Please continue to the next section [Paired Cuts - X Sections](#).

Paired Cuts - X Sections

Paired Cuts uses pairs of strings and where both strings cut each x-section, the cuts on the x-plot can be labelled with information such as

- (a) the name of the first and second cut strings
- (b) attributes from the first and second cut string
- (c) offset distance between the two cuts of the pair
- (d) 3d length between the two cuts of the pair
- (e) the offsets on the x-section of the first and second cuts of the pair

Symbols can be drawn at the offsets of the first and second cuts (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts.

The method for specifying which strings are to be checked for paired cuts is by first specifying the **models** (using wild cards and characters) that contains the strings, and then a **start name mask** to select the all the strings that are to be the first strings in a cut pair, and an **end name mask** to select all the strings that are the second strings in a cut pair.

For a x-section, all the cuts of the selected **start** strings are found and the cuts ordered by the offset of the cut on the x-section. Then all the cuts of the selected **end** strings are found and the cuts ordered by the offset of the cut on the x-section.

Up to twenty five different sets of models and name masks can be used so that different paired cut sets can be labelled in different ways.

Panel Field	Parameter name	Type
Define Set #		input

Model	pairing_n_model	model box
<i>models (the name can include wild cards (*) and wild characters (?)) from which start and end cut masks are derived.</i>		

text string containing the name masks to select the start strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes " (eg "bench 2").

For example: "ke*" or,
 "?bank*" or, if both masks are required,
 "ke* ?bank*"

text string containing the name masks to select the end strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes " (eg "bench 2")

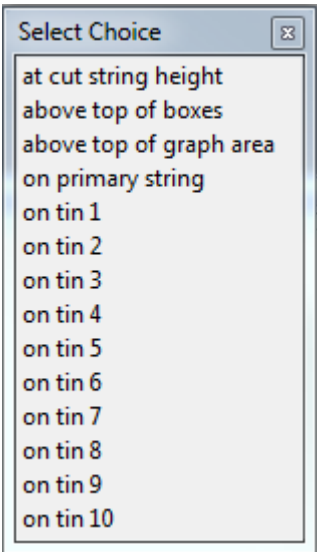

For example: "ke*" or;
 "?bank*" or, if both masks are required,
 "ke* ?bank*"

If **Start name mask** is blank and **End name mask** is not blank, then all strings in the models that are not used as end strings, are used as start string.

*If **End name mask** is blank and **Start name mask** is not blank, then all strings in the models that are not used as start strings, are used as end string.*

*This is currently not operational: If **Start name mask** and **End name mask** are both blank, then all strings in the models are used. All the strings are cut by the x-section are ordered by offset, and successive pairs of cuts taken to be the cut pairs. There could be one remaining cut point (it has the largest offset) and if so, it is taken to be orphaned start point.*

Position pairing_n_position choice box

where to get the z-values to use for the two cut positions. This is used in conjunction with the choice in the Adopted height field.

If left blank, **at cut string height** is used.

Adopted height pairing_n_height choice box lower position, higher position
start position, end position

for the choice selected in the Position field, there will be a z-value at the first cut and another z-value at the end cut. The Adopted height says which of the two z-value to use for placing symbols, lines between cuts, text from Attributes and the Offsets of the first cut and the second cut.

If lower (higher) position, the smaller (greater) of the two z-values will be used.

If start (end), the z-value of the first (second) cut of the cut point pair will be used.

If left blank, **lower position** is used.

Include orphaned start ? pairing_n_orphan_start choice box yes, no

if **Yes** and there are start cuts after the last end cut (and so can't be paired), then the last start cut (i.e. the one with the largest offset) is taken as an orphaned start and it is labelled as though there is a matching end at the end of the x-section.

if **No** and there are start cuts after the last end cut, then those start cut are ignored.

If left blank, **No** is used.

Include orphaned ends ? pairing_n_orphan_end choice box yes, no

if **Yes** and there are end cuts before the first start cut, then the first end cut (the one with the smallest offset) is taken as an orphaned end and it is labelled as though there is a matching start at the beginning of the x-section.

if **No** and there are end cuts before the first start cut, then those end cut are ignored.

If left blank, **No** is used.

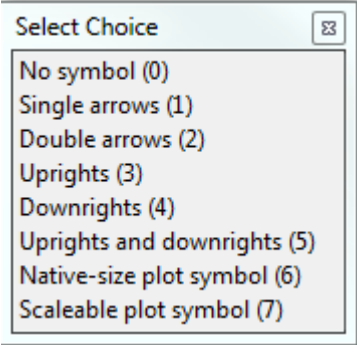

Paired Cuts - Lines and Symbols

Symbols can be placed at the start and end cut offsets (at the z-value given by the Position and Adopted height columns when defining the Sets), and a line can also be drawn between the cuts at that z-value. Having both the line and a symbol forms an arrow between the cuts pair.

Section: Pairing - Lines and symbol parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
set number as specified in the Define set #.			

Symbol type	pairing_line_symbols_n_symbol	choice box
-------------	-------------------------------	------------

type of symbol at each end of the cut pair:

for cases 6 and 7, a plot symbol is to be used and is given in the Symbol field

The height used for the symbol at both ends of the cuts pair is given by the Position and Adopted height column in the Set definition.

Symbol	pairing_line_symbols_n_user_symbol	plot symbols
--------	------------------------------------	--------------

for Symbol type 6 and 7, the plot symbol to be used at each cut point.

For Symbol type 0 to 5, this field is not used.

The height used for the symbol at both ends is given by the Position and Adopted height columns in the Set definition.

Symbol colour	pairing_line_symbols_n_symbol_colour	colour box
---------------	--------------------------------------	------------

colour of the symbol

Draw line	pairing_line_symbols_n_line	choice box	No line, Draw line
-----------	-----------------------------	------------	--------------------

if Draw line, draw a line between the start and end cuts for each cut pair.

If No line, no line is drawn between the start and end cuts for each cut pair.

The height used for the line at both ends is given by the Position and Adopted height columns in the Set definition.

Line colour	pairing_line_symbols_n_line_colour	colour box
-------------	------------------------------------	------------

colour of the line between the start and end cuts for each cut pair

Left symbol rotation	pairing_line_symbols_n_left_rotate	measure box
----------------------	------------------------------------	-------------

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the symbol at the start cut point for the cut point pair.

If there is no value then the rotation is 0.

Right symbol rotation	pairing_line_symbols_n_right_rotate	measure box
-----------------------	-------------------------------------	-------------

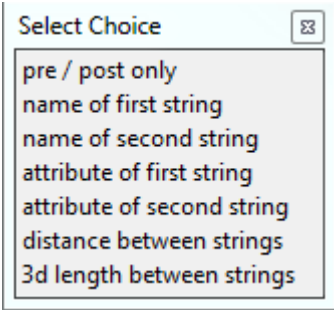

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the symbol at the end cut point for the cut point pair.
If there is no value then the rotation is 0.

X (mm)	pairing_line_symbols_n_x	measure box
horizontal adjustment to the position of the symbol.		
Y (mm)	pairing_line_symbols_n_y	measure box
vertical adjustment to the position of the symbol.		
Size	pairing_line_symbols_n_size	measure box
size of symbol. A value of 0 means no symbol.		

Paired Cuts - Labels

Section: Pairing - Label parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
set number as specified in the Define set # .			
Mode	pairing_label_n_mode	choice box	

type of label to write between the start and end points of the cuts pair
The height used for the label is given by the Position and Adopted height columns in the Set definition.

Attribute name	pairing_label_n_attribute	text box
if Mode is attribute of first string or attribute of second string , this is the name of the attribute to use as the label		
Offset	pairing_label_n_offset	measure box
the text is raised by this amount above the line between the cut pair		
Colour	pairing_label_n_colour	colour box
colour of the text		
Size (mm)	pairing_label_n_size	measure box
size of the text in millimetres. A value of 0 means no text.		
Textstyle	pairing_label_n_textstyle	textstyle box
the textstyle for the text		
Pre-text	pairing_label_n_pre_text	text box
text to draw before the label. This can include spaces, including one or more spaces after the last non blank character of Pre-text.		
Post-text	pairing_label_n_post_text	text box

text to draw after the label. This can include spaces, including one or more spaces before the first non blank character of Post-text.

Decimals pairing_label_n_no_decimals number box

if the label is a number, then Decimals is the number of decimal places to write the number out to.

If > 0, trailing zeros are **removed** after the decimal point.

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Leave gap for text pairing_label_n_?? tick box

if ticked then a gap in the line between the cuts pair is left large enough for the label and the pre-text and post-text.

If not ticked then no gap is left in the line between the cuts pair.

Rotate text to fit pairing_label_n_roate_text tick box

if ticked, then if the label and the pre-text and post-text will not fit between the start cut and end cut of the cut pair, the text is rotated through ninety degrees.

If not ticked, then the label text is drawn even though it will run over the ends of the cut pair.

Paired Cuts - Start Offset

The Offset (on the x-section) of the first point of the cut pair can be labelled.

The text for the label consists of pre-text followed by Offset value followed by post-text.

Section: Pairing - Start Offset parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	

set number as specified in the **Define set #**.

The height used for the text is given by the Position and Adopted height columns in the Set definition. This is then adjusted by the field Y (mm).

X (mm) pairing_start_offset_n_x measure box

for placing the text: horizontal adjustment from the offset of the first cut.

Y (mm) pairing_start_offset_n_y measure box

for placing the text: the vertical adjustment to the height given by the Position and Adopted height columns in the Set definition

Angle (dms) pairing_start_offset_n_angle measure box

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the text

Colour pairing_start_offset_n_colour colour box

colour of the text

Size (mm) pairing_start_offset_n_size measure box

size of the text in millimetres. A value of 0 means no text.

Textstyle pairing_start_offset_n_textstyle textstyle box

the textstyle for the text

Pre-text pairing_start_offset_n_pre_text text box

text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of Pre-text.

Post-text	pairing_start_offset_n_post_text	text box
<i>text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of Post-text.</i>		
Justification	pairing_start_offset_n_justification	justification box

justification of the text.

Decimals	pairing_start_offset_n_no_decimals	number box
<i>the number of decimal places for the offset value</i>		
<i>If > 0, trailing zeros are removed after the decimal point.</i>		
<i>If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.</i>		

Paired Cuts - End Offset

The Offset on the x-section of the second point of the cut pair can be labelled.
The label consists of pre-text then the Offset value followed by post-text.

Section: Pairing - End Offset parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
<i>set number as specified in the Define set #.</i>			
<i>The height used for the text is given by the Position and Adopted height columns in the Set definition. This is then adjusted by the field Y (mm).</i>			
X (mm)	pairing_end_offset_n_x	measure box	
<i>for placing the text: horizontal adjustment from the offset of the second cut.</i>			
Y (mm)	pairing_end_offset_n_y	measure box	
<i>for placing the text: the vertical adjustment to the height given by the Position and Adopted height columns in the Set definition</i>			
Angle (dms)	pairing_end_offset_n_angle	measure box	

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the text

Colour pairing_end_offset_n_colour colour box
colour of the text

Size (mm) pairing_end_offset_n_size measure box
size of the text in millimetres. A value of 0 means no text.

Textstyle pairing_end_offset_n_textstyle textstyle box
the textstyle for the text

Pre-text pairing_end_offset_n_pre_text text box
text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of Pre-text.

Post-text pairing_end_offset_n_post_text text box
text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of Post-text.

Justification pairing_start_offset_n_justification justification box

justification of the text.

Decimals pairing_start_offset_n_no_decimals number box

the number of decimal places for the Offset value

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Please continue to the next section [Paired Points](#).

Paired Points

Most cross sections are created with the vertices having vertex names which correspond to the strings created by template links, or MTF modifiers, or the names of the cut strings when cross sections are created by cutting through strings.

The **Paired Points** option enables a user to link pairs of these vertex names from the cross section being plotted (to create a points pair), and the points from the pair can be labelled with information such as

- (a) the name of the first and second point of the pair
- (b) vertex attributes of the cross section from the first and second points of the pair
- (c) distance between the two points in a pair
- (d) 3d length between the two points in a pair
- (e) the offsets on the x-section of the first and second points in a pair

Symbols can be drawn at the offsets of the first and second points of a pair (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts in a pair.

The method for specifying which named vertices are to be used for paired points is by a **start name mask** (using wild cards and characters) to select the all the vertices that are to be the first points in a pair, and an **end name mask** (using wild cards and characters) to select all the vertices that are the second points in a pair.

For a x-section, all the named vertices of the selected **start points** are found and the points ordered by the offset of the point on the x-section. Then all the named vertices of the selected **end points** are found and the points ordered by the offset of the point on the x-section.

The start points are then processed and each start point is paired with the next end point with a larger offset than the start point. It is possible that there are end points before the first start point (orphaned end points) and start points with no following end point (orphaned start points).

Up to twenty five different sets of name masks can be used so that different paired point sets can be labelled in different ways.

Section: Pairing - Model/Name mask parameters

Panel Field	Parameter name	Type
Define Set #		input

set number to be used to define different name mask sets.

Start name mask

text string containing the name masks to select the start points, each separated by one or more spaces, to test the x-section vertex names against. If the name includes spaces then it must be enclosed in the quotes " (eg "bench 2").

Each mask can include wild cards (*) and wild characters (?).

For example:

"ke*"	or,
"?bank*"	or, if both masks are required,
"ke* ?bank*"	

End name mask input

text string containing the name masks to select the end points, each separated by one or more spaces, to test the x-section vertex names against. If the name include spaces then it must be enclosed in the quotes " (eg "bench 2")

Each mask can include wild cards and wild characters.

For example: "ke*" or;
 "?bank*" or, if both masks are required,
 "ke* ?bank*"

Note

If **Start name mask** is blank and **End name mask** is not blank, then all vertices on the x-section that are not used as end points, are used as start points.

*If **End name mask** is blank and **Start name mask** is not blank, then all vertices on the x-section that are not used as start points, are used as end points.*

*If **End name mask** and **Start name mask** are both blank, then all vertices on the x-section are used. Successive pairs of vertices taken to be the point pairs. There could be one remaining point (it has the largest offset) and if so, it is taken to be orphaned start point.*

Position

choice box

where to get the z-values to use for the two paired points. This is used in conjunction with the choice in the Adopted height field.

If left blank, **at point height** is used.

Adopted height	pairing_n_height	choice box	lower position, higher position start position, end position
-----------------------	------------------	------------	-----------------------------------------------------------------

for the choice selected in the Position field, there will be a z-value at the first point and another z-value at the second point of the pair. The Adopted height says which of the two z-value to use for placing symbols, lines between paired points, text from Attributes and the Offsets of the first point and the second point of a point pair.

If lower (higher) position, the smaller (greater) of the two z-values will be used.

If start (end), the z-value of the first (second) cut of the cut point pair will be used.

If left blank, **lower position** is used.

Include orphaned start ?	pairing_n_orphan_start	choice box	yes, no
---------------------------------	------------------------	------------	---------

if **Yes** and there are start points after the last end point (and so can't be paired), then the last start point (i.e. the one with the largest offset) is taken as an orphaned start and it is labelled as though there is a matching end at the end of the x-section.

if **No** and there are start points after the last end point, then those start points are ignored.

If left blank, **No** is used.

Include orphaned ends ?	pairing_n_orphan_end	choice box	yes, no
--------------------------------	----------------------	------------	---------

if **Yes** and there are end points before the first start point, then the first end point (the one with the smallest offset) is taken as an orphaned end and it is labelled as though there is a matching start at the beginning of the x-section.

if **No** and there are end points before the first start point, then those end points are ignored.

If left blank, **No** is used.

Paired Points - Lines and Symbols

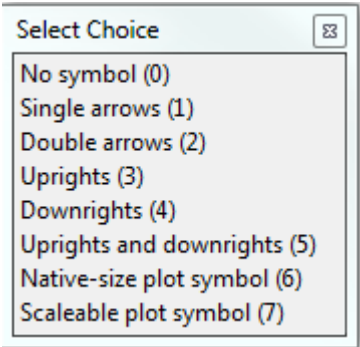

Symbols can be placed at the start and end point offsets (at the z-value given by the Position and Adopted height columns when defining the Sets), and a line can also be drawn between the paired points at that z-value. Having both the line and a symbol forms an arrow between the paired points.

Section: Pairing - Lines and symbol parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	

set number as specified in the **Define set #**.

Symbol type	pairing_line_symbols_n_symbol	choice box
-------------	-------------------------------	------------

type of symbol at each end of the points pair:

for cases 6 and 7, a plot symbol is to be used and is given in the Symbol field

The height used for the symbol at both ends is given by the Position and Adopted height column in the Set definition.

Symbol	pairing_line_symbols_n_user_symbol	plot symbols
--------	------------------------------------	--------------

for Symbol type 6 and 7, the plot symbol to be used at each paired point.

For Symbol type 0 to 5, this field is not used.

The height used for the symbol at both ends is given by the Position and Adopted height columns in the Set definition.

Symbol colour	pairing_line_symbols_n_symbol_colour	colour box
---------------	--------------------------------------	------------

colour of the symbol

Draw line	pairing_line_symbols_n_line	choice box	No line, Draw line
-----------	-----------------------------	------------	--------------------

if Draw line, draw a line between the start and end points for each point pair.

If No line, no line is drawn between the start and end points for each point pair.

The height used for the line at both ends is given by the Position and Adopted height columns in the Set definition.

Line colour	pairing_line_symbols_n_line_colour	colour box
-------------	------------------------------------	------------

colour of the line between the start and end points for each point pair

Left symbol rotation	pairing_line_symbols_n_left_rotate	measure box
----------------------	------------------------------------	-------------

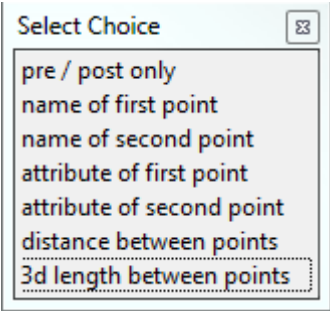

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the symbol at the start point of the point pair.

If there is no value then the rotation is 0.

Right symbol rotation	pairing_line_symbols_n_right_rotate	measure box
<i>angle (measured counterclockwise from the positive x-axis with units of degrees in HP Notation) to rotate the symbol at the end point of the point pair.</i>		
<i>If there is no value then the rotation is 0.</i>		
X (mm)	pairing_line_symbols_n_x	measure box
<i>horizontal adjustment to the position of the symbol.</i>		
Y (mm)	pairing_line_symbols_n_y	measure box
<i>vertical adjustment to the position of the symbol.</i>		
Size	pairing_line_symbols_n_size	measure box
<i>size of the symbol. A value of 0 means no symbol.</i>		

Paired Points - Labels

Section: Pairing - Label parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
<i>set number as specified in the Define set #.</i>			
Mode	pairing_label_n_mode	choice box	
			
<i>type of label to write between the start and end points of the points pair</i>			
<i>The height used for the label is given by the Position and Adopted height columns in the Set definition.</i>			
Attribute name	pairing_label_n_attribute	text box	
<i>if Mode is attribute of first point or attribute of second point, this is the name of the attribute to use as the label</i>			
Offset	pairing_label_n_offset	measure box	
<i>the text is raised by this amount above the line between the point pair</i>			
Colour	pairing_label_n_colour	colour box	
<i>colour of the text</i>			
Size	pairing_label_n_size	measure box	
<i>size of the text. A value of 0 means no text.</i>			
Textstyle	pairing_label_n_textstyle	textstyle box	
<i>the textstyle for the text</i>			
Pre-text	pairing_label_n_pre_text	text box	
<i>text to draw before the label. This can include spaces, including one or more spaces after the last non blank character of the Pre-text.</i>			

Post-text	pairing_label_n_post_text	text box
<i>text to draw after the label. This can include spaces, including one or more spaces before the first non blank character of the Post-text.</i>		
Decimals	pairing_label_n_no_decimals	number box
<i>if the label is a number, then Decimals is the number of decimal places to write the number out to.</i>		
<i>If > 0, trailing zeros are removed after the decimal point.</i>		
<i>If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.</i>		
Leave gap for text	pairing_label_n_??	tick box
<i>if ticked then a gap in the line between the points pair is left large enough for the label and the pre-text and post-text.</i>		
<i>If not ticked then no gap is left in the line between the points pair.</i>		
Rotate text to fit	pairing_label_n_roate_text	tick box
<i>if ticked, then if the label and the pre-text and post-text will not fit between the start point and end point of the point pair, the text is rotated through ninety degrees.</i>		
<i>If not ticked, then the label text is drawn even though it will run over the ends of the point pair.</i>		

Paired Points - Start Offset

The offset (on the x-section) of the first point of the point pair can be labelled.
The text for the label consists of pre-text followed by Offset value followed by post-text.

Section: Pairing - Start Offset parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
<i>set number as specified in the Define set #.</i>			
<i>The height used for the text is given by the Position and Adopted height columns in the Set definition. This is then adjusted by the field Y (mm).</i>			
X (mm)	pairing_start_offset_n_x	measure box	
<i>for placing the text: horizontal adjustment from the offset of the first cut.</i>			
Y (mm)	pairing_start_offset_n_y	measure box	
<i>for placing the text: the vertical adjustment to the height given by the Position and Adopted height columns in the Set definition</i>			
Angle (dms)	pairing_start_offset_n_angle	measure box	
<i>angle (measured counterclockwise from the positive x-axis with units of degrees in HP Notation) to rotate the text</i>			
Colour	pairing_start_offset_n_colour	colour box	
<i>colour of the text</i>			
Size (mm)	pairing_start_offset_n_size	measure box	
<i>size of the text in millimetres. A value of 0 means no text.</i>			
Textstyle	pairing_start_offset_n_textstyle	textstyle box	
<i>the textstyle for the text</i>			
Pre-text	pairing_start_offset_n_pre_text	text box	
<i>text before the Offset value. This can include spaces, including one or more spaces after the last non</i>			

blank character of Pre-text.

Post-text pairing_start_offset_n_post_text text box

text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of the Post-text.

Justification pairing_start_offset_n_justification justification box

justification of the text.

Decimals pairing_start_offset_n_no_decimals number box

the number of decimal places for the Offset value

*If > 0, trailing zeros are **removed** after the decimal point.*

If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Paired Points - End Offset

The Offset (on the x-section) of the second point of the point pair can be labelled.

The label consists of pre-text then the Offset value followed by post-text.

Section: Pairing - End Offset parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	

*set number as specified in the **Define set #**.*

The height used for the text is given by the Position and Adopted height columns in the Set definition. This is then adjusted by the field Y (mm).

X (mm) pairing_end_offset_n_x measure box

for placing the text: horizontal adjustment from the Offset of the second point.

Y (mm) pairing_end_offset_n_y measure box

for placing the text: the vertical adjustment to the height given by the Position and Adopted height columns in the Set definition

PPFs To Include

Panel Field	Parameter name	Type	Pop-Up
PPF files		input	
<i>by including pre-existing PPF files, the user can build up a modified version without having to set all the parameters.</i>			

Long Plot PPF Editor

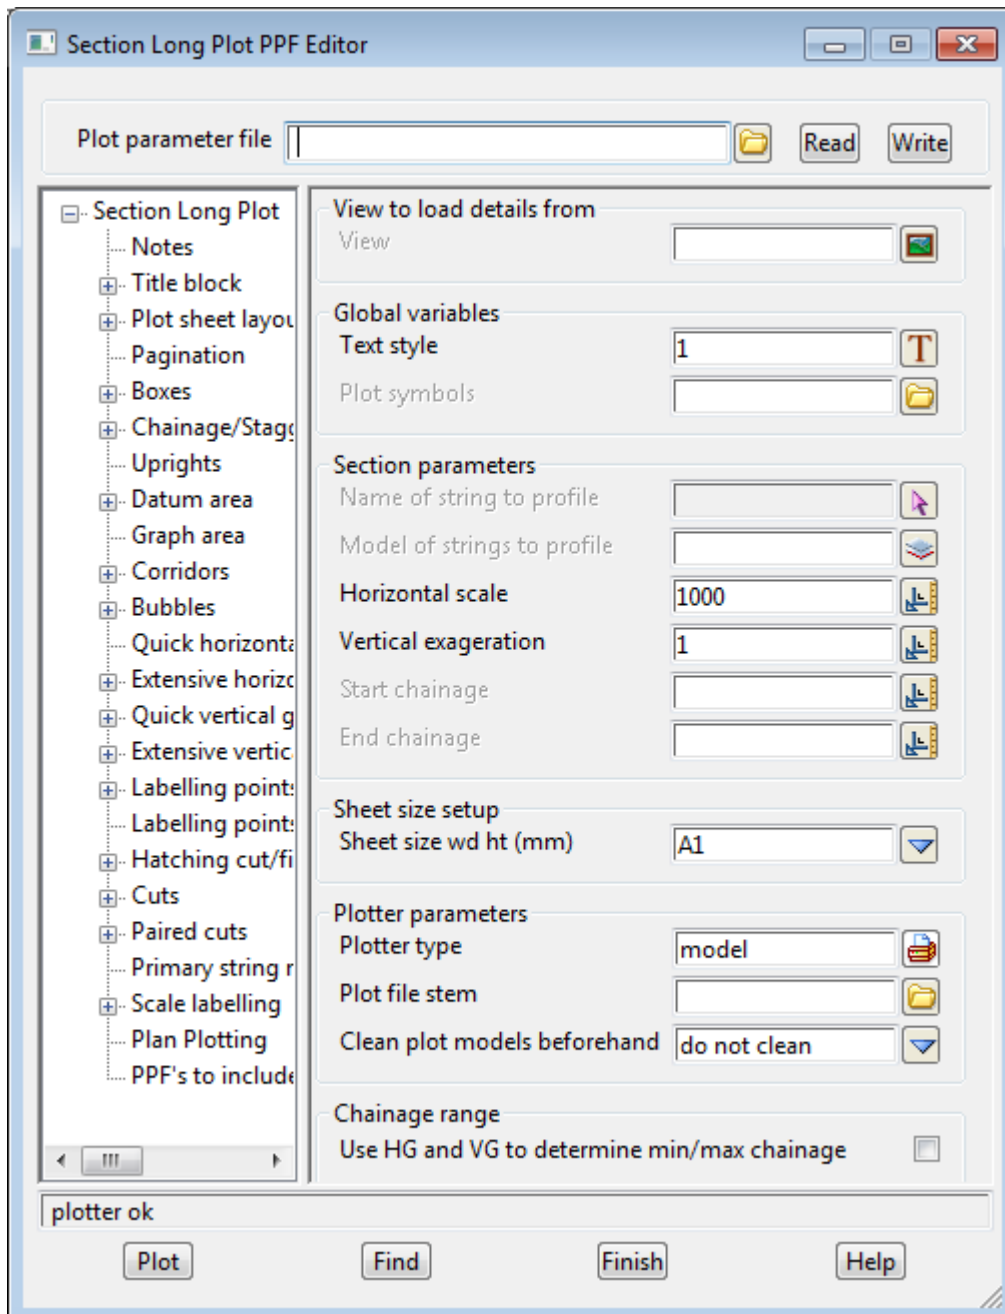

Position of option on menu: Plot =>Plot and PPF Editors =>Long sections

The **Long section PPF editor** is for creating and/or editing a (binary) long-section PPF and for creating a long section plot.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the **Long sections** option, the **Section Long Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the **Section Long Plot** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.

Information on the top and bottom buttons, and all the different nodes, now follows.

Please continue to the next section [Section Long Plot - Front Page](#).

Section Long Plot - Front Page

The long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

Apart from information labelled in the boxes area, the long section plot can label other information such as

- (a) horizontal geometry
- (b) vertical geometry
- (c) chainage, heights at special points
- (d) symbols at special points
- (e) bubbles at special chainages
- (f) cuts the design string makes through strings
- (g) cut and fill areas

Section: View to load details from

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
View		section view box	
<i>on selection of an existing section view, the vertical exaggeration, string to profile, corridor model and corridor settings from the section view are loaded into the ppf editor.</i>			

Section: Global variables

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Text style	global_textstyle	text box	
<i>default textstyle</i>			
Plot Symbols	plot_symbols	file box	
<i>specify a plot symbol file if it exists.</i>			

Section: Section parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Name of string to profile	string_to_plot		string box
<i>model of long sections to plot</i>			
Model of strings to profile	model_to_plot		model box
Horizontal Scale	scale	input	
<i>horizontal scale to be used for long section plots</i>			
Vertical exaggeration	vertical_exaggeration	input	
<i>vertical scale to be used for long section plots</i>			
Start chainage	start_chainage	input	
<i>start chainage of long sections to plot</i>			

End chainage	end_chainage	input
<i>start chainage of long sections to plot</i>		

Section: Sheet size setup

The plot **page** or **sheet** is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Sheet size wd ht (mm)	sheet_size	sheet size box	
<i>a valid sheet size is selected.</i>			

Section: Plotter parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plotter type	plotter_type	plotter box	
<i>a valid plotting option is selected.</i>			

Plot file stem	plot_stem	file box	
<i>plot file name. The appropriate extension is added dependant on the plotter type selected.</i>			

Clean plot models beforehand

	plot_model_clean	choice box	do not clean prompt for clean always clean
<i>whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.</i>			

Section: Chainage range

Use HG VG for min, max determines whether the horizontal geometry (HG) and the vertical geometry (VG) are both used to determine the minimum and maximum chainages for drawing. This allows the vertical geometry to be plotted when it is outside the horizontal geometry (e.g. kerb returns).

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use HG and VG to determine min/max chainage	use_hg_vg_for_min_max	tick box	
<i>if ticked, the min/max chainage will be determined by the Horizontal and Vertical geometry.</i>

Please continue to the next section [Plot Sheet Layout](#).

Plot Sheet Layout

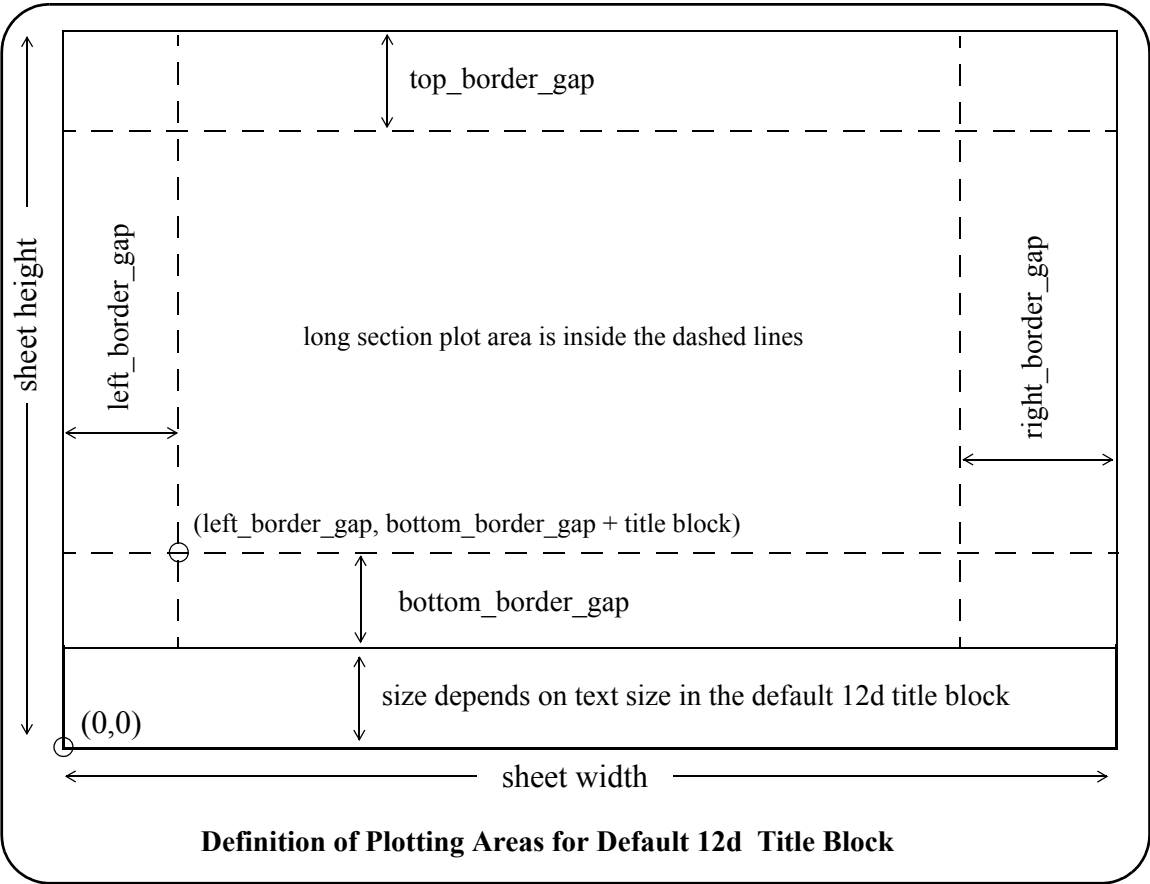

Plot Sheet Layout - Margins

Section: Margins for standard 12d title file - Border gaps

If the *default 12d title block* is used, then the size of the bottom of title block depends on the text size. The following parameters are used in the default title block case and the *bottom_border_gap* is added to the calculated height of the bottom of the title block.

The fields and buttons used in this section have the following functions.

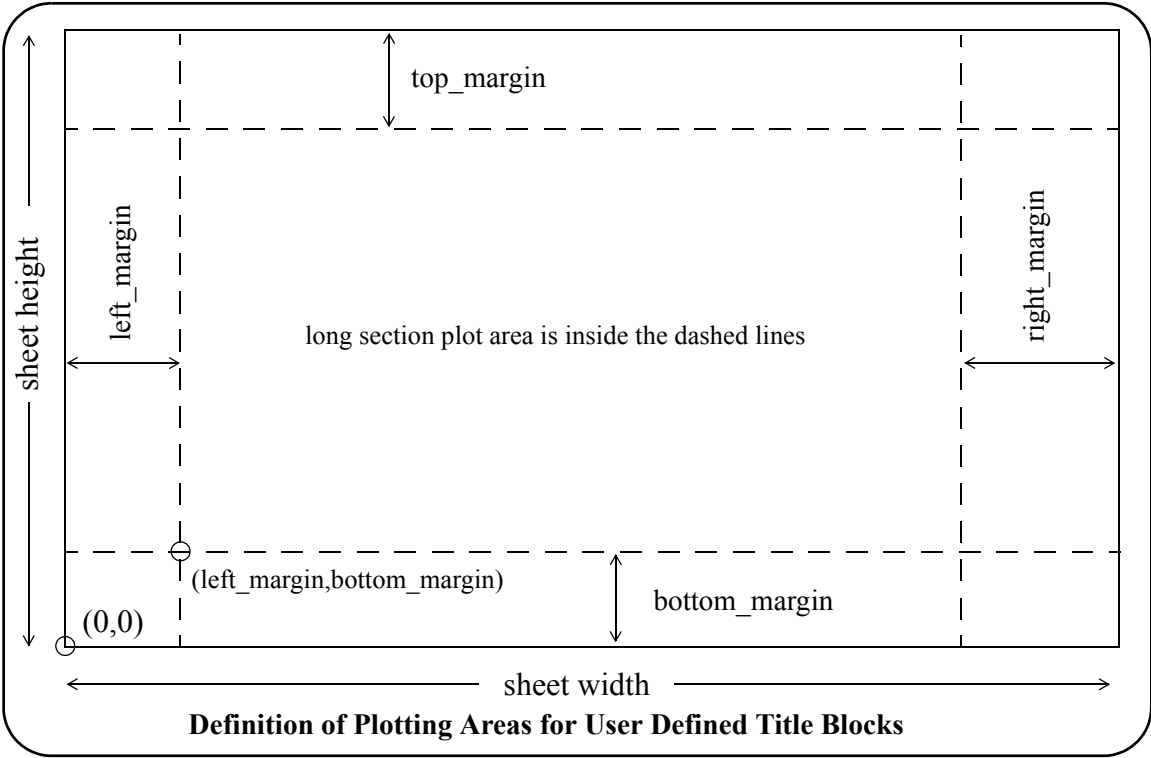

Field Description	Parameter name	Type	Pop-Up
Left (mm)	left_border_gap	input	
left border gap (in millimetres).			
Right (mm)	right_border_gap	input	
right border gap (in millimetres).			
Top (mm)	top_border_gap	input	
top border gap (in millimetres).			
Bottom (mm)	bottom_border_gap	input	
bottom border gap (in millimetres).			

Section: Margins for user title file

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left margin (in millimetres).</i>	left_margin	input	
Right (mm) <i>right margin (in millimetres).</i>	right_margin	input	
Top (mm) <i>top margin (in millimetres).</i>	top_margin	input	
Bottom (mm) <i>bottom margin (in millimetres).</i>	bottom_margin	input	

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

The (left_margin,bottom_margin) defines the left hand corner position of the long plot on the plot sheet.
The *right_margin* and *top_margin* need not be set and if missing, will be calculated from the other plot parameters defining the plot layout.
If the sheet sizes are missing, they will also be automatically calculated.

Please continue to the next section [Pagination](#).

Pagination

If the long section plot is too long to fit on one page, it can be broken into a number of pages (sheets).

The parameter, *pagination_length*, controls the amount of new chainage length on each plot page. Each page of the long section plot can also included a set chainage amount from the end of the **previous** plot.

Hence apart from the first page and possibly the last page, the plot will have a chainage length given by the sum of the *pagination_length* and *pagination_overlap*.

Section: *Pagination parameters*

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use pagination <i>if ticked, then break the plot into pages.</i>	pagination	tick box	
Pagination mode <i>length and overlap units.</i>	pagination_mode	choice	chainage millimetres
Chainage length <i>new chainage range on each page.</i>	pagination_length	input	
Chainage overlap <i>overlap between pages.</i>	pagination_overlap	input	

Note:

The *pagination_length* and *pagination_overlap* are given in chainage units **or** millimetres. The user must choose values which will fit on the selected sheet size or the end of each plot will be truncated by the sheet.

Please continue to the next section [Boxes](#).

Boxes

Each string in the long section plot can be labelled with one or two lines of title, and the chainages/heights/depths at the user specified chainages for the strings.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The **chainages/heights/depths** are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **chainage/height/depth** values along the string.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

- (a) optional super-elevation diagram
- (b) chainage values
- (c) can be primary string heights - user choice
- (d) tin heights and depths
- (e) offset heights and depths
- (f) optional volumes or earth works
- (g) can be primary string heights - user choice
- (h) zero or more blank boxes

Section: Linework parameters

Field Description	Parameter name	Type	Pop-Up
Draw box mode	draw_box_mode	choice box	Do not draw any box lines
			Draw box lines around height area only
			Draw box lines around title and height area only
			Use parameters defined in boxes - heights

mode for drawing the boxes for the long section plot.

Default box colour	box_colour	colour box
<i>default box colour</i>		

Number of blank boxes	number_of_blank_boxes	input
-----------------------	-----------------------	-------

number of boxes to be left blank

The blank boxes are used to place other information in (such as horizontal or vertical geometry) or for other user supplied information.

Section: Primary string parameters

The primary string (the design string) is used to define

- (a) the design long section
- (b) the chainage positions for labelling heights and drawing uprights
- (c) the section line used for sectioning through tins
- (d) the section line for defining the corridor for services

Although the primary string is used to set up most of the information for the long section plot, it doesn't have to be drawn on the long section.

The drawing or not drawing of the primary string on each cross section plot is controlled by the parameter *primary_string*.

The **colour** of the primary string in the plot is the actual primary string colour.

Sometimes the primary string is only required to define chainages or the horizontal path for tin sections. In this case, the primary string would not be drawn on the long section plot.

If the primary string is drawn, it is automatically labelled.

Also the drawing of crosses at the vertical intersection points can be controlled from the ppf file.

Draw and label the primary string *primary_string* tick box

if ticked, the primary string will be drawn and labelled.

Draw crosses at VIPs *primary_draw_vips* tick box

if ticked, crosses will be draw at the vertical intersection points.

The position of the primary string label box can be either straight after the chainage box, or after the tin and offset boxes but before the blank boxes.

Placing the primary string label before the bank boxes or just after the chainage box in controlled by the parameter *primary_label_mode*.

Primary string location *primary_label_mode* choice box in last box before blank boxes
in first box above chainages

position of the primary string label.

Although the order of the boxes may appear to be fixed, in practice they can be in any order. This is possible because for each box, there is a parameter to set the height in millimetres from the bottom of all the boxes that the text in the box is drawn at (the *_y_pos* parameters).

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

Boxes - Title Area

Section: Boxes - Title area parameters

The **title area** starts at the co-ordinate (left_margin,bottom_margin).

The size of the title text is given by the **title_box_text_size** parameter.

The **width** of the title area is either given by the *space_for_titles* parameter, or if omitted, the required width is automatically calculated.

Field Description	Parameter name	Type	Pop-Up
Size of titles (mm) <i>size of offset, height label and values</i>	title_box_text_size	input	

Space for titles (mm) <i>size of title area.</i>	space_for_titles	input	
------------------------------------------------------------	------------------	-------	--

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

X adjustment (mm) <i>distance to move the title text from the left hand side of the boxes</i>	box_titles_x	input	
---------------------------------------------------------------------------------------------------------	--------------	-------	--

The y position of the title text can be set separately for each type of title. The parameters are given later under each of the title types (e.g. chainages, primary string, tins, depths etc.).

After the title area there can be a user defined gap, followed by the heights area

Distance between title and values area (mm) <i>distance between title and values area in mm.</i>	box_gap	input	
------------------------------------------------------------------------------------------------------------	---------	-------	--

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_justification*).

Boxes - Values Area

Section: Boxes - Value area parameters

The **values area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

The number of decimal places (*number_of_decimals*), and the size of the heights text (*box_text_size*) can be specified globally but there is a parameter for each box which overrides these defaults for each box of heights.

Field Description	Parameter name	Type	Pop-Up
Justification <i>justification of height text.</i>	box_text_justification	choice box	bottom of individual boxes top of individual boxes

Number of decimals <i>number of decimal places in the height boxes. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the heights area.</i>	number_of_decimals	input	
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------	-------	--

Text size (mm) <i>distance to move the title text from the left hand side of the boxes</i>	box_text_size	input	
------------------------------------------------------------------------------------------------------	---------------	-------	--

Horizontal line spacing (mm) <i>height of the individual height boxes.</i>	horizontal_line_spacing	input	
--------------------------------------------------------------------------------------	-------------------------	-------	--

A global height for the individual boxes is either given by the *horizontal_line_spacing* parameter, or if omitted, a height to fit the largest height or depth value is calculated and used as the default box height.

However, the height of each box can be individually set by parameters *box_size_n* where the

boxing numbering, n. starts from the bottom box. The value of *horizontal_line_spacing* is used for any of the *box_size_n* parameters not specified.

Label tin/offset string heights by default

label_heights tick box

Label tin/offset string depths by default

label_depths tick box

Box #

input

specifying the nth value

Size (mm)

box_size_n input

height of the nth box, numbered from bottom up.

The total height of the boxes area is simply given by the sum of the heights of each box.

The **width** of the **heights area** is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the **title area** plus *box_gap*, plus the width of the **heights area**.

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area so that the distances are independent of the number of boxes and box sizes.

Boxes - Outside Linework

The drawing of the box line work, the box colour, the position of the primary string labels and the number of blank boxes are all set by parameters.

Section: Boxes - Outside linework parameters

Field Description	Parameter name	Type	Pop-Up
Draw the left side of title area(1)			
	draw_box_side_1	tick box	
<i>if ticked, draw the left side of the title area (def).</i>			
Draw the top line of title area(2)			
	draw_box_side_2	tick box

<i>colour to draw top of title area</i>		
Colour (3)	box_side_colour_3	colour box
<i>colour to draw right side of title area</i>		
Colour (4)	box_side_colour_4	colour box
<i>colour to draw bottom of title area</i>		
Colour (5)	box_side_colour_5	colour box
<i>colour to draw left side of heights area</i>		
Colour (6)	box_side_colour_6	colour box
<i>colour to draw top of heights area</i>		
Colour (7)	box_side_colour_7	colour box
<i>colour for right side of heights area</i>		
Colour (8)	box_side_colour_8	colour box
<i>colour for bottom of heights area</i>		

Boxes - Inside Linework

Section: Boxes - Inside linework parameters

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

The separation lines can be drawn just in the title area, just in the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where n = 1, ... number of boxes -1.

The top of the top box is not controlled by *box_line_mode_n* but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6*.

The fields and buttons used in this section have the following functions.

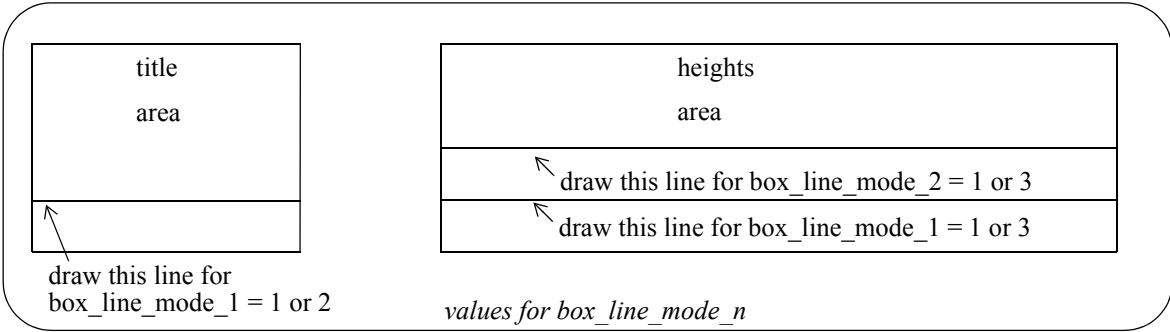

Field Description	Parameter name	Type	Pop-Up
Separation line mode	box_line_draw_mode	choice box	Do not draw any separation lines Draw the separation lines in both areas Draw the separation lines in the title area only Draw the separation lines in the heights area only

the separation line draw mode.

Box #		input	
			Where box # = 1 to number of boxes(n). Box 1 is the bottom box, increasing upwards.
Line mode	box_line_mode_n	choice box	No top line for title or height area (mode=0) Draw top line for title or height area (mode=1) Draw top line for title area only (mode=2)

Draw top line for height area only (mode=3)

line mode for top of title and height areas for box number specified.

Boxes - Chainage Titles/Values

Section: Chainage title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line 1	chainage_title	input	
1st line of chainage title.			
Title line 2	chainage_title_2	input	
second line of chainage title.			
Textstyle	chainage_title_textstyle	text box	
Textstyle for the chainage title			
Colour	chainage_title_colour	colour box	
colour of the chainage title			
Text size (mm)	chainage_title_size	input	
size of the chainage title			
Text y position (mm)	chainage_title_y_pos	input	
if set, the height in mm above the bottom of all the boxes that the chainage title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.			

Section: Chainage value parameters (raw/running chainage)

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	chainage_decimals	input	
number of decimal places for chainages			
Textstyle	chainage_textstyle	text box	
textstyle for the chainage values			
Colour	chainage_colour	colour box	

colour of the chainage values

Text size (mm) chainage_size input

size of the chainage values

Text y position (mm) chainage_y_pos input

if set, the height in mm above the bottom of all the boxes that the chainage values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.

Boxes - Chainage Title/Values - Equality Chainage Values

Section: Equality chainage values

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type
Label with equality chainages	chainage_label_eq	tick box
Decimal places	chainage_decimals_eq	input
1000s separator (non K-post)	chainage_thousands_separator_eq	input
Zero-pack digits after 1000s separator	chainage_zero_pack_eq	tick box
Show K-Post at non-zero offset (if defined)	chainage_name_include_eq	tick box
K-post pre text	chainage_name_pre_eq	input
K-post post text	chainage_name_post_eq	input
Space before offset of K-post	chainage_offset_space_eq	tick box
Plus sign before positive offset of K-post	chainage_plus_eq	tick box
Show equality zone (if defined)	chainage_zone_include_eq	tick box
Space before equality zone	chainage_zone_space_eq	tick box
Equality zone pre text	chainage_zone_pre_eq	input
Equality zone post text	chainage_zone_post_eq	input
Before/after equality separator	chainage_equals_separator_eq	input
Textstyle	chainage_textstyle_eq	input
Colour	chainage_colour_eq	colour box
Text size (mm)	chainage_size_eq	input
Text y position (mm)	chainage_y_pos_eq	input

Boxes - Primary String Titles/Heights

Sometimes the primary string is only required to define chainages or the horizontal path for tin sections. In this case, the primary string would not be drawn on the long section plot.

If the primary string is drawn, it is automatically labelled.

Also the drawing of crosses at the vertical intersection points can be controlled from the ppf file.

Section: Primary string title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line	primary_title	input	

1st line of string title.

Title line 2	primary_title_2	input
<i>second line of string title. Default is primary string name.</i>		
Textstyle	primary_title_textstyle	text box
<i>textstyle for the primary string title</i>		
Colour	primary_title_colour	colour box
<i>colour of the primary string title</i>		
Text size (mm)	primary_title_size	input
<i>size of the string title</i>		
Text y position (mm)	primary_title_y_pos	input
<i>if set, the height in mm above the bottom of all the boxes that the primary string title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the primary string.</i>		

Section: Primary string height parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	primary_decimals	input	
<i>number of decimal places for height values.</i>			
Textstyle	primary_textstyle	text box	
<i>textstyle for the height values</i>			
Colour	primary_colour	colour box	
<i>colour of the height values</i>			
Text size (mm)	primary_size	input	
<i>size of the height values</i>			
Text y position (mm)	primary_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the primary string height values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the primary string.</i>			
Search dist when no z (m)	primary_ch_tolerance	input	
<i>for a given chainage, if no z value exists, this distance is added to/subtracted from the chainage to search for a valid z value.</i>			

Boxes - Tin Titles/Heights/Depths

Section: Tin titles/heights/depths parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label depth default	label_depths	tick box	
<i>if ticked, the depths are labelled.</i>			
Define tin set #		input	
<i>where n = 1 to.... The set enables the specification of a number of parameters for a number of specified tin names.</i>			
Tin name	tin_n_name	tin box	available tins

the name of the nth tin to be used for labelling.

If a tin of the name given by **tin_n_name** does not exist, then the plot is not produced and an error message is given.

Tin draw mode	tin_n_draw_mode	choice box	Draw the tin
			Do not draw the tin

draw tin mode for the nth tin specified by tin set #.

Tin colour	tin_n_draw_colour	colour box
-------------------	-------------------	------------

tin colour mode for the nth tin specified by tin set #.

Tin label mode	tin_n_label	choice box	Label the tin
			Do not label the tin

tin label mode for the nth tin specified by tin set #.

Boxes - Tin Titles/Heights/Depths - Titles

Section: Tin - Title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set #		input	
<i>set number to be used to define sets of tin parameters i.e. n value</i>			
First line of tin title	tin_n_title	input	
<i>first line of nth tin title</i>			
Second line of tin title	tin_n_title_2	input	
<i>second line of nth tin title</i>			
Tin title textstyle	tin_n_title_textstyle	text box	
<i>nth tin title textstyle</i>			
Tin title colour	tin_n_title_colour	colour box	
<i>nth tin title colour</i>			
Tin title size (mm)	tin_n_title_size	input	
<i>nth tin title size</i>			
Title Y position (mm)	tin_n_title_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the nth tin title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>			

Boxes - Tin Titles/Heights/Depths - Heights

Section: Tin - Height parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set #		input	
<i>set number to be used to define sets of tin parameters i.e. n value</i>			
Decimals	tin_n_decimals	input	

<i>number of dec places in nth tin height. < 0 to keep all trailing zeros</i>		
Textstyle	tin_n_textstyle	text box
<i>textstyle of nth tin height</i>		
Colour	tin_n_colour	colour box
<i>nth tin height and depth colour</i>		
Size (mm)	tin_n_size	input
<i>nth tin height size</i>		
Y pos (mm)	tin_n_y_pos	input
<i>if set, the height in mm above the bottom of all the boxes that the tin height text is drawn.If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>		

Boxes - Tin Titles/Heights/Depths - Depths

Section: Tin depth parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set #		input	
<i>set number to be used to define sets of tin parameters i.e. n value</i>			
Depth label mode	tin_n_depth_label	choice box	Label depths Do not label depths
<i>depth label mode for the nth tin specified by set #.</i>			
First line of tin depth title	tin_n_depth_title	input	
<i>first line of nth tin depth title</i>			
Second line of tin depth title	tin_n_depth_title_2	input	
<i>second line of nth tin depth title</i>			
Depth title textstyle	tin_n_depth_title_textstyle	text box	
<i>nth tin depth title textstyle</i>			
Depth title colour	tin_n_depth_title_colour	colour box	
<i>nth tin depth title colour</i>			
Depth title size (mm)	tin_n_depth_title_size	input	
<i>nth tin depth title size</i>			
Depth title Y position (mm)	tin_n_depth_title_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the tin depth title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>			
Decimals in depth value	tin_n_depth_decimals	input	
<i>number of dec places in tin height. < 0 to keep all trailing zeros</i>			
Depth value textstyle	tin_n_depth_textstyle	text box	
<i>nth tin depth textstyle</i>			
Depth value colour	tin_n_depth_colour	colour box	
<i>nth tin depth colour</i>			

Depth value size (mm) tin_n_depth_size input

nth tin depth size

Depth value Y position (mm) tin_n_depth_y_pos input

if set, the height in mm above the bottom of all the boxes that the tin depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.

Multiplier for positive depths depth_positive_factor input

if set, this value will be used to multiply positive depth values.

Multiplier for negative depths depth_negative_factor input

if set, this value will be used to multiply negative depth values.

The depth from the primary string to a tin, at a particular offset is defined as

depth = tin height value - height of the primary string

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

if (depth >= 0) plotted_depth_value = depth * depth_positive_factor

if (depth < 0) plotted_depth_value = depth * depth_negative_factor

Hence the definition of depth can be modified by the parameters:

depth_positive_factor value // multiplier for positive depths

depth_negative_factor value // multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

depth = height of the primary string - tin height value

simply set

depth_positive_factor -1

depth_negative_factor - 1

Boxes - Offset String Titles/Heights/Depths

Section: Offset string titles/heights/depths parameters

Each string in the offset model given can be automatically projected onto the primary string and drawn on the long section plot.

The offset model has been modified to allow strings to be projected onto the primary string to be specified by model and name, rather than just projecting all the strings in a given model. The string can also be labelled with either the string name, its model name or both.

The string is specified by

offset_n_mask "model_name->string_name"

For each n, a set of plot parameters determine if the string's heights and/or depths from the primary string are labelled in the boxes area.

If only the *string_name* is given, then the model given in the Offset model field of the **Section Long Plot** panel.

If there is **more than one string** with the given model and name, then it will be considered to be one string and at any primary string chainage, the closest of the strings will be the part used for projecting. For example, strings of the same name on either side of a road intersection will be considered to be the one string for projecting.

If any *offset_n_mask* is used, then the Offset option expects all the strings to be specified by an

offset_n_mask. Then if no mask exists for any value of n, then that parameter set is ignored and no string projected.

If no offset masks are used (that is, no *offset_n_mask*'s are used), then the plot parameters determine whether each string in the offset model is drawn, and if the string's heights and depths from the primary string are labelled in the boxes area. The order that the strings are then plotted and labelled is the same as the order of the strings in the Offset model.

For the following sets of parameters, n takes the value 1 to 100 and specifies that the parameter set applies to the nth string given by *offset_n_mask* or, if no offset masks are given, the nth string in the *Offset model*.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Default offset model <i>default offset model.</i>	offset_model	model box	
Define set # <i>where n = 1 to.... The set enables the specification of a number of parameters for a number of specified tin names.</i>		input	
Offset mask <i>the value specified by model_name->string_name.</i>	offset_n_mask	input	
Offset draw mode <i>draw mode for offset string.</i>	offset_n_draw_mode	choice box	Draw the offset string Do not draw the offset string
Datum difference from primary		input	
Left search distance <i>default 1000. Distance to search to the left of the primary string for the offset string. If 0, don't search to the left.</i>	offset_n_lw	input	
Right search distance <i>default 1000. Distance to search to the right of the primary string for the offset string. If 0, don't search to the right.</i>	offset_n_rw	input	
Offset colour <i>default offset string colour.</i>	offset_n_draw_colour	colour box	
Offset label mode heights <i>offset string label mode.</i>	offset_n_label	choice box	Label the strings heights Do not label the strings

Boxes - Offset String Titles/Heights/Depths - Titles

Section: Offset string - Title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Offset string mode	offset_title_mode	choice box	Label with string name

Label with model name
Label with model->string as
name

offset string title mode.

Use set # input
set number to be used to define sets of offset parameters i.e. n value

or, for any set, the *offset_title_mode* can be replaced by two lines of user defined title:

First line of offset title offset_n_title input
first line of nth offset title

Second line of offset title offset_n_title_2 input
second line of nth offset title

Title textstyle offset_n_title_textstyle text box
nth offset title textstyle

Title colour offset_n_title_colour colour box
nth offset title colour

Title size (mm) offset_n_title_size input
nth offset title size

Title Y position (mm) offset_n_title_y_pos input
if set, the height in mm above the bottom of all the boxes that the offset title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.

Boxes - Offset String Titles/Heights/Depths - Heights

Section: Offset string - Height parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set # <i>set number to be used to define sets of offset parameters i.e. n value</i>		input	
Decimals <i>number of dec places in nth offset height. < 0 to keep all trailing zeros</i>	offset_n_decimals	input	
Textstyle <i>Textstyle of nth offset height</i>	offset_n_textstyle	text box	
Colour <i>nth offset height and depth colour</i>	offset_n_colour	colour box	
Size (mm) <i>nth offset height size</i>	offset_n_size	input	
Y pos (mm) <i>if set, the height in mm above the bottom of all the boxes that the offset height text is drawn.If not set, then the text is placed at a height that puts it inside the default box for the offset heights.</i>	offset_n_y_pos	input	

Boxes - Offset String Titles/Heights/Depths - Depths

Section: Offset string - Depth parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set number to be used to define sets of offset parameters i.e. n value</i>			
Depth label mode	offset_n_depth_label	choice box	Label depths Do not label depths
<i>depth label mode for the nth offset specified by set #.</i>			
First line of depth title	offset_n_depth_title	input	
<i>first line of nth offset depth title</i>			
Second line of depth title	offset_n_depth_title_2	input	
<i>second line of nth offset depth title</i>			
Depth title textstyle	offset_n_depth_title_textstyle	text box	
<i>nth offset depth title textstyle</i>			
Depth title colour	offset_n_depth_title_colour	colour box	
<i>nth offset depth title colour</i>			
Depth title size (mm)	offset_n_depth_title_size	input	
<i>nth offset depth title size</i>			
Depth title Y position (mm)	offset_n_depth_title_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the offset depth title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.</i>			
Decimals in depth value	offset_n_depth_decimals	input	
<i>number of dec places in offset height. < 0 to keep all trailing zeros</i>			
Depth value textstyle	offset_n_depth_textstyle	box	
<i>nth offset depth textstyle</i>			
Depth value colour	offset_n_depth_colour	colour box	
<i>nth offset depth colour</i>			
Depth value size (mm)	offset_n_size	input	
<i>nth offset depth size</i>			
Depth value Y position (mm)	offset_n_depth_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the offset depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the offset heights.</i>			

Boxes - Offset String Chainages

Section: Offset string - Chainage parameters

The fields and buttons used in this section have the following functions for the nth defined offset string.

Field Description	Parameter name	Type	Pop-Up
Use String	chainage_n_offset_mode	tick box	

if ticked, use offset string.

Offset String chainage_n_offset_string select box
the value specified by model_name->string_name.

First line of chainage title chainage_n_title input
first line of offset chainage title.

Second line of chainage title chainage_n_title_2 input
second line of offset chainage title.

Chainage title textstyle chainage_n_title_textstyle text box
textstyle for the offset chainage title

Chainage title colour chainage_n_title_colour colour box
colour of the offset chainage title

Chainage title size (mm) chainage_n_title_size input
size of the offset chainage title

Chainage title Y position (mm) chainage_n_title_y_pos input
if set, the height in mm above the bottom of all the boxes that the offset chainage title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.

Decimals in chainage value chainage_n_decimals input
number of decimal places for offset chainages

Chainage value textstyle chainage_n_textstyle text box
textstyle for the offset chainage values

Chainage value colour chainage_n_colour colour box
colour of the offset chainage values

Chainage value size (mm) chainage_n_size input
size of the offset chainage values

Chainage value Y position (mm) chainage_n_y_pos input
if set, the height in mm above the bottom of all the boxes that the offset chainage values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the chainage.

Boxes - Super Elevation Diagram

Section: Super elevation diagram parameters

The optional *super-elevation diagram* draws the values of the cross-fall (x-fall) between two strings using the primary string as the reference string. The cross-fall at a given chainage on the primary string is calculated by sectioning perpendicular to the reference string at that chainage and cutting the two strings. The cross-fall is defined as the cross-fall between the two cuts points on the strings.

The diagram has levels for the cross fall for a pair of strings on the left of the primary string, and a pair of strings on the right of the primary string. The diagram also has uprights in the super-elevation box with chainage values at the change of super values.

For the left hand side, the cross-fall is calculated at right angles to the primary string between the user given left hinge string and the left edge string.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Super elevation diagram draw mode			
	super_draw_mode	choice box	don't draw diagram
		mode = 1	draw diagram using super sample interval
		mode = 2	sample super using chainages of x-sec's
		mode = 3	sample super using chainages from a string

super elevation diagram draw mode.

Super sample interval super_sample_interval input

if mode = 1, Chainage distance to sample x-fall. (default 20)

Super sample name super_sample_name input

name to be used in sampling. If mode = 2, name = model_name.

If mode = 3, name = model_name->string_name

Super tolerance super_tolerance input

If super_draw_mode is 1, the change of super is greater than super_tolerance, draw uprights

Boxes - Super Elevation Diagram - Titles

Section: Super elevation diagram - Title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line of super title	super_title	input	
<i>1st line of the super title</i>			
Super title textstyle	super_title_textstyle	text box	

textstyle of super title

Super title colour	super_title_colour	colour box
---------------------------	--------------------	------------

colour of super title

Super title size (mm)	super_title_size	input
------------------------------	------------------	-------

size of super title

Super title Y position (mm)	super_title_y_pos	input
------------------------------------	-------------------	-------

if set, the height in mm above the bottom of all the boxes that the super title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the super.

Boxes - Super Elevation Diagram - X-Fall

Section: Super elevation diagram - X-fall parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
X-fall textstyle	super_xfall_textstyle	text box	

textstyle of super title

X-fall colour	super_xfall_colour	colour box
----------------------	--------------------	------------

colour of super title

X-fall size (mm)	super_xfall_size	input
-------------------------	------------------	-------

size of super title

X-fall X position (mm)	super_xfall_x	input
-------------------------------	---------------	-------

the distance to the right from the super chainage uprights to the start of the x-fall text.

X-fall Y position (mm)	super_xfall_y	input
-------------------------------	---------------	-------

if set, the height in mm above the bottom of all the boxes that the super x-fall text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the super.

Boxes - Super Elevation Diagram - Chainage

Section: Super elevation diagram - Chainage parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Chainage textstyle	super_ch_textstyle	text box	

textstyle of super chainage title

Chainage colour	super_ch_colour	colour box
------------------------	-----------------	------------

colour of super chainage title

Chainage size (mm)	super_ch_size	input
---------------------------	---------------	-------

size of super chainage title

Chainage X position (mm)	super_ch_x	input
---------------------------------	------------	-------

the distance to the right from the super chainage uprights to the start of the super chainage text.

Chainage Y position (mm)	super_ch_y	input
---------------------------------	------------	-------

if set, the height in mm below the bottom of all the boxes that the super chainage is finished.

Chainage decimal places `super_ch_decimals` input
number of dec places in super chainage

Boxes - Super Elevation Diagram - Left Side

Section: Super elevation diagram - Left side parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left hinge string <i>left hinge string. (model_name->string_name)</i>	<code>super_hinge_name_left</code>	select box	
Left edge string <i>left edge string. (model_name->string_name)</i>	<code>super_edge_name_left</code>	select box	
Super left linestyle <i>linestyle of super left line.</i>	<code>super_left_linestyle</code>	linestyle box	
Super left line colour <i>colour of super left line.</i>	<code>super_left_line_colour</code>	colour box	
Super left decimal places <i>number of dec places in super left x-fall value</i>	<code>super_left_decimals</code>	input	
Text before left X-fall value <i>text before super left x-fall value.</i>	<code>super_left_pre</code>	input	
Text after left X-fall value <i>text after super left x-fall value.</i>	<code>super_left_post</code>	input	

Boxes - Super Elevation Diagram - Right Side

Section: Super elevation diagram - Right side parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Right hinge string <i>right hinge string. (model_name->string_name)</i>	<code>super_hinge_name_right</code>	select box	
Right edge string <i>right edge string. (model_name->string_name)</i>	<code>super_edge_name_right</code>	select box	
Super right linestyle <i>linestyle of super right line.</i>	<code>super_right_linestyle</code>	linestyle box	
Super right line colour <i>colour of super right line.</i>	<code>super_right_line_colour</code>	colour box	
Super right decimal places <i>number of dec places in super right x-fall value</i>	<code>super_right_decimals</code>	input	
Text before right X-fall value <i>text before super right x-fall value.</i>	<code>super_right_pre</code>	input	

Text after right X-fall value super_right_post input
text after super right x-fall value.

Boxes - Super Elevation Diagram - Centre Line

Section: Super elevation diagram - Centre line parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Super centre linestyle <i>super centre line linestyle.</i>	super_cl_linestyle	linestyle box	
Super centre line colour <i>super centre line colour.</i>	super_cl_line_colour	colour box	

Boxes - Super Elevation Diagram - Common X-Fall

Section: Super elevation diagram - Common X-fall parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Text before common X-fall value <i>text before super common x-fall value.</i>	super_common_pre	input	
Text after common X-fall value <i>text after super common x-fall value.</i>	super_common_post	input	
Super common linestyle <i>super common linestyle.</i>	super_common_linestyle	linestyle box	
Super common line colour <i>super common colour.</i>	super_common_line_colour	colour box	
Super common decimal places <i>number of decimal places in super common x-fall value</i>	super_common_decimals	input	

Boxes - Super Elevation Diagram - Uprights

Section: Super elevation diagram - Upright parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Upright mode	super_upright_mode	choice box	for left string only for right string only for both strings

upright mode for super elevation diagram.

Super uprights colour `super_upright_colour` colour box
super upright colour.

Boxes - Volume Cut/Fill

Section: Volume cut/fill parameters

The values of calculated cut and fill volumes (cut and fill earth works) can be read from a file and then interpolated to produce cut and fill volumes for a given interval along the primary string.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Draw a volume diagram <i>if ticked, draw a volume diagram.</i>	<code>volume_draw_mode</code>	tick box	
Cut and fill text position <i>position of cut and fill text relative to the uprights.</i>	<code>volume_text_centre_mode</code>	choice box	along the uprights between the uprights
Sample interval <i>interval to display volumes.</i>	<code>volume_sample_interval</code>	input	
Report file <i>name of volumes report file.</i>	<code>volume_file_name</code>	report box	
Box Y position (mm) <i>if set, the volume box is positioned at this height from the bottom of the first box</i>	<code>volume_y_pos</code>	input	
Box size (mm) <i>if set, upright, volumes and titles box height.</i>	<code>volume_box_size</code>	input	
Horizontal cut/fill dividing line linestyle <i>linestyle of the cut/fill dividing line.</i>	<code>volume_cl_linestyle</code>	linestyle box	
Horizontal cut/fill dividing line colour <i>colour of the cut/fill dividing line.</i>	<code>volume_cl_line_colour</code>	colour box	

Boxes - Volume Cut/Fill - Titles

Section: Volumes cut/fill - Title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line of volume title <i>1st line of the volume title</i>	<code>volume_title</code>	input	
Volume title textstyle <i>textstyle of volume title</i>	<code>volume_title_textstyle</code>	text box	
Volume title colour <i>colour of volume title</i>	<code>volume_title_colour</code>	colour box	

Volume title size (mm) volume_title_size input
size of volume title

Volume title Y position (mm) volume_title_y_pos input
if set, the height in mm above the bottom of all the boxes that the volume title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the volumes.

Boxes - Volume Cut/Fill - Titles - Cut

Section: Volumes cut/fill - Title cut parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line of volume cut title <i>1st line of the cut volume title</i>	volume_cut_title	input	
Volume cut title textstyle <i>textstyle of cut volume title</i>	volume_cut_title_textstyle	text box	
Volume cut title colour <i>colour of cut volume title</i>	volume_cut_title_colour	colour box	
Volume cut title size (mm) <i>size of cut volume title</i>	volume_cut_title_size	input	
Volume cut title Y position (mm) <i>if set, the height in mm above the default position. If not set, then the text is placed at a height that puts it inside the default box for the cut volumes.</i>	volume_cut_title_y	input	

Boxes - Volume Cut/Fill - Titles - Fill

Section: Volumes cut/fill - Title fill parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line of volume fill title <i>1st line of the fill volume title</i>	volume_fill_title	input	
Volume fill title textstyle <i>textstyle of fill volume title</i>	volume_fill_title_textstyle	text box	
Volume fill title colour <i>colour of fill volume title</i>	volume_fill_title_colour	colour box	
Volume fill title size (mm) <i>size of fill volume title</i>	volume_fill_title_size	input	
Volume fill title Y position (mm) <i>if set, the height in mm above the default position. If not set, then the text is placed at a height that puts it inside the default box for the fill volumes.</i>	volume_fill_title_y	input	

Boxes - Volume Cut/Fill - Values

Section: Volumes cut/fill - Cut value parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Textstyle <i>textstyle of the cut values.</i>	volume_cut_textstyle	text box	
Colour <i>colour of cut values</i>	volume_cut_text_colour	colour box	
Size (mm) <i>size of cut values</i>	volume_cut_text_size	input	
X position (mm) <i>the x distance to move the cut text from the default cut text position, def 0, it is not used if volume_text_centre_mode= between the uprights</i>	volume_cut_text_x	input	
Y position (mm) <i>the y distance to move the cut text from the default cut text position</i>	volume_cut_text_y	input	
Decimal places <i>number of dec places in cut values.</i>	volume_cut_decimals	input	

Section: Volumes cut/fill - Fill value parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Textstyle <i>textstyle of the fill values.</i>	volume_fill_textstyle	textstyle box	
Colour <i>colour of fill values</i>	volume_fill_text_colour	colour box	
Size (mm) <i>size of fill values</i>	volume_fill_text_size	input	
X position (mm) <i>the x distance to move the fill text from the default fill text position, def 0, it is not used if volume_text_centre_mode= between the uprights</i>	volume_fill_text_x	input	
Y position (mm) <i>the y distance to move the fill text from the default fill text position</i>	volume_fill_text_y	input	
Decimal places <i>number of dec places in fill values.</i>	volume_fill_decimals	input	

Boxes - Volume Cut/Fill - Uprights/Sub Uprights

Section: Volumes cut/fill - Upright parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Draw cut/fill uprights	volume_uprights_draw_mode		

choice box don't draw cut/fill uprights
draw cut/fill uprights

upright draw mode.

Colour of uprights volume_uprights_line_colour colour box
colour of uprights

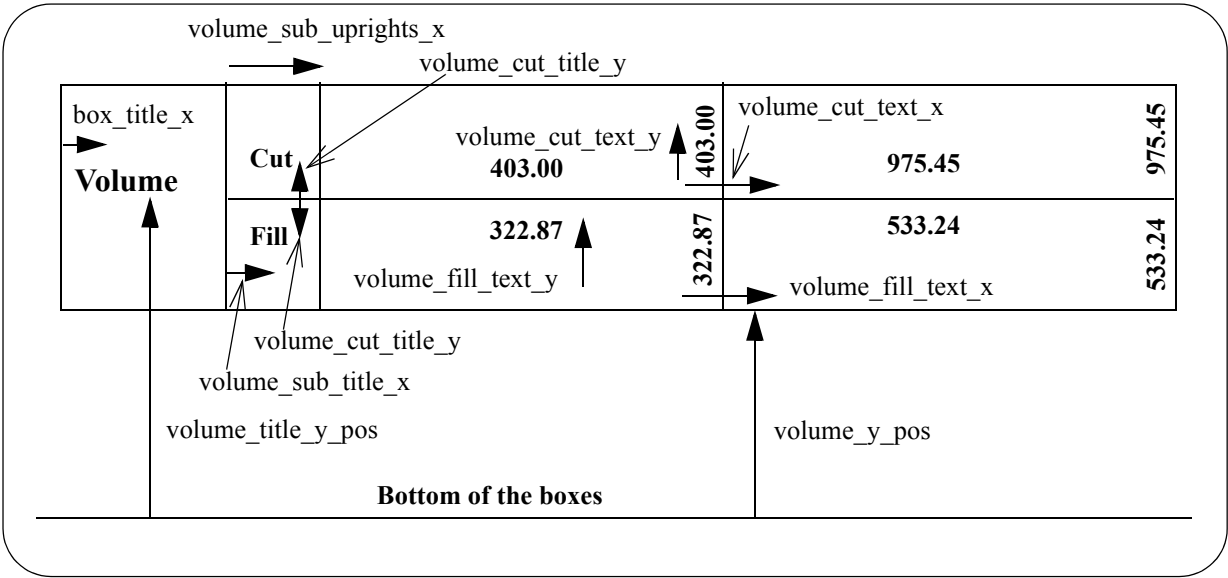

Section: Volumes cut/fill - Sub upright parameters

The fields and buttons used in this section have the following functions.

Field Description Parameter name Type Pop-Up
Colour of sub uprights volume_sub_upright_colour colour box
colour of sub uprights line

Sub upright X position (mm) volume_sub_uprights_x input
the x distance to move from the default sub uprights position.

Sub upright title X position (mm) volume_sub_title_x input
the distance to move the sub title text from the volume sub uprights

Boxes - X,Y

Section: X, Y parameters

The values of the X and Y coordinate for selected chainages can be labelled as separate boxes. The chainages specified are limited to the base set of chainages already defined in the chainage selection and staggering section. i.e. an upright must exist for the X and Y value to be labelled. Not all of the uprights have to be labelled, just those specified in this section.

There are plot parameters to control all aspects of the X and Y labelling.

Chainages are used for positioning X and Y labels.

The chainages for the long section plot relate to the primary string and are controlled by a set of parameters.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
X, Y order	xy_order	choice box	X before Y Y before X <i>order to place X and Y boxes. X before Y indicates that the X box will appear closest to the bottom of the boxes and the Y box will be on top of it. Note: The boxes are placed from bottom to top.</i>
Chord/arc chainage mode	xy_chord_arc	choice box	Do not use chord/arc chainages Use chord/arc chainages <i>mode to include chord/arc chainages.</i>
Start chainage	xy_start_chainage	input box	<i>start chainage of chainage range to be labelled.</i>
End chainage	xy_end_chainage	input box	<i>end chainage of chainage range to be labelled.</i>
Chainage interval	xy_interval	input	<i>the regular interval (0=no regulars).</i>
Include tangents, spirals	xy_label_hcp	tick box	<i>if ticked, include the tangents and spirals.</i>
Include hip points	xy_label_hip	tick box	<i>if ticked, include horizontal intersection points.</i>
Include vip points	xy_label_vip	tick box	<i>if ticked, include vertical intersection points.</i>
Include tangent points	xy_label_vtp	tick box	<i>if ticked, include tangent points.</i>
Include crest points	xy_label_crest	tick box	<i>if ticked, include crest points.</i>
Include sag points	xy_label_sag	tick box	<i>if ticked, include sag points.</i>
Include change of vertical grade	xy_label_grade_change	tick box	<i>if ticked, include changes in vertical grade.</i>
Include chord/arc tolerance chainages	xy_chord_arc	tick box	
Chainage weeding tolerance	xy_label_tolerance	input	<i>if >0 then use as a weeding tolerance, if <=0 don't weed.</i>
Files of special chainages	xy_special_n_file	file box	<i>n = 1 to 20 - include chainages from the file (one chainage per line)</i>

Boxes - X,Y - X Parameters

Section: X parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label X values/title	x_label	tick box	

if ticked, the X values/titles will be labelled.

Section: X title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line 1	x_title	input	
<i>1st line of X title.</i>			
Title line 2	x_title_2	input	
<i>second line of X title.</i>			
Textstyle	x_title_textstyle	text box	
<i>textstyle for the X title</i>			
Colour	x_title_colour	colour box	
<i>colour of the X title</i>			
Text size (mm)	x_title_size	input	
<i>size of the X title</i>			
Text y position (mm)	x_title_y_pos	input	

if set, the height in mm above the bottom of all the boxes that the X title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the X labels.

Section: X value parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	x_label_decimals	input	
<i>number of decimal places for X values</i>			
Textstyle	x_label_textstyle	text box	
<i>textstyle for the X values</i>			
Colour	x_label_colour	colour box	
<i>colour of the X values</i>			
Text size (mm)	x_label_size	input	
<i>size of the X values</i>			
Text y position (mm)	x_label_y_pos	input	

if set, the height in mm above the bottom of all the boxes that the X values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the X labels.

Boxes - X,Y - Y Parameters

Section: Y parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label Y values/titles	y_label	tick box	
<i>if ticked, the Y values/titles will be labelled.</i>			

Section: Y Title Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Title line 1	y_title	input	
<i>1st line of Y title.</i>			
Title line 2	y_title_2	input	
<i>second line of Y title.</i>			
Textstyle	y_title_textstyle	text box	
<i>textstyle for the Y title</i>			
Colour	y_title_colour	colour box	
<i>colour of the Y title</i>			
Text size (mm)	y_title_size	input	
<i>size of the Y title</i>			
Text y position (mm)	y_title_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the Y title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the Y labels.</i>			

Section: Y value parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Decimal places	y_label_decimals	input	
<i>number of decimal places for Y values</i>			
Textstyle	y_label_textstyle	text box	
<i>textstyle for the Y values</i>			
Colour	y_label_colour	colour box	
<i>colour of the Y values</i>			
Text size (mm)	y_label_size	input	
<i>size of the Y values</i>			
Text y position (mm)	y_label_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the Y values are drawn. If not set, then the text is placed at a height that puts it inside the default box for the Y labels.</i>			

Please continue to the next section [Chainage/Staggering](#).

Chainage/Staggering

Section: Chainage/Staggering - Chainage parameters

Chainages are used for positioning height labels, uprights (leader lines) and bubbles. The chainages for the long section plot relate to the primary string

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Chord/arc chainage mode	chord_arc	choice box	Do not use chord/arc chainages Use chord/arc chainages

mode to include chord/arc chainages.

Chainage interval	chainage_interval	input
--------------------------	-------------------	-------

the regular interval (0=no regulars).

Include start and end chainages

chainage_label_ends	tick box
---------------------	----------

if ticked, include the start and end chainages.

Include tangents, spirals	chainage_label_hcp	tick box
----------------------------------	--------------------	----------

if ticked, include the tangents and spirals.

Include horizontal intersection points	chainage_label_hip	tick box
-----------------------------------------------	--------------------	----------

if ticked, include horizontal intersection points.

Include horizontal tangent points	chainage_label_hcp	tick box
------------------------------------------	--------------------	----------

if ticked, include horizontal tangent points.

Include vertical intersection points	chainage_label_vip	tick box
---------------------------------------------	--------------------	----------

if ticked, include vertical intersection points.

Include vertical tangent points	chainage_label_vtp	tick box
----------------------------------------	--------------------	----------

if ticked, include vertical tangent points.

Include crest points	chainage_label_crest	tick box
-----------------------------	----------------------	----------

if ticked, include crest points.

Include sag points	chainage_label_sag	tick box
---------------------------	--------------------	----------

if ticked, include sag points.

Include change of vertical grade	chainage_label_grade_change	tick box
-----------------------------------------	-----------------------------	----------

if ticked, include changes in vertical grade.

Include chord/arc tolerance chainages	chainage_label_grade_change	tick box
----------------------------------------------	-----------------------------	----------

Chainage weeding tolerance	chainage_label_tolerance	input
-----------------------------------	--------------------------	-------

if >0 then use as a weeding tolerance, if <=0 don't weed.

Merge in bubble chainages	chainage_merge_bubbles	tick box
----------------------------------	------------------------	----------

if ticked, merge in bubble chainages.

Weeding tolerance after bubble merge	chainage_merge_tolerance	input
---------------------------------------------	--------------------------	-------

if > 0, weed after merge using specified weeding tolerance. If <= 0, don't weed after merge.

Files of special chainages	chainage_special_n_file	file box
-----------------------------------	-------------------------	----------

n = 1 to 20 - include chainages from the file (one chainage per line)

Chainage/Staggering - Staggering

Section: Chainage/Staggering - Staggering parameters

If the real chainage position is used for the horizontal position of the chainage/height/depth text, text over writing can easily occur.

To prevent over writing, the text can be **staggered**.

If the **stagger_mode** parameter is set to 1, the text position is adjusted so that the text does not over write.

The real chainage position is then indicated by the chainage markers which are drawn at the top of the text boxes from the staggered text position back to the actual chainage position of the text.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Stagger mode	stagger_mode	choice box	no staggering, allow over writing Stagger text

stagger mode.

Distance from boxes to top of staggers (mm)

stagger_gap_top input

distance from the top of boxes to top of staggers in mm.

Distance from boxes to bottom of staggers (mm)

stagger_gap_bottom input

distance from the top of boxes to bottom of staggers in mm.

Stagger gap factor

stagger_gap_factor input

*distance between staggers is box_text_size * stagger_gap_factor*

When staggering occurs, it is possible for the heights area to be longer than the graph area.

Please continue to the next section [Uprights](#).

Uprights

Section: Upright parameters

Uprights, or leader lines, can be drawn from the top of the staggers to the strings drawn on the plot.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Upright draw mode	uprights_draw_mode	choice box	<div>none</div> <div>max string height to stagger height</div> <div>uprights_y above boxes to primary string</div> <div>tin 1</div> <div>tin 2</div> <div>tin 3</div> <div>tin 4</div> <div>tin 5</div> <div>tin 6</div> <div>tin 7</div> <div>tin 8</div> <div>tin 9</div> <div>tin 10</div> <div>to offset 1</div> <div>to offset 2</div> <div>to offset 3</div> <div>to offset 4</div> <div>to offset 5</div> <div>to offset 6</div> <div>to offset 7</div> <div>to offset 8</div> <div>to offset 9</div> <div>to offset 10</div>

upright draw mode.

Uprights Y distance (mm)	uprights_y	input	
<i>distance to draw the uprights for <code>uprights_draw_mode</code> = "to <code>uprights_y</code> above boxes"</i>			
Uprights colour	uprights_colour	colour box	
<i>uprights colour: Default is <code>box_colour</code></i>			
Uprights bottom mode	uprights_bottom_mode	choice box	<div>stop at top of boxes</div> <div>draw to bottom of boxes</div> <div>draw to <code>uprights_bottom_y</code> below top of boxes</div> <div>draw to <code>uprights_bottom_y</code> above bottom of boxes</div> <div>ticks at chainage</div>

Upright draw mode below top of boxes.

Uprights bottom Y distance (mm)	uprights_bottom_y	input	
<i>distance in mm.</i>			
Uprights text offset factor	uprights_text_offset_factor	input	
<i>move the text by this factor*size.</i>			

When uprights go below the top of the boxes, the height and offset text is moved to the left so that the

upright does not go through the text. The left hand side of the heights boxes also moves to the left to leave room for the height text.

Please continue to the next section [Datum Area](#).

Datum Area

The **datum area** is the region between the boxes area and the graph area.

Section: Datum area - datum value mode

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use manual datum	manual_datum	tick box	
<i>if ticked the datum will be calculated internally, else use the datum_value parameter for the datum.</i>			
Datum value	datum_value	input	
<i>the value to be used for the datum.</i>			
Datum roundoff	datum_roundoff	input	
<i>the value to roundoff the datum value.</i>			
Decimal places for datum	datum_decimals	input	
<i>If > 0, trailing zeros are removed after the decimal point. If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed</i>			

Section: Datum area - other parameters

The fields and buttons used in this section have the following functions.

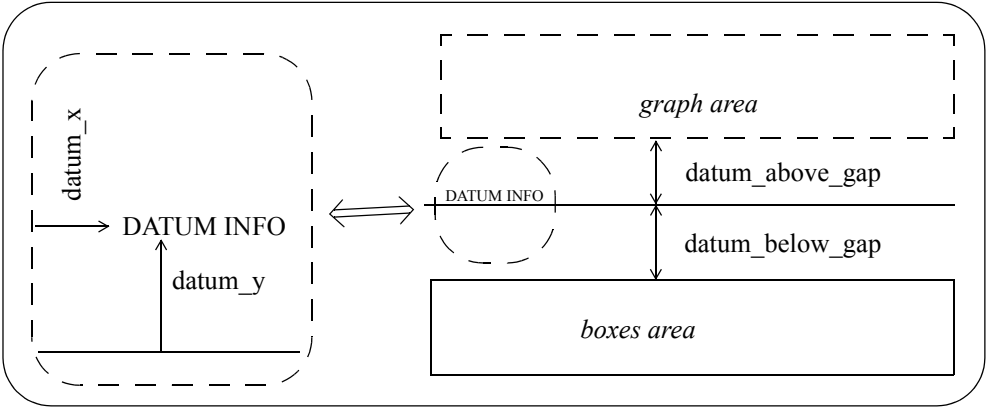

Field Description	Parameter name	Type	Pop-Up
Datum name	datum_name	input	
<i>text to write before the datum value</i>			
Graph area to datum line gap (mm)			
	datum_above_gap	input	
<i>distance from the bottom of the graph area to the datum line.</i>			
Datum line gap to top of boxes (mm)			
	datum_below_gap	input	
<i>distance from datum line to top of boxes.</i>			

The **datum line** is positioned the distance **datum_below_gap** above the top of the boxes area and the graph area is positioned the distance **datum_above_gap** above the datum line.
Hence the graph area is distance (datum_below_gap + datum_above_gap) above the top of the boxes area.

The *datum_below_gap* and *datum_above_gap* can be zero or positive.

Datum linestyle	datum_linestyle	linestyle box
<i>datum line linestyle (default solid)</i>		
Datum textstyle	datum_textstyle	text box
<i>textstyle for datum information</i>		
Datum text size (mm)	datum_text_size	input
<i>size of datum text and value (mm)</i>		
Datum colour	datum_colour	colour box
<i>colour of the datum text and line.</i>		

X adjustment (mm)	datum_x	input
<i>distance to move the datum text along the datum line</i>		
Y adjustment (mm)	datum_y	input
<i>distance to raise the datum text above the datum line</i>		

Datum Area - Offset String Datum Labels

Section: Offset string datum area label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Offset string			
Datum name			
Datum colour			
X adjustment (mm)			
Y adjustment (mm)			

Please continue to the next section [Graph Area](#).

Graph Area

The graph area sits on top of the boxes and datum areas, so there may not be enough room left on the sheet for the full plot height. In this case, the plot will be truncated at the top of the allowed graph area.

Section: Graph area parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left/Right extensions (world units)			
Extra space units	extra_space_units	choice box	world units millimetres
<i>units for specifying extra space.</i>			
Extra space left (units)	extra_space_left	input	
<i>distance to subtract from left of plot area</i>			
Extra space right (units)	extra_space_right	input	
<i>distance to add to right of plot area</i>			
Extra space top (units)	extra_space_top	input	
<i>distance to add to top of plot area</i>			
Extra space bottom (units)	extra_space_bottom	input	
<i>distance to subtract from bottom of plot area</i>			

Please continue to the next section [Corridors](#).

Corridors

A corridor around the primary string is defined by giving a left and right corridor width. Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the long section plot. To be drawn, strings do not have to cross the primary string, but just be in the corridor.

Section: Corridor parameters

The fields and buttons used in this section have the following functions.

Panel field	Parameter name	Type
Left corridor width (world units)		
	corridor_width_left	input
<i>left corridor width</i>		
Right corridor width (world units)		
	corridor_width_right	input
<i>right corridor width</i>		
Left corridor overlap (world units)		
	corridor_overlap_left	input
<i>left corridor overlap</i>		
Right corridor overlap (world units)		
	corridor_overlap_right	input
<i>right corridor overlap</i>		
Chord-arc tolerance (world units)		
	corridor_chord_arc	input
<i>chord-arc tolerance used near any bends in the corridor:</i>		

Corridors - Model Selection

Section: Corridor - Model selection

The fields and buttons used in this section have the following functions.

Panel field	Parameter name	Type
Corridor model	corridor_model_n	model box
<i>models containing tins and service strings to be drawn on the section. Where $n = 1, 2, \dots, 100$ given by line number on grid.</i>		

Please continue to the next section [Bubbles](#).

Bubbles

Section: Bubble definition parameters

Circles with the string name and a unique number (**bubbles**) can be drawn on the long section plot. Bubbles are normally used for lip profiles.

The chainages used for the bubbles are given by a set of parameters similar to the chainage parameters. The resulting set of bubbles are sequentially numbered (starting with one) in chainage order.

Although many bubbles can be defined by the bubble parameters, a bubble is only drawn on the plot if there is a labelled chainage to draw it above.

Hence not all bubbles given by the bubble chainage parameters are drawn but for the ones that are drawn, the bubble number is taken from the full bubble set.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Bubble draw mode <i>draw bubble mode</i>	chainage_bubbles	choice box	Do not draw bubbles Draw bubbles
Bubble radius <i>radius of the bubbles</i>	bubble_radius	input	
Bubble colour <i>colour of the bubbles</i>	bubble_colour	colour box	
Bubble upright mode <i>draw bubble upright mode</i>	bubble_draw_upright	choice box	Do not draw bubble upright Draw bubble upright
Bubble start chainage <i>start chainage bubbles</i>	bubble_start_chainage	input	
Bubble end chainage <i>end chainage bubbles</i>	bubble_end_chainage	input	
Chord/arc chainage mode <i>chord/arc chainage mode</i>	bubble_chord_arc	choice box	Do not use chord/arc chainages Use chord/arc chainages
Bubble interval <i>include regular interval for bubbles</i>	bubble_interval	input	

Bubbles - Text

Section: Bubble definition - Text parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Bubble text string name mode	bubble_text_string_name_mode		

		choice box	Do not label with string name Label with string name Label with model->string name
<i>mode of bubble text string name.</i>			
Pre text <i>pre text for label</i>	bubble_pre_text	input	
Post text <i>post text for label</i>	bubble_post_text	input	
Textstyle <i>textstyle of label of label</i>	bubble_textstyle	text box	
Size (mm) <i>size of label</i>	bubble_text_size	input	
Colour <i>colour of label</i>	bubble_text_colour	colour box	
Offset (mm) <i>offset value for bubbles.</i>	bubble_text_offset	input	
Upright distance (mm) <i>distance bubbles are above boxes/uprights</i>	bubble_upright_distance	angle box	
Bubble upright distance mode <i>mode of bubble upright distance.</i>	bubble_mode	choice box	Distance is above boxes Distance is above uprights

Bubbles - Label

Section: Bubble definition - Label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Include tangents, spirals <i>if ticked, include the tangents and spirals.</i>	bubble_label_hcp	tick box	
Include horizontal intersection points <i>if ticked, include horizontal intersection points.</i>	bubble_label_hip	tick box	
Include horizontal tangent points <i>if ticked, include horizontal tangent points.</i>	bubble_label_hcp	tick box	
Include vertical intersection points <i>if ticked, include vertical intersection points.</i>	bubble_label_vip	tick box	
Include vertical tangent points <i>if ticked, include vertical tangent points.</i>	bubble_label_vtp	tick box	
Include crest points	bubble_label_crest	tick box	

if ticked, include crest points.

Include sag points bubble_label_sag tick box

if ticked, include sag points.

Include change of vertical grade

 bubble_label_grade_change tick box

if ticked, include changes in vertical grade.

Include chord/arc tolerance chainages

 bubble_chord_arc tick box

Bubble weeding tolerance

 bubble_label_tolerance input

if >0 then use as a weeding tolerance, if <=0 don't weed.

Files of special chainages

 bubble_special_n_file file box

n = 1 to 20 - include chainages from the file (one chainage per line)

Please continue to the next section [Quick Horizontal Geometry](#).

Quick Horizontal Geometry

Section: Quick horizontal geometry

The standard horizontal geometry arrows can be drawn at a given distance above the top of the boxes area.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Distance above boxes (mm) <i>distance above boxes for drawing of arrows</i>	horizontal_geometry_y	input	

Section: Quick horizontal geometry - Left side label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type
Text <i>text for label</i>	horizontal_geometry_label_text	input
Textstyle <i>textstyle of label</i>	horizontal_geometry_label_textstyle	text box
Text colour <i>colour of label</i>	horizontal_geometry_label_text_colour	colour box
Text size (mm) <i>size of label</i>	horizontal_geometry_label_text_size	input

Section: Quick horizontal geometry - Arrow and text parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type
Text colour <i>colour of arrow text</i>	horizontal_geometry_arrow_text_colour	colour box
Textstyle <i>textstyle of arrow text</i>	horizontal_geometry_arrow_textstyle	text box
Text size (mm) <i>size of arrow text</i>	horizontal_geometry_arrow_text_size	input
Decimal places <i>number of decimal places in arrow text</i>	horizontal_geometry_label_decimals	input
Arrow colour <i>colour of arrow</i>	horizontal_geometry_arrow_colour	colour box
Arrow height (mm) <i>size of arrow</i>	horizontal_geometry_arrow_height	input

Please continue to the next section [Extensive Horizontal Geometry](#).

Extensive Horizontal Geometry

Section: Extensive horizontal geometry parameters

The standard horizontal geometry arrows can be drawn at a given distance above the top of the boxes area.

For complicated horizontal geometry labelling, there are sets of horizontal geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the horizontal geometry of **alignment** strings other than the primary string. To plot such a string on the same plot, the chainage position of the horizontal geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the horizontal geometry (such as radius and spiral length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting horizontal geometry, the user can give up to twenty sets of these labels and they can be used to label spirals, curves and tangent information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

- (a) a text label on the left hand side of the plot
- (b) an arrow
- (c) text on the arrows.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define set #		input	
<i>where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified extensive horizontal geometry.</i>			
For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.			
Geometry to label	h_g_n_type	choice box	label spirals label horizontal curves label horizontal tangents
<i>specifies what geometry is to be labelled for the nominated set. If h_g_n_type is missing, then the set is ignored.</i>			
Value to label	h_g_n_value_mode	choice box	nothing length radius (for curve labelling) or radius*length (for spiral)
<i>specifies the value to label.</i>			
Y offset (mm)	h_g_n_label_y	input	
<i>distance of arrow line above top of the boxes.</i>			
If the set of parameters is to apply to the horizontal geometry of an alignment string <i>other</i> than the primary string, then the offset string can be specified.			
Offset string	h_g_n_offset_string	select box	
<i>the name of the non-primary string. i.e.</i>			

h_g_n_offset_string model->string_name
or
h_g_n_offset_string string_name

and the model is the *defined by offset_model*. *offset_model* has been defined in the section [Boxes - Offset String Titles/Heights/Depths](#).

If the *h_g_n_offset_string* parameter does not exist, then the set of horizontal geometry parameters is applied to the primary string.

Extensive Horizontal Geometry - Left Hand Labels

Section: Extensive horizontal geometry - Left hand label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	

set #, as specified by the define set # parameter.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Label X (mm)	h_g_n_label_x	input	
distance from the left hand side of the labels area to start the left hand label text.			
Offset (mm)	h_g_n_label_offset	input	
distance to raise the left hand label text above arrow line.			
Text size (mm)	h_g_n_label_text_size	input	
size of the left hand label text.			
Text colour	h_g_n_label_text_colour	colour box	
size of the left hand label text.			
Text	h_g_n_label_text	input	
left hand label text.			
Textstyle	h_g_n_label_textstyle	text box	
textstyle for the left hand label text.			

Extensive Horizontal Geometry - Arrow Type

Section: Extensive horizontal geometry- Arrow type parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	

set #, as specified by the define set # parameter.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Arrow type mode	h_g_n_draw_mode	choice box	arrow (1) line (2) line with uprights at ends (3) uprights with no lines (4) line with downrights (5) downrights with no lines (6)
-----------------	-----------------	------------	---------------------------------------------------------------------------------------------------------------------------------------------------

line with up and downrights
at ends (7)
up and downrights with no
line (8)
draw curve (9)
radius*length curve (11)

specifies the arrow type to be drawn.

Left arrow gap (mm) <i>size of gap for left side of arrow.</i>	h_g_n_left_gap	input
Right arrow gap (mm) <i>size of gap for right side of arrow.</i>	h_g_n_right_gap	input
Arrow colour <i>colour of arrow text</i>	h_g_n_colour	colour box
Arrow height (mm) <i>height of arrow in mm.</i>	h_g_n_height	input
Leave gap in arrow for text <i>if ticked, a gap will be left for text.</i>	h_g_n_gap	tick box

Extensive Horizontal Geometry - Arrow Text

Section: Extensive horizontal geometry - Arrow text parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set # <i>set #, as specified by the define set # parameter.</i>		input	
Text colour <i>colour of arrow text</i>	h_g_n_text_colour	colour box	
Text size (mm) <i>size of arrow text</i>	h_g_n_text_size	input	
Text offset (mm) <i>distance to raise the text above the arrow line.</i>	h_g_n_text_offset	input	

Arrow text pre-text <i>text before the arrow text</i>	h_g_n_pre_text	input
Arrow text post-text <i>text after the arrow text</i>	h_g_n_post_text	input
Textstyle <i>textstyle of arrow text</i>	h_g_n_textstyle	text box
Decimal places <i>number of decimal places in arrow text. If > 0, all trailing zeros after the decimal place are removed. If < 0, the absolute value is taken as the number of decimal places and no trailing zeros are removed after the decimal point.</i>	h_g_n_no_decimals	input
Rotate text to fit <i>if ticked, the text on the arrows will be rotated to fit.</i>	h_g_n_rotate	tick box

Quick Vertical Geometry

Section: Quick vertical geometry - Grade

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Distance above boxes (mm)	vertical_geometry_grade_y	input	
distance above boxes. If 0, don't draw.			

Section: Quick vertical geometry - Length

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Distance above boxes (mm)	vertical_geometry_length_y	input	
distance above boxes. If 0, don't draw.			

Section: Quick vertical geometry - Common parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Arrow mode	vertical_geometry_arrow_mode	input	ticks arrows
arrow mode.			
Arrow colour	vertical_geometry_arrow_colour	colour box	
arrow colour.			
Arrow height (mm)	vertical_geometry_arrow_height	input	
height of arrow in mm.			

Quick Vertical Geometry - Grade Labels

Section: Quick vertical geometry - Grade left hand label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Text	vertical_geometry_label_grade_text	input	
text for left hand grade label.			
Textstyle	vertical_geometry_label_grade_textstyle	textstyle box	

Text colour

vertical_geometry_label_grade_text_colour
colour box

Text size (mm) vertical_geometry_label_grade_text_size

Text colour	vertical_geometry_label_length_text_colour
	colour box
	<i>colour of left hand length label</i>
Text size (mm)	vertical_geometry_label_length_text_size
	input
	<i>size of left hand length label</i>

Section: Quick vertical geometry - Length arrow and text parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Length mode	vertical_geometry_length_mode	choice box	length radius k value mixed - length for parabolic, radius for circular
			<i>mode of length for length labels.</i>
Length decimal places	vertical_geometry_label_length_decimals	input	
			<i>number of decimal places for length arrow labels.</i>
Length arrow textstyle	vertical_geometry_arrow_length_textstyle	textstyle box	
			<i>textstyle for length arrow labels.</i>
Length arrow text colour	vertical_geometry_arrow_length_text_colour	colour box	
			<i>colour of length arrow labels.</i>
Length arrow text size (mm)	vertical_geometry_arrow_length_text_size	input	
			<i>size of length arrow labels</i>

Please continue to the next section [Extensive Vertical Geometry](#).

Extensive Vertical Geometry

Section: Extensive vertical geometry parameters

For complicated vertical geometry labelling of the *primary alignment* string, there are sets of vertical geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the vertical geometry of **alignment** strings other than the primary string. To plot such a string on the same plot, the chainage position of the vertical geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the vertical geometry (such as grade and curve length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting vertical geometry, the user can give up to twenty sets of these labels and they can be used to label grades or vertical curve information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

- (a) a text label on the left hand side of the plot
- (b) an arrow
- (c) text on the arrows.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define set #		input	
<i>where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified extensive horizontal geometry.</i>			
For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.			
Geometry to label	v_g_n_type	choice box	label grades label vg curve information
<i>specifies what geometry is to be labelled for the nominated set. If v_g_n_type is missing, then the set is ignored.</i>			
Value to label	v_g_n_value_mode	choice box	nothing %grade or parabola length, arc length 1 in grade or radius mm grade or K value ch length between curve points per chord(QR) or curve constant (QR).

specifies the value to label. This will be dependant on the v_g_n_type chosen.

Vertical curve points to draw the arrows between (for grade labelling only)

Points to draw arrows between

v_g_n_between_mode	choice box	between chainages at the vips between chainages at the vtps
--------------------	------------	----------------------------------------------------------------

specifies where to draw the arrows between (for grade labelling only).

Y offset (mm) v_g_n_label_y input
distance of arrow line above top of the boxes. This value can be negative

If the set of parameters is to apply to the vertical geometry of an alignment string *other* than the primary string, then the following parameter can define the other alignment string

Offset string v_g_n_offset_string select box
the name of the non-primary string. i.e.

 v_g_n_offset_string model->string_name
or
 v_g_n_offset_string string_name

and the model is the *defined by offset_model*. *offset_model* has been defined in the section [Boxes - Offset String Titles/Heights/Depths](#).

If the v_g_n_offset_string parameter does not exist, then the set of vertical geometry parameters is applied to the primary string.

Extensive Vertical Geometry - Left Hand Labels

Section: Extensive vertical geometry - Left hand labels parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set #, as specified by the define set # parameter.</i>			

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Label X (mm) v_g_n_label_x input
distance from the left hand side of the labels area to start the left hand label text.

Offset (mm) v_g_n_label_offset input
distance to raise the left hand label text above arrow line.

Text size (mm) v_g_n_label_text_size input
size of the left hand label text.

Text colour v_g_n_label_text_colour colour box
size of the left hand label text.

Text v_g_n_label_text input
left hand label text.

Textstyle v_g_n_label_textstyle text box
textstyle for the left hand label text.

Extensive Vertical Geometry - Arrow Type

Section: Extensive vertical geometry - Arrow type parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Use set #		input
set #, as specified by the define set # parameter.		
For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.		
Arrow type mode	v_g_n_draw_mode	choice box
		arrow (1)
		line (2)
		line with uprights at ends (3)
		uprights with no lines (4)
		line with downrights (5)
		downrights with no lines (6)
		line with up and downrights at ends (7)
		up and downrights with no line (8)
		draw curve (9)
		draw grade (10)

specifies the arrow type to be drawn.

Left arrow gap (mm)	v_g_n_left_gap	input
size of gap for left side for arrow.		
Right arrow gap (mm)	v_g_n_right_gap	input
size of gap for right side of arrow.		
Arrow colour	v_g_n_colour	colour box
colour of arrow text		
Arrow height (mm)	v_g_n_height	input
height of arrow in mm.		
Leave gap in arrow for text	v_g_n_gap	tick box
if ticked, a gap will be left for text.		

Extensive Vertical Geometry - Arrow Text

Section: Extensive vertical geometry - Arrow text parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	

set #, as specified by the define set # parameter.

Text colour <i>colour of arrow text</i>	v_g_n_text_colour	colour box
Text size (mm) <i>size of arrow text</i>	v_g_n_text_size	input
Text offset (mm) <i>distance to raise the text above the arrow line.</i>	v_g_n_text_offset	input
Arrow text pre-text <i>text before the arrow text</i>	v_g_n_pre_text	input
Arrow text post-text <i>text after the arrow text</i>	v_g_n_post_text	input
Textstyle <i>textstyle of arrow text</i>	v_g_n_textstyle	text box
Decimal places <i>number of decimal places in arrow text. If > 0, all trailing zeros after the decimal place are removed. If < 0, the absolute value is taken as the number of decimal places and no trailing zeros are removed after the decimal point.</i>	v_g_n_no_decimals	input
Rotate text to fit <i>if ticked, the text on the arrows will be rotated to fit.</i>	v_g_n_rotate	tick box

Please continue to the next section [Labelling Points With Chainage/Height/Grade/Deflection](#).

Labelling Points With Chainage/Height/Grade/Deflection

Section: Labelling points with chainage/height/grade/deflection

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define set #		input	
<i>where $n = 1$ to....20. The set enables the specification of a number of parameters for a number of specified labels.</i>			
For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.			
Label Type	label_n_type	choice box	chainage of vip, height of vip chainage of vip, height of primary crest sag vtp hcp change of grade mid-ordinate of the vertical curve

The chainage and/or height values for certain points (given by label_n_type) can be labelled.

If label_n_type is missing, then the set is ignored.

Label height mode	label_n_y_mode	choice box	height above boxes (mm) height above height value (mm) height above primary height (mm)
<i>specifies which reference point the label_n_y distance is measured from.</i>			

Labelling Points - Label Position

Section: Ch/Ht/Grade label position parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set #, as specified by the Define set # parameter.</i>			
For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.			
Distance above point (mm)	label_n_y	input	
<i>distance above point.</i>			
Angle (dms)	label_n_angle	angle box	
<i>rotation about point.</i>			
Angle on grade		tick box	
Distance along from point (mm)	label_n_x	input	
<i>the distance along from the point in mm.</i>			

Text raise height (mm)	label_n_offset	input	
<i>the distance to raise the text in mm.</i>			
Justification	label_n_justification	choice box	left end middle end
<i>justification of the label.</i>			

Labelling Points - Label Text Type

Section: Ch/Ht/Grade label text type parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set #, as specified by the Define set # parameter.</i>			

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Size (mm)	label_n_size	input	
<i>size of the text.</i>			
Colour	label_n_colour	colour box	
<i>colour of text.</i>			
Textstyle	label_n_textstyle	text box	
<i>the textstyle of the text.</i>			

Labelling Points - Label Text

Section: Ch/Ht/Grade label text parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use set #		input	
<i>set #, as specified by the Define set # parameter.</i>			

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

Label type	label_n_value_mode	choice box	no values labelled val 1 = chainage val 1 = height val 1 = chainage, val2 = height val 1 = height, val2 = chainage
<i>the value label mode.</i>			
Pre-text	label_n_pre_text	input	
<i>text before the label text</i>			
Mid-text	label_n_mid_text	input	
<i>text at mid position i.e. between val 1 and val 2.</i>			
Post-text	label_n_post_text	input	

text after the label text

Decimal places val 1	label_n_no_decimals_1	input
----------------------	-----------------------	-------

number of decimal places in val 1.

Decimal places val 2 label_n_no_decimals_2 input

number of decimal places in val 2.

If the **number of decimal places is greater than zero (> 0)**, then any trailing zeros after the decimal point are removed.

If the **number of decimal places is less than zero (< 0)**, the absolute value is taken as the number of decimal places and **no** trailing zeros after the decimal point are removed.

Deflection mode input

Please continue to the next section [Labelling Points With Symbols](#).

Labelling Points With Symbols

Section: Labelling points with symbols

Symbols can be placed at certain points given by `symbol_n_type`.

The symbol is drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Set #		input	
<i>where n = 1 to....20. The set enables the specification of a number of parameters for a number of specified symbols.</i>			
Symbol Type	<code>symbol_n_type</code>	choice box	chainage of vip, height of vip chainage of vip, height of primary crest sag vtp hcp change of grade mid-ordinate of the vertical curve

If `symbol_n_type` is missing, then the set is ignored.

Label height mode	<code>symbol_n_y_mode</code>	choice box	height above boxes (mm) height above height value (mm) height above primary height (mm)
--------------------------	------------------------------	------------	-----------------------------------------------------------------------------------------------

specifies which reference point the label_n_y distance is measured from.

Distance above point (mm)	<code>symbol_n_y</code>	input	
----------------------------------	-------------------------	-------	--

distance above point given by mode.

Angle (dms)	<code>symbol_n_angle</code>	angle box	
--------------------	-----------------------------	-----------	--

rotation about point.

Distance along from point (mm)	<code>symbol_n_x</code>	input	
---------------------------------------	-------------------------	-------	--

the distance along from the point in mm.

Size (mm)	<code>symbol_n_size</code>	input	
------------------	----------------------------	-------	--

the symbol size in mm.

Colour	<code>symbol_n_colour</code>	colour box	
---------------	------------------------------	------------	--

the symbol size in mm.

Symbol draw mode	<code>symbol_n_draw_mode</code>	choice box	height above boxes (mm) cross (0) upright from centre of box (1) up and downright from centre of box (2) square (3) triangle, base at bottom (4) circle (5)
-------------------------	---------------------------------	------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

draw mode for symbol

Symbolinput

Please continue to the next section [Hatching Cut/Fill](#).

Hatching Cut/Fill

Section: Hatching cut/fill - Tin parameters

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

Panel Field	Parameter name	Type
Define Set #		input
set number to be used to define different original/new tin sets.		
Original tin	hatch_original_tin_n	tin box
tin_name for original surface		
New tin	hatch_new_tin_n	tin box
tin_name for final surface		

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting *hatch_cut_separation_n* to 0.0.
fill hatching is turned off by setting *hatch_fill_separation_n* to 0.0.

Hatching Cut/Fill - Cut

Section: Hatching cut/fill - Cut parameters

Panel Field	Parameter name	Type
Use Set #		input
set number as specified in the Define set# .		
Cut separation (mm)	hatch_cut_separation_n	input
distance between cut hatch lines. If 0, no hatching.		
Cut hatch angle (dms)	hatch_cut_angle_n	input

angle of hatching.

Cut colour	hatch_cut_colour_n	colour box
<i>colour of the hatching.</i>		
Cut linestyle	hatch_cut_linestyle_n	linestyle box
<i>linestyle of the hatching.</i>		
Draw sides of cuts	hatch_cut_draw_sides_n	choice box
<i>draw mode for sides of cut regions.</i>		
Draw original tin	hatch_cut_draw_original_n	choice box
<i>draw mode for sides of original tin in cut.</i>		
Draw new tin	hatch_cut_draw_new_n	choice box
<i>draw mode for sides of new tin in cut.</i>		

Hatching Cut/Fill - Fill

Section: Hatching cut/fill - Fill parameters

Panel Field	Parameter name	Type
Use Set #		input
<i>set number as specified in the Define set#.</i>		
Fill separation (mm)	hatch_fill_separation_n	input
<i>distance between fill hatch lines. If 0, no hatching.</i>		
Fill hatch angle (dms)	hatch_fill_angle_n	input
<i>angle of hatching.</i>		
Fill colour	hatch_fill_colour_n	colour box
<i>colour of the hatching.</i>		
Fill linestyle	hatch_fill_linestyle_n	linestyle box
<i>linestyle of the hatching.</i>		
Draw sides of fills	hatch_fill_draw_sides_n	choice box
<i>draw mode for sides of fill regions.</i>		
Draw original tin	hatch_fill_draw_original_n	choice box
<i>draw mode for sides of original tin in fill.</i>		
Draw new tin	hatch_fill_draw_new_n	choice box
<i>draw mode for sides of new tin in fill.</i>		

Please continue to the next section [Cuts](#).

Cuts

The cuts that the primary string (design line) makes through strings in any user-specified model can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol**. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the:

- (a) top of the boxes on the long section,
- (b) height value of the cut string,
- (c) height of the primary string,
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note: Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

Section: Cuts - Model/Name mask parameters

Panel Field	Parameter name	Type
Define Set #		input
set number to be used to define different model/mask sets.		
Model	cuts_n_model	model box
model from which cut masks are derived		
Name mask	cuts_n_mask	input
text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.		

For example: "ke*" or,
 "?bank*" or, if both masks are required,
 "ke* ?bank*"

If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being set to "*".

All strings in the model cuts_n_model whose name satisfy the name mask cuts_n_mask are then checked for cuts with the design string, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the nth set.

Cuts - Chainage

Section: Cuts - Chainage parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
set number as specified in the Define set#.			
Position	cuts_chainage_n_position	choice box	above cut string height value above top of boxes to primary string to tin 1 to tin 2 to tin 3 to tin 4 to tin 5 to tin 6 to tin 7 to tin 8 to tin 9 to tin 10

a valid plot symbol can be selected.		
Position	cuts_symbol_n_position	choice box
		at cut string height above top of boxes above top of graph area to primary string to tin 1 to tin 2 to tin 3 to tin 4 to tin 5 to tin 6 to tin 7 to tin 8 to tin 9 to tin 10

position of symbol.

X (mm)	cuts_symbol_n_x	input
horizontal adjustment to position of symbol.		
Y (mm)	cuts_symbol_n_y	input
vertical adjustment to position of symbol.		
Angle (dms)	cuts_symbol_n_angle	input
rotation of symbol about point.		
Colour	cuts_symbol_n_colour	colour box
colour of symbol.		
Size (mm)	cuts_symbol_n_size	input
size of symbol. A value of 0 means no symbol.		

Please continue to the next section [Paired Cuts - Long Section](#).

Paired Cuts - Long Section

Paired cuts uses pairs of strings and where both strings cut the primary string, the cuts on the long plot can be labelled with information such as

- (a) the name of the first and second cut strings
- (b) attributes from the first and second cut string
- (c) plan distance between the two cuts of the pair
- (d) 3d length between the two cuts of the pair
- (e) the change on the long section of the first and second cuts of the pair

Symbols can be drawn at the chainages of the first and second cuts (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts.

The method for specifying which strings are to be checked for paired cuts is by first specifying the **models** (using wild cards and characters) that contains the strings, and then a **start name mask** to select the all the strings that are to be the first strings in a cut pair, and an **end name mask** to select all the strings that are the second strings in a cut pair.

For a long section, all the cuts of the selected **start** strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section. Then all the cuts of the selected **end** strings are found and the cuts ordered by the chainage of the cut with the primary string of

The start cuts are then processed and each start cut is paired with the next end cut with a larger chainage than the start cut. It is possible that there are end cuts before the first start cut (orphaned end cuts) and start cut with no following end cut (orphaned start cuts).

Section: Pairing - Model/Name mask parameters

set number to be used to define different model/mask sets.

models (the name can include wild cards () and wild characters (?)) from which start and end cut masks are derived.*

text string containing the name masks to select the start strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes " (eg "bench 2").

For example: "ke*" or,
 "?bank*" or, if both masks are required,
 "ke* ?bank*"

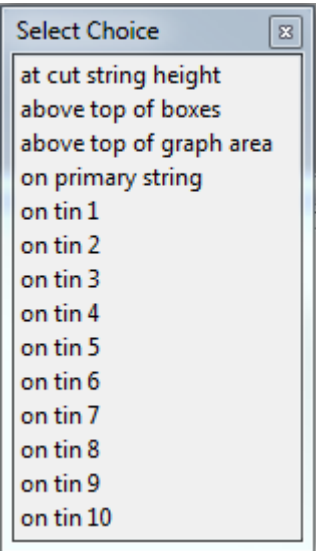

text string containing the name masks to select the end strings, each separated by one or more spaces, to test the string names against. If the name include spaces then it must be enclosed in the quotes " (eg "bench 2")

For example: `"ke"` or,
 `"?bank"` or, if both masks are required,
 `"ke* ?bank"`

If **Start name mask** is blank and **End name mask** is not blank, then all strings in the models that are not used as end strings, are used as start string.

*This is currently not operational: If **Start name mask** and **End name mask** are both blank, then all strings in the models are used. All the strings that cut the primary string of the long section are ordered by offset, and successive pairs of cuts taken to be the cut pairs. There could be one remaining cut point (it has the largest chainage) and if so, it is taken to be orphaned start point.*

Position pairing_n_position choice box

where to get the z-values to use for the two cut positions. This is used in conjunction with the choice in the Adopted height field.

If left blank, **at cut string height** is used.

Adopted height pairing_n_height choice box lower position, higher position
start position, end position

for the choice selected in the Position field, there will be a z-value at the first cut and another z-value at the end cut. The Adopted height says which of the two z-value to use for placing symbols, lines between cuts, text from Attributes and the Offsets of the first cut and the second cut.

If lower (higher) position, the smaller (greater) of the two z-values will be used.

If start (end), the z-value of the first (second) cut of the cut point pair will be used.

If left blank, **lower position** is used.

Include orphaned start ? pairing_n_orphan_start choice box yes, no

if **Yes** and there are start cuts after the last end cut (and so can't be paired), then the last start cut (i.e. the one with the largest chainage) is taken as an orphaned start and it is labelled as though there is a matching end at the end of the long section.

if **No** and there are start cuts after the last end cut, then those start cut are ignored.

If left blank, **No** is used.

Include orphaned ends ? pairing_n_orphan_end choice box yes, no

if **Yes** and there are end cuts before the first start cut, then the first end cut (the one with the smallest chainage) is taken as an orphaned end and it is labelled as though there is a matching start at the beginning of the long section.

if **No** and there are end cuts before the first start cut, then those end cut are ignored.

If left blank, **No** is used.

Paired Cuts (Long Section) - Lines and Symbols

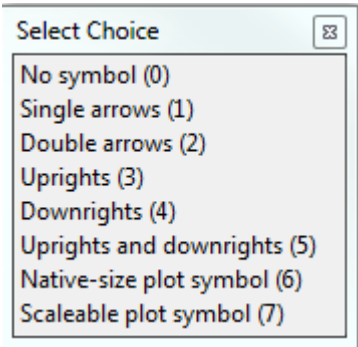

Symbols can be placed at the start and end cut chainages (at the z-value given by the Position and Adopted height columns when defining the Sets), and a line can also be drawn between the cuts at that z-value. Having both the line and a symbol forms an arrow between the cuts pair.

Section: Pairing - Lines and symbol parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	

set number as specified in the **Define set #**.

Symbol type	pairing_line_symbols_n_symbol	choice box
--------------------	-------------------------------	------------

type of symbol at each end of the cut pair.

for cases 6 and 7, a plot symbol is to be used and is given in the **Symbol** field

The height used for the symbol at both ends of the cuts pair is given by the **Position** and **Adopted height** column in the **Set** definition.

Symbol	pairing_line_symbols_n_user_symbol	plot symbols
---------------	------------------------------------	--------------

for **Symbol** type 6 and 7, the plot symbol to be used at each cut point.

For **Symbol** type 0 to 5, this field is not used.

The height used for the symbol at both ends is given by the **Position** and **Adopted height** columns in the **Set** definition.

Symbol colour	pairing_line_symbols_n_symbol_colour	colour box
----------------------	--------------------------------------	------------

colour of the symbol

Draw line	pairing_line_symbols_n_line	choice box	No line, Draw line
------------------	-----------------------------	------------	--------------------

if **Draw line**, draw a line between the start and end cuts for each cut pair.

If **No line**, no line is drawn between the start and end cuts for each cut pair.

The height used for the line at both ends is given by the **Position** and **Adopted height** columns in the **Set** definition.

Line colour	pairing_line_symbols_n_line_colour	colour box
--------------------	------------------------------------	------------

colour of the line between the start and end cuts for each cut pair

Left symbol rotation	pairing_line_symbols_n_left_rotate	measure box
-----------------------------	------------------------------------	-------------

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the symbol at the start cut point for the cut point pair.

If there is no value then the rotation is 0.

Right symbol rotation	pairing_line_symbols_n_right_rotate	measure box
------------------------------	-------------------------------------	-------------

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the symbol at the end cut point for the cut point pair.

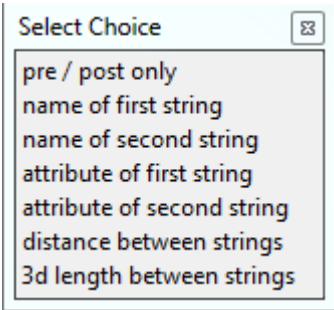

If there is no value then the rotation is 0.

X (mm)	pairing_line_symbols_n_x	measure box
horizontal adjustment to the position of the symbol.		
Y (mm)	pairing_line_symbols_n_y	measure box
vertical adjustment to the position of the symbol.		
Size	pairing_line_symbols_n_size	measure box
size of symbol. A value of 0 means no symbol.		

Paired Cuts (Long Section) - Labels

Section: Pairing - Label parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
set number as specified in the Define set #.			
Mode	pairing_label_n_mode	choice box	

type of label to write between the start and end points of the cuts pair

The height used for the label is given by the Position and Adopted height columns in the Set definition.

Attribute name	pairing_label_n_attribute	text box
-----------------------	---------------------------	----------

if Mode is **attribute of first string** or **attribute of second string**, this is the name of the attribute to use as the label

Offset	pairing_label_n_offset	measure box
the text is raised by this amount above the line between the cut pair		
Colour	pairing_label_n_colour	colour box
colour of the text		
Size (mm)	pairing_label_n_size	measure box
size of the text in millimetres. A value of 0 means no text.		
Textstyle	pairing_label_n_textstyle	textstyle box
the textstyle for the text		
Pre-text	pairing_label_n_pre_text	text box
text to draw before the label. This can include spaces, including one or more spaces after the last non blank character of Pre-text.		
Post-text	pairing_label_n_post_text	text box

text to draw after the label. This can include spaces, including one or more spaces before the first non blank character of Post-text.

Decimals pairing_label_n_no_decimals number box

if the label is a number, then Decimals is the number of decimal places to write the number out to.

If > 0, trailing zeros are **removed** after the decimal point.

If < 0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Leave gap for text pairing_label_n_?? tick box

if ticked then a gap in the line between the cuts pair is left large enough for the label and the pre-text and post-text.

If not ticked then no gap is left in the line between the cuts pair.

Rotate text to fit pairing_label_n_roate_text tick box

if ticked, then if the label and the pre-text and post-text will not fit between the start cut and end cut of the cut pair, the text is rotated through ninety degrees.

If not ticked, then the label text is drawn even though it will run over the ends of the cut pair.

Paired Cuts (Long Section) - Start Chainage

The Chainge (on the long section) of the first point of the cut pair can be labelled.

The text for the label consists of pre-text followed by Chainage value followed by post-text.

Section: Pairing - Start Chainage parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	

set number as specified in the **Define set #**.

The height used for the text is given by the Position and Adopted height columns in the Set definition. This is then adjusted by the field Y (mm).

X (mm) pairing_start_chainage_n_x measure box

for placing the text: horizontal adjustment from the chainage of the first cut.

Y (mm) pairing_start_chainage_n_y measure box

for placing the text: the vertical adjustment to the height given by the Position and Adopted height columns in the Set definition

Angle (dms) pairing_start_chainage_n_angle measure box

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the text

Colour pairing_start_chainage_n_colour colour box

colour of the text

Size (mm) pairing_start_chainage_n_size measure box

size of the text in millimetres. A value of 0 means no text.

Textstyle pairing_start_chainage_n_textstyle textstyle box

the textstyle for the text

Pre-text pairing_start_chainage_n_pre_text text box

text before the Chainage value. This can include spaces, including one or more spaces after the last non blank character of Pre-text.

Post-text	pairing_start_chainage_n_post_text	text box
<i>text after the Chainage value. This can include spaces, including one or more spaces before the first non blank character of Post-text.</i>		
Justification	pairing_start_chainage_n_justification	justification box

justification of the text.

Decimals	pairing_start_chainage_n_no_decimals	number box
<i>the number of decimal places for the offset value</i>		
<i>If > 0, trailing zeros are removed after the decimal point.</i>		
<i>If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.</i>		

Paired Cuts (Long Section) - End Chainage

The Chainage on the long section of the second point of the cut pair can be labelled.
The label consists of pre-text then the Chainage value followed by post-text.

Section: Pairing - End Chainage parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
<i>set number as specified in the Define set #.</i>			
<i>The height used for the text is given by the Position and Adopted height columns in the Set definition. This is then adjusted by the field Y (mm).</i>			
X (mm)	pairing_end_chainage_n_x	measure box	
<i>for placing the text: horizontal adjustment from the offset of the second cut.</i>			
Y (mm)	pairing_end_chainage_n_y	measure box	
<i>for placing the text: the vertical adjustment to the height given by the Position and Adopted height columns in the Set definition</i>			
Angle (dms)	pairing_end_chainage_n_angle	measure box	

angle (measured counterclockwise from the positive x-axis with units of degrees in [HP Notation](#)) to rotate the text

Colour pairing_end_chainage_n_colour colour box
colour of the text

Size (mm) pairing_end_chainage_n_size measure box
size of the text in millimetres. A value of 0 means no text.

Textstyle pairing_end_offset_n_textstyle textstyle box
the textstyle for the text

Pre-text pairing_end_chainage_n_pre_text text box
text before the Offset value. This can include spaces, including one or more spaces after the last non blank character of Pre-text.

Post-text pairing_end_chainage_n_post_text text box
text after the Offset value. This can include spaces, including one or more spaces before the first non blank character of Post-text.

Justification pairing_start_chainage_n_justification justification box

justification of the text.

Decimals pairing_start_chainage_n_no_decimals number box
the number of decimal places for the Offset value

*If > 0, trailing zeros are **removed** after the decimal point.*
If <0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Please continue to the next section [Primary String Name Label](#).

Primary String Name Label

The plot can be labelled with a name under the boxes area.
The name is made up of a concatenation of the text string names.

Section: Primary string name label parameters

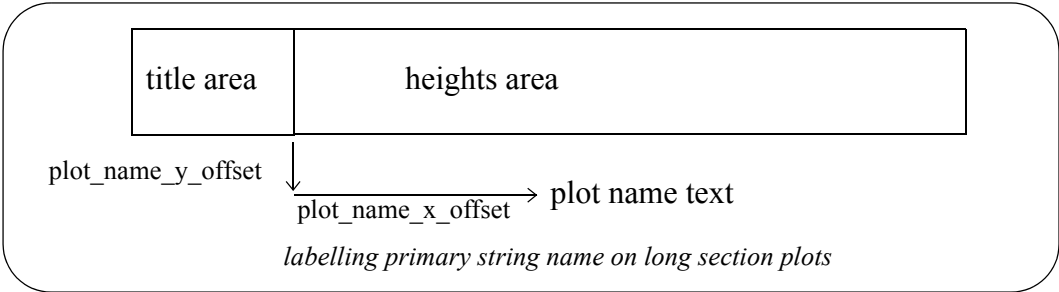

Panel Field	Parameter name	Type
Name mode <i>determines what text is placed in the name labels.</i>	plot_name_string_name	choice box
Pre-text <i>text before label.</i>	plot_name_pre_text	input
Post-text <i>text after label.</i>	plot_name_post_text	input
Textstyle <i>textstyle of label.</i>	plot_name_textstyle	text box
Size (mm) <i>size of label.</i>	plot_name_size	input
Colour <i>colour of label.</i>	plot_name_colour	colour box
X offset (mm) <i>horizontal adjustment to position of label.</i>	plot_name_x_offset	input
Y offset (mm) <i>vertical adjustment to position of label.</i>	plot_name_y_offset	input

The plot name is positioned under the boxes.

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being down.

Please continue to the next section [Scale Labelling](#).

Scale Labelling

The plot can be labelled with the horizontal and vertical scale under the boxes area.

The scale label is made up of a concatenation of the text strings:

scale_horizontal_pre_text

horizontal scale value

scale_horizontal_post_text

and

scale_vertical_pre_text

vertical scale value

scale_vertical_post_text

The horizontal scale value is the value given by the scale parameter.

The scales are positioned under the boxes.

Scale Labelling - Horizontal

Section: Scale labelling - Horizontal parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Pre-text <i>text before label</i>	scale_horizontal_pre_text	input	
Post-text <i>text after label</i>	scale_horizontal_post_text	input	
Textstyle <i>textstyle of label</i>	scale_horizontal_textstyle	textstyle box	
Size (mm) <i>size of label</i>	scale_horizontal_size	input	
Colour <i>colour of label</i>	scale_horizontal_colour	colour box	
X offset (mm) <i>horizontal adjustment to position of label.</i>	scale_horizontal_x_offset	input	
Y offset (mm) <i>height adjustment to position of label.</i>	scale_horizontal_y_offset	input	
Decimal places <i>height adjustment to position of label.</i>	scale_horizontal_decimals	input	

Scale Labelling - Vertical

Section: Scale labelling - Vertical parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Pre-text <i>text before label</i>	scale_vertical_pre_text	input	
Post-text <i>text after label</i>	scale_vertical_post_text	input	
Textstyle	scale_vertical_textstyle	textstyle box	

textstyle of label

Size (mm) scale_vertical_size input

size of label

Colour scale_vertical_colour colour box

colour of label

X offset (mm) scale_vertical_x_offset input

horizontal adjustment to position of label.

Y offset (mm) scale_vertical_y_offset input

height adjustment to position of label.

Decimal places scale_vertical_decimals input

height adjustment to position of label.

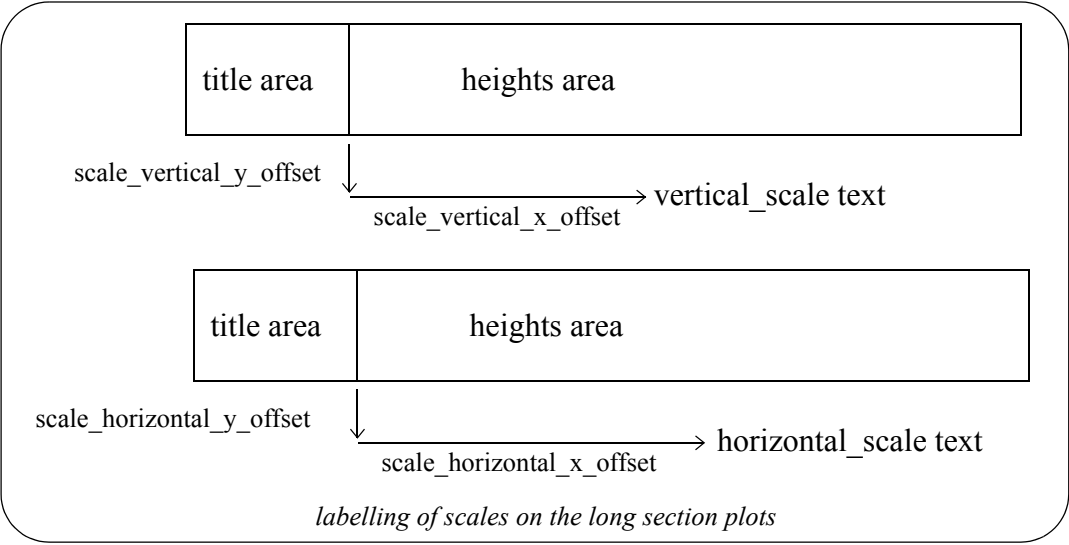

The *scale_vertical_x_offset* and *scale_horizontal_x_offset* are measured from the beginning of the heights area.

The default for *scale_vertical_x_offset* and *scale_horizontal_x_offset* are centred on the heights area.

The *scale_vertical_y_offset* and *scale_horizontal_y_offset* are measured from the bottom of the box area with positive being **down**.

If the **number of decimal places is greater than zero (> 0)**, then any trailing zeros after the decimal point are removed.

If the **number of decimal places is less than zero (< 0)**, the absolute value is taken as the number of decimal places and **no** trailing zeros after the decimal point are removed.

Please continue to the next section [Plan Plotting](#).

Plan Plotting

Section: Plan parameters

The *Plan Plotting* section is for generating a combined long section and plan plot on the one plot sheet. The chainage interval for the long section plots (as set up in the **Pagination** section [Pagination](#)) is used to define the chainage interval for the plan plot.

The total sheet size is given by the **Sheet size** parameter (see the section [Long Plot PPF Editor](#)), and the position of the long section plot on the sheet is defined in the section [Plot Sheet Layout](#). What is left to be defined is the area on the sheet for the plan plot.

Hence sheets of long sections and the associated plan plots are automatically generated.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use plan plotting <i>if tick, a plan plot to match the long section plot, is created on the same sheet. If not tick, no plan plot is created - only the long section.</i>	plan_plotting	tick box	
Left margin (mm) <i>left margin of the area of the plan plot</i>	plan_left_margin	input	
Right margin (mm) <i>right margin of the area of the plan plot</i>	plan_right_margin	input	
Top margin (mm) <i>top margin of the area of the plan plot</i>	plan_top_margin	input	
Bottom margin (mm) <i>bottom margin of the area of the plan plot</i>	plan_bottom_margin	input	
Gap from left margin to start chainage (mm)	plan_left_margin_gap	input	
Draw border around plan plot <i>if ticked, a border is drawn around the plan plot area</i>	plan_draw_border	tick box	
Border colour <i>colour of border</i>	plan_border_colour	colour box	
Symbol for start chainage <i>symbol to place in the plan area on the primary string at the start chainage of the long section plot</i>	plan_start_symbol	symbol box	
Symbol for end chainage <i>symbol to place in the plan area on the primary string at the end chainage of the long section plot</i>	plan_end_symbol	symbol box	
Symbol size (mm) <i>size of the symbols</i>	plan_symbol_size	input	
Symbol colour <i>colour of the symbols</i>	plan_symbol_colour	colour box	
View to plot <i>view containing the information to be plotted in the plan area</i>	plan_view_name	view box	

Please continue to the next section [PPFs To Include](#).

PPFs To Include

Panel Field	Parameter name	Type	Pop-Up
PPF files		input	
<i>by including pre existing PPF files, the user can build up a modified version without having to set all the parameters.</i>			

Drainage Plot PPF Editor

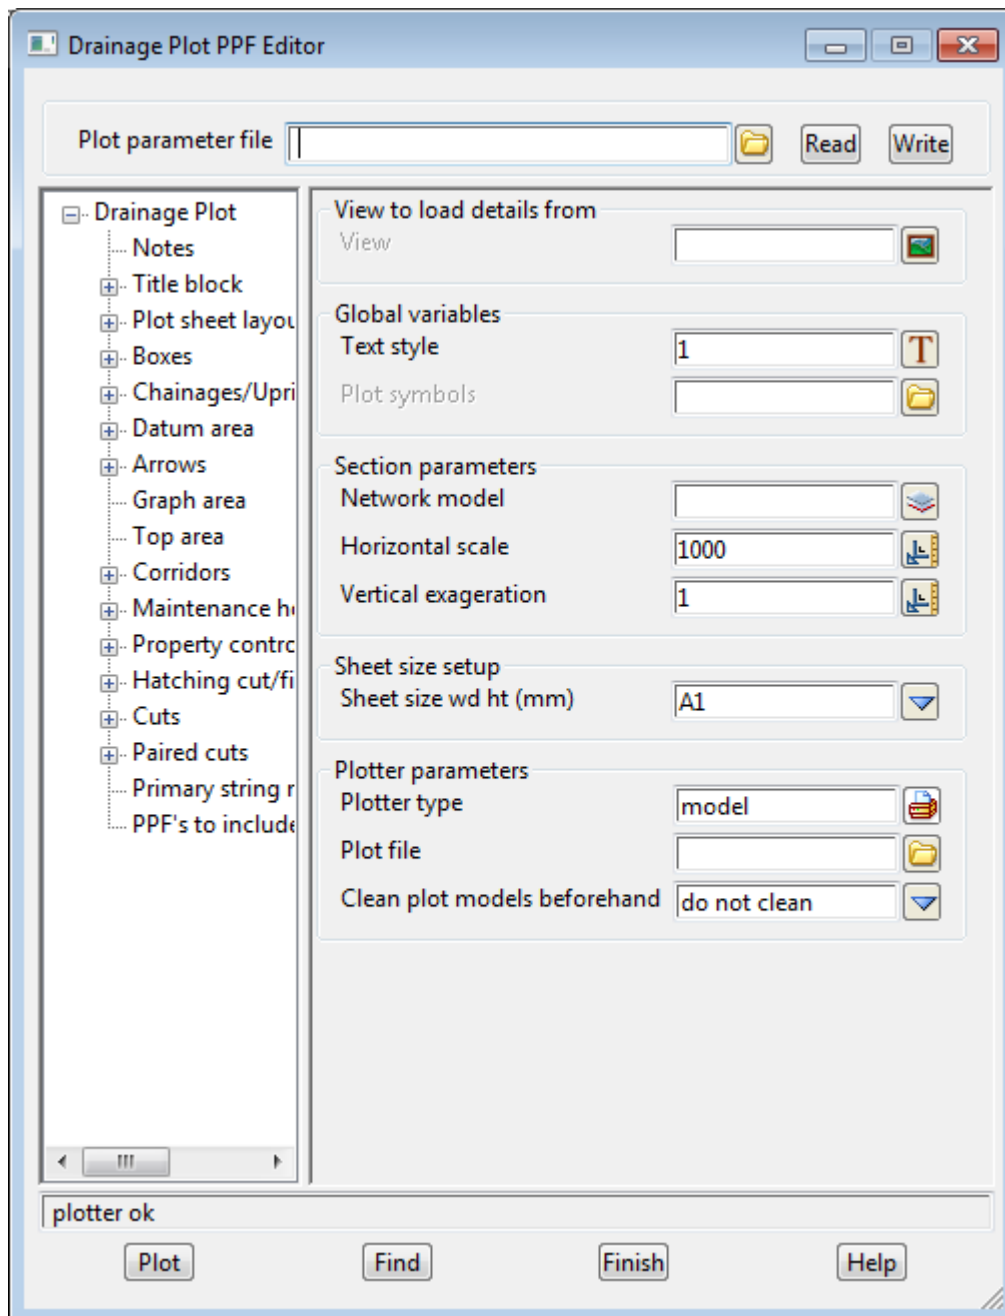

Position of option on menu: Plot =>Plot and PPF Editors => Drainage

The **Drainage Plot PPF Editor** is for creating and/or editing a (binary) drainage and sewer long section ppf file and for creating a drainage and/or sewer long section plot. An ascii version of the file is also produced.

Note: Binary and ascii PPFs are stored *within* the project (not in the folder containing the project).

On selecting the Drainage option, the **Drainage Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the **Drainage Plot** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.

Information on the top and bottom buttons, and all the different nodes, now follows.

<i>height of plot row (in millimetres).</i>			
Horizontal plot gap (mm)	horizontal_plot_gap	input	

gap between plot columns (in millimetres).

Vertical plot gap (mm) vertical_plot_gap input

gap between plot rows (in millimetres).

Start new sheet/row for strings longer than (world units) string_length_for_break input

Please continue to the next section [Boxes](#).

Boxes

The Boxes Area on the drainage long section plot is used to label points on the drainage strings with the following information: chainages, road centre line chainages, natural surface heights, finished surface heights, before pit and after pit invert levels, before pit and after pit hgl values, and before pit and after pit depths to inverts.

The default order of the boxes is as shown in the diagram, below.

The *chainage* box is hardwired to always appear first (at the bottom) in the order of boxes. If, you wish to change the order of any of the other boxes, or wish to omit any of the other boxes, you can do so by specifying the following box order parameters.

Panel Field	Parameter name	Type	Pop-Up
Box #	box_n_set	input	
<i>order (from 1 to 6) of the nth box type.</i>			
List #	box_n	choice box	road centre line chainages natural surface heights finished surface heights invert levels hgl values depths to inverts

box type for the nth set of box order parameters.

Boxes - Title Area

Section: Boxes - Title area parameters

Panel Field	Parameter name	Type	Pop-Up
Box width (mm)	box_width	input	
<i>width of the box title area.</i>			
Box height (mm)	box_height	input	
<i>default height of each box.</i>			
Colour of box linework	box_colour	colour box	available colours
<i>colour of box line work.</i>			
Size of titles (mm)	title_box_text_size	input	
<i>default text size of box titles.</i>			

Colour of titles	title_box_text_colour	colour box	available colours
<i>default text colour of box titles.</i>			
Suppress title left linework	suppress_title_box_line_left	tick box	
Suppress title top linework	suppress_title_box_line_top	tick box	
Draw linestyle legend beneath TIN & HGL titles	draw_linestyle_legends	tick box	
Draw linestyle legend beneath IL title	draw_linestyle_legend_il	tick box	

Boxes - Values Area

Section: Boxes - Value area parameters

Panel Field	Parameter name	Type	Pop-Up
Size of values (mm)	box_text_size	input	
<i>default text size of box values.</i>			
Colour of values	box_text_colour	colour box	available colours
<i>default text colour of box values.</i>			
Justification mode	box_text_left_justify	choice box	top justify values bottom justify values
<i>whether to justify the (vertical) value text with the top or the bottom of the box.</i>			
Text side mode	box_text_side	choice box	left right centre
<i>whether to place the (vertical) value text to the left of, to the right of, or on the chainage uprights.</i>			
Decimal places of values	number_of_decimals	input	
<i>default number of decimal places for box values.</i>			
Suppress value top linework	suppress_value_box_line_top	tick box	

Boxes - Chainage

Panel Field	Parameter name	Type	Pop-Up
Box height (mm)	chainage_box_size	input	
<i>height of chainage box (only required if different from default box_height).</i>			
Section: Title parameters			
Line 1	plot_title_chainage_name	input	
<i>first line of text for chainage box title.</i>			
Line 2	plot_title_chainage_name_2	input	
<i>optional second line of text for chainage box title.</i>			
Colour	chainage_title_colour	colour box	available colours
<i>text colour of chainage box title (required only if different from default title_box_text_colour).</i>			
Text size (mm)	chainage_title_text_size	input	
<i>text size of chainage box title (required only if different from default title_box_text_size).</i>			

Textstyle chainage_title_textstyle font box available fonts
font of chainage box title (required only if different from default global_textstyle).

Suppress title bottom linework suppress_title_box_line_ch tick box

Section: Value parameters

Colour chainage_text_colour colour box available colours
text colour of chainage box values (required only if different from default box_text_colour).

Text size (mm) chainage_text_size input
text size of chainage box values (required only if different from default box_text_size).

Textstyle chainage_textstyle font box available fonts
font of chainage box values (required only if different from default global_textstyle).

Decimal places chainage_decimals input
decimal places for chainage box values (required only if different from default number_of_decimals).

Suppress value bottom linework suppress_value_box_line_ch tick box

Boxes - Road Centre Line Chainage

Panel Field	Parameter name	Type	Pop-Up
Include centre line chainage box	draw_centre_chainage	tick box	
	<i>whether to include the road centreline chainage box in the boxes area.</i>		
Box height (mm)	centre_chainage_box_size	input	
	<i>height of road centreline chainage box (only required if different from default box_height).</i>		

Section: Title parameters

Line 1 plot_title_centre_chainage_name input
first line of text for road centreline chainage box title.

Line 2 plot_title_centre_chainage_name_2 input
optional second line of text for road centreline chainage box title.

Colour chainage_title_colour_cl colour box available colours
colour of road centreline chainage box title (required only if different from default title_box_text_colour).

Text size (mm) chainage_title_text_size_cl input
text size of road centreline chainage box title (required only if different from default title_box_text_size).

Textstyle chainage_title_textstyle_cl font box available fonts
font of road centreline chainage box title (required only if different from default global_textstyle).

Suppress title bottom linework suppress_title_box_line_rc tick box

Section: Value parameters

Colour	chainage_text_colour_cl	colour box	available colours
<i>text colour of road centreline chainage box values (required only if different from default box_text_colour).</i>			
Text size (mm)	chainage_text_size_cl	input	
<i>text size of road centreline chainage box values (required only if different from default box_text_size).</i>			
Textstyle	chainage_textstyle_cl	font box	available fonts
<i>font of road centreline chainage box values (required only if different from default global_textstyle).</i>			
Decimal places	chainage_cl_decimals	input	
<i>decimal places for road centreline chainage box values (required only if different from default number_of_decimals).</i>			
Suppress value bottom linework	suppress_value_box_line_rc	tick box	

Boxes - Natural Surface

Panel Field	Parameter name	Type	Pop-Up
Draw text mode	draw_ns_text	choice box	don't include ns box include ns box
<i>whether to include the natural surface box in the boxes area.</i>			
Box height (mm)	surface_box_size	input	
<i>height of natural surface box (only required if different from default box_height).</i>			

Section: Title parameters

Line 1	plot_title_surface_name	input	
<i>first line of text for natural surface box title.</i>			
Line 2	plot_title_surface_name_2	input	
<i>optional second line of text for natural surface box title.</i>			
Colour	ns_title_colour	colour box	available colours
<i>text colour of natural surface box title (required only if different from default title_box_text_colour).</i>			
Text size (mm)	ns_title_text_size	input	
<i>text size of natural surface box title (required only if different from default title_box_text_size).</i>			
Textstyle	ns_title_textstyle	font box	available fonts
<i>font of natural surface box title (required only if different from default global_textstyle).</i>			
Suppress title bottom linework	suppress_title_box_line_ns	tick box	

Section: Value parameters

Colour	ns_text_colour	colour box	available colours
<i>text colour of natural surface box values (required only if different from default box_text_colour).</i>			
Text size (mm)	ns_text_size	input	

text size of natural surface box values (required only if different from default box_text_size).

Textstyle	ns_textstyle	font box	available fonts
------------------	--------------	----------	-----------------

font of natural surface box values (required only if different from default global_textstyle).

Decimal places	ns_decimals	input
-----------------------	-------------	-------

decimal places for natural surface box values (required only if different from default number_of_decimals).

Suppress value bottom linework	suppress_value_box_line_ns	tick box
---------------------------------------	----------------------------	----------

Boxes - Finished Surface

Panel Field	Parameter name	Type	Pop-Up
Draw text mode	draw_fs_text	choice box	don't include fs box include fs box

whether to include the finished surface box in the boxes area.

FS tin/Top of MH mode	draw_fs_mode	choice box	height from fs tin height from top of MH
------------------------------	--------------	------------	---------------------------------------------

whether the finished surface height values come from the finished surface tin, or from the tops of the maintenance holes.

Box height (mm)	f_surface_box_size	input
------------------------	--------------------	-------

height of finished surface box (only required if different from default box_height).

Section: Title parameters

Line 1	plot_title_finished_name	input
---------------	--------------------------	-------

first line of text for finished surface box title.

Line 2	plot_title_finished_name_2	input
---------------	----------------------------	-------

optional second line of text for finished surface box title.

Colour	fs_title_colour	colour box	available colours
---------------	-----------------	------------	-------------------

text colour of finished surface box title (required only if different from default title_box_text_colour).

Text size (mm)	fs_title_text_size	input
-----------------------	--------------------	-------

text size of finished surface box title (required only if different from default title_box_text_size).

Textstyle	fs_title_textstyle	font box	available fonts
------------------	--------------------	----------	-----------------

font of finished surface box title (required only if different from default global_textstyle).

Suppress title bottom linework	suppress_title_box_line_fs	tick box
---------------------------------------	----------------------------	----------

Section: Value parameters

Colour	fs_text_colour	colour box	available colours
---------------	----------------	------------	-------------------

text colour of finished surface box values (required only if different from default box_text_colour).

Text size (mm)	fs_text_size	input
-----------------------	--------------	-------

text size of finished surface box values (required only if different from default box_text_size).

Textstyle	fs_textstyle	font box	available fonts
------------------	--------------	----------	-----------------

font of finished surface box values (required only if different from default global_textstyle).

Decimal places	fs_decimals	input
<i>decimal places for finished surface box values (required only if different from default number_of_decimals).</i>		
Suppress value bottom linework	suppress_value_box_line_fs	tick box

Boxes - Invert Levels

Panel Field	Parameter name	Type	Pop-Up
Box height (mm)	invert_height_box_size	input	
<i>height of invert level box (only required if different from default box_height).</i>			
Section: Title parameters			
Line 1	plot_title_invert_name	input	
<i>first line of text for invert level box title.</i>			
Line 2	plot_title_invert_name_2	input	
<i>optional second line of text for invert level box title.</i>			
Colour	il_title_colour	colour box	available colours
<i>text colour of invert level box title (required only if different from default title_box_text_colour).</i>			
Text size (mm)	il_title_text_size	input	
<i>text size of invert level box title (required only if different from default title_box_text_size).</i>			
Textstyle	il_title_textstyle	font box	available fonts
<i>font of invert level box title (required only if different from default global_textstyle).</i>			
Suppress title bottom linework	suppress_title_box_line_il	tick box	

Section: Value parameters

Colour	il_text_colour	colour box	available colours
<i>text colour of invert level box values (required only if different from default box_text_colour).</i>			
Text size (mm)	il_text_size	input	
<i>text size of invert level box values (required only if different from default box_text_size).</i>			
Textstyle	il_textstyle	font box	available fonts
<i>font of invert level box values (required only if different from default global_textstyle).</i>			
Decimal places	il_decimals	input	
<i>decimal places for invert level box values (required only if different from default number_of_decimals).</i>			
Suppress value bottom linework	suppress_value_box_line_il	tick box	

Boxes - HGL

Panel Field	Parameter name	Type	Pop-Up
Draw HGL box	draw_hgl_value	tick box	
<i>whether to include the HGL box in the boxes area.</i>			
Box height (mm)	hgl_box_size	input	

height of HGL box (only required if different from default box_height).

Section: Title parameters

Line 1	plot_title_hgl_name	input	
	<i>first line of text for HGL box title.</i>		
Line 2	plot_title_hgl_name_2	input	
	<i>optional second line of text for HGL box title.</i>		
Colour	hgl_title_colour	colour box	available colours
	<i>text colour of HGL box title (required only if different from default title_box_text_colour).</i>		
Text size (mm)	hgl_title_text_size	input	
	<i>text size of HGL box title (required only if different from default title_box_text_size).</i>		
Textstyle	hgl_title_textstyle	font box	available fonts
	<i>font of HGL box title (required only if different from default global_textstyle).</i>		
Suppress title bottom linework	suppress_title_box_line_hg	tick box	

Section: Value parameters

Colour	hgl_text_colour	colour box	available colours
	<i>text colour of HGL box values (required only if different from default box_text_colour).</i>		
Text size (mm)	hgl_text_size	input	
	<i>text size of HGL box values (required only if different from default box_text_size).</i>		
Textstyle	hgl_textstyle	font box	available fonts
	<i>font of HGL box values (required only if different from default global_textstyle).</i>		
Decimal places	hgl_decimals	input	
	<i>decimal places for HGL box values (required only if different from default number_of_decimals).</i>		
Suppress value bottom linework	suppress_value_box_line_hg	tick box	

Boxes - Depths

Panel Field	Parameter name	Type	Pop-Up
Depth box mode	depth_mode	choice box	don't include depths box depths from fs tin depths from top of MH depths from ns tin
	<i>whether to include the depths (to inverts) box in the boxes area, and if so, whether the depths are measured from the finished surface tin, the tops of the maintenance holes, or the natural surface tin.</i>		
Box height (mm)	invert_depth_box_size	input	
	<i>height of depths box (only required if different from default box_height).</i>		

Section: Title parameters

Line 1	plot_title_depth_name	input
	<i>first line of text for depths box title.</i>	
Line 2	plot_title_depth_name_2	input
	<i>optional second line of text for depths box title.</i>	

Colour	depth_title_colour	colour box	available colours
<i>text colour of depths box title (required only if different from default title_box_text_colour).</i>			
Text size (mm)	depth_title_text_size	input	
<i>text size of depths box title (required only if different from default title_box_text_size).</i>			
Textstyle	depth_title_textstyle	font box	available fonts
<i>font of depths box title (required only if different from default global_textstyle).</i>			
Suppress title bottom linework	suppress_title_box_line_dp	tick box	

Section: Value parameters

Colour	depth_text_colour	colour box	available colours
<i>text colour of depths box values (required only if different from default box_text_colour).</i>			
Text size (mm)	depth_text_size	input	
<i>text size of depths box values (required only if different from default box_text_size).</i>			
Textstyle	depth_textstyle	font box	available fonts
<i>font of depths box values (required only if different from default global_textstyle).</i>			
Decimal places	depth_decimals	input	
<i>decimal places for depths box values (required only if different from default number_of_decimals).</i>			
Suppress value bottom linework	suppress_value_box_line_dp	tick box	

Boxes - Outer linework

Section: Boxes - Outer linework

Panel Field	Parameter name	Type	Pop-Up
Title area box mode	draw_box_mode	choice box	do not draw title area box draw title area box, no lines draw title area box with lines
<i>whether to draw the line work around the titles area, and if so, whether to draw lines separating each title as well.</i>			
Chainage box mode	chainage_box_mode	choice box	don't draw the chainage box draw the chainage box
<i>whether to draw the line work around the chainage box.</i>			

Please continue to the next section [Chainages/Uprights](#).

Chainages/Uprights

Uprights, or leader lines, can be drawn through the points on the drainage strings, anywhere from the top area to the bottom of the boxes area.

Section: Upright parameters

Panel Field	Parameter name	Type	Pop-Up
Top of uprights mode	uprights_top_mode	choice box	stop at top of pit go to top area

determines how high on the plot, the uprights are drawn.

Bottom of uprights mode	uprights_bottom_mode	choice box	stop at top of boxes go to bottom of boxes
-------------------------	----------------------	------------	-----------------------------------------------

determines how low on the plot, the uprights are drawn.

Leave gap in uprights through pit	uprights_gap_mode	tick box	
Colour of uprights to pits	manhole_line_colour	colour box	available colours

colour of the uprights.

Section: Chainage parameters

Panel Field	Parameter name	Type	Pop-Up
Chainage values at uprights	chainage_mode	choice box	pipe length chainage running chainage both pipe length and running

whether the chainage values represent the individual pipe lengths, the running chainages, or both.

Pipe length label position	centre_pipe_length	choice box	0 at start pit, length at end pit centre of pipe length
----------------------------	--------------------	------------	------------------------------------------------------------

*determines how pipe length chainages are displayed. **Note:** if the centre of pipe length option is chosen, the pipe length chainage text is drawn horizontally, rather than vertically.*

Chainages/Uprights - Services

Any services crossing the drainage strings (defined by specifying *corridor service models* in the *Corridors* section) can be automatically labelled with an upright, chainage and invert level labels (of the drainage string, placed within the appropriate boxes in the Boxes area), and a name label (that includes the crossing service string name, its diameter, and its invert level at the point of crossing).

Note: crossing services may also be labelled (independently) by utilising the parameters in the *Cuts* section.

Panel Field	Parameter name	Type	Pop-Up
Service chainage values at uprights	service_chainage_mode	choice box	pipe length chainage running chainage both pipe length and running

whether the crossing service chainage values represent the chainages from the previous pits, the running chainages, or both.

Draw uprights to crossing services		tick box	
Colour of uprights to crossing services	service_line_colour	colour box	available colours

colour of the crossing service uprights.

Section: Service chainage text parameters

Panel Field	Parameter name	Type	Pop-Up
Colour	service_ch_text_colour	colour box	available colours
<i>text colour of crossing service chainage box values (required only if different from default box_text_colour).</i>			
Text size (mm)	service_ch_text_size	input	
<i>text size of crossing service chainage box values (required only if different from default box_text_size).</i>			
Textstyle	service_ch_textstyle	font box	available fonts
<i>font of crossing service chainage box values (required only if different from default global_textstyle).</i>			
Decimal places	service_ch_decimals	input	
<i>decimal places for crossing service chainage box values (required only if different from default number_of_decimals).</i>			

Section: Service invert level text parameters

Panel Field	Parameter name	Type	Pop-Up
Colour	service_il_text_colour	colour box	available colours
<i>text colour of crossing service invert level box values (required only if different from default box_text_colour).</i>			
Text size (mm)	service_il_text_size	input	
<i>text size of crossing service invert level box values (required only if different from default box_text_size).</i>			
Textstyle	service_il_textstyle	font box	available fonts
<i>font of crossing service invert level box values (required only if different from default global_textstyle).</i>			
Decimal places	service_il_decimals	input	
<i>decimal places for crossing service invert level box values (required only if different from default number_of_decimals).</i>			

Section: Service label text parameters

Panel Field	Parameter name	Type	Pop-Up
Show name	service_name_show_name	tick box	
Show size	service_name_show_size	tick box	
Show IL	service_name_show_il	tick box	
Show clearance	service_name_show_clr	tick box	
X adjustment (mm)	service_name_x	input	
Y adjustment (mm)	service_name_y	input	
Stagger	service_name_stagger	tick box	
Y position	service_name_y_mode	choice box	below crossing point above crossing point below top staggers above bottom staggers
Distance of label below crossing point (mm)	service_name_y	input	
<i>distance (in millimetres) of crossing service name labels below crossing points.</i>			

Colour	service_name_text_colour	colour box	available colours
<i>text colour of crossing service name labels (required only if different from default box_text_colour).</i>			
Text size (mm)	service_name_text_size	input	
<i>text size of crossing service name labels (required only if different from default box_text_size).</i>			
Textstyle	service_name_textstyle	font box	available fonts
<i>font of crossing service name labels (required only if different from default global_textstyle).</i>			
Decimal places	service_name_decimals	input	
<i>decimal places for the crossing service invert levels that make up part of the crossing service name labels (required only if different from default number_of_decimals).</i>			

Chainages/Uprights - Finished Surface/Top of MH Values

In addition to the finished surface level labels within the Boxes area, more detailed vertical labels representing finished surface levels at the pits, can be added to accompany the pit uprights within the Graph area.

Panel Field	Parameter name	Type	Pop-Up
Finished surface draw mode	draw_fs_vertical	choice box	do not draw fs values always draw fs values only draw if different
<i>whether to label the finished surface levels within the Graph area. Additional control is provided to only draw the labels if the finished surface level is different from the level at the top of the maintenance hole.</i>			
Finished surface value mode	draw_fs_vertical_mode	choice box	value from fs tin value from top of mh
<i>whether the finished surface level label values come from the fs tin or the top of the maintenance holes.</i>			
Pre text	fs_vertical_pre_text	input	
<i>label text before the finished surface level.</i>			
Post text	fs_vertical_post_text	input	
<i>label text after the finished surface level.</i>			
Decimal places	fs_vertical_decimals	input	
<i>decimal places for finished surface level values (required only if different from default number_of_decimals).</i>			
Colour	fs_vertical_colour	colour box	available colours
<i>text colour of finished surface level labels (required only if different from default box_text_colour).</i>			
Size (mm)	fs_vertical_size	input	
<i>text size of finished surface level labels (required only if different from default box_text_size).</i>			
Textstyle	fs_vertical_textstyle	font box	available fonts
<i>font of finished surface level labels (required only if different from default global_textstyle).</i>			
X adjustment (mm)	fs_vertical_x	input	
<i>horizontal adjustment to position of finished surface level labels.</i>			
Y adjustment (mm)	fs_vertical_y	input	
<i>vertical adjustment to position of finished surface level labels.</i>			

Chainages/Uprights - Staggering

Because the pit and service uprights are sometimes too close together to fit all the desired information in the Boxes and Arrows areas, the uprights can be staggered (widened) in such a way as to provide more space in these areas, below and above the Graph area, whilst still maintaining the correct upright spacing within the Graph area itself. Specifically, the staggering of the uprights occurs below the Graph area between Arrow areas 1 and 2, and above the Graph area between Arrow areas 3 and 4. As such, it is recommended that Arrow areas 2 and 3 be used only for information requiring minimal space.

Section: Stagger area below graph area parameters

Panel Field	Parameter name	Type
Top of arrow area 1 to start of the staggers (mm)	stagger_height_1	input
<i>refer to stagger_height_1 on above diagram.</i>		

Distance over which stagger occurs (mm)	stagger_height_2	input
<i>refer to stagger_height_2 on above diagram.</i>		

End of the staggers to bottom of arrow area 2 (mm)	stagger_gap_bottom	input
<i>refer to stagger_gap_bottom on above diagram.</i>		

Section: Stagger area above graph area parameters

Panel Field	Parameter name	Type
Top of arrow area 3 to start of the staggers (mm)	stagger_gap_top	input
<i>refer to stagger_gap_top on above diagram.</i>		

Distance over which stagger occurs (mm)	stagger_height_3	input
<i>refer to stagger_height_3 on above diagram.</i>		

End of the staggers to bottom of arrow area 4 (mm)	stagger_height_4	input
----------------------------------------------------	------------------	-------

refer to stagger_height_4 on above diagram.

Section: Stagger offset parameters

Panel Field	Parameter name	Type
Minimum distance between pit uprights (mm)	horizontal_text_gap	input

refer to horizontal_text_gap on above diagram.

Minimum distance before first service upright (mm)	service_text_gap_before	input
-----------------------------------------------------------	-------------------------	-------

Minimum distance after service uprights (mm)	service_text_gap	input
-----------------------------------------------------	------------------	-------

refer to service_text_gap on above diagram.

Please continue to the next section [Datum Area](#).

Datum Area

The Datum area is where each long section plot's datum value is drawn. The datum line for each long section plot is defined at the bottom of Arrow area 1.

Panel Field	Parameter name	Type
Below datum area gap (mm)	datum_gap	input
<i>distance from the top of the Boxes area to the bottom of Arrow area 1.</i>		
Extend datum line into title area	datum_extend	tick box

Datum Area - Name

The datum name (or title) is drawn at the datum line, above the Boxes title area.

Panel Field	Parameter name	Type	Pop-Up
Datum name	datum_name	input	
<i>title for the datum area.</i>			
X offset (mm)	datum_title_x	input	
<i>horizontal adjustment to position of datum name.</i>			
Y offset (mm)	datum_title_y	input	
<i>vertical adjustment to position of datum name.</i>			
Textstyle	datum_title_textstyle	font box	available fonts
<i>font of datum name (required only if different from default global_textstyle).</i>			
Text size (mm)	datum_title_text_size	input	
<i>text size of datum name (required only if different from default box_text_size).</i>			
Colour	datum_title_colour	colour box	available colours
<i>text colour of datum name (required only if different from default box_text_colour).</i>			

Datum Area - Values

The datum values are drawn at the datum lines, above the Box values areas.

Panel Field	Parameter name	Type	Pop-Up
Decimal places	datum_decimals	input	
<i>number of decimal places for datum values.</i>			
X offset (mm)	datum_x	input	
<i>horizontal adjustment to position of datum values.</i>			
Y offset (mm)	datum_y	input	
<i>vertical adjustment to position of datum values.</i>			
Textstyle	datum_textstyle	font box	available fonts
<i>font of datum values (required only if different from default global_textstyle).</i>			
Text size (mm)	datum_text_size	input	
<i>text size of datum values (required only if different from default box_text_size).</i>			
Colour	datum_text_colour	colour box	available colours
<i>text colour of datum values (required only if different from default box_text_colour).</i>			

Please continue to the next section [Arrows](#).

Arrows

The Arrow areas on the drainage long section plot, are used to label segments (individual pipes) on the drainage strings with the following information: grades, diameters and types, flow velocities, flow volumes, drainage line names, and any user-defined pipe attribute values.

There are four separate Arrow areas on the plot, any of which can be used to label the above information. From plot bottom to top, the Arrow areas are:

- Arrow area 1: staggered arrows below the Graph area,
- Arrow area 2: unstaggered arrows below the Graph area,
- Arrow area 3: unstaggered arrows above the Graph area,
- Arrow area 4: staggered arrows above the Graph area.

Panel Field	Parameter name	Type
Height of arrow area 1 (mm)	arrow_area_1	input
refer to arrow_area_1 on the above diagram.		
Height of arrow area 2 (mm)	arrow_area_2	input
refer to arrow_area_2 on the above diagram.		
Height of arrow area 3 (mm)	arrow_area_3	input
refer to arrow_area_3 on the above diagram.		
Height of arrow area 4 (mm)	arrow_area_4	input
refer to arrow_area_4 on the above diagram.		

Arrows - Grades

Panel Field	Parameter name	Type	Pop-Up
Draw pipe grade	draw_pipe_grade	check box	
whether to draw the pipe grades in one of the Arrow areas.			

Arrow area for the arrow	pipe_grade_arrow_area	choice box	Area 1
			Area 2
			Area 3
			Area 4

the desired Arrow area for the pipe grade information.

Y offset (mm)	pipe_grade_y	input
<i>vertical offset of pipe grade information, measured upwards from the bottom of the selected Arrow area.</i>		

Grade mode	percentage_grade	choice box	1 in grade % grade
-------------------	------------------	------------	-----------------------

determines the format of the pipe grade information.

Arrows - Grades - Title Text

Panel Field	Parameter name	Type	Pop-Up
Text	pipe_grade_title	input	
<i>title for the pipe grade information.</i>			
Textstyle	pipe_grade_title_textstyle	font box	available fonts
<i>font of pipe grade title.</i>			
Size (mm)	pipe_grade_title_text_size	input	
<i>text size of pipe grade title.</i>			
Colour	pipe_grade_title_text_colour	colour box	available colours
<i>text colour of pipe grade title.</i>			
Offset (mm)	pipe_grade_title_offset	input	
<i>vertical adjustment to position of pipe grade title.</i>			
X offset (mm)	pipe_grade_title_x	input	
<i>horizontal adjustment to position of pipe grade title.</i>			
Draw title bottom linework	pipe_grade_title_line	tick box	
Height of title left linework (mm)	pipe_grade_title_height	input	

Arrows - Grades - Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_grade_arrow_mode	choice box	available arrow types
<i>arrow type (0 to 8) for the pipe grade information.</i>			
Colour	pipe_grade_arrow_colour	colour box	available colours
<i>arrow colour for pipe grade information.</i>			
Size (mm)	pipe_grade_arrow_size	input	
<i>arrow size for pipe grade information.</i>			
Arrow gap mode	pipe_grade_arrow_gap	choice box	no gap in arrow leave gap in arrow for text

whether to put text gaps in the arrows, for pipe grade information.

Arrows - Grades - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_grade_arrow_pre_text	input	
<i>label text before the pipe grade values.</i>			
Post text	pipe_grade_arrow_post_text	input	
<i>label text after the pipe grade values.</i>			
Decimal places	pipe_grade_arrow_decimals	input	
<i>decimal places for pipe grade values.</i>			
Colour	pipe_grade_arrow_text_colour	colour box	available colours
<i>text colour for pipe grade values.</i>			
Size (mm)	pipe_grade_arrow_text_size	input	
<i>text size for pipe grade values.</i>			
Textstyle	pipe_grade_arrow_textstyle	font box	available fonts
<i>font of pipe grade values.</i>			
Offset (mm)	pipe_grade_arrow_text_offset	input	
<i>vertical adjustment to position of pipe grade values.</i>			

Arrows - Diameters

Panel Field	Parameter name	Type	Pop-Up
Pipe diameter scale factor	pipe_diameter_scale_factor	input	
<i>multiplier of pipe diameter values.</i>			
Draw pipe diameter	draw_pipe_diameter	choice box	don't draw pipe diameter draw pipe diameter
<i>whether to draw the pipe diameters in one of the Arrow areas.</i>			
Arrow area for the arrow	pipe_diameter_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
<i>the desired Arrow area for the pipe diameter information.</i>			
Y offset (mm)	pipe_diameter_y	input	
<i>vertical offset of pipe diameter information, measured upwards from the bottom of the selected Arrow area.</i>			

Arrows - Diameters - Title Text

Panel Field	Parameter name	Type	Pop-Up
Text <i>title for the pipe diameter information.</i>	pipe_diameter_title	input	
Textstyle <i>font of pipe diameter title.</i>	pipe_diameter_title_textstyle	font box	available fonts
Size (mm) <i>text size of pipe diameter title.</i>	pipe_diameter_title_text_size	input	
Colour <i>text colour of pipe diameter title.</i>	pipe_diameter_title_text_colour	colour box	available colours
Offset (mm) <i>vertical adjustment to position of pipe diameter title.</i>	pipe_diameter_title_offset	input	
X offset (mm) <i>horizontal adjustment to position of pipe diameter title.</i>	pipe_diameter_title_x	input	
Draw title bottom linework	pipe_diameter_title_line	tick box	
Height of title left linework (mm)	pipe_diameter_title_height	input	

Arrows - Diameters - Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type <i>arrow type (0 to 8) for the pipe diameter information.</i>	pipe_diameter_arrow_mode	choice box	available arrow types
Colour <i>arrow colour for pipe diameter information.</i>	pipe_diameter_arrow_colour	colour box	available colours
Size (mm) <i>arrow size for pipe diameter information.</i>	pipe_diameter_arrow_size	input	
Arrow gap mode <i>whether to put text gaps in the arrows, for pipe diameter information.</i>	pipe_diameter_arrow_gap	choice box	no gap in arrow leave gap in arrow for text

Arrows - Diameters - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text <i>label text before the pipe diameter values.</i>	pipe_diameter_arrow_pre_text	input	
Post text	pipe_diameter_arrow_post_text	input	

label text after the pipe diameter values.

Pipe type mode	pipe_type_mode	choice box	don't include the pipe type include the pipe type
----------------	----------------	------------	------------------------------------------------------

whether to include the pipe type after the post text in the pipe diameter labels.

Units factor	pipe_diameter_arrow_factor	input	
Decimal places	pipe_diameter_arrow_decimals	input	
Colour	pipe_diameter_arrow_text_colour	colour box	available colours

text colour for pipe diameter values.

Size (mm)	pipe_diameter_arrow_text_size	input
-----------	-------------------------------	-------

text size for pipe diameter values.

Textstyle	pipe_diameter_arrow_textstyle	font box	available fonts
-----------	-------------------------------	----------	-----------------

font of pipe diameter values.

Offset (mm)	pipe_diameter_arrow_text_offset	input
-------------	---------------------------------	-------

vertical adjustment to position of pipe diameter values.

Arrows - Velocities

Panel Field	Parameter name	Type	Pop-Up
Draw pipe velocity	draw_pipe_velocity	check box	
Arrow area for the arrow	pipe_velocity_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4

the desired Arrow area for the flow velocity information.

Y offset (mm)	pipe_velocity_y	input
---------------	-----------------	-------

vertical offset of flow velocity information, measured upwards from the bottom of the selected Arrow area.

Arrows - Velocities - Title Text

Panel Field	Parameter name	Type	Pop-Up
Text	pipe_velocity_title	input	
Textstyle	pipe_velocity_title_textstyle	font box	available fonts
Size (mm)	pipe_velocity_title_text_size	input	
Colour	pipe_velocity_title_text_colour	colour box	available colours

text colour of flow velocity title.

Offset (mm)	pipe_velocity_title_offset	input
<i>vertical adjustment to position of flow velocity title.</i>		
X offset (mm)	pipe_velocity_title_x	input
<i>horizontal adjustment to position of flow velocity title.</i>		
Draw title bottom linework	pipe_velocity_title_line	tick box
Height of title left linework (mm)	pipe_velocity_title_height	input

Arrows - Velocities - Arrow type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_velocity_arrow_mode	choice box	available arrow types
<i>arrow type (0 to 8) for the flow velocity information.</i>			
Colour	pipe_velocity_arrow_colour	colour box	available colours
<i>arrow colour for flow velocity information.</i>			
Size (mm)	pipe_velocity_arrow_size	input	
<i>arrow size for flow velocity information.</i>			
Arrow gap mode	pipe_velocity_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
<i>whether to put text gaps in the arrows, for flow velocity information.</i>			

Arrows - Velocities - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_velocity_arrow_pre_text	input	
<i>label text before the flow velocity values.</i>			
Post text	pipe_velocity_arrow_post_text	input	
<i>label text after the flow velocity values.</i>			
Units factor	pipe_velocity_arrow_factor	input	
Decimal places	pipe_velocity_arrow_decimals	input	
<i>decimal places for flow velocity values.</i>			
Colour	pipe_velocity_arrow_text_colour	colour box	available colours
<i>text colour for flow velocity values.</i>			
Size (mm)	pipe_velocity_arrow_text_size	input	
<i>text size for flow velocity values.</i>			
Textstyle	pipe_velocity_arrow_textstyle	font box	available fonts
<i>font of flow velocity values.</i>			

Offset (mm) pipe_velocity_arrow_text_offset
input

vertical adjustment to position of flow velocity values.

Arrows - Flow

Panel Field	Parameter name	Type	Pop-Up
Draw pipe flow	draw_pipe_flow	check box	

whether to draw the flow volumes in one of the Arrow areas.

Arrow area for the arrow	pipe_flow_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
---------------------------------	----------------------	------------	--------------------------------------

the desired Arrow area for the flow volume information.

Y offset (mm) pipe_flow_y input

vertical offset of flow volume information, measured upwards from the bottom of the selected Arrow area.

Arrows - Flow - Title Text

Panel Field	Parameter name	Type	Pop-Up
Text	pipe_flow_title	input	

title for the flow volume information.

Textstyle	pipe_flow_title_textstyle	font box	available fonts
------------------	---------------------------	----------	-----------------

font of flow volume title.

Size (mm)	pipe_flow_title_text_size	input	
------------------	---------------------------	-------	--

text size of flow volume title.

Colour	pipe_flow_title_text_colour	colour box	available colours
---------------	-----------------------------	------------	-------------------

text colour of flow volume title.

Offset (mm)	pipe_flow_title_offset	input	
--------------------	------------------------	-------	--

vertical adjustment to position of flow volume title.

X offset (mm)	pipe_flow_title_x	input	
----------------------	-------------------	-------	--

horizontal adjustment to position of flow volume title.

Draw title bottom linework	pipe_flow_title_line	tick box	
-----------------------------------	----------------------	----------	--

Height of title left linework (mm)	pipe_flow_title_height	input	
-------------------------------------------	------------------------	-------	--

Arrows - Flow - Arrow Type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	pipe_flow_arrow_mode	choice box	available arrow types

arrow type (0 to 8) for the flow volume information.

Colour	pipe_flow_arrow_colour	colour box	available colours
---------------	------------------------	------------	-------------------

arrow colour for flow volume information.

Size (mm)	pipe_flow_arrow_size	input	
------------------	----------------------	-------	--

arrow size for flow volume information.

Arrow gap mode pipe_flow_arrow_gap choice box no gap in arrow
leave gap in arrow for text

whether to put text gaps in the arrows, for flow volume information.

Arrows - Flow - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text	pipe_flow_arrow_pre_text	input	
<i>label text before the flow volume values.</i>			
Post text	pipe_flow_arrow_post_text	input	
<i>label text after the flow volume values.</i>			
Units factor	pipe_flow_arrow_factor	input	
Decimal places	pipe_flow_arrow_decimals	input	
<i>decimal places for flow volume values.</i>			
Colour	pipe_flow_arrow_text_colour	colour box	available colours
<i>text colour for flow volume values.</i>			
Size (mm)	pipe_flow_arrow_text_size	input	
<i>text size for flow volume values.</i>			
Textstyle	pipe_flow_arrow_textstyle	font box	available fonts
<i>font of flow volume values.</i>			
Offset (mm)	pipe_flow_arrow_text_offset	input	
<i>vertical adjustment to position of flow volume values.</i>			

Arrows - Drainage Line Name

Panel Field	Parameter name	Type	Pop-Up
Draw drainage line	draw_drainage_line	check box	
<i>whether to draw the drainage line names in one of the Arrow areas.</i>			
Arrow area for the arrow	drainage_line_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
<i>the desired Arrow area for the drainage line name information.</i>			
Y offset (mm)	drainage_line_y	input	
<i>vertical offset of drainage line name information, measured upwards from the bottom of the selected Arrow area.</i>			

Arrows - Drainage Line Name - Title Text

Panel Field	Parameter name	Type	Pop-Up
Text	drainage_line_title	input	

title for the drainage line name information.

Textstyle	drainage_line_title_textstyle	font box	available fonts
	<i>font of drainage line name title.</i>		
Size (mm)	drainage_line_title_text_size	input	
	<i>text size of drainage line name title.</i>		
Colour	drainage_line_title_text_colour	colour box	available colours
	<i>text colour of drainage line name title.</i>		
Offset (mm)	drainage_line_title_offset	input	
	<i>vertical adjustment to position of drainage line name title.</i>		
X offset (mm)	drainage_line_title_x	input	
	<i>horizontal adjustment to position of drainage line name title.</i>		
Draw title bottom linework	drainage_line_title_line	tick box	
Height of title left linework (mm)	drainage_line_title_height	input	

Arrows - Drainage Line Name - Arrow Type

Panel Field	Parameter name	Type	Pop-Up
Arrow type	drainage_line_arrow_mode	choice box	available arrow types
	<i>arrow type (0 to 8) for the drainage line name information.</i>		
Colour	drainage_line_arrow_colour	colour box	available colours
	<i>arrow colour for drainage line name information.</i>		
Size (mm)	drainage_line_arrow_size	input	
	<i>arrow size for drainage line name information.</i>		
Arrow gap mode	drainage_line_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
	<i>whether to put text gaps in the arrows, for drainage line name information.</i>		

Arrows - Drainage Line Name - Arrow Text

Panel Field	Parameter name	Type	Pop-Up
Pre text	drainage_line_arrow_pre_text	input	
	<i>label text before the drainage line names.</i>		
Post text	drainage_line_arrow_post_text	input	
	<i>label text after the drainage line names.</i>		
Colour	drainage_line_arrow_text_colour	colour box	available colours
	<i>text colour for drainage line names.</i>		

Size (mm)	drainage_line_arrow_text_size	input	
text size for drainage line names.			
Textstyle	drainage_line_arrow_textstyle	font box	available fonts
font of drainage line names.			
Offset (mm)	drainage_line_arrow_text_offset	input	
vertical adjustment to position of drainage line names.			

Arrows - User Defined Pipe Attributes

User defined pipe attribute data can be drawn in the Arrow areas.

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters.			
Draw pipe attribute mode	draw_pipe_attr_n	choice box	don't draw pipe attribute draw pipe attribute
whether to draw the nth set of pipe attribute data in one of the Arrow areas.			
Pipe attribute name	pipe_attr_n_name	input	
name of the nth pipe attribute.			
Arrow area for the arrow	pipe_attr_n_arrow_area	choice box	Area 1 Area 2 Area 3 Area 4
the desired Arrow area for the nth set of pipe attribute data.			
Y offset (mm)	pipe_attr_n_y	input	
vertical offset of the nth set of pipe attribute data, measured upwards from the bottom of the selected Arrow area.			

Arrows - User Defined Pipe Attributes - Title Text

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #'s from the grid in the parent node: User defined pipe attributes .			
Text	pipe_attr_n_title	input	
title for the nth set of pipe attribute data.			
Textstyle	pipe_attr_n_title_textstyle	font box	available fonts
font of the title for the nth set of pipe attribute data.			
Size (mm)	pipe_attr_n_title_text_size	input	

<i>text size of the title for the nth set of pipe attribute data.</i>			
Colour	pipe_attr_n_title_text_colour	colour box	available colours
<i>text colour of the title for the nth set of pipe attribute data.</i>			
Offset (mm)	pipe_attr_n_title_offset	input	
<i>vertical adjustment to position of the title for the nth set of pipe attribute data.</i>			
X offset (mm)	pipe_attr_n_title_x	input	
<i>horizontal adjustment to position of the title for the nth set of pipe attribute data.</i>			
Draw title bottom linework		tick box	
Height of title left linework (mm)		input	

Arrows - User Defined Pipe Attributes - Arrow Type

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
<i>a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #s from the grid in the parent node: User defined pipe attributes.</i>			
Arrow type	pipe_attr_n_arrow_mode	choice box	available arrow types
<i>arrow type (0 to 8) for the nth set of pipe attribute data.</i>			
Colour	pipe_attr_n_arrow_colour	colour box	available colours
<i>arrow colour for the nth set of pipe attribute data.</i>			
Size (mm)	pipe_attr_n_arrow_size	input	
<i>arrow size for the nth set of pipe attribute data.</i>			
Arrow gap mode	pipe_attr_n_arrow_gap	choice box	no gap in arrow leave gap in arrow for text
<i>whether to put text gaps in the arrows, for the nth set of pipe attribute data.</i>			

Arrows - User Defined Pipe Attributes - Arrow Text

The following fields are required for each desired pipe attribute (set). Each set of fields forms one row of a grid.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
<i>a unique integer n, greater than 0, to identify the nth set of pipe attribute plot parameters. The Set # should match one of the Set #s from the grid in the parent node: User defined pipe attributes.</i>			
Pre text	pipe_attr_n_arrow_pre_text	input	
<i>label text before the values of the nth set of pipe attribute data.</i>			
Post text	pipe_attr_n_arrow_post_text	input	
<i>label text after the values of the nth set of pipe attribute data.</i>			
Units factor			

Decimal places	pipe_attr_n_arrow_decimals	input	
	<i>decimal places the values of the nth set of pipe attribute data.</i>		
Colour	pipe_attr_n_arrow_text_colour	colour box	available colours
	<i>text colour for the values of the nth set of pipe attribute data.</i>		
Size (mm)	pipe_attr_n_arrow_text_size	input	
	<i>text size for the values of the nth set of pipe attribute data.</i>		
Textstyle	pipe_attr_n_arrow_textstyle	font box	available fonts
	<i>font for the values of the nth set of pipe attribute data.</i>		
Offset (mm)	pipe_attr_n_arrow_text_offset	input	
	<i>vertical adjustment to position of values of the nth set of pipe attribute data.</i>		

Please continue to the next section [Drainage Graph Area](#).

Drainage Graph Area

The Graph area is where the diagram of the drainage line, in long-section, is drawn. In addition, if Hydraulic Grade Line (HGL) information is set, the HGL can also be drawn in the Graph area.

Panel Field	Parameter name	Type	Pop-Up
Left/Right extensions (world units)	profile_extension	input	
Drainage string colour	drainage_colour	colour box	available colours
Draw finished surface tin	draw_fs_tin	tick box	
Finished surface tin colour	fs_tin_colour	colour box	available colours
Draw natural surface tin	draw_ns_tin	tick box	
Natural surface tin colour	ns_tin_colour	colour box	available colours
Draw HGL	draw_hgl_diag	tick box	
<i>whether to draw the HGL in the Graph area.</i>			
HGL colour	hgl_colour	colour box	available colours
<i>colour of HGL.</i>			
HGL linestyle	hgl_linestyle	choice box	
<i>linestyle of HGL.</i>			

Please continue to the next section [Top Area](#).

Top Area

Panel Field	Parameter name	Type	Pop-Up
Line at the bottom of the top area mode	draw_top_line	choice box	don't draw line draw line

whether to draw a horizontal line at the bottom of the Top area.

Please continue to the next section [Corridors](#).

Corridors

A corridor around the primary string is defined by giving a left and right corridor width. Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the long section plot. To be drawn, strings do not have to cross the primary string, but just be in the corridor.

Panel field	Parameter name	Type
Left corridor width (world units)		
	corridor_width_left	input
<i>left corridor width</i>		
Right corridor width (world units)		
	corridor_width_right	input
<i>right corridor width</i>		
Left corridor overlap (world units)		
	corridor_overlap_left	input
<i>left corridor overlap</i>		
Right corridor overlap (world units)		
	corridor_overlap_right	input
<i>right corridor overlap</i>		
Chord-arc tolerance (world units)		
	corridor_chord_arc	input
<i>chord-arc tolerance used near any bends in the corridor.</i>		

Corridors - Model Selection

Panel field	Parameter name	Type
Corridor model	corridor_model_n	model box

models containing tins and service strings to be drawn on the section. Where n = 1, 2, ... ,100 given by line number on grid.

Please continue to the next section [Maintenance Holes](#).

Maintenance Holes

Section: Maintenance hole names/types/bubbles

Panel Field	Parameter name	Type	Pop-Up
Include line name mode	draw_line_name	choice box	don't include line name include line name
<i>whether to include the drainage line name in the MH name label.</i>			
Include pit name mode	draw_pit_name	choice box	don't include pit name include pit name
<i>whether to include the MH name in the MH name label.</i>			
Include pit type mode	draw_pit_type	choice box	don't include pit type include pit type
<i>whether to include the MH type in the MH name label.</i>			
Size (mm)	bubble_text_size	input	
<i>text size of MH name label.</i>			
Colour	bubble_text_colour	colour box	available colours
<i>text colour of MH name label.</i>			
Textstyle	bubble_textstyle	font box	available fonts
<i>font of MH name label.</i>			
X adjustment (mm)	bubble_text_x	input	
<i>horizontal adjustment to position of MH name label.</i>			
Y adjustment (mm)	bubble_text_y	input	
<i>vertical adjustment to position of MH name label.</i>			
Pre text	bubble_pre_text	input	
<i>text to go before MH name label.</i>			
Post text	bubble_post_text	input	
<i>text to go after MH name label.</i>			
Text angle (dms)	bubble_text_angle	angle box	
<i>text angle of MH name label.</i>			
Text justification	bubble_text_justify	justification box	
<i>text justification of MH name label.</i>			
Bubble radius (mm)	bubble_radius	input	
<i>radius of bubble around MH name label. Zero (0) for no bubble.</i>			
Bubble colour	bubble_colour	colour box	available colours
<i>colour of bubble around MH name label.</i>			
Bubble length (mm)	bubble_length	input	
<i>length of bubble around MH name label. Zero (0) for circular bubble.</i>			
Bubble text position	draw_text_at_pit	choice box	draw bubble&text in top area draw bubble&text above pit
<i>whether to position the MH name labels and bubbles in the Top area, or directly above the pits.</i>			
Distance to add to place bubble above the pit (mm)			

distance_above_pit input

for draw_text_at_pit set to draw bubble & text above pit, distance to add between top of pit and bottom of bubble.

Maintenance Holes - Line/Junction Deflection Angles

Section: Maintenance hole line/junction deflection angles

Panel Field	Parameter name	Type	Pop-Up
Angled text x offset (mm)	angled_text_x_offset	input	
Angled text y offset (mm)	angled_text_offset	input	
Angled text horiz gap (mm)	angled_text_gap	input	
Angled text angle (dms)	angled_text_angle	input	
Angled text justification	angled_text_justification	choice box	left, right
Degrees mode	angled_text_degrees_mode	choice box	
Degrees decimals	angled_text_degrees_decimals	input	

Section: Drainage line deflection angles

Panel Field	Parameter name	Type	Pop-Up
Pre text	angled_pre_text	input	
Post text	angled_post_text	input	
Colour	angled_text_colour	colour box	available colours
Size (mm)	angled_text_size	input	
Textstyle	angled_textstyle	textstyle box	available textstyles

Maint Holes - Line/Junction Deflection Angles - Junction Names

Panel Field	Parameter name	Type	Pop-Up
Junction name mode	junction_name_mode	choice box	
Pre text	junction_pre_text	input	
Post text	junction_post_text	input	
Colour	junction_text_colour	colour box	available colours
Size (mm)	junction_text_size	input	
Textstyle	junction_textstyle	textstyle box	available textstyles

Maint Holes - Line/Junction Defl Ang - Junction Deflection Angles

Panel Field	Parameter name	Type	Pop-Up
Append mode	junction_angle_append	choice box	
Pre text	junction_angle_pre_text	input	
Post text	junction_angle_post_text	input	
Colour	junction_angle_text_colour	colour box	available colours
Size (mm)	junction_angle_text_size	input	
Textstyle	junction_angle_textstyle	textstyle box	available textstyles

Maintenance Holes - Symbols

Symbols representing the different types of maintenance holes used, can be drawn on the plots.

The following fields form one set (grid row) of controls for the placement of MH symbols on the plot. Normally, the grid will contain one row for each MH type/symbol used.

Panel Field	Parameter name	Type	Pop-Up
Set #		input	
	<i>a unique integer n, greater than 0, to identify the nth set of MH symbol plot parameters.</i>		
All MH types		input	
MH type	manhole_symbol_n_type	choice box	available MH types
	<i>the MH type to associate with the Set #, n.</i>		
MH symbol mode	manhole_symbol_n_mode	choice box	cross (0) up from centre of box (1) up&down from box centre(2) square (3) triangle, base at bottom (4) circle (5) use a symbol
	<i>for the nth MH type, whether to use one of the hard-wired symbols (1-5), or a symbol from the defined symbols list.</i>		
MH symbol position	manhole_symbol_n_position	choice box	at top of mh above top of boxes above highest point to primary string to first found tin
	<i>for the nth MH type, the desired position of the symbol.</i>		
Stagger		input	
Size (mm)	manhole_symbol_n_size	input	
	<i>for the nth MH type, the symbol size.</i>		
X (mm)	manhole_symbol_n_x	input	
	<i>for the nth MH type, the horizontal adjustment to the selected MH symbol position.</i>		
Y (mm)	manhole_symbol_n_y	input	
	<i>for the nth MH type, the vertical adjustment to the selected MH symbol position.</i>		
Symbol	manhole_symbol_n_style	choice box	available symbols
	<i>for the nth MH type, and with manhole_symbol_n_mode set to use a symbol, the symbol to use from the defined symbols list.</i>		
Angle (dms)	manhole_symbol_n_angle		

angle box

for the nth MH type, the symbol angle.

Colour	manhole_symbol_n_colour	colour box	available colours
--------	-------------------------	------------	-------------------

for the nth MH type, the symbol colour.

Maintenance Holes - Attribute Labels

Panel Field	Parameter name	Type	Pop-Up
Label MH attribute	drainage_manhole_attributes_grid	tick box	

Attribute name

From primary string at junction pits (non-standard)

Text size (mm)

Label position

Stagger	tick box

Please continue to the next section [Hatching Cut/Fill](#).

Hatching Cut/Fill

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

Panel Field	Parameter name	Type
Define Set #		input
set number to be used to define different original/new tin sets.		
Original tin	hatch_original_tin_n	tin box
tin_name for original surface		
New tin	hatch_new_tin_n	tin box
tin_name for final surface		

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting *hatch_cut_separation_n* to 0.0.
fill hatching is turned off by setting *hatch_fill_separation_n* to 0.0.

Hatching Cut/Fill - Cut

Panel Field	Parameter name	Type
Use Set #		input
set number as specified in the Define set# .		
Cut separation (mm)	hatch_cut_separation_n	input
distance between cut hatch lines. If 0, no hatching.		
Cut hatch angle (dms)	hatch_cut_angle_n	input
angle of hatching.		
Cut colour	hatch_cut_colour_n	colour box
colour of the hatching.

<i>draw mode for sides of original tin in fill.</i>		
Draw new tin	hatch_fill_draw_new_n	choice box
<i>draw mode for sides of new tin in fill.</i>		

Please continue to the next section [Cuts](#).

Cuts

The cuts that the primary string (design line) makes through strings in any user-specified model can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol**. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the:

- (a) top of the boxes on the long section,
- (b) height value of the cut string,
- (c) height of the primary string,
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note: Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

Panel Field	Parameter name	Type
Define Set #		input
<i>set number to be used to define different model/mask sets.</i>		
Model	cuts_n_model	model box
<i>model from which cut masks are derived</i>		
Name mask	cuts_n_mask	input
<i>text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.</i>		
<i>For example: "ke*" or, "bank*" or, if both masks are required,</i>		

"ke* ?bank*"

If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being set to "*".

All strings in the model cuts_n_model whose name satisfy the name mask cuts_n_mask are then checked for cuts with the design string, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the nth set.

Cuts - Chainage

vertical adjustment to position of symbol.

Angle (dms) cuts_symbol_n_angle input
rotation of symbol about point.

Colour cuts_symbol_n_colour colour box
colour of symbol.

Size (mm) cuts_symbol_n_size input
size of symbol. A value of 0 means no symbol.

Please continue to the next section [Paired Cuts - Drainage](#).

Paired Cuts - Drainage

Paired cuts uses pairs of strings and where both strings cut the primary string, the cuts on the long plot can be labelled with information such as

- (a) the name of the first and second cut strings
- (b) attributes from the first and second cut string
- (c) plan distance between the two cuts of the pair
- (d) 3d length between the two cuts of the pair
- (e) the change on the long section of the first and second cuts of the pair

Symbols can be drawn at the chainages of the first and second cuts (at a height specified when defining the Cut sets), and a line drawn between the symbols. Using both the line and a symbol of an arrow head makes an arrow between the two cuts.

The method for specifying which strings are to be checked for paired cuts is by first specifying the **models** (using wild cards and characters) that contains the strings, and then a **start name mask** to select the all the strings that are to be the first strings in a cut pair, and an **end name mask** to select all the strings that are the second strings in a cut pair.

For a long section, all the cuts of the selected **start** strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section. Then all the cuts of the selected **end** strings are found and the cuts ordered by the chainage of the cut with the primary string of the long section.

The start cuts are then processed and each start cut is paired with the next end cut with a larger chainage than the start cut. It is possible that there are end cuts before the first start cut (orphaned end cuts) and start cut with no following end cut (orphaned start cuts).

Up to twenty five different sets of models and name masks can be used so that different paired cut sets can be labelled in different ways.

Paired Cuts - Front Page

The information on this section is the same as that for Long Sections, please see [Paired Cuts \(Long Section\) - Front Page](#)

Paired Cuts - Lines and Symbols

The information on this section is the same as that for Long Sections, please see [Paired Cuts \(Long Section\) - Lines and Symbols](#)

Paired Cuts - Labels

The information on this section is the same as that for Long Sections, please see [Paired Cuts \(Long Section\) - Labels](#)

Paired Cuts - Start Chainage

The information on this section is the same as that for Long Sections, please see [Paired Cuts \(Long Section\) - Start Chainage](#)

Paired Cuts - End Chainage

The information on this section is the same as that for Long Sections, please see [Paired Cuts \(Long Section\) - End Chainage](#)

Please continue to the next section [Primary String Name Label](#).

Primary String Name Label

The plot can be labelled with a name under the boxes area.

The name is made up of a concatenation of the text string names:

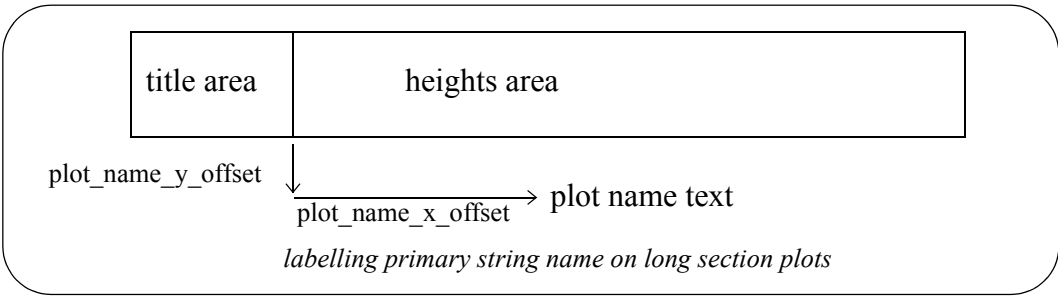

Panel Field	Parameter name	Type
Name mode	plot_name_string_name	choice box
<i>determines what text is placed in the name labels.</i>		
Pre-text	plot_name_pre_text	input
<i>text before label.</i>		
Post-text	plot_name_post_text	input
<i>text after label.</i>		
Textstyle	plot_name_textstyle	text box
<i>textstyle of label.</i>		
Size (mm)	plot_name_size	input
<i>size of label.</i>		
Colour	plot_name_colour	colour box
<i>colour of label.</i>		
X offset (mm)	plot_name_x_offset	input
<i>horizontal adjustment to position of label.</i>		
Y offset (mm)	plot_name_y_offset	input
<i>vertical adjustment to position of label.</i>		

The plot name is positioned under the boxes.

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being down.

Please continue to the next section [PPFs to include](#).

PPFs to include

Panel Field	Parameter name	Type	Pop-Up
PPF files		input	

by including pre existing PPF files, the user can build up a modified version without having to set all the parameters.

Melbourne Water Plot PPF Editor

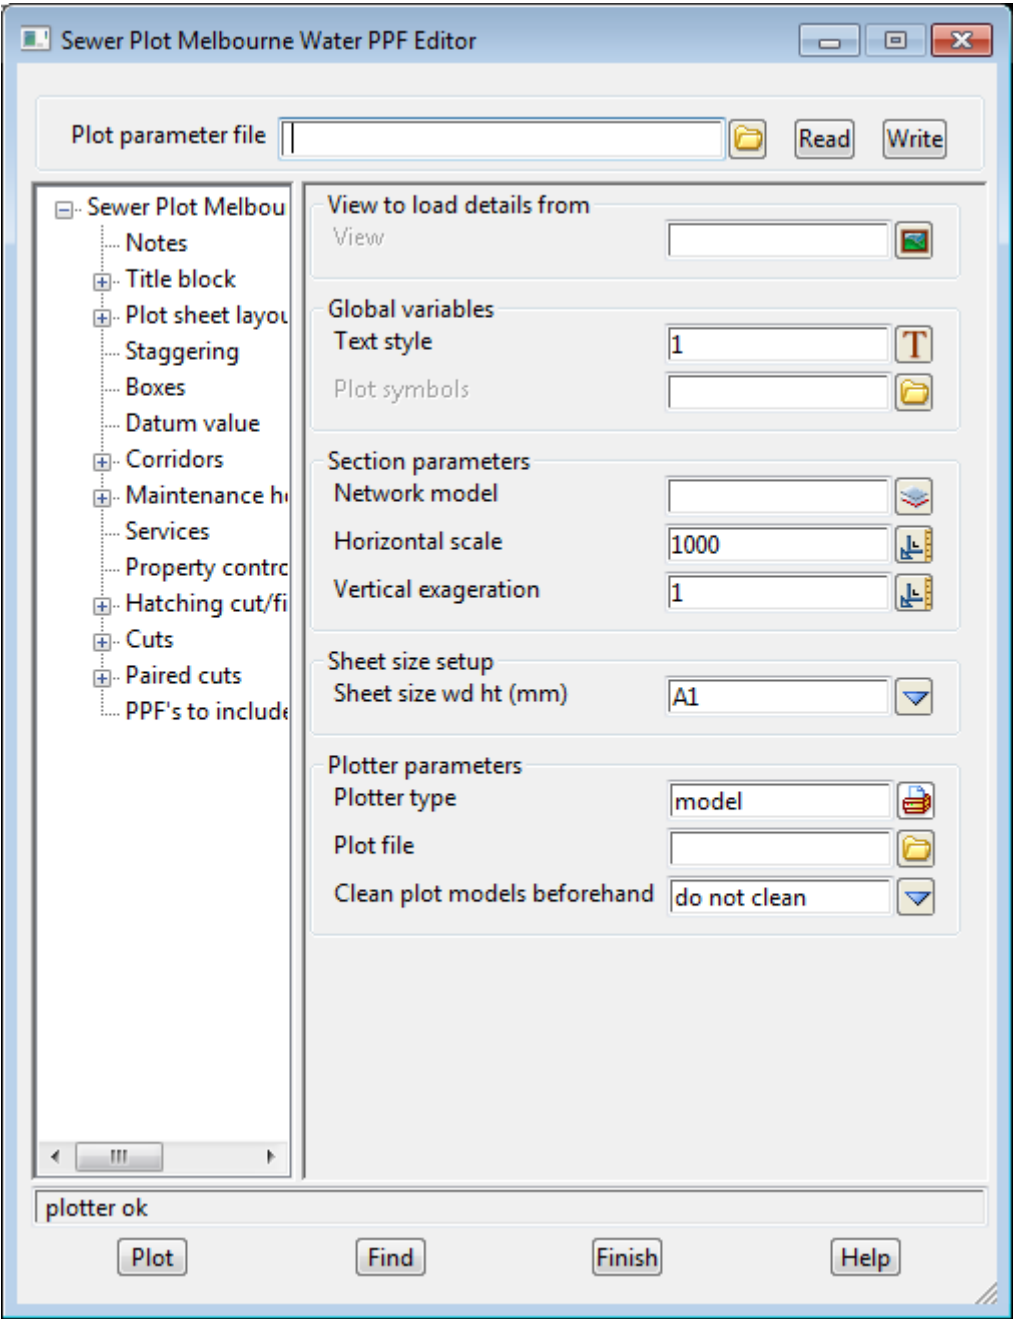

Position of option on menu: Plot =>Plot and PPF Editors =>Melbourne Water

The **Melbourne Water plot PPF editor** is for creating and/or editing a (binary) Melbourne Water sewer long section PPF and for creating a Melbourne Water sewer long section plot. An ascii version of the file is also produced.

Note: Binary and ascii PPFs are stored *within* the project (not in the folder containing the project).

On selecting the Melbourne Water option, the **Sewer Plot Melbourne Water PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the **Sewer Plot Melbourne Water** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.

Information on the top and bottom buttons, and all the different nodes, now follows.
See [Buttons on Top and Bottom of Panel](#)
See [Paired Cuts - Melbourne Water](#)

Buttons on Top and Bottom of Panel

Panel field	Type
Plot parameter file	file box

Panel field	Parameter name	Type	Pop-Up
Pipe string level mode	pipe_level_mode	choice box	available choices
Pipe string vertical offset	pipe_vertical_offset	measure box	available measures

Section: Draw multi-pipes

The fields in this section are grid column fields that may each have up to 20 sets (rows) defined.

Min pipe diam (m)	pipe_dia_min_n	input	
<i>minimum pipe diameter in metres for the nth set of pipe representations.</i>			
Max pipe diam (m)	pipe_dia_max_n	input	
<i>maximum pipe diameter in metres for the nth set of pipe representations. All pipes with diameters that fall between the min and max diameters of this set (row), will be represented according to the values of the other fields in this set. Pipe diameters are defined in the drainage design strings.</i>			
Pipe type mask		input	
Representation mode	pipe_dia_mode	choice box	none linestyle pipe linestyle and pipe
<i>determines whether to represent pipes as linestyles and/or solid pipes for the nth set of pipe representations.</i>			
Trim mode	trim_edge_mode	choice box	don't trim strings trim pipes trim linestyles trim pipes and linestyles
<i>determines whether to trim pipe and/or linestyle strings around maintenance holes for the nth set of pipe representations.</i>			
Multi-pipe spacing		input	
Colour	pipe_dia_colour_n	colour	available colours
<i>colour to use for the nth set of pipe representations.</i>			
Linestyle	pipe_dia_linestyle_n	linestyle	available linestyles
<i>linestyle to use for the nth set of pipe representations.</i>			
Linestyle string name	pipe_dia_name_n	input	
<i>string name of linestyles for the nth set of pipe representations.</i>			
Pipe string name	pipe_edge_name_n	input	
<i>string name of pipes for the nth set of pipe representations.</i>			

Section: Pipe labels

Panel field	Parameter name	Type	Pop-Up
Rise mode	rise_mode	choice box	rise from centre of pipe rise from edge of pipe
<i>determines where all pipe label text rise values are measured from.</i>			

Pipes - Pipe Diameter Labels

Panel field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Draw diameter labels	pipe_label_draw	tick box	
Label mode	pipe_label_mode	choice box	none pre dia post pre dia post grade pre dia post type grade

determines what text is to be placed for the pipe diameter labels. Pipe types and grades can be included, in addition to diameters. Pipe diameters, types and grades are all defined in the drainage design strings. **Note:** if a pipe attribute of real type named **width** exists and is greater than zero, the pipe is considered to be rectangular and is labelled <width x height>, where the height takes the value of the pipe diameter.

Text size	pipe_label_size	input
-----------	-----------------	-------

text size of the pipe diameter labels. The labels will only be created if the size is greater than zero.

Text offset	pipe_label_offset	input
-------------	-------------------	-------

distance to move the pipe diameter labels along the pipe, from the mid position of the pipe segment. Positive values are to the right.

Text rise	pipe_label_rise	input
-----------	-----------------	-------

distance to move the pipe diameter labels away from the pipe centreline or edge (depending on setting of rise_mode). A negative value will place the labels on the other side of the pipes.

Text colour	pipe_label_colour	colour	available colours
-------------	-------------------	--------	-------------------

colour of the pipe diameter labels.

Text style	pipe_label_textstyle	textstyle	available fonts
------------	----------------------	-----------	-----------------

font of the pipe diameter labels.

Pre text	pipe_label_pre_text	input
----------	---------------------	-------

text to be placed before the diameter in the pipe diameter labels.

Post text	pipe_label_post_text	input
-----------	----------------------	-------

text to be placed after the diameter in the pipe diameter labels.

Units factor	pipe_label_factor	input
--------------	-------------------	-------

multiplier of diameter values. A Units factor of 1000 will result in the diameters being labelled in mm.

Decimal places	pipe_label_decimals	input
----------------	---------------------	-------

number of decimal places in labelled diameter values.

Text string name	pipe_label_name	input
------------------	-----------------	-------

string name of the pipe diameter labels.

Pipes - Pipe IL Labels

Panel field	Parameter name	Type	Pop-Up
Draw IL labels	pipe_text_draw_il	tick box	
Text size	pipe_text_size_il	input	

text size of the pipe IL (Invert Level) labels. The labels will only be created if the size is greater than zero.

Text offset	pipe_text_offset_il	input
-------------	---------------------	-------

distance to move the pipe IL labels along the pipe, from the ends of the pipe. Positive values are towards the mid position of the pipe segment.

Text rise	pipe_text_rise_il	input
-----------	-------------------	-------

distance to move the pipe IL labels away from the pipe centreline or edge (depending on setting of

rise_mode). A negative value will place the labels on the other side of the pipes.

Text colour	pipe_text_colour_il	colour	available colours
<i>colour of the pipe IL labels.</i>			
Text style	pipe_text_textstyle_il	textstyle	available fonts
<i>font of the pipe IL labels.</i>			
Pre text	pipe_text_pre_text_il	input	
<i>text to be placed before the IL in the pipe IL labels.</i>			
Post text	pipe_text_post_text_il	input	
<i>text to be placed after the IL in the pipe IL labels.</i>			
Units factor	pipe_text_factor_il	input	
<i>multiplier of IL values. A Units factor of 3.281 will result in the ILs being labelled in feet.</i>			
Decimal places	pipe_text_decimals_il	input	
<i>number of decimal places in labelled IL values.</i>			
Text string name	pipe_text_name_il	input	
<i>text string name of the pipe IL labels.</i>

Please continue to the next section [Maintenance Holes](#).

Maintenance Holes

Section: Maintenance hole representation

Panel field	Parameter name	Type	Pop-Up
MH symbol direction mode	mh_symbol_dir_mode	choice box	use symbol angle left right average

determines what mode of direction is used to place the MH symbols.

MH symbol angle (dms)	mh_symbol_angle	angle	
<i>angle of MH symbol placement. This is only used depending on the setting of mh_symbol_dir_mode.</i>			

Use road direction where possible	tick box
Use MH label direction for Text mode	tick box
Group symbols with text labels	tick box

The remaining fields in this section are grid column fields that may each have up to 20 sets (rows) defined.

Panel field	Parameter name	Type	Pop-Up
MH type	mh_type_n	input	
<i>MH type of the nth set of maintenance holes. All MHs of this type will be represented according to the values of the other fields in this set (row). MH types are defined in the drainage design strings.</i>			
MH mode	mh_mode_n	choice box	none text symbol circle

determines whether a text string, a symbol, or a circle is to be used to represent the nth set of maintenance holes.

Insertion point

MH Symbol or Text	mh_symbol_n	symbol	available symbols
<i>symbol or text string to use to represent the nth set of maintenance holes. If mh_mode_n is set to text, a text string can be typed in. If mh_mode_n is set to symbol, the symbol name can be chosen from the pop-up list. Ignored if mh_mode_n is set to circle.</i>			

MH Symbol mirror image

Justification	mh_symbol_justify_n	choice box	left bottom left middle left top centre bottom centre middle centre top right bottom right middle right top
---------------	---------------------	------------	-------------------------------------------------------------------------------------------------------------------------------------

*justification mode of the MH text for the nth set of maintenance holes, relative to the centres of the MHs. This will only be relevant if mh_mode_n is set to **text**.*

Size	mh_symbol_size_n	input	
<i>size of the MH symbols or text strings for the nth set of maintenance holes. The symbols, circles or text strings will only be created if the size is greater than zero. In the case of a circle, the size is determined</i>			

to match the diameter of the MH.

Offset	mh_symbol_offset_n	input	
distance to move the MH symbols, circles or text strings to the left or right of the MH centres, for the nth set of maintenance holes. Positive values are to the right. The direction of movement is parallel to the angle of the MH symbols (see mh_symbol_dir_mode and mh_symbol_angle).			
Rise	mh_symbol_rise_n	input	
distance to move the MH symbols, circles or text strings above or below of the MH centres, for the nth set of maintenance holes. Positive values are upwards. The direction of movement is perpendicular to the angle of the MH symbols (see mh_symbol_dir_mode and mh_symbol_angle).			
Colour	mh_symbol_colour_n	colour	available colours
colour of the MH symbols, circles or text strings, for the nth set maintenance holes.			
Text style	mh_symbol_textstyle_n	style	available fonts
font of the MH text for the nth set of maintenance holes. This will only be relevant if mh_mode_n is set to text .			
MH Symbol string name	mh_symbol_name_n	input	
string name of the MH symbols, circles or text strings for the nth set of maintenance holes.			

Section: Maintenance Hole Labels

Panel field	Parameter name	Type	Pop-Up
MH label direction mode	mh_text_mode	choice box	use label angle use pipe angle
determines what angle is to be used to position the maintenance hole label text.			
MH label angle	mh_text_angle	angle	
angle of MH label text. This is only used depending on the setting of mh_text_mode.			
MH label justification	mh_text_justify	choice box	left bottom left middle left top centre bottom centre middle centre top right bottom right middle right top
justification mode of all MH label text strings, relative to the MH centres.			

Maintenance Holes - MH Name Labels

Panel field	Parameter name	Type	Pop-Up
Draw name labels		tick box	
Text size	mh_text_size	input	
text size of the MH name labels. The labels will only be created if the size is greater than zero. MH names are defined in the drainage design strings.			
Text offset	mh_text_offset	input	
distance to move the MH name labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.			
Text rise	mh_text_rise	input	

distance to move the MH name labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text colour	mh_text_colour	colour	available colours
colour of the MH name labels.			
Text style	mh_text_textstyle	textstyle	available fonts
font of the MH name labels.			
Pre text	mh_text_pre	input	
text to be placed before the MH name in the MH name labels.			
Post text	mh_text_post	input	
text to be placed after the MH name in the MH name labels.			
Text string name	mh_text_name	input	
text string name of the MH name labels.			

Maintenance Holes - MH diameter Labels

Draw diameter labels	tick box
-----------------------------	----------

Only label if diameter is outside range:

Panel field	Parameter name	Type
Min	mh_text_min_dia	input
Max	mh_text_max_dia	input

range of MH diameters for which the MH diameter labels will not be created. Both Min and Max are entered in metres.

Panel field	Parameter name	Type	Pop-Up
Text size	mh_text_size_dia	input	

text size of the MH diameter labels. The labels will only be created if the size is greater than zero. MH diameters are defined in the drainage design strings.

Text offset	mh_text_offset_dia	input
--------------------	--------------------	-------

distance to move the MH diameter labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text rise	mh_text_rise_dia	input
------------------	------------------	-------

distance to move the MH diameter labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.

Text colour	mh_text_colour_dia	colour	available colours
colour of the MH diameter labels.			

Text style	mh_text_textstyle_dia	textstyle	available fonts
font of the MH diameter labels.			

Pre text	mh_text_pre_dia	input
text to be placed before the diameter in the MH diameter labels.		

Post text	mh_text_post_dia	input
------------------	------------------	-------

text to be placed after the diameter in the MH diameter labels.

Units factor	mh_text_factor_dia	input	<i>multiplier of diameter values. A Units factor of 1000 will result in the diameters being labelled in mm.</i>	
Decimal places	mh_text_decimals_dia	input	<i>number of decimal places in labelled diameter values.</i>	
Text string name	mh_text_name_dia	input	<i>string name of the MH diameter labels.</i>	

Maintenance Holes - MH depth Labels

Panel field	Parameter name	Type	Pop-Up
Draw depth labels		tick box	
Text size	mh_text_size_depth	input	
<i>text size of the MH depth labels. The labels will only be created if the size is greater than zero. MH depths are defined in the drainage design strings.</i>			
Text offset	mh_text_offset_depth	input	
<i>distance to move the MH depth labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.</i>			
Text rise	mh_text_rise_depth	input	
<i>distance to move the MH depth labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.</i>			
Text colour	mh_text_colour_depth	colour	available colours
<i>colour of the MH depth labels.</i>			
Text style	mh_text_textstyle_depth	textstyle	available fonts
<i>font of the MH depth labels.</i>			
Pre text	mh_text_pre_depth	input	
<i>text to be placed before the depth in the MH depth labels.</i>			
Post text	mh_text_post_depth	input	
<i>text to be placed after the depth in the MH depth labels.</i>			
Units factor	mh_text_factor_depth	input	
<i>multiplier of depth values. A Units factor of 3.281 will result in the depths being labelled in feet.</i>			
Decimal places	mh_text_decimals_depth	input	
<i>number of decimal places in labelled depth values.</i>			
Text string name	mh_text_name_depth	input	
<i>string name of the MH depth labels.</i>			

Maintenance Holes - MH Chainage Labels

Panel field	Parameter name	Type	Pop-Up
Draw chainage labels		tick box	
Chainage mode	mh_text_mode_ch	choice box	running chainage

			previous chainage next chainage
<i>determines what chainage values will be labelled at the MHs. The running chainage option refers to the start of the drainage design string. The previous chainage and next chainage options refer to the previous and next MHs respectively.</i>			
Text size	mh_text_size_ch	input	
<i>text size of the MH chainage labels. The labels will only be created if the size is greater than zero.</i>			
Text offset	mh_text_offset_ch	input	
<i>distance to move the MH chainage labels to the left or right of the MH centres. Positive values are to the right. The direction of movement is parallel to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.</i>			
Text rise	mh_text_rise_ch	input	
<i>distance to move the MH chainage labels above or below the MH centres. Positive values are above. The direction of movement is perpendicular to the angle of the text, specified by parameters mh_text_mode and mh_text_angle. The justification of the text is specified by parameter mh_text_justify.</i>			
Text colour	mh_text_colour_ch	colour	available colours
<i>colour of the MH chainage labels.</i>			
Text style	mh_text_textstyle_ch	textstyle	available fonts
<i>font of the MH chainage labels.</i>			
Pre text	mh_text_pre_ch	input	
<i>text to be placed before the chainage in the MH chainage labels.</i>			
Post text	mh_text_post_ch	input	
<i>text to be placed after the chainage in the MH chainage labels.</i>			
Units factor	mh_text_factor_ch	input	
<i>multiplier of chainage values. A Units factor of 3.281 will result in the chainages being labelled in feet.</i>			
Decimal places	mh_text_decimals_ch	input	
<i>number of decimal places in labelled chainage values.</i>			
Text string name	mh_text_name_ch	input	
<i>string name of the MH chainage labels.</i>			

Maintenance Holes - MH Attribute Labels

Panel field	Parameter name	Type	Pop-Up
Label MH attribute			
Attribute name

Maintenance Holes - MH Setout Points

Panel field	Parameter name	Type	Pop-Up
Draw setout points	mh_setout_draw_mode	tick box	
Setout symbol	mh_setout_symbol	choice box	available choices
Symbol size	mh_setout_size	measure box	available measures
Colour	mh_setout_colour	colour box	available colours
Setout point string name	mh_setout_name	name box	available names
Include MH name in string name	mh_setout_name_by_pit	tick box	

Please continue to the next section [House Connections](#).

House Connections

Panel field	Parameter name	Type	Pop-Up
Draw house connections	hc_draw_mode	tick box	
HC linestyle	hc_line_style	linestyle	available linestyles
<i>linestyle with which to represent the house connections to the pipes. The HCs will be represented as lines perpendicular to the pipe, from the pipe centreline, to the sides of the pipe that the HCs are on.</i>			
HC colour	hc_colour	colour	available colours
<i>colour of the house connection linestyles</i>			
HC string name	hc_line_name	input	
<i>string name of the HC lines.</i>			
The remaining fields in this section are grid column fields that may each have up to 6 sets (rows) defined.			
Panel field	Parameter name	Type	Pop-Up
HC Type	hc_types_n	input	
<i>HC type of the nth set of house connections. All HCs of this type will be represented according to the values of the other fields in this set (row). HC types are defined in the drainage design strings. There are only 6 different HC types used in 12d Model.</i>			
HC Type label	hc_type_text_n	input	
<i>text label to be associated with the HC type of the nth set of house connections.</i>			
Label HC Name and Type	hc_type_tp_n	tick box	
<i>label the names and types of the HCs of the nth set of house connections. Depending on the HC type, it may not be desired to label the type.</i>			
Label HC IL	hc_type_il_n	tick box	
<i>label the ILs of the HCs of the nth set of house connections. Depending on the HC type, it may not make sense to label the IL.</i>			
Label HC Chainage	hc_type_ch_n	tick box	
<i>label the chainages of the HCs of the nth set of house connections. Depending on the HC type, it may not make sense to label the chainages.</i>			
Label HC Additional Text	hc_type_at_n	tick box	
<i>label the Additional text of the HCs of the nth set of house connections. Depending on the HC type, it may not be desired to label the Additional text.</i>			

House Connections - HC Name and Type Labels

Panel field	Parameter name	Type	Pop-Up
Label mode	hc_type_mode	choice box	available choices
Text size	hc_type_size	input	
<i>text size of the HC type labels. The labels will only be created if the size is greater than zero and the parameter hc_type_tp_n is set to on for the nth set of house connections. The HC type labels are associated with the HC types are defined by the parameter set hc_type_text_n.</i>			
Text offset	hc_type_offset	input	
<i>distance to move the HC type labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified,</i>			

depending on the side.

Text rise	hc_type_rise	input	
<i>distance to move the HC type labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.</i>			
Text colour	hc_type_colour	colour	available colours
<i>colour of the HC type labels.</i>			
Text style	hc_type_textstyle	textstyle	available fonts
<i>font of the HC type labels.</i>			
Text string name	hc_type_name	input	
<i>string name of the HC type labels.</i>			

House Connections - HC IL Labels

Panel field	Parameter name	Type	Pop-Up
Text size	hc_il_size	input	
<i>text size of the HC IL (Invert Level) labels. The labels will only be created if the size is greater than zero and the parameter hc_type_il_n is set to on for the nth set of house connections.</i>			
Text offset	hc_il_offset	input	
<i>distance to move the HC IL labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.</i>			
Text rise	hc_il_rise	input	
<i>distance to move the HC IL labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.</i>			
Text colour	hc_il_colour	colour	available colours
<i>colour of the HC IL labels.</i>			
Text style	hc_il_textstyle	textstyle	available fonts
<i>font of the HC IL labels.</i>			
Pre text	hc_il_pre	input	
<i>text to be placed before the IL in the HC IL labels.</i>			
Post text	hc_il_post	input	
<i>text to be placed after the IL in the HC IL labels.</i>			
Units factor	hc_il_factor	input	
<i>multiplier of IL values. A Units factor of 3.281 will result in the ILs being labelled in feet.</i>			
Decimal places	hc_il_decimals	input	
<i>number of decimal places in labelled IL values.</i>			
Text string name	hc_il_name	input	
<i>string name of the HC IL labels.</i>			

House Connections - HC Chainage Labels

Panel field	Parameter name	Type	Pop-Up
-------------	----------------	------	--------

Chainage mode	hc_chain_mode	choice box	hc lot offset running chainage previous chainage next chainage
----------------------	---------------	------------	-------------------------------------------------------------------------

determines what chainage values will be labelled at the HCs. The **running chainage** option refers to the start of the drainage design string. The **previous chainage** and **next chainage** options refer to the previous and next MHs respectively. The **hc lot offset** option is a special one that looks for a user-defined attribute called "<hc_name> hc lot offset" in the house connections along the drainage design strings. If the attribute is found, its value is set as the HC chainage label. If the attribute is not found, the value of the HC chainage label is set to a default HC Lot Offset of 5.0.

Text size	hc_chain_size	input
------------------	---------------	-------

text size of the HC chainage labels. The labels will only be created if the size is greater than zero and the parameter hc_type_ch_n is set to **on** for the nth set of house connections.

Text offset	hc_chain_offset	input
--------------------	-----------------	-------

distance to move the HC chainage labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	hc_chain_rise	input
------------------	---------------	-------

distance to move the HC chainage labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.

Text colour	hc_chain_colour	colour	available colours
--------------------	-----------------	--------	-------------------

colour of the HC chainage labels.

Text style	hc_chain_textstyle	textstyle	available fonts
-------------------	--------------------	-----------	-----------------

font of the HC chainage labels.

Pre text	hc_chain_pre	input
-----------------	--------------	-------

text to be placed before the chainage in the HC chainage labels.

Post text	hc_chain_post	input
------------------	---------------	-------

text to be placed after the chainage in the HC chainage labels.

Units factor	hc_chain_factor	input
---------------------	-----------------	-------

multiplier of chainage values. A Units factor of 3.281 will result in the chainages being labelled in feet.

Decimal places	hc_chain_decimals	input
-----------------------	-------------------	-------

number of decimal places in labelled chainage values.

Text string name	hc_chain_name	input
-------------------------	---------------	-------

string name of the HC chainage labels.

House Connections - HC Additional Text Labels

Panel field	Parameter name	Type	Pop-Up
--------------------	-----------------------	-------------	---------------

Additional text	hc_text	input	
------------------------	---------	-------	--

the additional text to place near the HCs.

Text size	hc_text_size	input
------------------	--------------	-------

text size of the HC additional text labels. The labels will only be created if the size is greater than zero and the parameter hc_type_at_n is set to **on** for the nth set of house connections.

Text offset	hc_text_offset	input
--------------------	----------------	-------

distance to move the HC additional text labels away from the pipe centreline. Negative values are converted to positive. HC label text is always placed perpendicular to the pipe (or parallel to the HC line) and on the same side of the pipe as the HC. The text will be automatically left justified or right justified, depending on the side.

Text rise	hc_text_rise	input	
<i>distance to move the HC additional text labels above or below the HC lines. Positive values are above. The direction of movement is parallel to the pipe (or perpendicular to the HC line). The text will be automatically bottom justified.</i>			
Text colour	hc_text_colour	colour	available colours
<i>colour of the HC additional text labels.</i>			
Text style	hc_text_textstyle	textstyle	available fonts
<i>font of the HC additional text labels.</i>			
Text string name	hc_text_name	input	
<i>string name of the HC additional text labels.</i>			

Please continue to the next section [Bubbles](#).

Bubbles

Panel field	Parameter name	Type	Pop-Up
Draw bubbles <i>draw bubbles (circles) around the MH name labels.</i>	bubble_draw_mode	tick box	
Bubble colour <i>colour of the bubbles.</i>	bubble_colour	colour box	available colours
Bubble factor <i>the initial radius of the bubble is calculated as half the text length of the MH name label. The bubble factor is used to multiply the initial radius to give the final bubble radius. Factors greater than 1 will increase the bubble size.</i>	bubble_factor	input	
Bubble string name <i>string name of the bubbles.</i>	bubble_name	input	

Please continue to the next section [Flow Arrows](#).

Flow Arrows

Panel field	Parameter name	Type	Pop-Up
Draw flow arrows	flow_arrow_mode	tick box	
<i>draw flow arrows near the pipe diameter labels, showing the direction of flow in the pipes.</i>			
Arrow colour	flow_arrow_colour	colour box	
<i>colour of the flow arrows.</i>			
Solid fill arrows	flow_arrow_fill	tick box	
Arrow length	flow_arrow_length	input	
<i>length of the flow arrows. Setting the length to a negative number will place the arrow on the other side of the pipe (whilst still maintaining the correct arrow direction).</i>			
Arrow rise	flow_arrow_rise	input	
Arrow string name	flow_arrow_name	input	
<i>string name of the flow arrows.</i>			

Plot Frame and PPF Editor

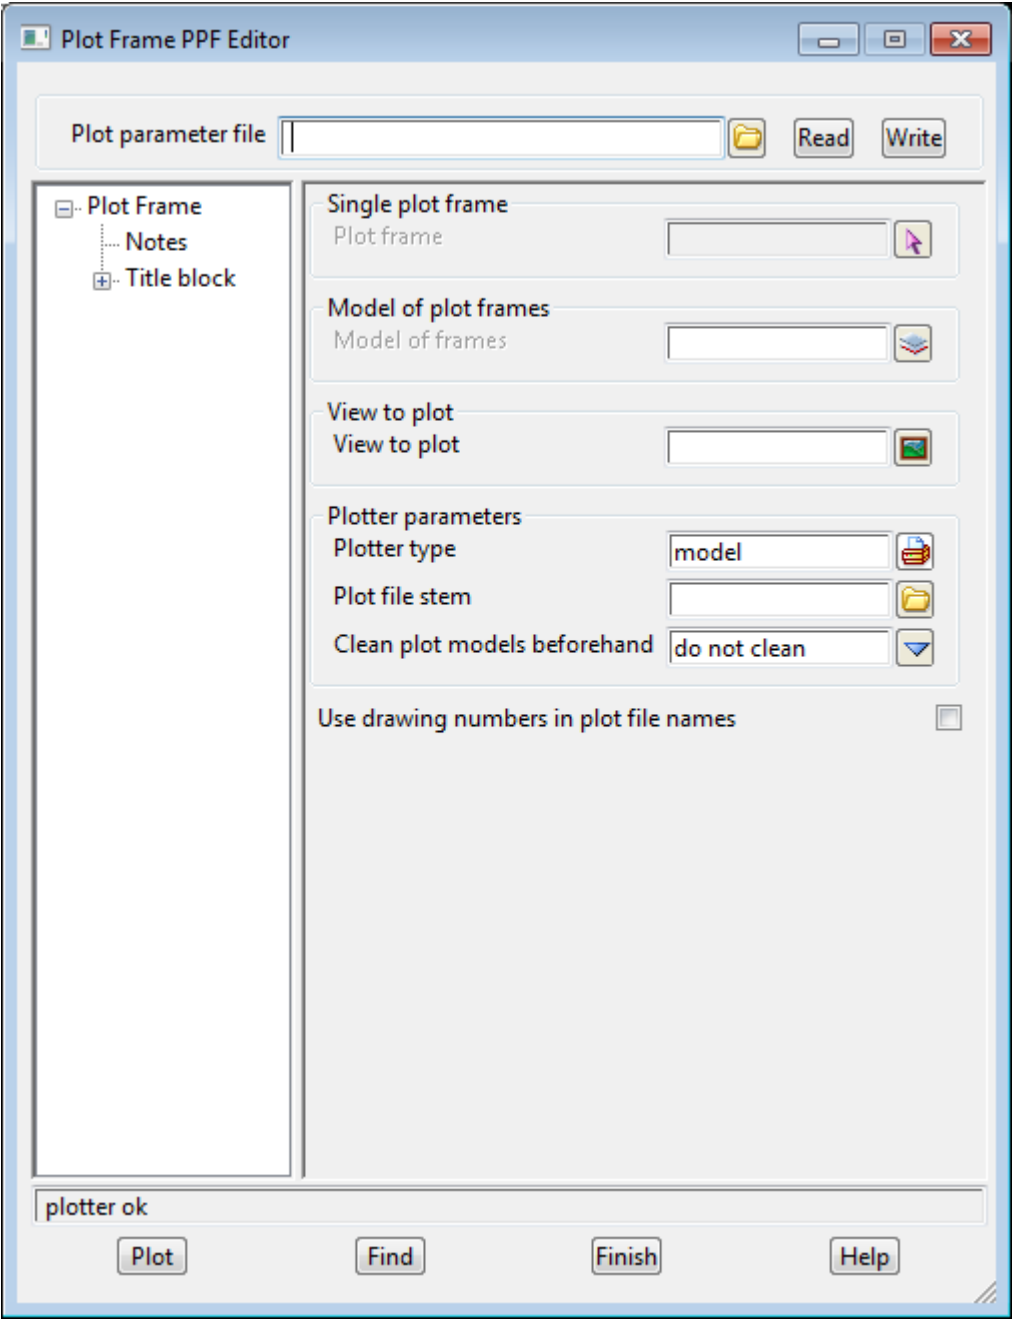

Position of option on menu: Plot =>Plot and PPF Editors =>Plot frames

The **Plot Frame PPF Editor** is for creating and/or editing a (binary) plot frame PPF file and for creating a cross section plot.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the ascii ppf's were).

On selecting the **Plot frames** option, the **Plot Frame PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding to the appropriate node in the **Plot Frame** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the required information to fill in is displayed on the right hand side of the panel.

Information on the top and bottom buttons, and all the different nodes, now follows.

See [Buttons on Top and Bottom of Plot Frame PPF Editor](#)

See [Plot Frame - Front Page](#)

See [Notes - Plot Frame](#)

See [Plot Frame Title Block](#)

Buttons on Top and Bottom of Plot Frame PPF Editor

Panel field

Type

file box

name for the binary plot parameter file to read in or write out.

Read	button
<i>read the given plot parameter file in.</i>	
Write	button
<i>write out the plot parameters to the given plot parameter file. An ascii ppf file is also written out.</i>	
Plot	button
<i>use the plot parameters from the panel to create the plot.</i>	
Find	button
<i>brings up a search box. If a valid parameter name is keyed in followed by the Enter key, the cursor will be placed in the appropriate field on the appropriate page.</i>	

Plot Frame - Front Page

Section: Single plot frame

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plot frame	single_frame	string	select box
<i>select the plot frame to be plotted.</i>			

Section: Model of plot frames

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Model of frames	model_of_frames	model	box
<i>model of plot frames to plot.</i>			

Section: View to plot

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
View to plot	view_name	model	box
<i>view in which data to plot resides.</i>			

Section: Plotter parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plotter type	plotter_type	plotter	box
<i>a valid plotting option is selected.</i>			
Plot file stem	plot_stem	plotter	box
<i>plot file name. The appropriate extension is added dependant on the plotter type selected.</i>			
Clean plot models beforehand	plot_model_clean	choice	box
			do not clean prompt for clean

always clean

whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.

Use drawing numbers in plot file names use_drawing_numbers_in_filenames tick box

Plot Frame Title Block

Section: Common title block parameters

Panel field	Parameter name	Type
Standard title	plot_border	tick box
if ticked, a standard 12d title block will be used.		
Use title file	use_title_file	tick box
if ticked, a user defined title file is used.		
Title line 1	title_1	input
if Standard title is ticked, Title line 1 is the first line of title text. If Use title file is ticked, Title line 1 is substituted for the title block variable \$title_1.		
Title line 2	title_2	input
if Standard title is ticked, Title line 2 is the second line of title text. If Use title file is ticked, Title line 2 is substituted for the title block variable \$title_2.		

Section: 12d default title block parameters

Panel field	Parameter name	Type	Pop-Up
Text size	title_text_size	input	
text size of title text.			
Text colour	title_colour	colour	available colours
colour of title text.			

Section: Model to plot in plotting units

Panel field	Parameter name	Type	Pop-Up
Plot data model	mm_plot_model	model box	available models
if not blank, the model is plotted as part of the plot frame plot. The Units for the Plot data model is considered to be millimetres and the (0,0) in the Plot data model corresponds to (0,0) in the plot. For more information see Plot Data Model .			

Title Block - User Title Info

The parameters shown below are subject to the appropriate title block variables existing in the title file. For more information on these variables see the section [Title Block Variables](#).

Section: User title block parameters

Panel field	Parameter name	Type	Pop-Up
Title file	title_file	file box	available title files
specifies the name of the title file to use. If a valid title file exists, the specified Name values will be filled out in the grid using the title block variable \$user_text_n.			
Name		output	
the alias for the nth user text specified in the title file.			
Value	user_text_n	input	
the alias text to be substituted in for the user text specified.			
Time format	time_format	input	
the time format relates to the \$time title block variable. For more information on the time formats see the section Specifying the Format for \$time .			

Start page number	start_page_number	input
<i>used as the starting value for the title block variable \$page_number. If missing, \$page_number starts at 1.</i>		
Start drawing number	start_drawing_number	input
<i>used as the starting value for the title block variable \$drawing_number. If missing, \$drawing_number starts at 1.</i>		
Drawing number prefix	drawing_number_prefix	input
<i>the value entered is used for the title block variable \$drawing_number_prefix.</i>

Convert Ascii PPF to Binary

Position of option on menu: Plot =>Plot and PPF Editors =>Convert Ascii to Binary

The **Convert ascii to binary** option is for converting the old ascii plot parameter files to the new binary plot parameter file format.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the Ascii PPFs were).

On selecting the **Convert ascii to binary** option, the **PPF Convert Ascii to Binary** panel is displayed.

The fields and buttons used in this panel have the following functions.

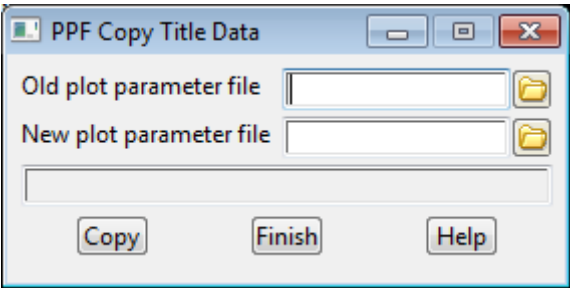

Field Description	Type	Defaults	Pop-Up
Ascii ppf	file box		
<i>name of the Ascii plot parameter file to convert.</i>			
Binary ppf	button		
<i>convert the Ascii PPF to the equivalent binary PPF. The binary PPF file will be stored in the current project.</i>			
Convert	button		
<i>convert the Ascii PPF to a binary PPF.</i>			

Copy Title Data

Position of option on menu: Plot =>Plot and PPF Editors =>Copy title data

The **Copy title data** option is for copying the title data in one binary plot parameter to another binary plot parameter file format.

On selecting the **Copy title data** option, the **PPF Copy Title Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old plot parameter file	file box		
<i>name of the plot parameter file to copy the title data from.</i>			
New plot parameter file	button		
<i>name of the plot parameter file to copy the title data to.</i>			
Copy	button		
<i>copy the title data from one PPF file to another.</i>			

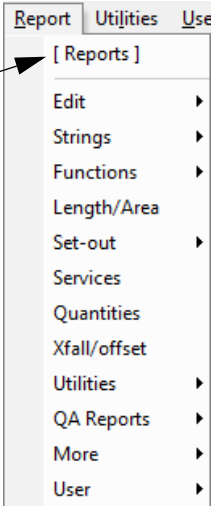

26 Reports

Position of menu: It is on the main menu as Report

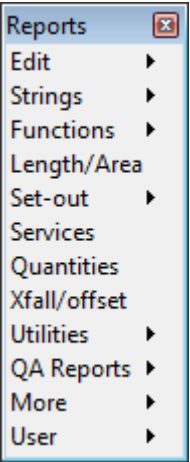

The Reports menu contains options to report on the strings in a model, polygon details (area, centroid), string set outs, string names, crest and sag points and x-falls.

The Reports menu is

on Main menu

on 12d Model menu and floating Reports menu

<ul style="list-style-type: none"> Edit ▶ Strings ▶ Functions ▶ Length/Area Set-out ▶ Services Quantities Xfall/offset Utilities ▶ QA Reports ▶ More ▶ User ▶ 	<ul style="list-style-type: none"> Edit ▶ Strings ▶ Functions ▶ Length/Area Set-out ▶ Services Quantities Xfall/offset Utilities ▶ QA Reports ▶ More ▶ User ▶ 	<ul style="list-style-type: none"> edit a .rpt file report on strings, crest/sag points, names report on functions length, area, centroid of strings point and string set-out information calculations of quantities report x-fall between two strings XML report utilities QA reports further reports Reports User menu

Each menu option will now be discussed.

Edit

Position on menu: Report =>Edit

The **Edit** option is used to edit any (printer) reports ending in *.rpt.

On walking right on *Edit*, the list of files ending in *.rpt are displayed.

Double clicking on the report name will bring up the report in the system editor.

Clicking on the *Edit* at the top of the menu brings up the **Edit a file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>the folder to look for the report file.</i>	folder box	current folder	folder browser
File to edit <i>name of the file to bring up in the system editor.</i>	file box		*.rpt

Strings

Position of menu: Report =>Strings

The **Strings** menu contains options to report on selected strings, report the crest/sag points for a string and create a list of all the unique string names in a model or view.

The **Strings** walk-right menu is

For the option *Coords/Brg-Dst*, go to

Crest/sag points

Names

Super alignment

[More Strings Reports.](#)

Coordinates or Bearing-Distance Report

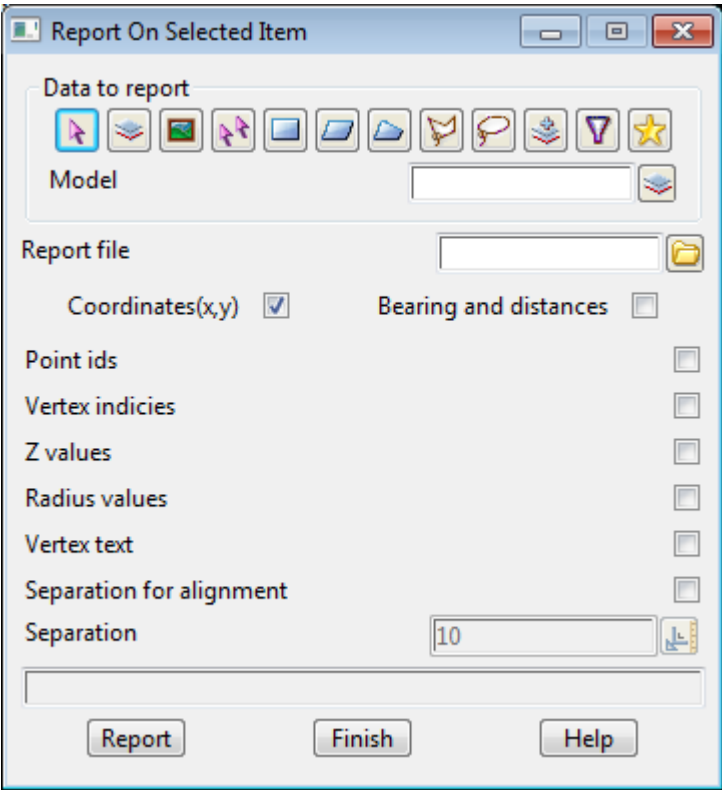

Position of option on menu: Report =>Strings =>Coords/Brg-Dst

The **Coords/Brg-Dst** option is used to generate a report on selected items defined by a source box. The report can be of the form of coordinates of each point of a string, or the co-ordinates of the first point of a string and the bearings and distances from each other point of the string to the first point of the string.

For a a Super Alignment string it will report the solved horizontal and vertical geometry (the horizontal and vertical Segments that make up the Super Alignment). If there is a non-zero separation value, then at each chainage that is a multiple of the separation value, the report also includes the chainage, x, y, z, and in and out bearings at he chainage.

For an Alignment string it will report on the HIP's and VIPS. If there is a non-zero separation value, then at each chainages that are multiples of the separation value, the report also includes the chainage, x, y, z, bearing for horizontal and chainage, height (z), grade for vertical.

On selecting the **Coords/Brg-Dst** option, the **Report on Selected Item** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Report file	input		*.rpt
<i>name of the file to report to.</i>			
Coordinates(x,y)	tick box	tick	

if **tick**, the coordinate report parameters will be displayed which will determine what other information as well as the coordinate values will be placed in the report. **NOTE:** If an **alignment string** is part of the selection, the report will include **all** relevant details about the alignment. In this case the report will not use the coordinate report parameters as specified, for the alignment string.

Bearing and Distances tick box

if **tick**, the bearing and distance report parameters will be displayed which will determine what other information as well as the bearing and distance values will be placed in the report.

Coordinate report parameters

if the **Coordinates(x,y)** option is selected, the following parameters will be displayed

Point ids tick box

if selected, any valid point ids will be shown in the report.

Vertex indices tick box

if selected, vertex indices will be shown in the report.

Z Values tick box

if selected, any valid z values will be shown in the report.

Radius values tick box

if selected, any valid radius values will be shown in the report.

Vertex Text tick box

if selected, any valid vertex text values will be shown in the report.

Separation for Alignment tick box

if selected, the separation for alignment box will be enabled.

Separation input box 10

if enabled by ticking the previous tick box, the alignment string information will be reported at a chainage interval given by the separation value.

Report button

run the option and create the report.

For a Super Alignment, the report is the same as **Reports => Strings => Super alignment** (see [Super Alignment Report](#)).

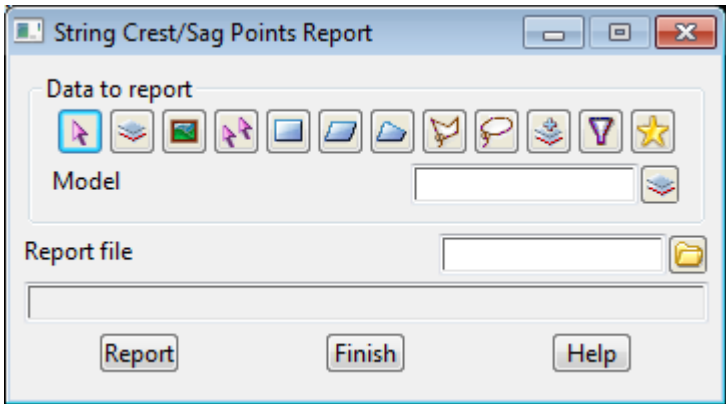

Crest/Sag Points Report

Position of option on menu: Report =>Strings =>Crest sag points

The **crest/sag points** option is used to generate a (printer) report on the crests and sags points of a string.

A number of strings can be reported on by selecting them in turn

On selecting the **crest/sag points** option, the **string crest/sag points report** panel is displayed.

The fields and buttons in this panel are used as follows

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source				
<i>type of data source.</i>				
Report file		input		*.rpt
<i>name of the file to contain the reports on the crest and sag points of strings.</i>				
Pick & Report		button		
<i>as strings are selected, the crest and sag points report is generated and appended to the report file. The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.</i>				

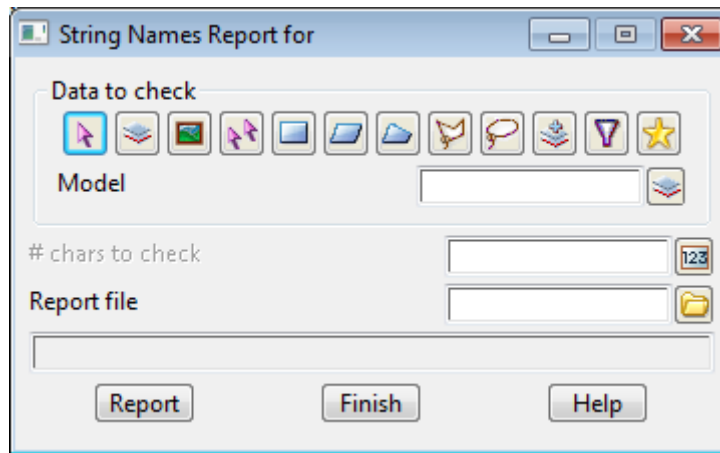

Names Report

Position of option on menu: Report =>Strings =>Names

The **names** option is used to report on all the unique strings in a model or on a view.

If the **report** button is selected, then all the strings in the model/view given by the model/view to report field will be checked and all unique names, plus a frequency count, will be written to the report file.

Selecting Names displays the **String Names Report for** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>type of data source.</i>			
# chars to check	input		
<i>if non blank, the number of characters to be used in the string name when checking for uniqueness. If blank, then the entire string name is used.</i>			
Report file	file box		*.rpt files
<i>name of the file for the report.</i>			
Report	button		
<i>report on all the unique string names in model/view.</i>			

Super Alignment Report

Position of option on menu: Report =>Strings =>Super alignment

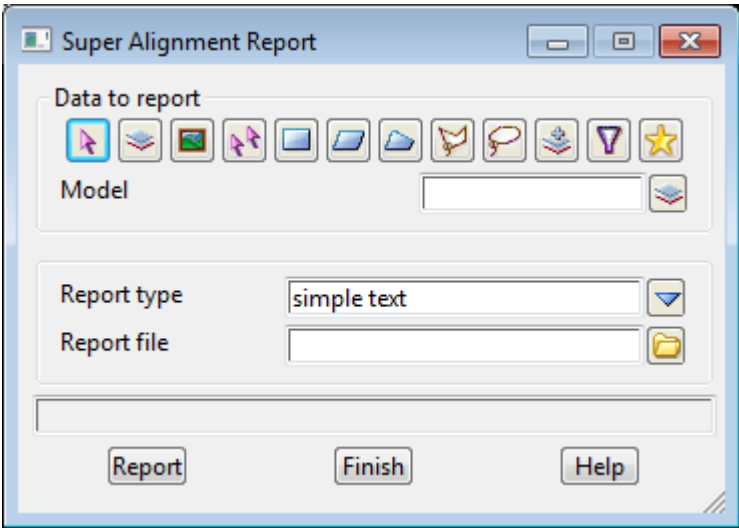

Position of option on menu: Strings =>SA tools =>Report

Report on the Super Alignment that gives information on the horizontal and vertical components.

For a Super Alignment string it will report the solved horizontal and vertical geometry (the horizontal and vertical Segments that make up the Super Alignment).

If there is a non-zero separation value, then at each chainages that are multiples of the separation value, the report also includes the chainage, x, y, z, in and out bearing for horizontal vertices, and chainage, height (z) and in and out grade for vertical vertices.

On selecting the Super alignment option, the **Super Alignment Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>type of data source.</i>			
Report type	choice box	simple text	html tables, pdf tables, original xml, csv ip tables, simple text, crests and sags
<i>type of report</i>			
Report file	input		*.rpt
<i>name of the file to report to. See below for definition of the report and an example.</i>			
Report	button		
<i>run the option and create the report.</i>			

The Super Alignment report is made up of 5 parts:

- (a) General Information
- The type of transition curve.

Whether the super alignment is closed or not.

The start chainage for the string and the chainage length (2d length) of the string.

(b) Horizontal Vertex Data

The **Horizontal Vertex Data** section of the report gives information about each of the *horizontal vertices* of the underlying **horizontal segment geometry**.

Note: "Solving" a super alignment takes all the constraints and produces a string of vertices with segments of type Line, Arc or Transition between each pair of adjacent vertices.

So the **Horizontal Vertex Data** report gives the (x,y,z) coordinates of each of the vertices of the solved horizontal geometry with the type of segment going into the vertex (**In Seg**), and the type of segment going out of the vertex (**Out Seg**).

The **In Direction** is the angle at the vertex of the segment going into the vertex, and the **Out Direction** is the angle at the vertex of the segment going out of the vertex.

If the *In* and *Out Direction* are the same, then the two segments are *tangential* at the vertex and there will be a **Yes** in the **Tan** column, otherwise there will be a **No** in the **Tan** column.

In Seg

The type of the segment going into the critical point (In Segment) at the chainage - Line, Arc, Leading Spiral (LSpiral), Trailing Spiral (TSpiral)

Out Seg

The type of the segment going out of the critical point (Out Segment) at the chainage - Line, Arc, Leading Spiral (LSpiral), Trailing Spiral (TSpiral)

Tan - yes or no

yes if the In Segment and Out Segment are tangential. That is, the In Direction and Out Direction are the same.

no if the In Segment and Out Segment are not tangential. That is, the In Direction and Out Direction are different.

Chainage

chainage of the critical point

X, Y and Z Coordinates at that chainage

In Direction

the angle of the In Segment at the critical point. Measured in dms, counterclockwise from the positive x-axis.

Out Direction

the angle of the Out Segment at the critical point. Measured in dms, counterclockwise from the positive x-axis.

In Radius

the radius of the In Segment at the critical point (or blank if on a Line).

Out Radius

the radius of the Out Segment at the critical point (or blank if on a Line).

(c) Horizontal Geometry Data

How each of the horizontal parts is defined.

(d) Vertical Vertex Data

The **Vertical Vertex Data** section of the report gives information about each of the *vertical vertices* of the underlying **vertical segment geometry**.

Note: "Solving" the vertical of a super alignment takes all the constraints and produces a 2d string in the (Chainage, height) plane, of vertices with segments of type Line, Arc or Parabola between each pair of adjacent vertices.

So the **Vertical Vertex Data** report gives the (ch,z) coordinates of each of the vertices of the solved vertical geometry with the type of segment going into the vertex (**In Seg**), and the type of segment going out of the vertex (**Out Seg**).

The **In Grade** is the grade at the vertex of the segment going into the vertex, and the **Out Grade** is the grade at the vertex of the segment going out of the vertex.

If the *In* and *Out Grade* are the same, then the two segments are *tangential* at the vertex and there will be a **Yes** in the **Tan** column, otherwise there will be a **No** in the **Tan** column.

In Seg

The type of the segment going into the critical point (In Segment) at the chainage - Line, Arc, Parabola

Out Seg

The type of the segment going out of the critical point (Out Segment) at the chainage - Line, Arc, Parabola

Tan - yes or no

yes if the In Segment and Out Segment are tangential. That is, the In Grade and Out Grade are the same.

no if the In Segment and Out Segment are not tangential. That is, the In Grade and Out Grade are different.

Chainage

chainage of the critical point

Level

height (z value) at that chainage

In Grade

the grade of the In Segment at the critical point.

Out Grade

the grade of the Out Segment at the critical point.

In VCL Radius

the radius of the parabola or arc of the In Segment at the critical point (or blank if on a Line).

Out VCL Radius

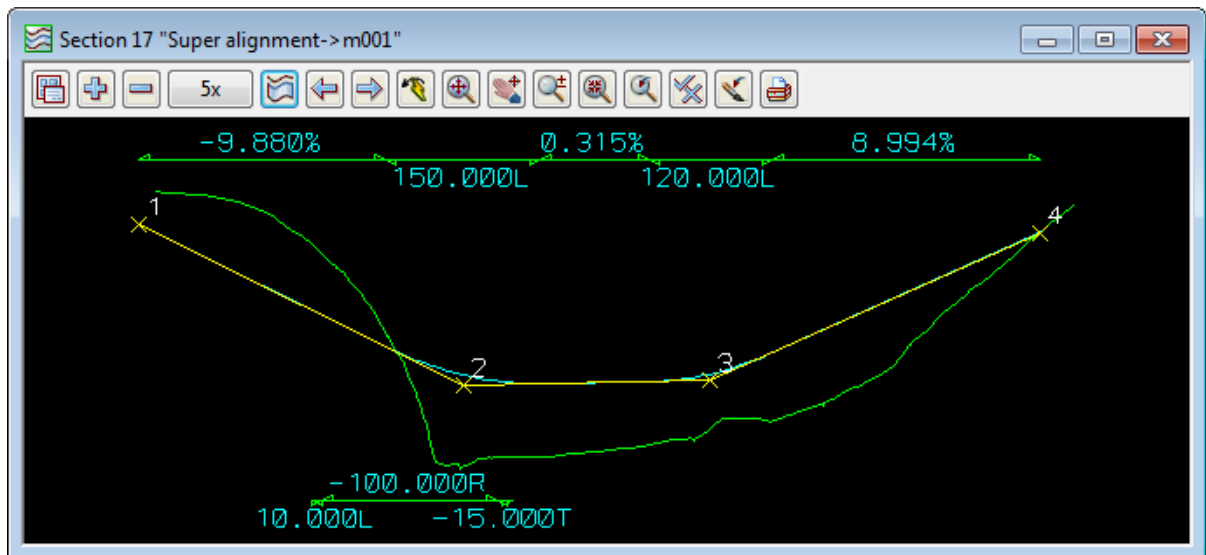

the radius of the parabola or arc of the Out Segment at the critical point (or blank if on a Line).

(e) Vertical Geometry Data

How each of the vertical parts is defined.

Old Report - V9

The Super Alignment report is made up of 5 parts:

(a) General Information

- The date the report was produced and the string and model name for the string.
- The type of transition curve.
- Whether the super alignment is closed or not.
- The start chainage for the string and the chainage length (2d length) of the string.

- (b) A report for the critical points, and the horizontal chainage increment of the string giving the **Point Type** at the chainage (eg Straight, Tangent-Curve, Curve, Spiral-Curve etc) **Chainage** at that point.

X, Y and Z Coordinates at that chainage

Instantaneous **Bearing** at that chainage

Instantaneous **Radius** at that chainage (or blank if on a straight)

- (c) Horizontal Vertex Data

The **Horizontal Vertex Data** section of the report gives information about each of the *horizontal vertices* of the underlying **horizontal segment geometry**.

Note: "Solving" a super alignment takes all the constraints and produces a string of vertices with segments of type Line, Arc or Transition between each pair of adjacent vertices.

So the **Horizontal Vertex Data** report gives the (x,y,z) coordinates of each of the vertices of the solved horizontal geometry with the type of segment going into the vertex (**In Seg**), and the type of segment going out of the vertex (**Out Seg**).

The **In Bearing** is the bearing at the vertex of the segment going into the vertex, and the **Out Bearing** is the bearing at the vertex of the segment going out of the vertex.

If the *In* and *Out Bearings* are the same, then the two segments are *tangential* at the vertex and there will be a **Yes** in the **Tan** column, otherwise there will be a **No** in the **Tan** column.

- (d) Horizontal Geometry Details

How each of the horizontal parts is defined.

- (e) Vertical Vertex Data

The **Vertical Vertex Data** section of the report gives information about each of the *vertical vertices* of the underlying **vertical segment geometry**.

Note: "Solving" the vertical of a super alignment takes all the constraints and produces a 2d string in the (Chainage, height) plane, of vertices with segments of type Line, Arc or Parabola between each pair of adjacent vertices.

So the **Vertical Vertex Data** report gives the (ch,z) coordinates of each of the vertices of the solved vertical geometry with the type of segment going into the vertex (**In Seg**), and the type of segment going out of the vertex (**Out Seg**).

The **In Grade** is the grade at the vertex of the segment going into the vertex, and the **Out Grade** is the grade at the vertex of the segment going out of the vertex.

If the *In* and *Out Grade* are the same, then the two segments are *tangential* at the vertex and there will be a **Yes** in the **Tan** column, otherwise there will be a **No** in the **Tan** column.

- (f) Horizontal Geometry Details

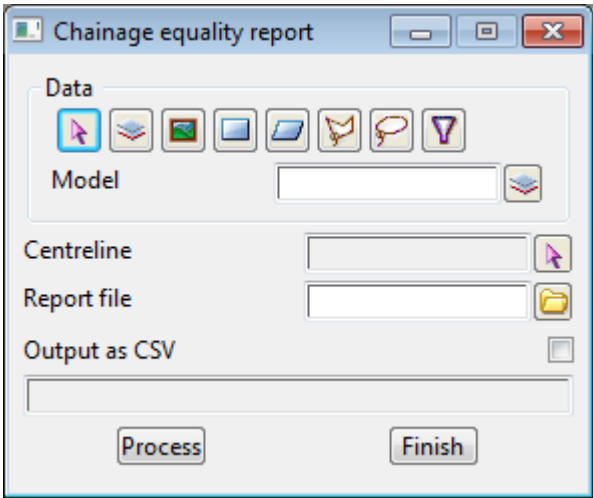

How each of the vertical parts is defined.

Chainage Equalities Report

Position of option on menu: Report =>Strings =>Chainage equalities

This option is under development.

On selecting the Chainage equalities option, the **Chainage Equality Report** panel is displayed.

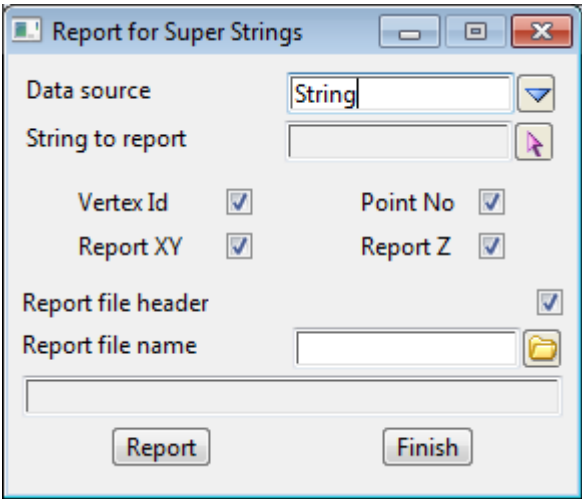

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>type of data source.</i>			
Centreline	string select		
<i>name of the super alignment to report on.</i>			
Report File	file select		
<i>name of the file to report to.</i>			
Output as CSV	tick box		
<i>if tick, write the report out as a CSV file</i>			
Report	button		
<i>run the option and create the report.</i>			

Report for Super Strings

Position of option on menu: Report =>Strings =>Super strings
This option reports on information in the super string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>		Model	
Data source <i>type of data source.</i>			
Vertex index <i>if tick, vertex indices are reported.</i>	tick box	tick	
Point id <i>if tick, point ids are reported.</i>	tick box	tick	
Report XY <i>if tick, x and y values are reported.</i>	tick box	tick	
Report Z <i>if tick, z values are reported.</i>	tick box	tick	
Report file header <i>if tick, a header including the date and model name and string names is included.</i>	input box	tick	
Report file name <i>name of the report.</i>	input box		
Report <i>Run the option.</i>	button		

More Strings Reports

There are currently no options on this menu.

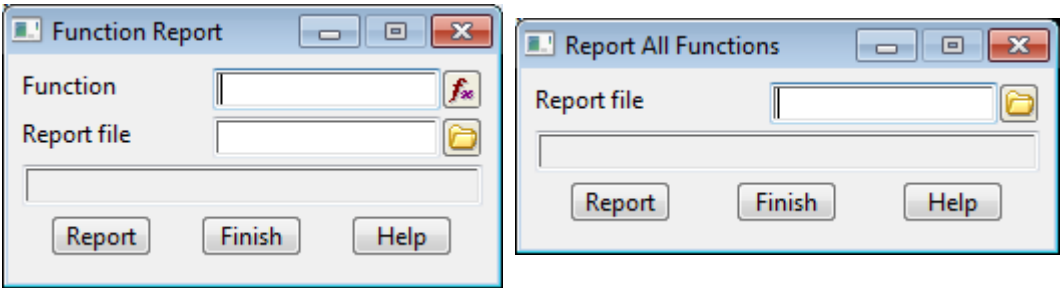

Functions

Position of menu: Report =>Functions
A report can be made on a function. The **function** walk-right menu is

Report a Function, Report all Functions

Position of option on menu: Report =>Functions =>One
Position of option on menu: Report =>Functions =>All
On selecting the **report** or **report all** option, the **function report/ report all functions** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be reported.</i>	function box		available functions
Report file <i>name of the file to write the report to.</i>	file box		*.rpt files
Report <i>after selecting this button, a report on the function/ all functions is produced.</i>	button		

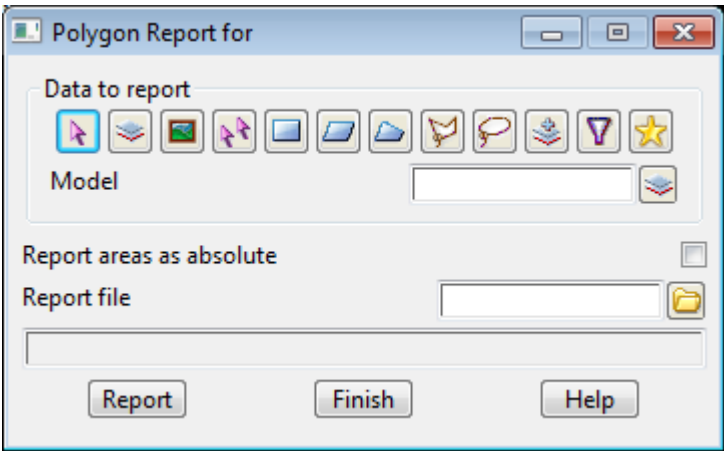

Length and Area

Position of option on menu: Report =>Length/Area

The **Length/area (Polygons)** option creates a report containing the following information for each selected string:

- s string name
- s if the string is closed or not
- s length of the string
- s area of the string (if not closed, join first and last points). A polygon area is positive if the vertices of the polygon go in a clockwise direction, or negative if the vertices go in an anti-clockwise direction.
- s centroid co-ordinates

On selecting the Length/Area option, the Polygon Report for panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>type of data source.</i>			
Report areas as absolute	tick box		
<i>A polygon area is positive if the vertices of the polygon go in a clockwise direction, or negative if the vertices go in an anti-clockwise direction.</i>			
<i>if ticked, report all areas as positive.</i>			
Report file	input		*.rpt
<i>file for the polygon reports.</i>			
Report	button		
<i>produce a polygon report for all strings selected in the Data source.</i>			

Set-Out Reports

Position of menu: Report =>Set-out

The **Set out** report options are for reporting the bearing and distance from a selected instrument station to individual points, strings, models of strings or views of strings.

In the *Setout report*, a backsight stations can be selected and the bearing of the **line** from the instrument station to the backsight station reported. Individual backsight points or strings of backsight points can be selected for reporting.

In the *Radial report*, the report can be sorted by point number, bearing or distance.

The **set outs** walk-right menu is

old set out report from V5.0

set out report for strings

set out report sorted by name, distance or bearing

For the option *Old setout report*, go to

Setout report

Radial report

[Old Setout Report](#)

[Setout Report](#)

[Radial Report](#)

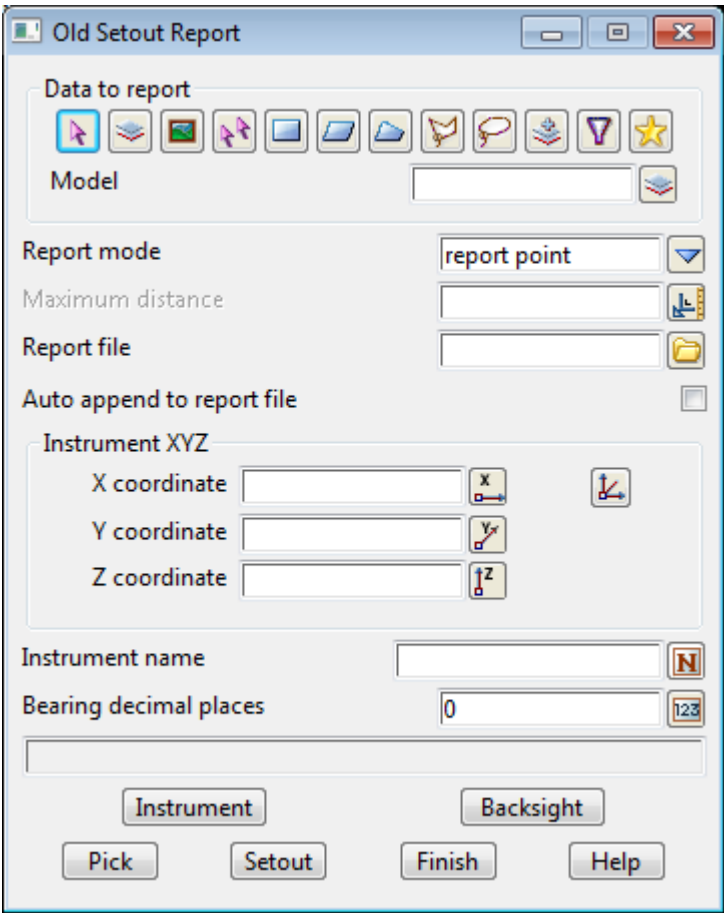

The menu options will now be discussed.

Old Setout Report

Position of option on menu: Report =>Set out =>Old setout report

The setout report from **12d Model** V5. This option has been rewritten for **12d Model** V6 and is called **Setout Report**.

On selecting the **Old setout report** option, the **Old Setout Report** panel is displayed.

The fields and buttons in this panel are used as follows

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source				
	<i>type of data source.</i>			
Report mode		input		report points, report string
	<i>if report points, report selected points. Otherwise report on all points in the selected string.</i>			
Maximum distance		input		
	<i>if non-blank, any points further that the maximum distance from the instrument station will not be reported on. If blank, all selected points will be reported on</i>			
Report file		input		
	<i>file for the backsight and setout reports</i>			

Instrument XYZ/name output

co-ordinates/name of the current instrument station

Bearing decimal places input

number of decimal places to report the bearings to

Instrument button

the required instrument station is selected and its name and position are reported in the instrument XYZ and instrument name panel fields.

Backsight button

a backsight is selected and written to the report file.

Pick button

*After pick is chosen, a set out report is written to the report file for any selected strings. If the report mode is **report point**, only the individual point is reported. If the report mode is **report string**, all the points in the string are reported.*

*The cycle is terminated by clicking RB to raise the **pick ops** menu and selecting **cancel** from it.*

Setouts button

produce a set out report for all the strings in the model/view given in the model/view field.

How to Use the Panel and Panel Messages

- (a) Enter the report file name and maximum distance.
- (b) The instrument station is chosen by activating the **station** button and selecting the required station point. It will then be reported in the file
- (c) Any backsight points to be reported can then be chosen by picking the **backsight** button and selecting the backsight point.
- (d) To report on individual strings or points, set the report mode to either point or string. The **pick** button is then activated and the individual points or strings selected. The cycle is terminated by clicking RB to raise the **pick ops** menu and selecting **cancel** from it.

To report on all the strings in a model/view, give the model/view in the model/view field, and select the **setout** button.

Note

The instrument station can be changed at any time by selecting the **station** button and picking the new station.

All backsight and set outs will then be taken from the new instrument station.

Setout Report

Position of option on menu: Report =>Set out =>Setout report

In the *Setout report*, a backsight stations can be selected and the bearing of the **line** from the instrument station to the backsight station reported. Individual backsight points or strings of back-sight points can be selected for reporting.

The instrument station can be changed at any time and new backsight and set outs reported.

The **set out** option prints the following information:

instrument station

string name, point number, x, y, z

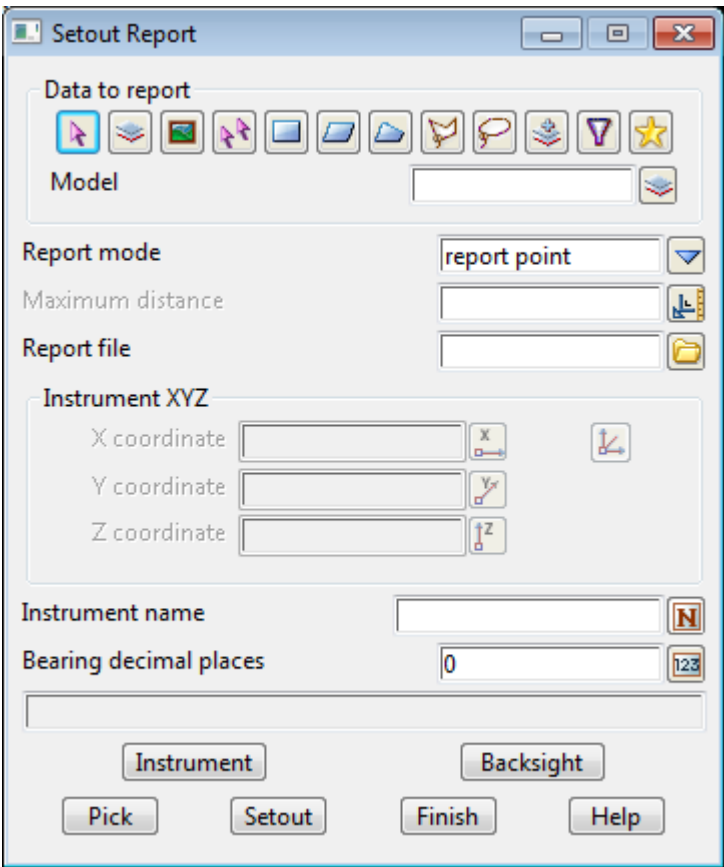

backsight point

string name, point number, x, y, z, bearing to the line joining the instrument and backsight, horizontal distance, height difference between instrument station and the backsight

point set-out point

string name, point number, x, y, z, bearing, horizontal distance, height difference between instrument station and the point

On selecting the **Setout report** option, the **Setout Report** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up

a backsight is selected and written to the report file.

Pick button

*After pick is chosen, a set out report is written to the report file for any selected strings. If the report mode is **report point**, only the individual point is reported. If the report mode is **report string**, all the points in the string are reported.*

*The cycle is terminated by clicking RB to raise the **Pick ops** menu and selecting **Cancel** from it.*

Setouts button

produce a set out report for all the strings in the model/view given in the model/view field.

How to Use the Panel and Panel Messages

- (a) Enter the report file name and maximum distance.
- (b) The instrument station is chosen by activating the **station** button and selecting the required station point. It will then be reported in the file
- (c) Any backsight points to be reported can then be chosen by picking the **backsight** button and selecting the backsight point.
- (d) To report on individual strings or points, set the report mode to either point or string. The **pick** button is then activated and the individual points or strings selected. The cycle is terminated by clicking RB to raise the **pick ops** menu and selecting **cancel** from it.

To report on all the strings in a model/view, give the model/view in the model/view field, and select the **setout** button.

Note

The instrument station can be changed at any time by selecting the **station** button and picking the new station.

All backsight and set outs will then be taken from the new instrument station.

Radial Report

Position of option on menu: Report =>Set out =>Radial report

The radial report reports the bearing and distance from the Instrument to selected vertices. the report can be sorted by point id, bearing or distance.

Selecting Radial report brings up the **Radial Report** panel.

Quantify button
produce the quantity report.

X-Fall and Offset Report

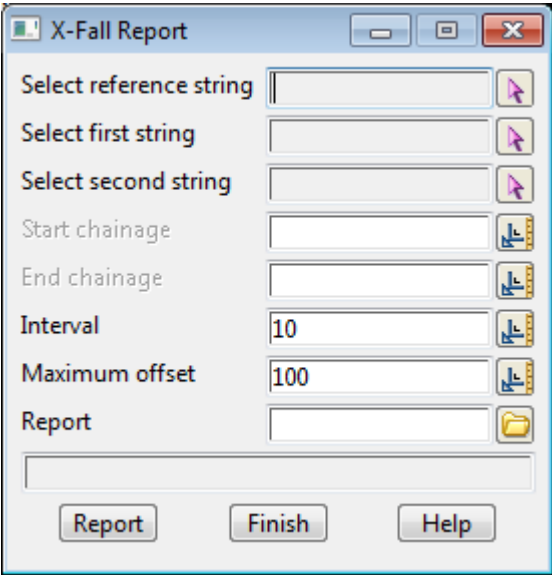

Position of option on menu: Report =>Xfall/offset

The **x-fall** report option reports on the horizontal and vertical offsets and the cross-fall between two strings.

The offsets are calculated as follows:

- (a) a reference string is selected which is used to define chainages.
- (b) lines perpendicular to the reference string are taken at regular chainages and intersected (in plan) with the first and second strings.
- (c) the horizontal and vertical offsets and the cross-fall between the two strings is calculated at the intersection points.

On selecting the **X-fall** option, the **X-Fall Report** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Start/End chainage <i>if blank, the start/end chainage of the reference string is used. if non-blank, the given chainage is used as the start/end chainage.</i>	input		
Interval <i>chainage interval to calculate values at.</i>	input	10	
Maximum offset <i>if non-blank, the maximum distance to search from the reference string to find the 1st and 2nd strings.</i>	input	100	
Report file <i>file for the x-fall report</i>	file box		*.rpt
Ref/1st/2nd <i>select the reference/first/second string.</i>	button		
Report <i>produce a offset and x-fall report between the first and second strings.</i>	button

[Check Survey Points vs Design Points \(Old\).](#)

[Compare Named Strings](#)

Check As built String vs Design String

Position of option on menu: Report => QA Reports => Check asbuilt string vs design string

This panel is used to check the horizontal and vertical differences between two strings (usually "as built" and design). A control string is selected to provide the chainage and line to cut the two strings and calculate the difference along. The control string can be one of the two strings.

The corridors are an optional setting for where multiple cuts of the as built and design strings are possible.

E.g. If string crosses over itself or turns through more than 90° a section normal to the control string could cut it more than once.

If the user sees warning messages such as "> 1 cut" then use these settings to filter out the multiple cuts.

Selecting the Check asbuilt string vs design string brings up the **Check As Built String vs Design String** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
As built string	string select		
<i>string to compare</i>			
Design string	string select		

string to compare

Control string string select

string to use to define chainage and right angles. The line at right angles cuts the “as built” and “design” strings and is used to calculate the horizontal and vertical differences.

Report horizontal difference choice box Right +ve None, Right +ve, Right -ve

if **None** Don't report horizontal distances.

if **Right +ve** Horizontal differences are reported with differences to the right reported as +ve

if **Right -ve** Horizontal differences are reported with differences to the right reported as -ve

Report vertical difference choice box Above +ve None, Above +ve, Above -ve

if **None** Don't report horizontal distances.

if **Above +ve** Vertical differences are reported with differences above reported as +ve

if **Above -ve** Vertical differences are reported with differences above reported as -ve

Report at asbuilt string's vertices tick box tick

if tick, the differences are reported at the vertices of the as built string.

Report at regular control line interval tick box tick

if tick, the differences are reported at the chainage interval given in the “Report interval” box.

Difference units choice box Millimetres (0 dp) Millimetres (0 dp)
Millimetres (1 dp)
Metres (3 dp)
Metres (4 dp)

if **Millimetres (0 dp)** In the report, differences are printed out as Millimetres with 0 decimal places

if **Millimetres (1 dp)** In the report, differences are printed out as Millimetres with 1 decimal place

if **Metres (3 dp)** In the report, differences are printed out as Metres with 3 decimal places

if **Metres (4 dp)** In the report, differences are printed out as Metres with 4 decimal places

Report interval input box 5

chainage interval of the control string to report the differences at.

Start chainage input box

start chainage of the control string to start reporting differences.

End chainage input box

end chainage of the control string to stop reporting differences.

Offset Corridor input box

If this value is set a cut offset greater than this from the design string is ignored.

Hgt diff Corridor input box

If this value is set a cut hgt difference greater than this from the design string is ignored

Report file input box

name of the report file.

Report button

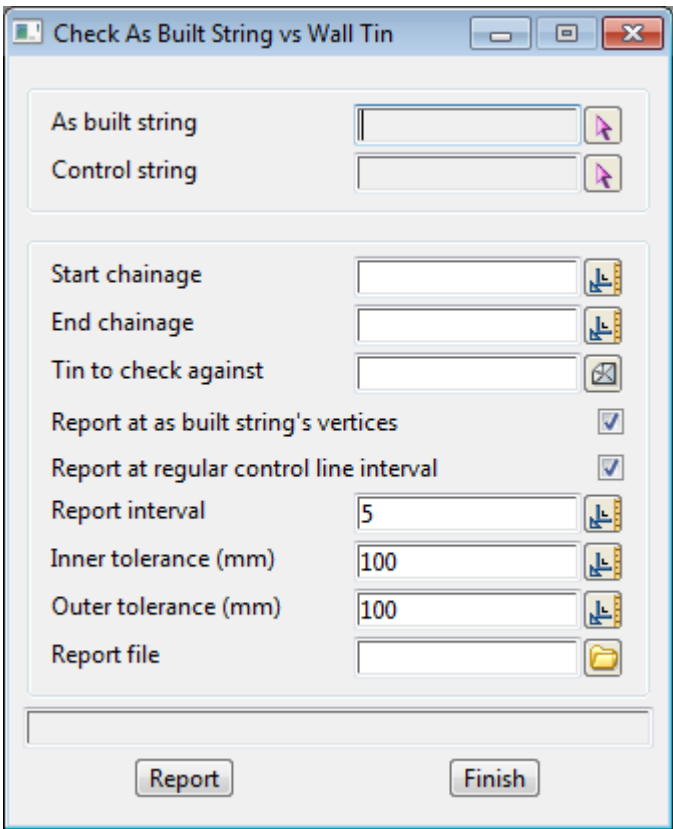

run the option.

Check Asbuilt String vs Wall Tin

Position of option on menu: Report =>QA Reports =>Check asbuilt string vs wall tin

This panel is used to check the horizontal difference between a string (usually the “as built”) and a tin (usually a wall tin). A control string is selected to provide the chainage and bearing to project a horizontal line to cut the string and the tin and calculate the horizontal difference along. The control string can be the “as built” string.

Points that are different by a given inner and outer tolerance are flagged in the report.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
As built string <i>string to compare against the wall tin.</i>	string select		
Control string <i>string to use to define chainage and right angles. The horizontal line at right angles cuts the “as built” string and “tin to check against” tin that is used to calculate the horizontal differences.</i>	string select		
Start chainage <i>start chainage of the control string to start reporting differences.</i>	input box		
End chainage <i>end chainage of the control string to stop reporting differences.</i>	input box		
Tin to check against <i>tin to compare the as built string with.</i>	input box		available tins
Report at as built string’s verticestick box <i>if tick, the differences are reported at the vertices of the as built string.</i>	tick box	tick	

Report at regular control line interval	tick box	tick
<i>if tick, the differences are reported at the chainage interval given in the “Report interval” box.</i>		
Report interval	input box	5
<i>chainage interval of the control string to report the differences at.</i>		
Inner tolerance (mm)	input box	100
<i>if the inner horizontal distance between the string and the wall is greater that this value (in units times 1000) then it is flagged in the report.</i>		
Outer tolerance (mm)	input box	100
<i>if the outer horizontal distance between the string and the wall is greater that this value (in units times 1000) then it is flagged in the report.</i>		
Report File	input box	
<i>name of the report file.</i>		
Report	button	
<i>run the option.</i>		

Check Points Above a Tin

Position of option on menu: Report => QA Reports => Check points above tin

This panel is used to check the z-value of points against the z-value of a tin at the same (x,y) locations and only report on those above the tin. To check points above and below a tin, go to the next section [Check Points vs Tin](#).

A z-tolerance above the tin is given and all points above the tin and outside the tolerance are especially flagged in the report.

Optionally the report can also include the chainage and offset of the points from a selected alignment string.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Model of shots	<i>model of points to check the z-value against the tin.</i>	model box		
Tin to check against	<i>tin to check the z-values against</i>	tin box		
Above tolerance (mm)	<i>if the z-value of the point is above the tin and the difference of the z-value of the point and the tin (times 1000), is greater than this amount then it is flagged in the report.</i>	input box	175	
Report file	<i>name of the report file.</i>	file box		
Report ch/off to centre line	<i>if tick, the chainage and offset of the points from the selected alignment string are included in the report.</i>	checkbox		
Select align	<i>select the alignment string to calculate offset and chainage from.</i>	string select		
Report		button		
Finish		button		

run the option.

Check Points vs Tin

Position of option on menu: Report => QA Reports => Check points vs tin

For Check points above tin, go to [Check Points Above a Tin](#).

This panel is used to check the z-value of points against the z-value of a tin at the same (x,y) locations, or if a **Layer depth** is given, the z-values of points are checked against the tin *minus* the layer depth.

Separate z-tolerances are supplied for **above** and **below** the tin and points outside either tolerance are especially flagged in the report.

Optionally the report can also include the chainage and offset of the points from a selected alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of shots	model box		
<i>model of points to check the z-value against the tin.</i>			
Tin to check against	tin box		
<i>tin to check the z-values against</i>			
Above tolerance (mm)	input box	175	
<i>if the z-value of the point is above the tin and the difference of the z-value of the point and the tin (times 1000), is greater than this amount then it is flagged in the report.</i>			
Below tolerance (mm)	input box	175	
<i>if the z-value of the point is below the tin and the absolute value of the difference of the z-value of the point and the tin (times 1000), is greater than this amount then it is flagged in the report.</i>			
Layer depth	input box	0	
<i>this value is subtracted form the z-value of the tin before the comparison is made with the z-value of the point.</i>			
Report file	file box		
<i>name of the report file.</i>			

Report ch/off to centre line tick box

if tick, the chainage and offset of the points from the selected alignment string are included in the report.

Select align string select

select the alignment string to calculate offset and chainage from.

Report

run the option.

Check Survey Points vs Design Points (Old)

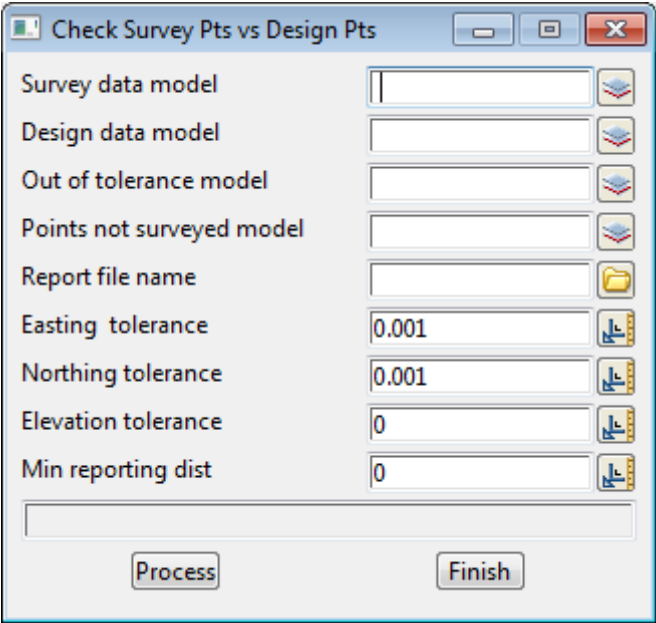

Position of option on menu: Report =>QA Reports =>Check survey points vs design points (old)

This option is used to check surveyed points against the design points.

Separate tolerances are given for Eastings (x), Northings (y) and Elevations (z).

Any design points that have not been surveyed are noted and copies of points out of tolerance and/or points not surveyed can be automatically made.

NOTE - if a **radial** search distance is required in (x,y), go to the next section [Check Survey Points vs Design Points \(3\)](#).

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Survey data model <i>model of points to be compared against the design points.</i>	model box		available models
Design data model <i>points to be compared against.</i>	model box		available models
Out of tolerance model <i>copies of any points out of tolerance are added to this model.</i>	model box		available models
Points not surveyed model <i>copies of any points from the design model that have not been surveyed.</i>	input box		
Report file name <i>name of the report.5</i>	input box		
Easting tolerance <i>tolerance in the x direction.</i>	input box	0.001	
Northing tolerance <i>tolerance in the y-direction.</i>	input box	0.001	
Elevation tolerance <i>tolerance in the z-direction.</i>	input box	0	

Min reporting dist	input box	0
Process <i>run the option.</i>	button	

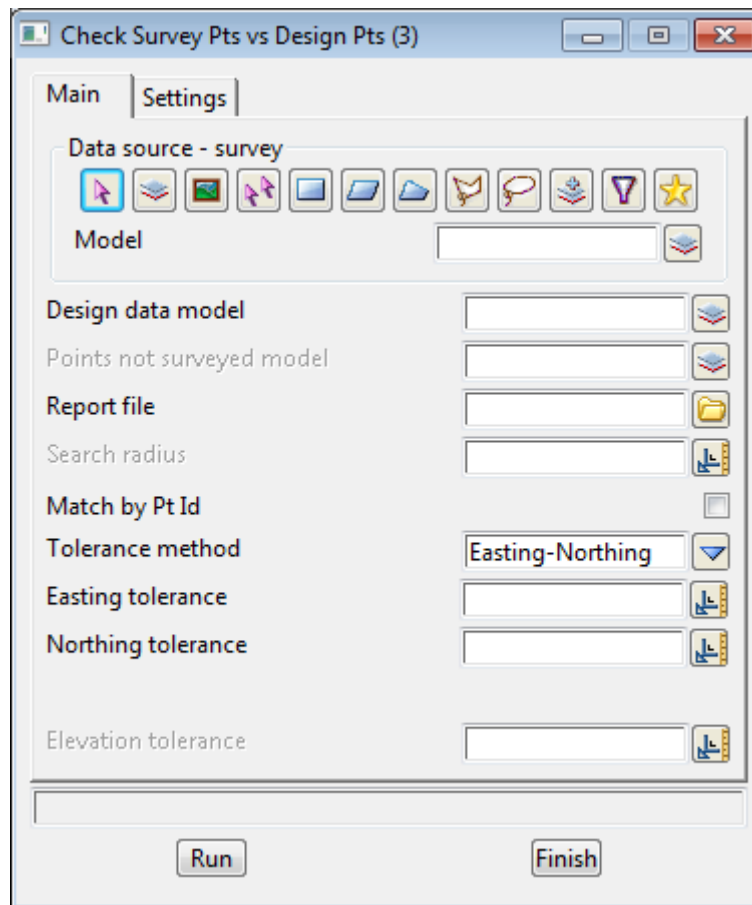

Check Survey Points vs Design Points (3)

Position of option on menu: Report => QA Reports => Check survey points vs design points

This option is used to check surveyed points against the design points.

The (x,y) search distance can be either one radial distance, a separate x and y distance or separate chainage and offset distances.

Any design points that have not been surveyed are noted and can be optionally copied to a model.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Report design coords

if ticked design coordinates will be written to the report file

Report as CSV?

*If **Report as CSV?** is ticked then the column width settings are ignored and the report written as a comma delimited 'CSV' file suitable for exports to spreadsheets and others.*

*If **Report as CSV?** is not ticked then the reported is formatted with the column width figures in mind.*

Run

button

run the option.

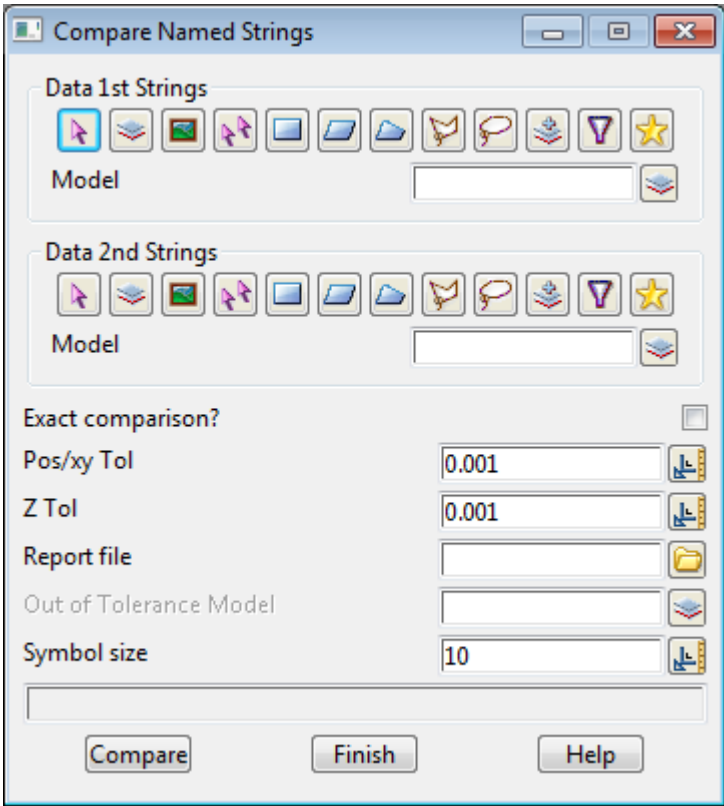

Compare Named Strings

Position of option on menu: Report =>QA Reports =>Compare named strings

The **compare named strings** panel is a utility to check for changes in a string and highlights these changes. It would typically be used when a revised design is released to highlight where the actual changes are.

Strings are matched by name, there must only be one string of the same name in each of the data sources.

Selecting **Compare named strings** brings up the **Compare Named Strings** panel.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data 1st Strings

the data source for the 1st set of strings.
for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data 2nd Strings

the data source for the set of strings to compare to the 1st set of strings.
for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Exact comparison?	tick box
--------------------------	----------

if ticked the strings are compared vertex by vertex
if unticked the points in the 2nd string are dropped to the first string and the comparison is done by offset and height difference.

Pos/xy Tol	measure box
-------------------	-------------

The distance between vertices or the difference in offset before the point is considered different.

Z Tol	measure box
--------------	-------------

The height difference between the strings before the point is considered different.

Report file file box

The file to which the results of the comparison are written, contains the strings compared, the number of name matches if not matched or unique and the details of differing points.

Out of Tolerance Model model box

Any points outside the nominated tolerances can be written to this model.

Symbol size input

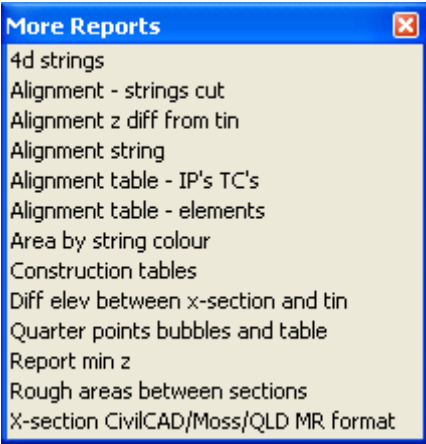

*Points in the **out of tolerance model** have a diamond of this real world size drawn around them to highlight the points.*

Compare button

Compares the two data sources

More Reports

Position of menu: Report =>More
More miscellaneous reports.

Report for 4d Strings

Position of option on menu: Report =>More =>Report for 4d strings

This panel is used to create a report for 4d strings where the x y and z values are printed out for each point plus either the 4d text for the point or the name of the string (repeated for each point).

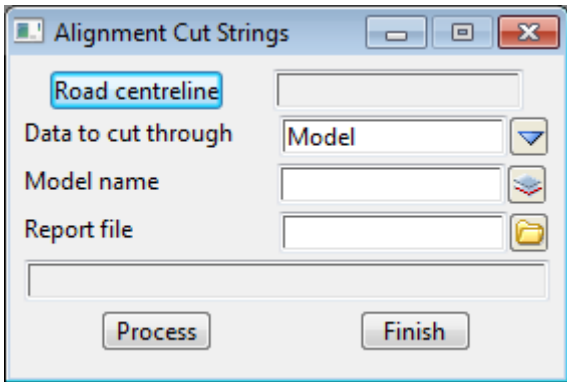

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>data source type.</i>	choice box	model	string, model, view
Model/View/String <i>Data source to do report of 4d strings on.</i>	data source		
Report as text <i>if 4d text, the 4d text for the point is written out after the x, y and z values. If string name, the string name is written out after the x, y and z values.</i>	file	4d text	string name 4d text
No decimal places <i>number of decimal places to use in the x, y and z values.</i>	input	3	
Report file <i>name of the report file.</i>	file		
Process <i>run the option.</i>	button		

Alignment - Strings Cut

Position of option on menu: Report =>More =>Alignment - strings cut

This option is used to create a report of the position and angle that strings make where they cut a selected alignment string.

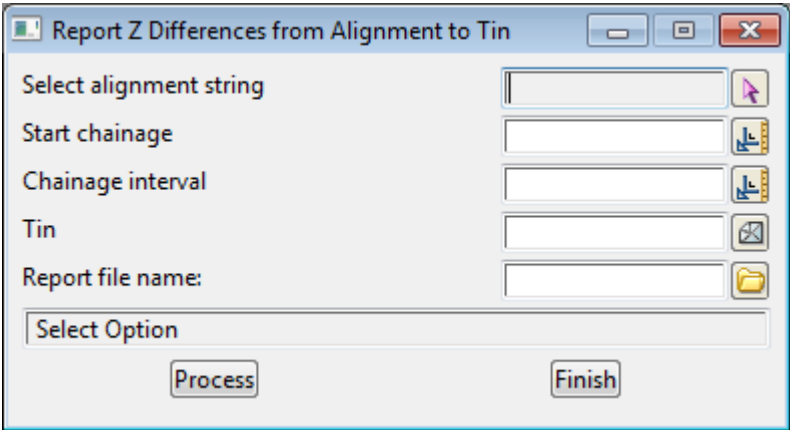

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Road centreline <i>select the alignment string to report the cuts for.</i>	string select		Pop-Up
Data source <i>source of the data</i>	choice box	Model	String/Model/View
Data <i>method a specifying data</i>			
Report file <i>name of the report file.</i>	input box		*.rpt files
Process <i>run the option.</i>	button		

Report Z Differences from Alignment to Tin

Position of option on menu: Report =>More =>Report z differences from alignment to tin

This panel is used to create a report of the difference in z-values between an alignment string and a tin. The differences are reported at a given chainage interval along the alignment string.

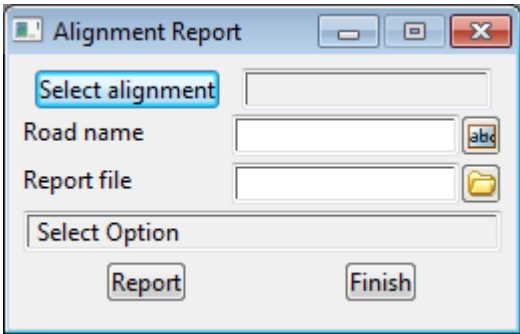

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select alignment string <i>select the alignment string to report z-differences for.</i>	string select		
Chainage interval <i>interval to report on.</i>	input box		
Tin <i>tin to get z-values from.</i>	input box		available tins
Report file name <i>name of the report file.</i>	input box		*.rpt files
Process <i>run the option.</i>	button		

Alignment Report

Position of option on menu: Report =>More =>Alignment string

This panel is used to report the tangent points and centres of arcs for an alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select alignment string <i>select the alignment string to report on.</i>	string select		
Report file name <i>name of the report file.</i>	input box		
Report <i>run the option.</i>	button		

Alignment Table - IP's, TC's

Position of option on menu: Report =>More =>Alignment table - IP's and TC's

Create table of IP and CT points for an alignment string.

This panel has already been documented.

See [Tabulate Alignment - IP's and CT's](#) in chapter [Drafting](#)

Alignment Table - Elements

Position of option on menu: Report =>More =>Alignment table - elements

Create table of horizontal elements for an alignment string.

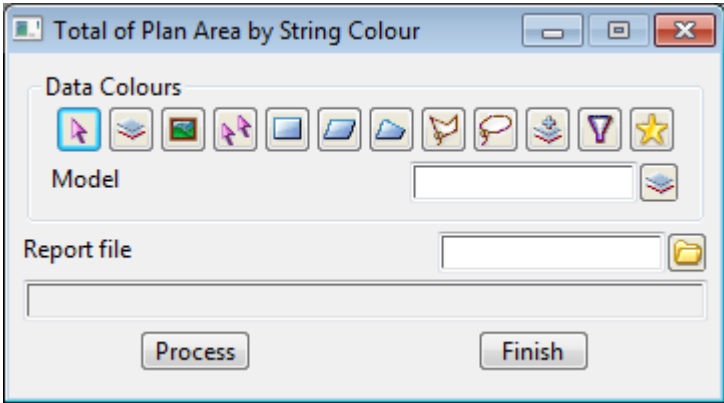

This panel has already been documented.

See [Tabulate Alignment - Elements](#) in chapter [Drafting](#)

Total of Plan Area by String Colour

Position of option on menu: Report =>More =>Area by string colour

This panel is used to calculate the sum of the plan area of all strings of the same colour. This is especially useful for calculating the plan areas of faces produced for slope areas, volumes etc.
A report giving the total plan area for each different colour is produced.

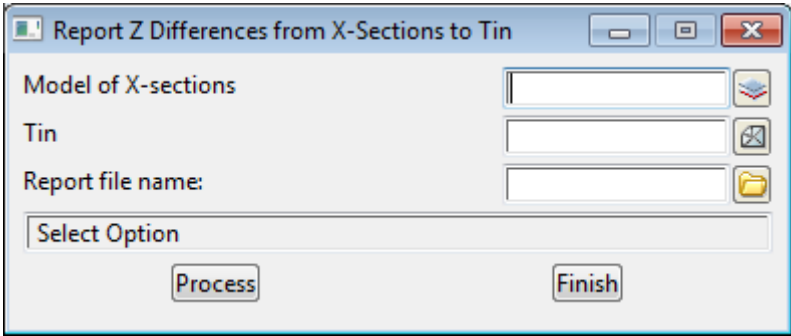

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to calculate areas for.</i>	data source	model	model, view
Model/View <i>Data source to calculate the areas and sum by colour.</i>	data source		
Report file <i>Report giving the total plan areas of the strings for each colour.</i>	input box		
Process <i>Run the option</i>	button		

Report Z Differences From X-Sections to a Tin

Position of option on menu: Report =>More =>Diff elev between x-section and tin

This panel is used to report the z differences between the points on cross sections and the corresponding z-values from a tin.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of X-Sections <i>model of cross sections to report on.</i>	model box		available models
Tin <i>tin to get z-values from.</i>	tin box		
Report file name <i>name of the report file.</i>	file box		
Process <i>run the option.</i>	button		

Quarter Points Report

Position of option on menu: Report =>More =>Quarter points bubbles and table

This option is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

This option has already been documented as

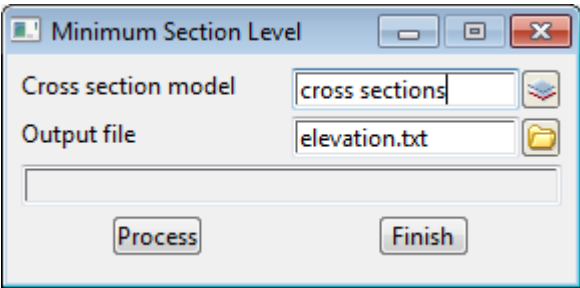

Survey =>Setout =>Setout lip line

in the section [Setout Lip Line](#) in the chapter [Survey](#).

Report Minimums Z-Value on a Cross Section

Position of option on menu: Report =>More =>Report min z

This panel creates a report giving the minimum z-value on a cross section.

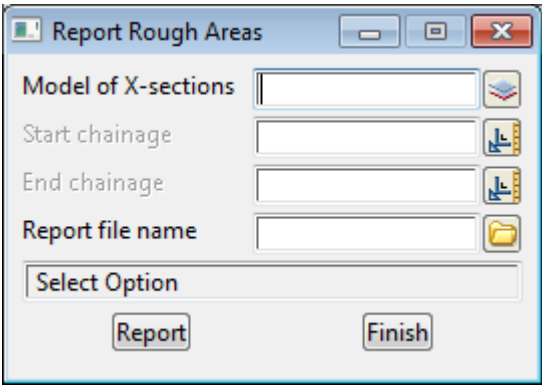

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Cross section model <i>model of cross sections to report on.</i>	model box		
Output file <i>file to write section names and minimum z-values to.</i>	file box		*.txt files
Process <i>run the option.</i>	button		

Report Rough Areas

Position of option on menu: Report =>More =>Rough areas between sections
This panel is used to

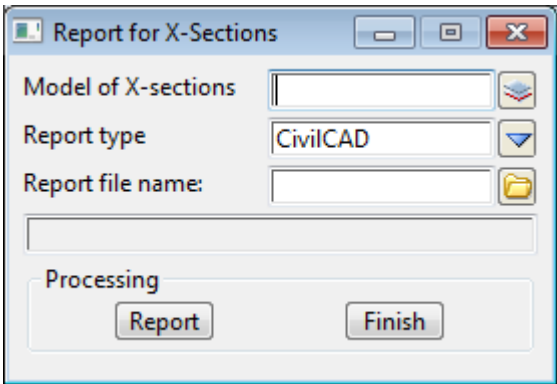

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of x-sections xxxxxx	input box		
Start chainage xxxxxx	input box		
End chainage xxxxxx	input box		
Report file name name of the report file.	input box		
Report run the option.	button		

X-Sections Report

Position of option on menu: Report =>More =>X-section CivilCAD/Moss/QLD MR format

This panel is used to write out cross sections in a variety of formats.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of x-sections <i>model of cross sections to write out.</i>	input box		available models
Report type <i>format of the report.</i>	file box	CivilCAD	CivilCAD, Moss MainRoad Qld, Brief
Report file name <i>name of the report file.</i>	input box		
Report <i>run the option.</i>	button		

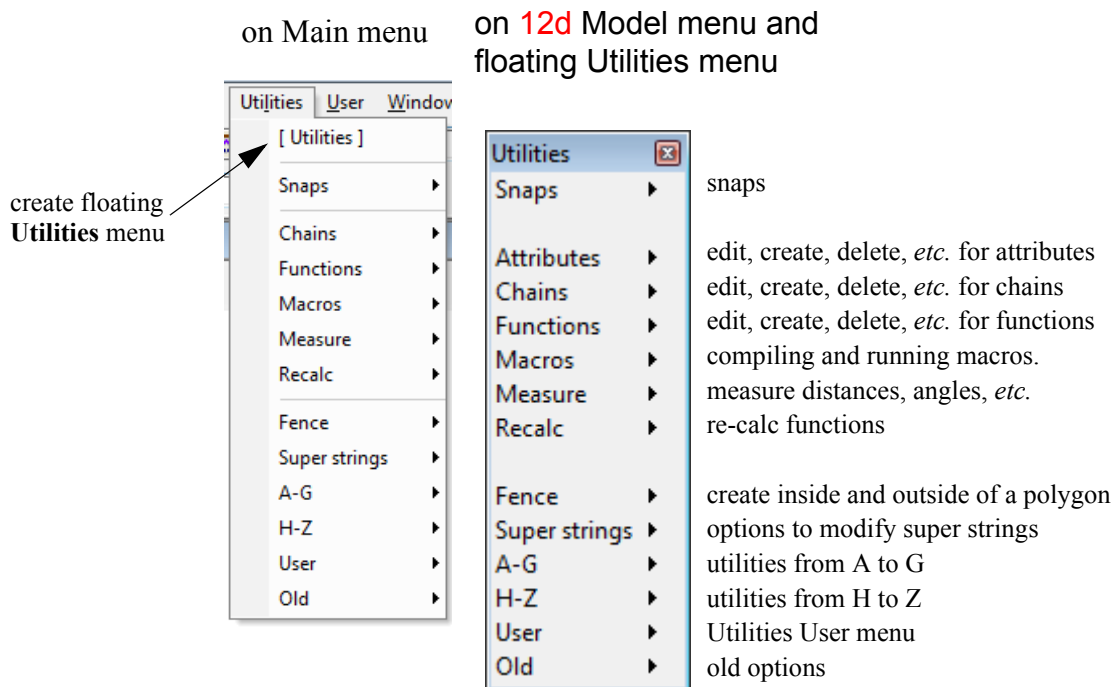

27 Utilities

Position of menu: It is on the main menu as Utilities

The Utilities menus contains a collection of useful operations that don't easily fit under any of the other menus.

For ease of selection, the frequently used utilities are placed on the first level of the menu. All the other utilities are split alphabetically between two walk-right menus - the utilities walk-right menus for A-G and H-Z.

For the option/menu *Snaps*, go to

Utilities A-G	
Add VIP to SA from file	add a vertical intersection point to a super alignment from a file
Affine 2D	perform 2D affine transformation
Affine 2D Orthogonal	perform 2D affine transformation with no skewing of axes
Archive models	save all models matching a specified model mask as 12d-ascii
Cartographic	perform cartographic projections
Change	change string colour
Change string chainage	set the start chainage of selected strings
Check / clash	check breaklines, strings, 3d clashes, polygons
Classify conduits	set attributes on conduit strings
Clear string names	remove string names
Colour sections by xfall range	colour sections using a x-fall colour file
Convert	convert 2d to 3d, 3d to 4d etc
Create centres of string curves	create centres of curves
Create Grid	create a world grid
Cuts	calculate sections by cuts through strings
Delete	delete strings
Draw perpendicular cl to points	draw perpendicular from selected points to centreline
Duplicate	duplicate strings
Explode	explode strings into lines and arcs
Explode (text)	explode text into lines and arcs
Factor	multiply the x,y,z values by factors
Filter	data filters
Grid setout	create vertices from intersection of strings and/or arcs

Snaps

Position of menu: Utilities =>Snaps

The **snaps** option allows the user to set snapping modes for use during pick operations. The snapping modes have been discussed in detail in the [Snaps](#) section in the chapter [Tools and Concepts](#).

The **Snaps** walk-right menu provides a full snap menu, abbreviated snap menus laid out either horizontally or vertically, and a snaps cogo menu for creating special point positions using co-ordinate geometry commands.

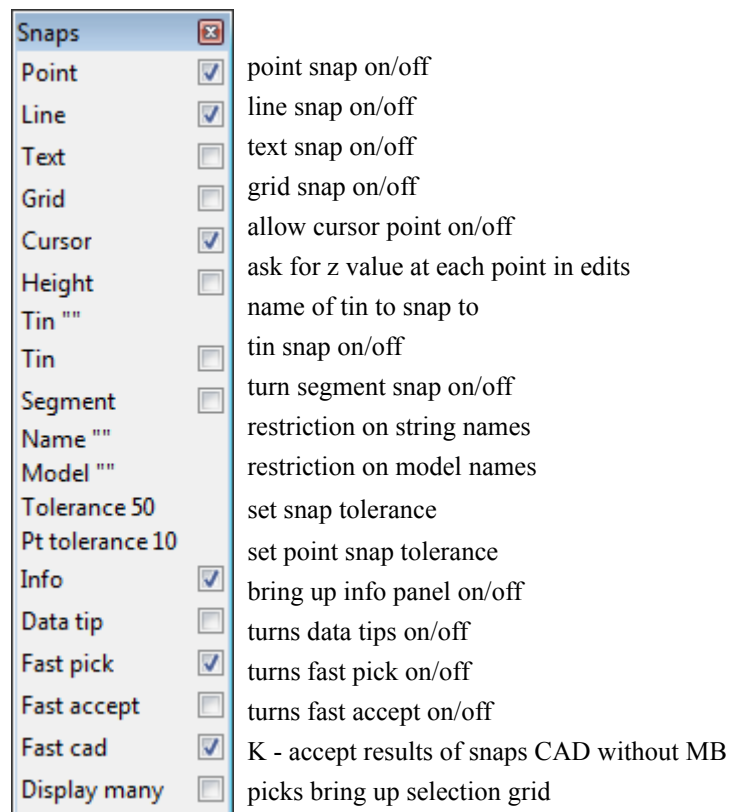

- full snaps menu
- brief snaps laid out vertically
- under development
- equivalent to middle mouse button (accept)

For the option <i>Snaps</i> , go to	Snaps
<i>Snaps (Vert)</i>	Snaps (Vert)
<i>Cogo</i>	Snaps Cogo
<i>New</i>	Snaps New
<i>Select accept button</i>	Select accept button

Snaps

Position of option on menu: Utilities =>Snaps =>Snaps

The **Snaps** menu provides tick boxes to turn the various snap modes on or off and options to set tin, string and model names. Any combination of snap modes and names can be set.

The snaps point, line, grid, cursor, tin and info are all set on or off using the tick boxes.

The *snap tolerance* is displayed on the **Tolerance** line on the menu.

The *point snap tolerance* is displayed on the **Pt tolerance** line on the menu.

For more information on snaps, go to the [Snaps](#) section in the chapter [Tools and Concepts](#).

Tin Snap

Tin snap means that when an (x,y) point is selected, the z-value for the point is taken to be the z-value on the tin at the same (x,y) position.

To use tin snap, the name of the tin to snap to must first be set. Then, snapping to that tin is controlled by the state of the tin snap tick box.

If the tick box is **on** (a tick), snapping to the tin is used. If the tick box is **off** (a cross or nothing), no tin snaps are used.

The name of the tin to snap to is set by selecting the tin option and entering the tin name in the **Snap Tin** panel and selecting the **set** button.

When a name is set, the tin tick box is automatically set to on.

For more information on snaps, go to the [Snaps](#) section in the chapter [Tools and Concepts](#).

Name and Model Snap

The user can restrict the snap to specific strings and/or models by selecting the name or model option. This brings up the **snap name** or **Snap Model** panel. The string name (model name) used to restrict the snap is entered into the name (model) field. The values are then set by selecting the **set** button.

When **12d Model** creates a new project, **line** and **point** snap are set to **on** and all other snaps set off.

For more information on snaps, go to the [Snaps](#) section in the chapter [Tools and Concepts](#).

Point Snap Tolerance

Point snap tolerance is not a tick box but a menu item. The point snap tolerance value is the distance to be used for considering vertices over anything else when point snap is on.

The point snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a point snap tolerance of say 10 means that the point snap distance about a vertex is one hundredth of the screen width.

The *point snap tolerance* is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current point snap tolerance value is displayed as **Pt tolerance** on the *Snap* menu.

The *Point snap tolerance* is modified by selecting the **Pt tolerance** item on the *Snaps* menu to bring up the **Point Snap Tolerance** panel.

The **point snap tolerance** to be used to restrict the point snap is entered into the panel and then the **Set** button selected. The default tolerance is 10.

For more information on snaps, go to the [Snaps](#) section in the chapter [Tools and Concepts](#).

Snap Tolerance

Snap tolerance is not a tick box but a menu item. The snap tolerance value is the distance to be used for considering data when snaps are on.

The snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a snap tolerance of say 50 means that the snap distance about a point, line etc. is one twentieth of the screen width.

Snap tolerance is given in terms of screen units rather than world units because it is a distance

on the screen, independent of any co-ordinate system being used in a view.

The current snap tolerance value is displayed as **Tolerance** on the *Snap* menu.

The *Snap tolerance* is modified by selecting the **Tolerance** item on the **Snap** menu to bring up the **Snap Tolerance** panel.

To change the snap tolerance, type a new value into the **Tolerance** panel field and then click LB on the **Set** button.

For more information on snaps, go to the [Snaps](#) section in the chapter [Tools and Concepts](#).

Info Snap

If info snap is set, then the information panel comes up whenever a string is picked.

Summarising, the available snap modes are

- s point - diamond cursor
- s line - square
- s grid - circle
- s cursor - circle
- s tin - squiggles under a line
- s name
- s model
- s info

On starting up a new project, point and line snap are on, all others off and tolerance is set to 50.

When an existing project is saved, the snap settings, snap tolerance and positions of any **snaps** menus on the screen, are also saved.

For more information on snaps, go to the [Snaps](#) section in the chapter [Tools and Concepts](#).

Snaps (Vert)

Position of option on menu: Utilities =>Snaps =>Snaps (Vert)

The Snaps (vert) menu provides the same tick boxes as the Snaps menu to turn the various snap modes on or off, however the snap descriptions are abbreviated to one character to reduce the menu size.

The Snaps and Snaps (vert) menu are

Snaps Cogo

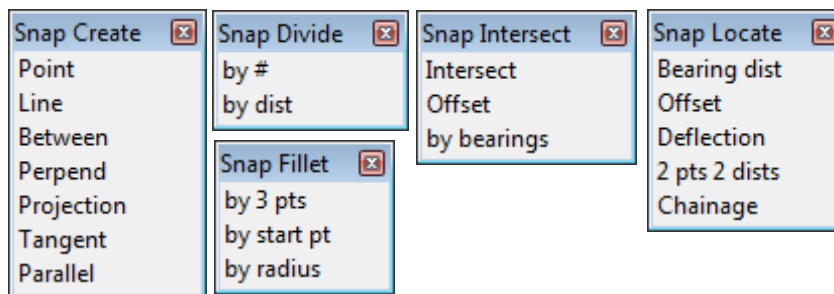

Position of menu: Utilities =>Snaps =>Cogo

The **Snaps cogo** options are used to create the point required for any **12d** Model select operation. For example, selecting the next point in **append** in an editor. The result of the **Snaps cogo** is returned to the **select operation** as the selected point.

Walking right on the **cogo** option brings up the **Snaps cogo** menu

and the walk-right menus for each of the **Snaps cogo** menu items are

Note on Combining Snaps Cogos

When using a snaps cogo option, another select is often required and it is permissible to use other snaps cogo option to create the point for that select.

For example, the required point is the point halfway between two other points **dropped perpendicularly** onto an arc.

Such a combined result can be achieved using **Snaps cogo** however the order of selecting the **snaps cogo** options may at first seem to be the reverse of what is required.

For the above example, the snaps cogo **perpen** must be selected before the **between** option.

This is because when the **perpen** snap cogo option is selected, it asks the user to **select** the point to drop and it is then that the snaps cogo **between** option is used to find the midpoint of two selected point. The result of the **between** then becomes the point to drop for the **perpen**.

If the **between** option had been selected first, the resultant midpoint would have been returned as the selected point and that select completed.

Select accept button

Position of menu: Utilities =>Snaps =>Select accept button

Instead of selecting (MB) to accept a string selection, you can click (LB) on the **Accept** button.

This option is usually used for tablet computers without a middle mouse button.

LB = the left mouse button

MB = the middle mouse button

Snaps New

Position of menu: Utilities => Snaps => New

The XTRA Snaps menu is currently under development.

Attributes

Position of menu: Utilities =>Attributes

This section of documentation is a work in progress and will be updated in subsequent releases.

The **Attributes** walk-right menu is:

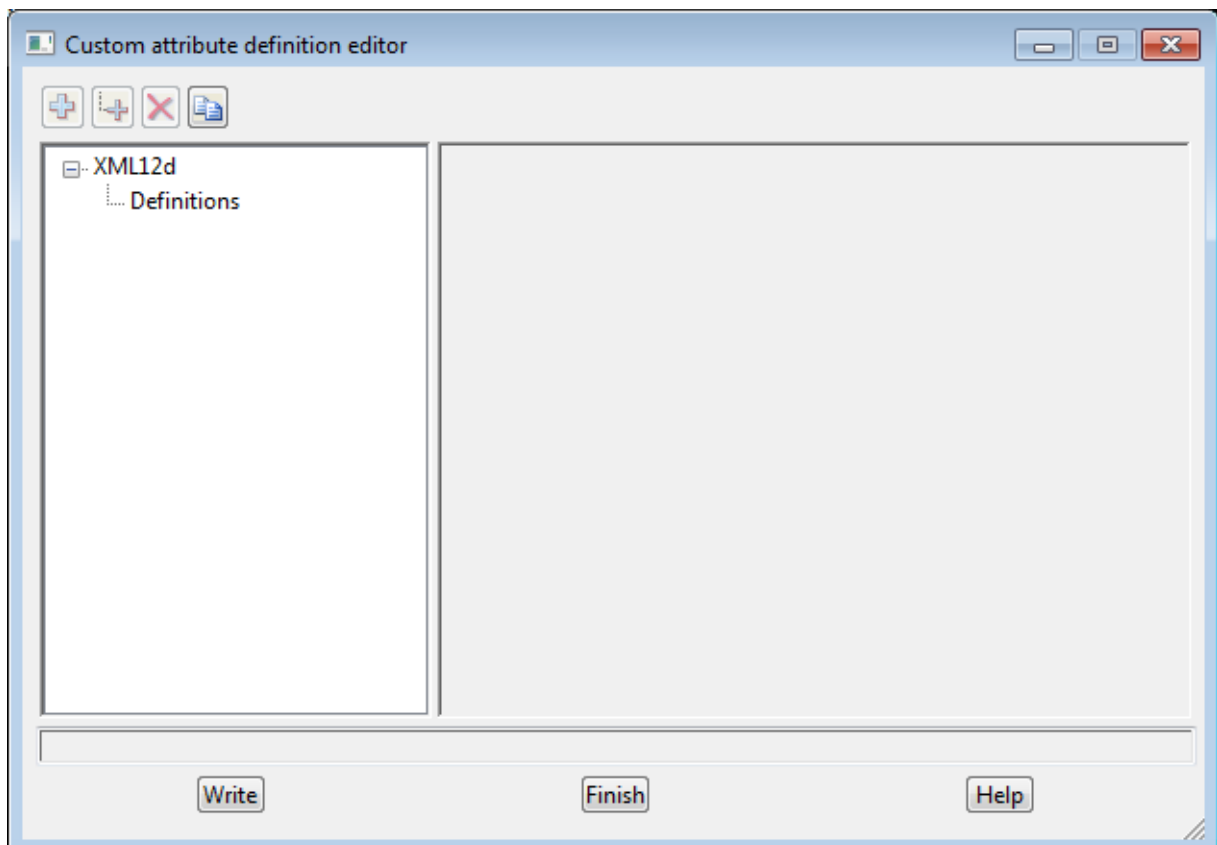

For the option *Attribute definitions editor*, go to [Attribute Definitions Editor](#)
Custom attribute editor [Custom Attribute Editor](#)

Attribute Definitions Editor

Position of option on menu: Utilities =>Attributes =>Attributes Edits =>Attribute definitions editor

This section of documentation is a work in progress and will be updated in subsequent releases.

Custom Attribute Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

Chains

Position of menu: Utilities => Chains

12d Model has many different built in objects, from simple strings, through to complex super alignments with computators, drainage networks, super tins and apply many functions.

However as complex as these objects are, no software can foresee every situation met in surveying and civil design, both now and into the future.

12d Model provides two tools to help users extend the supplied **12d Model** functionality and automate simple and complex tasks within a company. They are the

- (a) the **12d Model Macro Language** - a full programming language so users can write complex tailored options and functions

and

- (b) **chains**.

Chains are a relative simple method for users to be able to combine and run existing **12d Model** functions and options

In its simplest form, a **Chain** is a list of items that are run in the order that they appear in the list. Things that can be run in a **Chain** include:

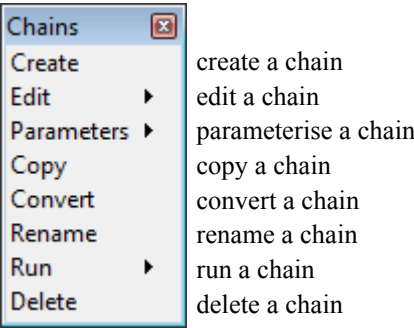

- (a) **12d Model** functions
- (b) other chains
- (c) super alignment resolves
- (d) plot parameter files
- (e) most **12d Model** options
- (f) most screen layout files
- (g) macro that don't have a panel
- (h) an external command line
- (i) some special hardwired chain commands such as delete a tin, delete all tins, delete a model, delete all models, clean a model, delete a file, compare files, redraw all views, comments

For more sophisticated applications, chains can also

- (a) create **12d Model** views and add and remove models from the views
- (b) include flow control using tests, labels and go to's
- (c) be parametrised and run with user supplied parameter values

So a **chain** can be as simple as running a list of functions. or as complex and making decisions inside the chain, thus creating user defined **Super Objects**.

The Chains walk-right menu is

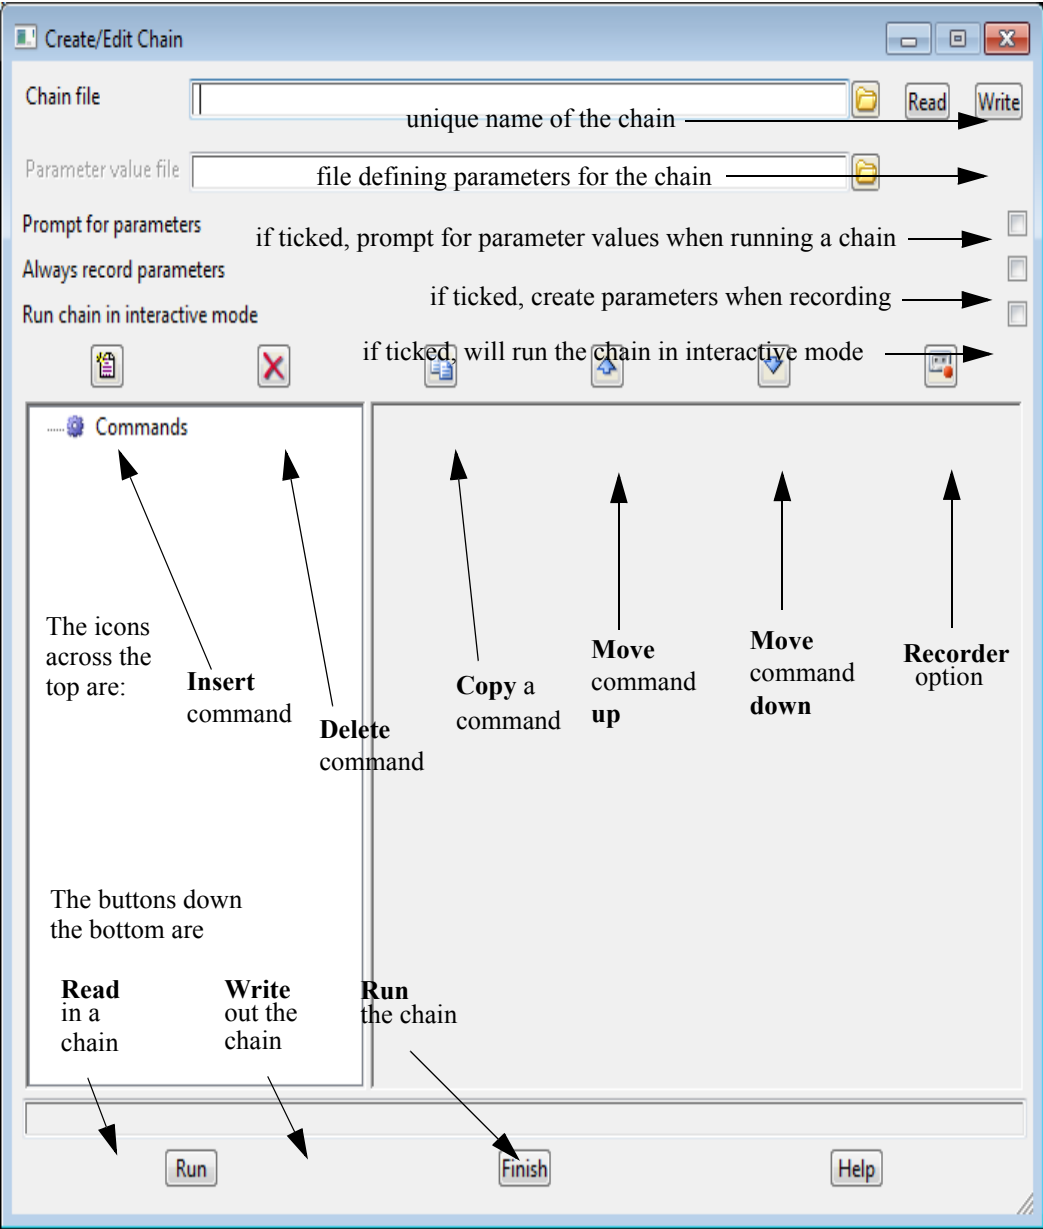

For the option <i>Create</i> , go to	Create/Edit a Chain
<i>Edit</i>	Edit a Chain
<i>Parameters</i>	Parameters
<i>Copy</i>	Copy a Chain
<i>Convert</i>	Chain Conversion
<i>Rename</i>	Rename a Chain
<i>Run</i>	Run a Chain
<i>Delete</i>	Delete a Chain

Create/Edit a Chain

Position of option on menu: Utilities =>Chains =>Create

Selecting **Create** brings up the **Create/Edit Chain** panel which is used to create, edit and run chains.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain file <i>name of the file for the chain.</i> <i>To create a new chain, a unique name is typed into the Chain file box and the Write button clicked.</i> <i>To edit an existing chain, enter the name of the existing chain into the Chain file box and then click on the Read button.</i> <i>The chain is then built up by inserting commands using the Insert icon.</i>	file box	blank	existing chains
Parameter value file <i>if non blank, the file to use for mapping parameters and values.</i> <i>If blank, no parameter file is used</i> <i>For more information, go to the section Parameters.</i>	file box	blank	existing parameter files

Prompt for parameters tick box
if ticked, when a chain is run and it has parameters, the table of parameters is displayed on the screen

before running the chain so that any required modifications can be made before the chain is run. If not ticked, any values for parameters are taken from the parameter value file.

Always record parameters tick box

When ticked on, if the user records a panel / option, the recorder will attempt to record parameters.

Run chain in interactive mode tick box

*if ticked, will run the chain in interactive mode (see [Interactive Mode](#))
if not ticked, the chain will run normally*

Insert icon

inserts commands into the chain. For more information on the commands, go to [Inserting a Command](#)

Delete icon

deletes the highlighted command in the chain

Copy icon

copies the highlighted command in the chain to the bottom of the chain

Move up icon

move the highlighted command up one position in the chain

Move down icon

move the highlighted command down one position in the chain

Record icon

record one or more options. For more information on Record, go to [Record Icon](#)

Read button

read in the given chain file

Write button

write out the information to the given chain file

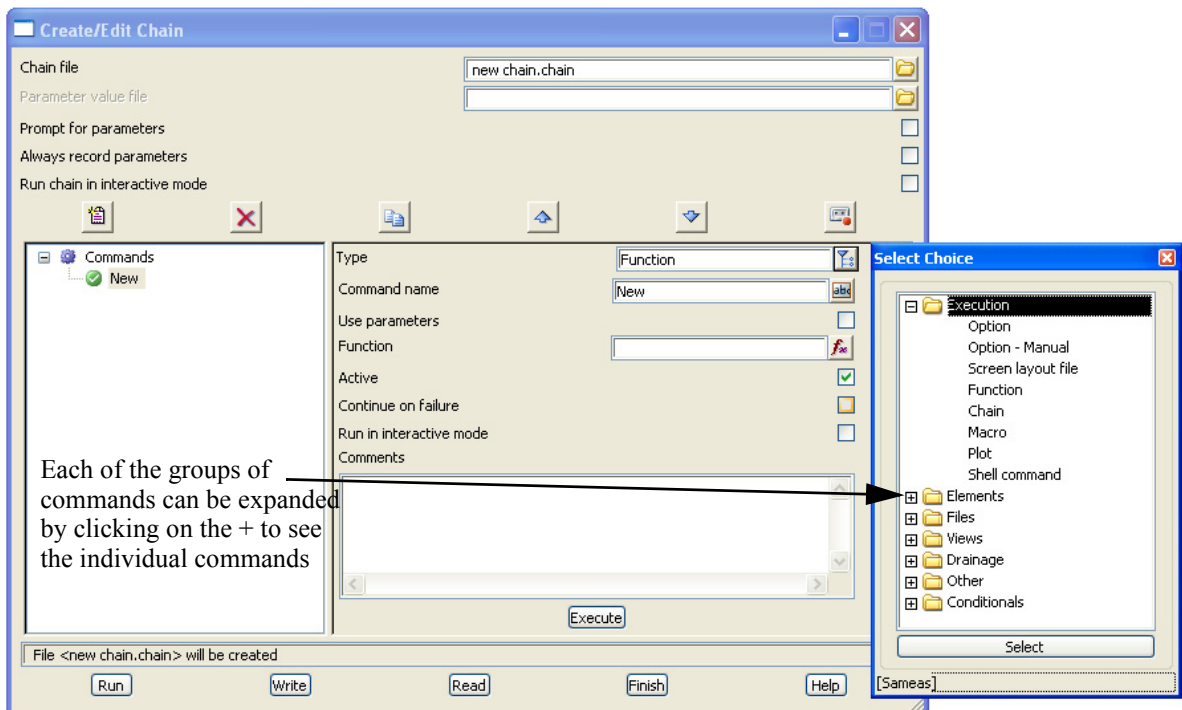

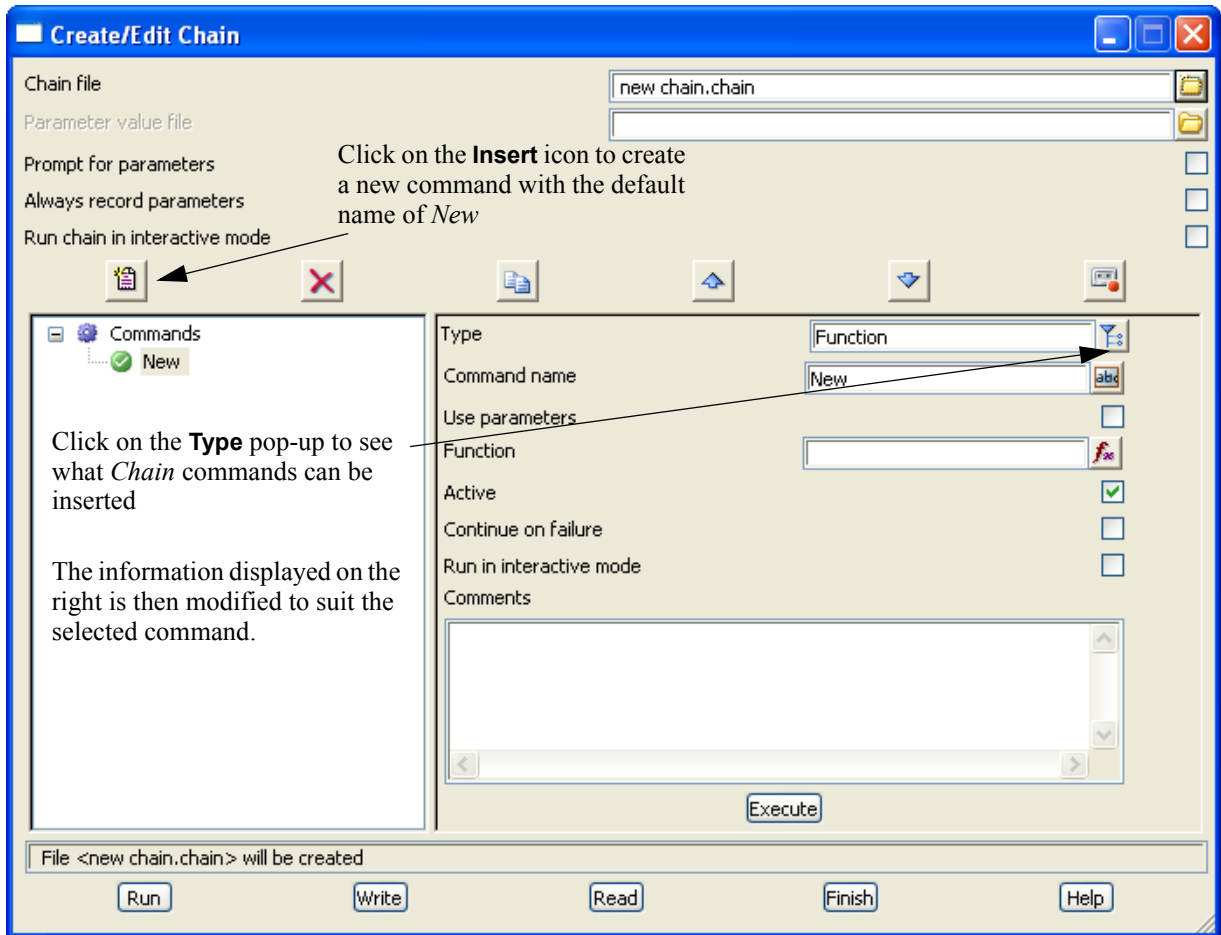

Run button

run the chain

Inserting a Command

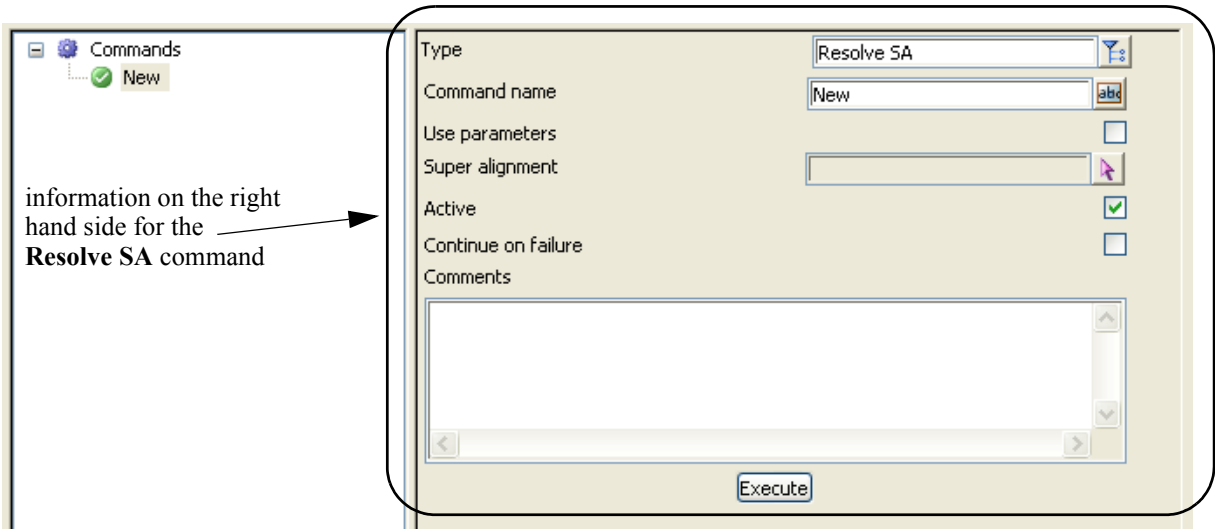

The chain is built up by *inserting commands* using the **Insert** icon.

Clicking on the **Insert** icon inserts a new command with the default name of **New** into the chain. The **Type** of the command is then selected on the right hand side of the panel. The specific information needed for defining that type of new command is then displayed on the right hand side of the panel.

Selecting a command will update the right hand side of the panel with information for that

particular command. For example, for the **Resolve SA** command:

Common Fields in Commands

The common fields used in the right hand side of a chain command.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Use parameters

*some chain commands also have **Use Parameters** tick. This can be turned on to allow the use of parameters within the command.*

Command name

each command is given a default Command name composed of the command and the extra information such as the name of the super alignment. The Command name does not have to be unique and can be changed at any time.

Active

*if ticked on then the command is run when the chain is run.
If not ticked, the command is not run.*

Continue on failure

*if ticked **on**, the chain will continue running if an error occurs with this command.
If not ticked, the chain will stop running if an error occurs in this command.*

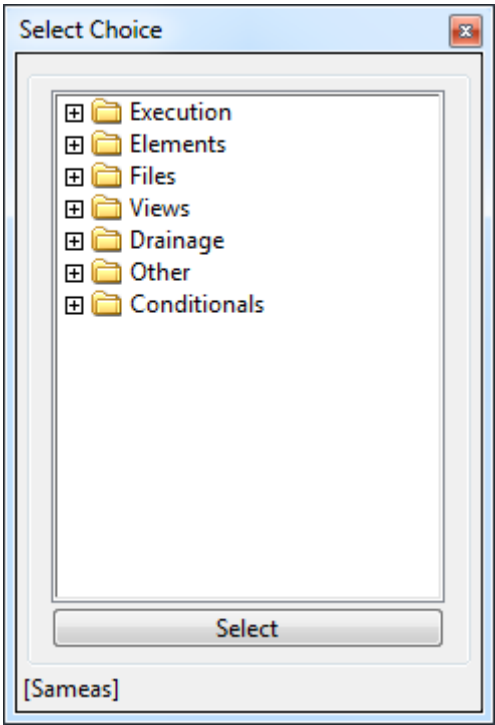

Comments

comments recorded for the options.

When a chain is running, messages and error messages are written to the **Output window**.

Important Note - each time a command is inserted or modified, the **Write** button must be clicked to write out the modified chain.

Types of Chain Commands

For the Chain commands under <i>Execution</i> , go to	Execution
<i>Elements</i>	Elements
<i>Files</i>	Files
<i>Views</i>	Views
<i>Drainage</i>	Drainage
<i>Other</i>	Other
<i>Conditionals</i>	Conditionals

Execution

Option

run a **12d Model** option. Note - not all options can be run in a chain. For more information, go to [Option](#).

Option - Manual

For more information, go to [Option - Manual](#).

Screen layout file

run an existing screen layout file. Note - not all slf's can be run.
For more information, go to [Screen Layout File](#).

Function

recalc a 12d function
For more information, go to [Function](#).

Chain

run an existing chain

Macro

run a **12d Model** macro that doesn't have a panel

For more information, go to [Macro](#).

Plot

run a plot parameter file.

For more information, go to [Plot](#).

Shell command

run an external program, Microsoft command line etc.

Elements

Resolve SA

resolve a selected super alignment

Delete string

delete the selected string

Clean model

clean the selected model

Create model

creates a new model of the specified name

Delete tin

delete the selected tin

Delete model

delete the selected model

Delete all tins

delete all tins in the project

Delete all models

delete all models in the project

Delete all templates

delete all templates in the project

Delete all empty models

delete all empty models in the project

Files

Delete file

deletes the specified file

Compare

compare two text files

Views

Redraw all views

redraws all views

Fit view

do a fit on a view

Create view

creates a new view of the specified name

Delete view

deletes the view of the specified name

Add model to view

adds the specified model to the specified view

Remove model from view

removes the specified model from the specified view

Remove all from view

removes all models from the specified view

Drainage**Drainage analysis**

runs drainage analysis on the specified model

Drainage analysis- dynamic

runs dynamic drainage analysis on the specified model

Set pit details

sets the pit details for the specified model

Regrade pipes

regrades the pipes in the specified model

Other**Comment**

creates a cosmetic comment - no action is performed

Halt

stop running the chain

Prompt

For more information, go to [Prompt](#).

Conditionals**Label**

create a labelled line in the chain

Goto

jump to a labelled line

If Model Is Empty

test if a model is empty

If Model Exists

test if a model exists

If Tin Exists

test if a tin exists

If File Exists

test if a file exists

If View Exists

test if a view exists

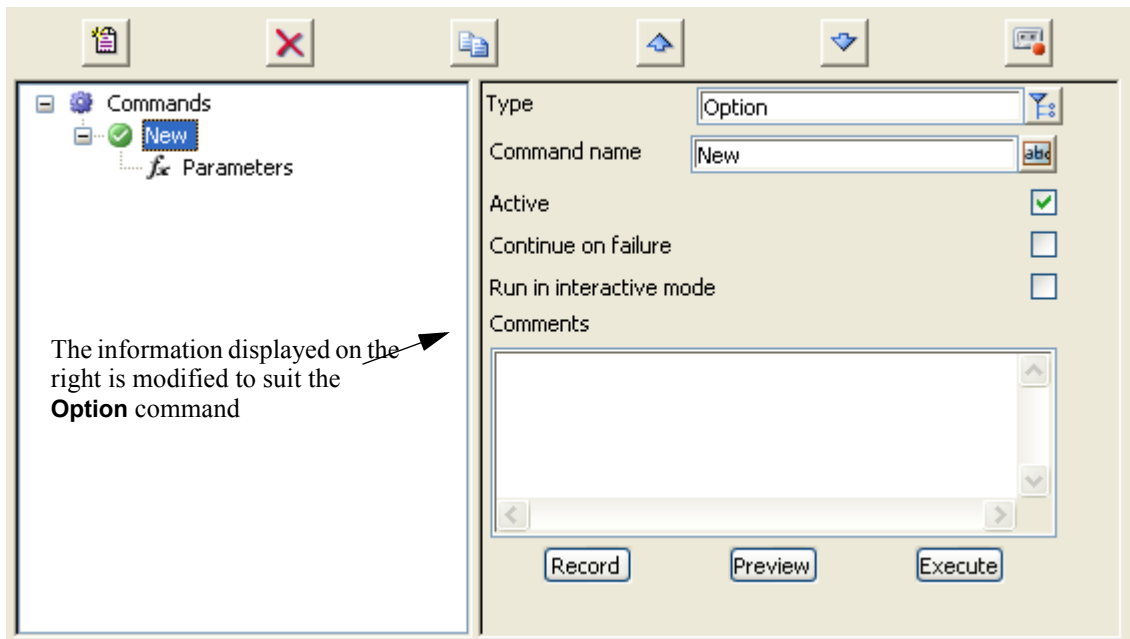

If Parameter Equals

test if a parameter has a certain value

Additional Information on Some Chain Commands

Option

Selecting the **Option** command modifies the information on the right side of the panel to suit the **Option** command. This includes buttons to record a panel, preview or execute a panel that has already been recorded.

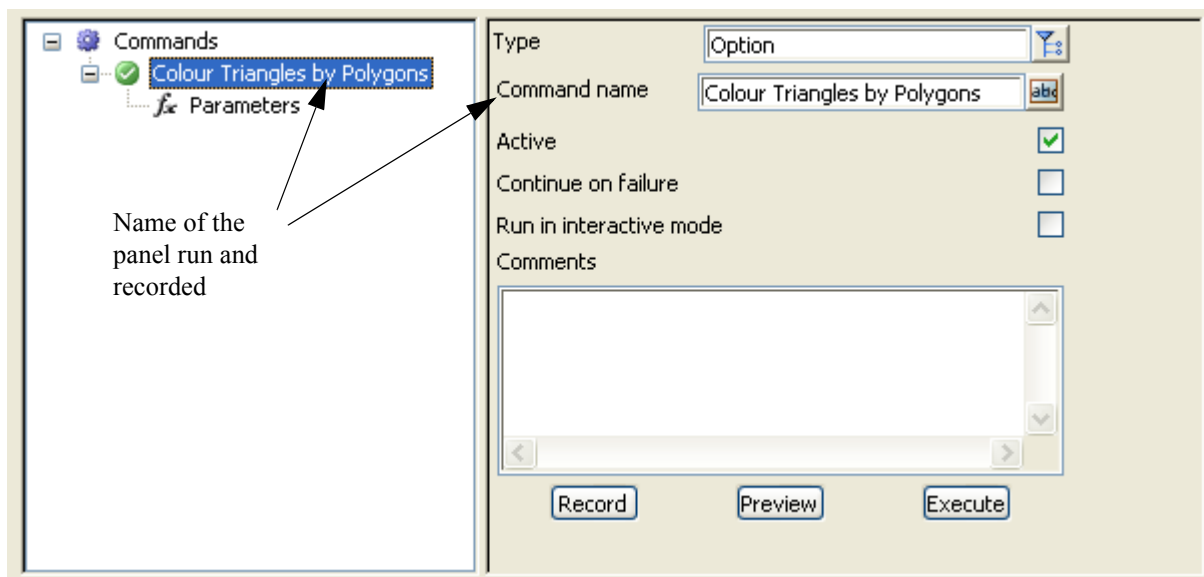

Clicking on the **Record** button starts a “one option” record cycle.

The **Recorder** panel is placed on the screen and you **run** the **12d Model** panel option that you wish to record (note - macros and CAD commands cannot be recorded).

Once the option is run, the **Recorder** panel is automatically removed and the **Option** in the **Create/Edit Chain** panel is given the name of the **12d Model** panel that was run.

Click on the **Write** button at the bottom of the **Create/Edit Chain** panel to update the chain information.

Important Note - the **Preview** button brings up the recorded panel with all the information filled in **that can be validated by the panel fields**. So sometimes **Preview** can not display the recorded information. Also **Preview** is for display only and can't be used to modify **Option**.

Important Note - To quickly change the values in a recorded option, select **Preview** to bring up the recorded panel with all the information filled in. Then hit the **Record** button on the **Option** command, make the changes you want and run the panel. This will record the new information in place of the existing information.

Option Parameters

To define or modify parameters used in an option, click on the **+** beside the option name in the chain (or double click on the option name) and the Parameters node for the option will be displayed.

For more details on option parameters, go to [Modifying / Creating parameters](#).

Special Notes on Recording Options

1. Use Unique String Names for String Selects

String selects on panels record the id and the name of the string, and the model id and the name of the model containing the string.

When the option is run in the chain, the string is first searched for using the model and string id's but if that fails then a string of the recorded name is searched for in the recorded model name.

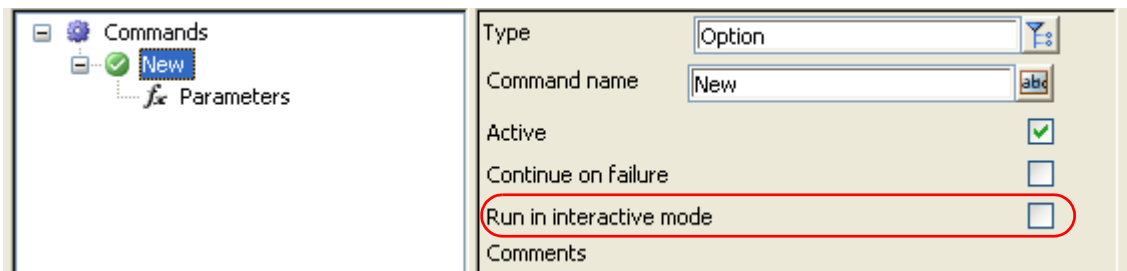

If the string name is unique in the model then the correct string will be selected. If there is more than one string with the same name in the model, then the first string of that name that is found will be used.

2. Polygon Selects

String selects can be recorded for a *Polygon box* but *Rectangle*, *Parallelogram* or *Lasso* can not be recorded.

Run in Interactive mode

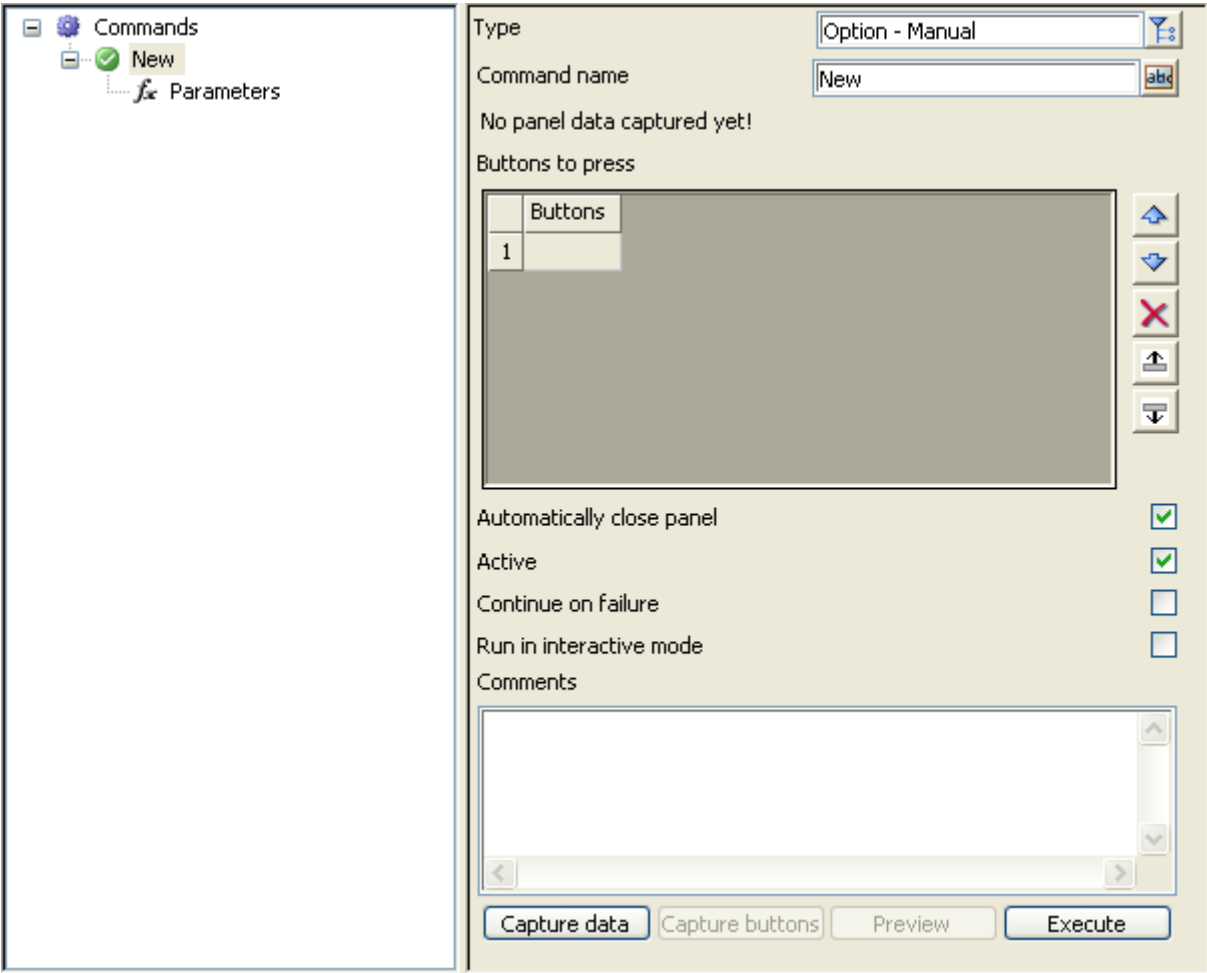

Run in interactive mode tick box

if ticked, when the command runs, the panel will be displayed. All field data may be changed at this point. It is the responsibility of the user to run the option as required. Once the panel is closed, the chain will continue.

if not ticked, the command will run as normal without user interaction.

Option - Manual

This command allows you to manually record an option for playback in a chain by recording it in two parts:

- 1. The data to use
- 2. The buttons to press and the order they should be pressed

This is useful for more complex panels or panels that require multiple button presses. It may also be useful for macro panels.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Buttons to press

Displays the list of buttons on the recorded panel

Automatically close panel tick box

*if ticked, the panel will be automatically closed after all buttons are pressed.
if not ticked, the panel will not be automatically closed. If a finish button has not been pressed, the panel will remain open after the command is finished.*

Run in interactive mode tick box

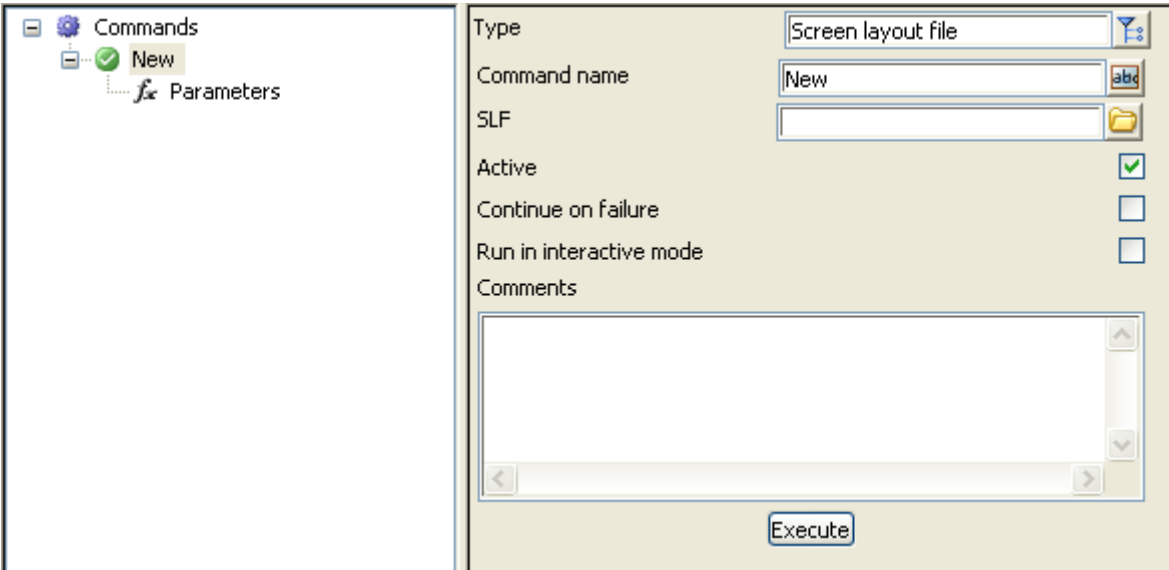

*if ticked, when the command is run, the recorded panel will be displayed. No buttons will be pressed. When the panel is closed, the chain will continue.
If not ticked, the panel will not be displayed and the command will run as normal.*

Capture data button
begins a panel capture. A panel is captured by selecting it.

Capture buttons button
begins capturing the buttons on a panel. The data for the panel must first be selected.

Screen Layout File

The **screen layout file** command displays the first panel stored in an SLF file and runs it by pressing its designated '**run button**'.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

SLF <i>the slf file to run</i>	file		
------------------------------------------	------	--	--

Run in interactive mode <i>if ticked, when the command runs, the panel will be displayed. All field data may be changed at this point. It is the responsibility of the user to run the option as required. Once the panel is closed, the chain will continue.</i>	tick box		
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------	--	--

Prompt message <i>the message to display</i>			
--------------------------------------------------------	--	--	--

Parameter result <i>the parameter to store the result in</i>			
------------------------------------------------------------------------	--	--	--

Widgets to display <i>An optional list of widgets to display on the panel, for capturing more information. The widget must be stored in an existing parameter, defined in the chain's PVF file. The type of parameter will determine the type of widget displayed.</i>			
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--	--	--

Name

the name of the widget

Parameter

the parameter that the widget is created for and will set once the prompt is closed

Mode**Optional?**

*if yes, the widget will be optional and the user will not need to fill it in when the prompt is displayed.
if no or blank, the widget will not be optional and the user will be required to fill in the widget.*

Buttons to display

a set of buttons to display on the panel, each with a name and the value

Name

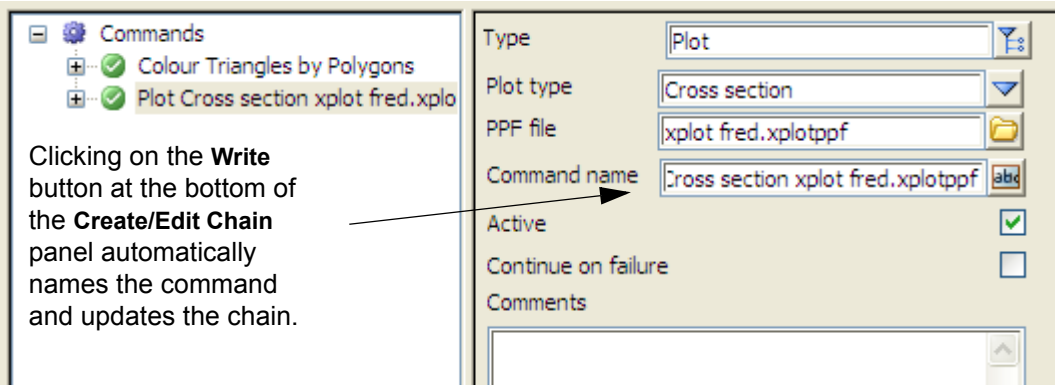

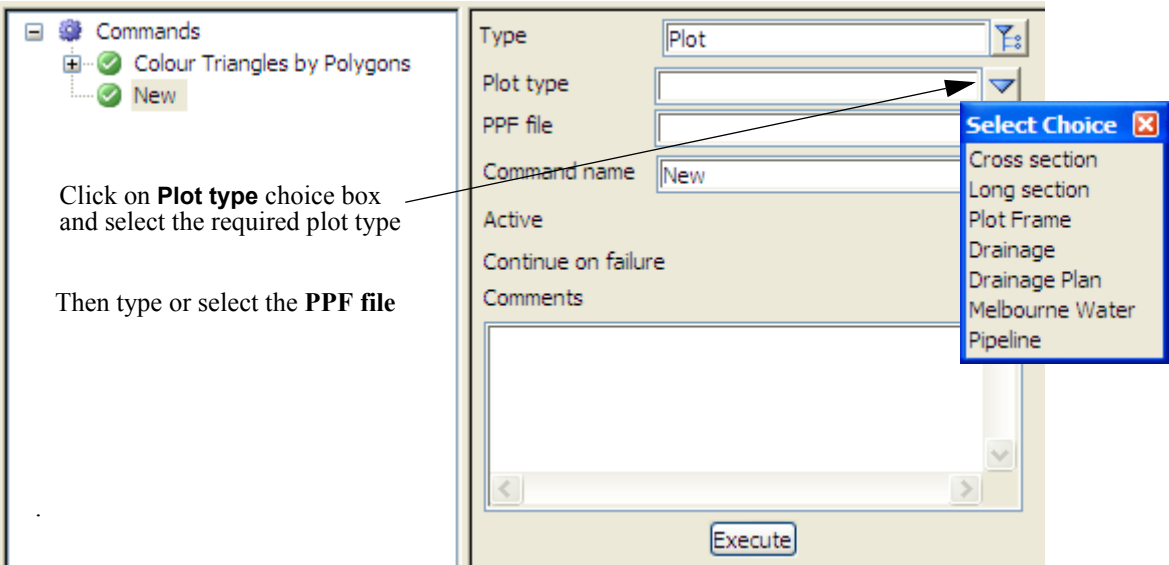

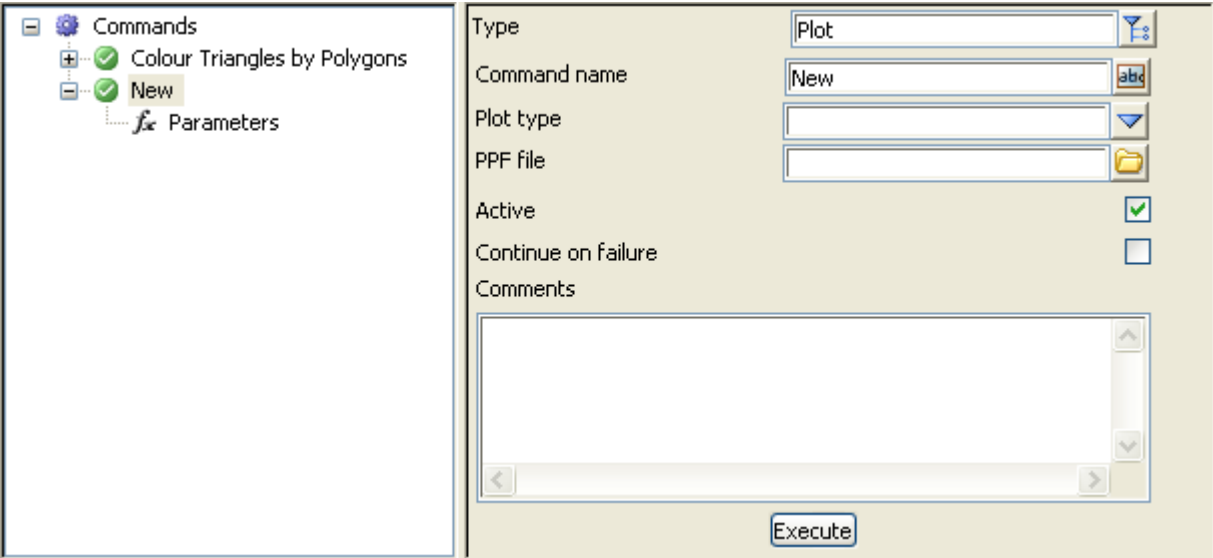

the name of the button

Value

the value to assign to the prompt parameter

Plot

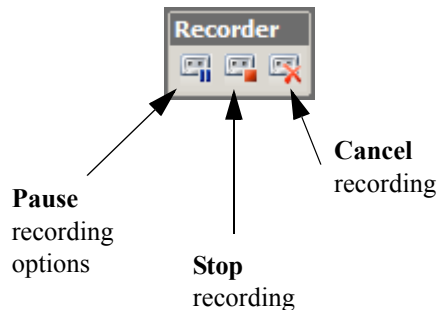

Selecting the **Plot** command modifies the information on the right side of the panel to suit the **Plot** command.

Record Icon

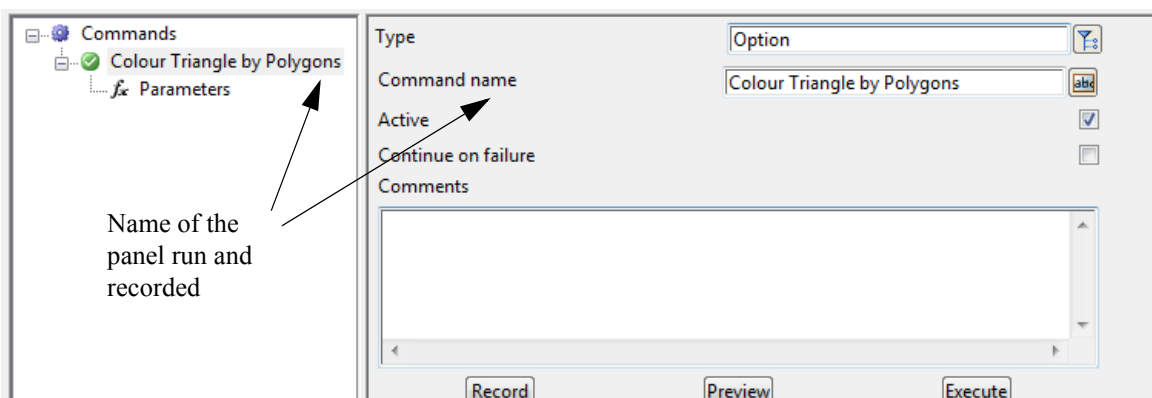

The **Record** option is like the **Macro** option in Word – it records the running of one or more **12d Model** panel options so that they can be replayed. Note that it **can not** record **12d** Macros or CAD commands.

Clicking on the **Record** icon removes the **Create/Edit Chain** panel and brings up the **Recorder** toolbar with icons to **Pause**, **Stop** and **Cancel** the recording.

Record is already recording and you simply **run** the **12d Model** panel options that you wish to record until you hit the **Stop** icon. The **Recorder** panel is then removed and the **Create/Edit Chain** panel returns to the screen with an **Option** command added to the chain *for each option that was recorded*.

Each recorded option is automatically given the name of the **12d Model** panel. The name can be modified by clicking on the command in **Create/Edit Chain** panel and changing the **Command name**. For more information on the command **Option**, go to [Option](#).

Click on the **Write** button at the bottom of the **Create/Edit Chain** panel to update the chain information.

Important Note - the **Preview** button brings up the recorded panel with all the information filled in **that can be validated by the panel fields**. So sometimes **Preview** can not display the recorded information. Also **Preview** is for display only and can't be used to modify **Option**.

Important Note - To quickly change the values in a recorded option, select **Preview** to bring up the recorded panel with all the information filled in. Then hit the **Record** button on the **Option** command, make the changes you want and run the panel. This will record the new information in place of the existing information.

Option Parameters

To define or modify parameters used in an option, click on the + beside the option name in the chain (or double click on the option name) and the Parameters node for the option will be displayed.

For more details on option parameters, go to [Modifying / Creating parameters](#)

Special Notes on Recording Options

1. Use Unique String Names for String Selects

String selects on panels record the id and the name of the string, and the model id and the name of the model containing the string.

When the option is run in the chain, the string is first searched for using the model and string id's but if that fails then a string of the recorded name is searched for in the recorded model name.

If the string name is unique in the model then the correct string will be selected. If there is more than one string with the same name in the model, then the first string of that name that is found will be used.

2. Polygon Selects

String selects can be recorded for a *Polygon box* but *Rectangle*, *Parallelogram* or *Lasso* can not be recorded.

Important Notes

1. Macros or CAD commands **can not** be recorded, and not all 12d panel options can be recorded. For example, if a screen layout file can not be created for an option, then it can't be recorded.
2. When recording, the **12d Model** panel option must be filled in and run. This may restrict what can be done.

Saving a Chain

After each item is added to the chain, click on **Write** to save the chain.

Running a Chain

There is a **Run** button on the **Create/Edit Chain** panel to run a chain.

However a chain can also be run simply by clicking on the **name** of the chain in the list created by walking right on

Recalc =>Run chain

Similarly editing an existing chain can easily be done by clicking on the name of the chain in the list created by walking right on

Recalc =>Edit chain

This brings up the **Create/Edit Chain** panel with the selected chain in the editor.

Interactive Mode

Chains now support an interactive mode, meaning that the user is allowed to influence the flow of commands or the data input into the chain.

There are two types of interactive mode: **Chain Interactive Mode** and **Command Interactive Mode**:

- **Chain Interactive Mode:**
This is toggled via the 'Run chain in interactive mode tick box' on the chain editor panel. When the chain is run, the interactive toolbar will be displayed and the chain will pause for user input. (See [Interactive Toolbar](#) for more details).
- **Command Interactive Mode:**
Several commands now support interactive mode, meaning that instead of running as normal, they will attempt to pause the chain and wait for further input from the user. This applies in the case of panels, functions and macros. In these cases, any panels associated with them, and the data they were recorded with, will be displayed and will wait for user input before continuing.

Interactive Toolbar

When running a chain in **interactive mode**, the chain pauses and waits for user input between each chain command.

The following Interactive Toolbar is seen when interactive mode is running:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Choice box	choice box		
 allows you to choose which command to run next			
Play button	button		
 plays the next command			
Play + i button	button		
 Plays the next command in an interactive way (See Interactive Commands)			
Stop button	button		
 stops the chain			
Fast forward button	button		
 runs the chain to the end			
Fx	button		

Edits the parameters for the current function

Interactive Commands

Running a command interactively will do one of several things, depending on the type of command:

1. If it is a recorded option, the panel will be presented to the user. When the panel is closed, the chain will move to the next command.
2. If it is a function command, the chain will attempt to open the function editor. When the function is closed, the chain will move to the next command.

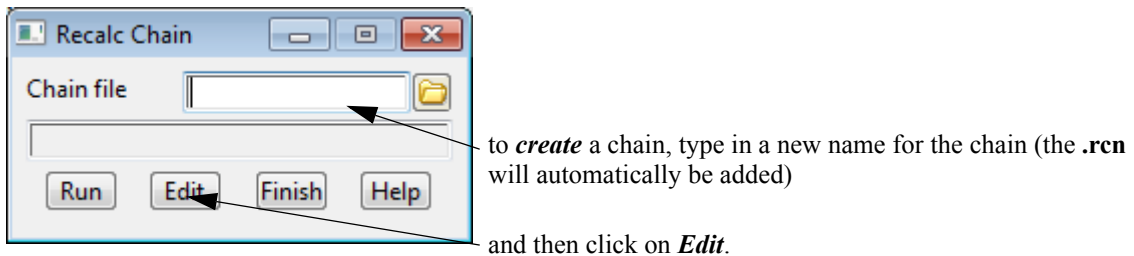

Edit a Chain

Position of option on menu: Utilities =>Chains =>Edit

The **Edit** walk-right menu displays all the chains in the project and double clicking on a chain in the list will bring up the **Create/Edit Chain** panel (see [Create/Edit a Chain](#) for more information).

The Recalc Chain Panel

The **Recalc Chain** panel comes up if you click on **Utilities =>Chains =>Edit** without walking right or **Utilities =>Recalc =>Edit chain** without walking right.

Parameters

The basic usage of chains allows you to record and playback a set of static actions. In many cases, it may make sense to use the same chains across different sets of data. In these cases, parameters can be used to change the values that were used in each command or option that was recorded.

For example, you may wish to run an option such as vehicle path across many different strings. You can set the alignment string to be used as a parameter and change it each time you run the chain.

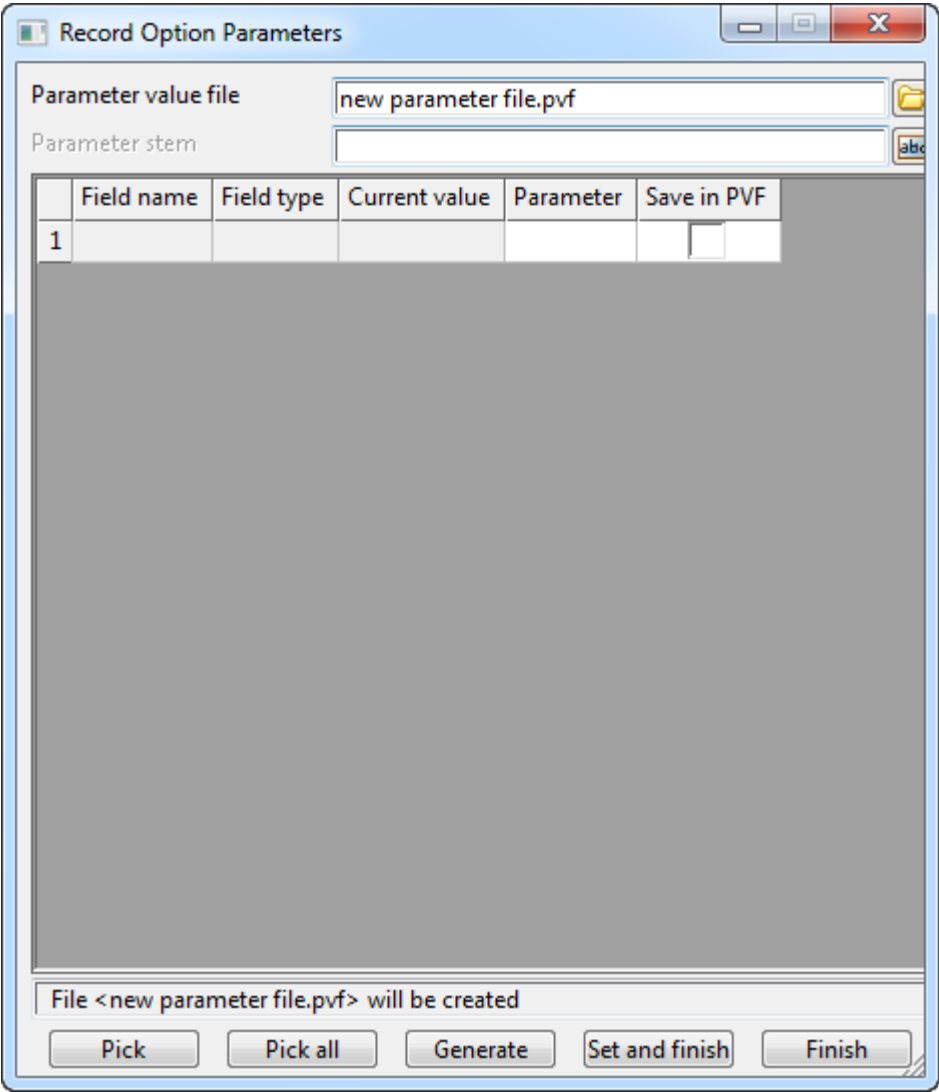

Parameters can be used by most chain commands. Which parameter you wish to use can be defined via the chain parameter. The actual values used are stored in separate files with the extension PVF, or parameter value file. The values of the parameters to be used can be created/edited within the parameter editor.

Option Parameters

Parameters for **Option** Commands can either be defined when recording the option or afterwards, in the chain editor. Parameters within options are defined as *Parameter Mappings*. A parameter mapping maps from a specific field to a named parameter. When an option command runs and fills out a particular field, it will look for the appropriate parameter mapping to use.

Recording parameters

To record parameters, make sure the **Always record parameters** tick is on before starting to record the option. After the option is recorded, the following panel will be displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Field name

the name of the parameterised field. This is read only.

Field type

the type of the parameterised field. This is read only.

Current value

the current value used in the panel at time of recording. This is read only.

Parameter

the name of the parameter

Save in PVF

whether or not to save the Current Value field in the associated parameter value file

Pick

pick a field from the recorded panel to use as a parameter

Pick all

automatically pick all fields to be used as parameters

Generate

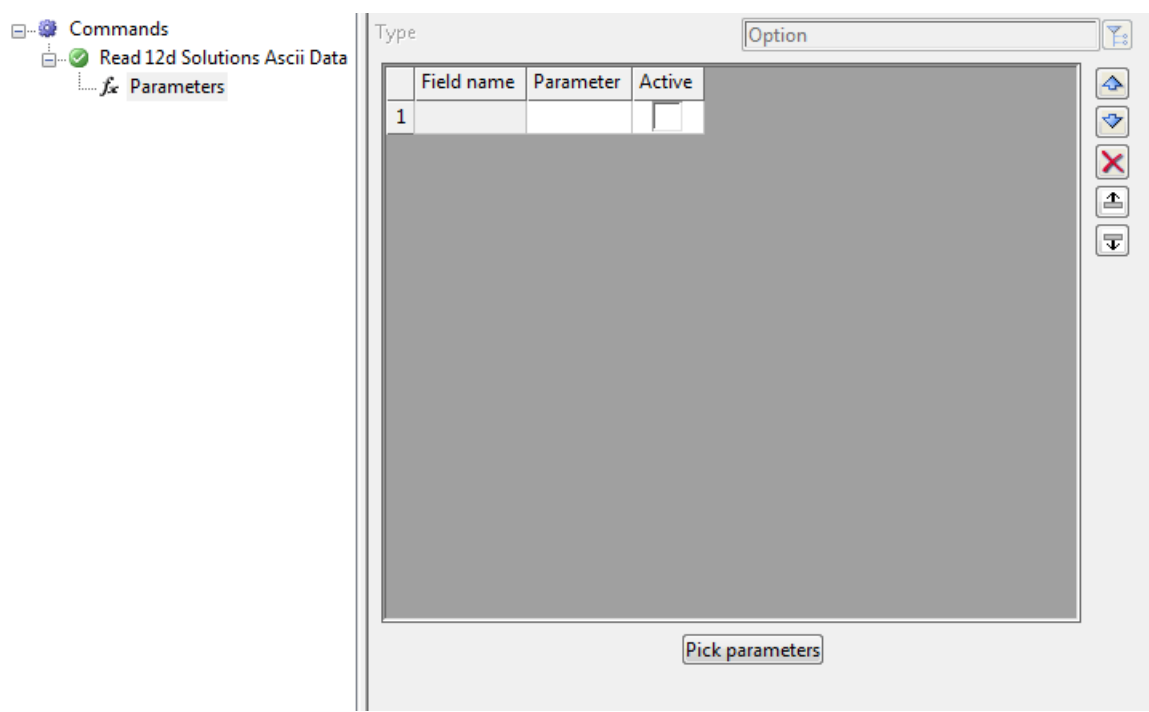

generate names for the parameters, using the optional parameter stem

Set and finish

save the recorded parameters and finish the panel

Modifying / Creating parameters

To create parameters without recording, or modify them, click on the Parameters under the expanded Option command in the chain editor. All the mappings from parameters to the fields they represent will be listed here.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Field name

the name of the field

Parameter

the name of the parameter

Active

*if ticked, the parameter mapping is used (i.e. active).
If not ticked, the parameter mapping is not used (i.e. not active).*

Pick Parameters

can be used to define more parameters for the option.

For information on Creating/Editing parameter files, please go to the next section [Creating/Editing Parameter Value Files](#)

Creating/Editing Parameter Value Files

Position of option on menu: Utilities =>Chains =>Parameters

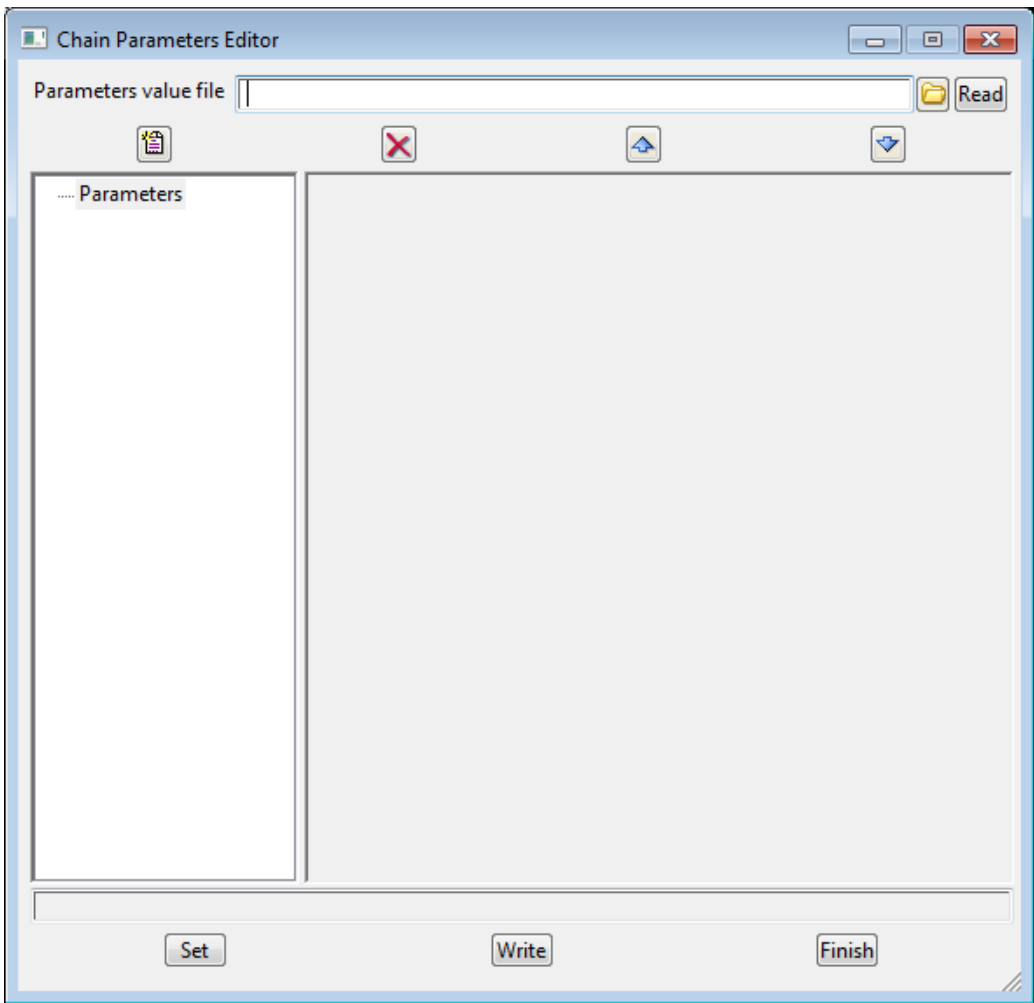

selecting Create opens the parameter editor
walk right on Edit, lists parameter files to edit
used to copy a Chain Parameter Value File from one file to another.

For the option Create, go to	Chain Parameters Editor
Edit	Chain Parameters Editor
Copy	Copy a PVF

Chain Parameters Editor

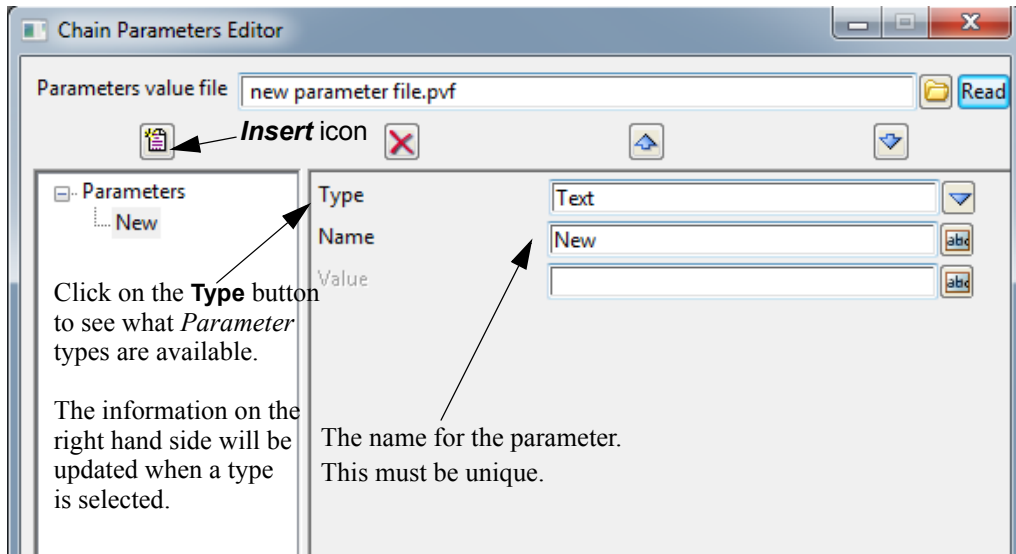

The **Edit** option is a walk-right which lists the existing parameter files. Clicking on a file in this list, brings it up in the **Chain Parameters Editor** panel which is documented below.

Selecting **Create** brings up the **Chain Parameters Editor** panel which is used to create and edit chain parameters.

Inserting a Parameter

Clicking on the **Insert** icon insert a new parameter into the parameter value file field and on the right hand side of the panel, has the information for defining the new parameter.

The **value** for each parameter is optional. The type of value will change to reflect the type chosen. The types of parameters available are:

Integer

an integer value

Real

a real value

Text

a text value

String

a string selected from a model

Function

an existing function name

Tin

an existing tin

Model

an existing model

True/False

a true or false answer, used for tick boxes

Colour

a colour value

Grid

a CSV (comma separated value) file, which defines the values to fill a grid

Copy a PVF

Position of option on menu: Utilities =>Chains =>Parameters=>Copy

Copy a PVF is used to copy a Chain Parameter Value File from one file to another.

On selecting the **Copy** option, the **Copy a PVF** panel is displayed on the screen.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source File <i>the original PVF file</i>	input		Folder*.pvf
Target File <i>the new PVF file to copy to</i>	input		Folder*.pvf
Copy <i>copies the PVF</i>	button		

Copy a Chain

Position of option on menu: Utilities =>Chains =>Copy
On selecting the Copy option, the **Copy a Chain** panel is displayed and it copy chains.

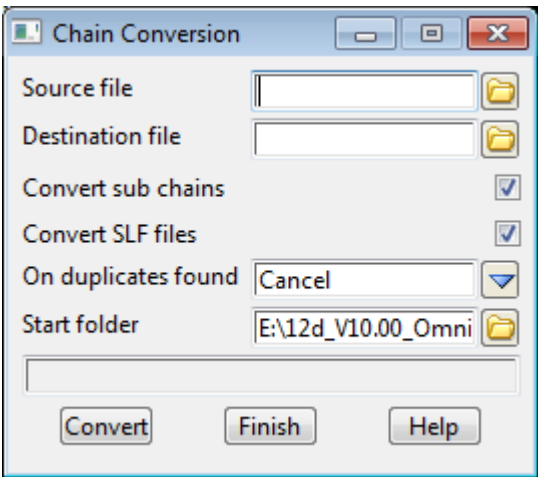

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source file <i>chain to be copied</i>	file		available *.rcn files
Target file <i>new destination for the chain</i>	file		
Copy <i>Copy the chain</i>	button		

Chain Conversion

Position of option on menu: Utilities =>Chains =>Convert
This panel converts from pre-v10 chain (rcn) files to the new chain format in v10 and beyond.
Selecting One brings up the Chain Conversion panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source file	file		Folder *.rcn

the original rcn

Destination file file Folder *.chain
the new formatted file

Convert sub chains tick box
if ticked, all sub chains will be converted.
if not ticked, no sub chains will be converted.

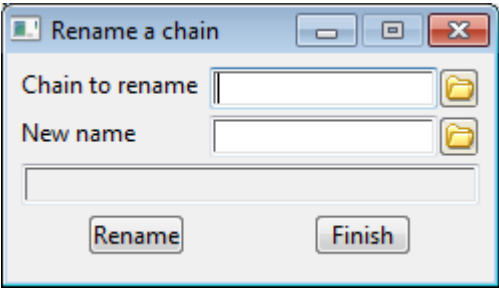

Convert slf files
if ticked, all slf files included in the chain will be converted to the new SLX format.
if not ticked, no slf files will be converted.

Convert button
converts the source rcn into the new .chain file format

Rename a Chain

Position of option on menu: Utilities =>Chains =>Rename

On selecting the **Rename** option, the **Rename a Chain** panel is displayed and is used to change the names of existing chains.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain to rename <i>chain to be renamed.</i>	folder box		available *.rcn files
New name <i>new name for the chain</i>	input		
Rename <i>Change the name of the chain</i>	button		

Run a Chain

Position of option on menu: Utilities =>Chains =>Run

The **Run** walk-right menu displays all the chains in the project and double clicking on a chain in the list will run the chain.

Clicking on **Run** brings up the **Recalc Chain** panel.

For more information on the **Recalc Chain panel** go to [The Recalc Chain Panel](#)

Delete a Chain

Position of option on menu: Utilities =>Chains =>Delete

On selecting the **Delete** option, the **Delete a Chain** panel is displayed and is used to delete chains.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain to delete <i>name of the chain to delete</i>	folder box		available *.rcn files
Delete <i>Delete the chain given in the Chain to delete field.</i>	button		

Functions

Position of menu: Utilities =>Functions

Functions are used in the template and interface options to collect special data together. This allows 12d Model to recognise when some of the data has been modified and that some of the data is no longer valid. It is then possible to re-run the functions (re-calc the functions) and update the modified data.

The **Functions** walk-right menu is

Functions	
Functions	list of functions in the project
Editor	modify an existing function
Lock	lock a function so it won't recalc
Order	modify the recalc order of functions
Recalc	recalculate functions
Rename	rename a function
Change all tins	change the name of tins in functions
Add	add functions to the project
Save	save a functions to disk
User	
Attributes	edit attributes of a function
Delete	delete functions from disk

The **Functions** walk-right simply lists all the functions that have been defined in the project. The other options in this menu will now be described in more detail.

For the option <i>Editor</i> , go to	Editor
<i>Lock</i>	Lock
<i>Order</i>	Order
<i>Recalc</i>	Recalc
<i>Rename</i>	Rename
Change all tins	Rename
<i>Add</i>	Add
<i>Save</i>	Save
<i>Attributes</i>	Attributes
<i>Delete</i>	Delete
<i>Delete many</i>	Delete Many Functions

Editor

On walking right on the **Editor** menu option, a list of defined functions appears.
By selecting the highlighted name of a function to be edited, the appropriate function panel filled with the information from the selected function, is displayed
The information in the selected function can then be modified.

Important Note

The defined functions menu also has a [Same as] option which is used to select the function to be edited by simply picking **any string** that was created by the function.

Lock

Position of option on menu: Utilities =>Functions =>Lock

The function lock option is used to *lock* a function so that it can't be re-calculated.
On selecting the **Lock** option, the **Function Lock Status** panel is displayed.

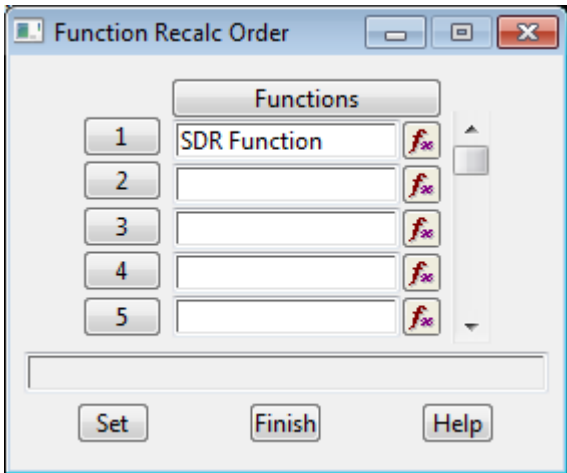

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to lock/unlock.</i>	input		available functions
Lock model <i>display and modifies the lock status for the given function. If ticked, the function is locked an won't re-calculate.</i>	tick box		
Set <i>set the lock mode for the selected function.</i>	button		

Order

Position of option on menu: Utilities =>Functions =>Order

The default recalculation order for functions is the order in which the functions were created.
However, the **Order** option is used to **modify** the function recalc order.
On selecting the **Order** option, the **Function Recalc Order** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Functions <i>list of functions in their recalculation order. Functions should only appear once in the list.</i>	table		available functions
Set <i>record the order of functions in the table.</i>	button		
Note - all functions must still exist somewhere in the re-arranged recalc order.			

Recalc

Position of option on menu: Utilities =>Functions =>Recalc

The **recalc** menu is the same as the menu.

 Utilities =>Recalc

For more information, please go to the section [Recalc](#) in this chapter.

Rename

Position of option on menu: Utilities =>Functions =>Rename

On selecting the **rename** option, the **function rename** panel is displayed.

This panel can be used to change the names of existing functions

The fields and buttons used in this panel have the following functions.

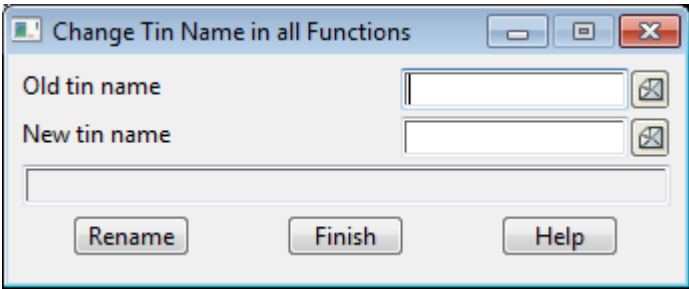

Field Description	Type	Defaults	Pop-Up
Old function <i>name of the function to be renamed.</i>	input		available functions
New function <i>new name for the function</i>	input		
Rename <i>Change the name of the function in the old function field to the name given in the new function field.</i>	button		

Change all Tins

Position of option on menu: Utilities =>Functions =>Change all tins

Selecting the **Change all tins** option, displays the panel **Change Tin Name in All Functions**.

This panel is used to change the name of a tin in all functions to another tin name.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin name <i>name of the tin to be renamed.</i>	Tin box		available tins
New tin name <i>new name for the tin in all functions.</i>	Tin box		available tins
Rename <i>Change the name of the tin in the Old tin name field in all functions to the name given in the New tin name field.</i>	button		

Add

Position of menu: Utilities =>Functions =>Add

The function add option brings up the walk-right menu, function adds

Position of option on menu: Utilities =>Functions =>Add =>Add all to project

On selecting the Add all to project option, the **Add All Functions To Project** panel is displayed.

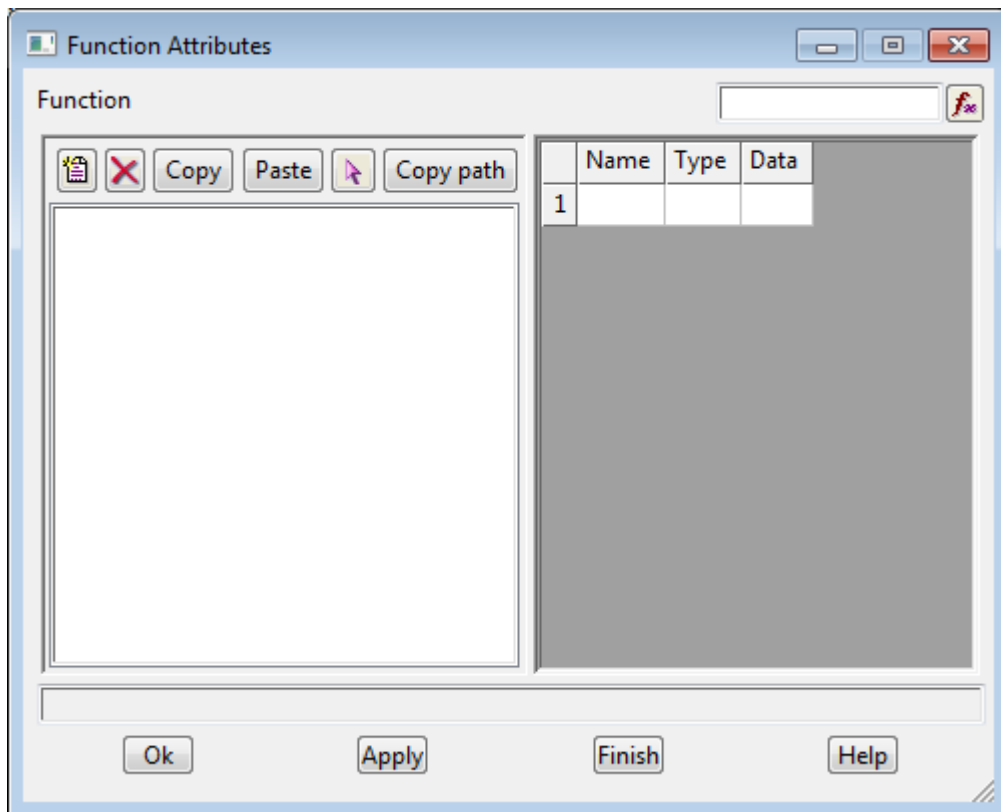

This panel is used to add all removed functions to the project.

Attributes

Position of menu: Utilities => Functions => Attributes

This section of documentation is a work in progress and will be updated in subsequent releases.

Delete

Position of menu: Utilities =>Functions =>Delete

Using the **Delete** option, functions can be deleted from disk so that they no longer can be accessed or take up disk space.

To help protect the user against disasters, when a function is selected for deletion, a **yes-no** pop-up menu is used to confirm that the user did intend deleting the function.

If deletion is confirmed, the selected function is removed from the project and deleted from the disk.

The **Function Delete** walk-right menu is

For the option *Delete a function*, go to
Delete many
Delete all functions

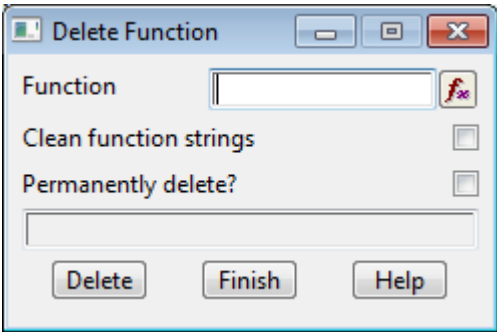

[Delete a Function](#)
[Delete Many Functions](#)
[Delete All Functions](#)

Delete a Function

Position of option on menu: Utilities =>Functions =>Delete =>Delete a function

The **Delete a function** option can be used to delete a function in the working project.

On selecting the **Delete a function** option, the **Delete Function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be deleted.</i>	function box		all project functions
Clean function strings <i>if ticked, delete all the strings created by the function</i>	tick box		
Delete <i>after selecting this button, the function given in the function field will be deleted from the computer disk. A yes-no pop-up is used to confirm that deletion is required.</i>	button		

Delete Many Functions

Position of menu: Utilities =>Functions =>Delete many

The **Delete many** option deletes one or more functions in the working project. Selecting the **Delete many**, displays the **Delete many functions** panel.

The fields and buttons used in this panel have the following functions.

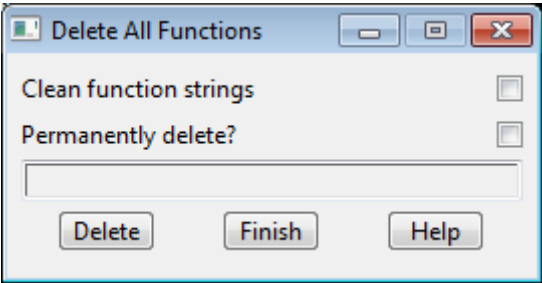

Field Description	Type	Defaults	Pop-Up
Delete	tick box		
<i>if ticked, delete the selected function listed after the tick</i>			
Function	input		all project functions
<i>name of all the functions in the project</i>			
Delete function strings	tick box		
<i>if ticked, delete all the strings created by the selected functions</i>			
Delete	button		
<i>delete all the ticked functions in the function field</i>			

Delete All Functions

Position of option on menu: Utilities =>Functions =>Delete =>Delete all functions

The Delete all functions option will delete all of the functions in the working project.

On selecting the Delete all functions option, the **Delete All Functions** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Clean function strings	tick box		
<i>if ticked, delete all the strings created by all the function</i>			

After selecting the **Delete** button, a yes-no pop-up is used to confirm that deletion is required. If it is, all functions in the working project will be deleted from disk and unless an error occurs, the panel will be removed.

Macros

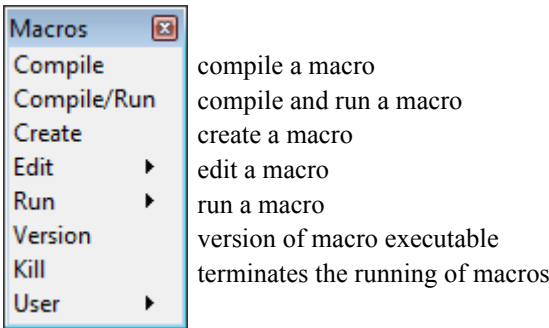

Position of menu: Utilities =>Macros

The 4D Solutions Macro Language (4DML) is a powerful programming language designed to run from within 12d Model. Its main purpose is to allow users to enhance the existing 12d Model package by writing their own programs (4DMLs or macros).

4DMLs can be compiled from within or outside 12d Model but can only be run from within 12d Model.

The macros menu has options to compile macros, compile and run macros or just run macros. A full description of macros is given in the 12d Model Macro Language manual.

The Macros walk- right menu is

For the option <i>Compile</i> , go to	Compile
<i>Compile/run</i>	Compile and Run
<i>Create</i>	Create
<i>Edit</i>	Edit
<i>Run</i>	Run
<i>Version</i>	Version
<i>Kill</i>	Kill

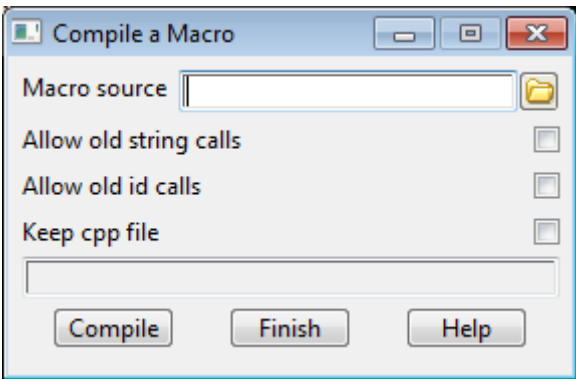

The options will now be described.

Compile

Position of option on menu: Utilities =>Macros =>Compile

The **Compile** option is used to compile the macro source code into a executable program which can then be run from within 12d Model.

On selecting the option, the **Compile a Macro** panel is placed on the screen.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro source <i>the name of the macro source file.</i>	input		*.4dm files
Compile <i>compile the code file given in the macro source field.</i>	button		

Compile and Run

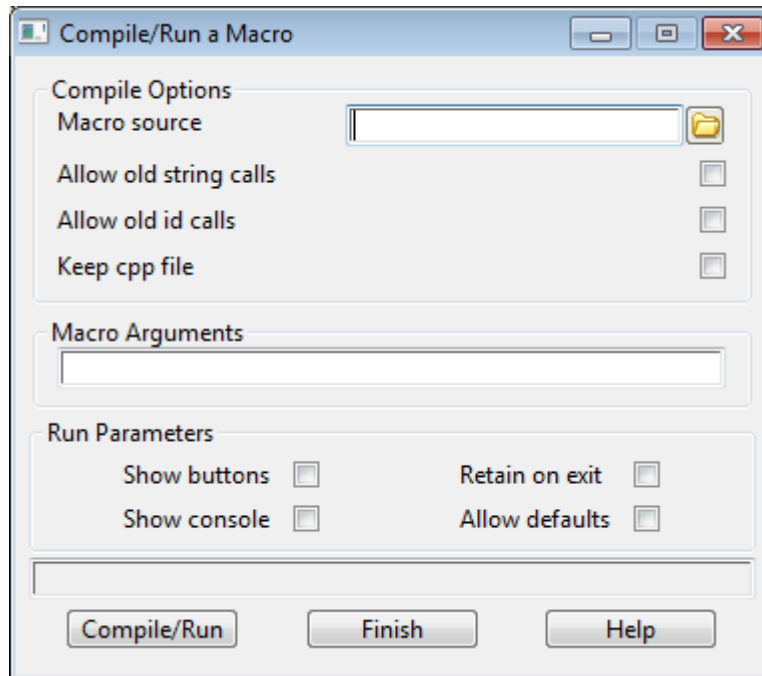

Position of option on menu: Utilities =>Macros =>Compile/Run

The **Compile/Run** option compiles the macro source code into a executable program, and if there are no errors, runs the program.

When a macro is run, a **macro console** panel is placed on the screen to provide an i/o and message area for the macro. It is possible to bring up the macro console with or without the **restart**, **abort** and **finish** buttons.

When the macro finishes, the macro console can be left on the screen or removed.

Selecting the **Compile/Run** menu option, brings up the **Compile/Run a Macro** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro source <i>the name of the macro source file.</i>	input		*.4dm files
Macro arguments <i>if non-blank, a text line which is passed to the program as an argument line.</i>	input		
Show buttons <i>if ticked, the macro console panel has abort, restart and finish buttons on it.</i>	tick box		
Retain on exit <i>if ticked, the macro console panel remains on the screen after the macro has finished running.</i>	tick box	tick	
Show console <i>if ticked, the macro console panel is placed on the screen. if not ticked, the macro console panel is not displayed - used mainly with panels.</i>	tick box	tick	
Allow defaults <i>if ticked, the default value for a prompt is displayed in the macro console panel.</i>	tick box		

Compile/Run button

*compile the code file given in the **macro source** field and if the compile is successful, run the program.*

Create

Position of option on menu: Utilities =>Macros =>Create

The **Macros=>Create** option is used to create macro files (*.4dm) with the editor pointed to by the EDIT_4D environment variable.

Selecting **Macros=>Create** brings up the **Create Macro File *.4dm** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder to create the .4dm file in.</i>	input	current folder	
File to create <i>name of the file, in folder, to create.</i>	input		*.4dm files
Create <i>create the file given by the folder and file to create panel fields. A macro header is set up in the file.</i>	button		

Edit

Position of option on menu: Utilities =>Macros =>Edit

The **Macros=>Edit** option is used to edit macro files (*.4dm) with the editor pointed to by the EDIT_4D environment variable.

The **Macros=>Edit** option has two modes of operation - selecting the **macros=>edit** itself, or by activating the **Macros=>Edit** option's walk-right menu, **folder *.4dm**.

Selecting **Macros=>Edit** itself brings up the **Edit Macro File *.4dm** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .4dm file.</i>	input	current folder	
File to edit <i>name of the file, in folder, to edit.</i>	input		*.4dm files
Edit <i>edit the file given by the folder and file to edit panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has each of the macro header set up.</i>	button		

The **Macros=>Edit** walk-right menu provides a list all the many template files (files ending in .mtf) in the current folder. When a file is selected from the list, it is automatically loaded into the editor.

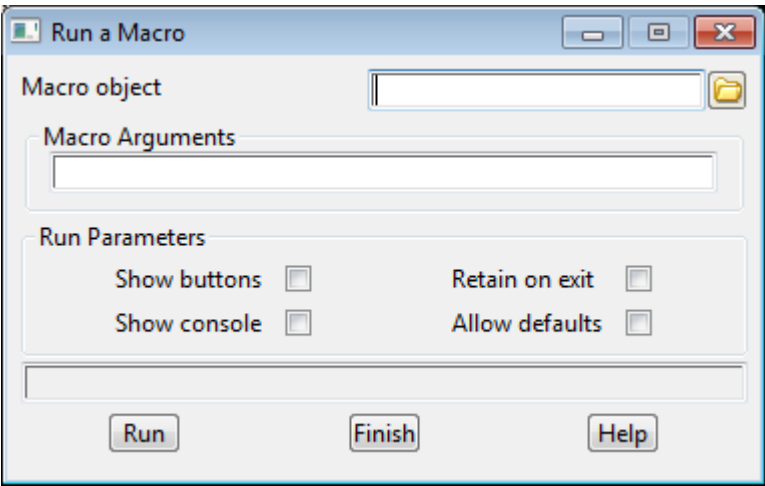

Run

Position of option on menu: Utilities =>Macros =>Run

The **Run** option runs an existing macro executable program (produced by the compile process).

Like the **Compile/Run** option, the Run options can run the macro executable with or without buttons on the macro console, and leave or remove the macro console once the macro has been executed.

Selecting the **Run** menu option brings up the **Run a Macro** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro object <i>the name of the macro object or executable program.</i>	input		*.4dm files
Macro arguments <i>if non-blank, a text line which is passed to the program as an argument line.</i>	input		
Show buttons <i>if ticked, the macro console panel has abort, restart and finish buttons on it.</i>	tick box		
Retain on exit <i>if ticked, the macro console panel remains on the screen after the macro has finished running.</i>	tick box		tick
Show console <i>if ticked, the macro console panel is placed on the screen. if not ticked, the macro console panel is not displayed - used mainly with panels.</i>	tick box	tick	
Allow defaults <i>if ticked, the default value for a prompt is displayed in the macro console panel.</i>	tick box		
Run <i>run the executable given in the macro object field.</i>	button		

Version

Position of option on menu: Utilities =>Macros =>Version

The **Version** option simply brings up a panel giving information about the macro process.

Kill

Position of option on menu: Utilities =>Macros =>Kill

The **Kill** option is used to terminate selected running macros.

This option is useful in situations such as when the macro writer has omitted a **Finish** button on the macro or has unintentionally made the macro panel invisible.

It cannot be used to terminate a macro in an infinite loop because there is no way of getting to the **Kill** option.

On selecting **Kill**, the **Kill Macros** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Macro Grid			
Macro name			
<i>the name of a running macro.</i>			
Kill	choice cell	yes	yes, no
<i>if yes, the macro will be terminated when the Kill button is selected.</i>			

Kill	button
<i>terminates all macros in the grid with yes in the Kill column.</i>	

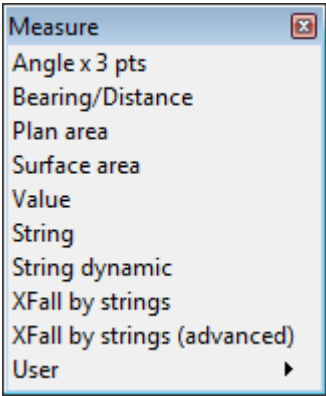

Measure

Position of menu: Utilities =>Measure

The **Measure** menu contains two options to display the
delta x, delta y, horizontal distance, angle and bearing
between points, and for a section view, the
delta chainage, delta height, slope distance and % grade
between points are calculated and displayed.

There are also options to calculate the plan area of polygons, the surface area of a tin within a polygon, run measures and dynamic measures and dynamically calculate and display the x-fall between two strings.

The **Measure** walk- right menu is

	<p>measure angle by 3 points</p> <p>distance/bearing with scale option</p> <p>plan areas</p> <p>surface area for a tin</p> <p>any measures</p> <p>information from a point to a string</p> <p>information from a position to a string</p> <p>x-fall between two strings</p> <p>more information & x-fall between strings</p>
------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Note

The **Measure** option has another mode of operation. Rather than moving onto the walk-right arrow, if LB is clicked when the **Measure** button is highlighted on the **12d Model=>utilities** menu, the **distance/bearing** panel is displayed on the screen.

For the option <i>Angle x 3 pts</i> , go to	Angle by 3 Points
<i>Bearing/distance</i>	Bearing and Distance
<i>Plan area</i>	Plan Area
<i>Surface area</i>	Surface Area in the chapter Triangles
<i>Value</i>	Value
<i>String</i>	String
<i>String dynamic</i>	String Dynamic
<i>Xfall by strings</i>	X Fall by Strings
<i>Xfall by strings (advanced)</i>	X Fall by Strings (advanced)

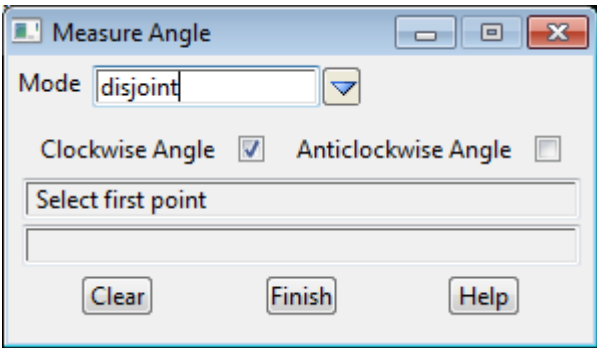

The options in the menu will now be described.

Angle by 3 Points

Position of option on menu: Utilities =>Measure =>Angle x 3 pts

The **Angle by 3 pts** option is used to calculate the angle formed by selected three positions. the angle can be expressed as a clockwise or anti-clockwise angle.

On selecting the **Angle x 3 pts** option, the **Measure Angle** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<i>In disjoint mode, only the angle between the three selected positions is reported. After the angle is reported, the user can select the 1st point in the sequence.</i>			
<i>In continuous mode, after the initial reporting of the angle, the user is prompted for the 3rd point of the new angle to be measured. By default, the previous 2nd point becomes the first point and the previous 3rd point becomes the 2nd point. This allows just one point (the third point) to be selected and the angle reported will change accordingly.</i>			
Clockwise angle	tick box	<i>if ticked, then the angle is measured in the clockwise (forward) direction.</i>	
Anti-clockwise angle	tick box	<i>if ticked, then the angle is measured in the anti-clockwise direction.</i>	
Clear	button	<i>when this button is selected, the sequence is re-initialised.</i>	

Note - after two positions are selected, the angle to the cursor position is dynamically calculated and displayed as the cursor moves around the view.

Bearing and Distance

Position of option on menu: Utilities =>Measure =>Bearing/Distance

The Bearing/Distance option is used to calculate

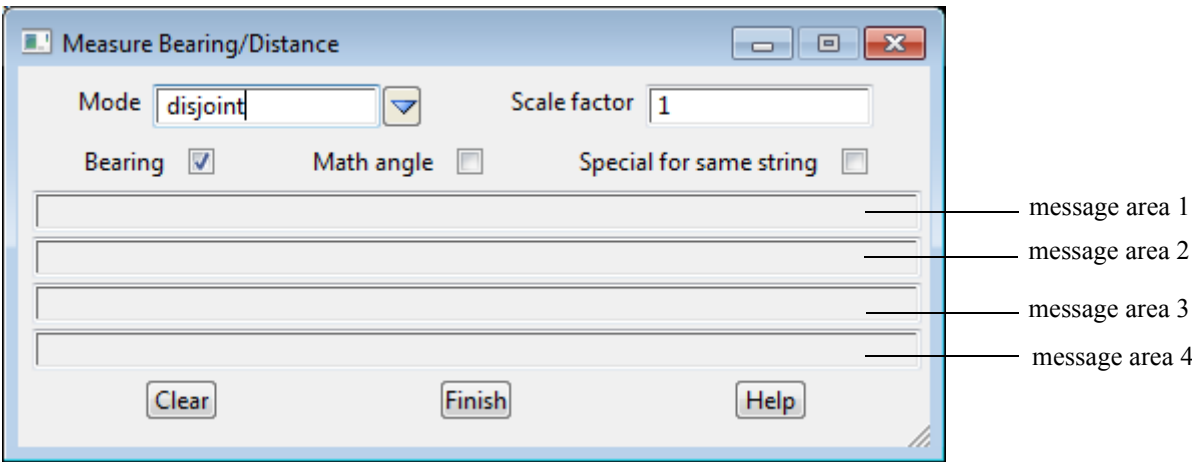

(a) the bearing measured in a clockwise direction between the positive y-axis and the (imaginary) line joining two selected points (when the bearing tick box is selected)

or

the bearing measured in an anticlockwise direction between the positive x-axis and the (imaginary) line joining two selected points (when the **Math angle** tick box is selected)

(b) the distance between two user selected points.

On selecting the **Bearing/Distance** option, the **Measure Bearing/Distance** panel is displayed.

This panel is principally used to display the distances between, and bearing of the line joining, pairs of user selected points.

message area 1 : brg = plane dist = ellipsoid dist =

where brg is the angle measured clockwise from north and is calculated using the coordinate values (Inverse value)

plane dist is the distance calculated using the coordinate values (Inverse value)

ellipsoid dist is the distance calculated by dividing the plane distance by the current scale factor

message area 2: dx = dy = dht = (if applicable)

where dx is the difference in x value between the two coordinates

dy is the difference in y value between the two coordinates

dz is the difference in z value between the two coordinates

If valid height values exist for two consecutive points the grade and slope is also reported

message area 3: grade % = slope =

If the measurement mode is set to continuous, the sum distances will be shown for the route taken

message area 4: Sum plane dist = Sum ellip dist =

where Sum plane dist, is the accumulative length of the route taken calculated using plane distances.

Sum ellip dist, is the Sum plane dist / scale factor.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<i>In disjoint mode, only the distance between the two points and the bearing (in degrees, minutes and seconds) of the (imaginary) line connecting the two points are displayed.</i>			
<i>In continuous mode, after the initial reporting of the bearing/distance, the user is prompted to select the next point (2nd point). In this case the previously selected second point becomes the first point.</i>			
Scale	input/output	1.0	
<i>the scale factor which will be used to convert plane distances to ellipsoid distances.</i>			
<i>i.e ellipsoid distance = plane distance / scale factor</i>			
Bearing	tick box	ticked	
<i>if ticked, the measured vectors can be displayed as bearings (angles measured from north, clockwise)</i>			
Math angle	tick box	un-ticked	
<i>if ticked, the measured vectors can be displayed as a mathematical angle (measured from east in a anti-clockwise direction).</i>			
Clear	button		
<i>when this button is selected, the selection sequence is re-initialised.</i>			

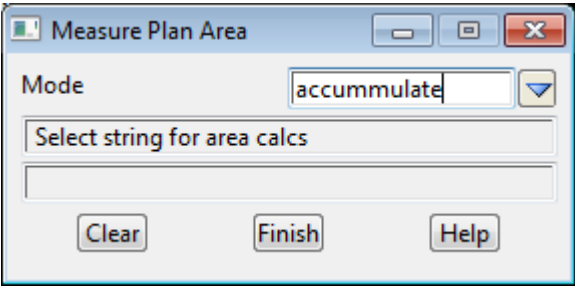

Plan Area

Position of option on menu: Utilities =>Measure =>Plan area

The **Plan area** option is used to calculate the plan areas enclosed by strings.

If a string is not closed, the first and last points are considered to be connected to form a polygon.

On selecting the option, the **Measure Plan Area** panel is placed on the screen.

This panel is principally used to display the plan areas of strings selected by the user.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<i>If disjoint, only the area of the selected string is displayed. If continuous, the total of the areas is also displayed.</i>			
Clear	button		
<i>when this button is selected, the total-to-date of the area is reset to zero and the selection sequence begun.</i>			

How to Use the Panel and Panel Messages

The measure area cycle consists is as follows:

- (a) the string is selected with the mouse.

message area 1

message area 2

select string for area calcs

(b) repeat step (a) to find more areas and accumulate them. If the accumulator is to be zeroed, simply select the **clear** button again.

The area of the selected string is displayed in message area 2.

If the mode is set to continuous, the accumulated areas (sum) of the selected strings is also displayed.

message area 1

message area 2

select string for area calcs

area = *value* sum = *value*

The cycle can then be repeated for as many strings as needed without leaving the option.

The accumulated total is reset to zero (cleared) by selecting the **clear** button again.

Surface Area

Position of option on menu: Utilities =>Measure =>Surface area

The **Surface area** option calculates and reports the surface area of a tin restricted to a user specified polygon.

This option has already been documented as **Tins=>Tin analysis=>Surface area**.

See the section [Surface Area](#) n the chapter [Triangles](#).

Value

Position of option on menu: Utilities =>Measure =>Value

The **Value** option is used to calculate and display any of the measures available in the **Measures** pop-up menu.

The **Measures** are documented under [Measures](#) in the chapter [Tools and Concepts](#).

On selecting the option, the **Measure Value** panel and the **Measures** menu are placed on the screen.

The fields and buttons used in this panel have the following functions.

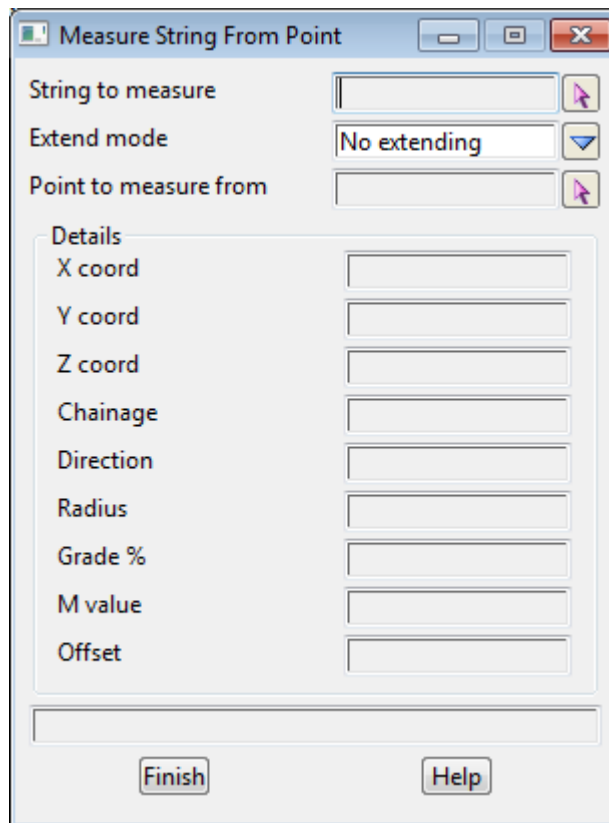

Field Description	Type	Defaults	Pop-Up
Value	output		
<i>the value calculated by the selected measure option.</i>			

String

Position of option on menu: Utilities =>Measure =>String

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting **String**, the **Measure String From Point** panel is placed on the screen.

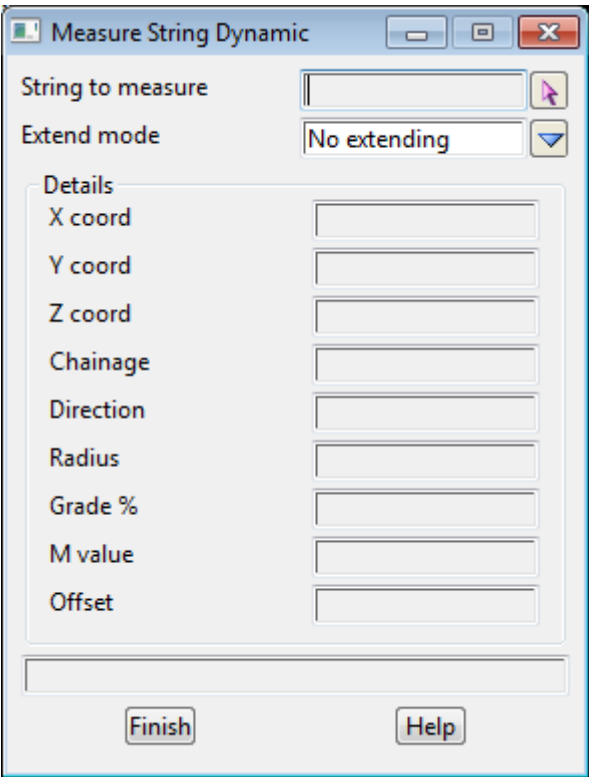

The screenshot shows a Windows-style dialog box titled "Measure String From Point". It has a standard title bar with minimize, maximize, and close buttons. The dialog contains several input fields and a list of details.

- String to measure:** A text input field with a mouse cursor icon to its right.
- Extend mode:** A dropdown menu currently showing "No extending" with a downward arrow icon to its right.
- Point to measure from:** A text input field with a mouse cursor icon to its right.
- Details:** A section containing a list of measurement parameters, each with a corresponding text input field:
 - X coord
 - Y coord
 - Z coord
 - Chainage
 - Direction
 - Radius
 - Grade %
 - M value
 - Offset
- Finish:** A button located at the bottom left of the dialog.
- Help:** A button located at the bottom right of the dialog.

String Dynamic

Position of option on menu: Utilities =>Measure =>String dynamic

This section of documentation is a work in progress and will be updated in subsequent releases.
On selecting **String dynamic**, the **Measure String Dynamic** panel is placed on the screen.

X Fall by Strings

Position of option on menu: Utilities =>Measure =>XFall by strings

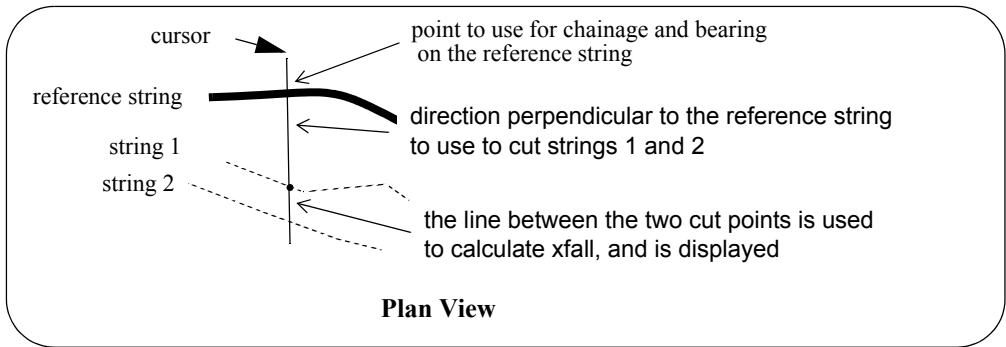

In this option, the user selects a reference string to define what is meant by chainage and right angles, and then selects two strings to calculate the x-fall between.

Once the three strings are selected, as the cursor moves around in a plan view, the cursor position is dropped perpendicularly onto the reference string.

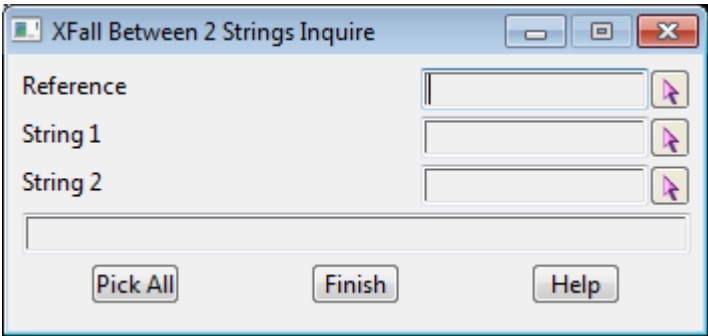

At the dropped chainage, a line is taken at right angles to the reference point and extended until it cuts the two selected strings. The xfall is then calculated between the cut points on the strings.

Then the chainage and the xfall are dynamically displayed in the panel message area.

The line joining the two strings is dynamically displayed on the plan view.

On selecting the Xfall by strings option, the **XFall Between 2 strings Inquire** panel is displayed.

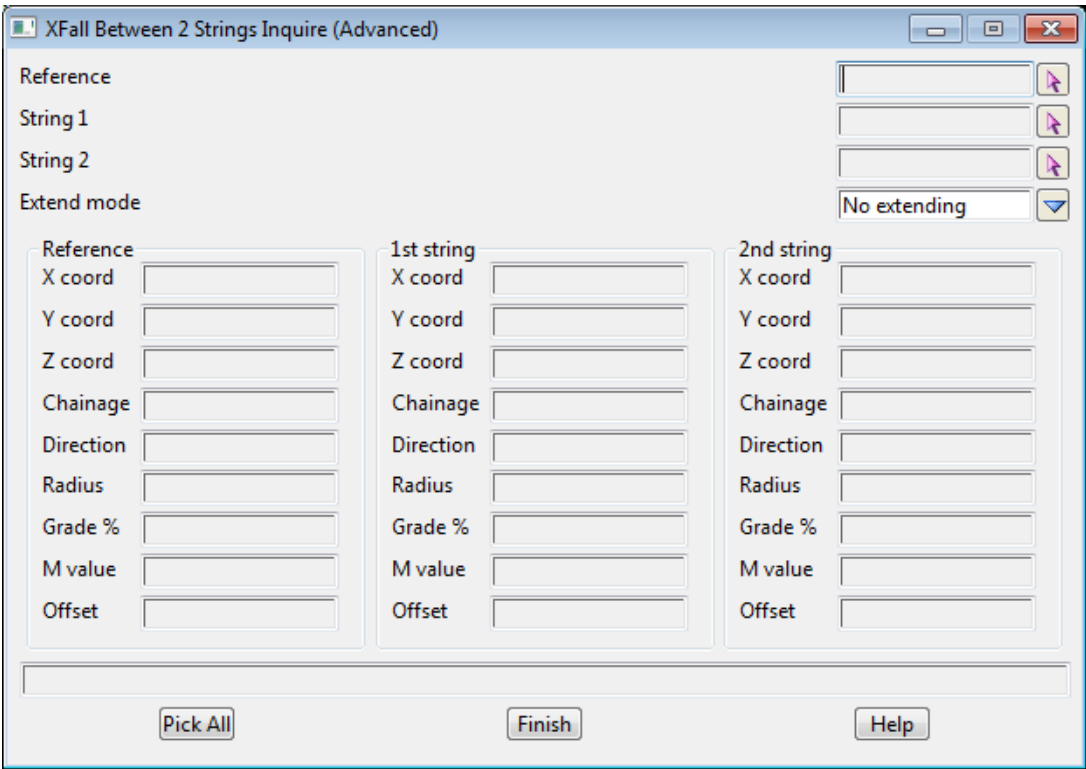

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Reference	string-select		
<i>the selected string is used to defined the meaning of chainage and bearing for the inquire. The cursor is dropped perpendicularly onto the reference string and at the dropped chainage, a line is taken at right angles to the reference point and extended until it cuts string 1 and string 2. The xfall is then calculate and displayed for the two cut points.</i>			
String 1/2	string-select		
<i>the two strings to calculate x-fall between.</i>			
Pick all	button		
<i>if pick all is selected, the user is asked to sequentially select the three strings: reference string, string 1 and string 2. The strings are automatically assigned to the appropriate string-select panel fields.</i>			

X Fall by Strings (advanced)

Position of option on menu: Utilities =>Measure =>XFall by strings (advanced)

This section of documentation is a work in progress and will be updated in subsequent releases.

Recalc

Position of menu: Utilities =>Recalc

Once a function has been applied, the calculated information is only correct whilst the initial data is not modified in any way. If any modifications are made to the data, then the function must be re-run and all the associated information recalculated and redrawn, and any perspective views associated with the function set with the new eye and target positions, and redrawn.

There are date and time stamps for all string, tin and template information in **12d Model** and this enables **12d Model** to determine what information has been modified since a function was last run and what re-calculations are required.

The **Recalc** option is designed to **re-run** functions

If LB is clicked whilst the **Recalc** menu option is highlighted, all the template functions with **auto recalc** set **on**, and that have had their initial data modified since their last re-run, will be recalculated and all appropriate information updated. The data will be redrawn on any views that is was on before the recalc.

The **Recalc** walk-right menu has four options:

For the option *Auto*, go to

Editor

Edit data

Recalc

Recalc all

Edit chain

Run chain

[Auto](#)

[Editor](#)

[Edit Data from String](#)

[Recalc](#)

[Recalc All](#)

[Edit Chain](#)

[Run Chain](#)

Auto

Position of option on menu: Utilities =>Recalc =>Auto

The **Auto** option allows the user to specify whether a function is automatically recalcd if another function, tin, template or string that it depends upon, is modified or recalcd.

Individual functions or all functions can have auto-recalc mode turned on or off and the default for a new function is **off**.

The **Function Auto** menu is

For the option Auto, go to
Auto all

[Auto](#)
[Auto all](#)

Auto

Position of option on menu: Utilities =>Recalc =>Auto =>Auto

Selecting **Auto** displays the **Auto Recalc Mode for a Function** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the function to be have auto recalc mode set on/off.</i>	input		available functions
Auto recalc <i>If the tick is on, the specified function will have its auto recalc value changed to on. If the tick is off, the specified function will have its auto recalc value changed to off.</i>	tick box	tick	
Set <i>Set the auto recalc mode for the selected function.</i>	button		

Auto all

Position of option on menu: Utilities =>Recalc =>Auto =>Auto all

Selecting **Auto all** displays the **Auto Recalc Mode For All Functions** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Auto recalc	tick box	tick	
<i>If the tick is on, all functions within the project will have their auto recalc value changed to on. If the tick is off, all functions within the project will have their auto recalc value changed to off.</i>			

Note: the tick is not a global setting within 12d. The use of the option changes every function within the project.

Set	button
<i>Set the auto recalc mode for all functions.</i>	

Editor

Position of option on menu: Utilities =>Recalc =>Editor

The Recalc=>Editor option is used to edit functions.

The Recalc=>Editor walk-right menu provides a list all the defined functions in the project.

When a function is selected from the list, it is automatically loaded into the appropriate function panel for the selected function, and displayed

The information in the selected function can then be modified.

Important Note

The defined functions menu also has a [Same as] option which is used to select the function to be edited by simply picking **any string** that was created by the function. This is documented in the next section [Edit Function from String](#).

Edit Function from String

Position of option on menu: Utilities =>Recalc =>Editor =>[Same as]

Position of option on menu: Utilities =>Recalc =>Recalc =>[Same as]

The Edit Function from String option allows the user to start up the *Function editor* by simply selecting a string that was created by the function.

On selecting the option, the **Edit Function From String** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick Edit	button		
<i>select data that was created by a function and the appropriate function editor is then opened.</i>			

Edit Data from String

Position of option on menu: Utilities =>Recalc =>Edit data

The **Edit data** option allows the user to start up the *MTF editor* by simply selecting a string that was created using an Apply Templates function (and hence an MTF file). The MTF file used in the *Apply Templates* function is automatically loaded into MTF editor (go to [MTF Edit](#)).

Similarly the **Edit data** option also allows the user to start up the *Survey Field Data editor* by simply selecting a string that was created using a *Survey Data Reduction* function. All the data produced by the *Survey Data Reduction* function is automatically loaded into the *Survey Field Data* editor (go to the section [Survey Field Data Editor](#)).

On selecting the **Edit data** option, the **Edit MTF/Survey Function Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick Edit	button		
<i>select data that was created by applying an MTF file or a Survey Data Reduction function. The appropriate MTF editor or Survey Field Data editor that created the selected data, is then opened.</i>			

For information on the *Survey Field Data Editor*, go to the section [Survey Field Data Editor](#).

For information on the *MTF Editor*, go to [MTF Edit](#).

Recalc

Position of menu: Utilities =>Recalc =>Recalc

The **Recalc** option is used to recalculate a user selected function, and all functions that depend on the function that have auto recalc set on.

The **Recalc** walk-right menu lists all the existing functions and by selecting a function name, the function will be forced to re-run and all appropriate information and views for that function will be

updated.

The existing functions menu also has a [Changed] option which recalcs all changed functions.

The existing functions menu has a [Same as] option which is used to select the function to be recalcd by simply picking **any string** that was created by the function. This is documented in the next section [Recalc Function from String](#)

Recalc Function from String

Position of option on menu: Utilities =>Recalc =>Recalc =>[Same as]

The **Recalc Function from String** option allows the user to recalcd a function by simply selecting a string that was created by the function.

On selecting the option, the **Recalc Function From String** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick Edit	button		
<i>select data that was created by a function and the appropriate function will be recalcd.</i>			

Recalc All

Position of option on menu: Utilities =>Recalc =>Recalc all

The **Recalc all** option re-runs all functions regardless of their date and time stamps.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Ignore auto recalc	tick box		
<i>if not ticked, all functions that have the auto-recalc flag set on are re-calculated.</i>			
<i>If ticked, the auto-recalc flag is ignored and all functions are re-calculated.</i>			

Edit Chain

Position of option on menu: **Utilities =>Recalc =>Edit chain**

The **Recalc=>Edit chain** option is used to edit chains.

The **Recalc=>Edit chain** walk-right menu provides a list all the defined chains in the project.

When a chain is selected from the list, it is automatically loaded into the **Edit/Create Chain** panel ready for editing.

Run Chain

Position of option on menu: **Utilities =>Recalc =>Run chain**

The **Recalc=>Run chain** option is used to run chains.

The **Recalc=>Run chain** walk-right menu provides a list all the defined chains in the project.

When a chain is selected from the list, it is automatically run.

Fence

Position of menu: Utilities => Fence

It is often necessary to divide strings into those parts that are within a certain region and those parts that are outside the region. In 12d Model, the Fence option is the method of achieving this result.

Given a string to be used as a fence, the 12d Model fencing options will process strings in a model/view against the fence and break the strings into the parts inside the fence string and those parts outside the fence string.

Any 2d, 3d or interface line-strings that cut the fence polygon will have points inserted at the intersections with the fence polygon. The z-value at the intersection point will be interpolated from the adjacent points in the line-string.

Point strings do not have any extra points added to them.

Restrictions

- s only 2d, 3d and interface strings can be split using the fence option.
- s 4d strings are treated as though they were point strings.
- s arcs are considered to be **inside** the fence if the minimum bounding rectangles of the fence and arc overlap.
- s alignment, pipeline, drainage, sewer strings are not processed by the fence option

Notes

1. if the fence string is not closed, the first and last points are joined together to form a closed polygon as the fence.
2. a string may be broken into a number of pieces if it wanders in and out of the fence string.
3. the fence string is not processed against itself even if it is in the model or view being fenced.
4. unpredictable results will occur if any strings being fenced lie on top of the fence. If problems occur, parallel the fence in or out by a millimetre.

The fence options allows the user to choose a single string to be used as the polygon fence or a number of strings to be used as polygons and process the data against all the strings in one operation.

The fence walk-right menu is

For the option *Fence*, go to

Fence stem

Multi fence

Multi fence stem

[Fence](#)

[Fence Stem](#)

[Multi Fence](#)

[Multi Fence Stem](#)

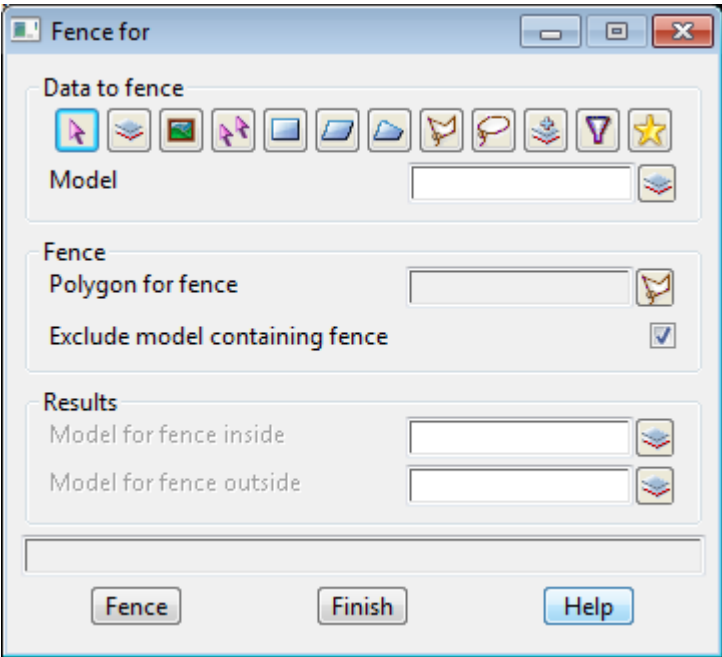

Fence

Position of option on menu: Utilities =>Fence =>Fence

In this option, the user selects a single string to be used as a polygon fence. If the string is not closed, the first and last points are joined together to form a polygon.

The Fence option will process a selected string or all the strings in a model/view/string against this fence and break the strings into the parts inside the fence string and those parts outside the fence string.

On selecting the Fence option and then the appropriate **Data Source** in the panel, the **Fence for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type				
	data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source				
	data source for strings to fence.			
Polygon for fence		string-select		
	the selected string will be used as the polygon to act as a fence to separate data into an inside and an outside.			
Exclude model containing fence		tick box	ticked	
	if ticked , no data in the model containing the fence string will be fenced. if not ticked , all the appropriate data in the model containing the fence string will be fenced.			
Model for fence inside		input		available models
	if non-blank , name of the model to contain the data inside of the fence string. If blank , then no fence inside will be calculated.			
Model for fence outside		input		available models
	if non-blank , name of the model to contain the data outside of the fence string. If blank , then no fence outside will be calculated.			

Fence button

*on selecting **fence**, the appropriate strings in the data source will be divided by the fence string (selected by the **poly** button) into the parts of the strings inside the fence string and the parts of the string outside the fence string. Any line-strings that cut the fence string will have a point inserted at the intersection with the fence string and the z-value for this point interpolated from the points on either side of it in the line-string.*

How to Use the Panel and Panel Messages

- (a) Select a fence polygon string by choosing **Polygon to fence**
- (b) Fence processing begins on selecting the **Fence** button.

Progress messages - sent to the panel message area

calculating inside-outside

calculating inside

calculating outside

fencing *string name*

Completion message - sent to the panel message area

finished fence

<esc> can be used to abort the fence option.

Fence Stem

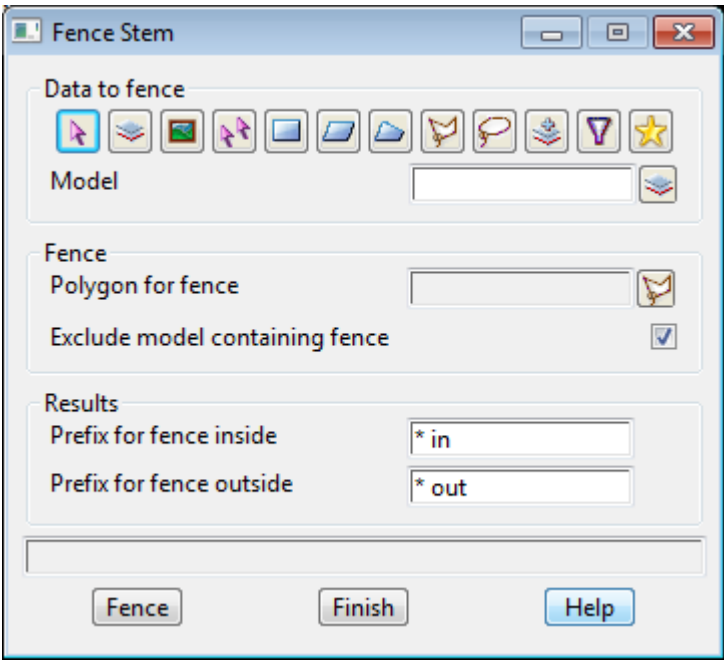

Position of option on menu: Utilities => Fence => Fence stem

As for the **Fence** option, the user selects a single string to be used as a polygon fence. If the string is not closed, the first and last points are joined together to form a polygon.

The **Fence Stem** option will process a selected string or all the strings in a model/view against this fence and break the strings into the parts inside the fence string and those parts outside the fence string. The inside and outside will then be put into models of the same name as the original model modified by a prefix and/or postfix.

This means that unlike the **Fence** option, when fencing a view with the **Fence Stem** option, the inside/outside for each model on the view goes to distinct models using the prefix/postfix for the inside/outside model names.

On selecting the **Fence Stem** option and then the appropriate **Data Source** in the panel, the **Fence Stem** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source	data source for strings to fence.			
Prefix for fence inside		input		available models
	if non-blank , prefix*postfix to adjust the data model name to be the model to contain the data inside of the fence string. If blank , then no fence inside will be calculated.			
Prefix for fence outside		input		available models
	if non-blank , prefix*postfix to adjust the data model name to be the model to contain the data outside of the fence string. If blank , then no fence outside will be calculated.			
Polygon for fence		string-select		
	the selected string will be used as the polygon to act as a fence to separate data into an inside and an outside.			
Exclude model containing fence		tick box	tick	
	if ticked , no data in the model containing the fence string will be fenced. if not ticked , all the appropriate data in the model containing the fence string will be fenced.			
Fence		button		
	on selecting Fence , the appropriate strings in the data source will be divided by the fence string into the parts of the strings inside the fence string and the parts of the string outside the fence string. Any line-strings that cut the fence string will have a point inserted at the intersection with the fence string and the z-value for this point interpolated from the points on either side of it in the line-string.			

<esc> can be used to abort the fence option.

Multi Fence

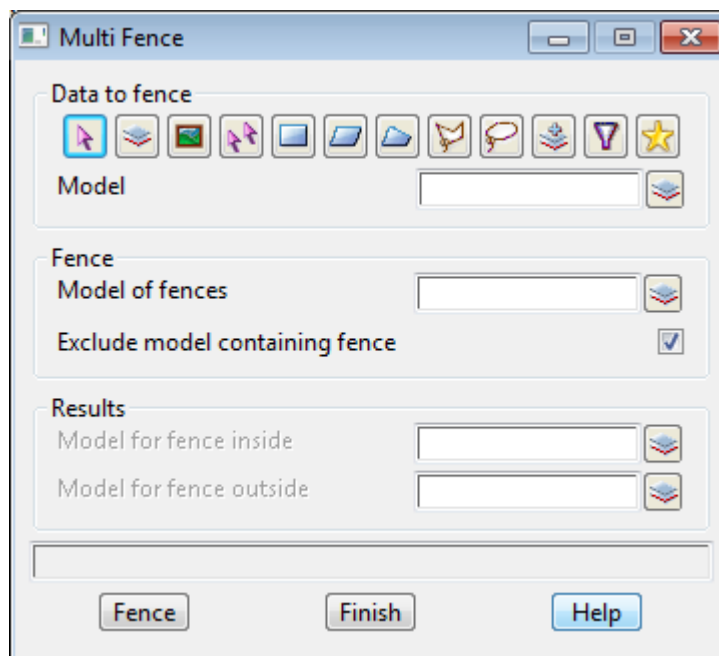

Position of option on menu: Utilities => Fence => Multi fence

It is often necessary to fence data against more than one polygon.

In the **Multi fence** option, the user provides a model containing all the polygons to be used as fences. The **Multi fence** option will process the selected string or all the strings in a model/view against all the polygons in the polygon model.

The data will be clipped and the **outside** is considered to be those bits are **outside all** of the polygons and the inside is the remainder, i.e. the bits **inside any one** of the polygon.

On selecting the **Multi fence** option and then the appropriate **Data Source** in the panel, the **Multi Fence String/Model/View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>data source for strings to fence.</i>			
Model of fences	input		available models
<i>name of the model that contains the polygons to be used as fences.</i>			
Model for fence inside	input		available models
<i>name of the model to contain the data that is inside any one of the fences. If this field is blank, then no fence inside will be calculated.</i>			
Model for fence outside	input		available models
<i>name of the model to contain the data outside all of the fences. If this field is blank, then no fence outside will be calculated.</i>			
Exclude model containing fence	tick box	tick	
<i>if ticked, no data in the model containing the fence string will be fenced.</i>			
<i>if not ticked, all the appropriate data in the model containing the fence string will be fenced.</i>			

Fence

button

the appropriate strings in the data source will be divided by the fence polygons (from the model of fences) into the parts of the strings inside any one fence and the parts of the string outside all of the fences. Any line-strings that cut the fences will have a point inserted at the intersection with each fence and the z-value for this point interpolated from the points on either side of it in the line-string.

<Esc> can be used to abort the multi-fence option.

Multi Fence Stem

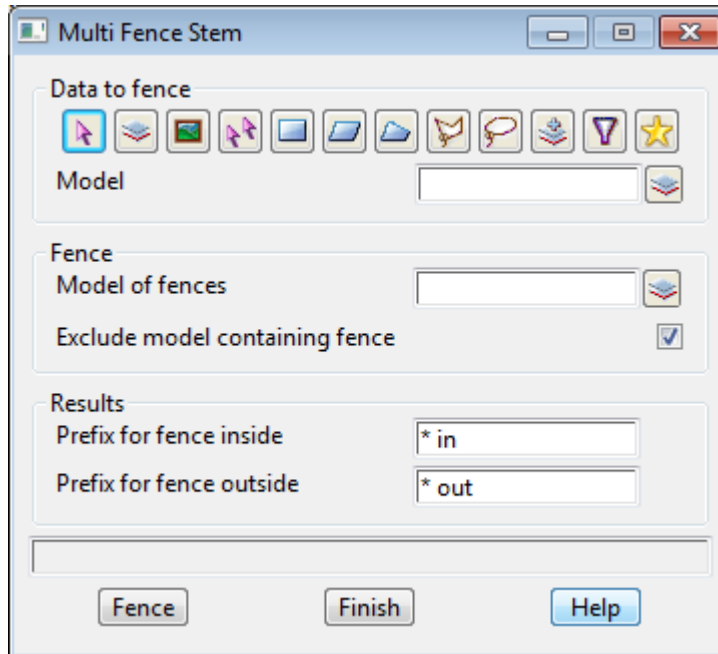

Position of option on menu: Utilities => Fence => Multi fence stem

It is often necessary to fence data against more than one polygon.

In the **Multi fence stem** option, the user provides a model containing all the polygons to be used as fences. The **Multi fence stem** option will process selected strings or all the strings in a model/view against all the polygons in the polygon model.

The data will be clipped and the **outside** is considered to be those bits are **outside all** of the polygons and the **inside** is the remainder, i.e. the bits **inside any one** of the polygon.

On selecting the **Multi fence stem** option and then the appropriate **Data Source** in the panel, the **Multi Fence Stem String/Model/View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>data source for strings to fence.</i>			
Model of fences	input		available models
<i>name of the model that contains the polygons to be used as fences.</i>			
Prefix for fence inside	input		available models
<i>if non-blank, prefix*postfix to adjust the data model name to be the model to contain the data inside of the fence string.</i>			
<i>If blank, then no fence inside will be calculated.</i>			
Prefix for fence outside	input		available models
<i>if non-blank, prefix*postfix to adjust the data model name to be the model to contain the data outside of the fence string.</i>			
<i>If blank, then no fence outside will be calculated.</i>			

Exclude model containing fence tick box tick

*if **ticked**, no data in the model containing the fence string will be fenced.*

*if **not ticked**, all the appropriate data in the model containing the fence string will be fenced.*

Fence button

the appropriate strings in the data source will be divided by the fence polygons (from the model of fences) into the parts of the strings inside any one fence and the parts of the string outside all of the fences. Any line-strings that cut the fences will have a point inserted at the intersection with each fence and the z-value for this point interpolated from the points on either side of it in the line-string.

<Esc> can be used to abort the multi-fence option.

Coordinate Transformations - Helmert and Affine

A **2D Helmert** transformation is a two dimensional linear transformation consisting of a scaling, a rotation (of both the x-axis and y-axis about the vertical axis) and a 2D- translation (shift) of data. Hence there are four parameters to be specified.

A **3D Helmert** transformation is a three dimensional linear transformation consisting of a scaling, three rotations (about the 3 axes), and a 3D-translation (shift) of data. Hence there are 7 parameters to be specified.

A **2D affine transformation** is a two dimensional linear transformation consisting of a 2D-translation (shift) of the data, a scaling of the data in two different directions and rotations of the x-axis (about the vertical axis) and of the y-axis (about the vertical axis). Hence there are six parameters to be specified. Unlike the Helmert transformations, rectangles can be skewed by an affine transformation.

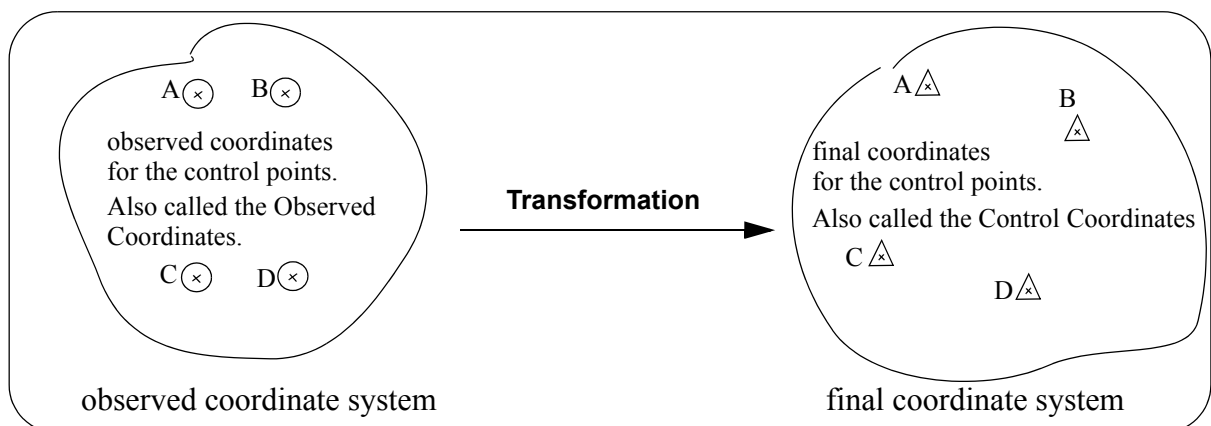

A **2D orthogonal affine transformation** is a two dimensional linear transformation consisting of a 2D-translation (shift) of the data, a scaling of the data in two different directions and the same rotation (of both the x-axis and y-axis like the Helmert). Hence there are five parameters to be specified. Unlike the standard affine transformations, rectangles are not skewed by the orthogonal affine transformation.

These types of transformation are often used in civil projects for converting data between a local coordinate system (observed coordinates) and another coordinate system.

The most frequent method of defining all these transformations is not by explicitly giving the transformation parameters but by having both the observed **and** the final coordinates for three or more points (known as the **control points**) and then trying to calculate the transformation parameters from these sets of coordinates.

If the transformation parameters can be successfully calculated from the observed-final coordinate pairs for the control points, then the transformation parameters are then be used to convert the coordinates of any other object in the observed coordinate system to the new final coordinates.

So for this method, the first step is to select **control points** for which the coordinates are known in the final coordinate system and in the local (observed) coordinate system.

And in the diagram above, the observed coordinates of the control point A are to be mapped by the transformation to the coordinates of the control point A in the final coordinate system. And similarly for the points B, C and D.

Note that A is the same point on the ground - it just has a different coordinate in a different coordinate system and hence will appear in a different place in a diagram for each coordinate

system.

Usually each control point is selected because

- (a) its final coordinates are already known
 - (b) there is a marker on the ground indicating the exact position of the control point
- and
- (c) the control point is the area that is being surveyed (observed).

The control point is then surveyed to get its observed coordinates.

Because the final coordinates of the control points are known in advance, the final coordinates of the control point are referred to as the **Control Coordinates**, or **Control Easting** and **Control Northing** and the control point coordinates often referred to as the **Control Point**. The surveyed coordinates of the control point are called as the **Observed Coordinates** or **Observed Easting** and **Observed Northing** (of the control point).

IMPORTANT NOTE - the control points must be selected so that they are spread throughout the area, and the control points must not all be on the one straight line.

The number of parameters to be determined for the transformation ranges from three in a fixed scale 2D Helmert up to seven for a 3D Helmert so there must be enough control points to provide sufficient independent equations to be able to solve for the parameters. Also all survey measurements have errors in them and it is best to have more than the minimum number of required control points to help control errors.

However when there are four or more control-observed point pairs, the system will be over determined. That is, by taking different subsets of the control-observed point pairs, different transformation parameters will result.

In this situation, **12d Model** uses **Least Squares** to calculate the transformation parameters from the over determined systems.

Once the transformation parameters have been calculated by Least Squares, for each of the control points the transformation can be applied to the observed coordinates of the control point. The difference between the Control Coordinates and the transformed Observed Coordinates for a control point is called the **residuals** for the transformation.

The **residuals** for the least squares solution gives a measure of how good the Least Squares solution was, and for checking purposes, the residuals are displayed in the transformation panel for each of the control-observed point pairs.

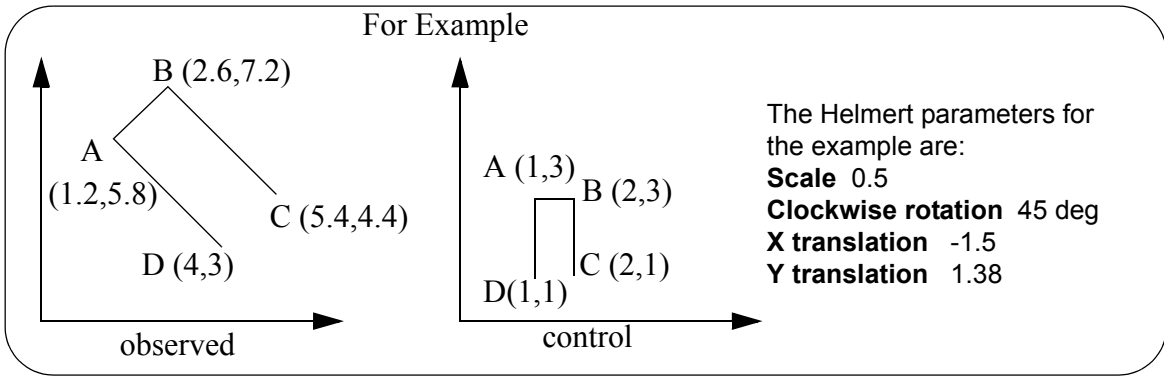

As an example of the meaning of the transformation parameters, we'll look at the 2D Helmert transformation.

The 2D Helmert has four parameters:

- (a) the scale factor for the existing coordinates with respect to the new coordinates
- (b) the (z axis) rotation of the existing coordinates to align it with the new coordinates axis
- (c) the two (x and y) translations of the existing coordinates after the scalings and rotations have been applied

and the operations to be performed on observed coordinates are:

1. Scale the observed coordinates about (0,0) by the *Scale* factor
2. Then rotate the resulting coordinates about (0,0) in a clockwise direction by the *Clockwise rotation* degrees.
3. Then translate the resulting coordinates by ((X translation, Y translation).

For information about how to select control and observed points in the Affine and Helmert panels, go to the next section [Selecting Control and Observed Points for the Helmert and Affine Transformations](#)

Selecting Control and Observed Points for the Helmert and Affine Transformations

For the Affine and Helmert transformations, the parameters can be either typed in or calculated from control-observed point pairs using the method of least squares.

If the **Parameters by** choice box is set to **Pt Selection** then control-observed point pairs are selected by the user and the pairs are written to the grids on the panels.

Control

Calculate

Grid for 3D transformations

If the **Pt selection** method is chosen, the selection of points is started by selecting the **Control** button.

Note - the default is to select the **Control Point** (the coordinates of the control point in the transformed coordinate system) and then its associated **Observed Point** (the coordinates of the control point in the observed system).

Neither point is accepted until the second point is selected.

However the **order** of selection can be **reversed** by setting the environment variable **PICK_ORDER_OBSERVED_FIRST_4D** (see [env.4d](#) in the chapter [Projects](#)). The order can then be **Observed Point first** and then its associated **control point with Control Coordinates**.

To help reduce errors, after a control point - observed point pair is selected, the position of the Control Point is shown as a triangle and the position of the associated Observed Point as a circle with a line drawn between the control-observed point pair for clarity

After selecting the **Control** button, the selection starts with the Control (Observed) Point,

accepting that point then selecting the corresponding Observed (Control) Point.

After selecting the first pair of points, the second pair is then selected and so on.

The picking is terminated by clicking **RB** and selecting **Cancel** when the next control (observed) point is to be selected.

The coordinates of the Control Points and Observed Points are added to the grid on the selection of two valid points. The **Use pt** field is ticked by default.

Use point column →

	Use pt	Control Easting	Control Northing	Observed Easting	Observed Northing	Residual Easting	Residual Northing
1	<input checked="" type="checkbox"/>	89621.0175	73418.2203	90542.9037	73734.1936		
2	<input checked="" type="checkbox"/>	90014.635	73150.7295	90827.5429	73541.8698		
3	<input checked="" type="checkbox"/>	89621.0175	73150.7295	90409.5592	73446.9901		
4	<input checked="" type="checkbox"/>	90014.635	73418.2203	90960.8874	73829.0734		
5	<input checked="" type="checkbox"/>						

After the selection process is terminated, additional control-observed point pairs can be selected at any time by simply clicking on the **Control** button again. The new control-observed point pairs are added after the existing control-observed point pairs.

If **Use pt** is set to tick, the corresponding control-observed point pair is used in the calculations. If **Use pt** is not ticked, the corresponding control-observed point pair is ignored and not used.

The **Calculate** button calculates the transformation parameters based on all the control-observed point pairs in the grid with the **Use pt** tick box ticked on.

The residuals are placed into the residual columns of the grid and the calculated parameters are placed into the parameters section of the panel.

	Use pt	Control Easting	Control Northing	Observed Easting	Observed Northing	Residual Easting	Residual Northing
1	<input checked="" type="checkbox"/>	89621.0175	73418.2203	90542.9037	73734.1936	76.42145	-51.17784
2	<input checked="" type="checkbox"/>	90014.635	73150.7295	90827.5429	73541.8698	-76.42145	51.1778
3	<input checked="" type="checkbox"/>	89621.0175	73150.7295	90409.5592	73446.9901	-38.60317	-26.98948
4	<input checked="" type="checkbox"/>	90014.635	73418.2203	90960.8874	73829.0734	38.60317	26.98953
5	<input checked="" type="checkbox"/>						

Residuals columns →

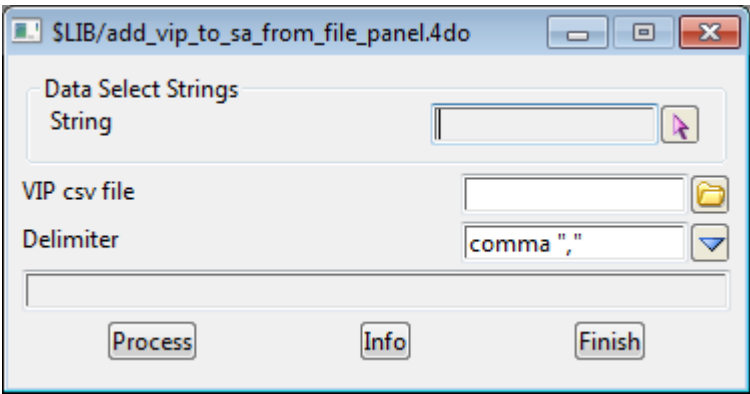

If the **Parameters by** choice box is set to **Direct entry**, the transformation parameters are manually entered into the panel and the grid section is not used.

Add VIP to SA From File

Position of option on menu: Utilities =>A-G =>Add VIP to SA from file

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting Add VIP to SA from file, the **Add VIP to SA from file** panel is displayed.

2D Affine

Position of option on menu: Utilities =>A-G =>Affine

An affine transformation is a two dimensional linear transformation consisting of a 2D-translation (shift) of the data, a scaling of the data in two perpendicular directions and a rotation of the x-axis and the y-axis. Hence there are six parameters to be specified. Unlike the Helmert transformations, rectangles can be skewed by an affine transformation.

So the affine parameters are

- (a) the x-scale factor for the observed co-ordinates with respect to the control coordinates
- (b) the y-scale factor for the observed co-ordinates with respect to the control coordinates
- (c) the rotation of the x-axis of the observed co-ordinates to align it with the control x co-ordinates axis
- (d) the rotation of the y-axis of the observed co-ordinates to align it with the control y co-ordinates axis
- (e) the x and y translation of the existing co-ordinates after the scalings and rotations have been applied

For information on the affine transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

Notes on Transformations applied to Rasters

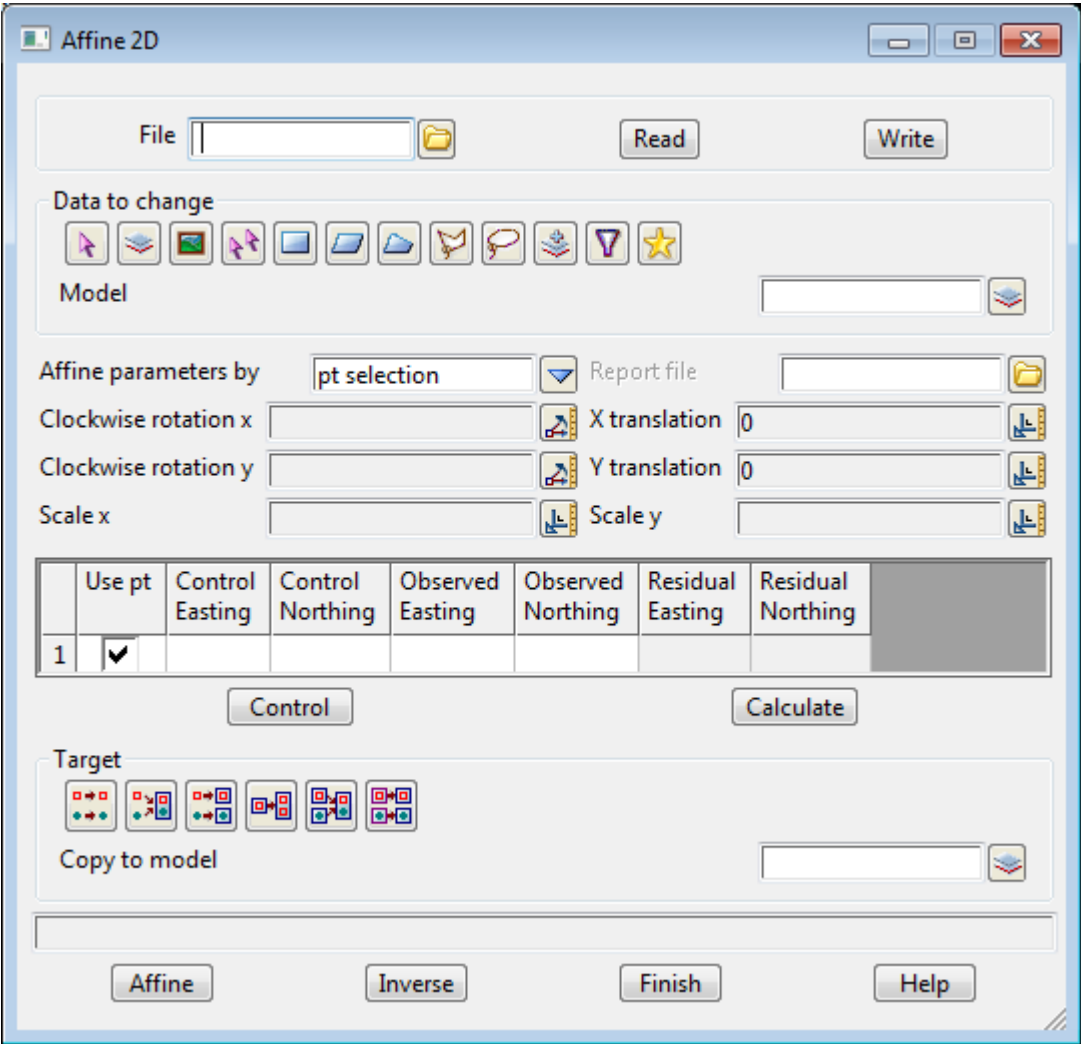

12d Rasters (including ECW rasters) may have transforms applied with any transformation panel with the following constraints:

1. "Replace existing data" is the only output option supported.
2. The set of parameters supplied for the transformation, when applied to the four corners of the original raster, results in a rectangle.
3. The raster cannot be selected as a string to be transformed, it should be placed in a model on its own and the model selected as the '**Data to change**'.

The raster images themselves will not be altered, only the model information which maps them into world coordinates is changed.

For the Affine panel, this means that different x and y scaling factors may be used, however the two axis rotations must be identical.

On selecting **Affine 2D**, the **Affine 2d** panel is displayed.

If the **Parameters by** choice box is set to **Pt Selection** then control-observed point pairs are selected by the user and the pairs are written to the grid on the panel. See the section [Selecting Control and Observed Points for the Helmert and Affine Transformations](#) for information on picking control and observed points.

If the **Parameters by** choice box is set to **Direct entry**, the transformation parameters are manually entered into the panel and the grid section is not used.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
File		file box		*.aaf files
	<i>a filename can be specified for reading or writing a file to restore the panel contents for re-use.</i>			
Read		button		
	<i>if a valid file exists, the file contents can be loaded into the panel.</i>			
Write		button		
	<i>if a valid name is specified, the user can write the input data to a file.</i>

Affine button
apply the affine transformation to the data specified in the source box, and put it into the appropriate target area.

2D Affine - Orthogonal

Position of option on menu: Utilities =>A-G =>Affine 2D orthogonal

A **2D orthogonal affine transformation** is a two dimensional linear transformation consisting of a 2D-translation (shift) of the data, a scaling of the data in two different directions and the same rotation of both the x-axis and y-axis (about the z axis, like the Helmert). Hence there are five parameters to be specified. Unlike the standard affine transformations, rectangles can not be skewed by the orthogonal affine transformation.

Hence the orthogonal affine parameters are

- (a) the x-scale factor for the observed co-ordinates with respect to the control coordinates
- (b) the y-scale factor for the observed co-ordinates with respect to the control coordinates
- (c) the same rotation of the x-axis and y-axis of the observed coordinates to align it with the control x and coordinate axis
- (d) the x and y translation of the observed coordinates after the scalings and rotations have been applied

For information on the affine transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

Notes on Transformations applied to Rasters

12d Rasters (including ECW rasters) may have transforms applied with any transformation panel with the following constraints:

1. "Replace existing data" is the only output option supported.
2. The set of parameters supplied for the transformation, when applied to the four corners of the original raster, results in a rectangle.
3. The raster cannot be selected as a string to be transformed, it should be placed in a model on its own and the model selected as the '**Data to change**'.

The raster images themselves will not be altered, only the model information which maps them into world coordinates is changed.

For this panel, this means that different x and y scaling factors may be used.

On selecting **Affine 2D orthogonal**, the **Orthogonal Affine** panel is displayed.

If the **Parameters by** choice box is set to **Pt Selection** then control-observed point pairs are selected by the user and the pairs are written to the grids on the panels. See the section [Selecting Control and Observed Points for the Helmert and Affine Transformations](#) for information on picking control and observed points.

If the **Parameters by** choice box is set to **Direct entry**, the transformation parameters are manually entered into the panel and the grid section is not used.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.ortho_aaf files
<i>a filename can be specified for reading or writing a file to restore the panel contents for re-use.</i>			
Read	button		
<i>if a valid file exists, the file contents can be loaded into the panel.</i>			
Write	button		

if a valid name is specified, the user can write the input data to a file.

Clockwise rotation angle box

the rotation of both x and y axes of the existing points with respect to the transformed x and y axes.

Fixed scale? ☐ tick box

if ticked, the x and y scales are typed into the X/Y Scale fields and are held fixed when the orthogonal affine parameters are calculated from the selected control-observed point pairs.

Scale x input/output

the x-scale factor for the existing co-ordinates with respect to the transformed coordinates

Scale y input/output

the y-scale factor for the existing coordinates with respect to the transformed coordinates

X Translation input/output

the x translation of the existing coordinates with respect to the transformed coordinates

Y Translation input/output

the y translation of the existing coordinates with respect to the transformed coordinates

Origin method	choice box	Pick	Pick, Obs'd centroid Ctrl centroid
----------------------	------------	------	---------------------------------------

the translation can be reported against another origin than the default (0,0).

Origin X/Y coordinate input

the translation parameters are written out with respect to this origin.

Control button

restarts the selection process for choosing more control points.

Calculate button

calculate the orthogonal affine parameters from the selected points shown in the grid.

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Affine button

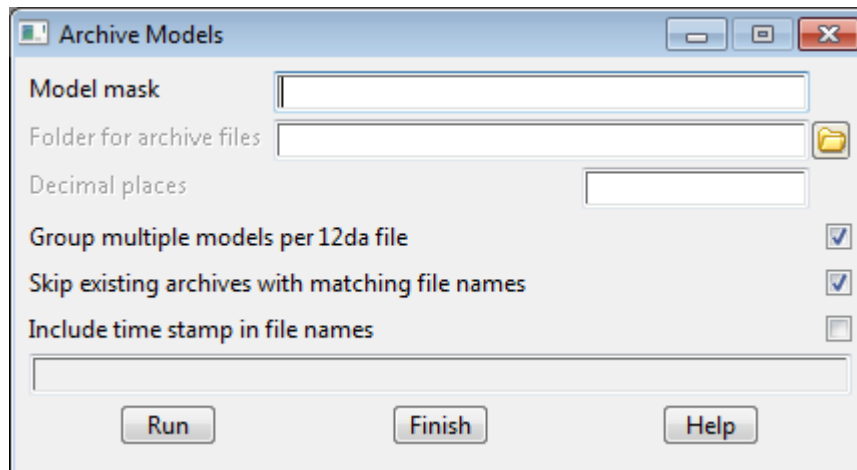

apply the orthogonal affine transformation to the data specified in the source box, and put it into the appropriate target area.

Archive Models

Position of option on menu: Utilities =>A-G =>Archive models

This option saves all models matching a specified model mask, to 12d-ascii files named in the style: <model name/prefix>[YYYYMMDD HHMMSS].12da

On selecting the **Archive models** option, the **Archive models** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults
Model mask	<i>specifies the model(s) to archive. Use '*' and '?' wildcards to specify multiple models.</i>	input text	
Folder for archive files	<i>a pre-existing folder to write the 12da files to. If unspecified, will write to backups.4d or working folder, depending on the environment variable \$USE_BACKUPS_4D_FOLDER_4D.</i>	folder	
Decimal places	<i>Number of decimal places to use when writing the 12da files. If unspecified, 15 decimal places are used.</i>	integer	
Group multiple models per 12da file	<i>if ticked, multiple models may be archived per 12da file, based on the matching first word of each model name. (The first word is the prefix of the model name, before the first space.) If not ticked, one model is archived per 12da file.</i>	tick box	ticked
Skip existing archives with matching file names	<i>if ticked, existing 12da files with matching names are left untouched and not re-archived. If not ticked, existing files are overwritten.</i>	tick box	ticked
Include time stamp in the file names	<i>if ticked, include archive date and time stamp in the file names, in the style: YYYYMMDD HHMMSS</i>	tick box	not ticked
Run	<i>runs the option</i>	button	

Special Note

The **Archive Models** option is a macro, which may optionally be run from a chain via arguments, rather than via an interactive panel. The details of the argument syntax are written to the Output Window, whenever the macro is run without valid arguments, namely:

Output Window

```
=====
12d Macro: "model_archive_panel.4do" started ...

Saves all models matching <model mask> to 12d-ascii files named: "<model name/prefix>[ YYYYMMDD HHMMSS].12da".

Usage with no arguments: macro is run with a panel interface.

Usage with arguments: model_archive_panel <model mask> [-f <folder>] -group -skip -timestamp

Arguments:
<model mask> = Models to be archived. Use "*" and "?" wildcards to specify multiple models.
[-f <folder>] = Existing folder to write 12da files to. If unspecified, will write to backups.4d or working folder, depending on $USE_BACKUPS_4D_FOLDER_4D.
-group = Group multiple models per 12da file, based on matching first word of model name. If unspecified, one model is archived per 12da file.
-skip = Existing 12da files with matching names are left untouched and not re-archived. If unspecified, existing files are overwritten.
-timestamp = Include archive date and time stamp in file names ["YYYYMMDD HHMMSS" format].

eg1: model_archive_panel OJT* -f ".\survey_archive" -group -skip
eg2: model_archive_panel "CONTROL*" -timestamp
```

Cartographic Projections

Position of option on menu: Utilities =>A-G =>Cartographic

The **Cartographic** option is used to transform data based on the same datum between

- (a) two different cartographic projections (based on the same datum)
- (b) longitude and latitude and a cartographic projection (based on the same datum)
- (c) a cartographic projection and longitude and latitude (based on the same datum).

The *Cartographic* option has already been documented in the section [Cartographic](#) in the chapter [Survey](#)

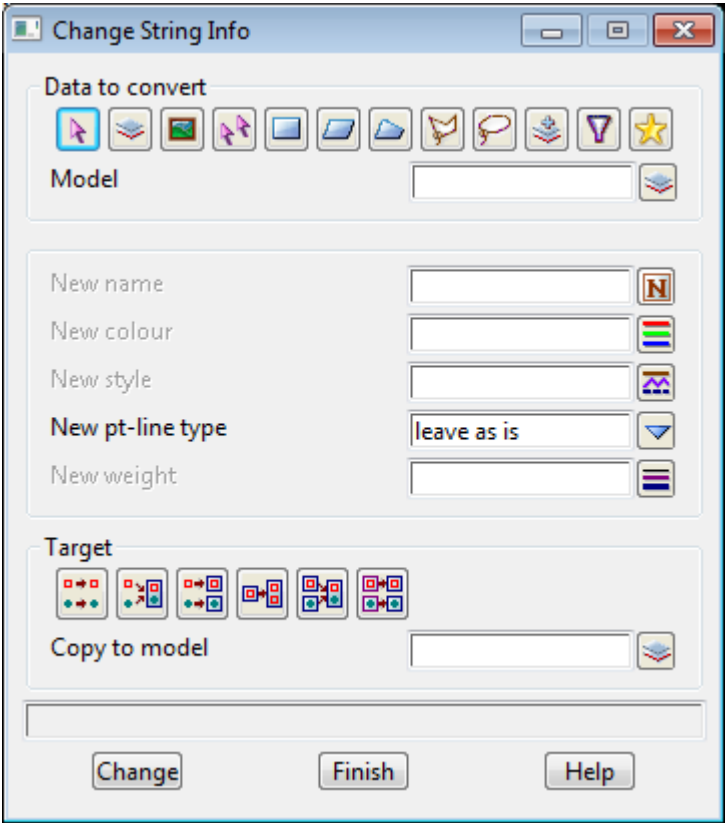

Change

Position of option on menu: Utilities =>A-G =>Change

This **Change** option is similar to the **Change** option from the **Strings** edits menu.

For the selected strings, **Change** can modify the colour, name, breakline type, style and model of each string.

On selecting the **Change** option, the **Change String Info** panel is displayed.

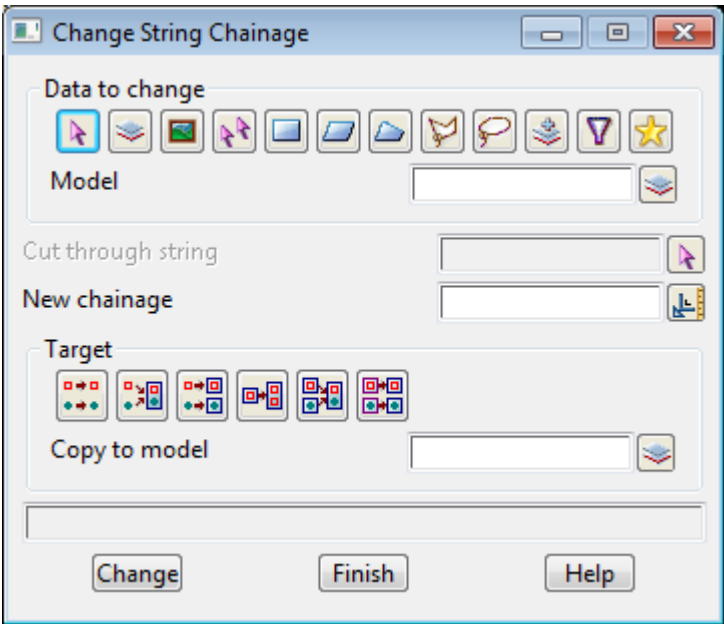

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source		input		
	source of data to be changed.			
New name		input		
	if non-blank, then the name of the selected strings will be changed to the name given in the new name field.			
New colour		input		available colours
	if non-blank, then the colour of the selected strings will be changed to the colour given in the new colour field.			
New style		input		
	if non-blank, then the linestyle of the selected strings will be changed to the given in the new style field.			

New pt-line type	input	leave as is	leave as is, point, line
<i>if leave as is, then the point-line type of the selected string will be not be changed.</i>			
<i>If point string or line string, then the point-line type of the selected string will be changed to that type.</i>			
New weight	input	leave as is	leave as is, point, line
<i>if non-blank, then the weight of the selected strings will be changed to the given in the new weight field.</i>

Check/Clash

Position of menu: Utilities =>A-G =>Check/clash

Check/clash options run checks on strings, and clashes between strings.

The Check/Clash walk-right menu is

check for crossing breaklines, duplicate vertices etc

run checks on a polygon

check strings against a mapping file etc

check strings clashing in 3d

For *Check breaklines*, go to

[Check Breaklines, Duplicate Vertices, Identicals](#)
in the chapter [Triangles](#)

Check polygon

[Check Polygon](#)

Check strings

[Check Strings](#)

3d service clash

[Strings Clash in 3d](#)

Check Polygon

Position of option on menu: Utilities =>A-G =>Check/clash =>Check polygon

Check polygon checks to see if a polygon passes the polygon checks performed by a polygon box.

The checks are to try and ensure that the polygon is suitable for use in some **12d** options.

For example, a polygon that crosses over itself, or has duplicate vertices, or has edges partially on top of other edges, or in parts consists of a single line, are not usable in most options requiring a polygon (fence) for calculations.

The **Exact Volumes** options in particular are very sensitive to having a well formed polygon whereas other options can use polygons that are unsuitable for *Exact Volumes*.

Some of the things that make a polygon unsuitable (and will produce the message "bad polygon" or "bad poly") are:

- (a) self intersects in the polygon
- (b) multiple vertices at the same (x,y) location
- (c) sides being partially on top of other sides
- (d) corners just touching other sides or vertices
- (e) parts of the polygon that contain no area. For example, a loop at one end and then a line going out from the loop. The line does not enclose any area. This may be created by contouring a surface that contains has a ridge line of constant height.

Errors in the polygon are reported in the **Output Window** with intelligent log lines to help find the section of the polygon with the error.

Selecting **Check polygons** brings up the **Check Polygon** panel

The fields and buttons used in the panel have the following functions.

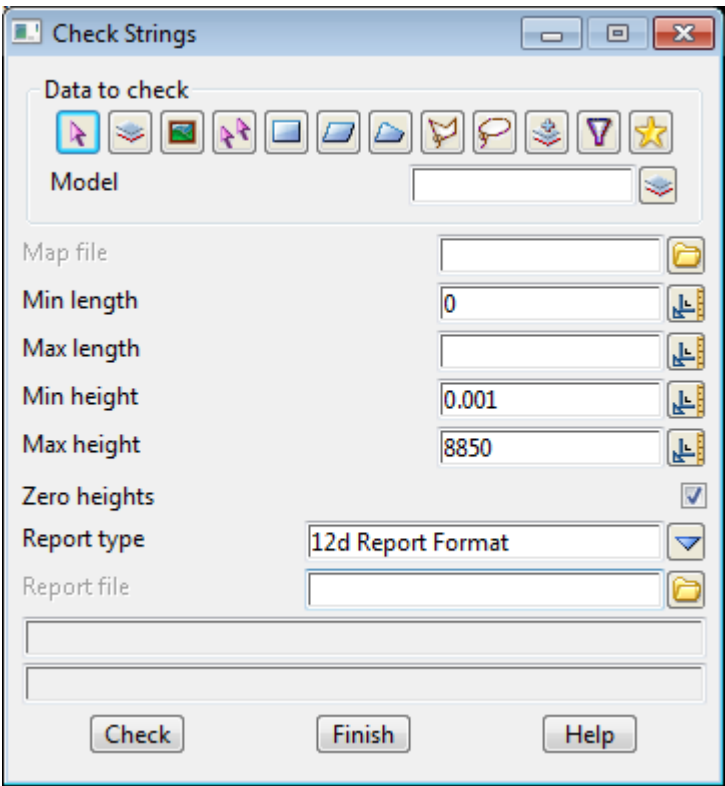

Field	Description	Type	Defaults	Pop-Up
Polygon	<i>select a polygon to check</i>	polygon box		
Output model	<i>if non blank, the resolved polygon is added to this model</i>			
Check	<i>perform the polygon checks. Error messages are written to the Output Window as Intelligent Log Lines to help find the problems.</i>	button		

Check Strings

Position of option on menu: Utilities =>A-G =>Check/clash =>Check strings

Check strings compares selected strings against a mapping file and also checks distances between vertices on strings.

Selecting Check strings brings up the **Check Strings** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be processed.</i>			
Map file		map file box		
	<i>if a map file is picked then each selected string is compared against the map file keys and if any matches occur, the string attributes must agree with the map file fields of the matched key. Any differences will be reported to the Output window and the Report file.</i>			
Min length		input		
	<i>report if any distance between adjacent vertices in a string is less than Min length.</i>			
Max length		input		
	<i>report if any distance between adjacent vertices in a string is greater than Max length.</i>			
Min height		input		
	<i>report if any vertex height is less than Min height.</i>			
Max height		input		
	<i>report if any vertex height is greater than Max height.</i>			

- Zero heights

if ticked, any vertex heights equal to 0.0 will be reported. It is vary rare that any height is exactly 0.0
- Report file

*if **non blank**, any failures are reported in this file.*
- Check

button

process the selected strings

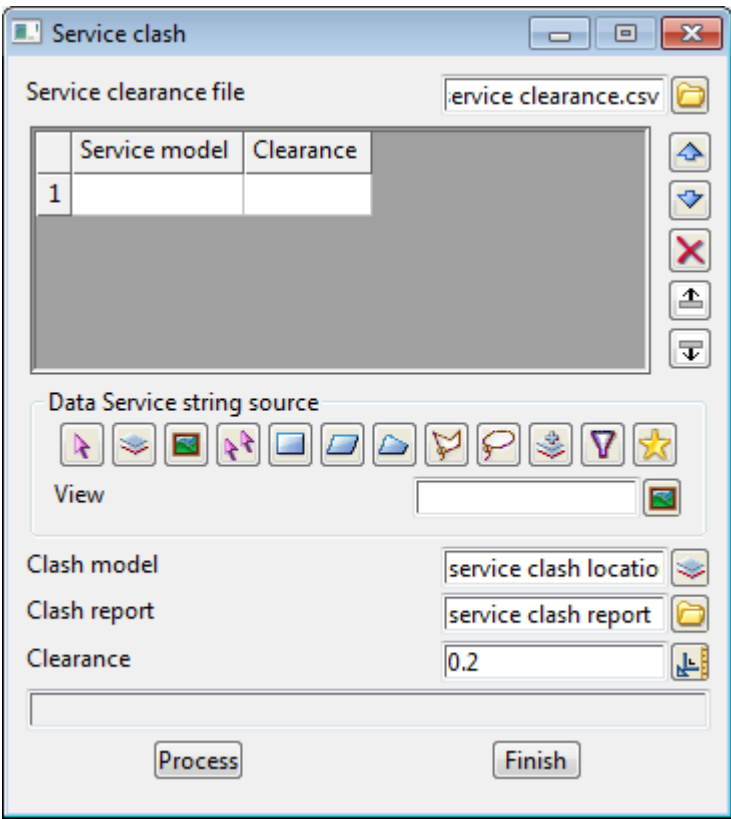

Strings Clash in 3d

Position of option on menu: Utilities =>A-G =>Check/clash =>3d service clash

3d service clash compares selected models of strings and checks to see if they intersect each other.

Selecting 3d service clash brings up the **Service Clash** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Service clearance file	file box		*.csv files

csv file containing a list of model names and clearances. This file is read in as soon as the option starts and fills out the Service and Clearance grid.

Grid - Service model and Clearance

For a row in the grid:

*any string in the model of name **Service model** must have the clearance given in the **Clearance** column. That is, any other string must be at least the **Clearance** distance from the string from the **Service model**.*

*When the option starts, the grid is loaded from the **Service clearance file**. The grid can be modified and whenever the **Process** button is selected, the contents of the grid is written to the file name given by **Service clearance file**.*

Data source type	Model
------------------	-------

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input
-------------	-------

source of data to be processed.

Each string in the data source is processed against all other strings selected by the Data source.

*If a string is from a model listed in the **Service model and Clearance** grid, then the corresponding clearance is used for the string, otherwise the default clearance given in the **Clearance** panel field is used.*

Clash model model box available models
*the lines of clash between any two strings is placed in the **Clash model**.*

Clash report
a report is generated for any clashes

Clearance input
*the default clearance to use for a string that is **not** in any of the Service models given in the **Service model and Clearance** grid*

Process button
process the selected strings and check for clashes

Classify Conduits

Position of option on menu: Utilities =>A-G =>Classify conduits

This option sets attributes on “conduit strings”, *i.e.* strings of the following type only: *Super* (with conduit dimensions), *Drainage*, *Pipeline*, *Pipe*.

String attributes set are:

"justification" (text) on all strings - values set to "invert", "obvert" or "centre".

"pipe size" (text) on constant-size Super string conduits, Pipeline and Pipe strings.

"diameter" (real) on constant-size Super string conduits, Pipeline and Pipe strings.

"width" (real) on constant-size Super string box conduits.

Segment attributes set are:

"pipe size" (text) on all Super string conduit segments.

"diameter" (real) on all Super string conduit segments.

"width" (real) on all Super string box conduit segments.

Notes:

1) *Drainage* and *Pipeline* strings are always invert justified.

2) *Pipeline* and *Pipe* strings are always circular with a constant diameter.

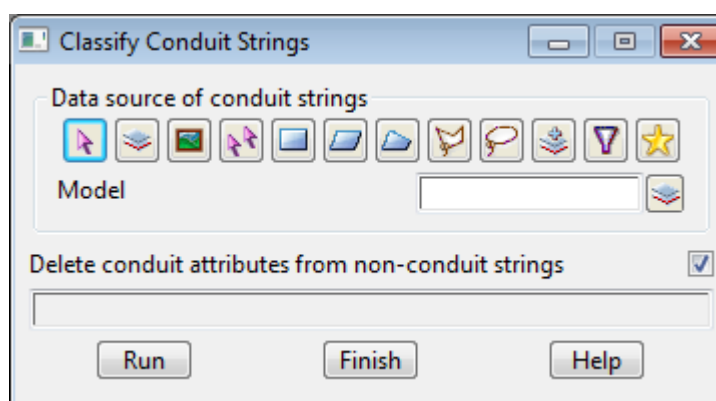

3) *Super* string conduits may be circular or box. *Drainage* strings may be circular, box, vee or trapezoid.

4) For non-circular conduit shapes, attribute "diameter" represents height of conduit.

5) Attribute "pipe size" is in mm (base units x 1000) and supports shapes: circular, box, vee, trapezoid - eg: "600", "1200x600", "V2000x600", "T2000B1200x600".

6) *Drainage* strings already have Pipe attributes "diameter" and "pipe size" (and potentially "width" and/or "top width") set via the *Drainage Network Editor*.

On selecting the **Classify conduits** option, the **Classify Conduit Strings** panel is displayed.

The fields and buttons used in the panel have the following functions.

<i>source of data to be processed.</i>			
Run	button		
<i>remove/delete the string names from the selected strings</i>			

Convert

Position of menu: Utilities =>A-G =>Convert

The **convert** options are designed to convert large numbers of strings between string types. There is also a **global convert** option which will convert even more string types.

The **convert** walk-right menu is

- convert bulk strings
- convert 2d strings to 3d strings
- convert 3d strings to 2d strings
- convert 4d strings to 3d strings
- convert text to 3d points
- convert polylines to alignments
- convert closed strings to closed super strings
- convert strings to super alignments

For the option *Convert*, go to the section

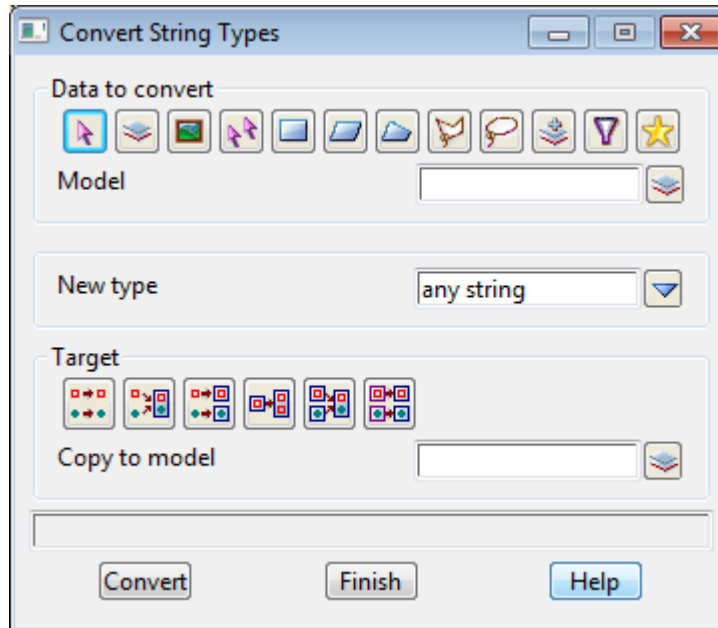

<i>2d to 3d</i>	Convert
<i>3d to 2d</i>	2d to 3d
<i>4d to 3d</i>	3d to 2d
<i>Text to 3d</i>	4d to 3d
<i>Poly to alignment</i>	Text to 3d
<i>Same start/end point strings</i>	Poly to Alignment
<i>Convert to super alignments</i>	Same Start/End Point Strings
	Convert to Super Alignment

Convert

Position of option on menu: Utilities =>A-G =>Convert =>Convert

The **Convert** option converts strings to a selected string type.

On selecting the **Convert** option, the **Convert String Types** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be processed.</i>			
New type		string type box		all string types
	<i>the type of string to try and convert the data to.</i>			
Target type				
	<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info		input		
	<i>extra information required for the target.</i>			
Convert		button		
	<i>convert all the selected strings to the type given in the New type field.</i>			

2d to 3d

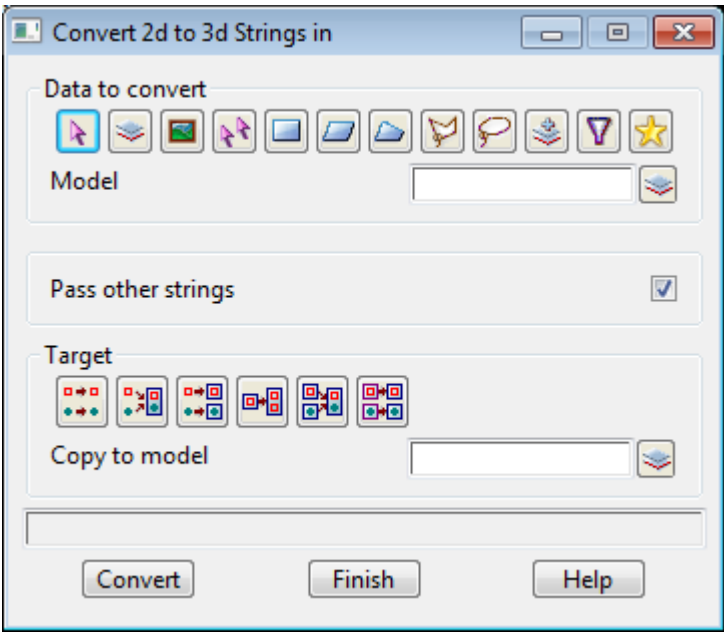

Position of option on menu: Utilities =>A-G =>Convert =>2d to 3d

The main difference between a 2d and a 3d string is that all the points in a 2d string have the same height. Hence to modify the z-values at individual points, a string must be 3d.

The 2d to 3d option is used to turn 2d (contour) strings into 3d strings.

This option is especially useful when a large number of strings have been read in with constant z-values (for example, cadastre) and the user then wants to modify the heights at each point on the string.

On selecting 2d to 3d and then the appropriate **Data Source** in the panel, the **Convert 2d to 3d Strings** in panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Pass other strings	tick box	tick	
<i>if ticked, copies of all other strings are passed through to the model for converted strings</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Convert	button		
<i>convert all the 2d string in the Data source to 3d strings.</i>			

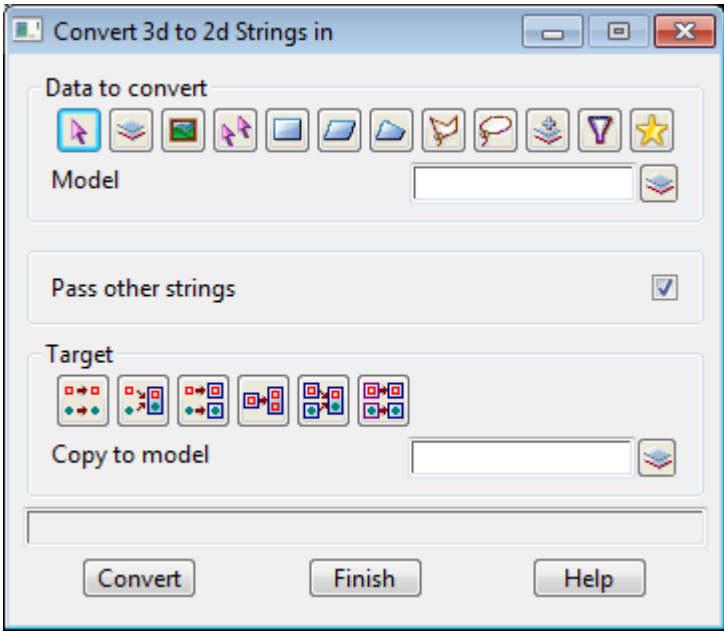

3d to 2d

Position of option on menu: Utilities =>A-G =>Convert =>3d to 2d

The difference between a 3d and a 2d string is that all the points in a 2d string have the same height. The **3d to 2d** option turns 3d string with a constant height into 2d strings. That is, it only converts 3d strings that have the **same** height at each point.

This option is useful when contours strings have come from another system as 3d strings, not 2d strings.

On selecting **3d to 2d** and then the appropriate **Data Source** in the panel, the **Convert 3d to 2d Strings** in panel is displayed.

The fields and buttons used in this panel have the following functions.

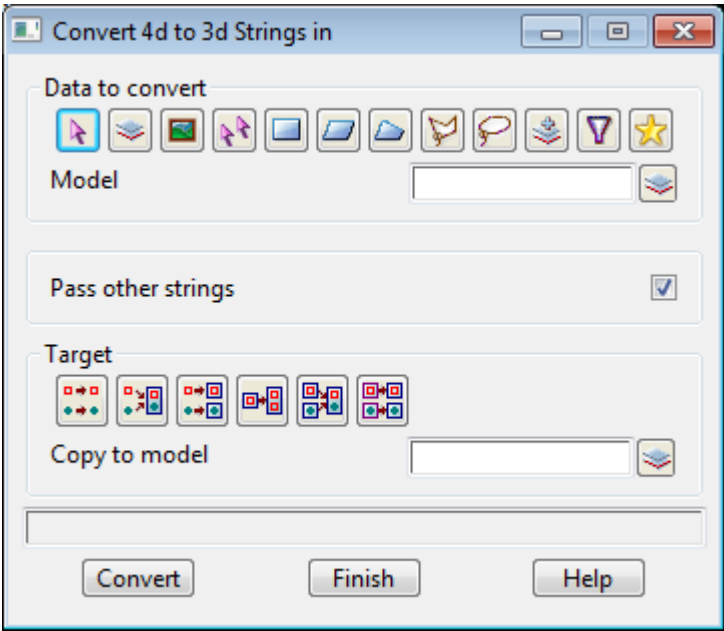

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Pass other strings	tick box	tick	
<i>if ticked, copies of all other strings are passed through to the model for 2d strings</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Convert	button		
<i>convert all the 3d strings with constant height in the Data source to 2d strings.</i>			

4d to 3d

Position of option on menu: Utilities =>A-G =>Convert =>4d to 3d

The difference between a 4d and a 3d string is that a 4d string can have a text label at each point on the string. The 4d to 3d option turns 4d string into 3d strings by stripping off the text labels at each point of the 4d string.

On selecting 4d to 3d and then the appropriate **Data Source** in the panel, the **Convert 4d to 3d Strings in** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
Pass other strings		tick box	tick	
<i>if ticked, copy all other strings and pass them through to the model for 3d strings</i>				
Target type				
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>				
Target info		input		
<i>extra information required for the target.</i>				
Convert		button		
<i>convert all the 4d strings in the Data source to 3d strings.</i>				

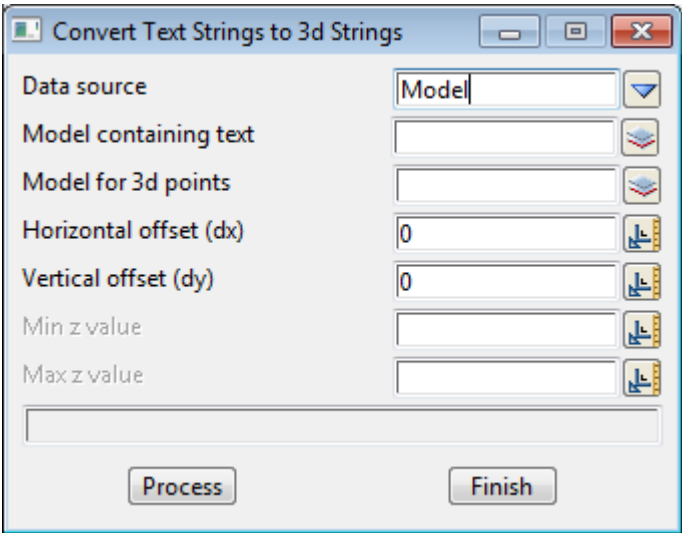

Text to 3d

Position of option on menu: Utilities =>A-G =>Convert =>Text to 3d

Sometimes when data for points is received from a CAD systems, all that is received is the text of the z-value of the point and no actual point.

The *Text to 3d* option will find text representing a z-value and create a new point using the justification point of the text as the (x,y) position and the value of the text as the z-value.

On selecting *Text to 3d*, the **Convert Text Strings to 3d Strings** panel is displayed.

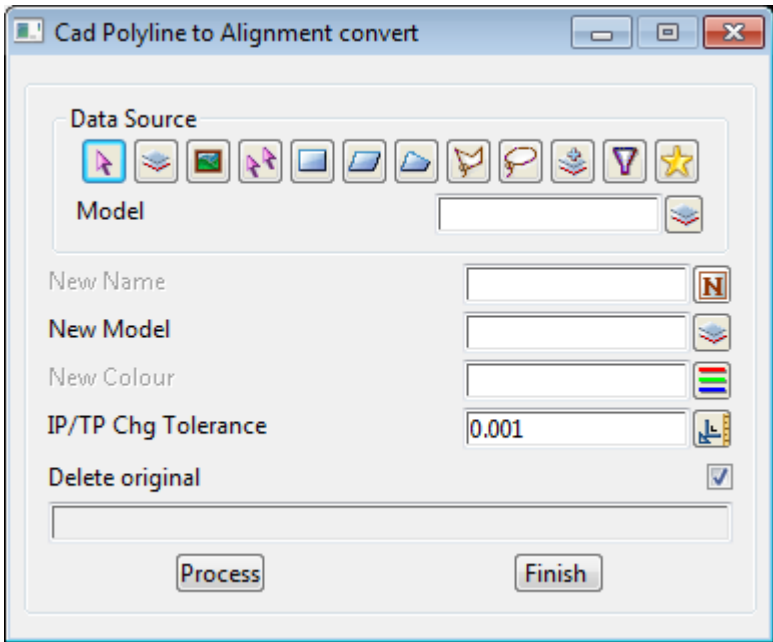

The fields and buttons used in this panel have the following functions

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data of the text to be processed.</i>			
Model for 3d points	model box		available models
<i>model to place the 3d points in.</i>			
Horizontal offset (dx)	input	0	
<i>the x-value for created point is the text justification point less the horizontal offset.</i>			
Vertical offset (dy)	input	0	
<i>the y-value for created point is the text justification point less the vertical offset.</i>			
Min z value	input		
<i>if non-blank, only convert text with z-value greater than Min z value.</i>			
Max z value	input		
<i>if non-blank, only convert text with z-value less than Max z value.</i>			
Process	button		
<i>convert all the selected text strings to 3d strings.</i>			

Poly to Alignment

Position of option on menu: Utilities =>A-G =>Convert =>Poly to alignment

Selecting Poly to alignment brings up the CAD Polyline to Alignment Convert panel.

The fields and buttons used in this panel have the following functions

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source		input		
	source of data of the text to be processed.			
New name		name box		available names
	if non blank , new name for the converted strings			
New model		model box		available models
	new model for the converted strings			
New colour		colour box		available colours
	if non blank , new colour for the converted strings			
IP/TP chg tolerance		input	0.001	
Delete original		tick box		tick
	if ticked , the original strings are deleted.			
Process		button		
	convert all the selected alignments.			

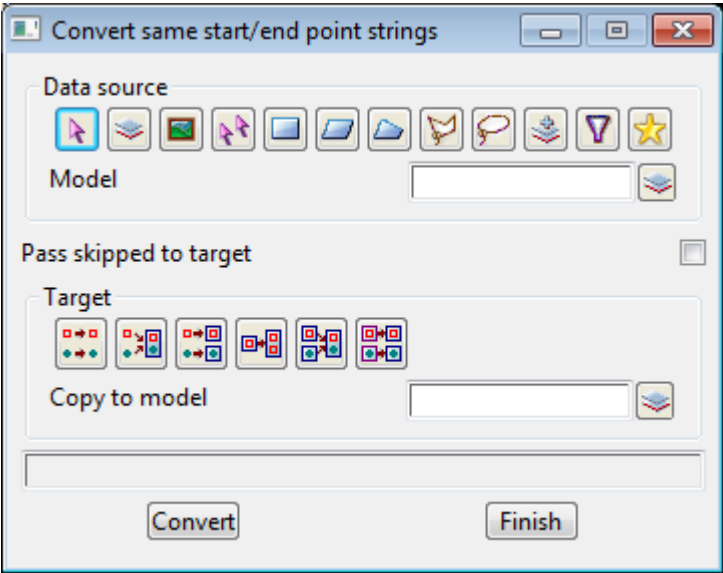

Same Start/End Point Strings

- Position of option on menu:** Strings =>Properties =>Same start/end point strings
- Position of option on menu:** Utilities =>A-G =>Convert =>Same start/end point strings
- Position of option on menu:** Utilities =>Super strings =>Same start/end point strings

When non super string strings are closed, an extra vertex identical to the first vertex is added to the end of the string. For super strings, there is a **closed string** flag and no duplication of the first and last vertices is required.

This options converts closed non super strings to closed super strings and deletes the duplicated vertex.

Selecting Same string/end point strings brings up the **Convert Same Start/End Point Strings** panel.

The fields and buttons used in this panel have the following functions

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Pass other strings	tick	tick	
<i>if ticked, copy all other strings and pass them through to the target model</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Convert	button		
<i>convert all the closed strings to closed super strings with duplicated end point.</i>			

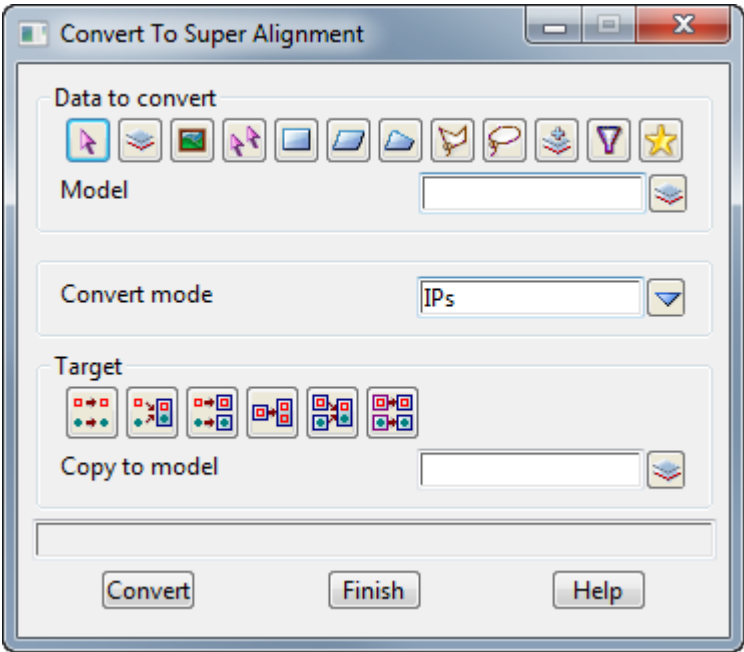

Convert to Super Alignment

Position of option on menu: Utilities =>A-G =>Convert =>Convert to super alignments

The **Convert** option converts strings to super alignments, either with just IPs or using Elements.

Note - conversion to *Elements* is only possible if you have the **Alignment** module.

Selecting **Convert to super alignments** brings up the **Convert to Super Alignment** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

source of data to be processed.

Convert mode

choice box

IPs, Elements

*if **IPs**, the strings are converted to super alignments with IPs.*

*If **Elements**, the strings are converted to super alignments using Elements.*

*Note - if the user does not have the Alignment module, then the **Convert mode** is automatically set to IPs.*

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info

input

extra information required for the target.

Convert

button

convert all the selected strings to either super alignments with IPs or super alignments with Elements.

Cuts

Position of menu: Utilities =>A-G =>Cuts

Cuts is used to create intersections through string data rather than tins.

That is, it calculates the cuts that a plan string makes with each of the strings in a model or view, and creates cut points with the z-value from the cut strings.

The cut points that the plan string creates are connected as a 4d string - the x-section of cuts through a model or view - with the z value coming from the cut string, and the text at the point being the name of string that was cut.

There are two methods for generating the cuts x-sections

- (a) by taking sections along selected strings or all the strings in a model or view
- (b) by taking sections at regular intervals and perpendicular to a selected centre line string.

The **Cuts** walk-right menu contains these two methods

For the option *by strings*, go to the section
by centreline

[Cuts by Strings.](#)
[Cuts by Centreline.](#)

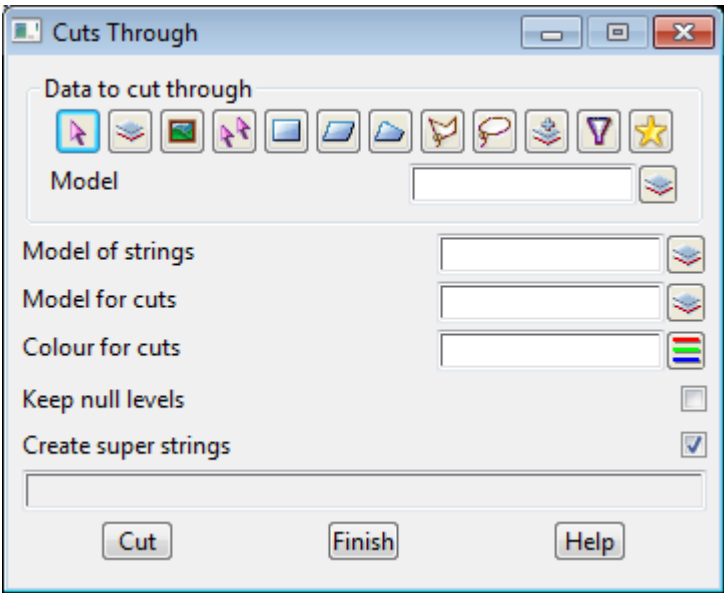

Cuts by Strings

Position of option on menu: Utilities =>A-G =>Cuts =>by strings

by strings generates cuts through a Data source of strings, for all the strings in a user specified model.

For each string in the **Model of strings**, the plan representation of the string is cut through the all the string in **Data to cut through**, to generate cut x-sections.

Selecting by strings displays the **Cuts Through** panel.

The fields and buttons used in this panel have the following functions

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be cut through.</i>			
Model of strings		input		available models
	<i>each string in this model will be processed against all the strings in the Data source Data to cut through.</i>			
Model for cuts		input		available models
	<i>model to place the cut x-sections into.</i>			
Colour for cuts		input		available colours
	<i>colour for the cut x- section strings</i>			
Cut		button		
	<i>each string in the Model of strings is processed against all the strings in the Data source Data to cut through. The 4d strings of cuts are placed in the Model for cuts.</i>			

Cuts by Centreline

Position of option on menu: Utilities =>A-G =>Cuts =>by centreline

For **by centreline**, a centre line string is selected by the user and temporary plan lines are created at regular intervals perpendicular to the selected string.

Cut x-sections are then generated for the temporary plan section lines by taking cuts through the Data source **Data to cut through**.

Selecting **by centreline** displays the **Cuts from CL for** panel.

The fields and buttons used in this panel have the following functions

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

source of data to be processed.

Section separation

input

10.0

the distance along the selected centre line to generate plan section lines to be used to cut through the data source.

Special chainages input *.spf files
a file containing chainages, one per line, that are also used as chainages to create cross sections at.

Gather vertical points of interest tick box
whether or not to create cuts at vertical points of interests (sags, crests, vertical tangent points etc)

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the selected string for determining how many plan sections are created around horizontal curves.

Left/Right cut width input 50
the left/right distance to go out from the centre line for creating a section to cut through the strings.

Model for cuts input available models
model to place the cut x-section strings into.

Clean cuts model beforehand tick box
*if **ticked**, the model is cleaned of all data before new sections are created.*

Colour for cuts colour box available colours
colour for the cut section strings

Keep null levels tick box
*if **ticked**, then if a null level exists on the string being cut, then a null level point is created.*

Select cl string-select
the selected cl string is used to create plan section lines at regular intervals and perpendicular to the centre line string. These strings are cut though the model/view of strings.

Start/End chainage input
if non-blank then sections for the cuts are restricted to between the given start and end chainage of the selected cl string.

End Area Calculations

Tin tin box available tins
*if **non-blank**, the cut and fill areas for the section against the tin are calculated and added as attributes to the section.*

Strip depth input
*if **non-zero**, then a strip depth is removed from the tin before the cut and fill areas for the section against the tin are calculated.*

Cut button
*each plan section line generated down the selected centre line string is processed against all the strings in the Data source. The 4d strings of cuts are placed in the **Model for cuts**.*

Delete

Position of option on menu: Utilities =>A-G =>Delete

The **Delete** option deletes all the selected strings.
On selecting the **Delete** option, the **Delete** panel is displayed.

The fields and buttons used in this panel have the following functions

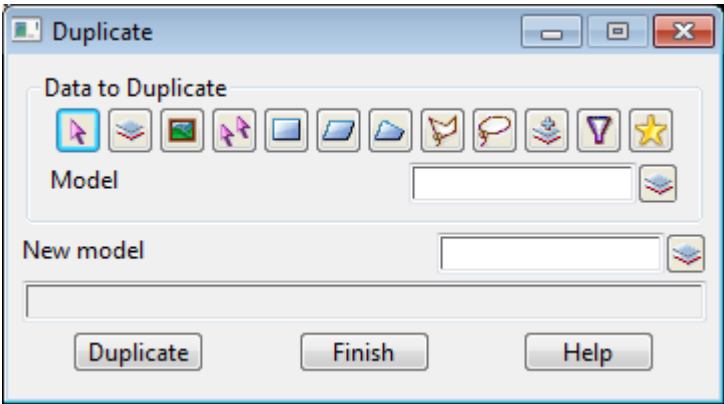

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be processed.</i>			
Delete		button		
	<i>delete the selected strings.</i>			

Duplicate

Position of option on menu: Utilities =>A-G =>Duplicate

Duplicate makes duplicates of strings.

Selecting **Duplicate** displays the **Duplicate** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>		Model	
Data source	<i>source of data to be processed.</i>	input		
New model	<i>name of the model to place the duplicated strings into.</i>	input		available models
Duplicate	<i>duplicate all the strings in the data source.</i>	button		

<esc> can be used to abort the duplicate option.

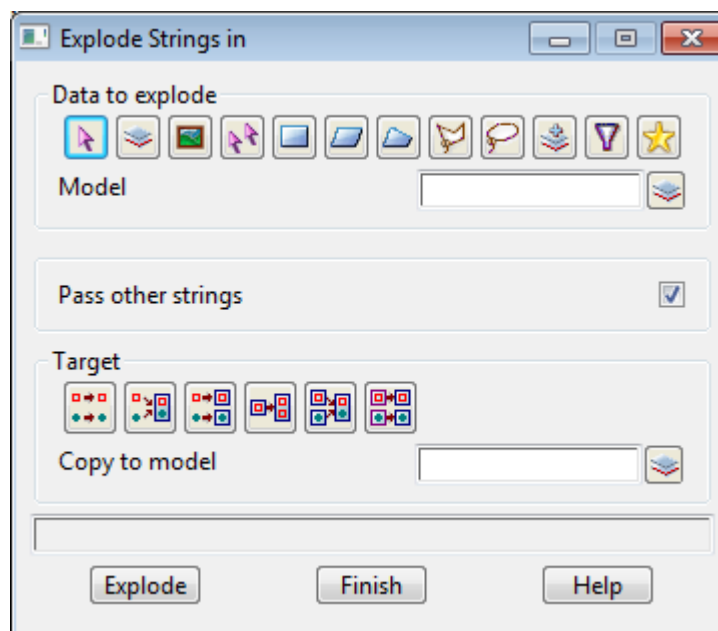

Explode

Position of option on menu: Utilities =>A-G =>Explode

The **Explode** option explodes point strings into individual one vertex strings and line strings into individual segments.

Super alignment, Alignment, pipeline, sewer and drainage strings are not exploded.

On selecting **Explode** and then the appropriate **Data Source** in the panel, the **Explode Strings in** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

source of data to be processed.

Pass other strings

tick box

tick

*if **ticked**, copies of all other strings and passed through to the exploded model.*

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info

input

extra information required for the target.

Explode

button

explode all the strings in the data source into one vertex strings and segments.

Explode Text

Position of option on menu: Utilities =>A-G =>Explode (text)

Explode (text) explodes text in text strings and the text from 4d strings, into its component arcs and lines. The exploded arcs and lines are placed in one new model.

Selecting **Explode (text)** displays the **Explode Text in** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be processed.</i>			
Exploded model		input		available models
	<i>name of the model to place the exploded text strings and text of 4d strings into.</i>			
Explode		button		
	<i>explode all the selected text and add them to the model given in the Exploded model field.</i>			

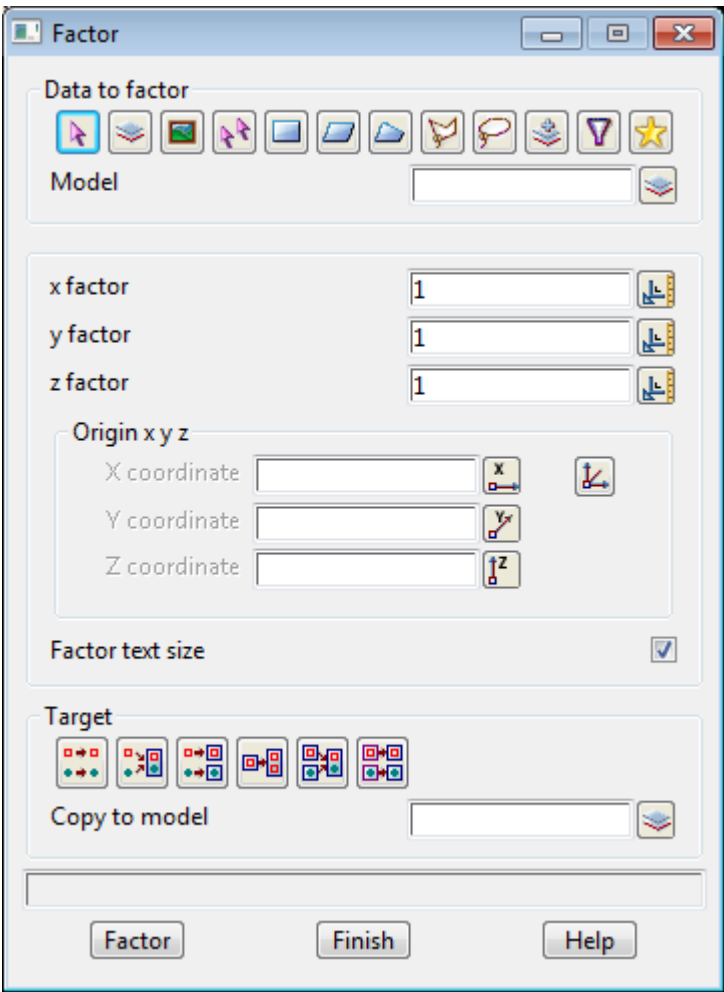

Factor

Position of option on menu: Utilities =>A-G =>Factor

Factor multiplies the x,y and z values of selected strings by user supplied factors.

The option is useful for changing the units of any data in a model (e.g. Imperial to metric).

Selecting Factor displays the Factor panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
x/y/z factor	input	1.0	
<i>factor to multiply the x/y/z-values of a string by.</i>			
Origin x y z	input		xyz ops menu
<i>field with x y z value to be used as (x,y,z) origin for the factor. if blank, an origin of (0,0,0) is used.</i>			

Factor text size tick box tick
if ticked, the size of text is factored.

Target type
Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

Factor button
multiply the (x,y,z) values of the selected strings by the x,y and z factors given in the appropriate panel fields.

WARNING - if the x factor and y factor are not equal, then arcs in arcs, circles, alignment and polyline strings can not be factored. For these cases, the y factor will be set the x-factor and then applied to the arcs.

Filter

Position of menu: Utilities =>A-G =>Filter

The **Filter** options are used to remove surplus points from strings.

Three types of filters are currently supported in **12d** Model:

- s a string filter, which removes points from 2d and/or 3d line strings that do not deviate by more than a specified offset tolerance from straight lines joining successive string points (in three dimensions for 3d strings)
- s a vertex-filter which removes adjacent vertices closer than a given user defined (x,y) and z distance
- s a z-filter which eliminates points not contained within a specified z-range

The **Filter** walk-right menu is

filter 2d and 3d strings
removes close adjacent vertices
filter z values

For the option *String filter*, go to
Vertex filter
z filter

[String Filter](#)
[Vertex Filter](#)
[Z Filter](#)

String Filter

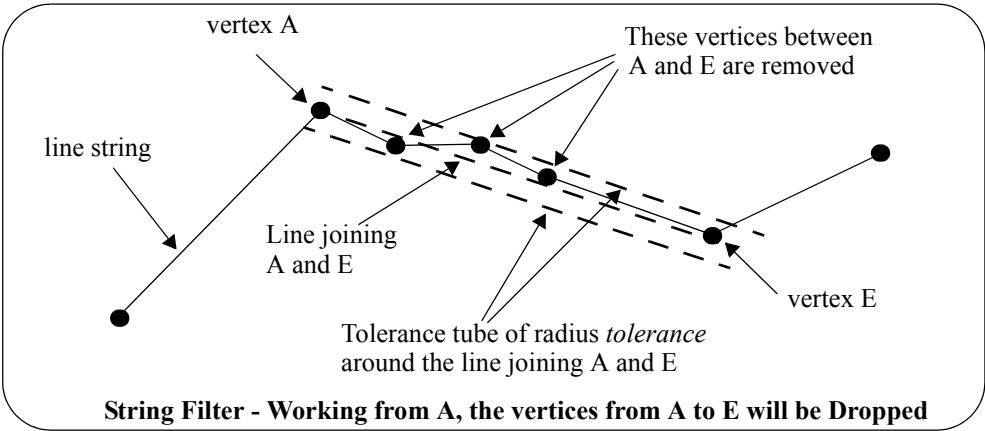

Position of option on menu: Utilities =>A-G =>Filter =>String filter

The String filter option is used to remove surplus vertices from 2d strings (contours) and 3d strings.

The string filter option tries to drop out vertices that if left out, don't make "too much difference".

So for a user defined tolerance:

if you have successive vertices A, B and C, and by leaving out vertex B, then the lines AB and BC don't go outside a tube of radius tolerance around the lines AC, then vertex B is dropped.

The filter starts at the first vertex of the string and looks ahead, dropping out vertices until it finds one that can't be removed. That vertex then become the new second vertex and the process is

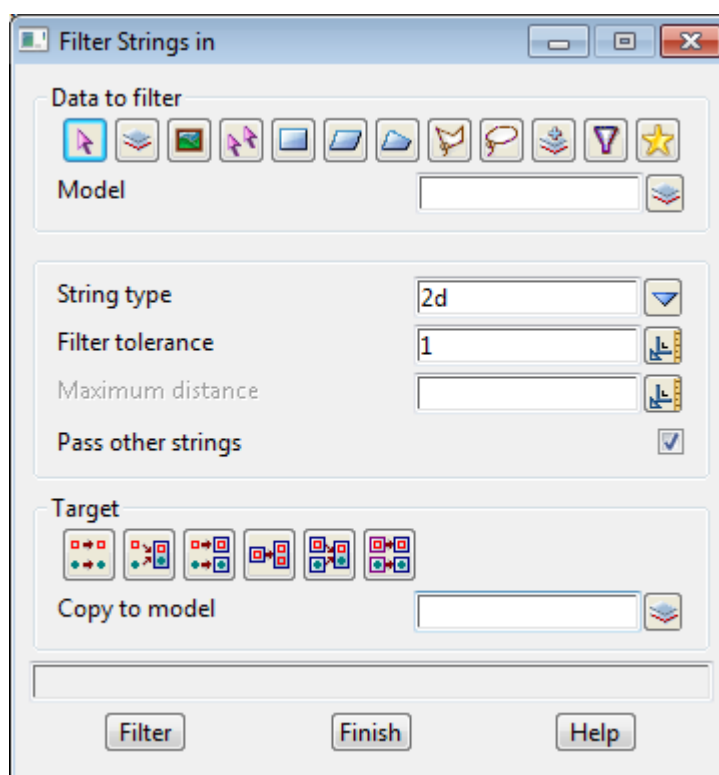

repeated but starting at the new second vertex. This process is repeated for the new third vertex and so on until the end of the string.

The *tolerance* value used normally depends on the data set and the job that the data is being used for.

So the string filter removes vertices from 2d and/or 3d line strings that do not deviate by more than a specified offset tolerance from straight lines joining successive string vertices (in three dimensions for 3d strings).

NOTE - string filter does not apply to point strings.

Selecting **String filter** displays the **Filter Strings in** panel.

The fields and buttons used in this panel have the following function

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>		Model	
Data source <i>source of data to be processed.</i>	input		
String type <i>string types to be filtered</i>	input	2d	2d, 2d & 3d
Filter tolerance <i>tolerance to be used in filtering</i>	input	1	
Pass other strings <i>if ticked, pass all other strings through to the model for filtered strings</i>	tick box	tick	
Target type <i>Data target type - where to put the processed strings. For a full description go to Data Target in the</i>			

chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

Filter button
filter all the selected strings.

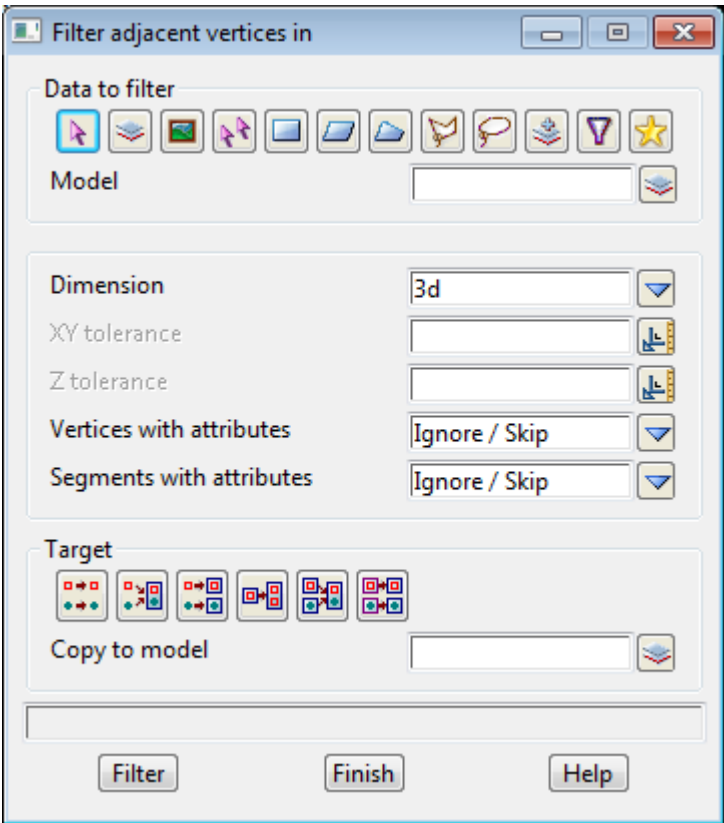

Vertex Filter

Position of option on menu: Utilities =>A-G =>Filter =>Vertex filter

The **Vertex filter** option is used to remove close adjacent vertices from selected strings. The strings can be *point* or *line* strings.

The option can remove adjacent string vertices that are equal to a given tolerance either in plan position only (*i.e.* have similar x and y co-ordinates) or equal to a given tolerance for x, y and z co-ordinates.

Selecting **Vertex filter** displays the **Filter adjacent vertices in** panel.

The fields and buttons used in this panel have the following function

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source		input		
	source of data to be processed.			
Dimension		input	2d	2d,3d
	if 2d, adjacent string vertices with equal x and y co-ordinates are filtered. If 3d, adjacent string vertices with equal x, y and z co-ordinates are filtered.			
xy tolerance		input		
	the distance to use for checking if adjacent vertices are too close in (x,y)			
z tolerance		input		
	the delta-z to use for checking if adjacent vertices are too close in z			
Vertices with attributes		choice box	Ignore/skip	Ignore/skip, Merge attributes Lose attributes

filter the selected strings.

Z Filter

Position of option on menu: Utilities =>A-G =>Filter =>Z filter

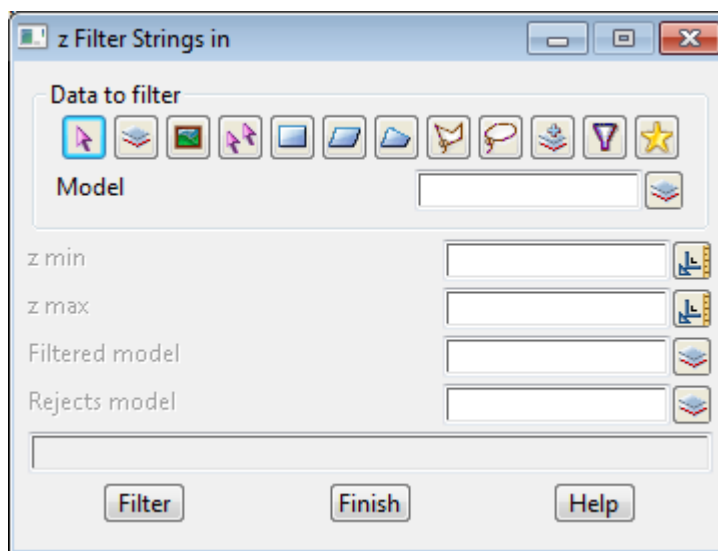

It is often necessary to remove data which is not within a certain z range. For example, all points with z-values below 0.0. The **z filter** option allows the user to define a z-range by specifying a minimum and maximum z value.

Strings of type 2d, 3d and 4d can then be processed against the z-range and new strings created containing only those points that are

- (a) within the z-range - accepted points
- or
- (b) outside the z-range - rejected points

For all other string types, the entire string is accepted if any part of the string is within the z-range, otherwise it is rejected.

Selecting **Z filter** displays the **Z Filter Strings in** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
z min	input		
<i>minimum z value to be accepted, If this field is blank, all string z-values pass the minimum test.</i>			
z max	input		
<i>maximum z value to be accepted, If this field is blank, all string z-values pass the maximum test.</i>			
Filtered model	input		available models
<i>if non-blank, the name of the model to place the accepted string points in. The string has the same name as the original string. If blank, the accepted point strings are not saved.</i>			
Rejects model	input		available models
<i>if non-blank, then strings containing the rejected points are placed in this model. The strings of rejected points have the same name as the original strings. If blank, the rejected point strings are not saved.</i>			

Filter button
z filter the selected strings by the z minimum and z maximum values.

Draw a Perpendicular from Centreline to a Point

Position of option on menu: Utilities =>A-G =>Draw perpendicular cl to points

This option creates strings drawn perpendicular from reference alignments to selected points, and output a Special Chainage (SPC) file of the reference chainages that the points are perpendicular to. The user has the choice of either output, or both.

Typical uses are to create a model of cut strings which can be used to for cut labelling on long section plots where features such as property access locations occur along the road corridor, or to write SPC files that can be used to create cross sections through the dropped points when running **Apply Many** functions.

Selecting **Draw perpendicular cl to points** displays the **Draw a Perpendicular from Centreline to a Point** panel.

The fields and buttons used in this panel have the following function

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data Points To Drop

Gathers a list of all the points on the selected strings.

For a full description of data source go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data Reference Strings

Selects the reference strings that the above points will be dropped onto. Reference strings must be of type Alignment or Super Alignment.

For a full description of data source go to [Data Source](#) in the chapter [Tools and Concepts](#)

Drop all points from chosen strings? tick box ☒

The default is to calculate chainages and/or strings from every point in the selected strings. Turning this tick box off will restrict the calculation to the end points only. e.g. It can be used to create cut strings for use with the **paired cuts** functionality in long section plotting.

Offset Tolerance input

Will restrict the search to points that fall within the specified width from the reference string.

Outputs

Name mode choice box From point text From point text, From string names, Typed

For the **From point text** mode, the name of the new string is set by the text attached to the points.
For the **From string names** mode, the name of the new string is set by the selected strings.
For the **Typed** mode, the name is given in the **Name** field.

Name name box names.4d file

This only needs to be filled in when using the **Typed** name mode. This field is not required for the other **Name mode** choices.

Model model box available models

The model to store the new strings on. This field is optional and no strings will be created if left blank. e.g. if you only want Special Chainage Files.

Colour colour box available colours

The colour to draw the new strings with.

Linestyle linestyle box 1 available linestyle

The linestyle to draw the new strings with.

Z value mode choice box 2d from point 2d from point, 2d from reference, 3d reference to point

The method by which z values are assigned to the points on the new string.
For the **2d from point** mode, all points have the same z value as the point being dropped.
For the **2d from reference** mode, all points have the same z value as the reference string.
For the **3d reference to point** mode, the new string is drawn from the z value at the reference to the z value of the dropped point.

Start extension measure box 1 At point, Point to Point, String from Point, String to Point

End extension measure box 1 At point, Point to Point, String from Point, String to Point

Write SPC Files(s)? tick box ☒

The writing of Special Chainage Files is optional.
If ticked, the names of the files are automatically derived from the combination of Model name and Reference string name and a user defined file stem (given in the **SPC file stem** field) may be added to the name.

SPC File Stem text box

An optional user entered text value that is added to the automatically derived file name.

Process

run the option.

button

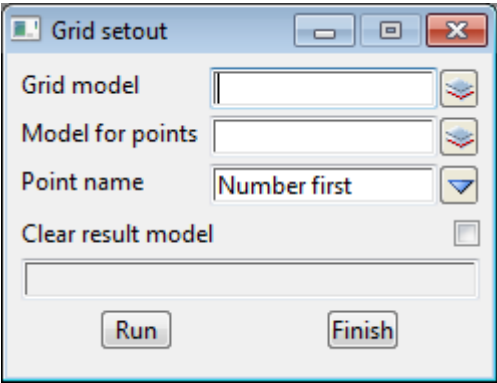

Grid setout

Position of option on menu: Utilities =>A-G =>Grid setout

Grid setout creates a set of points from the intersections of lines and/or arc strings. The strings to intersect normally form a grid.

It is assumed that the strings to intersect are named with letters along one axis of the grid and numbers in the other so that a point may be named in the following manner: 1a or a1.

Selecting **Grid setout** displays the **Grid Setout** panel.

The fields and buttons used in this panel have the following function

Field	Description	Type	Defaults	Pop-Up
Grid model	<i>The model of strings to intersect with each other</i>	model box		Select Model
Model for points	<i>the model to contain the points of intersection for the strings in Grid model.</i>	model box		Select Model
Point name	<i>Method used to determine how to name the created points based on names of the strings being intersected: Number first: use the numbered string first Letter first: use the alphabetical string first Any order: use the order in which the strings are processed</i>	choice box	Number first	Number first, Letter first, Any order
Clear result model	<i>if tick, clean out the Model for points before finding the intersections.</i>	tick box		
Run	<i>run the option.</i>	button		

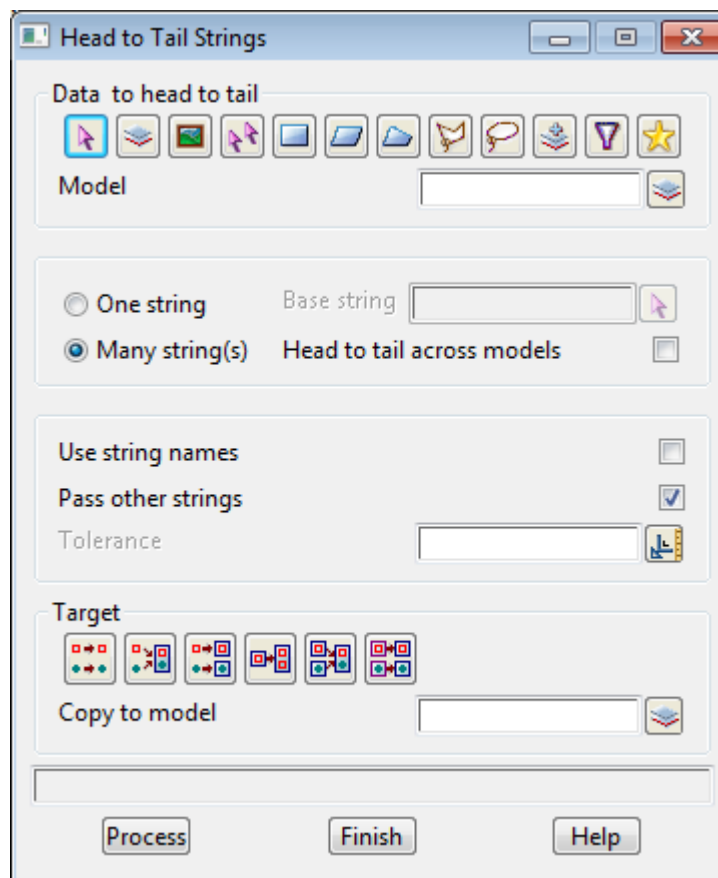

Head to Tail

Position of option on menu: Utilities =>H-Z =>Head to tail

Head to tail is used to join strings with common end points together.

If requested, strings are only joined if they have matching names as well as matching end points.

Selecting **Head to tail**, displays the **Head to Tail Strings** panel.

The fields and buttons used in this panel have the following functions

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

source of data to be processed.

One string or Many strings radio button

*if **One String** is selected, then a Base string is selected and only the head-to-tailed string containing the Base string is created.*

*If **Many strings** is selected, then head to tailing occurs for all the strings in the Data source.*

Head to tail across models tick box

*if **ticked**, then strings can be created from head to tailing strings from any of the selected models.*

*If **not ticked**, then strings will only be head to tailed with strings from the same model.*

Use string names

tick box

*if **ticked**, the string names must also match for the strings to be joined.*

Pass other strings	tick box	tick
<i>if ticked, any string not joined will also copied to the joined model.</i>		
Tolerance	input	0.0005
<i>If the distance between two end points is less than tolerance, then the points are considered the same and the strings may be joined.</i>		
Target type	<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>	
Target info	input	
<i>extra information required for the target.</i>		
Process	button	
<i>process all the selected strings</i>		

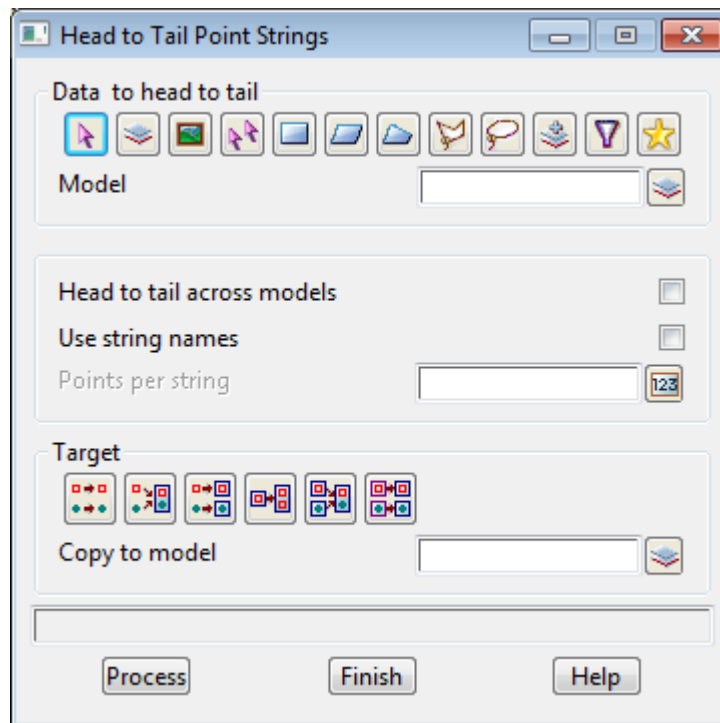

Head to Tail Point Strings

Position of option on menu: Utilities =>H-Z =>Head to tail point strings

Head to tail point string is used to joins point strings into larger point strings. This can speed up drawing and processing when there are large numbers of single point strings.

If requested, strings are only joined if they have matching names as well as being point strings.

Selecting **Head to tail points** displays the **Head to Tail Point Strings** panel.

The fields and buttons used in this panel have the following functions

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Head to tail across models	tick box		
<i>if ticked, then strings can be created from joining point strings from any of the selected models.</i>			
<i>If not ticked, then strings will only joined with strings from the same model.</i>			
Use string names	tick box		
<i>if ticked, the string names must also match for the strings to be joined.</i>			
Points per string	integer box		
<i>the maximum number of vertices to have in the joined strings.</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			

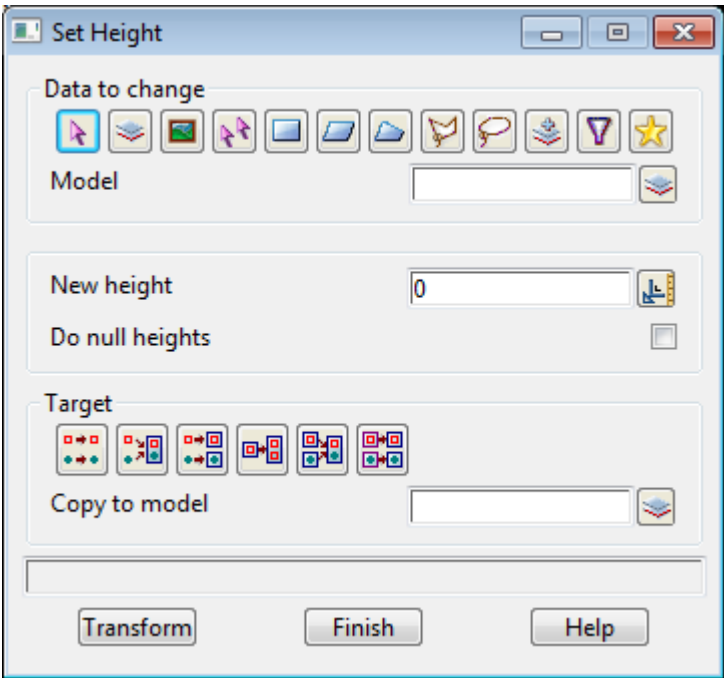

Process button
process all the selected point strings

Set Height

Position of option on menu: Utilities =>H-Z =>Height

For the selected strings, **Height** will set all the z-values to the given height.

Selecting **Height** displays the **Set Height** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
New height		input	0	
<i>the new height to set all the z-values in the selected strings to.</i>				
Do null heights		tick box		
<i>if ticked, null heights are set to the new height. If not ticked, null heights are not modified.</i>				
Target type				
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>				
Target info		input		
<i>extra information required for the target.</i>				
Set		button		
<i>process the selected string</i>				

Helmert Transformations

2D Helmert (Advanced)

Position of option on menu: Utilities =>H-Z =>Helmert 2D (Advanced)

A **2D Helmert** transformation is a two dimensional linear transformation consisting of a scaling, rotation and a 2D- translation (shift) of data. Hence there are four parameters to be specified.

Hence the 2D Helmert parameters are

- (a) the one scale factor for both the x and y axes
- (b) the same rotation of the x-axis and y-axis of the existing coordinates to align it with the control x and coordinate axis
- (c) the x and y translation of the observed coordinates after the scalings and rotations have been applied

The 2D Helmert (Advanced) option calculated and applied a Helmert transformation, and also allows the user to **fix the scale** for the transformation. That is, the scale is user defined and not determined by the least squared calculations.

For information on the 2D Helmert transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

Selecting **2D Helmert (Advanced)** brings up the **Helmert 2D (Advanced)** panel.

If the **Parameters by** choice box is set to **Pt Selection** then control-observed point pairs are selected by the user and the pairs are written to the grids on the panels. See the section [Selecting Control and Observed Points for the Helmert and Affine Transformations](#) for information on picking control and observed points.

If the **Parameters by** choice box is set to **Direct entry**, the transformation parameters are manually entered into the panel and the grid section is not used.

The fields and buttons used in this panel have the following functions

Field Description	Type	Defaults	Pop-Up
File	file box		*.hel_adv, *.hel files
<i>the name of a 2d Helmert parameter file to read in/write out</i>			
Read	button		
<i>read the contents of the *.hel_adv (or *.hel) file given in File and load the parameters saved in the file into the panel fields.</i>			

Note: the *.hel file format is from an earlier Helmert panel that no longer exists in **12d Model**.

Write	button	
<i>write the parameters and data in the panel fields to the file given in File.</i>		

Data source type	Model

3D Helmert

Position of option on menu: Utilities =>H-Z =>Helmert 3D

A **3D Helmert** transformation is a three dimensional linear transformation consisting of a scaling, three rotations, and a 3D-translation (shift) of data. Hence there are 7 parameters to be specified.

For information on the 3D Helmert transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

Selecting **Helmert 3D** brings up the 3D Helmert panel.

Control <i>restarts the selection process for choosing more control points.</i>	button		
Calculate <i>calculate the helmert parameters from the selected points shown in the grid.</i>	button		

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Helmert button

apply the Helmert transformation to the data specified in the source box, and put it into the appropriate target area.

Inverse button

applies the inverse transformation to the one defined in the panel.

Finish button

end the option, remove the panel from the screen.

2D Helmert

Position of option on menu: No longer in **12d Model**

NOTE - this option is no longer available from a **12d Model** menu.

A **2D Helmert** transformation is a two dimensional linear transformation consisting of a scaling, rotation and a 2D- translation (shift) of data. Hence there are four parameters to be specified.

Hence the 2D Helmert parameters are

- (a) the one scale factor for both the x and y axes
- (b) the same rotation of the x-axis and y-axis of the existing coordinates to align it with the control x and coordinate axis
- (c) the x and y translation of the observed coordinates after the scalings and rotations have been applied

For information on the 2D Helmert transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

This case of a fixed scale is not allowed in this option but is in the [2D Helmert \(Advanced\)](#) option. Selecting **Helmert** brings up the **Helmert 2D** panel.

If the **Parameters by** choice box is set to **Pt Selection** then control-observed point pairs are selected by the user and the pairs are written to the grids on the panels. See the section [Selecting Control and Observed Points for the Helmert and Affine Transformations](#) for

information on picking control and observed points.

If the **Parameters by** choice box is set to **Direct entry**, the transformation parameters are manually entered into the panel and the grid section is not used.

The fields and buttons used in this panel have the following functions

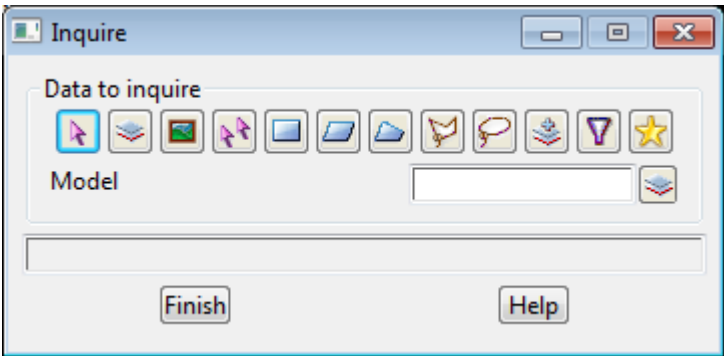

Field Description	Type	Defaults	Pop-Up
File <i>a file name can be specified for reading or writing a file.</i>	file box		*.hel files
Read <i>if a valid file exists, the file contents can be loaded into the panel.</i>	button

Scale <i>the scale factor for the existing coordinates with respect to the transformed coordinates</i>	input/output		
X Translation <i>the x translation of the existing coordinates with respect to the transformed x coordinates</i>	input/output		
Y Translation <i>the y translation of the existing coordinates with respect to the transformed y coordinates</i>	input/output		
Control <i>restarts the selection process for choosing more control points.</i>	button		
Calculate <i>calculate the helmert parameters from the selected points shown in the grid.</i>	button		
Target type <i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info <i>extra information required for the target.</i>	input		
Helmert <i>apply the helmert transformation to the data specified in the source box, and put it into the appropriate target area.</i>	button		
Inverse <i>applies the inverse transformation to the one defined in the panel.</i>	button		
Finish <i>end the option, remove this panel and the Helmert control points table from the screen.</i>	button		

Inquire

Position of option on menu: Utilities =>H-Z =>Inquire

Inquire highlights all the selected strings.

On selecting the **Inquire** option, the **Inquire** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be highlighted.</i>			

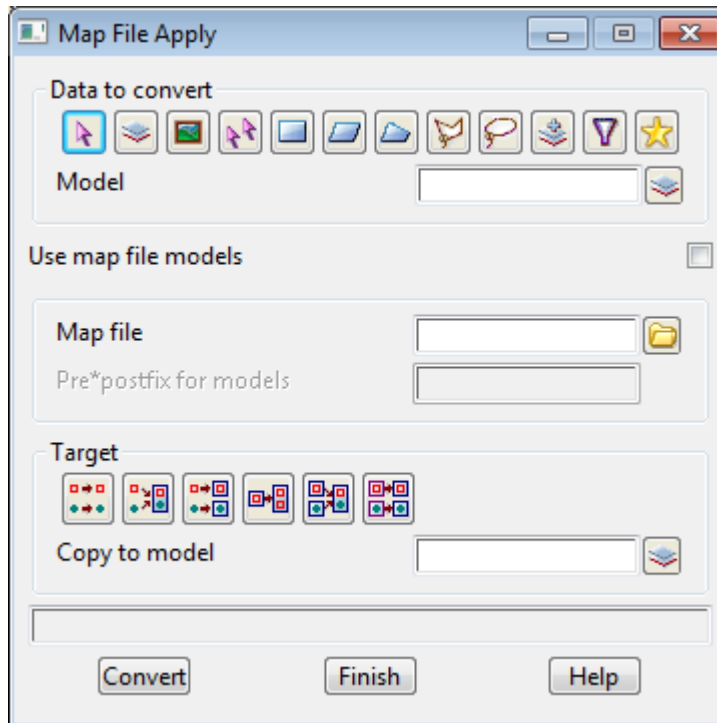

Map

Position of option on menu: Utilities =>H-Z =>Map

Map applies a **12d** Model Map File to the selected strings. The map file can be used to change string attributes such as string names, models, colours, breakline type and style, apply extrudes, apply polygon fills etc.

The layout and operation of a mapping file is described in the section [Create/Edit a Map File](#) in the chapter [File I/O](#).

Selecting **Map** displays the **Map File Apply** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be mapped.</i>			
Use map file models	tick box		
<i>if ticked, use the models from the map file. If not ticked, use the models from the Target.</i>			
Map file	map file box		*.mapfile, *.mf files
<i>the Map File to use.</i>			
Prefix for models	input		available models
<i>If non-blank, the prefix for models field gives the characters to be prepended and appended to the model names given in the mapping file. The prepended and appended characters are entered into the prefix for models field, separated by a *. For example, pre*pos would add pre before each model name and pos after each model name. For prepend only, no * is required. The pre and pos can included spaces.</i>			
Target type			

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info	input
<i>extra information required for the target.</i>	
Map	button
<i>run the option - process the selected strings</i>	

Null Heights

Position of option on menu: Utilities =>H-Z =>Null heights

A null value is used as a z-value (height) when no actual z-value exists at a vertex. That is, the vertex has valid x and y coordinates but no valid z-value.

The **null heights** walk-right menu is

For the option *Height*, go to
Height range
Null to height

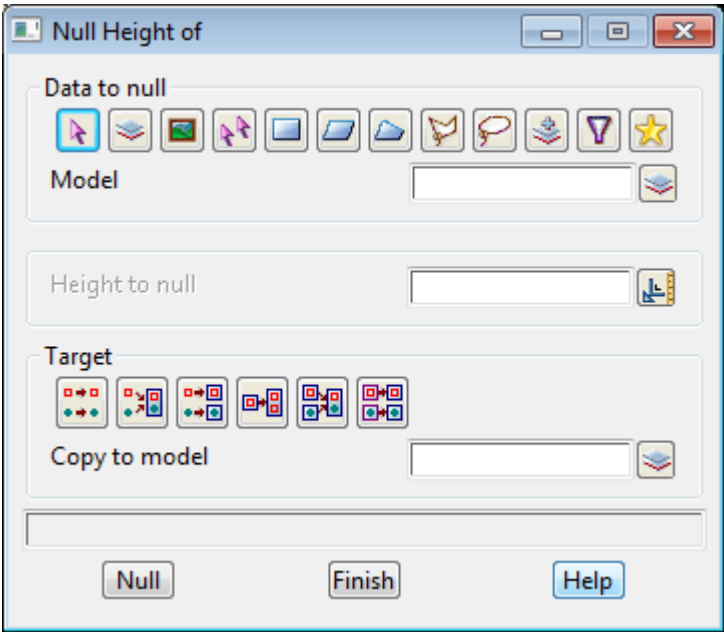

[Heights](#)
[Height Range](#)
[Null to Height](#)

Heights

Position of option on menu: Utilities =>H-Z =>Null heights =>Height

Null heights is used to set vertices with a given z-value to **12d Model's** null value.

Selecting **Heights** displays **Null Height of** panel.

The fields and buttons used in this panel have the following functions.

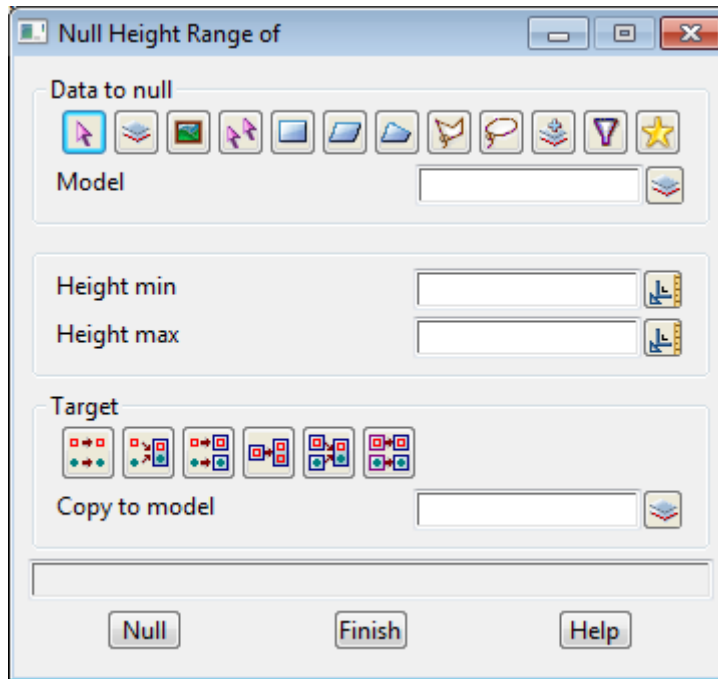

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
Height to null		input		
<i>height value to set to the null value.</i>				
Target type				
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>				
Target info		input		
<i>extra information required for the target.</i>				
Null		button		
<i>test all the z-values in the selected strings and if the value is equal to the Height to null value, set the z-value to null.</i>				

Height Range

Position of option on menu: Utilities =>H-Z =>Null heights =>Null range

Null height range sets the vertices with z-values between a given height minimum and height maximum, to **12d Model's** null value.

Selecting Height range displays the Null Height Range of panel.

The fields and buttons used in this panel have the following functions.

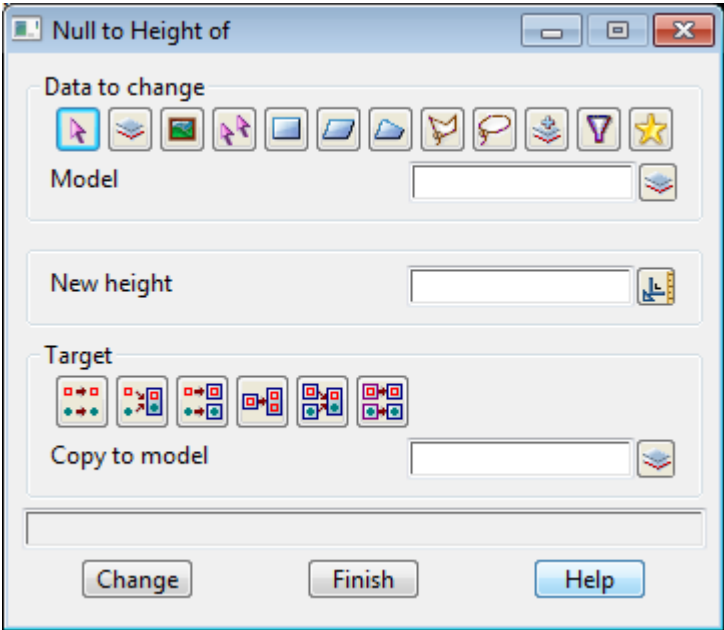

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Height min	input		
<i>minimum value of the heights to be set as null values.</i>			
Height max	input		
<i>maximum value of the heights to be set as null values.</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Null	button		
<i>test all the z-values in the selected strings and if the value is between the Height min and Height max value, set the z-value to null.</i>			

Null to Height

Position of option on menu: Utilities =>H-Z =>Null heights =>Null to height

Null to height is used to set vertices with a null z-value to a user given value.

Selecting Null to height range displays the Null to Height of panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
New height	input		
<i>height value to change null values to.</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Change	button		
<i>Change all the null z-values in the selected strings to the value in the New height field.</i>			

Parallel Strings Macro

Position of option on menu: Utilities =>H-Z =>Parallel

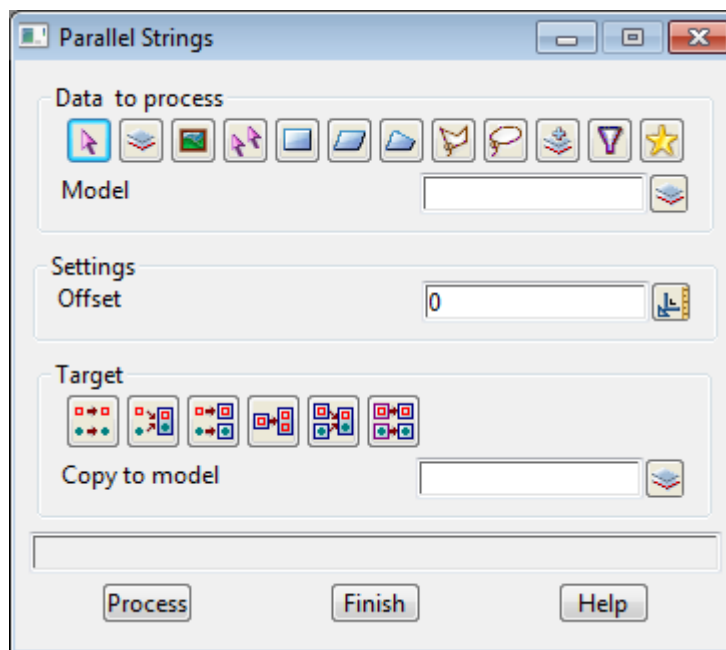

This option parallels horizontally one or more strings (the option Strings =>Strings edit =>Parallel only parallels one string at a time).

It is a macro and runs in two ways:

1. from the menu or
2. via a command line interface that does not require user interaction.

Note: the command line interface is available so that the option can be run in a chain if the macro can not be recorded in a chain. If the macro is called without any command line arguments, then it will assume it is being run in the graphical, interactive manner and will display a panel to the user. Otherwise, the macro will parse the relevant command line arguments and run without user interaction.

Selecting **Parallel** brings up the **Parallel Strings** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be processed.</i>			
Offset		measure box	0	available measures
	<i>the distance to parallel the source element.</i>			
	<i>The direction of the source string is used to determine the left and right side of the string in the parallel operation. A positive offset parallels the string to the right with respect to the string direction. A negative offset parallels to the left with respect to the string direction.</i>			
Target type				
	<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			

Target info	input <i>extra information required for the target.</i>
Process	button <i>processes the selected data.</i>

Note When Using the Option With Command Line Arguments:

When calling the macro using the command line interface, it must be called according to the following format:

parallel_strings_panel.4do "SOURCE MODEL" offset "TARGET MODEL"

The first argument passed must be the name of a model containing the data to process. The source model of data to process must be the first argument provided to the macro.

The second argument must be the offset distance to parallel the source strings. This can be negative or positive, but it must be a valid real number (e.g. 1.234, -567.00, 0).

The third and final argument must be the name of the model in which to place the resultant paralleled strings.

If any of the fields contain spaces, they must be enclosed in quotes
For example: "SOURCE DATA"

When using the command line interface, there must be 3 and only 3 arguments. Any fewer or more will be considered an error and will stop the macro from progressing any further.

Refer to the description of the fields in the Graphical User Interface section for further details, including restrictions on fields and expected behavior.

The macro uses the **Parallel()** function made available through the macro language. As such, the string types supported and behaviour of the macro is dependent on the implementation of that function.

Polygon Discovery

Position of option on menu: Utilities =>H-Z =>Polygon discovery

Polygon discovery takes a selected position/point on a plan view and from the data displayed on the view, finds the polygon enclosing the selected position/point from the line and arc segments in strings around the position/point.

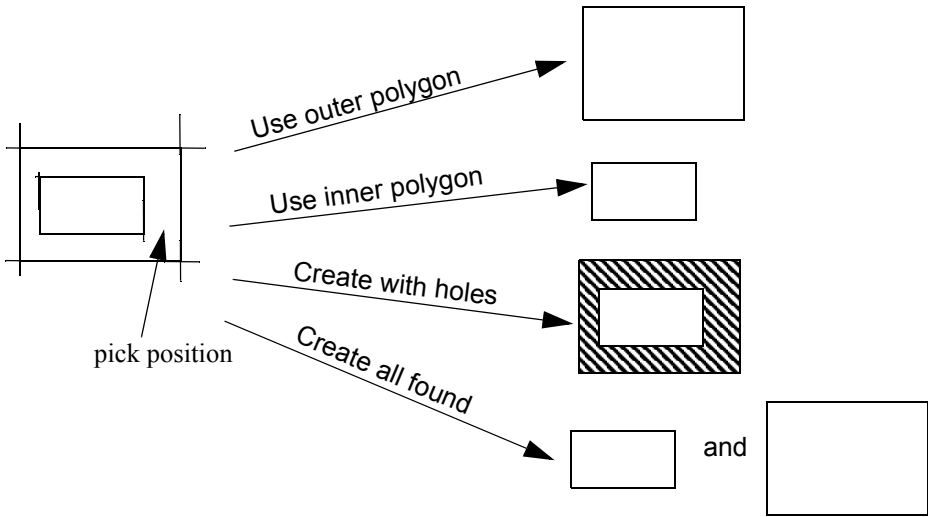

The name, colour and model for the created polygon are taken from the CAD Tool bar.

Selecting **Polygon discovery** brings up the **Polygon Discovery** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Max. extension <i>maximum distance to extend segments to get an intersection to help define the surrounding polygon.</i>	real value box	0.03	measures
Mode ,	choice box	Use outer polygon	Use outer polygon User inner polygon Create with holes Create all found

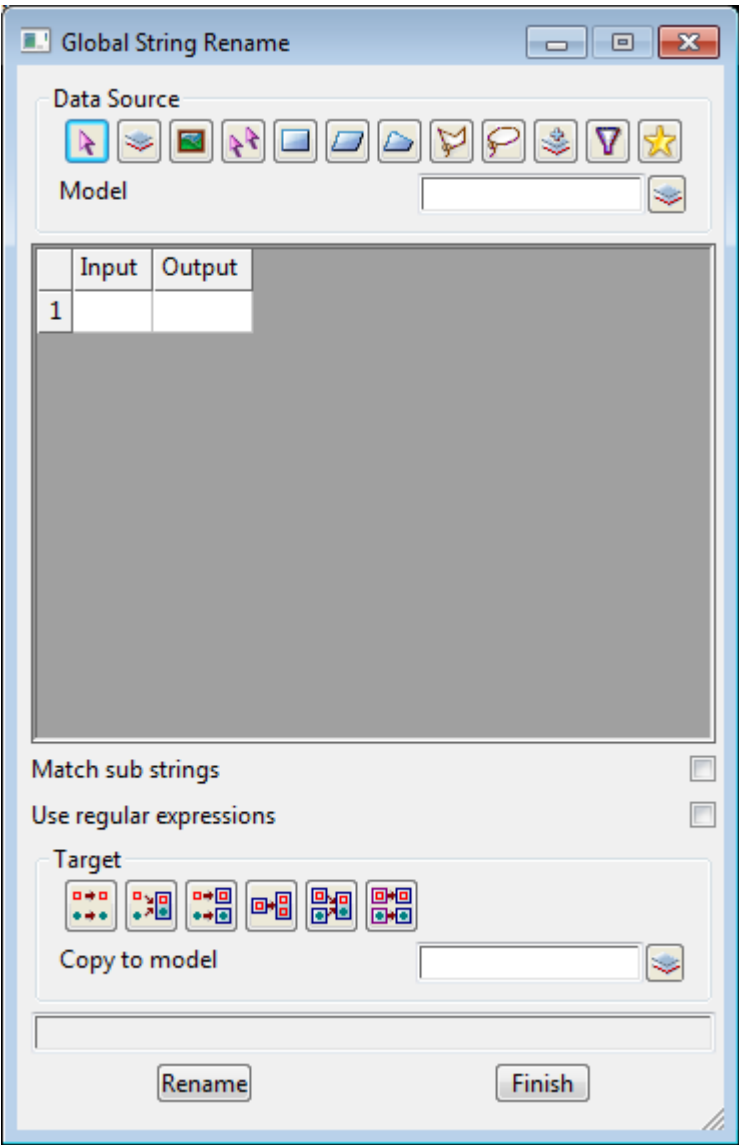

Create filled polygons <i>if ticked, the created polygons are given a fill colour.</i>	tick box
Pick	button

pick the position/point that will be used to find an enclosing polygon for.

Rename Strings

Position of option on menu: Utilities =>H-Z =>Rename strings
Selecting **Rename strings** brings up the **Global String Rename** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input		
--------------------	-------	--	--

source of data to be processed.

Input
expression to match the selected string names against.

*If a match occurs then the string name is modified as per the **Output** field.*

Output
*expression for renaming the strings that matched **Input**.*

Match sub strings tick box not ticked
*if ticked, only a part of the string name needs to match the expression in **Input**.*

Use regular expressions tick box not ticked
*if ticked, **Input** is a regular expression.*

Target type
Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

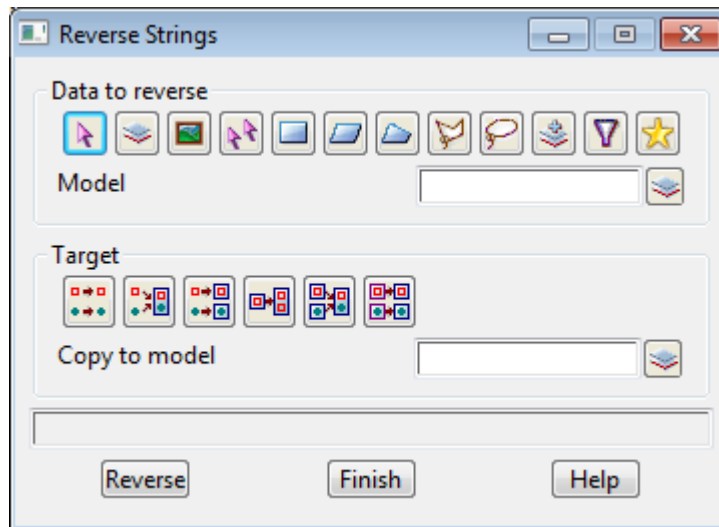

Rename button
rename the selected data.

Reverse Strings

Position of option on menu: Utilities =>H-Z =>Reverse strings

Reverses the direction of the selected strings.

Selecting **Reverse strings** brings up the **Reverse Strings** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

source of data to be processed.

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info

input

extra information required for the target.

Reverse

button

reverse the direction of the selected strings.

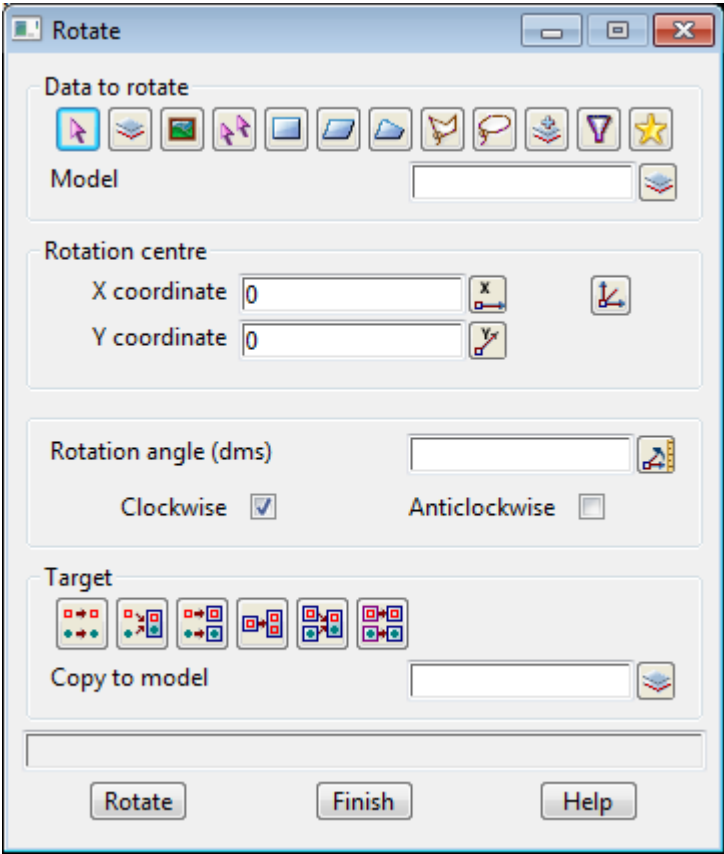

Rotate

Position of option on menu: Utilities =>H-Z =>Rotate

Rotate rotates all the selected strings about a central point (the rotation centre). The strings are rotated through a user supplied angle and can be moved or copied to their new rotated position.

The difference between a copy and a move is that if a string is **copied**, a copy of the string is rotated and the original string left untouched, whereas for a **move**, the actual string is moved from its original position to the new rotated position.

Selecting **Rotate** displays the **Rotate** panel.

The centre of the rotation is defined by selecting the **Centre** button and picking a point as the new centre. The centre can be changed at any time by using the **Centre** button to select another centre.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
Rotation centre				xyz ops
<i>select the centre of the rotation. The centre can be changed at any time.</i>				
Rotation angle (dms)		angle box		
<i>the angle in degrees to rotate the string through. The angle is measured about the rotation centre point in either a clockwise or anticlockwise direction.</i>				

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Rotate button

rotate the selected data.

Rotate Relative

Position of option on menu: Utilities =>H-Z =>Rotate relative

Rotate Relative allows multiple strings to be rotated in the XY plane by a user given angle and about various base points (rotation centres).

The simpler Rotate option (Utilities =>H-Z =>Rotate) only rotates the selected strings about a **single** point.

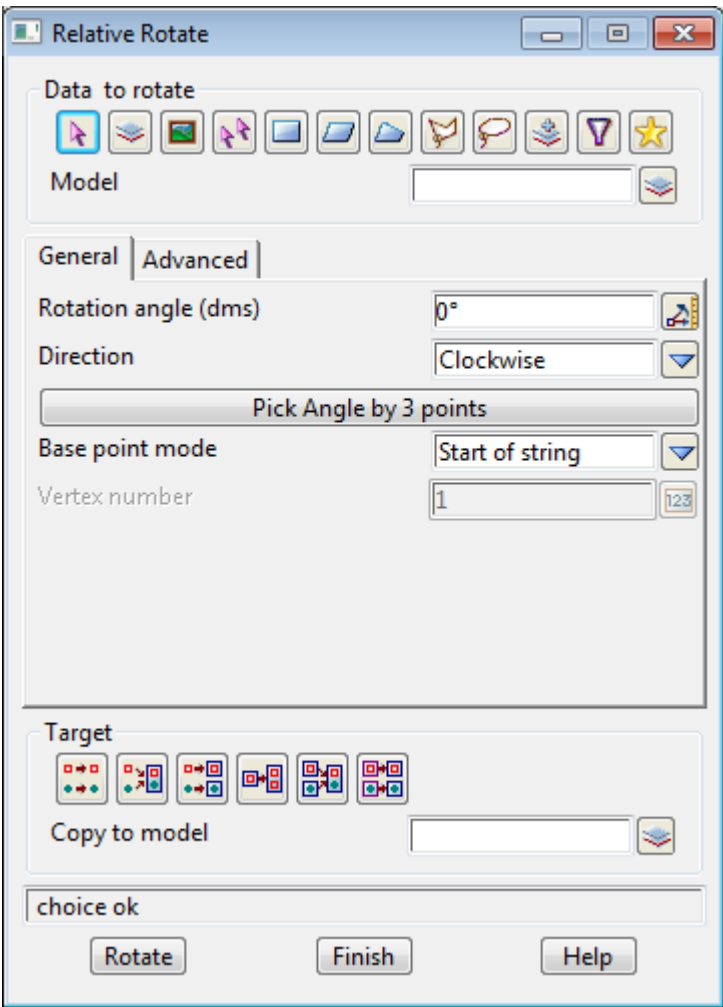

Rotate Relative is more flexible and has many methods for defining the base points (rotation centres), even allowing individual strings to have their own base point. In this case, the base point for rotation is calculated for each string in the Data Source and the rotation applied to each string individually. For example, Relative Rotate can rotate strings where the base point for each string is the start vertex of each string.

Allowing various base point modes allows greater flexibility in rotating many strings at once.

Rotate Relative performs a 2d rotation of strings. That is, the rotation is only in the XY plane.

The strings can be **moved** or **copied** to their new rotated position. The difference between a copy and a move is that if a string is copied, a copy of the string is rotated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new rotated position.

Selecting **Rotate Relative** displays the **Relative Rotate** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type	source box	Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be processed.</i>			
Rotation angle (dms)	angle box	0°	
<i>the angle in degrees to rotate the string through. The angle is measured about the rotation centre point in either a clockwise or anticlockwise direction.</i>			
Direction	choice box	Clockwise	Clockwise, Counter-clockwise
<i>the direction in which to apply the angle, either clockwise or counter-clockwise.</i>			
Pick Angle by 3 points	button		
<i>allows the user to measure the angle for rotation by picking 3 points on the screen.</i>			

- Upon clicking the button, the user will be asked to pick the:
1. Base point about which the angle is measured (A);
 2. Reference point (B); and
 3. New point (C).

The Rotation angle and Direction will be calculated based on the 3 picked points.

Base point mode	choice box	Start of string	Start of string, End of string, Middle of string, Middle Vertex, Vertex Number, Chainage, Chainage & Offset, Coordinates, Angle by 3 pts Vertex, Justification point (Text only!)
------------------------	------------	-----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

- allows the user to define how the base point for the rotation is determined for the data. Valid options include:
- Start of string – the base point is the start of each string
 - End of string – the base point is the end of each string
 - Middle of string – the base point is the middle (based on chainage) of each string
 - Middle Vertex – the base point is the middle vertex of each string. In the case of a string with an even number of vertices, the behaviour of this routine can be varied. Refer to the Middle Vertex Mode in the Advanced tab.

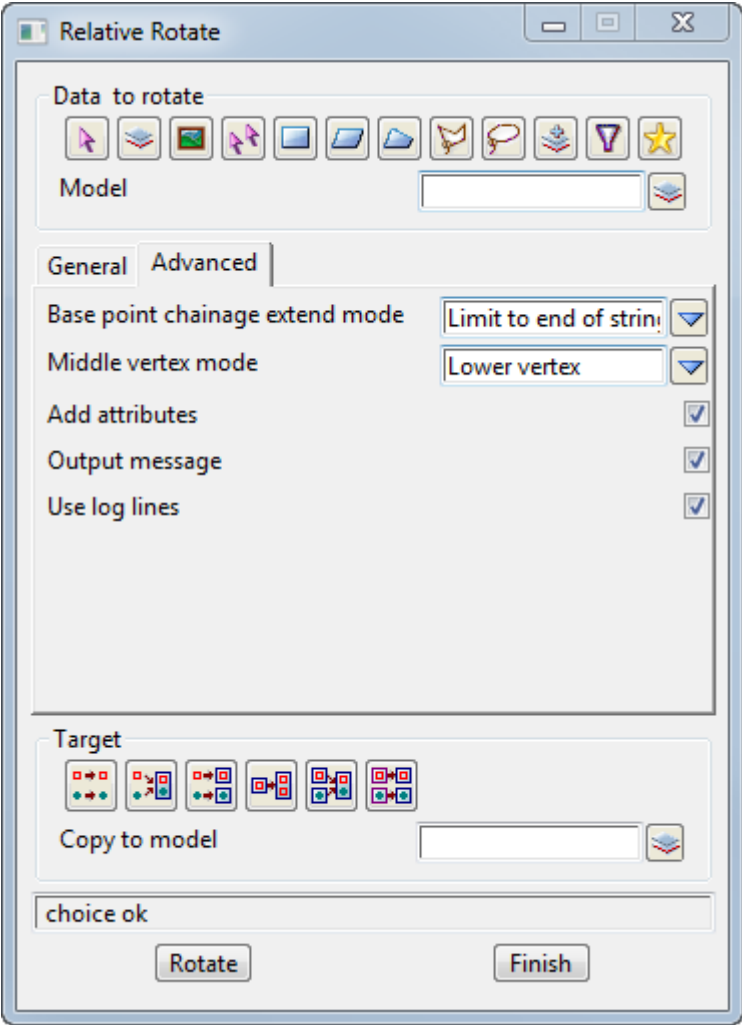

- *Vertex Number* – the base point is a specific vertex of each string, specified by the vertex number. The start vertex is 1, the next vertex 2 and so on for a string with n vertices. The vertex number may also be specified as a negative number to count vertices from the end of the string back towards the start. In this case, for a string with n vertices, a vertex number of -1 is the last vertex (nth vertex), - 2 the 2nd last vertex (n-1), and so on until the first vertex number is -n. If the specified vertex number exceeds the string extents, then an error will be produced and the string skipped.
- *Chainage* – the base point is calculated at a specific chainage along each string. Where the chainage is beyond either end of a string, the behaviour of this routine can be varied. Refer to the Base point chainage extend mode in the Advanced tab.
- *Chainage & Offset* – the base point is calculated at a specific chainage along and offset from each string. The standard convention of a negative offset to the left of the string and positive offset to the right of the string applies.
- *Coordinates* – the base point is specified by a set of coordinates. In this mode, the routine behaves in the same way as the normal Rotate routine- the same base point is used for all strings. The Z coordinate is not optional and must be entered, even if it is zero. The Z coordinate, however, does not affect the rotation.
- *Angle by 3pts Vertex* – the base point is the set of coordinates selected when the Angle by 3 pts was picked. This is the coordinates of point A in the diagram above.
- *Justification point (Text only!)* – the base point is the justification point of a Text object. Note that this only applies to Text objects- all other objects will be skipped in this mode.

The fields displayed on the panel will change depending on the base point mode chosen.

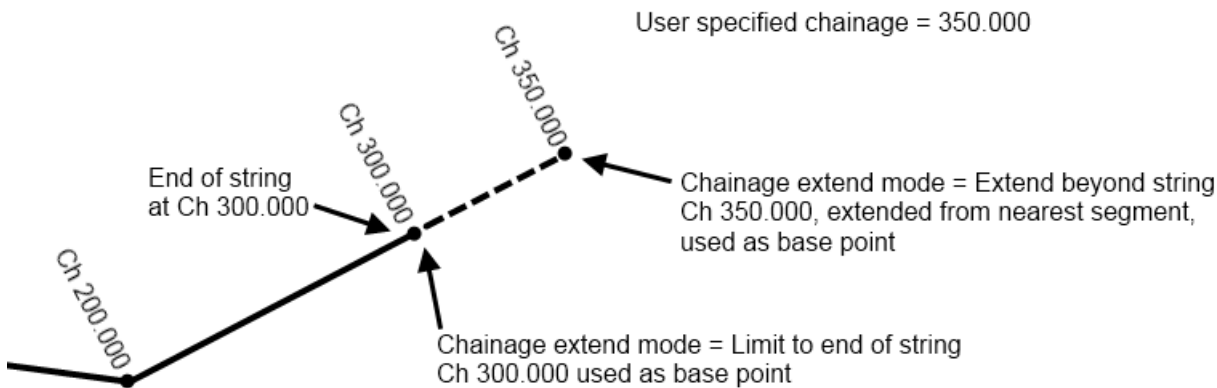

Vertex number	integer box	1	<i>the vertex number to be used as a base point. Enabled for Vertex Number mode only.</i>
Chainage	real box	0	<i>the chainage to be used for calculating the base point. Enabled for Chainage and Chainage & Offset modes only.</i>
Offset	real box	0	<i>the offset to be used for calculating the base point. Enabled for Chainage & Offset mode only.</i>
Base Point	xyz box	0,0,0	<i>the coordinates (X, Y, Z) to be used as the base point. Enabled for Coordinates mode only.</i>

Advanced Tab

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Base point chainage extend mode	choice box	Limit to end of string	Skip with error, Limit to end of string, Extend beyond string
<i>controls the behaviour of the routine when the base point mode is Chainage and the specified chainage is beyond the string extents.</i>			
<ul style="list-style-type: none">• <i>Skip with error</i> – the string will be skipped, with an error written to the output window• <i>Limit to end of string</i> – the base point will use the chainage of the nearest end point• <i>Extend beyond string</i> – the base point will be calculated based on a projection beyond the string to the specified chainage and based on the bearing of the nearest end.			

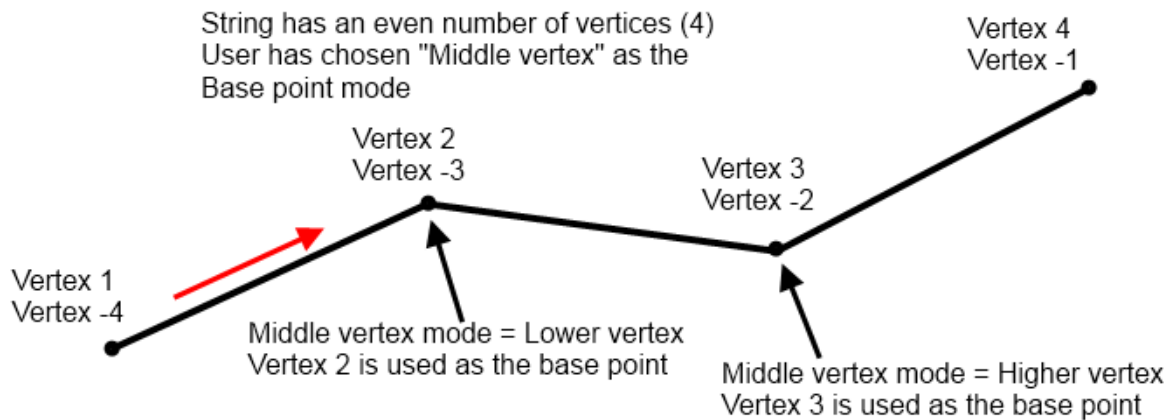

Middle vertex mode choice box Lower vertex Skip with error, Lower vertex < Higher vertex

controls the behaviour of the routine when the base point mode is Middle Vertex and the string has an even number of vertices. Where the string has an even number of vertices, the middle vertex can be one of two possibilities.

Skip with error – the string will be skipped, with an error written to the output window

Lower vertex – the lower-numbered vertex will be used as the middle vertex

Higher vertex – the higher-numbered vertex will be used as the middle vertex

Add attributes tick box ☒

writes the various relative rotate settings to the rotated string as string attributes.

Output messages tick box ☒

writes various output messages when run. If not ticked, no output messages will be produced by the routine, including critical warning and error messages.

Use log lines tick box ☒

use intelligent log lines for the certain output messages. If not ticked and output messages are enabled, the messages will be normal messages.

Target type

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Rotate

button

rotate the selected data.

Set Constant Z-Values

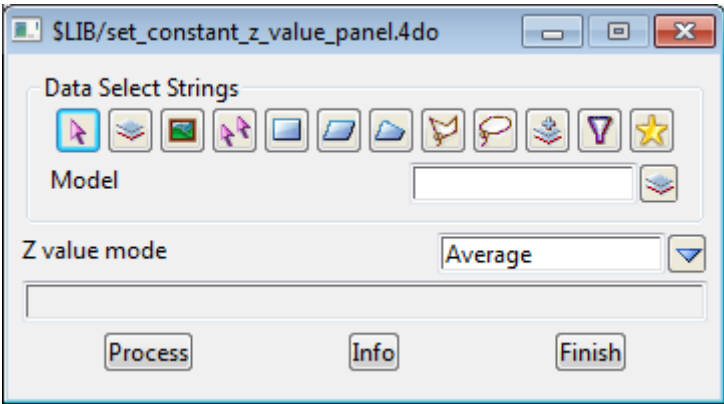

Position of option on menu: Utilities =>H-Z =>Set constant z-values

This option sets all the points on a string to the same elevation - the average, highest, or lowest z-value of each selected string's z-values.

For example, the option can be used to set a starting value for building pads.

The user can drape a string then average the z-values to get close to a volumes balance. Alternatively, the user can opt for the highest z-value calculated by the drape, *i.e.* the entire platform is in fill, or select the lowest z-value so the entire platform is in cut.

Selecting Set constant z-values brings up the Set Constant Z-Value panel.

The fields and buttons used in the panel have the following functions.

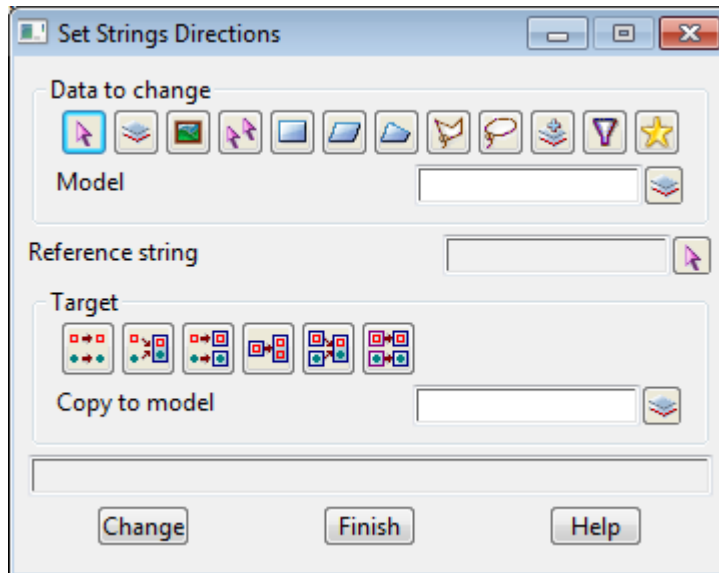

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Z value mode	choice box	Average	Average, Highest, Lowest
<i>if Average, the string is given the Z value that is the average of all the vertex Z values.</i>			
<i>If Highest, the string is given the Z value that is the highest of all the vertex Z values.</i>			
<i>If Lowest, the string is given the Z value that is the lowest of all the vertex Z values.</i>			
Process	button		
<i>sets the constant z-value for the selected strings.</i>			

Set Strings Directions

Position of option on menu: Utilities =>H-Z =>Set strings directions

Set strings directions attempts to set the direction of select strings to be the same as the direction of a selected reference string.

On selecting Set strings directions, the Set Strings Directions panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

data source to be select strings to change direction.

Reference string

string select

the string that is used as the reference direction. This is the direction that, if possible, the selected strings are given.

Target type

where to put the processed string - for a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info

input

extra information required for the target.

Change

button

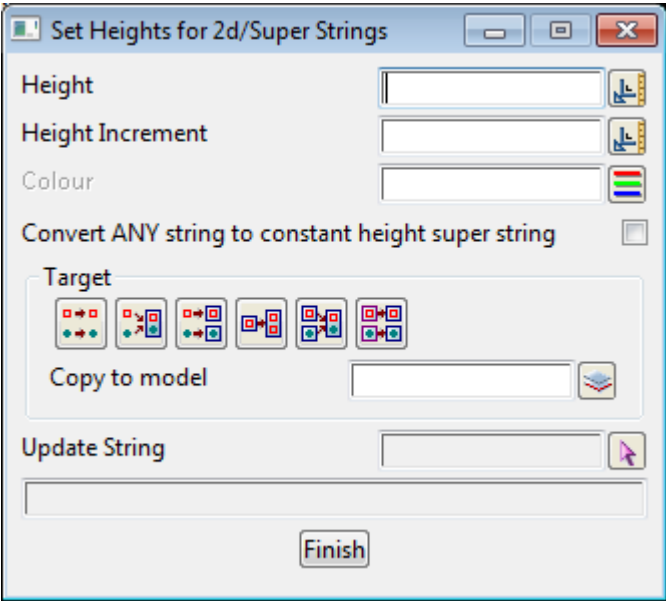

change the direction of the selected strings.

Set Heights for 2d/Super Strings

Position of option on menu: Utilities =>H-Z =>Set heights for 2d/super strings

Set heights for 2d/super strings is used to quickly change the height of selected 2d strings or 2d super strings (super strings with a constant z value). Is is especially useful when you have a lot of contours without z-values and you wish to give them z-values.

An initial height and increment is given and as each string is selected, it is given the current height and the height then incremented for use when picking the next string.

The fields and buttons used in this panel have the following functions:

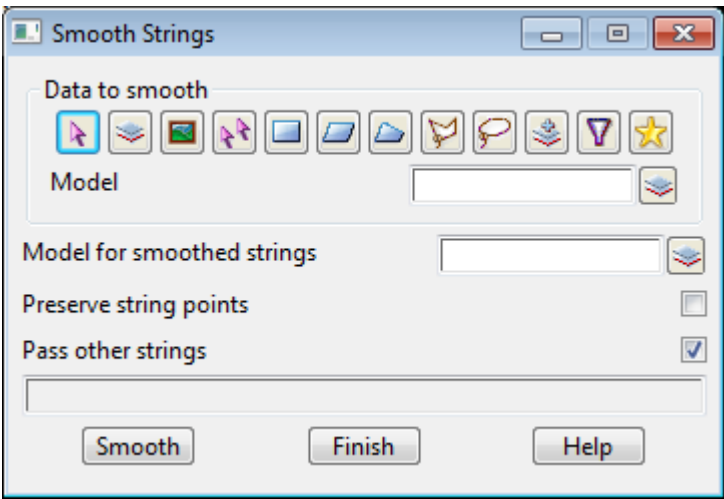

Field	Description	Type	Defaults	Pop-Up
Height	Height to used as the height for the next selected string. This is incremented by the Height increment after each string is accepted.	input		
Height increment	As each string is accepted and given the Height, Height is incremented by this value.	input		
Colour	if not blank, the selected strings are given this colour when their z-value is changed. If blank, the selected strings keep their original colour.	input		available colours
Target type	where to put the processed string - for a full description go to Data Target in the chapter Tools and Concepts			
Target info	extra information required for the target.	input		
Update string	After clicking on the Update string arrow icon, 2d strings are selected and when accepted, have their z-value changed to the value in Height. The height value is then automatically incremented by Height increment. The next string is then selected and accepted (without needing to click on Pick again). This continues until Cancel is selected from the Pick Ops menu.	string select		

Smooth Strings

Position of option on menu: Utilities =>H-Z =>Smooth strings

The **Smooth** options are used to add extra points into 2d or 3d strings to make a smoother string.

Selecting **Smooth strings** displays the **Smooth Strings** panel.

The fields and buttons used in this panel have the following function

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>data source to be smoothed.</i>			
Model for smoothed strings		input		available models
	<i>model for the smoothed strings to go to</i>			
Preserve string points		tick box		
	<i>if ticked, the smoothed strings will still contain all the original points.</i>			
	<i>if not ticked, the smoothed strings may deviate from the original string points</i>			
Pass other strings		tick box	tick	
	<i>if ticked, any strings that can't be smoothed are copied and added to the smoothed strings model.</i>			
Smooth		button		
	<i>smooth the selected strings.</i>			

Swap XY

Position of option on menu: Utilities =>H-Z =>Swap XY

The Swap xy option is used to swap the (x,y) coordinates of selected strings.

Selecting Swap XY displays the Swap XY **String/Model/View** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be have the XY coordinates swapped.</i>			
Target type			
<i>Data target - where to put the processed string. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Swap XY	button		
<i>swap the selected strings and add them to the target.</i>			

Test Wildcards

Position of option on menu: Utilities =>H-Z =>Test wildcards

Test wildcards is used to test the effect of pattern expressions and regular expressions on text.

Selecting Test wildcards displays the **Pattern/Regular Expression Tester** panel

The screenshot shows a window titled "Pattern/Regular Expression Tester". It has a "Search/Replace" section with two columns: "Pattern expression" (selected with a radio button) and "Regular expression" (unselected). Each column has "Search" and "Replace" text boxes. There are checkboxes for "Match sub strings" and "Ignore case". Below this is a "Test data" section with a table. The table has columns "Input", "Output", and "Status". The first row has "1" in the "Input" column and "option" in the "Output" column. The "Status" column is empty. At the bottom of the window are "Finish" and "Help" buttons.

	Input	Output	Status
1	option		

The **Search/Replace** criteria and the **Pattern expression** or **Regular expression** are applied to the data in the **Input** column and the results are placed in the **Output** column.

Text

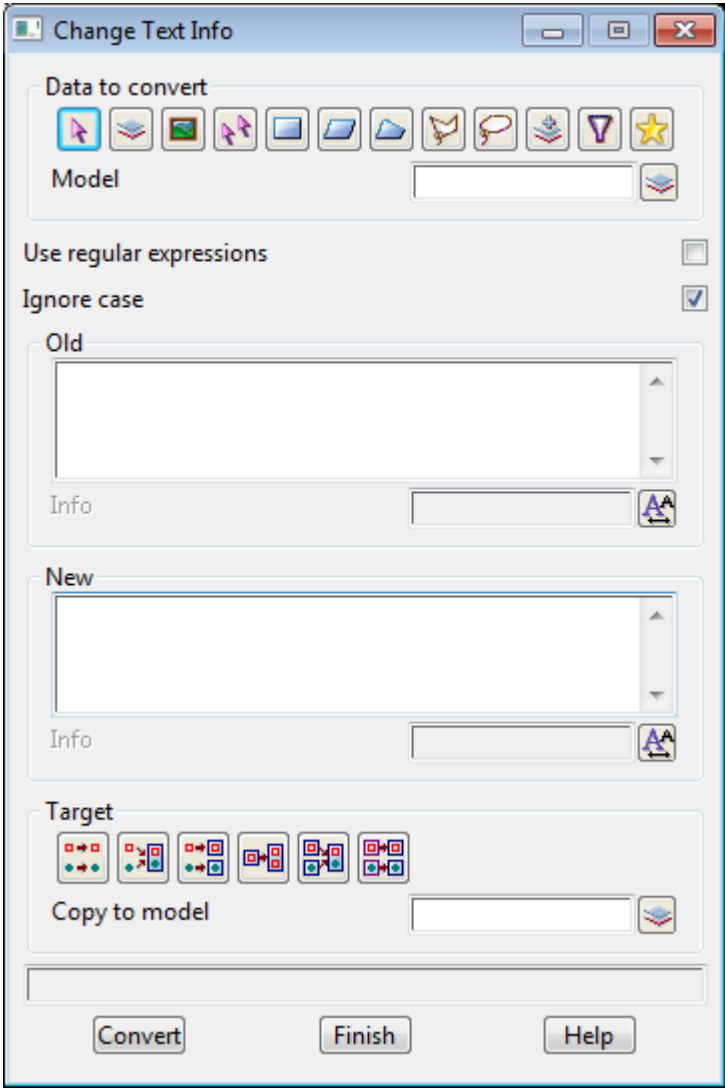

Position of option on menu: Utilities =>H-Z =>Text

The **Text** option is used to change the text style, units, height, offset, justification, angle and text for text, 4d strings and super strings.

For this option the selection process is extended from the standard Data Source.

After the data is selected as defined by the Data Source, the two extra parameters, **Old text** and the Textdata parameters in **Info**, are used to further specify which text is to be selected and modified.

Selecting **Text** displays the **Change Text Info** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Default
Data source type	Model	
Data source	input	
<i>source of data to be processed.</i>		
Use regular expressions	tick box	not ticked

Ignore case	tick box	ticked
Old text	input	
<i>if the Old text field is non-blank, then any text in 4d or text strings will be checked for a match against this value. Wild cards and characters can be used.</i>		
Info	input	
<i>if non-blank, then only strings which match these Textdata parameters will be selected.</i>		
New text	input	
<i>if non-blank, then any selected text the selected strings will be modified to this value. Wild cards and characters can be used.</i>		
Info	input	
<i>if non-blank, then the select text on the selected strings will be given these Textdata parameters.</i>		
Target type		
<i>Data target - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>		
Target info	input	
<i>extra information required for the target.</i>		
Convert	button	
<i>run the option and change the selected text.</i>		

Translate

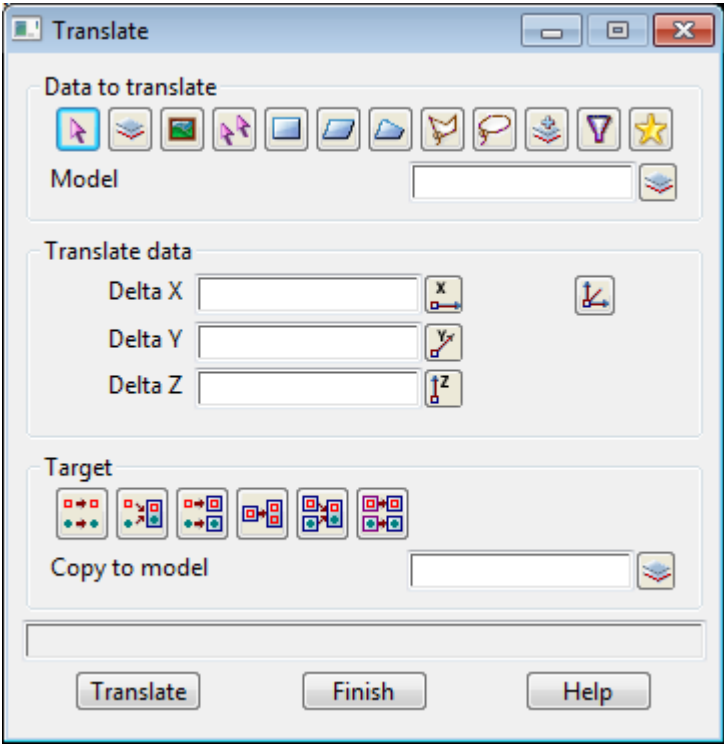

Position of option on menu: Utilities =>H-Z =>Translate

Translate is used to translate the selected strings through a user supplied translation vector (dx,dy,dz).

The strings can be translated in the x,y and z directions and be moved or copied to their new translated positions.

The difference between a **copy** and a **move** is that if a string is copied, a **copy** of the string is translated and the original string left untouched, whereas for a **move**, the actual string is moved from its original position to the new translated position.

Selecting **Translate** displays the **Translate** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type			Model	
-------------------------	--	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source		input		
--------------------	--	-------	--	--

source of data to be processed.

dx dy dz		input		
-----------------	--	-------	--	--

the translation vector (dx,dy,dz). This vector is added to all points in the strings.

*The translation (dx dy dx) can be typing into the **dx dy dz** field or by picking the **dx dy dx** button and then selecting two points with the cursor. When two points are selected, the difference vector of the two selected points is taken as the translation vector (dx,dy,dz). The (dx,dy,dz) value is piped into the **dx dy dz** field.*

Target type				
--------------------	--	--	--	--

Data target - where to put the processed string. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

Translate button
translate the selected strings.

How to Use the Panel

- (a) Enter the **Data source** for the strings are to translated.
- (b) Define the translation vector (dx dy dz) by either typing the value into the **dx dy dz** field or by selecting the **dx dy dz** button and picking two points to define the translation vector. The resulting (dx dy dz) values are piped into the **dx dy dz** field.
- (c) Select the **target** mode.
- (d) Selecting the **Translate** button then does the required translations (moves or copies).

Old

Position of option on menu: Utilities =>Old

The Old Utilities walk-right menu is:

For the option *Check breaklines*, go to

XXX New Name

Position of option on menu: User =>Miscellaneous =>A to C =>Change name of strings

Note - This is an unsupported option which may not be fully documented.

The fields and buttons used in this panel have the following functions:

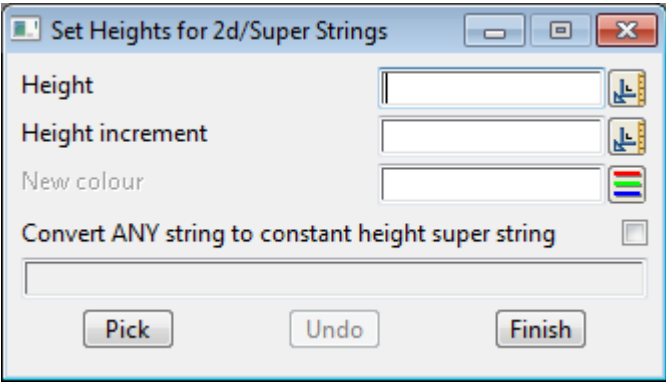

Field Description	Type	Defaults	Pop-Up
Data source		Model	string, model, view
Model/View/String of circles			
<i>type of source of the data to process.</i>			
Model for centres	model box		available models
<i>source of data to process.</i>			
Name stem	input		
Process	button		

Set Heights for 2d (contour) Strings

Position of option on menu: User =>Miscellaneous =>A to C =>Contour levels

Note - This is an unsupported option which may not be fully documented.

This panel is used to quickly change the height of contour strings. An initial height and increment is given. As each string is accepted, it is given the height and the height then incremented.

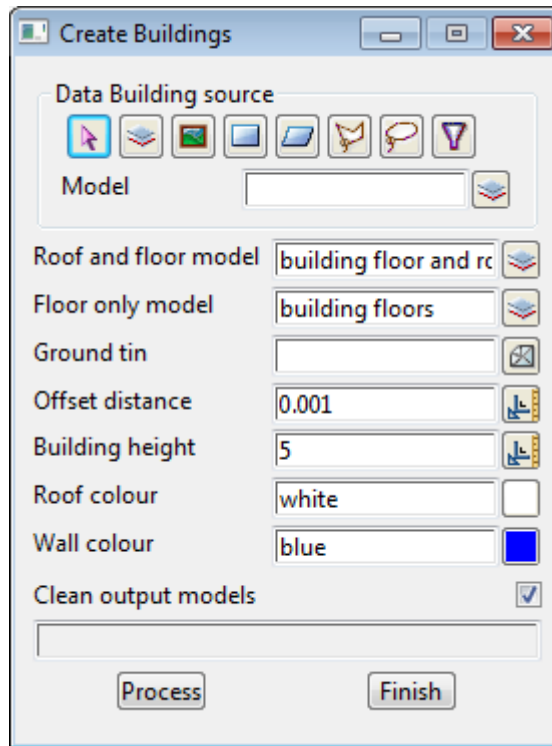

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Height <i>Height to use for the next selected string. This is incremented by the “Height increment” after each string is accepted.</i>	input		
Height increment <i>As each string is accepted, the “Height” value is incremented by this value.</i>	input		
New colour <i>If non-blank, the selected strings are given this colour when their z-value is changed.</i>	input		available colours
Pick <i>After clicking on Pick, 2d strings are selected and when accepted, have their z-value changed to the value in the Height field. The height value is then automatically incremented. The next string is then selected and accepted (without needing to click on Pick again). This continues until Cancel is selected from the “Pick Ops” menu.</i>	input		
Undo <i>Undo the last height change. This can be selected up to 200 times.</i>	button		

XXX Create Building for a Tin

Position of option on menu: User => Miscellaneous => A to C => Create buildings for tin

Note - This is an unsupported option which may not be fully documented.

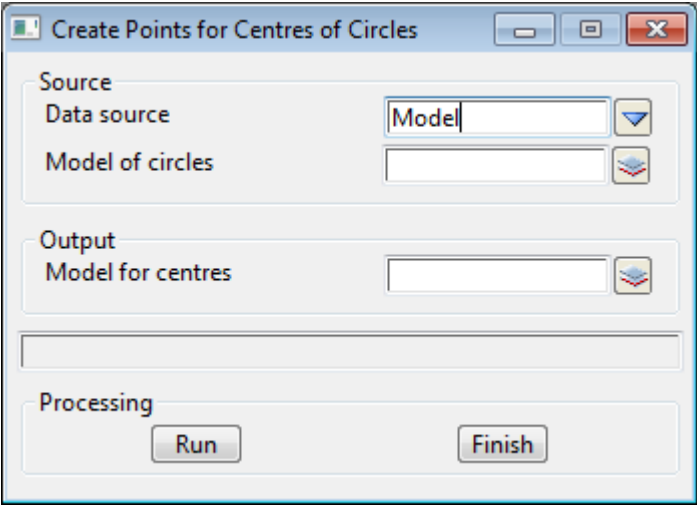

Create Points for Centre of Circles

Position of option on menu: User =>Miscellaneous =>A to C =>Convert circles to points

Note - This is an unsupported option which may not be fully documented.

This options creates points at the centres of circles.

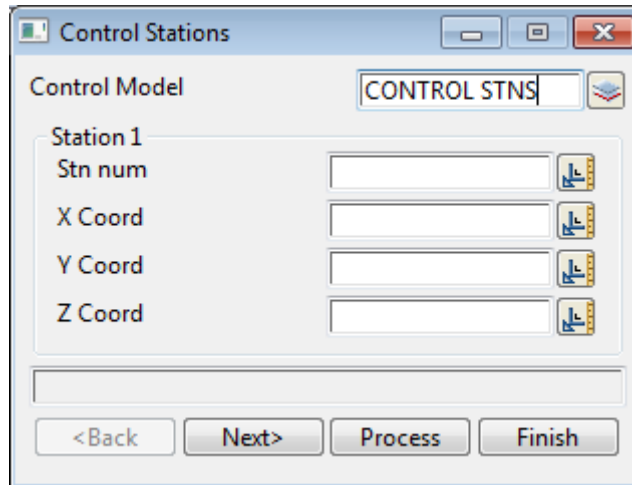

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source		Model	string, model, view
Model/View/string of circles <i>source of the circles to create centre points for.</i>			
Model for centres	model box		available models
<i>model to place the created centre points in.</i>			
Run	button		
<i>run the option.</i>			

XXX Create Control Stations

Position of option on menu: User =>Miscellaneous =>A to C =>Create control stations

Note - This is an unsupported option which may not be fully documented.

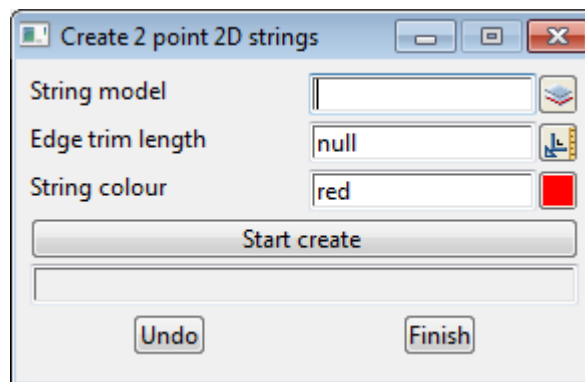

The 'Control Stations' dialog box features a title bar with standard window controls. Below the title bar, the 'Control Model' is set to 'CONTROL STNS'. Under the 'Station 1' section, there are four input fields: 'Stn num', 'X Coord', 'Y Coord', and 'Z Coord', each accompanied by a small icon. At the bottom, there are four buttons: '<Back', 'Next>', 'Process', and 'Finish'.

XXX Create 2d String from Two Points

Position of option on menu: User =>Miscellaneous =>A to C =>Create 2 point - 2d strings

Note - This is an unsupported option which may not be fully documented.

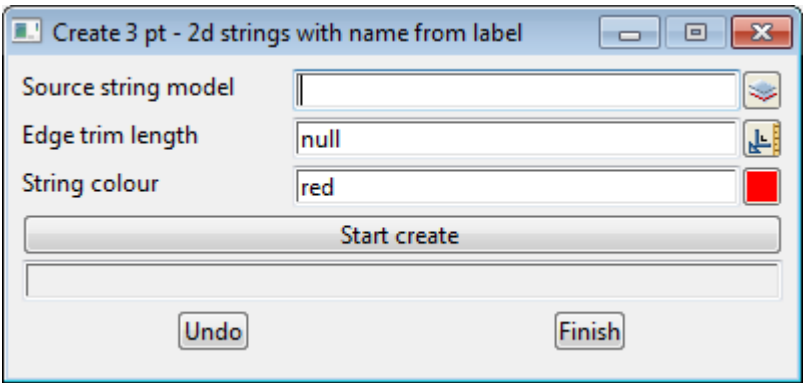

The 'Create 2 point 2D strings' dialog box has a title bar with standard window controls. It contains three input fields: 'String model', 'Edge trim length' (set to 'null'), and 'String colour' (set to 'red' with a red color swatch). Below these fields is a 'Start create' button. At the bottom, there are two buttons: 'Undo' and 'Finish'.

XXX Create 3 Point 2d Strings

Position of option on menu: User =>Miscellaneous =>A to C =>Create 3 point - 2d strings

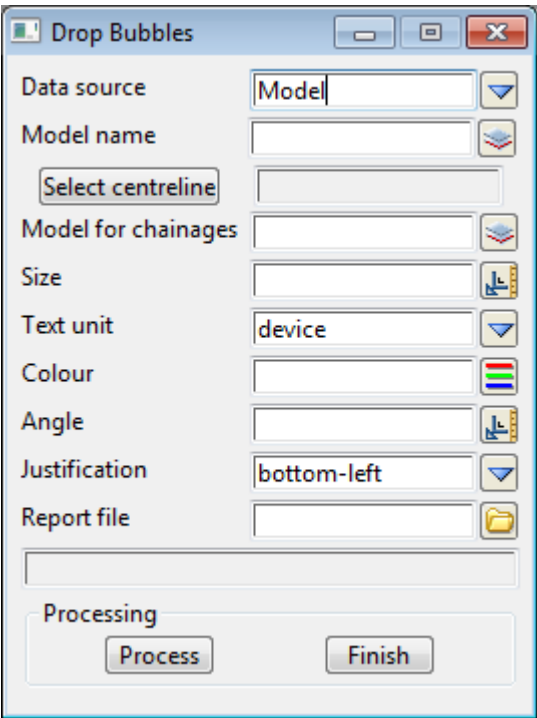

Note - This is an unsupported option which may not be fully documented.

XXX Drop Bubbles

Position of option on menu: User => Miscellaneous => D to K => Drop bubbles

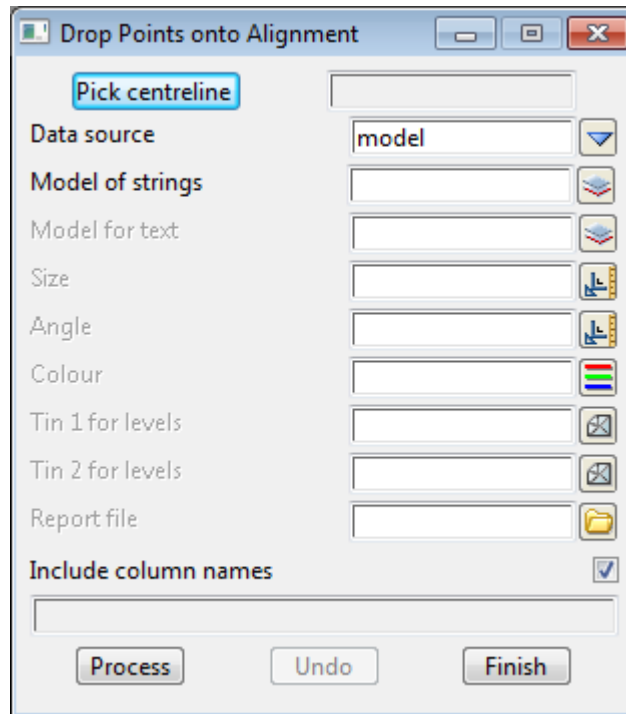

Note - This is an unsupported option which may not be fully documented.

XXX Drop Points onto Alignment

Position of option on menu: User => Miscellaneous => D to K => Drop points onto alignment

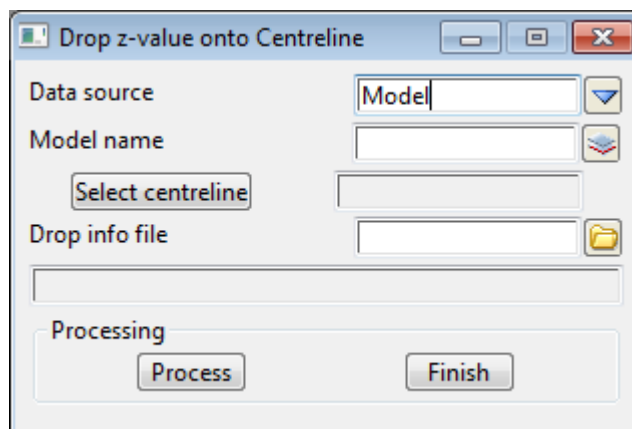

Note - This is an unsupported option which may not be fully documented.

XXX Drop z-value onto Centreline

Position of option on menu: User => Miscellaneous => D to K => Drop points on centreline

Note - This is an unsupported option which may not be fully documented.

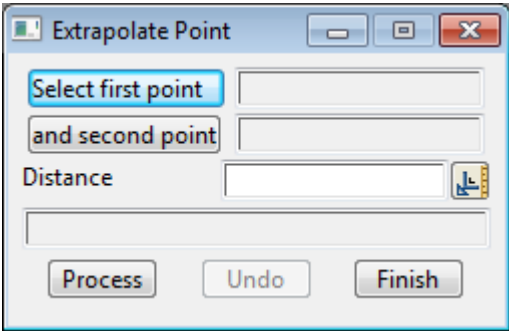

Extrapolate Point

Position of option on menu: User =>Miscellaneous =>D to K =>Extrapolate

Note - This is an unsupported option which may not be fully documented.

This option is used to select two point and then creates a new point a given distance from the second point along the line from the first point to the second point. The z-value for the point is the extrapolated z-value from the two selected points.

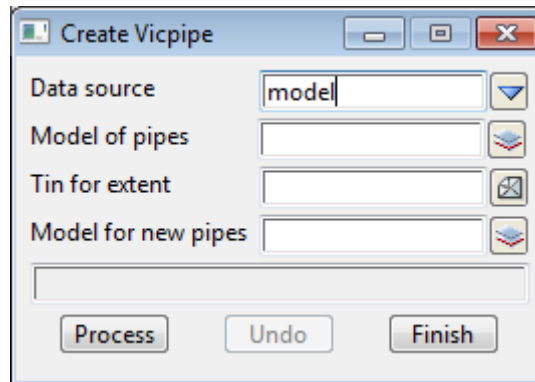

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select first point <i>select the first point to use in the extrapolation.</i>	string select		
and second point <i>select the second point to use in the extrapolation.</i>	string select		
Distance <i>distance to project from the second point along the line from the first to the second point.</i>	output box		
Process <i>run the option.</i>	button		
Undo <i>undo the last extrapolated point created since the panel has been up.</i>	button		

XXX Create VicRoad Pipe

Position of option on menu: User =>Miscellaneous =>D to K =>Extend pipe

Note - This is an unsupported option which may not be fully documented.

XXX Fencing Models

Position of option on menu: User =>Miscellaneous =>D to K =>Fencing models

Note - This is an unsupported option which may not be fully documented.

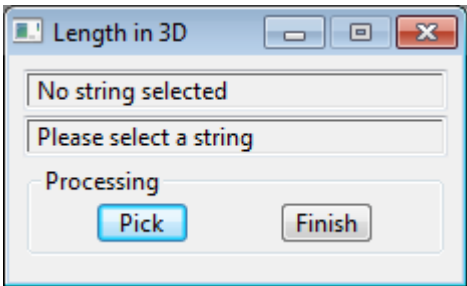

Length in 3d

Position of option on menu: User =>Miscellaneous =>D to K =>Get length in 3d

Note - This is an unsupported option.

This panel is used to calculate the 3d length of a selected string.

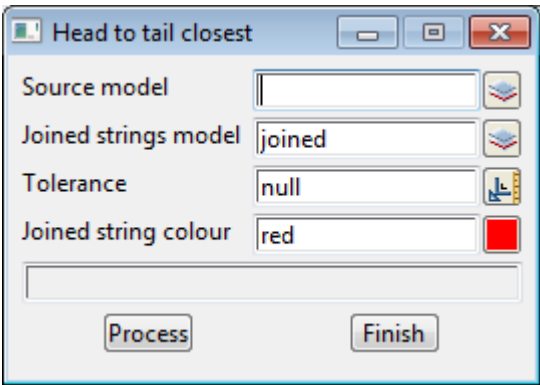

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Pick	button		
<i>select the string to calculated the 3d length for.</i>			

XXX Head to Tail Closest Points

Position of option on menu: User =>Miscellaneous =>D to K =>Head to tail closest points

Note - This is an unsupported option which may not be fully documented.

XXX Label Alignment

Position of option on menu: User =>Miscellaneous =>L to Q =>Label alignment

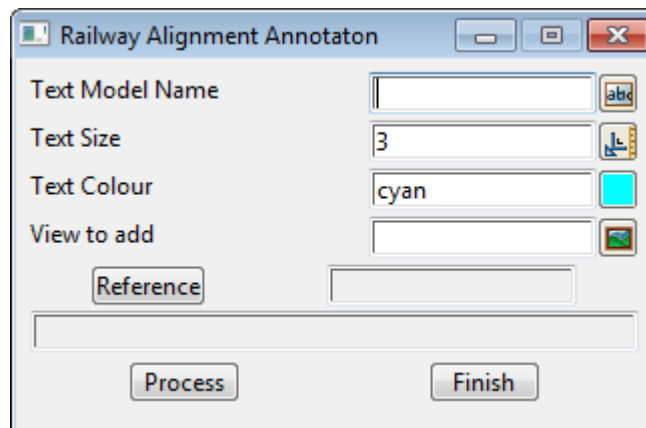

Note - This is an unsupported option which may not be fully documented.

XXX Label Alignment Radius

Position of option on menu: User =>Miscellaneous =>L to Q =>Label alignment radius/ip (rail)

Note - This is an unsupported option which may not be fully documented.

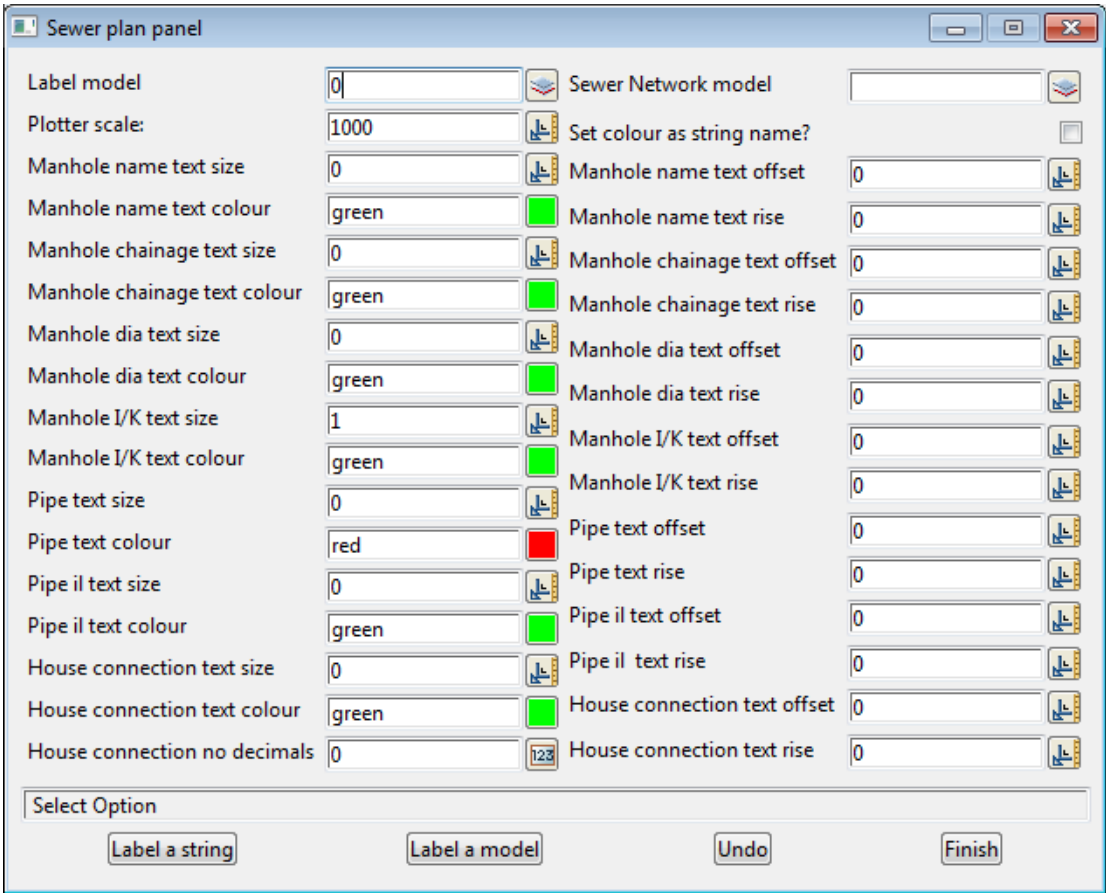

XXX Label Sewer Plan (old)

Position of option on menu: User =>Miscellaneous =>L to Q =>Label sewer plan

Note - This is an unsupported option which may not be fully documented.

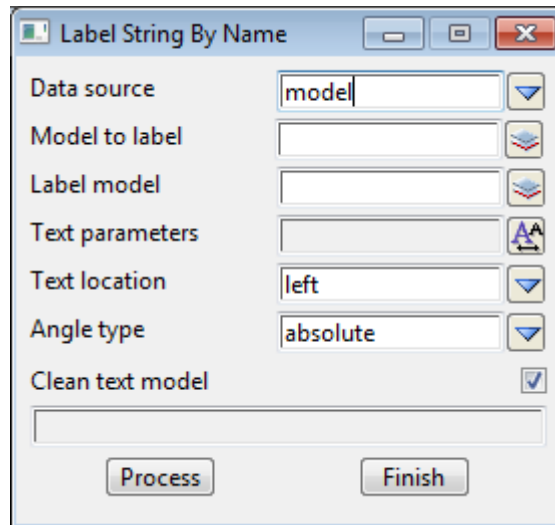

This option has been superseded.

XXX Name Strings by Nearby Text

Position of option on menu: User =>Miscellaneous =>L to Q =>Label strings with name

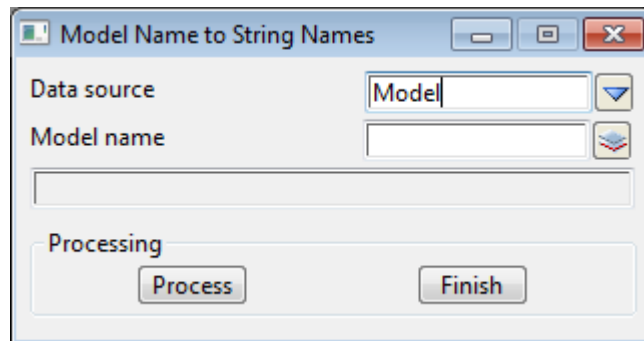

Note - This is an unsupported option which may not be fully documented.

XXX Name Strings by Model Name

Position of option on menu: User =>Miscellaneous =>L to Q =>Model to name

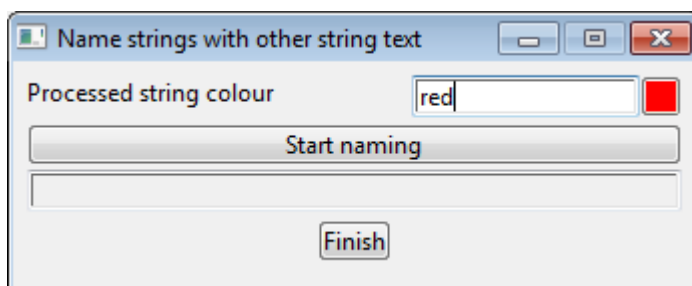

Note - This is an unsupported option which may not be fully documented.

XXX Name Section Strings by Picking Text

Position of option on menu: User =>Miscellaneous =>L to Q =>Name strings using text strings

Note - This is an unsupported option which may not be fully documented.

XXX Overlay Optimiser

Position of option on menu: User =>Miscellaneous =>L to Q =>Overlay optimiser

Note - This is an unsupported option which may not be fully documented.

The screenshot shows the 'Optimal Paver' window with the following fields and options:

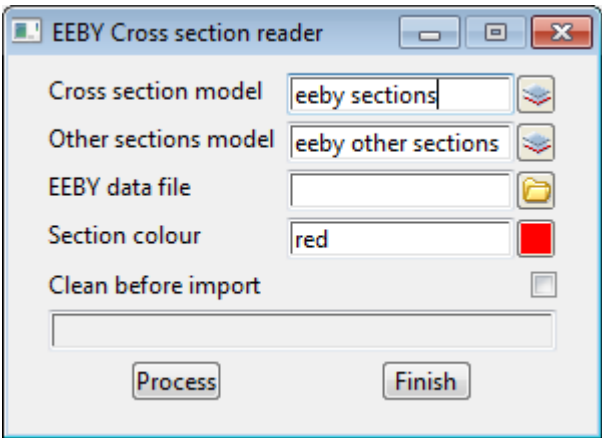

- Input Data**
 - Survey sections model: sections
 - Centre line code: CL
 - Left road edge code: ESL
 - Right road edge code: ESR
- Basic Overlay Data** (selected tab)
 - Overlay Data
 - Min overlay thickness: 0.1
 - Max overlay thickness: 0.2
 - Min crossfall %:
 - Road quality factor:
- Advanced Options** (unselected tab)
- Results**
 - Strings model: result strings
 - Section model: result sections
 - Survey tin: survey
 - Design tin: design
 - Report: results.rep

Buttons at the bottom: Process, Finish

XXX Read EEBY Sections

Position of option on menu: User =>Miscellaneous =>R to Z =>Read EEBY sections

Note - This is an unsupported option which may not be fully documented.

XXX Read USGS DEM Data

Position of option on menu: User =>Miscellaneous =>R to Z =>Read USGS DEM data

Note - This is an unsupported option which may not be fully documented.

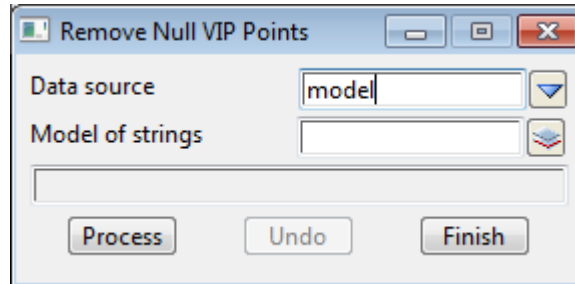

Remove Null VIP Points

Position of option on menu: User =>Miscellaneous =>R to Z =>Remove null VIP's

Note - This is an unsupported option which may not be fully documented.

This option is used to remove any null vertical intersection points from alignment strings.

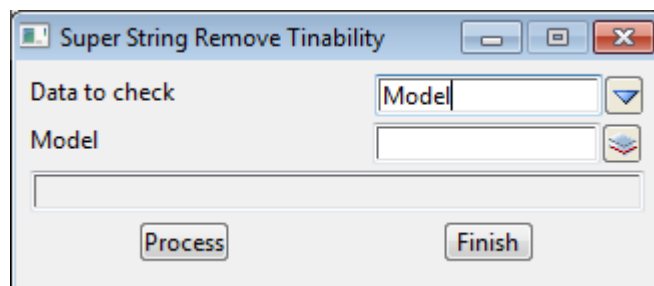

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to remove null vips for.</i>	data source	Model	String, Model, View
Model/View/String <i>Data source for all the alignment strings to remove all null vips from.</i>	data source		
Process <i>Run the option.</i>	button		

XXX Remove Tinability

Position of option on menu: User =>Miscellaneous =>R to Z =>Remove tinability

Note - This is an unsupported option which may not be fully documented.

XXX Restore Fenced Model

Position of option on menu: User =>Miscellaneous =>R to Z =>Restore fenced model
Note - This is an unsupported option which may not be fully documented.

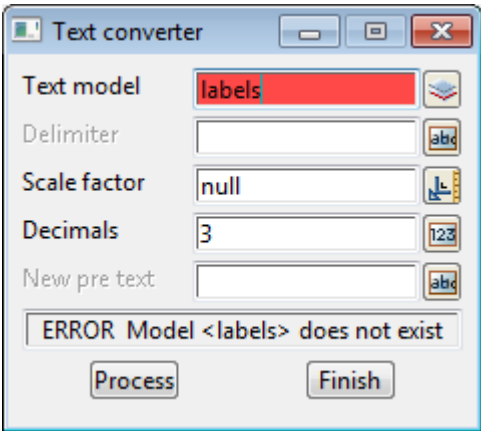

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

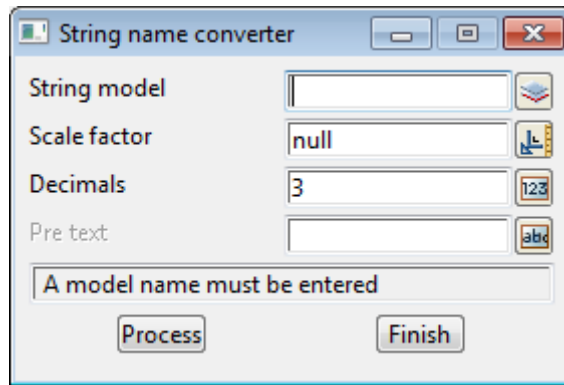

XXX Scale Text Values

Position of option on menu: User =>Miscellaneous =>R to Z=>Scale text values
Note - This is an unsupported option which may not be fully documented.

XXX Scale String Names

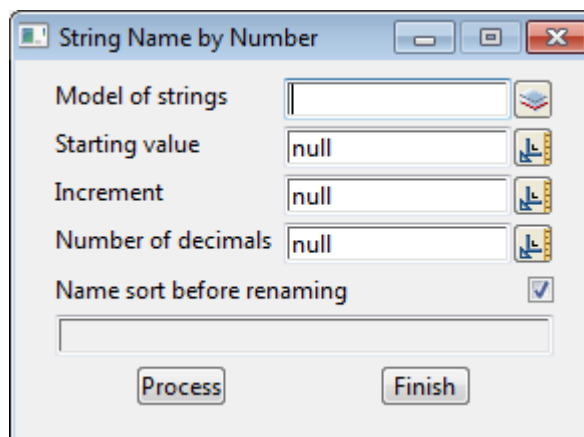

Position of option on menu: User =>Miscellaneous =>R to Z=>Scale string names
Note - This is an unsupported option which may not be fully documented.

XXX Set String Names by Number

Position of option on menu: User => Miscellaneous => R to Z => Set string names by number

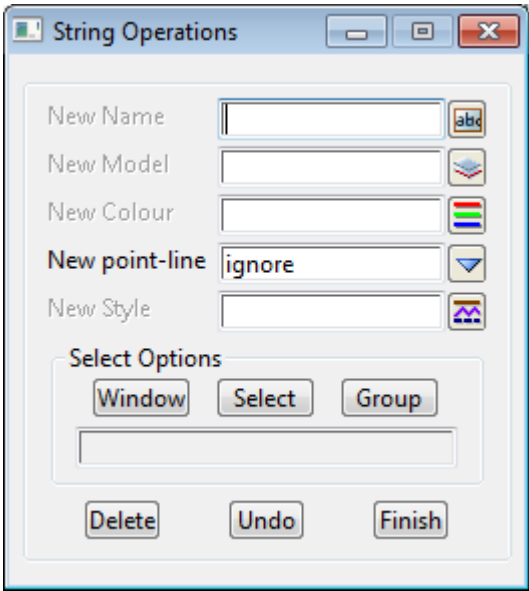

Note - This is an unsupported option which may not be fully documented.

XXX String Operations

Position of option on menu: User =>Miscellaneous =>R to Z=>Set string properties

Note - This is an unsupported option which may not be fully documented.

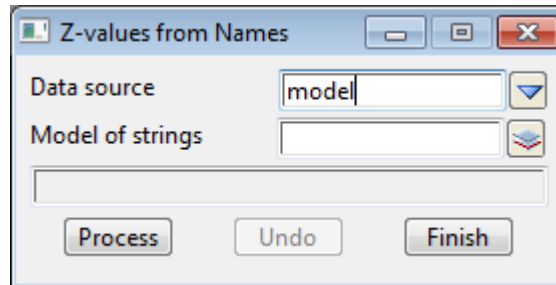

Set Contour Levels from String Names

Position of option on menu: User =>Miscellaneous =>R to Z=>Set contour level from contour name

Note - This is an unsupported option which may not be fully documented.

This operates on contour strings and sets the contour z-value to be the value of the name of the contour string. The z-values may need to be factored to bring them into the correct units.

The fields and buttons used in this panel have the following functions:

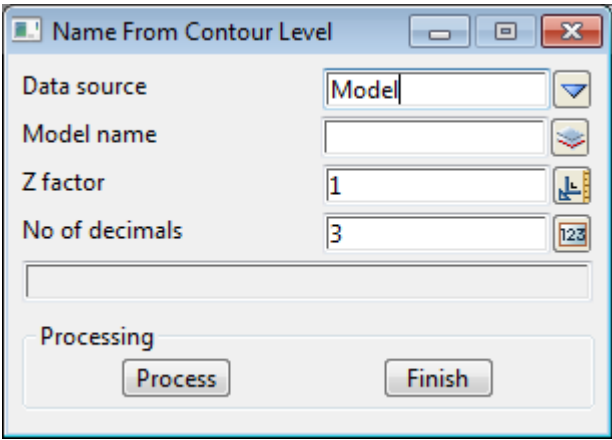

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to set contour z-values for.</i>	data source	Model	Model, View
Model/View <i>Data source to of contours to set z-values for.</i>	data source		
Process <i>Run the option</i>	button		
Undo <i>Undo the last set of contours labelled since the panel was up.</i>	button		

Set Contour Names From Contour Levels

Position of option on menu: User =>Miscellaneous =>R to Z=>Set contour names from contour levels

Note - This is an unsupported option which may not be fully documented.

This option operates on contours only and sets the string name to be the contour z value multiplied by the given factor.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>Type of data to label contours strings for.</i>	data source	Model	String, Model, View
Model/View/String <i>Data source to calculate label the contours for.</i>	data source		
Z factor <i>Value to multiply the z values by before creating the string name.</i>	input	1	
No of decimals <i>Number of decimals places to use in the string name.</i>	input	3	
Process <i>Run the option.</i>	button		

XXX Sort XYZs Data File

Position of option on menu: User => Miscellaneous => R to Z => Sort xyz data file

Note - This is an unsupported option which may not be fully documented.

String Clipboard

Position of option on menu: User => Miscellaneous => R to Z => String attributes-properties to-from clipboard

Position of option on menu: File I/O => User => String attributes-properties to-from clipboard

Note - This is an unsupported option which may not be fully documented.

On selecting the **String attributes-properties to-from clipboard** option, the **String clipboard** panel is displayed.

This panel can be used to export string properties and attributes to the windows clipboard and import the properties to update the same strings.

The following properties are always exported when **copy** is selected:

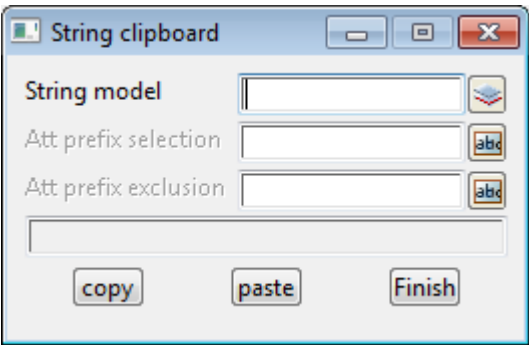

String id	Name	Type	Breakline	Style	Colour	Length
	1	3	3	1	3	1 3
3322187D1		Drainage		1	1	1004 238.358

String id, **Type** and **Length** are for export only and cannot be changed on an import.

Name, **Breakline**, **Style** and **Colour** may be changed to update the string when **paste** is selected. **Style** (linestyle order number from linestylel.4d) and **Colour** (colours.4d) numbers are used.

Starting in the 8th column, all of the string attributes are exported unless the **Att prefix selection** and/or the **Att prefix exclusion** filters are used. The first row is the string attribute name and the second row contains a number indicating the type of attribute. Attribute type numbers are

- 1 integer numbers (no decimals)
- 2 real numbers (decimals allowed)
- 3 text (characters allowed)

The fields and buttons used in this panel have the following functions.

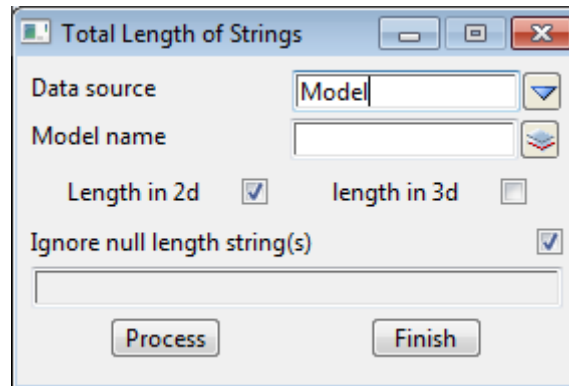

Field	Description	Type	Defaults	Pop-Up
String model	<i>name of the model to select strings from.</i>	model box		
Att prefix selection	<i>(copy only) if blank all attributes will be selected prior to the exclusion. If text is entered then only attributes with this exact text (case sensitive) will be selected prior to the exclusion.</i>	input	last data used	
Att prefix exclusion	<i>(copy only) if blank all attributes matching the selection above will be exported. If text is entered then attributes with this exact text (case sensitive) will be excluded from the export.</i>	input	last data used	
Copy	<i>copies the data from the string to the windows clipboard</i>	button		
Paste	<i>pastes the data from the windows clipboard. The string id is used to locate the string in the given model and then the properties/attributes are created and/or updated. If the attribute name is prefixed by DELETE followed by a space this string attribute will be deleted from all strings listed in the import.</i>	button		

Total Length of Strings

Position of option on menu: User => Miscellaneous => R to Z => Sum length of all strings

Note - This is an unsupported option which may not be fully documented.

This panel is used to calculate the total length of the strings in a selected model or view.

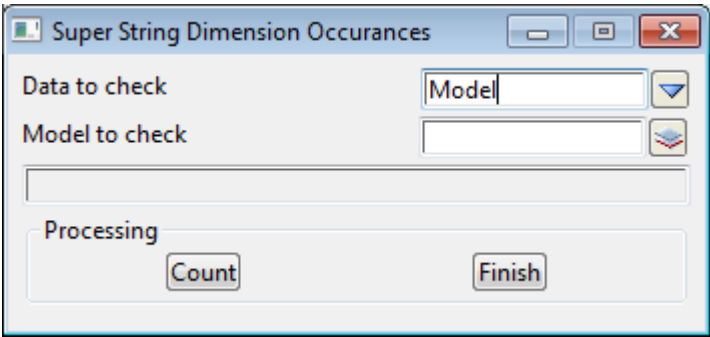

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>data source type</i>			model, view, string
Data source <i>data source to calculate lengths for.</i>			
Length in 2d/3d <i>if 2d, the lengths are only calculated in 2d. If 3d, the lengths are calculated in 3d.</i>	radio button	2d	
Ignore null length string(s) <i>if ticked, strings of null length are ignored in the string count and hence don't affect the average length.</i>	tick box	ticked	
Process <i>run the option</i>	button		

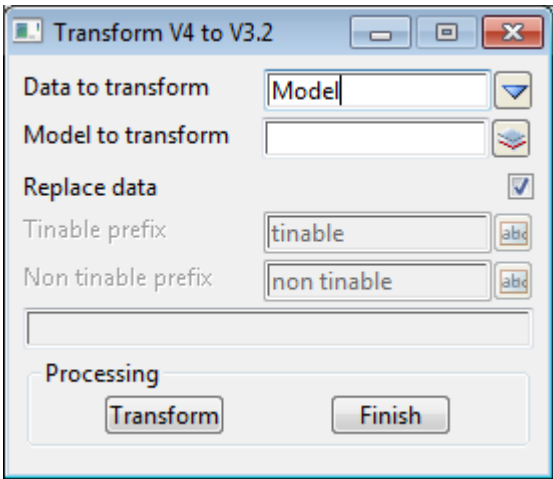

XXX Super String Dimension Occurrences

Position of option on menu: User =>Miscellaneous =>R to Z=>Super string dimension occurrences
Note - This is an unsupported option which may not be fully documented.

XXX Transform V4 to V3.2

Position of option on menu: User =>Miscellaneous =>R to Z=>Super string to V3.2 strings
Note - This is an unsupported option which may not be fully documented.
This panel convert a super string from **12d Model** V4.0 format to V3.2 strings.

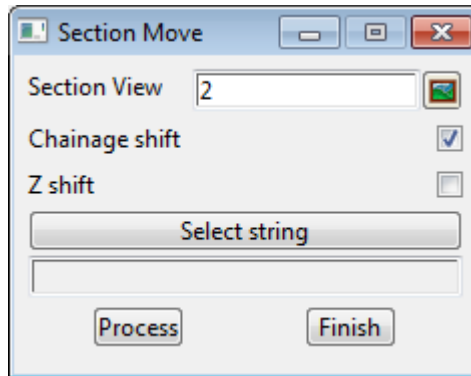

XXX Section Move

Position of option on menu: User =>Miscellaneous =>R to Z=>Translate string in section view

Note - This is an unsupported option which may not be fully documented.

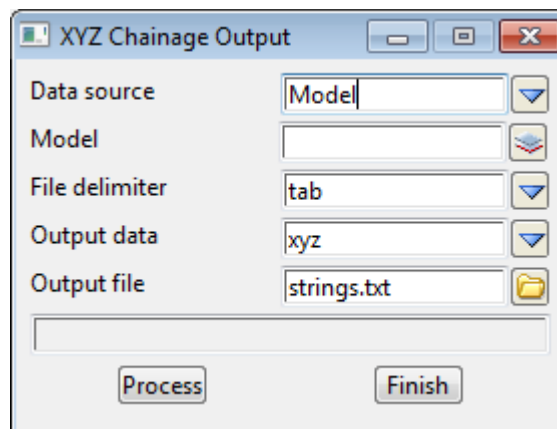

This panel is used to translate a string on a section view.

XXX Output XYZ and Chainage

Position of option on menu: User =>Miscellaneous =>R to Z=>XYZ chainage

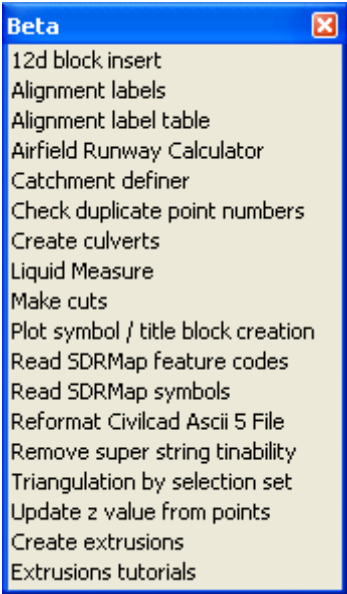

Note - This is an unsupported option which may not be fully documented.

Beta

All the options under **User** and **User menus** are either customers own macros or unsupported macros from 12D Solutions which may not be documented. For more information on *User* menus, go to [User Defined Menus](#)

The walk rights **Beta** menu is:

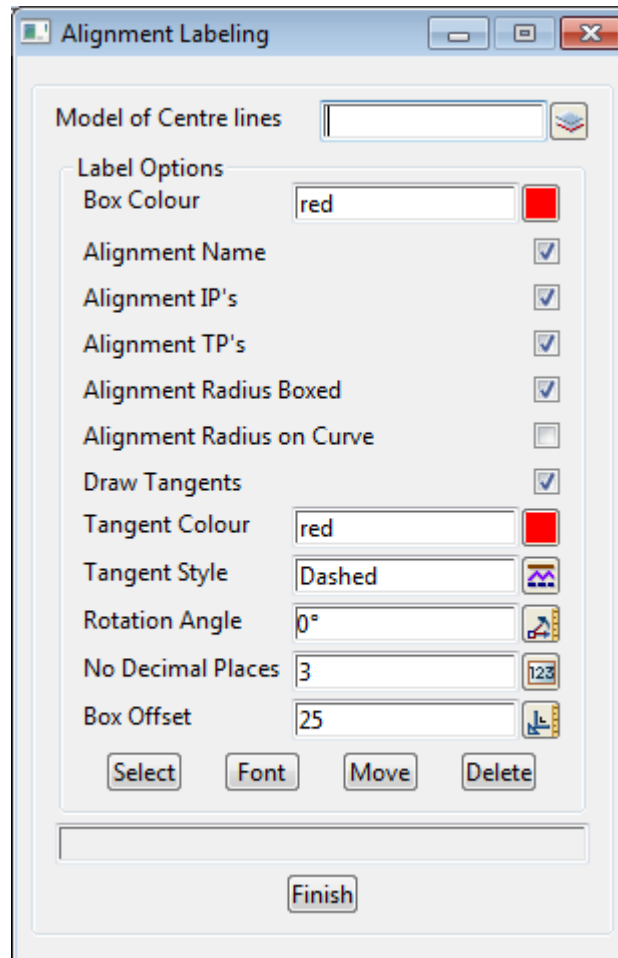

For the option <i>Alignment labels</i> , go to	XXX Alignment Labels
<i>Alignment label table</i>	XXX Table of Alignment Labels
<i>Airfield Runway Calculator</i>	Airfield Runway Calculator
<i>Catchment definer</i>	XXX Catchment Definer
<i>Check duplicate point numbers</i>	XXX Check Duplicate Point Numbers
<i>Create culverts</i>	XXX Create Culvert
<i>Liquid measure</i>	XXX Liquid Measure
<i>Make cuts</i>	XXX Make Cuts Through Strings
<i>Plot symbol/title block</i>	XXX Plot Symbol and Title Block Creation (old)
<i>Read SDRMap feature codes</i>	XXX Read SDRMap Feature Code
<i>Read SDRMap symbols</i>	XXX Read SDRMap Symbols
<i>Reformat CivilCAD Ascii 5 file</i>	XXX Reformat CivilCAD Ascii 5 file
<i>Remove super string tinability</i>	XXX Remove Super String Tinability
<i>Triangulate by selection set</i>	XXX Triangulate by Selection Set
<i>Update z values from points</i>	XXX Update Z Values from Points

XXX Alignment Labels

Position of option on menu: User =>Beta =>Alignment labels

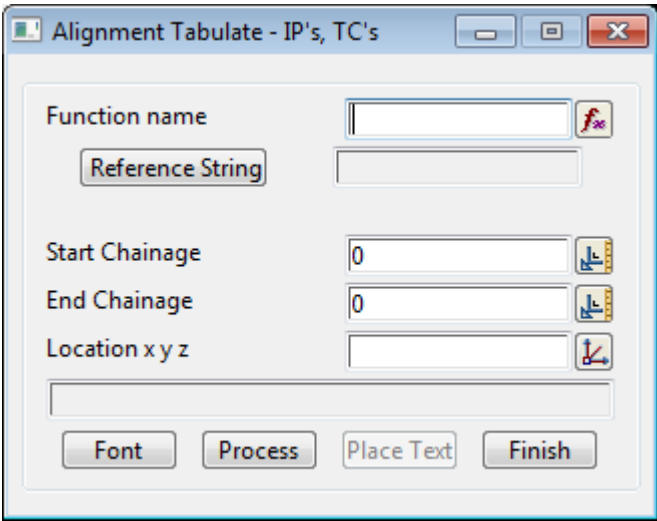

Note - This is an unsupported option which may not be fully documented.

XXX Table of Alignment Labels

Position of option on menu: User =>Beta =>Alignment label table

Note - This is an unsupported option which may not be fully documented.

Airfield Runway Calculator

Position of option on menu: User =>Beta =>Airfield Runway Calculator

This option is under development

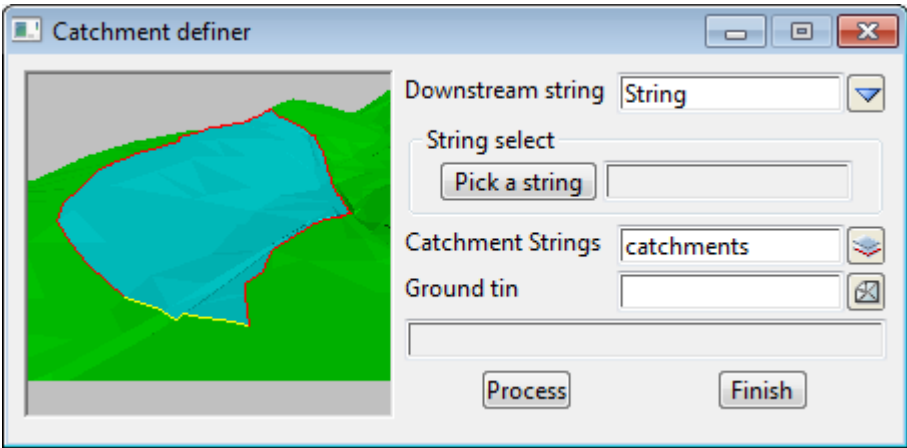

The screenshot shows the 'Airfield Runway Calculator' application window. The title bar reads 'Airfield Runway Calculator'. The interface is divided into several sections:

- Centreline Data:** Contains a 3D 'Model' logo on the left. To its right is a 'Function' text box with a calculator icon. Below this are two dropdown menus for 'Aerodrome Reference Code' (set to '4') and 'E'. Further down are two checkboxes: 'Instrument Approach?' (checked) and 'Precision Approach?' (unchecked). A 'Runway Alignment' button and an empty text box are at the bottom of this section.
- Threshold Data:** A tabbed interface with three tabs: 'Threshold Data', 'Runway Markings', and 'Output'. The 'Threshold Data' tab is active, showing two columns of input fields for 'Threshold 1' and 'Threshold 2'. Each column includes: 'Chainage' (0), 'Use displaced threshold' (unchecked), 'Displacement length' (0), 'RESA length' (90), 'Stopway length' (0), and 'Clearway length' (0). Each input field has a small icon to its right.
- calculations:** A large empty rectangular area with a vertical scrollbar on the right side.
- Finish:** A button located at the bottom left of the window.

XXX Catchment Definer

Position of option on menu: User =>Beta =>Catchment definer

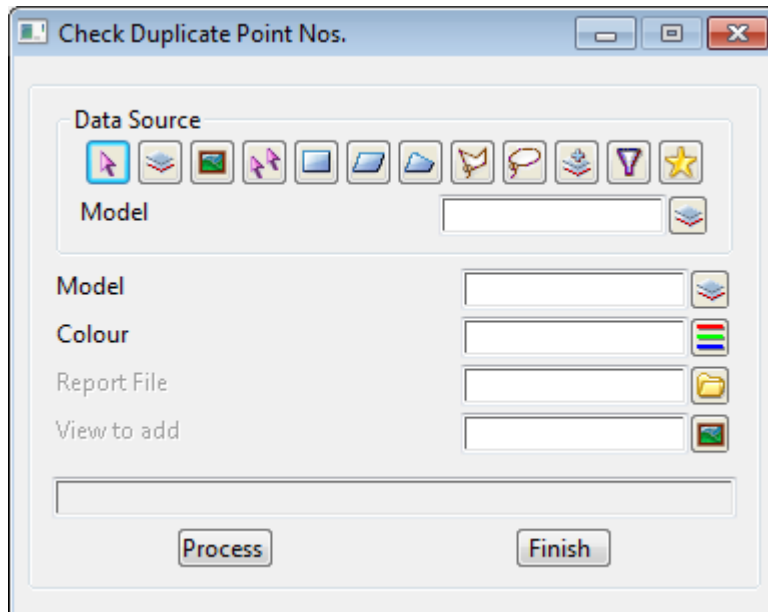

Note - This is an unsupported option which may not be fully documented.

XXX Check Duplicate Point Numbers

Position of option on menu: User =>Beta =>Check duplicate point numbers

Note - This is an unsupported option which may not be fully documented.

XXX Create Culvert

Position of option on menu: User =>Beta =>Create culvert

Note - This is an unsupported option which may not be fully documented.

XXX Liquid Measure

Position of option on menu: User =>Beta =>Liquid measure

Note - This is an unsupported option which may not be fully documented.

The screenshot shows a software window titled "12D Liquid Measure". It contains three main sections: "Tank geometry", "Survey Reduction", and "Options".

Tank geometry

- Model: [text box]
- Colour: [text box]
- Tank Centre: [text box]
- Circum: [text box] [icon]
- Thickness: [text box] [icon]
- No chords: [text box] [icon]
- No pts: [text box] [icon]
- Dip Plate Staff Reading: [text box] [icon]
- Buttons: Draw, Undo

Survey Reduction

- Dist = 0.000 Level = 0.000
- Vertex number = 0
- Vertex Staff Reading: [text box] [icon]
- Buttons: <= Prev, Next =>

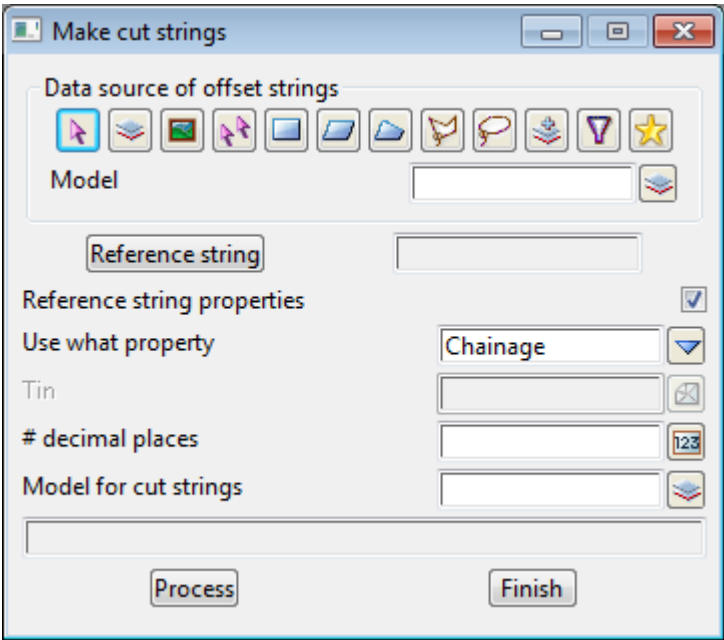

Options

- Output File name: [text box] [icon]
- Buttons: Pick, <-Prev, Next->, Write, Finish
- [Empty text box]

XXX Make Cuts Through Strings

Position of option on menu: User =>Beta =>Make cuts

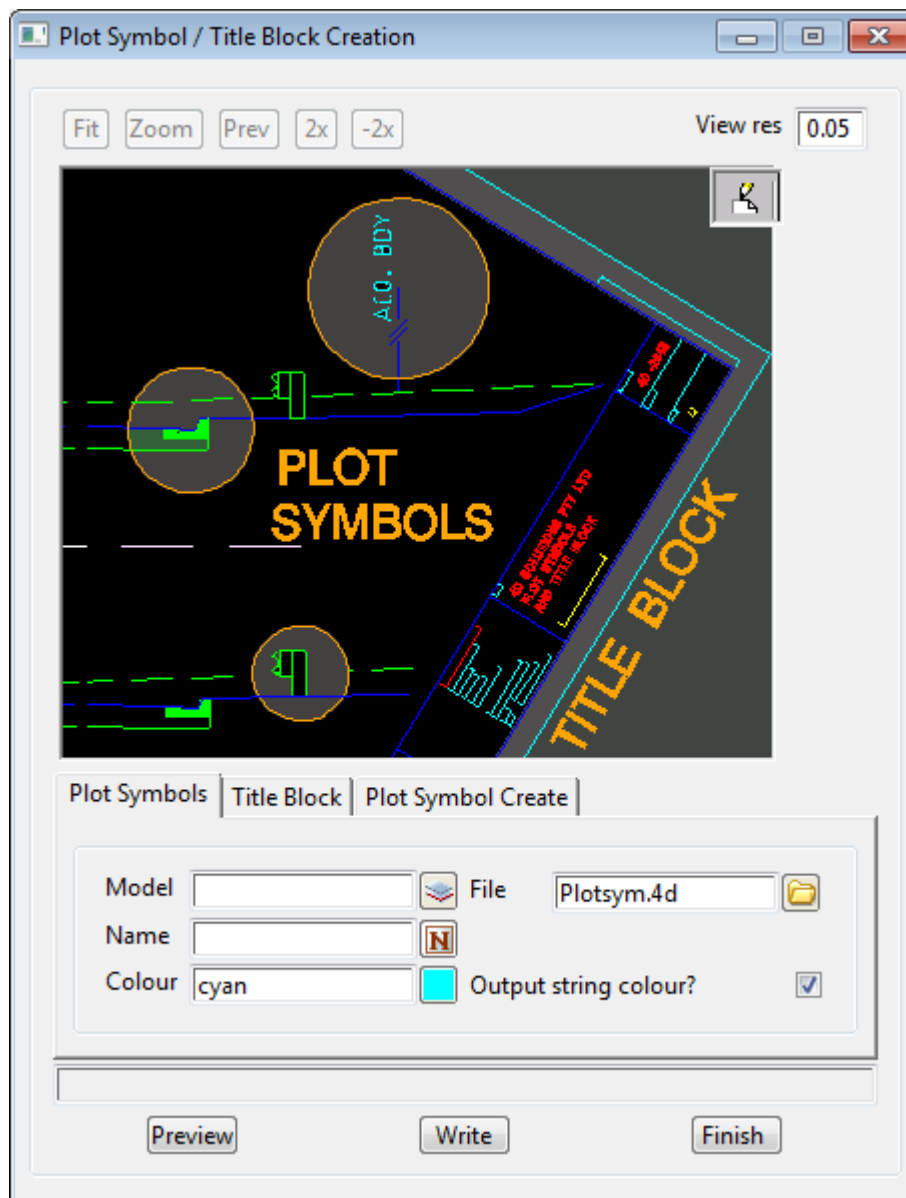

Note - This is an unsupported option which may not be fully documented.

XXX Plot Symbol and Title Block Creation (old)

Position of option on menu: User =>Beta =>Plot symbol/title block creation

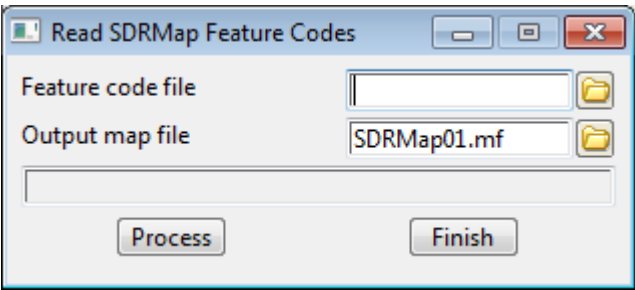

Note - This is an unsupported option which may not be fully documented.

XXX Read SDRMap Feature Code

Position of option on menu: User =>Beta =>Read SDRMap feature codes

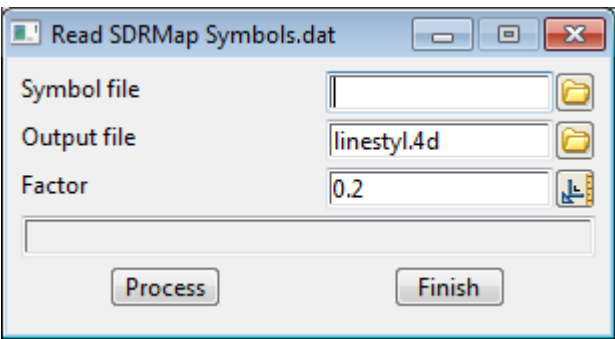

Note - This is an unsupported option which may not be fully documented.

XXX Read SDRMap Symbols

Position of option on menu: User =>Beta =>Read SDRMap symbols

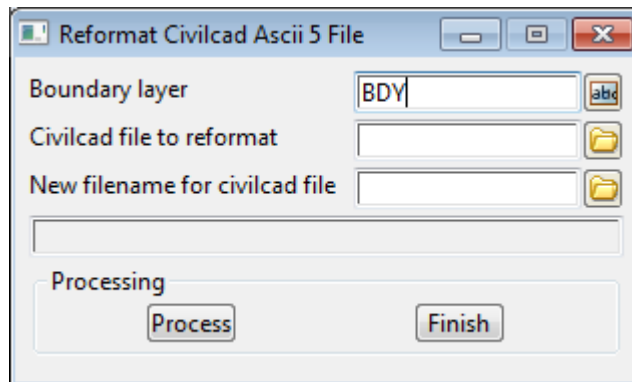

Note - This is an unsupported option which may not be fully documented.

XXX Reformat CivilCAD Ascii 5 file

Position of option on menu: User =>Beta =>Reformat CivilCAD Ascii 5 file

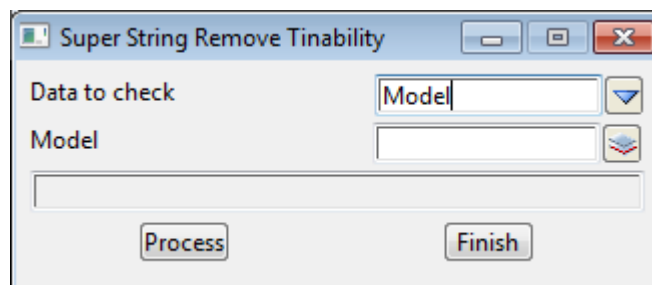

Note - This is an unsupported option which may not be fully documented.

XXX Remove Super String Tinability

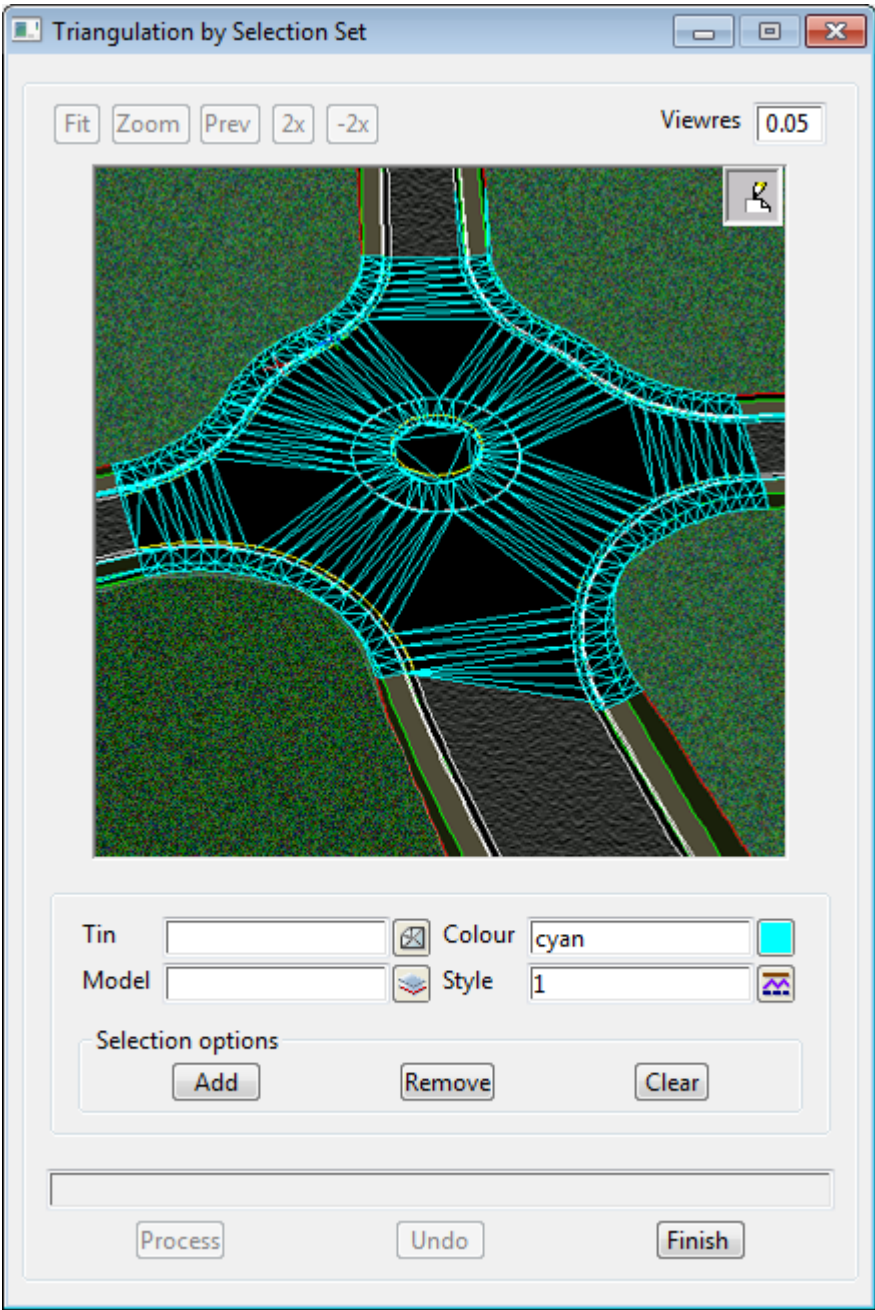

Position of option on menu: User =>Beta =>Remove super string tinability

Note - This is an unsupported option which may not be fully documented.

XXX Triangulate by Selection Set

Position of option on menu: User =>Beta =>Triangulation by selection set
Note - This is an unsupported option which may not be fully documented.

XXX Update Z Values from Points

Position of option on menu: User =>Beta =>Update z value from points

Note - This is an unsupported option which may not be fully documented.

Console

All the options under **User** and **User menus** are either customers own macros or unsupported macros from 12D Solutions which may not be documented. For more information on *User* menus, go to [User Defined Menus](#)

All the macros on the **Console** menu only use the console panel and so do not support a F1 key for help.

The User =>Console rights menu is:

Polygon

The **Polygon** walk-right menu is

create polygon by picking point inside
create polygon by picking sides
colour polygon by range file
remove polygon colour

and each option in this menu will now be discussed.

For *Create polygon by picking point inside area*, go to

[Surrounding Polygon](#) in the chapter [Strings](#)

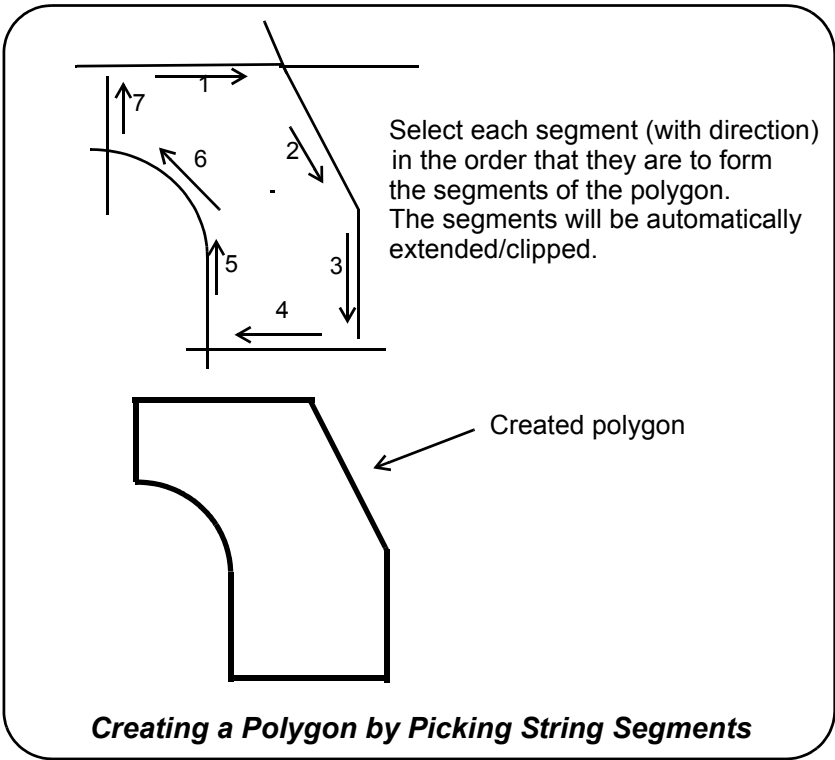

Create polygon by picking sides
Colour polygons from range file
Remove polygon colour
Road polygons

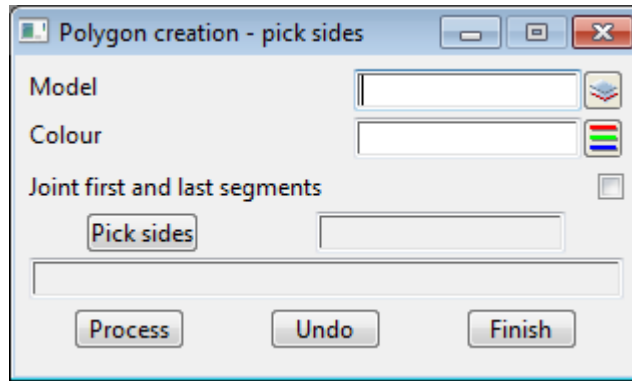

[Create Polygon by Picking Sides](#)
[Colour Polygons by Range File](#)
[Remove Polygon Colour](#)
[Road Polygons](#) in the chapter [Design](#)

Create Polygon by Picking Sides

Position of option on menu: User => Polygon => Create polygon by picking sides

This option creates a polygon by a picking each segment in its order (and with direction) around the polygon. Segments will be automatically extended or clipped to form the polygon.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for polygon <i>model for the created polygon</i>	model box		available models
Lot colour <i>colour for the created polygon</i>	colour box		available colours
Join first and last segment tick box <i>if tick, join the end of the last selected segment to the start of the first selected segment to form the final side of the polygon. The segments may be automatically trimmed/extended.</i>			
Pick sides	string select		
<i>pick, with direction, the segments to be joined together to form the sides of the polygon.</i>			
Process	button		
<i>create the polygon from the selected segments.</i>			

Colour Polygons by Range File

Position of option on menu: User =>Polygon =>Colour polygons by range file

This option creates a polygon by a picking each segment in its order (and with direction) around the polygon. Segments will be automatically extended or clipped to form the polygon.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range file <i>range file for colouring polygons.</i>	file box		*.lrf
Data source type <i>data source type.</i>		model	model, view
Data source <i>data source for polygons to be coloured.</i>			
Table location <i>position of the table.</i>	position select box		
Model for table <i>model for the table of statistics on the polygon areas.</i>	model box		available models
Text colour <i>colour of the text.</i>	colour box		available colours
Text size (w) <i>size of the text for the table.</i>	double box		
Process <i>select all the polygons given by the Data source and colour them according to the lot range file.</i>	button		

Remove Polygon Colour

Position of option on menu: Design =>Estate/Lots =>Lot utilities =>Remove polygon colour

Note - This is an unsupported option which may not be fully documented.

This option removes the colour of all the selected polygons.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>		model	model, view
Data source <i>data source for polygons to have their colour removed.</i>			
Process <i>select all the polygons given by the Data source and remove the polygon colour.</i>	button		

Undocumented User Menus

The options on a **User** menu are either customer's macros or unsupported macros from 12D Solutions and may not be documented.

To return to the start of the documentation on the User menu, click on [User](#).

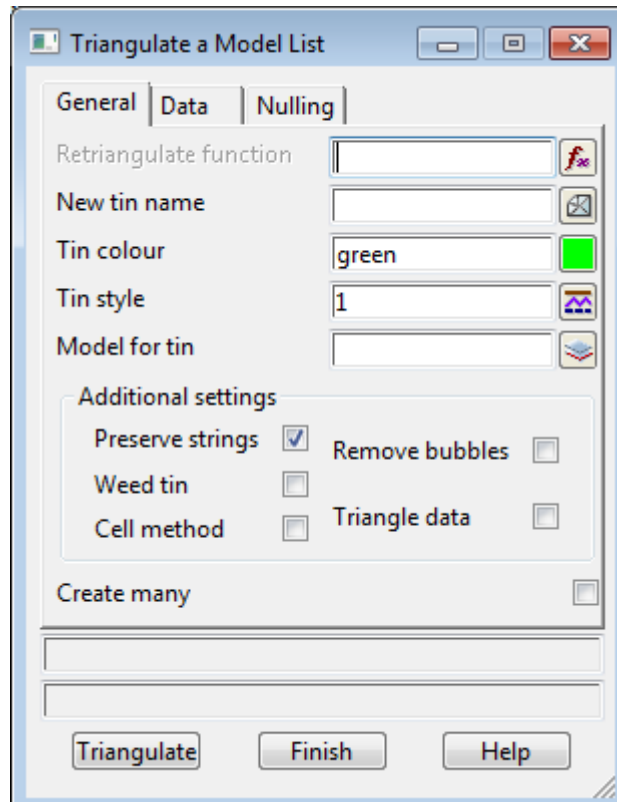

Obsolete Options

These options are now obsolete and may not be documented.

To return to the start of the documentation on the User menu, click on [User](#).

Triangulate a Model List

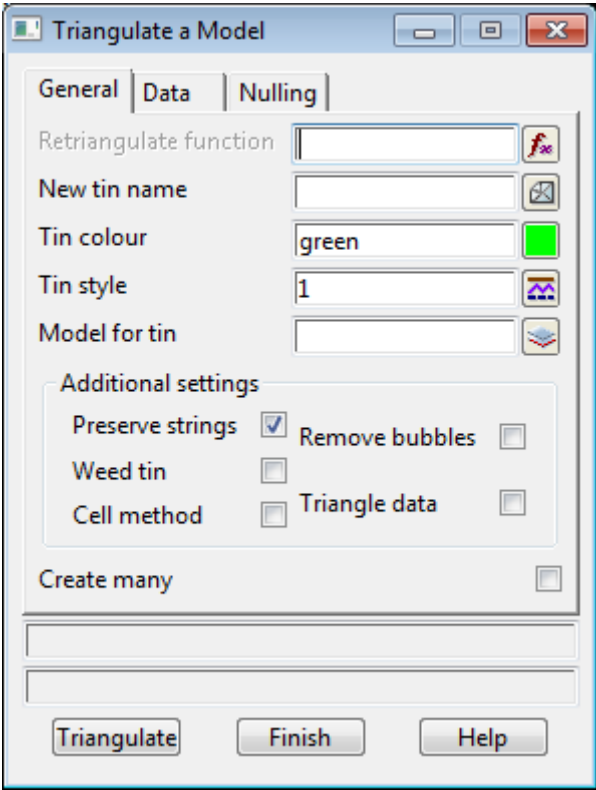

This is an obsolete option which is not documented.

To return to the start of the documentation on the User menu, click on [User](#).

Triangulate a Model

This is an obsolete option which is not documented.

To return to the start of the documentation on the User menu, click on [User](#).

MicroStation/ArcView/MapInfo Map File

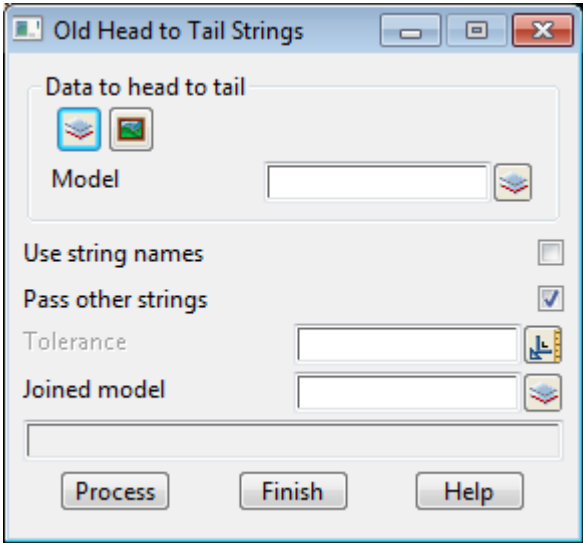

This is an obsolete option which is not documented.

To return to the start of the documentation on the User menu, click on [User](#).

Old Head to Tail Strings

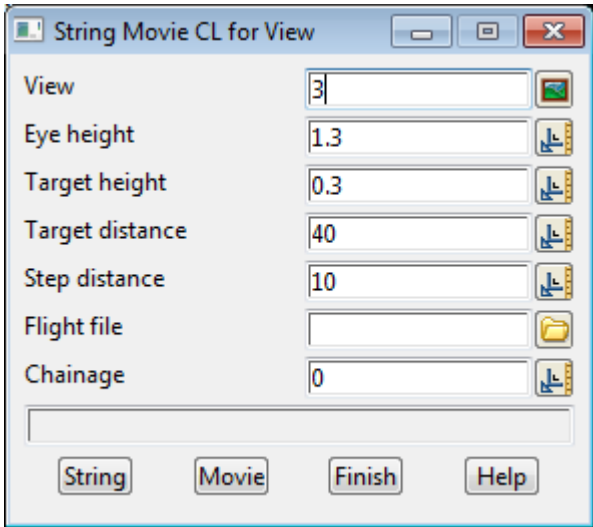

This is an obsolete option which is not documented.

To return to the start of the documentation on the **User** menu, click on [User](#).

String Movie CL for View

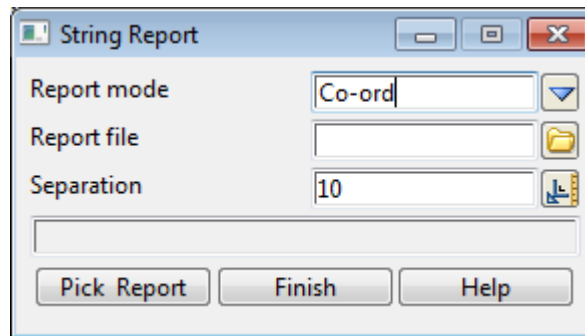

This is an obsolete option which is not documented.

To return to the start of the documentation on the **User** menu, click on [User](#).

String Report

This is an obsolete option which is not documented.

To return to the start of the documentation on the User menu, click on [User](#).

Write Binary XYZ File For

This is an obsolete option which is not documented.

To return to the start of the documentation on the User menu, click on [User](#).

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source model mask	input text		
<i>Specifies the model(s) from which to select Super strings to process. Use '*' and '?' wildcards to specify multiple models. Note: the target model cannot be specified.</i>			
Source string mask	input text		
<i>Specifies the string name(s) to process from within the selected model(s). Use '*' and '?' wildcards to specify multiple string names. Note: if blank, the option will match all string names in the selected model(s).</i>			
Colour for downhill strings	colour box		available colours
<i>Colour to apply to all strings in the target model (optional).</i>			
Linestyle for downhill strings	linestyle box	"FLOW LINE"	available linestyles
<i>Linestyle to apply to all strings in the target model (optional).</i>			
Levee tolerance	input real	0.025	
<i>Localised uphill portions will be allowed to rise up within this vertical tolerance.</i>			
Discard tolerance	input real	0.1	
<i>Resultant strings shorter than this tolerance will be discarded from the target model.</i>			
Join resultant strings head-to-tail	tick box	ticked	
<i>Whether to join strings in the target model in a head-to-tail fashion.</i>			
Head-to-tail tolerance	input real	0.005	
<i>If joining strings head-to-tail, the head must be within this tolerance of the tail.</i>			
Matching number of leading characters in string names	input integer0		
<i>If joining strings head-to-tail, this number of leading characters in both string names must match.</i>			
Split resultant strings at drainage inlets	tick	not ticked	
<i>Whether to split strings in the target model at nearby drainage inlets.</i>			
Drainage model	model box		available models
<i>If splitting strings at drainage inlets, strings will be split at all nearby drainage inlet pits found in this model. Drainage inlets (i.e. on-grade and sag pits only) must be within one pit diameter of the string, and may not be closer than the Discard tolerance from either end of the string.</i>			
Model of downhill strings	model box		available models
<i>Target model. All matching source strings are copied to and processed in this model.</i>			
Clean model beforehand	tick box	ticked	
<i>Whether to clean the target model beforehand.</i>			
Run	button		
<i>Runs the option.</i>			

Special Note:

The **Downhill Strings** option is a macro, that may optionally be run from a chain via arguments, rather than via a panel. The details of the argument syntax are written to the Output Window, whenever the macro is run without valid arguments, viz:

Output Window

=====

12d Macro: "downhill_strings_panel.4do" started ...

Credits: AECOM Australia Pty Ltd developed the original, non-panel version of this macro.

Copies Super strings matching <string mask> from all models matching <model mask> to <target model>. All strings copied to <target model> are split at crests and sags and set in downhill direction.

Usage with no arguments: macro is run with a panel interface.

Usage with arguments: downhill_strings_panel <model mask> <string mask> <target model>
[-clean] [-C <colour name>] [-L <linestyle name>]
[-t <levee tol>] [-d <discard tol>] [-j <h2t tol> <prefix len>]

Optional flags:

- clean = Clean <target model> beforehand.
- C <colour name> = Colour for resultant strings.
- L <linestyle name> = Linestyle for resultant strings.
- t <levee tol> = Allow localised uphill portions rising less than <levee tol>. Default is 0.025 without -t flag.
- d <discard tol> = Discard resultant strings shorter than <discard tol>. Default is 0.1 without -d flag.
- j <h2t tol> <prefix len> = Join <target model> strings head-to-tail when head is within <h2t tol> of tail ...
... and when first <prefix len> characters in string names match.

eg1: downhill_strings_panel "des * str*" DL* "down str*" -clean -t 0.025 -d 0.1
eg2: downhill_strings_panel "des * str*" DU* "down str*" -C cyan -L "FLOW LINE" -j 0.005 2

target model cleaned ...
added 38 downhill strings to target model ...
joined 18 string pairs head-to-tail in target model ...
split 14 strings in target model at nearby drainage inlets ...
discarded 0 short strings from target model ...

12d macro "downhill_strings_panel.4do" processed 24 strings from 15 models, to target model "drainage kerb inverts downhill"

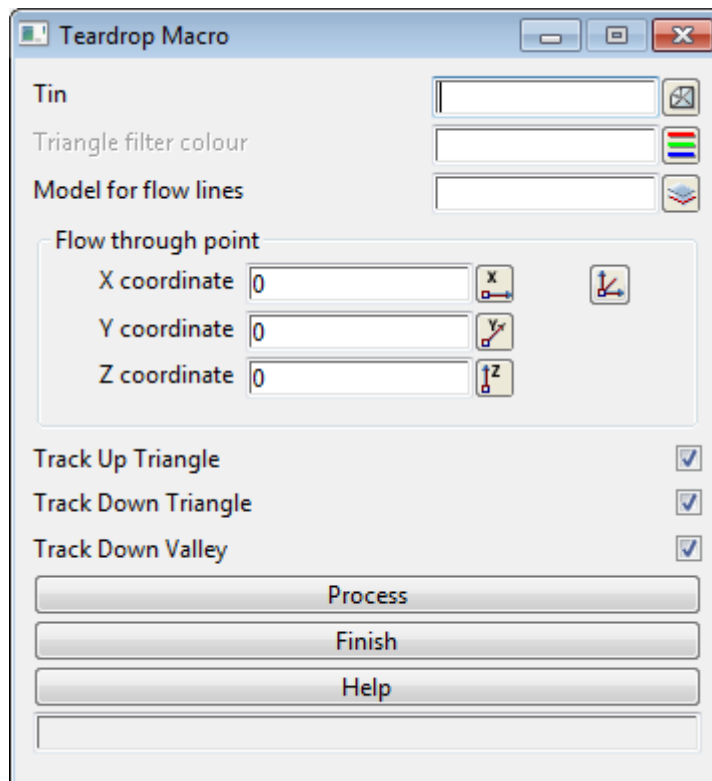

Raindrop/Teardrop

Position of option on menu: **Design=>Drainage-Sewer=>Raindrop**

Position of option on menu: **Tins=>Tin Analysis=>Rain drop**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **Raindrop** option, the **Teardrop Macro** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box	GROUND	available tins
Triangle filter colour	colour box		available colours
Model for flow lines	model box	FLOWMODEL	available models
Flow through point			
X coordinate	measure box	0	available measures
Y coordinate	measure box	0	available measures
Z coordinate	measure box	0	available measures
Track Up Triangle	tick box	ticked	
Track Down Triangle	tick box	ticked	
Track Down Valley	tick box	ticked	
Process	button		

Aquaplaning Risk Assessment

Position of option on menu: **Design=>Drainage-Sewer=>Aquaplaning risk**

This option performs an aquaplaning risk assessment using the *Gallaway Equation*. The user need only supply flow path strings as 2d Super strings in the areas of concern on the road pavement tin (typically at the transitions in the road cross-fall). The option then re-creates these flow path strings in 3d, with evenly spaced vertices, then applies the *Gallaway Equation* to determine a water film depth at each vertex (where all parameters considered are set as vertex attributes). It then assesses the risk of aquaplaning at each vertex by associating a risk level and segment colour with the water film depth calculated at each vertex. In addition, a report file is written to the *Windows* clipboard, and optionally to file.

The *Gallaway Equation* is defined as follows:

Gallaway Equation

$$d = \frac{0.103 T^{0.11} L^{0.43} I^{0.59}}{S^{0.42}} - T$$

d = water film depth above top of pavement texture (mm)

L = length of flow path (m)

S = slope of the flow path (%)

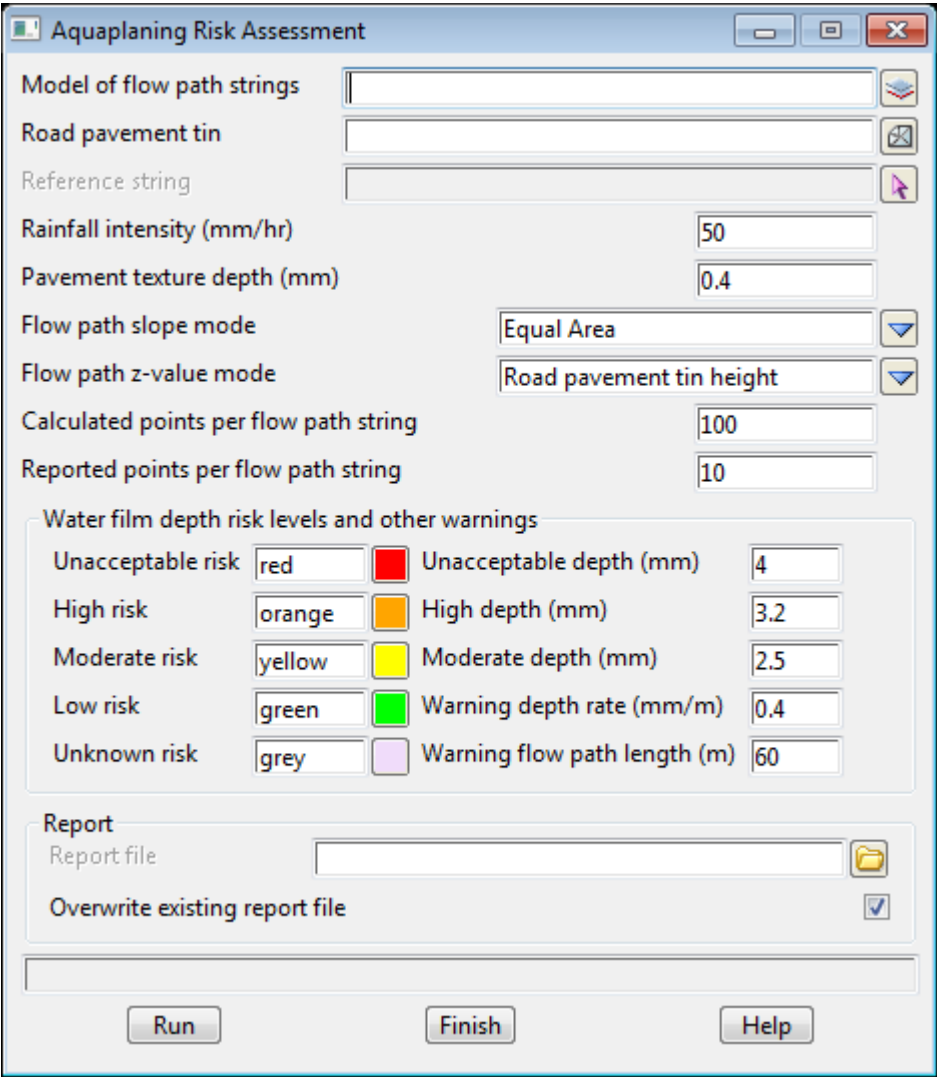

T = average pavement texture depth (mm)

I = rainfall intensity (mm/hr)

Source:

Gallaway, B. M., et. al., "Pavement and Geometric Design Criteria for Minimizing Hydroplaning", *Federal Highway Administration, Report No. FHWARD-79-31, (1979).*

On selecting the **Aquaplaning risk** option, the **Aquaplaning Risk Assessment** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of flow path strings	model box		available models
<i>All Super strings in this model will be analysed and updated with results.</i>			
Road pavement tin	tin box		available tins
<i>Used to define the vertical profile of each flow path string.</i>			
Reference string	string select		
<i>Used to locate, identify, rename and sort the flow path strings (optional).</i>			
Rainfall intensity (mm/hr)	input	50	
<i>Typically 50 mm/hr for aquaplaning checks.</i>			
Pavement texture depth (mm)	input	0.4	
<i>Average texture depths can range from about 0.2 to 4 mm for different pavement materials.</i>			
Flow path slope mode	choice box	Equal Area	Equal Area, Average

Determines how the slope of the flow path string is calculated at each vertex. Available modes are "Equal Area" and "Average" slope, from the start of the string to each vertex.

Flow path z-value mode choice box Road pavement tin height Road pavement tin height, Water film depth (mm)

Determines what the z-values of the flow path strings will represent. Available modes are "Road pavement tin height" and "Water film depth (mm)".

Calculated points per flow path string input 100

Number of evenly spaced points along each flow path string at which to calculate water film depths.

Reported points per flow path string input 10

Number of evenly spaced points along each flow path string at which to report water film depths.

Water film depth risk levels and other warnings

Unacceptable risk colour box red available colours

Colour to associate with an unacceptable risk.

Unacceptable depth (mm) input 4

The lowest water film depth associated with an unacceptable risk.

High risk colour box orange available colours

Colour to associate with a high (acceptable) risk.

High depth (mm) input 3.2

The lowest water film depth associated with a high (acceptable) risk.

Moderate risk colour box yellow available colours

Colour to associate with a moderate (acceptable) risk.

Moderate depth (mm) input 2.5

The lowest water film depth associated with a moderate (acceptable) risk.

Low risk colour box green available colours

Colour to associate with a low (acceptable) risk.

Unknown risk colour box grey available colours

Colour for strings that cannot be assessed for risk.

Warning depth rate (mm/m) input 0.4

Warn if <water film depth>/<flow path length> is excessive (optional).

Warning flow path length (m) input 60

Warn if flow path length is excessive (optional).

Report

Report file file box

Report will be written in tab-delimited format to the Windows clipboard, and optionally to this file.

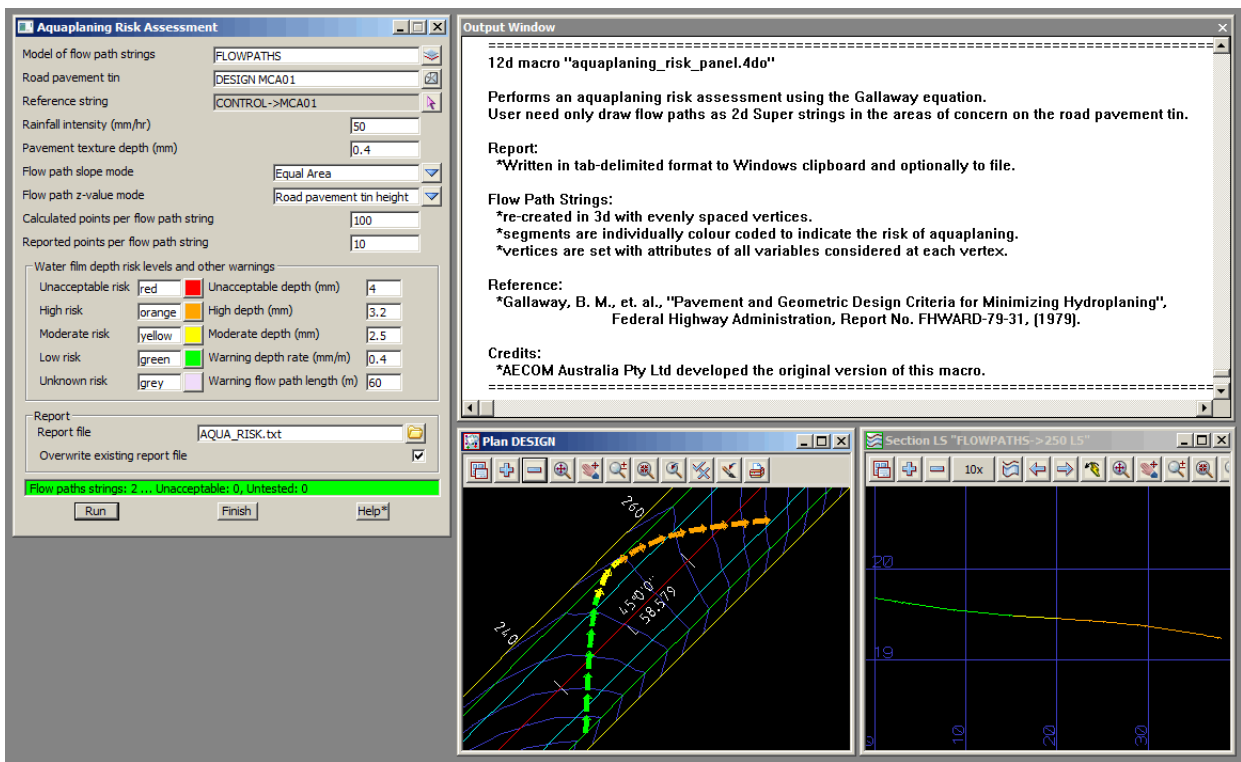

Overwrite existing report file tick box ticked

Whether to overwrite or append to an existing report file.

Run button
Runs the option.

Additional Notes:

1) The **Aquaplaning Risk Assessment** option writes auxiliary help information to the *Output Window* every time it is run, viz:

2) The tab-delimited report is always written to the *Windows* clipboard, even if a report file is not specified. A pre-formatted *Excel* report template is installed and available in the library – **\$LIB\aquaplaning_report_template.xlsx** – and after running the aquaplaning option, the contents of the clipboard may be pasted directly into a copy of this template file, as shown here:

12D AQUAPLANING RISK ASSESSMENT

250 L5	10	38.012	19.234	1.19	3.76	HIGH	0.10	

3) Combined plan and profile plots of the analysed flow path strings, for inclusion in reports, may be generated from the **Section Long Plot PPF Editor**. A PPF file set specifically for this purpose is installed and available in the library – \$LIB\aquaplaning_longsection_A4.lplotppf – as shown here:

Extract Sewer Controls

Position of option on menu: **Design=>Drainage-Sewer=>Extract sewer controls**

The sewer property control strings are a sub string of the drainage string and therefore may only be profiled using a right mouse click of the profile button. To include these control strings on plots or export to other packages they need to be converted to super strings.

On selecting the **Extract Sewer Controls** option, the **Extract Sewer Property Controls** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	model box		available models
<i>All drainage strings in this model will have their property controls strings duplicated as super strings.</i>			
Model for property controls	model box		available models
<i>The super strings for the property controls are placed in this model.</i>			
Extract with diameters	tick box	ticked	
<i>The super strings will have the constant pipe dimension set to the control diameter.</i>			
Run	button		
<i>Create the super strings representing the property controls.</i>			

Convert to Points and Lines

Position of option on menu: **Design=>Drainage-Sewer=>Convert to pts and lines**

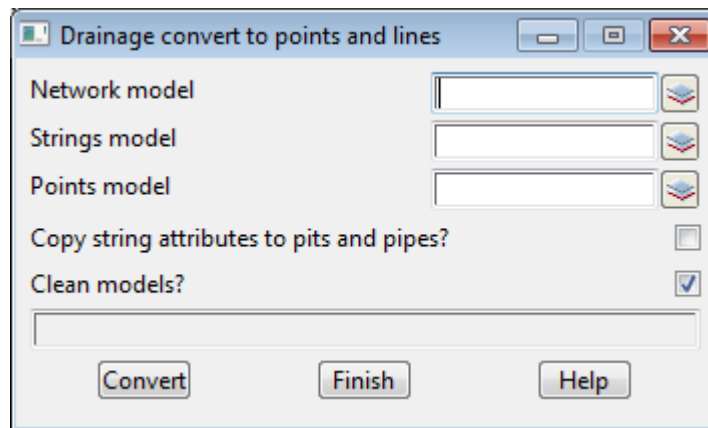

This option converts a drainage network into simple points and lines.

Pits will be created as single point super strings with the pit attributes set as string attributes.

Pipes will be created as single or multiple segment super strings with pipe attributes set as string attributes.

This may be useful for uploading to external GIS systems via the GIS module.

Selecting **Convert to pts and lines** brings up the **Drainage convert to points and lines** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Network model	<i>the source model of the drainage network</i>	model box		available models
Strings model	<i>the model to output pipe strings to</i>	model box		available models
Points model	<i>the model output pit point strings to</i>	model box		available models
Copy string attributes to pits and pipes?	<i>if ticked, the string attributes for points are copied to to pit attributes and string attributes for lines are copied to the pipe attributes. If not ticked, no attributes are copied.</i>	tick box	not ticked	
Clean models	<i>whether or not to clean the models first</i>	tick box	ticked	
Convert	<i>performs the conversion</i>	button		

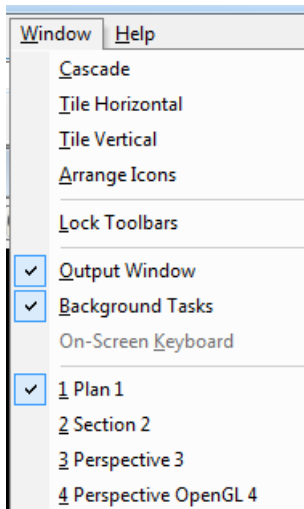

29 Window

The **12d** Model **window** menu contains options to cascade, tile horizontally and vertically.

The **Output window** can also be toggled on and off.

The **Window** on main menu and walk-right menus are

on Main menu

cascade the non-minimized views

horizontally tile the non-minimized views

vertically tile the non-minimized views

place all minimized view icons at the bottom of the views area

lock toolbars so that they can't be moved

toggle the output window on/off

toggle the background tasks window on/off

shows if on-screen keyboard is enabled

list of existing views

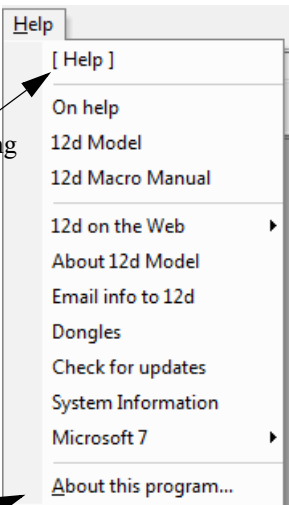

30 Help

Position of menu: It is on the main menu as Help

The **12d Model** help menu contains options to access Microsoft's Help on Microsoft's Help, the **12d Model Help** and the **12d Model Macro Programming Language Help**, plus links to the 12d Solutions web site www.12d.com., information about the option in the current **12d Model** being run, an email information to 12d Solutions, dongle testing routines, checking for updates to the **12d Model** exe, system information and for Windows 7, the download for using WinHlp.

The help on main menu and walk-right menus are

About 12d Model

Position of option on menu: **Help =>About 12d Model**

The **About 12d Model** option displays information about the current authorization **12d Model** such as the Client name, dongle number and authorized modules.

The existing 12d Model modules are shown on the **Modules** and **Extras** tabs with a tick indicating that the current licence has the module.

The **Program** tab has extra information about the current 12d Model executable and project.

On selecting the **About 12d Model** option, the **12d Model Information** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Client

name of the authorized client.

Dongle

number of the dongle for this licence.

Version

12d Model version number.

Days remaining

number of days left for the authorisation.

Modules tab**Base module**

number of allowed points in the Base module. If this number is exceeded then the project cannot be saved until enough points are deleted to bring the point count below the allowed number of points.

Alignment, CivilCAD i/o, etc. tick boxes

if ticked, the module is authorized.

Dongle Testing

Position of option on menu: Help =>Dongles

Selecting **Dongles** brings up the **Dongle Testing Panel** panel.

For documentation on the next item on the **Help** menu, please continue to the next section [Check for Updates](#).

Check for Updates

Position of option on menu: Help =>Check for updates

Selecting **Check for updates** will check if there are any newer versions and/or builds of **12d Model** than the one currently being run.

The **12d Update Checker** panel will give a link to the new versions or display the message that there is no update available if the current version and build of **12d Model** is the latest one.

For documentation on the next item on the **Help** menu, please continue to the next section [Microsoft 7](#).

Microsoft 7

Position of option on menu: **Help =>Windows 7**

12d Model has a context sensitive reference help system which can be accessed directly from most menus and panels:

- (a) For most menus in **12d Model**, when the menu is on the screen and has the Windows focus, simply press F1 and the **12d Help** will open automatically at that menu
- (b) For most panels in **12d Model**, when the panel is on the screen and has the Windows focus, simply press F1 and the **12d Help** will open automatically at that panel
- (c) Most panels in **12d Model** have a **Help** button on them and clicking on the **Help** button opens the **12d Help** at that panel
- (d) By clicking on the option **Help =>12d Model**

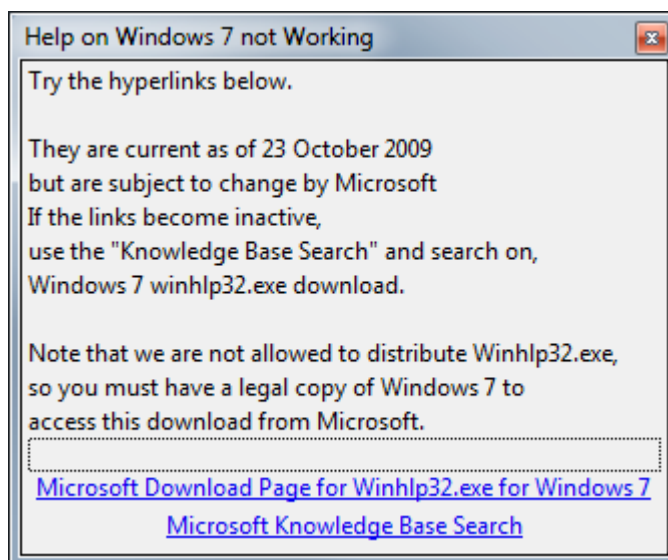

The **12d Model** context sensitive help uses Microsoft's **WinHlp**.

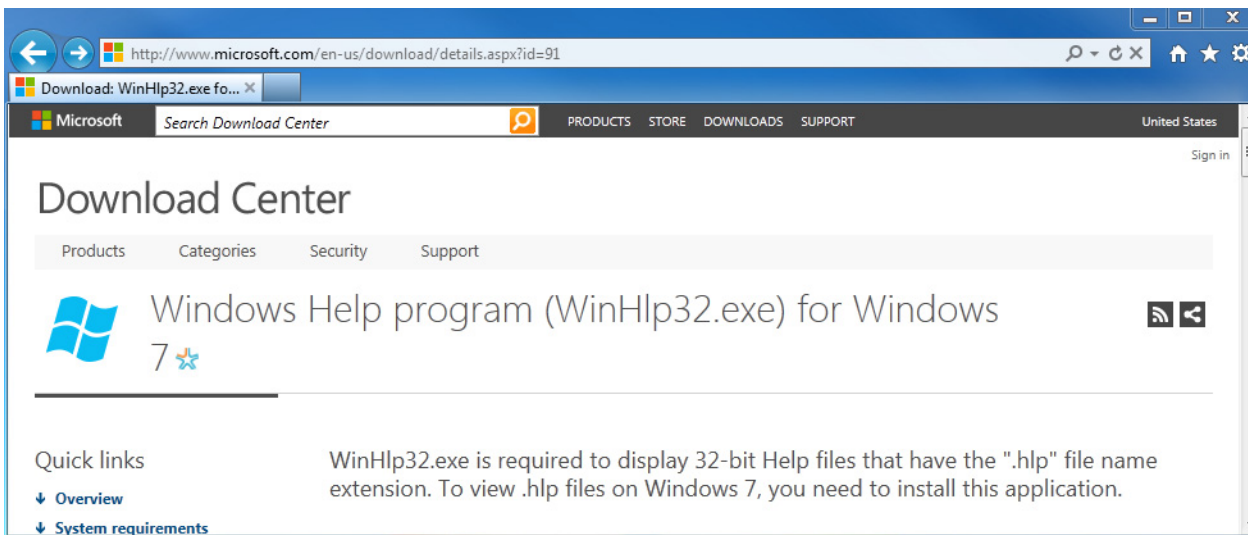

For *Vista* and *Win 7*, Microsoft no longer ships the WinHlp.exe executable and Microsoft will no longer allow it to be installed by the 12d Model installation DVD.

So if you are running Vista or Win 7, you need to download and install WinHlp.exe from Microsoft's website to access the **12d Model Help** files.

The link to the area for the download is

Walking right on **Microsoft 7** displays the **Help on Windows 7 Not Working** panel which has a link to the Microsoft web site to download Winhlp32.exe.

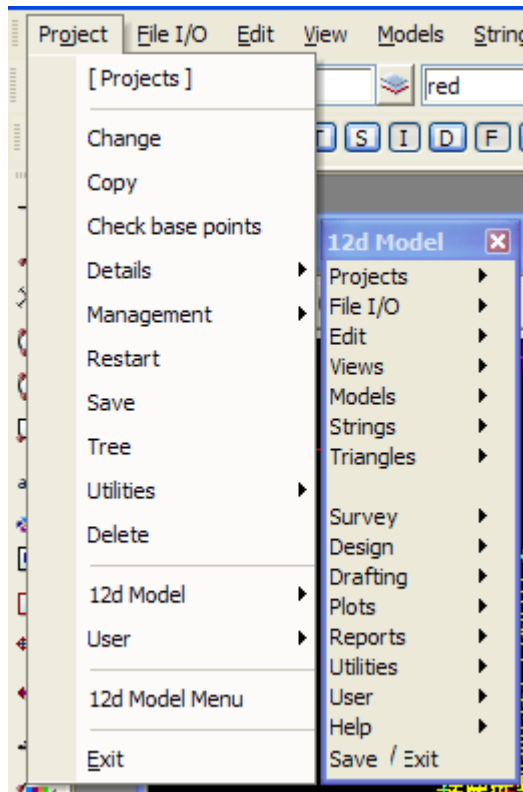

To return to the start of the documentation on the **Help** menu, click on [Help](#).

31 Save and Exit

Save and **Exit** are available from both the Main Menu under Project or on the floating **12d Model** menu.

Save and Exit from Main Menu

Selecting **Save** from the **Main Menu=>Projects** menu simply saves all data in the project modified since the last save.

When **Exit** is selected from the bottom of the **Main Menu=>Projects** menu and a save is not needed, **12d Model** exits the project.

If **Exit** is selected from the bottom of the **Main Menu=>Projects** menu and a save is needed, then the **Save Project ?** yes-no panel is placed on the screen.

If **Yes** is selected, then **12d Model** saves the project and exits.

If **No** is selected, then 12d Model does not save the project and exits.

If **Cancel** is selected, then the Exit is aborted and 12d Model stays in the project.

Note: when exiting 12d Model, the user is reminded if any *mtf* files modified by the 12d Model *mtf editor* have not been saved, or any string editors are still running.

Save and Exit from 12d Model Menu

When **Save** is selected from the left hand side of the bottom of the **12d Model** menu (**Save / Exit** menu option), all the information modified since the last save is written to disk.

When **Exit** is selected from the right hand side of the bottom of the 12d Model menu (**Save / Exit** menu option), an **Exit 12d Model** panel is fired up.

Selecting **No** removes the **yes-no** pop-up and leaves the user in **12d Model**.

If **Yes** is selected and a modification to the project has been made since the last project save, a **Save Project** panel is fired up.

If **yes** is selected, the project is **saved** and 12d Model terminates.

If **no** is selected, the project is **not saved** and 12d Model terminates.

If **cancel** is selected, the exit option is **aborted** and the user is left in 12d Model.

Note: When exiting 12d Model, the user is reminded if any *mtf* files modified by the 12d Model *mtf editor* have not been saved, or any string editors are still running.

Selecting **No** removes the **yes-no** pop-up and leaves the user in **12d Model**.

If **Yes** is selected and a modification to the project has been made since the last project save, a **Save Project** panel is fired up.

Appendices

A 12d Ascii File Format

The 12d Ascii file format (called 4D Ascii in Version 4 and earlier) is a text file definition from 12D Solutions which is used for reading and writing out string data from **12d Model**. 12d Ascii files normally end in '.12da'

This document is for the 12d Ascii file format used in **12d Model Version 9**.

For General Comments about 12da, go to the section [General Comments about 12d Ascii File](#)

For the 12da definitions of Attributes go to [Attributes](#)
 Commands [Commands](#)

For the 12da definitions of *each string type* [12d Ascii Definition for each String Type](#)
 tins [12d Ascii Definition for Tins](#)
 12d plot frames [12d Ascii Definition for Plot Frames](#)

For documentation on the first item, continue to the next section [General Comments about 12d Ascii File](#).

General Comments about 12d Ascii File

//

Anything written on a line after // is ignored. This is used to place comments in the file.

Blank lines

Unless they are part of a text string, blank lines are ignored.

Spaces

Unless enclosed in quotes ("), more than one consecutive space or tab is treated as one space. Except when it is the delimiter after a //, an end of line (<enter>) is also considered a space.

Spaces and special characters in text strings

Any text string that includes spaces and any characters other than a to z, A to Z or 0 to 9 (alphanumeric), must be enclosed in double quotes. In text strings, double quotes " and backslash \ must be preceded by a \. For example, \" and \\ define a " and a \ respectively in a text string.

Names of models, tins, styles, colours and attributes

Models, tins, styles (linestyles), colours and attributes can include the characters a to z, A to Z, 0 to 9 (alphanumeric characters) and space. Leading and trailing spaces are ignored. The names can be up to 255 characters in length. If the name includes spaces, the name must be enclosed in double quotes (").

The names for models, tins, styles, colours or attributes can not be blank.

The names for models, tins, styles and colours can contain upper and lower alpha characters

which are stored, but the set of model names, tin names, style names, colour names or attribute names for an object *must be unique when case is ignored*. For example, the model name "Fred" will be stored as "Fred" but "FRED" is considered to be the *same* model name as "Fred".

String names

String names can include the characters a to z, A to Z, 0 to 9 (alphanumeric characters), space, decimal point (.), plus (+), minus (-), comma (,), open and closed round brackets and equals (=). Leading and trailing spaces are ignored. String names can be up to 255 characters in length. If the string name includes anything other than alphanumeric characters, then the name must be enclosed in double quotes (").

String can contain upper and lower alpha characters which are retained but case is ignored when selecting by string name. That is, the string name "Fred" will be stored as "Fred" but "FRED" is not considered to be a different name.

String names do not have to be unique and can be blank.

Please continue to the next section [Attributes](#).

Attributes

Many 12d Model objects (such as individual strings, models and tins) can have an unlimited number of named **attributes** of type integer (numbers), real and text. Within an object, the attribute names must all be different.

The attributes for an object are given inside the curly braces of the **object** definition. The attributes are preceded by the **attributes** keyword followed by the *named attributes* enclosed in curly braces { and }.

The format for each named attribute is

	<code>attribute_type</code>	<code>attribute_name</code>	<code>attribute_value</code>
where	<code>attribute_type</code>	is integer, real or text	
	<code>attribute_name</code>	is the unique attribute name for the object	
and	<code>attribute_value</code>	is the either a number, a real or a text string.	

That is the attributes are defined in a block:

```
attributes {  
  integer      att_name      number  
  real         att_name      value  
  text         att_name      text  
}
```

The *text* for a text attribute can be blank an if so, is defined as "".

An example of defining attributes is:

```
attributes {  
  text      "pole id"      "QMR-37"  
  text      street      "477 Boundary St"  
  real      "pole height"  5.25  
  integer   "pole wires"   3  
}
```

Please continue to the next section [Commands](#).

Commands

Commands consist of a **keyword** followed by a space and then a **value** (a keyword and its value is often referred to as a **keyword pair**). A **value** must always exist.

keyword value // a keyword pair

There can be more than one command keyword pair per line as long as each keyword pair is separated by a space. In fact, the *keyword* can be on one line and the *value* on the next line.

Although the names of commands are only shown in lower case in these notes, commands are case insensitive and all combinations of case are recognised as the same command. That is 'model', 'MODEL' and 'Model' are all recognised as the command 'model'.

The commands in the 12d Ascii file are:

model model_name // system default data

All strings following until the next **model** keyword are placed in the model *model_name*. This can be overridden for a string by a **model** command inside the string definition.

If the model includes attributes, the following *model* definition must be used.

```
model {
  name    model_name
  ...
}
```

All 12d Model *models* can have an unlimited number of named attributes of type integer (numbers), real and text. Within a model, the attribute names must all be different.

The definition for a model with attributes is the **model** keyword followed by information enclosed in curly braces { and }. The keyword *name* followed by the *model_name* **must** be included inside the curly braces.

name model_name

The attributes for the model are also specified inside the curly braces of the **model** definition. As described previously, the attributes are preceded by the **attribute** keyword followed by the named attributes enclosed in curly braces { and }.

Hence the *model* definition with attributes is:

```
model {
  name                      model_name
  attributes {
    attribute_type    attribute_name    attribute_value
    attribute_type    attribute_name    attribute_value
    ...
    attribute_type    attribute_name    attribute_value
  }
}
```

For example:

```
model {
  name                      "telegraph poles"

  attributes {
    text                      "pole id"                      "QMR-37"
    text                      "street"                      "477 Boundary St"
    real                      "pole height"                      5.25
    integer                      "pole wires"                      3
  }
}
```

```

    }

    colour colour_name // system default red

    All strings following until the next colour keyword have colour colour_name. This can be
    overridden for a string by a colour command in the string definition.

    style style_name // system default l

    All strings following until the next style keyword have style style_name. This can be overridden
    for a string by a style command in the string definition.

    breakline point or line // system default line

    All strings following that requires a breakline point-line type until the next breakline keyword,
    have this point-line type. This may be overridden for the string by a breakline in the string
    definition.

    null value // system default -999

    All z-values equal to value in strings following until the next null keyword, are considered to be
    null z-values.

    string string_type {
    ...
    }

```

The *string_type* is compulsory and must be followed by all the string information enclosed in curly braces { and }.

Thus if a string type or possibly information inside the string is not recognised, the 12d Ascii reader has a chance of being able to jump over the string by looking for the end marker }.

Inside the braces are **string commands** as keyword pairs defining some information for the string.

There can be more than one *string command* keyword pair per line as long as each keyword pair is separated by a space. In fact, the *keyword* can be on one line and the *value* on the next line.

Any unrecognised *string commands* are ignored.

The *string command keyword pairs* include **model**, **colour**, **style** and **breakline** which are all *optional* inside the string definition. However if any of them exist inside a string definition, then the *string command keyword* overrides any **model**, **colour**, **style** or **breakline commands** but only for that particular string.

For some string types (e.g. 2d, 3d, pipe) there is more data required than just the *string command* keyword pairs.

This extra data is contained in blocks consisting of a *keyword* followed by the required information enclosed in curly braces { and }. For example attributes for all string types and (x,y) data for a 2d string.

For all string types, if there is not enough recognised information to define the string, the string is ignored.

The definition of each *string type* and the allowed *string commands* and extra data for that string type will be given after the next section on string attributes.

string attributes

All 12d Model strings can have an unlimited number of named **attributes** of type integer (numbers), real and text. Within a string, the attribute names must all be different.

The attributes for a string are given inside the curly braces of the **string** definition. As described previously, the attributes are preceded by the **attributes** keyword followed by the named attributes enclosed in curly braces { and }.

    "          "          "          "           // use "" for no text.
  }
}
```

Please continue to the next section [Alignment String](#).

Alignment String

In an alignment string the horizontal and vertical geometry are given separately and both can only be defined by the intersection point method (IP's).

For the horizontal geometry, the (x,y) position of the horizontal intersection points (HIPs) are given in the order that they appear in the string, plus the circular radius and left and right transition lengths on each HIP.

Hence a horizontal intersection point is given by either

```
x-value   y-value   radius           // circular curve, no transition
or
x-value y-value radius spill left-transition-length spill2 right-transition-length
```

radius, *left-transition-length*, *right-transition-length* can be zero (meaning they don't exist).

For the vertical geometry, the (chainage,height) position of the vertical intersection points (VIPs) are given in increasing chainage order, plus either the radius of the circular arc or the length of the parabolic curve on each VIP.

Hence for a vertical intersection point is given by either

```
ch_value   z-value   length   parabola
or
ch_value   z-value   radius   circle
where
```

the word *parabola* is optional. *length* and *radius* can be zero, meaning that the parabola or arc doesn't exist.

```
string alignment {
  model model_name   name string_name
  colour colour_name   style style_name
  chainage start_chainage   interval value
  draw_mode value           // 1 to draw crosses at HIPs and VIPs, 0 don't draw
```

```

spiral_type text // spiral_type covers both spiral and non-spiral transitions.
                // For an alignment string, the supported transition types
                // are clothoid, cubic parabola, westrail-cubic, cubic spiral
                // More transition are supported in the super alignment
                //
hipdata { // some hips must exist and precede the VIP data
    x-value y-value radius // or
    x-value y-value radius spill left-transition-length spill2 right-transition-length
    " " " " " " " "
}
vipdata { // vips optional
    ch_value z-value parabolic-length // or
    ch_value z-value parabolic-length parabola // or
    ch_value z-value radius circle
    " " " "
}
}

```

Please continue to the next section [Arc String](#).

Arc String

```

Pipeline String

This is the same as an alignment string except that it has the additional keywords

diameter, which gives the diameter of the pipeline in world units

and

length of the typical pipe making up the pipeline (used for deflections).

```
string pipeline {
  model model_name name string_name
  colour colour_name style style_name
```

```

diameter diameter length pipe-length
chainage start_chainage interval value
spiral_type text // spiral_type covers both spiral and non-spiral transitions
// supported by 12d. For an alignment string, the
// supported transition types are clothoid, cubic parabola,
// westrail-cubic, cubic spiral. Other transition types
// are supported in the super alignment
hipdata { // some hips must exist and precede vips
  x-value y-value radius // or
  x-value y-value radius spill left-transition-length spill2 right-transition-length
  " " " " " " " "
}
vipdata { // vips optional
  ch-value z-value parabolic-length // or
  ch-value z-value parabolic-length parabola // or
  ch-value z-value radius circle
  " " " "
}
}

```

Please continue to the next section [Polyline String](#).

Polyline String

The definition of a closed string has been refined for polyline and super strings. For other string types, closing a string simply meant having the first vertex the same as the last vertex. Hence the vertex was duplicated.

For a polyline string, being closed is a property of the string and no extra vertex is needed - the first and the last vertices are not the same and the polyline string knows there is an additional segment from the last vertex back to the first vertex.

In the 12d ascii format, there is a new *closed* flag for the polyline string:

closed *true* or *false*

where *true* can be 1 or T or t or Y or y (or words starting with T, t, Y or y))
and *false* is 0 or F or f or N or n (or words starting with F, f, N or n).

```

string polyline {
  chainage start_chainage
  model model_name name string_name
  colour colour_name style style_name
  breakline point or line
  closed true or false

  data { // keyword
    x-value y-value z-value radius bulge_flag
    " " "
    " " "
  }
}

```

Please continue to the next section [Super String](#).

Super String

Because the super string is so versatile, its 12d Ascii format looks complicated but it is very logical and actually quite simple.

In its most primitive form, the super string is simply a set of (x,y) values as in a 2d string, or (x,y,z) values as in a 3d string, or (x,y,z,radius,bulge_flag) as for a polyline string or even lines, arcs and transitions (spirals and non-spiral transitions).

Additional blocks of information can extend the definition of the super string. For example, text, pipe diameters and visibility.

Some of the properties of the super string extend what were constant properties for the entire string in other string types. For example, *breakline* type for the string extends to *tinability* of *vertices* and *segments*. One colour for the string extends to individual colours for each segment.

Other properties such as vertex id's (point numbers), visibility and culvert data are entirely new.

For user attributes, the super string still has the standard user attributes defined for the entire string, but user attributes for each vertex and segment are also supported.

The definition of a closed string has been refined for polyline and super strings. For other string types, closing a string simply meant having the first vertex the same as the last vertex. Hence the vertex was duplicated.

For a super string, being closed is a property of the string and no extra vertex is needed. That is, the first and the last vertices are not the same for a closed super string and the super string knows there is an additional segment from the last vertex back to the first vertex.

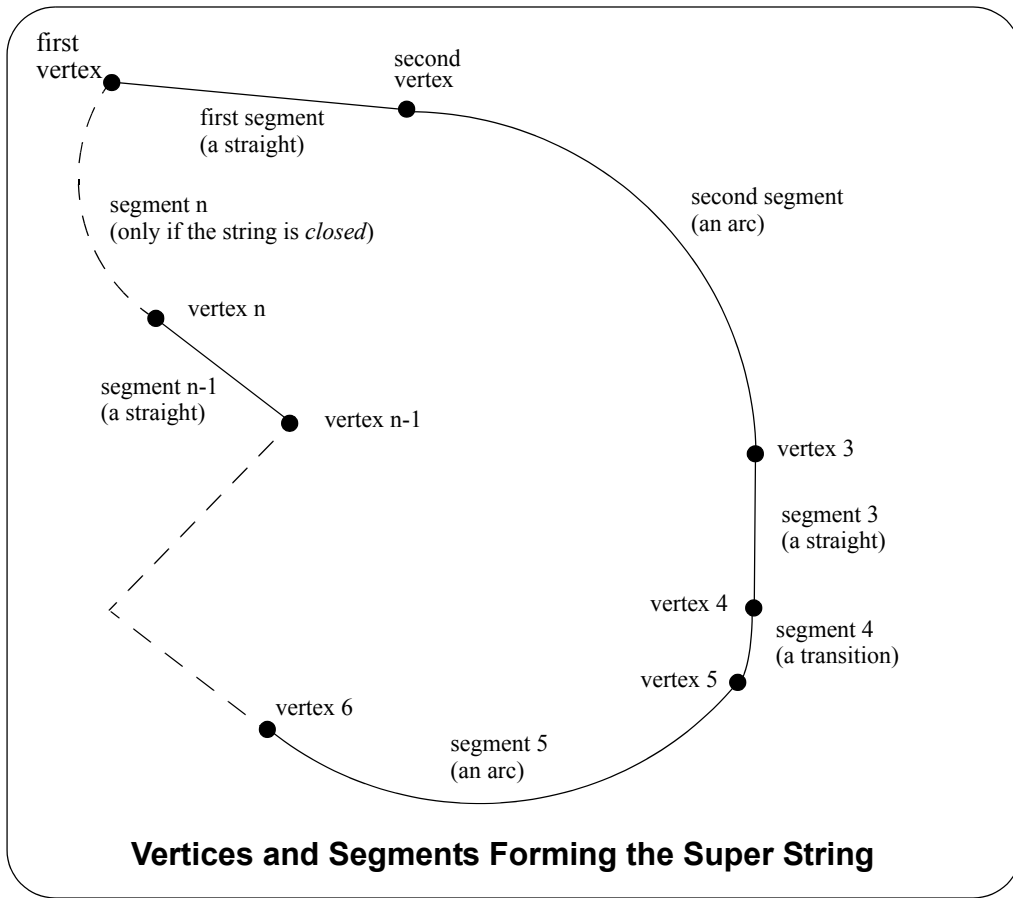

Hence in the 12d ascii format, there is a *closed* flag for the super string:

closed *true* or *false*

where *true* can be 1 or T or t or Y or y (or words starting with T, t, Y or y))
and *false* is 0 or F or f or N or n (or words starting with F, f, N or n).

Thus if a string has n vertices, then an open string has $n-1$ segments joining the vertices and a closed string has n segments since there is an additional segment from the last to the first vertex.

With the additional data for vertices and segments in the super string, the data is in vertex or segment order. So for a string with n vertices, there must be n bits of vertex data. For segments, if the string is open then there only needs to be $n-1$ bits of segment data but for closed strings, there must be n bits of data. For an open string, n bits of segment data can be specified and the n th bit will be read in and stored. If the string is then closed, the n th bit of data will be used for the extra segment.

The full 12d Ascii definition of the super string is:

```
string super {
  chainage start_chainage
  model model_name   name string_name
  colour colour_name style style_name
  breakline point or line
  closed true or false
  interval {
    chord_arc   value           // chord-to-arc tolerance for curves
    distance    value           // chainage interval to break the geometry up
  }

  block of info {
  }
  block of info {
  }
  block of info {
  }
}
```

The blocks of info can be broken up into four types.

(a) blocks defining the position of the vertices in z, y and z

data_2d or data_3d

- (b) blocks defining the geometry of the segments
 - radius_data* and *major_data* or *geometry_data*
- (c) a superseded block defining vertices and segment geometry
 - data*
- (d) extra information for the vertices and/or segments
 - pipe diameters - *diameter_value* or *diameter_data*
 - culvert dimensions - *culvert_value* or *culvert_data*
 - pipe/culvert justification - *justify*
 - colour - *colour* or *colour_data*
 - vertex ids (point numbers) at each vertex- *point_data*
 - tinability - *breakline* or *vertex_tinability_data* and *segment_tinability_data*
 - visibility - *vertex_visible_data* and *segment_visible_data*
 - vertex text and annotation - *vertex_text_data* and *vertex_annotation_data*
 - segment text and annotation - *segment_text_data* and *segment_annotation_data*
 - symbols at vertices - *symbol_value* or *symbol_data*
 - vertex attributes - *vertex_attribute_data*
 - segment attributes - *segment_attribute_data*
 - extrudes
 - image data
 - holes

The definition for the blocks of each type now follows.

(a) Blocks Defining the Position of the Vertices

For (x, y) Values with a Constant z

If there is only (x,y) values at each vertex (like a 2d string):

```
data_2d {                                     // keyword
    x-value  y-value
    "        "
    "        "
}
```

and if there is a non-null constant z for the string

z value

For (x,y,z) Values

If there is (x,y,z) values at each vertex (like a 3d string):

```
data_3d {                                     // keyword
    x-value  y-value  z-value
    "        "        "
    "        "        "
}
```

(b) Blocks Defining the Geometry of the Segments

Straights and Arcs Only for the Segments

If data_2d or data_3d was used, it is possible to add radius and bulge_flag data:

```
radius_data {                                 // keyword
    radius for first segment
    radius for second segment
```

```

        . . .
        radius for last segment
    }

    major_data {                                     // keyword
        bulge flag for first segment
        bulge flag for second segment
        . . .
        bulge flag for last segment
    }

```

Straights, Arcs and Transitions (Spiral and non-Spiral Transitions) for the Segments

If data_2d or data_3d was used, it is possible to specify if the segments are straight, arcs or transitions using a *geometry_data* block.

```

geometry_data {
    segment_info_1 {
        information on the first segment
    }
    segment_info_2 {
        information on the second segment
    }
    " "
    " "
    segment_info_n-1 { // the last segment if it is open
        information on the (n-1) segment
    }
    segment_info_n { // the last segment if it is closed
        information on the n-th segment
    }
}

```

where the *segment_info* blocks are from the following:

(a) Straight

No parameters are needed for defining a straight segment. The *straight* block is simply:

```

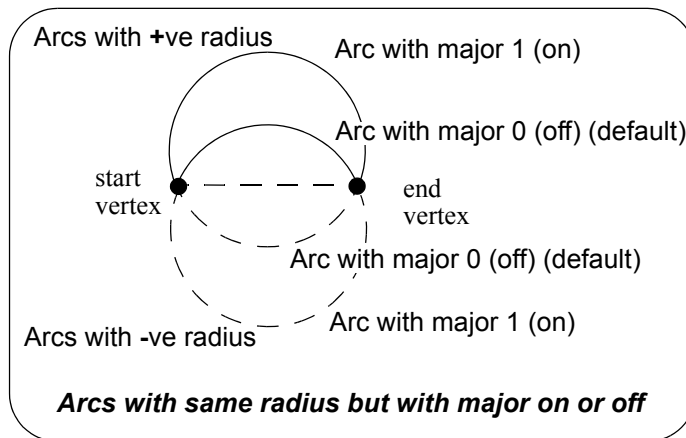

straight {                                     // no parameters are needed for a straight
}

```

(b) Arc

There are four possibilities for an arc of a given radius placed between two vertices.

We use *positive* and *negative* radius, and a flag *major* which can be set to 1 (on) or off (0) to differentiate between the four possibilities.

So the *arc* block is:

```
arc {
  radius value      // radius of the arc (+ve is above the line connecting the vertices)
  major 0 or 1       // 0 is the smaller arc, 1 the larger arc).
}
```

(c) Spiral - this covers both spiral and non-spiral transitions

There can be a partial transition between adjacent vertices. The partial transition is defined by the parameters

- l1** length of the full transition up to the start vertex
- r1** radius of the transition at the start vertex
- a1** angle in decimal degrees of the tangent to the transition at the start vertex
- l2** length of the full transition up to the end vertex
- r2** radius at the end vertex
- a2** angle in decimal degrees of the tangent to the transition at the end vertex

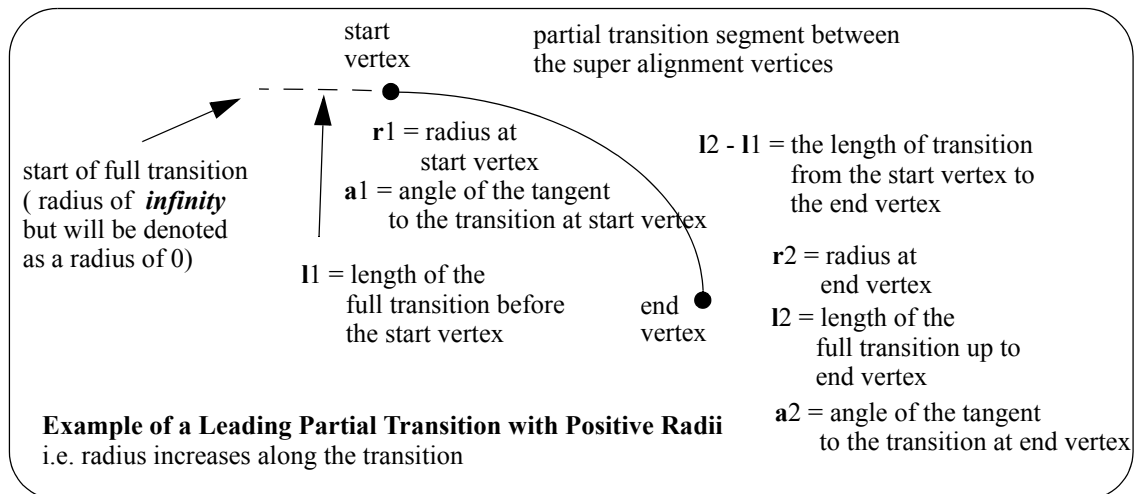

Since a radius can not be zero, a radius of infinity is denoted by *zero*.

The transition is said to be a *leading* transition if the absolute value of the radius is increasing along the direction of the transition (the transition will *tighten*). Otherwise it is a *trailing* transition.

If a leading transition is a full transition then $r1 = 0$ and $l1 = 0$. Similarly if a trailing transition is a full transition then $r2 = 0$ and $l2 = 0$.

For a partial transition, if the coordinates of the start of the full transition are needed then they can be calculated from $l1, r1, a1, l2, r2, a2$ and the co-ordinates of the start and end vertices.

Note that the radii can be positive or negative. If the radii's are positive then a leading transition will curl to the right (and will be above the line joining the start and end vertices).

The parameters for the *spiral* block are:

```

spiral {
  type      value           // type can be clothoid, cubic parabola, westrail-cubic,
                             // cubic spiral, natural clothoid, blossom,
                             // blossom, sinusoidal, cosinusoidal
  leading    1 or 0         // 1 denotes a leading transition, 0 a trailing transition
  l1         value          // length of the full transition at start vertex
  r1         value          // radius at the start vertex
  a1         value          // angle in decimal degrees of the tangent to the transition
                             // at the start vertex
  l2         value          // length of the full transition at end vertex
  r2         value          // radius at end vertex
  a2         value          // angle in decimal degrees of the tangent to the transition
                             // at the end vertex
}

```

Notes

1. The *spiral* block covers both spiral and non-spiral transitions.
2. The transitions/spirals supported by **12d Model** are:

Clothoid - spiral approximation used by Australian road authorities and Queensland Rail.

Cubic parabola – special transition curve used by NSW railways. Not a spiral.

Westrail cubic – spiral approximating used by WA railways.

Cubic spiral – low level spiral approximation. Only ever used in surveying textbooks.

Natural Clothoid – the proper Euler spiral. Not used by any authority.

Bloss – special transition used by Deutsche Bahn. Not a spiral.

Sinusoidal - special transition. Not a spiral.

Cosinusoidal - special transition. Not a spiral.

(c) Block Defining the Vertices and Segments

For compatibility with the polyline, the *data* block gives the (x,y,z,radius,bulge) values at each vertex of the string and so defines both the vertices and the geometry of the segments in the one block.

```
data {                                     // keyword
    x-value    y-value    z-value    radius    bulge
    "          "          "          "          "
    "          "          "          "          "
}
```

(d) Other Blocks

Pipe Diameters

There can be one pipe diameter value for the entire super string or the pipe diameter varies for each segment of the super string.

```
diameter_value value
or
diameter_data {                           // keyword
    pipe diameter for first segment
    pipe diameter for second segment
    . . .
    pipe diameter for last segment
}
```

Culvert Dimensions

There can be one culvert width and height for the entire super string or the culvert width and height vary for each segment of the super string.

```
culvert_value {
    width    value
    height   value
}
or
culvert_data { properties {width    value    // width and height for first segment
                          height   value
                          }
               properties {width    value    // width and height for second segment
                          height   value
                          }
               . . .
               properties {width    value    // width and height for last segment
                          height   value
                          }
}
```

Justification for Pipe or Culverts

There can be only one justification for the pipe or culvert for the entire super string.

```
justify justification    // bottom or invert
```

```
// top or obvert
// centre (default)
```

Colour

There can be one colour for the entire super string which is given by the `colour` command at the beginning of the string definitions (before the blocks of information) or the colour varies for each segment of the super string and is specified in a `colour_data` block.

```
colour_data {                                     // keyword
    colour for first segment
    colour for second segment
    ...
    colour for last segment
}
```

Vertex Id's (Point Numbers)

Each vertex can have a vertex id (point number). This is not the order number of the vertex in the string but is a separate id which is usually different for every vertex in every string. The vertex id can be alphanumeric.

```
point_data {                                     // keyword
    vertex id or first vertex                    // alphanumeric
    vertex id for second vertex
    ...
    vertex id for last vertex
}
```

Tinability

For a *super string*, the concept of breakline has been extended to a property called **tinable** which can be set independently for each vertex and each segment of the super string.

If a vertex is tinable, then the vertex is used in triangulations. If the vertex is not tinable, then the vertex is ignored when triangulating.

If a segment is tinable, then the segment is used as a side of a triangle during triangulation. This may not be possible if there are *crossing* tinable segments.

```
vertex_tinable_data {                           // keyword
    tinable flag for first vertex                // 1 for tinable
    tinable flag for second vertex               // 0 for not tinable
    ...
    tinable flag for last vertex

segment_tinable_data {                          // keyword
    tinable flag for first segment               // 1 for tinable
    tinable flag for second segment             // 0 for not tinable
    ...
    tinable flag for last segment
}
```

Note that even if a segment is set to tinable, it can only be used if both its end vertices are also tinable.

Visibility

For a *super string*, the concept of visibility and invisibility for vertices and segments has been

introduced.

```
vertex_visible_data {                                // keyword
    visibility flag for first vertex                // 1 for visible
    visibility flag for second vertex               // 0 for invisible
    ...
    visibility flag for last vertex
}

segment_visible_data {                               // keyword
    visibility flag for first segment               // 1 for visible
    visibility flag for second segment              // 0 for invisible
    ...
    visibility flag for last segment
}
```

Vertex Text and Vertex Annotation

There can be the same piece of text for every vertex in the super string or a different text for each vertex of the super string. How the text is drawn is specified by vertex annotation values. Note that in vertex annotations, all vertices must be either worldsize or all vertices papersize. That is, worldsize and papersize can not be mixed - the first one found is used for all vertices.

```
vertex_text_value      text
or
vertex_text_data {    // keyword
    text for first vertex    // text string, enclose
    text for second vertex   // by " " if there are any
    ...                     // spaces in the text string
    text for last vertex
}

vertex_annotate_value { // keyword
    angle value offset value raise value
    textstyle textstyle_name slant degrees xfactor value
    worldsize value or papersize value or screensize value
    justify "top|middle|bottom-left|centre|right"
    colour colour_name
}
or
vertex_annotate_data { // keyword
    properties { angle value offset value raise value
                  textstyle textstyle slant degrees xfactor value
                  worldsize value or papersize value or screensize value
                  justify "top|middle|bottom-left|centre|right"
                  colour colour_name
    }
    properties { text properties second vertex
    }
    properties { ...
    }
    properties { text properties for last vertex
    }
}
```

Segment Text and Segment Annotation

There can be the same piece of text for every segment in the super string or a different text for

each segment of the super string. How the text is drawn is specified by segment annotation values. Note that in segment annotations, all segments must be either worldsize or all segments papersize. That is, worldsize and papersize can not be mixed - the first one found is used for all segments. However, vertex text and segment text do not both have to be papersize or worldsize.

```

segment_text_value      text
or
segment_text_data {
    text for first segment           // keyword
    text for second segment         // text string, enclose
    ...                               // by " " if there are any
    text for last segment           // spaces in the text string
}

segment_annotate_value {
    angle value offset value raise value           // keyword
    textstyle textstyle slant degrees xfactor value
    worldsize value or papersize value or screensize value
    justify "top|middle|bottom-left|centre|right"
    colour colour_name
}
or
segment_annotate_data {
    properties { angle value offset value raise value
                  textstyle textstyle slant degrees xfactor value
                  worldsize value or papersize value or screensize value
                  justify "top|middle|bottom-left|centre|right"
                  colour colour_name
    }
    properties { text properties second segment
    }
    properties { ...
    }
    properties { text properties for last segment
    }
}

```

Symbols

There can be the same symbol (defined as a linestyle) for every vertex in the super string or a different symbol for each vertex of the super string. If a symbol does not have a colour, then it uses the string colour or the segment colour.

```

symbol_value {
    style linestyle_name colour colour_name size value
    rotation value // in dms
    offset value raise value
}
or
symbol_data {
    properties { style linestyle_name colour colour_name size value
                  style linestyle colour colour size value
                  rotation value // in dms
                  offset value raise value
    }
    properties { symbol and properties for second vertex
    }
}

```

```
        properties { ...
    }
    properties { symbol and properties for last vertex
    }
}
```

Vertex Attributes

Each vertex can have one or more user defined named attributes.

```
vertex_attribute_data { // key word
    attributes { attribute_type attribute_name attribute_value
                attribute_type attribute_name attribute_value
                ...
                attribute_type attribute_name attribute_value
    }
    attributes { named attributes for second vertex
    }
    attributes { ...
    }
    attributes { named attributes for last vertex
    }
}
```

Segment Attributes

Each segment can have one or more user defined named attributes.

```
segment_attribute_data { // keyword
    attributes { attribute_type attribute_name attribute_value
                attribute_type attribute_name attribute_value
                ...
                attribute_type attribute_name attribute_value
    }
    attributes { named attributes for second segment
    }
    attributes { ...
    }
    attributes { named attributes for last segment
    }
}
```

Please continue to the next section [Super Alignment String](#).

Super Alignment String

In an *alignment* string, only the intersection point method (IP's) could be used to construct the horizontal and vertical geometry. The IP definition is actually a *constructive* definition and the tangents points and segments between the tangent points (lines, arcs, transitions etc.) are calculated from the IP definition. For an alignment string, only the IP definitions are included in the 12d ascii file.

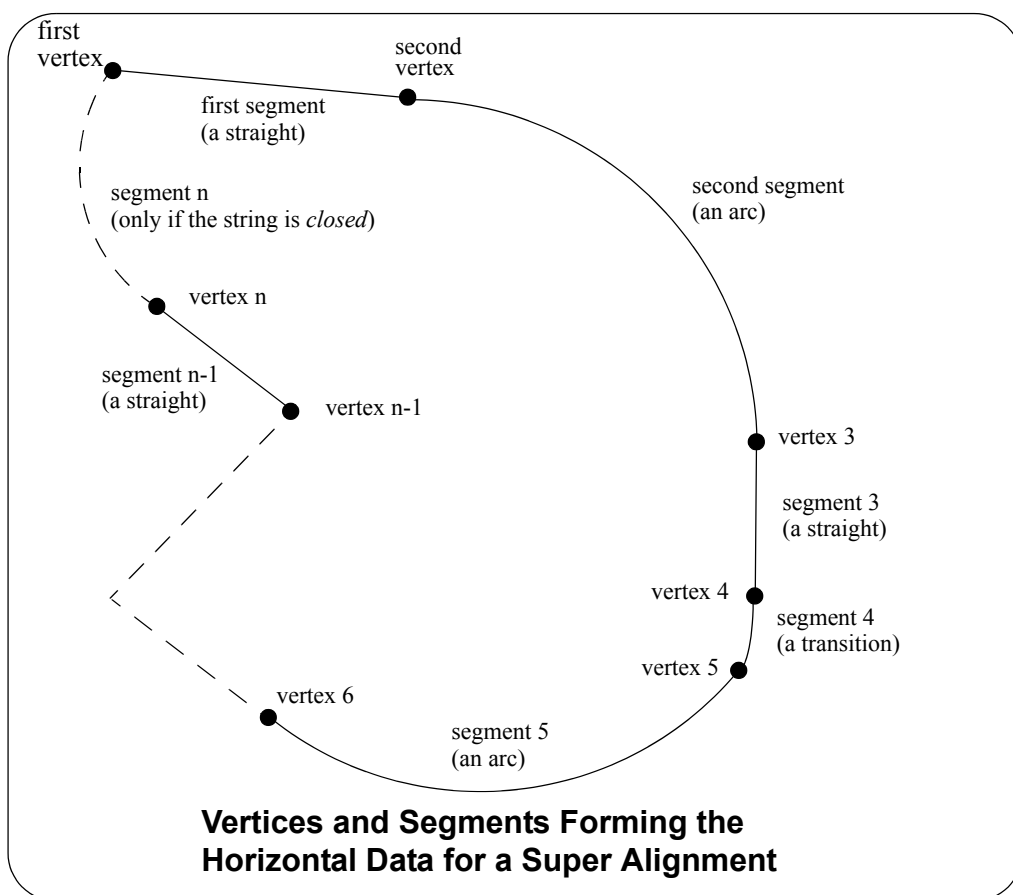

For a **super alignment**, the horizontal and vertical geometry are also defined separately and with construction definitions but the construction definition can be much more complex than just IP's. For example, an arc could be defined as being tangential to two offset elements, or constrained to go through a given point.

If the horizontal construction methods are consistent then the horizontal geometry can be solved, and the horizontal geometry expressed in terms of consecutive segments (lines, arcs, transitions) that are easily understood and drawn.

Similarly if the vertical construction methods are consistent then the vertical geometry can be solved, and the vertical geometry expressed in terms of consecutive segments (lines, arcs, parabolas) that are easily understood and drawn.

Unlike the *alignment*, the *super alignment* stores **both** the **construction methods** (the **parts**) and the resulting **vertices** and **segments** (lines, arcs, transitions etc.) that make up the horizontal and vertical geometry (the **data**).

For many applications such as uploading to survey data collectors or machine control devices, only the **horizontal data** and the **vertical data** are required, not the *construction methods* (i.e. the **horizontal** and **vertical parts**). When reading the 12d Ascii of a *super alignment*, only the **horizontal** and **vertical data** needs to be read in and the constructive methods (the **horizontal** and **vertical parts**) can be skipped over.

Notes

1. Just using the horizontal and vertical data is valid *as long as the super alignment geometry is consistent* (and solves) and the horizontal and vertical parts can be created.

There are flags in the 12d Ascii of the super alignment to say that the horizontal and vertical geometry is consistent and solves.

2. Segments meeting at a common vertex do not have to be tangential although for most road and rail applications, they should be.

The full 12d Ascii definition of the *super alignment* is:

```
string super_alignment {  
  //  
  name          string_name  
  chainage       start_chainage  
  colour         colour_name  
  style          style_name  
  breakline      point or line  
  closed         true or false  
  spiral_type    transition_type           // the spiral_types are clothoid,  
                                           // cubic parabola, westrail-cubic,  
cubic spiral,                             // natural clothoid, blossom, sinusoidal  
and                                         // cosinusoidal. Note that some  
spiral_type's                             // are non-spiral transitions  
  
  valid_horizontal true or false           // if true then the horizontal geometry  
                                           // is consistent and solves  
  valid_vertical   true or false           // if true then the horizontal geometry  
                                           // is consistent and solves  
  
  block of info {  
    }  
  block of info {  
    }  
  block of info {  
    }  
  
}
```

// end of super alignment

where the block of info can be one of more of:

attributes, horizontal_parts, horizontal_data, vertical_parts, vertical_data.

The *attributes* block has been described in the earlier section [Attributes](#).

The structure of the blocks *horizontal_parts*, *horizontal_data* which define the horizontal geometry, and *vertical_parts* and *vertical_data* which define the vertical geometry will now be described in more detail.

For information on *horizontal geometry*, go to
vertical geometry

[Horizontal Geometry](#)
[Vertical Geometry](#)

Horizontal Geometry

The horizontal geometry is described by two blocks - the *horizontal_parts* block and the *horizontal_data* block.

The ***horizontal_parts*** block contains the ***methods*** to construct the horizontal geometry such as float (fillet) an arc of a certain radius between two given lines or create a transition (spiral or non-spiral transition) between a line and an arc.

If the horizontal construction methods are consistent, then they can be solved to form a string made up of lines, arcs and transitions. The ***horizontal_data*** block is simply a list of the vertices and segments (lines, arcs etc.) that make up the ***solved*** geometry.

If the geometry in the *horizontal_parts* can be solved and produces a valid *horizontal_data* block, then the flag *valid_horizontal* in the super_alignment block is set to *true*.

```

    valid_horizontal  true or false  //true if the horizontal geometry can be solved
and
    horizontal_parts {/              // hence create a valid horizontal_data
    ....                          / methods for creating the horizontal geometry
    }
    horizontal_data {                // the horizontal segments that make up the solved
geometry
    ....
    }

```

For information on *horizontal_parts*, go to the section [Horizontal_parts](#)
horizontal_data [Horizontal_data](#)

Horizontal_parts

The *horizontal_parts* block describes the methods used to construct the horizontal geometry of the super alignment. The parts that make up the horizontal geometry are defined in chainage order from the start to the end of the super alignment.

```

horizontal_parts {  // methods for creating the horizontal geometry
    blocks defining the sequential parts
    making up the horizontal geometry
}

```

Apart from the special case of parts defined by horizontal intersection points and their accompanying transitions and arcs, the other parts in the *horizontal_parts* block are not documented.

Horizontal_parts for defined by IP Method Only

For a horizontal intersection point (HIP) with no transitions or arc defined at that HIP, the part is defined by:

```

ip {
    id  value  // part id - a number that is unique for each horizontal and ver-
tical part,
    // and the value of part id is a multiple of 100
    x  value  // x co-ordinate of the horizontal intersection point
    y  value  // y co-ordinate of the horizontal intersection point
}

```

For a horizontal intersection point (HIP) with an arc but no transitions defined at that HIP, the part is defined by

```
arc {
    id value // part id - a number that is unique for each horizontal and ver-
tical part,
                // and the value of part id is a multiple of 100
    r value // radius of the arc at the HIP
    x value // x co-ordinate of the HIP
    y value // y co-ordinate of the HIP
}
```

For a horizontal intersection point (HIP) with an arc and transitions defined at that HIP, the part is defined by

```
spiral {
    id value // part id - a number that is unique for each horizontal and ver-
tical part,
                // and the value of part id is a multiple of 100
    r value // radius of the arc at the HIP
    l1 value // length of the leading transition at the HIP
    l2 value // length of the trailing transition at the HIP
    x value // x co-ordinate of the HIP
    y value // y co-ordinate of the HIP
}
```

Note that the *transition* used in the **spiral** block is given by *spiral_type* in the super_alignment block.

Hence a super alignment with horizontal geometry defined by IP methods only would consist of a horizontal_parts section with only the above ip, arc and spiral blocks in it.

```
horizontal_parts {
    ip_spiral_arc {
        values // values defining the ip_spiral_arc
    }
    "
    values
    }
    ....
    ip_spiral_arc {
        values // values defining the ip_spiral_arc
    }
    "
    values
}
```

For example,

```

horizontal_parts {
  ip {
    id 100
    x 42606.66161172
    y 37239.28824481
  }
  ip {
    id 200
    x 43134.36832349
    y 37330.26705997
  }
  spiral {
    id 300
    r 50
    l1 30
    l2 40
    x 43336.6595
    y 37469.2563
  }
  arc {
    id 400
    r 75
    x 43481.15324268
    y 37331.6431906
  }
  ip {
    id 500
    x 43627.02308964
    y 37544.94343852
  }
}

```

Plan View of Super Alignment

Super Alignment Being Edited

Horizontal Parts with IP Methods Only

Horizontal_data

The *horizontal_data* block contains the **solved** horizontal geometry of the super alignment.

The *solved horizontal geometry* is made up of a series of (x,y) vertices given in a *data_2d* block followed by a *geometry_data* block specifying the geometry of the segments between adjacent vertices. The segment can be a straight line, an arc, a transition (e.g. a spiral) or a partial transition.

If the horizontal geometry has n vertices, then there will be (n-1) segments for an *open* super alignment or n segments if the super alignment is *closed*.

The format of the *horizontal_data* block is:

```

horizontal_data {
  name      ""
  chainage   value
  breakline  line or point
  colour     colour
  style      linestyle
  closed     0 or 1
}

```

// 0 if the string is open, 1 if it is closed

```

interval {
  chord_arc    value           // chord-to-arc tolerance for curves
  distance     value           // chainage interval to break the geometry up
}

data_2d {
  x1-value    y1-value         // co-ordinates of the first vertex
  x2-value    y2-value         // co-ordinates of the second vertex
  "           "
  "           "
  xn-value    yn-value         // co-ordinates of the n-th vertex
}

geometry_data {
  segment_info_1 {
    information on the first segment
  }
  segment_info_2 {
    information on the second segment
  }
  " "
  " "
  segment_info_n-1 {           // the last segment if it is open
    information on the (n-1) segment
  }
  segment_info_n {             // the last segment if it is closed
    information on the n-th segment
  }
}

```

where the *segment_info* blocks are from the following:

(a) Straight

No parameters are needed for defining a straight segment. The *straight* block is simply:

```

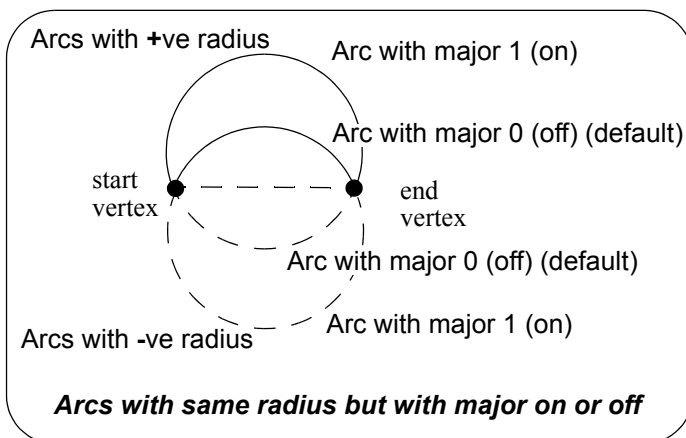

straight {
  // no parameters are needed for a straight
}

```

(b) Arc

There are four possibilities for an arc of a given radius placed between two vertices.

We use *positive* and *negative* radius, and a flag *major* which can be set to 1 (on) or off (0) to differentiate between the four possibilities.

So the *arc* block is:

```
arc {
    radius value      // radius of the arc (+ve is above the line connecting the vertices)
    major 0 or 1      // 0 is the smaller arc, 1 the larger arc).
}
```

(c) Spiral - this covers both spiral and non-spiral transitions

There can be a partial transition between adjacent vertices. The partial transition is defined by the parameters

l1 length of the full transition up to the start vertex
r1 radius of the transition at the start vertex
a1 angle in decimal degrees of the tangent to the transition at the start vertex
l2 length of the full transition up to the end vertex
r2 radius at the end vertex
a2 angle in decimal degrees of the tangent to the transition at the end vertex

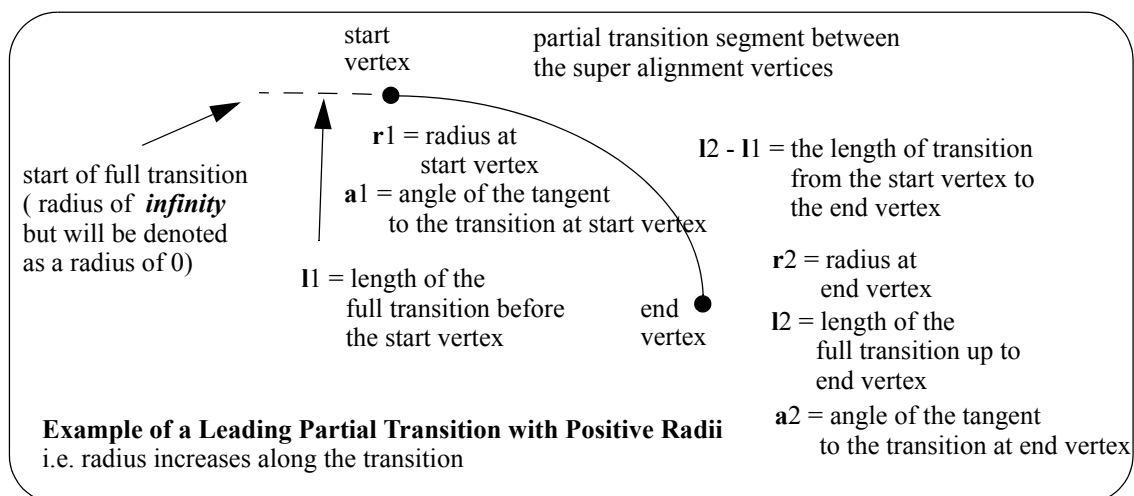

Since a radius can not be zero, a radius of infinity is denoted by *zero*.

The transition is said to be a *leading* transition if the absolute value of the radius is increasing along the direction of the transition (the transition will *tighten*). Otherwise it is a *trailing* transition.

If a leading transition is a full transition then $r1 = 0$ and $l1 = 0$. Similarly if a trailing transition is a full transition then $r2 = 0$ and $l2 = 0$.

For a partial transition, if the coordinates of the start of the full transition are needed then they can be calculated from $l1, r1, a1$, $l2, r2, a2$ and the co-ordinates of the start and end vertices.

Note that the radii can be positive or negative. If the radii's are positive then a leading transition will curl to the right (and will be above the line joining the start and end vertices).

The parameters for the *spiral* block are:

```
spiral {
    type      transition_type      // any of the transitions supported in 12d
    leading    1 or 0                // 1 denotes a leading transition, 0 a trailing transition
    l1         value                  // length of the full transition at start vertex
    r1         value                  // radius at the start vertex
    a1         value                  // angle in decimal degrees of the tangent to the transition
                                         // at the start vertex
    l2         value                  // length of the full transition at end vertex
```

```

    r2      value      // radius at end vertex
    a2      value      // angle in decimal degrees of the tangent to the transition
                        // at the end vertex
}
```

Notes

- 1. The *spiral* block covers both spiral and non-spiral transitions.
- 2. The transitions/spirals supported by **12d Model** are:

Clothoid - spiral approximation used by Australian road authorities and Queensland Rail.

Cubic parabola – special transition curve used by NSW railways. Not a spiral.

Westrail cubic – spiral approximating used by WA railways.

Cubic spiral – low level spiral approximation. Only ever used in surveying textbooks.

Natural Clothoid – the proper Euler spiral. Not used by any authority.

Bloss – special transition used by Deutsche Bahn. Not a spiral.

Sinusoidal - special transition. Not a spiral.

Cosinusoidal - special transition. Not a spiral.

Vertical Geometry

The *vertical* geometry is described by two blocks - the *vertical_parts* block and the *vertical_data* block.

The ***vertical_parts*** block contains the ***methods*** to construct the vertical geometry such as float (fit) a parabola of a certain length between two given lines.

If the vertical construction methods are consistent, then they can be solved to form a string made up of lines, parabolas and arcs. The ***vertical_data*** block is simply a list of the vertices and segments (lines, parabolas and arcs) that make up the *solved* geometry.

If the geometry in the *vertical_parts* can be solved and produces a valid *vertical_data* block, then the flag *valid_vertical* in the *super_alignment* block is set to *true*.

```
valid_vertical  true or false//true if the vertical geometry can be solved and
                                // hence create a valid vertical_data
vertical_parts {                // methods for creating the vertical geometry
    ....
}
vertical_data {                  // the vertical geometry
    ....
}
```

For information on *vertical_parts*, go to the section [Vertical_parts](#)
vertical_data [Vertical_data](#)

Vertical_parts

The *vertical_parts* block describes the methods used to construct the vertical geometry of the super alignment. The parts that make up the vertical geometry are defined in chainage order from the start to the end of the super alignment.

```
vertical_parts {                // methods for creating the vertical geometry
    blocks defining the sequential parts
    making up the vertical geometry
}
```

Apart from the special case of parts defined by vertical intersection points and their accompanying parabolas and arcs, the other parts in the *vertical_parts* block are undocumented.

Vertical_parts for defined by IP Method Only

For a vertical intersection point (VIP) with no parabola or arc defined at that VIP, the part is defined by:

```
ip {
    id  value    // part id - a number that is unique for each horizontal and ver-
    tical part,
                                // and the value of part id is a multiple of 100
    x   value    // chainage co-ordinate of the VIP
    y   value    // height co-ordinate of the VIP
}
```

For a vertical intersection point (VIP) with a parabola defined by a k value at that VIP, the part is defined by

```
kvalue {
    id  value    // part id - a number that is unique for each horizontal and ver-
```

```
    tical part,  
        // and the value of part id is a multiple of 100  
        k    value // k-value of the parabola at the VIP  
        x    value // chainage co-ordinate of the VIP  
        y    value // height co-ordinate of the VIP  
    }
```

For a vertical intersection point (VIP) with a parabola defined by length at that VIP, the part is defined by

```
    length {  
        id    value // part id - a number that is unique for each horizontal and ver-  
    tical part,  
        // and the value of part id is a multiple of 100  
        l    value // length of the parabola at the VIP  
        x    value // chainage co-ordinate of the VIP  
        y    value // height co-ordinate of the VIP  
    }
```

For a vertical intersection point (VIP) with a parabola defined by an effective radius at that VIP, the part is defined by

```
    radius {  
        id    value // part id - a number that is unique for each horizontal and ver-  
    tical part,  
        // and the value of part id is a multiple of 100  
        r    value // effective radius of the parabola at the VIP  
        x    value // chainage co-ordinate of the VIP  
        y    value // height co-ordinate of the VIP  
    }
```

For a vertical intersection point (VIP) with an asymmetric parabola defined by the start and end lengths at that VIP, the part is defined by

```
    length {  
        id    value // part id - a number that is unique for each horizontal and ver-  
    tical part,  
        // and the value of part id is a multiple of 100  
        l1    value // start length of the asymmetric parabola at the VIP  
        l2    value // end length of the asymmetric parabola at the VIP  
        x    value // chainage co-ordinate of the VIP  
        y    value // height co-ordinate of the VIP  
    }
```

For a vertical intersection point (VIP) with an arc defined by a radius at that VIP, the part is defined by

```
    arc {  
        id    value // part id - a number that is unique for each horizontal and ver-  
    tical part,  
        // and the value of part id is a multiple of 100  
        r    value // radius of the arc at the VIP  
        x    value // chainage co-ordinate of the VIP  
        y    value // height co-ordinate of the VIP  
    }
```

Hence a super alignment with vertical geometry defined by IP methods only would consist of a vertical_parts section with only the above ip, parabola and arc blocks in it.

```

vertical_parts {
    ip_parabola_arc {
        values // values defining the ip_parabola_arc
    }
    "
    values
}
....
ip_parabola_arc {
    values // values defining the ip_parabola_arc
}
"
values
}
}

```

For example,

```
vertical_parts {
  ip {
    id 600
    x -50.8459652
    y 159.79764161
  }
  kvalue {
    id 700
    k 1.25
    x 38.4627
    y 179.2126
  }
  length {
    id 800
    l 50
    x 172.61694837
    y 154.72967932
  }
  asymmetric {
    id 900
    l1 25
    l2 75
    x 270.0182
    y 208.1493
  }
  arc {
    id 1000
    r 1000
    x 424.2402
    y 196.5637
  }
  radius {
    id 1100
    r 200
    x 526.7263
    y 201.5302
  }
  ip {
    id 1200
    x 637.69216273
    y 198.71894484
  }
}

Vertical_data

The *vertical_data* block contains the *solved* vertical geometry of the super alignment.

The *solved vertical geometry* is made up of a series of (chainage,height) vertices given in a *data_2d* block followed by a *geometry_data* block specifying the geometry of the segments between adjacent vertices. The segment can be a straight line, a parabola or an arc.

If the vertical geometry has n vertices, then there will be (n-1) segments for an *open* super alignment or n segments if the super alignment is *closed*.

The format of the *vertical_data* block is:

```
vertical_data {
```

```

name      ""
chainage  value
breakline line or point
colour    colour
style     linestyle
closed    0 or 1           // 0 if the string is open, 1 if it is closed
interval {
    chord_arc  value           // chord-to-arc tolerance for curves
    distance   value           // chainage interval to break the geometry up
}

data_2d {
    ch1-value  ht1-value           // co-ordinates of the first vertex
    ch2-value  ht2-value           // co-ordinates of the second vertex
    "          "
    "          "
    chn-value  htn-value           // co-ordinates of the n-th vertex
}

geometry_data {
    segment_info_1 {
        information on the first segment
    }
    segment_info_2 {
        information on the second segment
    }
    "          "
    "          "
    segment_info_n-1 {           // the last segment if it is open
        information on the (n-1) segment
    }
    segment_info_n {           // the last segment if it is closed
        information on the n-th segment
    }
}

```

where the *segment_info* blocks are from the following:

(a) Straight

No parameters are needed for defining a straight segment. The *straight* block is simply:

```

straight {           // no parameters are needed for a straight
}

```

(b) Arc

Since vertical geometry can't go backwards in chainage value, the majors arcs can not be used and hence there are only possibilities for an arc of a given radius placed between two vertices.

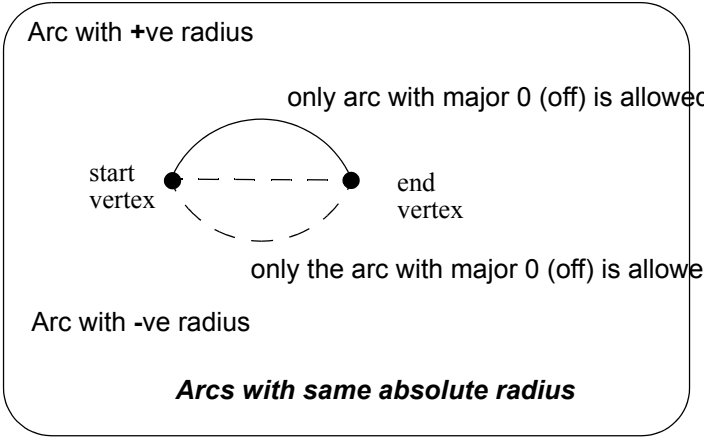

We use *positive* and *negative* radius to differentiate between the four possibilities.

So the *arc* block is:

```

arc {
    radius value       // radius of the arc (+ve is above the line connecting vertices)
    major  value       // this is ignored since only minor arcs are used
}

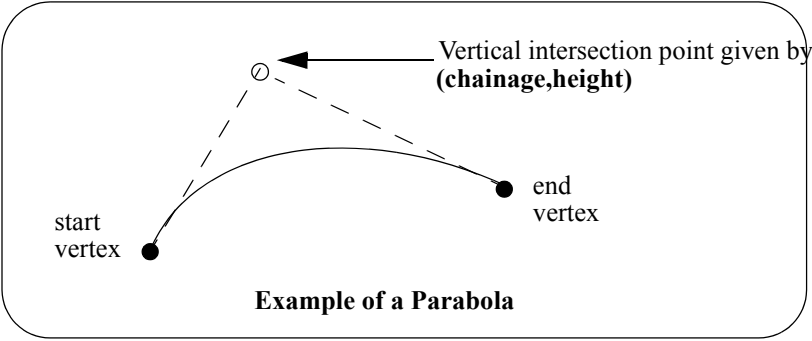

```

(c) Parabola

There can be a parabola between adjacent vertices. The parabola is defined by giving the coordinates of the vertical intersection point for the parabola

chainage chainage of the VIP of the parabola
height height of the VIP of the parabola

The parameters for the *parabola* block are:

```
parabola {  
  chainage    value           // chainage of the VIP of the parabola  
  height      value           // height of the VIP of the parabola  
}
```

Please continue to the next section [Text String](#).

Text String

```
string text {  
  x value y value z value  
  model model_name name string_name colour colour_name  
  text text_value  
  angle value offset value raise value  
  textstyle textstyle_name slant degrees xfactor value  
  worldsize value or papersize value or screensize value  
  justify "top|middle|bottom-left|centre|right"  
}
```

12d Ascii Definition for Tins

Tins (*tri*angulated *ir*regular *ne*tworks) and *Super Tins* can be written out and read in from a 12d Ascii file.

For the 12da definitions of *tins* go to the section [Tins](#)
super tins [Super Tins](#)

Tins

```
tin {
    name    tin_name          // MANDATORY name of the tin when created in 12d Model

    time_created text          // optional - time tin first created
    time_updated text          // optional - time tin last modified

// Attributes Block:

// This is mainly information used by 12d Model to create the tin.
// The attributes this block and the Attributes block itself are optional.
// When a tin is read into 12d Model from a 12da file, the style is used
// as the Tin style.

    attributes {
        text "style"          text          // name of line style for the tin
        integer "faces"       0 / 1         // 0 non triangle data, 1 triangle
data
        real "null_length"    value         // values for null by angle/length
        real "null_angle"     value         // angle in radians
        real "null_combined_length" value
        real "null_combined_angle" value    // angle in radians
//          any other attributes
    }                                     // end of attributes block

// Points Block
//
// Co-ordinates of the points at the vertices of the triangles
// The points are implicitly numbered by the order in the list (starting at point 1).
//
// The Points Block is MANDATORY

    points {
        x-value  y-value  -value          // x y z for each point in the tin
        "        "        "              // point 1
        "        "        "              // point 2
    }                                     // end of points block

// Triangles Block
//
// Each triangle is given as a triplet of the point numbers that make up
// the triangle vertices (the point numbers are the implicit position of the points
// given in the Points Block.
```

// The order of the triangles is unimportant

//

// The Triangles Block is MANDATORY

```

triangles {
    T1-1  T1-2  T1-3      // points making up each triangle
    T2-1  T2-2  T-33      // point numbers of the 3 vertices of first triangle.
    "      "      // point numbers of the 3 vertices of second triangle.
    "      "
}
// end of triangles block

```

// Base Colour

// The tin has a base colour that is the default colour for all triangles

```

colour tin_base_colour      // optional - base colour of the tin

```

// Colours Block

//

// Triangles can be given colours other than the base colour by including

// a *colours* block. The colour for each triangle is then individually given

// (-1 means base colour). The order is the same as the order of the triangles in

// the Triangles Block.

//

// If all the triangles are the base colour, then simply omit the Colours Block

```

colours {
    C1    C2    C3      // colour for each triangle given in triangle order
    C4    C5    C6    C7      // colour "-1" means use the base tin colour.
    "      "      "
    "      "      "
}
// end of colours block

```

Please continue to the next section [Guide to Survey Reduction in 12d Model](#).

Guide to Survey Reduction in 12d Model

The **12d Model** survey options are used to reduce electronically recorded survey information and produce **12d Model** strings, a process called **survey reduction**.

In the most general case, there are three steps involved:

1. **12d Model** downloads raw data from a data collector and stores it on the computer.
2. The raw data file is converted to a standard **12d Model** raw field file format, normally with extension of ".fld". For simplicity, the standard **12d Model** raw field file is called the "12d field file".
3. The 12d field file is read into a **12d Model** Survey Reduction function (12d Survey function) and reduced. If errors occur, the field data for 12d Survey function can be interactively and/or graphically edited. The reduction produces **12d Model** super strings in one or many **12d Model** models.

In some circumstances, not all steps are necessary.

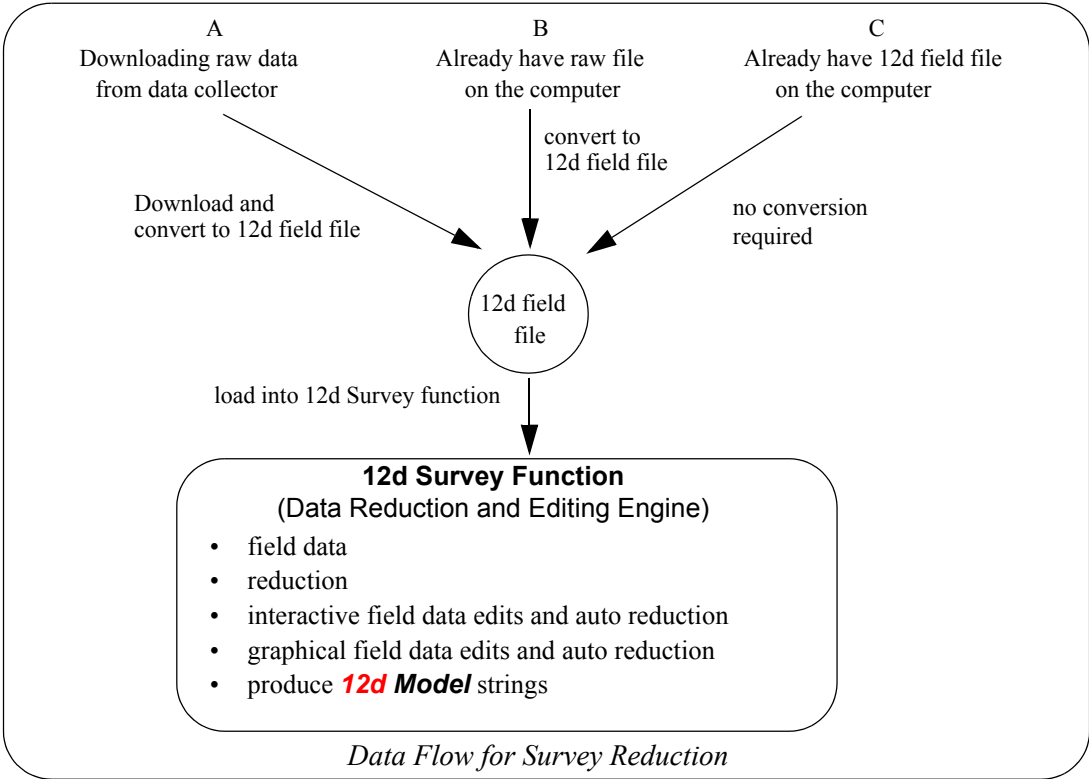

For example, Step 1 is not necessary when the raw data file is already on the computer (and hence doesn't need downloading).

This often occurs when data collectors have PCMCIA cards and PCMCIA card readers on the computer. Another example is when the raw data file has already been downloaded to the computer using another package such as HyperTerminal. Or maybe the raw data file has already been downloaded in a previous **12d Model** session.

Steps 1 and 2 are not necessary when the data is already in the form of a 12d field file.

This occurs when other software packages, such as TP Setout, can produce a 12d field file. Or the 12d field file was created in a previous **12d Model** session, maybe even on a different computer.

A data flow diagram for the survey reduction process is:

Please continue to the next section [Guide to Survey Coding in 12d Model](#).

Guide to Survey Coding in 12d Model

At first the whole process may seem confusing because there are a multitude of methods of setting up coding in the field. Why isn't there just one way of doing things?

Firstly, each brand of survey instrument has a totally different format for recording information. Unfortunately there is no industry standard. In fact, different instruments from the same survey instrument manufacturer can have different formats for recording data.

Secondly, many of our customers were already familiar with another survey package and if possible, wished to continue field coding in the same way. Where possible, **12d Model** has tried to accommodate this wish. Since **12d Model** has replaced a number of survey packages, this led to yet more possible configurations.

12d Model has also been developing its own preferred method of field coding for each instrument. It is not compulsory to use the 12d method but of course it is the only way of taking advantage of features that are not available in other coding systems. For example, defining and using field templates and recording user-defined attributes on points and segments.

So to make help guide you through survey coding section:

- (a) There are field coding concepts used in **12d Model** that are common to all instruments. For example, feature codes and string numbers, offset, close strings etc.
These are described in [Field Coding](#)
- (b) There are template field coding concepts used in **12d Model** that are common to all instruments. These are described in [Field Templates](#)
- (c) There are shape field coding concepts used in **12d Model** that are common to all instruments. These are described in [Shape field coding](#)
- (d) There are traverse field coding concepts used in **12d Model** that are common to all instruments. These are described in [Traverse coding](#)
- (e) For leica instruments, the coding methods are different from most other types. These are described in [Field Coding for Leica Instruments](#)
- (f) For non-leica instruments, the concepts used in coding are similar for each type. These are described in [Field Coding for Non Leica Instruments](#)

Field Coding

EDM equipment is used to make readings of points in the field.

However, rather than just collecting points, it is usually desirable to add extra information by coding the readings in a way that can be interpreted during the data reduction process and produce more valuable information.

Unfortunately, there is no industry standard for this extra coding and it is software specific.

In **12d Model**, the extra information is included in one or both of

- s a *feature code* and *string number*
- s extra commands called *field codes*

How the *feature codes*, *string number* and *field codes* are added in the field depends on the data collector being used and the coding convention set up by the user in **12d Model**.

For example, some surveyors like to enter the *feature code* before the *string number*, others like to enter the *feature code* after the *string number*. Other surveyors don't use string numbers at all but prefer to use a *New String* command to start new strings (mainly ex SDR Map users).

In **12d Model**, a particular *field coding convention* is defined by the user and stored with a **unique** name as a *data collector definition* in the file survey.4d. New data collector definitions can be created and existing ones modified using the *Survey Data Collectors* section of *Project=>Browse*.

12d Model converts all the raw data files from the different survey instruments and data recorders with different coding conventions, into the one **12d Model** standard field file format before being loaded into a **12d Model** Survey Reduction function and reduced. The **12d Model** standard field file will simply be referred to as the **12d** field file or just the field file.

The use of many of the commands allowed in the **12d** field file will now be described. The complete definition of all the 12d field file commands will be described later.

The coding methodology for specific data recorders will be described in separate Sections.

Please continue to the next section [Stringing in the Field](#).

Stringing in the Field

In the coding convention, it is possible to specify that

- (a) *feature codes* and *string numbers* are used
- or
- (b) just feature codes.

Case (a) *feature codes* and *string numbers*

If *feature codes* and *string numbers* are entered with measurements in the field, a coding methodology is used so that strings are automatically created during the reduction process.

To allow this stringing, the **feature code** and **string number** are interpreted in the following manner:

During reduction, **12d Model** connects measurement points with the **same feature code and string number** in the order they are measured in. That is, the feature code **and** string number determines which points are joined together to form the vertices of a super string. At the end of the reduction, the *string number* is dropped and just the *feature code* remains as the *name* for the super string.

Hence the *feature code* and *string number* combination allows any number of different super strings with the same name (feature code) to be produced.

If the *string number* is zero, then the point-line type of the super string is set to *point*. If the *string number* is non-zero, the point-line type of the super string is set to *line*.

Finally, during reduction, the *feature code* can be used as the key to a mapping file to specify the name, model, colour, point-line type, linestyle, tinability and other details for the super string.

Note that the measurements of points with different feature codes and string numbers can be intertwined. That is, *not* all the points in one super string need to be measured before the points in a different super string.

Hence at the end of the reduction, **12d** Model super strings are created for each unique *feature code* and *string number* combination in the input data.

Note - if the *string number* is blank, the *string number* defaults to 0

Case (b) just *feature codes*

If just *feature codes* are used then a *New String* command is used to start a new super string rather than giving a new string number.

During reduction, **12d** Model connects measurement points with the **same** feature code in the order they are measured in until a *New String* command is found. That is, just the feature code determines which points are joined together to form a super string and the *New String* command defines when a new super string begins.

At the end of the reduction, the *feature code* remains as the *name* for the super string.

Also during reduction, the *feature code* can be used as the key to a mapping file to specify the name, model, colour, point-line type, linestyle, tinability and other details for the super string.

Note that the measurements of points with different feature codes can be intertwined. That is, *not* all the points in one super string need to be measured before the points in a different super string.

An Example of Coding to String Points Together

Two super strings are to be created, one joining points **a** and **c**, the other joining points **b** and **d**.

Points may be measured and assigned *feature codes* and *string numbers* as follows:

Measurement to point	Feature code	String Number
a	123	01
b	ABC	01
c	123	01
d	ABC	01

Alternatively, the points could have been measured in the order a, c, b, d as long as the correct *feature codes* and *string numbers* were entered.

Measurement to point	Feature code	String Number
a	123	01
c	123	01

Measurement to point	Feature code	String Number
b	ABC	01
d	ABC	01

Because the *string numbers* are non-zero, the default *point-line* type for both super strings is *line*. Please continue to the next section [Offsets](#).

Offsets

It is not always possible to measure a point directly but it may be possible to measure a point nearby and then measure an offset to adjust the measured point by and so produce the co-ordinates of the required point.

The three offsets that are allowed in the 12d field file are:

- Height** - The *height offset* adjusts the height of a non-null point. A positive offset adds to the height and a negative offset reduces the height.
- Radial** - The *radial offset* adjusts the position of the specified point by a *plan* distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station and a negative offset is toward the station.
- Tangential** - The *tangential offset* adjusts the position of the specified point by a *plan* distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A positive offset is to the right (looking from the station to the point) and a negative offset is to the left.

Please continue to the next section [Start New String](#).

Start New String

A new string is automatically started whenever a different string number is used. However there is also a **start new string** command which begins a new super string even if the string number is the same as the string number for previous points.

The *New String* command is particularly useful for correcting the field error of forgetting to change the string number.

Please continue to the next section [Close String](#).

Close String

The close string command closes a super string by joining the first and last points of the super string. If a super string is already closed, then the close has no effect. The string closed command can be given at the recording of any point of the string, and the entire string is closed.

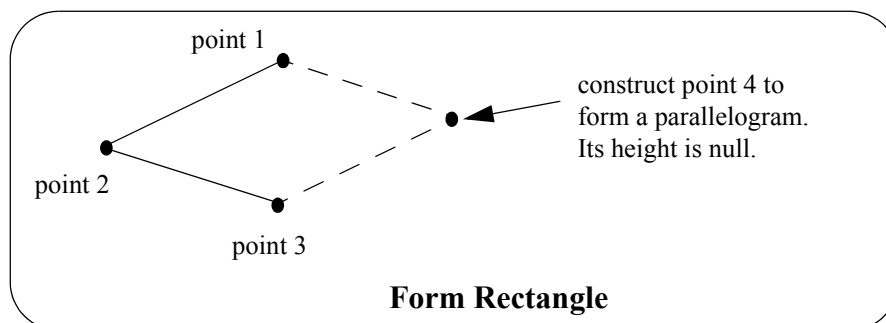

Please continue to the next section [Rectangle](#).

Rectangle

The rectangle command acts on last three points of a string and adds a new point after the last point to form a parallelogram (squashed rectangle). The string is then closed.

The height of the added point is set to null.

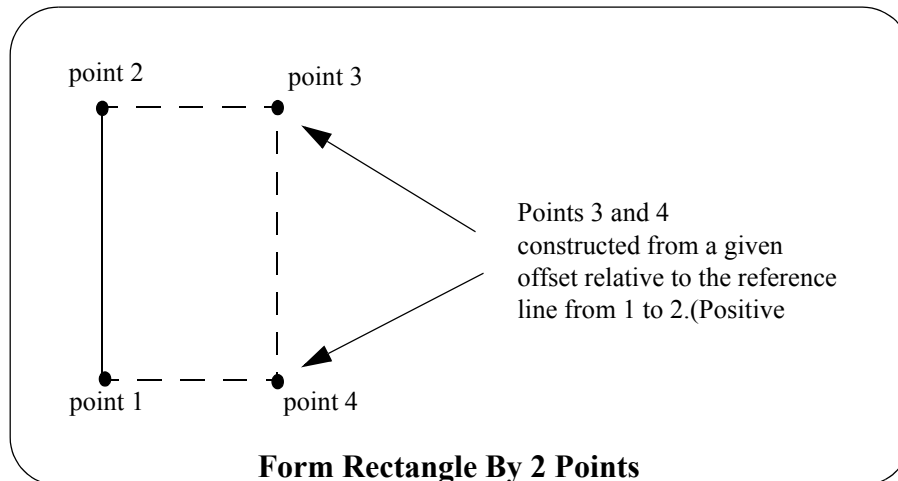

Please continue to the next section [Rectangle by 2 Points](#).

Rectangle by 2 Points

The rectangle by 2 pts command acts on last two points of a string and adds two new points at a given offset after the last point to form a rectangle. The string is then closed.

The height of the added points are set to null.

Please continue to the next section [Feature](#).

Feature

A *feature string* is a circle with a z-value at the centre but only null values on the circumference of the circle.

The feature commands creates a *feature string* with the picked up point as its centre and the radius/diameter being set by the feature command.

If a feature string is given a **world** line style, then the style is centred on the centre point of the feature string and scaled up to the radius of the feature string.

If a feature string is given a **screen** or **paper** line style, then the style is wrapped around the circumference of the feature string.

Please continue to the next section [Joining Strings](#).

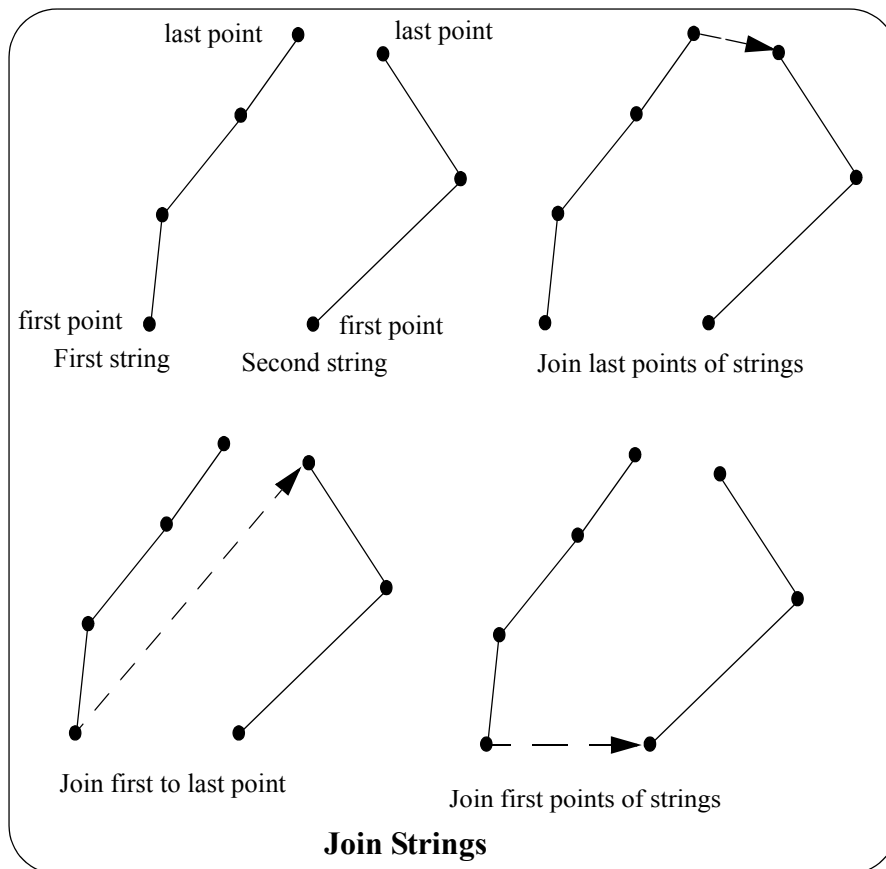

Joining Strings

There are three commands for joining two strings together.

Join last points of strings - the last point of the first string is joined to the last point of the second string. The direction of the final string is along the forward direction of the first string, across to the end of the second string and then in the reversed direction of the second string.

Join first to last points of strings - the first point of the first string is joined to the last point of the second string. The direction of the final string is in the reverse direction of the first string, across to the start of the second string and then in the forward direction of the second string.

Join first points of strings - the first point of the first string is joined to the first point of the second string. The direction of the final string is in the reverse direction of the first string, across to the start of the second string and then in the forward direction of the second string.

Please continue to the next section [Arcs Through Points](#).

Arcs Through Points

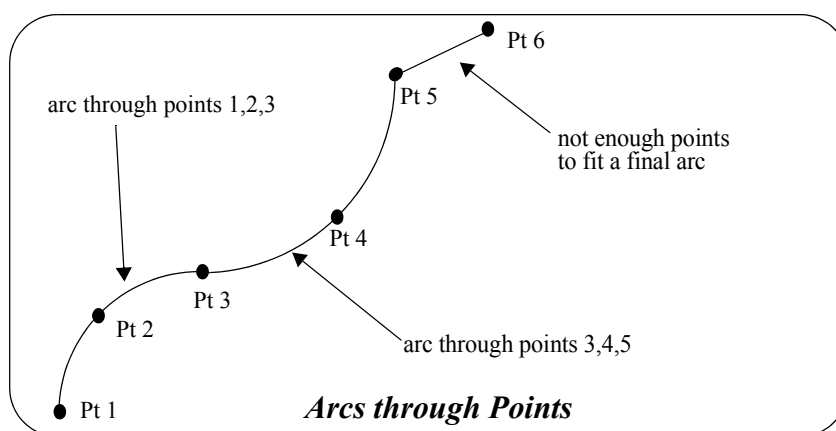

There are a number of commands to fit arcs through sequences of three or more points. Note that this is an **arc** in **plan**, with different z-values at each of the three points. The z-values are linearly interpolated around the arc between the points.

Hence it is a **helix** and **not** a circle in the plane containing the three points. Note that an 3d-arc in a plane not parallel to the x-y plane does **not** project onto an arc in the x-y plane.

There are arc commands to

- (a) fit an arc through the next three points
- (b) fit an arc through the previous three points.
- (c) fit arcs to sets of three points until stopped.

The first two cases need no explanation but in the final case, a arc is fitted to the first three points, and then another arc to points 3, 4 and 5 and then an arc through 5,6 and 7 and so on. If at any stage there is only one point left, then no arc can be fitted and a straight line is drawn to the final point.

Please continue to the next section [Field Templates](#).

Field Templates

If a series of points are being picked up along the one string then the *feature code* and *string number* only need to be entered once since the default is for a measurement to use the last *feature code* and *string number* if no new ones are given.

However it is often much more efficient to pick up one point from a number of strings before moving onto the next point of each string (this is called a cross section pick up).

For example when picking up a road, it would be preferable to pick up the points for a section across the road and then move onto the next section rather than picking up all of one string at a time.

In the diagram below, this means picking up one point from each of the strings LV, LS, LK, CL, RK, RS, RV and then moving onto the next cross section rather than picking up all of LV and then all of LS and so on.

Normally if each measurement is from a different string, then the feature code and string number would need to be re-entered with each measurement which is a very time consuming process. To simplify the coding for section pick up, **12d Model** uses **field templates**.

Basically, a **12d Model** *field template* consists of defining a sequence of *feature codes* and *string numbers* pairs for the field template. The field template can be given a unique name or have no name at all.

When a field template is used, measurements are taken without entering a *feature code* and *string number* and the *feature code* and *string number* for the measurement come from the *field template definition*.

For example, a field template could be defined as the sequence:

LV 01, LS 01, LK 01, CL 01, RK 01, RS 01, RV 01

When the field template is used, measurements are taken without giving a feature code or string number and the measurements will be sequentially given the codes LV 01, LS 01, LK 01 etc.

To define a **12d Model** field template, there is a command to *start recording* the field template.

The *feature codes* and *string numbers* for the next series of measurements until the *stop recording* command is given, are stored as the field template. There are also commands to *insert* and *delete* a point in the template when it is being used for picking up points.

When a field template is used, the feature code and string number from the field template can be used:

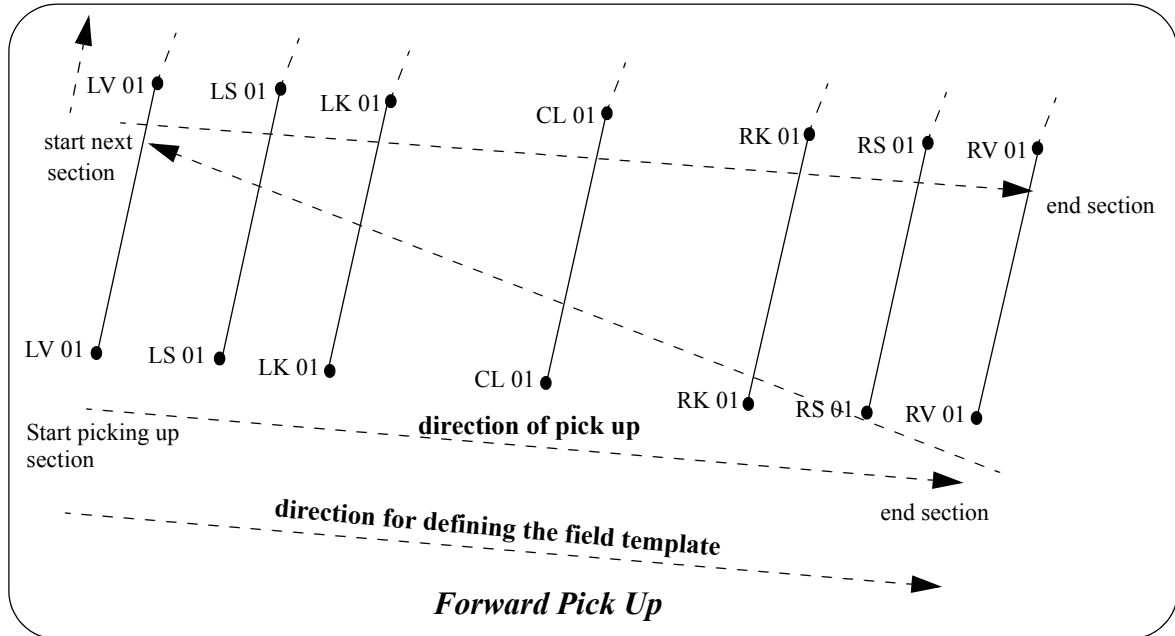

- (a) in the same order as the codes are defined in the field template (forward direction).
- (b) in the opposite order to how the codes are defined in the field template (reverse direction).
- (c) in an alternating same and opposite order that the codes are defined in field template (zig-zag)

These three modes of usage of a field template will be described in the following sections.

Please continue to the next section [Forward Direction](#).

Forward Direction

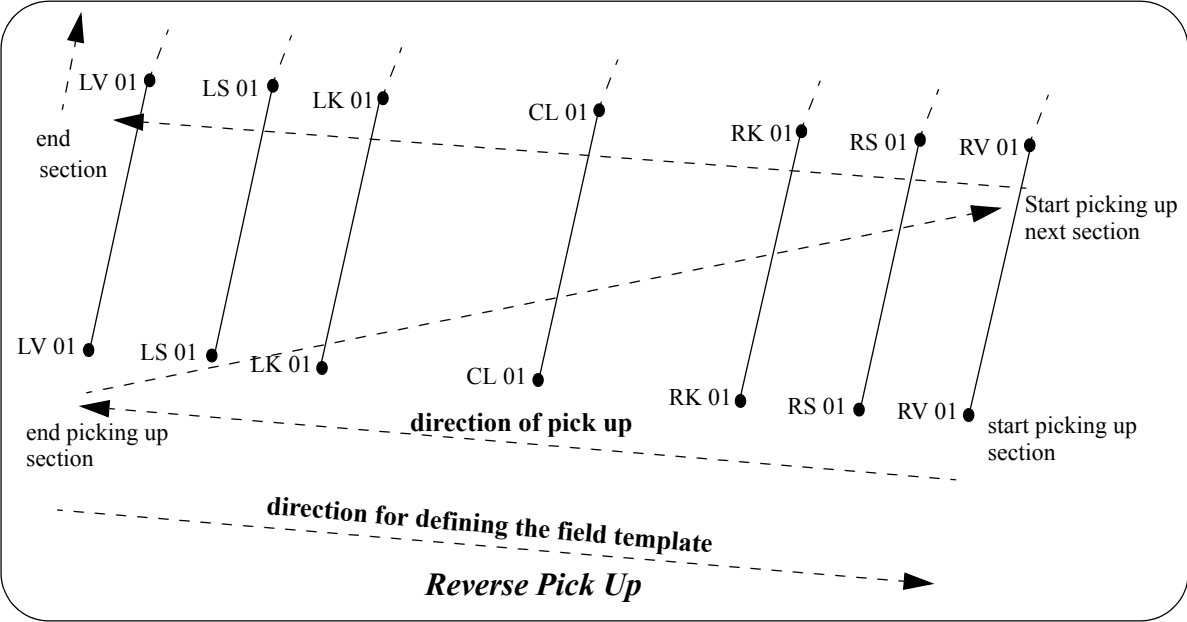

If the field template is used in the *forward* direction, then the feature codes and string numbers are used in the same order that they were defined to be in the field template. Once the end of the field template is reached, the feature codes and string numbers re-start at the beginning of the field template.

Please continue to the next section [Reverse Direction](#).

Reverse Direction

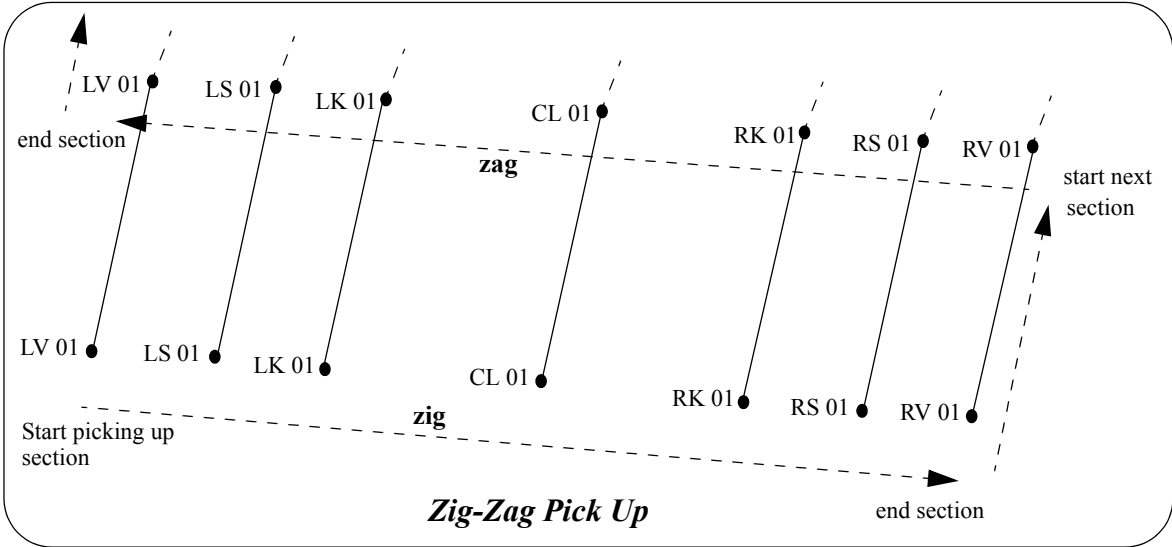

If the field template is used in the *reverse* direction, then the feature codes and string numbers are used in the reverse order to what they were defined to be in the field template. That is the feature codes and string numbers start at the *end* of the field template definition and are used in the reverse order. Once the beginning of the field template is reached, the feature codes and string numbers re-start at the end of the field template and are used in the reverse order.

Please continue to the next section [Zig-Zag](#).

Zig-Zag

When picking up a road in sections, it is often quickest to pick up the first section going from one side of the road to the other side, and then move onto to the next section point on the other side of the road and pick up points coming back across the road. Hence the points for the second section are in the reverse order to those in the first section. This process is known as zig-zagging.

This situation can be covered in two ways. A field template could be defined containing all the points for two sections and the field template used in the forward (or reverse) direction. For example, the field template to be used in the forward mode could be defined as:

LV 01, LS 01 LK 01, CL 01, RK 01, RS 01, RV 01, RV 01, RS 01, RK 01, CL 01, LK 01, LS 01, LV 01

However, in **12d Model** it is only necessary to define the *one* section
LV 01, LS 01 LK 01, CL 01, RK 01, RS 01, RV 01

and when the field template is used, it is specified that it is being used as a *zig-zag* field template starting on either the *zig* (the forward direction of the field template) or the *zag* (the reverse direction of the field template).

Once a *zig* is completed, **12d Model** automatically uses the reverse order of the field template and hence produces a *zag*. Similar, once a *zag* is completed, **12d Model** uses the forward order of the field template and produces a *zig*.

Thus a *zag* automatically follows a *zig* and a *zig* follows a *zag*.

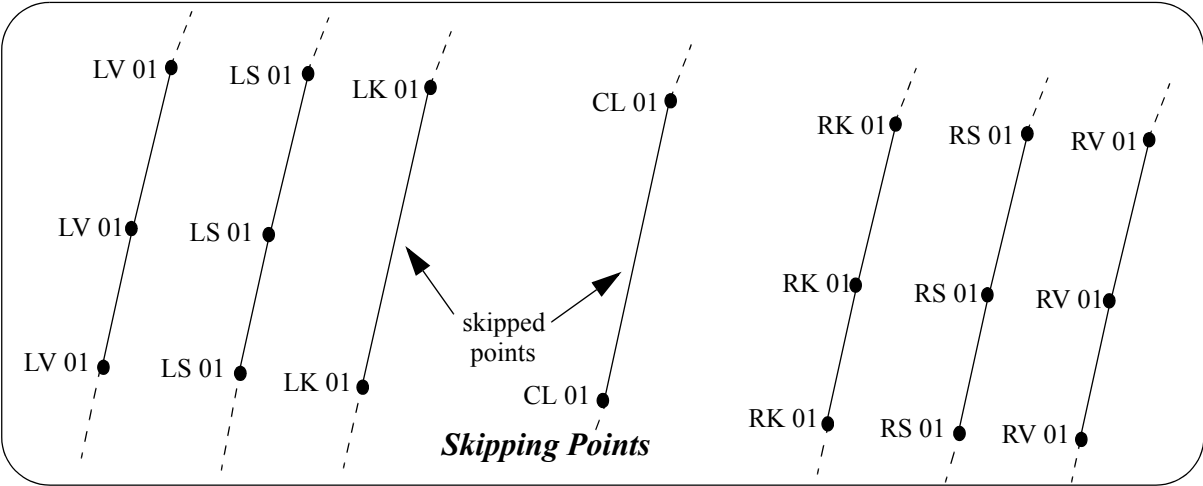

Hence if a field template is used in the zig-zag mode, it can be used as either:

- (a) a zig-zag field template starting on the *zig*
- (b) a zig-zag field template starting on the *zag*.

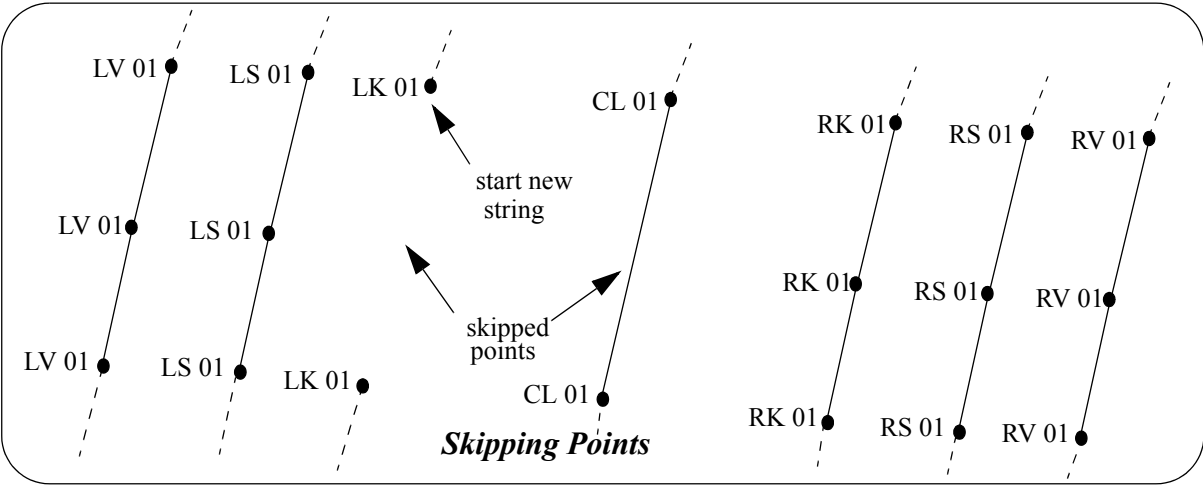

Please continue to the next section [Skipping Field Template Points](#).

Skipping Field Template Points

When picking up points using a field template, **12d Model** allows for one or more points to be skipped. By default, the points on the strings on either side of the skipped points will then be joined together.

By combining skipping points and start new string commands, points can be skipped and new strings started on the other side of the skipped points.

Please continue to the next section [Insert Template Points or Insert Multiple Codes](#).

Insert Template Points or Insert Multiple Codes

When picking up points using a field template, **12d Model** allows for one or more points to be inserted. The inserted points **change** the template from that point onwards so that extra strings can be picked up as they arise.

If the insert point command is given after the last point of a template, a flag can be applied to specify which template pick-up the inserted point is to be added to. That is, add it to the last series of points or the next series. This flag is called the "insert special" flag.

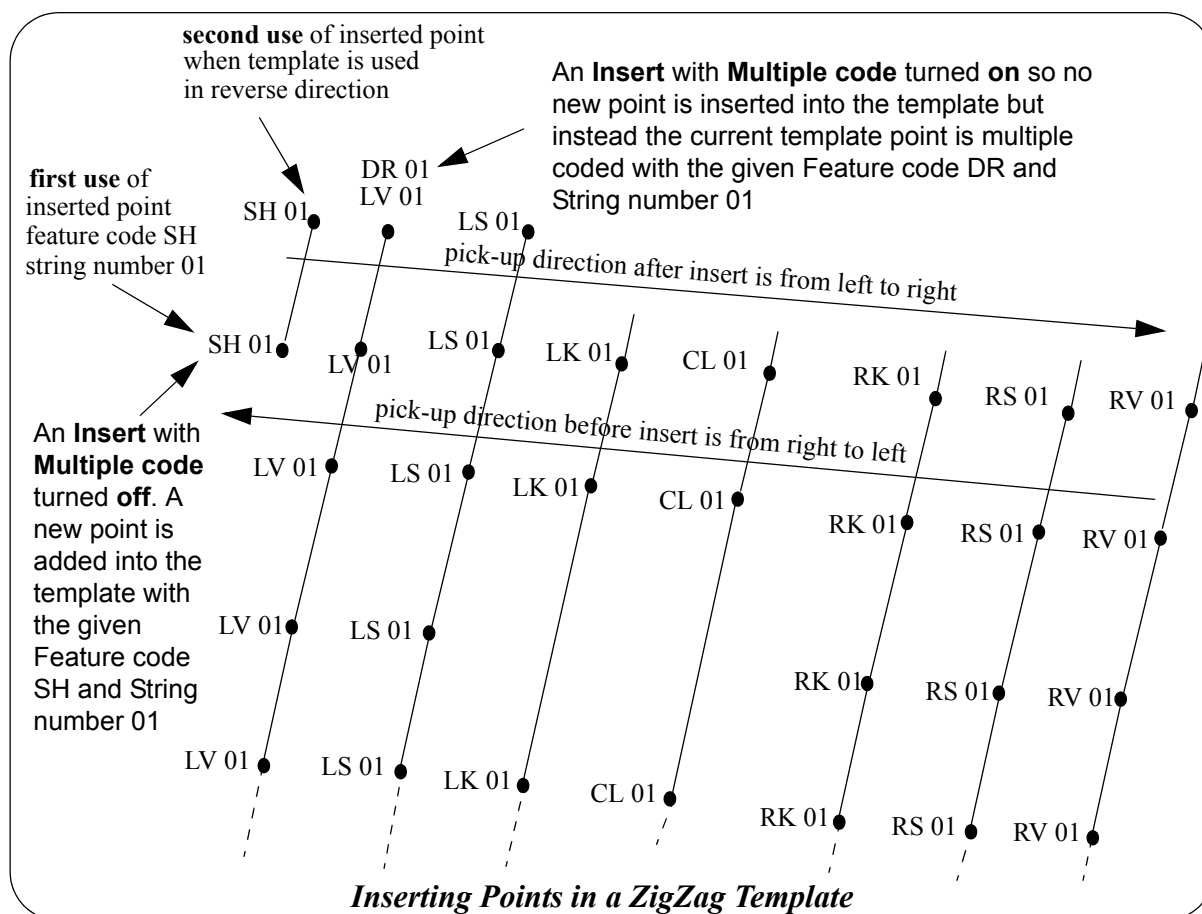

If ticked on in the insert panel, or if the flag given in the offset code is 1, the point will be added to the current series of points in the template being picked up.

In the case shown below where SH 01 is inserted, the insert special flag should be set to on so that the next picked up point will be on the current template. The insert would have been made after the last LV 01 observation in the last pick-up direction. The following pick-up will use the redefined template definition.

Note - in the example below, it is a zig-zag template so SH 01 is then used again straight away as the first point of the pickup when coming from left to right.

With the Insert, rather than insert new template points, it is also possible to give multiple codes to existing points in the template so that more than one code can be assigned to the one pick-up point (insert multiple codes).

In the case shown below, an insert was made on the next pick-up direction after the LV 01 observation. The multiple code tick box or flag was set on so that the last picked up point will be assigned the extra code specified, in this case DR 01. The template will be applied to all subsequent measurements so that the observed LV 01 string will also be coded DR 01.

Please continue to the next section [Delete Template Points](#).

Delete Template Points

When picking up points using a field template, **12d Model** allows for one or more points to be deleted. The deleted points change the template from the next specified number of points inclusive of the current point. i.e. They are removed from the template.

If a template delete command was given after the LS 01 string in the next pick-up direction, and the number of specified points were 3, the template will be altered such that the next observed string will be RS 01.

Shape field coding

If a an object of a standard section is to be picked up such as a length of kerb, a shape can be defined and extruded/paralleled along a single pick-up string related to that shape.

For example, a kerb shape can be defined by observing all points on a typical section of the kerb and assigned a shape name. Then when picking up the length of kerb, only one reference string to the shape (defined when recording the shape) has to be picked up e.g. lip of kerb. On reduction, 12d can extrude or parallel the shape such that the strings/shape of the kerb are produced for the entire kerb pick-up.

Normally if each measurement is from a different string e.g back of kerb, lip kerb etc., then the feature code and string number would need to be re-entered with each measurement which is a very time consuming process. To simplify the coding for section pick up, **12d Model** uses *shape field coding*.

Basically, a **12d Model shape** consists of observing a number of points on a given section of an object. The shape can be given a unique name or have no name at all.

For example, a shape can be defined by observations shown in order above

1- being the reference point, 2- 7 being the shape points. In this case, the 1st point of the shape pick-up coincides with the reference point.

To define a **12d Model shape**, there is a command to *start and end the recording* of the shape. The *feature codes* and *string numbers* for the next series of measurements until the *stop recording* command is given, are stored in the final shape.

As the shape is defined, other field codes can be used in conjunction such as offset. In this example an observation may be made at 5 for the position of 6 using a vertical offset. Similarly for point 7 using the observation at a point near point 2. In addition, points 6 and 7 can be made non-tinable so that formation of a tin is constrained to the surface of the kerb.

The next step is to pick up the entire length of the kerb at the reference string position using the same *feature code* and *string number* used for the reference string in the shape pick-up. In this example the lip of kerb.

Once completed, the shape can be extruded or paralleled using the extrude or parallel

commands. The parallel command will create a number of strings according to the number of points on the shape. The extrude will create a super string with a shape defined like a pipe string.

Traverse coding

If a traverse is undertaken as part of a survey, a traverse code and string number can be coded so that 12d can extract the traverse information. The specific traverse code can be supplied in the survey reduction panel under the traverse tab. An example is shown below:

Traverse	Geodetics	Others
Do traverse calcs		<input checked="" type="checkbox"/>
Traverse code	TL	+
Adjust method		▼
Network model	traverse string	

In this case, the feature code of TL will be searched in the field file on reduction, so that a traverse string can be extracted. The user is required to nominate the foresight measurement with the TL code in this example. If they also include the TL code in a backsight to a previously defined traverse leg, a reciprocal calculation will be made. It uses the pair of observations (Foresight and Backsight observations of the same line e.g. Foresight 1001 to 1002 and backsight from 1002 to 1001). This reciprocal calculation takes the mean of the distance and vertical angles eliminating the effects of refraction.

A number of separate but interrelated traverses can be extracted using differing string numbers in the field.

The traverse code also allows for adjustments to be made between known stations. This adjustment maybe be chosen in the reduction panel. This field is optional.

Field Coding for Leica Instruments

For Leica instruments, the Leica GSI format breaks lines of data into fixed length 'words' and cannot use the same encoding method as the other instruments. The **12d Model** coding system for the Leica TPS instruments is covered in the section [12d and Leica TPS Instruments](#).

Field Coding for Non Leica Instruments

EDM equipment is used to make readings of points in the field.

Rather than just collecting points, it is usually desirable to add extra information by coding the readings in a way that can be interpreted during the data reduction process and produce more valuable information. Unfortunately, this extra coding is non-standard and software specific.

In **12d Model**, all the raw data files from different data collectors are converted into the one standard field file format (the **12d Model** field file) before being loaded into a **12d Model** Survey Reduction function and reduced. Hence the method for coding information in the data collector in the field needs to be well defined so that it can be sensibly converted into a **12d Model** field file (the section [The 12d Field File Format](#) contains the complete description of the 12d field file).

When a measurement is taken, most data collectors (Sokkia, Geodimeter, Topcon, Nikon etc.) allow the user to enter text which is then output with the measurement data. Depending on the data collector, the total number of characters of text may be strictly limited and may also be restricted to only one line of text. In **12d Model**, a coding system has evolved so the text can be interpreted in a meaningful way.

Blocks and the Block (Command) Delimiter

To allow the one line of text to hold a variety of different information, the line of text is broken up into smaller blocks and each block is processed separately.

The character (or characters) used as the block separator is called the *command delimiter* or *block delimiter*.

Obviously the command delimiter can not appear in any of the commands inside a block.

What is used for the *command delimiter* is user defined in the data collector definition and is found on the *Delimiters* tab of the *Survey.4d Create/Edit* panel in the section [Data Collector Definitions](#).

The default command delimiter is * and this will be used in the examples in this appendix.

Hence using the command delimiter, the text line is broken into separate blocks for processing.

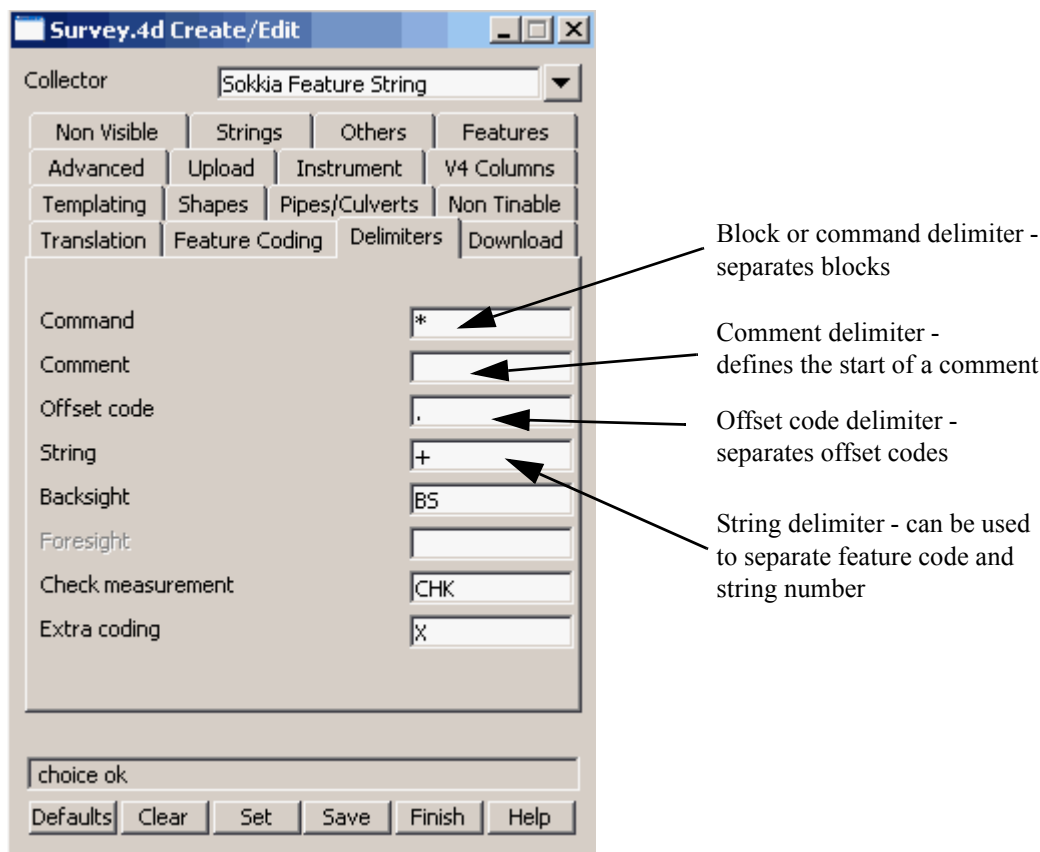

For example, the text string

EB01*XA.road

breaks into the separate blocks.

EB01

XA.road

A block can be either a **control code block** or a **feature code block**.

A **control code block** is any block that start with a valid *control code*.

Valid control codes are simply the one or more characters of text designated in the *Delimiters*, *Features*, *Templating*, *Pipes/Culverts*, *Not Tinable* and *Strings* tabs in the **Survey.4d Create/Edit** panel for the selected data collector definition.

If no control code appears at the start of the block, then the block is taken to be a **feature code block**.

For example, for the *Sokkia Feature String* data collector definition which is installed with **12d Model**, the *valid control codes* are *, dot (.), space, **+**, **BS**, **CHK**, **X**, **C**, **R**, **S**, **E**, **ST**, **XA**, **XB**, **XC**, **XD**, **XE**, **XF**, **NH**, **XP**, **XL**, **XN**, **I**, **O** and **A**

Any block starting with any of above control codes is a **control code block**. Blocks that aren't control code blocks are **feature code blocks**.

Tabs on the *Sokkia Feature String* data collector definition which define Control Codes

Blocks can include *comments* and how a comment is specified is given in the next section [Comments in a Block](#).

The feature code block is discussed in the section [Feature Code Blocks](#).

The explanation of each control code is given in the section [Control Code Blocks](#).

Please continue to the next section [Comments in a Block](#).

Comments in a Block

Comments are supported in a block. There is a *Comment* delimiter and all characters after the *comment* delimiter to the **end** of the **block** are treated as a comment.

Comments are attached to the measurement point as **text**.

Hence the *measurement* will create a vertex on a super string and the *comment* will create text at that vertex of the super string.

The default for the *Comment* delimiter is **/** and it is defined by the *Comment* field on the *Delimiters* tab of the *Survey.4d Create/Edit* panel.

For example, if * is the command (block) delimiter and / is the comment delimiter, then in

EB01/first point of a template*XA.road

there are two blocks *EB01/first point of a template* and *XA.road*

and the text "first point of a template" in the first block is a comment and will be added to the super string as vertex text.

Another common character to use as a *comment delimiter* is a space (' '). For example, if * is the command delimiter and space is the comment delimiter, then in

EB01 first point of a template*XA.road

"first point of a template" is a comment.

The *comment* delimiter for the *Sokkia Feature String* data collector is a space

Please continue to the next section [Feature Code Blocks](#).

Feature Code Blocks

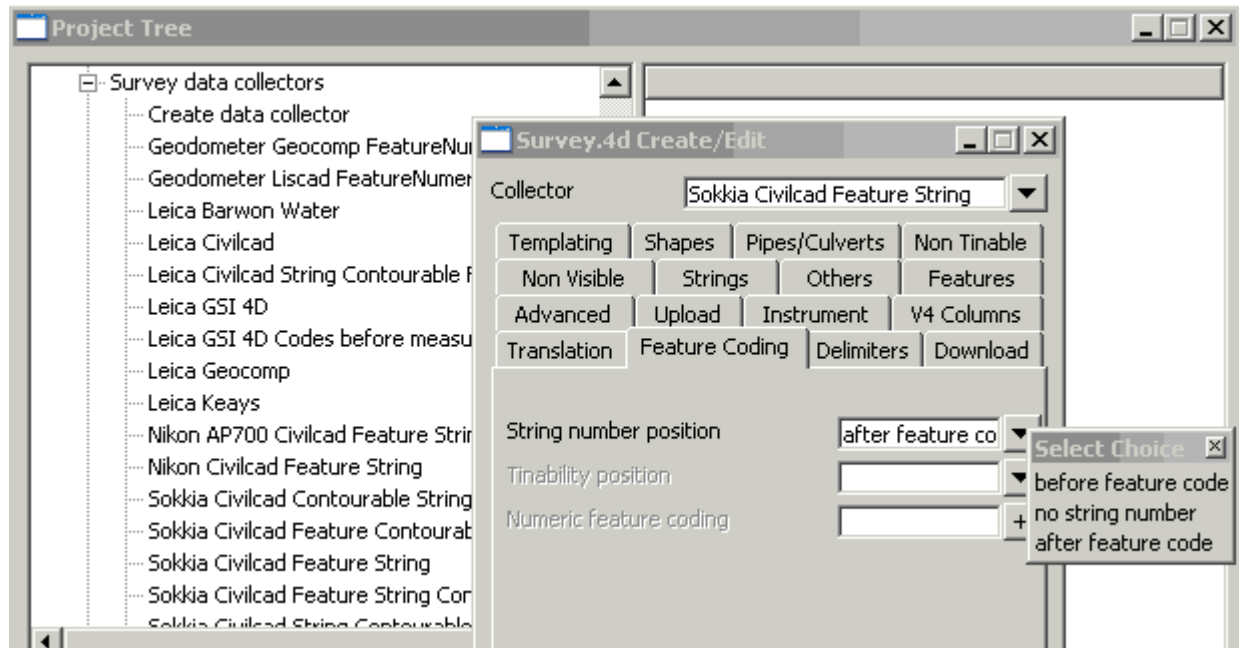

Feature Code, String Number and String Delimiter

In a feature code block, the *feature codes* and *string numbers* are given so that strings are automatically created during the reduction process.

The *feature code* and *string number* appear at the start of the feature code block and can be entered in a variety of ways.

Some surveyors like to enter the *string number* before the *feature code* and other surveyors prefer to enter the *string number after the feature code*. Some surveyors prefer to use *no string numbers* at all (SDRmap users) and use a *new string* control code to start a new string.

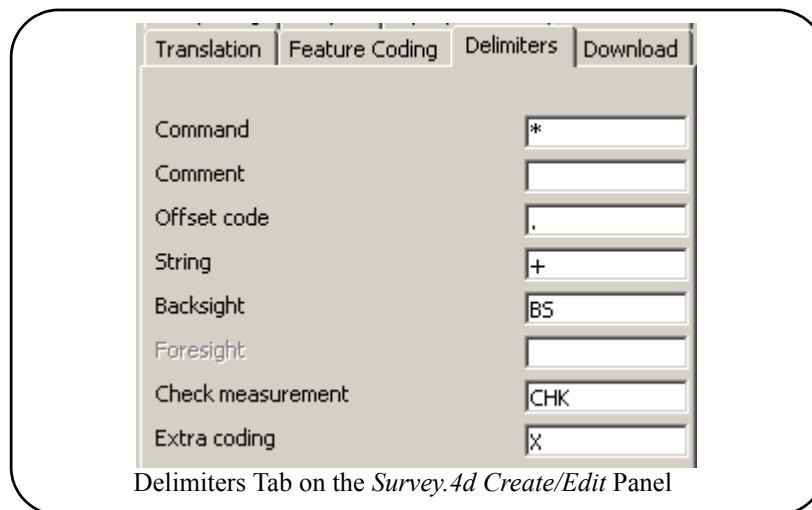

All three methods are supported in 12d. The setting is made on the *String number position* field on the *Feature Coding* tab of the *Survey.4d Create/Edit* panel. The default is 'before feature code'.

If string numbers are going to be used (either *before feature code* or *after feature code*) then there are rules for determining what is the feature code and what is the string number. Note that the *string number* is always *numeric* and can be any length.

Firstly, the *feature code* and *string numbers* can be separated by an **optional String** delimiter given by the *String* field on the *Delimiters* tab of the *Survey.4d Create/Edit* panel. The default character for the *string delimiter* is **+**.

For example, 20+110KVA is interpreted as string number '20' and feature code '110KVA' if the string number comes before the feature code.

Delimiters Tab on the *Survey.4d Create/Edit* Panel

If a String delimiter is not used, then there are **some restrictions** on the feature code so that the feature code and string number can be split apart. Note that the *string number* is always *numeric* and can be any length.

If a string delimiter is not used, then either

- (a) the *feature code* must be *purely alpha* and then the feature code can be of any length.
- or

- (b) the *feature code* is purely numeric. Then the feature code must be the **fixed length** given by the *Numeric feature coding* field on the *Feature Coding* tab of the *Survey.4d Create/Edit* panel. If the *Numeric feature coding* field is not set and the feature code is numeric, then the whole thing is interpreted as a feature code with a string number of 0.

If a *feature code* is a **mixture of alpha and numeric**, then a **string delimiter must be used** to separate the feature code from the string number. Once a string delimiter is used, feature code can be any length.

Tinability as Part of the String Number

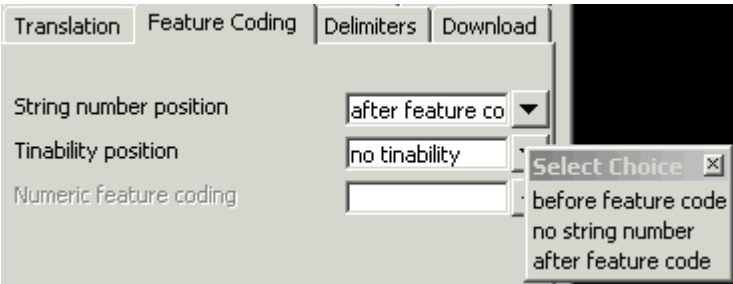

For compatibility with other software coding schemes, the tinability of a point can be included as part of the string number. This is **not normally recommended** since 12d has more flexible methods of defining tinability.

The field *Tinability position* on the *Feature Coding* tab of the *Survey.4d Create/Edit* panel controls whether it is used or not. The default is 'no tinability' as part of the string number.

If tinability is used as part of the string number, then it consists of either a **0** or a **1**.

If *Tinability position* is set to *before string*, the first character of the *string number* is stripped off and taken as the tinability flag. A value of 1 means the point is tinable and 0 is non-tinable.

If *Tinability position* is set to *after string*, the last character of the *string number* is stripped off and taken as the tinability flag. A value of 1 means the point is tinable and 0 is non-tinable.

Offset Codes

It is not always possible to measure a point directly but it may be possible to measure a point nearby and then measure an offset to adjust the measured point by and so produce the co-ordinates of the required point. The three offsets that are allowed in **12d Model** are height, radial and tangential. See the Section [Offsets](#) for more information.

The three offsets height, radial and tangential have the codes H, R and T respectively.

The *offset codes* come after the feature code-string number combination and are separated by the **Offset code** delimiter whose default value is a decimal point (.) and is defined by the *Offset code* field on the *Delimiters* tab of the *Survey.4d Create/Edit* panel.

After the *offset code delimiter*, the offset code is given as either H, R or T and then a real value for the offset (with no spaces in between). The offset can be positive or negative with the sign only being recorded if negative. A second and third offset code (H, R or T) can follow the first but no offset code delimiter is used for the second or third offset codes. The offset code delimiter is only used to separate the field code-point number from the offset codes.

In the example 20+110KVA.H2.1T0.5 there is a horizontal offset of 2.1 and a tangential offset of 0.5.

Multiply Coded Points

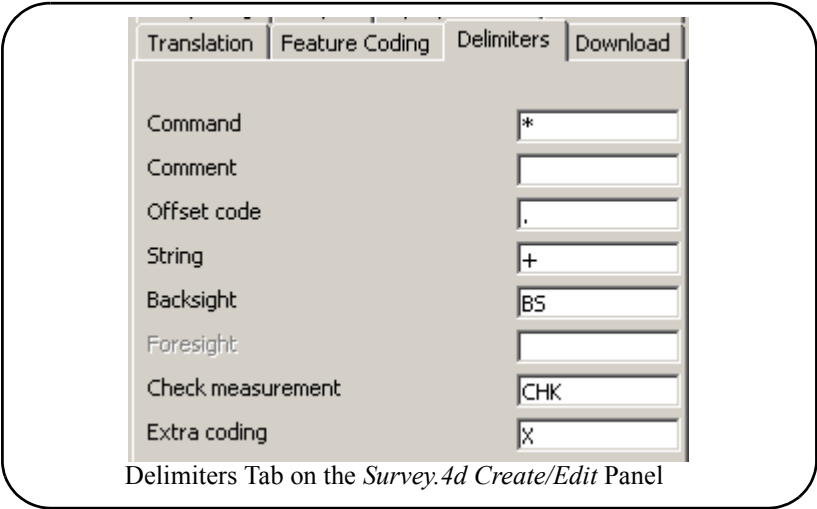

It is possible to have more than one *Feature code block* and this will create a multiply coded point.

For example, if the command delimiter is *, then EB01*PP would have the two feature code blocks 'EB01' and 'PP'.

Please continue to the next section [Control Code Blocks](#).

Control Code Blocks

Control Codes on the Delimiters tab

Extra Coding

This code is only for the instruments supporting the Sokkia SDR format.

The default for the *extra coding* control code is **X** and it is defined by the *Extra coding* field on the *Delimiters* tab of the *Survey.4d* Create/Edit panel.

For some instruments, extra lines of information can be entered after a measurement. For example on a Sokkia by using the note (13NM) to add more information to the previous measurement line (07).

The *extra coding* control code is used to append this additional information to the information on the measurement line. Hence it is then possible to have extra blocks of information on the line (or lines) following the measurement line.

The block containing the *extra coding* control code must be the last block on the measurement line.

For example,

```
EB01/first point of a template*XA.road*X
/ this is some extra info that happens to be a comment
```

is the same as

```
EB01/first point of a template*XA.road*/ this is some extra info that happens to be a comment
```

Note that there must be a feature code block on the measurement line otherwise a point will be created with no name.

Backsight

The default for the *backsight* control code is **BS** and it is defined by the *Backsight* field on the *Delimiters* tab of the *Survey.4d* Create/Edit panel.

The rest of the block after the *backsight control code* is the name of the station that the backsight was to, or the point number that the backsight was to.

For example, if *BS* is the backsight control code

```
BSPSM3
```

would designate a backsight to the station PSM3.

If only the backsight control code exists, the point number from the reading is taken as the point number for the backsight. This may be data collector dependent.

Warning for feature codes starting with the *backsight* control code.

If the feature codes comes before the string number, then feature codes for ordinary measurements **can not** start with the backsight control code because they would be interpreted as backsight measurements and no measurement point would be created.

If the feature codes comes after the string number, then whenever a feature codes for ordinary measurements is used that starts with the backsight control code, a string number (which may be zero for a point string) **must** be used otherwise the feature code will be interpreted as a backsight measurement and no measurement point would be created.

Foresight

There is no default for the *foresight* control code. It is defined by the *Foresight* field on the *Delimiters* tab of the *Survey.4d Create/Edit* panel.

The rest of the block after the *foresight control code* is the name of the station that the foresight was to, or the point number that the foresight was to.

For example, if *FS* is the backsight control code

FSPSM3

would designate a backsight to the station PSM3.

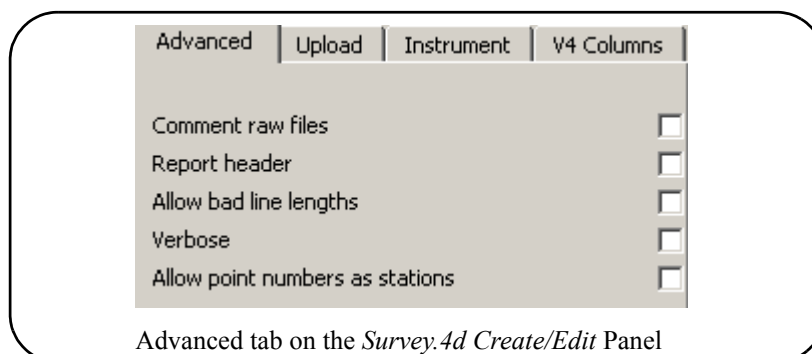

If only the foresight control code exists, the point number from the reading is taken as the point number for the foresight. This may be data collector dependent.

Warning for feature codes starting with the *foresight* control code if the *Allow point numbers as stations* flag is *not* set on the Advanced tab of the *Survey.4d Create/Edit* panel.

If the feature codes comes before the string number, then feature codes for ordinary measurements **can not** start with the foresight control code because they would be interpreted as foresight measurements and no measurement point would be created.

If the feature codes comes after the string number, then whenever a feature codes for ordinary measurements is used that starts with the check measurement control code, a string number (which may be zero for a point string) must be used otherwise the feature code will be interpreted as a foresight measurement.

If the *Allow point numbers as stations* flag is set on, then a point number used as a foresight will create a measurement point for that point number.

Check Measurement

The default for the *check measurement* control code is **CHK** and it is defined by the *Check measurement* field on the *Delimiters* tab of the *Survey.4d Create/Edit* panel.

The rest of the block after the *check measurement control code* is the name of the station that

the check measurement was to, or the point number that the check measurement was to.
For example, if *CHK* is the check measurement control code

CHKPSM3

would designate a check measurement to the station PSM3.

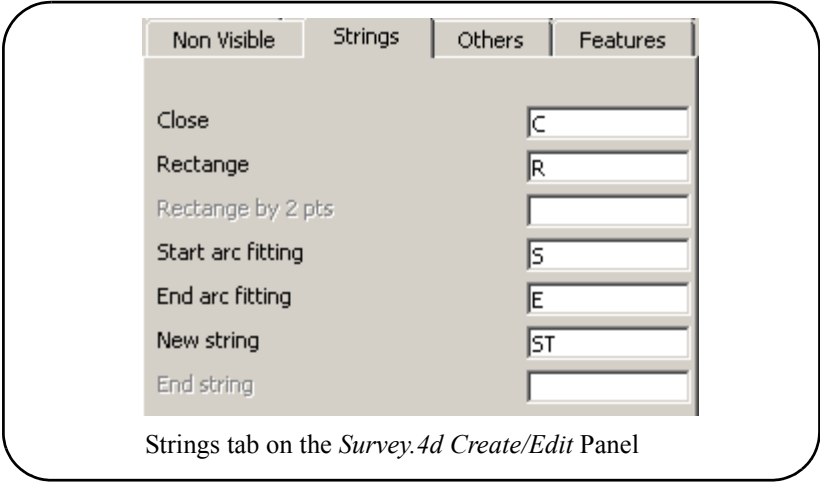

If only the check measurement control code exists, the point number from the reading is taken as the point number that the check measurement is made to. This may be data collector dependent.

Warning for feature codes starting with the *check measurement* control code.

If the feature codes comes before the string number, then feature codes for ordinary measurements **can not** start with the check measurement control code because they would be interpreted as check measurements and no measurement point would be created.

If the feature codes comes after the string number, then whenever a feature codes for ordinary measurements is used that starts with the check measurement control code, a string number (which may be zero for a point string) **must** be used otherwise the feature code will be interpreted as a check measurement and no measurement point would be created.

Control Codes on the Strings tab

Close String

The default for the *close string* control code is **C** and it is defined by the *Close* field on the *Strings* tab of the *Survey.4d Create/Edit* panel.

The *close string* control code closes the string that the measurement is a point of.

See the Section [Close String](#) for more information on closing a string.

Rectangle

The default for the *rectangle* control code is **R** and it is defined by the *Rectangle* field on the *Strings* tab of the *Survey.4d Create/Edit* panel.

The *rectangle* control code uses the current point and the previous two points in the same string (three points total) and creates a new point to form a parallelogram.

See the Section [Rectangle](#) for more information on forming a rectangle.

Rectangle by 2 Pts

A *rectangle_2* control code can be defined by the *Rectangle by 2 pts* field on the *Strings* tab of the *Survey.4d Create/Edit* panel.

The *rectangle_2* control code uses the current point, last point and an offset. The rectangle is

defined by two points (reference side) and a offset.

If a positive offset value is given, two points will be created to the right of the reference side.

If a negative offset value is given, two points will be created to the left of the reference side.

If no Description is given, the two new points will be joined to the given points in a closed rectangular string, and will have the same feature code as the points given.

If the feature code and string number exist, then a search is made for the last occurrence of two points with the same feature code and string number. If found, then these points are used to define the reference side of the rectangle.

If the point number exists, then a search is made for the last occurrence of two points with the same feature code and string number as the point given by the point number. If found, then these points are used to define the reference side of the rectangle.

Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

See the Section [Rectangle by 2 Points](#) for more information on forming a rectangle by 2 points.

Start Arc Fitting

The default for the *start arc fitting* control code is **S** and it is defined by the *Start arc fitting* field on the *Strings* tab of the *Survey.4d Create/Edit* panel.

The *start arc fitting* control code starts arc fitting with the current point.

See the Section [Arcs Through Points](#) for more information on arc fitting.

End Arc Fitting

The default for the *end arc fitting* control code is **E** and it is defined by the *End arc fitting* field on the *Strings* tab of the *Survey.4d Create/Edit* panel.

The *end arc fitting* control code ends arc fitting at the current point. That is, the current point is included in the arc fitting but it is the last point used in the arc fitting.

See the Section [Arcs Through Points](#) for more information on arc fitting.

New String

The default for the *new string* control code is **ST** and it is defined by the *New string* field on the *Strings* tab of the *Survey.4d Create/Edit* panel.

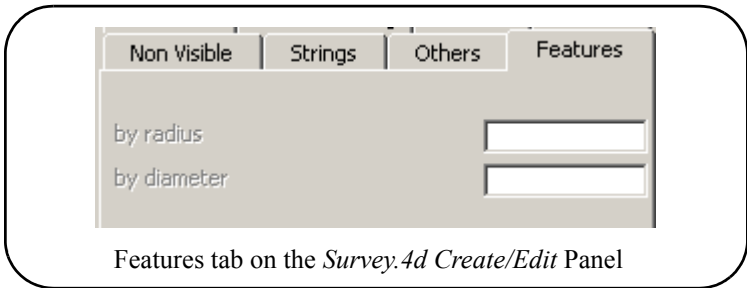

The *new string* control code starts a new string with the current point even if the feature code and string number haven't changed.

See the Section [Start New String](#) for more information on starting a new string.

End String

The *end string* control code ends the current string even if the feature code and string number haven't changed for the next point.

Control Codes on the Features tab

Feature by Radius

There is no default for the *feature by radius* control code. It is defined by the *by radius* field on the *Features* tab of the *Survey.4d Create/Edit* panel.

The *feature by radius* control code denotes that the feature has a given radius. For example, if RA was used then TRE*RA2 would denote a feature code TRE with a radius of 2 units.

See the Section [Feature](#) for more information on feature strings.

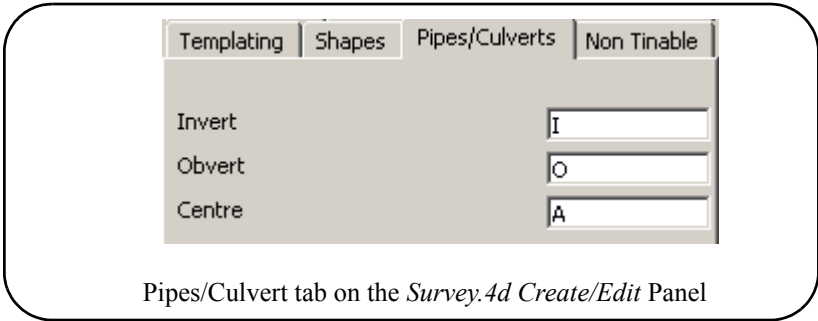

Feature by Diameter

There is no default for the *feature by diameter* control code. It is defined by the *by diameter* field on the *Features* tab of the *Survey.4d Create/Edit* panel.

The *feature by diameter* control code denotes that the feature has a given diameter. For example, if DI was used then TRE*DI2 would denote a feature code TRE with a diameter of 2 units.

See the Section [Feature](#) for more information on feature strings.

Control Codes on the Pipes/Culverts tab

Invert Point for Pipe or Culvert

The default for the *invert level* control code is I and it is defined by the *Invert* field on the *Pipe/Culverts* tab of the *Survey.4d Create/Edit* panel.

The *invert level* control code denotes that the point is an invert level (bottom).

The invert commands can also denote the diameter of a pipe or width and height of a culvert. For example, I.3 denotes the measurement was an invert level and it was a pipe of diameter 0.3 units. I.3x.4 denotes the measurement was an invert level and it was a box culvert of width 0.3 and height 0.4 units.

Obvert Point for Pipe or Culvert

The default for the *obvert level* control code is O and it is defined by the *Obvert* field on the *Pipe/Culverts* tab of the *Survey.4d Create/Edit* panel.

The *obvert level* control code denotes that point is an obvert level (top).

The obvert command can also define the diameter of a pipe or width and height of a culvert. For example, O.3 denotes the measurement was an invert level and it was a pipe of diameter 0.3 units. O.3x.4 denotes the measurement was an invert level and it was a box culvert of width 0.3 and height 0.4 units.

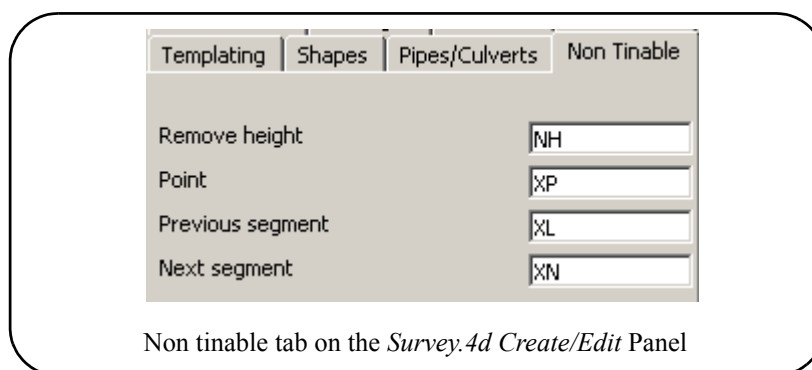

Centre Point for Pipe or Culvert

The default for the *centre level* control code is **A** and it is defined by the *Centre* field on the *Pipe/Culverts* tab of the *Survey.4d Create/Edit* panel.

The *centre level* control code denotes that point is an centre level (axial).

The centre command can also define the diameter of a pipe or width and height of a culvert. For example, A.3 denotes the measurement was an invert level and it was a pipe of diameter 0.3 units. A.3x.4 denotes the measurement was an invert level and it was a box culvert of width 0.3 and height 0.4 units.

Control Codes on the Non Tinable tab

Remove Height

The control code to set the height of the current point to null.

The default for the *remove height from point* control code is **NH** and it is defined by the *Remove height* field on the *Non-Tinable* tab of the *Survey.4d Create/Edit* panel.

Point

The default for the *make point non-tinable* control code is **XP** and it is defined by the *Point* field on the *Non-Tinable* tab of the *Survey.4d Create/Edit* panel.

The *make point non-tinable* control code makes the current point non-tinable. That is, the point is not used in tins (triangulations).

Previous Segment

The default for the *make previous segment non-tinable* control code is **XL** and it is defined by the *Previous segment* field on the *Non-Tinable* tab of the *Survey.4d Create/Edit* panel.

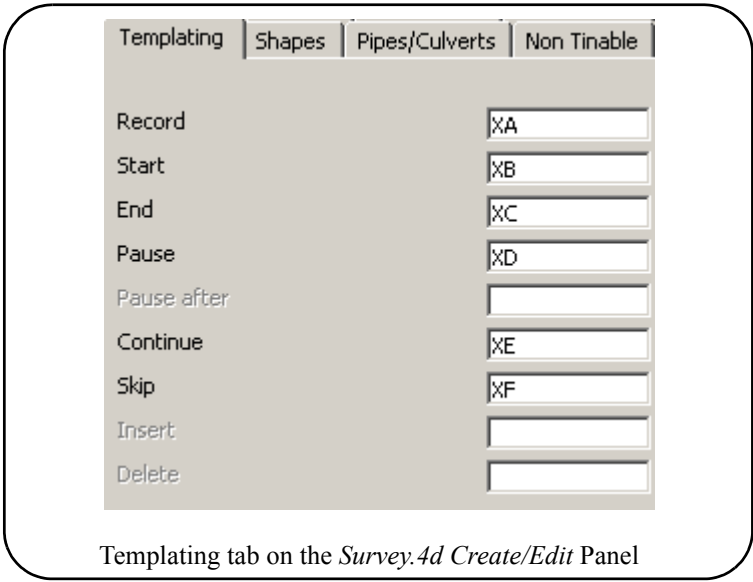

The *make previous segment non-tinable* control code makes the previous segment non-tinable. That is, the segment that the current point is the end of is non-tinable and hence not used as a breakline in tins (triangulations).

Next Segment

The default for the *make next segment non-tinable* control code is **XN** and it is defined by the *Next segment* field on the *Non-Tinable* tab of the *Survey.4d Create/Edit* panel.

The *make next segment non-tinable* control code makes the next segment point non-tinable. That is, the segment that the current point is the start of is non-tinable and hence not used as a breakline in tins (triangulations).

Control Codes on the Templating tab

Record

The control code to denote that this is the first point of a new field template definition. The field template definition continues until the next *stop recording a field template* control code or a *start using a field template* control code.

If the field template is to have a name, then the *start recording* control code is followed by the *offset code* delimiter and then the name for the field template. If no name is given, then the field template defines the default field template.

For example, if XA starts recording for the default template, XA.road starts recording the field template called road

The default for the *start recording a field template* control code is **XA** and it is defined by the *Record* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

Start

The control code to denote that a field template is being used. This point takes the feature code and string number from the field template. If it is a named field template, then the control code is followed by the *offset code* delimiter and then the name of the field template.

The field template can also be used as a forward template, a reverse template or as a zig-zag template starting on either a zig or on a zag.

To denote using the field template as a forward template, add the *offset code* delimiter and *for*.

To denote using the field template as a reverse template, add the *offset code* delimiter and *rev*.

To denote zig-zag mode starting on a zig, add the *offset code* delimiter and *zig*.

To denote zig-zag mode starting on a zag, add the *offset code* delimiter and *zag*.

If anything other than 'for', 'rev' or 'zag' is given, the field template is used as a zig-zag template starting on a zig.

For example, if XB starts using the default template, XB.road.zag starts using the field template

called road as a zig-zag field template starting on a zag.

The default for the *start using a template* control code is **XB** and it is defined by the *Start* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

End

The control code to end the use of the current field template after the current point. That is, the current point uses the field template but subsequent measurements don't.

The default for the *stop using a template* control code is **XC** and it is defined by the *End* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

Pause

The control code to pause using the current field template. The current point does not use the field template.

The default for the *pause using a template* control code is **XD** and it is defined by the *Pause* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

Pause after

The control code to pause using the current field template and the current point does use the field template.

There is no default for the *pause after* control code and it is defined by the *Pause after* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

Continue

The control code to continue the use of a paused field template. The current point uses the field template.

The default for the *continuing using a field template* control code is **XE** and it is defined by the *Continue* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

Skip

The control code to skip point one or more points of the field template. The current point uses the next point *after* the skipped points from field template.

If more than one point is to be skipped then the control code is followed by the *offset code* delimiter and then number of points to be skipped.

For example, if **XF** is the skip points control code, **XF.2** skips two points. Note that just **XF** skips one point and the **'1'** is not required.

The default for the *skipping field template points* control code is **XF** and it is defined by the *Skip* field on the *Templating* tab of the *Survey.4d Create/Edit* panel.

See the Section [Field Templates](#) for more information on field templates.

Insert

A default control code to insert a point in the field template can be added to this field. The point is inserted after the last point.

See the Section [Field Templates](#) for more information on field templates.

Delete

A default control code to delete a point in the field template can be added to this field. a number of points can be nominated for deletion.

See the Section [Field Templates](#) for more information on field templates.

Feature coding for traverse extraction (Non- Leica instruments)

In the example shown above, three distinct traverses were observed. The main traverse between stations 900 and 901 were given a feature code of TL and a string number of 1 (TL1). A typical observation description follows:

Setup on station 900. A foresight measurement was taken from 900 to 1001. A typical feature code may be:

TL1 FS1001. Where the block delimiter is a space(" ") breaking the feature code up into TL1 and FS1001. This tells the reduction that the observation was a traverse because it has a feature code of TL as specified in the traverse tab of the reduction panel. The foresight control code may be FS, telling the reduction that the observation is a foresight observation to a named point

Setup on station 1001. A backsight to station 900 was observed. A typical feature code may be:

TL1 BS900. Where BS is the backsight control code

A foresight to 1002 may be coded as:

TL1 FS1002.

And so forth.

The observation to station 1013 may be made at the same time as when observing to station 1007 from the setup station 1006. Simply changing the string number to 2 for the observation to 1013 will ensure that it is treated as a different traverse. i.e. TL2 FS1013.

The second traverse between stations 1006 and 902 were given a feature code of TL and a string number of 2 whilst the traverse between stations 1010 and 903 were given a feature code of TL and a string number of 3.

The feature code/ string number needs to be present for at least the foresight or measured leg of each of the traverse legs. If they are also present for the backsight, then foresight/backsight pairs will be grouped together and reciprocal calculations done for that leg.

Data Collector Definitions

Unfortunately, each brand of data collector has its own method of communicating with a computer and a software package.

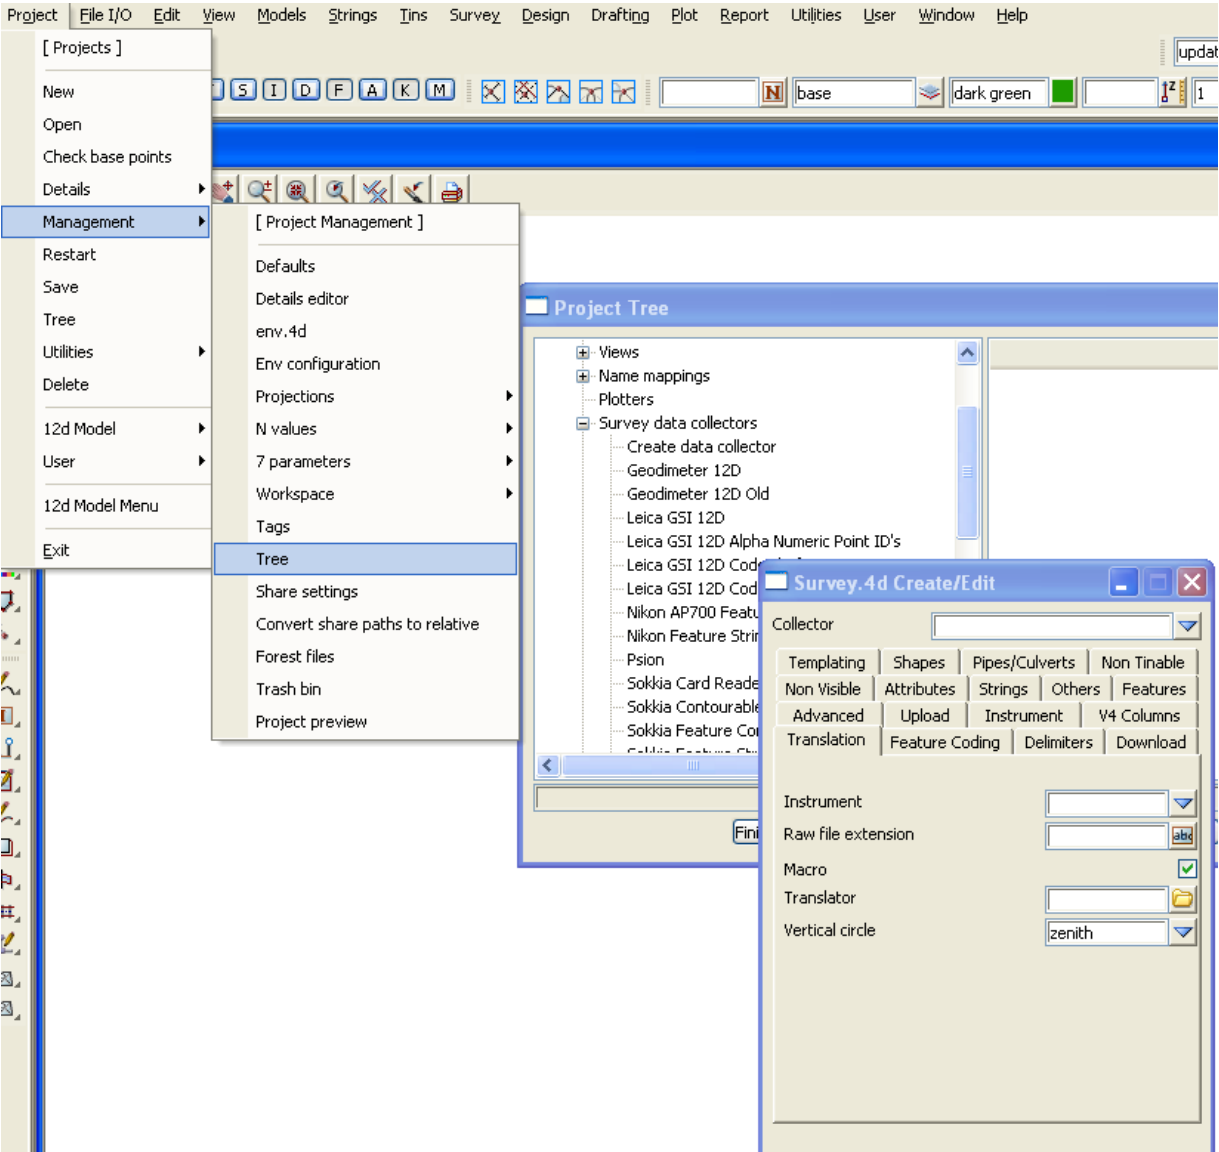

To allow for a variety of data collectors, **12d Model** lets the user create and edit data collector definitions which are simply user defined sets of data collector parameters stored under user specified names.

The set of data collector definitions are stored in a file but are created and edited using the **12d Model** panel *Survey.4d Create/Edit*.

The *Survey.4d Create/Edit* panel is accessed via **Project => Management =>Tree**. First select **Project => Management =>Tree** and then click on the **+** beside the Project name to expand the list of available information for the project. Then click on the **+** beside *Survey data collectors* to see the list of existing 12d data collector definitions.

Double click LB on *Create data collector* to create a new data collector definition, or double click LB on an existing data collector definition to examine and/or modify it.

The **Survey.4d Create/Edit** panel will then appear.

The fields and buttons used in this panel have the following functions.

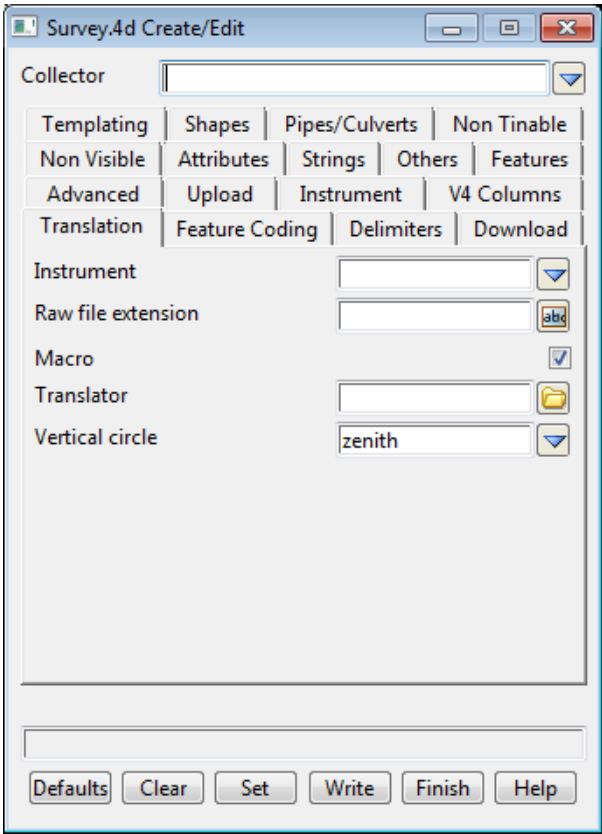

Field Description	Type	Defaults	Pop-Up
Collector <i>name of the data collector to create/edit.</i>	input		available data collectors
Defaults <i>set all the panel fields to default values.</i>	button		
Clear <i>clear the values in the panel fields in all the tabs.</i>	button		
Set <i>set the values in the panel fields for the given data collector for this session of 12d Model.</i> <i>WARNING - Set does not save the changes to the survey.4d file. To save the changes, click on the 'Save' button.</i>	button		
Save <i>store the data collector definitions to the survey.4d file.</i>	button		

For descriptions of each of the tabs on the panel, go to:

<i>Translation</i>	Translation tab
<i>Feature coding</i>	Feature Coding tab
<i>Delimiters</i>	Delimiters tab
<i>Download</i>	Download tab

Advanced	Advanced tab

Instrument	Instrument tab
V4 Columns	V4 Columns tab
Templating	Templating tab
Shapes	Shapes tab
Pipe/Culverts	Pipes/Culverts tab
Non tinnable	Non Tinnable tab
Non visible	Non visible tab
Attributes	Attributes tab
Strings	Strings tab
Other	Others tab
Features	Features tab

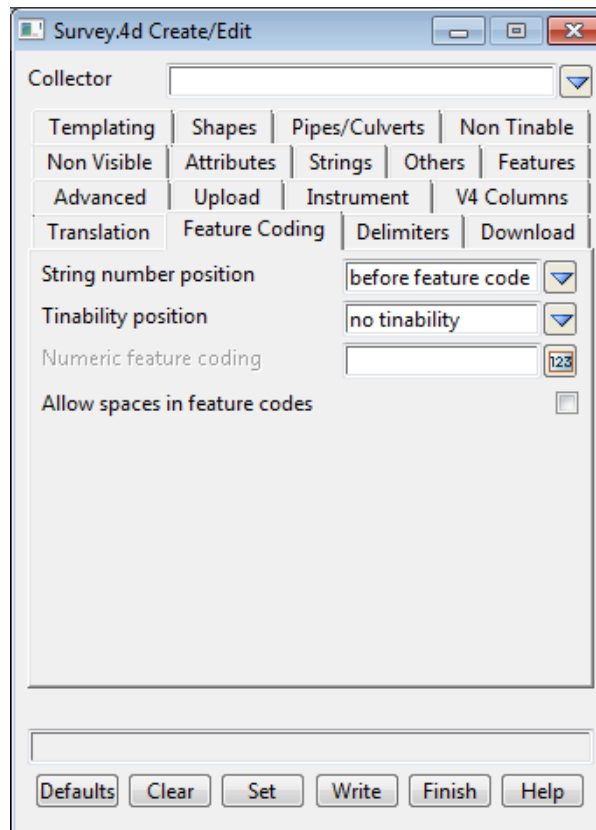

Translation tab

Instrument	input	Geodimeter, Leica Nikon DR1, Nikon AP700, Sokkia 20/33 Topcon GT700, Topcon FC5
		<i>type of data collector format.</i>
Raw file extension	input	
		<i>file ending to use for the raw file when it is downloaded.</i>
Macro	tick box	tick
		<i>if tick, then the Translator pop-up list only shows 12d Model macros. If not ticked, then the Translator pop-up list only shows programs.</i>

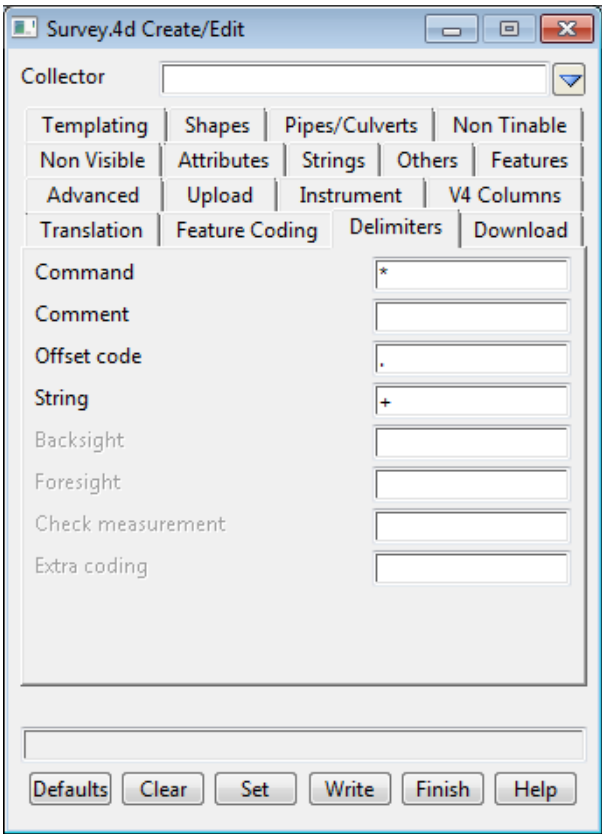

Translator	input	list of translators in library	
<i>name of the macro/program to translate the raw survey file into the 12d field file format.</i>			
Vertical circle	input	zenith	zenith, nadir
<i>define the vertical circle zero.</i>			

Feature Coding tab

String number position	input	before	before feature code no string number after feature code
<i>defines if the string number is before or after the feature code or is not used at all (no string number). When 'no string number' then the New string command is used to start new strings with the same feature code.</i>			
Tinability position	input	no tinability	before string no tinability after string
<i>defines the position or absence, of the tinability flag. This should only be used for compatibility with data coded for other systems such as CivilCAD. 12d has more flexible methods of defining tinability.</i>			
Numeric feature coding	integer		
<i>if 'no string number' is given for String number position then Number feature coding is ignored. If a number is given, then the feature code must be numeric and the given number is the length of the feature code (that is, the number of digits in the feature code). If no number is given, then feature codes are alphabetical characters only except when a String code is used to separate the feature code and string number.</i>			

Delimiters tab

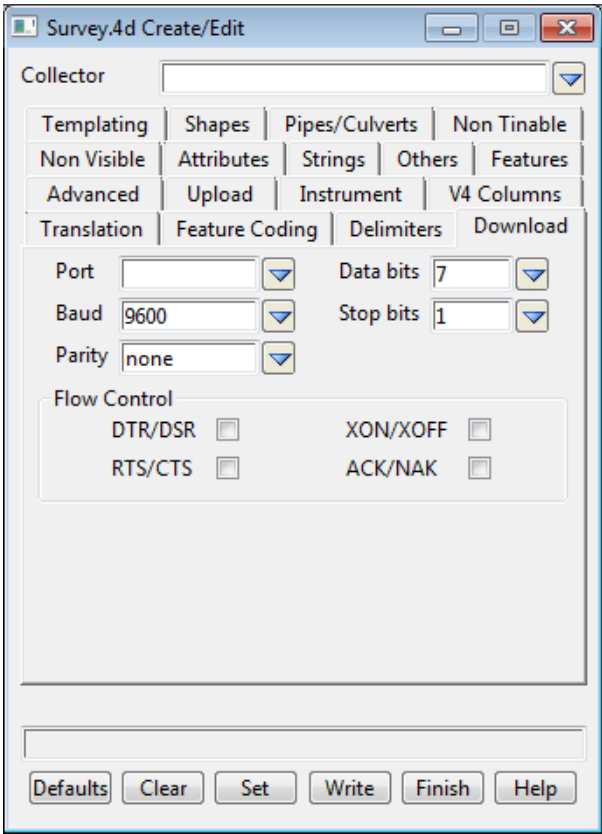

Command	input	*	<i>defines the separator between the feature code/string number and op code commands. The delimiter characters can not be used in any other part of the command line.</i>
Comment	input	/	<i>defines the separator for comments. Note that this can be a space.</i>
Offset code	input	dot (.)	<i>defines the beginning of the offset code block. If the offset code block exists, it must come immediately after the Feature code/string number/tinability block. The offset code used R for radial, T for tangential, H for height.</i>
String	input	+	<i>separates the feature code from the string number. Used when the feature code includes numbers. For example 110KVA+20 would be a feature code of 110KVA and a string number of 20.</i>
Backsight	input	BS	<i>if the feature code is this control code then the measurement is to a backsight and not a point.</i>
Foresight	input		<i>if the feature code is this control code then the measurement is to a foresight and not a point.</i>
Check measurement	input	CHK	<i>if the feature code is this control code then the measurement is a check measurement and not a point.</i>
Extra coding	input	X	<i>denotes that the information following is appended to the previous information for the measurement. This allows extra coding than may be allowed for on the measurement line. Mainly for Sokkia using the</i>

note (13NM) to add more information to the previous measurement line (07).

A feature code block must be on the measurement line or a measurement with no name will be created.

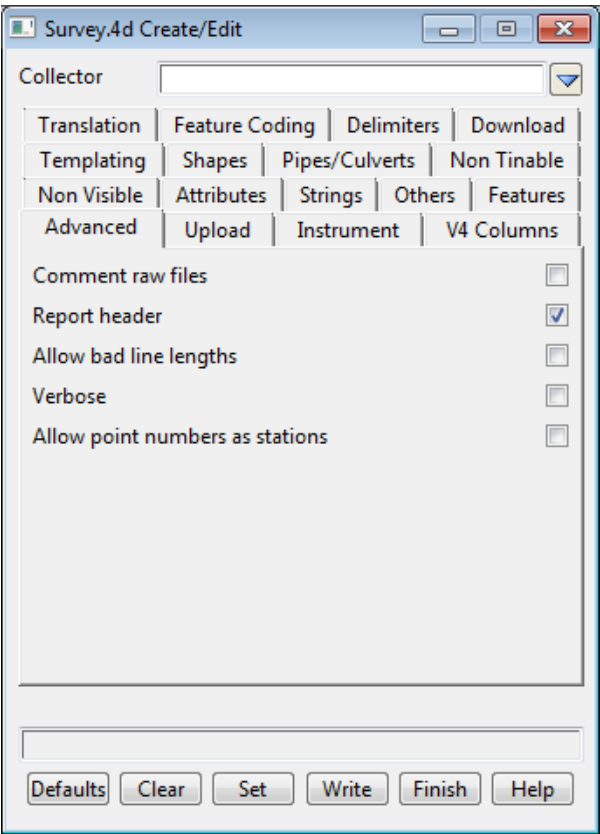

Also a command block can't be split between two lines.

Download tab

Port	input	COM1	COM1 to COM4
<i>port on the computer to use to communicate with the data collector for downloads.</i>			
Baud rate	input	9600	110, 300 ... 256000
<i>baud rate to use for the computer port.</i>			
Data bits	input	7	5, 6, 7, 8
<i>number of data bits to use.</i>			
Stop bits	input	1	0, 1, 1.5, 2
<i>number of stop bits to use.</i>			
Parity	input	none	none, even, odd, mark, space
<i>parity to use.</i>			
DTR/DSR, RTS/CTS, XON/XOFF,ACK/NAK	tick boxes		
<i>flow control settings.</i>			

Advanced tab

Comment raw files tick box

if tick, include the data from the raw survey file as comments in the 12d field file.

Report header tick box

if tick, include some header information as comments in the 12d field file.

Allow bad line lengths tick box

if tick, ignore the fact that the length of the line from the data collector is incorrect. This may lead to other errors so it should be used sparingly.

Verbose tick box

if tick, then extra information is written to the Output window.

Allow point numbers as stations tick box

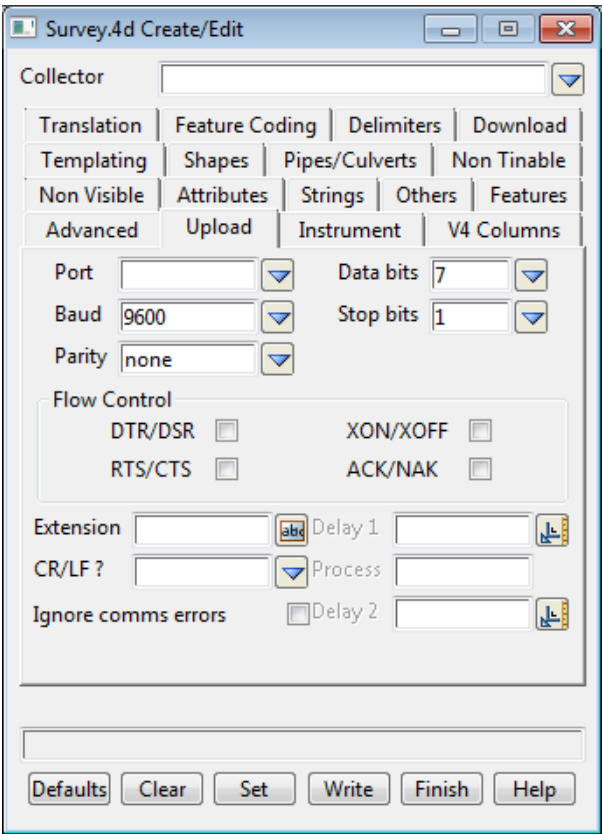

if tick, the point numbers for previous measurements can be used as stations for instrument setups, backsights, foresights and check measurements.

Note

When 12d Model starts up, it checks to see if an environment variable called DATA_COLLECTORS_4D exists and if it does, then the file it points to is used to provide the definitions for the data collectors.

If the environment variable is not set, then 12d Model searches for a file called **survey.4d** (this was **data_collectors_definitions** in V3.0) in the standard 12d Model search sequence for set up files.

Upload tab

Port	input	COM1	COM1 to COM4
<i>port on the computer to use to communicate with the data collector for uploads.</i>			
Baud rate	input	9600	110, 300 ... 256000
<i>baud rate to use for the computer port.</i>			
Data bits	input	7	5, 6, 7, 8
<i>number of data bits to use.</i>			
Stop bits	input	1	0, 1, 1.5, 2
<i>number of stop bits to use.</i>			
Parity space	input	none	none, even, odd, mark,
<i>parity to use.</i>			
DTR/DSR, RTS/CTS, XON/XOFF,ACK/NAK	tick boxes		
<i>flow control settings.</i>			
Extension	input		
<i>ending of the file that will be uploaded. For example, typing in sdr means the file to upload ends in ".sdr"</i>			
CR/LF ?	input	cr, lf, crlf, lfcr,none	
<i>end of line characters - characters needed by the data recorder to denote the end of a line of data being uploaded to the data recorder.</i>			
Delay 1	input		
<i>the time between sending lines of data to the data recorder.</i>			

- Process

input

for some data recorders after a data line is sent, a text string needs to be sent to the data recorder to make it process the data line (e.g. GRE3 used a P).
- Delay 2

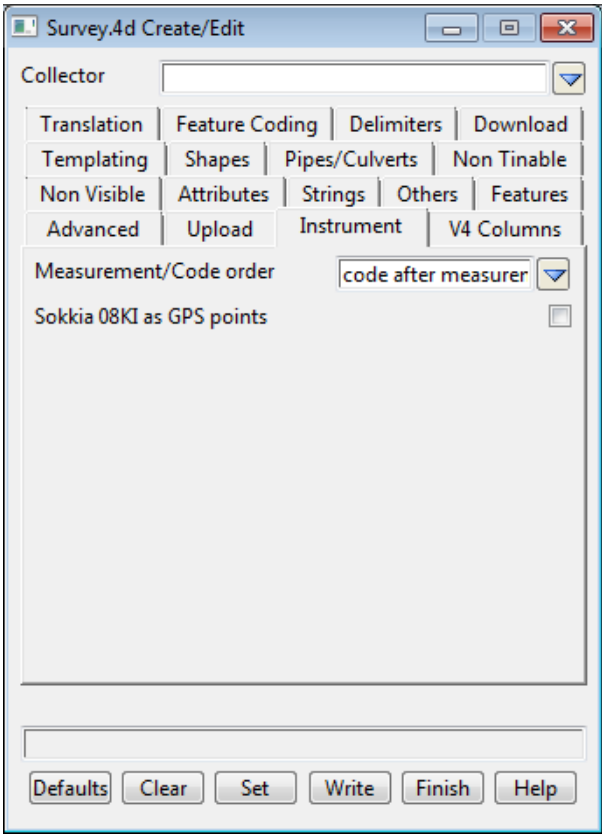

input

the time between sending the process string and sending the next data line.
- Ignore comms errors

tick box

if tick, ignore any communication errors whilst uploading to the data recorder.

Instrument tab

- Measurement/code order

input

after measurementcode before measurementcode after measurement

For Leica only where the feature code/string number record is separate to the measurement record. For all other data recorders the feature code block is in the same record as the measurement. If 'code before measurement', then the feature code/ string number record for a measurement is entered before taking the measurement. If 'code after measurement', then the feature code/ string number record for a measurement is entered after taking the measurement.
- Sokkia 08KI as GPS points

tick box

if tick, when converting reading an Sokkia SDR file, the "08KI" records are treated as points and no directly entered station co-ordinates.

V4 Columns tab

The screenshot shows the 'Survey.4d Create/Edit' dialog box with the 'V4 Columns' tab selected. The 'Collector' field is empty. The 'Columns' section contains five rows of input fields for 'start' and 'end' positions: 'Feature code start/end', 'String number start/end', 'Point name start/end', 'Attribute start/end', and 'Point number start/end'. Below these is a 'Total length' input field. At the bottom are buttons for 'Defaults', 'Clear', 'Set', 'Write', 'Finish', and 'Help'.

The V4 columns tab is for compatibility with **12d Model** V4 field files which were of fixed column widths.

Feature code start/end input 1/6

the start and end column position for the feature code in the field file record.

String number start/end input 7/9

the start and end column position for the string number in the field file record.

Point name/Attribute/Point number start/end input 22/30, 10/16, 17/20

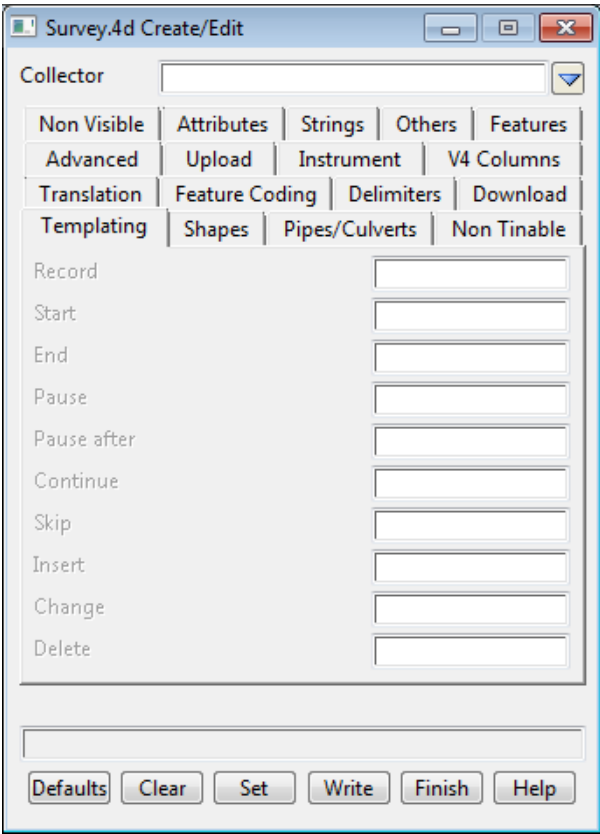

the start and end column position for the point name/Attribute/Point number in the field file record.

Total length input

the total length of line expected.

Templating tab

For information on field templating, see [Field Templates](#).

Record input XA text

characters to denote the start of recording a field template. For example XA starts recording for the default template, XA.road starts recording the field template called road. See [55 Start recording a field template](#).

Start input XB text

characters to denote the start of using a field template. For example XB starts using the blank field template, XB.road starts using the field template called 'road'. XB.road.zig starts using 'road' a zig-zag field template and begins as a zag. See [51 Start using an existing field template](#).

End input XC text

characters to denote stop using the current field template. See [52 Finish using a field template or finish recording a field template](#).

Pause input XD text

characters to denote temporarily stop using the current field template to take other measurements. The current point does not use the field template. See [53 Pause using the current field template](#).

Pause after input XD text

characters to denote temporarily stop using the current field template to take other measurements. The current point does use the field template. See [51 Start using an existing field template](#).

Continue input XE text

characters to denote continuing to use the current field template after a pause. See [54 Continue the current field template](#).

Skip input XF text

characters to denote that template points are to be skipped. For example XF means skip one field

template point, XF.3 means skip three field template points. See [56 Skipping picking up points when using a field template](#).

Insert input XI text

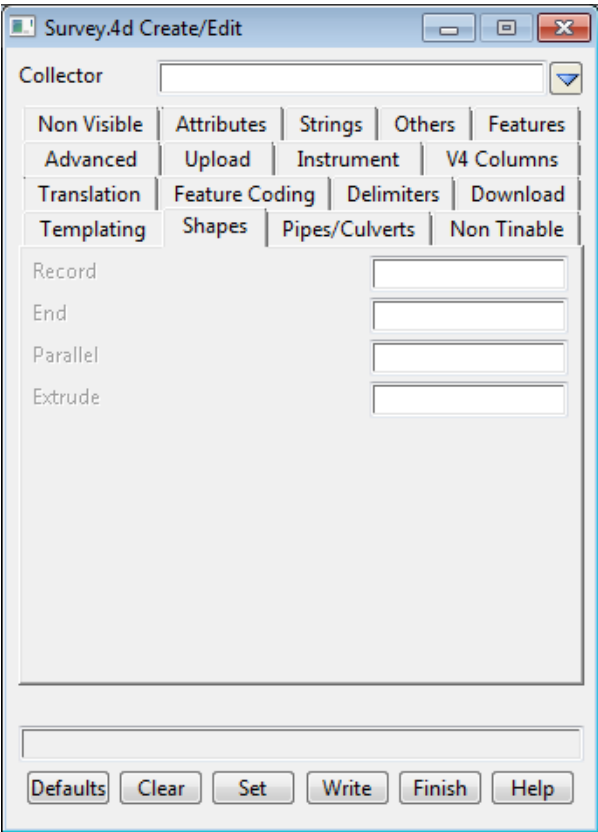

characters to denote that template points are to be inserted. For example XI.FE01 means insert a template point of FE01 into the template after the last measured template point. See [58 Insert points when using a field template - after the measurement of last point](#).

Delete input XQ text

characters to denote that template points are to be deleted. For example XQ.3 means delete the next 3 pts from the template after the last measured template point. See [57 Delete points on a field template - after the measurement of last point](#).

Shapes tab

For information on shapes, see [Shape field coding](#).

Record input text

characters to denote the start of recording a shape. For example if RS was used, the code RS starts recording for the default shape, RS.shape_name defines the recording of a shape of name shape_name. See [83 Start recording a shape - before the measurement](#).

End input text

characters to denote stop using the current shape. See [84 Finish using a shape definition or finish recording a shape - after the measurement](#).

Parallel input text

characters to denote the application of a shape by parallelling to the shape reference string. The code may be LK01*PS.shape_name

Where the Parallel command is PS, the shape reference string is LK01 and the shape name = shape_name. See [85 Shape parallel](#).

Extrude

input

text

characters to denote the application of a shape by extrusion to the shape reference string. The code may be `LK01*ES.shape_name`

Where the Extrusion command is *ES*, the shape reference string is *LK01* and the shape name = *shape_name*. See [86 Shape extrude](#).

Invert

Obvert

Axial

Defaults Clear Set Write Finish Help

Invert

input

1

text

characters to denote that the measurement was the an invert level. See [80 Pipe invert point \(bottom of the pipe\)](#).

Obvert

input

O

text

characters to denote that the measurement was the an obvert level. See [82 Pipe obvert point \(top of the pipe\)](#).

Centre

input

C

text

characters to denote that the measurement was the a centreline (axial) level. See [81 Pipe axial point \(centre of the pipe\)](#).

Note that these commands can also denote the diameter of a pipe or width and height of a culvert. For example, I.3 denotes the measurement was an invert level and it was a pipe of diameter 0.3 units. I.3x.4 denotes the measurement was an invert level and it was a box culvert of width 0.3 and height 0.4 units.

Non Tinable tab

Remove height

characters to denote that the measurement has a null height. See [30 Remove height from a point - that is make it a null height](#).

Point

characters to denote that the measurement is a non-tinable point. See [40 Make a point non-tinable](#)

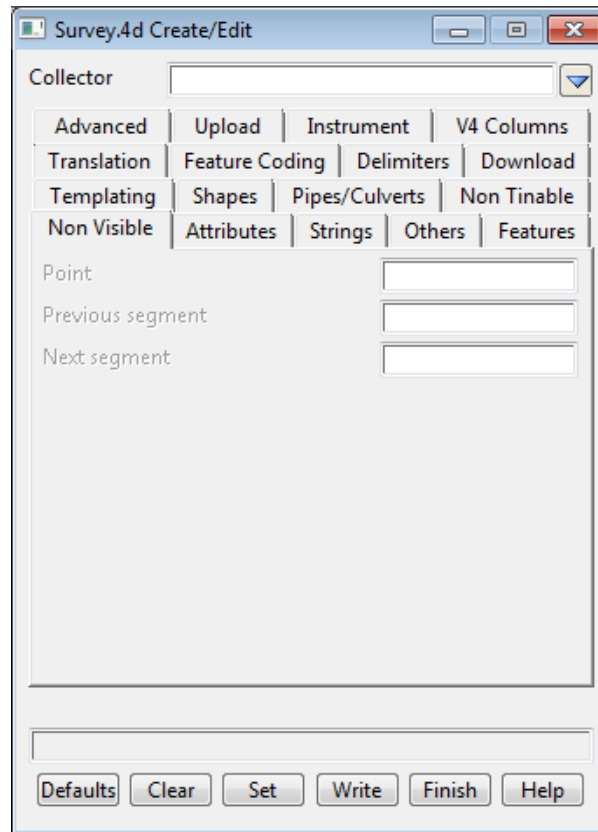

Previous segment

characters to denote that the next segment of the current string is non-tinable. See [38 Make the previous segment non-tinable](#).

Next segment

characters to denote that the previous segment of the current string is non-tinable. See [39 Make the next segment non-tinable](#).

Non visible tab

Point	input	text
-------	-------	------

characters to denote that the measurement is a non-visible point. That is, the point is not visible and is not included in a triangulation. See [109 Make a point invisible - after the measurement](#).

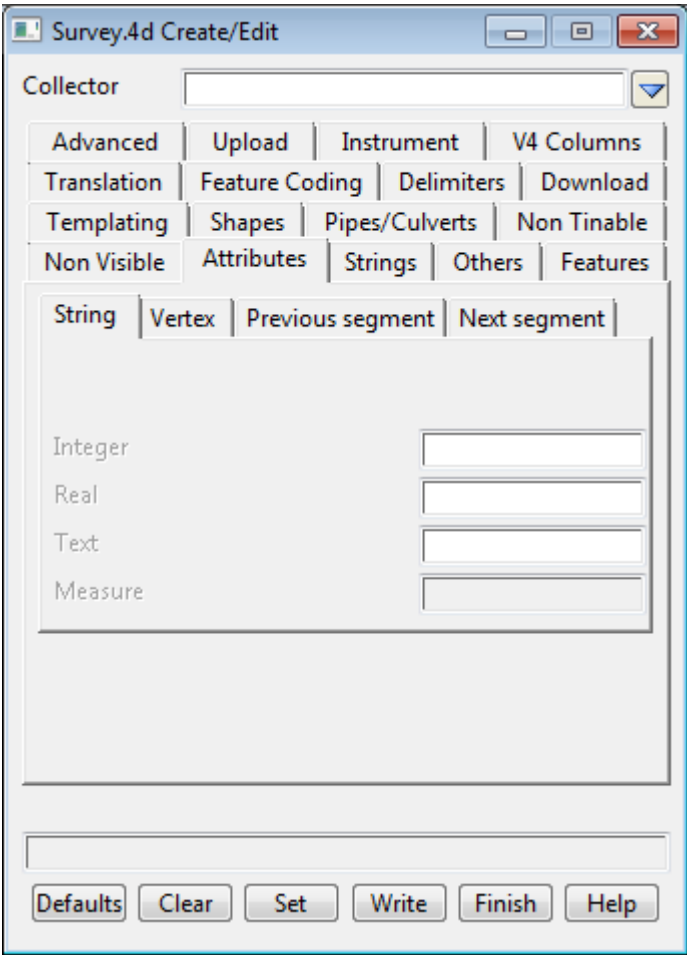

Previous segment input text

characters to denote that the measurement is the end of a non-visible segment. That is, the previous segment is not used as a breakline in a triangulation and it is not visible. See [107 Make the previous segment invisible - after the measurement.](#)

Next segment input text

characters to denote that the measurement is the start of a non-visible segment. That is, the next segment is not used as a breakline in a triangulation and is not visible. See 108 Make the next segment invisible - after the measurement for the first point of the segment.

Strings tab

For information on the string commands, see [Field Coding](#).

Close input C text

characters to denote that the string is closed. That is the current measurement is joined to the first point of the string. See [20 Close string](#).

Rectangle input R text

characters to denote that the string is a rectangle. That is the current measurement and the previous two points of the string are three points of a parallelogram and the fourth point is automatically created (and given a null height). See [45 Make a parallelogram from the last three measurement points](#).

Rectangle by 2 pts input text

characters to denote that the string is a rectangle. That is the previous two points of the string define one side and a offset defines the opposite side. Positive being to the right. The created points are given null height. See [37 Rectangle by two points](#).

Start arc fitting input S text

characters to denote the start of arc fitting. See [61 Start of arc through sets of three points until end of string, or a 62 occurs](#).

End arc fitting input E text

characters to denote the end of arc fitting. See [62 End the arcs begun by a 61 command](#).

New string input ST text

characters to denote the that the current measurement is the start of a new string, even if the string number has not changed. See [47 Start a new string using the same feature code and string number](#).

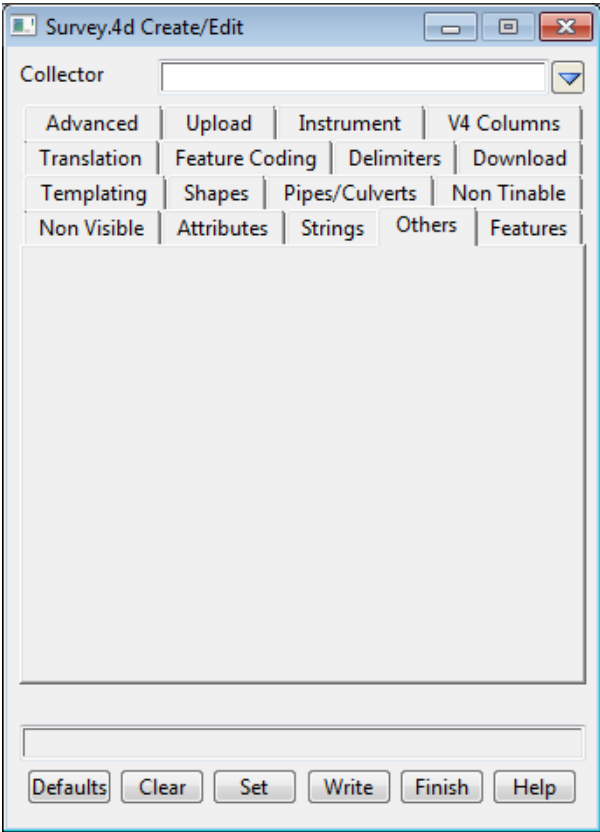

End string input text

characters to denote the that the current measurement is at the end of a string, even if the string

number has not changed on the next measurement. See [48 End a string](#).

Others tab

Under development.

Features tab

For information on Feature string, see [Feature](#).

			Features

by radius

by diameter

Defaults Clear Set Write Finish Help

By radius input text

characters to denote that the feature has a given radius. For example, if RA was used then TRE*RA2 would denote a feature code TRE with a radius of 2 units.

There can be more than one set of characters that define 'By radius'. The sets are entered into the By radius field separated by a space. For example

$RA \quad RAD \quad RD$

would specify that RA and RAD and RD can be used to denote that the feature is defined by radius.

By diameter input text

characters to denote that the feature has a given diameter. For example, if DI was used then TRE*DI2 would denote a feature code TRE with a diameter of 2 units.

There can be more than one set of characters that define 'By diameter'. The sets are entered into the By diameter field separated by a space. For example

DI DIA DR

would specify that DI and DIA and DR can be used to denote that the feature is defined by diameter.

The 12d Field File Format

The detailed definition of the standardised 12d Field File will now be given. This is the file that all raw files are converted to before reduction in **12d Model**.

A few definitions will be given, followed by the complete description of the 12d Field File.

The raw data files from different data collectors are all converted to the **12d** field file format.

The 12d field file is ascii and has a name ending in **.fld**

Each line in the 12d field file is called a record and consists of an **operation code** (or *op code* for short) followed by zero or more tabs and pieces of information.

(a) zero fields

What actually follows the fixed header depends on the *op code*.
Hence the 12d field file record is:

op code
99

or

op code	tab	value	...	tab	value
02		abcS			fred

A number of conventions and definitions will be now given, followed by the complete description of the 12d Field File.

Important Note

Op codes are not the same as field codes. *Field codes* are entered by the surveyor in the field and may lead to one or more op codes being created in the 12d field file.

Please continue to the next section [Point Description](#).

Point Description

The *feature codes* and *string numbers* are entered by the surveyor whilst surveying in the field and the *point numbers* are usually automatically created by the surveying instrument but may sometimes be entered into the instrument by the surveyor.

Other information can also be entered by the surveyor using **field codes** and associated information. How each field code and associated information is entered in the field *depends on the data recorder* and the *coding convention* being used. This is set up in the *Data Collector definitions* in **12d Model**.

The data file from the instrument or data collector (raw file) is first converted in **12d Model** to the **12d** field file ready for loading into a **12d Model** Survey Reduction function for reduction.

In most lines of the **12d field file**, a *feature code*, *string number*, *point number*, *point name* and *point text* are given and are stored next to each other separated by tabs.

The **feature code** and **string number** have already been described.

The **point number** is the EDM tacheometry measurement point number which is not normally entered by the user but is written in the raw data file by the data collector. This is stored as the point number for the vertex of the super string.

The **point name** is used to store the name of a station (see the next section on *named measurements*) and is supplied by the user with certain op codes. It is also used by some op codes that do not require an actual point name but have other special information that needs to be stored.

The **point text** is stored as vertex text for that vertex of the super string.

In the 12d field file, the *feature code*, *string number*, *point number*, *point name* and *point text* are given in this order and are separated by tabs. Each can be up to sixty-three characters in length. If the item is missing then a tab is still needed so there may be two or more sequential tabs.

For simplicity in describing the **12d field file**, the feature code, string number, point number, point name and point text are grouped together and called the **point description**.

Hence the **point description** consists of the following pieces of information separated by tabs:

- s feature code (string name)
- s string number
- s point number
- s point name
- s point text

So it is convenient to think of the *point description* record as five columns of information:

feature code	string number	point number	point name	text
abc	01	1002	STN 4	freddie

Please continue to the next section [Measurements and Named Measurements](#).

Measurements and Named Measurements

The **12d** field file allows five types of measurements that create points (vertices) in super strings. They are

- (a) directly entered co-ordinates measurement
- (b) EDM measurement (HA,VA,SD, + point_description.)
- (c) EDM measurement VD (HA,HD,VD + point_description.)
- (d) EDM measurement HT (HA,HD,HT, + point_description.)
- (e) three hair stadia measurement

Each type of measurement creates a new point which is appended to the previous points with the same *feature code* and *string number*.

The last such measurement is referred to as the *current measurement point* or *current point* and the string it is appended to is the *current string*.

If a *point_name* exists in the *point_description* for any of the three types of measurements, then it is called a **named measurement** and a one point super string of name *point_name* is created and mapped using the mapping file. The vertex text for the one point super string is the station prefix followed by *point_name*. The *point_name* is added to an internal list of named points for searching for co-ordinates.

Please continue to the next section [Existing Station Co-ordinates](#).

Existing Station Co-ordinates

When setting up a new instrument, measuring to a backsight, doing a check measurement or manually entering a bearing to use as the bearing datum difference, the *point_name* or point number from the *point_description* is used to specify a point. The (x,y,z) co-ordinates for *point_name* are found by searching in the following order:

The difference between *point names* and *point numbers* is that *point names* are usually given by the user and should be a unique identifier for a point whilst for that same physical point a number of measurements (and hence point numbers) may be assigned (usually by the data collector). This may be particularly true of control station measurements where measurements are made to a given point name but each measurement is given a different point number by the data collector.

In most instances, a measurement to a point has a point number (from the data collector) and 12d automatically gives it the same point name as it is rare to measure a non-control point more than once (the point name can be over ridden by the user).

The names allow the reduction routine to search for the details of that point (e.g. coordinates) to allow for the reduction of further measurements. The order in which this searching takes place is as follows:

First search the Control model (if it exists):

1. A search is made of the control model for a string whose name is the same as the specified *point name*. If a string is found, the first point of the string is used for the (x,y,z) co-ordinates.
2. A search is made of the control model for a vertex of a string whose point number is the same as the specified *point name*. If a vertex is found its (x,y,z) co-ordinates are used.
3. If only a *point number* was specified, a search is made of the control model for a vertex of a string whose point number is the same as the specified *point number*. If a vertex is found its (x,y,z) co-ordinates are used.

Next search the already entered directly entered co-ordinates (DEC) in the field file:

4. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point name* is the same as the specified *point name*. If a DEC is found, its (x,y,z) co-ordinates are used.
5. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point number* is the same as the specified *point name*. If a DEC is found, its (x,y,z) co-ordinates are used.
6. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point number* is the same as the specified *point number*. If a DEC is found, its (x,y,z) co-ordinates are used.

Next search the previous measurements in the field file:

7. A search is made of previous measurements in the field file for a measurement whose *point name* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
8. A search is made of previous measurements in the field file for a measurement whose *point number* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
9. A search is made of previous measurements in the field file for a measurement whose *point number* is the same as the specified *point number*. If a measurement is found, its (x,y,z) co-ordinates are used.
10. or finally, the user is asked to type in the (x,y,z) co-ordinates in a **Survey Data Define Station** panel. If a model is specified in the Add to model field of the panel, then a new one point super string is created with the name *point_name*, and as the vertex text for the point, the Station label prefix field value followed by *point_name*.

For a summary of the **12d Field File Op Codes**, go to the section [Summary of 12d Field File Op Codes](#)

For the full description of the **12d Field File Op Codes**, go to the section [Full Description of 12d Field File Op Codes](#)

Full Description of 12d Field File Op Codes

For a summary of the **12d Field File Op Codes**, go to the section [Summary of 12d Field File Op Codes](#).

The record for each *op code* allowed in the 12d field file will now be described in detail.

For each *op code* record, two lines and a paragraph of description are given:

- s The first line consists of the *op code* and a short description of the purpose of the code.
- s The second line gives the full syntax of the record for that *op code*.
- s The paragraph gives a detailed description of the *op code* record.

Optional information is enclosed in the square brackets []

All **angles** in the 12d field file are given in **decimal** degrees.

Important Note

Op codes are not the same as field codes. *Field codes* are entered by the surveyor in the field and may lead to one or more op codes being created in the 12d field file.

Op Code	Description of Record
1	<p>Four 10 character information blocks</p> <p><i>01 block1 block2 block3 block4</i></p> <p>This information is ignored.</p>
2	<p>Directly entered coordinate measurement</p> <p><i>02 Point_description X Y Z</i></p> <p>A <i>measurement</i> point is created with the <i>feature code</i> and <i>string number</i> from the <i>point_description</i> and given (x, y,z) co-ordinates. No reduction is needed.</p> <p>The <i>point_number</i> and <i>text</i> from the <i>point_description</i> are recorded as the point number and text for that vertex of the super string.</p> <p>If a <i>point_name</i> exists in the <i>point_description</i>, then it is a named measurement and a 4d point string of name <i>point_name</i> is created and mapped using the mapping file. The 4d text is the station prefix followed by <i>point_name</i>. The <i>point_name</i> is added to the internal list of named points for searching for co-ordinates.</p>
3	<p>New instrument point</p> <p><i>03 Point_description instrument_height</i></p> <p>Setting up an instrument at the point with name given in the <i>point_name</i> section of the <i>point_description</i>. The (x,y,z) co-ordinates for <i>point_name</i> are found by first searching the control model, then the list of previously named point in the reduction, point numbers of previous measurements and finally if <i>point_name</i> is still not found, the user is asked to type in the (x,y,z) co-ordinates. A record is written to the report file.</p>
4	<p>Measurement to backsight</p> <p><i>04 Point_description horizontal_circle vertical_circle slope_distance azimuth</i></p> <p>Measurement to a backsight whose name is given in the <i>point_name</i> section of the <i>point_description</i>. If the <i>Display panel for backsights</i> field in the Survey Data Reduce panel is tick, then the Survey Data Bearing Datum Difference panel shows the <i>bearing datum difference</i> and the <i>horizontal distance</i></p>

difference. A record is written to the report file. The units for *horizontal_circle* and *vertical_circle* are decimal degrees. The azimuth may be specified where no coordinate for the backsight point exists in decimal degrees.

5 New target height

05 Target_height

Set a new target height.

6 Check measurement

06 Point_description horizontal_circle vertical_circle slope_distance

A check measurement is made to the station given in the *point_name* section of the *point_description*. A two point super string (with name *point_name*) from the instrument point to the measured point is created in the default model for the check measurement. The instrument point name, the station name and the differences between the measurement point co-ordinates and the station co-ordinates are written as text along the super string. The differences between the measurement and the known point is also written to the report file. The units for *horizontal_circle* and *vertical_circle* are decimal degrees.

7 Measurement - HA, VA, SD

07 Point_description horizontal_circle vertical_circle slope_distance

Measurement made by the instrument. A *measurement* point is created with the *feature code* and *string number* from the *point_description*. The units for *horizontal_circle* and *vertical_circle* are decimal degrees.

The *point_number* and *text* from the *point_description* are recorded as the point number and text for that vertex of the super string.

If a *point_name* exists in the *point_description*, then it is a **named measurement** and a 4d point string of name *point_name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *point_name*. The *point_name* is added to the internal list of named points for searching for co-ordinates.

9 Scale factor for subsequent distances

09 Scale_factor

Scale factor to apply to subsequent slope distances.

10 Three hair stadia measurement

10 Point_description horizontal_circle vertical_circle bottom middle top

Manual measurement. A *measurement* point is created with the *feature code* and *string number* from the *point_description*. The units for *horizontal_circle* and *vertical_circle* are decimal degrees.

The *point_number* and *text* from the *point_description* are recorded as the point number and text for that vertex of the super string.

If a *point_name* exists in the *point_description*, then it is a **named measurement** and a 4d point string of name *point_name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *point_name*. The *point_name* is added to the internal list of named points for searching for co-ordinates.

11 Measurement - HA, HD, Height

11 Point_description horizontal_circle horizontal_distance height

Measurement made by the instrument. A *measurement* point is created with the *feature code* and *string number* from the *point_description*. The unit for *horizontal_circle* is decimal degrees.

The *point_number* and *text* from the *point_description* are recorded as the point number and text for that vertex of the super string.

If a *point_name* exists in the *point_description*, then it is a **named measurement** and a 4d point string of name *point_name* is created and mapped using the mapping file. The 4d text is the station prefix

followed by *point_name*. The *point_name* is added to the internal list of named points for searching for co-ordinates.

12 Measurement - HA, HD, Height difference

11 *Point_description horizontal_circle horizontal_distance height_difference*

Measurement made by the instrument. A *measurement* point is created with the *feature code* and *string number* from the *point_description*. The unit for *horizontal_circle* is decimal degrees.

The *point_number* and *text* from the *point_description* are recorded as the point number and text for that vertex of the super string.

If a *point_name* exists in the *point_description*, then it is a **named measurement** and a 4d point string of name *point_name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *point_name*. The *point_name* is added to the internal list of named points for searching for co-ordinates.

15 Vertical circle correction

09 *Vertical_circle_in_decimal_degrees*

The *vertical_circle_in_decimal_degrees* is **subtracted** from the vertical circle value in any measurements. The units for *vertical_circle_in_decimal_degrees* is decimal degrees.

16 Multiply coded point

16 *Point_description*

Additional coding for the current measurement point created by op codes 02, 07 or 10. A new measurement point is created at the same position as the current measurement point but with the *feature code* and *string number* from the *point_description* for this op code.

The *point_number* and *text* from the *point_description* are recorded as the point number and text for that vertex of the super string.

If a *point_name* exists in the *point_description*, then it is a **named measurement** and a 4d point string of name *point_name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *point_name*. The *point_name* is added to the internal list of named points for searching for co-ordinates.

17 Arc through previous three points

17 [*Point_description*]

If no *point_description* is given, then the current measurement point and the two previous points with the same *feature code* and *string number* as the current measurement point, are joined by an arc. If there is less than three such points, no arc is fitted.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* from the *point_description* exist, the last three previous measurement points of the same *feature code* and *string number* are joined by an arc. If the current measurement point has that *feature code* and *string number*, then it is the third of the three points used. If there is less than three points, no arc is fitted.

If *Point_number* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point number. That point and the two measurement points previous to the predefined point of the same *feature code* and *string number*, are joined by an arc. If there is less than three points, no arc is fitted

See [Arcs Through Points](#)

18 Circle Feature

18 *Radius*

Creates a feature string with the given radius and centred on the current measurement point.

See [Feature](#)

20 Close string

20 [Point_description]

If no *point_description* is given, the current string is closed.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* from the *point_description* exist, the last previous string with that *feature code* and *string number* is closed.

If the *point number* from the *point_description* exists, then the string containing that point number will be closed.

See [Close String](#)

21 Join last points of strings

21 *Feature_code string_number_1 string_number_2*

In the final reduction, the last point of the string with the given *feature_code* and *string_number_1* is joined to the last point of the string with given *feature_code* and *string_number_2*. The created string has the given *feature_code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

See [Joining Strings](#)

22 Join first to last point of strings

22 *Feature_code string_number_1 string_number_2*

In the final reduction, the first point of the string with the given *feature_code* and *string_number_1* is joined to the last point of the string with given *feature_code* and *string_number_2*. The created string has the given *feature_code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

See [Joining Strings](#)

23 Join first points of strings

23 *Feature code string number_1 string number_2*

In the final reduction, the first point of the string with the given *feature code* and *string number 1* is joined to the first point of the string with given *feature code* and *string number 2*. The created string has the given *feature code* (no string number is needed since it is the final reduction when the string numbers are then dropped).

See [Joining Strings](#)

28 Add text to the string name

28 [Point_description] *Text*

Text is appended to the string name. For example, if 1.200 is entered, "1.200" is appended to the string name.

If no *point_description* is given, *Text* is appended to the string name of the current string.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last previous string with that *feature code* and *string number* has *Text* appended to the string name.

If the *point number* exists, then the string containing that point number has *Text* appended to the string name.

29 Note or memo*29 Comments*

Any text may be entered and will be added to the check measurements model at the position of the current measurement point.

30 Remove height from a point - that is make it a null height*30 [Point_description]*

If no *point_description* is given, the height of the current measurement point is set to null.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the height of the last point of the previous string with that *feature code* and *string number* is set to null.

If the *point number* exists, then the height of the point with that point number is set to null.

37 Rectangle by two points*37 [Point_description] offset_in_metres*

The rectangle is defined by two points (reference side) and a offset.

If a positive offset value is given, two points will be created to the right of the reference side.

If a negative offset value is given, two points will be created to the left of the reference side.

If no *point_description* is given, the two new points will be joined to the given points in a closed rectangular string, and will have the same feature code as the points given.

If the *feature code* and *string number* exist, then a search is made for the last occurrence of two points with the same *feature code* and *string number*. If found, then these points are used to define the reference side of the rectangle.

If the *point number* exists, then a search is made for the last occurrence of two points with the same *feature code* and *string number* as the point given by the point number. If found, then these points are used to define the reference side of the rectangle.

Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

See [Rectangle by 2 Points](#)

38 Make the previous segment non-tinable*38 [Point_description]*

If no *point_description* is given, the previous segment containing the current measurement point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point number* exists, then the segment containing the point with that point number as an end point, is set to non-tinable.

39 Make the next segment non-tinable*39 [Point_description]*

If no *point_description* is given, the next segment containing the current measurement point as a starting point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point number* exists, then the segment containing the point with that point number as a start point, is set to non-tinable.

40 Make a point non-tinable

40 [*Point_description*]

If no *point_description* is given, the current measurement point is set to non-tinable. That is, it will not be included in triangulations.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point number* exists, then the point with that point number is set to non-tinable.

41 Add additional text for the current measurement point

41 *Text*

The given *text* is added to the end of any existing text for the current measurement point. Any spaces from column four onwards will be part of the text.

42 Add a radial offset

42 [*Point_description*] *Radial_offset_in_metres*

The *radial_offset_in_metres* is used to adjust the position of the specified point by a plan distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station, negative is toward the station.

If no *point_description* is given, the offset is used to adjust the position of the current measured point.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point number* exists, then the point with that point number is adjusted.

See [Offsets](#)

43 Add a tangential offset

43 [*Point_description*] *Tangential_offset_in_metres*

The *tangential_offset_in_metres* is used to adjust the position of the specified point by a plan distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A negative offset is to the left (looking from the station), and positive is to the right (looking from the station).

If no *point_description* is given, the offset is used to adjust the position of the current measured point.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point number* exists, then the point with that point number is adjusted.

See [Offsets](#)

44 Add a height offset

44 [*Point_description*] *Height_offset_in_metres*

If the height of the specified point is not null, then the *height_offset_in_metres* adjusts the height of the point. A positive offset adds to the height, a negative offset reduces the height.

If no *point_description* is given, the offset is used to adjust the position of the current measured point.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point number* exists, then the point with that point number is adjusted.

See [Offsets](#)

45 Make a parallelogram from the last three measurement points

45 [*Point_description*]

If no *point_description* is given, the current measurement point and the two previous points from the current string are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last three points with that *feature code* and *string number* are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the *point number* exists, then the *feature code* and *string number* of the point with that point number are used and processed as above. Note that the point with the point number is not necessarily used.

See [Rectangle](#)

46 Make the string a breakline or not

46 [*Point_description*] [*mode*]

The *point_description* is used to select a string and the *mode* is used specify if the string is a breakline or not.

point_description:

If no *point_description* is given, the current string is selected.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with that *feature code* and *string number* is selected.

If the *point number* exists, then the string containing the point with that point number is selected.

mode:

If no *mode* is given, the selected string is set as a point string (that is, not a breakline).

If *mode* is given, then

if *mode* is 0, the selected string is set to a point string and hence is not a breakline.

if *mode* is 1, the selected string is set to a *line* string and is therefore a breakline

47 Start a new string using the same feature code and string number

47 [*Point_description*]

If no *point_description* is given, the current string is terminated (without including the current

measurement point) and the current measurement point becomes the first point of a new string with the same feature code and string number.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that feature code and string number becomes the first point of a new string with the same *feature code* and *string number*.

If the *point number* exists, then the previous string containing the point with that point number is terminated *before* the point number point, and the point becomes the first point of a new string with the same *feature code* and *string number*.

See [Start New String](#)

48 End a string

48 [*Point_description*]

If no *Point_description* exists, the current string is terminated (including the current measurement point).

If *Feature_code* and *String_number* exist, then the last point of the previous string with that feature code and string number becomes the last point of that string.

If *Point_number* exists, then the previous string containing the point with that point number is terminated *after* the point number point

50 Specify the bearing to correct for true north - used as the bearing datum difference

50 *Point_description bearing_in_decimal_degrees*

The *bearing_in_decimal_degrees* is used as the bearing datum difference for the current instrument set up. The *point_name* in the *point_description* and the *bearing_in_decimal_degrees* are written to the report file.

51 Start using an existing field template

51 *Template_name zigzag_mode*

Start using the field template *Template_name*. If *Template_name* is blank, the default field template is used.

If *mode* is "for", then the field template is used as a *forward* template.

"rev", then the field template is used as a *reverse* template.

"zig", then the field template is used as a *zigzag* template and is used in the *forward* definition direction first (that is starts on a zig).

"zag", then the template is used as a *zigzag* template and is used in the *reverse* direction first (that is, starts on a zag).

If *mode* is blank, or anything other than "for", "rev", or "zag" then the field template is used as a zigzag template starting on a *zig*.

See [Field Templates](#)

52 Finish using a field template or finish recording a field template

52

Stops using the current field template or stops recording a field template.

See [Field Templates](#)

53 Pause using the current field template

53

Pause using the current field template or defining a field template, until a continue field template (54) or a finish field template (52) code is given.

See [Field Templates](#)

54 Continue the current field template

54

Continue using or defining the current field template, which has been stopped by a *Pause* field template command (53). The *Continue* command only needs to be given once and applies to all following measurements until another *Pause* or *Finish* command is given.

See [Field Templates](#)

55 Start recording a field template

55 [Template_name]

Start recording a field template with the name *Template_name*. If *Template_name* is blank, then it is the default field template that is defined. The *feature_code* and *string_number* of the following measurements until a *Finish* code (52) are stored as the field template. There is no limit to the number of points in a field template.

See [Field Templates](#)

56 Skipping picking up points when using a field template

56 [num_skipped_points]

Allows the user to skip picking up one or more points from the field template currently being used. The next measurement takes the *feature_code* and *string_number* from the next point of the field template definition. If *num_skipped_points* is missing, then only one point is skipped otherwise *num_skipped_points* are skipped.

See [Skipping Field Template Points](#)

57 Delete points on a field template - after the measurement of last point

57 [num_points_to_delete]

Allows the user to delete one or more points from the field template currently being used. The *next measurement* takes the *feature_code* and *string_number* from the next point of the field template definition.

See [Field Templates](#)

58 Insert points when using a field template - after the measurement of last point

58 Feature_code String_number Multiple_code_flag Insert_special_flag

Allows the user to insert points into the field template currently being used, or give an existing point a multiple code.

If the *Multiple_code_flag* = 1, then the feature code will be added to the previous defined template point else if *Multiple_code_flag* = 0 (default), it will be added to the template as a separate point.

If the insert is done at the end of a section and the *Insert_special_flag* = 1 the point will be added to the end of the current template section else it will be at the start of the next section.

The *next measurement* takes the *feature_code* and *string_number* from the next point of the field template definition.

See [Insert Template Points or Insert Multiple Codes](#)

60 Arc through next three points

60 [Point_description]

If no *point_description* is given, an arc is inserted through the current measurement point and the next two measured points with the same feature code and string number as the current measurement point. If there is less than three points, no arc is fitted.

If a *point_description* exists, then either the *feature code* and/or *string number* and/or the *point number* section of the *point_description* can be used.

If the *feature code* or *string number* from the *point_description* exist, a search is made for a previously

defined measurement with the same feature code or string number. An arc is inserted through this previous measurement and the next two measured points following this previous measurement with the same feature code and string number, as given in *point_description*. If the current point has that feature code and string number, then it is the first of the three points. If there is less than three points, no arc is fitted.

If the *point number* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point number, and an arc is inserted through that point and the next two measurement points with the same *feature code* and *string number*. If there is less than three points, no arc is fitted

See [Arcs Through Points](#)

61 Start of arc through sets of three points until end of string, or a 62 occurs

61 [Point_description]

If no *point_description* is given, arcs are inserted through the following sets of measurement points with the same feature code and string number as the current measurement point. The current measurement point is the first of the points.

The arcs are fitted as follows - the first arc is fitted through points one, two and three, the next arc through points three, four and five etc. If the current point has that feature code and string number, then it is the first of the points. If there is less than three points, then no arc is fitted.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through the following measured points with the same feature code and string number as given in *point_description*. If the current point has that feature code and string number, then it is the first of the points.

If the *point number* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point number, and arcs are inserted through that point and the following measured points with the same *feature code* and *string number*.

See [Arcs Through Points](#)

62 End the arcs begun by a 61 command

62 [Point_description]

If no *point_description* is given, then the fitting of arcs through the points of the current string is stopped. The current measurement point is the last of the points used in the arc fitting.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* from the *point_description* exist, then the fitting of arcs through the points of the previous string with the same *feature code* and *string number* is stopped. If the current measurement point has that feature code and string number, then it is the last point used in the arc fitting.

If the *point number* from the *point_description* exists, then the point with that point number is the last point used in the arc fitting.

If **12d Model** encounters an *End Arcs* (62) but no *Start Arcs through sets of three points* (61) command for the string, then a *Start Arcs through sets of three points* (61) is assumed to apply at the beginning of the string and hence arc fitting will be applied to the entire string.

See [Arcs Through Points](#)

There are op codes for adding user defined attributes to:

- (a) the current string being measured (i.e. the string containing the current measurement point)

- (b) the current measurement point
 - (c) the next segment from the current measurement point (i.e. the segment joining the current measurement point and the *next* measured point of the same feature code and string number)
- or
- (d) the previous segment to the current measurement point (i.e. the segment joining the current measurement point to the previous measured point of the same feature code and string number).

If there is no name for the attribute (name is just spaces or a tab), then the attribute is *unnamed*. The attributes are coded in the following way:

68 Add an integer user defined attribute to the current string

68 Name Integer

Add an user defined integer attribute to the current string.

69 Add a real user defined attribute to the current string

69 Name Real

Add a real (floating point) user defined attribute to the current string.

70 Add text user defined attribute to the current string

70 Name Text

Add a text user defined attribute to the current string.

71 Add integer user defined attribute to the current point

71 Name Integer

Add an integer user defined attribute to the current measurement point.

72 Add real user defined attribute to the current point

72 Name Real

Add a real (floating point) user defined attribute to the current measurement point.

73 Add text user defined attribute to the current point

73 Name Text

Add a text user defined attribute to the current measurement point.

74 Add integer user defined attribute to the next segment

74 Name Integer

Add an integer user defined attribute to the next segment from the current measurement point.

75 Add real user defined attribute to the next segment

75 Name Real

Add a real (floating point) user defined attribute to the next segment from the current measurement point.

76 Add text user defined attribute to the next segment

76 Name Text

Add a text user defined attribute to the next segment from the current measurement point.

77 Add integer user defined attribute to the previous segment

77 Name Integer

Add an integer user defined attribute to the previous segment for the current measurement point.

78 Add real user defined attribute for the previous segment*78 Name Real*

Add a real (floating point) user defined attribute to the previous segment for the current measurement point.

79 Add text user defined attribute to the previous segment*79 Name Text*

Add a text user defined attribute to the previous segment for the current measurement point.

In addition, extra codes allow special **12d Model** pipe strings to be coded in the field

80 Pipe invert point (bottom of the pipe)*80 [Point_description]*

If no *point_description* is given, the current measurement point is on the invert (bottom) of a pipe. This is the default for measurements to points on pipe strings. If the point is not part of a pipe string, it is ignored.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point_description* is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point number* exists, then the point with that point number is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

81 Pipe axial point (centre of the pipe)*81 [Point_description]*

If no *point_description* is given, the current measurement point is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point_description* is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point number* exists, then the point with that point number is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

82 Pipe obvert point (top of the pipe)*82 [Point_description]*

If no *point_description* is given, the current measurement point is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point_description* is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point number* exists, then the point with that point number is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

83 Start recording a shape - before the measurement*83 [Shape_name]*

Start recording a shape with the name *Shape_name*. If *Shape_name* is non-blank, then the default field Shape is defined by the *feature_code* and *string_number* of the following measurements until a *Finish* code (84) are stored as the shape. There is no limit to the number of points in a shape.

See [Shape field coding](#)

84 Finish using a shape definition or finish recording a shape - after the measurement

Stops using the current shape or stops recording a shape.

See [Shape field coding](#)

85 Shape parallel*85 [Shape_name] [Point_description]*

Takes all the points on the defined shape of *Shape_name* and parallels them the entire length of the string. Once paralleled, a number of strings are created.

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* has the shape applied to the entire length of the string.

If *Point_number* exists, then the string containing that point number has the shape applied to the entire length of the string.

See [Shape field coding](#)

86 Shape extrude*86 [Shape_name] [Point_description]*

Takes the defined shape of *Shape_name* and extrudes it along the entire length of the string. Once extruded, only one strings is created which contains all the shape information.

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* has the shape applied to the entire length of the string.

If *Point_number* exists, then the string containing that point number has the shape applied to the entire length of the string.

See [Shape field coding](#)

92 Remove all z-values for a string (i.e. make all z-values null)*92 [Point_description]*

If no *point_description* is given, all z-values for the current string are removed.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* has all its z-values removed.

A *point-line type* can be embedding as a 0 or 1 in the *point name* part of the *point description* field. A zero value specifies a point string, and a non-zero value specifies a line string. If the field was omitted, a line string is assumed.

The point-line type may be overridden by the mapping file.

93 Set the Point-line type*93 [Point_description]*

A *point-line type* can be embedding as a 0 or 1 in the *point name* part of the *point description* field. A zero value specifies a point string, and a non-zero value specifies a line string. If the field was omitted, a line string is assumed.

If no *point_description* is given, the point-line type for the current string is set to *line*.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the point-line type is set for the last previous string with the same *feature code* and *string number*.

If the *point number* exists, then the point-line type is set for the string containing that point number.

The point-line type may be overridden by the mapping file.

94 Use name library file/ mapping file for vertex text on the string - name mapping

94 [*Point_description*]

If this op code exists then during reduction, vertex text is creating using either the name library, or if the name library doesn't exist, the map file. If neither exist then the op code is ignored.

if a name library is used and the feature code of the string is found in the first column of the name library, then the entry from the second column of that row will be used as text for *all* vertices of the string that don't already have vertex text. As a default, the string is set as a point string.

if the map file is used and the feature code of the string is found in the first column of the map file, then the *string name* field of the map file is used as vertex text for all vertices that don't already have text. As a default, the string is set as a point string.

If no *point_description* is given, then name mapping is applied to the current string.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, then name mapping is applied to the last previous string with the same *feature code* and *string number*.

If the *point number* from the *point_description* exists, then name mapping is applied to the string containing that point number.

A *point-line type* can be embedding as a 0 or 1 in the *point name* part of the *point description* field. A zero value specifies a point string, and a non-zero value specifies a line string. If the field was omitted, a line string is assumed.

The point-line type may be overridden by the mapping file.

95 Pipe string

95 [*Point_description*] *diameter*

Pipe strings are always line strings and are stored with the justification of the majority of the string points. Individual pipe points are picked up either top (obvert), centre (axial) or bottom (invert) of the pipe using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a pipe string with the given diameter.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a pipe with the given diameter.

If the *point number* exists, then the string containing that point number is created as a pipe string with the given diameter.

96 Culvert string

96 [*Point_description*] *width* *height*

Culvert strings are always line strings and are stored with the justification of the majority of the string points. Individual culvert points are picked up either top (obvert), centre (axial) or bottom (invert) of the culvert using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a culvert string with the given width and height.

If a *point_description* exists, then either the *feature code* and *string number* or the *point number* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a culvert with the given width and height.

If the *point number* exists, then the string containing that point number is created as a culvert string with the given width and height.

99 Terminate processing

99

Stop processing the 12d field file at this line. Useful for debugging errors.

107 Make the previous segment invisible - after the measurement

107 [*Point_description*]

If no *Point_description* exists, the previous segment containing the current measurement point is set to invisible.

If the *Feature_code* and *String_number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to invisible.

If *Point_number* exists, then the segment containing the point with that point number as an end point, is set to invisible.

108 Make the next segment invisible - after the measurement for the first point of the segment

108 [*Point_description*]

If no *Point_description* exists, the next segment containing the current measurement point as a starting point is set to invisible.

If the *Feature_code* and *String_number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to invisible.

If *Point_number* exists, then the segment containing the point with that point number as a start point, is set to invisible.

109 Make a point invisible - after the measurement

109 [*Point_description*]

If no *Point_description* exists, the current measurement point is set to invisible.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that *feature code* and *string number* is set to invisible.

If *Point_number* exists, then the point with that point number is set to invisible.

110 Start buildings face observations - before the measurements

110 [*Building_name*]

Start recording a field template with the name *Building_name*. If *Building_name* is non-blank, then the default building face is defined. The *feature_code* and *string_number* of the following measurements until a *Finish* code (111) are stored as the building face. There is no limit to the number of points in a building face.

111 End building face observations

111 [*Building_name*]

If no *Building_name* exists, the current building face observation set is finished (including the current measurement point).

Notes

1. Arc fitting is applied *after* the Joins are processed. Hence the new joined strings are created and then curve fitting is applied according to the arc codes (start arc, end arc, fit arcs, stop fitting arcs etc.) on any vertex of the string.
2. The *point description* has several pieces of information embedded in it and has been described in the previous section. For some op codes, the *point name* section of the *point description* is used to hold other information.

For a summary of the **12d Field File Op Codes**, go to the section [Summary of 12d Field File Op Codes](#)

Summary of 12d Field File Op Codes

Op Code	Description of Record
-2	Comment
-1	Error
01	Header Information
02	Directly entered coordinate measurement
03	New instrument setup point
04	Measurement to backsight
05	New target height
06	Check measurement
07	Measurement - HA, VA, SD
09	Scale factor for subsequent distances
10	Three hair stadia measurement
11	Measurement - HA, HD, Ht
12	Measurement - HA, HD, Ht diff
15	Vertical circle correction
16	Multiply coded point
17	Arc through previous three points
18	Circle Feature
20	Close string
21	Join last points of strings
22	Join first to last point of strings
23	Join first points of strings
28	Add text to the string name
29	Note or memo
30	Remove height from a point - that is make it a null height
37	Rectangle by two points
38	Make the previous segment non-tinable
39	Make the next segment non-tinable
40	Make a point non-tinable
41	Add additional text for the current measurement point
42	Add a radial offset
43	Add a tangential offset
44	Add a height offset
45	Make a parallelogram from the last three measurement points
46	Make the string a breakline or not
47	Start a new string using the same feature code and string number
48	String end
50	Specify the bearing to correct for true north - used as the bearing datum difference
51	Start using an existing field template
52	Finish a field template or finish recording a field template
53	Pause the current field template until a continue op code (54) or a finish template (52)
54	Continue the current field template
55	Start recording a field template
56	Skip picking up one or more points from a field template
57	Delete one or more points from a field template
58	Insert a point into a field template
60	Arc through next three points
61	Start of arc through sets of three points until end of string, or a 62 occurs
62	End the arcs begun by a 61 command
68	Add an integer user defined attribute to the current string
69	Add a real user defined attribute to the current string
70	Add text user defined attribute to the current string
71	Add integer user defined attribute to the current point
72	Add real user defined attribute to the current point
73	Add text user defined attribute to the current point
74	Add integer user defined attribute to the next segment

- 75 Add real user defined attribute to the next segment
- 76 Add text user defined attribute to the next segment
- 77 Add integer user defined attribute to the previous segment
- 78 Add real user defined attribute for the previous segment
- 79 Add text user defined attribute to the previous segment
- 80 Pipe or culvert invert point (bottom of the pipe or culvert)
- 81 Pipe or culvert axial point (centre of the pipe or culvert)
- 82 Pipe or culvert obvert point (top of the pipe or culvert)
- 83 Start recording/measuring a shape
- 84 End measuring a shape
- 85 Parallel an existing shape
- 86 Extrude an existing shape
- 92 Remove all z-values for a string (i.e. make all z-values null)
- 93 Set the Point-line type
- 94 Use name library file/ mapping file for vertex text on the string - name mapping
- 95 Pipe string
- 96 Culvert string
- 99 Terminate processing
- 107 Last segment of point invisible
- 108 Next segment of point invisible
- 109 Point invisible
- 110 Building face start recording
- 111 Building face end recording

Batch Typed Entry

Typed entry can be used to enter survey data into a 12d Field File and reduced using the Survey data Editor.

12d Model uses the following 12d field file ops code:

Op Code	Description of Record
-2	Comment
-1	Error
01	Header Information
02	Directly entered coordinate measurement
03	New instrument setup point
04	Measurement to backsight
05	New target height
06	Check measurement
07	Measurement - HA, VA, SD
09	Scale factor for subsequent distances
10	Three hair stadia measurement
11	Measurement - HA, HD, Ht
12	Measurement - HA, HD, Ht diff
15	Vertical circle correction
16	Multiply coded point
17	Arc through previous three points
18	Circle Feature
20	Close string
21	Join last points of strings
22	Join first to last point of strings
23	Join first points of strings
28	Add text to the string name
29	Note or memo
30	Remove height from a point - that is make it a null height
37	Rectangle by two points
38	Make the previous segment non-tinable
39	Make the next segment non-tinable
40	Make a point non-tinable
41	Add additional text for the current measurement point
42	Add a radial offset
43	Add a tangential offset
44	Add a height offset
45	Make a parallelogram from the last three measurement points
46	Make the string a breakline or not
47	Start a new string using the same feature code and string number
48	String end
50	Specify the bearing to correct for true north - used as the bearing datum difference
51	Start using an existing field template
52	Finish a field template or finish recording a field template
53	Pause the current field template until a continue op code (54) or a finish template (52)
54	Continue the current field template
55	Start recording a field template
56	Skip picking up one or more points from a field template
57	Delete points from a field template
58	Insert points in a field template
60	Arc through next three points
61	Start of arc through sets of three points until end of string, or a 62 occurs
62	End the arcs begun by a 61 command
68	Add an integer user defined attribute to the current string
69	Add a real user defined attribute to the current string
70	Add text user defined attribute to the current string

- 71 Add integer user defined attribute to the current point
- 72 Add real user defined attribute to the current point
- 73 Add text user defined attribute to the current point
- 74 Add integer user defined attribute to the next segment
- 75 Add real user defined attribute to the next segment
- 76 Add text user defined attribute to the next segment
- 77 Add integer user defined attribute to the previous segment
- 78 Add real user defined attribute for the previous segment
- 79 Add text user defined attribute to the previous segment
- 80 Pipe or culvert invert point (bottom of the pipe or culvert)
- 81 Pipe or culvert axial point (centre of the pipe or culvert)
- 82 Pipe or culvert obvert point (top of the pipe or culvert)
- 83 Start recording/measuring a shape
- 84 End measuring a shape
- 85 Parallel an existing shape
- 86 Extrude an existing shape
- 92 Remove all z-values for a string (i.e. make all z-values null)
- 93 Set the Point-line type
- 94 Use name library file/ mapping file for vertex text on the string - name mapping
- 95 Pipe string
- 96 Culvert string
- 99 Terminate processing
- 107 Last segment of point invisible
- 108 Next segment of point invisible
- 109 Point invisible
- 110 Building face start recording
- 111 Building face end recording

Users can enter text for each measurement (observation 09 record or position 08 record) which is appended to the end of the record and this is used as the text of blocks that are interpreted according to the descriptions given in the earlier section [Field Coding for Non Leica Instruments](#).

The '13' record can also be used after a measurement record to add additional information to the preceding blocks using the *extra coding* control code at the end of the previous line (see [Extra Coding](#) in the section [Control Code Blocks](#))

Strictly speaking the Sokkia SDR20/33 formats use fixed length lines and if the lengths are incorrect, an error message will be written to the Output Window. For example,

'Line 248 line incorrect length. required length is 58. received length is 50.'

These messages often appear after a raw file has been manually edited because most editors remove space padding at the end of a line.

For the full description of the **12d Field File Op Codes**, go to the section [Full Description of 12d Field File Op Codes](#)

C 12d and Sokkia Instruments (SDR Files)

This Section deals with interfacing 12d with Sokkia SDR20/33 data formats specifically with the SDR33 electronic field book (Controller). Other controllers and instruments such as the powerset range of total stations also use these formats.

A large number of instruments support the Sokkia SDR data format including (Trimble Total Station ACU), not just those from Sokkia.

For the topic:

1. Field Coding see the section [Coding For SDR Files](#)
2. Sending raw file from controller to 12d [Downloading SDR File To 12d](#)
3. Converting raw data to field file see the section [Converting SDR Raw File To Field File](#)
4. Creating Points upload file see the section [Creating SDR Point Upload File](#)
5. Creating Road upload file see the section [Creating SDR Roads Upload File](#)
6. Creating Tin upload file see the section [Create Tin Upload File](#)

Also, SDRMap users should also read the section [Special Notes for SDRmap Users](#)

Coding For SDR Files

The Sokkia SDR20/33 data formats are used as raw data files by 12d Model and are converted into a 12d Field File before reduction. 12d Model uses the following Sokkia records:

01	Record header - SDR format
02	Station details
03	Target height
07	Back bearing details
08	Position - directly entered co-ordinates
09	Observation - measurement
13	Comment or continuation of blocks
15	RTK station details
16	RTK observation - measurement
57	RTK antenna height

Users can enter text for each measurement (observation 09 record or position 08 record) which is appended to the end of the record and this is used as the text of blocks that are interpreted according to the descriptions given in the earlier section [Field Coding for Non Leica Instruments](#).

The '13' record can also be used after a measurement record to add additional information to the preceding blocks using the *extra coding* control code at the end of the previous line (see [Extra Coding](#) in the section [Control Code Blocks](#))

Strictly speaking the Sokkia SDR20/33 formats use fixed length lines and if the lengths are incorrect, an error message will be written to the Output Window. For example,

'Line 248 line incorrect length. required length is 58. received length is 50.'

These messages often appear after a raw file has been manually edited because most editors remove space padding at the end of a line.

To ignore such error messages, there is a setting *Allow bad line lengths* on the *Advanced* tab of the

Survey.4d Create/Edit panel. If this is set for a data collector, then lines of incorrect length will not be rejected.

Advanced	Upload	Instrument	V4 Columns
Comment raw files <input type="checkbox"/>			
Report header <input type="checkbox"/>			
Allow bad line lengths <input type="checkbox"/>			
Verbose <input type="checkbox"/>			
Allow point numbers as stations <input type="checkbox"/>			

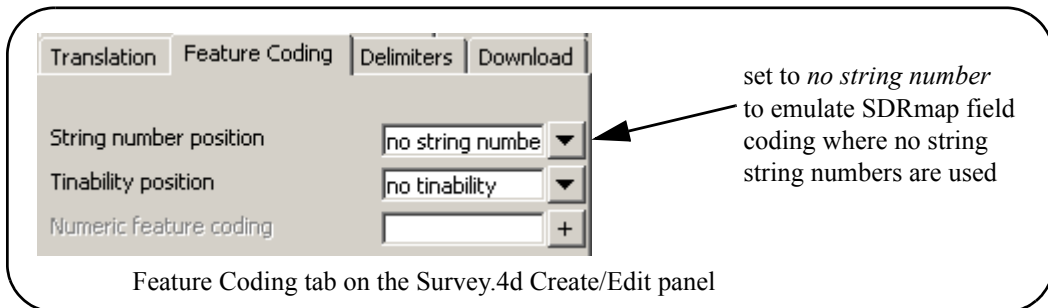

For non SDRmap users, please proceed to the section [Downloading SDR File To 12d](#).

SDRmap users, please continue to the next section [Special Notes for SDRmap Users](#).

Special Notes for SDRmap Users

SDRmap does not use String numbers - only Feature codes are used and a *New String* command to denote the start of a new string.

12d Model supports **only using a Feature code** by setting the *String number position* on the *Feature Coding* tab to **no string number**.

If *no string number* is set for the data collector (and so no string numbers are used in the field), then there is no way of telling from the field data whether the string is a *point* string or a *line* string (setting the pt-line type for the string).

For the *no string number* case, the method of defining the point-line type is to:

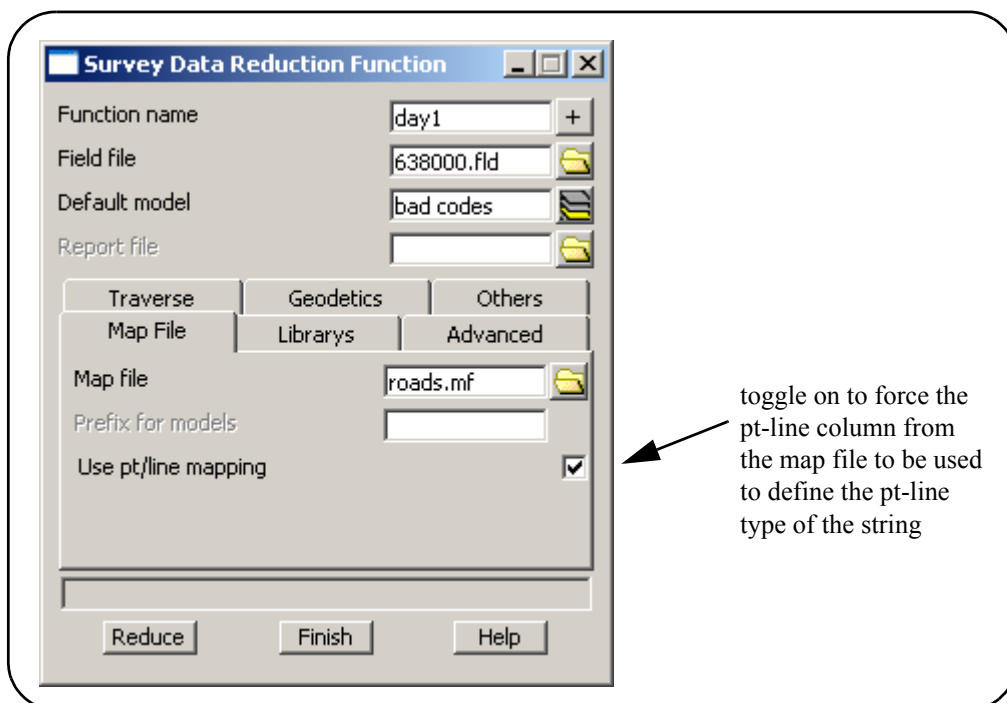

- (a) use a map file during the reduction

and

- (b) have a key in the map file to match the feature code *and* have the pt-line type set for that key. If the *feature code* does not match any key in the map file, the string defaults to a *point string*.

and

- (c) because by default the pt-string column in the map file is *ignored* during reduction (the string number usually defines the pt-line type), the *Use pt/line mapping* tick box in the Survey Data Reduction Function panel must be set to tick to *force* the pt-line column in the mapping file to be used.

Please continue to the next section [Downloading SDR File To 12d](#).

Downloading SDR File To 12d

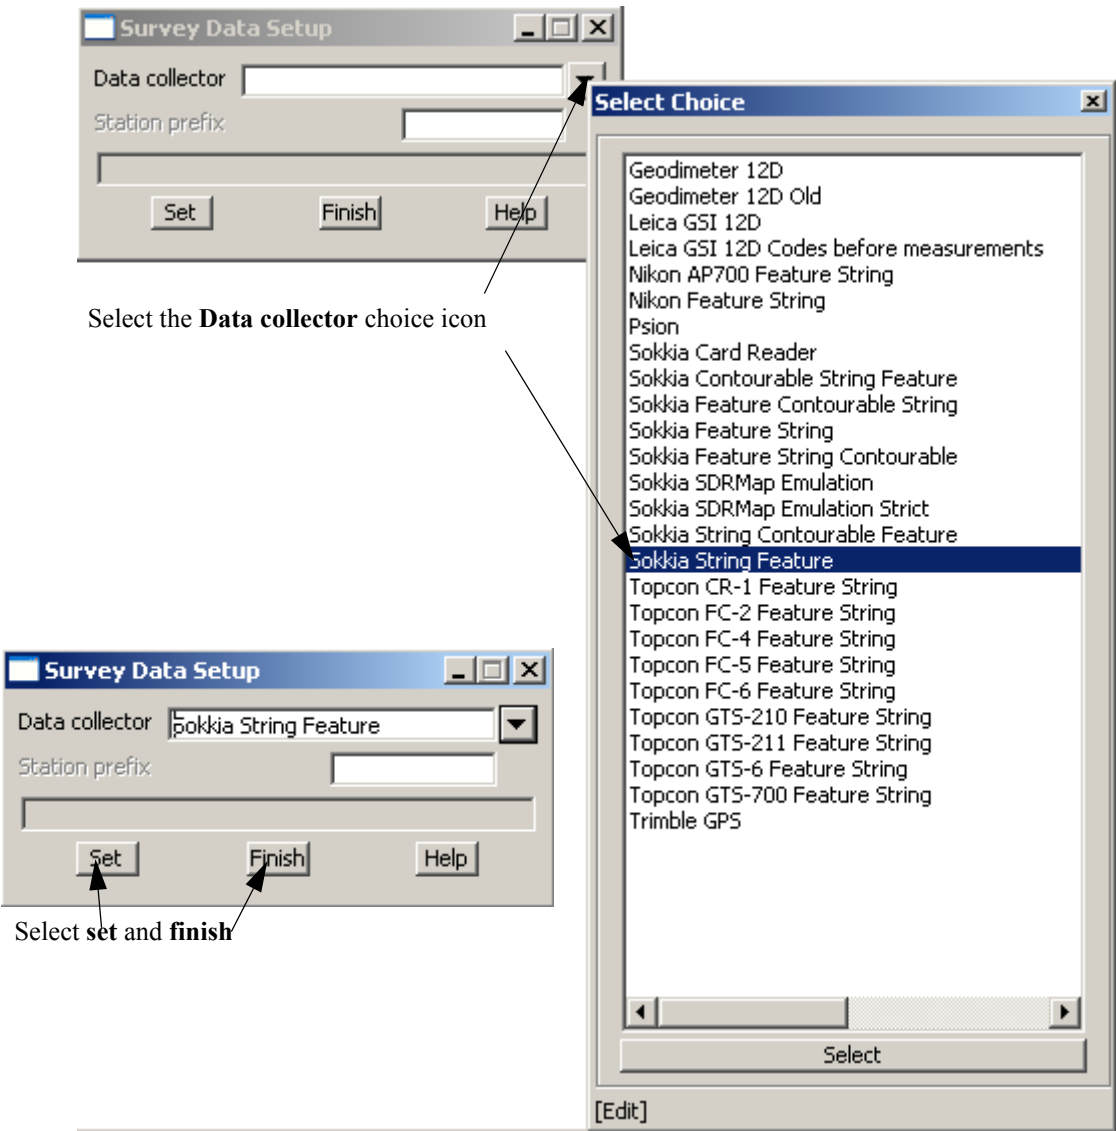

Raw SDR files can be input to 12d for reduction by two basic methods:

- 1. Download directly from the instrument
- 2. Copy the SDR file to the working folder directly from a PCMCIA card or by using a data transfer product such as "HyperTerminal" or "Wincomms". For this method, see the following section [Converting SDR Raw File To Field File](#).

An option exists within 12d to download the raw SDR file from the instrument. This option has the added functionality that is reduces the raw propriety format (SDR file) to a 12d field file format at the same time. This conversion requires that the data collector definition be set before the download of the file is commenced.

Select the data collector type

Select option *Survey=>Setup*

The raw file will be converted to the 12d field file format using the specified translator macro

Survey.4d Create/Edit

Collector: Sokkia String Feature

Templating | Shapes | Pipes/Culverts | Non Tinable
Non Visible | Strings | Others | Features
Advanced | Upload | Instrument | V4 Columns
Translation | Feature Coding | Delimiters | Download

Instrument: Sokkia 20/33
Raw file extension: .sdr
Macro: ☒
Translator: \$LIB/sdr.4do
Vertical circle: zenith

choice ok

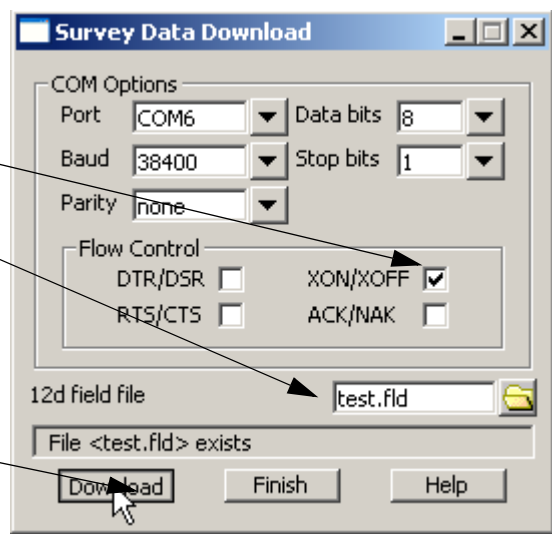

Defaults | Clear | Set | Save | Finish | Help

Select **Survey=>Download**

Ensure that the correct values are set for the comms settings i.e. they match the data collector parameters

Enter a name for the field file

Press **download**

The 12d download window is shown.

Prepare the data collector for download by connecting to appropriate port, selecting file to download etc.

From the Data collector main menu
select the **FUNC** (function) menu

Toggle down to the
Communications menu

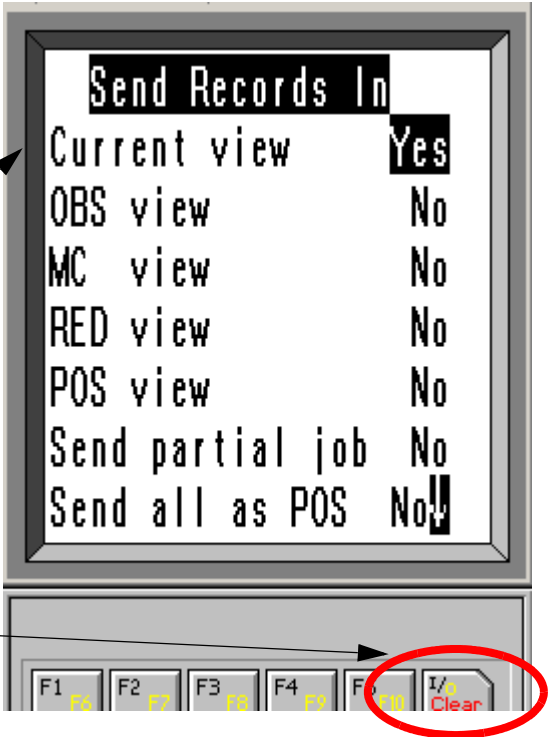

Press **OK** to select
menu

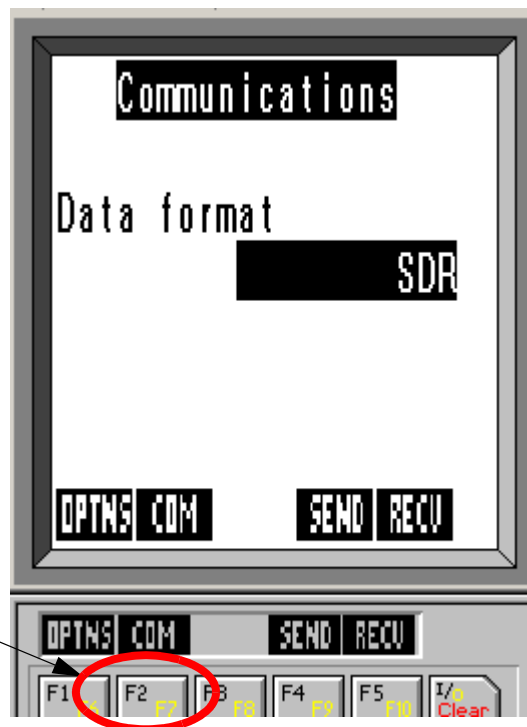

Select the **Options** menu to view the current settings

Select the **Current view** to **Yes** only. If the POS view were set to **Yes** also, the POS points would be sent also and eventually reduced twice in 12d (once from observations and the other from the POS record). Press **Clear** to leave menu

Select the **COM** menu to view the current comms settings

Ensure the comms settings are as per the values set in the 12d download option.

Select **Clear** to leave the menu

Select the **SEND** menu

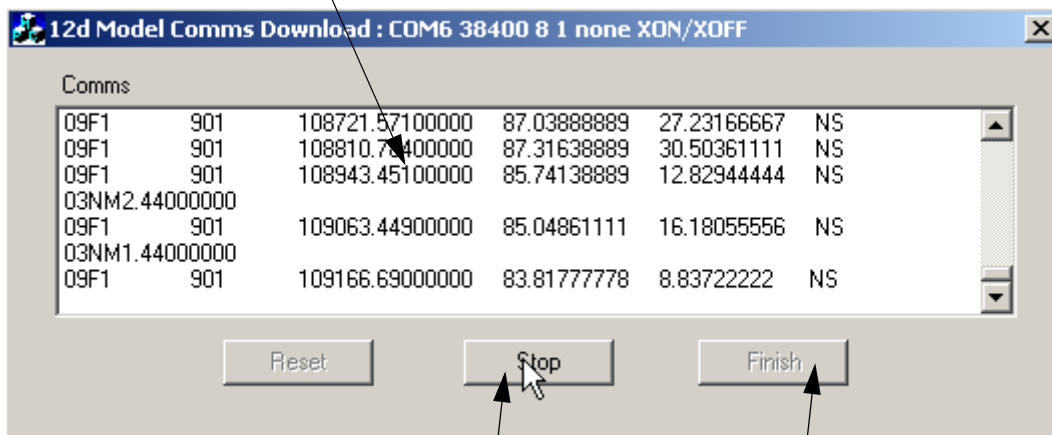

Select the file to download

Press **OK** to send

The file is shown downloading line by line in the 12d download window.

When the download is finished select the **stop** button and then **finish**

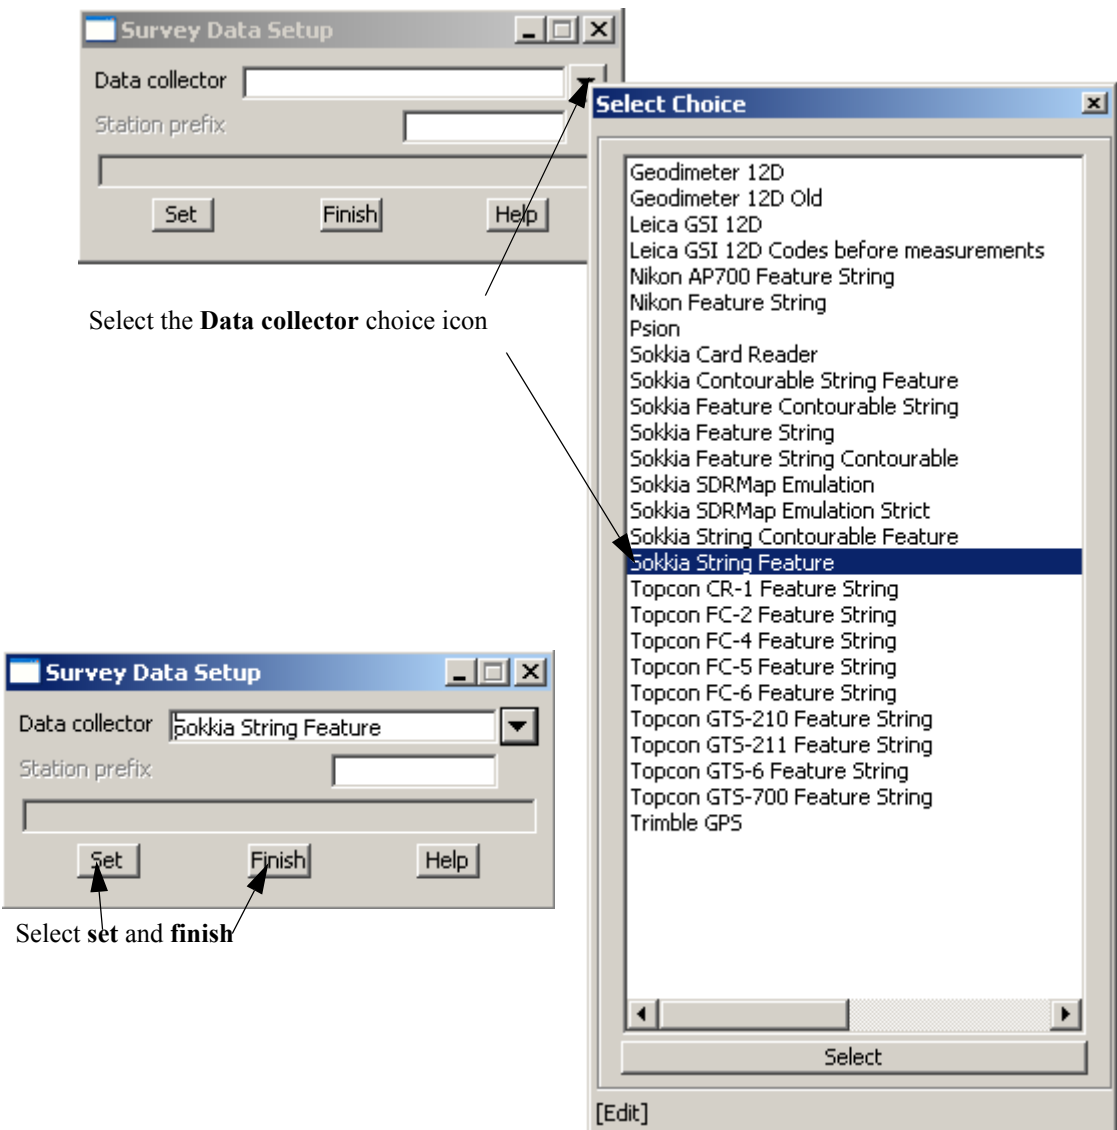

Please continue to the next section [Converting SDR Raw File To Field File](#)

Converting SDR Raw File To Field File

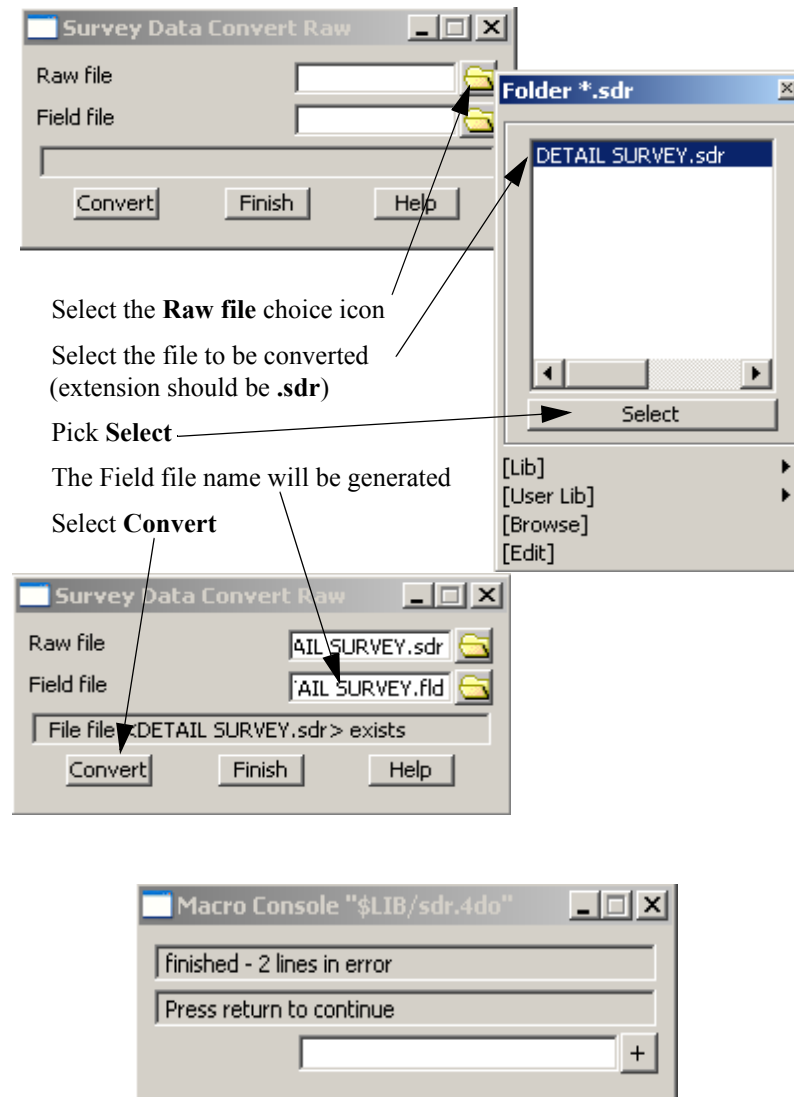

If a raw SDR file is copied to the working folder from a PCMCIA card or other means such as transferring it from a third party software package, it must be converted to a 12d field file for reduction inside 12d.

Select the data collector type

Select option *Survey=>Setup*

Select option *Survey=>Convert raw*

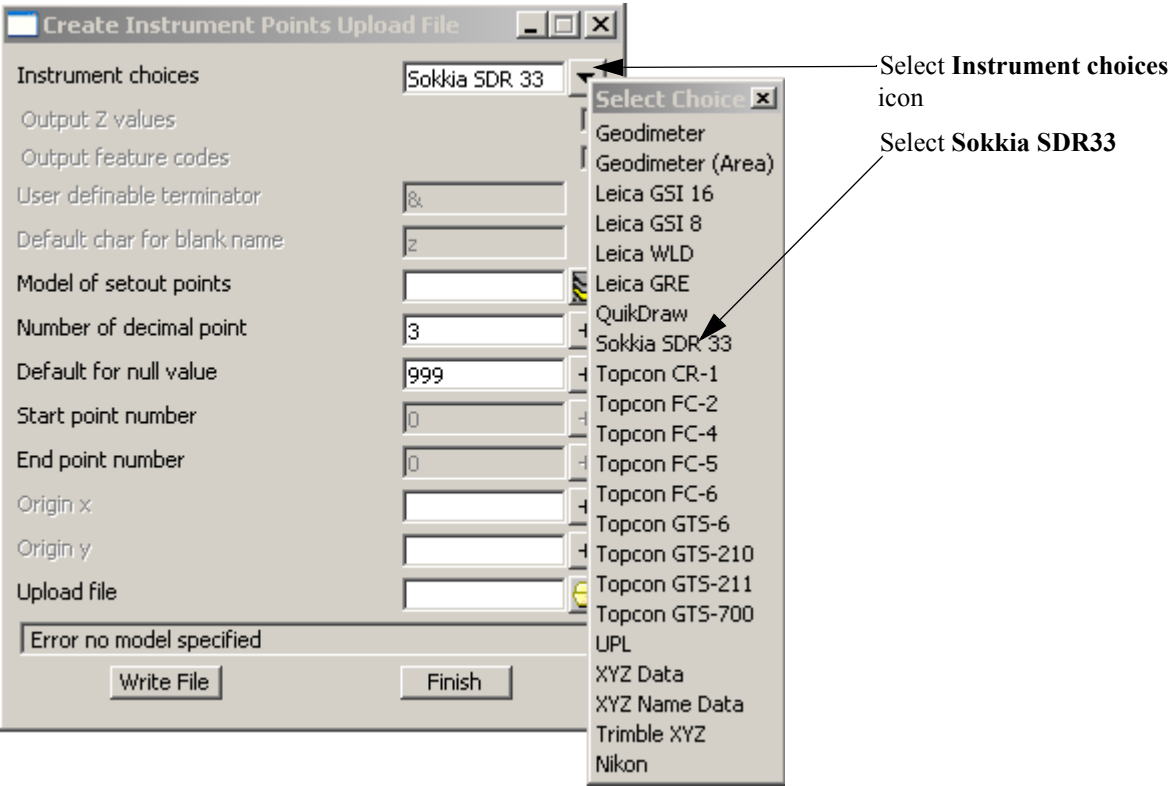

Any errors will be listed in the Output window. If the Output window is not shown, it can be opened using the option **Window=>Output Window**

Creating SDR Point Upload File

Create upload file in 12d

After creating the setout points an upload file can be created for the sdr format

Select option *Survey=>Upload=>Create points upload file*

Fill in the rest of the screen as per normal

Select **Write File**

A SDR33 file is created ready to send to the instrument directly using the upload facility or by copying the file to PCMCIA cards etc.

Loading file into controller using 12d upload facility

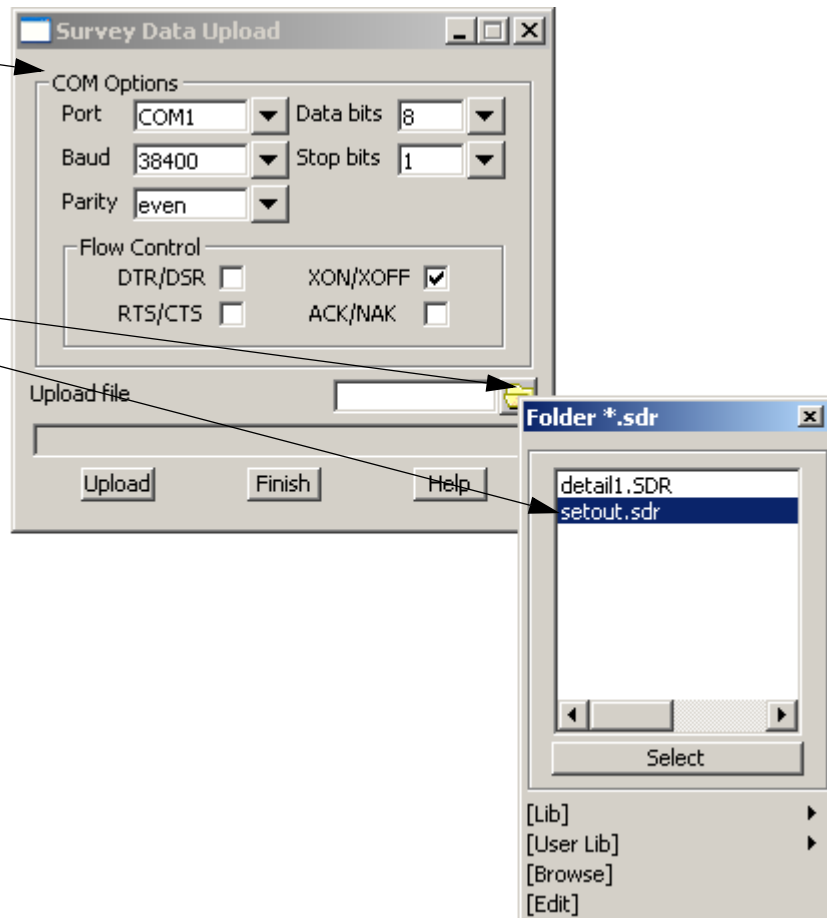

The points upload file can be transferred to the controller for setout using the upload panel.

Connect the controller to the PC

Select option **Survey=>Upload=>Upload**

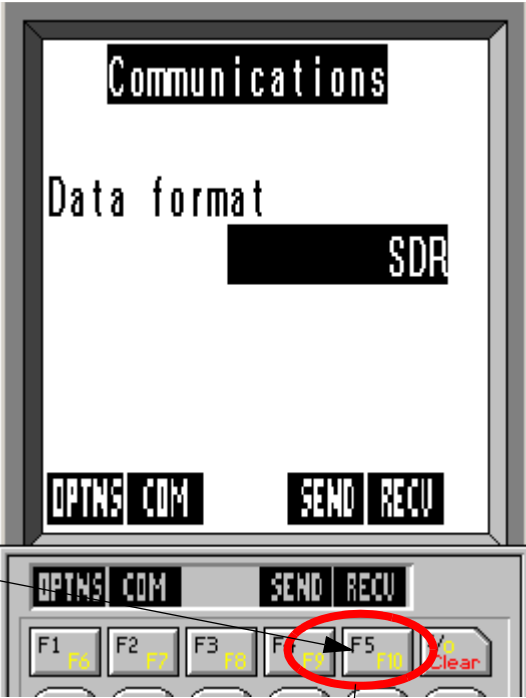

Ensure that the correct values are set for the comms settings i.e. they match the data collector parameters

Select the upload file by selecting the folder icon and selecting the appropriate file

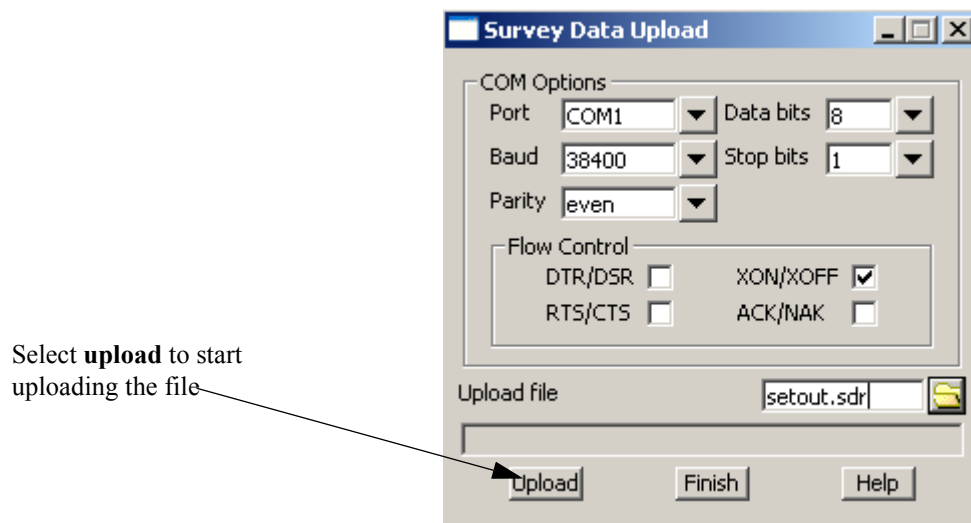

Prepare the data collector for uploading.

From the communication menu, select the receive button

Once the data collector is ready, the data can be sent from 12d

Please continue to the next section [Creating SDR Point Upload File](#)

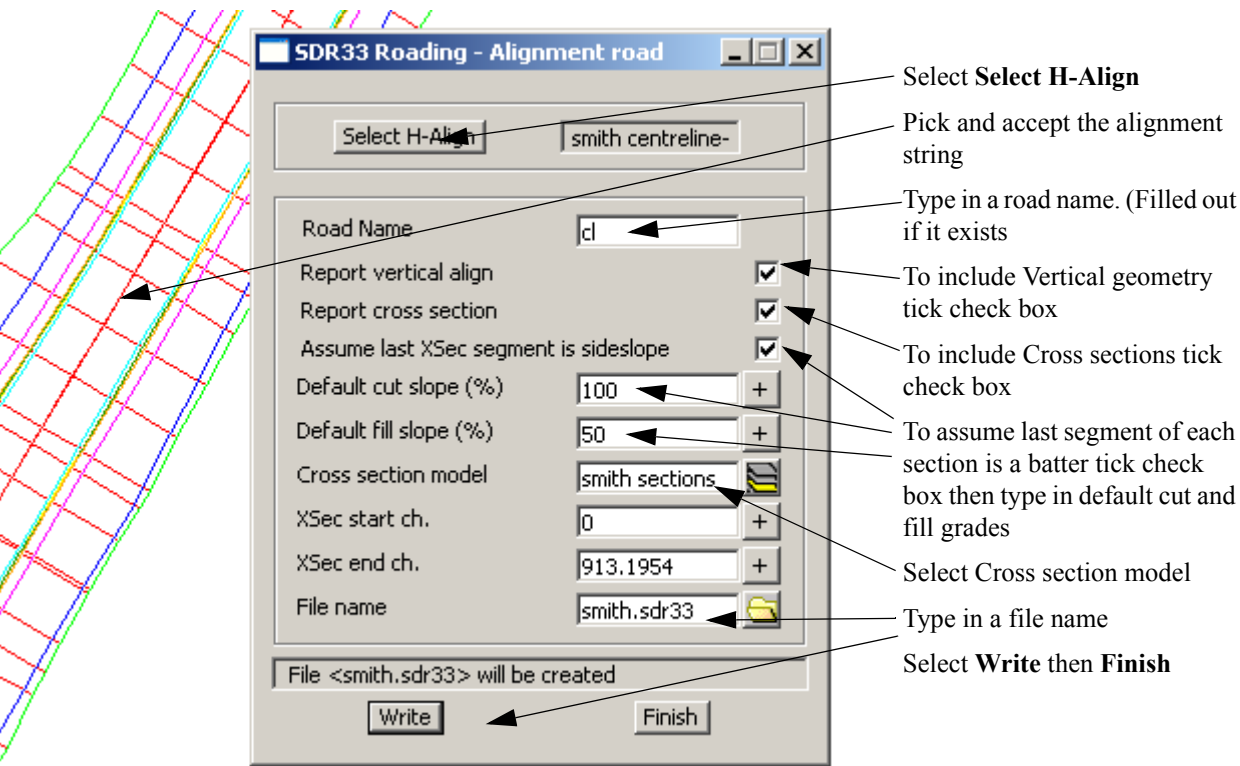

Creating SDR Roads Upload File

Create upload file in 12d

After creating the road alignment an upload file can be created for the SDR33 format
Select option *Survey=>Upload=>Create roads upload file*

Select **Instrument** choice icon
Select **Sokkia Roading - Alignment Road**

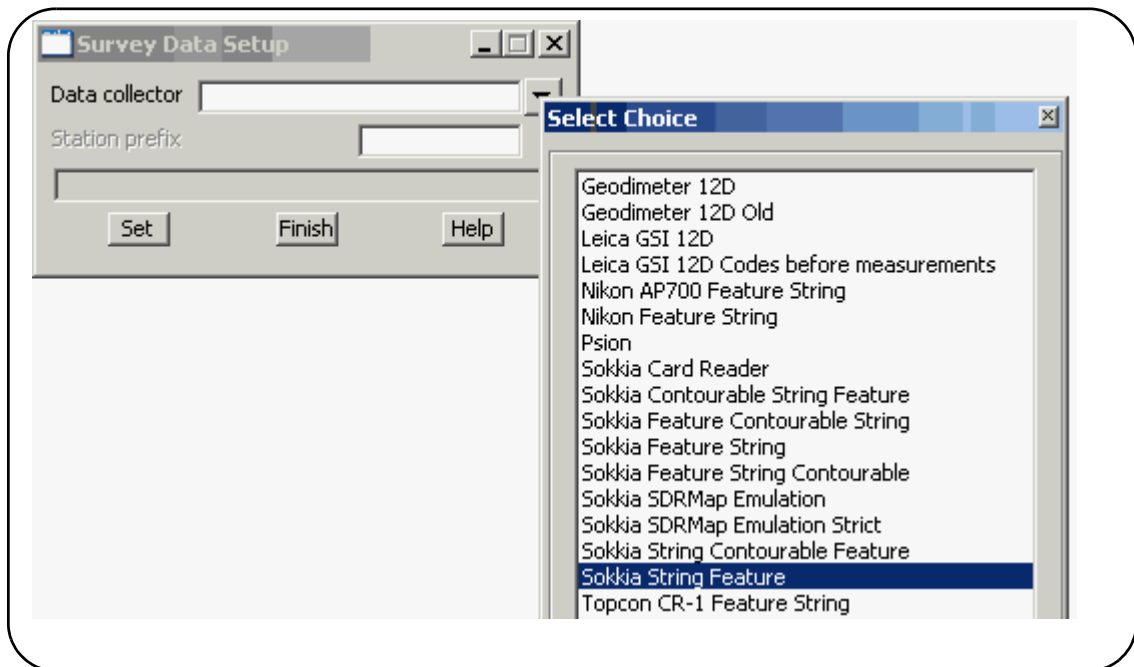

A SDR33 file is created ready to send to the instrument directly using the upload facility or by copying the file to PCMCIA cards etc. The steps involved in uploading the file to the controller using the 12d upload facility can be seen in the previous section [Loading file into controller using 12d upload facility](#).

Please continue to the next section [Example of Sokkia SDR File](#)

Example of Sokkia SDR File

The raw Sokkia SDR file 'detail1.sdr' has been coded in accordance with the data collector definition *Sokkia String Feature* which is shipped with 12d Model.

The data collector *Sokkia String Feature* is set using the option *Survey=>Setup*

For the *Sokkia String Feature* data collector definition, the *string number* is given before the *feature code*.

Some of the control codes defined for the *Sokkia String Feature* data collector that are used in the example are:

- * is used as the Command (Block) delimiter
- space is used as the comment delimiter
- S and E are used to start arc fitting and end arc fitting respectively
- R is the Rectangle (make a parallelogram) command
- the template commands XA, XB, XC and XD are used
- the invert I and obvert O commands are used.
- XN for the next segment to be non-tinable (that is, not a breakline).

The listing of the raw file 'Detail1.sdr' is now given, followed by a dump of a 12d Model view displaying the job. No mapping file has been used in the reduction so no line styles appear on the view.

WARNING - The raw file 'Detail1.sdr' is in the Survey area of the training data but the file has been manually edited and if read in with the standard *Sokkia String Feature* data collector, will have bad line lengths and the data ignored. To read the file in, the *Allow bad line lengths* on the *Advanced* tab of the *Sokkia String Feature* data collector will need to be set before converting the raw file to a 12d field file.

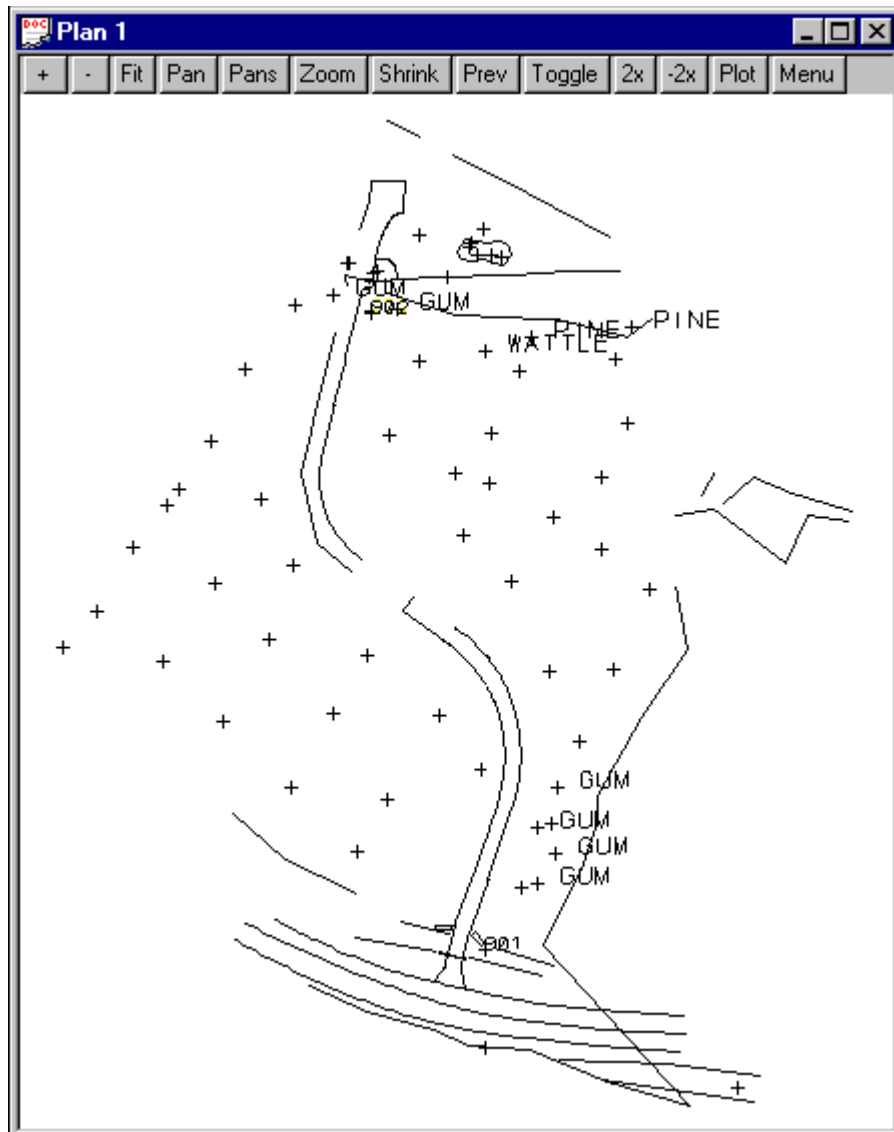

The image shows a screenshot of the 'Advanced' tab in the Sokkia String Feature data collector interface. The tab is selected, and the following options are listed with checkboxes to their right:

Option	Checkbox
Comment raw files	<input type="checkbox"/>
Report header	<input type="checkbox"/>
Allow bad line lengths	<input checked="" type="checkbox"/>
Verbose	<input type="checkbox"/>
Allow point numbers as stations	<input type="checkbox"/>

D 12d and the Trimble Total Station ACU

This Section deals with interfacing 12d with the Trimble Total Station ACU unit data formats

These notes are not meant to take the place of the operations manuals for the Trimble ACU but rather to act as a guide for ensuring the correct file types are used between the two systems.

See the sections:

[Coding](#)

[Sending Raw file to 12d](#)

[Creating and Setting Data Collector Type](#)

[Convert Raw File](#)

[Creating Point Upload File](#)

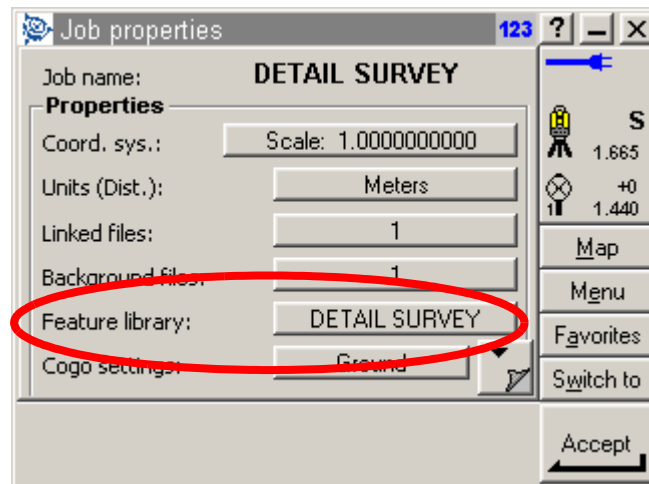

[Create Roads Upload File](#)

[Create Tin Upload File](#)

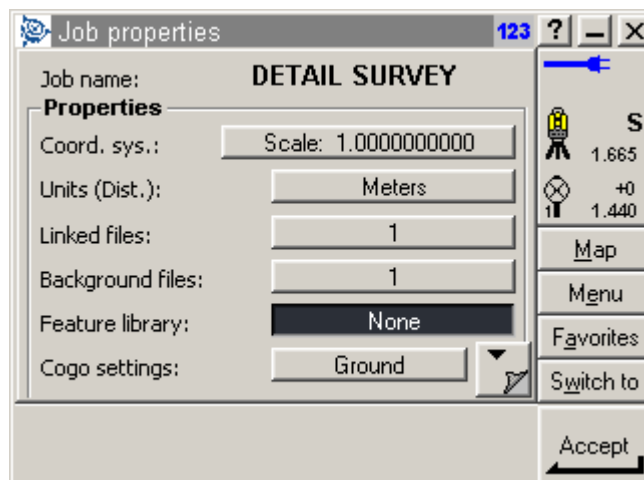

Coding

On the ACU the user can either manually type in a code for field readings or use a code library to pre-define codes which can then be selected from a list

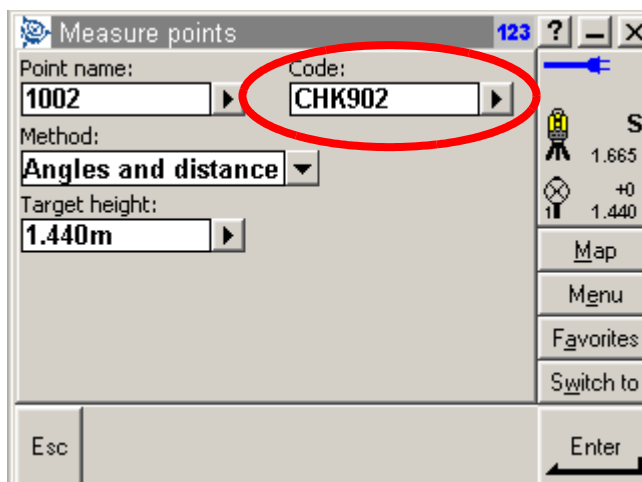

To use a code library the user should select the relevant library when creating the job

If using string numbers the Feature library can be set to *None* and the string number, feature code, field code and delimiters can be manually typed in

Codes are typed in to the ACU in the **MEASURE POINTS** option

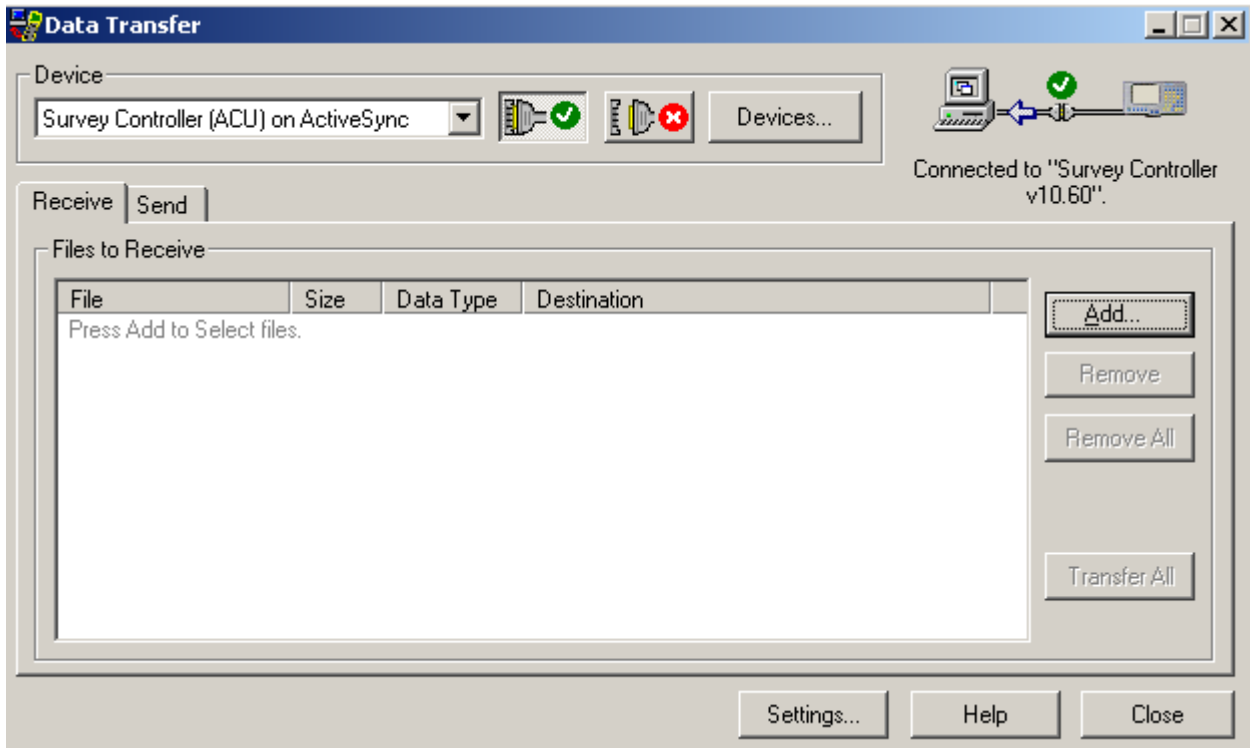

Please continue to the next section [Sending Raw file to 12d](#)

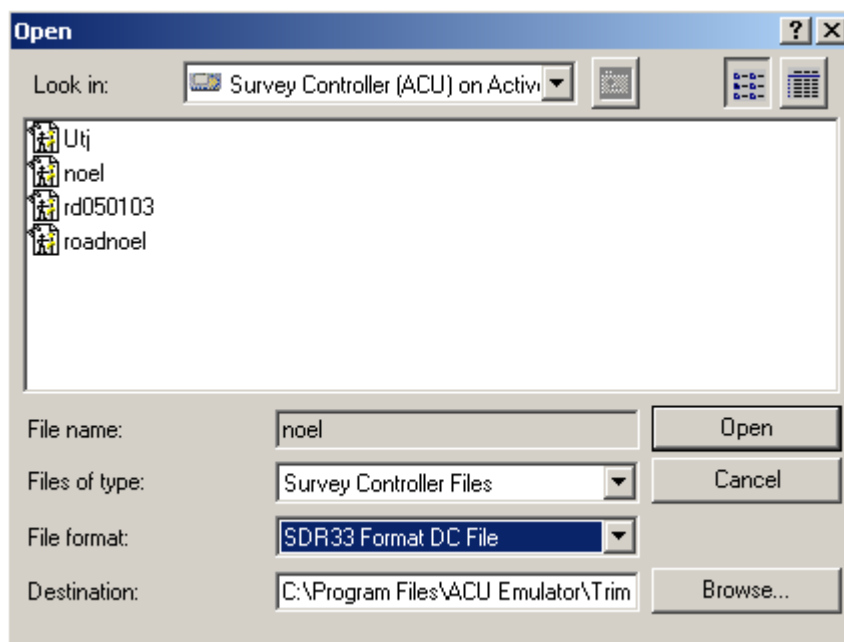

Sending Raw file to 12d

The raw file can be transferred from the ACU as a format similar to the SDR33. This is called the **SDR33 DC** file format.

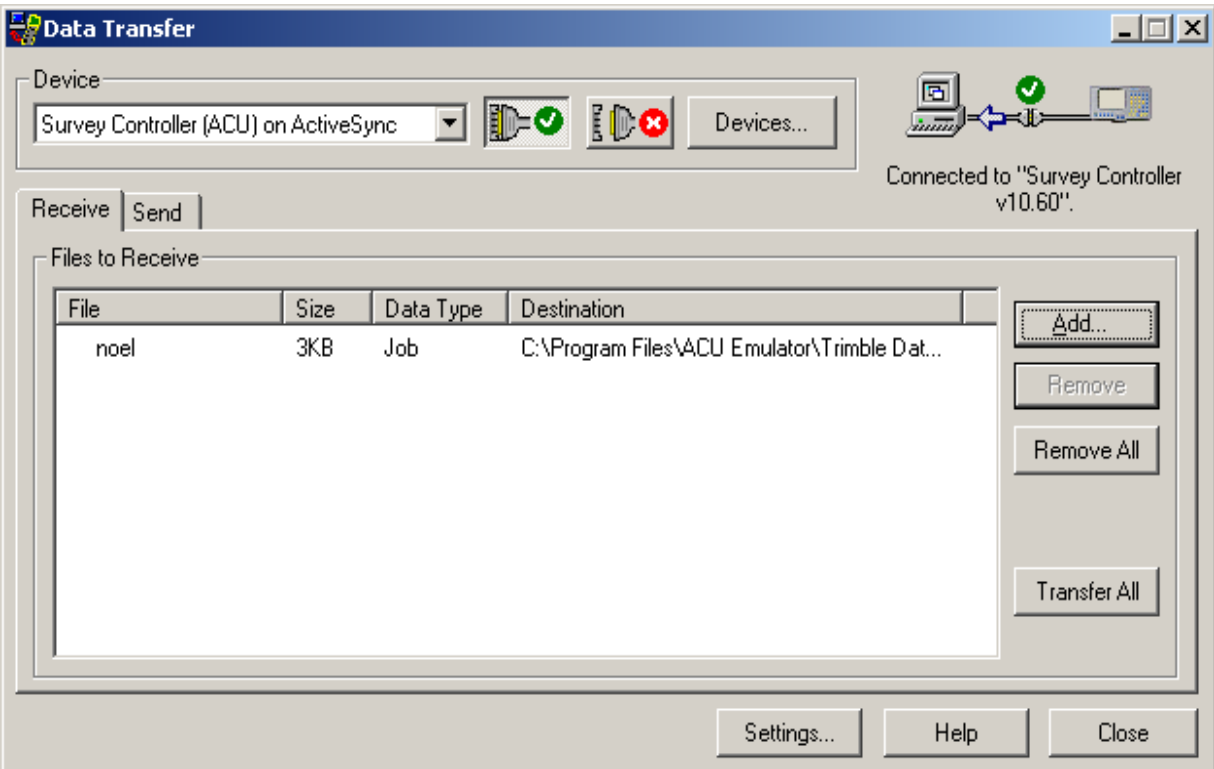

Connect the ACU to the PC using **TRIMBLE DATA TRANSFER**

Select *Receive* tab then select *Add*

Select the Job to download using the format *SDR33 FORMAT DC FILE*

Select *Transfer All* to transfer the file

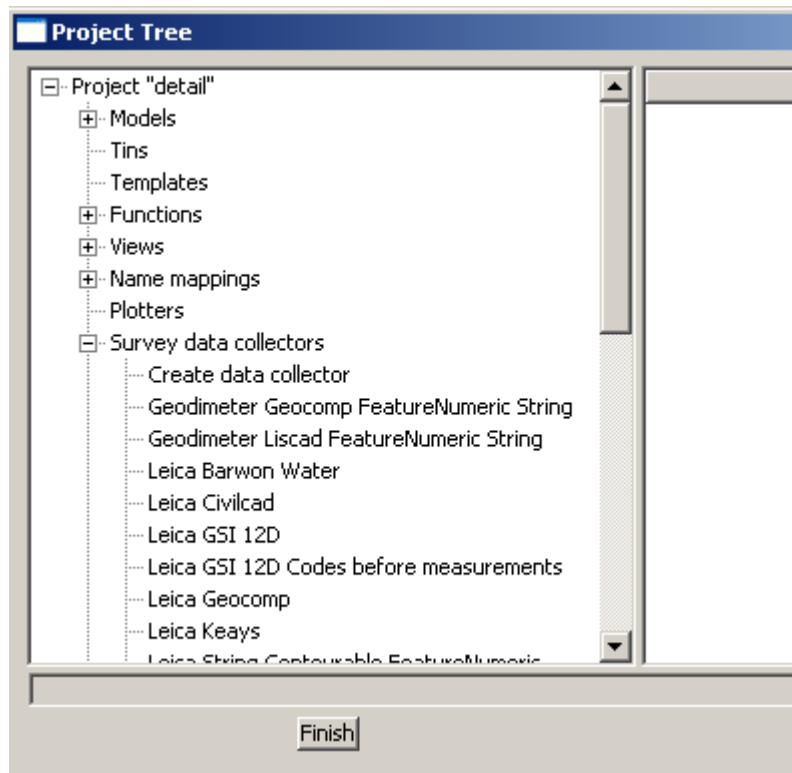

Please continue to the next section [Creating and Setting Data Collector Type](#)

Creating and Setting Data Collector Type

Create new data collector type

We will create a specific name for the Trimble data collector even though it is similar to the SDR33 format

Select **Project=>Browse**

Select the Survey data collectors branch

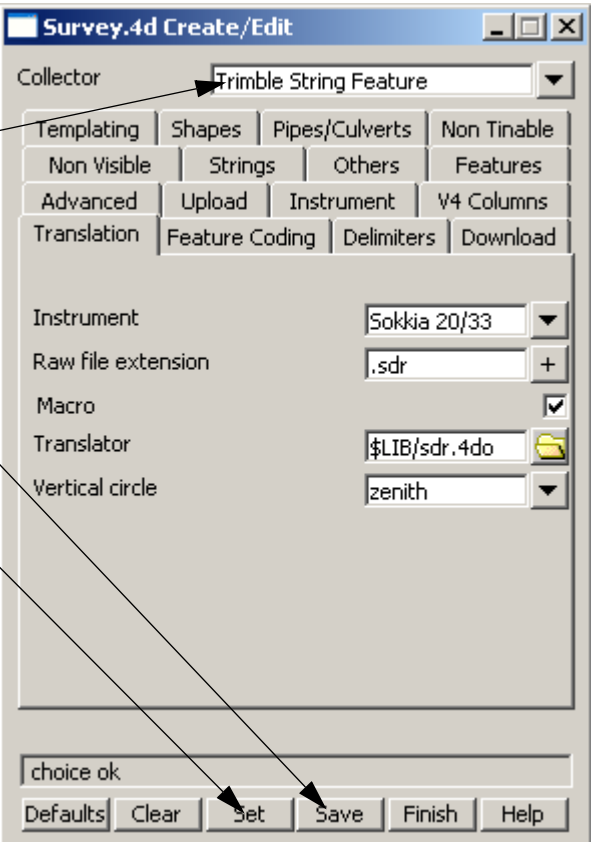

Double click on **Sokkia String Feature**

This loads up the default parameters for the SDR33 format.

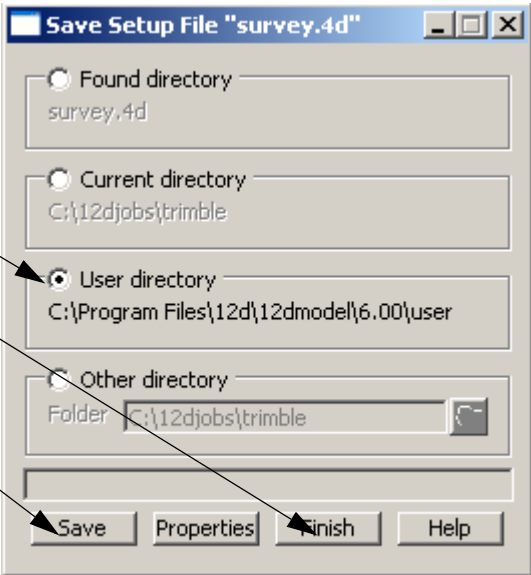

Type in the new name **Trimble String Feature**

Select **Set** then **Save**

Select **User directory**

Select **Save** then **Finish**

Select **Finish** back in the previous panel

To set the changes the project has to be restarted by selecting **Project=>Restart**

Select the data collector type

Select option ***Survey=>Setup***

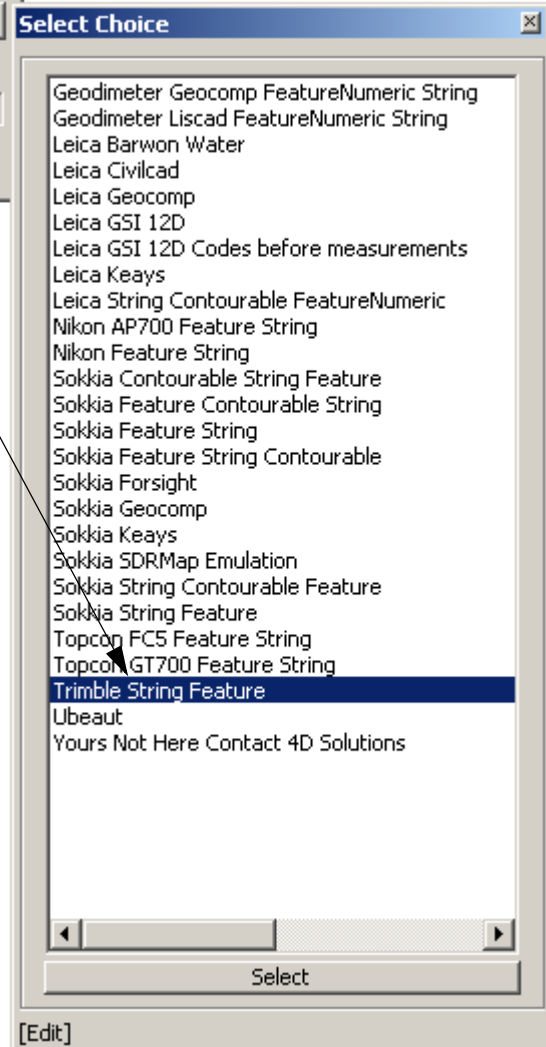

Select the **Data collector** choice icon

Double click on **Trimble String Feature**

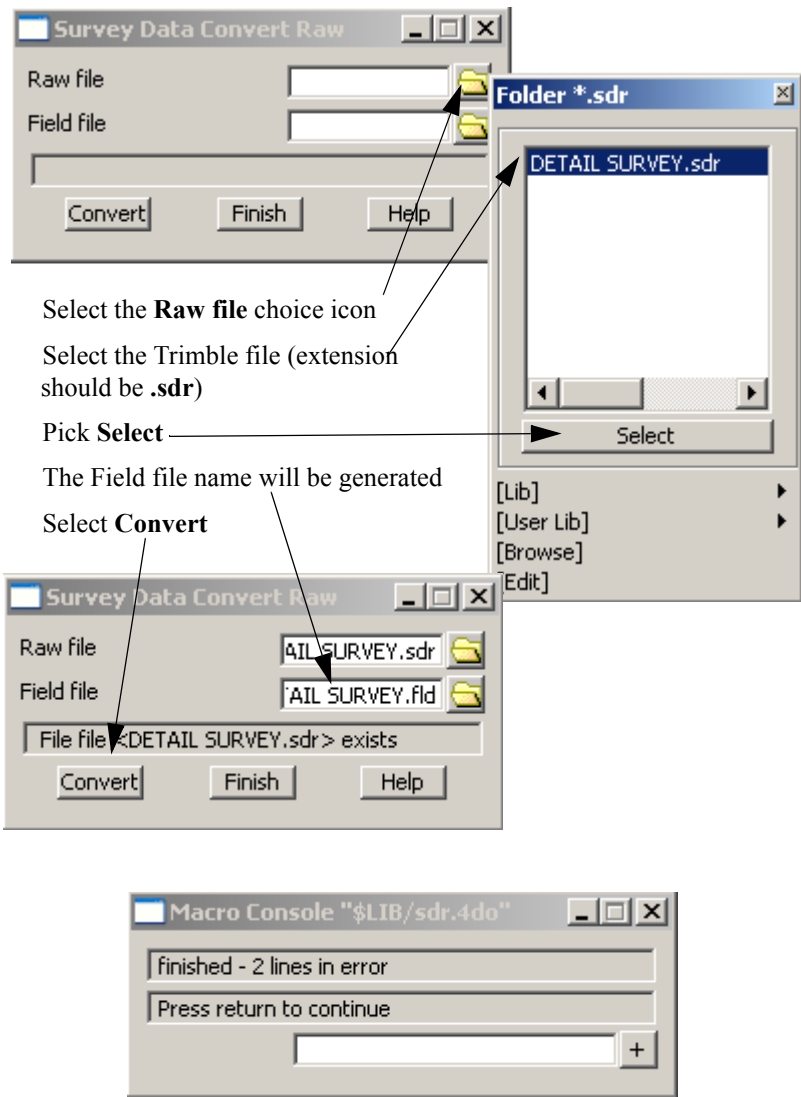

Select **Set** then **Finish**

Please continue to the next section [Convert Raw File](#)

Convert Raw File

To convert raw file to field file select option *Survey=>Convert raw*

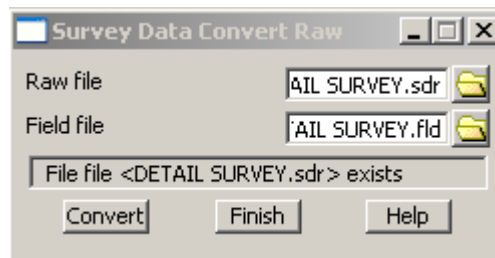

Any errors can be listed by opening the Output window using option *Window=>Output Window*

```
format = sdr33
Line 7 command not implimented <05NM
Line 8 non supported derivation code <02
Line 14 command not implimented <05NM
Line 15 non supported derivation code <02
```

	>	
901	5000.0000000000001000.0000000000010	
	>	
901	5000.0000000000001000.0000000000010	

Close the Error panel

Select **Finish**

The field file can now be reduced in the normal manner

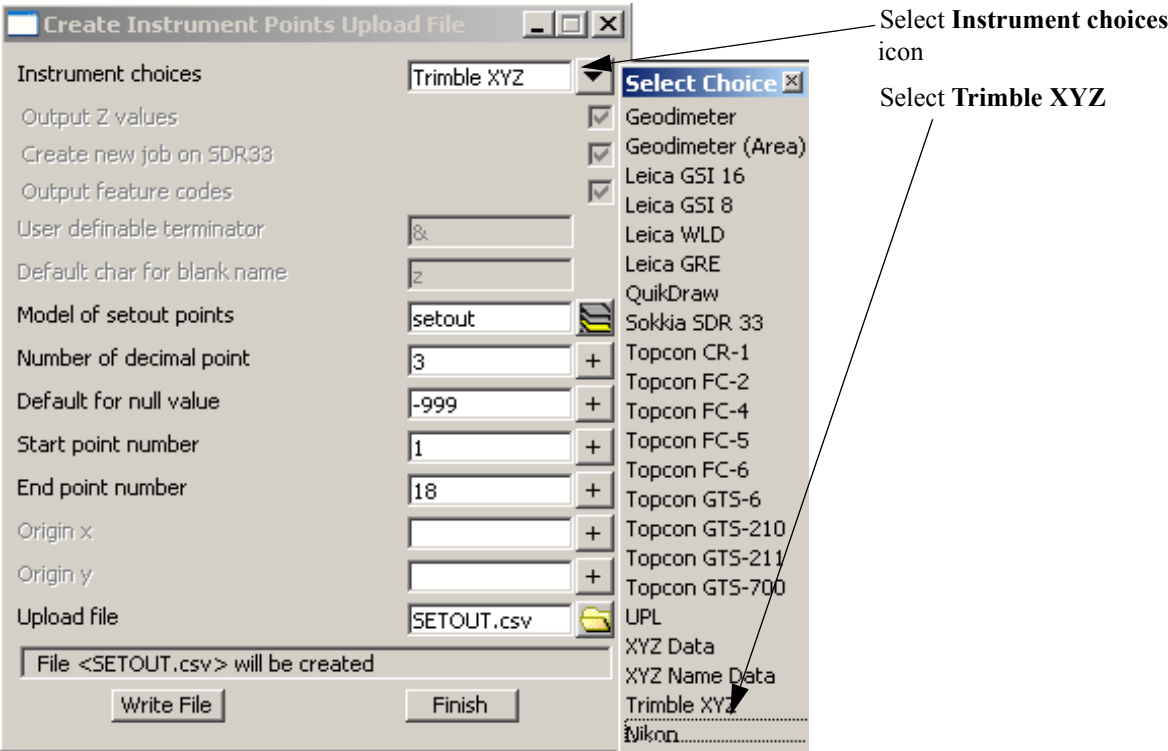

Please continue to the next section [Creating Point Upload File](#)

Creating Point Upload File

Create upload file in 12d

After creating the setout points an upload file has to be created for the trimble format

Select option *Survey=>Upload=>Create points upload file*

Fill in the rest of the screen as per normal

Select **Write File**

A standard comma delimited file is created ready to send to the ACU

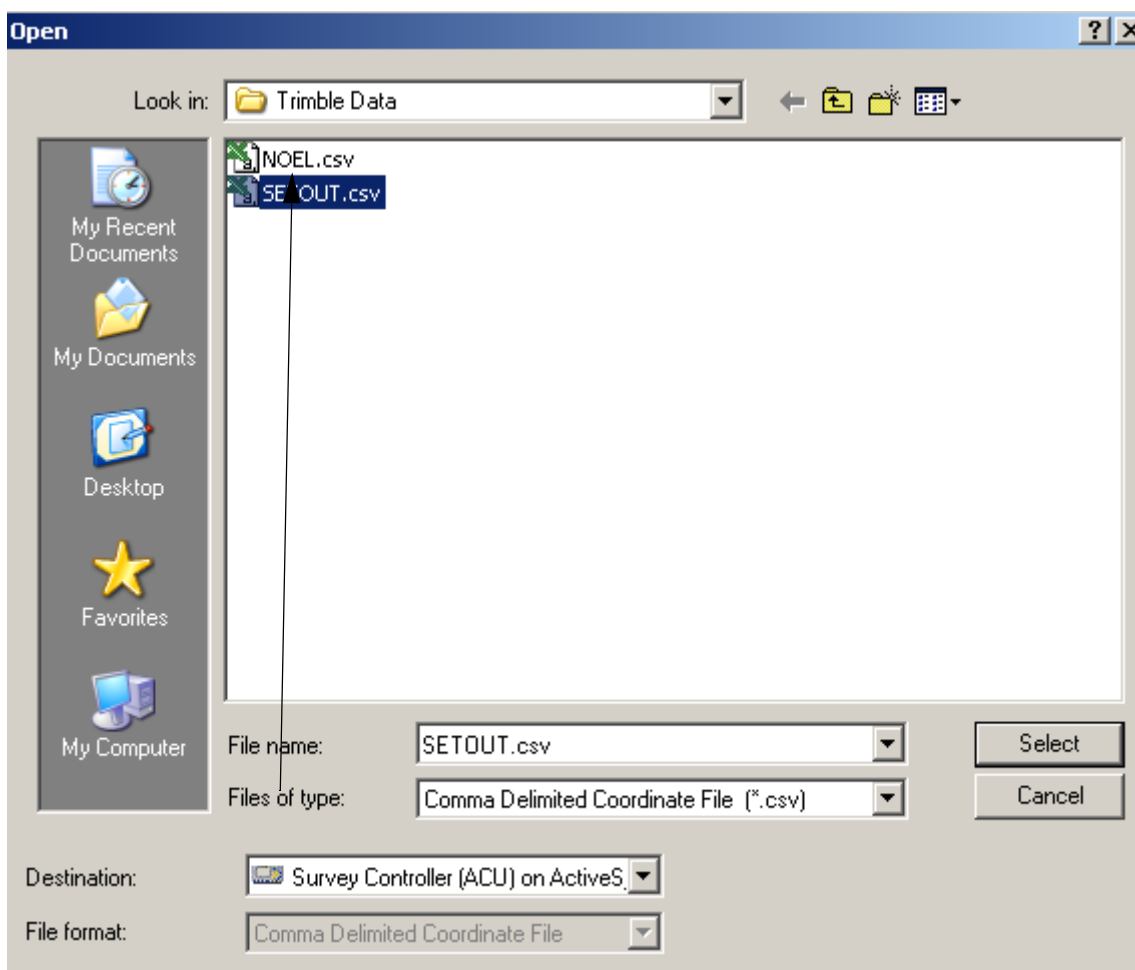

Loading file into job in ACU

The points upload file can be transferred to the ACU for setout.

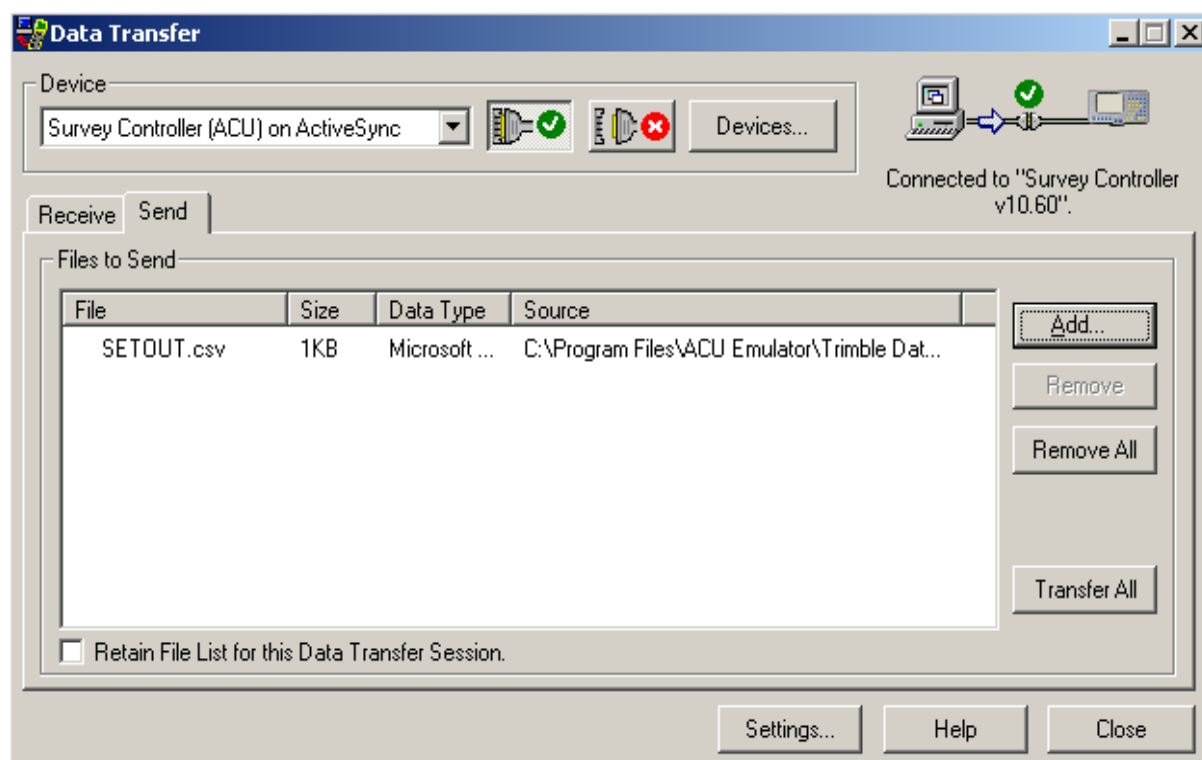

Connect the ACU to the PC using **TRIMBLE DATA TRANSFER**

Select *Send* tab then select *Add*

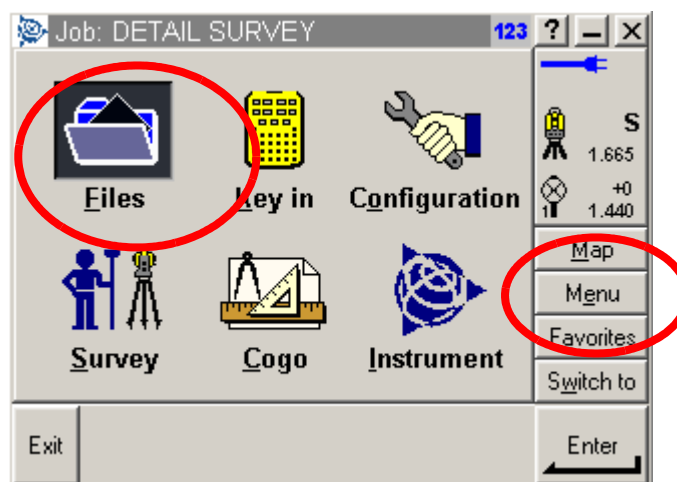

Select the file to upload using format *Comma delimited coordinate file*

Select **Transfer All** to transfer the file

To load the file into the current job on the ACU select **Menu=>Files**

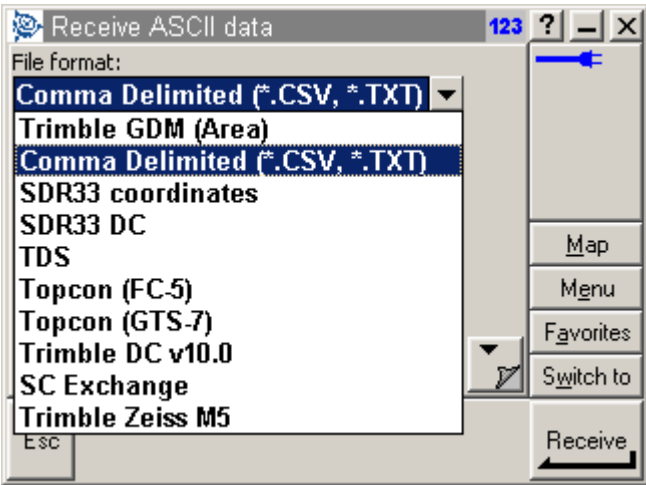

Select **Import / Export**

Select **Receive ASCII data**

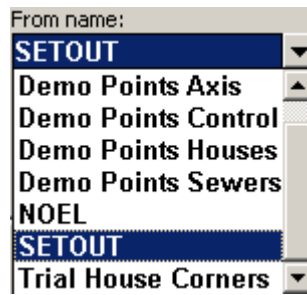

Select **File format** choice icon then pick **Comma Delimited (*.CSV, *.TXT)**

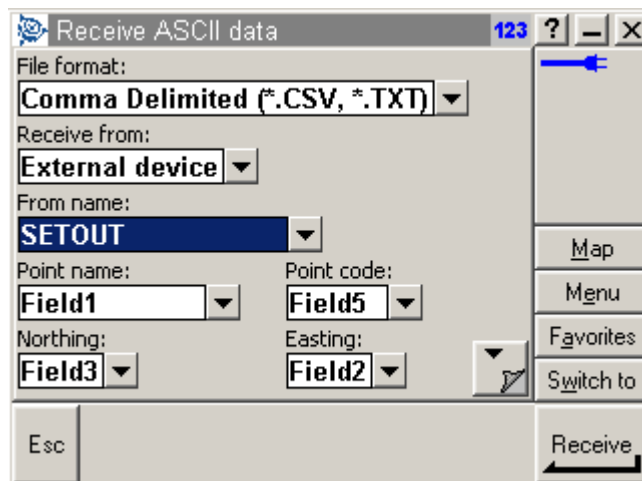

Select **Receive from** choice icon and pick **Trimble Data**

Select **From file** choice icon and select file

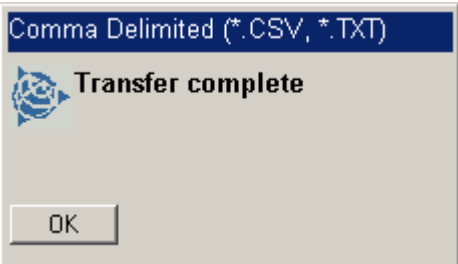

Select the field order for the file as (1) Point number, (2) Easting, (3) Northing, (4) Level and (5) Code

Select the **Next page** icon

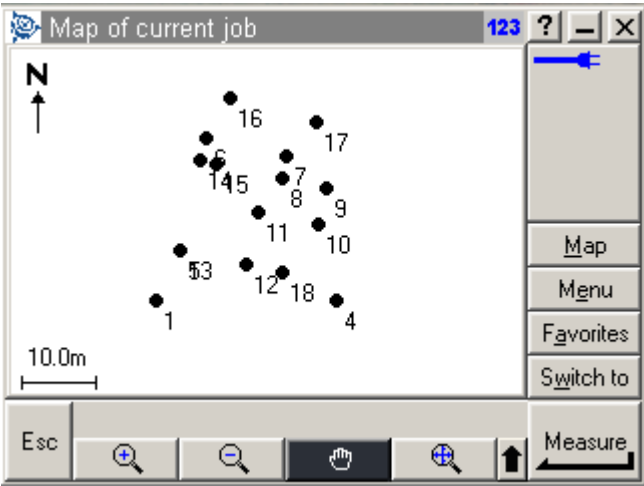

Select **Receive**

Select **OK** to finish

The points can be displayed by selecting **Map** and zooming all of the job

Please continue to the next section [Create Roads Upload File](#)

Create Roads Upload File

Create upload file in 12d

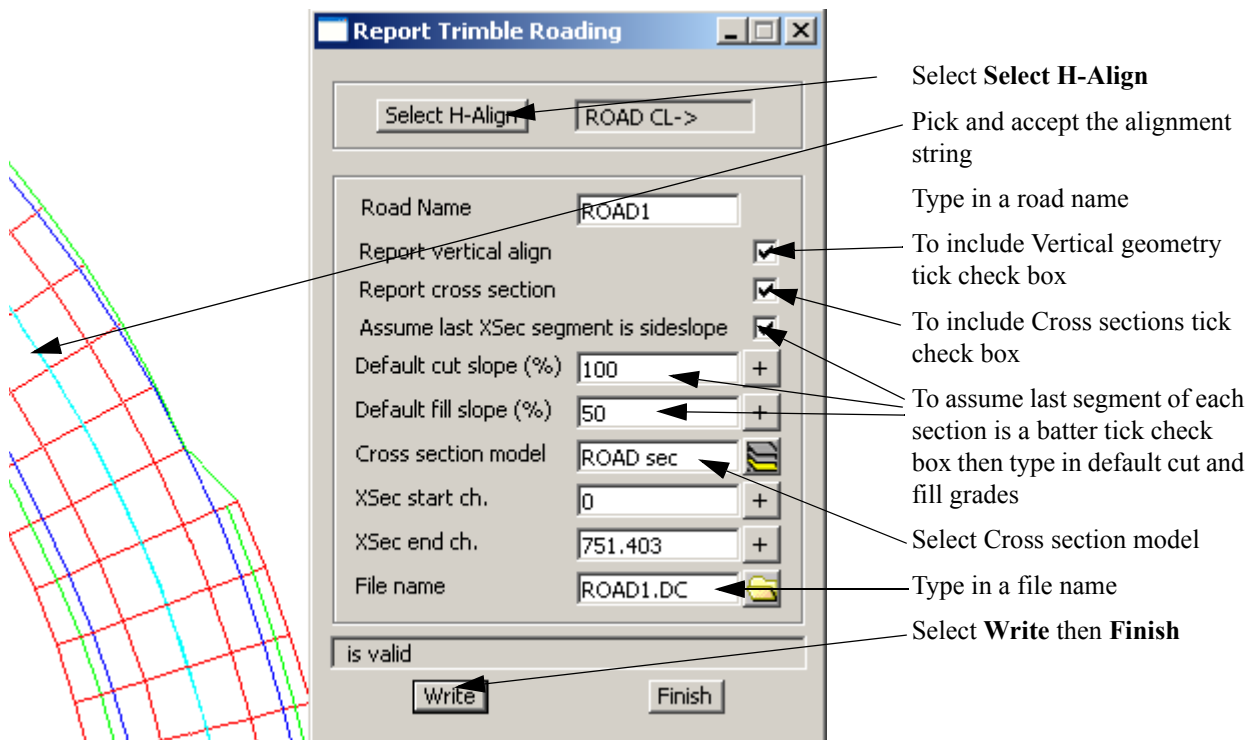

After creating the road alignment an upload file has to be created for the trimble format

Select option ***Survey=>Upload=>Create roads upload file***

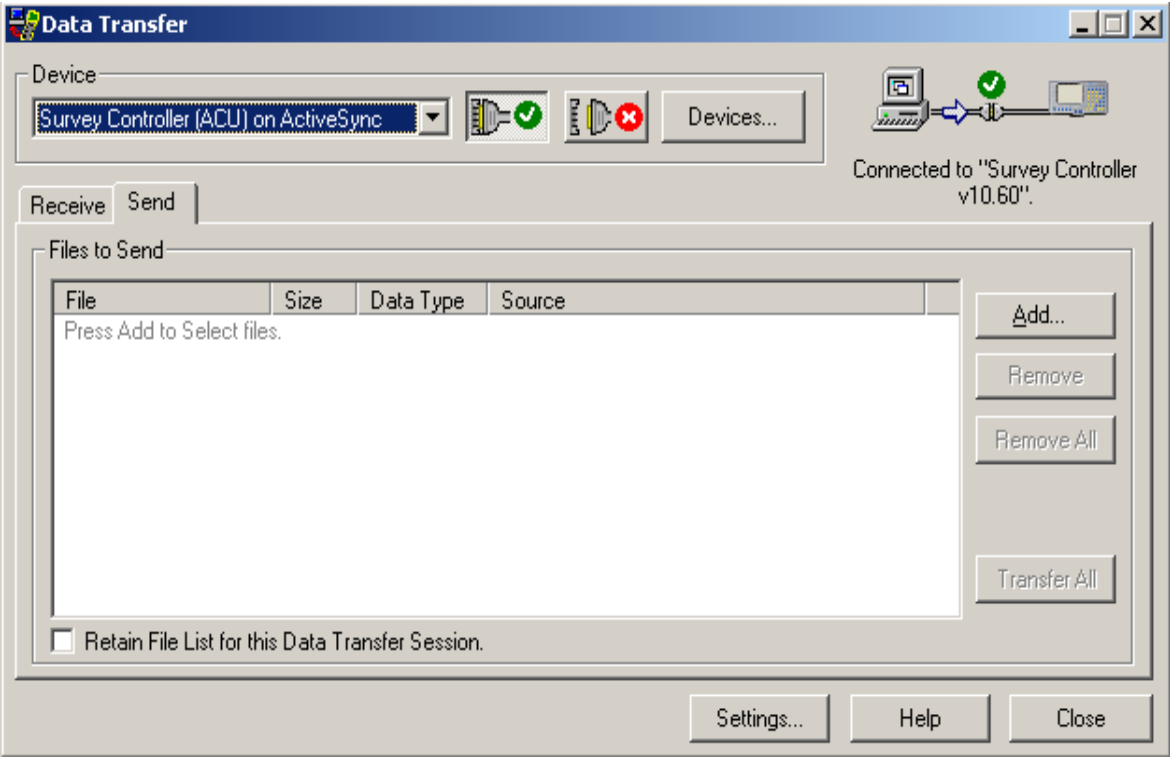

Select **Instrument** choice icon

Select **Trimble Roading**

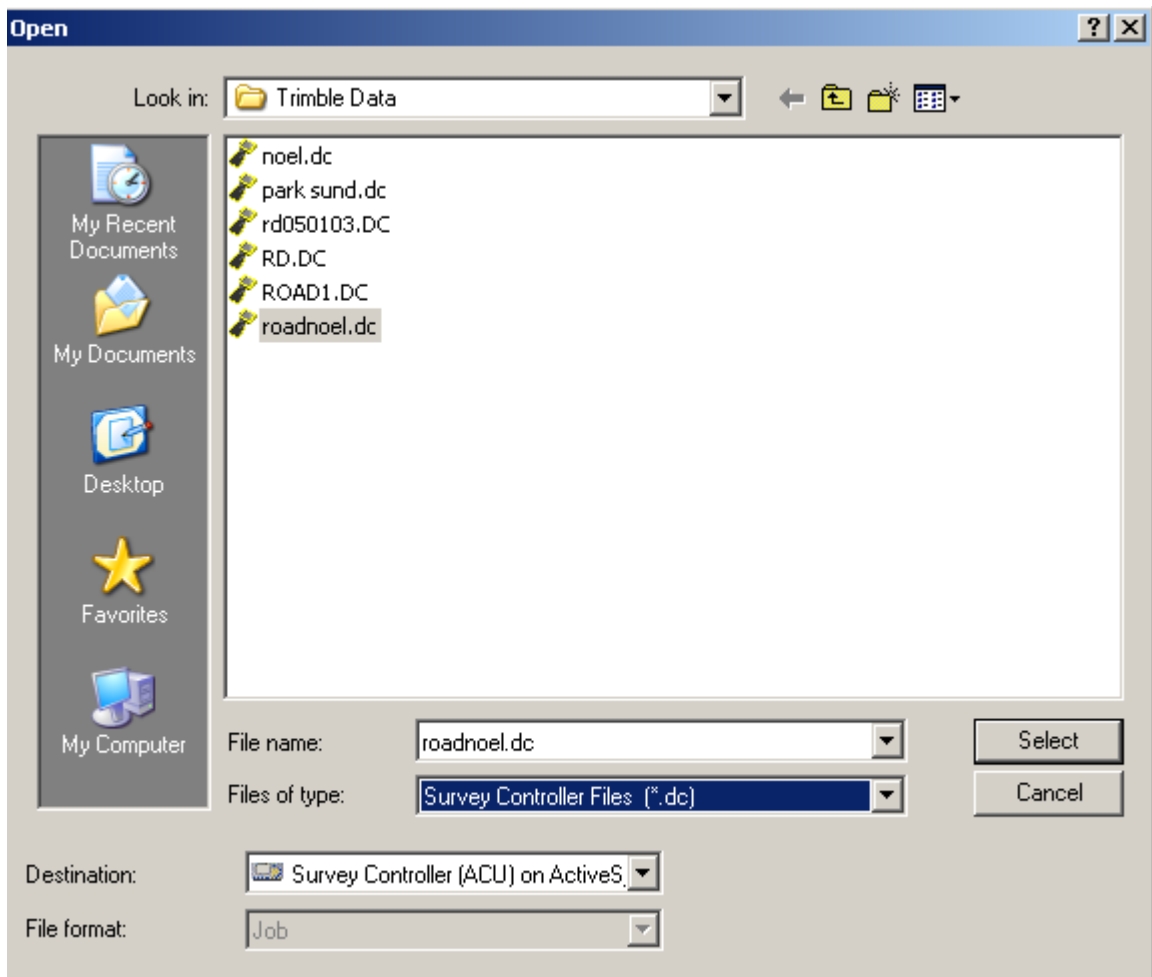

Loading file to the ACU

The road upload file can be transferred to the ACU for setout.
Connect the ACU to the PC using **TRIMBLE DATA TRANSFER**

Select *Send* tab then select *Add*

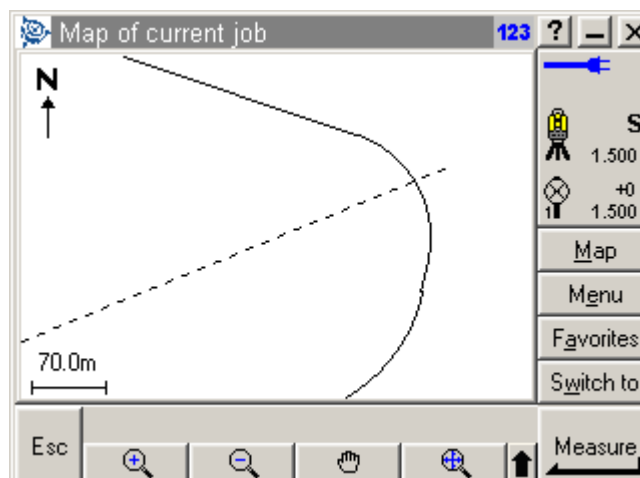

Select the road file to upload using format ***Survey Controller file***

Select **Transfer All** to transfer the file

Once the road file has been copied into the ACU it can be setout using option **Survey=>Stakeout=>Roads**

Stake out road 123 ? - X

Road name: road080103 Code: CL

Stake: Station and offset

Target height: 1.500m

Station: 0+295.000m

Offset (left): 0.000m

Map Menu Favorites Switch to

Go In 0.039m

Go Right 0.000m

V. Dist Cut 1.441m

Go Forward 0.007m

Go Left 0.038m

Map Menu Favorites Switch to

Esc Measure Target Options Accept

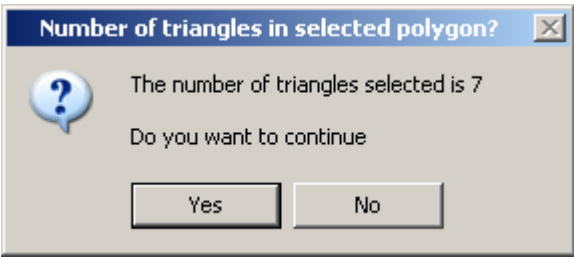

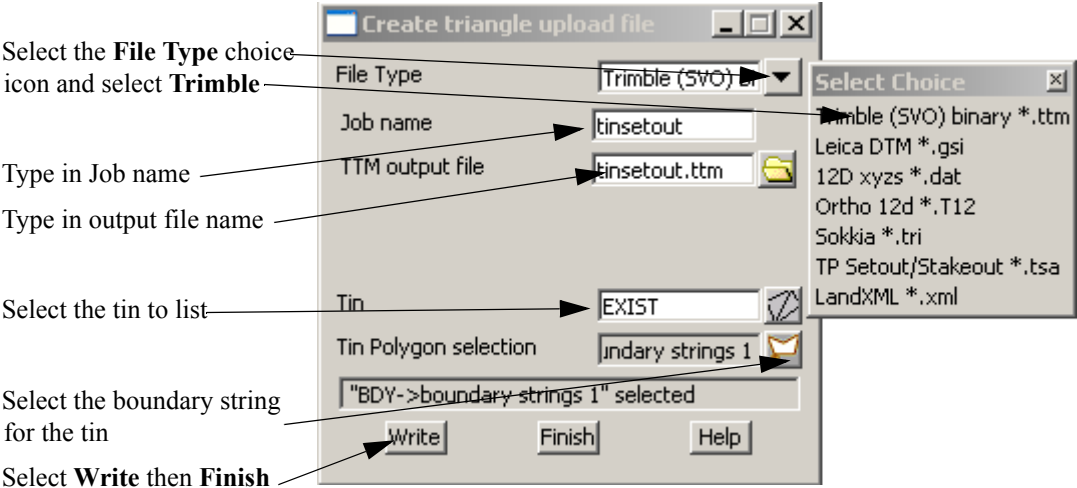

Please continue to the next section [Create Tin Upload File](#)

Create Tin Upload File

Create upload file in 12d

After creating the triangulation an upload file has to be created for the trimble format

Select option *Survey=>Upload=>Create triangle upload file*

Select **Yes** to create the file

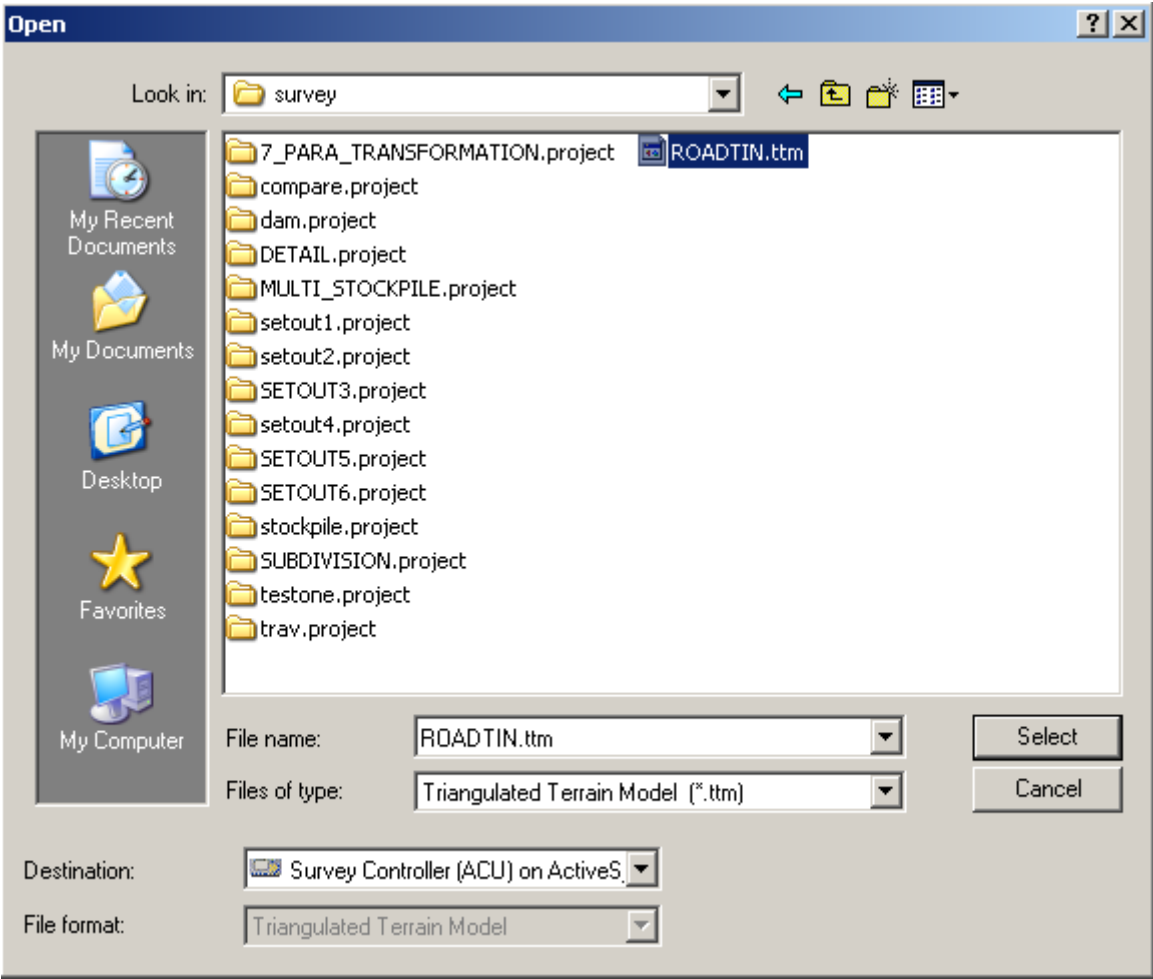

Loading and using the file in the ACU

The tin upload file can be transferred to the ACU for setout.

Connect the ACU to the PC using **TRIMBLE DATA TRANSFER**

Select **Send** tab then select **Add**

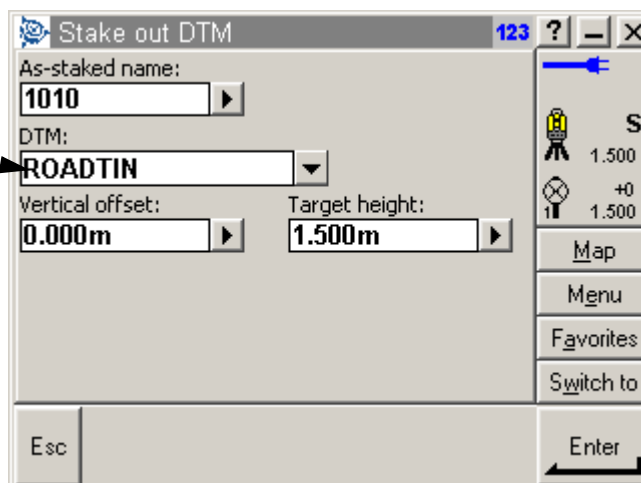

Select the tin file to upload using format *Triangulated Terrain model*

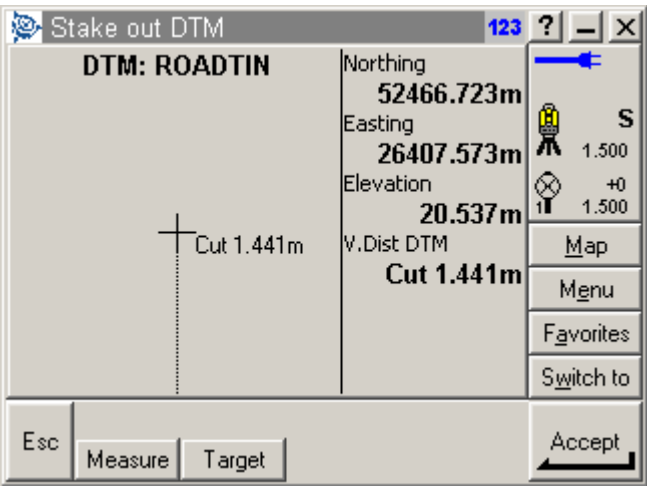

Select ***Transfer All*** to transfer the file

Once the tin has been copied into the ACU it can be called up when using the Stakeout option
Survey=>Stakeout=>DTM

Select the uploaded tin file
to setout

The cut to the tin is calculated and displayed

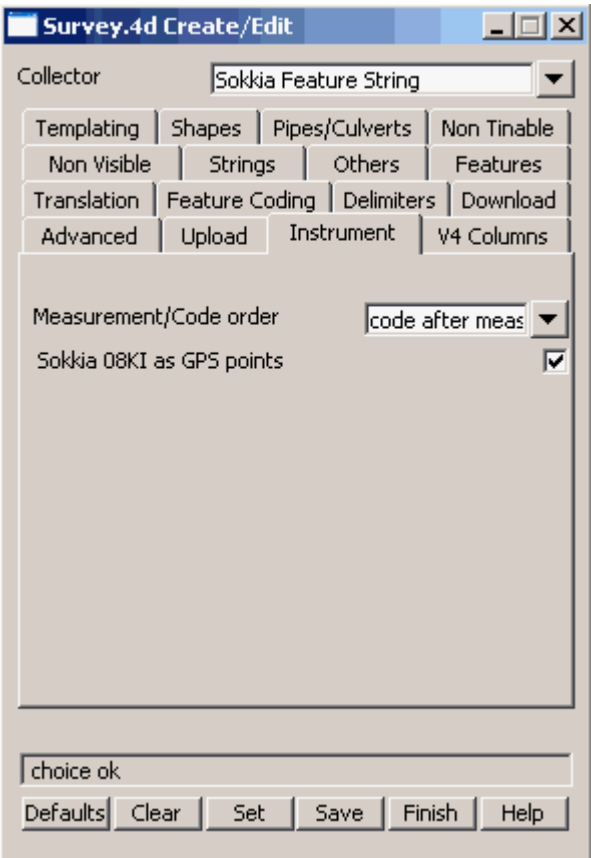

E 12d and Trimble GPS Controllers

The Trimble Geomatics Office software which comes with most Trimble GPS units can produce a Sokkia SDR file which is used by 12d Model as a raw data file.

However, the Trimble software writes out the (x,y,z) co-ordinates of GPS points as a "08KI" record which is normally treated by 12d Model as directly entered co-ordinates for a Station.

To overcome this problem, there is a flag in the data collector definitions to treat the Sokkia 08KI records as GPS points.

So before converting a Sokkia SDR file from a Trimble GPS unit, define a data collector which has a tick for the field *Sokkia 08KI as GPS points* on the *Instrument* tab of the **Survey.4d Create/Edit** panel.

This flag needs to be ticked on for reducing the SDR files created by Trimble GPS units

The code information that is entered on the Trimble in the field is appended the Sokkia 08KI record and is processed as blocks of information as given in the section [Field Coding for Non Leica Instruments](#) and the appendix [12d and Sokkia Instruments \(SDR Files\)](#).

F 12d and Geodimeter Instruments

This appendix deals with interfacing 12d with Geodimeter files.

See the sections:

[12d UDS's](#)

[Using 12d Field Ops Codes on the Geodimeter](#)

[Example of Geodimeter File](#)

12d UDS's

The geodimeter allows the recording of information in a format specified by the user. Data for each label can be prompted for and measurements from the instrument can be registered. The user can assign a certain series of labels to a User Defined Sequence or UDS.

For 12d to reduce files from the geodimeter instruments, the recorded information from the instrument must be in a specific format that 12d can understand. A number of Geodimeter UDS files are supplied on the 12d Model Installation CD in the folder 'Other_Software\Geodimeter'.

For uploading or direct entry of UDS's to your particular instrument see you instrument manual.

*These UDS's have been set up so that 12d can convert the raw files from the instrument in a 12d field file. These UDS's should be installed **prior** to undertaking surveys that are to be reduced by 12d. The standard UDS that 12d supply is as follows:*

UDS 1 - used within UDS 8 to record 12d field op codes.

UDS 2 - prompts for additional data for a 12d field op code.

UDS 5 - job administration at the start of a job

UDS 6 - station co-ordinates entry

UDS 7 - station set up - name and instrument height

UDS 8 - data pick-up

UDS 5 is run at the beginning of the job and it runs UDS 6, which runs UDS 7 which runs UDS 8.

UDS 1 can be run as required from within UDS8 to give 12d field file op codes.

UDS 1 - used within UDS 8 to record 12d field op codes	UDS 5 - job admin at start of day	UDS 7 - station set up - name and instrument height	UDS 8 - data pick-up

12d standard UDS's for pick-up with Geodimeter

The Geodimeter data format is used as a raw data file by 12d Model and is converted into a 12d Field File before reduction by potentially 2 different macros:

- 1) geodat4d.4do (default) for use with the 12d standard UDS's.
- 2) geodat_qmrd.4do (Specialised reduction) for use with Queensland MRD UDS's.

For the geodat4d.4do macro (default) 12d Model uses the following Geodimeter labels:

- 0= Information
- 1= Attributes
- 2= Station name or named point
- 3= Instrument height
- 4= Blocks
- 5= Point number
- 6= Target (signal) height
- 7= Horizontal angle
- 8= Vertical angle
- 9= Slope distance
- 37= Northing (X) value
- 38= Easting (Y) value
- 39= Height (Z) value
- 51= Date
- 53= Operator
- 90= End of record, flush buffer
- 91= 12d Model field file op code
- 92= Parameters for the previous 12d op code
- 95=

In particular, the Geodimeter PCode label block (4=) is used as the text of blocks that are interpreted according to the descriptions given in the earlier section [Field Coding for Non Leica Instruments](#).

A new conversion macro for V6.0, geodat_qmrd.4do recognises geodimeter Program 22 and Program 32 commands **if the following setup/procedures are used:**

1. The geodimeter should be set to record program numbers. This is shown by the label **0=Pn** in the raw file, where **n** is the program number and is assigned by the instrument. To set this up on the instrument use MENU 6 1(Switches) and turn Prg_Num on.
2. For 12d to convert raw files using geodimeter programs such as P22 and P32 the data must contain a label **61=n** each time an UDS or onboard program is started (Where **n** is the program number). This allows 12d to be able to determine when one program is finished and another started. Queensland MRD have created there own UDS's which utilise the **61=** label so that it is prompted for within the UDS's. They have also set up a UDS (UDS 6) which is used to place the label at the commencement of an onboard program such as program 22.

Please continue to the next section [Using 12d Field Ops Codes on the Geodimeter](#).

Using 12d Field Ops Codes on the Geodimeter

In addition to the commands accessible from the blocks, most of the 12d field file op codes are accessible directly from the Geodimeter.

The label '91=' label is used to specify a 12d field file op code and any following '92=' labels provide any additional information required by the 12d op code.

The 12d field file ops codes apply to the measurement *before* the op code.

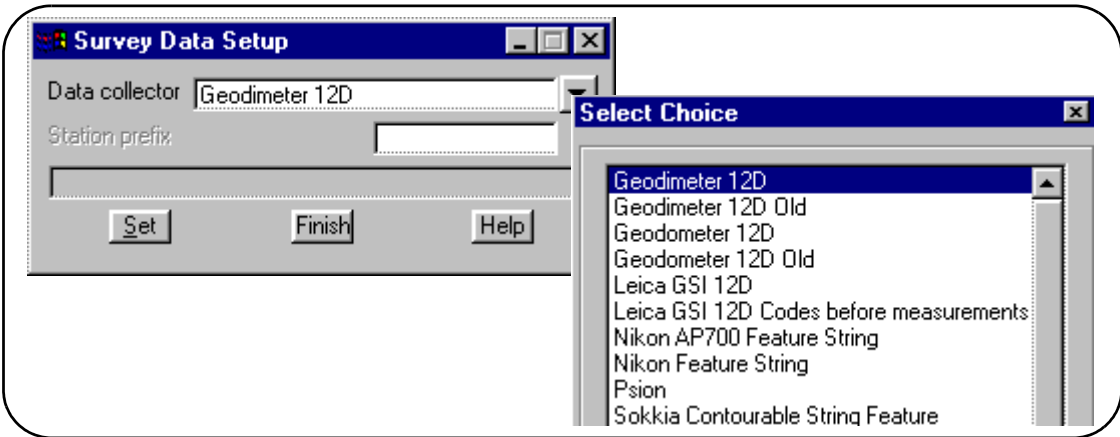

For a complete definition of the 12d Model field file and the 12d Model field file op codes, see the section [The 12d Field File Format](#)

Please continue to the next section [Example of Geodimeter File](#).

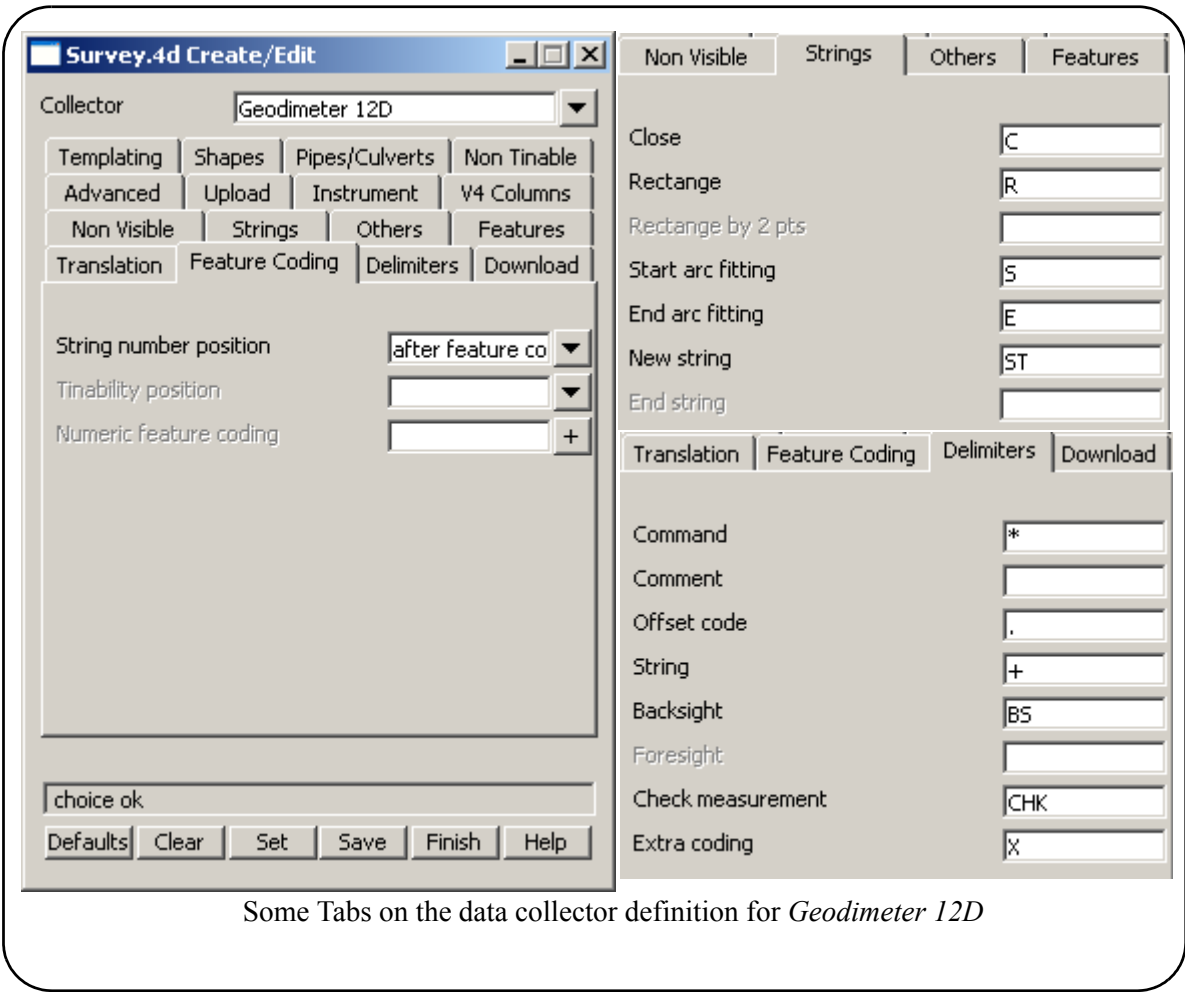

Example of Geodimeter File

The raw file 'Geodimeter.job' has been coded in accordance with the data collector definition *Geodimeter 12D* which is shipped with 12d Model. The 12d Model Geodimeter UDS's were used in the field pick-up.

The data collector *Geodimeter 12D* is set using the option *Survey=>Setup*

Some of the tabs on the *Geodimeter 12D* data collection definition as show below. Note that * is used as the Command (Block) delimiter, the *string number* is given after the *feature code*, S is used to start arc fitting and R is the Rectangle (make a parallelogram) command.

Some Tabs on the data collector definition for *Geodimeter 12D*

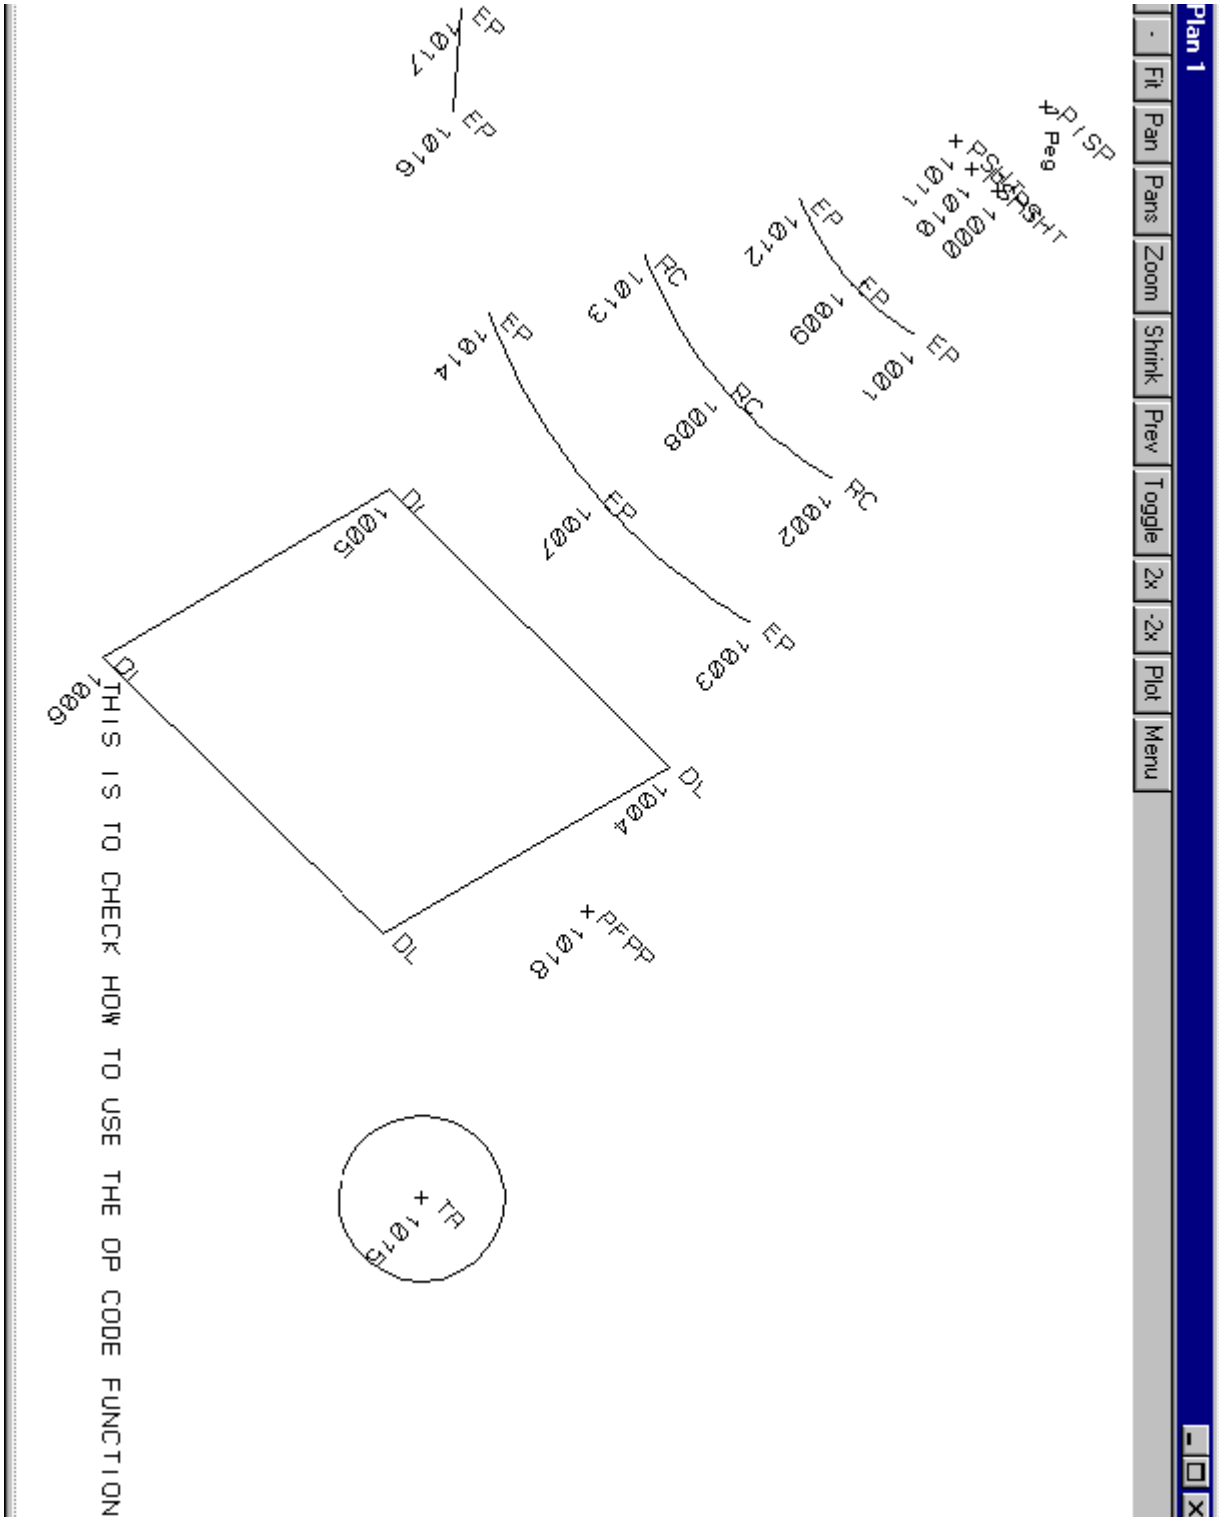

The listing of the raw file is now given, followed by a dump of a 12d Model view displaying the job with string names (feature codes) and point numbers toggled on. The raw file 'Geodimeter.job' is in the Survey

area of the training data. It can be converted into a 12d field file by using the default conversion macro geodat4d.4do.

G 12d and Topcon Instruments

The Topcon data format is used as a raw data file by 12d Model and is converted into a 12d Field File before reduction.

H 12d and Leica TPS Instruments

The Leica GSI data format produced by the Leica TPS is used as a raw data file by 12d Model and is converted into a 12d Field File. The contents of the recorded data can be manipulated by use of the Leica's recording masks. The setup of which is explained in the section [Setup of Leica 1100 instrument for detail pickup and use with 12d](#).

Each line (data block) of the Leica GSI file consists of between 1 and 12 words, with the words containing either 16 (8 characters for data) or 24 (16 characters for data) characters. The two formats will be referred to as the 8 format and 16 format respectively.

Measurement lines in the 8 format start with 11 and code lines start with 41.

For the 16 format, measurement lines start with *11 and code lines start with *41.

For an example of a GSI file in the 8 format, go to the section [Example of Leica GSI File](#).

When using a Leica, the Leica screen can be standard or controlled by using a code.hex file on the 1000 series or a Geobasic program or Leica Codelist (.crf file) on the 1100 series.

12d Solutions provide a basic code.hex, Geobasic program and various Codelists(.crf files) on the 12d Model Installation CD in the folder 'Other_Software\Leica'. These can be customised to your requirements - please contact 12d Solutions for more information.

For an example of a Leica screen with standard set-up, Codelist and Geobasic program, please go to the section [Examples of Leica Screens](#).

See the sections:

[Example of Leica GSI File](#)

Please continue to the next section [Feature Codes and String Numbers](#).

Feature Codes and String Numbers

The *feature code* and *string number* for a measurement are entered in the Leica by giving the *feature code* in the first word and the *string number* as the second word of a code line. The feature codes and string numbers can be alpha or numeric and up to 8 (16) characters long.

For example, the feature code ABC with string number 1 is recorded as:

410003+00000ABC 42....+00000001 for the 8 format

or

*410003+00000000000000ABC 42....+0000000000000001 for the 16 format.

Some surveyors like to define the *feature code* and *string number* **before** they make a measurement. Other surveyors prefer to define the *feature code* and *string number* **after** they make a measurement.

When defining a *Data Collector setup*, 12d Model allows the user to specify whether the feature code comes before or after a measurement:

code before measurement

The given *feature code* and *string number* applies to the **next** measurement and all subsequent measurements until another *feature code* and *string number* is entered.

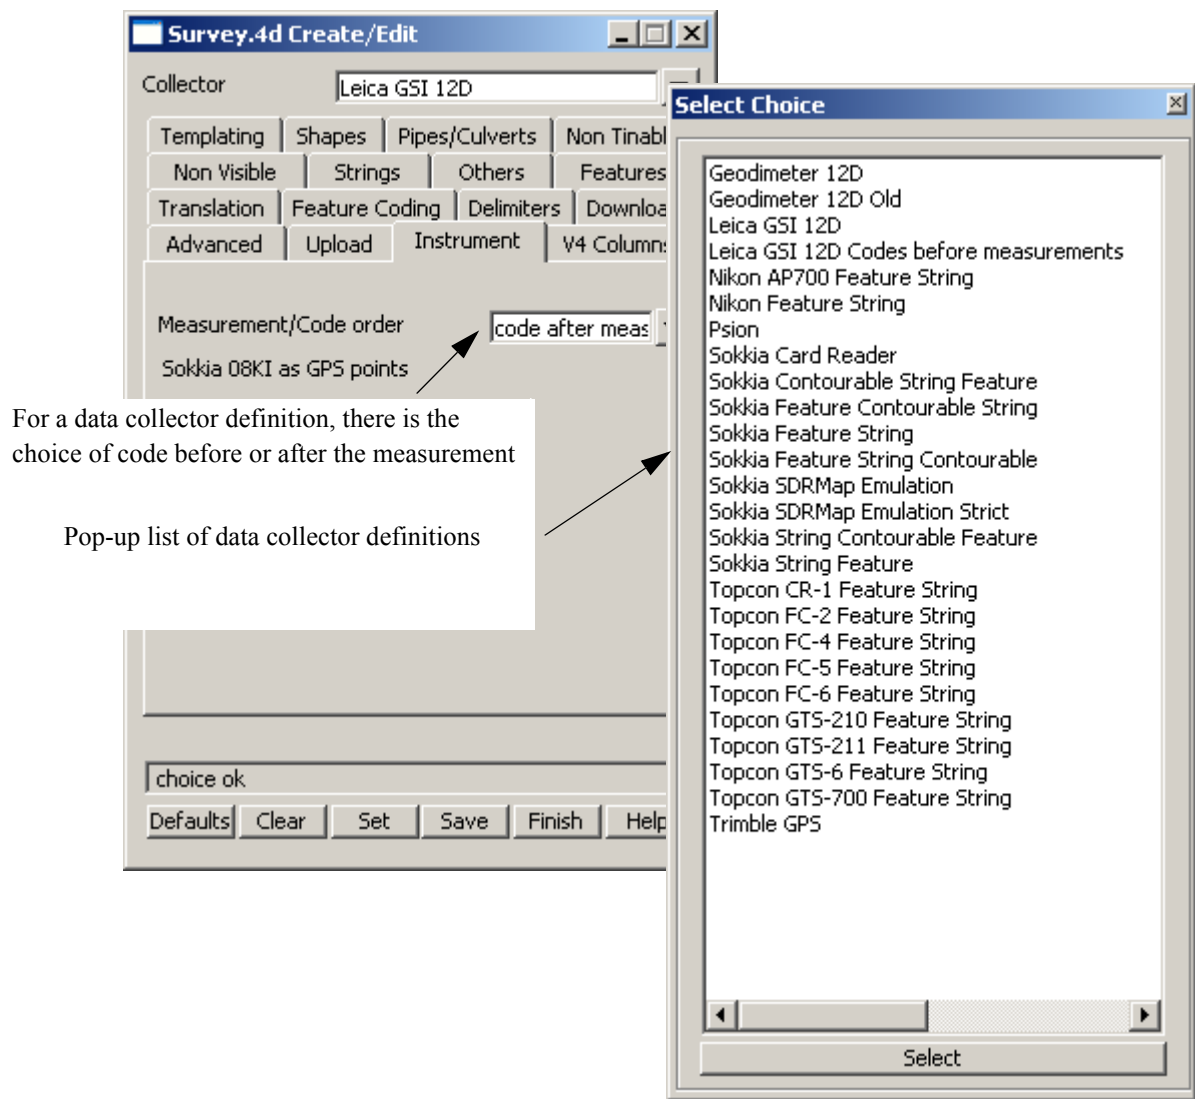

code after measurement

The given *feature code* and *string number* applies to the **last** measurement and all subsequent measurements until another *feature code* and *string number* is entered.

However, for a particular data collector setup, it can be only be defined as one of the two choices. That is you can't change between having feature codes before or after measurements in the one raw file.

Summarising:

Whether feature code definitions come before or after the measurements is defined in the *Survey Data Collector* definition and is set by the *Measurement/Code order* field on the *Instrument* tab of the *Survey.4d Create/Edit* panel.

Please continue to the next section [Leica Field Codes](#).

Leica Field Codes

12d Model also uses code lines to supply extra information using field codes.

All *field codes* are entered as the first word of the code line and to differentiated it from a *feature code*, the *field code* is preceded by a ".". Depending on the field code, more information may be required and it is entered in words 2 and above in the code line.

Each *field code* will now be described in detail.

For each *field code*, two lines and a paragraph of description are given:

- s The first line consists of the *field code* and a short description of the purpose of the code.
- s The second line gives the full syntax of the record for that *field code*.
- s The paragraph gives a detailed description of the *field code*.

A 12d Model code list containing 12d Model field codes is available for the TPS to help coding in the field.

Field Code Conventions

In the syntax for the *field codes*, optional Words or groups of Words are enclosed in the square brackets [].

However, when the Leica TPS creates the Leica GSI format, the data in all Words is right justified and left filled with zeros. Consequently, 12d Model strips leading zeros from all Words before processing the data.

This means that

- (a) an **optional Word** still exists in the file but its data field is simply **filled with zeros**.
- (b) any **text** in a Word **cannot start with a zero**. You would need to start with a space and then a zero.

In the *field code* descriptions, the point just measured is referred to as the *current measurement point*, the *current point* or the *last measurement point*.

The *string* that the current measurement point belongs to is called the *current string*.

For a summary of the Leica Field Codes, go to the section [Summary of Leica Field Codes](#)

For the full description of the Leica Field Codes, go to the section [Full Description of Leica Field Codes](#).

For an example of a raw Leica file, please go to the section [Example of Leica GSI File](#).

Full Description of Leica Field Codes

For a summary of the Leica Field Codes, go to the section [Summary of Leica Field Codes](#)

Field Code	Description of Record
------------	-----------------------

.2 Directly entered coordinates

Word 1 .2 Word 2 X Word 3 Y Word 4 Z Word 5 Feature_code
Word 6 String_number [Word 7 Point_number Word 8 Point_name]

A *measurement* point is created with the given *feature code* and *string number* and given (x, y, z) co-ordinates. No reduction is needed.

If a *Point_name* exists, then it is a **named measurement** and in the reduction, a 4d point string of name *Point_name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *Point_name*. The *Point_name* is added to the internal list of named points for searching for co-ordinates.

Note that the Leica GSI format includes directly entered coordinates in a code line by data blocks with word indices 81, 82, 83 (Easting, Northing and Elevation).

.3 New instrument point - before the measurement

Word 1 .3 Word 2 Point_name Word 3 Instrument_height

Set up an instrument at the point with name *Point_name*. In the reduction, the (x, y, z) co-ordinates for *Point_name* are found by first searching the control model, then the list of previously named points in the reduction, point numbers of previous measurements and finally if *Point_name* is still not found, the user is asked to type in the (x, y, z) co-ordinates.

Note that the Leica GSI format includes setting up on a station in a measurement line by data blocks with word indices 84, 85, 86 (Station easting, Station northing and Station elevation) and 88 (Instrument height).

.4 Next measurement is a backsight - before the measurement

Word 1 .4 Word 2 Station_name [Word 3 Feature_code Word 4 String_number Word 5 Target_height]

The **next** measurement is to a backsight with name *Station_name*.

For traverse reduction, if the traverse code specified in the reduction panel matches the Feature code given in Word 3, the data will be included in a traverse reduction, string number can also be specified. Also the target height to the backsight can be given in the backsight command.

.5 New target height for subsequent measurements - before the measurement

Word 1 .5 Word 2 Target_height

Set a new target height to be used for all subsequent measurement points.

Note that the Leica GSI format can include the target height on each measurement line (word index 97).

.6 Next measurement is a Check measurement - before the measurement

Word 1 .6 Word 2 Station_name

The **next** measurement is a check measurement made to the station *Station_name*.

During reduction a two point super string (with name *Station_name*) from the instrument point to the measured point is created in the default model for the check measurement. The instrument point name, the station name and the differences between the measurement point co-ordinates and station co-ordinates are written as text along the super string. The differences between the measurement and the known point is also written to the report file.

.9 Scale factor for subsequent distances

Word 1 .9 Word 2 Scale_factor

Scale factor to apply to subsequent slope distances.

.11 Next measurement is to a named station - before the measurement

Word 1 .11 Word 2 Station_name [Word 3 Feature_code Word 4 String_number Word 5 Target_height]

This field code gives a name to a measurement so that it can be used in other field codes for setting up an instrument on, backsighting to or doing a check measurement to.

The *next* measurement locates a new instrument station with the name *Station_name*. A point with vertex text of *Station_name* is created. The *Station_name* is added to the internal list of named points for searching for co-ordinates.

If *Feature_code* exists, the point is given that *Feature_code*, otherwise the current feature code is used.

For traverse reduction, if the traverse code specified in the reduction panel matches the Feature code given in Word 3, the data will be included in a traverse reduction, string number can also be specified. Also the target height to the foresight can be given in this command.

.14 Feature code and string number - before or after measurement depends on the data collector definition

Word 1 .14 Word 2 Feature_code Word 3 String_number [Word 5 text Word 6 text] ...

A field code for entering the feature code and string number rather than using the standard method of using word 1 and word 2. This is for use with Leica quick codes which must put out a fixed first word. Any additional *text* is added to the end of any existing vertex text for the current measurement point. Any leading zeros in the text words will be ignored.

This field code is used *always before* or *always after* measurements depending on the *Measurement/code* field on the *Instrument* tab of the **Survey.4d Create/Edit** panel for the selected data collector definition.

.15 Vertical circle correction for subsequent measurements - before the measurement

Word 1 .15 Word 2 Vertical_circle_in_decimal_degrees

The *vertical_circle_in_decimal_degrees* is **subtracted** from the vertical circle value in any subsequent measurements.

.16 Additional code for point (multiply coded point) - after the measurement

Word 1 .16 Word 2 Feature_code Word 3 String_number [Word 4 Point_name] [Word 5 Point_text]

Additional coding for the current measurement point. A new measurement point is created at the same position as the current measurement point but with the *Feature_code* and *String_number* from this field code. The same point number is used as for the current measurement point.

If *Point_text* exists, it is used as the vertex text for that vertex of the super string.

If *Point_name* exists, then it is a **named measurement** and during reduction, a 4d point string of name *Point_name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *Point_name*. The *Point_name* is added to the internal list of named points for searching for co-ordinates.

.17 Arc through previous three points - after the measurement of last point of arc

Word 1 .17 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, then the current measurement point and the two previous points with the same feature code and string number as the current measurement point, are joined by an arc. If there is less

than three such points, no arc is fitted.

If the *Feature_code* and *String_number* exist, the last three previous three measurement points of the same *feature code* and *string number* are joined by an arc. If the current measurement point has that feature code and string number, then it is the third of the three points used. If there is less than three points, no arc is fitted.

If *Point_number* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point number, and that point and the two measurement points previous to the pre-defined point of the same *feature code* and *string number*, are joined by an arc. If there is less than three points, no arc is fitted

See the Section [Arcs Through Points](#) for more information on arc fitting.

.18 Circle Feature - after the measurement

Word 1 .18 Word 2 Radius [Word 2 Radius ...]

Creates a feature string with the given radius and centred on the current measurement point. If there is more than one radius, then separate feature strings are created each with one of the radii.

.20 Close string - after the measurement

Word 1 .20 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the current string is closed.

If the *Feature_code* and *String_number* exist, the last previous string with that *feature code* and *string number* is closed.

If *Point_number* exists, then the string containing that point number is closed.

See the Section [Close String](#) for more information on closing a string.

.21 Join last points of strings

Word 1 .21 Word 2 Feature_code Word 3 String_number_1 Word 4 String_number_2

In the final reduction, the last point of the string with the given *Feature_code* and *String_number_1* is joined to the last point of the string with given *Feature_code* and *String_number_2*. The created string has the given *Feature_code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

See the Section [Joining Strings](#) for more information on joining strings.

.22 Join first to last point of strings

Word 1 .22 Word 2 Feature_code Word 3 String_number_1 Word 4 String_number_2

In the final reduction, the first point of the string with the given *Feature_code* and *String_number_1* is joined to the last point of the string with given *Feature_code* and *String_number_2*. The created string has the given *Feature_code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

See the Section [Joining Strings](#) for more information on joining strings.

.23 Join first points of strings

Word 1 .23 Word 2 Feature_code Word 3 String_number_1 Word 4 String_number_2

In the final reduction, the first point of the string with the given *Feature_code* and *String_number_1* is joined to the first point of the string with given *Feature_code* and *String_number_2*. The created string has the given *Feature_code* (no string number is needed since it is the final reduction when the string numbers are then dropped).

See the Section [Joining Strings](#) for more information on joining strings.

.28 Text appended to a string name

Word 1 .28 Word 2 Text [Word 3 Feature_code Word 4 String_number] [Word 5 Point_number]

Text is appended to the string name. For example, if 1.200 is entered, “ 1.200” is appended to the string name.

If only *Text* is given, *Text* is appended to the string name of the current string.

If the *Feature_code* and *String_number* exist, then the last previous string with that *feature code* and *string number* has *Text* appended to the string name.

If *Point_number* exists, then the string containing that point number has *Text* appended to the string name.

.29 Note or memo - after the measurement

Word 1 .29 [Word 2 text] [Word 3 text] ...

Any text may be entered and will be added to the check measurements model at the position of the current measurement point.

.30 Remove height from a point - that is make it a null height - after the measurement

Word 1 .30 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the height of the current measurement point is set to null.

If *Feature_code* and *String_number* exist, then the height of the last point of the previous string with that *feature code* and *string number* is set to null.

If *Point_number* exists, then the height of the point with that point number is set to null.

.37 Rectangle by two points

Word 1 .37 Word 2 offset_in_metres [Word 3 Feature_code Word 4 String_number] [Word 5 Point_number]

The rectangle is defined by two points (reference side) and a offset.

If a positive offset value is given, two points will be created to the right of the reference side.

If a negative offset value is given, two points will be created to the left of the reference side.

If *Feature_code* and *String_number* exist, the last two points with that *feature code* and *string number* are used and a fourth points are created to form a rectangle. The height of the two new points are set to null. The string is then closed.

If *Point_number* exists, then the *feature code* and *string number* of the point with that point number are used and processed as above. Note that the point with the point number is not necessarily used.

Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

See the Section [Rectangle](#) for more information.

.38 Make the previous segment non-tinable (not a breakline) - after the measurement

Word 1 .38 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the previous segment containing the current measurement point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If the *Feature_code* and *String_number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to non-tinable.

If *Point_number* exists, then the segment containing the point with that point number as an end point, is set to non-tinable.

.39 Make the next segment non-tinable (i.e. not a breakline) - after the measurement for the first point of the segment

Word 1 .39 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the next segment containing the current measurement point as a starting point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If the *Feature_code* and *String_number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If *Point_number* exists, then the segment containing the point with that point number as a start point, is set to non-tinable.

.40 Make a point non-tinable - after the measurement

Word 1 .40 [Word 2 *Feature_code* Word 3 *String_number*] [Word 4 *Point_number*]

If only Word 1 exists, the current measurement point is set to non-tinable. That is, it will not be included in triangulations.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If *Point_number* exists, then the point with that point number is set to non-tinable.

.41 Add additional text to the current measurement point - after the measurement

Word 1 .41 Word 2 *text* [Word 3 *text*] ...

The given *text* is added to the end of any existing vertex text for the current measurement point. Any leading zeros in the text words will be ignored.

.42 Add a radial offset - after the measurement

Word 1 .42 Word 2 *Radial_offset_in_metres* [Word 3 *Feature_code* Word 4 *String_number*] [Word 5 *Point_number*]

The *Radial_offset_in_metres* is used to adjust the position of the specified point by a plan distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station, negative is toward the station.

If only Word 1 and 2 exist, the offset is used to adjust the position of the current measured point.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If *Point_number* exists, then the point with that point number is adjusted.

See the Section [Offsets](#) for more information on offsets.

.43 Add a tangential offset - after the measurement

Word 1 .43 Word 2 *Tangential_offset_in_metres* [Word 3 *Feature_code* Word 4 *String_number*] [Word 5 *Point_number*]

The *Tangential_offset_in_metres* is used to adjust the position of the specified point by a plan distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A negative offset is to the left (looking from the station), and positive is to the right (looking from the station).

If only Word 1 and 2 exist, the offset is used to adjust the position of the current measured point.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If *Point_number* exists, then the point with that point number is adjusted.

See the Section [Offsets](#) for more information on offsets.

.44 Add a height offset - after the measurement

Word 1 .44 Word 2 *Height_offset_in_metres* [Word 3 *Feature_code* Word 4 *String_number*] [Word 5 *Point_number*]

If the height of the specified point is not null, then the *Height_offset_in_metres* adjusts the height of the point. A positive offset adds to the height, a negative offset reduces the height.

If only Word 1 and 2 *exist*, the offset is used to adjust the position of the current measured point.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If *Point_number* exists, then the point with that point number is adjusted.

See the Section [Offsets](#) for more information on offsets.

.45 Make a parallelogram from the last three measurement points - after the measurement

Word 1 .45 [Word 2 *Feature_code* Word 3 *String_number*] [Word 4 *Point_number*]

If only Word 1 *exists*, the current measurement point and the two previous points from the current string are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If *Feature_code* and *String_number* exist, the last three points with that *feature code* and *string number* are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If *Point_number* exists, then the *feature code* and *string number* of the point with that point number are used and processed as above. Note that the point with the point number is not necessarily used.

See the Section [Rectangle](#) for more information on forming a parallelogram.

.46 Make the entire string a breakline or not (tinable or non-tinable)

Word 1 .46 [Word 2 *Breakline_type*] [Word 3 *Feature_code* Word 4 *String_number*]
[Word 5 *Point_number*]

Word 2: *Breakline_type*:

If *Breakline_type* is 0, the selected string is set to a point string and hence is not a breakline (non-tinable).

If *Breakline_type* is 1, the selected string is set to a *line* string and is therefore a breakline (tinable).

Words 3, 4, and 5:

If none of Words 3, 4 and 5 exist, the *Breakline_type* is applied to the current string.

If *Feature_code* and *String_number* exist, the *Breakline_type* is applied to the last string with that *feature code* and *string number*.

If *Point_number* exists, then the *Breakline_type* is applied to the string containing the point with that point number.

.47 Start a new string using the same feature code and string number - after the measurement of the first point of the new string

Word 1 .47 [Word 2 *Feature_code* Word 3 *String_number*] [Word 4 *Point_number*]

If only Word 1 *exists*, the current string is terminated (without including the current measurement point) and the current measurement point becomes the first point of a new string with the same feature code and string number.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that feature code and string number becomes the first point of a new string with the same *feature code* and *string number*.

If *Point_number* exists, then the previous string containing the point with that point number is terminated *before* the point number point, and the point becomes the first point of a new string with the same *feature code* and *string number*.

.48 End a string

Word 1 .48 [Word 2 *Feature_code* Word 3 *String_number*] [Word 4 *Point_number*]

If only Word 1 *exists*, the current string is terminated (including the current measurement point).

If *Feature_code* and *String_number* exist, then the last point of the previous string with that feature

code and string number becomes the last point of that string.

If *Point_number* exists, then the previous string containing the point with that point number is terminated *after* the point number point

.50 Specify the bearing to correct for true north - used as the bearing datum difference

Word 1 .50 Word 2 *Bearing_in_decimal_degrees* [Word 3 *Text*]

The *Bearing_in_decimal_degrees* is used as the bearing datum difference for the current instrument set up. The *Text* and the *Bearing_in_decimal_degrees* are written to the reduction report file.

.51 Start using an existing field template - before the measurement

Word 1 .51 Word 2 [*Template_name*] [*mode*]

Start using the template *Template_name*. If *Template_name* is blank, the default template is used. If *mode* is "for", then the field template is used as a *forward* template.

"rev", then the field template is used as a *reverse* template.

"zig", then the field template is used as a *zig_zag* template and is used in the *forward* definition direction first.

"zag", then the field template is used as a *zig_zag* template and is used in the *reverse* direction first

If *mode* is blank, or 0, or anything other than "for", "rev", or "zag", then the field template is used as a *zig-zag* field template starting on a *zig*.

See the Section [Field Templates](#) for more information on field templates.

.52 Finish using a field template or finish recording a field template - after the measurement

Word 1 .52

Stops using the current field template or stops recording a field template.

.53 Pause using the current field template - after the measurement

Word 1 .53

Pause using the current field template or defining a field template, until a continue template (54) or a finish field template (52) code is given.

.54 Continue the current field template - before the measurement

Word 1 .54

Continue using the current field template or defining the current field template, which has been stopped by a *Pause* command (53). The *Continue* command only needs to be given once and applies to all *following* measurements until another *Pause* or *Finish* command is given.

.55 Start recording a field template - before the measurement

Word 1 .55 Word 2 [*Template_name*]

Start recording a field template with the name *Template_name*. If *Template_name* is non-blank, then the default field template is defined. The *feature_code* and *string_number* of the following measurements until a *Finish* code (52) are stored as the field template. There is no limit to the number of points in a field template.

See the Section [Field Templates](#) for more information on field templates.

.56 Skipping picking up points when using a field template - after the measurement of last point before skipping points

Word 1 .56 Word 2 [*num_skipped_points*]

Allows the user to skip picking up one or more points from the field template currently being used. The *next measurement* takes the *feature_code* and *string_number* from the next point of the field template definition. If *num_skipped_points* is missing, then only one point is skipped otherwise *num_skipped_points* are skipped.

.57 Delete points on a field template - after the measurement of last point

Word 1 .57 Word 2 [num_points_to_delete]

Allows the user to delete one or more points from the field template currently being used. The *next measurement* takes the *feature_code* and *string_number* from the next point of the field template definition.

**.58 Insert points when using a field template - after the measurement of last point
before inserting points**

Word 1 .58 Word 2 Feature_code Word 3 String_number Word
4 Multiple_code_flag Word 5 Insert_special_flag

Allows the user to insert points into the field template currently being used. The *next measurement* takes the *feature_code* and *string_number* from the next point of the field template definition.

If the *Multiple_code_flag* = 1, then the *feature code* will be added to the previous defined template point else if *Multiple_code_flag* = 0 (default), it will be added to the template as a separate point.

If the insert is done at the end of a section and the *Insert_special_flag* = 1 the point will be added to the end of the current template section else it will be at the start of the next section.

.60 Start of arc through next three points - after the measurement of the first point of the arc

Word 1 .60 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, an arc is inserted through the current measurement point and the next two measured points with the same feature code and string number as the current measurement point. If there is less than three points, no arc is fitted.

If *Feature_code* and *String_number* exist, a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through the previous measurement and the next two measured points following this previous measurement with the same feature code and string number. If the current point has that feature code and string number, then it is the first of the three point. If there is less than three points, no arc is fitted.

If *Point_number* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point number, and an arc is inserted through that point and the next two measurement points with the same *feature code* and *string number*. If there is less than three points, no arc is fitted

See the Section [Arcs Through Points](#) for more information on arc fitting.

**.61 Start of arc through sets of three points until end of string, or a 62 occurs - after the
measurement of the first point of the arc**

Word 1 .61 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

The arcs are fitted as follows - the first arc is fitted through points one, two and three, the next arc through points three, four and five etc. If there is less than three points remaining at the end, then no arc is fitted to the end points.

If only Word 1 exists, arcs are inserted through the following sets of measurement points with the same feature code and string number as the current measurement point. The current measurement point is the *first* of the points.

If the current point has that feature code and string number, then it is the first of the points. If there is less than three points, then no arc is fitted.

If the *feature code* and *string number* exist, a search is made for a previously defined measurement with the same feature code or string number. An arc is inserted through the following measured points with the same feature code and string number as given in *point_description*. If the current point has that feature code and string number, then it is the first of the points.

If *Point_number* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point number, and arcs are inserted through that point and the following measured points with the same *feature code* and *string number*.

If 12d Model encounters a *Start Arcs through sets of three points* but no *End Arcs* command for the string, then an *End Arcs* is assumed at the end of the string.

See the Section [Arcs Through Points](#) for more information on arc fitting.

.62 End the arcs begun by a 61 command - after the measurement of the last point of the arcs

Word 1 .62 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, then the fitting of arcs through the points of the current string is stopped. The current measurement point is the *last* of the points used in the arc fitting.

If *Feature_code* and *String_number* exist, then the fitting of arcs through the points of the previous string with the same *feature code* and *string number* is stopped. If the current measurement point has that feature code and string number, then it is the last point used in the arc fitting.

If *Point_number* exists, then the point with that point number is the last point used in the arc fitting.

If 12d Model encounters an *End Arcs* (62) but no *Start Arcs through sets of three points* (61) command for the string, then an *Start Arcs through sets of three points* (61) is assumed to apply at the beginning of the string and hence arc fitting will be applied to the entire string.

See the section [Arcs Through Points](#) for more information on arc fitting.

There are field codes for adding user defined attributes to:

- (a) the current string being measured (i.e. the string containing the current measurement point)
 - (b) the current measurement point
 - (c) the next segment from the current measurement point (i.e. the segment joining the current measurement point and the *next* measured point *of the same feature code and string number*)
- or
- (d) the previous segment to the current measurement point (i.e. the segment joining the current measurement point to the previous measured point *of the same feature code and string number*).

The attributes can be named or unnamed and are coded in the following way:

If Word 2 is missing (i.e. all zeros), then the attribute is an un-named attribute and the rest of the Words on the line is the attribute value. The attribute is given the special name "unnamed attribute n" for n=1, 2,

.68 Add an integer user defined attribute to the current string

Word 1 .68 [Word 2 Name] Word 3 Integer

Add an user defined integer attribute to the current string.

.69 Add a real user defined attribute to the current string

Word 1 .69 [Word 2 Name] Word 3 Real

Add a real (floating point) user defined attribute to the current string.

.70 Add text user defined attribute to the current string

Word 1 .70 [Word 2 Name] Word 3 Text [Word 4 Text] ...

Add a text user defined attribute to the current string.

.71 Add integer user defined attribute to the current point

Word 1 .71 [Word 2 Name] Word 3 Integer

Add an integer user defined attribute to the current measurement point.

.72 Add real user defined attribute to the current point

Word 1 .72 [Word 2 Name] Word 3 Real

Add a real (floating point) user defined attribute to the current measurement point.

.73 Add text user defined attribute to the current point

Word 1 .73 [Word 2 Name] Word 3 Text [Word 4 Text] ...

Add a text user defined attribute to the current measurement point.

.74 Add integer user defined attribute to the next segment

Word 1 .74 [Word 2 Name] Word 3 Integer

Add an integer user defined attribute to the next segment from the current measurement point.

.75 Add real user defined attribute to the next segment

Word 1 .75 [Word 2 Name] Word 3 Real

Add a real (floating point) user defined attribute to the next segment from the current measurement point.

.76 Add text user defined attribute to the next segment

Word 1 .76 [Word 2 Name] Word 3 Text [Word 4 Text] ...

Add a text user defined attribute to the next segment from the current measurement point.

.77 Add integer user defined attribute to the previous segment

Word 1 .77 [Word 2 Name] Word 3 Integer

Add an integer user defined attribute to the previous segment for the current measurement point.

.78 Add real user defined attribute for the previous segment

Word 1 .78 [Word 2 Name] Word 3 Real

Add a real (floating point) user defined attribute to the previous segment for the current measurement point.

.79 Add text user defined attribute to the previous segment

Word 1 .79 [Word 2 Name] Word 3 Text [Word 4 text] ...

Add a text user defined attribute to the previous segment for the current measurement point.

In addition, extra codes allow 12d Model pipe strings to be coded in the field.

.80 Pipe invert point (bottom of the pipe) - after the measurement

Word 1 .80 [Word 2 Feature_code] Word 3 String_number [Word 4 Point_number]

If only Word 1 *exists*, the current measurement point is on the invert (bottom) of a pipe. This is the default for measurements to points on pipe strings. If the point is not part of a pipe string, it is ignored.

If *Feature_code* and *String_number* exist, the last point of the previous string with the same *feature code* and *string number* is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

If *Point_number* exists, then the point with that point number is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

.81 Pipe axial point (centre of the pipe) - after the measurement

Word 1 .81 [Word 2 Feature_code] Word 3 String_number [Word 4 Point_number]

If only Word 1 *exists*, the current measurement point is on the axis (centre) of a pipe. If the point is not

part of a pipe string, it is ignored.

If *Feature_code* and *String_number* exist, the last point of the previous string with the same *feature code* and *string number* is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If *Point_number* exists, then the point with that point number is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

.82 Pipe obvert point (top of the pipe) - after the measurement

Word 1 .82 [Word 2 *Feature_code* Word 3 *String_number*] [Word 4 *Point_number*]

If only Word 1 exists, the current measurement point is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If *Feature_code* and *String_number* exist, the last point of the previous string with the same *feature code* and *string number* is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If *Point_number* exists, then the point with that point number is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

.83 Start recording a shape - before the measurement

Word 1 .83 [Word 2 *Shape_name*]

Start recording a shape with the name *Shape_name*. If *Shape_name* is non-blank, then the default field Shape is defined by the *feature_code* and *string_number* of the following measurements until a *Finish* code (84) are stored as the shape. There is no limit to the number of points in a shape.

See the Section [Field Templates](#) for more information on field templates.

.84 Finish using a shape definition or finish recording a shape - after the measurement

Word 1 .84

Stops using the current shape or stops recording a shape.

.85 Shape parallel

Word 1 .85 Word 2 *Shape_name* [Word 3 *Feature_code* Word 4 *String_number*] [Word 5 *Point_number*]

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* has the shape applied to the entire length of the string.

If *Point_number* exists, then the string containing that point number has the shape applied to the entire length of the string.

Parallelling the shape will produce separate strings for each point of the shape.

.86 Shape extrude

Word 1 .86

Word 1 .85 Word 2 *Shape_name* [Word 3 *Feature_code* Word 4 *String_number*] [Word 5 *Point_number*]

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* has the shape applied to the entire length of the string.

If *Point_number* exists, then the string containing that point number has the shape applied to the entire length of the string.

Extruding the shape will produce a single string for the shape.

.92 Remove all z-values for a string (i.e. make all z-values null) - after the measurement

Word 1 .92 [Word 2 *Point_line_type*] [Word 3 *Feature_code* Word

4 *String_number*] [*Word 5 Point_number*]

If only *Word 1* exists, all z-values for the current string are removed.

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* has all its z-values removed.

If *Point_number* exists, then the string containing that point number has all its z-values removed.

If *Point_line_type* is 0, the selected string is set to a point string.

If *Point_line_type* is 1, the selected string is set to a *line* string.

.93 Set the Point-line type - after the measurement

Word 1 .93 [*Word 2 Point_line_type*] [*Word 3 Feature_code Word 4 String_number*] [*Word 5 Point_number*]

If only *Word 1* exists, the current string is created as a point string.

If *Feature_code* and *String_number* exist, the last previous string with the same *feature code* and *string number* has its point-line type modified.

If the *point number* exists, then the string containing that point number has its point-line type modified.

If *Point_line_type* is 0, the selected string is set to a point string.

If *Point_line_type* is 1, the selected string is set to a *line* string.

.94 Use name library/mapping file for vertex text on the string - name mapping - after the measurement

Word 1 .94 [*Word 2 Point_line_type*] [*Word 3 Feature_code Word 4 String_number*] [*Word 5 Point_number*]

If this field code exists then during reduction, vertex text is creating using either the name library, or if the name library doesn't exist, the map file. If neither exist then the field code is ignored.

if a name library is used and the feature code of the string is found in the first column of the name library, then the entry from the second column of that row will be used as text for *all* vertices of the string that don't already have vertex text. As a default, the string is set as a point string.

if the map file is used and the feature code of the string is found in the first column of the map file, then the *string name* field of the map file is used as vertex text for all vertices that don't already have text. As a default, the string is set as a point string.

If only *Word 1* exists, then name mapping is applied to the current string.

If *Feature_code* and *String_number* exist, then name mapping is applied to the last previous string with the same *feature code* and *string number*.

If *Point_number* exists, then name mapping is applied to the string containing that point number.

If *Point_line_type* is 0, the selected string is set to a point string.

If *Point_line_type* is 1, the selected string is set to a *line* string.

.95 Circular Pipe string - after the measurement

Word 1 .95 Word 2 Diameter [*Word 3 Feature_code Word 4 String_number*] [*Word 5 Point_number*]

Pipe strings are always line strings and are stored with the justification of the majority of the string points. Individual pipe points are picked up either top (obvert), centre (axial) or bottom (invert) of the pipe using field codes 80, 81 and 82.

If only *Word 1* and *2* exists, the current string is created as a pipe string with the given diameter.

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* is created as a pipe with the given diameter.

If *Point_number* exists, then the string containing that point number is created as a pipe string with the given diameter.

.96 Box Culvert string - after the measurement

Word 1 .95 Word 2 Width Word 3 Height [Word 4 Feature_code Word 5 String_number] [Word 6 Point_number]

Culvert strings are always line strings and are stored with the justification of the majority of the string points. Individual culvert points are picked up either top (obvert), centre (axial) or bottom (invert) of the culvert using field codes 80, 81 and 82.

If only Word 1, 2 and 3 *exists*, the current string is created as a culvert string with the given width and height.

If *Feature_code* and *String_number* exist, the last string with the same *feature code* and *string number* is created as a culvert with the given width and height.

If *Point_number* exists, then the string containing that point number is created as a culvert string with the given width and height.

.99 Terminate processing

Word 1 .99

Stop processing the field file at this line. Useful for debugging errors.

.107 Make the previous segment invisible - after the measurement

Word 1 .107 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the previous segment containing the current measurement point is set to invisible.

If the *Feature_code* and *String_number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to invisible.

If *Point_number* exists, then the segment containing the point with that point number as an end point, is set to invisible.

.108 Make the next segment invisible - after the measurement for the first point of the segment

Word 1 .108 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the next segment containing the current measurement point as a starting point is set to invisible.

If the *Feature_code* and *String_number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to invisible.

If *Point_number* exists, then the segment containing the point with that point number as a start point, is set to invisible.

.109 Make a point invisible - after the measurement

Word 1 .109 [Word 2 Feature_code Word 3 String_number] [Word 4 Point_number]

If only Word 1 exists, the current measurement point is set to invisible.

If *Feature_code* and *String_number* exist, then the last point of the previous string with that *feature code* and *string number* is set to invisible.

If *Point_number* exists, then the point with that point number is set to invisible.

.110 Start buildings face observations - before the measurements

Word 1 .110 Word 2 [Building_name]

Start recording a field template with the name *Building_name*. If *Building_name* is non-blank, then the default building face is defined. The *feature code* and *string number* of the following measurements until a *Finish* code (111) are stored as the building face. There is no limit to the number of points in a building face.

.111 End building face observations

Word 1 .111 *Word 2* [*Building_name*]

If only Word 1 *exists*, the current building face observation set is finished (including the current measurement point).

Notes

1. Arc fitting is applied *after* the Joins are processed. Hence the new joined strings are created and then curve fitting is applied according to the arc codes (start arc, end arc, fit arcs, stop fitting arcs etc.) on any vertex of the string.

For a summary of the Leica Field Codes, go to the section [Summary of Leica Field Codes](#)

Summary of Leica Field Codes

Most of the field codes are entered after the measurement is taken and they will have a (AM) after the description. Some of the field codes are entered before the measurement is taken (mainly set up codes) and will have a (BM) after the description.

Field Code Description of Record

- .2 Directly entered coordinate measurement
- .3 New instrument setup point (BM)
- .4 Measurement to backsight (BM)
- .5 New target height (BM)
- .6 Check measurement (BM)
- .9 Scale factor for subsequent distances (BM)
- .10 Three hair stadia measurement
- .11 Measurement to a named station (BM)
- .15 Vertical circle correction (BM)
- .14 A field code for entering Feature code and String number - BM or AM depends on data collector definition
- .16 Multiply coded point (AM)
- .17 Arc through previous three points (AM of last point of arc)
- .18 Circle Feature (AM)
- .20 Close string (AM)
- .21 Join last points of strings
- .22 Join first to last point of strings
- .23 Join first points of strings
- .28 Add text to the string name (AM)
- .29 Note or memo (AM)
- .30 Remove height from a point - that is make it a null height (AM)
- .37 Rectangle by two points
- .38 Make the previous segment non-tinable (AM of end point of segment)
- .39 Make the next segment non-tinable (AM of first point of segment)
- .40 Make a point non-tinable (AM)
- .41 Add additional text (AM)
- .42 Add a radial offset (AM)
- .43 Add a tangential offset (AM)
- .44 Add a height offset (AM)
- .45 Make a parallelogram from the last three measurement points (AM)
- .46 Make the string a breakline or not
- .47 Start a new string using the same feature code and string number (AM of first point of new string).
- .48 End a string -
- .50 Specify the bearing to correct for true north - used as the bearing datum difference
- .51 Start using an existing field template (BM)
- .52 Finish using a field template or finish recording a field template (AM)
- .53 Pause the current field template until a continue op code (54) or a finish template (52)
- .54 Continue the current field template (BM)
- .55 Start recording a field template (BM)
- .56 Skip picking up one or more points from a field template (AM of last point before skipping)
- .57 Delete one or more points from a field template (AM)
- .58 Insert a point into a field template (BM)
- .60 Arc through next three points (AM of first point of arc)
- .61 Start of arc through sets of three points until end of string, or a 62 occurs (AM of first point of arc)
- .62 End the arcs begun by a 61 command (AM of last point of arcs)
- .68 Add an integer user defined attribute to the current string (AM of any point of the string)
- .69 Add a real user defined attribute to the current string (AM of any point of the string)
- .70 Add text user defined attribute to the current string (AM of any point of the string)
- .71 Add integer user defined attribute to the current point (AM)
- .72 Add real user defined attribute to the current point (AM)
- .73 Add text user defined attribute to the current point (AM)

- .74 Add integer user defined attribute to the next segment (AM of first point of the segment)
- .75 Add real user defined attribute to the next segment (AM of first point of the segment)
- .76 Add text user defined attribute to the next segment (AM of first point of the segment)
- .77 Add integer user defined attribute to the previous segment (AM of last point of the segment)
- .78 Add real user defined attribute for the previous segment (AM of last point of the segment)
- .79 Add text user defined attribute to the previous segment (AM of last point of the segment)
- .80 Pipe invert point (bottom of the pipe) (AM)
- .81 Pipe axial point (centre of the pipe) (AM)
- .82 Pipe obvert point (top of the pipe) (AM)
- .83 Start recording a shape - before the measurement
- .84 Finish using a shape definition or finish recording a shape - after the measurement
- .85 Shape parallel
- .86 Shape extrude
- .92 Remove all z-values for a string (i.e. make all z-values null) (AM of point of the string)
- .93 Set the Point-line type
- .94 Use name library file/ mapping file for vertex text on the string - name mapping
- .95 Circular pipe string with diameter (AM)
- .96 Box culvert string with dimensions (AM)
- .99 Terminate processing
- .107 Make the previous segment invisible - after the measurement
- .108 Make the next segment invisible - after the measurement for the first
point of the segment
- .109 Make a point invisible - after the measurement
- .110 Start buildings face observations - before the measurements
- .111 End building face observations

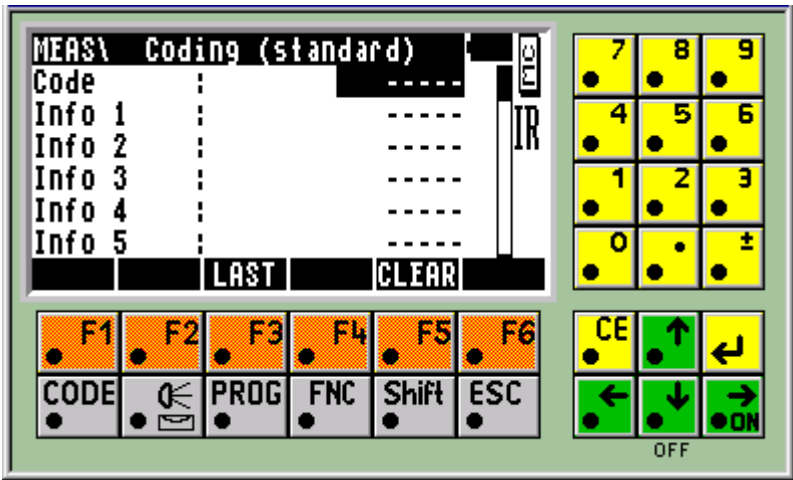

For a full description of the Leica codes, please go to the section [Full Description of Leica Field Codes](#).

For an example of a raw Leica file, please go to the section [Example of Leica GSI File](#).

Examples of Leica Screens

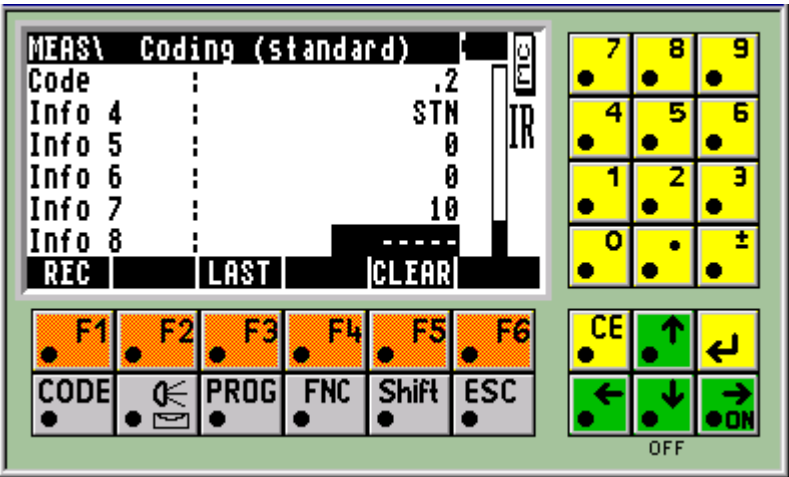

Standard Screen

When using a Leica instrument with no code.hex on the 1000 series, or Geobasic program or Codelist (.crf file) on the 1100 series, hitting the *Code* button brings up the standard Leica screen:

The information entered in *Code* goes to Word 1 of the line written to the Leica GSI file.
The information in *Info 1* to *Info 8* go to Word 2 to Word 9 respectively of the line written to the GSI file.
As an example, to enter a *directly entered co-ordinate* (the 2 field code),
".2" is entered in the *Code* field
X, Y and Z in *Info 1*, *Info 2* and *Info 3* respectively.
the feature code (STN) is entered into *Info 4*
the station name "10" is entered into *Info 7*

To enter a *feature code* and *string number* to be used for measurements
the feature code is entered into the *Code* field
the string number is entered into *Info 1*.

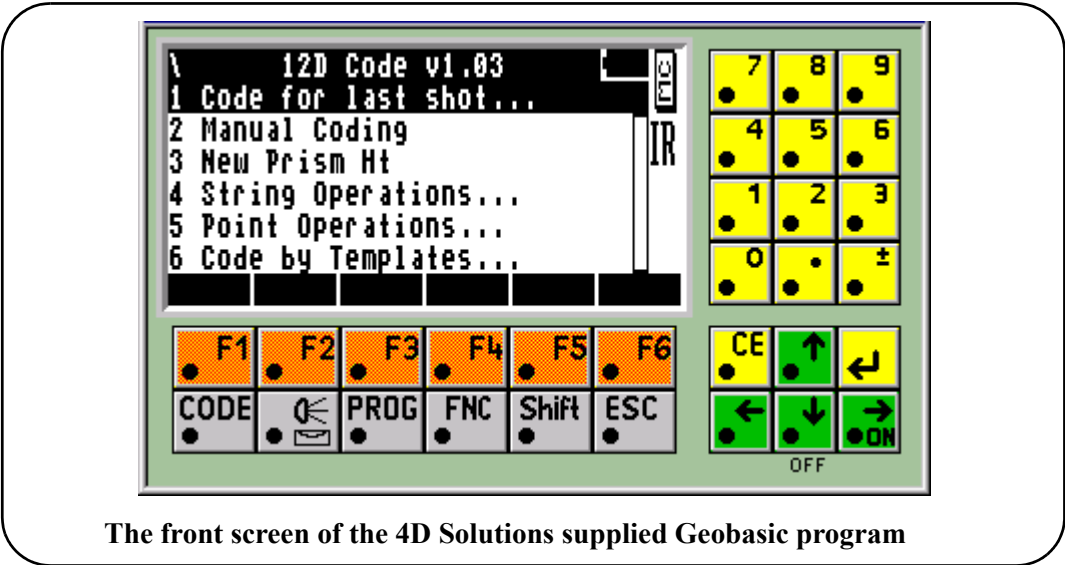

Leica Geobasic Program

A Leica Geobasic program gives the programmer full control over the Leica screen.

WARNING

Only one Geobasic program can exist on the Leica at any one time. Loading a Geobasic program will over write the existing Geobasic program on the instrument. Make sure you have a backup copy of the existing Geobasic program on your computer before loading a new one onto the instrument.

If you do not have a backup copy of the existing Geobasic program, do not load a new one.

The front screen of the 4D Solutions supplied Geobasic program

Leica Codelist

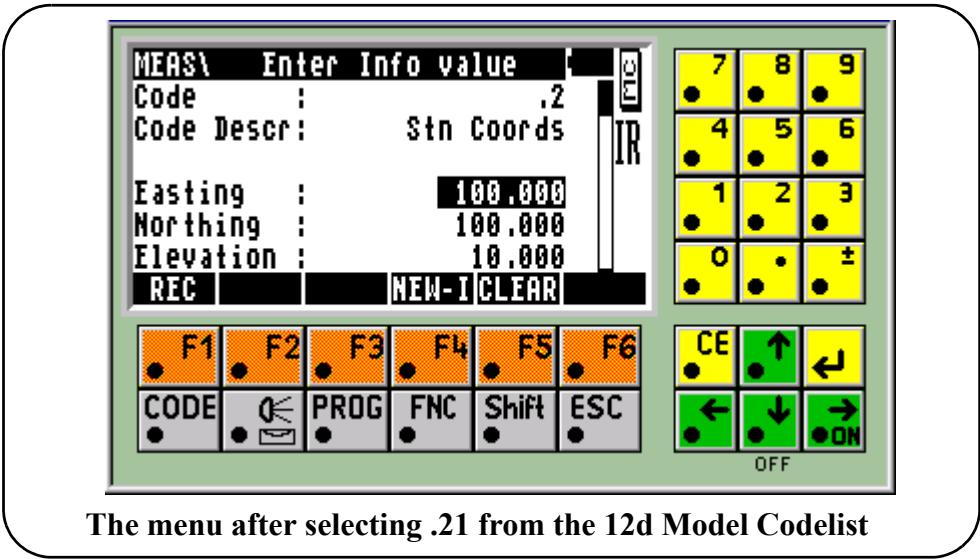

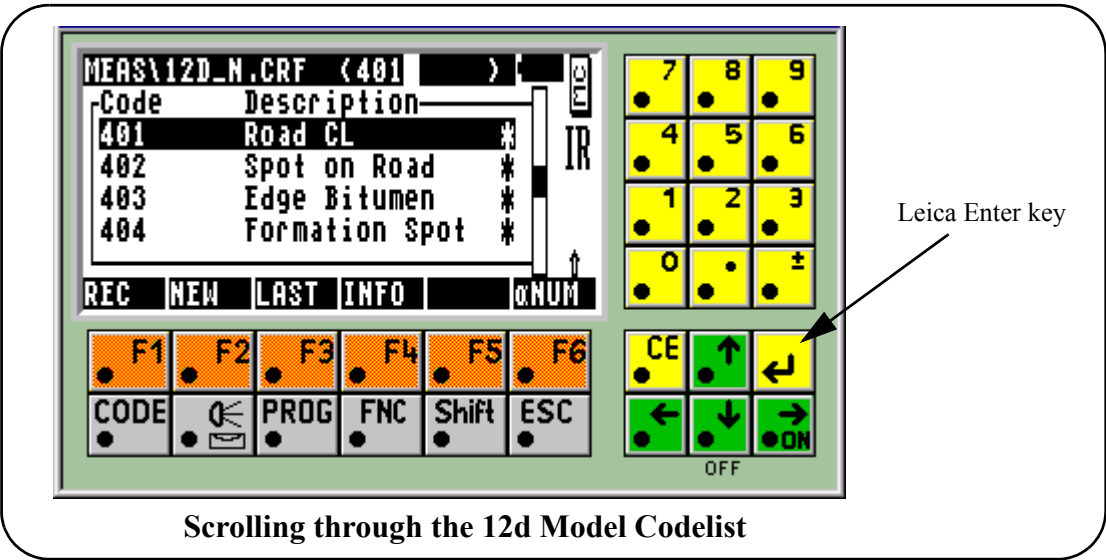

A Leica Codelist (.crf file) controls what is displayed and validated on the Leica screen and what values are recorded whenever the *Code* button is selected. For example, when using the 4D Solutions supplied Codelists , a list of defined feature codes and descriptions are displayed.

The Codelist controls what codes are displayed and whenever a code is selected, what information is required for that code. The Codelist also specifies what information is written out to the GSI file for that code.

After hitting the *Code* button, the list of codes from the Codelist is displayed in alphanumeric order. Because the 12d Model field codes start with a ".", they will appear at the top of the list.

A code can be typed in or the list can be scrolled through using the arrow keys.

The highlighted code is selected by pressing the Leica Enter Key. The menu for the selected code then appears. The line of data is written out to the GSI file when the F1 (REC) button is selected.

Setup of Leica 1100 instrument for detail pickup and use with 12d

The following relates to the setup of a Leica 1100 series instrument for topographic/detail pickup and use with 12d.

Setting up the Instrument

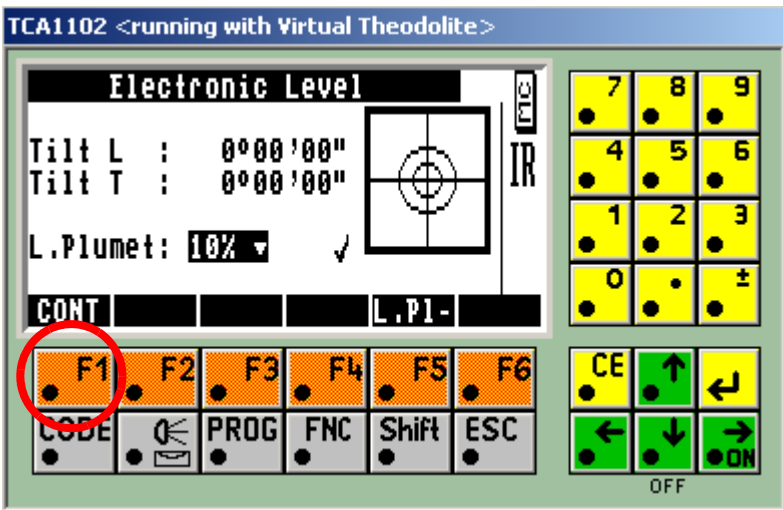

Copying the CRF file

A number of example .crf files are include on the installation CD. These can be found in the directory Other_Software\Leica\ . For the purpose of this documentation, we will use the file **12D_DS.CRF** which is designed for detail pickup. This file should be copied from the 12d CD to the folder “Code” on the Leica card.

This file contains all of the field codes used in 12d model along with a sample code listing

Set up the display and record masks

Turn on and level instrument

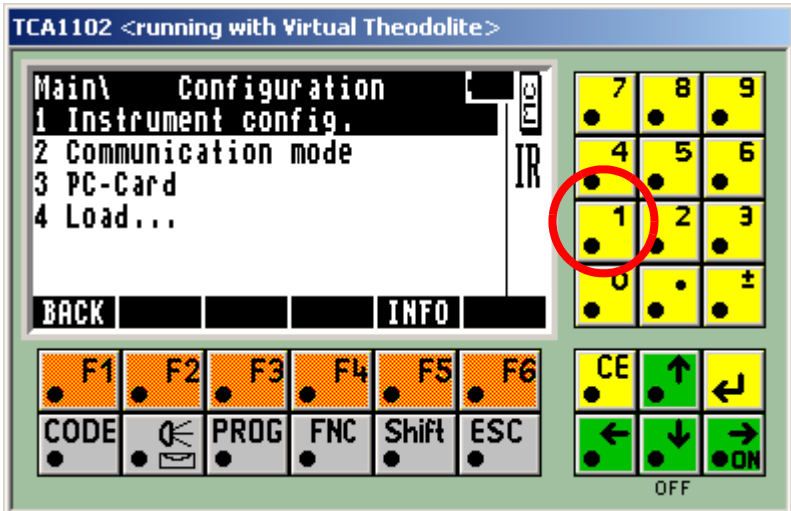

Press F1 to Continue

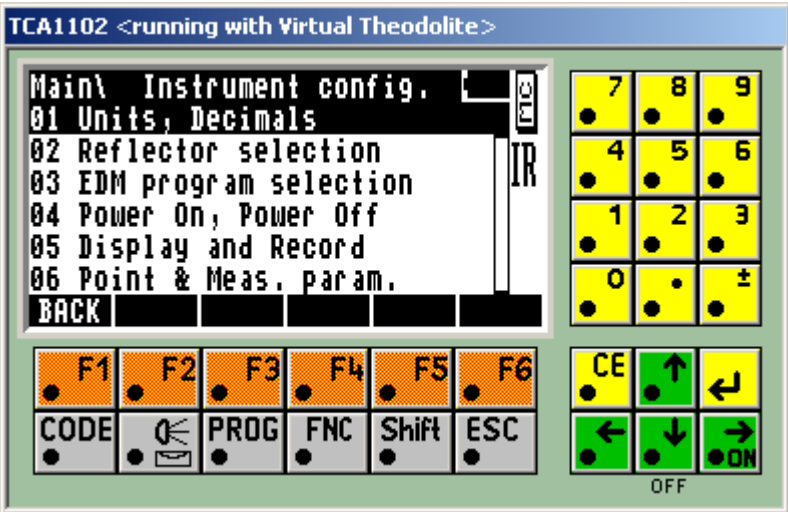

Press 5 to configure the instrument

Press 1 for instrument configuration

Press 05 for Display and Record mask setup

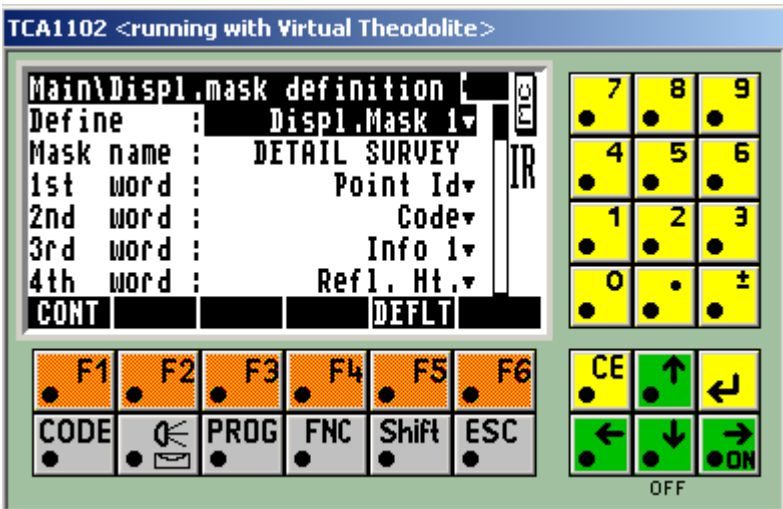

Display mask:

Press F3 to set up display mask

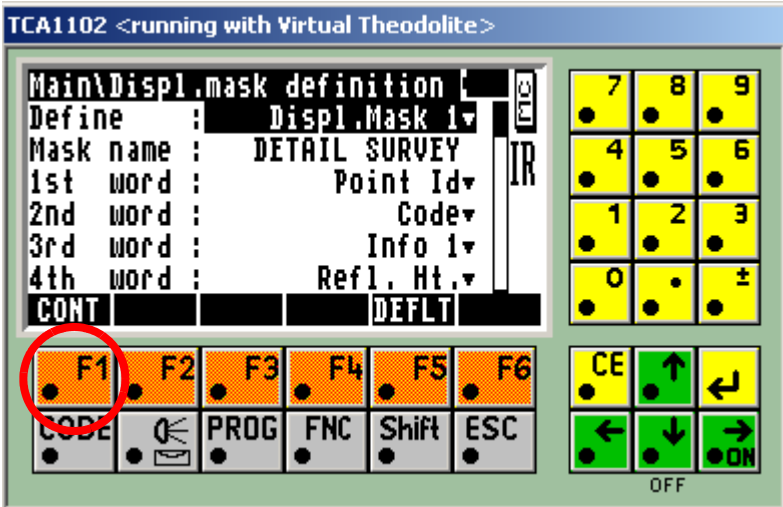

Type in the description DETAIL SURVEY for the Mask name

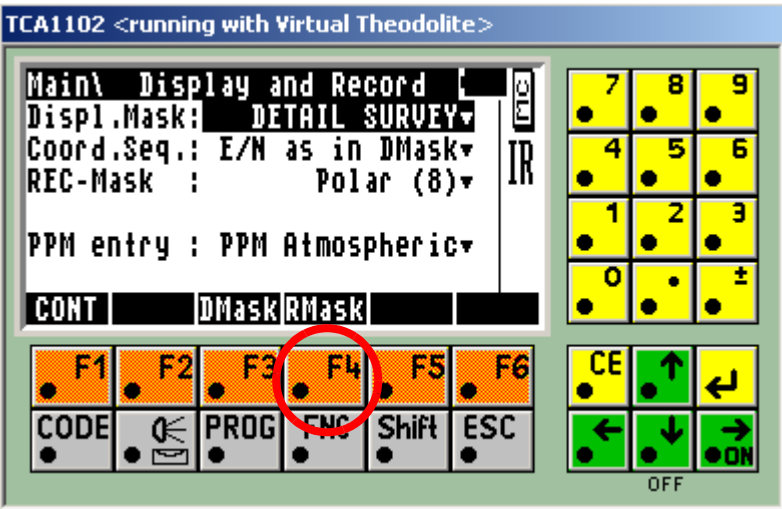

Select the following settings:

- 1st Word.....Point Id
 - 2nd Word.....Code
 - 3rd Word.....Info 1
 - 4th Word.....Ref1. Ht.
 - 5th Word.....Hz
 - 6th Word.....Horiz. Dist
 - 7th Word.....East
 - 8th Word.....North
 - 9th Word.....Elev
- Press F1

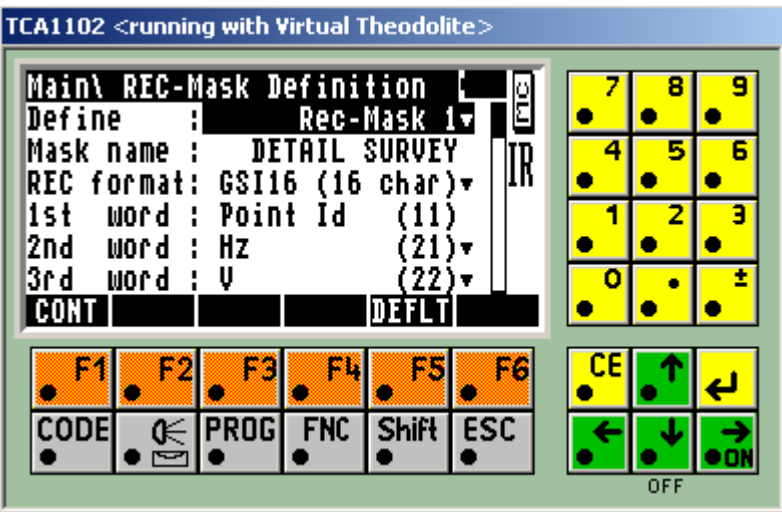

Record mask:

Press F4 to set up record mask

Type in the description DETAIL SURVEY for the Mask name

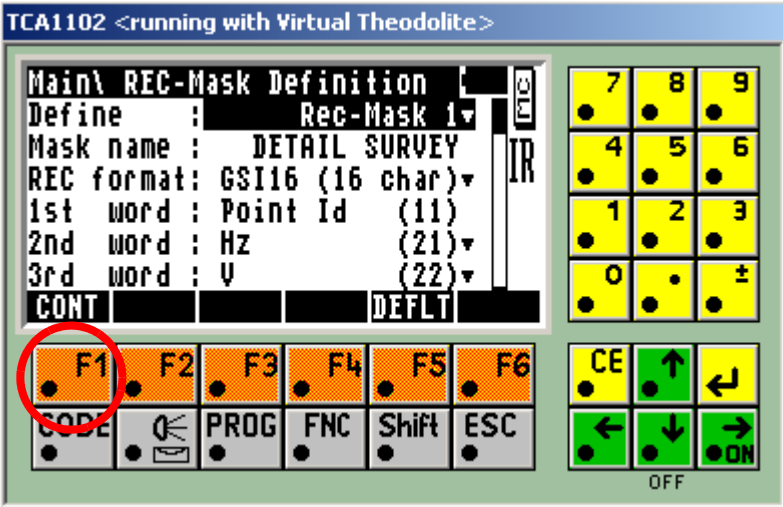

Select the following settings:

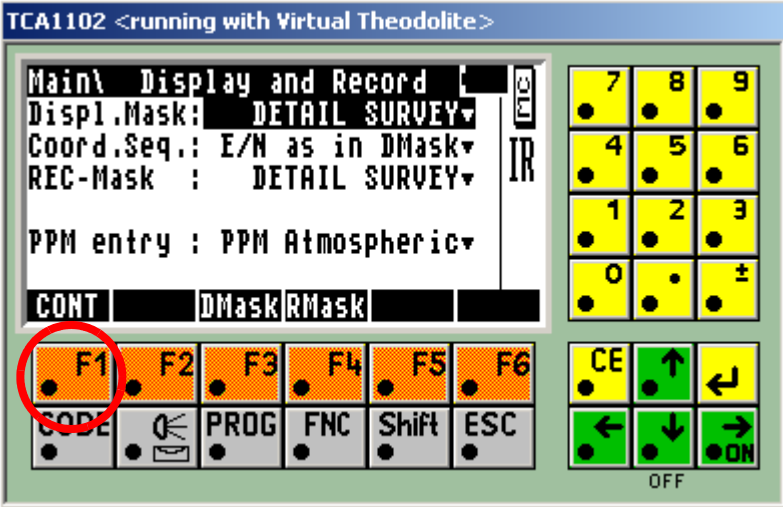

- REC format....GSI16 (16 char)
- 1st Word.....Point Id (11)
- 2nd Word.....Hz (21)
- 3rd Word.....V (22)
- 4th Word.....Slope Dist (31)
- 5th Word.....Ref. Ht. (87)
- 6th Word.....East (81)
- 7th Word.....North (82)

8th Word.....Elev (83)

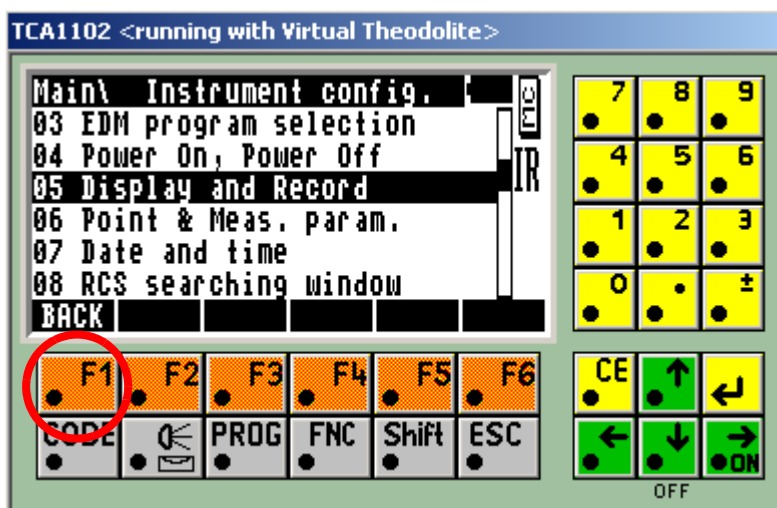

Press F1

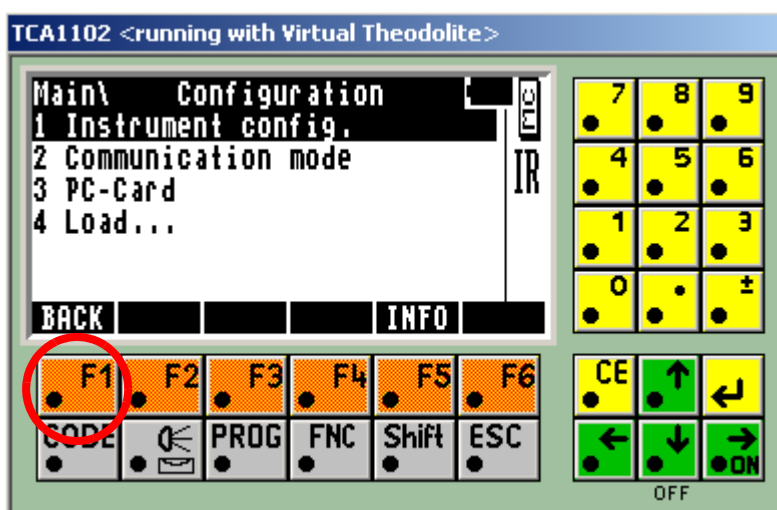

Press F1

Press F1 to exit menu

Press F1 to exit menu

Leica field codes

It is important to know when the code is entered into the instrument as some codes should precede a reading (BM) and some come after (AM). In this manual if a code is related to the current string then it is placed before the reading.

Below is a list of the commonly used codes to be used

- | | |
|----|------------------------------|
| .2 | Directly entered coordinates |
| .3 | New instrument station |
| .4 | Backsight reading (BM) |
| .5 | Height of target (BM) |
| .6 | Check measurement (BM) |

.9	Scale factor (BM)
.11	Foresight station (BM)
.14	Feature code and string number (Use for Leica quick codes only)
.15	Vertical circle correction (d.dddd) (BM)
.16	Additional code for point (AM)
.17	Arc thru last 3 points (AM)
.18	Circle (AM)
.20	Close string (AM)
.29	Note (AM)
.30	Remove height from point (AM)
.37	Rectangle by two points (AM)
.38	Make last segment non tinable (AM)
.39	Make next segment non tinable (AM)
.40	Make point non tinable (AM)
.42	Add radial offset (AM)
.43	Add tangential offset (AM)
.44	Add height offset (AM)
.45	Create parallelogram from last three points (AM)
.47	Start new string with same code and string no. as previous string (AM)
.48	End string (AM)....Not generally used

Templates

.51	Start template readings (BM)
.52	Finish template readings (AM)
.53	Pause template (AM)
.54	Continue a template (BM)
.55	Start recording template (BM)
.56	Skip points on template (BM)

Arcs

.60	Arc thru next 3 points (AM).....See also .17
.61	Arc through sets of 3 points until .62 code entered (BM)
.62	End of arc from .61 (AM)

Pipes

.80	Reading taken to invert level of pipe (AM)
.81	Reading taken to centre of pipe (AM)
.82	Reading taken to obvert level of pipe (AM)
.95	Circular pipe diameter (AM)
.96	Box culvert dimensions (AM)

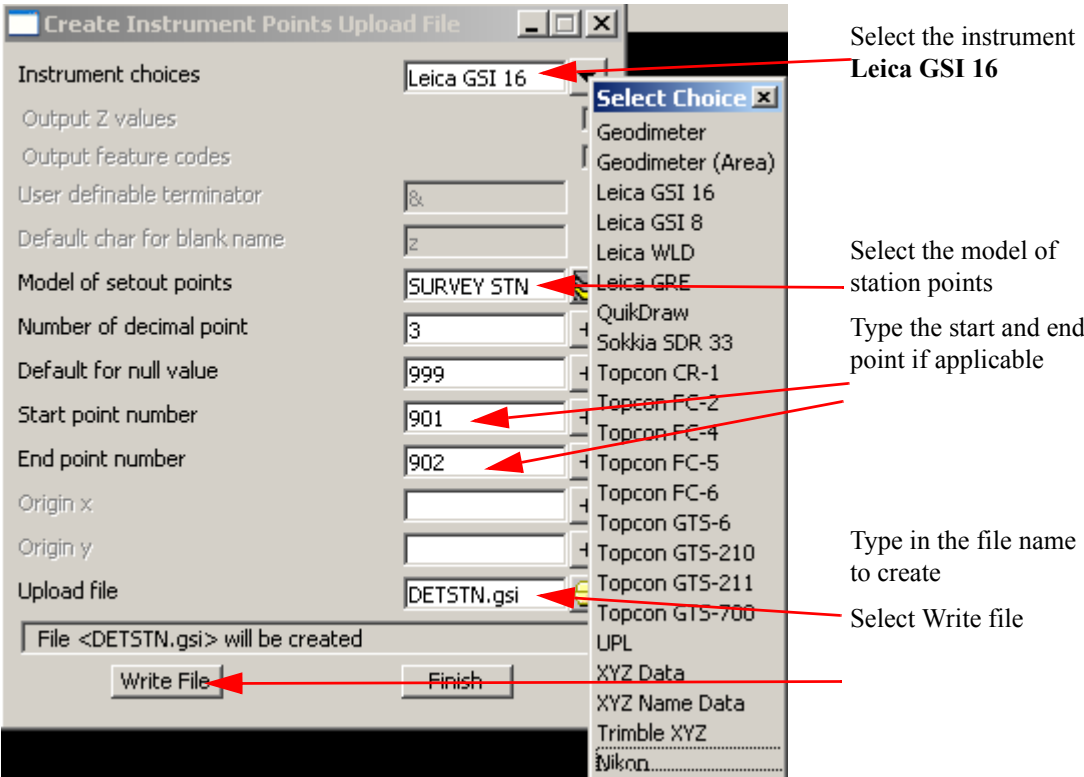

- .92 Remove heights from string (AM)
- .107 Make previous segment invisible (AM)
- .108 Make next segment invisible (AM)

Setting up files

The existing station coordinates for a pickup can be entered into the Leica by hand or they can be uploaded using 12d. The 12d upload sequence will be described here.

Uploading coordinate file

Select option Survey=>Upload=>Create points upload file

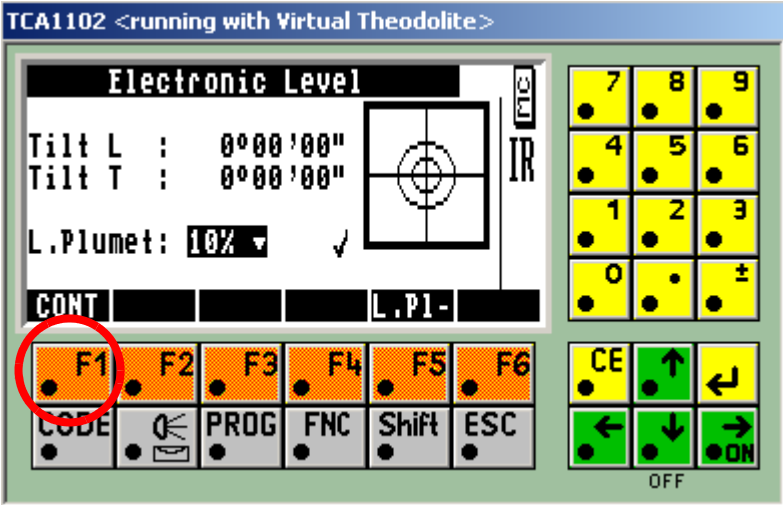

Copy the upload file

The file upload file should be copied to the folder “GSI” on the Leica card

Data file setup

Turn on and level instrument

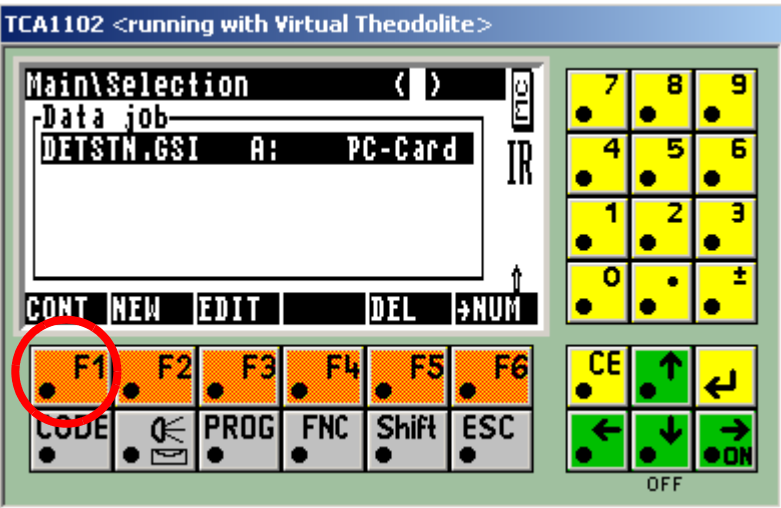

Press F1 to Continue

Press 2 to select Data job file.

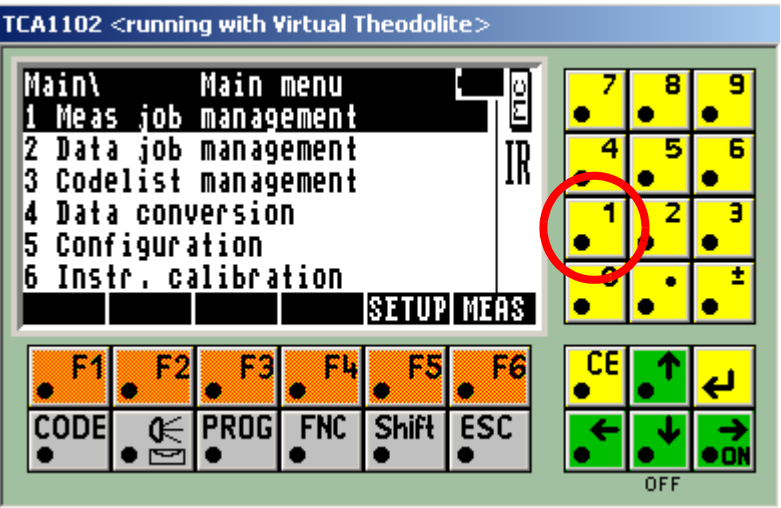

This is the file containing the control points if uploaded or if entered during the survey. Keep the file name separate from the measured data file name

Select the file to use followed by the F1 key or press F2 to create a new file

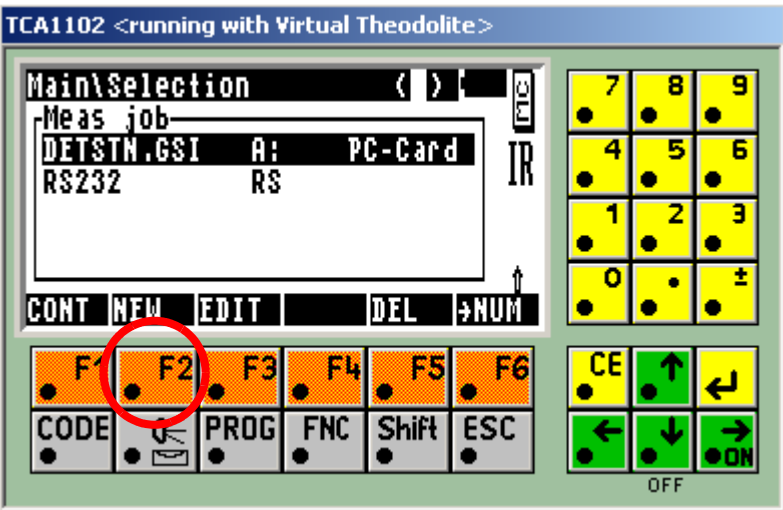

Press F1 to continue

Measured file setup

Select 1 to set up Measured job file. This is the file that will contain the detail survey readings

Select F2 to create new file

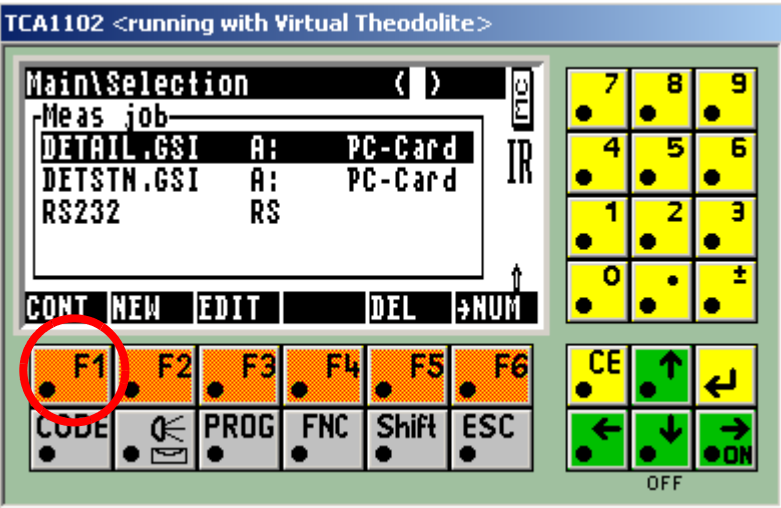

Type in new job name

Press F1 to continue

Press F1 to continue

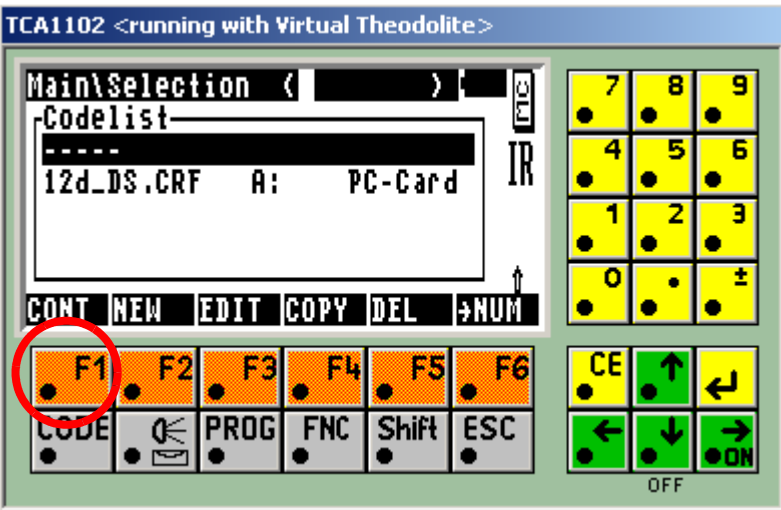

Code list selection

Press 3 to select code list

Select the code list 12D_DS.CRF

Press F1 to continue

Station setup

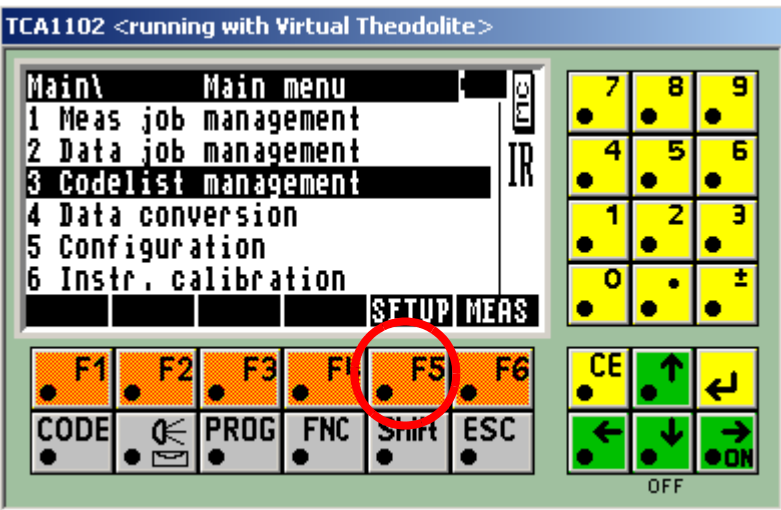

We can use Quick set (See the section [Setup using Quick set \(QSET\)](#)) for the station setup or manually select the Station

The following notes assume that the data file contains station coordinates

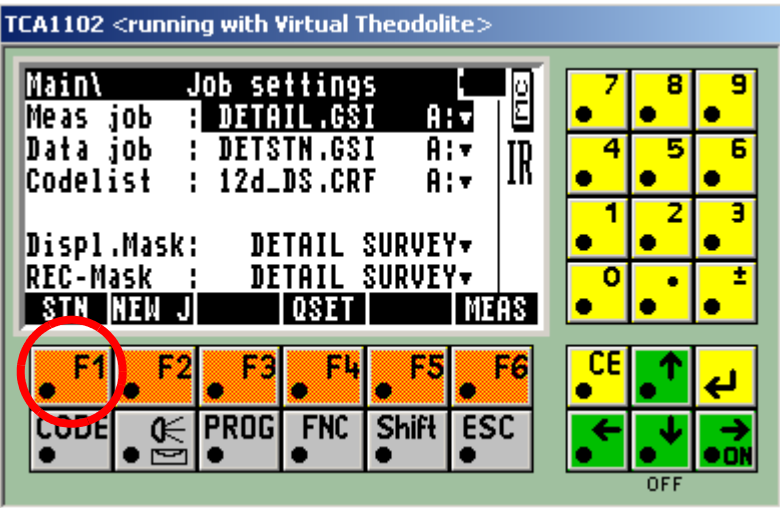

If not the user will have to follow prompts to insert the coordinates

Manual setup

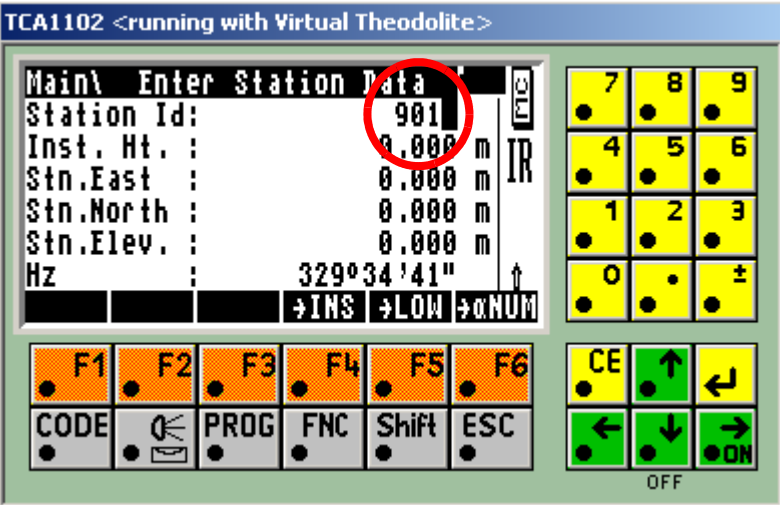

Press F5 for set up

Press F1 to select station

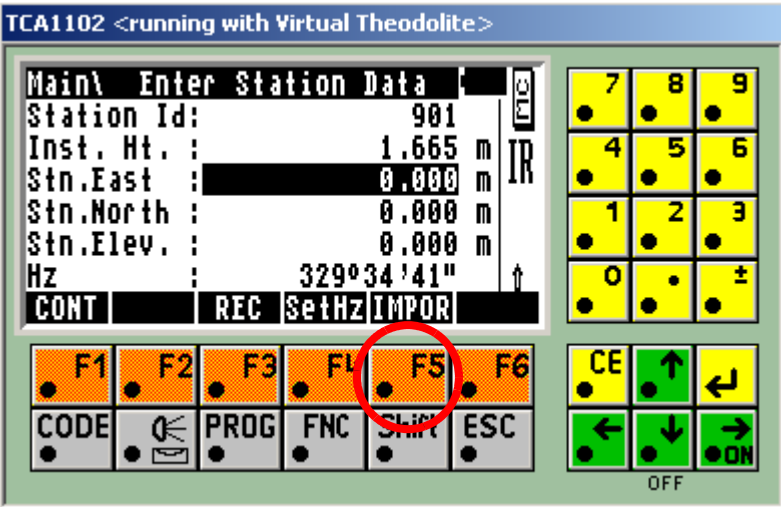

Type in setup station number

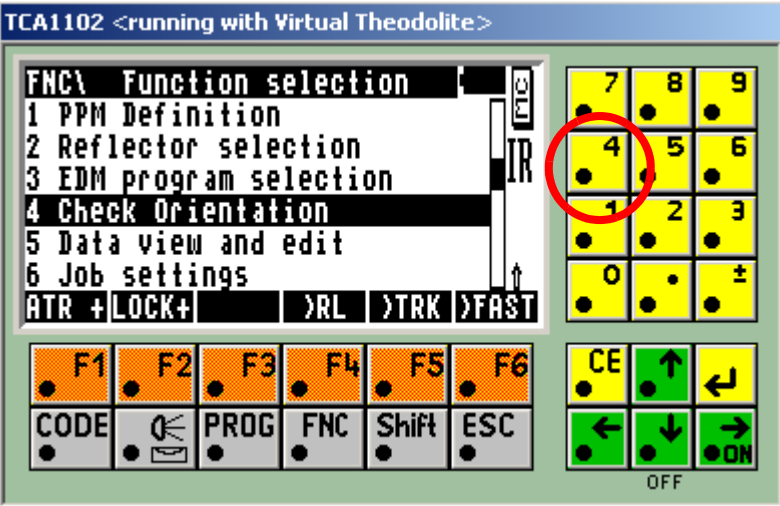

Type in the instrument height

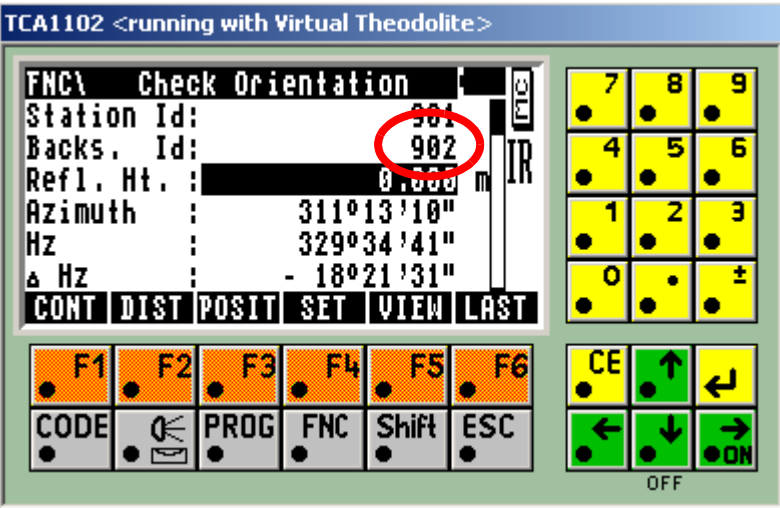

Press F5 to read the coordinates from the data file

To view the bearing between the setup station and backsight station select FNC
Press 4 to check orientation

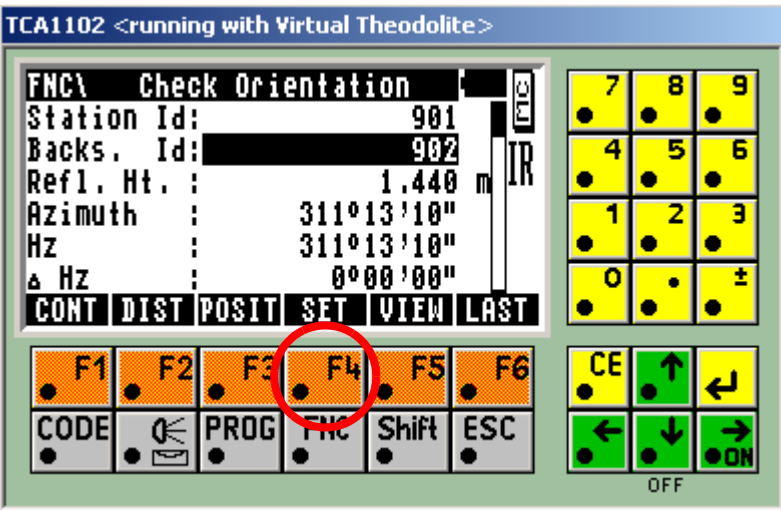

Type in the backsight station number

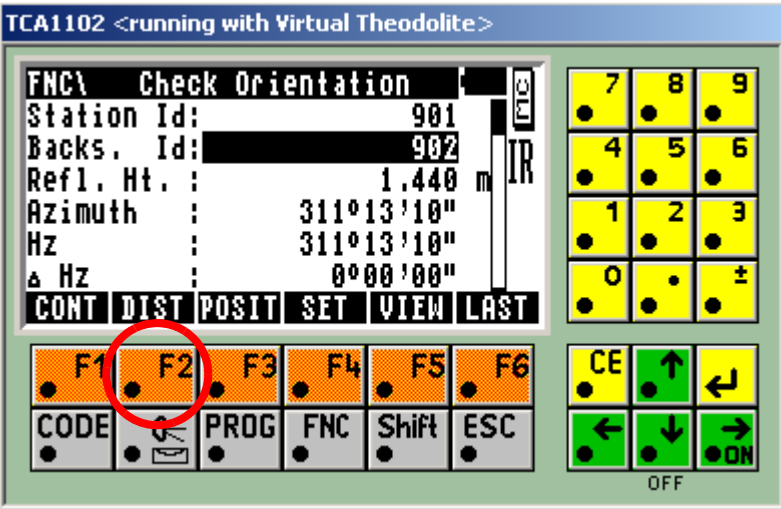

The Azimuth is displayed
Type in the reflector height of the backsight

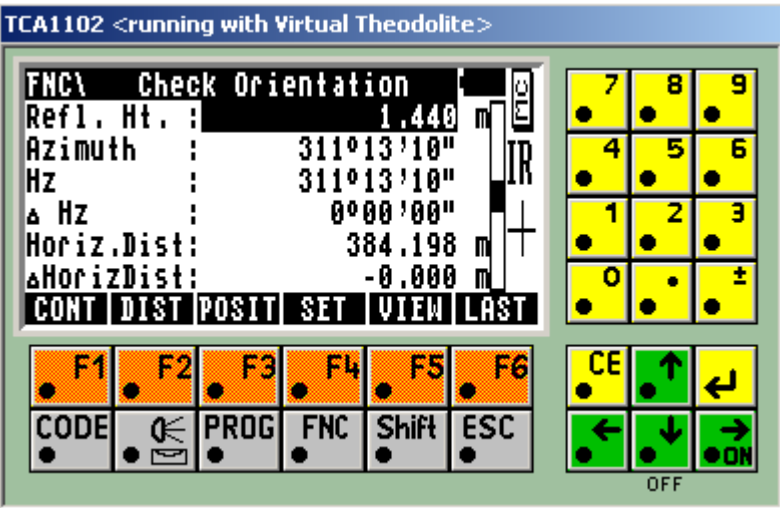

Sight to the backsight station and press F4 to set the bearing

The Bearing is set. Notice that the Azimuth and HZ values are set to the same value.
Press F2 to take a distance to the backsight station

Arrow down to view the distance error

If acceptable press F1 to continue

To save the station information press F3 then F1 to continue

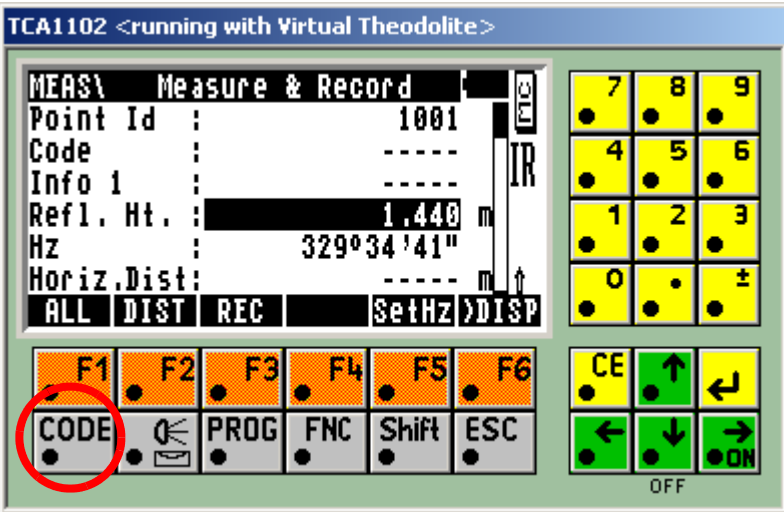

Take Backsight reading:

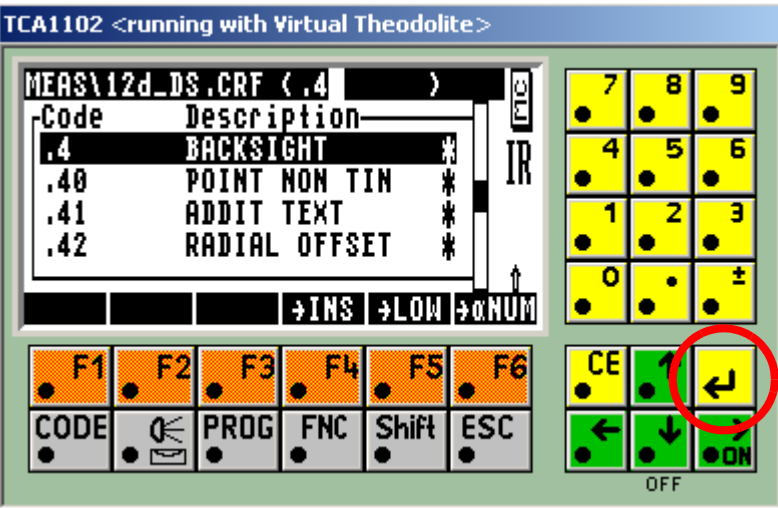

Type in the start point number of the survey

Type in the reflector height. This can also be done as part of the backsight measurement as shown below.

Select CODE

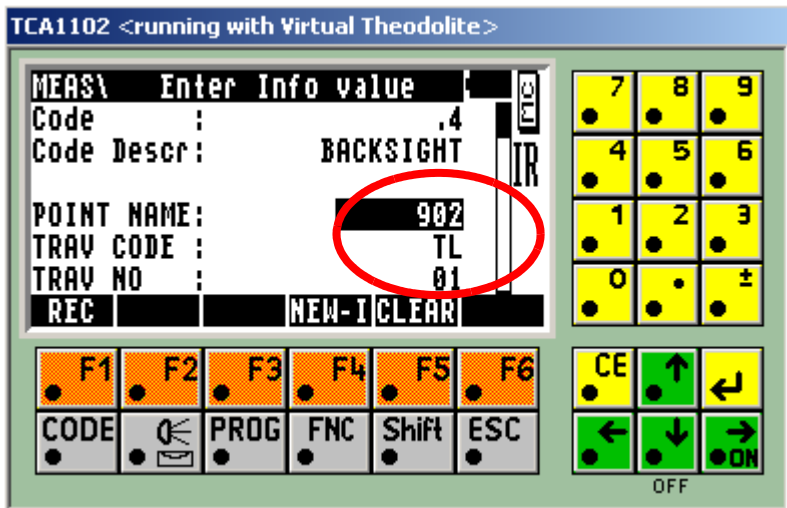

Type in .4 for backsight code followed by the enter key

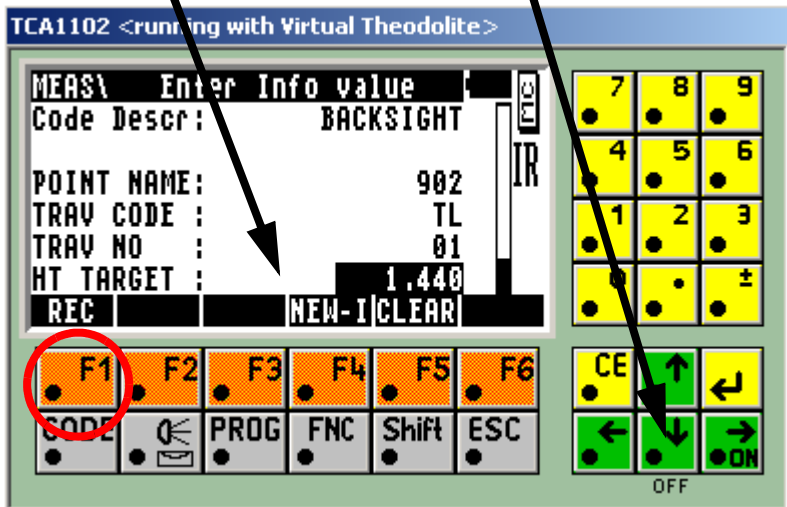

Type in backsight station number

Type in traverse code and traverse no. string number if using traverse coding. For more information about traverse coding see the section [Traverse coding](#).

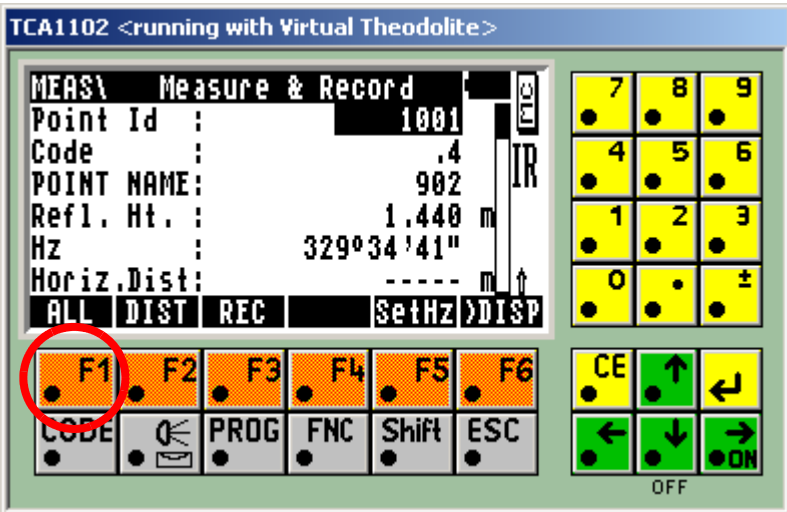

Scroll down using the arrow keys to show other parameters

Press F1 to record the code

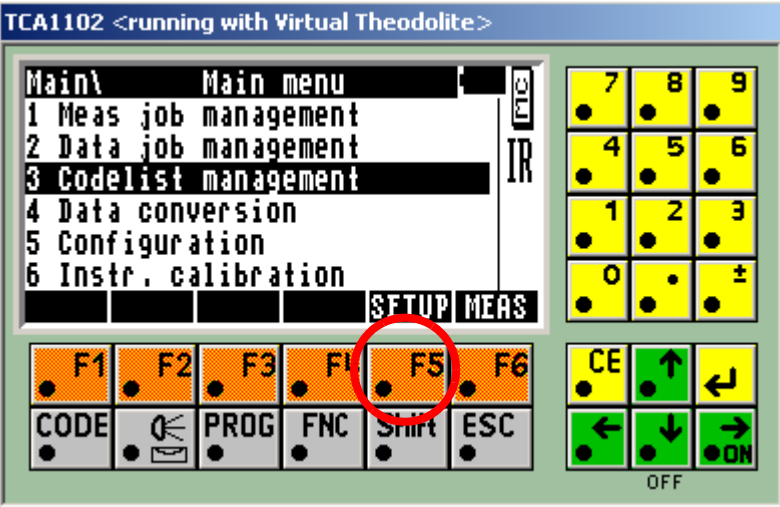

Point to backsight station and press F1 to take and record reading

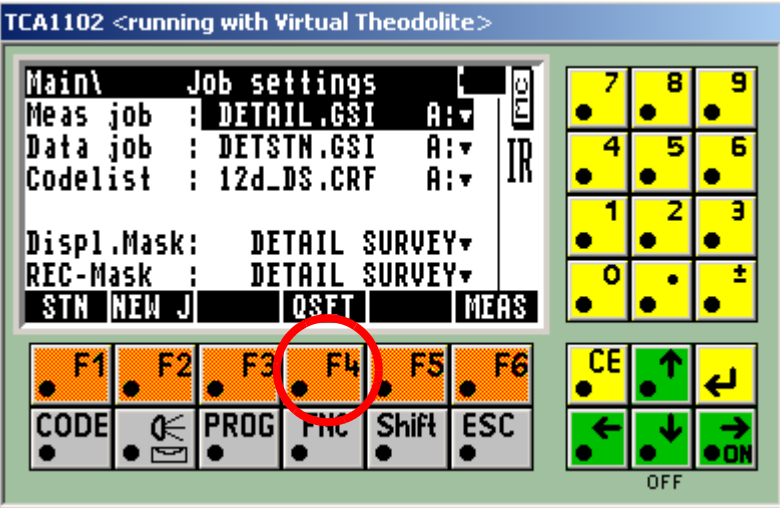

Setup using Quick set (QSET)

IMPORTANT NOTE: If using QSET, you MUST take a check reading to your backsight station as described below.

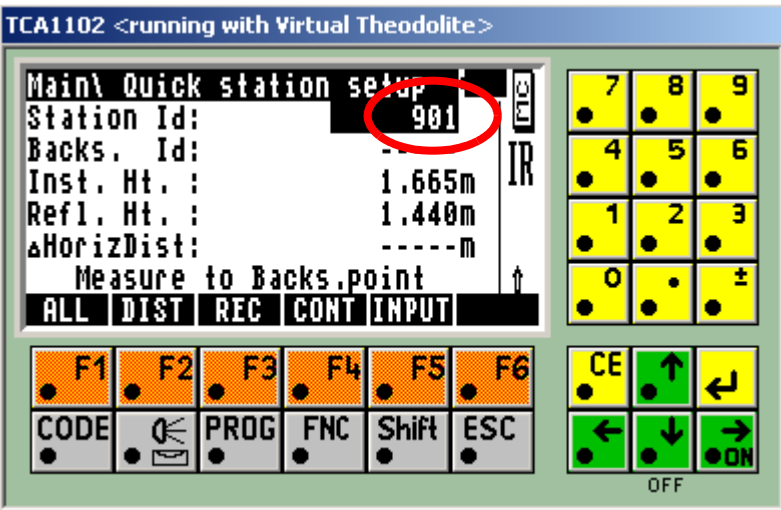

Press F5 for set up

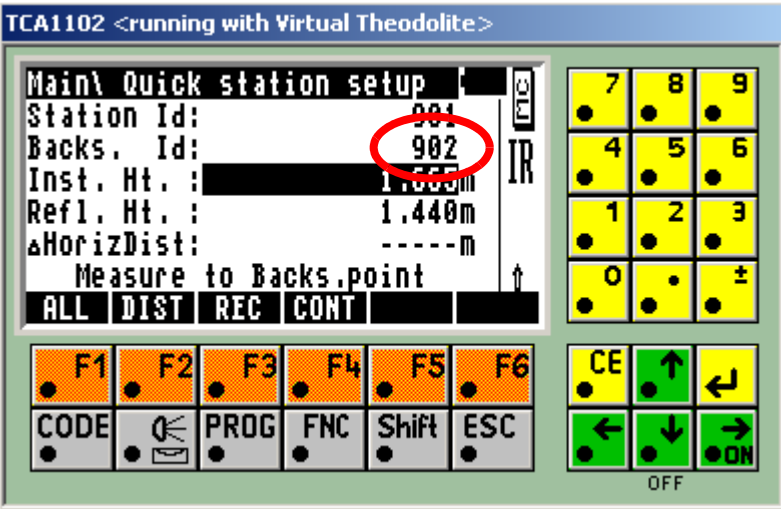

Press F4 for Quick set

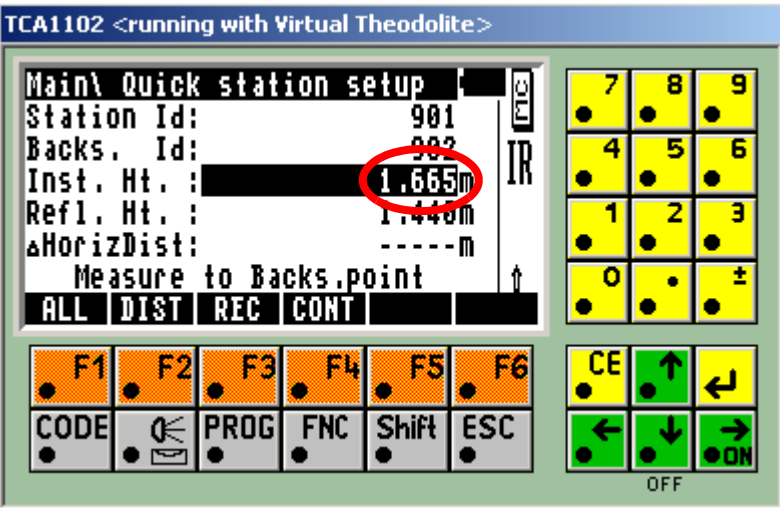

Type in setup station number

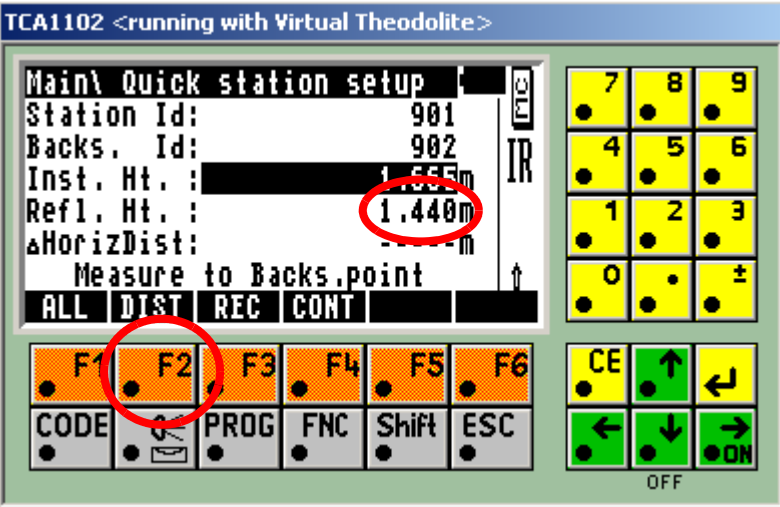

Type in the backsight station number

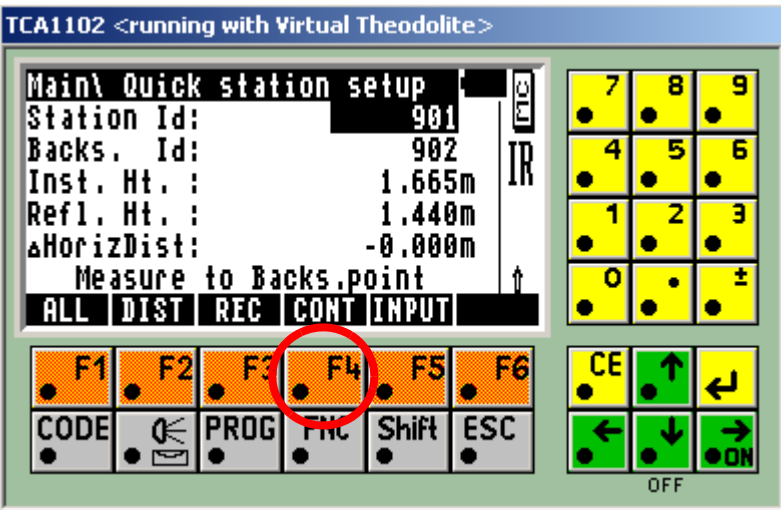

Type in instrument height

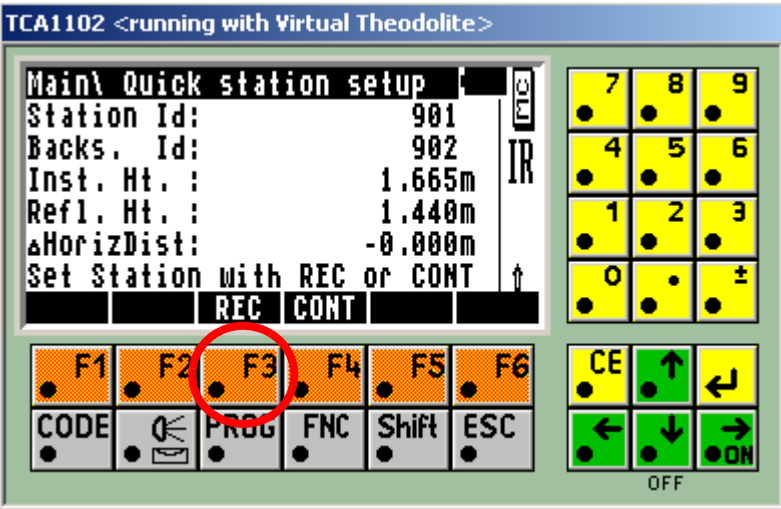

Type in height of target then Press F2 to take reading to backsight to initialise the QSET function.

Press F4 to continue

Press F3 to record the station setup information.

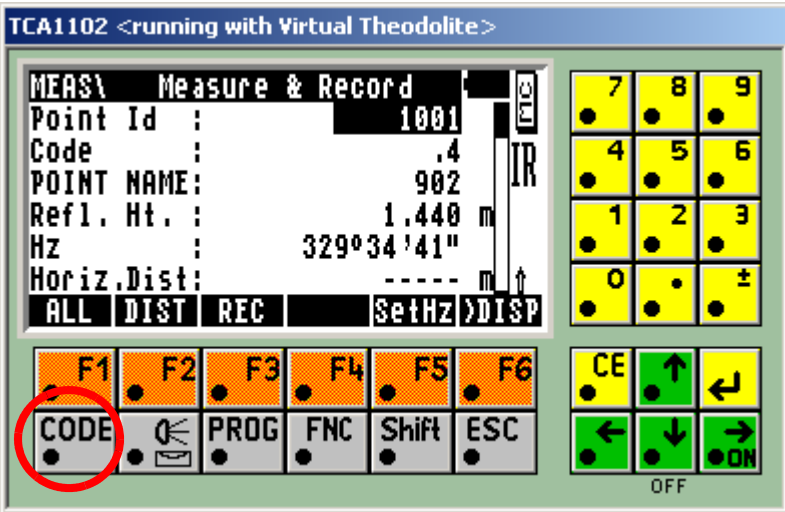

IMPORTANT NOTE: If using QSET, you MUST take a check reading to your backsight station as described below.

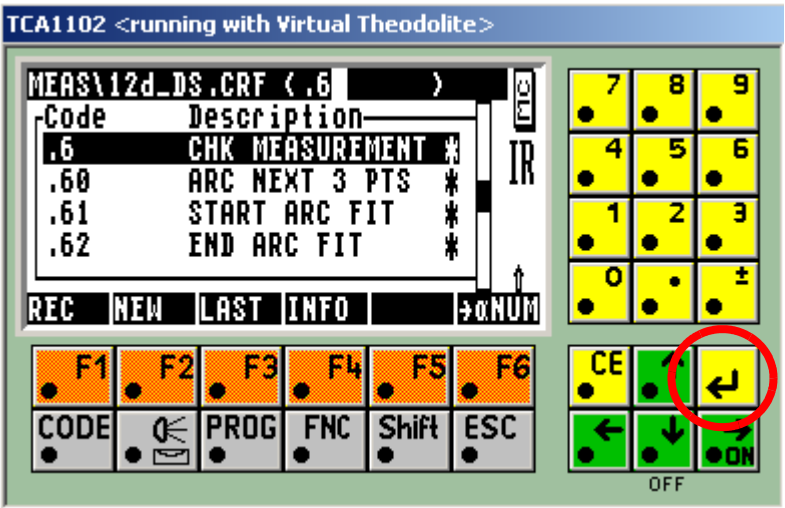

Take Check reading (Mandatory):

Type in reflector height

Select CODE

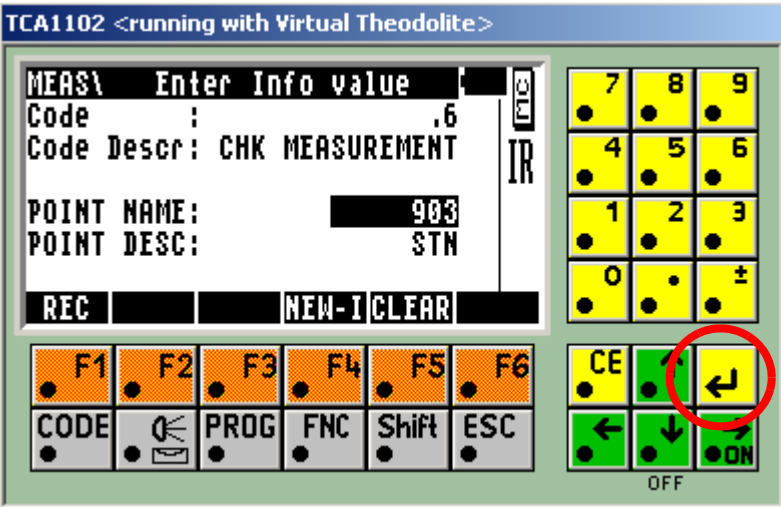

Type in .6 for check measurement code followed by the enter key

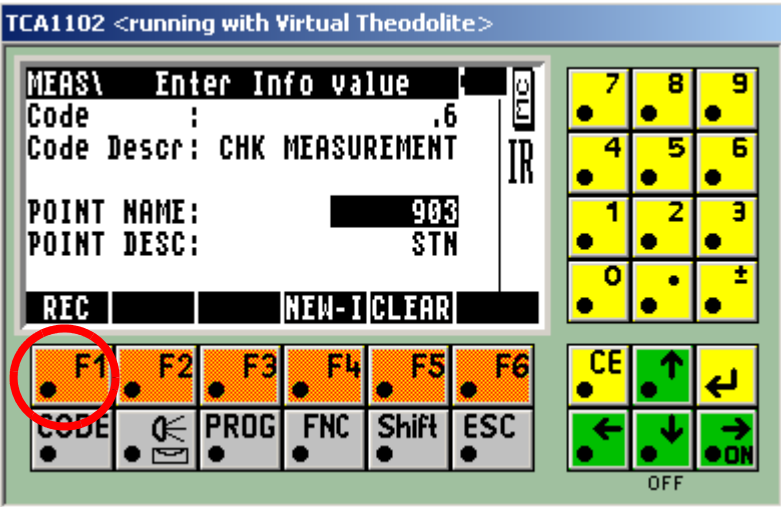

Type in the check station number

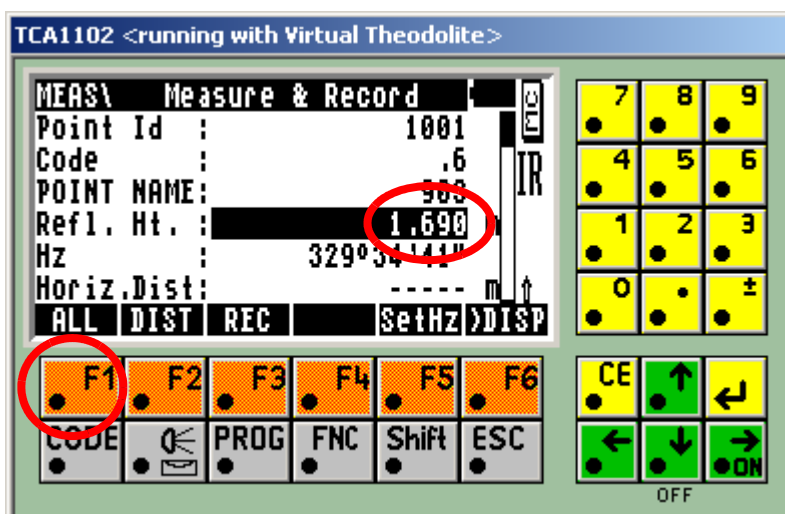

Type in the description

Press F1 to record code

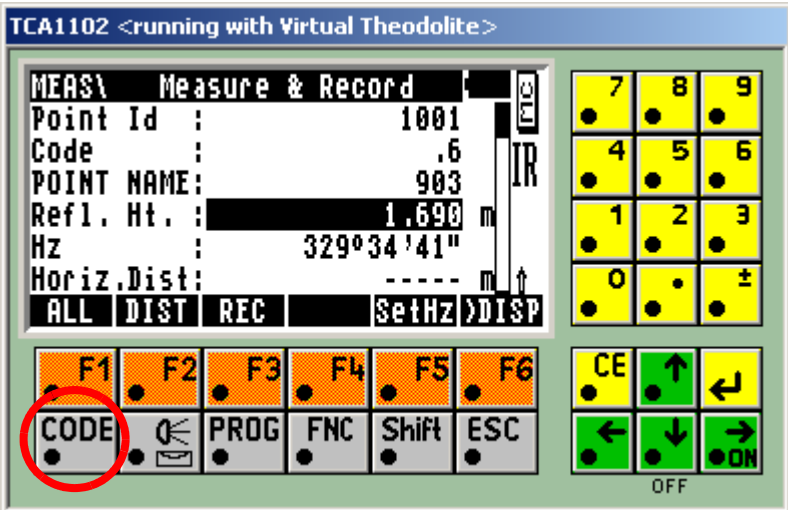

Type in the reflector height

Select F1 to take reading

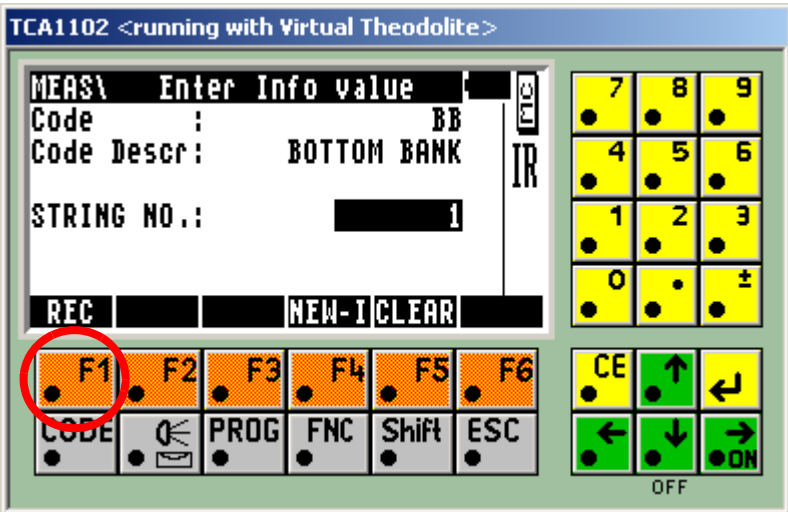

Normal readings

Always change the code prior to starting a new feature and ensure the reflector height is correct

Select Code

Type in the required code and string number

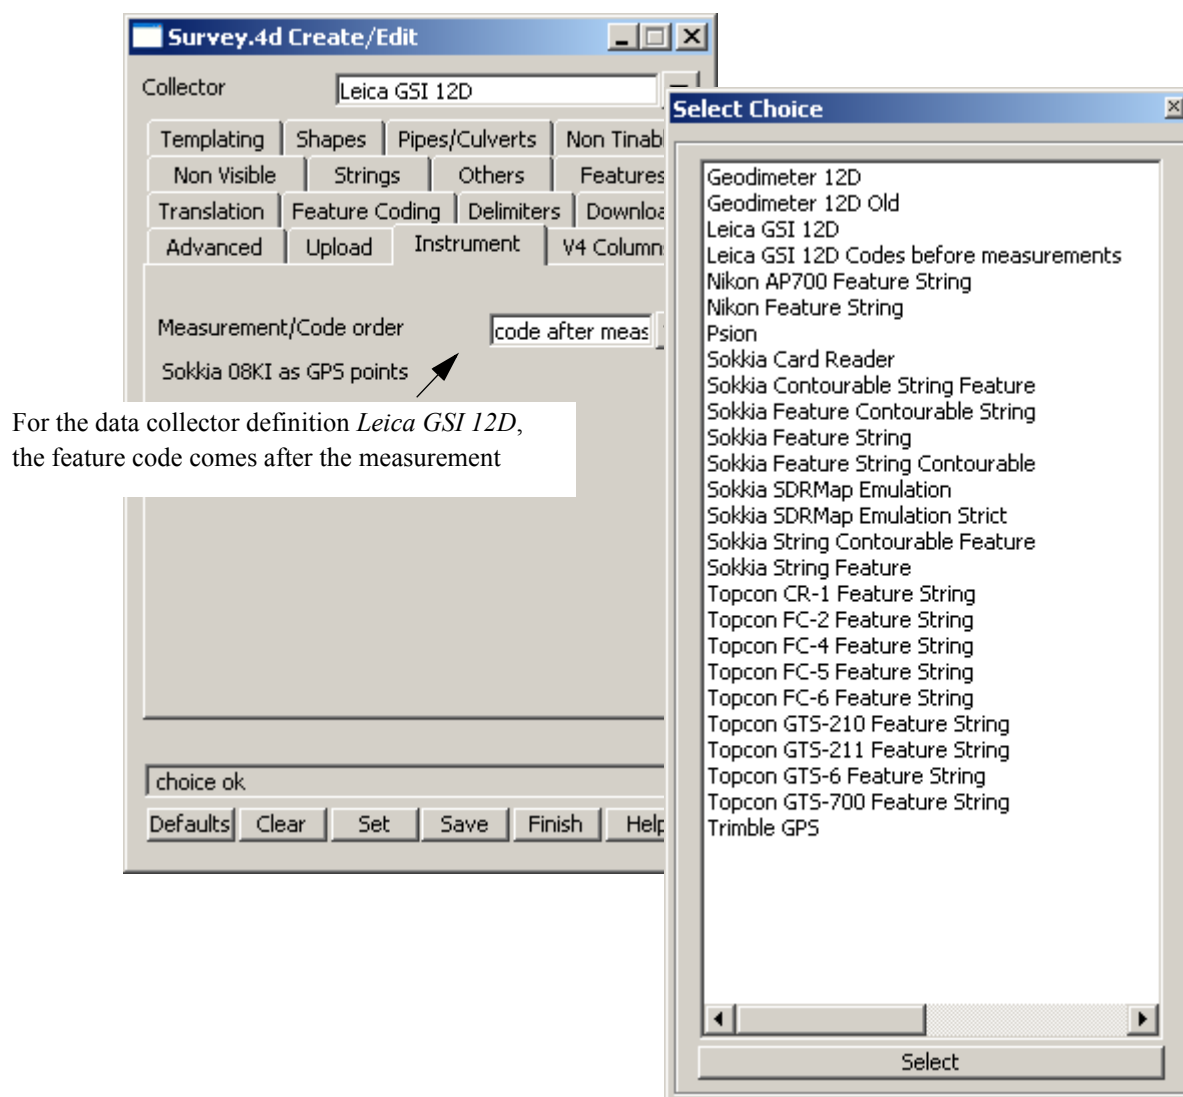

Press F1

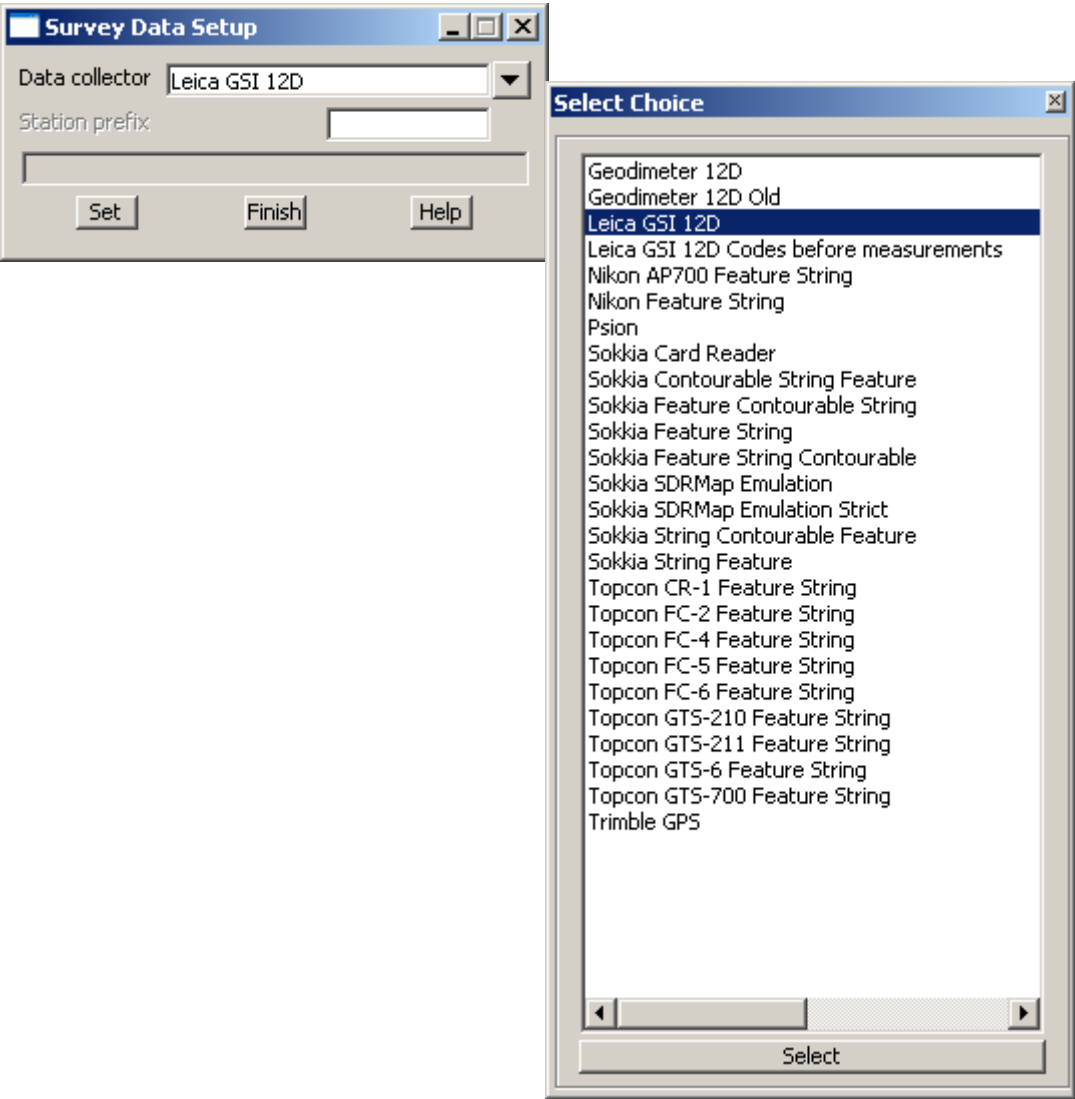

Example of Leica GSI File

The following GSI file has been coded with the Feature Code being recorded after the measurement. The Feature code definition is then applied to all subsequent measurements until another measurement with a following Feature Code definition is found.

The data collector definition *Leica GSI 12D* which is shipped with 12d Model, is an appropriate data collector definition for converting the example GSI file to a 12d Field File ready for processing.

The data collector definition *Leica 12D* which is shipped with 12d Model is selected using the option *Survey=>Setup*

Description

Close the previous string RDG	410013+00000.20

I Geodetics Summary

Various options in **12d** Model version 7.0 and above, use geodetic calculations to present and change data. These options use terminology that are common to the field of geodetics, which will be defined here.

Most of the terminology adopted follows definitions given in the Australian “**GDA Technical Manual**” which is published by the Intergovernmental Committee on Surveying and Mapping (ICSM). This publication is a valuable reference document and the reader is encouraged to obtain a copy for a full understanding of the topic. The document can be accessed on the internet at the following address <http://www.anzlic.org.au/icsm/gdatm/>

Please continue to the next section [Shape Of The Earth](#).

Shape Of The Earth

The determination of the Earth’s shape is a science known as **Geodesy**. Today, it is widely accepted that the Earth’s shape best approximates an **ellipsoid** that has been revolved around the Earth’s polar axis. Put another way, the shape is a sphere that has been squashed at the north and south poles. The non-spherical shape is due to gravity.

A number of ellipsoids have been calculated to best approximate the Earth’s shape at local locations and the earth as a whole. The best fit is concerned with matching the Earth’s equipotential gravity field (the **Geoid** that is best approximated by Mean Sea Level), to a geometric ellipsoid shape. As such, there a wide number of definitions.

Diagram from: A guide to coordinate systems in Great Britain.
See <http://www.gps.gov.uk/guidecontents.asp>

The most common way of defining an ellipsoid is by describing the **semi-major axis** value and an **inverse flattening** value (this parameter describes the “squashing” of the ellipse).

Some commonly used ellipsoids are:

Ellipsoid	Semi-major axis	Inverse flattening
GRS80	6,378,137.0	298.257222101

This ellipsoid is used for Australia's GDA definition (Geocentric Datum of Australia GDA 94) used for MGA (Map Grid of Australia) calculations, New Zealand's NZGD2000 datum as well as other geocentric earth model datums around the world.

Ellipsoid	Semi-major axis	Inverse flattening
ANS	638160	298.25

This was the ellipsoid used to define the Australian Geodetic datum (AGD 84) used for AMG (Australian Map Grid) calculations and ISG (Integrated Survey Grid) co-ordinates.

Ellipsoid	Semi-major axis	Inverse flattening
NZ Geodetic 49	6378399.065	297.0

This was the ellipsoid used to define the NZ 1949 Geodetic datum. The semi-major axis given here has been adjusted to compensate for errors in units conversion from links to meters.

Please continue to the next section [Geodetic Coordinates](#).

Geodetic Coordinates

Once an ellipsoid or **Geodetic Datum** is defined, a position on the earths surface can be described in terms of Geodetic coordinates. These coordinates are **Longitude**, **Latitude** and **Ellipsoid height**.

Longitude is a angular quantity measured from the Greenwich meridian. It is most commonly described in terms of degrees, minutes, seconds East or west of the Greenwich meridian.

Latitude is a angular quantity measured from the equatorial plane, to the plane defined by the point position and the plumb line to the ellipsoid surface. It is most commonly described in terms of degrees, minutes, seconds South or North to the equator.

The **ellipsoid height**, h is the height above the reference ellipsoid.

Most height datums are not based on ellipsoid height but are based on the **geoid**. e.g. AHD in Australia.

As such, levels from GPS observations (which are *ellipsoid* heights) need to be corrected to a geoidal or orthometric height. To do this, we require the separation or gap distance between the two different surfaces. This separation is known as the **N value**.

The Ellipsoid height = Geoid height + N value, or

$$h = H + N$$

N values can be defined in a geoidal model such as Ausgeoid98 which represents grids of N values over all of Australia. For a given Geodetic coordinate, an N value can be interpolated from the model and applied to the ellipsoid height to give a geoidal height. Similarly, the N value can be used to convert a geoidal height to an ellipsoid height.

Since most geodetic calculations are made on the ellipsoid, the **ellipsoid height** is required for precise calculations.

Please continue to the next section [Projections](#).

Projections

In order to represent ellipsoid data on a flat surface for mapping, it is necessary to use a projection. A projection enables points on the earth's surface to be mathematically projected onto an imaginary developable surface. This surface can then be developed or “rolled flat”. Typically, this surface is a cylinder or cone.

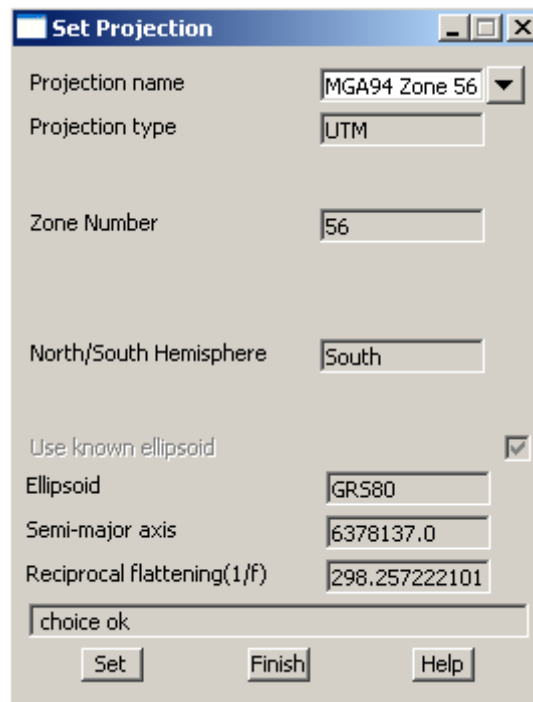

The Transverse Mercator system (TM) projects coordinates onto a cylinder that is tangent to the equator and the entire length of a meridian of Longitude.

12d Model version 6.0 and above, allows a number of projections to be specified including, Universal Transverse Mercator (UTM), Transverse Mercator (TM) and Rectified Skew Orthomorphic (RSO). There are many more available using the **General** type.

Within 12d Model, a projection can be defined that specifies both the **reference ellipsoid** and **projection type**. This then can be used for geodetic calculations.

A projection has various parameters that define it. These are specific to the projection and are clearly defined for major mapping systems. For example MGA94 zone 56 projection is defined as follows:

The image shows a 'Set Projection' dialog box with the following fields and controls:

- Projection name:** A dropdown menu showing 'MGA94 Zone 56'.
- Projection type:** A text box containing 'UTM'.
- Zone Number:** A text box containing '56'.
- North/South Hemisphere:** A text box containing 'South'.
- Use known ellipsoid:** A checkbox that is checked.
- Ellipsoid:** A text box containing 'GRS80'.
- Semi-major axis:** A text box containing '6378137.0'.
- Reciprocal flattening(1/f):** A text box containing '298.257222101'.
- choice ok:** A text box.
- Buttons:** 'Set', 'Finish', and 'Help' buttons at the bottom.

Please continue to the next section [Terminology](#).

Terminology

The various geodetic options in 12d Model mostly use standard geodetic terminology as defined in the Australian GDA technical manual. For clarity, they will be defined again here. For some options it is important to note that some terminology used in Australia has quite a differing meaning in other countries.

Ellipsoid Distance

The **ellipsoid distance** is the reduced distance along the *surface* of the ellipsoid. Standard survey measurements are reduced to the horizontal but require a correction due to the height above the ellipsoid. This is usually done by a **height scale factor** which takes into account the ellipsoid height at each end of the measured line. i.e.

$$\text{HeightScaleFactor} = 1 - \frac{h_M}{R + h_M}$$

Where:

h_M = Mean terrain height (mean of the two ellipsoid heights at either end of the measured line)

R = Radius of the earth in the azimuth of the line.

Note: An error of 60 meters in the value of **h_M** will introduce an error of 10 ppm in the reduced ellipsoid distance. With the introduction of the Australian Geocentric datums, the N values have increased markedly over Australia. So even if a survey is undertaken at sea level (Geoid height approximately 0.0), the ellipsoid heights may very well be greater than 60 meters. As The Ellipsoid height = Geoid height + N value, N values should be considered when reducing measured distances to these datums.

For older Australian ellipsoids, Mean seal level approximated the surface of the ellipsoid (i.e. N value approximately 0.0), so corrections could use geoidal heights to bring the distances down onto the reference surface.

The ellipsoid distance can be calculated using the calculated height factor:

Ellipsoid Distance = Reduced Horizontal Distance x height scale factor.

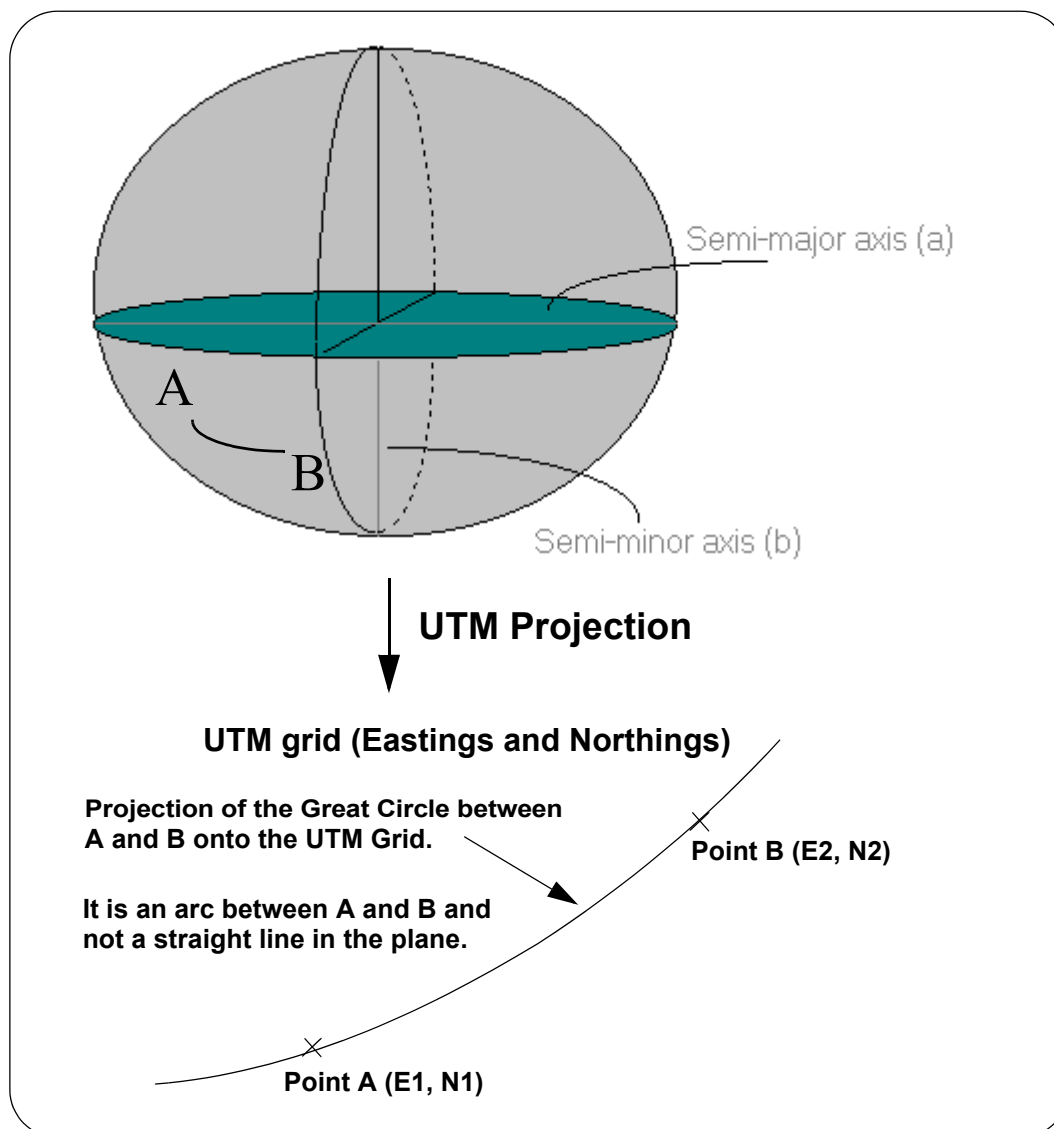

Bearings and Distances - Plane and Grid

If you have a point on an ellipsoid and a Transverse Mercator projection (such as UTM), the projection co-ordinates are known as the grid co-ordinates of the point (Easting and Northing).

On an *ellipsoid*, the **straight line** joining two points is the **Great circle** between the two points. If each point along the Great circle is projected onto the grid, the path that is traced out is an **arc** between the points.

That is, the *straight lines* on an ellipsoid project onto the TM grid as arcs.

In the diagram below, the Great circle arc through points A and B on the ellipse projects onto the arc shown through Points A and B in grid co-ordinates.

So the *straight line* joining the two points in the **plane** is *different* from the projection of the great circle (straight line on the ellipse) joining the two points on the ellipse.

Plane Bearing, Projection Bearing

If a straight line is drawn in the plane between two points on a grid, the angle between grid north and this line is equal to the **plane bearing**.

In other words, if the two point's coordinates are known, standard plane trigonometry can be used to calculate the bearing of the line.

$$\tan(\text{plane bearing}) = (E2 - E1) / (N2 - N1)$$

Projection bearing and plane bearing is used interchangeably in 12d Model.

Australian Grid Bearing, Ellipsoid Bearing

In Australia, the **grid bearing** is the angle between grid north and the *tangent* to arc at a point on the arc. e.g Point A. The grid bearing at point A is **not** equal to the reverse grid bearing from point B.

This term is also known as the **ellipsoid bearing** in some countries.

Warning: In some countries, including New Zealand and the US, the term **Grid bearing** is used for the previously defined term **Plane bearing**. However, as defined in the Australian GDA technical manual, the definition of Grid bearing is different to that of a plane bearing.

To avoid confusion, we will use the term **ellipsoid bearing**.

Plane Distance

The **plane distance** is the length in the plane of the straight line joining two points on a grid - that is, the standard distance between two points in a plane

$$\text{plane distance} = \text{square root} [(E2-E1)*(E2-E1) + (N2-N1)*(N2-N1)]$$

Australian Grid Distance

On an ellipsoid, the *straight line* joining two points on the ellipsoid is the Great circle between the two points. The *straight lines* on an ellipsoid project onto the UTM grid as arcs. In the diagram below, the arc shown through points A and B is the projection of the Great circle arc through points A and B on the ellipse.

In Australia, the **grid distance** is the distance on this *arc* from point A to B.

The difference between the plane distance and the grid distance is usually negligible.

Warning: In some countries, the term *grid distance* is used for the definition of plane distance here.

Datum

Within the Geodetic sections of 12d Model, the term **datum** relates to the reference ellipsoid adopted by countries/organisations for mapping projects.

For example AGD is the Australian Geodetic Datum, using the ANS ellipsoid parameters. GDA refers to the Geodetic Datum of australia, using the GRS80 ellipsoid as the basis for defining geodetic coordinates.

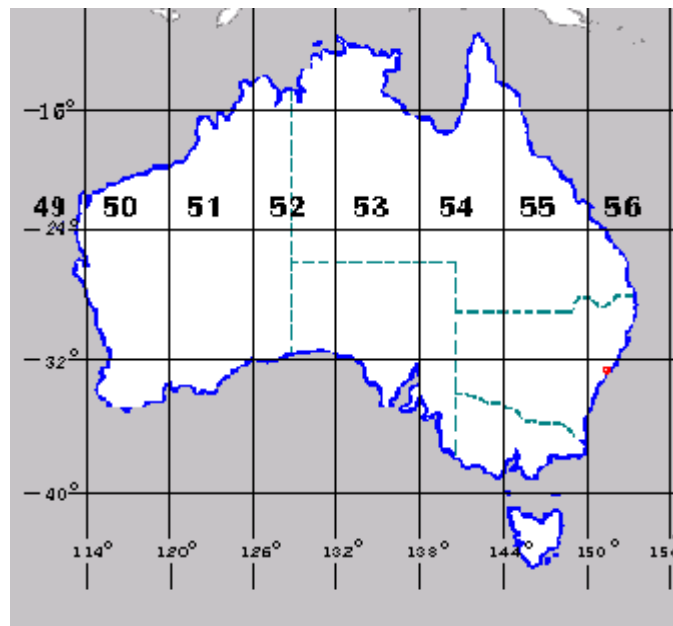

In New Zealand, the NZGD49 datum refers to the NZ Geodetic 49 ellipsoid. The NZGD2000 datum is the New Zealand geodetic datum which again refers to the GRS80 ellipsoid.

Zone

The meaning of **zone** is specific to the UTM projection type which is commonly used around the world as a mapping projection. This includes AMG and MGA in Australia.

The Universal Transverse Mercator projection splits the world into 60 zones of 6 degrees of longitude. The zone numbering starts at 180 degrees West, longitude. Each zone has a specific central meridian and range of longitude that defines it. As such, by supplying a zone number, a number of parameters about a projection can be deduced.

For example, Australia is covered by the UTM zones 49 to 56.

Arc-to-Chord Correction (t-T correction)

The **arc-to-chord** correction is the quantity to be added algebraically to a ellipsoid bearing (Australian grid bearing) to obtain a plane bearing.

Plane Bearing = Ellipsoid Bearing + Arc-To-Chord Correction

Plane Bearing = Australian Grid Bearing + Arc-To-Chord Correction

This correction is only really applicable for lines over 10 km but it is included in calculations for completeness. The correction shown in the example below is negative in sign but it can also be positive.

Point Scale Factor

The **point scale factor** is the ratio of an infinitesimal plan distance at a point on a grid to a corresponding ellipsoid distance.

It can be used as an approximation to convert (factor) measured ellipsoid distances to plane distances.

Line Scale Factor

The **line scale factor** is the ratio of the plane distance on a grid to a corresponding ellipsoid distance. i.e.

$$\text{LineScaleFactor} = \frac{\text{PlanDist}}{\text{EllipsoidDist}}$$

This factor can be used to calculate either the plane or ellipsoid distance given the Line Scale Factor and the other distance. i.e.

Plane distance = Ellipsoid distance x Line scale factor,

Similarly,

Ellipsoid distance = Plane distance / Line scale factor.

Combined Point Scale Factor

The **combined point scale factor** is the product of the point scale factor and the height scale factor. i.e.

$$\text{Combined Scale Factor} = \text{Point Scale Factor} \times \text{Height Scale Factor}.$$

Azimuth and Convergence

Azimuth is the horizontal angle measured from an *ellipsoidal meridian clockwise from north* and the great circle between measured points.

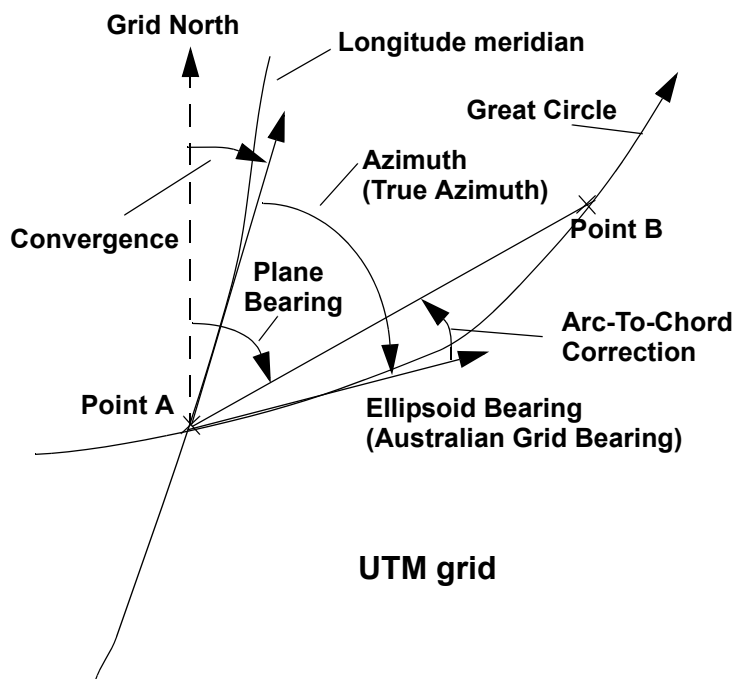

It is also known as the **True Azimuth**. In general, this value will be calculated internally in **12d** Model.

Convergence or **Grid Convergence** is the angular quantity to be added algebraically to an *Azimuth* to obtain an ellipsoid bearing (Australian grid bearing). i.e.

$$\text{Ellipsoid Bearing} = \text{Azimuth} + \text{Grid Convergence}$$

$$\text{Australian Grid Bearing} = \text{Azimuth} + \text{Grid Convergence}$$

Warning: In some countries, the *Grid Convergence* has the opposite sign.

Combining

$$\text{Ellipsoid Bearing} = \text{Azimuth} + \text{Grid Convergence}$$

$$\text{Australian Grid Bearing} = \text{Azimuth} + \text{Grid Convergence}$$

and

$$\text{Plane Bearing} = \text{Ellipsoid Bearing} + \text{Arc-To-Chord Correction}$$

$$\text{Plane Bearing} = \text{Australian Grid Bearing} + \text{Arc-To-Chord Correction}$$

produces the equation

$$\text{Plane Bearing} = \text{Azimuth} + \text{Grid Convergence} + \text{Arc-To-Chord Correction}$$

or

$$\text{Azimuth} = \text{Plane Bearing} - \text{Grid Convergence} - \text{Arc-To-Chord Correction}$$

$$\text{True Azimuth} = \text{Plane Bearing} - \text{Grid Convergence} - \text{Arc-To-Chord Correction}$$

Warning: In some countries, the *Grid Convergence* has the opposite sign.

Please continue to the next section [Converting Between AMG, ISG and MGA](#).

Converting Between AMG, ISG and MGA

In Australia the ellipsoid used to represent the shape of the earth used to be defined by AGD 84 but it has now been changed to an ellipsoid that has its centre at the centre of mass of the earth (geocentric - GDA 94). See [Shape Of The Earth](#).

This is to fit in with GPS because satellites orbits are centred on the centre of mass.

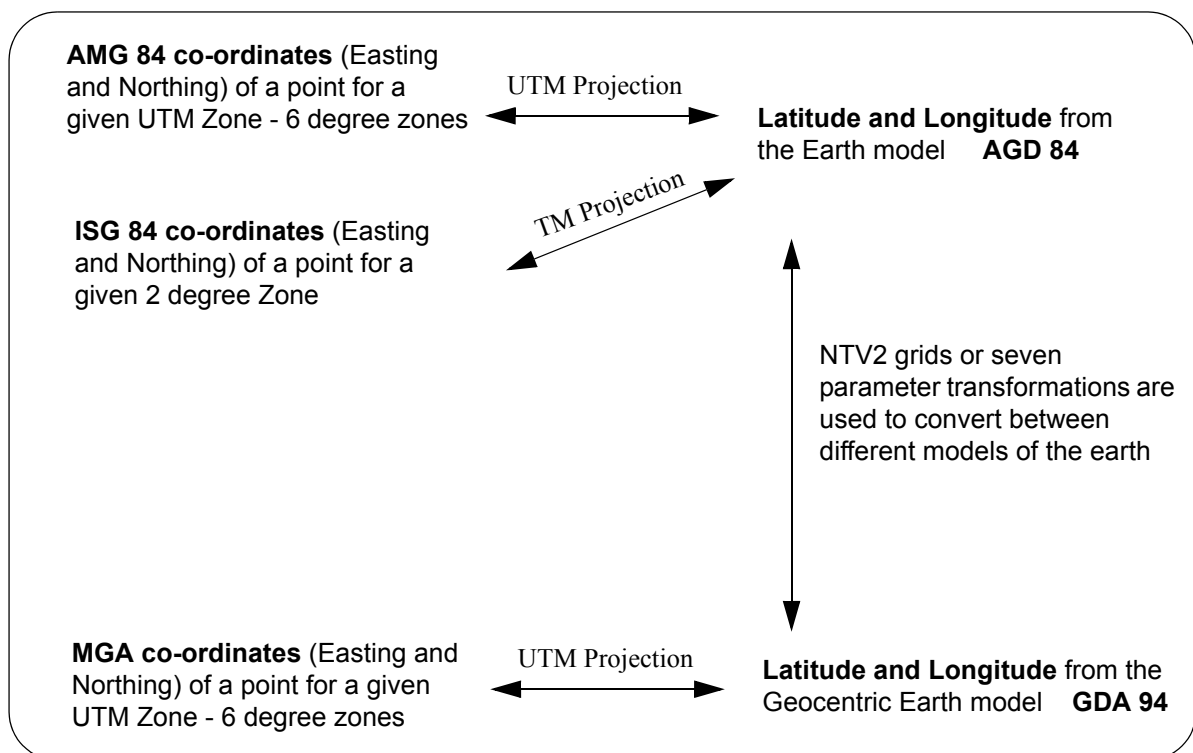

This means that the Latitude and Longitude of every point has changed.

The use of UTM projections (Universal Transverse Mercator - see [Projections](#)) and Zones still apply but because the latitude and longitude of each point has change, its Easting and Northing for a UTM zone has also changed.

AMG 84 Zones are the co-ordinates for the UTM Projections defined for six degree zones using the ellipsoid defined by AGD 84.

MGA 94 Zones are the co-ordinates for the UTM Projections defined for six degree zones using ellipsoid define by GDA 94.

Note - ISG 84 Zones are the co-ordinates for the TM Projections defined for two degree zones using the ellipsoid defined by AGD 84.

For converting between the *different datums* AGD66/84 and GDA94 (i.e. AMG, ISG, Long Lat <-> MGA, Long Lat), use the option

Survey =>Conversions =>AGD66/84 <-> GDA94 (see [AGD66/84 <---> GDA94](#) in the chapter [Survey](#))

For converting between different AMG Zones (AMG <->AMG) or different MGA Zones (MGA<->MGA) use the option

Survey =>Conversions =>Australian conversions see [Australian Conversions](#)

in the chapter [Survey](#)).

For converting between different ISG/AMG Zones (AMG,ISG <->AMG, ISG)

Survey =>Conversions =>Cartographic see [Cartographic](#)

in the chapter [Survey](#)).

J Setting Up and Configuring 12d

This appendix contains information about files used for setting up and configuring **12d Model**.

Go to [Folder Structure Installed by 12d Model](#)
[Set Up Files](#)

[Colours File](#)
[Defaults File](#)
[GUI](#)
[Sheet Sizes File](#)
[Transitions and Spirals File](#)
[12d Model Options Map](#)
[Monitoring 12d Model Usage](#)

For documentation on the first item, continue to the next section [Folder Structure Installed by 12d Model](#).

Folder Structure Installed by 12d Model

12d Model has Set Up files to define how new projects are created, define colours, linestyles, symbols etc. and control many other aspects of **12d Model**.

12d Model comes with defaults for these things but most users wish to customise many of the settings, share them between groups of users across a network etc.

To make customisation easier, all the **12d Model** customisation files (called Set Up files) have default names and on installation, are stored in a folder called **Set_ups**.

To customise **12d Model**, users only need to which file to modify for that particular customisation.

When *12d Model 10* is installed on a *Windows* computer, the major components are installed in the Microsoft preferred installation folder **Program Files**, in the sub folders **12d\12dmodel\10.00**.

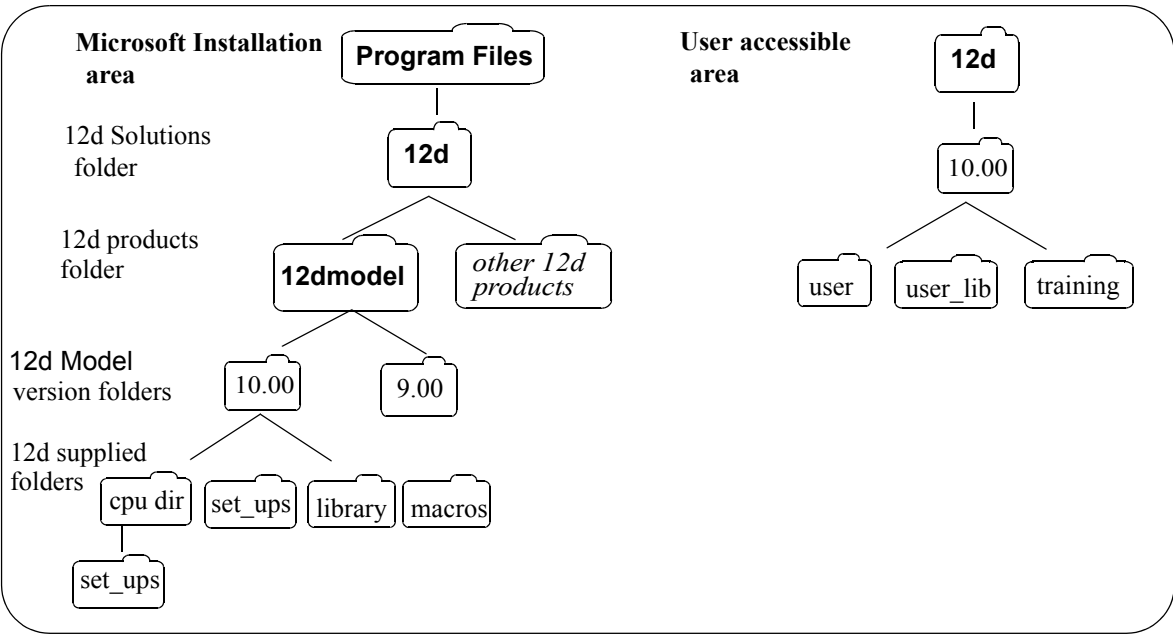

That is, the software and associated files are installed in **Program Files\12d\12dmodel\10.00**
However, without *Administrator* privilege, users do not have write access to **Program Files**.

To allow non-administrator users access to Set Up areas that users can store modified files, *12d Model 10* also installs extra folders in an area that could be accessed by the user. The default folder structure for this area is **C:\12d\10.00**

So the customisation system allows the use of both the areas
Program Files\12d\12dmodel\10.00

and

C:\12d\10.00 for storing Set Up and other files necessary for the tailoring and running of **12d Model**.

Please continue to the next section [Set Up Files](#).

Set Up Files

When *12d Model* fires up, it looks for special files (called Set Up files) to define many of its features. Hence the *Set Up* files can be used to customize *12d Model* for a site, a client or even a user.

When **12d Model** creates a new project, or changes to another project, then for each Set Up file

EITHER

- (a) an environment variable for the Set Up file exists, and the value of the environment variable is taken as the full path name of the file to be used as that Set Up file.

OR if the environment variable does not exist for the Set Up file

- (b) a file with the default Set Up file name is searched for in specially named folders, in a fully defined order.

The search for **each Set Up file** is independent of any other Set Up file. That is, for each Set Up file, the folders are searched in the specific order until that file is first found and the searching stops for that Set Up file. and then the search is begun again for the next Set Up file.

Consequently the Set Up files do not all have to be in the same folder. This greatly increases the tailorability of **12d Model**.

The description, default name and any environment variable for each Set up file are given in the sections [Set Up Files Only Used for a New Project](#), [Set Up Files Only Used for an Existing Project](#) and [Set Up Files Used for New and Existing Projects](#).

The folders searched for Set Up, and the folder search order, is described in the section [Folders Searched for Set Up Files](#).

Set Up Files Only Used for a New Project

The two Set Up files, **setups.4d** and **defaults.4d**, are only used when creating a NEW 12d Model project, and after the project is created, the information supplied in these two Set Up files is **stored within the 12d Model project** and is then modified from within **12d Model** when in that project.

Similarly the file **macros.4d** is a file of macros or chains (one per line) that are only run when a **new** project is created (**project_macros.4d** is a run when an **existing** project is opened).

defaults.4d // define the defaults for a **new** project
 (Defaults panel from the **Utilities => Defaults** option).
 Once a project is created, the defaults can be modified inside 12d Model.
 The defaults are then saved with the project.

The environment variable is [DEFAULTS_4D](#).

For more information go to the section [Defaults File](#)

setups.4d // define the layout of views on the screen for a **new** project. Once a project is created, the view layout can be modified inside **12d Model**.
 The view layout is then saved with the project.

The environment variable is [SETUPS_FILE_4D](#).

For more information go to the section [Setups File](#)

macros.4d // a file of macros and/or chains (one per line) that are run when a **new** project

is created (see [Running Macros and Chains on Start Up](#)).

The environment variable is [RUN_MACROS_FILE_4D](#).

Set Up Files Only Used for an Existing Project

The file **project_macros.4d** is a file of macros or chains (one per line) that are only run when an **existing** project is opened. So project_macros.4d is modified between accesses to the project then the modified version of the file is used for the project.

project_macros.4d // a file of macros (one per line) that are run when an **existing** project is opened (see [Running Macros and Chains on Start Up](#)).

The environment variable is [RUN_PROJECT_MACROS_FILE_4D](#).

Set Up Files Used for New and Existing Projects

The other Set Up files are searched for **each time a project is created or opened**. So if these files are modified between accesses to the project then the modified versions of the files are used for the project.

The Set Up files that **12d Model** searches for each time a project is opened are:

colours.4d // sets the colour names and red, green, blue mix; also defines the default pens that the colours map to (as displayed in the panel **colours to pens**). See [Colours File](#).

The environment variable is [COLOURS_4D](#).

digitize.4d // list and defines the digitizers available in **12d Model**. See [Digitizer Definitions File](#).

The environment variable is [DIGITIZERS_4D](#).

env.4d // contains values for environment variables See [Environment Variables](#).

The environment variable is [ENVIRONMENT_4D](#).

fonts.4d // defines the fonts used in text styles. See [Textstyles and Fonts](#).

The environment variable is [FONTS_4D](#).

gui.4d // define the fonts and colours used in panels and menus, spacing between items in panels and menus and the maximum pop-up length. See [GUI](#).

The environment variable is [GUI_4D](#).

layout.4d // a file containing the screen layout file information (slx/slf) for placing menus or panels on the screen. The layout file is used every time a project is opened. The layout file can have most menus and panels in it. See [Screen Layout File](#) in the appendix [Special File Formats](#).

The environment variable is [LAYOUT_FILE_4D](#).

linestyl.4d // defines the line styles (linestyles, worldstyles, groupstyles and twoptstyles). See [Line Styles](#).

The environment variable is [LINESTYLES_4D](#).

names.4d // a special mapping file which is used to define for given string names, information such as colours, model etc. This is used in some panels to fill out other panels fields after entering the string names in the panel.

The environment variable is [NAME_MAPPINGS_4D](#).

plotters.4d // defines the plotters that appear in the pop-up for the plotter type panel field. See [User Defined Plotters](#).

The environment variable is [PLOTTERS_4D](#).

pmf.4d // plotter mapping file for defining mapping of 12d Model colours to pens with

thicknesses, and the rgb for the pens See [Plotter Mapping File](#)
The environment variable is [PLOTTER_MAPPING_4D](#).

sheets.4d // gives sheet sizes and names used in the pop-up for the sheet size panel field.
See [Sheet Sizes File](#)
The environment variable is [SHEET_SIZES_4D](#).

survey.4d // lists and defines the data collectors available in 12d Model See [Survey Data Collectors](#)
The environment variable is [DATA_COLLECTORS_4D](#).

symbols.4d // defines the symbols. See [Symbols](#)
The environment variable is [SYMBOLS_4D](#).

textstyl.4d // defines the text styles. See [Textstyles and Fonts](#).
The environment variable is [TEXTSTYLES_4D](#).

textstyle_names.4d // defines the textstyle favourites
The environment variable is [TEXTSTYLE_MAPPINGS_4D](#).

toolbars.4d // defines the toolbars See [User Defined Toolbars](#)
The environment variable is [TOOLBARS_4D](#).

userkeys.4d // defines the action of function keys. See [User Defined Function Keys](#)
The environment variable is [FUNCTION_KEYS_4D](#).

usermenu.4d // defines the user defined walk-right menus for User on 12d Model menus. See [User Defined Menus](#).
The environment variable is [USER_OPTIONS_4D](#).

xtramenu.4d // defines the 12d Solutions defined walk-right menus for User on 12d Model menus. See [User Defined Menus](#).
The environment variable is [EXTRA_OPTIONS_4D](#).

The folders searched for Set Up, and the folder search order, is described in the next section [Folders Searched for Set Up Files](#).

Folders Searched for Set Up Files

When *12d Model 10* is installed on a *Windows* computer the major components installed by **12d Solutions** are under the Microsoft preferred installation folder **Program Files**, in the sub folders **12d\12dmodel\10.00**. That is **Program Files\12d\12dmodel\10.00**

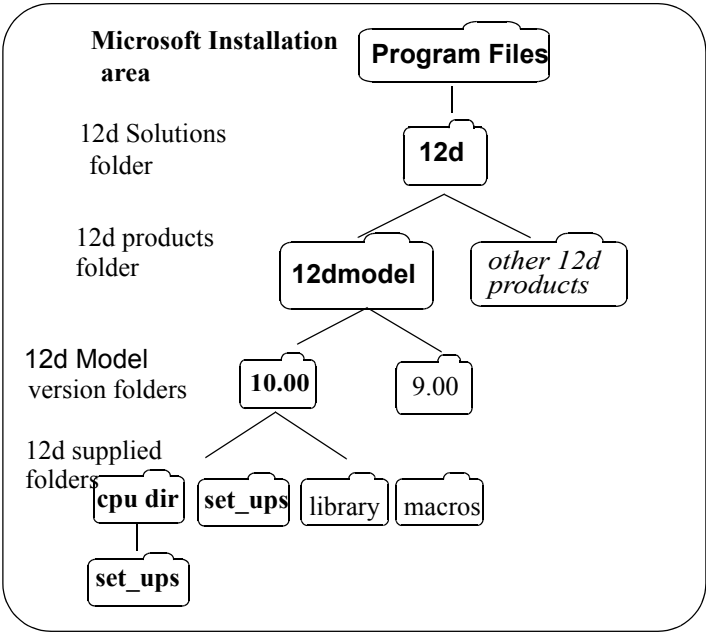

Without Administrator privilege, users do no have access to this area.

Other information that can be accessed and modified by the user, will be installed in the sub folders **C:\12d\10.00** in an area that the user has access to.

The structure of the Set Up folders **Set_ups** and **User** and how the various folders are searched for Set Up files will be described in the following sections.

Set_Ups

The *12d Model* installation creates a number of specific folders such as the operating system-cpu specific folder (for example **nt.x86** for *Windows NT* on *Intel* chips), and areas for **set up files**: namely an o/s-cpu specific **set_ups** under the o/s-specific folder and a **set_ups** under **Program files\12d\12dmodel\10.00**.

It is also possible to move the Set Up folder **Program files\12d\12dmodel\10.00\set_ups** to another location, and even give it another name, by defining an environment variable **SET_UPS_4D** which gives the path of the moved folder

SET_UPS_4D folder // 12d supplied folder of Set Up files

User and Customer_User

Users usually want to customise **12d Model** by modify one or more of the Set Up files but most users do not have written access to the **Program Files** folder, and **Program files\12d\12dmodel\10.00\set_ups**. Also, any files in the **Set_ups** folders may be overwritten by future **12d Model** installations.

To overcome these two problem, there are two special folders (reserved for customers) that are searched **before set_ups** for any Set Up files.

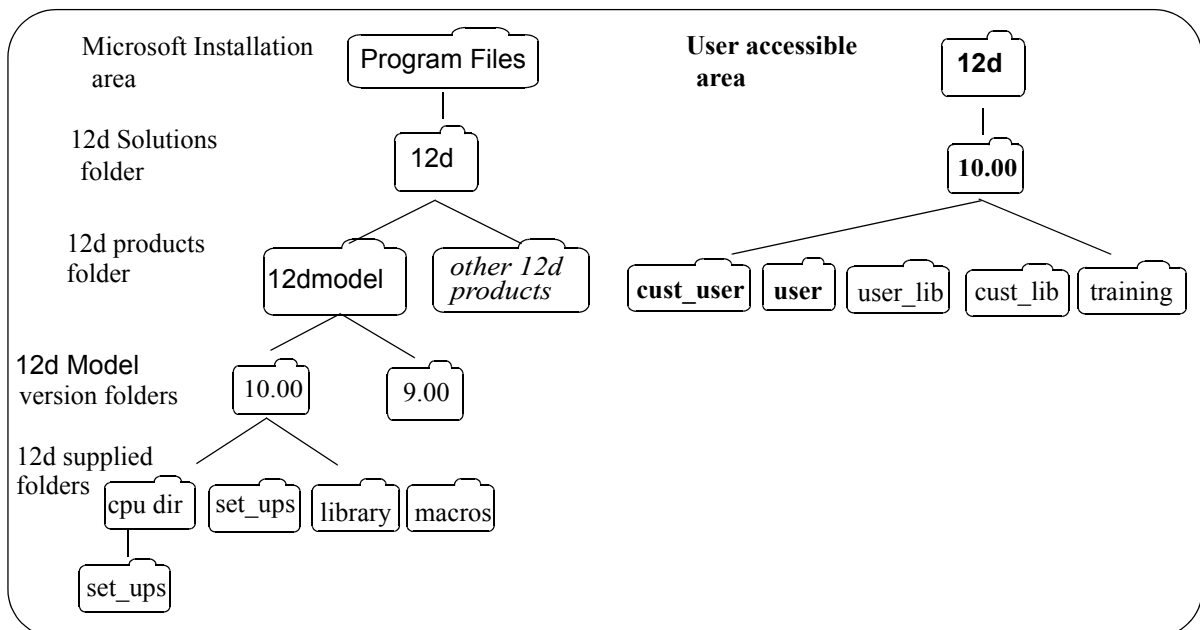

One folder is only looked for when it has been created by a user and is pointed to by the environment variable **CUSTOMER_USER_4D**. It has no default name but is whatever name has been set up for it. We will call it as **Cust_user**.

The other folder has the default name **User**.

The folders **Cust_user** and **User** should **NOT** be under **Program Files** but in **12d\10.0** which at installation time, the installer should have placed in an area that the **12d Model** user has been given read/write access to. The default folder to contain **User** and **Cust_user** is **C:\12d\10.0**

During the **12d Model** installation, if **User** does not exist, an empty **User** folder is created.

The folder **Cust_user** is not created and if required, must be created by the user and the environment variable **CUSTOMER_USER_4D** set up to point to it.

To find a Set Up file, the folder **Cust_user** will be searched for before **User**, and **User** is searched for before **Set_Ups**.

Consequently any modified Set Up files should be placed in **Cust_user** or **User** and then they will be found before the file of the same name in **Set_ups** (**User** may contain o/s-cpu specific folders).

When a new **12d Model** version is issued (e.g. 10), the contents of **Cust_user** and **User** from the previous version of 12d Model (e.g. V9) need to be copied over to the new **Cust_user** and **User** area. This is **NOT** done automatically during the installation in case there are files that need to be modified for the newer version.

There is also an **environment variable USER_4D** which can be set to point to another user defined folder which will be searched for Set Up files **before** the default **User** is searched.

USER_4D

folder

// users own folder for Set Up info

This is a common method for having all users on a network share the same Set Up files. The common files are placed on a disk drive accessible by all the users and the environment variable `USER_4D` defined to point to that folder.

Note - both **User** and the folder pointed to by `USER_4D` can exist.

Current and Home

The folder that a project is in (the **current** folder) and the users **home** folder are also searched for Set Up files.

Searching Order for Set Up Files

When **12d Model** creates a new project, or changes to another project, it searches folders for the Set Up files in a well defined order.

Each Set Up file has a default name, and unless there is an environment variable for that specific Set Up file defining its exact name and path, folders are searched in a specific order until the file is found. The search is begun afresh for each Set Up file so different Set Up files may come from different folders.

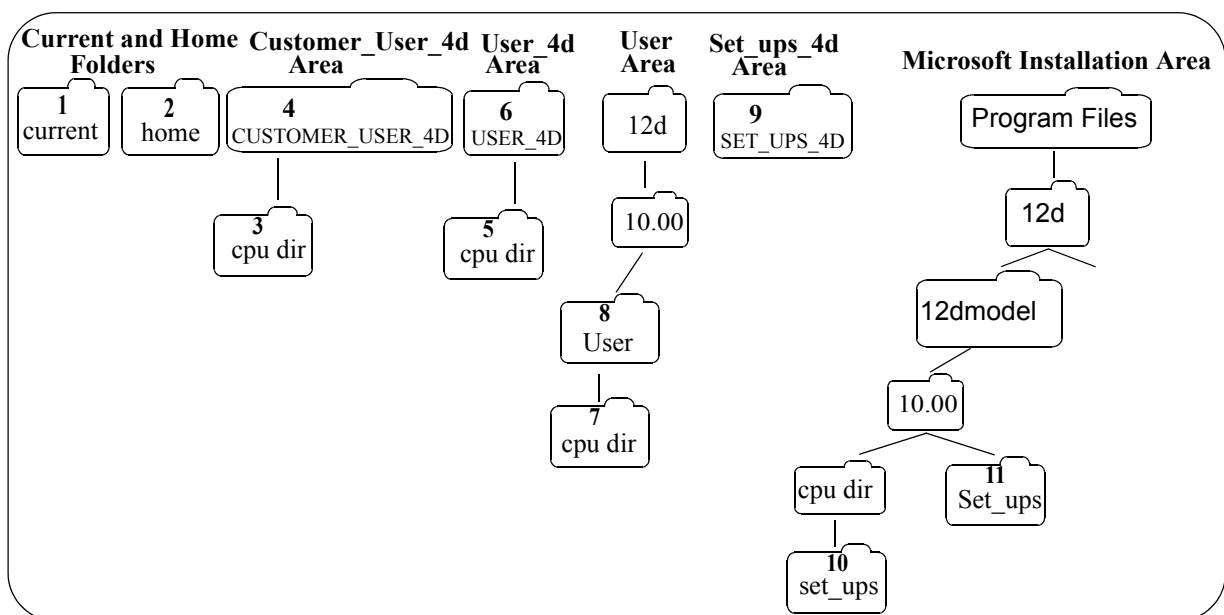

The fixed search order for any Set Up files is

1. check for the appropriate environment variable defining the full path to the **specific** Set Up file.

If the environment variable is not defined, or the file pointed to does not exist, then the folders are searched for in the following order for the specific Set Up file with its default name (e.g. colours.4d)

2. the projects current folder
3. the users home folder
4. specific cpu folder in CUSTOMER_USER_4D
5. file folder defined by CUSTOMER_USER_4D
6. specific cpu folder in USER_4D e.g. nt.x86 for Intel
7. file folder defined by USER_4D
8. specific cpu folder in **User** under **C:\12d\10.00**
9. **User** under **C:\12d\10.00**
10. the folder defined by SET_UPS_4D
11. **Set_ups** folder under the specific cpu folder under **Program Files\12d\12dmodel\10.0**
12. **Set_ups** folder under **Program Files\12d\12dmodel\10.00**

Once the appropriate Set Up file is found, the search is terminated and that, and only that file, is used.

Note

- (a) When an **existing** project is opened by *12d Model*, the Set Up files **setups.4d** and **defaults.4d** are not used. These files are only used for defining a NEW project.
- (b) A Set Up file such as **colours.4d** may exist in one or more of the above folder. However, only the first occurrence of the file found when using the above search order, is used.

Please continue to the next section [Writing Set Up Files](#).

Writing Set Up Files

Most of the Set Up files can be created and edited within 12d Model using panels such as **Defaults** which is accessed via the **Utilities => Defaults** option.

When the **Write** button is selected on these panels, a **Write Setup File** panel comes up to specify where the file is to be written out to.

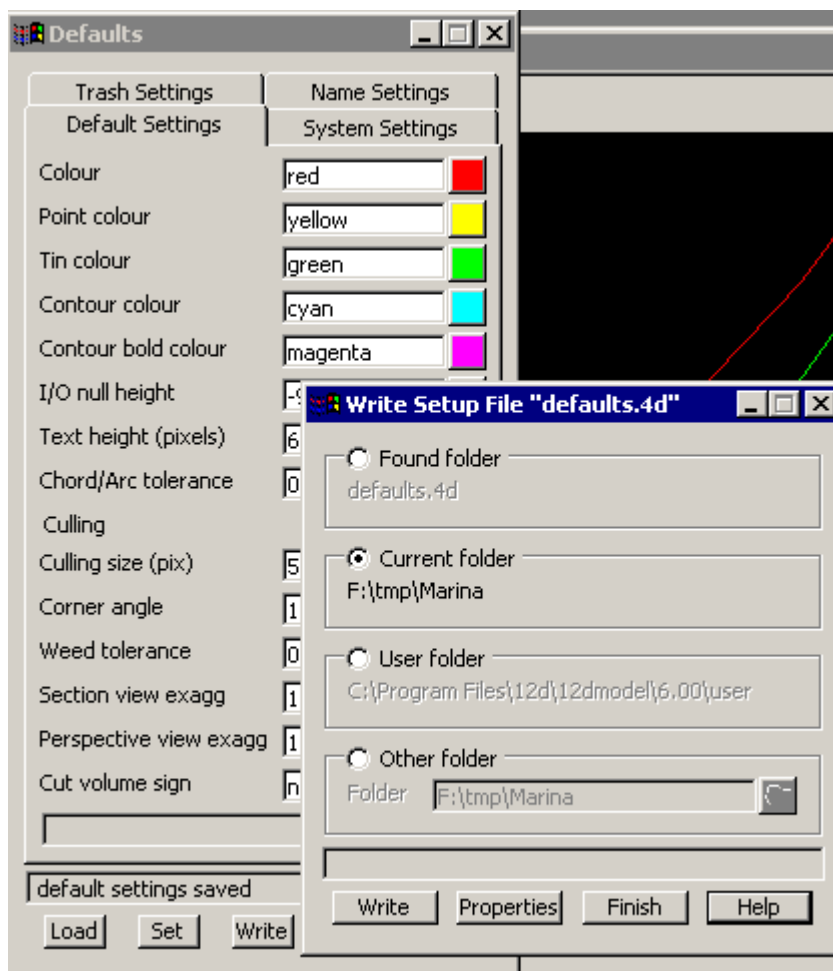

The choices on the panel allow the file to be written out to:

Found folder - the folder where the file currently being used by 12d Model resides. This will be unavailable (greyed out) if the user doesn't have access to the folder.

Current folder - the folder where the project currently being used by 12d Model resides. This will be unavailable (greyed out) if the user doesn't have access to the folder.

User folder - the User folder. This will be unavailable (greyed out) if the user doesn't have access to the folder.

Other folder - any folder can be selected.

If you are having problems writing to the file, click on the **Properties** button to bring up the **Properties** panel for the selected file (if it exists) and check the **Security** for the file.

Please continue to the next section [Library, User Library, Customer Library](#).

Library, User Library, Customer Library

Apart from Set Up files which are only accessed when a project is opened or first created, there are two or three special library areas that are searched for files with the appropriate file ending whenever the folder icon at the end of a panel file field is selected. For example, clicking on the folder icon for a **mapping file** panel field would display a list of files ending in **.mf**.

One folder, **Library**, is supplied by *12d Solutions Pty Ltd* and is installed by **12d Model**, and two other folders, **User_Lib** and **Customer_Lib** are not touched in an install and only contains files placed there by users.

Library

In a manner similar to the Set Up folders, the location of **Library** can be modified defining the environment variable

LIB_4D

If the environment variable LIB_4D doesn't exist, or the folder it points to doesn't exist, then the folder **Library** installed by 12d as **Program files\12d\12dmodel\10.00\Library** is used.

The files of the required ending in **library** are listed under the **[Lib]** walk right of pop-ups.

User Library

Because most users do not have write access to **Program files\12d\12dmodel\10.00\Library** and any files in that area may be overwritten by future **12d Model** installation, there is a special user library folder called **User_lib** where user library files should be placed.

The user library, is also a folder and is pointed to by the environment variable

USER_LIB_4D

or if the environment variable USER_LIB_4D or the folder that it points to doesn't exist, in a folder called **User_lib** directly under the user accessible area **C:\12d\10.00**

The files from the User library are listed under the **[User Lib]** walk right of the pop-up.

So unlike the setup files, files in the **12d** supplied area **Library** and the user file in **User_lib**, are all displayed.

Customer Library

There is one more folder that is only looked for when it has been created by a user and is pointed to by the environment variable CUSTOMER_LIB_4D. It has no default name but is whatever name has been set up for it. We will call it as **Customer_lib**.

So the customer library, is also a folder and is pointed to by the environment variable

CUSTOMER_LIB_4D

If the environment variable CUSTOMER_LIB_4D or the folder that it points to doesn't exist, then no Customer Library is used.

The files from the Customer library are listed under the **[Customer Lib]** walk right of the pop-up.

So unlike the setup files, files in the **12d** supplied area **Library** and the users files in **User_lib** and **Customer_lib**, are all displayed.

Note

1. The list of special endings for files is given in the Appendix, Special File Formats.

2. A full list of environment variables is given in the later section [Environment Variables](#).

Please continue to the next section [Environment Variables](#).

Environment Variables

When **12d** Model is invoked for a new or existing project, it uses environment variables to tailor the system.

In Windows, environment variables can be set for each User from the Control Panel, but a much easier method to set the environment variables used by **12d** Model is to include them in a special file which is read in each time a project (new or existing) is opened by **12d** Model.

The environment variables that **12d** Model recognises can be broken into two types - one type where the environment variable is only a flag setting a mode, and a second type which point to a file, program or folder. For the environment variables of the second type, a default file/program is often searched for if the environment variable is not defined.

The folder search order for the default files for the type group of environment variables is given in the previous sections.

The list of environment variables will just be given in alphabetical order but it will be obvious from the documentation which type the environment variable is.

Alphabetical Environmental Variables List

For environment variables that simply set a flag or value is (the default value is shown in bold) the documentation will be:

Variable Name	Value	Description	Default
---------------	-------	-------------	---------

For environment variables that point to a file, program or folder, and their associated default files/programs, the documentation will be:

Environment Variable Name	Type	Default
---------------------------	------	---------

ACAD_SEEDFILES_4D

ACAD_SEEDFILES_4D	folder	no default
-------------------	--------	------------

if non blank, the full path name of the folder holding Autocad template files.

ALIGNMENT_CORRIDOR_FIXUP_4D

ALIGNMENT_CORRIDOR_FIXUP_4D	value 0 or 1	default 1
-----------------------------	--------------	------------------

if non zero, alignment corridor calculations introduced in V8 are used.

If zero, the V7 alignment corridor calculations are used.

ALLOW_ANONYMOUS_FUNCTIONS_4D

ALLOW_ANONYMOUS_FUNCTIONS_4D	value 0 or 1	
------------------------------	--------------	--

if tick, when a file is read with a File input option, a function is automatically created and named. This function must exist to allow data to be added to a view after it is read in, to be able to delete all the data read in at a later time, and to re-run the function to reread the data file and replace the data read in last time.

ALLOW_SUPER_TINS_EXACT_CALCS_4D

ALLOW_SUPER_TINS_EXACT_CALCS_4D	value 0 or 1	
---------------------------------	--------------	--

Options using tins are split into two categories:

- (1) options that require sections through tins
- (2) options that require the triangles of the tin

if ticked, this allows super tins to be used in options where triangles are required for calculations. if not ticked, this prevents super tins to be used in options where triangles are required for

calculations.

Note: ticking this option requires super tins to be updated when a tin within the super tin changes, so there is a time, storage, and memory cost. It was found that some projects only ever required options that used sections (not triangles), so for these type of projects, there is an efficiency gain by turning off this option.

ALLOW_OLD_PLOTTING_4D

ALLOW_OLD_PLOTTING_4D value 0 or 1

If non zero, then a menu **Plot =>Old plotting** is included which has all the old Ascii ppf options.

ALWAYS_VALIDATE_PROJECT_DETAILS_4D

ALWAYS_VALIDATE_PROJECT_DETAILS_4D value 0 or 1

if ALLOW_ANONYMOUS_FUNCTIONS_4D is set to 1, then when a file is read with a File input option, a function is automatically created and named. This function can be used to delete all the data at a later time, to allow the data to be added to a view after it is read in, and to re-run the function to reread in the data file.

AUTHORIZATION_4D

AUTHORIZATION_4D full path name to nodes.4d

The authorization file is normally called **nodes.4d**, and is under the folder c:\12d\12d model\version_number. However, the file name and path can be set by the user with the AUTHORIZATION_4D environment variable.

The full path-name of the file is given.

AUTO_DELETE_WALKRIGHTS_4D

AUTO_DELETE_WALKRIGHTS_4D	0	Use old method from V3.1	32
	<i>pixels</i>	Distance in pixels to move past the end of the last menu before the cascade collapses	

If non zero, the environment variable AUTO_DELETE_WALKRIGHTS_4D sets the distance in pixels that is used to collapse the cascade of walk-right menus when the cursor moves that distance past the end of the last walk-right menu.

The default value is 32.

AUTO_HIDE_PANEL_SELECTS_4D

AUTO_HIDE_PANEL_SELECTS_4D value 0 or 1 *default 1*

if non zero, when the string select icon is picked on a panel, the panel minimises until a string is selected is accepted.

This mode was introduced so that the panel was not in the way when selecting a string. It is particularly useful on tablets with limited screen area.

AUTO_MODEL_SYNC_4D

AUTO_MODEL_SYNC_4D	0	Don't auto sync models	<i>default 0</i>
	1	Auto sync models	

if auto-model sync is set to on, the server projects for any shared models added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any models have been modified, they are re-copied to this project.

AUTO_PAN_SELECT_4D

AUTO_PAN_SELECT_4D value 0 or 1 *default 1*

if non zero, if you have accepted but not accepted a string and are zoomed in on the strings and

type **ch value** where the position at that chainage is off the view, the view will autopan so that the new selection point (at chainage value) is on the view. This applies for all typed selects.

AUTO_RESET_SELECT_4D

AUTO_RESET_SELECT_4D	0	Don't use auto-reset reselect
	1	Use auto-reset reselect

The reset mechanism for picking has ben modified for V5.0 and above. Reset is now done automatically if the cursor is moved a user specified distance (given by AUTO_RESET_TOLERANCE_4D) after a pick (without accepting), and a separate user specified distance (given by AUTO_RESET_DRAG_TOLERANCE_4D) after a directional pick (without accepting).

The default value is 1.

AUTO_RESET_SELECT_DRAG_TOLERANCE_4D

AUTO_RESET_SELECT_DRAG_TOLERANCE_4D *value*

Reset distance for directional picks.

If AUTO_RESET_SELECT_4D is non zero, then AUTO_RESET_SELECT_DRAG_TOLERANCE_4D is the distance in pixels to move the cursor to reset the picking rejection list for a directional pick.

The default value is 50.

AUTO_RESET_TOLERANCE_4D

AUTO_RESET_TOLERANCE_4D *value*

Reset distance for non-directional picks.

If AUTO_RESET_SELECT_4D is non zero, then AUTO_RESET_TOLERANCE_4D is the distance in pixels to move the cursor to reset the picking rejection list for a non-directional pick.

The default value is 5.

AUTO_TIN_SYNC_4D

AUTO_TIN_SYNC_4D	0	Don't auto sync tins	<i>default 0</i>
	1	Auto sync tins	

if auto-tin sync is set to on, the server projects for any shared tins added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any tins have been modified, they are re-copied to this project.

AUTOCAD_PATTERNS_4D

AUTOCAD_PATTERNS_4D folder no default

if non blank, the full path name of the AutoCAD patterns file.

BISECTORS_4D

BISECTORS_4D	0	Don't use bisector section	<i>default 0</i>
		use two sections instead.	
	1	Use bisector section	

When applying templates to a horizontal intersection point with a sharp change of direction, (that is, it is not an end point and the HIP has no curve on it and there is a change of direction at the HIP), either two sections can be applied at the HIP point (applied perpendicular to the line on either side of the HIP point) or just a single bisector section applied to the bisector of the change of angle through the HIP.

The default value is 0.

BOXING_CONTINUE_ON_FAIL_4D

BOXING_CONTINUE_ON_FAILURE_4D value **0** or 1 *default 0*

if non zero, the boxing stops if there is an error such as not being able to intersect with a tin.
If zero, the boxing stops when an error is found.

BOXING_RULES_COLOUR_4D

BOXING_RULES_COLOUR_4D *colour* *default blue*

the colour of the text in the Type column in the Boxing Rules panel for all Boxing command other than Comment, Decision, Goto and Labels.

BOXING_COMMENT_COLOUR_4D

BOXING_COMMENT_COLOUR_4D *colour* *default yellow*

background colour for the Comment boxing command grid row in the Boxing Rules panel. The text in the grid row is black.

BOXING_DECISION_GOTO_COLOUR_4D

BOXING_DECISION_GOTO_COLOUR_4D *colour* *default mauve*

the colour of the text in the Type column for the Decision and Goto commands in the Boxing Rules panel.

BOXING_LABEL_COLOUR_4D

BOXING_LABEL_COLOUR_4D *colour* *default light red*

the colour of the text in the Type column for the Label command in the Boxing Rules panel.

BOXING_WALL_OFFSET_4D

BOXING_WALL_OFFSET_4D *real* *default 0.000001*

when boxing automatically creates a vertical wall, this is the offset distance between the top and bottom of the vertical wall.

CIVILCAD_PATH_4D

CIVILCAD_PATH_4D folder no default

if non blank, the full path name of the folder holding CivilCAD files.

There is no default.

COLOURS_4D

COLOURS_4D filename default colours.4d

file of colour rgb definitions and names. See [Colours File](#).

The default is colours.4d.

CONSTRUCTION_SNAP_MODEL_4D

CONSTRUCTION_SNAP_MODEL_4D model name

If non blank, the model to use for objects created during construction snaps.

CUBED_CHARACTER_4D

CUBED_CHARACTER_4D *integer (base 10)* *default 179*

The integer (base 10) value of the character to use as the cubed symbol.

CUSTOMER_LIB_4D

CUSTOMER_LIB_4D folder name no default name

if the environment variable exists and the folder exists, then the folder is available when selecting a library file (see [Library](#), [User Library](#), [Customer Library](#)).

There is no default folder name.

CUSTOMER_USER_4D

CUSTOMER_USER_4D folder name no default name

if the environment variable exists and the folder exists, then the folder is part of the search for locating setup files (see [Set Up Files](#)).

There is no default folder name.

CUT_HEIGHT_ZONE_COLOUR_4D

CUT_HEIGHT_ZONE_COLOUR_4D colour default dark red

the colour of the text in the *Type* column for the *Cut* commands involving height, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

CUT_WIDTH_ZONE_COLOUR_4D

CUT_WIDTH_ZONE_COLOUR_4D colour default light red

the colour of the text in the *Type* column for the *Cut* commands involving width, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

CUT_SLOPE_ZONE_COLOUR_4D

CUT_SLOPE_ZONE_COLOUR_4D colour default dark red

the colour of the text in the *Type* column for the *Cut* commands involving slope, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

CUT_ZONE_COLOUR_4D

CUT_ZONE_COLOUR_4D colour default red

the colour of the text in the *Type* column for the *Cut* commands (other than those involving width, height or slope) in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

DATA_COLLECTOR_4D

DATA_COLLECTOR_4D data collect name

the data collector that is used if no data collector is set for a project.

There is no default.

DATA_COLLECTORS_4D

DATA_COLLECTORS_4D filename default survey.4d

file of definitions of available data collectors

The default is survey.4d.

DATA_TIPS_4D

DATA_TIPS_4D	0	Don't show data tips
	1	Show data tips

When non zero, data tips are displayed when the cursor moves over vertices in a plan view.

The default value is 0.

DECISION_ZONE_COLOUR_4D

DECISION_ZONE_COLOUR_4D colour default green

the colour of the text in the *Type* column for the *Decision* commands in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

DEBUG_DONGLE_ACCESS_4D

DEBUG_DONGLE_ACCESS_4D positive integer
time between searches for a dongle

DEFAULTS_4D

DEFAULTS_4D filename default defaults.4d
file of defaults - only used for new project
The default is defaults.4d. See [Defaults File](#).

DEFAULT_PLAN_PLOT_SCALE_4D

DEFAULT_PLAN_PLOT_SCALE_4D *value*
value is the scale (1:*value*) for new plan views
If a value is given, then it is used the default scale for any new plan view created in a project.
Note that the scale is used in the plan view for displaying text, linestyles and symbols that have been defined in paper units.

DEFAULT_RASTER_DPI_4D

DEFAULT_RASTER_DPI_4D *real_dots_per_inch*
default dots per inch to use for plotting rasters
The default value is 150.0

DEFAULT_TABLE_WIDTH_4D

DEFAULT_TABLE_WIDTH_4D *number_of_characters* *default 32*
Gives the number of characters displayed in tables such as decisionals and mtf editor.
The default value is 32.

DEFAULT_VIEW_COLOUR_4D

DEFAULT_VIEW_COLOUR_4D *colour_number* *default 0*
The default background colour for views.

DEGREES_CHARACTER_4D

DEGREES_CHARACTER_4D *integer (base 10)* *default 176*
The integer (base 10) value of the character to use as the degrees symbol.

DGN_PLOT_SEED_FILE_4D

DGN_PLOT_SEED_FILE_4D filename
if non blank, the full path name of the file to use as a seed file for Microstation plots.

DIAMETER_LARGE_CHARACTER_4D

DIAMETER_LARGE_CHARACTER_4D *integer (base 10)* *default 216*
The integer (base 10) value of the character to use as the large diameter symbol.

DIAMETER_SMALL_CHARACTER_4D

DIAMETER_SMALL_CHARACTER_4D *integer (base 10)* *default 248*
The integer (base 10) value of the character to use as the small diameter symbol.

DIGITIZERS_4D

DIGITIZERS_4D filename *default digitize.4d*
file of digitizer definitions
The default is digitize.4d. See [Digitizer Definitions File](#).

DISABLE_MTF_WARNINGS_4D

DISABLE_MTF_WARNINGS_4D	0	Display the mtf warnings in the text editor
	1	Write mtf warnings to the background window

Controls whether the mtf warnings go to a file or to the output window.

If non zero, write mtf warnings to the background window

If zero, display the mtf warnings in the text editor.

The default value is 0.

DONGLE_4D

The environment variable can have a number of parameters to control the use of Hardlock network and stand alone dongles.

(a) DONGLE_4D -local OR -no_local

usually used when there is a network dongle and need to know if any stand alone Hardlock dongle is to be looked for on the computer that the user is on.

if **-local**, then a stand alone Hardlock dongle is looked for on the computer the user is on.

If **-no local**, then no stand alone Hardlock dongle is looked for on the computer the user is on.

For example DONGLE_4D - local or -no local

(b) DONGLE_4D -no network OR -network first OR -network last

need to specify if any network Hardlock network dongle is to be looked for.

if **-no network**, then no Hardlock network dongle is looked for.

If **-network first**, then a Hardlock network dongle is looked for before a stand alone local dongle.

If **-network last**, then a Hardlock network dongle is looked for after looking for a stand alone local dongle.

For example DONGLE_4D -no_network or - network_first or -network_last

(c) DONGLE_4D -login_retries number of retries to find a Hardlock dongle

the number **nn** of retries to make when searching for a Hardlock dongle and it is not found.

For example DONGLE_4D -login_retries 3

(d) DONGLE_4D -login_wait ss

the number of seconds **ss** to wait between retries to find a network Hardlock dongle.

For example DONGLE_4D -login_wait 5

(e) DONGLE_4D -no_dongle

if the parameter -no_dongle is found, then no search is made for a Hardlock dongle.

For example DONGLE_4D -no_dongle

(f) DONGLE_4D -debug

if the parameter -debug is found, then Hardlock dongle debug information is written to the

For example DONGLE_4D -debug

See the separate notes on installing a network dongle for more details.

DONGLE_ORDER_4D

DONGLE_ORDER_4D choice box Hardlock/Wibu, Wibu/Hardlock

the order to search for network dongles.

If **Wibu/Hardlock**, then Wibu networks dongles are searched for before any Hardlock dongles.

If **Hardlock/Wibu**, then Hardlock networks dongles are searched for before any Wibu dongles.

All new dongles are Wibu so most **12d Model** sites now only have Wibu dongles.

DOUBLE_CONFIRM_DELETE_4D

DOUBLE_CONFIRM_DELETE_4D	0	Confirm deletes/cleans without undos once
	1	Confirm deletes/cleans without undos twice

Controls whether or not the user is asked once or twice to confirm that deletes and cleans that do not have undos are to be done.

If non zero, the user is asked twice to confirm for deletes and cleans.

If zero, the user is asked once to confirm for deletes and cleans.

The default value is 1.

DRAINAGE_4D

DRAINAGE_4D	filename	default drainage.4d
-------------	----------	---------------------

file of definitions for the drainage option

The default is drainage.4d.

DRAINAGE_PPF_4D

DRAINAGE_PPF_4D	<i>full path name of .ppf file</i>	no default
-----------------	------------------------------------	------------

Points to the file used as the default plot parameter file (.ppf) for the panel **New Plot Drainage Network**.

The path name to the .ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/drainage.ppf** points to the file drainage.ppf in the area defined by \$LIB_4D.

DRAINAGE_FLOW_DIR_4D

DRAINAGE_FLOW_DIR_4D	0	Flow direction is opposite to the string direction
	1	Flow direction is the same as string direction

Defines the default flow direction used in the creating a drainage string.

The environment variable DRAINAGE_FLOW_DIR_4D specified whether the default flow direction that appears in the **Create Drainage String** panel is that the flow direction in the line is in the same direction as the direction of the drainage string (ascending chainage) or that the flow direction in the drainage line is in the opposite direction to the direction of the drainage string (descending chainage).

If non zero, the drainage flow direction is the same as the string direction.

If zero, the drainage flow direction is in the opposite direction to the string direction.

The default value is 0.

DWG_PLOT_SEED_FILE_4D

DWG_PLOT_SEED_FILE_4D	filename
-----------------------	----------

if non blank, the full path name of the file to use as a template file for AutoCAD plots.

DWG_PLOT_UNIT_FILE_4D

DWG_PLOT_UNIT_FILE_4D	English OR Metric
-----------------------	-------------------

if non blank, the units to use for AutoCAD files.

EDIT_BOX_WIDTH_IN_CHARACTERS_4D

EDIT_BOX_WIDTH_IN_CHARACTERS_4D	<i>number</i>	<i>default 10</i>
---------------------------------	---------------	-------------------

if non blank, the number of characters to make the width of an Edit Box on a panel.

EDITOR_4D

EDITOR_4D	script/program	10.00\cpu_area\te
-----------	----------------	-------------------

the script or program that is fired up when a report is created. It usually points to an editor.

The default is **10.00\cpu_area\te.**

ENVIRONMENT_

It is possible to set all the environment variables from a file normally called **env.4d**. The environment variable file is searched for in the standard Set Up areas (local, USER_4D, user, set_ups) or is set by the environment variable ENVIRONMENT_4D.

The format of the environment variable file is given in the section [Setting Environment Variables](#).

EXTRA_OPTIONS_

The default is xtramenu.4d. See [User Defined Menus](#)

EXTRA_START_EXTRA_END_

The default value is 1.

EXTRUSIONS

The default is `extrusions.4d`.

FAST ACCEPT

FAST CONSTRUCTION SNAP

The default value is 0.

FLD IGNORE EXTERA WORDs 4

Page 5465

If non zero, trailing tabs are not considered words in a field file. Mainly for Leica when it is writing a format file which can't suppress trailing tabs when writing a 12d Field file.

The default value is 0.

FILE_READ_ADD_TO_VIEW_4D

FILE_READ_ADD_TO_VIEW_4D choice box

if anonymous function are set, the data created by the File input option can be added to a view. The choices are:

Do nothing - don't add the data read in to any view

Add to current view - add the data read in to the current view (the current view is the view that highlighted)

Add to new view - automatically create a new view and add the data read in to that view

Add to named view - add the data read in to the view given by

FILE_READ_ADD_TO_VIEW_NAME_4D

FILE_READ_ADD_TO_VIEW_NAME_4D

FILE_READ_ADD_TO_VIEW_NAME_4D text box

name of the view to use if FILE_READ_ADD_TO_VIEW_4D is set to **Add to named view**.

If the view does not exist then it is created.

FILL_HEIGHT_ZONE_COLOUR_4D

FILL_HEIGHT_ZONE_COLOUR_4D colour default dark green

the colour of the text in the *Type* column for the *Fill* commands involving height, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

FILL_WIDTH_ZONE_COLOUR_4D

FILL_WIDTH_ZONE_COLOUR_4D colour default light green

the colour of the text in the *Type* column for the *Fill* commands involving width, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

FILL_SLOPE_ZONE_COLOUR_4D

FILL_SLOPE_ZONE_COLOUR_4D colour default dark green

the colour of the text in the *Type* column for the *Fill* commands involving slope, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

FILL_ZONE_COLOUR_4D

FILL_ZONE_COLOUR_4D colour default green

the colour of the text in the *Type* column for the *Fill* commands (other than those involving width, height or slope) in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

FINAL_CUT_SLOPE_ZONE_COLOUR_4D

FINAL_CUT_SLOPE_ZONE_COLOUR_4D colour default black

the colour of the text in the *Type* column for the *Final* command for Final Cut slope, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

FINAL_FILL_SLOPE_ZONE_COLOUR_4D

FINAL_FILL_SLOPE_ZONE_COLOUR_4D colour default black

the colour of the text in the *Type* column for the *Final* command for Final Fill slope, in the *Modifiers* section of the *Left/Right Template Modifiers panel*.

FINAL_NO_CUT_SLOPE_ZONE_COLOUR_4D

FINAL_NO_CUT_SLOPE_ZONE_COLOUR_4D colour default black

the colour of the text in the *Type* column for the *Final* command for No Cut slope, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FINAL_NO_CUT_FILL_SLOPE_ZONE_COLOUR_4D

FINAL_NO_CUT_FILL_SLOPE_ZONE_COLOUR_4D colour default dark brown

the colour of the text in the *Type* column for the *Final* commands for No cut/fill, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FINAL_NO_FILL_SLOPE_ZONE_COLOUR_4D

FINAL_NO_FILL_SLOPE_ZONE_COLOUR_4D colour default black

the colour of the text in the *Type* column for the *Final* command for No Fill slope, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FINAL_WIDTH_ZONE_COLOUR_4D

FINAL_WIDTH_ZONE_COLOUR_4D colour default light brown

the colour of the text in the *Type* column for the *Final* commands involving width, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FINAL_ZONE_COLOUR_4D

FINAL_ZONE_COLOUR_4D colour default brown

the colour of the text in the *Type* column for the *Final* commands (other than those involving width or slope) in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FIXED_HEIGHT_ZONE_COLOUR_4D

FIXED_HEIGHT_ZONE_COLOUR_4D colour default dark blue

the colour of the text in the *Type* column for the *Fixed* commands involving height, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FIXED_WIDTH_ZONE_COLOUR_4D

FIXED_WIDTH_ZONE_COLOUR_4D colour default light blue

the colour of the text in the *Type* column for the *Fixed* commands involving width, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FIXED_XFALL_ZONE_COLOUR_4D

FIXED_XFALL_ZONE_COLOUR_4D colour default dark blue

the colour of the text in the *Type* column for the *Fixed* commands involving xfall, in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FIXED_ZONE_COLOUR_4D

FIXED_ZONE_COLOUR_4D colour default blue

the colour of the text in the *Type* column for the *Fixed* commands in the *Modifiers* section of the *Left/Right Template Modifiers* panel.

FONTS_4D

FONTS_4D filename default fonts.4d

font definitions

The default is fonts.4d. See [Textstyles and Fonts](#)

FULL_HYDRAULIC_REPORT_4D

FULL_HYDRAULIC_REPORT_4D 0, 1 default 0

The rational hydraulic report contains hydrology data.

If non zero, the hydrology calculations for each catchment set (1 to 3) are written to the hydraulic report.

FUNCTION_KEYS_4D

FUNCTION_KEYS_4D filename default userkeys.4d

function key definitions

The default is userkeys.4d. See [User Defined Function Keys](#)

GENIO_WILDCARD_4D

GENIO_WILDCARD_4D text default *.mos

Sets the ending of the files selected for the pop-up list for the **File** field in the **Read Genio Data** panel.

The default value is "*.mos".

GUI_4D

GUI_4D **Standard** default Standard

Non Standard

Defines the mouse button usage within 12d Model.

The default value is *Standard*.

GUI_COLOURS_4D

GUI_COLOURS_4D filename default gui.4d

file of colour definitions used in the GUI

The default is gui.4d. See [GUI](#)

HARDLOCK_4D

HARDLOCK_4D 1, 0

if non zero, search for 12d Hardlock dongles.

If zero, don't search for Hardlock dongles

HARDWARE_ARCS_4D

HARDWARE_ARCS_4D 1 Use hardware arcs default 1

0 Hardware arcs are not used

if non zero, use computer hardware to draw arcs (rather than software).

If zero, draw arcs in software

The default value is 1.

HEIGHT_MAX_DEFAULT_4D

HEIGHT_MAX_DEFAULT_4D integer (world units) default 0

set the default value to use in Plan Settings panels that have a **Height max (w)** field.

HELP_4D

HELP_4D folder default 10.00\help

folder containing the 12d Model help files.

The default is **10.00\help**.

HELP_BUTTONS_4D

HELP_BUTTONS_4D 0 Disable help buttons on panels

1 Enable help buttons on panels.

If non zero, **Help** buttons are added to panels.

The default value is 0.

HIMETRIC_4D

HIMETRIC_4D	0	Printer resolution of 0.04 mm - for Win 95,98,ME	default 0
	1	Printer resolution of 0.01 mm - for Win NT, 2000, XP	

For Windows 95, 98 and ME, the printer resolution can only be 0.04 mm when covering an A0 sheet.

Under Windows NT, 2000 and XP, no such restriction exists and the full resolution of 0.01 mm can be used so the environment variable HIMETRIC_4D allows access to the higher resolution for Windows NT, 2000 and XP.

The default value is 0.

See also [WINDOWS_PRINTERS_4D](#) for enabling access to Windows printers.

HLS_IPADDR

HLS_IPADDR list of IP addresses and/or computer names

if **non blank**, a list of IP addresses and/or computer names to search for a 12d Hardlock network dongle. The items in the list are separated by commas

If **blank**, search the entire network for a 12d Hardlock network dongle

HOME_4D

HOME_4D	folder	three folder levels up from where 12d.exe is
---------	--------	-------------------------------------------------

12d Model home folder

INTERPRET_DMS_INPUT_OLD_4D

INTERPRET_DMS_INPUT_OLD_4D	0, 1
----------------------------	------

if non zero, the special case of 0.mms is interpreted as mm minutes and s seconds. That is, 0.123 is interpreted as 12 minutes and 3 seconds.

If zero, the special case of 0.mms is interpreted as mm minutes and 10 x s seconds. That is, 0.123 is interpreted as 12 minutes and 30 seconds.

LABEL_PVC_150_PIPES_4D

LABEL_PVC_150_PIPES_4D	0, 1	default 1
------------------------	------	-----------

If non zero, the 150 PVC pipes are labelled on the drainage long section.

If zero, the 150 PVC pipes are not labelled on the drainage long section.

LAYOUT_FILE_4D

LAYOUT_FILE_4D	filename	default layout.4d
----------------	----------	-------------------

a file containing the screen layout file information (slx/slf) for placing menus or panels on the screen. The layout file is used each time a project is opened to place the menus and panels in it on the screen. See [Screen Layout File](#) in the appendix [Special File Formats](#).

The default is layout.4d.

LIB_4D

LIB_4D	folder	HOME_4D\10.00\library
--------	--------	-----------------------

12D Solutions library folder for input files such as mapping, template and macros (4DML's).

The default is **HOME_4D\10.00\library**.

LINESTYLE_BOX_HEIGHT_4D

LINESTYLE_BOX_HEIGHT_4D *value*

If non blank, the pixel height of the linestyle and symbol scrolling pop-ups.

The default is 512

LINESTYLE_BOX_WIDTH_4D

LINESTYLE_BOX_WIDTH_4D *value*

If non blank, the pixel width of the linestyle and symbol scrolling pop-ups.

The default is 256

LINESTYLE_DUPLICATE_MODE_4D

LINESTYLE_DUPLICATE_MODE_4D choice box

This environment variable manages what to do if symbols or linestyles with the same name are read from the symbols.4d or linstyle.4d file

Do nothing - accept all instances of symbols/linestyles of the same name

Take first - accept only the first instance of the symbol/linestyle

Take last - accept only the last instance of the symbol/linestyle

LINESTYLES_4D

LINESTYLES_4D filename default linestyl.4d

file of linestyle definitions

The default is linestyl.4d. See [Line Styles](#)

LIST_POPUPS_4D

LIST_POPUPS_4D	1	Pop-up lists as scrolling lists
	0	Pop-up lists as menus (as in versions up to V3.2)

Defines the look of pop-up lists.

If non zero, the popup lists are scrolling lists.

If zero, the pop-ups are menus which turn into walk-right menus when the list is too long.

The default value is 1.

LOOK3D_4D	1	3D look and greenish background	default 1
	0	Original 12d gui colours	

The default value is 1.

LOG_DIR_4D

LOG_DIR_4D folder-path-name default is local folder

An error log file is created each time 12d Model is invoked. The error log name automatically created by 12d Model and has the form:

log?????.4de

where ?????? is a hashed number using your login name, process id & the current time.

The **folder** that the error log file is created in is given by the environment variable LOG_DIR_4D. The full path-name of the folder is given.

If LOG_DIR_4D is not used, 12d Model tries to create the log file in the current folder, the HOME folder, the TMP folder and the TEMP folder.

If creating an error log file fails in all these ares, 12d Model does not create an error log file.

LONG_SECTION_PPF_4D

This environment points to the file used as the default plot parameter file (.ppf) for the panel **section long plot**.

ACRO_INPUT_MODE_4D

Controls whether or not the value passed down in the variable to receive the answer for any macro prompt, is actually placed into the console panel as the default answer so that it can be accepted by just typing <enter> into the console panel.

MAXIMUM_TRASH_SIZE_4D

the maximum number of Mb that the size of the trash file can be.

If the value is 0, the Trash Bin is **not** limited in size.

DDLE DOT CHARACTER 4D

The integer (base 10) value of the character to use as the squared symbol.

MODEL_FOR_TIN_PREFIX_4D

This environment variable is used to customize the default model for the tin in the panels for creating triangulations. Text can be defined for prepending and/or appending to tin name to create a default model name from the tin name.

The text for prefixing and postfixing is given in a special form: **pre-text*post-text**

If pretext only, just give the text. If post text is required, precede it by a "*".

MODEL_VIEW_WALKRIGHTS_4D

Defines whether the Data source field is used instead of model/view walk-rights used in V3.2.

MOVIE_4D

X-Windows only - program for running perspective movie

S_SEEDFILES_4D

if non blank, the full path name of the folder of Microstation seed files.

TF_TMP_4D

Page 5471

If defined, then the temporary files for mtf calculations go to the Windows temp folder. This is to get over a bug in Novell under Windows 95.

MULTI_LINE_TEXT_4D

MULTI_LINE_TEXT_4D *value 0 or 1* *default 0*

If non zero, a Text Edit Box is used instead of the Input Box and more than one line of text can be typed into the Text Edit Box.

NAME_MAPPINGS_4D

NAME_MAPPINGS_4D *filename* *default names.4d*

A mapping file can be specified which is used to fill out information such as colour, model etc. for given string names.

The mapping works in two ways. After typing part or all of a string name,

- (a) if <enter> is entered, the map file is searched for a match in the first column.
If a match is found, the name, colour, model, style etc. from the other columns in the mapping file are used to fill out the panel fields.
- (b) if a <tab> is entered, the second column is searched for a list of completions (if a * is found, the first column is used for that check) which are displayed in a pop-up. When an entry is selected from the completion list, the name, colour, model, style etc. from the columns in the mapping file are used to fill out the panel fields.
- (c) mapping file are used to fill out the panel fields.

NEVER_SNAP_ITSELF_4D

NEVER_SNAP_ITSELF_4D **1** try to stop a string snapping to itself during editing
 0 let a string snap to itself - behaviour in V3.2

Tries to stop a string snapping to itself during editing.

The default value is 1.

NEW_DRAINAGE_PPF_4D

NEW_DRAINAGE_PPF_4D *full path name of binary ppf file* no default

Points to the file used as the default binary plot parameter file (.drainppf) for the long section plot produced by the panel **Drainage Plot PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/drainage_long.drainppf** points to the file drainage_long.drainppf in the area defined by \$LIB_4D.

NEW_DRAINAGE_MELB_PPF_4D

NEW_DRAINAGE_MELB_PPF_4D *full path name of binary ppf file* no default

Points to the file used as the default binary plot parameter file (.melbppf) for the long section plot produced by the panel **Sewer Plot Melbourne Water PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/melb_water.melbppf** points to the file melb_water.melbppf in the area defined by \$LIB_4D.

NEW_DRAINAGE_PLAN_PPF_4D

NEW_DRAINAGE_PLAN_PPF_4D *full path name of binary ppf file* no default

Points to the file used as the default binary parameter file (.drainplanppf) for the plan annotation produced by the panel **Drainage Plan Plot PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/drainage_plan.drainplanppf** points to the file drainage_plan.drainplanppf in the area defined by \$LIB_4D.

NEW_LONG_SECTION_PPF_4D

NEW_LONG_SECTION_PPF_4D *full path name of binary ppf file* no default

Points to the file used as the default binary plot parameter file (.lplotppf) for the long section plot produced by the panel **Section Long Plot PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/long_section.lplotppf** points to the file long_section.lplotppf in the area defined by \$LIB_4D.

NEW_MTF_EDITOR_AUTOPAN_DEFAULT_4D

NEW_MTF_EDITOR_ZOOM_BUFFER_4D 0, 1 *default 1*

if non zero, the default for Autopan is **on** for the MTF **Left/Right Template Modifiers** panel.

if zero, the default for Autopan is **off** for the MTF **Left/Right Template Modifiers** panel.

NEW_MTF_EDITOR_DEFAULT_HEIGHT_4D

NEW_MTF_EDITOR_DEFAULT_HEIGHT_4D *real_value*

real_value is the height in pixels of the MTF **Left/Right Template Modifiers** panel.

The default value is 250

NEW_MTF_EDITOR_DEFAULT_WIDTH_4D

NEW_MTF_EDITOR_DEFAULT_WIDTH_4D *real_value*

real_value is the width in pixels of the MTF **Left/Right Template Modifiers** panel.

The default value is 750

NEW_MTF_EDITOR_ZOOM_BUFFER_4D

NEW_MTF_EDITOR_ZOOM_BUFFER_4D *real_value*

real_value is a percentage.

if *Autopan* is on for the MTF **Left/Right Template Modifiers** panel, then when a command is clicked on in the panel and the region to pan into is not displayed on the view, then the extent displayed is the required amount increased by the *real_value* percentage.

The default value is 5

NEW_PIPELINE_PPF_4D

NEW_PIPELINE_PPF_4D *full path name of binary ppf file* no default

Points to the file used as the default binary pipeline plot parameter file (.pipelineppf) for the long section plot produced by the panel **Pipeline Plot PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/pipeline_long_section.pipelineppf** points to the file pipeline_long_section.pipelineppf in the area defined by \$LIB_4D.

NEW_PLOT_FRAME_PPF_4D

NEW_PLOT_FRAME_PPF_4D *full path name of binary ppf file* no default

Points to the file used as the default binary parameter file (.plotframeppf) for the plan plot produced by the panel **Plot Frame PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/plot_frame.plotframeppf** points to the file plot_frame.plotframeppf in the area defined by \$LIB_4D.

NEW_TOOLBARS_VISIBLE_4D

NEW_TOOLBARS_VISIBLE_4D 1, 0 *default*

if non zero, when a project starts up, all the toolbars are checked to see if they are listed in the workspace (visible or invisible) and if the toolbar does not exist, then the toolbar will be displayed.

This is to allow any new toolbars added to toolbars.4d to be automatically displayed so that the user knows that it exists.

if zero, then new toolbars are not displayed. That is, only toolbars listed in the workspace (visible) are displayed.

NEW_X_SECTION_PPF_4D

NEW_X_SECTION_PPF_4D *full path name of binary ppf file* *no default*

Points to the file used as the default binary plot parameter file (.xplotppf) for the cross section plots produced by the panel **Section X Plot PPF Editor**.

The path name to the binary ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/cross_section.xplotppf** points to the file cross_section.xplotppf in the area defined by \$LIB_4D.

NVALUES_4D

NVALUES_4D filename default nvalues.4d

This points to the file which is used as the file of n value definitions. These are described in [N values](#) and the editing of the n values file is documented in [Create/Edit N-Values](#).

The default is nvalues.4d.

OPENGL_CACHE_4D

OPENGL_CACHE_4D *value 0 or 1* *default 1*

If non zero, rasters and textures are cached in the graphics card memory for potential speed ups. More memory in the graphics card allows more caching and usually more performance gains.

OPENGL_CACHE_TINS_4D

OPENGL_CACHE_TINS_4D *value 0 or 1* *default 0*

If non zero, tins are cached in the graphics card memory for potential speed ups. More memory in the graphics card allows more caching and usually more performance gains.

OPENGL_MIPMAP_4D

OPENGL_MIPMAP_4D *value 0 or 1*

If ticked, the graphics card down samples for rasters when the image is further away.

Default value is 1.

OPENGL_MIPMAP_BILLBOARDS_4D

OPENGL_MIPMAP_BILLBOARDS_4D *value 0 or 1*

If ticked, the graphics card down samples for billboards when the image is further away.

OPENGL_MIPMAP_PLAN_IMAGES_4D

OPENGL_MIPMAP_PLAN_IMAGES_4D *value 0 or 1* *default 1*

If ticked, the graphics card down samples plan images when draped onto a tin.

OPENGL_MIPMAP_PROJECTOR_IMAGES_4D

OPENGL_MIPMAP_PROJECTOR_IMAGES_4D *value 0 or 1* *default 1*

If ticked, the graphics card down samples projector images (a projector is for the "hidden" perspective image data object of a super string).

OPENGL_OFFSET_4D

OPENGL_OFFSET_4D value 0 or 1 default 1

If non zero, the coordinates are localised for OpenGL calls. This is to work around problems with some graphics cards that can't handle large coordinates.

OPENGL_VIEW_BACKING_STORE_4D

OPENGL_VIEW_BACKING_STORE_4D value 0 or 1

if 1, a backing store is used.

if 0, a backing store is not used.

For Window Vista/Windows 7, the default is 1. Otherwise the default is 0.

ONSCREEN_KEYBOARD_4D

ONSCREEN_KEYBOARD_4D value 0, 1 or 2

if 0, then no onscreen keyboard comes up when you double click in a panel field.

if 1, when you double click in a panel field that takes typed input, then a dockable onscreen keyboard come up for the user to type the data for the panel field into.

if 2, when you double click in a panel field that takes typed input, then a full screen onscreen keyboard come up for the user to type the data for the panel field into.

The default is 0.

ONSCREEN_KEYBOARD_FONT_SIZE_4D

ONSCREEN_KEYBOARD_FONT_SIZE_4D *number*

if non blank, the pixel size of the font for the onscreen keyboard.

If blank, it defaults to the normal system font size.

The default is the normal system font size.

ONSCREEN_KEYBOARD_LAYOUT_4D

ONSCREEN_KEYBOARD_LAYOUT_4D value 0, or 1

if 0, then when there is an onscreen keyboard, it comes up with a full keyboard.

if 1, then when there is an onscreen keyboard, it comes up with just a numeric keyboard.

The default is 0.

OVERFLOWING_TRASH_MODE_4D

OVERFLOWING_TRASH_MODE_4D choice box *default* Auto manage

the action to take when the trash bin exceeds the maximum trash bin size.

If **Auto manage**, the oldest files in the trash bin are deleted until the new item can fit in the trash bin.

if **Auto empty**, files in the trash bin are deleted.

Note - if a large model or tin is deleted and it is bigger than the maximum trash bin size, the user is alerted and asked to decide if they want the element to go in the trash bin anyway, or if they want to permanently delete it.

The default value is Auto manage.

PAN_MODE_4D

PAN_MODE_4D	0	Use standard pan for pan, pans on views
	1	Use pan deltas for pan, pans on views

Sets whether pan or pan delta is used for the pan and pans buttons on views.

The default value is **0**.

PDF995_TIME_LIMIT_4D

PDF995_TIME_LIMIT_4D *number*

the number of seconds to wait for PDF995 to finish producing the current PDF file.

PLAN_TABLE_SETTINGS_4D

PLAN_TABLE_SETTINGS_4D	0	Don't allow setting by model
	1	Allow setting by model

Trial only - allow the drawing of z-values, vertices etc. on the plan view to be set by individual models rather than for all models on the view.

The default value is 0.

PLOTTER_4D

PLOTTER_4D script/program no default

This environment variable points to a script/program which can be fired up whenever a plot is generated. The name of the plot is given as the first script parameter of the script.

If the parameter **Send plots** on the 'System Settings' tab of the menu option **Utilities => Defaults** is set to **yes**, the plotter script is run as each plot is created.

If more than one plot is created by an option (e.g. x plot) then the script is called separately for each of the plots.

An example of a script to send the plot to port lpt1 for Windows NT would be

```
@echo off
copy %1 lpt1
```

An example for Windows NT which looks for hp files is

```
@echo off
echo.
echo -----
:next_file
if "%1" == "" goto done
echo %1 | find /I ".hp" > nul
if ERRORLEVEL 0 if not ERRORLEVEL 1 goto hp_plotter
echo Plotting file %1
shift
goto next_file
:hp_plotter
echo Plotting %1 to HP plotter
shift
goto next_file
:done
echo -----
```

PLOTTER_MAPPING_4D

PLOTTER_MAPPING_4D filename default pmf.4d

This points to the file which is used as the default plotter mapping file. The format for the plotter mapping file is described in the section [Mapping Colours to Plotter Pens](#) in the Appendix [Setting Up and Configuring 12d](#).

The default is pmf.4d.

PLOTTERS_4D

PLOTTERS_4D filename default plotters.4d

This points to the file which contains user defined plotters. The format for the file of user defined plotters is described in the section [User Defined Plotters](#) in the Appendix [Setting Up and](#)

[Configuring 12d.](#)

The default is plotters.4d.

PLOT_SYMBOLS_4D

PLOT_SYMBOLS_4D filename default plotsymb.4d

Points to the file used to define the symbols used in long and cross section plots.

The default is plotsymb.4d.

POLYPOLYLINES_4D

POLYPOLYLINES_4D	0	Don't use speed ups	<i>default 2</i>
	1	Intermediate speed ups	
	2	Faster speed ups.	

A few experimental techniques are available for speeding up the drawing on the screen.

For some specific things such as fast contours, fast mesh and point crosses, the techniques can result in some redraws being up to three times faster.

The default env.4d shipped with **12d Model** has this set to 2.

PREVIEW_VIEW_4D

PREVIEW_VIEW_4D *text*

if non blank, the name of the view whose image is dumped on exiting the project. The image is used as the project preview.

If blank then the last active view is used.

PRINTER_4D

PRINTER_4D script/program no default

Points to a script or program which can be fired up whenever a report is generated. The name of the report is given as the first parameter of the script.

If the parameter **Print reports** on the 'System Settings' tab on the menu option **Utilities => Defaults** is set to **yes**, the printer script is run as each report is created.

PROJECT_DETAILS_4D

PROJECT_DETAILS_4D file name

If non blank, the full path name of the file of project details file to use for new projects.

PROJECT_NAMES_4D

PROJECT_NAMES_4D	0	Use long filenames for internal files	<i>default</i>
	1	Use short names (8.3 format)	

The use of long or short extension names for internal 12d Model files for items such as models, tins, templates etc. is controlled by the environment variable PROJECT_NAMES_4D.

Opening a new project with the short name format, project-name.4dp, will automatically create a short name project (i.e. a project using the short extension names - 3 characters after the .).

The default value is 0.

PROJECTIONS_4D

PROJECTIONS_4D filename default carto.4d

This points to the file which is used as the file of projections. These are described in [Projections](#) and the editing of the projections file is documented in [Create/Edit Projection](#).

The default is carto.4d.

PROMPT_ON_VIEW_CLOSE_4D

PROMPT_ON_VIEW_CLOSE_4D 0, 1

If non zero, when a view is closed/deleted, a prompt asks for a confirmation of deleting/closing.
If zero, no confirmation is requested when a view is closed/deleted.
The default is 0.

PURGE_TRASH_DAYS_4D

PURGE_TRASH_DAYS_4D *number_of_days* *default 0*

number_of_days is a positive integer and is the number of days before the Trash Bin is automatically purged of tins and models.
If *number_of_days* is zero, the Trash Bin is **not** purged.
The default value is 0.

RECENT_PROJECTS_4D

RECENT_PROJECTS_4D positive integer default 20

The maximum number of accessed projects displayed in the Projects list when 12d Model starts up.

REPORT_HEADER_4D

REPORT_HEADER_4D	0	Report files have no header page
	1	Some header information is used
	2	A full header page is produced. <i>default 2</i>

Controls the amount of header information in reports.
For the cases 1 and 2, the header information includes

- (a) the 12d Model Project
 - (b) the name of the user
 - (c) the organization
 - (d) the current date
 - (e) the current report file name
- The default value is 2.

RUN_MACROS_FILE_4D

RUN_MACROS_FILE_4D filename default macros.4d

if non blank, the full pathname of the file of macros (one per line) that are run when a new project is created.
Note: This is only run for new projects. RUN_PROJECT_MACROS_FILE_4D is run when opening an existing project.
The default is macros.4d

RUN_PROJECT_MACROS_FILE_4D

RUN_PROJECT_MACROS_FILE_4D filename default project_macros.4d

if non blank, the full path name of the file of macros (one per line) that are run when an existing project is opened.
Note: This is only run when opening existing projects. RUN_MACROS_FILE_4D is run when creating a new project.
The default is project_macros.4d

SETUPS_FILE_4D

SETUPS_FILE_4D filename default setups.4d

file setting up the initial screen layout for new projects. This is not to be confused with SET_UPS_4D which is where the standard Set Up files are installed. See [SETUPS_FILE_4D](#).

The default is setups.4d. See [Setups File](#).

SET_UPS_4D

SET_UPS_4D folder HOME_4D\10.00\set_ups

folder for storing the standard Set Up files installed by 12D Solutions.

The default is **HOME_4D\10.00\set_ups**.

SEWER_PPF_4D

SEWER_PPF_4D path name to .ppf file no default

points to the file used as the default plot parameter file (.ppf) for the panel **new plot sewer network**.

SHARE_CHECK_INTERVAL_4D

SHARE_CHECK_INTERVAL_4D positive integer *default 0*

if non zero, the number of seconds between checks to see if any of the shared tins or models added to the project have been modified.

SHARED_ELEMENT_COLOUR_4D

SHARED_ELEMENT_COLOUR_4D colour default blue

the colour to use in a list of tins/models for showing shared tins/models. That is, the tins/models that have been added to the project as shared tins/models are shown in this colour.

Setting the colour to black will disable this feature.

SHARING_ELEMENT_COLOUR_4D

SHARING_ELEMENT_COLOUR_4D colour default rgb 255,165,0

the colour to use in a list of tins/models for showing the tins/models in the project that you are allowing to be shared. That is, those tins/models in the project that the user has allowed others to share are shown in this colour.

Setting the colour to black will disable this feature.

SHARE_LOCKS_FOLDER_4D

SHARE_LOCKS_FOLDER_4D folder default no folder

if non blank, the full path name of the folder used to keep lock files for shares.

If no folder is given, the locking files are stored inside the project.

SHARE_MAP_FILE_4D

SHARE_MAP_FILE_4D filename default blank

if non blank, the full path name of the map file to be applied to shared models.

SHEET_SIZES_4D

SHEET_SIZES_4D filename default sheets.4d

For plot frames, long and x plots, the overall size of the plot sheet can be given by a pop-up containing defined sheet size.

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal Set Up areas, or is pointed to by the environment variable SHEET_SIZES_4D.

The default is sheets.4d. See [Sheet Sizes File](#).

The default value is 1.

SYMBOLS_4D

SYMBOLS_4D filename default symbols.4d

Points to the file used to define the symbols used for super strings.

The default is symbols.4d.

SYSTEM_NAMES_4D

SYSTEM_NAMES_4D	1	Only use the longer names
	2	Only use the 8.3 file names
	3	Use short names first then look for a long name.

For file name compatibility with DOS 8.3 format, the default names for all Set Up files can be restricted to just short names (8.3), long names, or short and then long.

The default value is 3.

TRANSFORMATIONS_4D

TRANSFORMATIONS_4D filename default 7params.4d

This points to the file which is used as the file of seven parameter transformations. These are described in [7 Parameters](#) and the editing of the transformations file is documented in [Create/Edit 7 Parameters](#).

The default is 7params.4d.

TEXTSTYLE_MAPPINGS_4D

TEXTSTYLE_MAPPINGS_4D filename default textstyle_names.4d

file of textstyles favourites definitions

The default is textstyle_names.4d

TEXTSTYLES_4D

TEXTSTYLES_4D filename default textstyl.4d

file of textstyles definitions

The default is textstyl.4d. See [Textstyles and Fonts](#).

TEXTURE_MAP_4D

TEXTURE_MAP_4D filename default texture_map.4d

This points to the file which defines the tables of texture mappings. These are described in [Texture Map Edit](#).

The default is texture_map.4d.

TICK_DRAW_CROSS_4D

TICK_DRAW_CROSS_4D	0	Nothing for off
	1	Cross for off

The default value is 0.

TIN_VIEWPORT_CLIP_4D

TIN_VIEWPORT_CLIP_4D	0	Drawing tins, fast contours as per V3.1
	1	A speed up for drawing tins, fast contours

Use some experimental techniques for speeding up the drawing of tins, fast contours.

The env.4d file shipped with **12d Model** has this set to 1.

TOOLBAR_DUPLICATE_MODE_4D

TOOLBAR_DUPLICATE_MODE_4D choice box

This environment variable manages what to do if toolbars with the same name are read from a *toolbars.4d* file. The choices are

Do nothing - accept all toolbars of the same name

Take first - accept only the first instance of the toolbar

Take last - accept only the last instance of the toolbar

TOOLBARS_4D

TOOLBARS_4D filename default toolbars.4d

file of toolbar definitions and names

The default is toolbars.4d. See [User Defined Toolbars](#)

TP_STAKEOUT_PATH_4D

TP_STAKEOUT_PATH_4D folder no default

if non blank, the full path name of the folder of TP Stakeout files.

TYPED_UNITS_MODE_4D

TYPED_UNITS_MODE_4D	0	International units only e.g. f and F are both International fee
	1	USA units only e.g. f and F are both US feet
	2	Mixed e.g. f is International feet and F is US feet.

Controls the typed input units for feet - international and/or US

The default value is 0.

UNDO_4D

UNDO_4D	0	Don't allow undo's	
	1	Allow undo/redos	default 1

Undo and Redo is available for most operations from 12d Model V3.1 onwards. The availability of Undo/Redo facility is controlled by the environment variable:

The default value is 1.

USE_BACKUPS_4D_FOLDER_4D

USE_BACKUPS_4D_FOLDER_4D 0, 1 default 1

If non-zero: in the places where 12d Model creates a backup file when a new file is created (using the file endings 1, 2, ... for the old file) then the backup file is placed in the folder *backups.4d*.

Backups are created for options such as env.4d editor, mtf editor, boxing editor, survey.4d editor, whenever the "Write Setup File(s)" is displayed, plus the macro calls *Backup_version_file* and *Restore_version_file*.

The *backups.4d* folder is created in the project working folder (that is, in the folder containing the *.project* folder).

USE_DENSITY_CHECKS_4D

USE_DENSITY_CHECKS_4D	0	Don't do density checks	
	1	Do density checks	default 1

If non zero then for a new project, the default for **Use density drawing** in the **Defaults** panel is **tick**.

If zero then for a new project, the default for **Use density drawing** in the **Defaults** panel is **no tick**.

For more information on **density drawing**, see [Use density drawing tick box](#) in the chapter [Projects](#).

Note: This setting is only applicable to the 250M version of **12d Model**.

USE_NEW_LINestyle_LIST_BOX_4D

USE_NEW_LINestyle_LIST_BOX_4D value 0, 1

If non zero, the linestyle and symbol pop-up lists are in scrolling boxes so they don't run over the bottom of the screen. The list of linestyles/symbols is displayed in a tree structure with the Groups as the nodes of the tree.

If zero, the linestyle and symbols lists are one long list with each Groups being an item in the list. The list may get too long to fit on the screen.

The default value is 1.

USAGE_LOG_4D

USAGE_LOG_4D folder *no default*

when set, log files of the form

<log file folder>\(<dongle> <user> <computer> <time stamp> <process ID>).log)

will be created in the given folder.

That is, the log files will all be in the one folder.

USAGE_LOGS_4D

USAGE_LOGS_4D folder *no default*

when set, log files of the form

<log file folder>\<dongle>\<user>\<computer>\(<time stamp> <process ID>).log)

will be created in the given folder.

That is, the log files will be in subfolders \dongle\<user>\<computer>.

USE_ALL_USERS_PROFILE_4D

USE_ALL_USERS_PROFILE_4D 0, 1

If no-zero then the file env.4d and the folders user and user_lib are looked for in **Documents and Setting\All Users**.

USE_TRASH_BIN_4D

USE_TRASH_BIN_4D	0	Don't use the Trash Bin	<i>default 1</i>
	1	Use the Trash Bin	

The Trash Bin is used to store copies of deleted tins and models, and cleaned models. The items can be retrieved from the Trash Bin. The Trash Bin is automatically purged of contents after PURGE_TRASH_DAYS_4D.

The default value is 1.

USE_VALIDATION_COLOURS_4D

USE_VALIDATION_COLOURS_4D *value 0 or 1* default 1

If 1, when a panel field fails to validate, the panel field is filled with the colour given by

USER_4D

USER_4D folder HOME_4D\10.00\user

user folder containing Set Up files

The default is **HOME_4D\10.00\user**.

USER_LIB_4D

USER_LIB_4D folder HOME_4D\10.00\user_lib

user library folder for input files such as mapping, template and macros (4DML's).

The default is **HOME_4D\10.00\user_lib**.

USER_OPTIONS_4D

USER_OPTIONS_4D file default usermenu.4d

To help customise 12d Model, the walk-right menu **User** on the main 12d Model menu, can be user defined. The text for each button of **User**, plus the action taken when the button is selected is user specified. Any of the buttons can include further walk-right menus.

The definitions for the menus on **User**'s is given in the file *usermenu.4d* which is searched for in the standard Set Up areas (local, USER_4D, user, set_ups) or set by the environment variable USER_OPTIONS_4D.

if USER_OPTIONS_4D is blank, usermenu.4d is searched for in the standard search path for *User* files.

if USER_OPTIONS_4D is not blank, then it is used as the full path name of the user supplied file of definitions for user defined menus.

The default is usermenu.4d. See [User Defined Menus](#)

V7_TITLE_BLOCKS_4D

V7_TITLE_BLOCKS_4D value 0 or 1 default 1

if non zero, the title block file is in 12d Ascii format.

If zero, the title block is in the pre V7 title block .tf format

VALIDATION_FAIL_COLOUR_4D

VALIDATION_FAIL_COLOUR_4D text

If not blank, the colour to fill the panel field with when there is a validation error for the field. The *text* is either a colour name, a colour number or RGB(x,y,z).

This is only used if USE_VALIDATION_COLOURS_4D is non zero (or at least not set to zero since the default is one).

If blank, the default colour is RGB(255,72,72),

VEHICLE_PATH_4D

VEHICLE_PATH_4D folder no default

The DOS Version of Vpath is no longer supported.

The environment variable VEHICLE_PATH_4D points to the folder where the Dos version of the Vpath executable is located. Note that WINDOWS_VEHICLE_PATH_4D points to the Windows version.

VIEW_BITMAP_BUTTONS_4D

VIEW_BITMAP_BUTTONS_4D	0	User text for view buttons
	1	Use icons for view buttons

The default value is 1

VIEW_BUTTONS_4D

VIEW_BUTTONS_4D	0	No view buttons are displayed
	1	The view buttons are displayed

If non zero, then menu items (view buttons) are displayed on the views (as icons or text).

If zero, menu items (view buttons) are not displayed on the views.

The default value is 1

Note: displaying *view buttons* as icons or text is controlled by VIEW_BITMAP_BUTTONS_4D

WARP_CURSOR_HIDE_4D

WARP_CURSOR_HIDE_4D	0	Don't hide the cursor before moving it
	1	Hides the cursor before moving it

Controls whether the cursor is hidden before moving - only needed on some computers.

If non zero, don't hide the cursor before moving it.

If zero, hides the cursor before moving it.

The default value is 0.

WEB_SEARCH_4D

WEB_SEARCH_4D	search engine web address	www.google.com
---------------	---------------------------	----------------

web address of the search engine that is fired up from the 12d option

Help =>12d on the Web =>Search the web.

WEED_TOLERANCE_4D

WEED_TOLERANCE_4D	0	Don't weed
	real	Weed tolerance

used in Alignment and Super strings so that when arcs have been chord-to-arc'd, the resulting points are weeded so that no point is closer than the weed tolerance. Is is also used in Apply and Apply Many so that no cross sections are closer than the weed tolerance.

WIBU_4D

WIBU_4D	1, 0
---------	------

if non zero, search for 12d Wibu dongles.

If zero, don't search for Wibu dongles

WIBU_DONGLE_4D

The environment variable can have a number of parameters to control the use of Wibu network and stand alone dongles.

(a) WIBU_DONGLE_4D -local OR -no_local

usually used when there is a network dongle and need to know if any stand alone Wibu dongle is to be looked for on the computer that the user is on.

if **-local**, then a stand alone Wibu dongle is looked for on the computer the user is on.

If **-no local**, then no stand alone Wibu dongle is looked for on the computer the user is on.

For example WIBU_DONGLE_4D - local or -no local

(b) WIBU_DONGLE_4D -no network OR -network first OR -network last

need to specify if any network Wibu network dongle is to be looked for.

if **-no network**, then no Wibu network dongle is looked for.

If **-network first**, then a Wibu network dongle is looked for before a stand alone local dongle.

If **-network last**, then a Wibu network dongle is looked for after looking for a stand alone local dongle.

For example WIBU_DONGLE_4D -no_network or - network_first or -network_last

(c) WIBU_DONGLE_4D -login_retries number of retries to find a Wibu dongle

the number **nn** of retries to make when searching for a Wibu dongle and it is not found.

For example WIBU_DONGLE_4D -login_retries 3

(d) WIBU_DONGLE_4D -login_wait ss

the number of seconds **ss** to wait between retries to find a network Wibu dongle.

For example WIBU_DONGLE_4D -login_wait 5

(e) WIBU_DONGLE_4D -no_dongle

if the parameter -no_dongle is found, then no search is made for a Wibu dongle.

For example WIBU_DONGLE_4D -no_dongle

(f) WIBU_DONGLE_4D -debug

if the parameter -debug is found, then Wibu dongle debug information is written to the

For example WIBU_DONGLE_4D -debug

See the separate notes on installing a network dongle for more details.

WIBU_IPADDR

WIBU_IPADDR list of IP addresses and/or computer names

if **non blank**, a list of IP addresses and/or computer names to search for a 12d Wibu network dongle. The items in the list are separated by commas

If **blank**, search the entire network for a 12d Wibu network dongle

WINDOWS_PRINT_MODE_4D

WINDOWS_PRINT_MODE_4D value

value is an integer representing "bit mask".

If **bit 1** set (contributes 1 to value): Windows 2000/XP print dialog means PrintDlgEx otherwise if bit 1 is not set, then PrintDlg.

if **bit 2** set (contributes 2 to value): Use exclusive access to the printer to force direct printing to the printer (may need Printer admin access)

if **bit 3** set (contributes 4 to value): Use an intermediate print file so that printing is first done to a file and then that file is submitted to the printer

So the legal values are from 0 to 7

WINDOWS_PRINTERS_4D

WINDOWS_PRINTERS_4D	0	Don't allow Windows printers
	1	Enable Windows printers

The default value is 1.

WINDOWS_VEHICLE_PATH_4D

WINDOWS_VEHICLE_PATH_4D folder no default

if non blank, the full path name of the folder where the Windows program Vpath is located.

Note - Vpath is the Vehicle Turning Path program written by Queensland Department of Transport and Main Roads that is provided free of charge.

WINTER_4D

WINTER_4D path name to WINTER program

12d Model no longer uses the external Winter program and so this environment variable is no longer used.

Points to the WINTER program for calculation N-values for Australia.

WINTER_DATA_4D

WINTER_DATA_4D folder no default

Folder containing the Winter data of N-values for Australia.

WINTER_USE_NEW_METHOD_4D

WINTER_USE_NEW_METHOD_4D value 0, 1 default 1

if tick, re-reading the Winter data is avoided and this speeds up the calculation for the Winter interpolations.

WORKSPACE_FILE_4D

WORKSPACE_FILE_4D path name

if non blank, the full path name of the workspace file for new projects.

WRITE_ALL_PLOT_PARAMETERS_4D

WRITE_ALL_PLOT_PARAMETERS_4D 0 Only write out the plot parameters
that are used in the ppf.
1 Write out all plot parameters to a ppf file

Controls whether all plot parameters are written out to a ppf file or just those that have been used in the ppf file.

The default value is 1.

X_SECTION_PPF_4D

X_SECTION_PPF_4D path name to .ppf file no default

points to the file used as the default plot parameter file (.ppf) for the panel **section X** plot.

The path name to the .ppf file can contain \$LIB which expands out to the path of the library area. For example, **\$LIB/cross.ppf** points to the file cross.ppf in the area defined by \$LIB_4D.

ZOOM_ORIGIN_DYNAMIC_4D

ZOOM_ORIGIN_DYNAMIC_4D 0 The centre of the view is the zoom centre point
1 The point you pick is the zoom centre point

Controls the origin of the dynamic zoom.

If non zero then the point selected in the view to indicate which view to dynamically zoom (and to be the zoom-in, zoom-out definition point) becomes the point to dynamically zoom about. Whilst the dynamic zoom is running, another point can be selected to become the new zoom origin.

The default value is 0.

ZOOM_PAN_DYNAMIC_4D

ZOOM_PAN_DYNAMIC_4D 0 Dynamic pan is not the default
1 Dynamic pan is the default for pan

If non zero then **dynamic pan** is the default for the pan options. The middle mouse button (or 'd') is not required to place the pan option in dynamic mode. In fact, it would then toggle it off.

The default value is 0.

Notes

- If any of the environment variables (pointing to files) are not set, or the file pointed to does not exist, then 12d Model searches for the default files in a number of locations. The search order is given at the beginning of this Appendix.
- The eagle pen mapping file, **eagleplt.emf** is also searched for in the same order as the default files.
- When an **existing** project is opened by 12d Model, the setups.4d and defaults.4d are not used.

Please continue to the next section [Setting Environment Variables](#).

Setting Environment Variables

The simplest method for setting the required environment used in 12d Model is to place them into a file, called the environmental file (default name env.4d).

Environment Variables File

It is possible to define a file which sets the value for one or more environment variables.

The file format consists of one line for each environment variable being set and each line contains the environment variable name, followed by one or more spaces and then the value for the environment variable:

```
environment_variable_name      value
```

The value of any environment variable given in the environment variable file **overrides** any other definition for that environment variable.

The file used as the environmental variable file is checked for in the following order - as soon as a file is found, the search terminates and that file is used:

1. as a command line argument when 12d Model is fired up. The syntax is

```
12d -env path_name
```

where path_name is the full path name of the file

2. pointed to by the environment variable ENVIRONMENT_4D

```
ENVIRONMENT_4D      file           // file of environment variables
                                // default env.4d
```

3. a file called **env.4d** which is searched for in the standard Set Up areas (local, USER_4D, user, set_ups).

An example of an environment variable file is

```
EDITOR_4D           te           // set the text editor used
SHOW_PATHS_4D       1           // show file names set by environment variables
SHEET_SIZES_4D      c:\standards\shfile
```

Setting Environment Variables not in a File

Environment variables can be set in **Windows NT** for a user from the *Environment* tab on the *System Properties* panel brought up by clicking on the *System* icon in the *Control Panel* of Windows.

To bring up the *Control Panel*, click on *Start* in the Windows Task bar, walk right on *Settings* and then click on *Control Panel*.

Please continue to the next section [Setups File](#).

Setups File

The St Up file, **setups.4d**, is used to define the initial screen set-ups. It can be used for

- s the system font used for text
- s the size of the initial window
- s the position of the main menu, header menu, function menu, function recalc menu, snaps menu, volumes menu, geometry menu, sewer menu, pipeline menu
- s the position of the screen message box, xyz message box
- s the position of the **save project** panel (now redundant)
- s the position, size, name and viewing parameters for the initial views

The co-ordinate system used for specifying the position of the left hand top corner of items on the screen is by column and row. For items which include an area of the screen (such as the window and views), a width and depth are also specified.

The column value is measured from the left hand size of the screen and the row value is measured from the top of the screen.

The units for row, column, width and depth are screen pixels.

Note - If any views are defined in the set_up_file, then the position of the **screen message box** must be also be defined and it must be **before** the definition of any view.

The format of the commands in the file setups.4d is

WINDOW	<i>column_value</i>	<i>row_value</i>	<i>width</i>	<i>depth</i>	// main window
MAIN MENU		<i>column_value</i>		<i>row_value</i>	
FUNCTION MENU		<i>column_value</i>		<i>row_value</i>	
FUNCTION RECALC MENU		<i>column_value</i>		<i>row_value</i>	
GEOMETRY MENU		<i>column_value</i>		<i>row_value</i>	
PIPELINE MENU		<i>column_value</i>		<i>row_value</i>	
SEWER MENU		<i>column_value</i>		<i>row_value</i>	
SURVEY MENU		<i>column_value</i>		<i>row_value</i>	
VOLUMES MENU		<i>column_value</i>		<i>row_value</i>	
SNAPS MENU		<i>column_value</i>		<i>row_value</i>	
SNAPS BUTTONS HORIZONTAL		<i>column_value</i>		<i>row_value</i>	
SNAPS BUTTONS VERTICAL		<i>column_value</i>		<i>row_value</i>	
PROJECT SAVE PANEL		<i>column_value</i>		<i>row_value</i>	
// Views					
PLAN VIEW	<i>column_value</i>	<i>row_value</i>	<i>width</i>	<i>depth</i>	<i>name</i>

SECTION VIEW	<i>column_value</i>	<i>row_value</i>	<i>width</i>	<i>depth</i>	<i>name</i>
PERSPECTIVE VIEW	<i>column_value</i>	<i>row_value</i>	<i>width</i>	<i>depth</i>	<i>name</i>
reference point	0.0	750.0	120.0	// x y z	
view plane normal	1.0	0.0	0.0	// dx dy dz	
view up vector	0.0	0.0	1.0	// dx dy dz	
view distance	10.0			// distance	
PERSPECTIVE OPENGL VIEW	<i>column_value</i>	<i>row_value</i>	<i>width</i>	<i>depth</i>	<i>name</i>
reference point	0.0	750.0	120.0	// x y z	
view plane normal	1.0	0.0	0.0	// dx dy dz	
view up vector	0.0	0.0	1.0	// dx dy dz	
view distance	10.0			// distance	

The following parameters were used for V5.00 but are ignored for V5.0 onward:

SCREEN MESSAGE BOX	<i>column_value</i>	<i>row_value</i>
XYZ MESSAGE BOX	<i>column_value</i>	<i>row_value</i>

Please continue to the next section [Colours File](#).

Colours File

12d Model allows the use of up to 10,240 distinct colours for drawing in any view.

The colours are numbered from 0 to 10,239 and the user defines the red, green and blue mix (RGB) for each colour and what name is used throughout the program when referring to the colour.

The colour names and RGB mix associated with each colour number is defined in the file **colours.4d**.

The format for each line of the *colours.4d* file is:

red_value green_value blue_value pen_num col_name col_num pop-up_num col_group

Each colour is defined in terms of its red, green and blue intensity (RGB). The intensity value is between 0 and 255, where 0 represents no colour and 255 full colour. The RGB values for the colour are *red_value*, *green_value* and *blue_value*.

When plotting, the **default plotter pen number** used to plot a colour is given in the file as *pen_num*. The pen number is an integer that is positive or zero.

The actual **colour name** used to describe the colour is given in quotes after the default plotter pen number - *col_name*. Colour names can be alphanumeric although upper and lower case are considered the same. Each colour must have a unique colour name. If an underscore "_" is used in a colour name in the *colours.4d* file then a space is inserted in 12d Model. The colour name must be enclosed within quotes. For example, "dark red".

The **colour number** is what is actually stored in 12d Model and it is given after the colour name - *col_num*. A colour number is an integer that is positive or zero. Colour numbers can only occur once in the *colours.4d* file but there can be gaps in the colour numbers.

The **colour pop-up number**, *pop-up_num* is the next item in the *colours.4d* file.

The colour pop-up number is an integer that can be negative, zero or positive. Colour pop-up numbers can only occur once in the *colours.4d* file but there can be gaps in the colour pop-up numbers.

The *colour pop-up number* is used to decide which colours are should in the Colour box. If *Display colours* is set to *n* in *Utilities => Defaults*, then the colours with the *n* smallest pop-up numbers are displayed in the Colour box pop-up. So the order that the colours are chosen to appear in the colour pop-up is independent of the colour number.

The **colour group**, *col_group*, is the last item in the *colours.4d* file. The colour group is simply text and does not have to be unique. The colour group is enclosed in quotes. For example, "vis".

The colour group is not currently used in 12d Model but is expected to be used to group colours together in a colours pop-up.

The *colours.4d* file is displayed and modified by using the **Edit Colours** panel brought up from the [Edit] item on the colours pop-up, *Select Colour*. For more information, go to the section [Colours](#) in the Chapter [Tools and Concepts](#).

Please continue to the next section [Defaults File](#).

Defaults File

The **defaults** file, **defaults.4d**, defines the initial default settings used in the 12d Model **default** and the **systems defaults** panels.

The **defaults** file can contain:

```
// general defaults

DEFAULT COLOUR                      red
DEFAULT POINT COLOUR                yellow
DEFAULT TIN COLOUR                  brown
DEFAULT CONTOUR COLOUR              cyan
DEFAULT CONTOUR INDEX COLOUR        magenta
DEFAULT TEXT SIZE                    8

// view settings

DEFAULT CULLING OFF/ON
DEFAULT CULLING SIZE                1.0
DEFAULT SECTION VIEW EXAGGERATION    10.0
DEFAULT PERSPECTIVE VIEW EXAGGERATION 1.0

DEFAULT FAST TEXT CULL SIZE          4.5    // if not specified assumes 4.5
DEFAULT NONE TEXT CULL SIZE          2.0    // if not specified assumes 2.0

// highlighting

DEFAULT ANGLE MODE                   BEARINGS/DEGREES
DEFAULT HIGHLIGHT COLOUR             white
DEFAULT HIGHLIGHT CROSS COLOUR       yellow
DEFAULT HIGHLIGHT CROSS SIZE         2.0

// drawing points

DEFAULT CHORD ARC TOLERANCE          0.1
DEFAULT POINT CROSS SIZE MMS         2.0
DEFAULT POINT CROSS SIZE PIXELS      3

// trash model and mode

DEFAULT TRASH MODEL                  model_name    // model for trash
DEFAULT TRASH MODE                   trash string  // send used strings to trash
                                      delete string // delete used strings
                                      keep string   // keep used strings

// miscellaneous

DEFAULT NAME SETTINGS                file_name    // names.4d file

The information panel for each editor can be toggled on/off and the initial state when a new edit
operation is begun is given by

DEFAULT EDIT INFORMATION              1           // show info panel on editor start-up
                                      0           // don't show info panel
```

When output report are created, the scripts/programs pointed to by **EDITOR_4D** and **PRINTER_4D** will be run depending on the values of the defaults **display reports** and **print reports**.

DEFAULT DISPLAY REPORT FILES	1	// run EDITOR_4D
	0	// don't run "
DEFAULT PRINT REPORT FILES	1	// run PRINTER_4D
	0	// don't run "

Similarly when plots are created, the script/program pointed to by PLOTTER_4D and will be run depending on the value of the default **send plots**.

DEFAULT SEND PLOT FILES	1	// run PLOTTER_4D
	0	// don't run "

The number of minutes between displays of the **save project** yes-no box is given by

DEFAULT SAVE INTERVAL	minutes	// 0 for never
-----------------------	---------	----------------

The file defining string colours can have up to 10,240 colours in it however this number is usually inconvenient to display in the standard colour pop-up so there is a setting to set how many colours are displayed from the list.

DEFAULT POPUP COLOURS	number_of_colours	// default 16
-----------------------	-------------------	---------------

The precision for displaying real numbers in the information panel and in boxes and panel fields can be set.

DEFAULT PRECISION	integer	// info panel - default 3
DEFAULT BOX PRECISION	integer	// boxes & panels -default 4

The sign for cut areas and volumes can be positive or negative (fill is the opposite) and is given by

DEFAULT CUT VOLUME SIGN	-1	// negative for cut (default)
	1	// positive for cut

Text in text string, 4d strings and linestyles may be in pixels and must be given a millimetre size for plotting. Pixel text is multiplied by a factor to convert it to a millimetre size. The pixels to mm plot

DEFAULT PIXELS TO MM PLOT FACTOR	real	// default 1.0
----------------------------------	------	----------------

Please continue to the next section [GUI](#).

GUI

Note - this section is only for versions earlier than V4.0

The file **gui.4d** defined the colours used for screen objects (the graphical user interface objects), screen fonts, maximum pop-up length, and spacing in the menus and panels.

The gui.4d file is read every time a project (new or old) is opened.

GUI Colours

The colours associated with each screen object are given in terms of intensity values of red, green and blue. The intensity values are between 0 and 255, where 0 represents no colour and 255 full colour.

The layout for screen colours in the gui.4d file is:

// object	RGB values- red	green	blue	
VIEW BACKGROUND COLOUR	0	0	0	// black
VIEW BORDER COLOUR	255	255	0	// yellow
BUTTON HIGHLIGHT COLOUR	255	255	0	// yellow
BUTTON TEXT COLOUR	127	127	127	// grey
BUTTON BACKGROUND COLOUR	60	60	200	// dark blue
MENU BACKGROUND COLOUR	150	90	0	// brown
MENU BORDER COLOUR	255	255	0	// yellow
PANEL BACKGROUND COLOUR	150	90	0	// brown
PANEL BORDER COLOUR	255	255	0	// yellow
FRONT SCREEN LOGO COLOUR	255	255	0	// yellow
FRONT SCREEN TEXT COLOUR	0	255	0	// green
FRONT SCREEN BACKGROUND COLOUR	60	60	200	// dark blue
WINDOW BACKGROUND COLOUR 1	64	128	0	// half green
WINDOW BACKGROUND COLOUR 2	0	128	196	// cyan

Maximum Pop-Up Length

The maximum number of items in a pop-up list before splitting into walk-right pop-ups is given by (necessary when using VGA screens on PC's)

POPUP LENGTH integer //maximum number of items in a pop-up

Fonts for Menus and Panels

A font can be defined for use in the menu and panel titles areas and a separate font for the rest of the text in the menus and panels.

The fonts are defined in the gui.4d file as:

SYSTEM TITLE FONT	font_name	// font for titles
SYSTEM FONT	font_name	// font used elsewhere

For X-Windows, the font_name is the name of the required font from the font list given by the

command xlsfonts.

For Windows NT, the font_name is made up of the Windows font name plus zero or more parameter values for the font.

The font name and parameter values are given as one text name, font_name, by concatenating the font name and values with only a minus separating them.

If the font name consists of more than one word, the font name is enclosed in double quotes(").

Hence for NT, an example of defining fonts is:

Parameter	Possible Values
Font	font name (less than 32 characters)
Height	number
italic	
underline	
strikeout	
Weight	thin extralight light normal medium semibold bold extrabold heavy
Quality	draft proof
Pitch	default_pitch fixed_pitch variable_pitch
Family	decorative modern roman script swiss

Defaults

Height	14
Weights	fw_dontcare (family weight don't care)
Pitch	font default pitch
Family	ff_dontcare (font family don't care)
Quality	default_quality
italic	false
underline	false
strikeout	false

For example

Arial-14-bold-italic is the fond Arial, of height 14 and bold and italic
"Courier New"-16-italic is the font Courier New, of height 16 and bold.

Under NT, if the font is not properly defined or doesn't exist, then the system font is used.

Under X-Windows, if the font does not exist, the font fixed is tried. If fixed does not exist, 12d Model will not start up.

Spacing for Borders and Panels

There are parameter to control the amount of space in border, between items etc. for menus and borders. These are normally set by 12D Solutions and should not need to be modified.

SCREEN TEXT BORDER X	pixels
SCREEN TEXT BORDER Y	pixels
SCREEN TEXT EXTRA X	pixels
SCREEN TEXT EXTRA Y	pixels
EDIT BOX BORDER X	pixels
EDIT BOX BORDER Y	pixels

PANEL BORDER X	pixels
PANEL BORDER Y	pixels
PANEL GAP Y	pixels
VERTICAL BORDER X	pixels
VERTICAL BORDER Y	pixels
VERTICAL GAP Y	pixels
HORIZONTAL BORDER X	pixels
HORIZONTAL BORDER Y	pixels
HORIZONTAL GAP Y	pixels
INPUT BOX BORDER X	pixels
INPUT BOX BORDER Y	pixels

Please continue to the next section [Sheet Sizes File](#).

Sheet Sizes File

For plot frames, long and x plots, the overall size of the plot sheet can be given by a pop-up containing defined sheet size.

The sheet size names, width and heights can be specified by the user in a file named **sheets.4d** which is in the normal Set Up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D      file           // file of plotter sheets sizes
```

The layout of the sheet sizes file is

```
// User definition file for sheets sizes in 12d Model
// Heights and widths are in mm.
```

//	sheet name	width	height
	A0	1189	841
	A1	841	594
	A2	594	420
	A3	420	297
	A4	297	210
	B1	1000	707

Please continue to the next section [Transitions and Spirals File](#).

Transitions and Spirals File

A transition is a means of easing from a straight to a curve (full transition) or from one radius curve to another radius curve (partial transition).

There is often confusion between the words spirals and transition curves come in a variety of formulae and spiral is just one type of transition curve.

Spirals

A spiral curve (Euler spiral) is a special type of transition where the radius of curvature is proportional to the length along the curve.

That is

Radius of curvature at a point x length from start of spiral to that point = Constant

$$r/l = K$$

Although the above definition fully defines a spiral (or Euler curve), spiral calculations are difficult by hand and so no authority uses the full definition but uses an approximation to the Euler spiral.

A Euler spiral can be uniquely defined in terms of a start tangent vector, a final radius of curvature (R) and a total spiral length (L).

The equation for this spiral can be given in terms of a local co-ordinate system where the origin is at the start of the spiral and the x-direction (abscissa) is along the tangent vector at the start of the spiral. The y-direction (ordinate) is given as the offset from the x-axis of the point on the spiral.

Formulae for the local co-ordinates of a point on the spiral can then be derived in terms of the distance of the point along the spiral (the spiral length to the point) and the given constants L (the total spiral length) and R (the final radius of curvature of the spiral).

These formulae for the local co-ordinates of a point on the spiral are **polynomial series** in terms of the spiral length to that point.

For use in calculations, the local co-ordinates can be **approximated** by restricting the polynomial series for the abscissa and the offset to a fixed number of terms.

So for example, the so called **clothoid** spiral used by Australian road authorities is defined as using exactly 5 terms for the abscissa (x) polynomial and exactly 4 terms of the offset (y) polynomial.

Note that a spiral is a transition but not all transitions are spirals.

Left/Right, Leading/Trailing Transitions

The radius of curvature **R** (or simply the radius) of a transition is allowed to be positive or negative.

To agree convention of going to the left or right when travelling along a road and the sign of the curve radius, the radius of curvature **R** of a transition is allowed to be positive or negative.

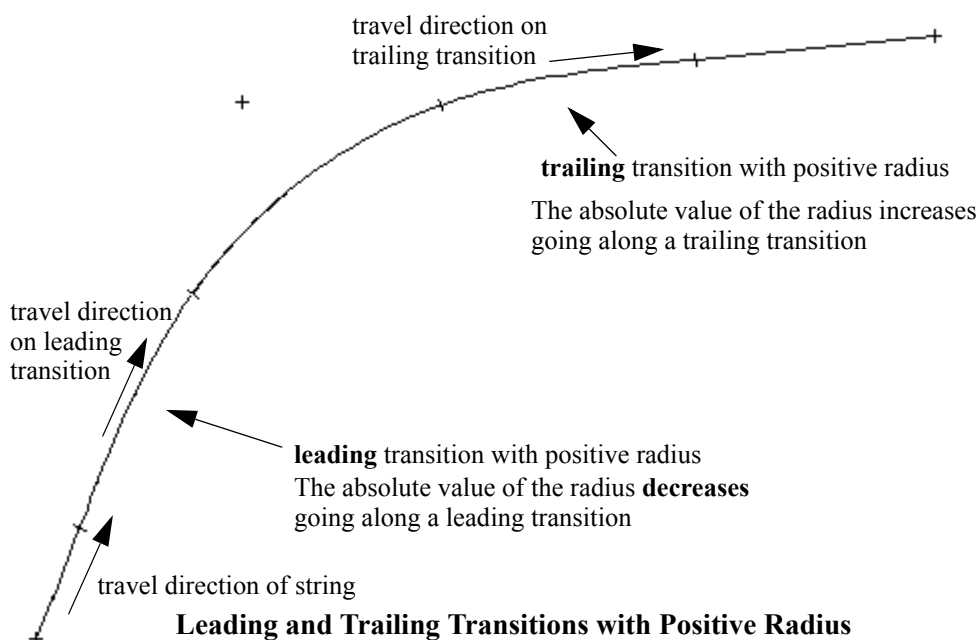

If **R** is **positive**, the transition will then curve to the **right**

If **R** is **negative**, the transition will then curve to the **left**

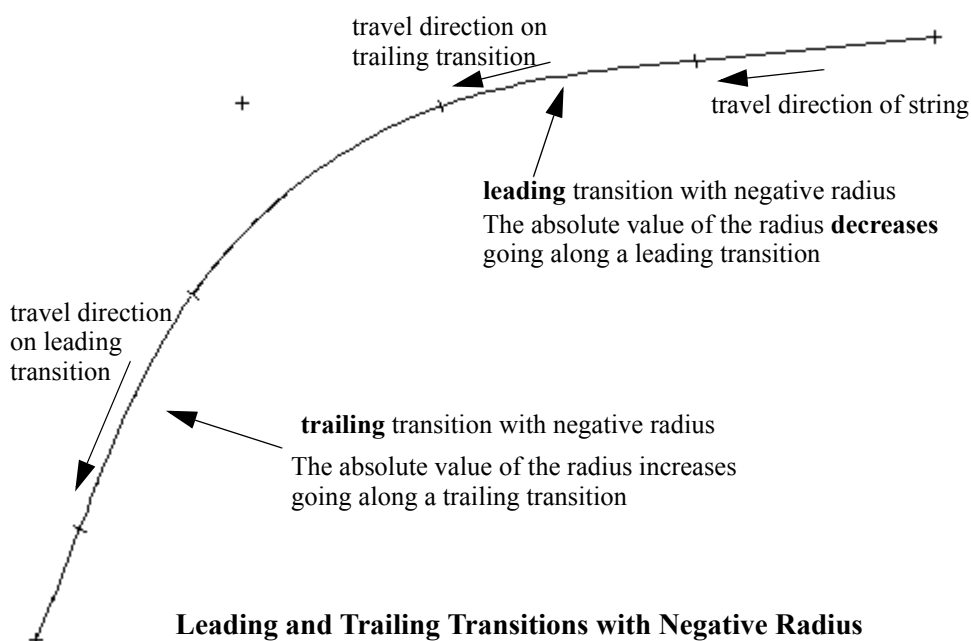

Also depending on the direction of travel along a transition, the absolute radius of curvature will be increasing or decreasing going along the transition.

If the radius is decreasing along the transition, it is called a **leading** transition.

If the radius is increasing along the transition, it is called a **trailing** transition.

If the direction of the travel along the string is reversed, the radius of the transitions, and the arc, will be negative and the leading transition become trailing transition and the trailing transition becomes a leading transition.

Transitions/Spirals Supported by 12d Model

Users must be aware of the exact transition definitions that are to be used in their work.

In Australia, totally different transitions are used by NSW Rail, Queensland Rail and WA Rail.

Luckily all the road authorities in Australia use the same spiral approximation, and that is the same spiral approximation used by Queensland Rail.

So if work is being done in Western Australia or New South Wales, a different transition type is needed in the road alignments from that used in any rail alignments.

The transitions/spirals supported by 12d Model are:

Clothoid - spiral approximation used by Australian road authorities and Queensland Rail.

Cubic parabola – special transition curve used by NSW railways. Not a spiral.

Westrail cubic – spiral approximating used by WA railways.

Cubic spiral – low level spiral approximation. Only ever used in surveying textbooks.

Natural Clothoid – the proper Euler spiral. Not used by any authority.

Bloss – special transition used by Deutsche Bahn. Not a spiral.

Sinusoidal - special transition. Not a spiral.

Cosinusoidal - special transition. Not a spiral.

Please continue to the next section [12d Model Options Map](#).

12d Model Options Map

The **12d Model** menu map shows the menu structure for all the sub-menus on the main 12d Model menu and the menus on the views.

The map is designed to be printed out for users who wish to affix it to a wall.

The PDF file of the menu map on the 12d Model Installation CD in the folder

Documentation\12d Model menu map

Or in the *Updates* section of the web site www.12d.com.

Please continue to the next section [Monitoring 12d Model Usage](#).

Monitoring 12d Model Usage

Overview

12d Model usage can be monitored for single-user and network licenses (or a mix of both), whether installed on a single computer, a local-area network, or a wide-area network across different time zones.

Monitoring the usage is a 3 stage procedure:

1. Generating individual .log files for each 12d Model session run.
2. Consolidating all the completed .log files into a CSV file.
3. Reporting the usage details, using the CSV file as input.

The 1st stage is achieved by setting an environment variable in your env.4d file(s).

The last 2 stages are achieved by running the supplied program: 12d_usage.exe.

Generating the .log files

By setting one of two possible environment variables in the env.4d file(s) used for your 12d Model sessions, uniquely named .log files can be generated in a specified folder on your network.

For example, by adding the lines:

```
usage_log_4d F:\12d model usage
```

or

```
usage_logs_4d F:\12d model usage
```

to your env.4d file(s), then each time a 12d Model session is run, a .log file will be created in the “F:\12d model usage” folder. This folder, referred to as the <log file folder>, can be anywhere on your network and can have any name, **but it must be created beforehand**, and all 12d Model users must have write-access to it.

In the first case, using variable “usage_log_4d”, log files will be generated in the form:

```
<log file folder>\(<dongle> <user> <computer> <time stamp> <process ID>).log
```

In the second case, using variable “usage_logs_4d”, log files will be generated within sub-folders of the form:

```
<log file folder>\<dongle>\<user>\<computer>\(<time stamp> <process ID>).log
```

Note that the <time stamp> represents the start time of the 12d Model session in GMT (also known as UTC or Zulu Time).

It does not matter which variable you decide to use, and you can even use a mix of the variables, if you have more than one env.4d file. However, regardless of which variable you use, it is recommended that the <log file folder> is the same for all 12d Model users on your network so that all 12d Model sessions can be easily included in the reports.

The **.log** file generated in the <log file folder> for each individual 12d Model session run on your network, contains all the information required about that session. While the session is still running, the log file will be updated at a minimum of every 75 seconds, with the time that the session has been active. At the close of the 12d Model session, the log file is again updated and is set as “completed”.

Installing 12d_usage.exe

You can put the 12d_usage.exe program wherever you like on your network. Then, simply create a shortcut to the program on your desktop, making sure the shortcut properties are set as follows:

Target:	<path to program location>\12d_usage.exe
Start in:	<path to Working Folder>

The Working Folder is the folder that you run the 12d_usage.exe program from (it does not have to be the same as the location of the 12d_usage.exe file). After running the program for the first time, a file named 12d_usage.defaults will be created in the Working Folder. This file is used to save your settings from the last run of the program and to load your settings for the next run of the program. In addition, you might also wish to use the Working Folder to store your 12d Model Usage report files (although you are free to store them elsewhere).

Running 12d_usage.exe

To run the 12d_usage program, simply double-click on the shortcut icon you created at install time. This will open up a DOS window from where the program's keyboard-driven menu system can be run.

From the Main menu within the 12d_usage program, your keyboard-driven menu options are:

C	Bring up the Consolidate menu
R	Bring up the Report menu
Q	Exit (quit) the 12d_usage program

Consolidating the .log files

After a while, you should notice that a lot of .log files are being generated in your specified <log file folder>. To consolidate all these .log files into a single Comma-Separated-Variable (CSV) file, you will need to run the 12d_usage.exe program, and press the "C" key to bring up the Consolidate menu.

From the Consolidate menu, your keyboard-driven menu options are:

F	Specify the <log file folder>
O	Specify the output CSV file name
T	Toggle whether to delete or rename consolidated log files
C	Consolidate 12d Model session log files
Q	Exit the Consolidate menu and return to the Main menu

When specifying the name of the CSV file you wish to consolidate your log files to (using the "O" key), if you want a .csv file extension (to allow the file to be easily loaded into MS?Excel for your own custom reports, for example), you must include the .csv in the file name. It is recommended that all users of the 12d_usage program consolidate log files to the same CSV file every time. Newly consolidated logs are always appended to an existing CSV file. If there is to be more than one user of the 12d_usage program, it might be a good idea to specify the CSV file to be in the <log file folder> or the Working Folder (or at least, some folder that all 12d_usage users can access).

You also need to specify how to tidy up the log files, after they have been consolidated, so that they are not consolidated more than once. Your options here are to rename or to delete the log files (the "T" key toggles between rename and delete). If you choose to rename them, they will be renamed with a .logc extension. If you choose to delete them, they will be lost forever, and the only record you will have of your consolidated sessions will be contained in the CSV file. As such, you should be very careful not to delete your CSV file.

Pressing the “C” key will then go ahead and consolidate the log files. Note that consolidation will only take place on “completed” log files (or on log files that have not been updated for more than 24 hours - to handle the case of a power failure, for instance).

Reporting on 12d Model Usage

After creating or adding to your consolidated CSV file, you can press the “R” key from the Main menu, in order to bring up the Report menu.

From the Report menu, your keyboard-driven menu options are:

I	Specify the input CSV file name (generated from the Consolidate menu)
O	Specify the output report file name
M	Toggle whether to overwrite or append to existing report file
D	Add/Remove Dongle constraints
C	Add/Remove Computer constraints
U	Add/Remove User constraints
F	Add/Remove Folder constraints
P	Add/Remove Project constraints
E	Add/Remove Program constraints
V	Add/Remove Version constraints
T	Specify Start and End times for report (in Local Time of 12d_usage User*)
S	Specify which summary tables you want in the report
R	Generate the 12d Model Usage report
Q	Exit the Report menu and return to the Main menu

After generating the report (using the “R” key), you will be asked if you want to view the report file. If you answer yes (using the “Y” key), the report file will be opened using Notepad.exe as the default file editor. If you would prefer to use a different file editor, you can specify it by manually editing the 12d_usage.defaults file (see Installing 12d_usage.exe), and replacing the word “notepad” (last line of the file), with the command to start your preferred editor.

***Note:** In general, if reporting on 12d Model sessions running on a WAN across different time zones, *Local Time of 12d Model User* and *Local Time of 12d_usage User* may be different.

K Line styles, Symbols and Textstyles

This appendix contains information about how linestyles, symbols and text is defined and used in *12d Model*.

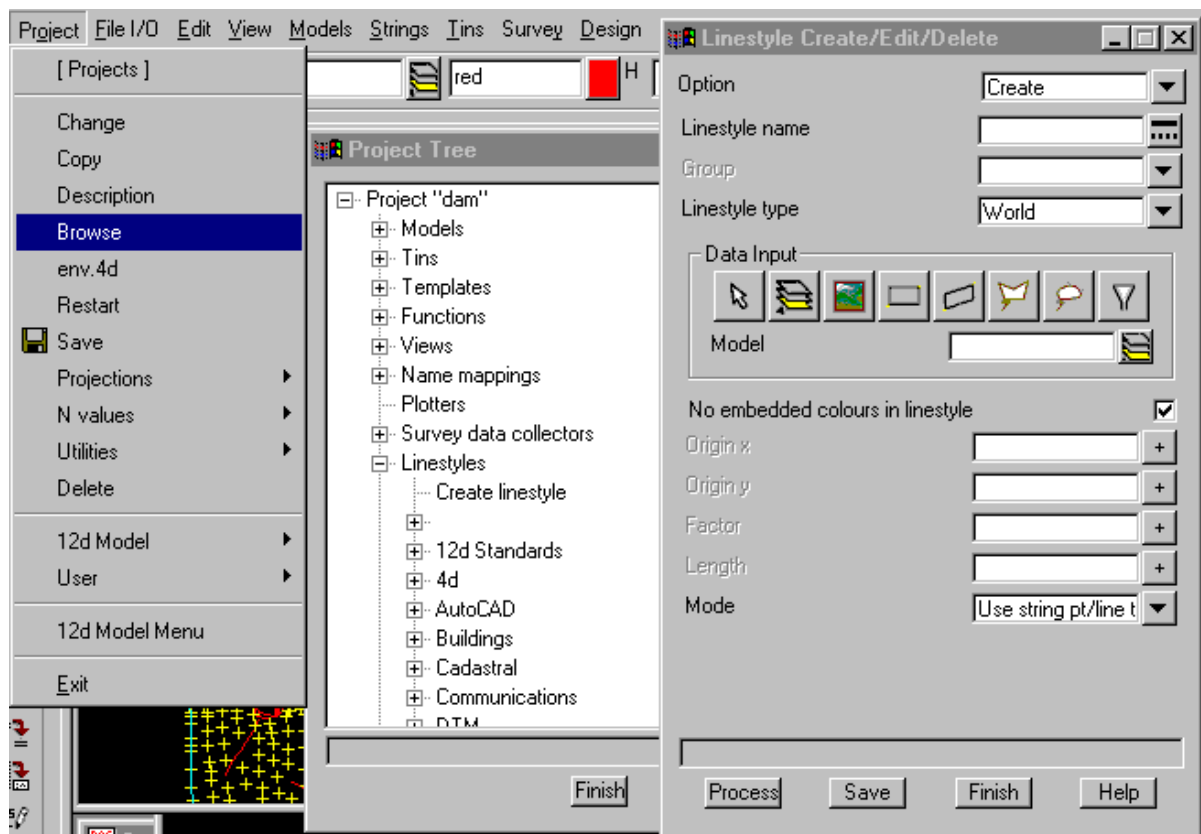

Go to [Line Styles](#)
[Line Style Definitions](#)
[Symbols](#)
[Symbol Definition](#)
[Textstyles and Fonts](#)

For documentation on the first item, continue to the next section [Line Styles](#).

Line Styles

Users can define their own line styles to use when drawing **12d** Model strings. The definition of linestyles are stored in a file called **linestyl.4d**.

Linestyles in the file can be created/edited/deleted using the **Linestyle Create/Edit/Delete** panel which is brought up by double clicking on *Create linestyle* in the *Linestyles* expansion of the *Project Tree* (see [Linestyles](#) in the chapter [Projects](#)) brought up by the **Project=>Browse** option.

The **Linestyle Create/Edit/Delete** panel acts as an interactive editor to a text file which contains the linestyle definitions.

The user defined line styles can be

- (a) applied at each vertex of the string - vertex mode
- (b) repeated along the string - continuous mode
- (c) stretched between adjacent vertices of the string
- (d) any combination of the above.

Each line style can be made up of lines, arcs, circles and text.

For cases (a) and (b), the units for the line style can be in pixels, millimetres or world units.

The line style with one origin is called a

linestyle if the definition of the style is given in pixel units

paperstyle if the definition of the style is given in paper units

worldstyle if the definition of the style is given in world units

and line style with two origins is called a **twopstyle**.

A linestyle, worldstyle or paperstyle can be drawn at each point or repeated along the string

For case (c) the style is stretched between two adjacent points and is called a **twopstyle** style.

A twopstyle stretches between two points in one or both directions.

Finally, case (d) is called a **groupstyle** and is a combined style made up of one or more linestyle, paperstyle, worldstyle or twopstyle.

A groupstyle made up of a vertex and a continuous line style.

Note:

The words **linestyle** or **line style** are often used in the manual to refer to either a linestyle, paperstyle, worldstyle, twopstyle or groupstyle.

Defining Line Styles

A *line style* is defined in a (x,y) co-ordinate system as a series of moves, drawn, arcs, circles and text commands.

The bounding box of the line style is the smallest rectangle parallel to the (x,y) axis which contains all the moves, draws, circles and arcs of the line style. Note that moves are included in the bounding box even if a line isn't drawn to the point.

The default **origin of the line style** is defined to be the midpoint of the bounding box surrounding the line style. The bounding box includes the points moved to and drawn to, but does not automatically include (0,0). Hence the calculated origin may not be (0,0).

There are **xorigin** and **yorigin** commands to override the default origin of the line style.

If a **yorigin** is set, then it is used as the y-coordinate of the line style. If the **xorigin** isn't given, then the **xorigin** is the midpoint of the x-extent of the bounding box of the line style.

Similarly, if a **xorigin** is set, then it is used as the x-coordinate of the line style. If the **yorigin** isn't given, then the **yorigin** is the midpoint of the y-extent of the bounding box of the line style.

The default **length** of the line style is the *horizontal size* of the bounding box.

There is a **length** commands to override the default length of the line style. The *length* must always be positive but it can be larger or smaller than the line styles's calculated horizontal length.

The *origin* and the *length* of the line style are both used in positioning and redrawing the line style.

For *vertex mode*, the **origin** of the line style is placed at each point of the string and the line style drawn around the **origin**.

For *continuous mode*, the **origin** of the line style is initially placed at a distance of half of the **length** of the line style along the first link in the string, and then moved the distance **length** along the string and redrawn. This is repeated along the string until the end of the string is reached.

Hence for *continuous mode*, the style is continually repeated along the string.

Linestyl.4d

The definitions for the available line styles are normally stored in a file called **linestyl.4d** which is read in each time 12d Model opens an existing project or creates a new project. *Linestyl.4d* is searched for in the standard set up paths, or is pointed to by the environment variable

LINESTYLES_4D *filename*

The definition of the line styles will be given in the following section [Line Style Definitions](#).

Line Style Definitions

Linestyles, Paperstyles and Worldstyles

The line style with one origin is called a

linestyle if the definition of the style is given in *pixel* units

paperstyle if the definition of the style is given in *paper* units

worldstyle if the definition of the style is given in *world* units

and line style with two origins is called a **twoptstyle**.

The line style can be drawn at each point of a string (**vertex mode**) or redrawn regularly along the lines joining string points (**continuous mode**).

The definition of a **linestyle** of a given name *name* is

```
linestyle name {  
    set_up_commands  
    draw_commands  
}
```

a **paperstyle** is

```
paperstyle name {  
    set_up_commands  
    draw_commands  
}
```

and a **worldstyle** is

```
worldstyle name {  
    set_up_commands  
    draw_commands  
}
```

where the `set_up_commands` **must** be before the `draw_commands`.

The linestyle/paper/worldstyle must have a name and if the name includes imbedded spaces, it must be enclosed in double quotes “.”.

The line style itself is defined inside the braces where there can be zero or more `set_up_commands` from the list

```
length    value  
group     name  
mode      value  
factor    value  
xorigin   value  
yorigin   value
```

followed by zero or more **draw_commands** from the list

```
move      x-value    y-value  
draw      x-value    y-value  
rmove     dx-value   dy-value  
rdraw     dx-value   dy-value  
colour    colour_name  
circle    radius  
arc       radius     start-angle  end-angle
```

```

text      "text"      angle  height  "justification"
text      "text"      angle  height  "justification"  "textstyle"
text "text" angle height "justification" "textstyle" xfactor slant offset _width offset_height
repeat num_repeats{  repeat_commands repeat_draw_commands}

```

The **repeat** command is a positive integer *num_repeats*

and zero or more *repeat_commands* from the list

```

xpos      x-value
ypos      y-value
rfactor   value

```

and zero or more *repeat_draw_commands* where *repeat_draw_commands* include all the *draw_commands* except **repeat**.

The **set_up** commands for linestyle, paperstyles and worldstyles will now be described. The **draw_commands** will be described after the definition of a groupstyle since they are the same for linestyle, paperstyles, worldstyles and twoptstyles.

set_up_commands for Linestyles, Paperstyles and Worldstyles

group

The **group** is used to associate line styles in pop-up menus.

If the group is not defined, the style is placed in a default (blank) group.

If the group name includes imbedded spaces, then it must be enclosed in double quotes ".

mode

mode specifies whether the linestyle, paperstyle or worldstyle is drawn at the individual points on a string (vertex mode) or it is to be redrawn regularly along the lines joining the points on the string (continuous mode).

If the **mode** is not specified, the mode used for a string depends on the breakline type of the string and the number of points on the string.

Breakline Type	Number of Points	mode: vertex	mode: continuous	mode: not-given
point	1	vertex	cross	vertex
	>1	vertex	continuous	vertex
line	1	vertex	cross	vertex
	>1	vertex	continuous	continuous

NOTE: in early versions of 12d Model, **mode** was known as **pointline** and had the values **point** instead of *vertex*, and **line** instead of *continuous*.

factor

This command factors up/down the drawing co-ordinates, heights and radii.

xorigin, yorigin

The default **origin of the line style** is defined to be the midpoint of the bounding box of the line style. The bounding box includes the points moved to and drawn to but does not automatically include (0,0). Hence the calculated origin may not be (0,0).

The **xorigin** and **yorigin** commands are used to override the default origin of the line style.

length

If **length** is omitted, then **length** is taken to be the horizontal size of the calculated bounding box of the style.

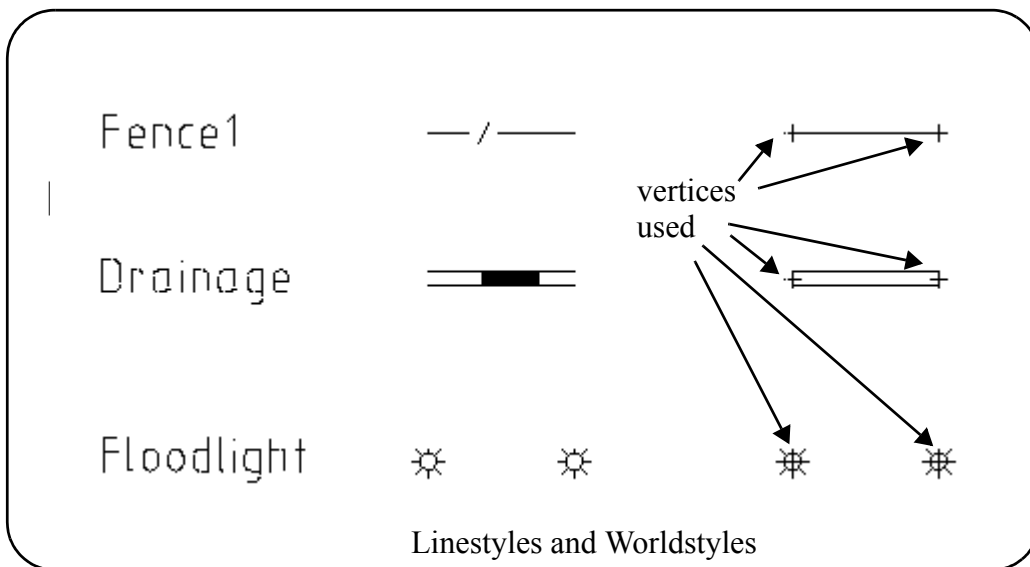

The **length** must always be positive but it can be larger or smaller than the line style's calculated horizontal size.

The origin of the line style and the length are both used in positioning and redrawing the line style.

In **vertex** mode, the origin of the line style is placed at the string points.

In **continuous** mode, the origin is initially placed at a distance of half of **length** along the first line in the string, and then moved the distance **length** along the string for each redraw.

Examples

```
// Fence1
worldstyle "FENCE1"{
  group SWCS
  factor 20
  move 0 0
  rdraw 1 0
  rmove 0.25 -0.25
  rdraw 0.25 0.50
  rmove 0.25 -0.25
  rdraw 1 0
}

// Drainage
worldstyle drainage {
  group "4d"
  factor 0.1
  colour green

  move 0.0 -2.0  draw 30 -2.0

  move 30 -1.5  draw 15 -1.5
  move 15 -1.0  draw 30 -1.0
  move 30 -0.5  draw 15 -0.5
```

```

    move 15 0.0  draw 30 0.0

    move 30  0.5  draw 15  0.5
    move 15  1.0  draw 30  1.0
    move 30  1.5  draw 15  1.5

    move 30  2.0  draw  0  2.0
}
// Floodlight
worldstyle FLOODLIGHT {
  group "Energex"
  mode vertex
  xorigin 0
  yorigin 0
  colour "yellow"
  circle 0.225
  move -.45 0
  draw -0.225 0
  move 0.45 0
  draw 0.225 0
  move 0 -.45
  draw 0 -0.225
  move 0 0.45
  draw 0 0.225
  move -.159 0.159
  draw -0.318 0.318
  move 0.159 0.159
  draw 0.318 0.318
  move 0.159 -0.159
  draw 0.318 -0.318
  move -0.159 -0.159
  draw -0.318 -0.318
  move 0 0.8
  text "FL" 0 0.5 "centre-middle"
}

```

Twoptstyles

A **twoptstyle** is a line style which is stretched so that one cycle fits between consecutive points on a string (line or arc segments). This is achieved by defining **two origins** for the twoptstyle and the first and second origins are mapped to the consecutive points on the string.

Hence the mapping of the two origins defines the final size of the size in world units.

The *twoptstyle* can stretch in just the direction along the string, or both along and perpendicular to the direction of the string.

Also the *twoptstyle* can be drawn for each line/arc on the string, or for every second line/arc of the string.

For a feature/circle string, the first origin is placed at the centre of the feature/circle and the second origin is placed on the circumference of the feature/circle. Hence the size of the *twoptstyle* is determined by the radius of the feature/circle string.

The definition of a **twoptstyle** of a given name is

```

twoptstyle name {
  set_up_commands
  draw_commands
}

```

where the `set_up_commands` **must** be before the `draw_commands`.

The *twoptstyle* must have a name and if the name includes imbedded spaces, it must be enclosed in double quotes “ ”.

The *twoptstyle* itself is defined inside the braces where there can be zero or more `set_up_commands` from the list

<code>group</code>	<i>name</i>
<code>stretch_mode</code>	<i>value</i>
<code>cycle_mode</code>	<i>value</i>
<code>xorigin1</code>	<i>value</i>
<code>yorigin1</code>	<i>value</i>
<code>xorigin2</code>	<i>value</i>
<code>yorigin2</code>	<i>value</i>

followed by zero or more `draw_commands` from the list

<code>move</code>	<i>x-value</i>	<i>y-value</i>
<code>draw</code>	<i>x-value</i>	<i>y-value</i>
<code>rmove</code>	<i>dx-value</i>	<i>dy-value</i>
<code>rdraw</code>	<i>dx-value</i>	<i>dy-value</i>
<code>colour</code>	<i>colour_name</i>	
<code>circle</code>	<i>radius</i>	
<code>arc</code>	<i>radius</i>	<i>start-angle</i> <i>end-angle</i>
<code>text</code>	<i>"text"</i>	<i>angle</i> <i>height</i> <i>"justification"</i>
<code>text</code>	<i>"text"</i>	<i>angle</i> <i>height</i> <i>"justification"</i> <i>"textstyle"</i>
<code>text</code>	<i>"text"</i>	<i>angle</i> <i>height</i> <i>"justification"</i> <i>"textstyle"</i> <i>xfactor</i> <i>slant</i> <i>offset</i> <i>width</i> <i>offset_height</i>
<code>repeat</code>	<i>num_repeats</i>	{ <i>repeat_commands</i> <i>repeat_draw_commands</i> }

The `repeat` command is a positive integer *num_repeats* and zero or more *repeat_commands* from the list

<code>xpos</code>	<i>x-value</i>
<code>ypos</code>	<i>y-value</i>
<code>rfactor</code>	<i>value</i>

and zero or more *repeat_draw_commands* where *repeat_draw_commands* include all the *draw_commands* except `repeat`.

The `set_up` commands for a *twoptstyle* will now be described. The *draw_commands* will be described after the definition of a **groupstyle** since they are the same for *linestyles*, *paperstyles*, *worldstyles* and *twoptstyles*.

set_up_commands for Twoptstyles

group

The **group** is used to associate line styles in pop-up menus.

If the group is not defined, the line style is placed in a default (blank) group.

If the group name includes imbedded spaces, then it must be enclosed in double quotes “ ”.

stretch_mode

stretch_mode controls whether the symbol stretches in just the direction along the string, or both along and perpendicular to the direction of the string

stretch_mode	1	// stretch in one direction only (default)
	2	// stretch in both directions

stretch in one direction

stretch in both directions

A twoptstyle stretches between two points in one or both directions.

cycle_mode

cycle_mode controls whether the symbol is drawn for each line/arc on the string, or for every second line/arc of the string.

cycle_mode

1

// draws on every line/arc (default)

2

// draws every second line/arc

draw on every line/arc

draw on every second line/arc

A twoptstyle draws on each line/arc or every second line/arc

xorigin1, yorigin1

The point (xorigin1, yorigin1) is mapped to the first point that the *twoptstyle* is being applied to.

The default **first point of origin of the twoptstyle** is defined to be the minimum x value and the average of the minimum and maximum y values ($x_{\min}, (y_{\min} + y_{\max})/2$).

The **xorigin1** and **yorigin1** commands are used to override the default first origin of the *twoptstyle*.

xorigin2, yorigin2

The point (xorigin2, yorigin2) is mapped to the second point that the *twoptstyle* is being applied to.

The default **second point of origin of the twoptstyle** is defined to be the maximum x value and the average of the minimum and maximum y values ($x_{\max}, (y_{\min} + y_{\max})/2$).

The **xorigin2** and **yorigin2** commands are used to override the default second origin of the *twoptstyle*.

Examples

```
// Gate
twoptstyle GATE {
  group "Two Points"
  stretch_mode 2
  cycle_mode 2
  colour red
  move 100 105
  draw 140 95
  draw 140 105
  draw 100 95
  draw 100 105
}

// two point tree
twoptstyle 2PT_TREE {
  group "4d_standards"
  stretch_mode 2
  cycle_mode 2
  xorigin10
  yorigin10
  // xorigin22.5
  // yorigin2 1.25

  colour "green"
  move 0 0
  circle 2.5
  move 2.48 0.2
  draw 0.5 0
  draw 2.48 -0.2
  move 2.2 -1.2
  draw 1.2 -0.9
  draw 1.8 -1.7
  move 0.7 -2.4
  draw 0.2 -1
  draw 0.3 -2.45
  move -0.2 2.45
  draw 0 1
  draw 0.2 2.45
  move 1.2 2.2
```

```

draw 0.9 1.2
draw 1.7 1.8
move -2.48 0.2
draw -0.5 0
draw -2.48 -0.2
move -1.8 1.6
draw -0.8 0.6
draw -2.1 1.3
move -1.6 -1.9
draw -1.1 -0.8
draw -1.3 -2.1
}
// Culvert
twoptstyle CULV {
  group "Two Points"
  stretch_mode 2
  cycle_mode 2

  move 8 12
  draw 10 10
  draw 14 10
  move 16 10
  draw 20 10
  move 22 10
  draw 26 10
  move 28 10
  draw 32 10
  move 34 10
  draw 38 10
  move 40 10
  draw 44 10
  move 46 10
  draw 50 10
  move 52 10
  draw 56 10
  draw 58 12
  move 58 6
  draw 56 8
  draw 56 10
  move 10 10
  draw 10 8
  draw 8 6
  move 10 8
  draw 14 8
  move 16 8
  draw 20 8
  move 22 8
  draw 26 8
  move 28 8
  draw 32 8
  move 34 8
  draw 38 8
  move 40 8
  draw 44 8
  move 46 8
  draw 50 8
  move 52 8
  draw 56 8

```

}

Groupstyles

A **groupstyle** is a combined line style which is made up of one or more *linestyles*, *paperstyles*, *worldstyles* and/or *twoptstyles*.

The definition of a **groupstyle** is simply an optional **group** for the line style to belong to, and a list of linestyle, paperstyles, worldstyle and twoptstyle names which must have already been defined in the file.

```
groupstyle name {
    group    name
    style_name_1
    style_name_2
    ...
}
```

If the *groupstyle* name contains spaces, then it must be enclosed in double quotes ". For example, "style 1".

Example

```
// POLE
worldstyle POLE {
    group "Electricity"
    mode vertex
    circle 0.5
}
// FN
worldstyle FN {
    group "Fences"
    length 5
    draw 4 0
    move 4.4 0.6
    draw 4.6 -0.6
}
// PF
}groupstyle "PF" {
    group "Miscellaneous"
    "POLE"
    "FN"
}
```

Description of the draw_commands

move *x-value* *y-value*

move the pen from the current pen position to the new position (x-value, y-value).

draw *x-value* *y-value*

draw from the current pen position to the new position (x-value, y-value)

rmove *dx-value* *dy-value*

move relative from the current pen position through the distance (dx-value, dy-value)

rdraw *dx-value* *dy-value*

draw relative from the current pen position through the distance (dx-value, dy-value)

colour *colour-name*

change colour (line styles can contains more than one colour).

If colour is not defined, the line style is drawn in the colour of the string that the line style is applied to. If the colour-name includes imbedded spaces, then it must be enclosed within double quotes "".

circle *radius*

draw a circle of the given radius at the current pen position.

After drawing a circle, the current pen position is left at the centre of the circle.

arc *radius* *start-angle* *end-angle*

draw an arc of the given radius from the start angle to the end angle. A positive radius denotes that the arc is drawn in a clockwise direction, a negative radius means anti-clockwise. Angles are given in degrees, minutes and seconds in the ddd.mmssfff format.

After drawing an arc, the current pen position is left at the centre of the arc.

text *text* *angle* *height* "*justification*"
text *text* *angle* *height* "*justification*" *textstyle*
or

text *text* *angle* *height* "*justification*" *textstyle* *xfactor* *slant* *offset_width* *offset_height*

the characters *text* are drawn at the current pen position with the given angle, height, justification and possibly *textstyle*, *xfactor*, *slant*, *offset_width* and *offset_height*. Angle and slant are given in degrees, minutes and seconds in the ddd.mmssfff format. Slant is between -45 and 45 degrees.

The allowed justifications are

top-left	top-centre	top-right
middle-left	middle-centre	middle-right
bottom-left	bottom-centre	bottom-right

and the value is enclosed inside double quotes (").

After drawing text, the current pen position is left where it was before the text was drawn.

repeat num_repeats { repeat_commands repeat_draw_commands }

The **repeat** command allows the set of *repeat_draw_commands* inside the braces (the repeat-style) to be re-drawn a number of times (*num_repeats*), and with each redraw, the size of the repeat-style is modified.

In the definition of repeat, there can be zero or more *repeat_commands* from the list

xpos *x-value*

ypos	<i>y-value</i>
rfactor	<i>value</i>

and zero or repeat_draw_commands where repeat_draw_commands include all draw_commands except **repeat**.

Unlike style, the repeat-style is defined in terms of a local origin at (0,0). The repeat-style is actually drawn with this origin at the position given by the values of **xpos** and **ypos**.

The repeat-style is drawn *num_repeats* times and on each redraw, the distances, heights and radii are factored by the amount

$$\text{repeat_factor} = (1 - i * \text{rfactor})$$

where $i = 0, 1, \dots, \text{num_repeats} - 1$

If rfactor is not specified, it is given the default value of $1/\text{num_repeats}$. The factor is then

$$\text{repeat_factor} = (\text{num_repeats} - i) / \text{num_repeats}$$

where $i = 0, 1, \dots, \text{num_repeats} - 1$

Examples of the Repeat Command

1. To produce circles of radius 10,9,8,...1 about the origin.

```
repeat 10 { circle 10 }
```
2. To produce circles of radius 10,9.5,9,...5.5 about the origin

```
repeat 10 { rfactor 0.05 circle 10 }
```

More Examples of Line, Paper and World Styles

1. draw a circle of radius 20. The origin of the style is (0,0)

```
worldstyle "circle" {
  move 0 0
  circle 20
}
```
2. draw a circle of radius 20. The origin of the style is (100,100)

```
paperstyle "circle" {
  move 100 100
  circle 20
}
```
3. draw a circle of radius 20. The origin of the style is (0,0)

```
linestyle "circle" {
  xorigin 0
  yorigin 0
  move 100 100
  circle 20
}
```
4. draw a gate symbol as a twoptstyle.

```
worldstyle "circle" {
  group "fences"
  stretch_mode 1           // one direction stretch
  cycle_mode 2             // draw every second line

  move 0 0
```

```
draw 0 0.1
draw 1 0
draw 1 0.1
draw 0 0
}
```

5. draw concentric circles of centre (0,0) inside a box

```
linestyle "dot" {
  xorigin 0
  yorigin 0
  move -5 -5
  draw -5 25
  draw 25 25
  draw 25 -5
  draw -5 -5
  repeat 10 {
    move 0 0
    circle 10
  }
}
```

6. draw an arc of absolute radius 10 in the clockwise direction from the angle 45 to the angle -45.

```
linestyle "arc" {
  move 0 0
  arc 10 45 -45
}
```

7. draw an arc of absolute radius 10 in the anti-clockwise direction from the angle 45 to the angle -45.

```
worldstyle "arc 1" {
  move 0 0
  arc -10 45 -45
}
```

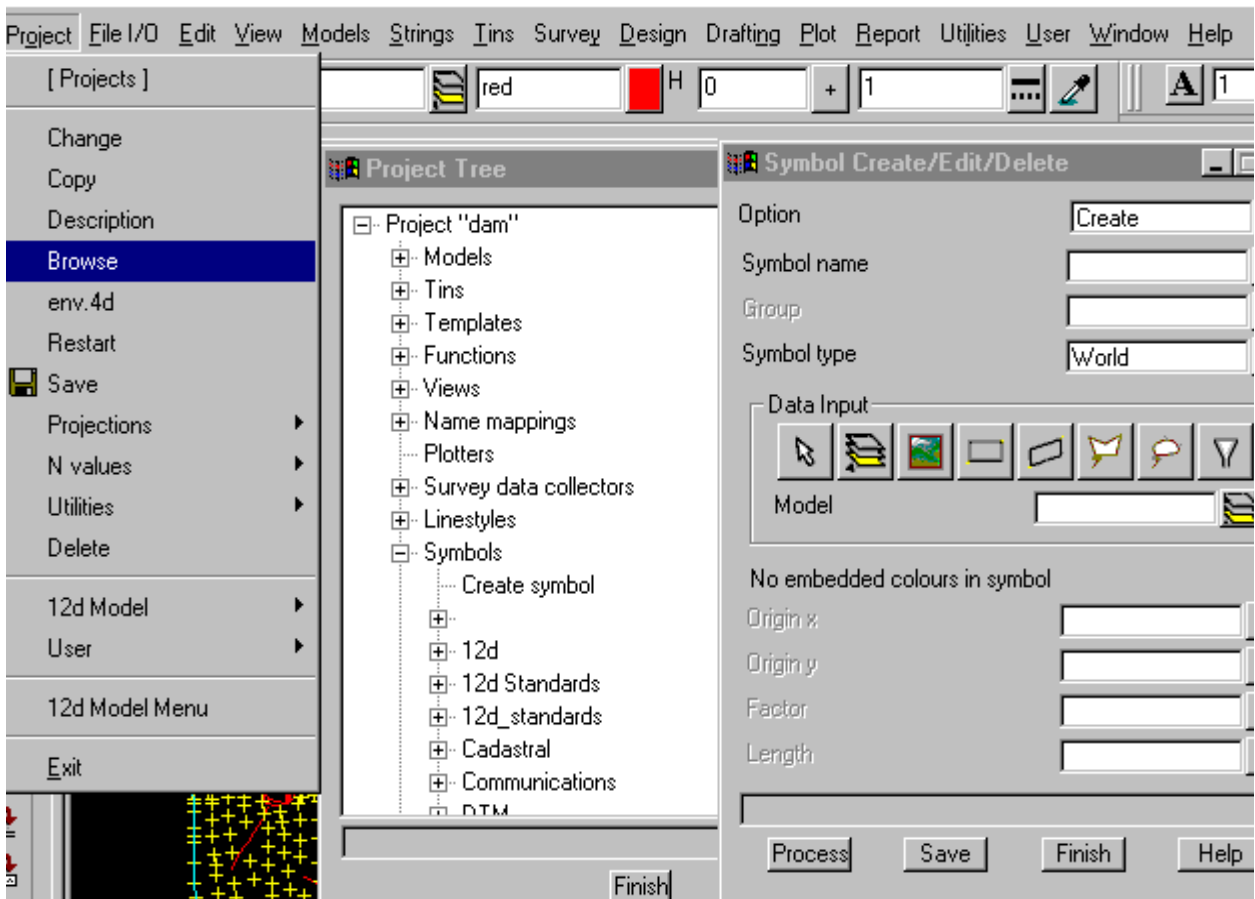

8. top-left justified text with a circle centred on the actual text position

```
linestyle "top-left" {
  group text
  move 0 0
  circle 4
  text "<top left>" 0 10 "top-left"
}
```

Symbols

Users can define their own symbols to draw at vertices of 12d Model strings. The definition of symbols are stored in a file called **symbols.4d**.

Symbols in the file can be created/edited using the **Symbols Create/Edit/Delete** panel which is brought up by double clicking on *Create symbol* in the *Symbols* expansion of the *Project Tree* (see [Symbols](#) in the chapter [Projects](#)) brought up by the **Project=>Browse** option.

The **Symbol Create/Edit/Delete** panel acts as an interactive editor to a text file which contains the symbol definitions.

The user defined symbols can be applied to each vertex of a string. Each symbol can be made up of lines, arcs, circles and text.

A symbol applied to vertices.

The units for the symbol can be in pixels, millimetres or world units. The symbol is called a

paperstyle if the definition of the symbol is given in paper units

worldstyle if the definition of the symbol is given in world units

Defining Symbols

A *symbol* is defined in a (x,y) co-ordinate system as a series of moves, drawn, arcs, circles and text commands.

The bounding box of the line style is the smallest rectangle parallel to the (x,y) axis which contains all the moves, draws, circles and arcs of the line style. Note that moves are included in the bounding box even if a line isn't drawn to the point.

The default **origin of the symbol** is defined to be the midpoint of the bounding box surrounding the symbol. The bounding box includes the points moved to and drawn to, but does not automatically include (0,0). Hence the calculated origin may not be (0,0).

There are **xorigin** and **yorigin** commands to override the default origin of the symbol.

If a **yorigin** is set, then it is used as the y-coordinate of the symbol. If the *xorigin* isn't given, then the *xorigin* is the midpoint of the x-extent of the bounding box of the symbol.

Similarly, if a **xorigin** is set, then it is used as the x-coordinate of the symbol. If the *yorigin* isn't given, then the *yorigin* is the midpoint of the y-extent of the bounding box of the symbol.

The default **length** of the line style is the *horizontal* size of the bounding box.

There is a **length** commands to override the default length of the symbol. The *length* must always be positive but it can be larger or smaller than the symbols calculated horizontal length.

The *origin* and the *length* of the symbol are both used in positioning and sizing the symbol.

Symbol.4d

The definitions for the available symbols are normally stored in a file called **symbols.4d** which is read in each time 12d Model opens an existing project or creates a new project. *Symbol.4d* is searched for in the standard set up paths, or is pointed to by the environment variable

SYMBOLS_4D *filename*

The definition of the symbols will be given in the following section [Symbol Definition](#).

Symbol Definition

The definition of a worldstyle **symbol** of a given name *name* is

```
worldstyle name {
    set_up_commands
    draw_commands
}
```

where the set_up_commands **must** be before the draw_commands.

The linestyle/paper/worldstyle must have a name and if the name includes imbedded spaces, it must be enclosed in double quotes “.”.

The symbol itself is defined inside the braces where there can be zero or more set_up_commands from the list

```
length    value
group     name
factor    value
xorigin   value
yorigin   value
```

followed by zero or more **draw_commands** from the list

```
move      x-value    y-value
draw      x-value    y-value
rmove     dx-value   dy-value
rdraw     dx-value   dy-value
colour    colour_name
circle    radius
arc       radius     start-angle end-angle
text      "text"     angle    height  "justification"
text      "text"     angle    height  "justification" "textstyle"
text      "text"    angle    height  "justification" "textstyle" xfactor slant offset_width offset_height
repeat   num_repeats { repeat_commands repeat_draw_commands }
```

The **repeat** command is a positive integer *num_repeats*

and zero or more repeat_commands from the list

```
xpos      x-value
ypos      y-value
rfactor    value
```

and zero or more repeat_draw_commands where repeat_draw_commands include all the draw_commands except **repeat**.

The **set_up** commands for symbols will now be described followed by the **draw_commands**.

set_up_commands for symbols

group

The **group** is used to associate symbols in pop-up menus.

If the group is not defined, the symbol is placed in a default (blank) group.

If the group name includes imbedded spaces, then it must be enclosed in double quotes “.”.

factor

This command factors up/down the drawing co-ordinates, heights and radii.

xorigin, yorigin

The default **origin of the symbol** is defined to be the midpoint of the bounding box of the line style. The bounding box includes the points moved to and drawn to but does not automatically include (0,0). Hence the calculated origin may not be (0,0).

The **xorigin** and **yorigin** commands are used to override the default origin of the symbol.

length

If length is omitted, then **length** is taken to be the horizontal size of the calculated bounding box of the symbol.

The **length** must always be positive but it can be larger or smaller than the symbols calculated horizontal size.

The origin of the symbol and the length are both used in positioning and sizing of the symbol.

Examples

```
// Floodlight
worldstyle FLOODLIGHT {
  group "Energex"
  mode vertex
  xorigin 0
  yorigin 0
  colour "yellow"
  circle 0.225
  move -.45 0
  draw -0.225 0
  move 0.45 0
  draw 0.225 0
  move 0 -.45
  draw -0.225
  move 0 0.45
  draw 0 0.225
  move -.159 0.159
  draw -0.318 0.318
  move 0.159 0.159
  draw 0.318 0.318
  move 0.159 -0.159
  draw 0.318 -0.318
  move -0.159 -0.159
  draw -0.318 -0.318
  move 0 0.8
  text "FL" 0 0.5 "centre-middle"
}
```

Description of the draw_commands

move *x-value* *y-value*

move the pen from the current pen position to the new position (x-value, y-value).

draw *x-value* *y-value*

draw from the current pen position to the new position (x-value, y-value)

rmove *dx-value* *dy-value*

move relative from the current pen position through the distance (dx-value, dy-value)

rdraw *dx-value* *dy-value*

draw relative from the current pen position through the distance (dx-value, dy-value)

colour *colour-name*

change colour (line styles can contains more than one colour).

If colour is not defined, the symbol is drawn in the colour of the string that the symbol is applied to. If the colour-name includes imbedded spaces, then it must be enclosed within double quotes " ".

circle *radius*

draw a circle of the given radius at the current pen position.

After drawing a circle, the current pen position is left at the centre of the circle.

arc *radius* *start-angle* *end-angle*

draw an arc of the given radius from the start angle to the end angle. A positive radius denotes that the arc is drawn in a clockwise direction, a negative radius means anti-clockwise. Angles are given in degrees, minutes and seconds in the ddd.mmssfff format.

After drawing an arc, the current pen position is left at the centre of the arc.

text *text* *angle* *height* "*justification*"
text *text* *angle* *height* "*justification*" *textstyle*
or

text *text* *angle* *height* "*justification*" *textstyle* *xfactor* *slant* *offset_width* *offset_height*

the characters *text* are drawn at the current pen position with the given angle, height, justification and possibly *textstyle*, *xfactor*, *slant*, *offset_width* and *offset_height*. Angle and slant are given in degrees, minutes and seconds in the ddd.mmssfff format. Slant is between -45 and 45 degrees.

The allowed justifications are

top-left	top-centre	top-right
middle-left	middle-centre	middle-right
bottom-left	bottom-centre	bottom-right

and the value is enclosed inside double quotes (").

After drawing text, the current pen position is left where it was before the text was drawn.

repeat *num_repeats* { *repeat_commands* *repeat_draw_commands* }

The **repeat** command allows the set of *repeat_draw_commands* inside the braces (the repeat-style) to be re-drawn a number of times (*num_repeats*), and with each redraw, the size of the repeat-style is modified.

In the definition of repeat, there can be zero or more *repeat_commands* from the list

<i>xpos</i>	<i>x-value</i>
<i>ypos</i>	<i>y-value</i>
<i>rfactor</i>	<i>value</i>

and zero or `repeat_draw_commands` where `repeat_draw_commands` include all `draw_commands` except `repeat`.

Unlike `symbol`, the `repeat-style` is defined in terms of a local origin at (0,0). The `repeat-style` is actually drawn with this origin at the position given by the values of **xpos** and **ypos**.

The `repeat-style` is drawn *num_repeats* times and on each redraw, the distances, heights and radii are factored by the amount

$$\text{repeat_factor} = (1 - i * \text{rfactor})$$

where $i = 0, 1, \dots, \text{num_repeats} - 1$

If `rfactor` is not specified, it is given the default value of $1/\text{num_repeats}$. The factor is then

$$\text{repeat_factor} = (\text{num_repeats} - i) / \text{num_repeats}$$

where $i = 0, 1, \dots, \text{num_repeats} - 1$

Examples of the Repeat Command

1. To produce circles of radius 10,9,8,...1 about the origin.

```
repeat 10 { circle 10 }
```
2. To produce circles of radius 10,9.5,9,...5.5 about the origin

```
repeat 10 { rfactor 0.05 circle 10 }
```

More Examples of World Styles

1. draw a circle of radius 20. The origin of the style is (0,0)

```
worldstyle "circle" {
  move 0 0
  circle 20
}
```
2. draw a circle of radius 20. The origin of the style is (100,100)

```
worldstyle "circle" {
  move 100 100
  circle 20
}
```
3. draw a circle of radius 20. The origin of the style is (0,0)

```
worldstyle "circle" {
  xorigin 0
  yorigin 0
  move 100 100
  circle 20
}
```
4. draw concentric circles of centre (0,0) inside a box

```
worldstyle "dot" {
  xorigin 0
  yorigin 0
  move -5 -5
  draw -5 25
  draw 25 25
  draw 25 -5
  draw -5 -5
}
```

```
repeat 10 {  
  move 0 0  
  circle 10  
}
```

5. draw an arc of absolute radius 10 in the clockwise direction from the angle 45 to the angle -45.

```
worldstyle "arc" {  
  move 0 0  
  arc 10 45 -45  
}
```

6. draw an arc of absolute radius 10 in the anti-clockwise direction from the angle 45 to the angle -45.

```
worldstyle "arc 1" {  
  move 0 0  
  arc -10 45 -45  
}
```

7. top-left justified text with a circle centred on the actual text position

```
worldstyle "top-left" {  
  group text  
  move 0 0  
  circle 4  
  text "<top left>" 0 10 "top-left"  
}
```

Textstyles and Fonts

Users can define any number of textstyles and specify how they are mapped to AutoCAD style names or Microstation (DGN, Intergraph) font numbers.

There is one fixed spaced textstyle called "1" (the default) which is identical to the textstyle used in earlier versions of 12d Model.

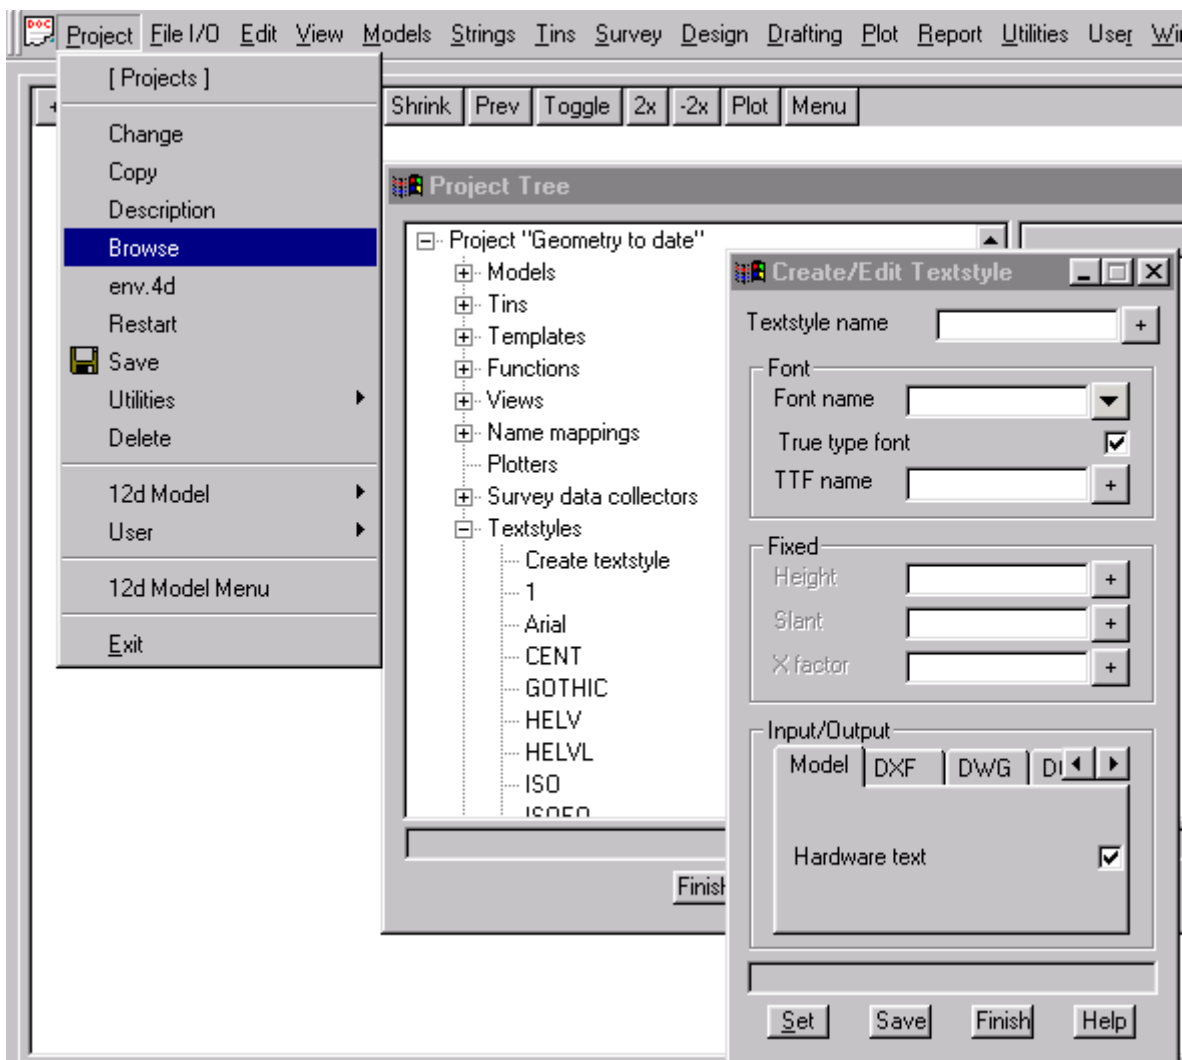

Each textstyle has a font definition (or font 1 as the default) which defines the stroking for each character in the font. True Type fonts are supported and most AutoCAD SHP files can be used to define the fonts.

Textstyles using True Type fonts or shape file which do not use arcs in their font definition, can also have a slant and a x_factor.

Textstyles can be used in text strings, 4d strings, super strings, linestyles, plots and user defined title blocks.

Textstyles Definitions File

Textstyles can be created/edited using the **Create/Edit Textstyle** panel which is brought up by double clicking on *Create textstyle* in the *Textstyles* expansion of the *Project Tree* (see [Textstyles](#) in the chapter [Projects](#)) brought up by the **Project=>Browse** option.

The **Create/Edit Textstyle** panel acts as an interactive editor to a text file which contains the textstyle definitions. The full description of the text file will now be given.

The definitions for the available textstyles are normally stored in a file called **textstyl.4d** which is read in each time 12d Model opens an existing project or created a new project. *Textstyl.4d* is searched for in the standard set up paths, or is pointed to by the environment variable

TEXTSTYLES_4D filename

Inside textstyl.4d, a textstyle of a given name is defined by

```
textstyle  textstyle_name  {  
                                textstyle commands  
}
```

Each textstyle must have a **name** and if the name includes imbedded spaces, it must be enclosed in double quotes "".

The textstyle itself is defined inside the braces where there can be zero or textstyle commands from the list

	font_name	text
or	hardware_text_dxf stroked_text_dxf	
	output_name_dxf	text
	input_name_dxf	text
or	hardware_text_dgn stroked_text_dgn	
	output_name_dgn	integer
	input_name_dgn	integer
or	hardware_text_model stroked_text_model	
or	stroked_text hardware_text	
	fixed_height	value
	variable_height	
	fixed_slant	value
	variable_slant	
	fixed_xfactor	value
	variable_xfactor	

The description of each command is

font_name text

Name of the font to be used to draw the characters of the textstyle. The stroking of the font characters can be defined in the file fonts.4d. If no font_name is given, or the stroking is not given in the font file, then the standard 12d Model font is used ("1").

hardware_text_dxf or **stroked_text_dxf**

If stroked_text_dxf appears, then any text in this textstyle written out to dxf will be stroked - that is, broken into straights, lines and curves.

If hardware_text_dxf is in the file, then any text in this textstyle sent to dxf will be given as actual dxf text (not stroked).

output_name_dxf dxf_style_name

If text is sent to dxf as hardware text, the dxf style of the text will be dxf_style_name.

input_name_dxf dxf_style_name

When reading in dxf files, any text of style dxf_style_name will be given the 12d Model textstyle name textstyle_name.

The commands for reading and writing dgn files are similar to those for dxf except that dgn has font numbers.

hardware_text_dgn or **software_text_dgn**

output_name_dgn dgn_font_number

input_name_dgn dgn_font_number

hardware_text_model or **stroked_text_model**

Similarly, when writing out to a 12d Model model. For hardware_text_model, text will be sent to text with the same textstyle.

stroked_text or **hardware_text**

If stroked_text appears in the definition and there is no other hardware_text flag set, then the text will be stroked - that is, broken into straights, lines and curves.

If hardware_text appears in the definition, then the text is written out as hardware text.

By default, the height, slant and xfactor for the text can be set when text is defined however it is possible to set each of height, slant and xfactor to a fixed value.

or **fixed_height** value
 variable_height

If fixed_height and a value are specified, then all text in this textstyle is drawn at a fixed height. If fixed_height is missing or variable_height (the default) appears, then each text string in the textstyle has its own height.

or **fixed_slant** value
 variable_slant

If fixed_slant and a value are specified, then all text in this textstyle is drawn at a fixed slant. If fixed_slant is missing or variable_slant (the default) appears, then each text string in the textstyle has its own slant. Slant is given in degrees, minutes and seconds in the ddd.mmssfff format and must be between -45 and 45 degrees.

or **fixed_xfactor** value
 variable_xfactor

If fixed_xfactor and a value are specified, then all text in this textstyle is drawn at a fixed xfactor. If fixed_xfactor is missing or variable_xfactor (the default) appears, then each text string in the textstyle has its own xfactor.

Example of a Textstyle File

```
textstyle "1" {                      // DGN FONT 0                      ACAD FONT STANDARD
    output_name_dxf                  STANDARD
    input_name_dxf                  STANDARD
    input_name_dgn                  "0"
    output_name_dgn                  "0"
    stroked_text
    hardware_text_model
    hardware_text_dgn
    hardware_text_dxf
}
```

```
textstyle ISO {           // DGN FONT 1           ACAD FONT ISO

    font_name             ISO
    input_name_dxf         ISO
    output_name_dxf        ISO
    input_name_dgn         "1"
    output_name_dgn        "1"
    stroked_text
    hardware_text_model
    hardware_text_dgn
    hardware_text_dxf
}

textstyle MONO {          // DGN FONT 2           ACAD FONT MONO

    font_name             MONO
    output_name_dxf        MONOTXT
    input_name_dxf         MONOTXT
    input_name_dgn         "2"
    output_name_dgn        "2"
    stroked_text
    hardware_text_model
    hardware_text_dgn
    hardware_text_dxf
}

textstyle SCRIPT {        // DGN FONT 3           ACAD FONT SCRIPTC

    font_name             SCRIPT
    output_name_dxf        SCRIPTC
    input_name_dxf         SRCIPTC
    input_name_dgn         "3"
    output_name_dgn        "3"
    stroked_text
    hardware_text_model
    hardware_text_dgn
    hardware_text_dxf
}
```

Please see the next section [Fonts Definitions File](#) for a description of the fonts file.

Fonts Definitions File

The definition of any fonts referred to in the **textstyl.4d** file are given in the **fonts.4d** file which is searched for in the standard 12d Model set up paths, or is pointed to by the environment variable

```

    FONTS_4D           filename
```

The stroking for each character in the font (which is used when drawing the text on the screen and when required, stroking the text for outputs and plots) can be given in a separate file in the Autocad shape file format.

Inside **fonts.4d**, a font of a given name is defined by

```
font    font_name {
        font commands
    }
```

Each font must have a name and if the name includes imbedded spaces, it must be enclosed in

double quotes "".

The font itself is defined inside the braces where there can be zero or more font commands from the list

```

        stroke_file      filename
        proportional
or       fixed

```

The description of each command is

stroke_file stroke_file_name

The name of the file containing the stroking for each character in the font in Autocad ascii shape file format (.shp). The stroke_file_name is searched for in the standard 12d Model set up paths.

If the stroking for a character is not defined, the standard 12d Model character is used instead.

proportional or **fixed**

If a stroke file is not given, then the font could be a fixed (mono) or proportional font.

Example of a Font File

```

font  ISO {
        proportional
        stroke_file "ISO"
}
font  GOTHIC {
        proportional
        stroke_file "GOTHICE.SHP"
}
font  MONO {
        proportional
        stroke_file "MONOTXT.SHP"
}

```

To return to the beginning of this appendix, click on [Line styles, Symbols and Textstyles](#).

L Functions Keys, Menus, Toolbars

This appendix contains information about how user defined function keys, menus and toolbars are defined and used in *12d Model*.

Go to [User Defined Function Keys](#)
[User Defined Menus](#)
[User Defined Toolbars](#)

For documentation on the first item, continue to the next section [User Defined Function Keys](#).

User Defined Function Keys

The user can define function keys (with possible modifiers) to be used to

- (a) bring up most **12d** Model menus or panels
- (b) toggle certain snaps on or off.
- (c) start some geometry snaps
- (d) read a layout file
- (e) execute a batch file or a program (system call).
- (f) run users **12d** Model macros

The function key definitions are given in the file

userkeys.4d

which is searched for in the standard set up areas (local, USER_4D, user, set_ups etc.) or is pointed to by the environment variable

FUNCTION_KEYS_4D file // function key definitions

The format of the function_keys file is simply a list of function key definitions with only one per line. Blank lines in the file are ignored and anything on a line after a // is a comment.

The function key definition is

MODIFIERS FUNCTION_KEY OPERATION

where MODIFIERS can be totally missing or any combination of

 shift
 control
or alt

FUNCTION_KEY is one of

f1, f2,...f12 (**f7 should be avoided since it is used in 12d Model for typed input**,
f1 & f10 should be avoided since they are reserved by Windows NT)

and OPERATION is one of

menu	menu_name	// raise a menu
panel	panel_name	// raise a panel
snap	toggle_snap	// list of toggle_snaps given below
snap	cogo_snap	// list of cogo_snaps given below

```

                                cogog_command           // list of cogog_commands given below
                                layout                   layout_file_name // run a screen layout file
                                system                   batch_file         // run a batch file
                                system                   program             // run a program
or for macros
                                macro      options      user_macro_name      macro_arguments
where the macros options are:
```

```

                                -no_console             // don't display macro console
                                -close_on_exit           // remove console when macro terminates
                                -buttons                 // have buttons for finish, restart and quit on console
                                -allow_defaults          // allow default answers for console questions
```

The default when there are no macro options is to run the macro with a console but without buttons, and to leave the macro console on the screen when the macro terminates.

Menus and Panels

Menus and panels can be programmed by functions keys by simply giving the name of the menu and panel after the menu and panel command respectively.

For example,

```

                                f5      panel      "String Inquire"
                                f6      menu      "String Create"
```

View Menus and Panels

Menus and panels for views can be programmed by functions keys by substituting the text \$PLAN_VIEW, \$SECTION_VIEW or \$PERSPECTIVE_VIEW in place of the view name in the panel name or menu name.

For example,

```

                                f9      panel      "Plan Plot $PLAN_VIEW".
```

A panel for each view type can be programmed for the same modifier and function key combination. If the cursor is over the appropriate view type when the function key is selected, then the panel is fired up.

For example, the three definitions for f5

```

                                f5      panel      "Section Plot $SECTION_VIEW"
                                f5      panel      "Plan Plot $PLAN_VIEW"
                                f5      panel      "Perspective Plot $PERSPECTIVE_VIEW"
```

means that a panel will come up when f5 is selected over any of the three view types.

View Toggle Menus

The **toggle menus** available on each view can be set to a function key by

```

MODIFIERS  FUNCTION_KEY  menu      "Toggle $PLAN_VIEW"
MODIFIERS  FUNCTION_KEY  menu      "Toggle $SECTION_VIEW"
MODIFIERS  FUNCTION_KEY  menu      "Toggle $PERSPECTIVE_VIEW"
```

As for the view menus, the cursor must be over the appropriate view type when the function key is selected.

For example,

```

                                shift f8 menu "Toggle $PLAN_VIEW"
```

brings up the plan view toggle menu if shift f8 is selected when in a plan view.

Available Snaps to be Toggled

```

                                toggle_point_snap
                                toggle_line_snap
```

toggle_grid_snap
 toggle_cursor_snap
 toggle_tin_snap
 toggle_input_height_snap
 toggle_show_information

For example,

control f2 toggle_point_snap

Available Cogo Snaps

snap create_edit
 snap line_create_edit
 snap tangent_items_edit
 snap fillet_3_points_edit
 snap fillet_item_item_cp_edit
 snap fillet_item_item_radius_cp_edit
 snap locate_divide_edit
 snap locate_divide_distance_edit
 snap parallel_edit
 snap intersect_edit
 snap intersect_offset_edit
 snap bearings_intersect_edit
 snap between_points_edit
 snap locate_edit
 snap locate_chainage_edit
 snap locate_offset_edit
 snap locate_deflection_edit
 snap locate_drop_perpendicular_edit
 snap locate_projection_edit
 snap locate_two_point_distances_edit

For example,

shift f1 snap locate_chainage_edit

Available Cogo Commands

All the new cogo commands can be activated by a function key.

create_edit
 line_create_edit
 tangent_items_edit
 fillet_3_points_edit
 fillet_item_item_cp_edit
 fillet_item_item_radius_cp_edit
 locate_divide_edit
 locate_divide_distance_edit
 parallel_edit
 intersect_edit
 intersect_offset_edit
 bearings_intersect_edit
 between_points_edit
 locate_edit
 locate_chainage_edit
 locate_offset_edit
 locate_deflection_edit
 locate_drop_perpendicular_edit
 locate_projection_edit
 locate_two_point_distances_edit

For example,

f2 between_points_edit

Layout Files

Layout files can be called up using the **layout** command.
For example,

```
f8          layout      "/temp/contours.slf"
```

System Calls

Programs and batch files can be called up using the **system** command. The directories defined by the environment variables \$LIB_4D and \$USER_4D are included in the PATH environment variables so that any batch files or executables in these areas will be accessible without including any path name in the system call.

For example,

```
f4          system      special.exe      // run the program special.exe
shift f4    system      batch.bat        // run a batch file
control f4  system      "start cmd /k dir" // do a dir in a command shell
```

Macros

User macros can be run and the macros brought up with or without buttons, and with leaving or removing the macro console when the macro has finished.

The macro command structure and options are:

```
macro      options      user_macro_name      macro_arguments
```

where the macros options are:

```
-no_console      // don't display macro console
-close_on_exit   // remove console when macro terminates
-buttons         // have buttons for finish, restart and quit on console
-allow_defaults  // allow default answers for console questions
```

The default when there are no macro options is to run the macro with a console but without buttons, and to leave the macro console on the screen when the macro terminates.

For example,

```
f8    macro -no_console -close_on_exit"/area/drape_align.4do"
f9    macro  -buttons"/games/lots.4do"
```

For compatibility with earlier versions of 12d Model, the following macro commands are also supported:

```
macro          user_macro_name      // run macro without buttons,
                                         // leave console panel on exit
macro_2        user_macro_name      // run macro without buttons,
                                         // remove console panel on exit
macro_with_buttons user_macro_name  // run macro with buttons,
                                         // leave console panel on exit
macro_with_buttons_2 user_macro_name // run macro with buttons,
                                         // remove console panel on exit
```

\$LIB and \$USER_LIB

The variable \$LIB and \$USER_LIB can be used as part of the layout_file_name and user_macro_name to pick up files from either the library or user library.

For example,

```
f7          macro      "$LIB/drape_align.4do"
f8          macro      "$USER_LIB/lots.4do"
f9          layout      "$LIB/contours.slf"
```

Note - if \$LIB_4D is not defined, then 12dmodel/6.00/library is used. If \$USER_LIB_4D is not

defined, then 12dmodel/6.00/user_lib is used

Example of a User Function Key File

```
// File to define function key usage
// Note: f1, f6 & f10 are reserved by Windows NT
// f7 is reserved by 4D Solutions for typed input
// Available function key modifiers are

//          shift control alt

// Note: some alt key combinations are reserved by Windows NT
// Some sample lines may be

// f5          toggle_point_snap
// shift f5     toggle_line_snap
// control shift f7 toggle_input_height_snap

// Note that all function key modifiers must come before the function key itself.
// -----

// snaps

f3    toggle_point_snap
f4    toggle_line_snap
f5    toggle_grid_snap
f5    toggle_cursor_snap
f8    toggle_input_height_snap
// snaps cog

f9    snap intersect_offset_edit
f11   snap locate_chainage_edit
f12   snap locate_drop_perpendicular_edit

// panels

f2    panel "String Inquire"

shift f1 panel "Edit String"
shift f2 panel "String Delete"
shift f3 panel "Clean Model"
shift f4 panel "Delete Model"
shift f5 panel "Strings Edit Ops"
shift f6 panel "Points Edit Ops"
shift f7 panel "String Attributes"
shift f8 panel "Toggle $PLAN_VIEW"

// layout files

control f4 layout "$LIB/tri_contour_clean.slf"

// user macros

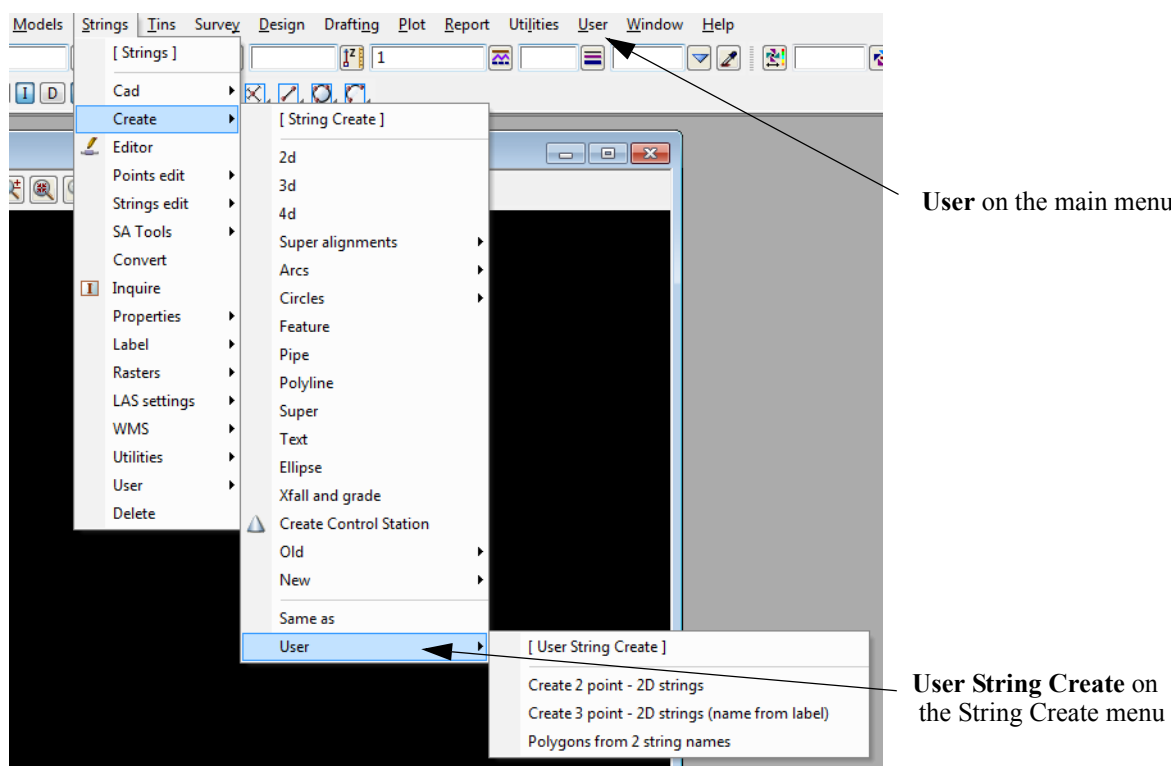

control f5 macro -no_console -close_on_exit "$LIB/Culd.4do"

// -----
```

Please continue to the next section [User Defined Menus](#).

User Defined Menus

To help customise **12d Model**, there is a pull down menu **User** on the Main menu and **User** menus on each of the pull down menus on the Main menu, and some other Menus.

The **User** menus can run **12d Model** macros, external programs, chains, and bring up **12d Model** screen layout files, panels and menus.

User menus can have walk-right menus, and any walk-right menus can have further walk-right menus so **User** menus can be used to build sophisticated tailored additions to **12d Model**. Each of the **User Defined** menus are also floating (tear away) menus just like standard **12d Model** menus.

All the **User** menus are defined in the two files: *Usermenu.4d*, which is created by the user, and *Xtramenu.4d*, which is supplied by **12d Solutions**.

When displayed, each **User** menu is divided into two sections with menu options supplied by **12d Solutions** in the file *Xtramenu.4d* on the top, and any options supplied by the user (in the file *Usermenu.4d*) underneath.

The default name for the **User Defined** Menu definition file is

usermenu.4d

which is searched for in the standard set up areas (local, USER_4D, user, set_ups etc.) or set by the environment variable

USER_OPTIONS_4D file // Customers User menu definition

The default name for the **12D Solutions** definition file which includes some macro for **User** is

xtramenu.4d

which is also searched for in the standard set up areas (local, USER_4D, user, set_ups etc.) or set by the environment variable

EXTRA_OPTIONS_4D file // 12D Solutions User menu definitions

The format for the User Defined Menu's file s given in the next section [Full Definition of User Menus](#).

Important Note

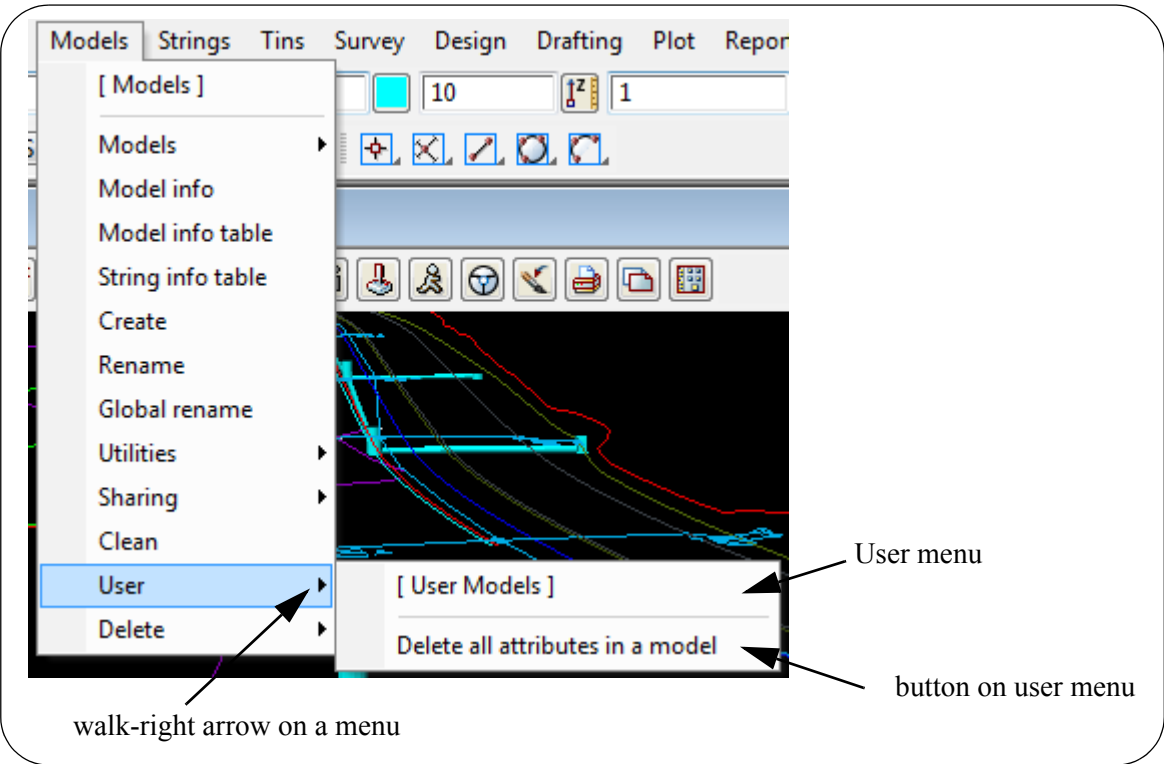

The file *xtramenu.4d* is for use by **12d Solutions** only. Please do not modify it because it may be over written in future updates. The file *usermenu.4d* is for Customer use.

Go to [Full Definition of User Menus](#)
 [Using \\$LIB and \\$USER_LIB in User Menus](#)
 [Placing User Defined Menus on User and Other 12d Menus](#)
 [Example of a User Defined Menu](#)

Full Definition of User Menu

The **User Defined Menus** are made up of *buttons* which have text on them and when the left hand mouse button (LB) is pushed down and released on a button, a *command* is executed.

A button can also have a walk-right menu which appears when the left hand mouse button (LB) is moved over the arrow on the right had side of the button. Walk-right menus can have walk-right menus.

The **text** for each button in the **User** menus, plus the action taken when the button is selected, is user specified. Any of the buttons can include further walk-right menus.

When a button is **selected**, the action can be to

- (a) run a 12d Model macro
- (a) run a 12d Model chain
- (b) bring up a 12d Model menu or User Defined menu
- (c) bring up a 12d Model panel
- (d) read a screen layout file
- (e) execute a batch file or program (system call)

In the *Usermenu.4d* file, a menu is defined by:

```
Menu menu_name {  
    button_1  
    button_2  
    ...  
    button_n  
}
```

where a button can include one or both of the keywords *Command* and *Walk_Right*, and the syntax for a button is

```
Button button_name {
    Walk_Right          menu_name_1
and/or    Command      command_name
}
```

The *text* displayed on the button is ***button_name*** and the definitions of the *Walk_Right* and *Command* commands are:

Walk_Right Menu for Buttons

The ***Walk_Right*** keyword specifies that there *is* a walk-right menu for the button and gives the *name* of the menu that is displayed when LB is moved over the walk-right arrow on the button.

The *Walk_Right* command consists of the word *Walk_Right* followed by one or more spaces and then the name of the menu that is displayed when over the walk-right arrow.

```
Walk_Right          menu_name
```

where *menu_name* is the name of another menu **defined elsewhere** in the *usermenu.4d* file.

When the *Walk_Right* keyword exists, a walk-right arrow is created on the button.

If there is no *Walk_Right* keyword, then there is no walk right arrow on the button.

A *Walk_Right* line is optional.

NOTE - walk-right menus *can* contain walk-right menus.

Commands for Buttons

The ***Command*** keyword defines what action occurs if **LB is clicked on the button**.

The *Command* consists of the word *Command* followed by one or more spaces and then the name of the command and any arguments it requires.

```
Command "command_name command_arguments"
```

The ***command_name*** and ***command_arguments*** can do any of:

(a) Run a User Defined or 12d Supplied **12d** Model Macro

```
Command "macro macro_options user_macro_name macro_parameters" // run macro
```

where the *macros_options* are:

```
-no_console          // don't display macro console
-close_on_exit       // remove console when macro terminates
-buttons             // have buttons for finish, restart and quit on console
-allow_defaults      // allow default answers for console questions
```

The default when there are no macro options is to run the macro with a console but without buttons, and to leave the macro console on the screen when the macro terminates.

For example

```
Button "Write Levels" {
    Command "macro Tival.4do"
}
Button "ADAC - show attributed/not attributed" {
    Command "macro -no_console -close_on_exit Adac_show_panel.4do"
```

```
}
```

(b) Run a chain

Command "**chain** chain_file_name"

For example

```
Button "Survey to ADAC 41 chain" {  
    Command "chain Survey_to_adac_data_41.chain"  
}
```

(c) Bring up a 12d Model menu and/or a User Defined Menu

Command "12d_model_menu_name"

or

Command "user_defined_menu_name"

The *12d_model_menu_name* is simply the name on the top of the **12d Model** menu.

The *user_defined_menu_name* is the name of a User Defined menu that is defined further down in the *usermenu.4d* file.

For example, for the menu called "Model Utilities", the

```
Button "Bring up the Model Utilities menu" {  
    Command "Model Utilities"  
}
```

Notice that for a menu, only the menu name in quotes follows the keyword *Command*.

Note: - this works because all the names must be unique amongst the **12d Model** menus, **12d Model** panels and *User Defined* menus.

A menu can occur as a *Walk_Right* menu and/or as a *Command*.

(d) Bring up a 12d Model panel

Command "12d_model_panel_name"

Every **12d Model** menu and panel has a unique name and the *12d_model_panel_name* is simply the name on the top of the panel.

For example, for the menu called "Test Helmert 2d (Advanced) panel", the

```
Button "Bring up a Helmert panel" {  
    Command "Test Helmert 2d (Advanced)"  
}
```

Notice that for a panel, only the panel name in quotes follows the keyword *Command*.

Note: - this works because all the names must be unique amongst the **12d Model** menus, **12d Model** panels and *User Defined* menus.

(e) Run a User Defined screen layout file

Command "**layout** layout_file_name"

For example

```
Button "Generate ADAC Tree Spreadsheet" {  
    Command "layout ADAC_Tree_Report.slx"  
}
```

(f) Execute a batch file or program

Command "**system** program_or_batch_file_name"

A Command line is optional.

Notes

1. A button can have both a **Walk_Right** and a **Command** defined for it.
2. If there is only a *Walk_Right* menu and no *Command*, clicking on the button will bring up the **Walk_Right** menu.
3. Both *Walk_Right* and *Command* can be left out.

For example

```
Button "-----" {
}
Button "" {
}
```

will create a button with the text "-----" on it and a button with no text on it.

4. in the *usermenu.4d* file, blank lines are ignored and anything on a line after a *//* is a comment

Continue to the next section [Using \\$LIB and \\$USER_LIB in User Menus](#) or return to [User Defined Menus](#).

Using \$LIB and \$USER_LIB in User Menus

The variable \$LIB and \$USER_LIB can be used in Commands as part of the user_macro_name, chain_file_name, layout_file_name and programe_or_batch_file_name to pick up files from either the *12d Library* or the *User library*.

Note

If \$LIB_4D is not defined, then 12dmodel/version_number.00/library is used.

If \$USER_LIB_4D is not defined, then 12dmodel/version_number.00/user_lib is used

For example, the definition of a menu called "Lots" could be:

```
Menu "Lots" {  
  Button "Create lots" {                                // button called "Create lots" which  
    Command "macro -close_on_exit $USER_LIB/subdiv.4do" // fires up a 12d Model macro  
  }  
  Button "Roads" {                                       // button with walk-right menu "Roads" and layout file  
    Walk_Right "Roads"                                   // walk-right menu "Roads"  
    Command "layout $USER_LIB/road.slx"                 // button invokes a layout file if selected  
  }  
}
```

Continue to the next section [Placing User Defined Menus on User and Other 12d Menus](#) or return to [User Defined Menus](#).

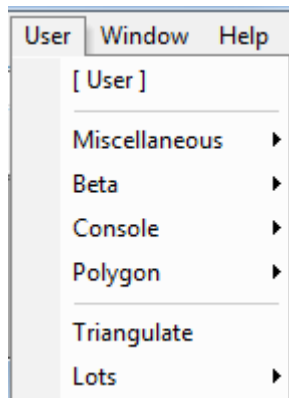

Placing User Defined Menus on User and Other 12d Menus

User Defined Buttons on Main User Menu

The place buttons or menus in the bottom of the **User** menu on the Main menu, put the buttons in a menu called **User** in the `usermenu.4d` file.

For example

```
Menu "User" {
  Button "Triangulate" {           // button called Triangulate which brings up
    Command "Triangulate a View"   // the "Triangulate a View" panel
  }
  Button "Lots" {                 // button called Lots with its
    Walk_Right "Lots"             // own walk-right menu called Lots
    Command "Triangulate a View"   // plus clicking on the button brings up the
  }                               // the "Triangulate a View" pane
}
```

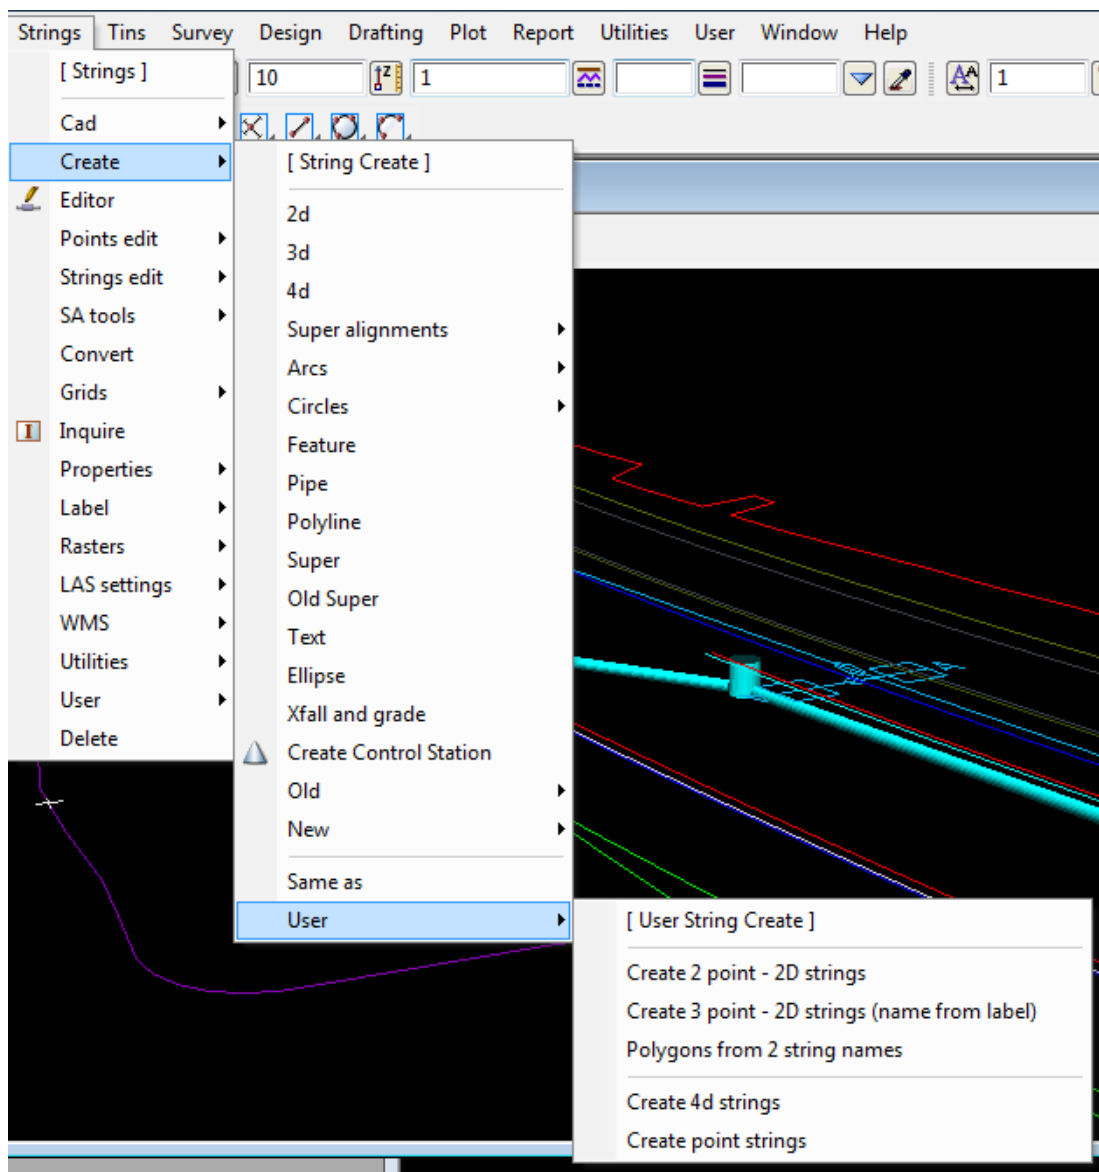

User Defined Menus on Other 12d Menus

It is also possible to define a **User** submenu on any **12d Model** menus or submenu.

In **12d Model**, all menus and sub-menus on the **Main** menu have a unique name. So a **User** menu is defined for any of them by simply having a menu called "User menu_name" in the `usermenu.4d` file.

For example, the menu for the option *Strings=>Create* is called **String Create** (String not Strings) so a **User** menu for *Strings=>Create* would be called "User String Create":

```
Menu "User String Create" {
  Button "Create 4d strings" {
    Command "macro -close_on_exit $USER_LIB/ref_points.4do"
  }
  Button "Create point strings" {
    Command "macro -close_on_exit $USER_LIB/x_sects.4do"
  }
}
```

Names for User Defined Menus

Apart from the names of the special User menus just mentioned, all other menu names in *usermenu.4d* are user defined so they can be easily used in user defined walk-right menus.

And menu referred to in the file *usermenu.4d* that is not one of the special *User menus*, ***must be must be defined*** somewhere in the *usermenu.4d* file.

And remember, all the names must be unique amongst the **12d Model** menus, **12d Model** panels, special User menu and *user named User Defined* menus.

Continue to the next section [Example of a User Defined Menu](#) or return to [User Defined Menus](#).

Example of a User Defined Menu

// the definition of buttons to go on the Main menu option "User"

```
Menu "User" {                                     // User menu on Main menu
  Button "Triangulate" {                           // button called Triangulate which brings up
    Command "Triangulate a View"                   // the "Triangulate a View" panel
  }
  Button "Lots" {                                  // button called Lots with its
    Walk_Right "Lots"                              // own walk-right menu called Lots
  }
  Button "Roads" {                                 // button with walk-right menu "Roads"
    Walk_Right "Roads"
    Command "layout $LIB/road.slf"                 // button invokes a layout file if selected
  }
}
```

// the definition of the walk-right menu Lots

```
Menu "Lots" {
  Button "Create lots" {
    Command "macro $LIB/subdiv9.4do"
  }
  Button "Label lots" {
    Command "macro $LIB/subnum3.4do"
  }
  Button "Write Lot Levels" {
    Command "macro $LIB/Tinval.4do"
  }
}
```

// the definition of the walk-right menu Roads

```
Menu "Roads" {
  Button "Roundabout" {
    Command "macro $LIB/Round.4do"
  }
  Button "Culdesac bulb" {
    Command "macro $LIB/Culd.4do"
  }
  Button "Drape alignment string" {
    Command "macro $LIB/Drape_al.4do"
  }
  Button "Create Table drain" {
    Command "macro $LIB/Table_dr.4do"
  }
}
```

// the definition of User on the Main menu option Strings=>Create"

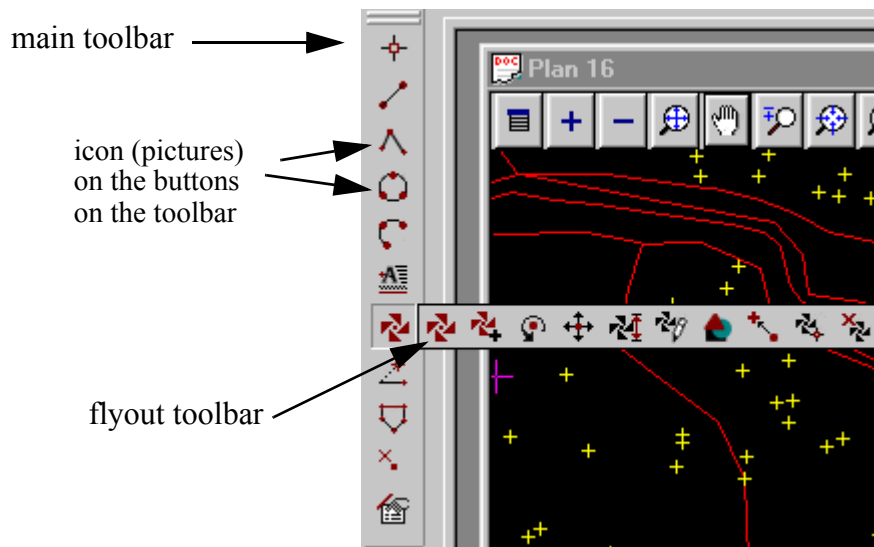

```
Menu "User String Create" {                       // User menu on option Strings=>Create
  Button "Create ref points" {
    Command "macro -close_on_exit $LIB/ref_points.4do"
  }
  Button "Create X-sections" {
    Command "macro -close_on_exit $LIB/x-Sects.4do"
  }
}
```

Continue to the next section [User Defined Toolbars](#) or return to [User Defined Menus](#).

User Defined Toolbars

A **toolbar** is made up of buttons which can have a picture on them (icons) and when the left hand mouse button (LB) is pushed down and released on the button, a command is executed.

A button can also have a *flyout* toolbar which appears when the left hand mouse button (LB) is held down on the button (note that there can only be one level of flyouts).

The definitions for *toolbars* in 12d Model are stored in a file called *toolbars.4d*. When 12d Model is installed, *toolbars.4d* is installed in the 12d Model folder *Set_Ups*.

To customise 12d Model toolbars, a user can modify *toolbars.4d* and save the modified version in the folder *Users*.

The icon for each button on a toolbar, plus the action taken when the button is selected is user specified. A button can include a fly-out toolbar but flyouts can only be to one level (i.e. no flyouts on flyouts).

When a button is **selected**, the action can be to

- (a) run a 12d Model macro
- (b) bring up a 12d Model menu
- (c) bring up a 12d Model panel
- (d) read a layout file
- (e) execute a batch file or program (system call)

When 12d Model starts up, any toolbars defined in *toolbars.4d* that are *not* called as flyouts by another toolbar in *toolbars.4d*, are displayed in the *main toolbar* on the left hand side of the 12d Model screen.

For 12d Model V6.0, toolbars can be moved around but the new positions are not saved with the project. Also there is no way within 12d Model to select which toolbars are used for a project - all the ones defined in *toolbars.4d* are used whenever a new or existing project is loaded into 12d Model V6.0.

Full Definition of Toolbars

The definition for **Toolbars** is given in a file called

Toolbars.4d

which is searched for in the standard set up areas (local, USER_4D, user, set_ups etc.) or set by the environment variable

```
TOOLBARS_4D                                file           // Toolbars definition
```

In the *toolbars.4d* file, a **toolbar** is defined by:

```
Toolbar toolbar_name {  
    button_1  
    button_2  
    ...  
    button_n  
}
```

where a button can include none or more the commands *Icon*, *Command* and *Flyout*, and the syntax for button is:

```
Button button_name {  
    Icon      icon_name_1  
    Command   command_name_1  
    Flyout    toolbar_name_1           // only used if a flyout toolbar is required  
}
```

The definitions of the *Icon*, *Command* and *Flyout* commands are:

Icons for Toolbars

The **Icon** command defines the bitmap that is displayed for the button in the toolbar. The format of the bitmap is a bmp file (.bmp) of size 16x16. The *Icon* command consists of the word *Icon* followed by one or more spaces and then the name of the bitmap, *icon_name*.

```
Icon icon_name
```

The *icon_name* can include a pathname but if no pathname is present, the bitmap is searched for in the folder *Images* under the folders *User* or *Set_Ups*.

If the *Icon* command is missing then a default *Icon* command is used with the *icon_name* **button_name.bmp**

```
Icon button_name.bmp
```

Command for Toolbars

The **Command** command defines what action occurs if LB is clicked on the button. The *Command* command consists of the word *Command* followed by one or more spaces and then the name of the command and any arguments it requires.

```
Command command_name
```

The Commands are the same as those for a User Defined menu. See [Commands for Buttons](#)

If the *Command* command is missing then a default *Command* is used with the command name **button_name** with no arguments

```
Command button_name
```

Flyout for Toolbars

The ***Flyout*** command defines what toolbar is displayed when LB is help down on the button. The *Flyout* command consists of the word *Flyout* followed by one or more spaces and then the name of the toolbar that is displayed.

Flyout *flyout_toolbar_name*

where *flyout_toolbar_name* is the name of another toolbar defined elsewhere in the toolbars file.

When the *Flyout* command exists, *Icon* and *Command* are not required and if they are present, are ignored.

The icon on the *Flyout* button is the *Icon* from the first button in the flyout toolbar.

The command executed if LB is pressed and released on the *Flyout* button is the *Command* from the first button in the flyout toolbar.

NOTE - flyouts *can not* be nested so the toolbar *flyout_toolbar_name* can not contain a *Flyout* command.

NOTE - when 12d Model starts up, any toolbars defined in *toolbars.4d* that are *not* called as flyouts by another toolbar in *toolbars.4d*, are displayed in the *main toolbar* on the left hand side of the 12d Model screen.

Example of a User Defined Toolbar

```
// -----
// WARNING: you cannot have the same command using different icons
// ALSO: when using a flyout, the Command & Icon are ignored
//      and the details are taken from the first button
//      on the flyout
// -----

Toolbar "Cad" {
  Button "Points" {
    Command "Create Point"           // this is ignore since it is a flyout
    Icon   "Create Point.bmp"       // this is ignore since it is a flyout
    Flyout "Cad Points"
  }
  Button "Change String" {
    Flyout "Change String"
  }
}

Toolbar "Cad Points" {               // used as a flyout toolbar
  Button "Create Point" {
    Command "Create Point"
    Icon   "Create Point.bmp"
  }
  Button "Chainage" {
    Command "Locate Chainage"
    Icon   "Chainage.bmp"
  }
} // end of "Cad Points" toolbar

Toolbar "Change String" {           // used as a flyout toolbar
  Button "String Close" {
    Command "String Close"
    Icon   "String Close.bmp"
  }
  Button "String Reverse" {
    Command "String Reverse"
    Icon   "String Reverse.bmp"
  }
  Button "String Trim" {
```

```
        Command "String Trim"
        Icon   "String Trim.bmp"
    }
} // end of "Change String" toolbar
```

\$LIB and \$USER_LIB

As they were for Commands in User Defined menus, the variables \$LIB and \$USER_LIB can be used in Commands as part of the user_macro_name, chain_file_name, layout_file_name and programe_or_batch_file_name to pick up files from either the *12d Library* or the *User* library. See [Using \\$LIB and \\$USER_LIB in User Menus](#).

For example, the definition of a toolbar called "Lots" could be:

```
Toolbar "Lots" {
    Button "Create lots" {                                // button called "Create lots" which
        Command "macro -close_on_exit $USER_LIB/subdiv.4do" // fires up a 12d Model macro
    }
    Button "Roads" {                                     // button with walk-right menu "Roads" and layout file
        Walk_Right "Roads"                               // walk-right menu "Roads"
        Command "layout $USER_LIB/road.slf"               // button invokes a layout file if selected
    }
}
```

Notes

- (a) The variables \$LIB and \$USER_LIB can be used as part of the layout_file_name and user_macro_name to pick up files from either of the libraries.
- (b) blank lines in the toolbars file are ignored and anything on a line after a // is a comment

Another Example of a Toolbar

```
Toolbar "Cogo" {
// in this case, the Command is assumed to be "Create Line"
// the icon is "Create Line.bmp"
// Command is normally the name of the panel/menu
    Button "Create Line" {
    }
// this is a spacer
    Button "" {
    }
// this is a command and also has a flyout capability
// calling the toolbar called Flyout
// flyouts cannot be nested
    Button "Create Fillet by radius" {
        Command "Create Fillet by radius"
        Icon   "Create Fillet by radius.bmp"
        Flyout "Flyout"
    }
}
```

```
// The flyout toolbar for above (and a normal toolbar as well)
Toolbar "Flyout" {
  Button "Create Line" {
  }
  Button "" {
  }
  Button "Create Arc by Centre Radius" {
    Command "Create Arc by Centre Radius End Points"
    Icon "Create Arc by Centre Radius End Points.bmp"
  }
  Button "Create Fillet by radius" {
    Command "Create Fillet by radius"
    Icon "Create Fillet by radius.bmp"
  }
}
```

To return to the beginning of this appendix, click on [Functions Keys, Menus, Toolbars](#).

M Special File Formats

Default File Ending

In any panel pop-up requiring a file name to be displayed, default file endings are used to restrict the **names** of the files selected from the current folder and if they exist, from the library and user library areas.

Whilst a panel is up, the extension being searched for can be changed by typing say "*.xyz" into the panel field requiring a file name, and then pressing <enter>. The list of files ending in **.xyz** will be displayed and clicking B3 in the panel field will also bring up a list of all files ending in **".xyz"**. When a new panel is created, the panel fields revert to the default file ending.

A list of the **default** files used in **12d** Model pop-ups and their endings is:

File Type	Default Ending

4DML's - 12d Solutions programming/macro language

macro source file	.4dm
macro object/executable	.4do
macro listing	.4dl

Note

This list is for the default files used in 12d Model panel fields. It does not include 12d Model setup files which are given in the appendix [Setting Up and Configuring 12d](#).

Special 12d Solutions File Formats

12d Solutions has a number of special file formats, most of which have already been specified. The remaining formats will now be given.

In any of the files, blank lines ignored and any information after // until the end of that line is ignored. Hence **comments** can easily be inserted into the files by preceding them by //. Unless enclosed in quotes ("), more than one consecutive space or tab are treated as one space.

Eagle Map File

An eagle map file is a user created file consisting of a list of 12d Model colours and the Eagle pen, dash style, pen thickness and frag to be used for the colour. The map file is set out with one 12d Model colour per line. The line begins with the 12d Model colour followed by the Eagle pen number, dash style, thickness and frag to be used for the 12d Model colour. Each item is separated by one or more spaces.

For example, if the 12d Model colour red is to be mapped to Eagle pen 3, dash style 4, thickness 2 and frag 1, then the line in the eagle map file would be

red 3 4 2 1

An eagle map file can be used for writing out three dimensional data to Eagle, or when producing plots in Eagle format. For plotting, the map file must be called eagleplt.emf.

When writing three dimensional data out to Eagle, a user specified file name is allowed. In the output case, as each string is written out, the map file is searched sequentially until a colour match is made. If no match is found, the colour of the string is used as a pen number and default values used for dash, thickness and frag.

Comments can be included in the map file by preceding the comment with a double forward slash (i.e. //). Anything on the line following the // will be ignored.

An example of an Eagle map file is,

```
//12d Model colour to Eagle mapping file
//
//12d Model colour eagle pen dash thickness frag

black 0 1 1 1
red 2 0 1 5
green 4 1 1 1
blue 4 2 1 11
cyan 5 1 1 1
yellow 6 1 1 1
magenta 7 1 1 1
white 1 1 1 1
orange 15 1 1 1
purple 14 1 1 1
grey 13 1 1 1
"dark green" 12 1 1 1
"dark red" 11 1 1 1
"off yellow" 4 1 1 1
"dark blue" 8 1 1 1
brown 11 1 1 1
```

Template File

The 12d Solutions Template file format is a simple ascii file definition for reading and writing out template definitions for use in the apply options in **12d Model**.

The template definition begins with the key word **template** followed by the template name and then the definitions of

fixed, cut, fill and final parts of the template

or fixed and decision parts

all enclosed within curly braces { }.

```

template fred {
    fixed {
        ...
    }
    cut {
        ...
    }
    fill {
        ...
    }
    final {
        ...
    }
}

template fred {
    fixed {
        ...
    }
    decisional {
        ...
    }
}

```

The definition of the **fixed** part of the template begins with the key word **fixed** followed by a list of the links enclosed in curly braces {}.

The links are defined one per line in order from the centre-line. Each link begins with the keyword **link** followed by the width, percent cross-fall, colour and name for each link. For the percent cross-fall, positive means up, negative is down and zero horizontal.

For example,

```

fixed {
    link    3.5    -3    cyan    kerb
    link    1      -4    magenta shoulder
    link    2      -5    blue    verge
}

```

describes a fixed template with three links, the first of width 3.5 with a 3% cross-fall downwards, the next link of width 1 with 4% cross-fall downwards and the third link of width 2 and 5% cross-fall downwards.

The definition of the **cut** part of the template begins with the key word **cut** followed by a list of the links enclosed in curly braces {}.

The links are defined one per line in order from the end of the fixed template (or centre-line if no fixed part exists). Each link begins with the keyword **link** followed by the width, one in slope, colour and name for each link. For cut, the **one in** slope is positive for up, negative for down, and zero for horizontal.

For example,

```
cut {
  link    3      2      yellow  a
  link    2      0      magenta  b
  link    3     -1      yellow  c
  link    2      0      magenta  d
}
```

describes a cut template with four links, the first of width 3 with 1:2 slope upwards, the next link of width 2 horizontally, the third link of width 3 and 1:1 slope downwards and width 2 horizontally.

The definition of the **fill** part of the template begins with the key word **fill** followed by a list of the links enclosed in curly braces {}.

The links are defined one per line in order from the end of the fixed template (or centre-line if no fixed part exists). Each link begins with the keyword **link** followed by the width, one in slope, colour and name for each link. For fill, the **one in** slope is positive for down, negative for up, and zero for horizontal. Please note that this is the opposite to **cut**.

For example,

```
fill {
  link    5      2      yellow  e
  link    1      0      magenta  f
  link   10     -1      yellow  g
}
```

describes a fill template with three links, the first of width 5 with 1:2 slope downwards, the next link of width 1 horizontally, and the third link of width 10 and 1:1 slope upwards.

The definition of the **final** part of the template begins with the key word **final** followed the cut slope, fill slope and search distance enclosed in curly braces {}. The key words for the three values are **cut_slope**, **fill_slope** and **search_distance**.

For example,

```
final {
  cut_slope  1  fill_slope  2  search_distance  100
}
```

describes a final cut slope of 1:1 (upwards), fill slope of 1:2 downwards and template with three links, the first of width 5 with 1:2 slope downwards, both going for a maximum distance of 100.

The definition of the **decisions** part of the template begins with the key word **decisional** followed by a list of the decision commands enclosed in curly braces {}.

The decision commands are defined one per line and have the format:

Fixed Xfall Width *value* Height *value* XFall *value* Name *text* Colour *colour*

Fixed Slope Width *value* Height *value* Slope *value* Name *text* Colour *colour*

Tin Width *tin_name* Strip *value* width *value* Name *text* Colour *colour*

String Offset *string_name* Strip *value* Offset *value* Name *text* Colour *colour*

Batter *tin_name* Strip *value* Width *value* Height *value* Slope *value* Name *text*
Colour *colour* Goto *label*

Tin Decision *tin_name* Offset *value* Min *value* Max *value* Goto *label*

Label *label_name*

Goto *label_name*

End

For example,

```
template "std" {
  fixed {
    link 3 unknown -3 cyan "kerb"
    link 1 unknown -4 magenta "shoulder"
    link 2 unknown -5 purple "verge"
  }
  decisional {
    Tin_Decision "rock" 0 0 1000 "cut_rock"
    Tin_Decision "shale" 0 0 1000 "cut_shale"
    Tin_Decision "terrain" 0 0 1000 "cut_terrain"
    Label "fill_terrain"
    Batter "terrain" 0 8 unknown -3 "f1" blue "alldone"
    Batter "terrain" 0 1 unknown 0 "f2" "dark green" "alldone"
    Goto "fill_terrain"
    Label "cut_rock"
    Tin_Decision "rock" 0 0 0.3 "cut_rock_done"
    Batter "rock" 0.3 5 unknown 0.5 "r1" cyan "cut_rock_done"
    Batter "rock" 0 2.5 unknown 0 "r2" yellow "cut_rock_done"
    Goto "cut_rock"
    Label "cut_rock_done"
    Tin_Decision "shale" 0 0 1000 "cut_shale"
    Goto "cut_shale_done"
    Label "cut_shale"
    Tin_Decision "shale" 0 0 0.6 "cut_shale_done"
    Batter "shale" 0.6 6 unknown 1 "s1" magenta "cut_shale_done"
    Batter "shale" 0 3 unknown 0 "s2" "dark red" "cut_shale_done"
    Goto "cut_shale"
    Label "cut_shale_done"
    Tin_Decision "terrain" 0 0 1000 "cut_terrain"
    Goto "alldone"
    Label "cut_terrain"
    Batter "terrain" 0 3 unknown 1.5 "t1" red "alldone"
    Batter "terrain" 0 2 unknown 0 "t2" green "alldone"
    Goto "cut_terrain"
    Label "alldone"
  }
}
```

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

Screen Layout File

The 12d Model **screen layout file** contains a simple text file definition for 12d Model panels and menus in either the pre-V10 format (slf) or the V10 XML format (slx).

The definition includes a screen position for the panel or menu, and for panels, values for any of the panel fields.

At any time, the layout of the menus and panels on the screen in a 12d Model session can be written out using the menu option

File i/o=>Layouts =>Layout output

Also, the layout for an individual panel or menu can be created by clicking RB in the menu/view title area and selecting the dump option to bring up the **Menu/Panel Dump** panel.

Note: If a screen layout file is created and added to the *layout.4d* file (by selecting *layout.4d* as the file name and selecting **Append**), then the menu/panel will appear whenever a project is opened. See [layout.4d](#)

A screen layout file can be read in using the menu options

File i/o=>Layouts =>Layout input Or File i/o=>Layouts =>Layout input files

Also when a project starts up, the layout file **layout.4d** is read in and any menus and panels described in the file are placed on the screen (see [Set Up Files Used for New and Existing Projects](#)).

An example of a screen layout file for 'Read x y z s Data' in the V10 format is:

```

```

Map File for 12d Model V4.0

Up to 12d Model V4.0, the map file format consisted of one or more lines. Each line begins with a key (entity-mask) followed by a string name, model name, colour, breakline type (point or line), and line style separated by one or more spaces. The key can contain wild cards (*) and wild characters (?).

When a string is read in and satisfies a key, the key's corresponding string name, model, colour, breakline type and style is used for that string.

For example, any entity name beginning with 31 can be created as a 12d Model string with the name picket, colour cyan, breakline type line, line style 1 and model fences by the map file line

31*	picket	fences	cyan	line	1
-----	--------	--------	------	------	---

If a map file is used, as each entity is read in, the map file is searched sequentially until a match with a key is made and the key's name, colour etc. used. If no match is found, the default colours and model (given in the read panel) are used.

Notes

- 1. If the entity-name is to be used as the new string name, use an asterisk (*) in place of the string name. For example,

fred	*	fences	cyan	line	1
------	---	--------	------	------	---
- 2. If the default model for the reader is to be used as the model name, use an asterisk in place of the model name. For example,

31	31	*	cyan	line	1
----	----	---	------	------	---
- 3. A * for colour, breakline type and linestyle means that if the entity has a colour, breakline style or line-style, then it is used rather than be mapped to another one.
- 4. All model names used in the map file can be given an extra (common) prefix by typing the prefix into the prefix for models field in the read panel.
- 5. If any information includes a space, then it must be enclosed in quotes ". For example, the model name may be "trial 1" or a style "large tanks".
- 6. Comments can be included in the map file by preceding them with a double forward slash //. Anything on the line after the // is ignored.

An example of a 12d Model map file is

```
// 12d Model map file
// key      name      model      colour      pt-line      linestyle

102      break      breaks      red      line      solid
305      fence      caddast      green      point      dash
998      bdry      bound      cyan      line      solid
spots      *      spot      yellow      point      1
PS*      *      *      yellow      point      1
```

Map File for 12d Model V5.0 and Above

For 12d Model V5.0, the map file was extended to allow for defining properties such as tinability, symbols at vertices, vertex and segment text and pipe and culverts.

To allow for all the different type of mapping in the one file, the map file is broken up into sections (one section for each tab of the map file editor) and each section begins with a header record which is the section name enclosed in braces ({ }). For example, the symbols section has the

header

{symbol_data}

Inside each section, the data is similar to the V4.0 map file with lines consisting of a key (entity-mask) followed by the data required for that section. The key can contain wild cards (*) and wild characters (?).

The exact format for the map file is not required since they are created and edited from within 12d Model by the option

File i/o => Map file

12d Patterns File

This section of documentation is a work in progress and will be updated in subsequent releases.

N Plotters and Plotting

The method of creating plots and sending them to a plotter or a Cad system such as AutoCad or Microstation, varies from site to site.

12d Model provides an array of set ups and options to enable the user to tailor the plotting system.

Since the plotting set ups and options are scattered throughout **12d** Model, the rationale behind the plotting set ups will be summarized in this chapter.

Go to [Supported Plotters](#)
[Sending Plots to a Plotter](#)
[Mapping Colours to Plotter Pens](#)
[User Defined Plotters](#)
[Microstation \(DGN\) Plot Seed File](#)
[Sheet Sizes](#)
[Hardware Arcs](#)
[Interface Colours](#)
[Text Units](#)
[Pixels to mm](#)

For documentation on the first item, continue to the next section [Supported Plotters](#).

Supported Plotters

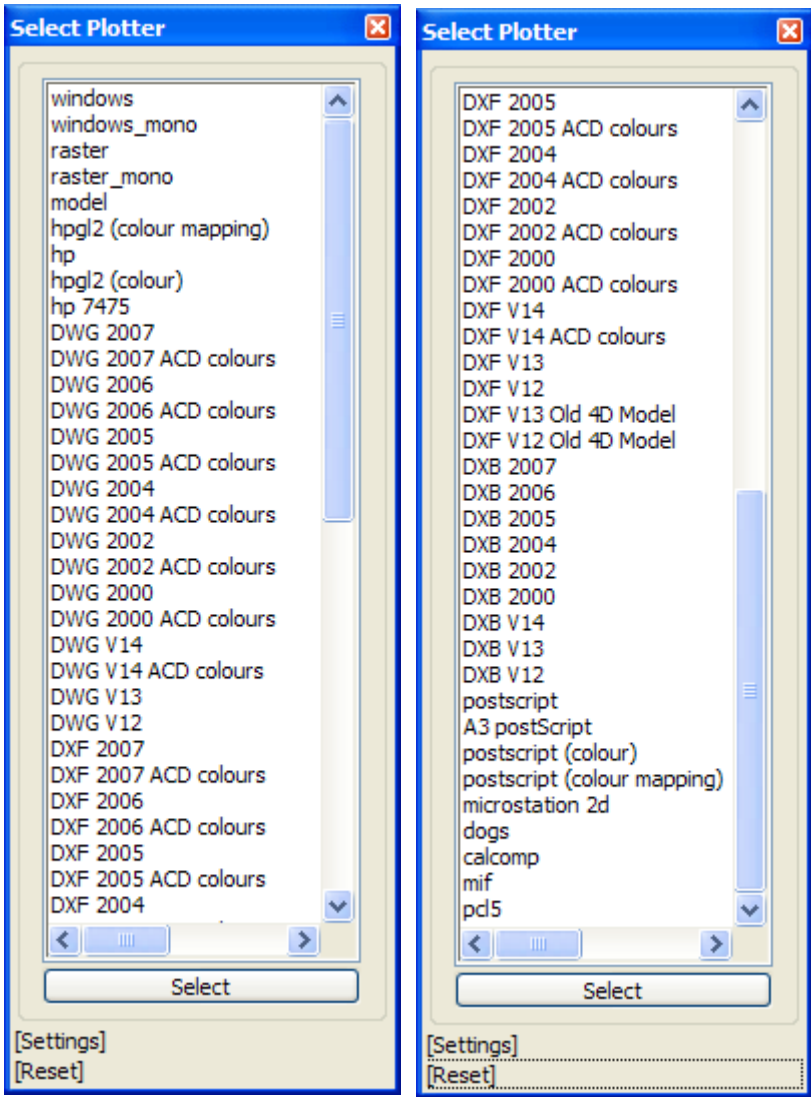

When creating a **plot**, **12d** Model can either use a Windows printer driver to plot directly, or instead of driving the plotter directly, create a computer disk file (the plot file) containing the relevant plotter instructions for producing the plot (which is then sent to the plotter), or in the case of the plotter type **model**, create a **12d** Model model.

The **plot file** can be written in a variety of formats including

windows	Windows colour printer, or grey scale on mono printers
windows_mono	Windows mono printer - uses black, not grey scale
raster	raster - used when images are part of plot
raster_mono	raster - used when images are part of plot
hp	standard HPGL with all of one pen being plotted before the next pen is used
hp (no sort)	standard HPGL with no pen sorting
hp 7475	small HP plotter, common hp emulation mode for lasers
hpgl 2 7600	HPGL 2 for HP 7600 mono plotter
hpgl 2 (colour)	standard HPGL 2 for colour plotters
hpgl 2 (colour mapping)	standard HPGL 2 for colour plotters using a plotter mapping file
dxg	2d DXF file
dwg	2d DWG file
pcl5	pcl5 format
eagle single	Eagle single precision binary model (not in the base module)
eagle double	Eagle double precision binary model (not in the base module)
postscript	Postscript format (generally for laser printers)

postscript (colour)	colour postscript format (generally for laser printers)
postscript (colour mapping)	colour postscript format using a plotter mapping file
dgn 2d	Intergraph/Microstation binary model (.dgn file)
dogs	Dogs parametric format
calcomp	Calcomp plot format
mif	frame maker interface format.
model	creates a 12d Model model

By default, this list of plotters appears when RB is clicked in a **plotter panel field**

However, a user defined list of available plotters, with user definable names and properties, can be set up and used instead of the default list. User defined plotters will be documented later in the section [User Defined Plotters](#).

Please continue to the next section [Sending Plots to a Plotter](#).

Sending Plots to a Plotter

When plots are created, **12d** Model can fire up a user supplied script/program with the plot file as the first argument. By checking the plot name suffix, the script could for example, decide which plotter the plot must be sent to.

The environment variable

PLOTTER_4D *points_to_script/program*

points to the script/program which can be fired up whenever a plot is generated. The name of the plot is given as the first script parameter of the script.

If the tick box **Send plots** in the panel tab **System Settings** of the panel **Defaults** (given by the menu option **Utilities => Default**) is set to **on**, the plotter script is run as each plot is created.

If more than one plot is created by an option (e.g. x plot) then the script is called separately for each of the plots.

An example of a script to send the plot to port lpt1 for Windows NT would be

```
@echo off
copy %1 lpt1
```

An example for Windows NT which looks for hp files is

```
@echo off
echo.
echo -----
:next_file
if "%1" == "" goto done
echo %1 | find /I ".hp" > nul
if ERRORLEVEL 0 if not ERRORLEVEL 1 goto hp_plotter
echo Plotting file %1
shift
goto next_file
:hp_plotter
echo Plotting %1 to HP plotter
copy %1 \\server_name\printer_name
shift
goto next_file
:done
echo -----
```

Environment variables are fully defined in the section [Environment Variables](#) in the Appendix [Setting Up and Configuring 12d](#)

Please continue to the next section [Mapping Colours to Plotter Pens](#).

Mapping Colours to Plotter Pens

12d Model uses up to 10,240 different colours and when it comes to plotting, it must be decided how these colours are mapped for the particular plotter being used.

For some plotters, colours may be used whereas for mono plotters, line thickness and linestyles may be needed.

When plotting to CAD systems such as AutoCad and Microstation, no physical plot is created but the plot image may need to be send to special colours, layers and styles in the Cad system.

For plotting to actual plotters, there are two methods of specifying the colour to pen mappings.

- (a) **pen mapping** - a simple colour to pen mapping, mainly used for pen plotters
- (b) **plotter mapping** - a colour to pen mapping plus the red, green, blue definition for colours used on the plotter. This is mainly for electrostatic, inkjet and bubblejet plotters.

Plotter mapping is an extension of pen mapping and only one of the two is used for a plot.

Pen Mapping

For all plotters types except Eagle, the **Plots=>Pen mapping** option can be used to define the correspondence between **12d** Model colours and plotter pens for the first sixteen colours.

The other colours are given in the **colours.4d** file. For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

The pen mapping option is only used if a plotter mapping is **not** being used (see next section).

When starting a new project or entering an existing project, the default pen mapping table is defined by the **colours.4d** file.

Once inside the project, any pen number in the table can be modified by changing the appropriate pen field and then selecting the **set** button. The modified table is stored until **12d** Model is quit or the user changes to another project.

The pen mappings for colours above sixteen are given in the **colours.4d** file but can not be displayed or modified by the **colour to pens** panel.

Whenever a plot is created using non-eagle plotter types, the colours are mapped to the pen numbers given in the **colours to pen** table before writing out the plot file.

For Eagle plots, the **eagle_plotter.emf** file is used to map colours to pens.

Note - when **12d** Model is started up again or the user changes to a new project, the table reverts to its default settings as given in the **colours.4d** file.

Colours.4d

The **colours.4d** file defines the distinct colours for drawing in any **12d** Model view.

The **colours.4d** file is also used to define the **default plotter pen** associated with the colour.

See [Colours File](#) in the Appendix [Setting Up and Configuring 12d](#)

Plotter Mapping

The **plotter mapping file** can be used use with pen plotters but is more specifically designed for electrostatic and inject plotters and allows the user to

- (a) map **12d** Model colours to particular plotter pens and also specify a width (or weight) to be used for PCL5, HPGL2, postscript and all Windows plotters.
- (b) specify the red, green and blue mix for pens on HPGL2, colour postscript and all Windows plotters

The plotter mapping file to be used can be set using

- (a) the option **Plots=>Plotter mapping**
- (b) set by the environment variable PLOTTER_MAPPING_4D, or the file pmf.4d
- (c) defined for a particular plotter in the user defined plotters file.

There are also two special formats of the plotter mapping file which are used for plotting to Auto-cad dxf and Intergraph dgn. The special mapping files use the **12d Model colour** as a key to tables which control how the information is passed to DXF and DGN.

- (d) .tbl file used with plotting to Intergraph dgn
- (e) .amf used with plotting to Autocad dxf

The plotter mapping file to be used can be set using

- (a) the option **Plots=>Plotter mapping**
- (b) set by the environment variable PLOTTER_MAPPING_4D, or the file pmf.4d
- (c) defined for a particular plotter in the user defined plotters file.

Plotter Mapping File

The plotter mapping file (.pmf) consists of two sections:

- (a) pen_mapping table to define the which pen a **12d Model colour** is mapped to, and the weight for the pen.
- (b) pen_colour table which defines the red, green and blue values to be used for the pens on the plotter.

The format of the plotter mapping file (.pmf) is

```

pen_mapping {                                // pen mapping and weight table

//          12d          plotter          weight
//          colour       pen no           for pen

          0             1             0.15
          1             2             0.25
          3             1             0.5
//          etc.
}
pen_colours {                                // pen colours table

// plotter
// pen      red          green          blue          values 0-255
    0        0           0           0           // pen 0 is black
    1       255          0           0           // pen 1 is red
//          etc.
}

```

The **colour n** and **pen n** and the **default weight** for n=0,1...255 is used to initially fill up the 10,240 positions of the **pen_mapping** weight table.

The **pen n** and the **rgb** of the **default colour** (take its rgb from the colour_map.def file) for n=0,1...10,240 is used to fill up the 0,240 rgb positions of the **pen_colours** table before the plotter mapping file is used.

If the **Plots=>Plotter mapping** option is used, and the **merge colours.4d** flag is set, the rgb columns from the colours.4d file are used to define the pen_colours (first row is pen 0, second row is pen 1 etc.), and the pen mapping number is used to construct the pen_mapping table.

The plotter mapping file is then processed and overwrites any of the above initial mapping values.

If the plotter type is **dgn** and the map file is a table file with the extension of .tbl, the plotter will use the colour being plotted as the key in the table file and so allows the mapping from the plot colour directly into dgn level, weight, style and colour. See the next section for an example of a table file.

If the plotter type is **dxf** and the map file is an AutoCAD mapping file with the extension of .amf, the plotter will use the colour being plotted as the key in the mapping file and so allows the mapping from plot colour directly into layer name, Autocad colour and linestyle. Note that if Autocad colour or linetype is BYLAYER, then 12d Model uses the correct values in Autocad. The * character means that the field is ignored. See the next section for an example of an Autocad mapping file.

Please continue to the next section [User Defined Plotters](#).

User Defined Plotters

A file can be set up to define the plotters that appear in the **plotter type** panel field, and the properties of the plotters.

It is possible to customize:

- (a) the name of the plotter
- (b) the start and end sequence that is sent to the plotter
- (c) for each plotter, whether pen or plotter mapping occurs.

The full set of user defined plotters is given in a file called **plotters.4d** which is searched for in the standard set up paths, or is pointed to by the environment variable

PLOTTERS_4D filename

In the plotter file, the definition of a **plotter** of a given name *plotter_name* is set out as:

```
plotter plotter_name {
    set_up_commands
}
```

plotter_name must not be blank and if it includes imbedded spaces, it must be enclosed in double quotes “.”

The plotter itself is defined inside the braces where there can be zero or more plotter set up commands from the list:

```
colours
engine
extension
footer
header
map_file
map_pens
output_cmd
```

Description of the Plotter Set Up Commands

engine windows|dxf_4d|dxf_12|dxf_13|dxf_14|dxf_2000|
 dwg_4d|dwg_12|dwg_13|dwg_14|dwg_2000
 dgn|dgn|hpgl|hpgl2|hpgl_7475|
 calcomp|model|mif|postscript

extension ".???"

extension added to the file name used for the plot file written out by this plotter.

map_file *plotter_mapping_file_name*

points to a plotter mapping file which is used to redirect colours for any plotter. For hpgl2 and postscript, it also defines the pen weights (widths).

If map_file is not set and a global mapping file is specified, then it will be used as the plotter mapping file. Otherwise the pen mapping table is used.

If the **engine** is **dgn** and the **map_file** is a table file with the extension of .tbl, the plotter will use the colour being plotted as the key in the table file. This allows the mapping from the plot colour directly into dgn level, weight, style and colour.

If the **engine** is **dxf** and the **map_file** is an Autocad mapping file with the extension of .amf, the plotter will use the colour being plotted as the key in the mapping file. This allows the mapping from plot colour directly into layer name, Autocad colour and linestyle. Note that if Autocad colour or linetype is BYLAYER, then 12d Model uses the correct values in Autocad. The * character means that the field is ignored.

map_pens true|false

if true, it uses the specified map_file, or if map_file is false, it doesn't use any mappings (map_file, global plotter mapping file or pen mapping table). It leaves the pen number untouched. This was used in the hpgl2 colour and postscript colour - the screen colours were preserved. This can now be done for any plotter.

This is ignored when the map_file is used as a tbl file (plotter engine is dgn and the map_file has an extension of .dgn - any mapping is occurring via the tbl file where colour is the key).

This is ignored when the map_file is used as a amf file (plotter engine is dxf and the map_file has an extension of .dxf - any mapping is occurring via the .dxf file where colour is the key).

output_cmd path to a *script* or *program*

for this plotter, the given script or program is used on the created plot file. This replaces the PLOTTER_4D definition of script or program for this plotter.

colour true|false

used in hpgl2 and postscript.

If false, then for postscript don't send the rgb for colours and for hpgl2, it doesn't send down the block of information with the number of pens and the rgb for each pen. That is, if false, it stops hpgl2 and postscript writing out the colour definition commands.

header and footer

The **header** information is placed in the plot file before any plot commands and the **footer** information is placed at the end of plot file after all the plot commands.

The format for the **header** or **footer** is:

```
header {     // this information is placed in the plot file before any plot commands
            lines of text which can include plotter variables
}
```

or

```
footer {     // this information is placed at the end of the plot file, after the plot commands
```

```

    lines of text which can include plotter variables
}

```

Each line of text is surrounded by quotes. For example, "this is some stuff".

The *plotter_variables* used in the **header** or **footer** are:

```

username
filename
date
time
sheet_width
sheet_height
page_number - not used
minimum_x, minimum_y // plotter dependent
maximum_x, maximum_y// plotter dependent

```

and are included in the text by preceding them by a + and also following them by a cross if more text follows. For example:

```
"the user is " + username+"of 4D Solutions"
```

The appropriate information is substituted for the *plotter_variables* when a plot is created.

Hence

```
"the user is "+ username+" of 4D Solutions"
```

would give

```
"the user is fred of 4D Solutions"
```

A *plotter_variable* may not be appropriate for a particular plotter and if a *plotter_variable* is specified but not used for a plotter, it is substituted by *blank*.

If **header** or **footer** is not specified, then appropriate default information for the plotter is used.

The **header** and **footer** *set_up_commands* are not used by all plotters. If they are not used for a particular plotter, the **header** or **footer** command is ignored.

At present, only the plotters hpgl, hpgl2, postscript and dxf use **header** and **footer**.

minimum_x etc for postscript, it is the extent of the plot in mm

sheet_width, sheet_height for postscript in mm

For hpgl2

```
sheet_width, sheet_height          in mm/40.
```

Example of a Plotters.4d File

An example of a plotters.4d file is:

```
// -----
// File:      plotters.4d
// Date:      25 January 1997
// Use:      User definable plotter names
// -----

plotter "Windows" {                                // Windows printer drivers
  engine windows
  colour true
  map_pens true
  map_file "windows_colour.pmf"
}
plotter "Windows mono" {                          // Windows printer drivers
  engine windows
  colour false
  map_pens true
  map_file "windows_mono.pmf"
}
plotter "HP Colour" {                             // hp plotter using hpgl2
  engine hpgl2
  colour true
  map_pens true
  map_file "jetcolor.pmf"
  output_cmd "print -s://melba/jet_design"
  extension ".hp2"
}

plotter "HPGL Pen plotter" {                      // hp pen plotter using hpgl
  engine hpgl
  map_file "jetcolor.pmf"
  output_cmd "print -s://melba/devel_hp4v"
  extension ".hp"
}

plotter "Model" {                                 // plot to a 12d Model model
  engine model
  extension ""
  map_pens false                                // don't map colours
}

plotter "DGN" {                                   // output to a Microstation dgn file
  engine dgn
  extension ".dgn"
}

plotter "DGN with tbl" { // define a dgn plotter using an output table file
  engine dgn
  extension ".dgn"
  map_pens true // ignored where the map_file is used as a tbl file
  map_file "vicplot.tbl"
}
```

```
plotter "DXF 2000" {           // output to a dxf file
    engine dxf_2000
    extension ".dxf"
}
plotter "DXF 2000 with amf" { // output to a dxf file using an autocad map file
    engine dxf_2000
    extension ".dxf_2000"
    map_file "acadplot.amf"
}
```

Definition and Example of a .tbl File

An example of an output mapping file for use with an Microstation (Intergraph) dgn plotter:

```
// -----
// File: vicplot.tbl
// -----
// column 1 12d colour name          (any length - but only 1st four characters passed)
// column 2 Vic roads code           (only 1st four characters passed)
// column 3 AS2482 feature code
// column 4 description              (any length but if embedded spaces then must be quoted)
// column 5 line level                (between 1 and 64)
// column 6 line colour              (between 1 and 256)
// column 7 line weight              (between 1 and ?)
// column 8 line style
//
// notes: if column 2 is a * then the 12d name is transmitted (up to 4 characters that is)
//        columns 9 through 16 are only used for point strings which map into characters

1 PM  38010000 "Permanent Survey Mark  " 49 0 1 0
2 BM  38020000 "Bench Mark              " 49 0 1 0
3 TPEG 31000001 "Title peg               " 50 0 1 0
4 STN  38100000 "Instrument Station      " 50 0 1 0
5 SM   38000000 "Survey mark (general)   " 50 0 1 0
6 PCON 38040001 "Photo control point     " 50 0 1 0
7 CHEK 38000001 "Check profile/point     " 52 10 3 0
8 TRIG 38010000 "Trigonometric Station  " 50 0 3 0
9 BMQS 38020001 "Bench Mark QS-1        " 49 11 1 0
10 BMS  38020002 "Bench Mark S-2         " 49 11 1 0
11 BMSH 38020003 "Bench Mark SH-1        " 49 11 1 0
12 RM   38000001 "Reference Mark - General " 50 11 1 0
* ROD  38000002 "Reference Mark - Rod    " 50 11 1 0 // everything else
```

Definition and Example of a .amf File

An example of an AutoCad output mapping file for use with an Autocad plotter:

```
// -----
// File: acadplot.amf
// -----
// column 1 match colour - can include wild cards * and wild characters ?
// column 2 new name      - not output to DXF
// column 3 ACD layer     -
// column 4 ACD colour    - * for 12d Model colour (mapped to ACD),
//                          BYLAYER for ACD BYLAYER
// column 5 ACD line type- * for 12d Model linestyle,
//                          BYLAYER for ACD BYLAYER
// column 6 ACD text style- not yet used, * for 12d Model text style
//
// Notes:
// 1. column 5 (ACD colour) can only be a number between 0 and 256, or * or BYLAYER
// 2. The DXF file produced needs to be loaded into an existing Autocad drawing
//    which has the ACD layers and linestyles defined.
// column 1      2      3      4      5      6
//
// 1  CONT  ljpg1  1      1      *
// 2  TOP   ljpg2  2      CONTINUOUS  *
// 3  TOP   *      3      *          *
// 4  TOP   ljpg4  *      BYLAYER    *
// 5  TOP   ljpg5  BYLAYER  DASH      *
```

Please continue to the next section [Microstation \(DGN\) Plot Seed File.](#)

Microstation (DGN) Plot Seed File

When creating dgn plot files in Microstation (Intergraph) DGN format, a Microstation (Intergraph) DGN seed file can be used.

The folder containing the seed files can be pointed to with the environment variable `MS_SEEDFILES_4D`:

MS SEEDFILES 4D folder

The Microstation seed file is set by the **Plots=>DGN plot seed file** option.

Please continue to the next section **Sheet Sizes**.

Sheet Sizes

For plot frames, long and x plots, the overall size of the plot sheet can be given by a pop-up containing defined sheet size.

The sheet size names, width and heights can be specified by the user in a file named **sheets.4d** which is in the normal set up areas, or is pointed to by the environment variable

SHEET SIZES 4D file // file of plotter sheets sizes

The layout of the sheet sizes file is given in the section [Sheet Sizes File](#) in the Appendix [Setting Up and Configuring 12d](#)

Environment variables are fully defined in the section [Environment Variables](#) in the Appendix [Setting Up and Configuring 12d](#)

Please continue to the next section [Hardware Arcs](#).

Hardware Arcs

When plotting arcs, the arc can either be broken into a series of straight lines within 12d Model, or plotted using the arc command (if it exists) for the relevant plotter.

The initial default for hardware arcs is set by the environment variable `HARDWARE_ARCS_4D`:

HARDWARE_ARCS_4D	1	use hardware arcs	default
	0	hardware arcs are not used	

but this can be overridden by the option **Plots=>Hardware arcs**.

Environment variables are fully defined in the section [Environment Variables](#) in the Appendix [Setting Up and Configuring 12d](#)

Please continue to the next section [Interface Colours](#).

Interface Colours

When drawing interface strings in 12d Model, cut areas are denoted in red, fill areas in green and sections on the surface in yellow.

However, when plotting it is convenient to be able to map the interface colours to other colours.

This panel is used to define new colours for the interface colours, and the new colours are then mapped to pens using the pen mapping table or plotter mapping file.

The colours used for plotting the interface colours is set from the option **plots=>interface colours**

Please continue to the next section [Text Units](#).

Text Units

Text occurs in 12d Model plots in a number of ways -

- s plotting **text strings** and **4d strings**
- s automatic text such as grid values, x-section and long-section plot annotation.
- s text within linestyles.

The most difficult thing about text is that because of the different uses of text, there needs to be more than one systems of **units** to define text heights.

The height of text for a given textstyle is defined to be the height of a capital A. However, in 12d Model, there are three methods of defining the units for measuring this height.

- s world units - the units used for data
- s screen units - pixels (the screen is 1000 pixels wide)
- s plot paper units - millimetres.

World Units

World units are the units of user data. For most users, the base unit for user data is metres. However 12d Model is a dimensionless system and the base unit is totally dependent on the user.

The height of world text when displayed in a view depends upon on the text height and the scale of the view.

When plotted, the height that world text appears on a plot sheet is the same as for any data defined in world units - the height depends on the **scale** used for the plot.

Text heights that are only given in world units have (**w**) after them.

For some text, the choice of units is either world or pixels. The text parameters then have a **(u)** after them.

Screen Units - pixels

When screen units (pixels) are used, the text is a fixed height on the screen. If the user zooms in on text given in pixels, the text remains the same height.

To have a height on a plot, screen unit text needs a height defined in millimetres.

For some screen text, both a pixel and a millimetre height is supplied when the text is defined.

For text with only a pixel height, there is a plotting multiplication parameter called **pixels-to-millimetres** which is used to convert pixel heights to plot paper heights. The value of pixels-to-millimetres is set using the **plots=>pixels to mm** option and is stored for the project.

Text heights that are only given in pixels have a **(pix)** or **(p)** after them.

For some text, the choice of units is either world or pixels. These text parameters then have a **(u)** after them.

Plot Paper Units - millimetres

Text defined in plot paper units (millimetres) has a well defined height on a plot sheet.

Text heights that are only given in millimetres have **(mm)** after them.

Pixels to mm

To allow text and linestyles with only a pixel size to be plotted, a factor to convert pixels to millimetres is used.

When plotting, any text and linestyle defined **only** in pixel units is **multiplied** by the pixels-to-millimetre factor to determine its size in the plot.

For a new project, the initial value is loaded from the **defaults** file and is defined in this file by

PIXELS TO MM PLOT FACTOR value

See [Defaults File](#) in the Appendix [Setting Up and Configuring 12d](#)

The pixels-to-mm factor can be modified by the **Plots=>Pixel to mm** option.

The pixel-to-millimetres value is stored for the project

Environment variables are fully defined in the section [Environment Variables](#) in the Appendix [Setting Up and Configuring 12d](#)

To return to the beginning of this appendix, click on [Plotters and Plotting](#).

O Plot Parameters

This appendix contains information about the definitions in the Ascii versions of the plot parameter files. The Ascii plot parameter files are not normally seen by users because the *Plot Parameter* editors create binary plot parameter files.

For 12d Model users, Ascii PPFs were replaced by the PPF editors and the definition of the Ascii PPFs has not been upgraded since *12d Model 7*. For the plot parameter editors, go to [PPF Editors](#).

Go to [Plot Frame Plot Parameter File](#)
[Cross Section Plot Parameter File](#)
[Long Section Plot Parameter File](#)
[#Include in Plot Parameter Files](#)

For documentation on the first item, continue to the next section [Plot Frame Plot Parameter File](#)

Plot Frame Plot Parameter File

The plot frame section plot parameters are placed in a file with ending **.ppf**

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash **//** is considered to be a comment.

The set of all parameters for the plot frame plot is enclosed within a set of curly brackets **{ }** with the header

```
plot_frame_plot "plot set name"
```

before the curly brackets.

That is,

```
plot_frame_plot "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one `plot_frame_plot` parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as `section_long_plot` in the same file. The other sets will be ignored when doing plot frame plots.

The only parameters not connected with title block file are

<code>view_name</code>	<code>view_name</code>	// name of view used for information // on the plot
<code>single_frames</code>	<code>frame_name</code>	// name of plot frame to be plotted
<code>model_of_frames</code>	<code>model_name</code>	// model of plot frames which may be // plotted as a group

Both these parameters exist in the **plot frames plot** panel and when the parameter file is first read, if either of these parameters exist in the plot parameter file then they will be used to replace the

corresponding parameters in the panel.

However, if the parameters are subsequently modified in the panel, the new panel value will be the value used for plotting.

Title Block Information

A plot frame plot can have a standard **12d** Model title block or a user defined title block.

For a user defined title block, the title block drawing commands are kept in a file whose name is given by the user when setting up the plot frame. The title block drawing commands are almost identical to the linestyle drawing commands.

If a user defined title block has been set for the plot frame, plot frame parameters can be used to pass information though to the title block.

User Title Block

Some of the plot parameters are used to pass information down to variables in a user defined title block specified in the plot frame.

The parameters are:

<code>time_format</code>	<i>text</i>	// format for \$time
<code>title_1</code>	<i>text</i>	// passed down to \$title_1
<code>title_2</code>	<i>text</i>	// passed down to \$title_2
 <code>user_text_n</code>	 <i>text</i>	 // where n = 1,2,... 1000 // passed down to \$user_text_n
<code>start_page_number</code>	<i>integer</i>	// used as the starting value for \$page_number. // if missing, \$page_number starts at 1.
<code>start_drawing_number</code>	<i>integer</i>	// added to \$drawing_number in title block file // if missing, \$drawing_number starts at 1.
<code>drawing_number_prefix</code>	<i>text</i>	// passed down to \$drawing_number_prefix
<code>drawing_number_postfix</code>	<i>text</i>	// passed down to \$drawing_number_postfix

Notes

1. A warning is given if the keyword in a plot parameter file does not exist.
2. A warning is also given if the key word pair is defined more than once in a ppf.

Please continue to the next section [Cross Section Plot Parameter File](#).

Cross Section Plot Parameter File

The cross section plot parameters are placed in a file with ending **.ppf**

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash **//** is considered to be a comment.

The set of all parameters for the cross section plot is enclosed within a set of curly brackets **{ }** with the header

```
section_x_plot    "plot set name"
```

before the curly brackets.

That is,

```
section_x_plot    "plot set name" {  
    plot parameters  
    one per line  
}
```

If there is more than one `section_x_plot` parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as `section_long_plot` in the same file. The other sets will be ignored when doing cross section plots.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section [Plot Sheet Layout](#).

Boxes and datum area, please continue to the section [Boxes and Datum Area](#).

Only for the Centre line case:

Datum area, please continue to the section [Datum Line](#).

Labelling the centreline, style etc., please continue to the section [Labelling the Centreline Chainage](#).

Only for the Boxes case:

Datum area, please continue to the section [Datum Line](#).

Labelling the centreline chainages, please continue to the section [Labelling the Centreline Chainage](#).

Defining boxes and what is labelled in them, please continue to the section [Defining Boxes](#).

For Both the Centre Line and Boxes case:

Labelling cuts, please continue to the section [Labelling Cuts of X-Sections Through Strings in a Model](#).

Hatching cut/fill, please continue to the section [Hatching Cut and Fill Areas](#).

Drawing extra x-sections, please continue to the section [Extra Models of X-Sections](#).

Sorting x-sections, please continue to the section [Sorting X-Sections by Chainage](#).

Title block information, please continue to the section [Title Block Information](#).

Panel modifying parameters, please continue to the section [Parameters that Modify Fields In the Cross Plot Panel](#).

Example, please continue to the section [Example of a Cross Section Plot Parameter File](#).

Plot Sheet Layout

X-sections are normally generated at chainages along a given centreline. This centreline chainage is stored with each x-section string.

The chainages of the actual x-sections are referred to as **offsets** from the centreline position rather than x-section chainages. The offsets of the x-section are set up so that the zero offset occurs where the x-section crossed the centreline string.

The x-sections along the centreline are stored in the one model (the primary model) which is then used to generate the cross section plot.

```
model_to_plot          text          // name of the model of x-sections
```

Each x-section from the primary model of x-sections generates its own sub-plot for which the x-section is the primary string. Hence the cross section plot consists of many individual plots drawn on one or more plot sheets.

Each plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size            text          // sheet name, or
                      "mm  mm"      // sheet size: width height
```

The sheet size name, width and heights can be specified by the user in a file named **sheets.4d** which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D        file          // file of plotter sheets sizes
```

The plotting area is restricted to within the plot sheet by giving margins which are:

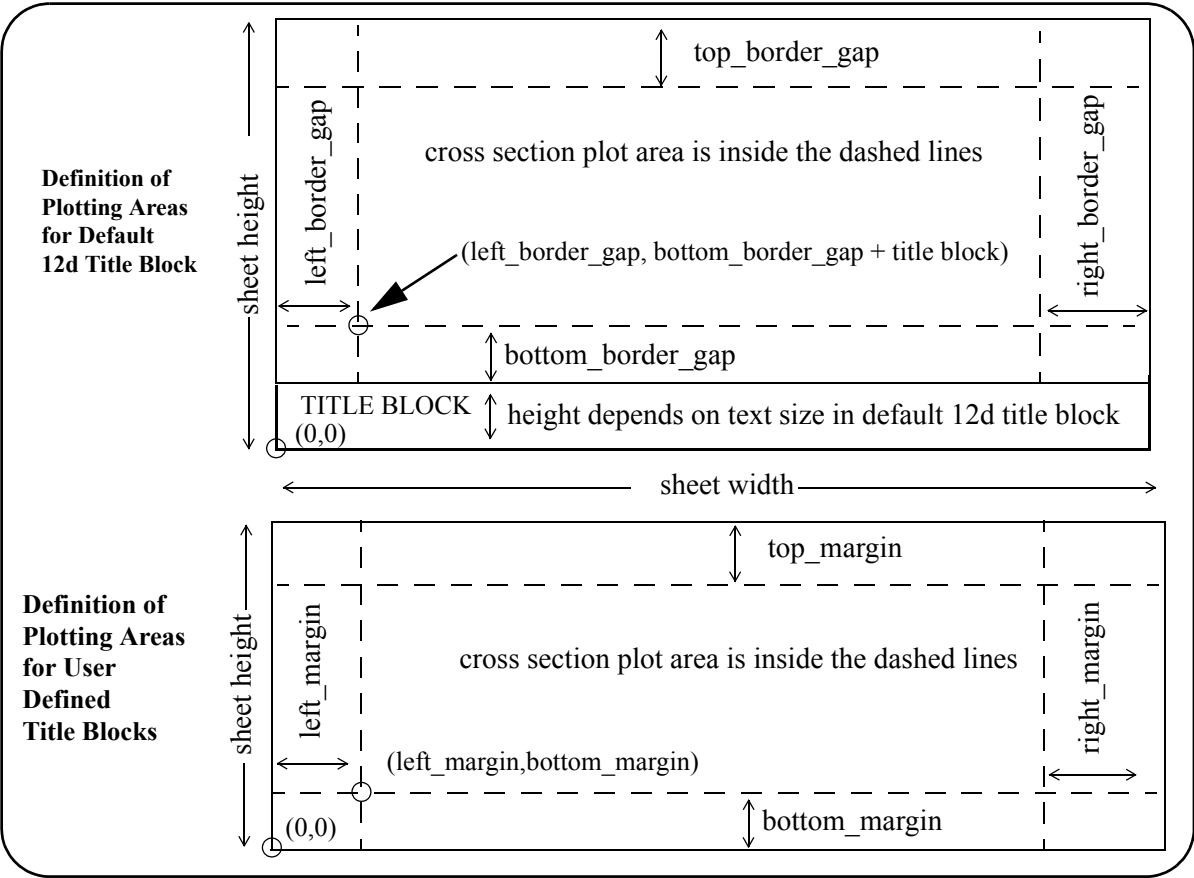

If a *User Defined Title Block* is used:

```
left_margin           mm
right_margin          mm
top_margin             mm
bottom_margin         mm
```

If the *default 12d title block* is used, then the size of the bottom of title block depends on the text size. The following parameters are used in the default title block case and the *bottom_border_gap* is added to the calculated height of the bottom of the title block.

```
left_border_gap       mm
right_border_gap      mm
top_border_gap        mm
bottom_border_gap     mm
```

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

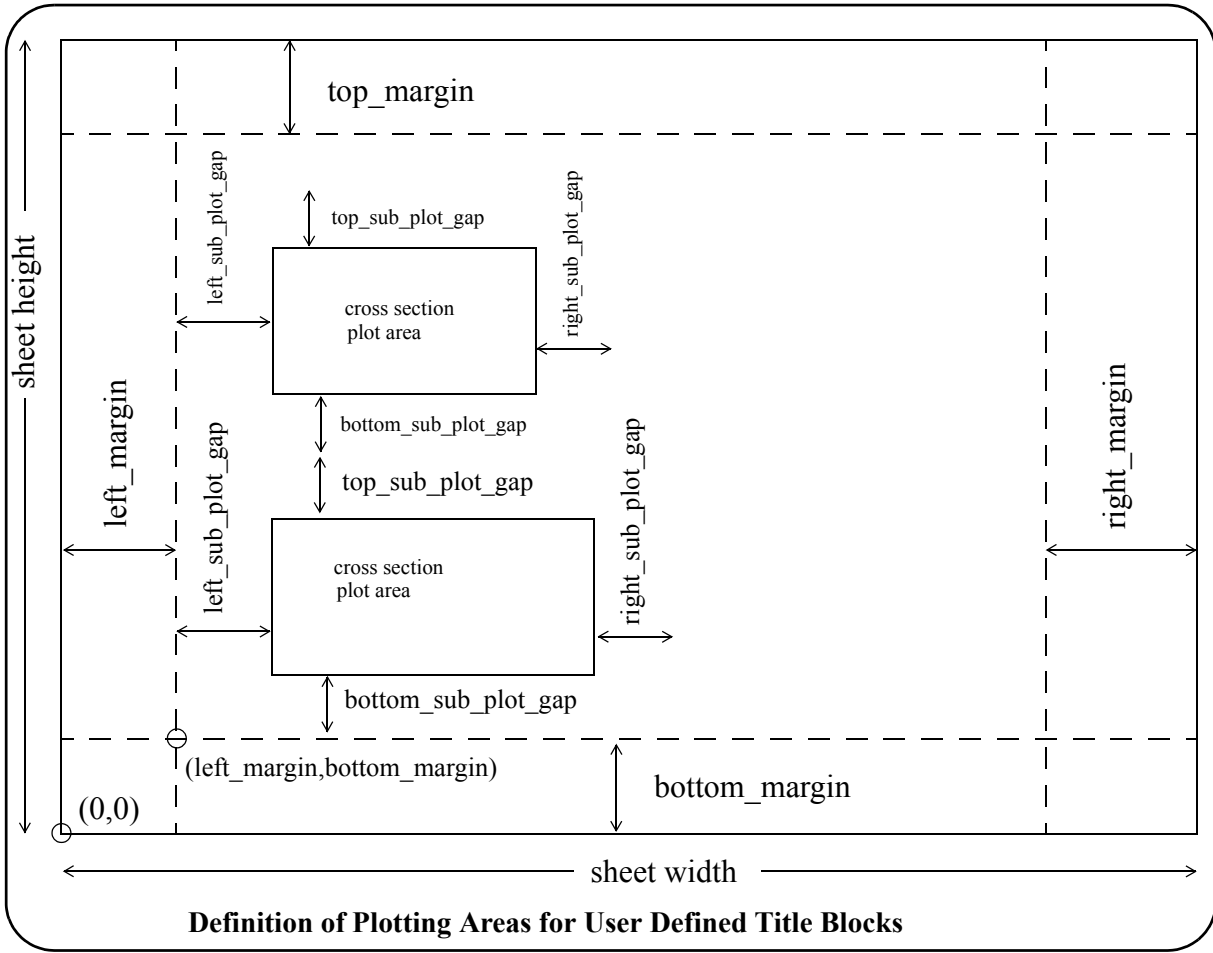

The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the cross section plotting area.

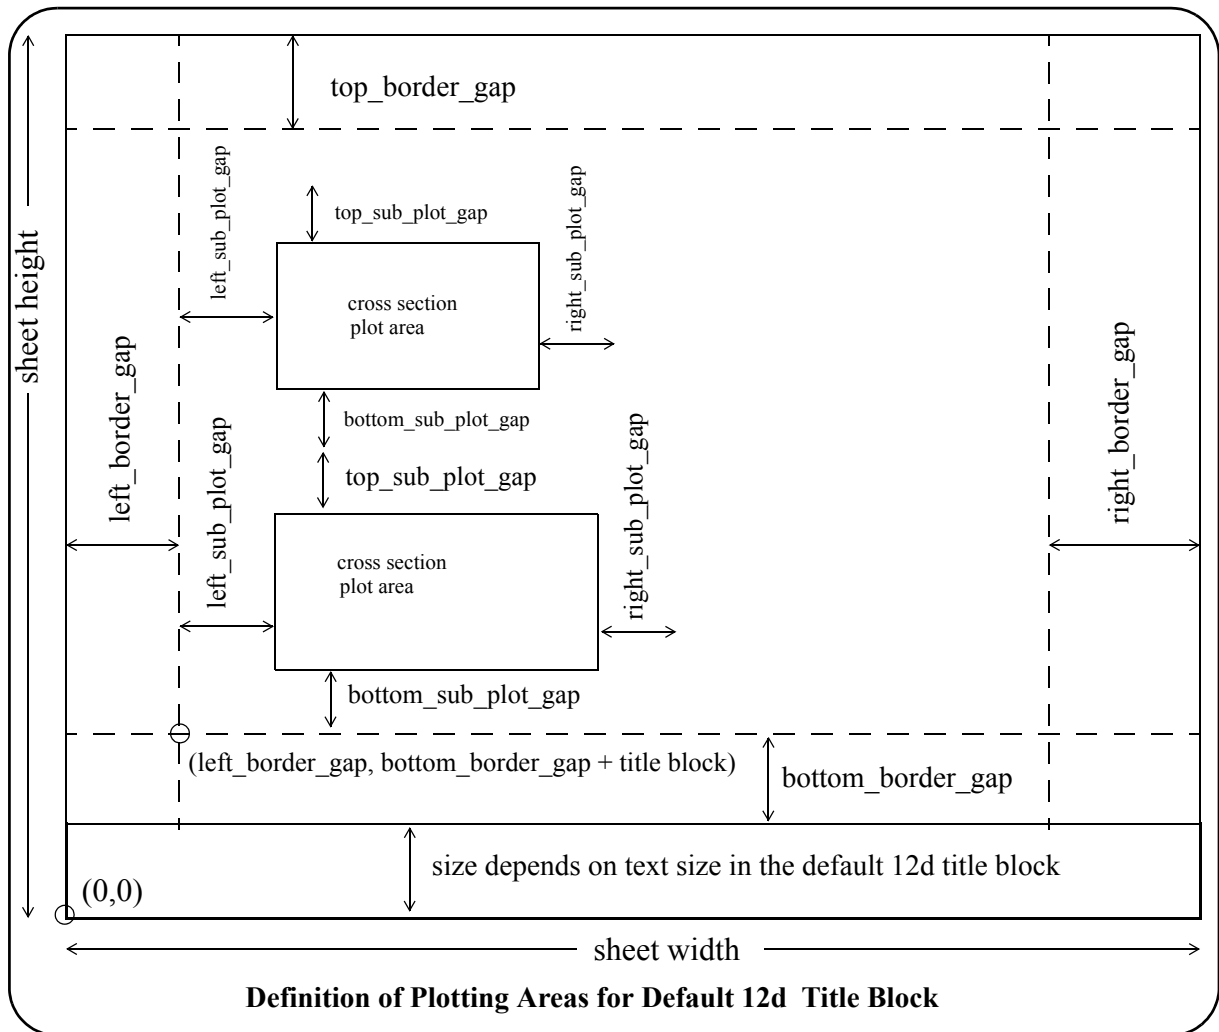

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Each individual x-section sub-plot is positioned with the surrounding gaps:

<code>left_sub_plot_gap</code>	<i>mm</i>
<code>right_sub_plot_gap</code>	<i>mm</i>
<code>top_sub_plot_gap</code>	<i>mm</i>
<code>bottom_sub_plot_gap</code>	<i>mm</i>

If required, all the sub-plots in a column can be automatically positioned up so that the zero offsets (the centrelines) of each x-section line up.

```
line_up_cl          yes/no          // yes - line up zero offsets
```

The width of the plot can be a fixed distance left or right of the centre line (zero offset) or for the full section plus an extra left and right distance:

```
absolute_extensions      yes           // The section goes from the
                           // left_extension offset on the left to the
                           // right_extension offset on the right.
                           no           // The section goes for the entire section
                           // length plus the left and right extension
                           // distances.
```

```

left_extension      world-units      // left extension value
right_extension     world-units      // right extension value

```

The x-section can be drawn and labelled with either

- centreline case - the x-section is plotted and an upright, and the offset and height value at the zero offset (normally the centre line position)
- boxes case - the x-section is plotted and the heights of the x-section and the tins at all the x-section points are labelled in boxes under the plot of the x-section.

The x-section sub-plot itself consists of the three regions - graph, datum and boxes.

The **graph area** is the area where the actual plots of the strings are drawn. This exists for both the centreline and boxes case.

The **datum area** is the region between graph area and the datum line. This exists for both the centreline and boxes cases.

The **boxes area** is where the offset values and the heights for the strings drawn on the x-section plot are labelled. This only exists for the boxes case.

For both cases, the x-section sub-plot can be labelled with other information such as

- (a) grades across the x-section
- (b) points across the x- section
- (c) cuts the x-section makes through strings
- (d) cut and fill areas

All the required parameters will be described in the following sections.

Please continue to the next section [Boxes and Datum Area](#).

Boxes and Datum Area

The x-section can be labelled with either

- (a) an upright, and the offset and height value at the zero offset (normally the centre line position)
- (b) the heights of the x-section and the tins at all the x-section points.

The choice is given by the parameter **label_type**:

```
label_type          "centre line"          // type (a)
                   boxes                    // type (b)
```

A datum line exists for both cases.

For the boxes case, a box area for the offset and heights is created below the datum line. The available parameters for tailoring the box area will be given after describing the datum line parameters.

For the centre line case, the centre line and offset and height of the centre line are shown.

In both cases, the actual cross section plot is drawn above the datum line in the graph area.

Please continue to the next section [Centre Line Case](#) for the centre line parameters.

Please continue to the section [Boxes Case](#) for the boxes parameters.

Centre Line Case

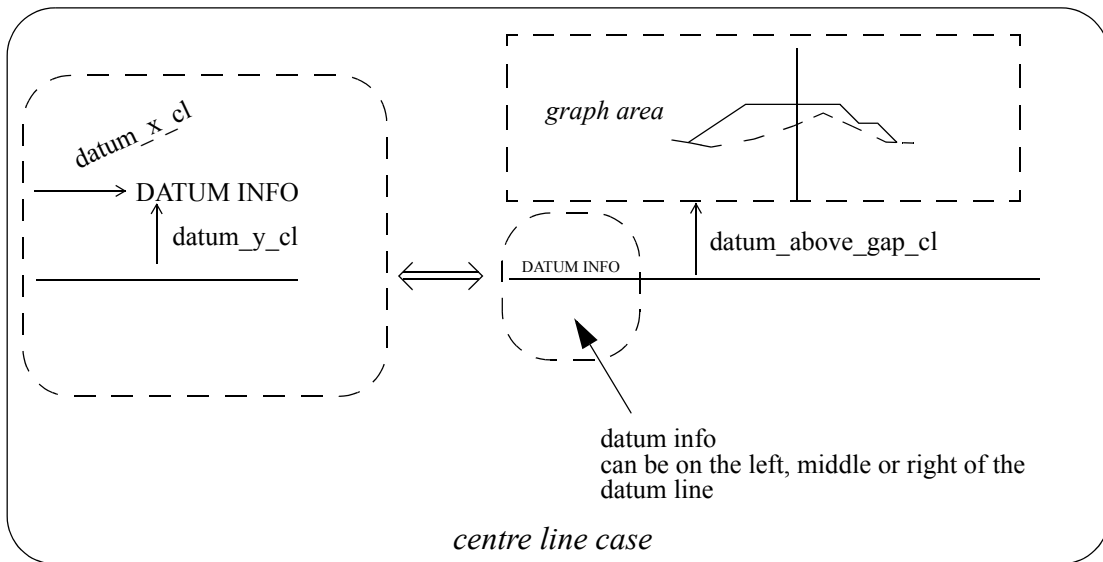

Datum Line

Each x-section sub-plot can be labelled with the datum value for the plot of the x-section string.

This DATUM INFO label is made up of the text strings:

"datum_name" followed by the *datum-value*

and is above the datum line.

For the centreline case, the graph area is positioned the distance **datum_above_gap_cl** above the datum line.

datum_above_gap_cl	<i>mm</i>	// dist from datum line to bottom of the
		// graph area

The **datum_above_gap_cl** can be zero or positive.

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

The datum value can be placed on the left, centre or right side of the datum line.

datum_roundoff	<i>1.0</i>	// value to roundoff the datum value to
		// e.g. 0.5, 0.2, 1.0 (default 1.0)
datum_decimals	<i>integer</i>	// number of decimal places to display
		// the datum value (default 1).
		// If > 0, trailing zeros are removed after
		// the decimal point.
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
datum_side_cl	<i>0</i>	// datum text in middle of datum line
	<i>1</i>	// " " " left of datum line (default)
	<i>2</i>	// " " " right of datum line
datum_linestyle	<i>linestyle</i>	// datum line linestyle (default solid)
datum_name	<i>text</i>	// text to write before the datum value
datum_textstyle	<i>text</i>	// textstyle for datum information
datum_text_size	<i>mm</i>	// size of datum text and value
datum_colour	<i>colour</i>	// colour of the datum text
datum_line_colour	<i>colour</i>	// colour of the datum line
datum_text_justification_cl	<i>just</i>	// justification for datum text
		// NOTE - this is not normally required since
		// by default the text justification is set to
		// match datum_side_cl
datum_x_cl	<i>mm</i>	// distance to move the datum text
		// along the datum line
datum_y_cl	<i>mm</i>	// distance to raise the datum text
		// above the datum line (used to be
		// called datum_offset)

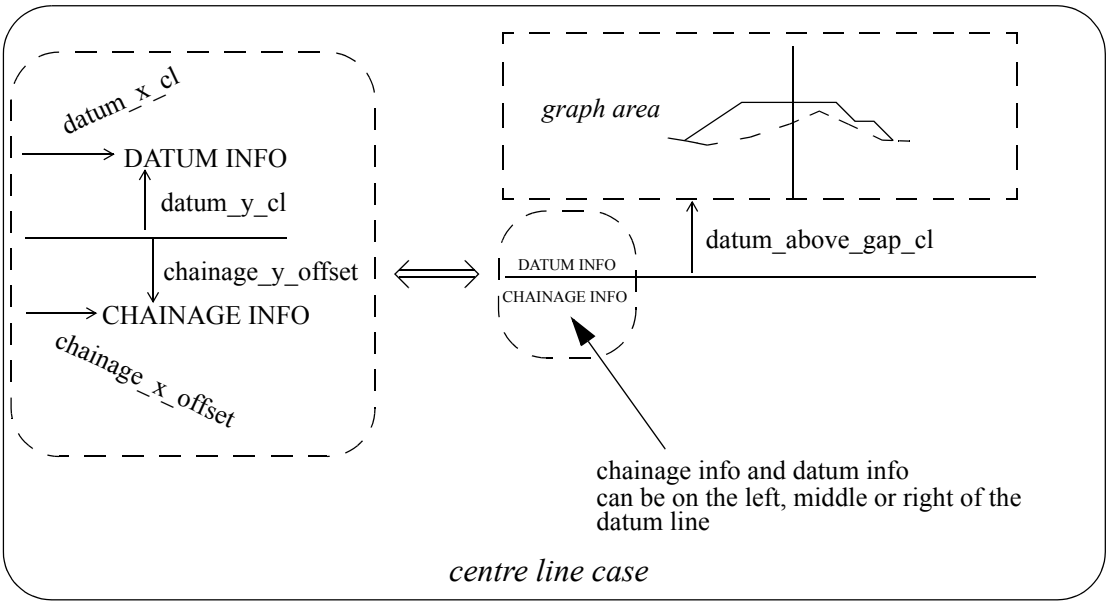

The **datum_x_cl** and **datum_y_cl** can be positive, zero or negative.

Labelling the Centreline Chainage

Each x-section sub-plot can be labelled with the centreline chainage of the x-section string.

This CHAINAGE INFO label is made up of the text strings:

"chainage_title" followed by the *chainage-value*
 and is drawn under the datum line.

The chainage value can be placed on the left, centre or right side of the datum line.

chainage_side_cl	0	// text in middle of datum line (default)
	1	// " " " left of datum line
	2	// " " " right of datum line

The parameters controlling the labelling are:

chainage_label	0/1	// 1 = label sub-plot with centreline // chainage, 0 don't label.
chainage_title	text	// text before the chainage value
chainage_decimals	integer	// number of decimals in the chainage // value. If <0, the absolute value // is taken as the number of decimal // places i.e. no trailing zeros are // removed for the values in the // chainage values.

chainage_colour	colour	// colour of the text
chainage_size	mm	// size of the text
chainage_textstyle	colour	// textstyle for the chainage label
chainage_text_justification_cl	just	// justification of the chainage text
chainage_x_offset	mm	// x position of text
chainage_y_offset	mm	// y position of text

The *chainage_x_offset* is measured from the beginning of the datum line.

The *chainage_y_offset* is measured from the bottom of the datum line with positive being **down**.

Centre Line Linestyle

The upright at the centre line position can have its own linestyle.

cl_linestyle *linestyle* //linestyle for centreline

Labelling the Design Height, X and Y Co-ordinates and Tin Heights at Offset Zero

The values of the height and X and Y co-ordinates of the **primary string** (usually the design cross section) at the zero offset can be labelled. Note that zero offset is normally where the alignment string cuts the cross section.

The heights of any tins (such as the natural surface) at the zero offset can also be labelled.

The labels are made up of:

pre_text value post_text

where *value* is either a height or a co-ordinate.

The label is positioned at either the left, right or middle of the datum line, with an x and y adjustment and a rotation.

Parameters for labelling the X Co-ordinate at Zero Offset:

primary_x0_draw_mode	0	// don't draw the label -default
	1	// draw the label
primary_x0_position	0	// label in middle of datum line (default)
	1	// " " " " left of datum line
	2	// " " " " right of datum line
primary_x0_pre_text	text	// pre-text for label - def " "
primary_x0_post_text	text	// post-text for label - def " "
primary_x0_decimals	integer	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
primary_x0_x	mm	// x adjustment to position of label - def 0
primary_x0_y	mm	// y adjustment to position of label - def 0
primary_x0_angle	degrees	// angle of the label - def 0
primary_x0_colour	colour	// colour of the label
primary_x0_size	mm	// size (in mm) of the label
primary_x0_textstyle	textstyle	// textstyle of the label
primary_x0_justify	just	// justification for text

Parameters for Labelling the Y Co-ordinate at Zero Offset:

primary_y0_draw_mode	0	// don't draw the label -default
	1	// draw the label
primary_y0_position	0	// label in middle of datum line (default)
	1	// " " " " left of datum line

	2	// " " " " right of datum line
primary_y0_pre_text	text	// pre-text for label - def " "
primary_y0_post_text	text	// post-text for label - def " "
primary_y0_decimals	integer	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
primary_y0_x	mm	// x adjustment to position of label - def 0
primary_y0_y	mm	// y adjustment to position of label - def 0
primary_y0_angle	degrees	// angle of the label - def 0
primary_y0_colour	colour	// colour of the label
primary_y0_size	mm	// size (in mm) of the label
primary_y0_textstyle	textstyle	// textstyle of the label
primary_y0_justify	just	// justification for text

Parameters for Labelling the Height of Primary String at Zero Offset:

primary_height_draw_mode	0	// don't draw the label -default
	1	// draw the label
primary_height_position	0	// label in middle of datum line (default)
	1	// " " " " left of datum line
	2	// " " " " right of datum line
primary_height_pre_text	text	// pre-text for label - def " "
primary_height_post_text	text	// post-text for label - def " "
primary_height_decimals	integer	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
primary_height_x	mm	// x adjustment to position of label - def 0
primary_height_y	mm	// y adjustment to position of label - def 0
primary_height_angle	degrees	// angle of the label - def 0
primary_height_colour	colour	// colour of the label
primary_height_size	mm	// size (in mm) of the label
primary_height_textstyle	textstyle	// textstyle of the label
primary_height_justify	just	// justification for text

Parameters for Placing Some Text:

extra_text_draw_mode	0	// don't draw the label -default
	1	// draw the label
extra_text_position	0	// label in middle of datum line (default)
	1	// " " " " left of datum line
	2	// " " " " right of datum line
extra_text	text	// text for label - def " "
extra_text_x	mm	// x adjustment to position of label - def 0
extra_text_y	mm	// y adjustment to position of label - def 0
extra_text_angle	degrees	// angle of the label - def 0
extra_text_colour	colour	// colour of the label
extra_text_size	mm	// size (in mm) of the label
extra_text_textstyle	textstyle	// textstyle of the label
extra_text_justify	just	// justification for text

Parameters for Labelling the Height of a Tin at Zero Offset:

A section along the primary string through each tin on the section view is automatically drawn on

the cross section plot but the user can specify whether the tin height at the zero offset is labelled or not.

Hence although there may be a number of tins drawn on the section plot, not all of them need to have their height at zero offset labelled.

The default order for labelling the tins is the order that they were added to the view but it is possible to specify which tin is used for labelling by giving the tin name rather than just using the tin on the section view.

In fact, it is possible to use **any tin** in the project **to label** the height at zero offset, **not just those drawn** on the section view.

tin_n_name	text	// n=1, ... no of tins on the section view.
		// use the tin called <i>text</i> to label the nth
		// row of tin heights.

If a tin of the name given by **tin_n_name** does not exist, then the plot is not produced and an error message is given.

The parameters for labelling the height of the tin at zero offset are:

tin_n_height_draw_mode	0	// don't draw the label -default
	1	// draw the label
tin_n_height_position	0	// label in middle of datum line (default)
	1	// " " " left of datum line
	2	// " " " right of datum line
tin_n_height_pre_text	text	// pre-text for label - def " "
tin_n_height_post_text	text	// post-text for label - def " "
tin_n_height_decimals	integer	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
tin_n_height_x	mm	// x adjustment to position of label - def 0
tin_n_height_y	mm	// y adjustment to position of label - def 0
tin_n_height_angle	degrees	// angle of the label - def 0
tin_n_height_colour	colour	// colour of the label
tin_n_height_size	mm	// size (in mm) of the label
tin_n_height_textstyle	textstyle	// textstyle of the label

Labelling the Centre Line Offset and Height

In the centre line case, the value of the height of the **primary string** (usually the design cross section) at the zero offset can be labelled. This is normally where the alignment string cuts the cross section.

The label is made up of the texts:

primary_title offset_title offset_value height_text height_value

NOTE: These parameters have now been superseded. The parameters for labelling the height of the primary string at zero offset covers this case. To use the zero offset parameters instead, the *primary_height_pre_text* would include all text required for the Primary_title, offset_title, offset_value and height_text (offset_value is always 0.0).

The parameter *primary_mode_cl* controls whether the **primary_title** is included in the label.

primary_mode_cl	0	// don't include primary_title, primary_value
	1	// incl. primary_title, primary_value default

The parameter *height_mode_cl* controls whether the **height_title** and **height_value** are included in the label.

height_mode_cl	0	// don't include height_title, height_value
	1	// include height_title, height_value default

The parameter *offset_mode_cl* controls whether the **offset_title** and **offset_value** are included in the label.

offset_mode_cl	0	// don't include offset_title, offset_value
	1	// include offset_title, offset_value default

The label can be placed on the left, centre of right side of the datum line.

offset_height_side_cl	0	// text in middle of datum line (default)
	1	// " " " " left of datum line
	2	// " " " " right of datum line

The size, colour, text justification and text style for the label is given by:

primary_title	text	//primary title
offset_title	text	// offset label (default "Offset")
height_text	text	// height text label (default "Height")
primary_textstyle	textstyle	// textstyle used for offset and height
		// label
primary_colour	colour	//colour for offset and height label
primary_size	mm	//size of the offset and height label
offset_height_text_justification_cl	justif	// text justification
		// NOTE - this is not normally required since
		// by default the text justification is set to
		// match offset_height_side_cl

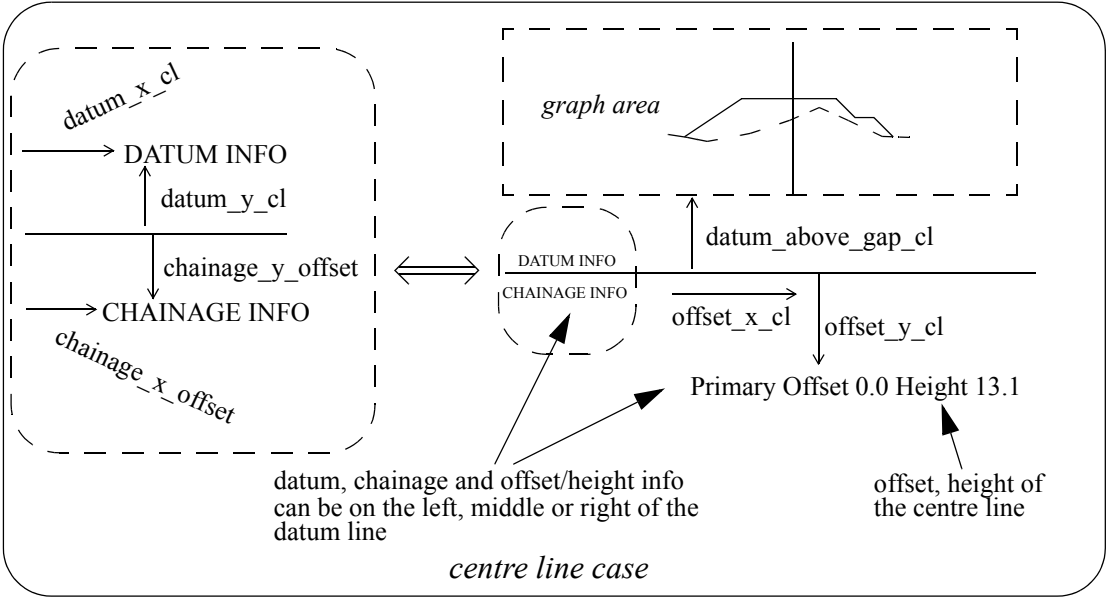

The number of decimals in the offset-value and height-value is controlled by:

number_of_decimals	integer	// number of decimal places in the offset,
		// height boxes. If <0, the absolute value
		// is taken as the number of decimal
		// places i.e. no trailing zeros are
		// removed for the values in the offset,
		// heights area.

The label is placed an distance *offset_x_cl* along the datum line and a distance *offset_y_cl* below the datum line of the plot.

offset_x_cl	mm	// distance to move the text along the
		// datum line
offset_y_cl	mm	// distance to shift the text below the
		// datum line

The `offset_y_cl` is measured from the datum line with positive being **down**.

Please continue to the next section [Boxes Case](#) for the boxes parameters.

Please continue to the section [Graph Area](#) if you are not using boxes parameters.

Boxes Case

Datum Line

For the boxes case, the **datum line** is positioned the distance ***datum_below_gap*** above the top of the boxes area and the graph area is then positioned the distance ***datum_above_gap*** above the datum line.

Hence the graph area is distance (*datum_below_gap* + *datum_above_gap*) above the top of the boxes area.

<i>datum_above_gap</i>	<i>mm</i>	// dist from datum line to bottom of the // graph area
<i>datum_below_gap</i>	<i>mm</i>	// dist from datum line to the top of the // boxes
<i>datum_linestyle</i>	<i>linestyle</i>	//linestyle for the datum line

The *datum_below_gap* and *datum_above_gap* can be zero or positive.

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

<i>datum_roundoff</i>	<i>1.0</i>	// value to roundoff the datum value to // e.g. 0.5, 0.2, 1.0 (default 1.0)
<i>datum_decimals</i>	<i>integer</i>	// number of decimal places to display // the datum value (default 1). // If > 0, trailing zeros are removed after // the decimal point. // If <0, the absolute value is taken as the // number of decimal places to report // i.e. no trailing zeros are removed
<i>datum_name</i>	<i>text</i>	// text to write before the datum value
<i>datum_textstyle</i>	<i>text</i>	// textstyle for datum information
<i>datum_text_size</i>	<i>mm</i>	// size of datum text and value
<i>datum_colour</i>	<i>colour</i>	// colour of the datum text
<i>datum_line_colour</i>	<i>colour</i>	// colour of the datum line
<i>datum_x</i>	<i>mm</i>	// distance to move the datum text // along the datum line
<i>datum_y</i>	<i>mm</i>	// distance to raise the datum text // above the datum line (used to be // called <i>datum_offset</i>)

The *datum_x* and *datum_y* can be positive, zero or negative.

Labelling the Centreline Chainage

Each x-section sub-plot can be labelled with the centreline chainage of the x-section string.

This CHAINAGE INFO label is made up of the text strings:

"chainage_title" followed by the *chainage-value*
and is drawn under the boxes area.

The parameters controlling the labelling are:

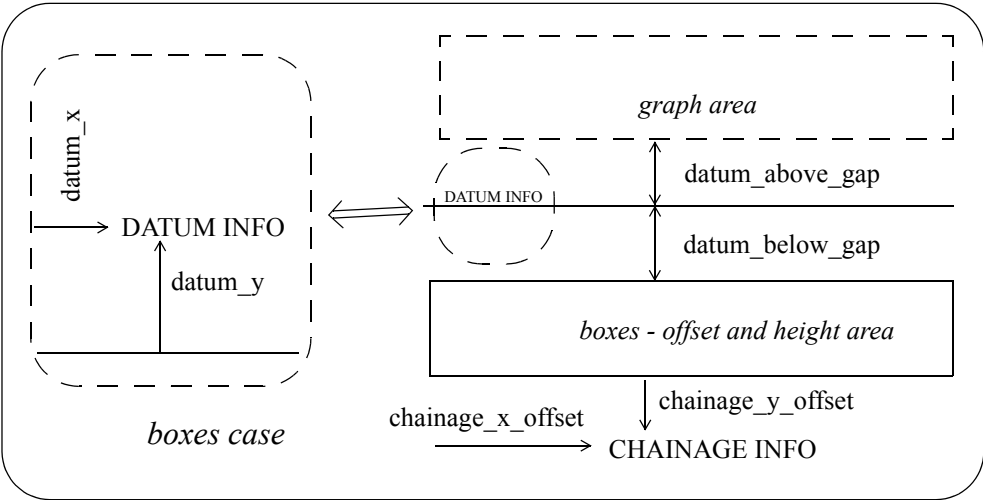

<i>chainage_label</i>	<i>0/1</i>	// 1 = label sub-plot with centreline // chainage, 0 don't label.
<i>chainage_title</i>	<i>text</i>	// text before the chainage value
<i>chainage_decimals</i>	<i>integer</i>	// number of decimals in the chainage // value. If <0, the absolute value // is taken as the number of decimal // places i.e. no trailing zeros are // removed for the values in the

		// chainage values.
chainage_size	mm	// size of the text
chainage_textstyle	colour	// textstyle for the chainage label
chainage_text_justification	just	// justification of the chainage text
chainage_colour	colour	// colour of the text
chainage_x_offset	mm	// x position of text
chainage_y_offset	mm	// y position of text

The *chainage_x_offset* is measured from the beginning of the height boxes.

If *chainage_x_offset* is omitted, the text is centred on heights area.

The *chainage_y_offset* is measured from the bottom of the box area with positive being **down**.

Defining Boxes

When **boxes** is selected for *label_type*, the primary string (usually the design cross section) and each tin in the x-section sub-plot can be labelled with one or two lines of title, and the height at the offset position for each point in the primary string.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The offsets/heights are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **offset/height values** across the string/tin.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

- (a) offset title and values
- (b) tin title and heights - natural surface etc. (optional)
- (c) primary string title and heights - design x-section (optional)

The **title area** starts at the relative position (`left_sub_plot_gap`,`bottom_sub_plot_gap`).

The size of the title text is given by the **`title_box_text_size`** parameter.

The width of the title area is either given by the **`space_for_titles`** parameter, or if omitted, the required width is automatically calculated.

<code>title_box_text_size</code>	<i>mm</i>	// size of the titles in the boxes
<code>space_for_titles</code>	<i>mm</i>	// calculated if omitted

There can be two lines of title text and the title text, textstyle and colour can be set independently for the primary string and each tin.

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

<code>box_titles_x</code>	<i>mm</i>	// distance to move the title text from the // left hand side of the boxes
---------------------------	-----------	-------------------------------------------------------------------------------

The **heights area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (**`box_text_justification`**).

The number of decimal places and the size of the heights text can also be specified.

The height of each individual box area is either given by the **`horizontal_line_spacing`** parameter, or if omitted, the required height is automatically calculated.

<code>number_of_decimals</code>	<i>integer</i>	// number of decimal places in the // height boxes. If <0, the absolute value // is taken as the number of decimal // places i.e. no trailing zeros are // removed for the values in the heights // area.
<code>text_size</code>	<i>mm</i>	// size of the height values
<code>offset_textstyle</code>	<i>textstyle</i>	// textstyle for height text
<code>offset_colour</code>	<i>colour</i>	// colour of height text
<code>box_text_justification</code>	0	// bottom of individual boxes
	1	// top of individual boxes
<code>horizontal_line_spacing</code>	<i>mm</i>	// calculated if omitted

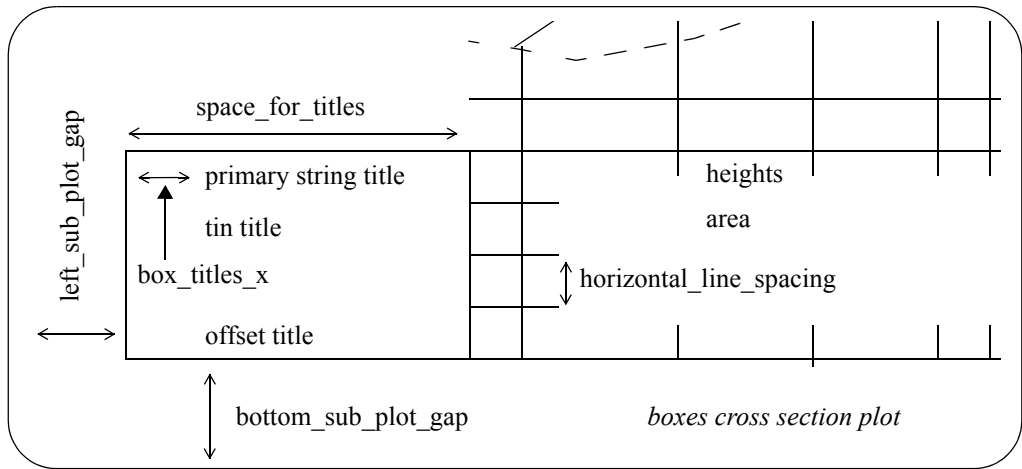

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of one box (they all have the same height).

The **width** of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the labels area plus the width of the

heights area.

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area.

The text in the title area is the same for each cross section plot on the sheet so it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections.

label_first_only	0	//title area on all x-sections (default)
	1	// title area on first x-sect of page only
	2	// title area on x-sects in first column

The drawing of the box line work is user defined. This has been extended from V3.1 although *draw_box_mode* has been left in for upward compatibility.

draw_box_mode	0	// don't draw box lines
	1	// draw box lines around heights area
		// only
	2	// draw box lines around title and
		// heights areas
	3	// use draw_box_side_n,
		// box_line_draw_mode and
		// box_line_mode_n

box_colour	colour	// colour of the boxes
------------	--------	------------------------

For V3.2, the line work for the outside of the title and heights boxes is controlled by the parameters *draw_box_side_n* and *box_side_colour_n*, and the separation lines inside the boxes are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n* where the box numbering, n, starts from the bottom box.

Note: The following parameters are only used if *draw_box_mode* is set to 3.

draw_box_side_1	1	// draw the left side of the title area (def)
	0	// don't draw the left side
box_side_colour_1	colour	// colour to draw left side of title area
		// default box_colour
draw_box_side_2	1	// draw top of the title area (default)
	0	// don't draw the top
box_side_colour_2	colour	// colour to draw top of title area
		// default box_colour
draw_box_side_4	1	// draw bottom of the title area (default)

	0	// don't draw the bottom
box_side_colour_4	colour	// colour to draw bottom of title area
		// default box_colour
draw_box_side_5	1	// draw left side of the heights area (def)
	0	// don't draw the left side
box_side_colour_5	colour	// colour to draw left side of heights area
		// default box_colour
draw_box_side_6	1	// draw top of the heights area (default)
	0	// don't draw the top
box_side_colour_6	colour	// colour to draw top of heights area
		// default box_colour
draw_box_side_7	1	// draw right side of the heights area def
	0	// don't draw the right side
box_side_colour_7	colour	// colour for right side of heights area
		// default box_colour
draw_box_side_8	1	// draw bottom of the heights area (def)
	0	// don't draw the bottom
box_side_colour_8	colour	// colour for bottom of heights area
		// default box_colour

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

The separation lines can be drawn just in the title area, just in the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where *n* = 1, ... number of boxes -1.

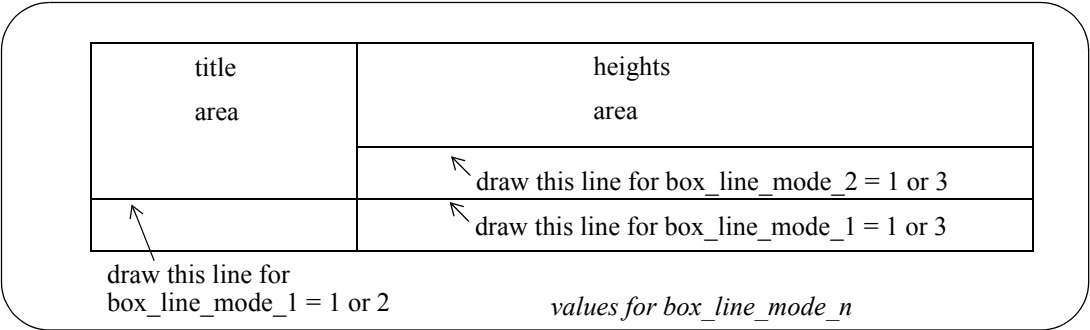

The top of the top box is not controlled by *box_line_mode_n* but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6*.

box_line_draw_mode	0	// don't draw any separation lines inside
		// the title and heights areas
	1	// draw the separation lines inside the
		// title and heights areas (default)
	2	// draw the separation lines inside the
		// title area only
	3	// draw the separation lines inside the
		// heights area only
box_line_mode_n	0	// for the nth box, don't draw any
		// line at the top of the box for either
		// the title or the heights areas
	1	// for the nth box, draw the line at the
		// top of the box for both the

2

3

// title and heights areas
// for the nth box, draw the line at the
// top of the box for the title area only
// for the nth box, draw the line at the
// top of the box for the heights area only

Finally, the right hand end of the boxes can stop at the end of the design x-section or extend to the end of the *right_extension* distance.

box_extension_mode

0

1

// default - stop right end of boxes at the
// end of design x-section
// extend right end of boxes to the end of
// the right_extension distance.

Offset Titles and Values

If the **label_type** is set to boxes, the offsets of the points across the primary string (usually the design cross section) are always labelled.

offset_title	<i>text</i>	// first line of offset title (def offsets)
offset_title_2	<i>text</i>	// second line of offset title
offset_title_textstyle	<i>textstyle</i>	// textstyle for offset title
offset_title_colour	<i>colour</i>	// offset title text colour
offset_title_size	<i>mm</i>	// offset title text size
offset_colour	<i>colour</i>	// colour of offset values
offset_textstyle	<i>textstyle</i>	// textstyle for offset values
offset_size	<i>mm</i>	// size for offset values

Example of Offset Titles Parameters

```
// offset titles and values
```

```
offset_title      "Offset"
offset_title_2    "metres"
offset_title_colour grey
```

Primary String Titles and Heights

Sometimes the primary string (the design cross section) is only required to define the offset positions to label and the section line for the tin sections. In this case, the primary string would not be drawn on the cross section plot.

The drawing or not drawing of the primary string on each cross section plot is controlled by the parameter *primary_string*.

If the primary string is drawn, by default a row of labelling is included in the boxes area with up to two lines of title information and heights for each point across the cross section.

primary_string	<i>yes</i>	// draw and label the primary string
	<i>no</i>	// don't draw or label the primary string
primary_title	<i>text</i>	// first line of string title
primary_title_2	<i>text</i>	// second line of string title
primary_title_textstyle	<i>textstyle</i>	// textstyle for primary string titles
primary_title_colour	<i>colour</i>	// colour of the string titles
primary_title_size	<i>mm</i>	// primary title text size
primary_textstyle	<i>textstyle</i>	// textstyle for primary string heights
primary_title_y_pos	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // primary title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the primary title.
primary_colour	<i>colour</i>	// colour of the primary string heights
primary_size	<i>mm</i>	// primary text size
primary_y_pos	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // primary height text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the primary height text.
primary_decimals	<i>integer</i>	// number of dec places in primary height // < 0 to keep all trailing zeros

Example of Labelling Primary String Titles

primary_title	“Design”	
// primary_title_2	“primary2”	// not being used - commented out
primary_colour	“purple”	
primary_title_colour	“red”	

Tin Titles, Heights and Depths

A section along the primary string through each tin on the section view is automatically drawn on the cross section plot, but the user can specify whether the tin heights and depths are labelled or not in the boxes area.

Hence although there may be a number of tins drawn on the section plot, not all of them need to be labelled or have their depths labelled.

The default order for labelling the tins and depths is the order that they were added to the view but it is possible to specify which tin is used for labelling each row of tin heights and depths by giving the tin name rather than just using the tin order on the section view.

In fact, it is possible to use **any tin** in the project **to label** a row, **not just those drawn** on the section view.

tin_n_name	text	// n=1, ... no of tins on the section view. // use the tin called <i>text</i> to label the nth // row of tin heights.
------------	------	-----------------------------------------------------------------------------------------------------------------------------

If a tin of the name given by **tin_n_name** does not exist, then the plot is not produced and an error message is given.

For the following parameters, n takes the value 1 to 100 and specifies that the parameter set applies to the *n*th tin on the section view or if *tin_n_name* is set, by the tin specified by *tin_n_name*.

tin_n_draw_mode	1	// draw the nth tin (default))
	0	// don't draw the nth tin
tin_n_draw_colour	colour	// colour to draw the nth tin // if omitted then use the tin colour
tin_n_label	1	// label the nth tin (default)
	0	// don't label the nth tin
tin_n_title	text	// first line of nth tin title
tin_n_title_2	text	// second line of nth tin title
tin_n_title_textstyle	textstyle	// textstyle for nth tin titles
tin_n_title_colour	colour	// colour for nth tin titles
tin_n_title_size	mm	// size for nth tin titles
tin_n_title_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // tin title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the tin heights.
tin_n_decimals	integer	// number of dec places in tin height // < 0 to keep all trailing zeros
tin_n_textstyle	textstyle	// textstyle of the tin heights
tin_n_colour	colour	// colour for heights and depths
tin_n_size	mm	// default nth tin's title size
tin_n_y_pos	mm	//if set, the height in mm above the //bottom of all the boxes that the // tin height text is drawn. //If not set, then the text is placed at a //height that puts it inside the default // box for the tin heights.
tin_n_depth_label	1/0	// 1 to label, 0 don't label depths
tin_n_depth_title	text	// first line of tin depth title
tin_n_depth_title_2	text	// second line of tin depth title
tin_n_depth_title_textstyle	textstyle	// textstyle of the tin depth titles
tin_n_depth_title_colour	colour	// colour for titles of depths

tin_n_depth_title_size	mm	// size for title of depths
tin_n_depth_title_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // tin depth title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the tin heights.
tin_n_depth_decimals	integer	// number of dec places in tin height // < 0 to keep all trailing zeros
tin_n_depth_textstyle	textstyle	// textstyle of the tin depths
tin_n_depth_colour	colour	// colour for depths
tin_n_depth_size	mm	// size for depths
tin_n_depth_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // tin depth text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the tin heights.

Definition of Depth to a Tin or to Offset Strings

The depth from the primary string to a tin, at a particular offset is defined as

depth = tin height value - height of the primary string

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

```
if (depth >= 0)  plotted_depth_value = depth * depth_positive_factor
if (depth < 0)   plotted_depth_value = depth * depth_negative_factor
```

Hence the definition of depth can be modified by the parameters:

depth_positive_factor	value	// multiplier for positive depths
depth_negative_factor	value	// multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

depth = height of the primary string - tin height value

simply set

```
depth_positive_factor  -1
depth_negative_factor- 1
```

Example of Labelling Tins

```
// tin label 1 for on
//           0 for off

tin_1_label      1
tin_1_title      "Natural"
// tin_1_title_2  "Surface"
tin_1_colour     grey
tin_1_title_colour red
```

tin_2_label	1
tin_2_title	“Water table”
tin_2_colour	grey
tin_2_title_colour	red

Labelling the Design Height, X and Y Co-ordinates and Tin Heights at Offset Zero

The values of the height and X and Y co-ordinates of the **primary string** (usually the design cross section) at the zero offset can be labelled. Note that zero offset is normally where the alignment string cuts the cross section.

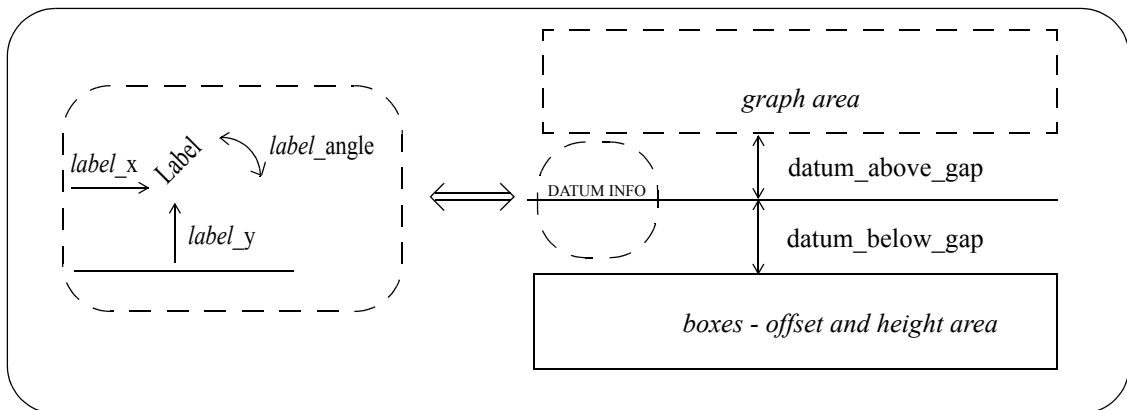

The heights of any tins (such as the natural surface) at the zero offset can also be labelled.

The labels are made up of:

```
pre_text  value  post_text
```

where *value* is either a height or a co-ordinate.

The label is positioned at either the left, right or middle of the datum line, with an x and y adjustment and a rotation.

Parameters for labelling the X Co-ordinate at Zero Offset:

primary_x0_draw_mode	<i>0</i>	// don't draw the label -default
	<i>1</i>	// draw the label
primary_x0_pre_text	<i>text</i>	// pre-text for label - def " "
primary_x0_post_text	<i>text</i>	// post-text for label - def " "
primary_x0_decimals	<i>integer</i>	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
primary_x0_x	<i>mm</i>	// x adjustment to position of label - def 0
primary_x0_y	<i>mm</i>	// y adjustment to position of label - def 0
primary_x0_angle	<i>degrees</i>	// angle of the label - def 0
primary_x0_colour	<i>colour</i>	// colour of the label
primary_x0_size	<i>mm</i>	// size (in mm) of the label
primary_x0_textstyle	<i>textstyle</i>	// textstyle of the label
primary_x0_justify	<i>just</i>	// justification for text

Parameters for Labelling the Y Co-ordinate at Zero Offset:

primary_y0_draw_mode	<i>0</i>	// don't draw the label -default
	<i>1</i>	// draw the label
primary y0 pre text	<i>text</i>	// pre-text for label - def " "

primary_y0_post_text	<i>text</i>	// post-text for label - def " "
primary_y0_decimals	<i>integer</i>	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
primary_y0_x	<i>mm</i>	// x adjustment to position of label - def 0
primary_y0_y	<i>mm</i>	// y adjustment to position of label - def 0
primary_y0_angle	<i>degrees</i>	// angle of the label - def 0
primary_y0_colour	<i>colour</i>	// colour of the label
primary_y0_size	<i>mm</i>	// size (in mm) of the label
primary_y0_textstyle	<i>textstyle</i>	// textstyle of the label
primary_y0_justify	<i>just</i>	// justification for text

Parameters for Labelling the Height of Primary String at Zero Offset:

primary_height_draw_mode	<i>0</i>	// don't draw the label -default
	<i>1</i>	// draw the label
primary_height_pre_text	<i>text</i>	// pre-text for label - def " "
primary_height_post_text	<i>text</i>	// post-text for label - def " "
primary_height_decimals	<i>integer</i>	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
primary_height_x	<i>mm</i>	// x adjustment to position of label - def 0
primary_height_y	<i>mm</i>	// y adjustment to position of label - def 0
primary_height_angle	<i>degrees</i>	// angle of the label - def 0
primary_height_colour	<i>colour</i>	// colour of the label
primary_height_size	<i>mm</i>	// size (in mm) of the label
primary_height_textstyle	<i>textstyle</i>	// textstyle of the label
primary_height_justify	<i>just</i>	// justification for text

Parameters for Placing Some Text:

extra_text_draw_mode	<i>0</i>	// don't draw the label -default
	<i>1</i>	// draw the label
extra_text_pre_text	<i>text</i>	// pre-text for label - def " "
extra_text_post_text	<i>text</i>	// post-text for label - def " "
extra_text_decimals	<i>integer</i>	// number of decimal places to display - def 1
		// If > 0, trailing zeros are removed after
		// the decimal point
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed
extra_text_x	<i>mm</i>	// x adjustment to position of label - def 0
extra_text_y	<i>mm</i>	// y adjustment to position of label - def 0
extra_text_angle	<i>degrees</i>	// angle of the label - def 0
extra_text_colour	<i>colour</i>	// colour of the label
extra_text_size	<i>mm</i>	// size (in mm) of the label
extra_text_textstyle	<i>textstyle</i>	// textstyle of the label
extra_text_justify	<i>just</i>	// justification for text

Offset Selection for Uprights and Staggering of Heights

For each sub-plot, the offsets of the points across the x-section string (primary string) are used for positioning uprights (leader lines), and the offset and height labels for the uprights.

By default, there is an upright at each point across the primary string.

However, if the primary string is a 4d string, then the text at the points on the 4d string can be used as a key to **suppress** the labelling and upright at that point.

The parameters to **stop** labelling and uprights are:

mask_name_n *4d_string_point_text* where n=1,100

Note -the text `4d_string_point_text` can include wild cards (*) and characters (?).

After any *name masks* have been applied, it is often desirable to weed out offset values that are too close together before doing any labelling.

[illegible]

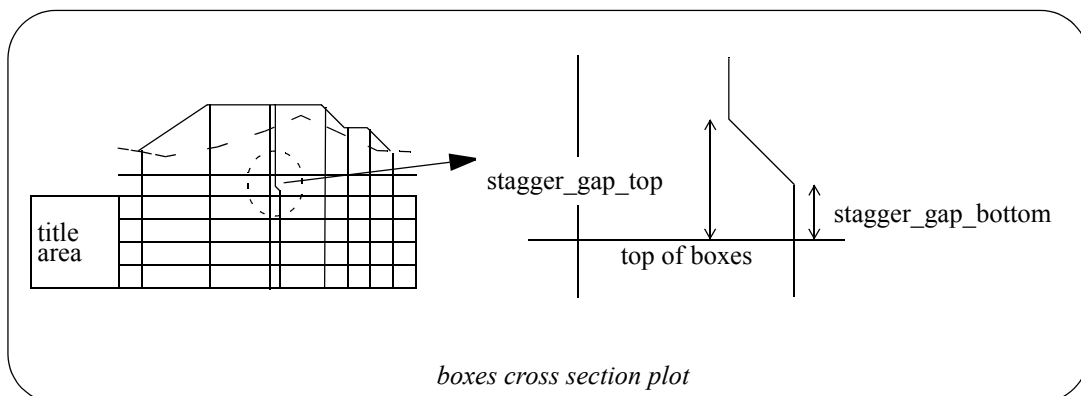

If the real offset position is used for the horizontal position of the offset/height text, text over writing can easily occur. To prevent over writing, the text is automatically **staggered**.

When staggering occurs, the real offset position is then indicated by the offset markers which are drawn at the top of the text boxes from the staggered text position back to the actual offset position of the text.

The size and position of the staggers are given by:

stagger_gap_top	<i>mm</i>	// distance from boxes to top of stagger
stagger_gap_bottom	<i>mm</i>	// distance from boxes to bottom of stagger
		// stagger
stagger_gap_factor	<i>value</i>	// distance between staggers is box text size * stagger gap factor

When staggering occurs, it is possible for the heights area to be wider than the graph area.

Uprights

Uprights (leader lines) can be drawn from the top of the staggers to strings drawn on the plot.
The height of the uprights is given by the ***uprights_draw_mode***:

uprights_draw_mode	0	// none
	1	// to maximum string height at that // chainage
	2	// ticks, to stagger height
	3	// to uprights_y above the boxes
	100	// to the primary string
	101-500	// to tin1 or tin2 etc.
uprights_y	mm	// distance to draw the uprights for // mode 3
uprights_colour	colour	// uprights colour (def boxes colour)
The uprights can go below the top of the boxes.		
uprights_bottom_mode	0	// stop at top of boxes (default)
	1	// draw to bottom of boxes
	2	// draw to uprights_bottom_y below the // top of the boxes
	3	// draw to uprights_bottom_y above the // bottom of the boxes
	4	// ticks at chainage
uprights_bottom_y	mm	//distance
uprights_text_offset_factor	value	// move the text by this factor*size

When uprights go below the top of the boxes, the height and offset text is moved to the left so that the upright does not go through the text. The left hand side of the heights boxes also moves to the left to leave room for the height text.

Please continue to the next section [Graph Area](#).

Graph Area

The **graph area** for each section sub-plot is the area where the actual plot of the x-section string is drawn.

The **width** of the graph area is determined by the width of the x-section string being plotted, the left and right extensions and horizontal scale (scale) given by parameters or in the **section x plot** panel, and the vertical exaggeration given by the section view or a parameter.

view_name	text	// default is section view in panel.
vertical_exaggeration	value	// default is vertical exag for view
scale	value	// 1:value - horizontal scale, default is
		// scale 1: in panel.
left_extension	world-units	// left extension value
right_extension	world-units	// right extension value

The vertical scale is determined by the horizontal scale and the vertical exaggeration.

The **height** of the graph area is determined by the vertical scale (given by the horizontal scale and the vertical exaggeration) and the minimum and maximum values of the data being plotted. Hence the graph height is a calculated rather than a given value.

The size of the graph area can also be extended to allow for symbols by the parameters:

extra_space_units	0	// extra space values are world units - default
	1	// " " " are millimetres on plot page
extra_space_left	units	// subtract from left of plot area, def 0
extra_space_right	units	// add to right of plot area, default 0
extra_space_top	units	// add to top of plot area, default 0
extra_space_bottom	units	// subtract from bottom of plot area,
		// default 0

The types of strings that are drawn in the graph area of a cross section plot are:

- (a) **primary string** the x-section string from the x-section model that is being drawn.
Called the primary string and is usually the design x-section.
- (b) **tins** sections of the primary string through any tins either in models on the section view or in corridor models.
- (c) **services** parts of strings (from either models on the section view or in corridor models) that cut the defined corridor.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

Although all the strings are plotted, the plot parameter file can be used to select which ones are

labelled with heights.

Primary String (Design Cross Section)

The primary string (the design cross section) is used to define

- (a) the design cross section
- (b) the chainage of the section
- (c) the offset positions for labelling heights and drawing uprights
- (d) the section line used for sectioning through tins
- (e) the section line for defining the corridor for services

Although the primary string is used to set up most of the information for the cross section plot, it doesn't have to be drawn on the cross section.

The drawing or not drawing of the primary string on each cross section plot is controlled by the parameter *primary_string* which was described earlier.

The **colour** of the primary string in the plot is the actual primary string colour.

Tins

A section along the primary string through each tin on the specified section view is automatically drawn on the cross section plot.

The **colour** and **linestyle** of the tin section in the plot is the actual tin colour and tin linestyle.

Whether the tin heights are labelled or not in the boxes area is controlled by parameters and has been described earlier

Corridor and Services

A corridor around the primary string is defined by giving a left and right corridor width and a left and right extension.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, then it is drawn on the cross section plot.

Strings do not have to cross the primary string, but just be in the corridor.

The corridor defining parameters are

left_extension	world-units	// left extension value
right_extension	world-units	// right extension value
corridor_width_left	world-units	// corridor left and right widths
corridor_width_right	world-units	// defaults are the section view values
corridor_overlap_left	world-units	// corridor left and right overlaps.
corridor_overlap_right	world-units	// defaults are the section view values
corridor_chord_arc	world-units	// chord-arc tolerance used to // approximate arcs in the corridor. // default is the section view value

The models containing tins for sectioning and strings for services are taken from the section view or given by the parameters

corridor_model_n	model	// n = 1, 2 ... 100 // models containing tins and service // strings to be drawn on the view.
------------------	-------	-----------------------------------------------------------------------------------------------------

If any *corridor_model_n* parameters are defined, then only the models given by the parameters are used. If no *corridor_model_n* parameters are set, then the models added to the given section view are used.

That is, either the *corridor_model_n* parameters are used or if none exist, then the models added to the section view are used for tins and service strings.

The **colour** and **diameter** of the service strings drawn in the plot are the actual strings colour and diameter.

Please continue to the next section [Grade Labelling](#).

Grade Labelling

The plot of the x-section string is made up of straight lines joining the individual points of the x-section.

The **grades** of these lines can be labelled:

grade_label	0	// don't label grades (default)
	1	// label grades

Either the individual lines can be used as the segments to be labelled for grade, or adjacent lines of the same grade can be considered to be just one segment and labelled only once.

Hence the segments to be labelled for grade can be the individual lines of the x-section, or the segments defined by changes of grade.

grade_change_only	0	// label individual lines
	1	// label change of grade segments

It is also possible to ignore segments smaller than a given minimum width on the plot.

grade_minimum_width	mm	// segments smaller are not labelled
---------------------	----	--------------------------------------

The grade labels are drawn parallel to the segment, centred about the segments end points, and a distance *grade_offset* above the segment. The size, colour and number of decimal places can all be set.

grade_decimals	integer	// number of decimal places in grade
grade_size	mm	// size of the grade label
grade_textstyle	text	// textstyle of the grade label
grade_colour	colour	// colour of the grade label
grade_offset	mm	// distance above the segment for label
grade_signed	yes	// default - grades are signed
	no	// absolute value of grades

The grade can be labelled as percent cross-fall, 1 in slope, m/m or VicRoads x:1.

Also a threshold value can be set and any grades whose absolute value are below the threshold

can be labelled in one way, and those above the threshold labelled a different way.

Hence, if the absolute value of the grade is less than or equal to the absolute value of *grade_threshold*, then **grade_mode** is used, otherwise **grade_upper_mode** is used.

```

grade_mode          0          // % grade
                    1          // 1 in
                    2          // m/m
                    3          // VicRoads x:1
grade_threshold      value      // grade threshold for type of grade
                                // labelling
grade_threshold_mode 0-3        // type of grade value given in
                                // grade_threshold types are the same as
                                // grade_mode
grade_upper_mode     0          // % grade
                    1          // 1 in
                    2          // m/m
                    3          // VicRoads x:1
grade_upper_decimals integer    // number dec places in grades above
                                // threshold value

```

Example of Grade Labelling

```

grade_label          1          // turn grade labels on
grade_mode            0          // percent grade
grade_decimals        1          // one decimal place, no trailing zeros
grade_change_only     1          // only label when change of grade
// text size for grade annotations
grade_size            2
grade_colour           yellow
// how far the annotation is (perpendicularly)
// from the string itself
grade_offset           1
// label all annotations separated by more than
// the minimum width in plot units
grade_minimum_width    0
// threshold and threshold mode describe the value
// at which the grade labelling changes
// mode to grade_upper_mode
grade_threshold        7          // change labelling when over 7%
grade_threshold_mode    0          // units for threshold - %
grade_upper_mode       1          // label as 1:x

```

Please continue to the next section [Labelling Points of the X-Sections](#).

Labelling Points of the X-Sections

The points across each x-section can be automatically labelled on the x-section plots.

The **height**, **offset** and **name** of the point can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the point.

The height position for the labelling can be specified as the

- (a) top of the boxes for the x-section
- (b) above the maximum height of the strings on the plot
- (c) height of the point on the x-section string (primary string)
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the point on the cross section string. For all other cases, only the offset of the cut string is used.

Other heights, for example, the height of the tin at that offset can be used as the height (case (d)).

Text justification refers to the actual position and is given by

“top-left”	“top-centre”	“top-right”
“middle-left”	“middle-centre”	“middle-right”
“bottom-left”	“bottom-centre”	“bottom-right”

A choice of six special symbols and/or or any of the 12d symbols can be drawn at the cut point.

The special **12d** Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate sets of points can be labelled.

Parameters for Labelling Points of X-Sections

The points of the x-section to be for labelled for the nth set of parameters is restricted to all the points whose name satisfying the *points_n_mask*:

`points_n_mask` *point_names* // points to be labelled

where *point_names* is a text string containing the name masks, each separated by one or more spaces, to test the point name against. Each mast can include wild cards and wild characters.

For example

`points_1_mask` "ke*"
or `points_1_mask` "?bank*"
or, if both masks are required,
`points_1_mask` "ke* ?bank*"

The parameters for drawing a **symbol** are

<code>points_symbol_n_mode</code>	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○
predefined symbols for

If *points_symbol_n_mode* is 6, then the plot symbol is given by

`points_symbol_n_style` *plotsymbol* // name of the 12d symbol to draw at point

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

- (a) the parameter *plot_symbols* in the ppf file

`plot_symbols` *filename*

or if *plot_symbols* is not defined, then

- (b) in the file pointed to by the environment variable `PLOT_SYMBOLS_4D`

`PLOT_SYMBOLS_4D` *filename* // default *plotsym.4d*

or if *PLOT_SYMBOLS_4D* is not defined, then

- (c) in the file *plotsym.4d*

which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

- (d) either pointed to by the environment variable `SYMBOLS_4D`

`SYMBOLS_4D` *filename* // default *symbols.4d*

or if the environment variable `SYMBOLS_4D` does not exist, in the file, *symbols.4d*

The position of the symbol is given by:

points_symbol_n_position	1	// above point height value
	3	// above top of boxes
	4	// above top of graph area but not including
		// the extra_space_top
	100	// to primary string (same as 1)
	101-500	// to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

points_symbol_n_x	<i>mm</i>	// offset adjustment to position
points_symbol_n_y	<i>mm</i>	// height adjustment to position
points_symbol_n_angle	<i>degrees</i>	// rotation about point
points_symbol_n_colour	<i>colour</i>	// colour of symbol

and for all values of *points_symbol_n_mode* **other** than 6:

points_symbol_n_size	<i>mm</i>	// size of symbol, 0 don't draw
----------------------	-----------	---------------------------------

The value of the **offset** of the point can be labelled using the parameters

points_offset_n_position	1	// above point height value
	3	// above top of boxes
	4	// above top of graph area but not including
		// the extra_space_top
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
points_offset_n_x	<i>mm</i>	// offset adjustment to position
points_offset_n_y	<i>mm</i>	// height adjustment to position
points_offset_n_angle	<i>degrees</i>	// rotation about point
points_offset_n_size	<i>mm</i>	// size of text, 0 don't label
points_offset_n_colour	<i>colour</i>	// colour of text
points_offset_n_textstyle	<i>textstyle</i>	// textstyle to use for points offset text.
points_offset_n_pre_text	<i>text</i>	// text before the offset value
points_offset_n_post_text	<i>text</i>	// text after the offset value
points_offset_n_justification	<i>justification</i>	// justification of the text
points_offset_n_no_decimals	<i>integer</i>	// number of decimals in offset

The value of a **height** at the offset of the point can be calculated and labelled using the parameters

points_height_n_mode	1	// use height of point itself
	3	// use real world height of position
		// above boxes
	100	// height of primary string (same as 1)
	101-500	// use height of to tin1 or tin2 etc.
points_height_n_position	1	// at points position
	3	// above top of boxes
	4	// above top of graph area but not including
		// the extra_space_top
	100	// to primary string (same as 1)
	101-500	// to tin1 or tin2 etc.
points_height_n_x	<i>mm</i>	// offset adjustment to position
points_height_n_y	<i>mm</i>	// height adjustment to position
points_height_n_angle	<i>degrees</i>	// rotation about point
points_height_n_size	<i>mm</i>	// size of text, 0 don't label
points_height_n_colour	<i>colour</i>	// colour of text
points_height_n_textstyle	<i>textstyle</i>	// textstyle to use for points height text.

points_height_n_pre_text	<i>text</i>	// text before the height value
points_height_n_post_text	<i>text</i>	// text after the height value
points_height_n_justification	<i>justification</i>	// justification of the text
points_height_n_no_decimals	<i>integer</i>	// number of decimals in height

A **label** which can include the **name** of the point is drawn by using the parameters

points_label_n_position	<i>1</i>	// at the points position
	<i>3</i>	// above top of boxes
	<i>4</i>	// above top of graph area but not including // the extra_space_top
	<i>100</i>	// to primary string (same as 1)
	<i>101-500</i>	// to tin1 or tin2 etc.
points_label_n_mode	<i>0</i>	// don't include point name
	<i>1</i>	// include point name in label
points_label_n_x	<i>mm</i>	// offset adjustment to position
points_label_n_y	<i>mm</i>	// height adjustment to position
points_label_n_angle	<i>degrees</i>	// rotation about point
points_label_n_size	<i>mm</i>	// size of text, 0 don't label
points_label_n_colour	<i>colour</i>	// colour of text
points_label_n_textstyle	<i>textstyle</i>	// textstyle to use for points label text.
points_label_n_pre_text	<i>text</i>	// text before the point name
points_label_n_post_text	<i>text</i>	// text after the point name
points_label_n_justification	<i>justification</i>	// justification of the text

Please continue to the next section [Labelling Cuts of X-Sections Through Strings in a Model.](#)

Labelling Cuts of X-Sections Through Strings in a Model

The cuts that each x-section string makes through any strings in user given models can be automatically labelled on the x-section plots.

The **height**, **offset** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the x-section
- (b) above the maximum height of the strings on the plot
- (c) height value of the cut string
- (d) height of the x-section string (the primary string)
- (e) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the offset of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the offset is required and the height of the tin at that offset can be used as the height (case (d)).

Text justification refers to the actual position and is given by

"top-left"	"top-centre"	"top-right"
"middle-left"	"middle-centre"	"middle-right"
"bottom-left"	"bottom-centre"	"bottom-right"

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

Parameters for Labelling Cuts of X-Sections Through Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the *n*th set (where *n* can be from 1 to 25) of cuts of the x-sections with the strings in the model are given by:

```
cuts_n_model          model_name          // model of strings to be cut
```

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

```
cuts_n_mask          name_mask          // strings to check for cuts
                                     // and if a cut occurs,
                                     // parameters show how to
                                     // label the cut
```

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example

```
cuts_1_mask          "ke*"
or
cuts_1_mask          "?bank*"
or, if both masks are required,
cuts_1_mask          "ke* ?bank*"
```

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being *"*"*.

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the x-sections, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the *n*th set.

The parameters for drawing a **symbol** at the cut points are:

```
cuts_symbol_n_mode    0          // cross
                      1          // up from centre of box
                      2          // up and down from centre of box
                      3          // square
                      4          // triangle, base at bottom
                      5          // circle
                      6          // use a 12d symbol
```

If *cuts_symbol_n_mode* is 6, then the plot symbol is given by

```
cuts_symbol_n_style    plotsymbol        // 12d symbol to draw at cut
```

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

(a) the parameter *plot_symbols* in the ppf file

```
plot_symbols          filename
```

or if `plot_symbols` is not defined, then

- (b) in the file pointed to by the environment variable `PLOT_SYMBOLS_4D`
`PLOT_SYMBOLS_4D filename // default plotsym.4d`

or if `PLOT_SYMBOLS_4D` is not defined, then

- (c) in the file `plotsym.4d`
 which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

- (d) either pointed to by the environment variable `SYMBOLS_4D`
`SYMBOLS_4D filename // default symbols.4d`
 or if the environment variable `SYMBOLS_4D` does not exist, in the file, `symbols.4d`

The position of the symbol is given by:

<code>cuts_symbol_n_position</code>	1	// above point height value
	3	// above top of boxes
	4	// above top of graph area but not including
		// the <code>extra_space_top</code>
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

<code>cuts_symbol_n_x</code>	<i>mm</i>	// offset adjustment to position
<code>cuts_symbol_n_y</code>	<i>mm</i>	// height adjustment to position
<code>cuts_symbol_n_angle</code>	<i>degrees</i>	// rotation about point
<code>cuts_symbol_n_colour</code>	<i>colour</i>	// colour of symbol

and for all values of `cuts_symbol_n_mode` **other** than 6:

<code>cuts_symbol_n_size</code>	<i>mm</i>	// size of symbol, 0 don't draw
---------------------------------	-----------	---------------------------------

The value of the **offset** of the cut string can be labelled using the parameters

<code>cuts_offset_n_position</code>	1	// above cut strings height value
	3	// above top of boxes
	4	// above top of graph area but not including
		// the <code>extra_space_top</code>
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
<code>cuts_offset_n_x</code>	<i>mm</i>	// offset adjustment to position
<code>cuts_offset_n_y</code>	<i>mm</i>	// height adjustment to position
<code>cuts_offset_n_angle</code>	<i>degrees</i>	// rotation about point
<code>cuts_offset_n_size</code>	<i>mm</i>	// size of text, 0 don't label
<code>cuts_offset_n_colour</code>	<i>colour</i>	// colour of text
<code>cuts_offset_n_textstyle</code>	<i>textstyle</i>	// textstyle to use for cuts offset text.
<code>cuts_offset_n_pre_text</code>	<i>text</i>	// text before the offset value
<code>cuts_offset_n_post_text</code>	<i>text</i>	// text after the offset value
<code>cuts_offset_n_justification</code>	<i>justification</i>	// justification of the text
<code>cuts_offset_n_no_decimals</code>	<i>integer</i>	// number of decimals in offset

The value of a **height** at the offset of the point can be calculated and labelled using the parameters

<code>cuts_height_n_mode</code>	1	// use height of cut point itself
	3	// use real world height of position
		// above boxes

	100	// height of primary string
	101-500	// use height of to tin1 or tin2 etc.
cuts_height_n_position	1	// at points position
	3	// above top of boxes
	4	// above top of graph area but not including
		// the extra_space_top
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_height_n_x	mm	// offset adjustment to position
cuts_height_n_y	mm	// height adjustment to position
cuts_height_n_angle	degrees	// rotation about point
cuts_height_n_size	mm	// size of text, 0 don't label
cuts_height_n_colour	colour	// colour of text
cuts_height_n_textstyle	textstyle	// textstyle to use for cuts heights text.
cuts_height_n_pre_text	text	// text before the height value
cuts_height_n_post_text	text	// text after the height value
cuts_height_n_justification	justification	// justification of the text
cuts_height_n_no_decimals	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters:

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	4	// above top of graph area but not including
		// the extra_space_top
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// offset adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	textstyle	// textstyle to use for cuts label text.
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Please continue to the next section [Hatching Cut and Fill Areas](#).

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

<code>hatch_original_tin_n</code>	<i>tin_name</i>	// tin_name for original surface
<code>hatch_new_tin_n</code>	<i>tin_name</i>	// tin_name for final surface
<code>hatch_cut_separation_n</code>	<i>mm</i>	// distance between cut hatch lines
	0	// don't do cut hatching
<code>hatch_cut_angle_n</code>	<i>degrees</i>	// angle in degrees of cut hatching
<code>hatch_cut_colour_n</code>	<i>colour</i>	// colour of the cut hatching
<code>hatch_cut_linestyle_n</code>	<i>linestyle</i>	// linestyle for cut hatching
<code>hatch_cut_draw_sides_n</code>	1/0	// 1 = draw sides of cut regions
<code>hatch_cut_draw_original_n</code>	1/0	// 1 = draw original tin in cut regions
<code>hatch_cut_draw_new_n</code>	1/0	// 1 = draw new tin in cut regions
<code>hatch_fill_separation_n</code>	<i>mm</i>	// distance between fill hatch line
	0	// don't do fill hatching
<code>hatch_fill_angle_n</code>	<i>degrees</i>	// angle in degrees of fill hatching
<code>hatch_fill_colour_n</code>	<i>colour</i>	// colour of the fill hatching
<code>hatch_fill_linestyle_n</code>	<i>linestyle</i>	// linestyle for fill hatching
<code>hatch_fill_draw_sides_n</code>	1/0	// 1 = draw sides of fill regions
<code>hatch_fill_draw_original_n</code>	1/0	// 1 = draw original tin in fill regions
<code>hatch_fill_draw_new_n</code>	1/0	// 1 = draw new tin in fill regions

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting `hatch_cut_separation_n` to 0.0.
fill hatching is turned off by setting `hatch_fill_separation_n` to 0.0.

Please continue to the next section [Extra Models of X-Sections](#).

Extra Models of X-Sections

The order and centreline chainages of the x-section subplots for the x-section plot are defined by the sections from the primary model of cross sections.

The sections through any specified triangulations and service models, and offsets for labelling are fully defined by these primary x-sections.

However it is also possible to plot extra x-sections on each of the sub-plots by supplying extra models of x-sections which are at the same plan positions as the primary x-section strings.

Only those x-sections from the extra models that are within a user specified tolerance of a primary x-section are plotted.

The extra models of x-sections and the plan tolerance for checking that the extra cross-sections are the same position as the primary x-sections are

```
extra_model_tolerance_1      value                // tolerance in 12d Model units
extra_model_n                model_name           // where n=1, ... 100
                                   // extra models of x-sections
```

The actual colour of the extra x-sections is used as their plotting colour.

Please continue to the next section [Sorting X-Sections by Chainage](#).

Sorting X-Sections by Chainage

The chainage on the design string that the x-section is created at is stored with the cross-section.

When the x-sections are created by the apply functions, they are created in the order of increasing chainage and added to the *model for sections* in that order.

Hence if the cross sections are plotted, the natural order would be in increasing chainage order.

However, it is possible to upset the order in the model by manually adding in extra sections.

Hence there is a parameter in both the **section x plot** panel and the plot parameter file to ensure that the cross sections are sorted in increasing chainage order before they are plotted.

```
sort_sections                1                // sort sections by design chainage
                              0                // use order of sections in model
```

Please continue to the next section [Title Block Information](#).

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

<i>plot_border</i>	<i>yes/no</i>	<i>// yes plots a standard title block</i> <i>// default yes</i>
<i>title_1</i>	<i>text</i>	
<i>title_2</i>	<i>text</i>	
<i>title_text_size</i>	<i>value</i>	
<i>title_colour</i>	<i>colour</i>	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of this chapter.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

<i>use_title_file</i>	<i>yes/no</i>	<i>// yes draws the title block given in title_file</i> <i>// default no</i>
<i>title_file</i>	<i>filename</i>	
<i>plot_border</i>	<i>no</i>	<i>// turn off standard title block</i>

Some special plot parameters are used to pass information down to variables in a user defined title block. For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* (n = 1,2,... 1000)

<i>user_text_n</i>	<i>text</i>
--------------------	-------------

The special plot parameters are:

<i>time_format</i>	<i>text</i>	<i>// format for \$time</i>
<i>user_text_n</i>	<i>text</i>	<i>// where n = 1,2,... 1000</i> <i>// passed down to \$user_text_n</i>
<i>title_1</i>	<i>text</i>	<i>// passed down to \$title_1</i>
<i>title_2</i>	<i>text</i>	<i>// passed down to \$title_2</i>
<i>start_page_number</i>	<i>integer</i>	<i>// used as the starting value for</i> <i>// \$page_number. If missing,</i> <i>// \$page_number starts at 1.</i>
<i>start_drawing_number</i>	<i>integer</i>	<i>// added to \$drawing_number in title</i> <i>// block file. If missing,</i> <i>// \$drawing_number starts at 1.</i>
<i>drawing_number_prefix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_prefix</i>
<i>drawing_number_postfix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_postfix</i>

Please continue to the next section [Parameters that Modify Fields In the Cross Plot Panel](#).

Parameters that Modify Fields In the Cross Plot Panel

A number of parameters match those in the **section x plot** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters in the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for any plots.

The plot parameters that also occur in the **section x plot** panel are:

view_name	text
plotter_type	text
model_to_plot	text
plot_stem	text
start_chainage	chainage
end_chainage	chainage
sheet_size	text or "width height"
scale	value
absolute_extensions	yes/no
left_extension	world-units
right_extension	world-units
line_up_cl	yes/no
primary_string	yes/no
label_type	yes/no
box_colour	colour
text_size	mm
sort_sections	yes/no
use_title_file	yes/no
title_file	filename
plot_border	yes/no
title_1	text
title_2	text
title_text_size	value
title_colour	colour
global_textstyle	textstyle

Please continue to the next section [Generating Cross Section Plots Without a View](#).

Generating Cross Section Plots Without a View

The cross section plot parameters are comprehensive enough that it is possible to completely generate a cross section plot without referencing a section view, or even using the **section X plot** panel.

Such a ppf can be run using the **plots=>plot a ppf** option or from the 4D Solutions programming language, 4DL.

When generating a cross section plot using the **section X plot** panel, a plot parameter file containing all the parameters needed to regenerate the plot using **plots=>plot a ppf** can be written out by simply giving a name for the ppf file in the plot parameters write field of the **section X plot** panel.

Notes

1. A warning is given if the keyword in a plot parameter file does not exist.
2. A warning is also given if the key word pair is defined more than once in a ppf.

Please continue to the next section [Example of a Cross Section Plot Parameter File](#).

Example of a Cross Section Plot Parameter File

```

// ppf file to generate x-section example
section_x_plot "plot 2" {

// plot margins
left_margin      0.0

Please continue to the next section [Long Section Plot Parameter File](#).

Long Section Plot Parameter File

The long section plot parameters are placed in a file with ending **.ppf**

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash **//** is considered to be a comment.

The set of all parameters for the long section plot is enclosed within a set of curly brackets **{ }** with the header

```
section_long_plot    "plot set name"
```

before the curly brackets.

That is,

```
section_long_plot "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one `section_long_plot` parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as `section_x_plot` in the same file. The other sets will be ignored when doing a long section plot.

The plot parameters are documented in following groups:

For *Defining chainage range*, go to the section [Possible Chainage Range](#).

Breaking the plot into pages, go to the section [Pagination](#).

Plot Sheet layout, go to the section [Plot Sheet Layout](#).

Boxes area, go to the section [Boxes Area](#).

Defining chainages and staggering, go to the section [Chainage Selection and Staggering](#).

Defining uprights, go to the section [Uprights](#).

Datum area, go to the section [Datum Area](#).

Graph (drawing) area, go to the section [Graph Area](#).

Defining bubbles, go to the section [Bubbles Definitions](#).

Quick HG, go to the section [Quick Horizontal Geometry Labelling](#).

Extensive HG, go to the section [Extensive Horizontal Geometry Labelling](#).

Quick VG, go to the section [Quick Vertical Geometry Labelling](#).

Extensive VG, go to the section [Extensive Vertical Geometry Labelling](#).

Labelling heights, go to the section [Labelling Chainages and Heights in the Graph Area](#).

Symbols, go to the section [Labelling With Symbols](#).

Hatching cut/fill, go to the section [Hatching Cut and Fill Areas](#).

Labelling cuts, go to the section [Labelling Cuts of Design Through Strings in a Model](#).

Labelling string name, go to the section [Labelling the Primary String Name on the Plot](#).

Labelling with scale, go to the section [Labelling the Scale on the Plot](#).

Title block information, please continue to the section [Title Block Information](#).

Panel modifying parameters, please continue to the section [Parameters that Modify Fields In the Long Plot Panel](#).

Example, please continue to the section [Example of a Long Section Plot Parameter File](#).

Possible Chainage Range

In the panel, the field **Use HG VG for min, max** determines whether the horizontal geometry (HG) and the vertical geometry (VG) are both used to determine the minimum and maximum chainages for drawing. This allows the vertical geometry to be plotted when it is outside the horizontal geometry (e.g. kerb returns).

The equivalent parameter in the ppf is

use_vg_hg_for_min_max	<i>1</i>	// the chainage range available for plotting // is from the minimum of the horizontal // geometry (HG) and the vertical geometry // (VG) to the maximum of the HG and VG. // This is useful for kerb returns
	<i>0</i>	// the chainage range available for // plotting is from the minimum of the // horizontal geometry (HG) to the // maximum of the HG.

Pagination

If the long section plot is too long to fit on one page, it can be broken into a number of pages (sheets).

The parameter, *pagination_length*, controls the amount of new chainage length on each plot page. Each page of the long section plot can also included a set chainage amount from the end of the **previous** plot.

Hence apart from the first page and possibly the last page, the plot will have a chainage length given by the sum of the *pagination_length* and *pagination_overlap*.

pagination	<i>yes/no</i>	// if yes, then break the plot into pages
pagination_mode	<i>chainage</i>	// length and overlap in chainage units
	<i>millimetre</i>	// length and overlap in millimetres
pagination_length	<i>chainage or</i>	
	<i>millimetres</i>	// new chainage range on each page
pagination_overlap	<i>chainage or</i>	
	<i>millimetres</i>	// overlap between pages

Note

The *pagination_length* and *pagination_overlap* are given in chainage units **or** millimetres. The user must choose values which will fit on the selected sheet size or the end of each plot will be truncated by the sheet.

Plot Sheet Layout

The plot **page** or **sheet** is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

sheet_size	<i>text</i>	// sheet name, or
	<i>“mm mm”</i>	// sheet size: width height

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal set up areas, or is pointed to by the environment variable

SHEET_SIZES_4D	<i>file</i>	// file of plotter sheets sizes
----------------	-------------	---------------------------------

The plotting area is restricted to within the plot sheet by giving margins which are:

If a *User Defined Title Block* is used:

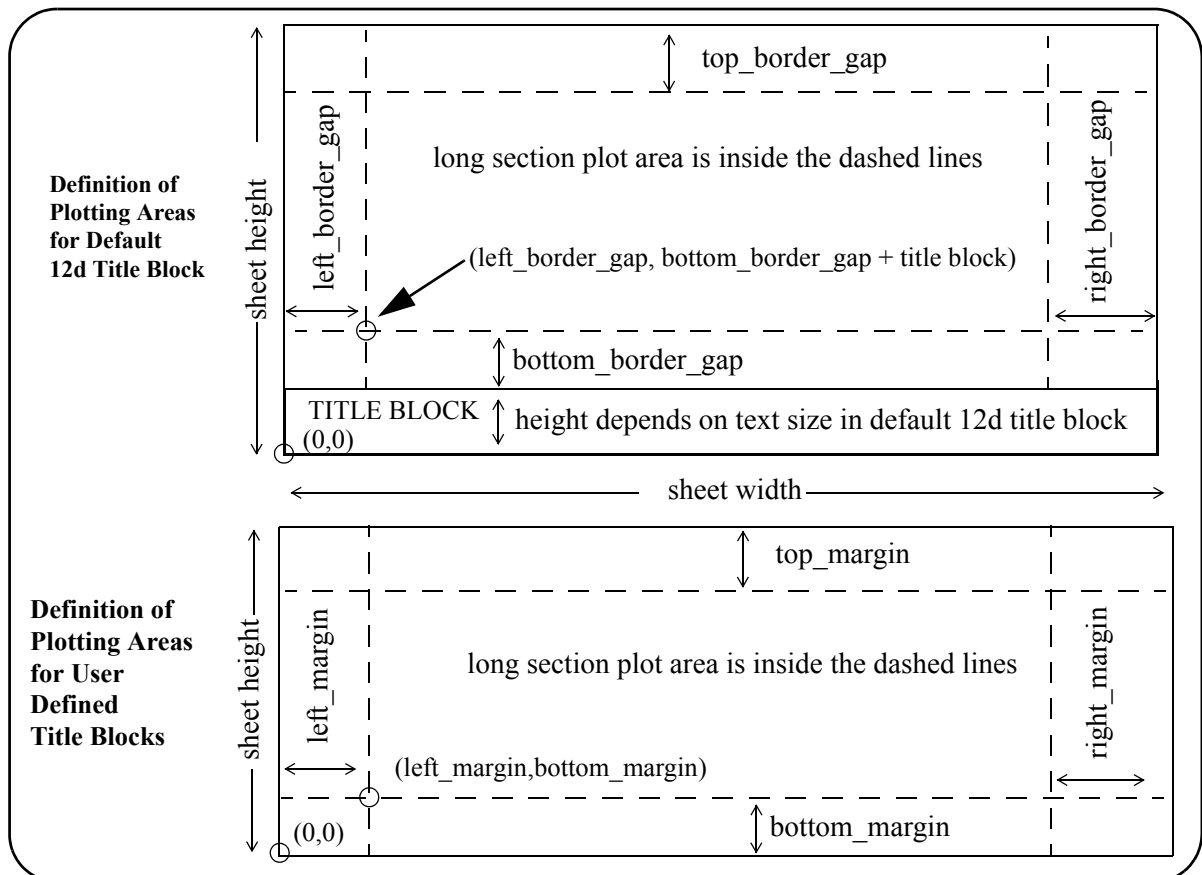

left_margin	<i>mm</i>
right_margin	<i>mm</i>
top_margin	<i>mm</i>

bottom_margin mm

If the *default 12d title block* is used, then the size of the bottom of title block depends on the text size. The following parameters are used in the default title block case and the *bottom_border_gap* is added to the calculated height of the bottom of the title block.

left_border_gap	mm
right_border_gap	mm
top_border_gap	mm
bottom_border_gap	mm

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margins and gap parameters can exist in the one plot parameter file.

The long plot itself consists of the three regions - boxes, datum and graph areas.

The **boxes area** is where the titles and the chainage values and the heights/depths for the strings drawn on the long plot are labelled.

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

Apart from information labelled in the boxes area, the long section plot can label other information such as

- (a) horizontal geometry
- (b) vertical geometry
- (c) chainage, heights at special points

- (d) symbols at special points
- (e) bubbles at special chainages
- (f) cuts the design string makes through strings
- (g) cut and fill areas

The size of the graph area can also be extended to allow for plot symbols by the parameters:

extra_space_units	0	// extra space values are world units - default
	1	// " " " are millimetres on plot page
extra_space_left	units	// subtract from left of plot area, def 0
extra_space_right	units	// add to right of plot area, default 0
extra_space_top	units	// add to top of plot area, default 0
extra_space_bottom	units	// subtract from bottom of plot area, default 0

Please continue to the next section [Boxes Area](#).

Boxes Area

Each string in the long section plot can be labelled with one or two lines of title, and the chainages/heights/depths at the user specified chainages for the strings.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The **chainages/heights/depths** are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **chainage/height/depth** values along the string.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

- (a) optional super-elevation diagram
- (b) chainage values
- (c) can be primary string heights - user choice
- (d) tin heights and depths
- (e) offset heights and depths
- (f) optional volumes or earth works
- (g) can be primary string heights - user choice
- (h) zero or more blank boxes

The blank boxes are used to place other information in (such as horizontal or vertical geometry) or for other user supplied information.

Placing the primary string label before the bank boxes or just after the chainage box is controlled by the parameter *primary_label_mode*.

<code>number_of_blank_boxes</code>	<i>integer</i>	// integer > 0
<code>primary_label_mode</code>	0	//put primary string labels in last box
		// before blank boxes
	1	// or first box above the chainages

Although the order of the boxes may appear to be fixed, in practice they can be in any order. This is possible because for each box, there is a parameter to set the height in millimetres from the bottom of all the boxes that the text in the box is drawn at (the *_y_pos* parameters).

The **title area** starts at the co-ordinate (left_margin,bottom_margin).

The size of the title text is given by the **title_box_text_size** parameter.

The **width** of the title area is either given by the *space_for_titles* parameter, or if omitted, the required width is automatically calculated.

title_box_text_size	mm	// size of the title text for boxes
space_for_titles	mm	// calculated if omitted

There can be two lines of title text and the title text, textstyle and colour can be set independently for each box.

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

box_titles_x	mm	// distance to move the title text from the // left hand side of the boxes
--------------	----	-------------------------------------------------------------------------------

The y position of the title text can be set separately for each type of title. The parameters are given later under each of the title types (e.g. chainages, primary string, tins, depths etc.).

After the title area there can be a user defined gap, followed by the heights area

box_gap	mm	// blank area between the title area // and the heights area default 0
---------	----	---------------------------------------------------------------------------

The **heights area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_justification*).

The number of decimal places (*number_of_decimals*), and the size of the heights text (*box_text_size*) can be specified globally but there is a parameter for each box which overrides these defaults for each box of heights.

box_text_justification	0	// bottom of individual boxes
	1	// top of individual boxes
number_of_decimals	integer	// number of decimal places in the // height boxes. If <0, the absolute value // is taken as the number of decimal // places i.e. no trailing zeros are // removed for the values in the heights // area.
box_text_size	mm	// size of the height text values

A global height for the individual boxes is either given by the *horizontal_line_spacing* parameter, or if omitted, a height to fit the largest height or depth value is calculated and used as the default box height.

horizontal_line_spacing	mm	// calculated if omitted
-------------------------	----	--------------------------

However, the height of each box can be individually set by parameters *box_size_n* where the boxing numbering, n, starts from the bottom box. The value of *horizontal_line_spacing* is used for any of the *box_size_n* parameters not specified.

box_size_n	mm	// height of the nth box, numbered from // bottom up.
------------	----	----------------------------------------------------------

The total height of the boxes area is simply given by the sum of the heights of each box.

The **width** of the **heights area** is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the **title area** plus `box_gap`, plus the width of the **heights area**.

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area so that the distances are independent of the number of boxes and box sizes.

The drawing of the box line work, the box colour, the position of the primary string labels and the number of blank boxes are all set by parameters.

First, all the line work for the box itself is user defined. This has been extended from V3.1 although `draw_box_mode` has been left in for upward compatibility.

<code>draw_box_mode</code>	<code>0</code>	// don't draw box lines
	<code>1</code>	// draw box lines around heights area
		// only
	<code>2</code>	// draw box lines around title and
		// heights areas
	<code>3</code>	// use <code>draw_box_side_n</code> ,
		// <code>box_line_draw_mode</code> and
		// <code>box_line_mode_n</code>
<code>box_colour</code>	<code>colour</code>	// colour of the boxes

For V3.2, the line work for the outside of the title and heights boxes is controlled by the parameters `draw_box_side_n` and `box_side_colour_n`, and the separation lines inside the boxes are controlled by the parameters `box_line_draw_mode` and `box_line_mode_n` where the box numbering, `n`, starts from the bottom box.

Note: The following parameters are only used if `draw_box_mode` is set to **3**.

<code>draw_box_side_1</code>	<code>1</code>	// draw the left side of the title area (def)
	<code>0</code>	// don't draw the left side
<code>box_side_colour_1</code>	<code>colour</code>	// colour to draw left side of title area
		// default <code>box_colour</code>
<code>draw_box_side_2</code>	<code>1</code>	// draw top of the title area (default)
	<code>0</code>	// don't draw the top
<code>box_side_colour_2</code>	<code>colour</code>	// colour to draw top of title area
		// default <code>box_colour</code>
<code>draw_box_side_3</code>	<code>1</code>	// draw right side of the title area

		// (default if box_gap is non-zero)
	0	// don't draw the right side
		// (default if box_gap is zero)
box_side_colour_3	colour	// colour to draw right side of title area
		// default box_colour
draw_box_side_4	1	// draw bottom of the title area (default)
	0	// don't draw the bottom
box_side_colour_4	colour	// colour to draw bottom of title area
		// default box_colour
draw_box_side_5	1	// draw left side of the heights area (def)
	0	// don't draw the left side
box_side_colour_5	colour	// colour to draw left side of heights area
		// default box_colour
draw_box_side_6	1	// draw top of the heights area (default)
	0	// don't draw the top
box_side_colour_6	colour	// colour to draw top of heights area
		// default box_colour
draw_box_side_7	1	// draw right side of the heights area def
	0	// don't draw the right side
box_side_colour_7	colour	// colour for right side of heights area
		// default box_colour
draw_box_side_8	1	// draw bottom of the heights area (def)
	0	// don't draw the bottom
box_side_colour_8	colour	// colour for bottom of heights area
		// default box_colour

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

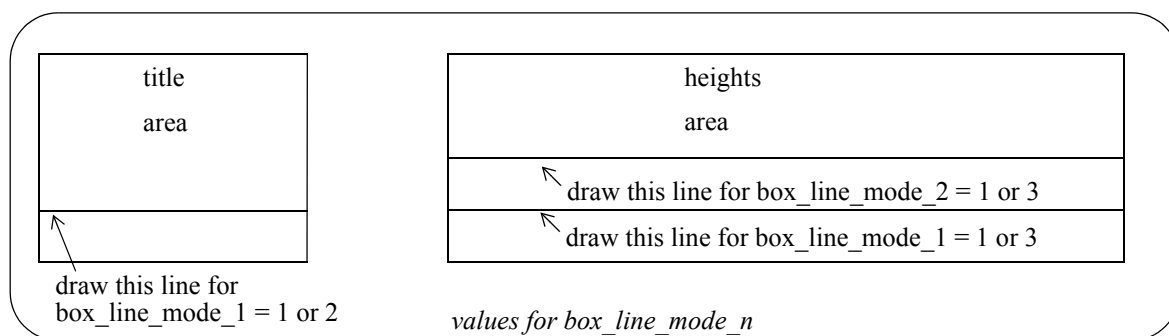

The separation lines can be drawn in just the title area, just the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where n = 1, ... number of boxes -1.

The top of the top box is not controlled by *box_line_mode_n* but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6*.

box_line_draw_mode	0	// don't draw any separation lines inside
		// the title and heights areas
	1	// draw the separation lines inside the
		// title and heights areas (default)
	2	// draw the separation lines inside the
		// title area only

	3	// draw the separation lines inside the // heights area only
box_line_mode_n	0	// for the nth box, don't draw any // line at the top of the box for either // the title or the heights areas
	1	// for the nth box, draw the line at the // top of the box for both the // title and heights areas
	2	// for the nth box, draw the line at the // top of the box for the title area only
	3	// for the nth box, draw the line at the // top of the box for the heights area only

Chainage Titles and Values

The chainages are always labelled

chainage_title	text	// first line of chainage title // (default chainages)
chainage_title_2	text	// second line of chainage title
chainage_title_textstyle	textstyle	// textstyle of the chainage titles
chainage_title_colour	colour	// default chainage title colour
chainage_title_size	mm	// default chainage title size
chainage_title_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // chainage title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the chainage.
chainage_decimals	integer	// number of decim places for chainages
chainage_textstyle	textstyle	// textstyle of the chainage values
chainage_colour	colour	// colour of chainages, def is box_colour
chainage_size	mm	// size of chainages, def is box_text_size
chainage_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // chainage values text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the chainage.

Example of Chainage Titles

chainage_title	"DESIGN"
chainage_title_2	"CHAINAGE"

chainage_title_colour	“yellow”	
chainage_colour	“grey”	// colour of chainage text
chainage_decimals	-3	// 3 decimal places - leave trailing zeros

Primary String Title and Heights

Sometimes the primary string is only required to define chainages or the horizontal path for tin sections. In this case, the primary string would not be drawn on the long section plot.

If the primary string is drawn, it is automatically labelled.

Also the drawing of crosses at the vertical intersection points can be controlled from the ppf file.

primary_draw_vips	<i>1</i>	// draw crosses at VIPS (default)
	<i>0</i>	// don't draw VIP crosses

The position of the primary string label box can be either straight after the chainage box, or after the tin and offset boxes but before the blank boxes.

primary_string	<i>yes</i>	// draw and label the primary string
	<i>no</i>	// don't draw or label the primary string
primary_label_mode	<i>0</i>	// last box before blank boxes
	<i>1</i>	// first box above the chainages
primary_title	<i>text</i>	// first line of string title
primary_title_2	<i>text</i>	// second line of string title, default is
		// the primary string name.
primary_title_textstyle	<i>textstyle</i>	// textstyle of the primary string titles
primary_title_colour	<i>colour</i>	// colour of the string titles
primary_title_size	<i>mm</i>	// default primary title size
primary_title_y_pos	<i>mm</i>	// if set, the height in mm above the
		// bottom of all the boxes that the
		// primary string title text is drawn.
		// If not set, then the text is placed at a
		// height that puts it inside the default
		// box for the primary string.
primary_decimals	<i>integer</i>	// number of decimal places
primary_textstyle	<i>textstyle</i>	// textstyle of the primary string heights
primary_colour	<i>colour</i>	// colour of the heights
primary_size	<i>mm</i>	// default primary value size
primary_y_pos	<i>mm</i>	// if set, the height in mm above the
		// bottom of all the boxes that the
		// primary string height text is drawn.
		// If not set, then the text is placed at a
		// height that puts it inside the default
		// box for the primary string.
primary_ch_tolerance	<i>mm</i>	// for a given chainage, if no z value exists,
		// this distance is added to/subtracted from the
		// chainage to search for a valid z value.

Example of Primary String Titles

primary_title	"DESIGN"	
primary_title_2	"CENTRELINE"	
primary_title_colour	"yellow"	
primary_colour	"grey"	// colour of height text
primary_decimals	-2	// 2 decimal places - leave trailing zeros

Tin Titles and Heights

A section along the primary string through each tin on the section view can be automatically drawn on the long plot, and the user can specify whether the tin heights and depths are labelled or not in the boxes area. Hence although there may be a number of tins drawn on the section plot, not all of them need to be labelled or have their depths labelled.

The default order for labelling the tins and depths is the order that the tins were added to the view however it is possible to specify which tin is used for labelling each row of tin heights and depths by giving the tin name rather than just using the tin order on the section view.

In fact, it is possible to use **any tin** in the project to **label** a row, **not just those drawn** on the section view.

The parameter to define the nth tin by name is *tin_n_name*:

<i>tin_n_name</i>	<i>text</i>	// n=1, ... no of tins on the section view. // use the tin named <i>text</i> to label the nth // row of tin heights and depths.
-------------------	-------------	---------------------------------------------------------------------------------------------------------------------------------------

If a tin of the name ***tin_n_name*** does not exist, then the plot is not produced and an error message is given.

For the following parameters, n takes the value 1 to 100 and specifies that the parameter set applies to the nth tin on the section view, or if *tin_n_name* is set, for the tin specified by *tin_n_name*.

<i>tin_n_draw_mode</i>	1 0	// draw the nth tin (default) // don't draw the nth tin
<i>tin_n_draw_colour</i>	<i>colour</i>	// colour to draw the nth tin. // If omitted, then use the tin colour
<i>tin_n_label</i>	1 0	//label the tin's heights (default) // don't label the tin's heights
<i>tin_n_title</i>	<i>text</i>	// first line of tin title
<i>tin_n_title_2</i>	<i>text</i>	// second line of tin title
<i>tin_n_title_textstyle</i>	<i>textstyle</i>	// textstyle of the tin titles
<i>tin_n_title_colour</i>	<i>colour</i>	// colour for titles of heights
<i>tin_n_title_size</i>	<i>mm</i>	// default nth tin's title size
<i>tin_n_title_y_pos</i>	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // tin title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the tin heights.
<i>tin_n_decimals</i>	<i>integer</i>	// number of dec places in tin height
<i>tin_n_textstyle</i>	<i>textstyle</i>	// textstyle of the tin heights
<i>tin_n_colour</i>	<i>colour</i>	// colour for heights and depths
<i>tin_n_size</i>	<i>mm</i>	// default nth tin's title size
<i>tin_n_y_pos</i>	<i>mm</i>	//if set, the height in mm above the //bottom of all the boxes that the // tin height text is drawn. //If not set, then the text is placed at a //height that puts it inside the default // box for the tin heights.
<i>tin_n_depth_label</i>	1/0	// 1 to label, 0 don't label depths
<i>tin_n_depth_title</i>	<i>text</i>	// first line of tin depth title
<i>tin_n_depth_title_2</i>	<i>text</i>	// second line of tin depth title
<i>tin_n_depth_title_textstyle</i>	<i>textstyle</i>	// textstyle of the tin depth titles
<i>tin_n_depth_title_colour</i>	<i>colour</i>	// colour for titles of depths
<i>tin_n_depth_title_size</i>	<i>colour</i>	// size for title of depths

tin_n_depth_title_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // tin depth title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the tin depths.
tin_n_depth_decimals	integer	// number of dec places in tin depth
tin_n_depth_textstyle	textstyle	// textstyle of the tin depths
tin_n_depth_colour	colour	// colour for depths
tin_n_depth_size	mm	// size for depths
tin_n_depth_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // tin depth text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the tin depths.

Offset Model Titles and Heights

For **12d Model V3.2**, Each string in the offset model given in the **section long plot** panel can be automatically projected onto the primary string and drawn on the long section plot.

For **12d Model V4.0**, the idea of an offset model has been modified to allow strings to be projected onto the primary string to be specified by model and name, rather than just projecting all the strings in a given model. The string can also be labelled with either the string name, its model name or both.

The string is specified by

offset_n_mask "*model_name->string_name*"

For each n, a set of plot parameters determine if the string's heights and/or depths from the primary string are labelled in the boxes area.

If only the *string_name* is given, then the model given in the Offset model field of the **Section Long Plot** panel.

If there is **more than one string** with the given model and name, then it will be considered to be one string and at any primary string chainage, the closest of the strings will be the part used for projecting. For example, strings of the same name on either side of a road intersection will be considered to be the one string for projecting.

If any *offset_n_mask* is used, then the Offset option expects all the strings to be specified by an *offset_n_mask*. Then if no mask exists for any value of n, then that parameter set is ignored and no string projected.

If no offset masks are used (that is, no *offset_n_mask*'s are used), then the Offset option works as it did in **12d Model V3.0**. That is, plot parameters determine whether each string in the offset model is drawn, and if the string's heights and depths from the primary string are labelled in the boxes area. The order that the strings are then plotted and labelled is the same as the order of the strings in the Offset model.

For the following sets of parameters, n takes the value 1 to 100 and specifies that the parameter set applies to the nth string given by *offset_n_mask* or, if no offset masks are given, the nth string in the *Offset model*.

offset_n_mask	<i>"model_name->string_name"</i>	
offset_n_draw_mode	1	// draw the nth offset string (default)
	0	// don't draw the nth offset string
offset_n_lw	value	// default 1000. Distance to search to the left // of the primary string for the offset string.

		// If 0, don't search to the left.
offset_n_rw	<i>value</i>	// default 1000. Distance to search to the right // of the primary string for the offset string. // If 0, don't search to the right.
offset_n_draw_colour	<i>colour</i>	// colour to draw the nth offset string. // If omitted, then use the string colour
offset_n_label	<i>1</i>	//label the string's heights (default)
	<i>0</i>	// don't label the string's heights

The default title for each set each parameter set, is the string name but this can be changed to just the model name or the model and string name:

offset_title_mode	<i>0</i>	// label with string name (default)
	<i>1</i>	// label with model name
	<i>2</i>	// label with model->string as name

or, for any set, the *offset_title_mode* can be replaced by two lines of user defined title:

offset_n_title	<i>text</i>	// first line of title
offset_n_title_2	<i>text</i>	// second line of title
offset_n_title_textstyle	<i>textstyle</i>	// textstyle of the offset titles

The rest of the parameters for the set are:

offset_n_title_colour	<i>colour</i>	// colour for titles of heights
offset_n_title_size	<i>size</i>	// colour for titles of heights
offset_n_title_y_pos	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // offset title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the offset heights.
offset_n_decimals	<i>integer</i>	// number of dec places in offset height
offset_n_textstyle	<i>textstyle</i>	// textstyle of the offset heights
offset_n_colour	<i>colour</i>	// colour for heights
offset_n_size	<i>size</i>	// size for heights
offset_n_y_pos	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // offset height text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the offset heights.
offset_n_depth_label	<i>1/0</i>	// 1 to label, 0 don't label depths
offset_n_depth_title	<i>text</i>	// first line of offset depth title
offset_n_depth_title_2	<i>text</i>	// second line of offset depth title
offset_n_depth_title_textstyle	<i>textstyle</i>	// textstyle of the offset depth titles
offset_n_depth_title_colour	<i>colour</i>	// colour for titles of depths
offset_n_depth_title_size	<i>mm</i>	// size for titles of depths
offset_n_depth_title_y_pos	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // offset depth title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the offset depths.
offset_n_depth_decimals	<i>integer</i>	// number of dec places in offset depth
offset_n_depth_textstyle	<i>textstyle</i>	// textstyle of the offset depths

offset_n_depth_colour	<i>colour</i>	// colour for depths
offset_n_size	<i>size</i>	// size for depths
offset_n_depth_y_pos	<i>mm</i>	// if set, the height in mm above the // bottom of all the boxes that the // offset depth text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the offset depths.

Chainages of Offset Strings - Offset Chainages

For a string other than the primary string, it is possible to label the chainages that are obtained *from the other string* by going out perpendicular to the primary string at a chainage, cutting the other string and then calculating the *chainage from the other string* at the cut point.

The other string is known as an **offset** string and the chainage from the offset string corresponding to a primary chainage is called the *offset chainage*.

Up to twenty sets of offset chainages can be labelled - each is defined by its own set of parameters:

Note no box is automatically created for the offset chainages. An empty box must be defined and the appropriate values set for *chainage_n_title_y_pos* and *chainage_n_y_pos*

chainage_n_offset_mode	tick box	// if ticked, use nth offset string for calculations
chainage_n_offset_string	"model_name->string_name"	// string to calculate offset chainages for
chainage_n_title	text	// first line of offset chainage title
chainage_n_title_2	text	// second line of offset chainage title
chainage_n_title_textstyle	textstyle	// textstyle of the offset chainage titles
chainage_n_title_colour	colour	// offset chainage title colour
chainage_n_title_size	mm	// offset chainage title size
chainage_n_title_y_pos	mm	// the height in mm above the bottom of all the boxes that the offset chainage title text is drawn.
chainage_n_decimals	integer	// number of decim places for offset chainages
chainage_n_textstyle	textstyle	// textstyle of the offset chainage values
chainage_n_colour	colour	// colour of offset chainages
chainage_n_size	mm	// size of offset chainages
chainage_n_y_pos	mm	// the height in mm above the bottom of all the boxes that the chainage values text is drawn.

Example of Offset Chainage and Titles

chainage_1_offset_string	"Design->RKERB"	
chainage_1_title	"RIGHT KERB"	
chainage_1_title_2	"CHAINAGE"	
chainage_1_title_colour	"yellow"	
chainage_1_colour	"grey"	// colour of offset chainage text
chainage_1_decimals	-3	// 3 decimal places - leave trailing zeros

Definition of Depth to a Tin or to Offset Strings

The depth from the primary string to a tin or to a string from the offset model, at a particular chainage is defined as

$$\text{depth} = \text{tin height value} - \text{height of the primary string}$$

or

$$\text{depth} = \text{offset string height value} - \text{height of the primary string}$$

That is, the depth that the primary string is **below** the tin or a string from the offset model.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

if (depth >= 0) plotted_depth_value = depth * depth_positive_factor

if (depth < 0) plotted_depth_value = depth * depth_negative_factor

Hence the definition of depth can be modified by the parameters:

depth_positive_factor	value	// multiplier for positive depths
depth_negative_factor	value	// multiplier for negative depths

For example, if the opposite sign is required for depth, that is,

$$\text{depth} = \text{height of the primary string} - \text{tin/offset string height value}$$

simply set

depth_positive_factor	-1
depth_negative_factor	-1

Super-Elevation Diagram

The optional *super-elevation diagram* draws the values of the cross-fall (x-fall) between two strings using the primary string as the reference string. The cross-fall at a given chainage on the primary string is calculated by sectioning perpendicular to the reference string at that chainage and cutting the two strings. The cross-fall is defined as the cross-fall between the two cuts points on the strings.

The diagram has levels for the cross fall for a pair of strings on the left of the primary string, and a pair of strings on the right of the primary string. The diagram also has uprights in the super-elevation box with chainage values at the change of super values.

For the left hand side, the cross-fall is calculated at right angles to the primary string between the user given left hinge string and the left edge string.

There are plot parameters to control all aspects of the super diagram.

super_draw_mode	0	// default, don't draw a super diagram
	1	// draw super using <i>super_sample_interval</i>
	2	// sample super using chainages of x-sections
	3	// sample super using chainages from a string
super_sample_interval	value	// if super_draw_mode = 1, default 20
		// chainage distance to sample x-fall
super_sample_name	model_name	// if super_draw_mode = 2
	model_name->string_name	// if super_draw_mode = 3
super_tolerance	value	// If super_draw_mode is 1, the change
		// of super is greater than super_tolerance,
		// draw uprights
super_title	text	// first line of super title
		// def <i>Super elevation</i>
super_title_textstyle	textstyle	// textstyle of the super titles
super_title_colour	colour	// super title colour, def box_colour
super_title_size	mm	// super title size, def label_text_size
super_title_y_pos	mm	// if set, the height in mm above the
		// bottom of all the boxes that the
		// super title text is drawn.
		// If not set, then the text is placed at a
		// height that puts it inside the default
		// box for the super.
super_xfall_textstyle	textstyle	// textstyle of the super x-fall labels
super_xfall_colour	colour	// super x-fall colour, def box_colour
super_xfall_size	mm	// super x-fall size, def label_text_size
super_xfall_x	mm	// def 0
super_xfall_y	mm	// def 0.5
super_ch_textstyle	textstyle	// textstyle of the super chainages
super_ch_colour	colour	// super chainage colour, def box_colour
super_ch_size	mm	// super chainage size, def label_text_size
super_ch_x	mm	// def 0
super_ch_y	mm	// def -1
super_ch_decimals	integer	// number decimal places in chainage
		// def number_of_decimals

Volume Cut and Fill Values

The values of calculated cut and fill volumes (cut and fill earth works) can be read from a file and then interpolated to produce cut and fill volumes for a given interval along the primary string.

There are plot parameters to control all aspects of the volume diagram.

volume_draw_mode	0	// default, don't draw a volume diagram
	1	// draw a volume diagram
volume_text_centre_mode	0	// default, the text of cut and fill are labelled // along the uprights
	1	// the text are centred in between the uprights
volume_sample_interval	value	// interval to display volumes, default 20
volume_file_name	file_name	// the volumes report file
volume_y_pos	mm	// if set, the volume box is positioned at this // height from the bottom of the first box
volume_box_size	mm	// if set, the uprights and volume and titles // are plotted in accordance with this heights
volume_title	text	// first line of volume title // default <i>Earthworks</i>
volume_title_textstyle	textstyle	// textstyle of the volume titles
volume_title_colour	colour	// volume title colour, def box_colour
volume_title_size	mm	// volume title size, def label_text_size
volume_title_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // volume title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the volumes.
volume_cut_title	text	// first line of volume sub title // default <i>cut</i>
volume_cut_title_textstyle	textstyle	// textstyle of the cut volume titles
volume_cut_title_colour	colour	// cut volume title colour, def box_colour
volume_cut_title_size	mm	// cut volume title size, def label_text_size
volume_cut_title_y	mm	// if set, the height in mm above the // default position. // If not set, then the text is placed at a // height that puts it inside the default // box for the cut volumes.
volume_fill_title	text	// first line of volume sub title // default <i>fill</i>
volume_fill_title_textstyle	textstyle	// textstyle of the fill volume titles
volume_fill_title_colour	colour	// fill volume title colour, def box_colour
volume_fill_title_size	mm	// fill volume title size, def label_text_size
volume_fill_title_y	mm	// if set, the height in mm above the // default position. // If not set, then the text is placed at a // height that puts it inside the default // box for the fill volumes.
volume_cut_textstyle	textstyle	// textstyle of the cut values
volume_cut_text_colour	colour	// cut value colour, def box_colour
volume_cut_text_size	mm	// cut value size, def label_text_size
volume_cut_text_x	mm	// the x distance to move the cut text from the // default cut text position, def 0, it is not used // if volume_text_centre_mode=1
volume_cut_text_y	mm	// the y distance to move the cut text from the // default cut text position, def 0
volume_cut_decimals	integer	// number decimal places in cut values // def number_of_decimals

volume_fill_textstyle	textstyle	// textstyle of the fill values
volume_fill_text_colour	colour	// fill value colour, def box_colour
volume_fill_text_size	mm	// fill value size, def label_text_size
volume_fill_text_x	mm	// the x distance to move the fill text from the // default fill text position, def 0, it is not used // if volume_text_centre_mode=1
volume_fill_text_y	mm	// the y distance to move the fill text from the // default fill text position, def 0
volume_fill_decimals	integer	// number decimal places in fill values //def number_of_decimals
volume_cl_linestyle	linestyle	// linestyle of horizontal cut/fill dividing line
volume_cl_line_colour	colour	// colour of horizontal cut/fill dividing line
volume_uprights_draw_mode	0	// default, don't draw cut/fill uprights
	1	// draw cut/fill uprights
volume_uprights_line_colour	colour	// colour of uprights
volume_sub_upright_colour	colour	// colour of sub uprights line
volume_sub_uprights_x	mm	// the distance to move from the default // sub uprights position, def 0
volume_sub_title_x	mm	// the distance to move the sub title text // from the volume sub uprights

//      volume_sub_uprights_x      10

//      volume_sub_title_x      3

```

X,Y Values

The values of the X and Y coordinate for selected chainages can be labelled as separate boxes. The chainages specified are limited to the base set of chainages already defined in the chainage selection and staggering section. i.e. an upright must exist for the X and Y value to be labelled. Not all of the uprights have to be labelled, just those specified in this section.

There are plot parameters to control all aspects of the X and Y labelling.

Chainages are used for positioning X and Y labels.

The chainages for the long section plot relate to the primary string and are controlled by a set of parameters.

xy_order	0	// 0 = X on bottom, Y on top
	1	// 1 = Y on bottom, X on top
xy_chord_arc	0	// don't use chord/arc chainages
	1	// include chainages for chord/arc
xy_start_chainage	<i>value</i>	// start chainage of labelling range
xy_end_chainage	<i>value</i>	// end chainage of labelling range
xy_interval	<i>value</i>	// regular interval (0 = no regulars)
xy_label_hcp	0/1	// 1 = include tangents, spirals
xy_label_hip	0/1	// 1 = include hip points
xy_label_vip	0/1	// 1 = include vip points
xy_label_vtp	0/1	// 1 = include tangent points
xy_label_crest	0/1	// 1 = include crest points
xy_label_sag	0/1	// 1 = include sag points
xy_label_grade_change	0/1	// 1 = include change of vertical grade
xy_special_n_file	<i>filename</i>	// n = 1 to 20 - include chainages from the file (one chainage per line)
xy_label_tolerance	<i>value</i>	// > 0 use as weeding tolerance
		// <= 0, don't weed

For X parameters:

x_label	0/1	// 0 = Don't label X values/titles
		// 1 = Label X values/titles
x_title	<i>text</i>	// first line of X title
		// (default "Easting")
x_title_2	<i>text</i>	// second line of X title
x_title_textstyle	<i>textstyle</i>	// textstyle of the X titles
x_title_colour	<i>colour</i>	// default X title colour
x_title_size	<i>mm</i>	// default X title size
x_title_y_pos	<i>mm</i>	// if set, the height in mm above the
		// bottom of all the boxes that the
		// X title text is drawn.
		// If not set, then the text is placed at a
		// height that puts it inside the default
		// box for the X.
x_label_decimals	<i>integer</i>	// number of decim places for X values
x_label_textstyle	<i>textstyle</i>	// textstyle of the X values
x_label_colour	<i>colour</i>	// colour of X values, def is box_colour
x_label_size	<i>mm</i>	// size of X values, def is box_text_size
x_label_y_pos	<i>mm</i>	// if set, the height in mm above the
		// bottom of all the boxes that the
		// X value text is drawn.
		// If not set, then the text is placed at a
		// height that puts it inside the default
		// box for the X value.

For Y parameters:

y_label	0/1	// 0 = Don't label Y values/titles // 1 = Label Y values/titles
y_title	text	// first line of Y title // (default "Easting")
y_title_2	text	// second line of Y title
y_title_textstyle	textstyle	// textstyle of the Y titles
y_title_colour	colour	// default Y title colour
y_title_size	mm	// default Y title size
y_title_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // Y title text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the Y.
y_label_decimals	integer	// number of decim places for Y values
y_label_textstyle	textstyle	// textstyle of the Y values
y_label_colour	colour	// colour of Y values, def is box_colour
y_label_size	mm	// size of Y values, def is box_text_size
y_label_y_pos	mm	// if set, the height in mm above the // bottom of all the boxes that the // Y value text is drawn. // If not set, then the text is placed at a // height that puts it inside the default // box for the Y value.

Please continue to the next section [Chainage Selection and Staggering](#).

Chainage Selection and Staggering

Chainages are used for positioning height labels, uprights (leader lines) and bubbles.

The chainages for the long section plot relate to the primary string and are controlled by a set of parameters.

chord_arc	0	// don't use chord/arc chainages
	1	// include chainages for chord/arc
chainage_interval	value	// regular interval (0 = no regulars)
chainage_label_ends	0/1	// 1 = include start and end chainages
chainage_label_hcp	0/1	// 1 = include tangents, spirals
chainage_label_hip	0/1	// 1 = include hip points
chainage_label_vip	0/1	// 1 = include vip points
chainage_label_vtp	0/1	// 1 = include tangent points
chainage_label_crest	0/1	// 1 = include crest points
chainage_label_sag	0/1	// 1 = include sag points
chainage_label_grade_change	0/1	// 1 = include change of vertical grade
chainage_special_n_file	filename	// n = 1 to 20 - include chainages from // the file (one chainage per line)
chainage_label_tolerance	value	// > 0 use as weeding tolerance // <= 0, don't weed
chainage_merge_bubbles	0/1	// 1 = merge in the bubble chainages
chainage_merge_tolerance	value	// > 0, weeding tol after bubble merge // <= 0, don't weed after merge

Default values

chainage_label_tolerance = 1.0 exp -4 (world units)
chainage_merge_tolerance = 1.0 exp -8 (world units)

If a tolerance is zero or negative, no weeding is performed.

The format of a chainage special file is simply a list of chainage values, one value per lines. Blank lines in the file are ignored and anything on a line after a // is a comment.

If the real chainage position is used for the horizontal position of the chainage/height/depth text, text over writing can easily occur.

To prevent over writing, the text can be **staggered**.

If the **stagger_mode** parameter is set to 1, the text position is adjusted so that the text does not over write.

The real chainage position is then indicated by the chainage markers which are drawn at the top of the text boxes from the staggered text position back to the actual chainage position of the text.

stagger_mode	0	// no staggering, allow over writing
	1	// stagger text to prevent over writing
stagger_gap_top	mm	// distance from boxes to top of stagger
stagger_gap_bottom	mm	// distance from boxes to bottom of // stagger
stagger_gap_factor	value	// distance between staggers is // box_text_size * stagger_gap_factor

When staggering occurs, it is possible for the heights area to be longer than the graph area.

Please continue to the next section [Uprights](#).

Uprights

Uprights, or leader lines, can be drawn from the top of the staggers to the strings drawn on the plot.

The height of the uprights is given by the `uprights_draw_mode`:

<code>uprights_draw_mode</code>	0	// none
	1	// to maximum string height at that chainage
	2	// ticks, to stagger height
	3	// to <code>uprights_y</code> above the boxes
	100	// to the primary string
	101-500	// to tin1 or tin2 etc.
	501-900	// to offset1 or offset2 etc.
<code>uprights_y</code>	<i>mm</i>	// distance to draw the uprights for mode 3
<code>uprights_colour</code>	<i>colour</i>	// uprights colour (default <code>boxes_colour</code>)

The uprights can go below the top of the boxes.

<code>uprights_bottom_mode</code>	0	// stop at top of boxes (default)
	1	// draw to bottom of boxes
	2	// draw to <code>uprights_bottom_y</code> below the top of the boxes
	3	// draw to <code>uprights_bottom_y</code> above the bottom of the boxes
	4	// ticks at chainage
<code>uprights_bottom_y</code>	<i>mm</i>	// distance
<code>uprights_text_offset_factor</code>	<i>value</i>	// move the text by this factor*size

When uprights go below the top of the boxes, the height and offset text is moved to the left so that the upright does not go through the text. The left hand side of the heights boxes also moves to the left to leave room for the height text.

Please continue to the next section [Datum Area](#).

Datum Area

The **datum area** is the region between the boxes area and the graph area.

The **datum line** is positioned the distance ***datum_below_gap*** above the top of the boxes area and the graph area is positioned the distance ***datum_above_gap*** above the datum line.

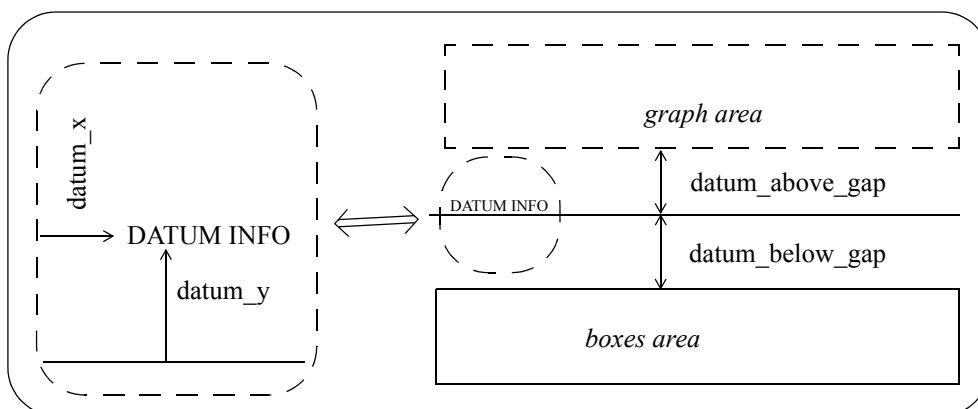

Hence the graph area is distance (*datum_below_gap* + *datum_above_gap*) above the top of the boxes area.

<i>datum_above_gap</i>	<i>mm</i>	// distance from datum line to the // bottom of the graph area
<i>datum_below_gap</i>	<i>mm</i>	// distance from datum line to the top of // the boxes
<i>datum_linestyle</i>	<i>linestyle</i>	// linestyle for datum line (default solid)

The *datum_below_gap* and *datum_above_gap* can be zero or positive.

A value for the datum can be specified by the parameter ***datum_value*** or if the *datum_value* is not set, a datum value is automatically calculated for the long section using a roundoff specified by the user (default 1.0).

<i>datum_value</i>	<i>value</i>	// if set, the value to use for datum. // If not set, the datum is automatically // calculated (using <i>datum_roundoff</i>)
<i>datum_roundoff</i>	<i>1.0</i>	// value to roundoff the datum value to // e.g. 0.5, 0.2, 1.0 (default 1.0)
<i>datum_decimals</i>	<i>integer</i>	// number of decimal places to display // the datum value (default 1). // If > 0, trailing zeros are removed after // the decimal point. // If < 0, the absolute value is taken as the // number of decimal places to report // i.e. no trailing zeros are removed
<i>datum_name</i>	<i>text</i>	// text to write before the datum value
<i>datum_textstyle</i>	<i>textstyle</i>	// textstyle for the datum text
<i>datum_text_size</i>	<i>mm</i>	// size of datum text and value
<i>datum_colour</i>	<i>colour</i>	// colour of the datum text and line
<i>datum_x</i>	<i>mm</i>	// distance to move the datum text // along the datum line
<i>datum_y</i>	<i>mm</i>	// distance to raise the datum text // above the datum line (used to be // called <i>datum_offset</i>)

Please continue to the next section [Graph Area](#).

Graph Area

The **graph area** is the area where the actual plots of the strings are drawn.

The string used to define the horizontal position and chainage of the plot is called the **primary string** and is either

(a) the string being profiled on the given section view
or

(b) the string given by the parameter

```
string_to_plot          "model->string_name"    // name of string to profile
```

When the primary string is being written out to a plot parameter file by 12d Model, a *string_to_plot* parameter and special parameters recording the internal id's for the string and it's model are all written out.

```
primary_model_id        integer                // internal 12d Model parameter
primary_string_id       integer                // internal 12d Model parameter
```

The **length** of the graph area is determined by the length of the primary string being plotted (restricted to the specified start and end chainages) and the horizontal scale (scale) given by parameters or in the **section long plot** panel, and the vertical exaggeration given by the section view or a parameter.

```
view_name               text                  // default is section view in panel.
vertical_exaggeration   value                // default is vertical exag for the view
scale                   value                // 1:value - horizontal scale, default is
                                          // scale 1: in panel
start_chainage          value                // " " means use start of primary string
end_chainage            value                // " " means use end of primary string
```

The vertical scale is determined by the horizontal scale and the vertical exaggeration.

The **height** of the graph area is determined by the vertical scale (given by the horizontal scale and the vertical exaggeration) and the minimum and maximum values of the data being plotted. Hence the graph height is a calculated rather than a given value.

The types of strings that can be drawn in the graph area of a long section plot are:

- (a) primary string the string being profiled (usually the design string).
- (b) tins sections of the primary string through any tins either in models on the section view or in corridor models.
- (c) offset strings strings in the **offset model** that are projected back onto the primary string
- (d) services parts of strings (from either models on the section view or in corridor models) that cut the defined corridor.

The **colour** of the strings in the plot is the actual string colour for cases (a), (c) and (d), and the colour of the tin used for the section in case (b).

Although all the strings are plotted, the plot parameter file can be used to select which ones are labelled with heights and/or depths.

Primary String (Design String)

The primary string (the design string) is used to define

- (a) the design long section
- (b) the chainage positions for labelling heights and drawing uprights
- (c) the section line used for sectioning through tins
- (d) the section line for defining the corridor for services

Although the primary string is used to set up most of the information for the long section plot, it doesn't have to be drawn on the long section.

The drawing or not drawing of the primary string on each cross section plot is controlled by the parameter *primary_string* which was described earlier.

The **colour** of the primary string in the plot is the actual primary string colour.

Tins

A section along the primary string through each tin on the specified section view is automatically drawn on the cross section plot.

The **colour** and **linestyle** of the tin section in the plot is the actual tin colour and tin linestyle.

Whether the tin heights are labelled or not in the boxes area is controlled by parameters and has been described earlier

Corridor and Services

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, then it is drawn on the long section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

The corridor defining parameters are

corridor_width_left	world-units	// corridor left and right widths
corridor_width_right	world-units	// defaults are the section view values
corridor_overlap_left	world-units	// corridor left and right overlaps.
corridor_overlap_right	world-units	// defaults are the section view values
corridor_chord_arc	world-units	// chord-arc tolerance used to
		// approximate arcs in the corridor.
		// default is the section view value

The models containing tins for sectioning and strings for services are taken from the section view or given by the parameters

corridor_model_n	model	// n = 1, 2 ... 100
		// models containing tins and service
		// strings to be drawn on the view.

If any *corridor_model_n* parameters are defined, then only the models given by the parameters are used. If no *corridor_model_n* parameters are set, then the models added to the given section

view are used.

That is, either the *corridor_model_n* parameters are used or if none exist, then the models added to the section view are used for tins and service strings.

The **colour** and **diameter** of the service strings drawn in the plot are the actual strings colour and diameter.

The graph area sits on top of the boxes and datum areas, so there may not be enough room left on the sheet for the full plot height. In this case, the plot will be truncated at the top of the allowed graph area.

Please continue to the next section [Bubbles Definitions](#).

Bubbles Definitions

Circles with the string name and a unique number (**bubbles**) can be drawn on the long section plot. Bubbles are normally used for lip profiles.

The chainages used for the bubbles are given by a set of parameters similar to the chainage parameters. The resulting set of bubbles are sequentially numbered (starting with one) in chainage order.

Although many bubbles can be defined by the bubble parameters, a bubble is only drawn on the plot if there is a labelled chainage to draw it above.

Hence not all bubbles given by the bubble chainage parameters are drawn but for the ones that are drawn, the bubble number is taken from the full bubble set.

chainage_bubbles	0	// don't drawn bubbles
	1	// draw bubbles
bubble_radius	<i>mm</i>	// radius of the bubbles
bubble_colour	<i>colour</i>	// colour for the bubbles
bubble_text_string_name_mode	0	// do not label with string name
	1	// label string name
	2	// label with <i>model->string name</i>
bubble_pre_text	<i>text</i>	
bubble_post_text	<i>text</i>	
bubble_textstyle	<i>textstyle</i>	
bubble_text_size	<i>mm</i>	
bubble_text_colour	<i>colour</i>	
bubble_text_offset	<i>mm</i>	
bubble_upright_distance	<i>mm</i>	// distance bubbles are above boxes/uprights
bubble_mode	0	// bubble_upright_distance is above boxes
	1	// bubble_upright_distance is above
		// uprights
bubble_draw_upright	0/1	// 1 = draw extra upright if
		// bubble_mode = 1
bubble_start_chainage	<i>value</i>	// start chainage for bubbles
bubble_end_chainage	<i>value</i>	// end chainage for bubbles
bubble_chord_arc	0/1	// 1 = use chord-arc chainages
bubble_interval	<i>value</i>	// include regular interval
		// (0 = no regulars)
bubble_label_ends	0/1	// 1 = include start and end chainages
bubble_label_hcp	0/1	// 1 = include tangents, spirals
bubble_label_hip	0/1	// 1 = include hip points
bubble_label_vip	0/1	// 1 = include vip points
bubble_label_vtp	0/1	// 1 = include tangent points
bubble_label_crest	0/1	// 1 = include crests
bubble_label_sag	0/1	// 1 = include sags
bubble_label_grade_change	0/1	// 1 = include change of grade
bubble_special_n_file	<i>filename</i>	// n = 1 to 20 include chainages from the
		// file
bubble_label_tolerance	<i>value</i>	// > 0 use as weeding tolerance
		// <= 0, don't weed

Defaults

bubble_label_tolerance = 1.0 exp -4 (world units)

If a tolerance is zero or negative, no weeding is performed.

The format of a bubble special file is simply a list of chainage values, one value per lines. Blank lines in the file are ignored and anything on a line after a *//* is a comment.

Please continue to the next section [Quick Horizontal Geometry Labelling](#).

Quick Horizontal Geometry Labelling

The standard horizontal geometry arrows can be drawn at a given distance above the top of the boxes area.

horizontal_geometry_y'	<i>mm</i>	// dist above boxes // 0 = don't draw
horizontal_geometry_arrow_text_colour	<i>colour</i>	
horizontal_geometry_arrow_textstyle	<i>textstyle</i>	
horizontal_geometry_arrow_text_size	<i>mm</i>	
horizontal_geometry_arrow_colour	<i>colour</i>	
horizontal_geometry_arrow_height	<i>mm</i>	
horizontal_geometry_label_text	<i>text</i>	
horizontal_geometry_label_textstyle	<i>textstyle</i>	
horizontal_geometry_label_text_colour	<i>colour</i>	
horizontal_geometry_label_text_size	<i>mm</i>	
horizontal_geometry_label_decimals	<i>number</i>	

Please continue to the next section [Extensive Horizontal Geometry Labelling](#).

Extensive Horizontal Geometry Labelling

For complicated horizontal geometry labelling, there are sets of horizontal geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the horizontal geometry of **alignment** strings other than the primary string. To plot such a string on the same plot, the chainage position of the horizontal geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the horizontal geometry (such as radius and spiral length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting horizontal geometry, the user can give up to twenty sets of these labels and they can be used to label spirals, curves and tangent information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

- (a) a text label on the left hand side of the plot
- (b) an arrow
- (c) text on the arrows.

For the following parameters, n takes the value 1 to 20 and specifies the nth parameter set.

h_g_n_type	0	// label spirals
	1	// label horizontal curves
	2	// label horizontal tangents

If *h_g_n_type* is missing, then the set is ignored.

h_g_n_value_mode		
for spiral labelling	0	// nothing
	1	// length
for curve labelling	0	// nothing
	1	// length
	2	// radius
for tangent labelling	0	// nothing

	1	// length
for spiral labelling	0	// nothing
	1	// length
	2	// radius*length
h_g_n_label_y	mm	// distance of arrow line above the top of // the boxes

Parameters for the left hand label of the line of the horizontal geometry arrows:

h_g_n_label_x	mm	// distance from the left hand side of the // labels area
h_g_n_label_offset	mm	// distance to raise the label_text above // arrow line
h_g_n_label_text_size	mm	
h_g_n_label_text_colour	colour	
h_g_n_label_text	text	
h_g_n_label_textstyle	textstyle	// textstyle used

Parameters for arrow type

h_g_n_draw_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
	9	// draw curve
	11	// radius*length curve

h_g_n_left_gap	mm	// size of gap for left side of arrow
h_g_n_right_gap	mm	// size of gap for right side of arrow
h_g_n_colour	colour	// colour of the arrow
h_g_n_height	mm	// height of the arrow
h_g_n_gap	0	// no gap
	1	// leave gap in arrow for text

Parameters for text on the arrows

h_g_n_text_colour	colour	// colour of the text
h_g_n_text_size	mm	// size of the text
h_g_n_text_offset	mm	// distance to raise the text above the // arrow line
h_g_n_pre_text	text	// text before the arrow text
h_g_n_post_text	text	// text after the arrow text
h_g_n_textstyle	textstyle	// textstyle used

h_g_n_no_decimals	integer	// number of decimal places in arrow // text. // If > 0, all trailing zeros after the // decimal place are removed. // If < 0, the absolute value is taken as // the number of decimal places and no // trailing zeros are removed after the // decimal point.
h_g_n_rotate	mm	// if ticked, the text on the arrows will be rotated to fit.

If the set of parameters is to apply to the horizontal geometry of an alignment string *other* than the primary string, then simply add the following parameter to define the other alignment string

h_g_n_offset_string	"model->string_name"
or	
h_g_n_offset_string	"string_name"

and the model is the *Offsets model* from the **Section Long Plot** panel.

If the *h_g_n_offset_string* parameter does not exist, then the set of horizontal geometry parameters is applied to the primary string.

Example of Extensive Horizontal Geometry

```
// Parameter to stop the drawing of the quick horizontal geometry
horizontal_geometry_y      0

// Set 1 - Extensive Horizontal Geometry Labelling - label the horizontal curve radius
h_g_1_type                 1                // label horizontal curve
                                // if this param is missing then set is ignored
h_g_1_value_mode           2                // label curve radius
h_g_1_label_y              45
h_g_1_label_x              0
h_g_1_label_offset         2
h_g_1_label_text_size      4
h_g_1_label_text_colour    YELLOW
h_g_1_label_text           "Horiz Curve Data"

// Parameters for arrow type
h_g_1_draw_mode            1
h_g_1_colour               "white"
h_g_1_height               1.5
h_g_1_gap                  0

// Parameters for text on the arrows
h_g_1_text_colour          YELLOW
h_g_1_text_size            3.5
h_g_1_text_offset          2.5
h_g_1_pre_text             "R"
h_g_1_post_text            "m"
h_g_1_no_decimals          2
```

Example of Extensive Horizontal Geometry for use with a Non-primary Alignment String

// Set 2 labels the horizontal curves radii of the kerb string projected onto primary stings

h_g_2_offset_string	"left offsets->kerb"	// non-primary string to do VG of
h_g_2_type	1	// label horizontal curve // if this param is missing then set is ignored
h_g_2_value_mode	2	// label curve radius
h_g_2_label_y	55	
h_g_2_label_x	0	
h_g_2_label_offset	2	
h_g_2_label_text_size	4	
h_g_2_label_text_colour	GREEN	
h_g_2_label_text	"Left Kerb - Horiz Curve Data"	

// Parameters for arrow type

h_g_2_draw_mode	1
h_g_2_colour	"white"
h_g_2_height	1.5
h_g_2_gap	0

// Parameters for text on the arrows

h_g_2_text_colour	GREEN
h_g_2_text_size	3.5
h_g_2_text_offset	2.5
h_g_2_pre_text	"R"
h_g_2_post_text	"m"
h_g_2_no_decimals	2

Please continue to the next section [Quick Vertical Geometry Labelling](#).

Quick Vertical Geometry Labelling

The standard vertical geometry arrows can be drawn at a given distance above the top of the boxes area.

vertical_geometry_grade_y	mm	// dist above boxes // 0 = don't draw
vertical_geometry_grade_mode	0 1	// % // 1 in
vertical_geometry_label_grade_text	text	
vertical_geometry_label_grade_textstyle	textstyle	// textstyle to use
vertical_geometry_label_grade_text_colour	colour	
vertical_geometry_label_grade_text_size	mm	
vertical_geometry_label_grade_decimals	number	
vertical_geometry_length_y	mm	// dist above boxes // 0 = don't draw
vertical_geometry_length_mode	0 1 2 3	// length // radius // k value // mixed - length for parabolic // radius for circular
vertical_geometry_label_length_text	text	
vertical_geometry_label_length_textstyle	textstyle	// textstyle to use

vertical_geometry_arrow_length_textstyle	textstyle	// textstyle to use
vertical_geometry_arrow_length_text_colour	colour	
vertical_geometry_arrow_length_text_size	mm	
vertical_geometry_arrow_colour	colour	
vertical_geometry_arrow_height	mm	

Please continue to the next section [Extensive Vertical Geometry Labelling](#).

Extensive Vertical Geometry Labelling

For complicated vertical geometry labelling of the *primary alignment* string, there are sets of vertical geometry labelling parameters which give tight control over the position and types of labels.

It is also possible to label the vertical geometry of **alignment** strings other than the primary string. To plot such a string on the same plot, the chainage position of the vertical geometry for the non-primary alignment strings is *projected* onto the primary string to give a primary string chainage for plotting. The values of the vertical geometry (such as grade and curve length) that are plotted are taken from the other string. Independently graded offset strings (such as a left and right kerbs) are the type of additional alignment strings that may need to be plotted on the same long section plot as the reference string (primary string).

For plotting vertical geometry, the user can give up to twenty sets of these labels and they can be used to label grades or vertical curve information for the primary string and/or additional alignment strings.

Each label set consists of three parts:

- (a) a text label on the left hand side of the plot
- (b) an arrow
- (c) text on the arrows.

For the following parameters, *n* takes the value 1 to 20 and specifies the *n*th parameter set.

<i>v_g_n_type</i>	0	// labelling grades
	1	// labelling vg curve information

If *v_g_n_type* is missing, then the entire *n*th set is ignored.

The interpretation of the value of the

parameter *v_g_n_value_mode* depends on whether the set is being used for grade labelling or curve labelling:

for grade labelling	<i>v_g_n_value_mode</i>	0	// nothing
		1	// % grade
		2	// 1 in grade
		3	// m/m grade
		4	// chainage length between vertical curve points
for curve labelling		5	// per chord - Queensland Rail
		0	// nothing
		1	// length - chainage for parabolic vc's
			// arc length for circular vc's
		2	// radius
		3	// K value
		5	// curve constant - Queensland Rail

Vertical curve points to draw the arrows between (for grade labelling only)

<i>v_g_n_between_mode</i>	0	// between chainages at the vip's
	1	// between chainages at the vtp's

Position of the Arrow Line

<i>v_g_n_label_y</i>	<i>mm</i>	// distance of arrow line above the top of // the boxes this can be negative
----------------------	-----------	---------------------------------------------------------------------------------

Parameters for the left hand label of the whole line of the vg arrows:

<i>v_g_n_label_x</i>	<i>mm</i>	// distance from the left hand side of the // labels area
<i>v_g_n_label_offset</i>	<i>mm</i>	// distance to raise the label_text above // arrow line
<i>v_g_n_label_text</i>	<i>text</i>	
<i>v_g_n_label_textstyle</i>	<i>textstyle</i>	
<i>v_g_n_label_text_size</i>	<i>mm</i>	
<i>v_g_n_label_text_colour</i>	<i>colour</i>	

Parameters for arrow type

<i>v_g_n_draw_mode</i>	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line

7	// line with up and downrights at ends
8	// up and down rights, no line
9	// draw curve
10	// draw grade

v_g_n_left_gap	mm	// size of gap for left side of arrow
v_g_n_right_gap	mm	// size of gap for right side of arrow
v_g_n_colour	colour	// colour of the arrow
v_g_n_height	mm	// height of the arrow
v_g_n_gap	0	// no gap
	1	// leave gap in arrow for text

Parameters for text on the arrows

v_g_n_text_colour	colour	// colour of the text
v_g_n_text_size	mm	// size of the text
v_g_n_text_offset	mm	// distance to raise the text above the // arrow line
v_g_n_pre_text	text	// text before the arrow text
v_g_n_post_text	text	// text after the arrow text
v_g_n_textstyle	textstyle	// textstyle used
v_g_n_no_decimals	integer	// number of decimal places in arrow // text. // If > 0, all trailing zeros after the // decimal place are removed. // If < 0, the absolute value is taken as // the number of decimal places and no // trailing zeros are removed after the // decimal point.
v_g_n_rotate	mm	// if ticked, the text on the arrows will be // rotated to fit.

If the set of parameters is to apply to the vertical geometry of an alignment string *other* than the primary string, then simply add the following parameter to define the other alignment string

v_g_n_offset_string "model->string_name"
or
v_g_n_offset_string "string_name"

and the model is the *Offsets model* from the **Section Long Plot** panel.

If the v_g_n_offset_string parameter does not exist, then the set of vertical geometry parameters is applied to the primary string.

Example of Extensive Vertical Geometry

```
// Parameter to not to draw the quick vertical geometry
vertical_geometry_grade_y    0

// Set 1 labels the vertical curves with length
v_g_1_type                  1 // curve
v_g_1_value_mode            1 // chainage length

v_g_1_label_y               45
v_g_1_height                4
v_g_1_label_offset          -2
v_g_1_label_text            "VG Curves"
v_g_1_text_offset           2
v_g_1_label_text_size       6
v_g_1_pre_text              ""
v_g_1_post_text             "L"
v_g_1_gap                   0
v_g_1_draw_mode             8
v_g_1_text_size             4
```

```
// Set 2 labels the vertical curves with K value
v_g_2_type                  1 // curve
v_g_2_value_mode            3 // K value

v_g_2_label_y               45
v_g_2_height                1.5
v_g_2_label_text            ""
v_g_2_text_offset           -5
v_g_2_pre_text              ""
v_g_2_post_text             "K"
v_g_2_gap                   0
v_g_2_draw_mode             1
v_g_2_text_size             4
```

Example of Extensive Vertical Geometry for use with a Non-primary Alignment String

```
// Set 3 labels the vertical curves with length with the kerb string projected onto primary strings
v_g_3_offset_string         "left offsets->kerb" // non-primary string to do VG of
v_g_3_type                  1 // curve
v_g_3_value_mode            1 // chainage length

v_g_3_label_y               55
v_g_3_height                4
v_g_3_label_offset          -2
v_g_3_label_text            "Left kerb - VG Curves"
v_g_3_text_offset           2
v_g_3_label_text_size       6
v_g_3_pre_text              ""
v_g_3_post_text             "L"
v_g_3_gap                   0
v_g_3_draw_mode             8
v_g_3_text_size             4
```

Please continue to the next section [Labelling Chainages and Heights in the Graph Area](#).

Labelling Chainages and Heights in the Graph Area

The chainage and/or height values for certain points (given by *label_n_type*) can be labelled.

Up to twenty sets of chainage/height labels can be done.

label_n_type	0	// chainage of vip, height of vip
	1	// chainage of vip, height of primary
	2	// crest
	3	// sag
	4	// vtp
	5	// hcp
	6	// change of grade
	7	// mid-ordinate of the vertical curve

If *label_n_type* is missing, then the set is ignored.

label_n_y_mode	0	// height in mm above boxes
	1	// above height value (default)
	2	// above primary height
label_n_y	<i>mm</i>	// distance above point
label_n_angle	<i>degrees</i>	// rotation about point
label_n_x	<i>mm</i>	// distance along from point
label_n_offset	<i>mm</i>	// text raise height
label_n_justification	0	// left end
	1	// middle
	2	// end
label_n_size	<i>mm</i>	
label_n_colour	<i>size</i>	
label_n_textstyle	<i>textstyle</i>	
label_n_value_mode	0	// no values labelled
	1	// val 1 = chainage
	2	// val 1 = height
	3	// val 1 = chainage, val 2 = height
	4	// val 1 = height, val 2 = chainage
label_n_pre_text	<i>text</i>	
label_n_mid_text	<i>text</i>	
label_n_post_text	<i>text</i>	
label_n_textstyle	<i>textstyle</i>	// textstyle to use
label_n_no_decimals_1	<i>integer</i>	// number of decimal places in val 1
label_n_no_decimals_2	<i>integer</i>	// number of decimal places in val 2

If the **number of decimal places is greater than zero (> 0)**, then any trailing zeros after the decimal point are removed.

If the **number of decimal places is less than zero (< 0)**, the absolute value is taken as the number of decimal places and **no** trailing zeros after the decimal point are removed.

Example of Labelling Chainage and Heights

```
// label the crests with chainage on one line
// and height (elevation) on the next

label_1_type      2 // crest
label_1_y_mode    2 // above string
label_1_y         10
label_1_angle     0
label_1_justification 1 // centre
label_1_size      4
label_1_colour    red
label_1_value_mode 1 // chainage
```

```
label_1_pre_text      "CH "  
label_1_no_decimals_1 1  
  
label_2_type          2 // crest  
label_2_y_mode        2 // above string  
label_2_y             2  
label_2_angle         0  
label_2_justification 1 // centre  
label_2_size          4  
label_2_colour        red  
label_2_value_mode    2 // height  
label_2_pre_text      "EL "  
label_2_no_decimals_1 1
```

Please continue to the next section [Labelling With Symbols](#).

Labelling With Symbols

Symbols can be placed at certain points given by *symbol_n_type*.

The symbol is drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

Up to twenty sets of symbol labelling can be done.

```
symbol_n_type      0 // chainage of vip, height of vip  
                  1 // chainage of vip, height of primary  
                  2 // crest  
                  3 // sag  
                  4 // vtp  
                  5 // hcp  
                  6 // change of grade
```

If *symbol_n_type* is missing, then the set is ignored.

```
symbol_n_y_mode    0 // height in mm above boxes  
                  1 //   above height value (default)  
                  2 //   above primary height  
  
symbol_n_y         mm // distance above point given by mode  
symbol_n_angle     degrees // rotation about point  
symbol_n_x         mm // distance along from point  
symbol_n_size      mm //  
symbol_n_colour    colour // colour of symbol  
  
symbol_n_draw_mode 0 // cross  
                  1 // upright from centre of box  
                  2 // up and downright from centre of box  
                  3 // square  
                  4 // triangle, base at bottom  
                  5 // circle
```

Example of Labelling with Symbols

```
// draw a triangle symbol at the crest  
symbol_1_type      2 // crest
```

```

symbol_1_y_mode      2 // above string
symbol_1_y           0
symbol_1_angle       0
symbol_1_size        2
symbol_1_colour      red
symbol_1_draw_mode   4 // triangle

```

Please continue to the next section [Hatching Cut and Fill Areas](#).

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

<code>hatch_original_tin_n</code>	<i>tin_name</i>	// tin_name for original surface
<code>hatch_new_tin_n</code>	<i>tin_name</i>	// tin_name for final surface
<code>hatch_cut_separation_n</code>	<i>mm</i>	// distance between cut hatch lines
	0	// don't do cut hatching
<code>hatch_cut_angle_n</code>	<i>degrees</i>	// angle in degrees of cut hatching
<code>hatch_cut_colour_n</code>	<i>colour</i>	// colour of the cut hatching
<code>hatch_cut_linestyle_n</code>	<i>linestyle</i>	// linestyle for cut hatching
<code>hatch_cut_draw_sides_n</code>	1/0	// 1 = draw sides of cut regions
<code>hatch_cut_draw_original_n</code>	1/0	// 1 = draw original tin in cut regions
<code>hatch_cut_draw_new_n</code>	1/0	// 1 = draw new tin in cut regions
<code>hatch_fill_separation_n</code>	<i>mm</i>	// distance between fill hatch line
	0	// don't do fill hatching
<code>hatch_fill_angle_n</code>	<i>degrees</i>	// angle in degrees of fill hatching
<code>hatch_fill_colour_n</code>	<i>colour</i>	// colour of the fill hatching
<code>hatch_fill_linestyle_n</code>	<i>linestyle</i>	// linestyle for fill hatching
<code>hatch_fill_draw_sides_n</code>	1/0	// 1 = draw sides of fill regions
<code>hatch_fill_draw_original_n</code>	1/0	// 1 = draw original tin in fill regions
<code>hatch_fill_draw_new_n</code>	1/0	// 1 = draw new tin in fill regions

Notes

- cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- cut hatching is turned off by setting `hatch_cut_separation_n` to 0.0.
fill hatching is turned off by setting `hatch_fill_separation_n` to 0.0.

Please continue to the next section [Labelling Cuts of Design Through Strings in a Model](#).

Labelling Cuts of Design Through Strings in a Model

The cuts that the primary string (design line) makes through any strings in user given models can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol**. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

"top-left"	"top-centre"	"top-right"
"middle-left"	"middle-centre"	"middle-right"
"bottom-left"	"bottom-centre"	"bottom-right"

A choice of six special symbols and/or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

Parameters for Labelling Where the Design Cuts Strings in a Model

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

The parameters for selecting and labelling the *nth* set (where *n* can be from 1 to 25) of cuts of the design string with the strings in the model are given by:

```
cuts_n_model          model_name          // model of strings to be cut
```

The selection of the strings from the model *model_name* whose cut points are to be labelled is all the strings whose name satisfies the name mask *cuts_n_mask*:

```
cuts_n_mask          name_mask          // strings to check for cuts
                                     // and if a cut occurs,
                                     // parameters show how to
                                     // label the cut
```

where *name_mask* is a text string containing the name masks, each separated by one or more spaces, to test the string name against. Each mask can include wild cards and wild characters.

For example

```
or          cuts_1_mask          "ke*"
           cuts_1_mask          "?bank*"
```

or, if both masks are required,

```
           cuts_1_mask          "ke*  ?bank*"
```

If *cuts_n_mask* is missing, then all strings in the model are used. This is equivalent to *name_mask* being *"*"*.

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the design string, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the *nth* set.

The parameters for drawing a **symbol** at the cut points are

```
cuts_symbol_n_mode    0          // cross
                     1          // up from centre of box
                     2          // up and down from centre of box
                     3          // square
                     4          // triangle, base at bottom
                     5          // circle
                     6          // use a 12d symbol
```

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for

If *cuts_symbol_n_mode* is 6, then the 12d symbol is given by

```
cuts_symbol_n_style    plotsymbol    // plot symbol to draw at cut
```

Important Note

The plot symbol of name *plotsymbol* is defined in the file given by:

- (a) the parameter *plot_symbols* in the ppf file

plot_symbols filename

or if plot_symbols is not defined, then

(b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D
PLOT_SYMBOLS_4D filename // default plotsym.4d

or if PLOT_SYMBOLS_4D is not defined, then

(c) in the file plotsym.4d
which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

(d) either pointed to by the environment variable SYMBOLS_4D
SYMBOLS_4D filename // default symbols.4d
or if the environment variable SYMBOLS_4D does not exist, in the file, symbols.4d

The position of the symbol is given by:

cuts_symbol_n_position	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

cuts_symbol_n_x	mm	// offset adjustment to position
cuts_symbol_n_y	mm	// height adjustment to position
cuts_symbol_n_angle	degrees	// rotation about point
cuts_symbol_n_colour	colour	// colour of symbol

and for all values of cuts_symbol_n_mode **other** than 6:

cuts_symbol_n_size	mm	// size of symbol, 0 don't draw
--------------------	----	---------------------------------

The value of the **chainage** of the cut string can be labelled using the parameters

cuts_chainage_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_chainage_n_x	mm	// chainage adjustment to position
cuts_chainage_n_y	mm	// height adjustment to position
cuts_chainage_n_angle	degrees	// rotation about point
cuts_chainage_n_size	mm	// size of text, 0 don't label
cuts_chainage_n_colour	colour	// colour of text
cuts_chainage_n_textstyle	text	// textstyle of text chainage
cuts_chainage_n_pre_text	text	// text before the chainage value
cuts_chainage_n_post_text	text	// text after the chainage value
cuts_chainage_n_justification	justification	// justification of the text
cuts_chainage_n_no_decimals	integer	// number of decimals in chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of the position
	100	// of the label above the boxes
	101-500	// height of primary string
cuts_height_n_position	1	// use height of to tin1 or tin2 etc.
	3	// at points position
	100	// above top of boxes
	101-500	// to primary string
cuts_height_n_x	mm	// to tin1 or tin2 etc.
cuts_height_n_y	mm	// chainage adjustment to position
cuts_height_n_angle	degrees	// height adjustment to position
cuts_height_n_size	mm	// rotation about point
cuts_height_n_colour	colour	// size of text, 0 don't label
cuts_height_n_textstyle	text	// colour of text
cuts_height_n_pre_text	text	// textstyle of text height
cuts_height_n_post_text	text	// text before the height value
cuts_height_n_justification	justification	// text after the height value
cuts_height_n_no_decimals	integer	// justification of the text
		// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// chainage adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Please continue to the next section [Labelling the Primary String Name on the Plot](#).

Labelling the Primary String Name on the Plot

The plot can be labelled with a name under the boxes area.

The name is made up of concatenation the text strings:

```
plot_name_pre_text      primary-string-name      plot_name_post_text
```

The plot name is positioned under the boxes.

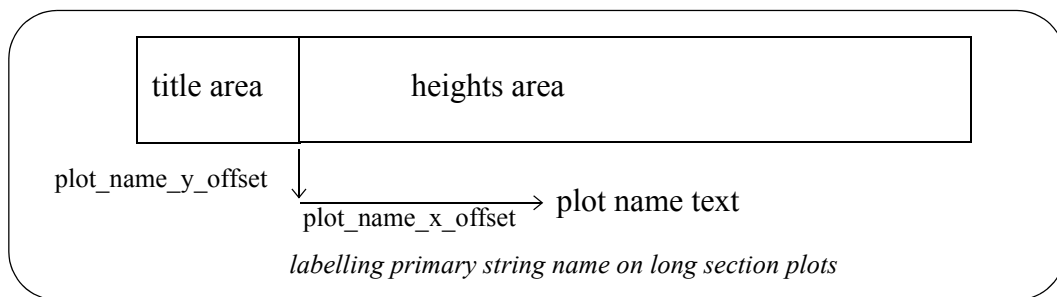

```
plot_name_string_name      0      // don't use the primary string name
                           1      // use primary string name
                           2      // use model->string name

plot_name_pre_text         text
plot_name_post_text        text
plot_name_textstyle        textstyle
plot_name_size             mm
plot_name_colour           colour
plot_name_x_offset         mm
plot_name_y_offset         mm
```

The *plot_name_x_offset* is measured from the beginning of the height boxes.

The default for *plot_name_x_offset* is centred on heights area.

The *plot_name_y_offset* is measured from the bottom of the box area with positive being **down**.

Example of Labelling Primary String Name

```
plot_name_pre_text      "Long Section Plot for String"
plot_name_post_text     ""
plot_name_size          15
plot_name_colour        red
plot_name_string_name   1
plot_name_y_offset      30
```

Please continue to the next section [Labelling the Scale on the Plot](#).

Labelling the Scale on the Plot

The plot can be labelled with the horizontal and vertical scale under the boxes area.

The scale label is made up of concatenation the text strings:

scale_horizontal_pre_text horizontal scale value scale_horizontal_post_text

and

scale_vertical_pre_text vertical scale value scale_vertical_post_text

The horizontal scale value is the value given by the scale parameter.

The vertical scale value is calculated from the horizontal scale and the vertical exaggeration for the section view.

The scales are positioned under the boxes.

scale_horizontal_pre_text	<i>text</i>
scale_horizontal_post_text	<i>text</i>
scale_horizontal_textstyle	<i>textstyle</i>
scale_horizontal_size	<i>mm</i>
scale_horizontal_colour	<i>colour</i>
scale_horizontal_x_offset	<i>mm</i>
scale_horizontal_y_offset	<i>mm</i>
scale_horizontal_decimals	<i>integer</i>
scale_vertical_pre_text	<i>text</i>
scale_vertical_post_text	<i>text</i>
scale_vertical_textstyle	<i>textstyle</i>
scale_vertical_size	<i>mm</i>
scale_vertical_colour	<i>colour</i>
scale_vertical_x_offset	<i>mm</i>
scale_vertical_y_offset	<i>mm</i>
scale_vertical_decimals	<i>integer</i>

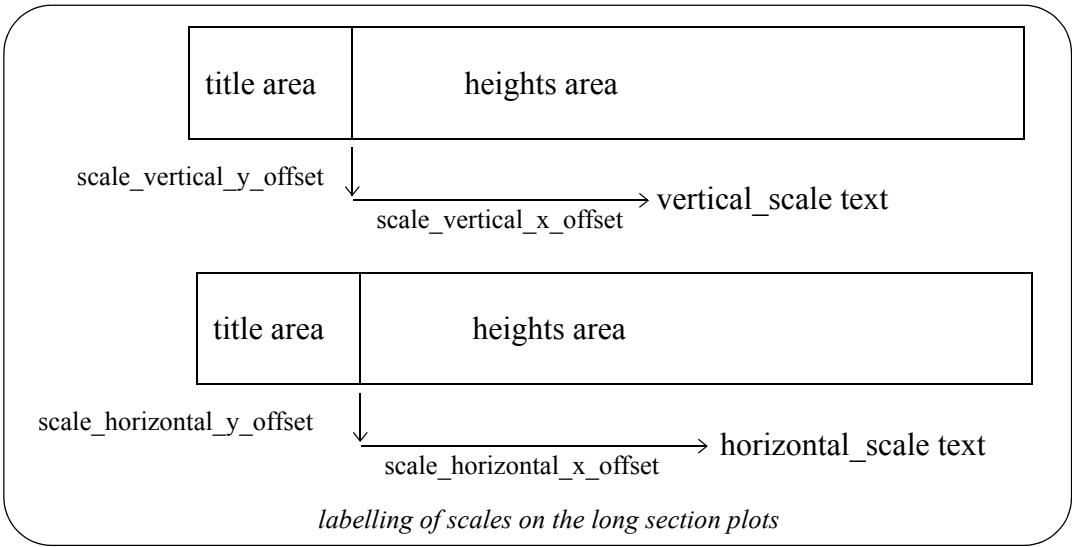

The *scale_vertical_x_offset* and *scale_horizontal_x_offset* are measured from the beginning of the heights area.

The default for *scale_vertical_x_offset* and *scale_horizontal_x_offset* are centred on the heights area.

The *scale_vertical_y_offset* and *scale_horizontal_y_offset* are measured from the bottom of the box area with positive being **down**.

If the **number of decimal places is greater than zero (> 0)**, then any trailing zeros after the decimal point are removed.

If the **number of decimal places is less than zero (< 0)**, the absolute value is taken as the number of decimal places and **no** trailing zeros after the decimal point are removed.

Example of Labelling Horizontal and Vertical Scales

scale_horizontal_pre_text	"Horizontal Scale 1:"
scale_horizontal_post_text	""
scale_horizontal_size	15
scale_horizontal_colour	yellow
scale_horizontal_y_offset	60
scale_vertical_pre_text	"Vertical Scale 1:"
scale_vertical_post_text	""
scale_vertical_size	15
scale_vertical_colour	green
scale_vertical_y_offset	90

Please continue to the next section [Title Block Information](#).

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

plot_border	yes/no	// yes plots a standard title block // default yes
title_1	text	
title_2	text	
title_text_size	value	
title_colour	colour	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of this chapter.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

use_title_file	yes/no	// yes draws the title block given in title_file // default no
title_file	filename	
plot_border	no	// turn off standard title block

Some special plot parameters are used to pass information down to variables in a user defined title block. For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* (n = 1,2,... 1000)

user_text_n	text
-------------	------

The special plot parameters are:

time_format	text	// format for \$time
user_text_n	text	// where n = 1,2,... 1000 // passed down to \$user_text_n
title_1	text	// passed down to \$title_1
title_2	text	// passed down to \$title_2
start_page_number	integer	// used as the starting value for // \$page_number. If missing, // \$page_number starts at 1.
start_drawing_number	integer	// added to \$drawing_number in title // block file. If missing, // \$drawing_number starts at 1.
drawing_number_prefix	text	// passed down to // \$drawing_number_prefix
drawing_number_postfix	text	// passed down to // \$drawing_number_postfix

Please continue to the next section [Parameters that Modify Fields In the Long Plot Panel](#).

Parameters that Modify Fields In the Long Plot Panel

A number of parameters match those in the **section long plot** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for any plots.

The plot parameters that also occur in the **section long plot** panel are:

scale	<i>value</i>
start_chainage	<i>value</i>
end_chainage	<i>value</i>
chainage_interval	<i>value</i>
chord_arc	0/1
plotter_type	<i>text</i>
plot_file	<i>text</i>
view_name	<i>text</i>
offset_model	<i>text</i>
plot_border	<i>yes/no</i>
label_depths	<i>yes/no</i>
primary_string	<i>yes/no</i>
datum_value	<i>value</i>
sheet_size	<i>text</i> or “width height”
box_text_size	<i>mm</i>
box_colour	<i>colour</i>
use_title_file	<i>yes/no</i>
title_file	<i>filename</i>
plot_border	<i>yes/no</i>
title_1	<i>text</i>
title_2	<i>text</i>
title_text_size	<i>value</i>
title_colour	<i>colour</i>
pagination	<i>yes/no</i>
pagination_length	<i>value</i>
pagination_overlap	<i>value</i>
global_textstyle	<i>textstyle</i>

Please continue to the next section [Generating Long Section Plots Without a View](#).

Generating Long Section Plots Without a View

The long section plot parameters are comprehensive enough that it is possible to completely generate a long section plot without referencing a section view, or even using the **section long plot** panel.

Such a ppf can be run using the **plots=>plot a ppf** option or from the 4D Solutions programming language, 4DML.

When a long section plot is being generated entirely from a file, an extra parameter is needed to specify whether the datum value is calculated or the *datum_value* parameter is used.

```
manual_datum      1          // use the datum_value parameter for
                        // the datum
                        0          // ignore the datum_value and let
                        // 12d Model calculate the datum.
```

When generating a long section plot using the **section long plot** panel, a plot parameter file containing all the parameters needed to regenerate the plot using **plots=>plot a ppf** can be written out by simply giving a name for the ppf file in the plot parameters write field of the **section long plot** panel.

Notes

- 1. A warning is given if the keyword in a plot parameter file does not exist.
- 2. A warning is also given if the key word pair is defined more than once in a ppf.

Please continue to the next section [Example of a Long Section Plot Parameter File](#).

Example of a Long Section Plot Parameter File

```
// ppf file to generate longsection example
section_long_plot  "diag2" {
// plot margins
left_margin        0

Please continue to the next section [#Include in Plot Parameter Files](#).

#Include in Plot Parameter Files

The plot parameter file also recognizes the CCCP preprocessor rules including #include which can be used to include other files in the plot parameter file.

The format of the #include command is:

#include *file_name*

Hence a block of plot parameters can be set up in a file and included in another file using #include rather than typing them all in again.

Any number of #include's can be placed in the plot parameter file.

To return to the beginning of this appendix, click on [Plot Parameters](#).

P Glossary

Glossary of Common Terms

Arc

Part of the circumference of a circle.

Affine Transformation 2D

A two dimensional transformation where one set of points is fitted to another. The transformation is a six parameter transformation, i.e., x displacement, y displacement, x scale factor, y scale factor, a x-rotation and y-rotation. If more variables exist than degrees of freedom, i.e., more than three control points are used, a least squares solution is calculated.

AGD

Australian Geodetic Datum.

AGD66

Australian Geodetic Datum 1966.

AGD84

Australian Geodetic Datum 1984.

AMG

Australian Map Grid.

Angle, Cartesian Angle, Mathematical Angle

The angle of a point is the counter-clockwise angle from the x-axis (horizontal or East line) to the line joining the point to the origin.

The angle of a line is the counter-clockwise angle measured from the x-axis to the line.

Batter

A steeply sloping surface (usually the wall of an earth bank).

Bearing

The bearing of a point is the clockwise angle from the y-axis (vertical or North line) to the line joining the point to the origin.

The bearing of a line is the clockwise angle measured from the y-axis to the line.

Blend

Use to define how opaque/translucent/transparent the fill of a polygon, face or tin is.

The value of blend is between 0 and 1.

0 means the fill is totally transparent (and hence invisible) and 1 means that the fill is opaque (non-translucent) and can't be seen through at all.

Breakline

A line on a surface joining a series of points on a common change-of-grade line. For example, the ridge top or spur, top or toe of batter, creek bank. See also *tinable segment*.

Cartesian Angle

See Angle.

Chainage

Chainage is a measure of the plan length along a string. The chainage at a point on a string is the start chainage of the string plus the plan length of the string from the beginning of the string to that point.

Circular Curve

Curves defined as an arc.

Cross Fall

The lateral grade or slope of a surface (particularly of a road pavement); usually expressed as a percentage of the proportion of metres vertically to metres horizontally.

End Chainage

The chainage of the last point of a string.

Eye-Point

For a perspective view, it is the point where the observer of the perspective view looks from.

GDA

Geocentric Datum of Australia.

GDA94

Geocentric Datum of Australia 1994.

GPS

Global Positioning System.

Grade

The longitudinal slope of a surface (particularly of road pavement). Usually expressed as a cross fall percentage or as a ratio of one unit vertically to a number of units horizontally. For example, 3% or 1:10.

GRS80

Geocentric Reference System 1980.

Helmert Transformation 2D

A two dimensional transformation where one set of points is fitted to another. The transformation is a four parameter transformation, i.e., x displacement, y displacement, scale factor and rotation. If more variables exist than degrees of freedom, i.e., more than two control points are used, a least squares solution is calculated.

Helmert Transformation 3D

A three dimensional transformation where one set of points is fitted to another. The transformation is a seven parameter transformation, i.e., x displacement, y displacement, z displacement, scale factor and three rotations. If more variables exist than degrees of freedom, i.e., more than two control points are used, a least squares solution is calculated.

Hidden Line

Lines that are hidden between protruding landforms, etc. in perspective views.

Horizontal Alignment

The plan position of an alignment string (centre line) defined by intersection points, spirals and arcs.

Intersection Point (IP)

The point where two lines intersect. Usually horizontal intersection points (HIP) or vertical intersection points (VIP)

Invert

The lower inner surface of a drain or sewer pipe.

ISG

Integrated Survey Grid (NSW Australia).

MGA, MGA94

Map Grid of Australia 1994.

NTv2

National Transform Version 2. Special grid file format used in Australia, NZ and Canada for converting longitude and latitude.

Null Value

In three dimensional data, it is possible that a point can have a valid plan position but an undefined height. In **12d** Model, there is a special **null** value which is used internally when height is undefined (-9.9e29).

Obvert

The upper inner surface of a drain or sewer pipe.

Parabolic Curve

Curves defined as a parabola.

Plot File

A file of plotting instructions in a format to suit a particular plotter. In 12d Model, HPGL is the default format for plot files.

Polygon

A string where the first point and the last point have the same plan co-ordinate. That is, the string closes on itself.

Screen Units

The unit of resolution for the computer screen - usually called pixels.

Shade

For a shade for a perspective view, the colour of all triangle faces are adjusted depending on the angle they make with a specified light source.

Slope

The inclination or grade of a surface or line, usually expressed as a ratio between one unit vertically to a number of units horizontally. For example, 1:10.

Snapping

A process where the element to be selected does not have to be exactly located. A tolerance is specified (the snap tolerance) and if the cursor is placed within the tolerance distance of the element then the cursor is moved directly ("snaps") to the element.

Different snap settings determine what parts of the element are considered for snapping to. For example, points on the string (point snap), drop perpendicular on the lines of an element (line snap) and grid points (grid snap).

Spiral

The special type of curve used for transitioning between straights and arcs in an alignment string (centre line). Also known as a transition curve or transition spiral.

Start Chainage

The chainage of the first point of a string.

String

A string is an ordered series of points.

Apart from the first and last point in a string, each point in a string has a unique next point (successor) and a unique previous point (predecessor). The previous and next points for a point are called its string neighbours. The lines joining a point with its neighbours are called string links.

A string which has the same first and last point is called a closed string otherwise a string is said to be open.

Strings are very useful in the modelling of terrain and design surfaces. 12d Model uses a number of different **types** of strings which as defined in the chapter **Tools and Concepts**.

Sweep Angle

For an arc, the sweep angle is the angle, measured in the *clockwise* direction, between the line joining the arc start point to the arc centre and the line joining the arc end point to the arc centre.

Tangent Point

A point at which a curve touches a line or another curve such that the tangent vector at that point is the same for the two touching items.

Target-Point

For a perspective view, it is the point that the observer is looking at.

Template

Standardized cross-section which is applied to a string at defined chainage points.

Template Modifiers

12d Model commands which modify the definition of a template. Template modifiers are used in preference to defining hundreds of different templates.

TIN

Triangulated Irregular Network. A TIN is a set of triangles which do not non-overlap in plan. Each vertex of a triangle has a z-value so that the TIN represents a surface in three dimensional space made up of triangular faces. When a TIN is created from a data set, the triangles are formed so that all non-null points are vertices of triangles. If breaklines are preserved in the TIN, then triangles are constrained so that any link from a breakline string is a side of a triangle.

Tinable vertex or point

If a vertex or point is tinable, then the vertex/point is included in triangulations. If the vertex/point is not tinable, then the vertex/point is ignored when triangulating.

Tinable segment or line

If a segment or line is tinable (and both the vertices at the ends of the segment/line are tinable and the z-values not null), then the segment/line is used as a side of a triangle during triangulation. This may not be possible if there are *crossing* tinable segments/lines.

A tinable segment is also known as a *breakline*.

Note that for a segment/line to be used as a side of a triangle, then its end vertices must be tinable and the z-values not null.

Triangulation

A set triangles, which do not overlap in a plan view, created from a set of data points. See TIN.

UTM

Universal Transverse Mercator.

View

The area in 12d Model used for displaying (drawing) graphical information. In 12d Model there are three types of views - plan, section and perspective.

Vertical Alignment

The long section position of an alignment string (centre line) defined by vertical intersection points (VIP's) and parabolic or circular curves.

WGS84

World Geodetic System 1984.

World Units

The fundamental units used in 12d Model - usually metres.
