The create circles option is used to create **12d** Model circles.

A **12d** Model **circle** has no start and end points but is defined by a centre point and a radius. The circle has a constant height (z-value).

For convenient **12d** Model includes a variety of methods for creating circles. On walking-right on the **circles** option, the **create circles** menu is displayed giving all the different methods for creating circles.

For Centre, radius, go to
 Centre, pt on circle
 3 pts on circle

[Create Circle - Centre Point, Radius](#)

[Create Circle - Centre Point, Point on Circle](#)

[Create Circle - Three Points on Circle](#)

Each option in the **create circles** menu fires up its own special panel to collect the necessary information for defining the circle.

The mouse is used to select the special points required for the circle definitions. For example, the **circle - centre, radius** option required the value of the radius to be entered into the **circle - centre point, radius** panel and the centre point is selected using the cursor.

Unlike the other strings created under **strings=>create**, the circles can be created immediately without needing any options from the circle editor. Consequently, after a circle is defined, the create panel is not removed and is left on the screen to create another circle. Any information that needs modifying is changed in the **circle** panel and is used for the new create.

New circles are created until either the panel is removed by selecting the **finish** or **[X]** button, or the create terminated by selecting **cancel** from the **pick ops** menu in which case the panel will be left on the screen. In the last case, the **circle** button is then used to begin a new create sequence.

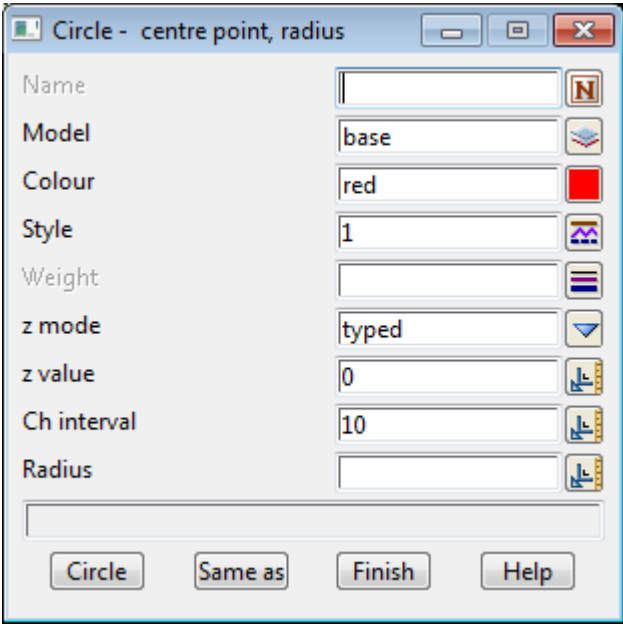

Each of the methods for creating circles and arcs will now be described.

Create Circle - Centre Point, Radius

Position of option on menu: Strings =>Create =>Circles =>Centre, radius

This option defines a circle by supplying a typed radius and selecting a centre point with the mouse

After selecting the option, the **circle - centre point, radius** panel is displayed.

To **create** a circle, the name, colour, model, chainage interval and radius are entered into the appropriate fields and the centre point selected with the cursor. The circle is then created using the information provided in the panel.

The new fields and buttons used in the **circle - centre point, radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the circle is the value in the field.</i>	input	0	
Ch interval <i>the chainage interval used when a chord approximation is needed for the circle.</i>	input	10	
Radius <i>the radius for the circle.</i>	input	10	

Circle button

The *circle* button is used to begin a new create if the previous one was cancelled.

Same as button

After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.

Panel Messages

Next step messages sent to the screen message when selecting and accepting the centre point are

<Circle centre> [picks][][][menu]

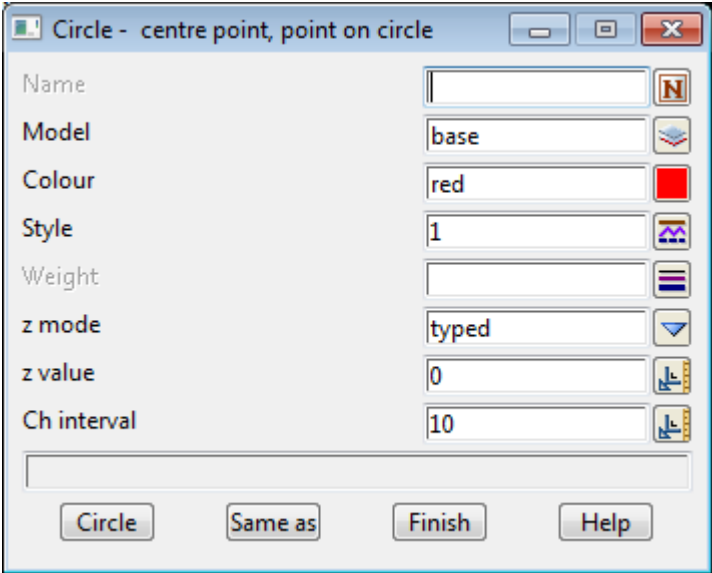

<Circle centre> [picks][accepts][menu]

Create Circle - Centre Point, Point on Circle

Position of option on menu: Strings =>Create =>Circles =>Centre, pt on circle

This option defines a circle by selecting a centre point and a point on the circle. The radius is automatically calculated by the option and is simply the distance between the two selected points.

After selecting the option, the **circle - centre point, point on circle** panel is displayed.

To **create** a circle, the name, colour, model and chainage interval are entered into the appropriate fields and the centre point and a point on the circle selected with the cursor. Then the circle is created using the information provided in the panel.

The new fields and buttons used in the **circle - centre point, point on circle** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours

Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the circle is the value in the field.</i>	input	0	
Ch interval <i>the chainage interval used when a chord approximation is needed for the circle.</i>	input	10	
Circle <i>The circle button is used to begin a new create if the previous one was cancelled.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

How to Use the Panel to Create a Circle

- (a) The panel fields are filled in with the appropriate data for use in defining the circle.
- (b) The mouse is then used to select the centre point for the circle.

Messages sent to the screen message area when selecting and accepting the centre point

```
<Circle centre> [picks][ ][menu]
<Circle centre> [picks][accepts][menu]
```

When selecting a point on the circle

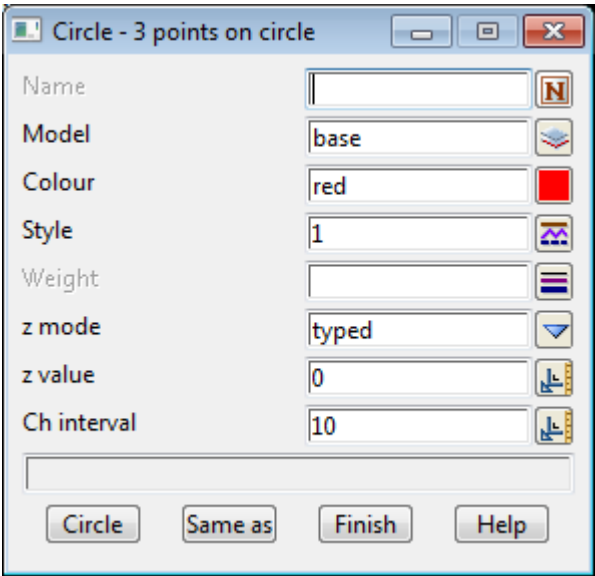

```
<Point on circle> [picks][ ][menu]
<Point on circle> [picks][accepts][menu]
```

Create Circle - Three Points on Circle

Position of option on menu: Strings =>Create =>Circles =>3 pts on circle

This option defines a circle by selecting three points that all lie on the circle. The radius and centre point are automatically calculated by the option.

After selecting the option, the **circle - 3 points on circle** panel is displayed.

To **create** a circle, the name, colour, model and chainage interval are entered into the appropriate fields and then three points which lie on the circle are selected with the cursor. The circle is then created using the information provided in the panel.

The fields and buttons used in the **circle - 3 points on circle** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Name	<i>the name of the new string.</i>	input		
Model	<i>name of the model that the new string is in.</i>	input		available models
Colour	<i>the colour of the new string.</i>	input	default colour	available colours
Style	<i>line style of the string.</i>	input	1	available line styles
Weight	<i>thickness of the string.</i>	input	0	
z mode	<i>the method of specifying the z-value for the circle. It can be typed in or taken from the z-value of the selected centre point.</i>	input	typed	snap, typed
z value	<i>if the z mode method is typed, then the height (z-value) of the circle is the value in the field.</i> <i>if the z mode method is typed, then the height (z-value) of the circle is the value in the field.</i>	input	0	
Ch interval	<i>the chainage interval used when a chord approximation is needed for the circle.</i>	input	10	
Circle	<i>The circle button is used to begin a new create if the previous one was cancelled.</i>	button		
Same as	<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

Panel Messages

Next step messages sent to the screen message area when selecting and accepting the 1st point

<First point on circle> [picks][accepts][menu]

When selecting and accepting the second point

<Second point on circle> [picks][][menu]

<Second point on circle> [picks][accepts][menu]

When selecting and accepting the third point

<Third point on circle> [picks][][menu]

<Third point on circle> [picks][accepts][menu]

Create - Feature

Position of option on menu: Strings =>Create =>Feature

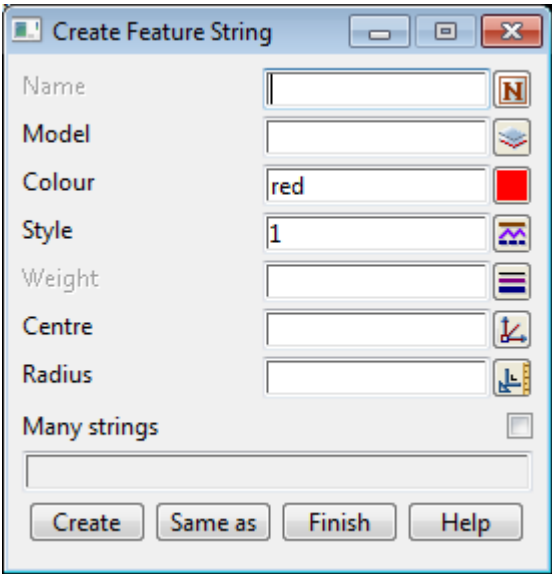

A feature string consists of a centre point (x,y,z) and a user given radius.

The difference between a circle and a feature string is that for a feature string the **centre point** is considered to be a valid (x,y,z) point but all the points on the circumference of the feature string are null values. Feature strings can be used to represent objects such as trees.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Feature String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Feature String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Feature String** panel.

After selecting the option, the **Create feature string** panel is displayed.

The new fields and buttons used in the **create feature string** panel have the following functions.

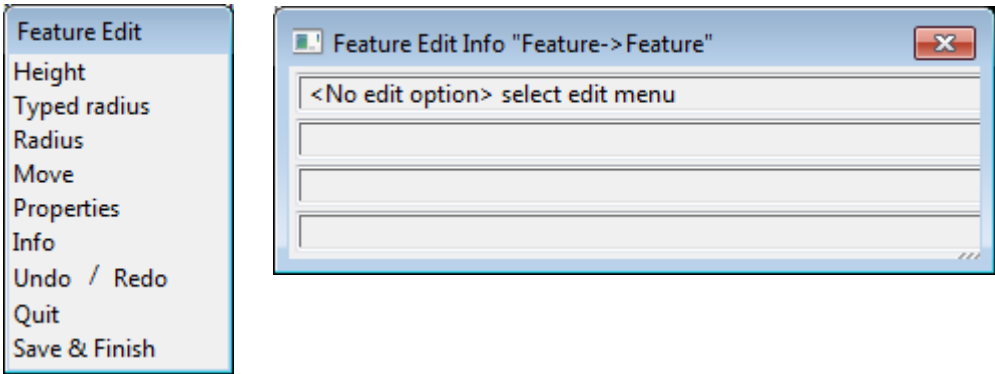

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	

Centre	input	xyz ops menu
<i>co-ordinates of the centre of the feature.</i>		
Radius	input	
<i>the radius for the feature.</i>		
Many strings	tick	
<i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>		
Create	button	
<i>After the create button is chosen, the feature edit menu and feature edit info panel are displayed.</i>		
Same as	button	
<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>		

Note - the centre co-ordinates can either be typed into the **centre** panel field, or if LB is clicked on **[+]** for the **centre** panel field, the xyz ops menu comes up and the **pick xyz** option can be used from it to select a point as the arc centre.

Start Edit - Feature

Like the arc creates, on selecting the **Create** button the feature string is immediately created. The **feature edit menu** and **feature edit info panel** are also placed on the screen at the same time
The **feature edit menu** and panel for a feature string are

For full information in the Feature Editor, go to the section [Feature Edit](#)

Create - Pipe Super

Position of option on menu: Strings =>Create =>Pipe

A pipe super string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that the pipe diameter can be modified in the Properties panel for the string.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super Pipe String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super Pipe String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle style, weight, diameter and tinability fields of the **Create Super Pipe String** panel.

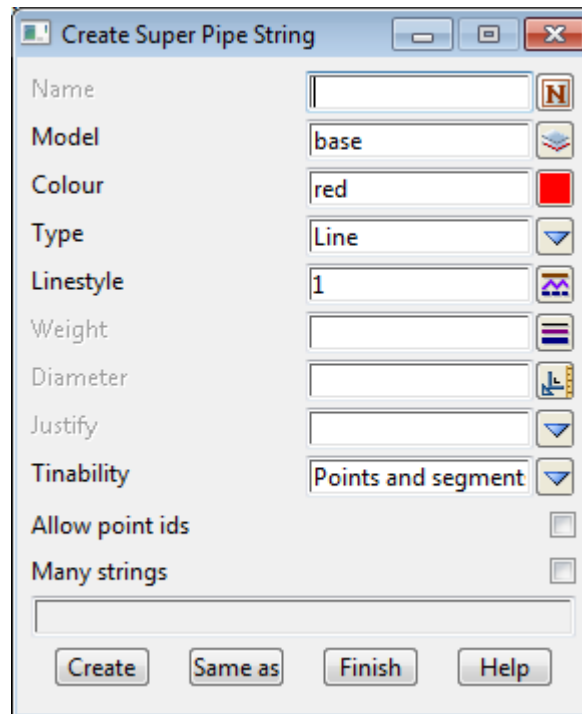

From **12d Model 8** onwards, the default is to create **super pipe strings** rather than the **pipe strings** used up to **12d Model 7**. The advantage of using a **pipe super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *pipe string* create option is still available under

Strings =>Create =>Old

(go to the section [Create - Pipe \(Pre V8\)](#))

On selecting the **Pipe** option, the **Create Super Pipe String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see [CAD, Symbol and Text Controlbars](#))

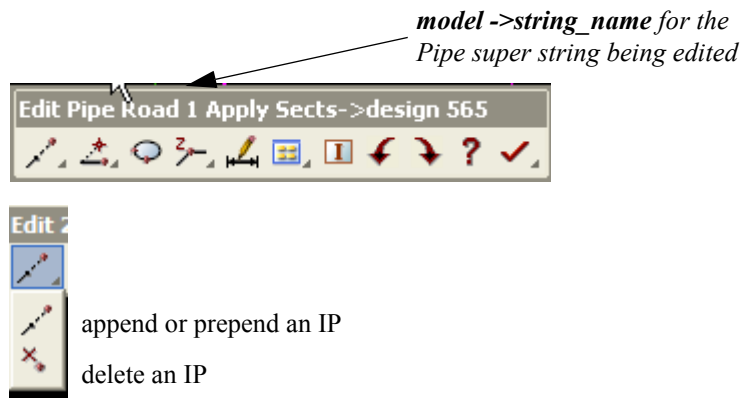

To **create a new pipe super string**, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super Pipe String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	input	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Diameter <i>diameter of the pipe</i>	input	0	
Justify <i>justification of the pipe with respect to the co-ordinates given for the pipe string.</i>	input	invert	invert, centre, overt
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
<i>if Vertices and segments, all the vertices and segments of the string are set to tinable. If Vertices only, all the vertices are set to tinable and the segments to not tinable. If Not tinable, all the vertices or segments are set to not tinable.</i>			
Allow point ids <i>if ticked, the super string can have point ids for each vertex. If not ticked, the super string will not have point ids. This can be reversed if point ids are required in the future.</i>	tick box		
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box		
Create <i>after the Create button is chosen, the Edit Pipe menu is displayed</i>	button		
Same as <i>after the Same as button is chosen, another string is selected and information about it is used for the fields in this panel</i>	button		
Finish <i>end the option, don't proceed to the edit stage</i>	button		

Start Edit - Pipe Super

On selecting the **Create** button in the **Create Super Pipe String** panel the **Edit Pipe** menu is placed on the screen. The **Edit Pipe** menu for a *pipe super string* is

To create a new *pipe super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit options on the string's **Edit Pipe** menu are usable.

The options in the **Edit Pipe** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit Pipe** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Pipe Editor, go to the section [Edit Pipe](#)

Create - Polyline Super

Position of option on menu: Strings =>Create =>Polyline

A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) vertices of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end vertices are joined by straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super Polyline String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super Polyline String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

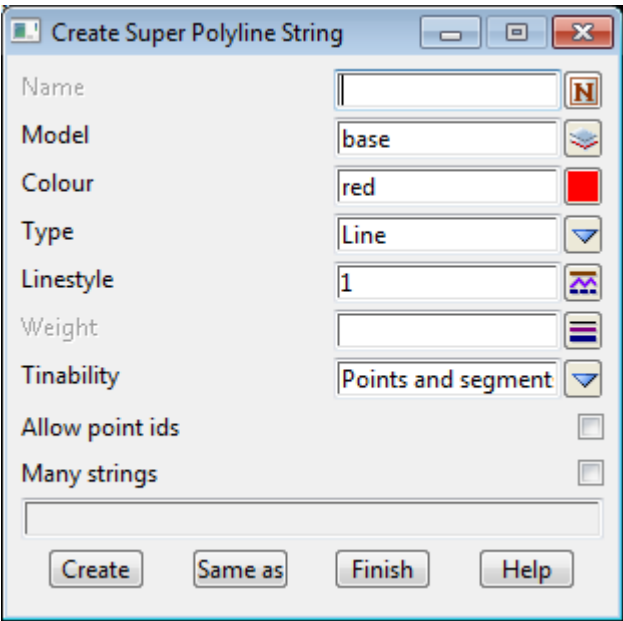

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle style and weight fields of the **Create Super Polyline String** panel.

From **12d Model 8** onwards, the default is to create **super polyline strings** rather than the **polyline strings** used up to **12d Model 7**. The advantage is using a **super polyline string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *pipe string* create option is still available under

Strings =>Create =>Old (go to the section [Create - Polyline \(Pre V8\)](#))

On selecting the **Polyline** option, the **Create Super Polyline String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see [CAD, Symbol and Text Controlbars](#))

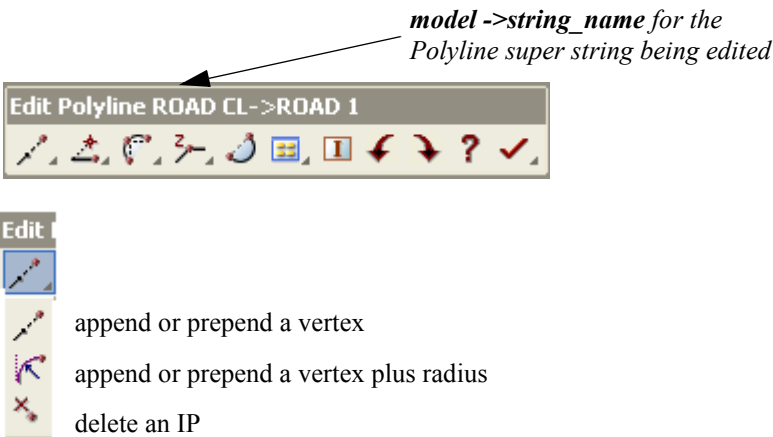

To **create a new polyline super string**, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super Polyline String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	input	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
<i>if Vertices and segments, all the vertices and segments of the string are set to tinable. If Vertices only, all the vertices are set to tinable and the segments to not tinable. If Not tinable, all the vertices or segments are set to not tinable.</i>			
Allow point ids <i>if ticked, the super string can have point ids for each vertex. If not ticked, the super string will not have point ids. This can be reversed if point ids are required in the future.</i>	tick box		
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box		
Create <i>after the Create button is chosen, the Edit Polyline menu is displayed</i>	button		
Same as <i>after the Same as button is chosen, another string is selected and information about it is used for the fields in this panel</i>	button		
Finish <i>end the option, don't proceed to the edit stage</i>	button		

Start Edit - Polyline Super

On selecting the **Create** button in the **Create Super Polyline String** panel the **Edit Polyline** menu is placed on the screen. The **Edit Polyline** menu for a *polyline super string* is

To create a new polyline string, the user must select one of the two append options (**Append** or **Append + radius**) on the **Append** drop-down toolbar on the **Edit Polyline** toolbar. The **Append** option simply creates vertices which are joined by a straight segment whereas the **Append + radius** creates vertices with a radius for the segment.

The **Append** options are used to add vertices to either end of an existing string, or in the case of a new string, places the 1st vertex and then begins appending vertices to the 1st vertex.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

The options in the **Edit Polyline** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit Polyline** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Polyline Editor, go to the section [Edit Polyline](#)

Create - Super

Position of option on menu: Strings =>Create =>Super

A super string is a combination and generalisation of a 4d string, a pipe string and a polyline string.

A super strings consists of a series of (x,y) vertices, plus it can have either straight lines or arcs joining the vertices of the string.

At each vertex, the super string has:

- height
- text
- visibility
- tinability (contourability)
- point number
- symbol
- user defined attributes

For each segment, the super string has:

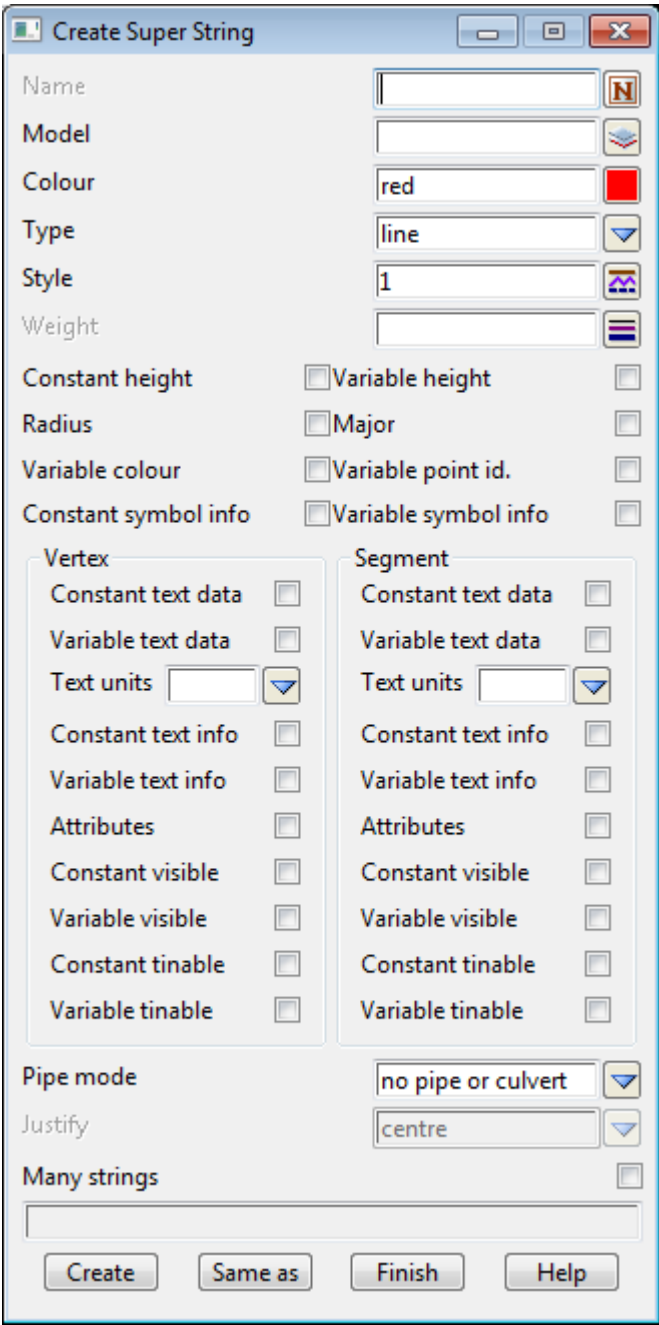

- plan radius
- colour
- text
- tinability (breakline)
- pipe diameter or box dimensions
- visibility
- user defined attributes

Creating and editing a super string is very similar to a polyline string in that a radius is can be given at each string segment (a radius of 0 means no arc, just a straight line), and also like a 4d string in that there can be text at each vertex. However there are many more choices about what is defined for each vertex and segment of the super string.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Super String** panel.

On selecting the **Super string** option, the **Create Super String** panel is displayed.

To **create** a new super string, the name, colour, model, point-line type and linestyle of the new string are entered into the appropriate fields, plus settings any required settings in the tick boxes, and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models

Colour	input	default colour	available colours
<i>the colour of the new string.</i>			
Style	input	1	available line styles
<i>line style of the string.</i>			
Weight	input	0	
<i>thickness of the string.</i>			

Height choice

There are three choice for height: no height at all, one height for the entire string (for example a 2d string), or a different height for each vertex (for example, a 3d string).

Constant height	tick box	Variable height	tick box
<i>no height at all -</i>		Constant height not ticked and Variable height not ticked.	
<i>one height for the entire string -</i>		Constant height ticked and Variable height not ticked.	
<i>a different height for each vertex -</i>		Constant height not ticked and Variable height ticked.	

Radius choice

There are only two choices for radius: no radius at all or a different radius for each vertex. For example, each segment of a polyline can have a different radius.

Radius	tick box	Major	tick box
<i>no radius at all -</i>		Radius not ticked and Major not ticked.	
<i>a different radius for each vertex -</i>		Radius ticked and Major ticked.	

Note: the radius is a signed value and in the direction of travel along the arc, a negative radius means the arc bends to the left and a positive radius means the arc bends to the right. This is still not enough to uniquely define the arc and it can be a minor major arc (turns through less than or equal to 180 degrees), or a major arc (turns through more than 180 degrees). The Major flag is 0 for a minor arc and 1 for a major arc.

Colour choice

There can be one colour for the entire string, or each segment can have its own colour.

Colour	tick box
<i>if not ticked, there is only one colour for the entire string and it is the colour in the colour field.</i>	
<i>If ticked, there is a different colour for each segment.</i>	

Point id choice

There can be no point ids or a different point id at each vertex.

Variable point id	tick box
<i>if not ticked, there is no point ids for the string.</i>	
<i>If ticked, there is a different point id for each segment.</i>	

Symbol choice

There are three choice for symbols: no symbols at all, one symbol for the entire string, or a different symbols at each vertex.

Constant symbol info	tick box	Variable symbol info	tick box
<i>no symbol at all -</i>		Constant symbol info not ticked and Variable symbol info not ticked	
<i>one symbol for the entire string -</i>		Constant symbol info ticked and Variable symbol info not ticked	
<i>a different symbol for each vertex -</i>		Constant symbol info not ticked and Variable symbol info ticked	

Vertex:

Vertex Text Data choice

There are three choices for vertex text data at a vertex:

Constant text data	tick box	Variable text data	tick box
<i>no text data at all -</i>		Constant text data not ticked and Variable text data not ticked.	
<i>the same text data for all vertices of the string -</i>		Constant text data ticked and Variable text data not	

ticked.
a different text data for each vertex - Constant text data not ticked and Constant text data ticked.

Text units choice box paper, world, device,
screen (device), pixels (device)

if paper, the text units are millimetres on a plot.
if world, the text units are in world units.
if device, the units are in pixels.
if screen (device), same as device.
if pixels (device), same as device.

Vertex Text info choice

There are three choices for vertex text info at a vertex:

Constant text info tick box **Variable text info** tick box
no text info at all - Constant text info not ticked and Variable text info not ticked.
the same text info for all vertices of the string - Constant text info ticked and Variable text info not ticked.
a different text info for each vertex - Constant text info not ticked and Constant text info ticked.

Vertex Attribute choice

There can be no attributes at any vertex, or any number of attributes at each vertex.

Attributes tick box
if not ticked, there are not attributes on any vertex.
If ticked, there is any number of attributes at each vertex.

Vertex Visibility choice

There are thee choices for tinability for vertices: all vertices are visible, all vertices are visible, each vertex has its own visibility setting.

Constant visible tick box **Variable visible** tick box
all vertices visible Constant visible not ticked and Variable visible not ticked.
all vertices are visible Constant visible ticked and Variable visible not ticked.
a different visibility for each vertex - Constant visible not ticked and Variable visible ticked.

Vertex Tinable choice

There are thee choices for tinability for vertices: use default type (point or line), vertices are not tinable, all vertices are tinable, each vertex has its own tinability setting.

Constant tinable tick box **Variable tinable** tick box
use default type (point or line) Constant tinable not ticked and Variable tinable not ticked.
all vertex are tinable - Constant tinable ticked and Variable tinable not ticked.
a different tinability for each vertex - Constant tinable not ticked and Variable tinable ticked.

Segment:

Segment Text Data choice

There are three choices for segment text data on a segment:

Constant text data tick box **Variable text data** tick box
no text data on a segment at all - Constant text data not ticked and Variable text data not ticked.
same text data for all segments of the string - Constant text data ticked and Variable text data not ticked.
a different text data for each segment - Constant text data not ticked and Constant text data ticked.

Text units choice box paper, world, device,
screen (device), pixels (device)

if paper, the text units are millimetres on a plot.
if world, the text units are in world units.
if device, the units are in pixels.

if screen (device), same as device.
if pixels (device), same as device.

Segment Text info choice

There are three choices for text info for text on a segment:

Constant text info	tick box	Variable text info	tick box
<i>no text info at all -</i>			
<i>Constant text info not ticked and Variable text info not ticked.</i>			
<i>same text info for all segments of the string-Constant text info ticked and Variable text info not ticked.</i>			
<i>a different text info for each segment -</i>			
<i>Constant text info not ticked and Constant text info ticked.</i>			

Segment Attribute choice

There can be no attributes on any segment, or any number of attributes on each segment.

Attributes	tick box
<i>if not ticked, there are no attributes on any segment.</i>	
<i>If ticked, there are any number of attributes on each segment.</i>	

Segment Visibility choice

There are thee choices for visibility for segments: all visible, all segment are visible, each segment has its own visibility setting.

Constant visible	tick box	Variable visible	tick box
<i>all segments visible by default</i>			
<i>Constant visible not ticked and Variable visible not ticked.</i>			
<i>all segments are visible</i>			
<i>Constant visible ticked and Variable visible not ticked.</i>			
<i>a different visibility for each segment -</i>			
<i>Constant visible not ticked and Variable visible ticked.</i>			

Segment Tinable choice

There are thee choices for tinability for segment: use type (line or point), all segments are tinable, each segment has its own tinability setting.

Constant tinable	tick box	Variable tinable	tick box
<i>use default type (point or line)</i>			
<i>Constant tinable not ticked and Variable tinable not ticked.</i>			
<i>all segments are tinable -</i>			
<i>Constant tinable ticked and Variable tinable not ticked.</i>			
<i>a different tinability for each segment -</i>			
<i>Constant tinable not ticked and Variable tinable ticked.</i>			

Pipe choice

There are five choice: the string is a
constant pipe string and has one diameter for the entire string
a variable pipe string and can have a different diameter for each segment
a constant culvert string and has the one width and height for each segment
a variable culvert string and can have a different width and height for each segment
or the string has no diameter or width and height for any segment.

Pipe mode	choice box	no pipe or culvert pipe entire string pipe each segment culvert entire string culvert each segment
------------------	------------	----------------------------------------------------------------------------------------------------------------

if pipe entire string, there is one diameter for all segments in the string.
if pipe each segment, there is a diameter for each segments of the string.
if culvert entire string, there is one width and a height of a box for all segments in the string.
if culvert each segment, there is a different width and height for each segment.
if no pipe or culvert, there is no diameter; or any width and height box for any segment.

Justify	choice box	Invert, centre, obvert
<i>The Justify choice box is only active if Pipe mode is NOT no pipe or culvert.</i>		
<i>If invert, the coordinates of the vertices are on the top of the pipe/culvert.</i>		
<i>If centre, the coordinates of the vertices are in the centre of the pipe/culvert.</i>		
<i>If obvert, the coordinates of the vertices are at the bottom of the pipe/culvert.</i>		

Many strings tick

if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

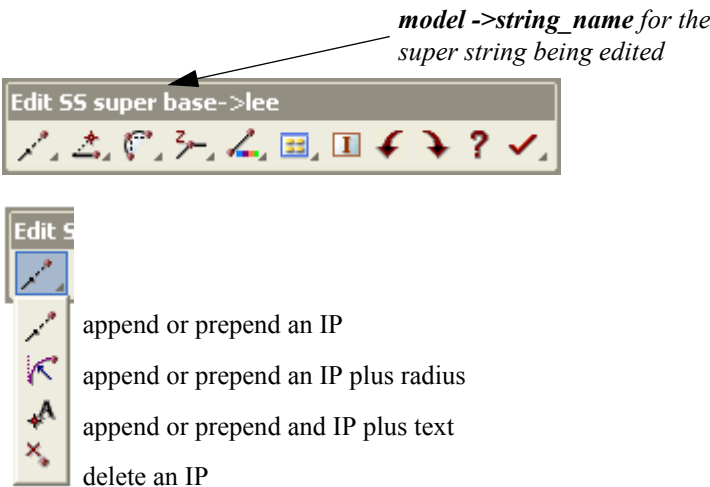

*After the **create** button is chosen, the **super edit** menu and **super edit info** panel are displayed.*

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

Start Edit - Super String

On selecting the **Create** button in the **Create Super String** panel the **Super Edit** menu and **Super Edit Info** panels are placed on the screen.

To create a new super string, select the **Append** or **Append + radius** or **Append + text** icons.

The **Append** and **Append + text** options simply creates vertices that are joined by a straight segments. **Append + text** also asks for text at each vertex.

The **Append + radius** create vertices with a radius for the segment.

For all super strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

If **Append + text** was selected, the user will then be prompted for the text to be placed at the vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Super Edit** menu are usable.

The options in the **Super Edit** menu are not only used for placing the initial vertices of the string,

but for editing the string once it is created. Since the **Append** and other options in the **Super Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Super Editor, go to the section [Edit Super](#)

Create - Text

Position of option on menu: Strings =>Create =>Text

A text string consists of

- (a) the text
- (b) an (x,y) position for the text
- (c) a text style
- (d) a justification
- (e) the height of the text in pixels, paper or world units
- (f) the x factor and slant of the text
- (g) the colour of the text
- (h) the angle to write the text at

The default text style uses a non-proportional font but user defined fonts can be proportional or non-proportional.

The justification of the text with respect to text string's (x,y) position is user specified.

The text angle is measured in a counter- clockwise direction with respect to the horizontal axis.

For more information on text definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

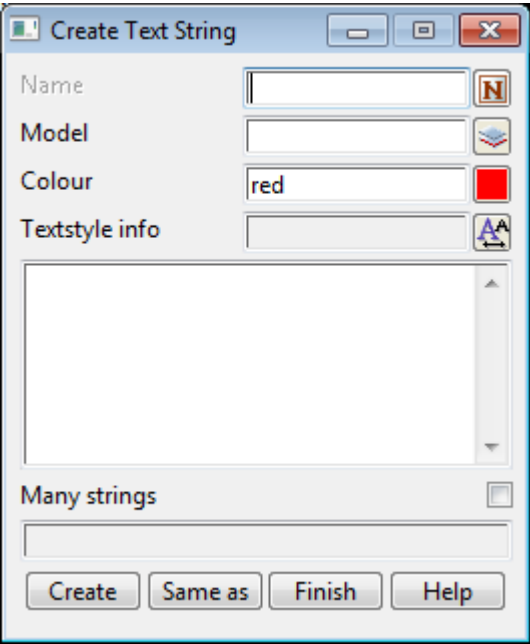

Note - deleting text

Text is deleted as a normal string with the picking point at the text string's definition point. The relationship of the definition point and the text depends on the text offset and justification

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Text String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Text String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Text String** panel.

On selecting the **Text string** option, the **Create text string** panel is displayed.

To **create** a new text string, the name, model, colour and actual text of the new string are entered into the appropriate fields, and the textstyle info such as height, offset, justification, angle are entered by clicking on the Textstyle info box. The **create** button is then selected.

The new fields and buttons used in the **create text string** panel have the following functions.

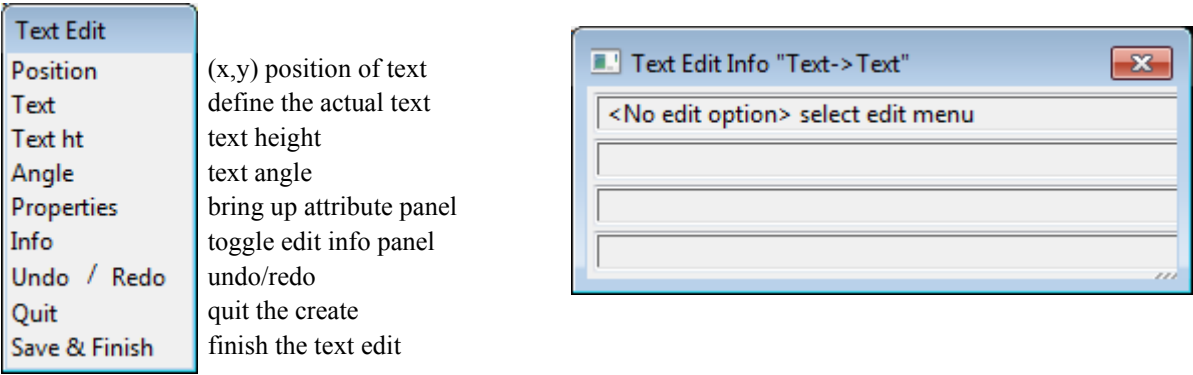

Field	Description	Type	Defaults	Pop-Up
Name	<i>the name of the new string.</i>	name box		
Model	<i>name of the model that the new string is in.</i>	model box		available models
Colour	<i>the colour of the new string.</i>	colour box	default colour	available colours
Textstyle info	<i>textstyle information.</i>	textstyle info box		
Text	<i>the actual text.</i>	multi-line text box		
Many strings	<i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box	not ticked	
Create	<i>After the create button is chosen, the text edit menu and text edit info panel are displayed.</i>	button		
Same as	<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

Start Edit - Text

On selecting the **create** button in the **create text string** panel the **text edit** menu and **text edit info**

panel are placed on the screen.

The **text edit** menu for a text string is and the **text edit** panel is

To creating a new text string, the user must first select the **Position** option from the **Text edit** menu. Then after selecting a position, the text is created and displayed (if the model is on the view).

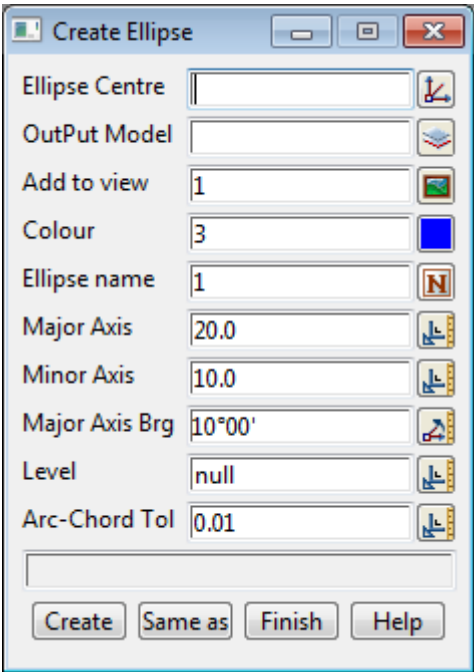

For full information in the Text Editor, go to the section [Text Edit](#)

Create - Ellipse

Position of option on menu: Strings =>Create =>Ellipse

.This option creates a super string of points along the ellipse defined in the panel. The frequency of points is determined by a user defined chord-to-arc tolerance.

After selecting the **Ellipse** option, the **Create Ellipse** panel is displayed.

Field Description	Type	Defaults	Pop-Up
Ellipse centre <i>centre of the ellipse</i>	model select		
OutPut model <i>name of the model to place put the ellipse string in</i>	model box		available models
Add to view <i>add the model to the given view</i>	view select	1	
Colour <i>the colour of the new string.</i>	colour box	default colour	available colours
Ellipse name <i>the name of the new string.</i>	name mapping box		names in name mapping file
Major Axis <i>the length of the major axis of the ellipse</i>	measure box	20	
Minor Axis <i>the length of the minor axis of the ellipse</i>	measure box	10	
Major Axis Brg <i>bearing of the major axis of the ellipse</i>	measure box		
Level <i>z-value for the points on the ellipse</i>	measure box	null	

Arc-Chord Tol	measure box	0.01
<i>the chord to arc tolerance to use for deciding how often to create points around the ellipse</i>		
Create	button	
<i>after the Create button is chosen, a string of points around the ellipse is created</i>		
Same as	button	
<i>after the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>		

Create - Control Stations

Position of option on menu: Strings =>Create =>Create Control Station

This option is documented in Survey =>Extras =>Create Control stations in the section [Create Control Stations](#) in the chapter [Survey](#)

New

Position of option on menu: Strings =>Create =>New

This section of documentation is a work in progress and will be updated in subsequent releases.

The New walk-right menu contains options *Interface* and *Face*.

For the option *Interface*, go to
Face

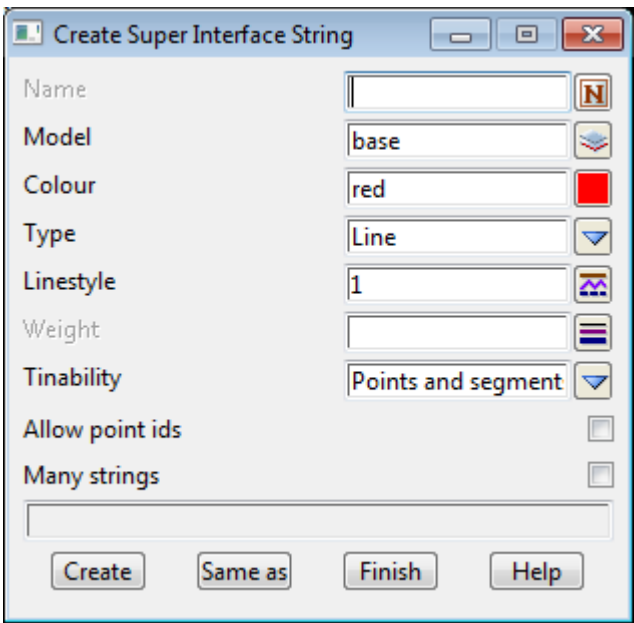

[Interface](#)
[Face](#)

Interface

Position of option on menu: Strings =>Create =>New =>Interface

This section of documentation is a work in progress and will be updated in subsequent releases.

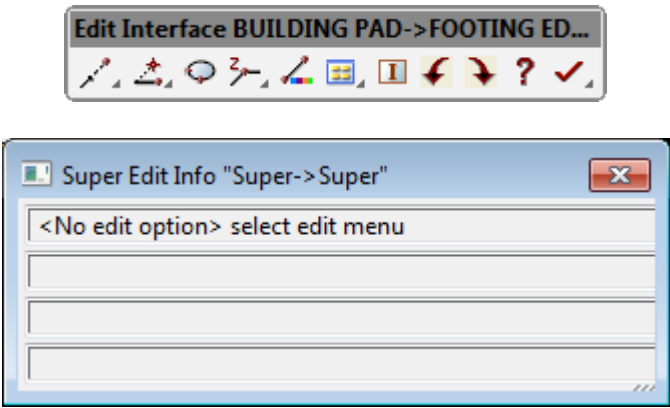

On selecting the *Interface* option, the Create Super Interface String panel is displayed.

The fields and buttons used in the **Create Super Interface String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
Model	model box		available models
Colour	colour box		available colours
Type	choice box	line	point, line
Linestyle	input	from CAD controlbar	available line styles
Weight	input	from CAD controlbar	
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids	tick box		
Many strings	tick box		
Create	button		
Same as	button		

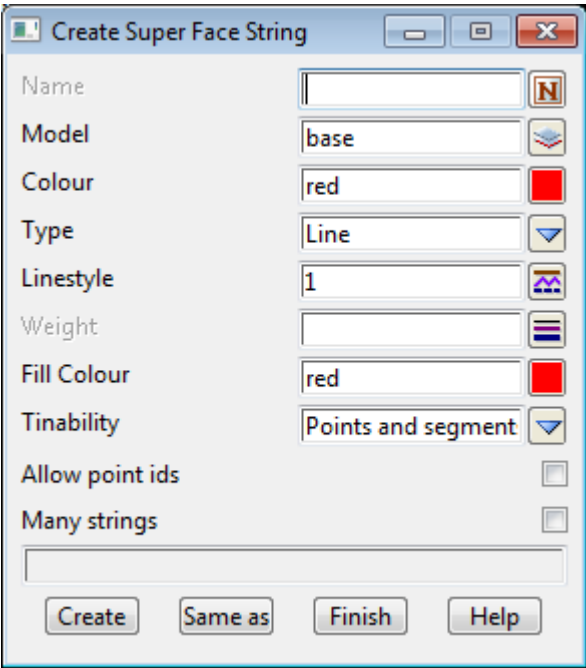

Once the **Create** button has been pressed, the **Edit Interface** toolbar and **Super edit Info** panel appears on the screen, containing the list of available edit options for the Super Interface String.

Face

Position of option on menu: Strings ==>Create ==>New ==>Face

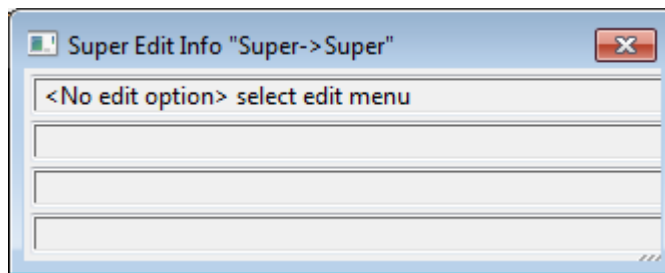

This section of documentation is a work in progress and will be updated in subsequent releases.
On selecting the **Face** option, the **Create Super Face String panel** is displayed.

The fields and buttons used in the **Create Super Face String panel** have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	input		
Model	model box		available models
Colour	colour box		available colours
Type	choice box	line	point, line
Linestyle	input	from CAD controlbar	available line styles
Weight	input	from CAD controlbar	
Fill Colour	colour box		available colours
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids	tick box		
Many strings	tick box		
Create	button		
Same as	button		

Once the **Create** button has been pressed, the **Edit Face** toolbar and **Super edit Info** panel appears on the screen, containing the list of available edit options for the Super Face String

Create - Same As

Position of option on menu: Strings =>Create =>Same as

The **same as** option is used to create a new string of the same type and with similar header information as an existing string.

On selecting the **same as** create option, the **create same as** panel is displayed.

After selecting the option, the option is already running and waiting for a string to be selected.

Once a string is selected from a view, a new **create nd string** panel of the same type as the selected string and with all the header information from the selected string, is displayed on the screen.

The user then proceeds as a normal create string option.

If the pick is terminated by clicking RB to get up the **pick ops** menu and selecting **cancel** from it, the option can be started again by selecting the **pick & create** button.

Editor

Position of option on menu: Strings =>Editor

The string editor is used for modifying any of the **12d Model** strings.

After selecting the **editor** option, the **edit string** panel is placed on the screen to record any error messages.

The option is already in **pick** mode (the **pick & edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited. From the picked string's type, the editor is able to determine the appropriate editor and placed on the screen.

Each string type has its own edit operations which will now be discussed in detail.

Note - if the **edit** menu is deleted from the screen using the **menu delete** option, it can be raised again by clicking RB in any view.

For the option *2d*, go to

Super String Edit - Common Information

nd edit menu

After selecting the string to be edited, the toolbar containing the list of available edit options (the string's **Edit nd** menu) is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Edit nd info** panel) is also displayed.

For example, the **Edit String** menu and **Super Edit Info** panel for a 3d super string are

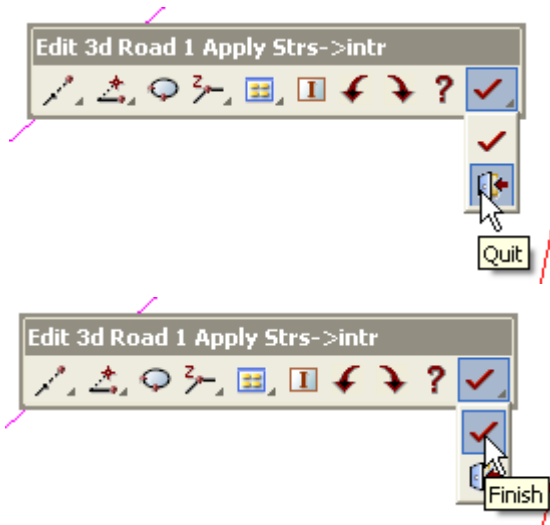

Most of the options chosen from the **Edit nd** menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

For example, if the **Delete** option is selected, any number of vertices can be deleted from the chosen string without re-selecting the **Delete** option. For full information on the **Delete** option, go to the section [Delete](#)

To select a new edit nd option, simply select the option from the **Edit nd** toolbar. The current option is automatically terminated and the new option begins.

An option is also terminated when the entire string editing option is ended by selecting either the **Quit** or **Finish** button in the **Edit nd** menu.

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertices (point type) or with straight lines joining the vertices (line type). Linestyles can be defined that drawn lines between the vertices even though the breakline type is **point**.
2. The string vertices are called intersection points (IPs).
3. The string **Super Edit Info** panel will not automatically appear if **Display edit info** is set to **off** in the **System Settings** tab of the **Project =>Management =>Defaults** panel.

See [Delete](#)

[Open/Close](#)
[Properties](#)
[Info](#)
[Undo/Redo](#)
['? Help](#)
[Quit](#)
[Finish](#)
[Typed input](#)

Delete

The delete option is used to delete selected vertices from the string.

The vertex to be deleted is picked (LB) and accepted (MB). When the vertex is accepted, it is **deleted**. The string, minus the deleted point, is then redrawn.

Once a vertex has been deleted, another vertex in the string can then be selected and deleted. Hence any number of vertices from the string can be deleted one after another.

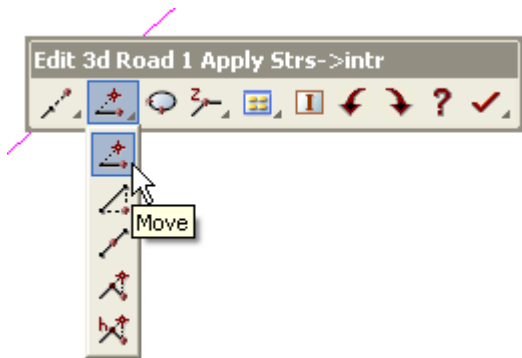

message area 1 <Delete>
Screen message area
 <Select a vertex to delete> [picks][fast][menu]

The delete option is terminated by selecting cancel from the pick ops menu or by selecting a new option from the **Edit nd** menu.

Typed input can be used to select a point for deletion.

Move

The move option is for moving individual vertices (intersection points - IPs) of the string.

The move cycle consists of two steps:

- (a) selecting the vertex to move
- (b) selecting the new position for the vertex.

Step (a)

First the point to be moved is selected. The selected vertex will then move around the view and the string redrawn to show the change as the cursor is moved.

message area 1 <Move>

Screen message area

 <Pick vertex to move> [picks][fast][Menu

Step (b)

The current cursor position is selected as the new position for the vertex by selecting (LB) and accepting (MB). The vertex being moved is then anchored at the cursor position for the vertex, and the string redrawn.

message area 1 <Move>

Screen message area

 <Pick new location of vertex> [picks][fast][menu]

Typed input can be used in either step.

Once the move cycle is completed and the vertex moved, the move option is still current and can be repeated for other vertices without having to re-select the **move** option.

The **move** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **Edit nd** option.

Insert

The **insert** option is designed to place a new vertex in a string between two adjacent vertices (note that the inserted point **does not** have to be on the segment joining the two vertices).

Select the two adjacent vertices by selecting the segment joining them

New vertex added at this location

Inserting a vertex, like moving a vertex, is a two step process.

Step (a) - selecting the vertices to be on either side of the new vertex by selected the segment
The two adjacent vertices are chosen by selecting the **segment** connecting the two vertices. Once the segment is selected, the new vertex is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted vertex.

message area 1 <Insert >
Screen message area
 <Pick position to insert vertex> [picks][fast][menu]

Step (b) - selecting the position for the new vertex

The position of the new vertex is selecting

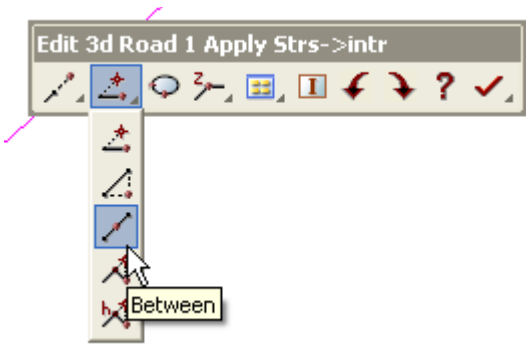

message area 1 <Insert >
Screen message area
 <Pick new location of vertex> [picks][fast][menu]

Once the insert cycle is completed and the vertex inserted, the insert option is still current and can be repeated for other insertions without having to re-select the **insert** option.

The **insert** option is terminated by selecting **Cancel** from the **Pick ops** menu or by selecting a new option from the **Edit nd** menu.

Typed input can be used in either step.

Between

The **between** option is similar to the **insert** option except that the inserted vertex **does** have to be on the segment joining the two vertices. To accomplish this, the cursor position is projected onto the segment to give the new vertex position.

Select the segment that the new vertex must be on

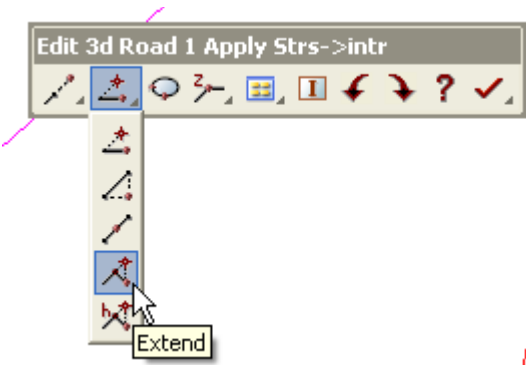

New vertex added at this location

● denotes a string vertex

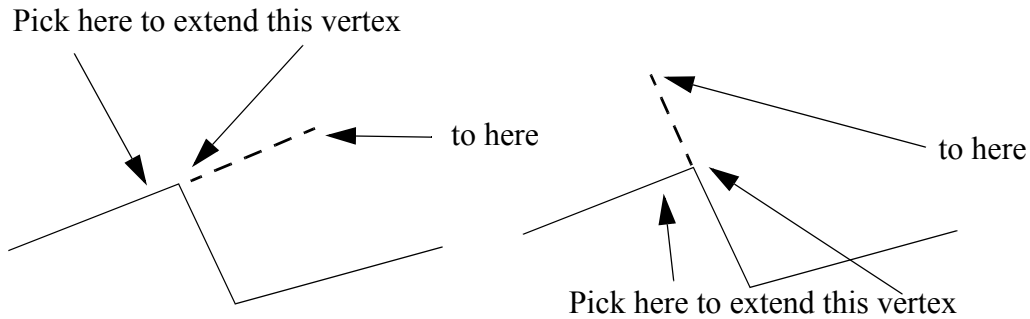

The **between** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit nd** menu.

Extend

The **extend** option is used to move a vertex along the line joining the vertex to its neighbouring vertex.

The **extend** option is used to move a vertex along the line joining the vertex to its neighbouring vertex.
That is, the bearing of the segment is kept constant and the vertex is moved along that segment either **towards** or **away** from its neighbouring vertex on the segment.

Extending, like moving a vertex, is a two step process.

Step (a) - selecting the segment and the vertex to be moved along that segment

The segment and the vertex to be moved are chosen in the one operation by picking (LB) and accepting (MB) at a co-ordinate point near the segment and close to the vertex to be moved along that segment.

Once the segment and vertex are selected, the new position of the selected vertex is assumed to be at the current cursor position projected along the selected segment.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex.

message area 1 <Extend>
Screen message area
 <Pick position to extend> [picks][fast][Menu]

Step (b) - selecting the final position for the vertex

The final position for the vertex is set to the projection of the selected cursor position onto the segment.

message area 1 <Extend>
Screen message area
 <Pick new location of vertex> [picks][fast][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **extend** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit nd** menu.

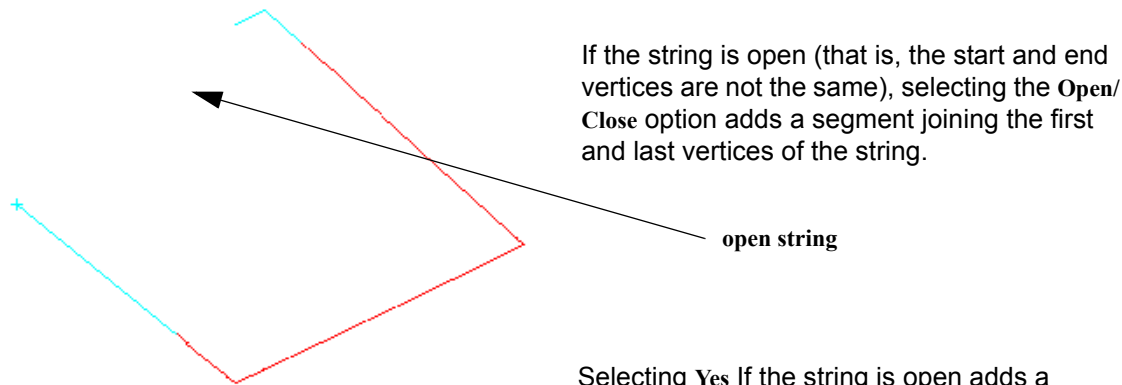

Typed input can be used in either step.

Note - Extend can be used on the end points of the string

Open/Close

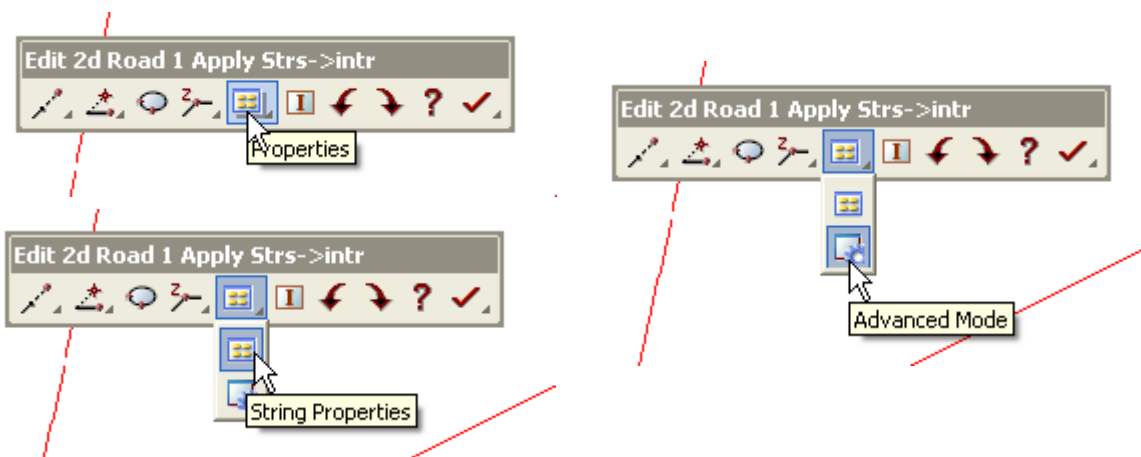

Toggles a string between **Open** and **Closed**.

If the string is closed (that is, there is a segment from the start to the end vertices), selecting the **Open/Close** option removes the last segment of the string.

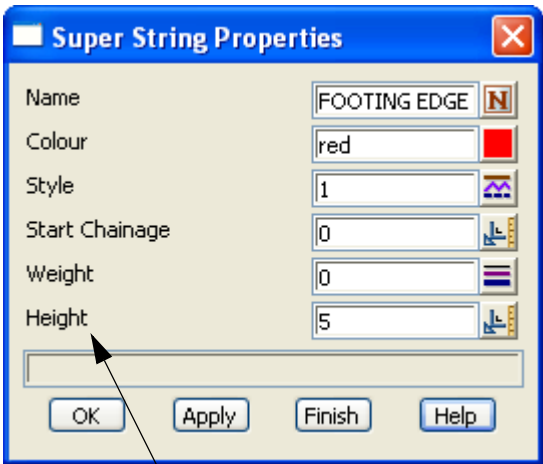

Properties

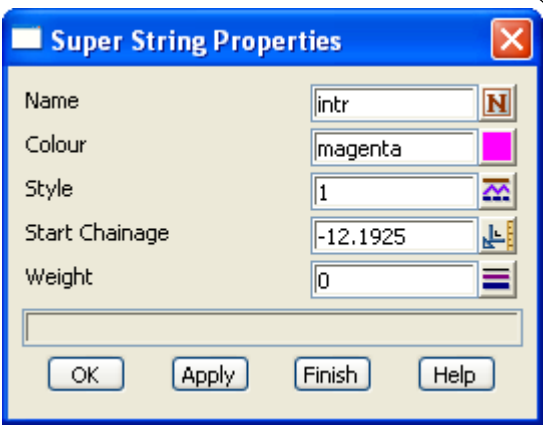

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string's header information.

What is displayed in the **Super String Properties** panel depends on the type of the super string. That is, it depends on what properties of the super string have been enabled.

For example, **constant height** enabled means that there is only one height for the entire super string so height appears in the **Super String Properties** panel. If **variable height** is enabled, there is a height for each vertex and so height does not appear in the **Super String Properties** panel.

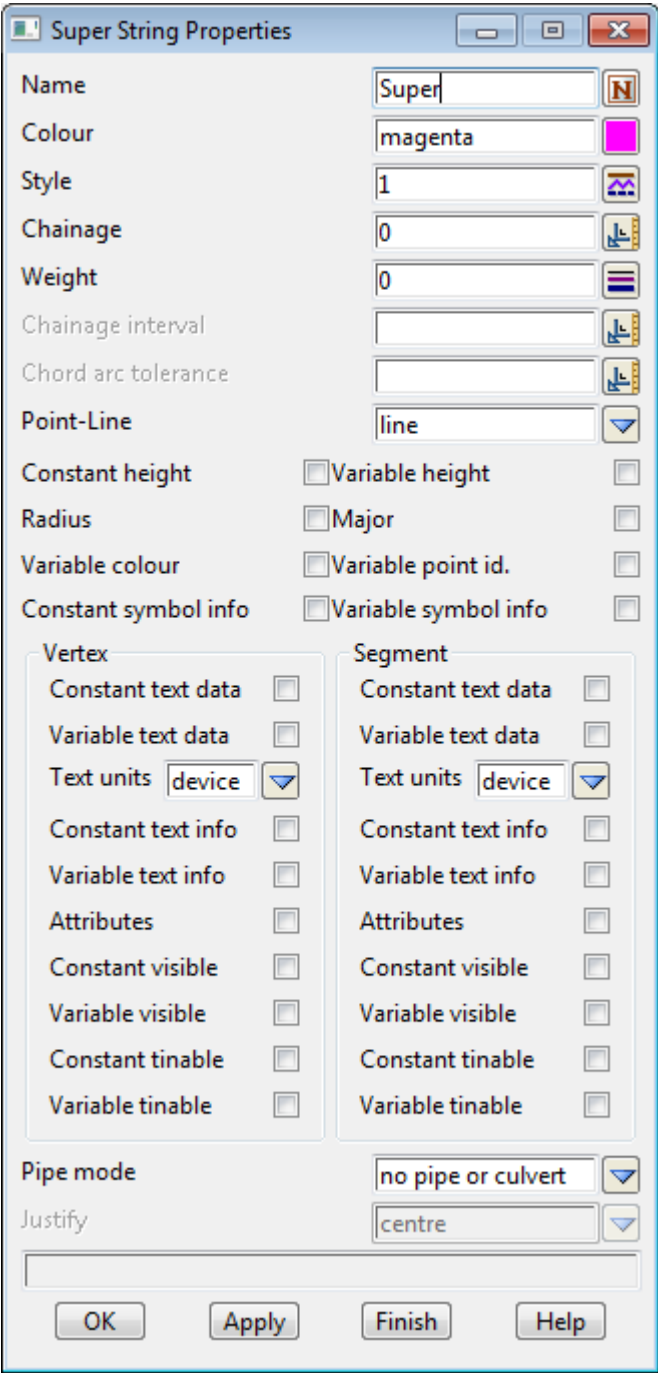

Height appears in the panel when **Constant height** is set for the super string (e.g. 2d super string)

Height does not appear when **Variable height** is set for the super string (e.g. 3d super string)

In the **Advanced** mode, all the super string properties can be modified and so all possible super string fields are displayed in the **Super String Properties** panel.

The fields in the panels are similar to those in the **Create Super String** panels. The only new fields are the **OK** and **Apply** which are used in the normal way.

Info

Toggles the **Super Edit Info** panel on/off for the string.

For more information on the Super Edit Info panel see [nd edit menu](#) in the section [Super String Edit - Common Information](#)

Undo/Redo

An **undo** and **redo** list is defined for each editor on the screen. That is, each editor has its own undo/redo lists. If an option is **undone**, it is added to the **redo** list so that it can be **redone**.

When the editor is exited by either **Quit** or **Finish**, the undo and redo lists are deleted and are no longer usable.

Undo

Undoes the last editor operation for this string and adds it to the top of the redo list.

Undoes the last editor operation for this string and adds it to the top of the redo list.

Redo

Redo the last editor operation that was undone for this string. Add the undone operation to the top of the undo list.

'?' Help

Help button to go to the Help topic for the panel.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings, the panel **Super Edit Info**, and the options, [Delete](#), [Insert](#), [Move](#), [Between](#), [Extend](#), [Open/Close](#), [Properties](#), [Info](#), [Undo](#), [Redo](#), ['?'](#) [Help](#), [Finish](#), [Quit](#) and [Typed input](#).

For the **Edit 2d** options not mentioned in [Super String Edit - Common Information](#) see [Edit 2d](#)

For the **Edit 3d** options not mentioned in [Super String Edit - Common Information](#) see [Edit 3d](#)

For the **Edit 4d** options not mentioned in [Super String Edit - Common Information](#) see [Edit 4d](#)

For the **Edit Super** options not mentioned in [Super String Edit - Common Information](#) see [Edit Super](#)

For the **Edit Pipe** options not mentioned in [Super String Edit - Common Information](#) see [Edit Pipe](#)

For the **Edit Polyline** options not mentioned in [Super String Edit - Common Information](#) see [Edit Polyline](#)

Finish

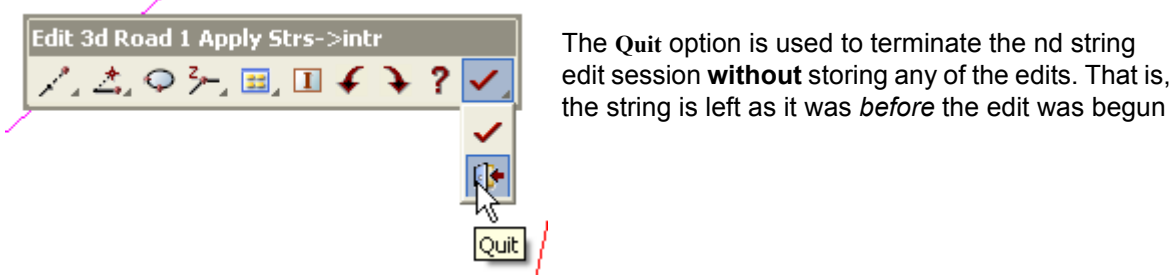

The edit process is completed and the modified string stored in the given model when the **Finish** option is chosen from the **Edit nd** menu.

After selecting the **Finish** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **Yes** is selected, the edits will be stored.

Quit

Even after points are created for the new string, the create process can be **aborted** by selecting the **Quit** option from the **Edit nd** menu. The option then terminates and **no** string is created.

The **Quit** option is used to terminate the nd string edit session **without** storing any of the edits. That is, the string is left as it was *before* the edit was begun

After selecting the **Quit** option, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be ended. If **yes** is selected, the edits will be ignored and the unedited string kept.

Note that if it was a new string being created, the option terminates by **Quit** and **no** string is created.

Typed input

Typed input can be used wherever a select is required to obtain a co-ordinate. For example an (x,y), (x, y, z) or (chainage, height).

To start typed input, start typing, and a special typed-input box appears on the screen

If the focus is on a Plan or Perspective view, then an **Enter X Y Z** box comes up when you are placing horizontal geometry for an alignment or super alignment, or vertices for all other string types. If you are creating vertical geometry for an alignment or super alignment and the focus is on a Section view, then a **Enter Ch Ht** box appears.

These are also called the *XYZ typed input box* and the *Chainage Height typed input box* respectively.

An <enter> terminates the typed input and the entered values taken as the position of the required point. The typed-input box then disappears.

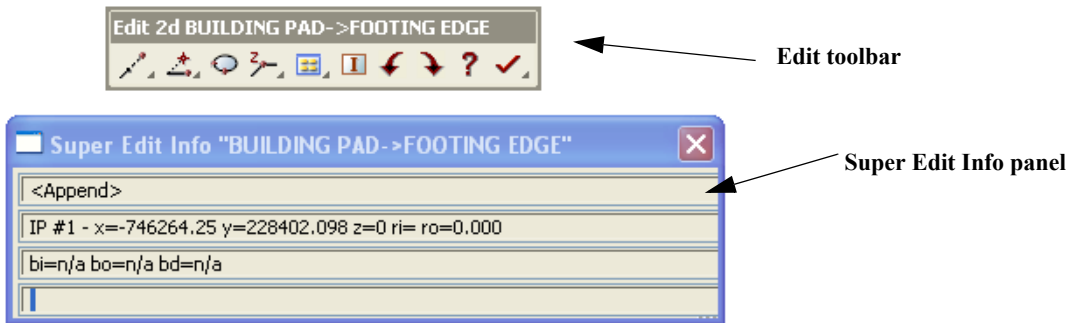

If the user wishes to **abort** the typed input and return to mouse input, simply select the **[X]** button on the typed input box or type <enter> with no values in the typed input box.

Please continue to the next section [Edit 2d](#).

Edit 2d

Position of option on menu: Strings =>Editor

On picking a 2d string, the Edit 2d toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings, the panel **Super Edit Info**, and the options, [Delete](#), [Insert](#), [Move](#), [Between](#), [Extend](#), [Open/Close](#), [Properties](#), [Info](#), [Undo](#), [Redo](#), [Quit](#), ['? Help](#), [Finish](#) and [Typed input](#).

Each **Edit 2d** option not mentioned in the earlier section [Super String Edit - Common Information](#) will now be described.

- See [2d - Append](#)
- [2d - Height](#)
- [2d - Height \(Nav\)](#)
- [2d Properties](#)

2d - Append

The **append** option is used to

- create the 1st vertex in a new string
- or , to append a new vertex to the end of the string
- or to prepend a new vertex to the beginning of the string.

In this option, both appending and prepending will be referred to as *appending*.

Existing 2d Strings

Appending a vertex is a two step process.

Step (a) - For an existing string - selecting the end of the string to append the vertex to.

After the **Append** option has been selected, the end of the string to append the vertex to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1 <Append>
 Screen message area
 <Pick end to append to> [picks][fast][menu]

Step (b) - selecting the position for the new appended vertex.

The position of the new appended vertex is set to the current cursor position by picking (LB) and accepting (MB).

message area 1 <Append>
 Screen message area
 <Pick location of vertex> [picks][fast][Menu]

Once a vertex has been appended to the string, the appended vertex is considered to be the selected string end and a new step (b) begins. The current cursor position indicates the new position for the next appended vertex.

Hence a **series** of string vertices is easily entered by first selecting the string end that the new vertices are to be appended to (step (a)) and then moving the cursor to the position of each new vertex and selecting them in turn (step (b)).

Once the move cycle is completed and the vertex moved, the move option is still current and can be repeated for other vertices without having to re-select the **move** option.

The **Append** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new **Edit 2d** option.

New 2d String

For creating a new string, the cursor is used to select the 1st vertex of the string. The option then continues as if appending to an existing 2d string where the end vertex has already been selected.

Typed input can be used in either step.

2d - Height

The **height** option is used to modify the height (z value) of the 2d string.

After the height option is chosen, a height **typed input** box is displayed on the screen with the string's current height (z value).

The height typed-input box looks like:

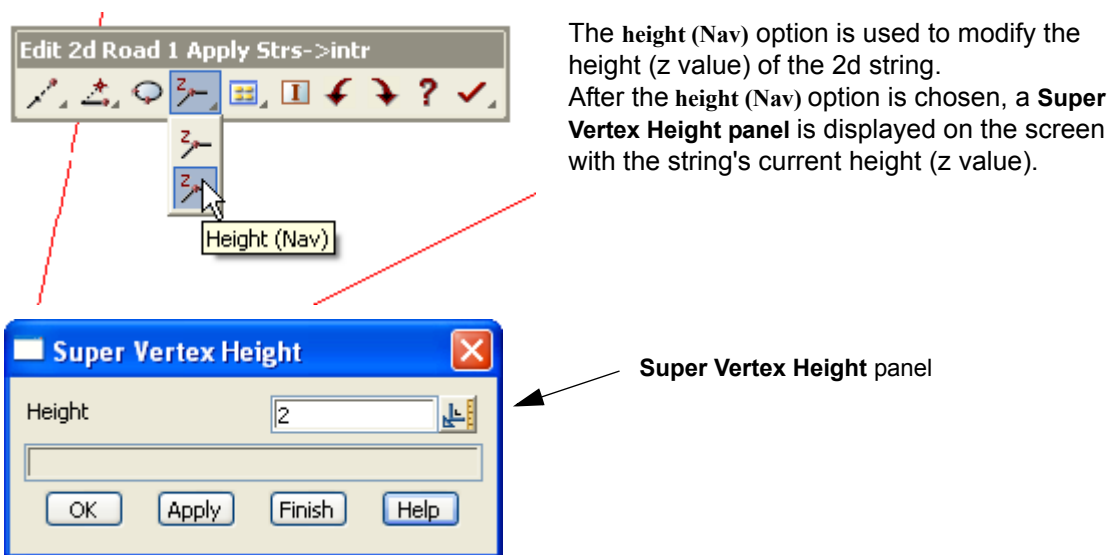

The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2d string and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the **Edit 2d**.

Note - all the points in a 2d string have the same height. Height (Nav)

2d - Height (Nav)

To change the height of the selected string, enter the value into the height field and press **ok** or **apply**. The entered value is then taken as the height of the 2d string and the string redrawn with the new height.

Note - all the points in a 2d string have the same height.

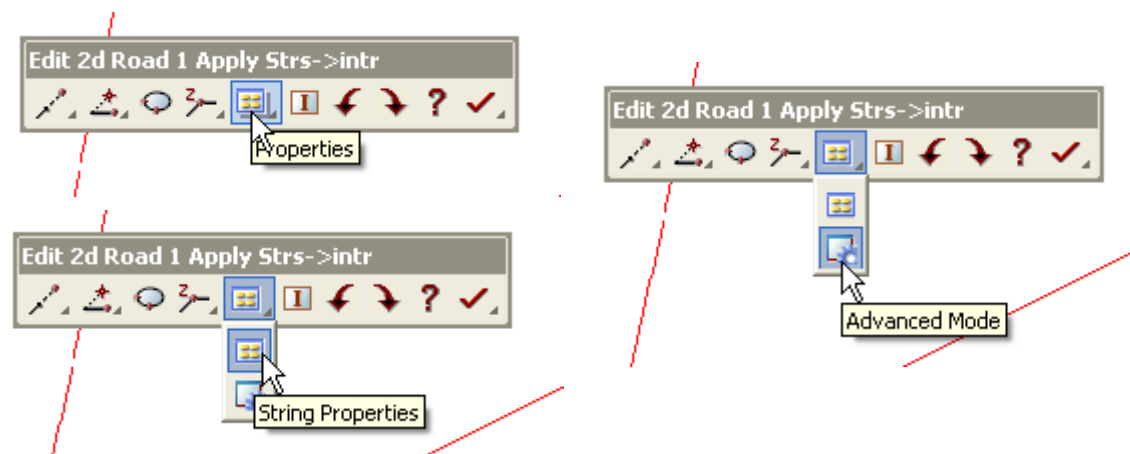

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Height	input	height of vertex/string
	<i>the height used for the entire string.</i>	

OK/Apply button

OK sets the string with the value in the panel field and removes the panel. **Apply** set the string with the value in the panel field and leaves the panel on the screen.

2d Properties

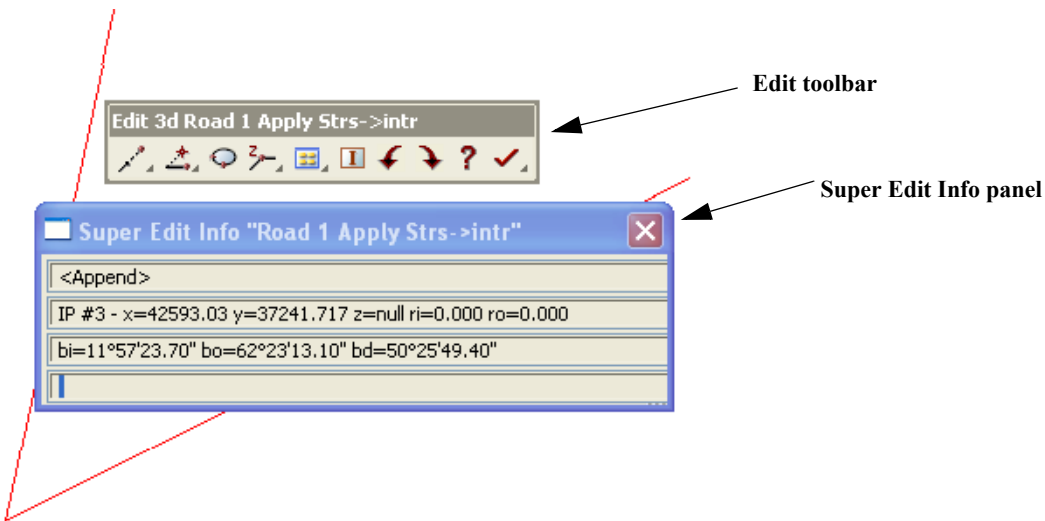

For information on the **Super String Properties** panel, go to [Properties](#)

Edit 3d

Position of option on menu: Strings =>Editor

On picking a 3d string, the Edit 3d toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (Project =>Management =>Defaults), an information panel, (the string's **Super Edit Info** panel) is also displayed.

Each option in the **Edit 3d** menu will now be described.

See [3d - Append](#)

[3d - Extend and Extend ht](#)

[3d - Height](#)

[3d - Height \(Nav\)](#)

[3d Properties](#)

The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the **Edit 3d** menu are similar to the **Edit 2d** options of the same name, and only the differences for each option will be discussed. The **Edit 2d** options are given in the section [Edit 2d](#)

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings, the panel **Super Edit Info**, and the options, [Delete](#), [Insert](#), [Move](#), [Between](#), [Extend](#), [Open/Close](#), [Properties](#), [Info](#), [Undo](#), [Redo](#), [Quit](#), ['? Help](#), [Finish](#) and [Typed input](#).

3d - Append

The **Append** operation for a 3d string is similar to that for a 2d string except that a height (z-value) is required for each new vertex.

Since in most cases, it would be tiresome to ask for a height every time a vertex is added, the entry of a new height is controlled by the **height** toggle in the **snaps** menu. If **height** is toggled to on, then every time a vertex is placed or moved an **enter height** typed-input box is displayed on the screen.

The enter height typed-input box looks like:

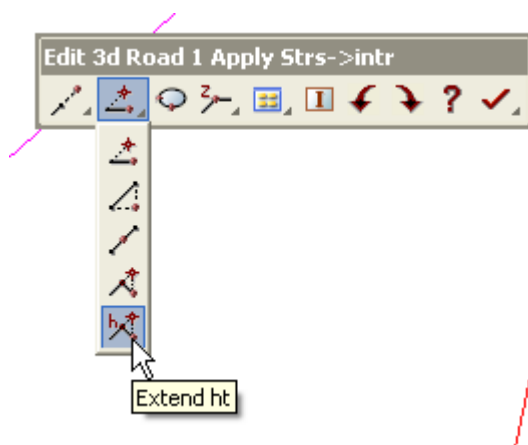

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string vertex and the string redrawn with the new height at the vertex. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a vertex or segment was snapped to, the height at that vertex or segment will be displayed in the box.

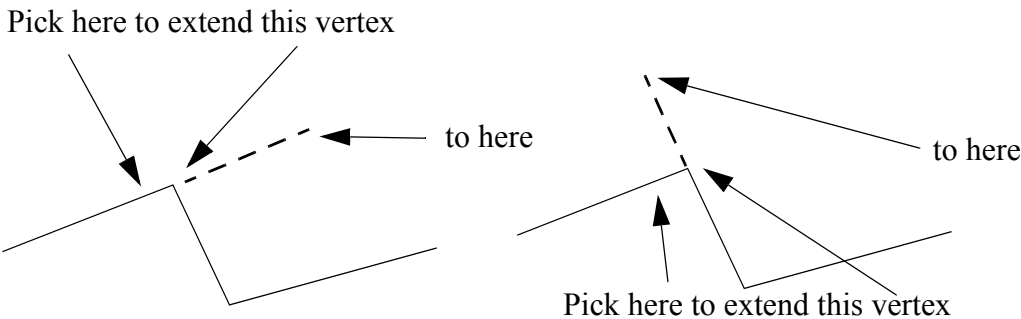

3d - Extend and Extend ht

The **Extend ht** option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

The **Extend ht** option is similar to the **Extend** option except that the z-value of the moved vertex is modified by linearly interpolating the z-value from the original vertices at the end of the selected segment.

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend.

3d - Height

The **height** option is used to modify the height (z value) of any vertex in the string.

After the height option is chosen, the user must select which vertex is going to have its height modified.

After the vertex has been selected, a **Height** typed-input box is displayed on the screen with the vertex's current height (z value).

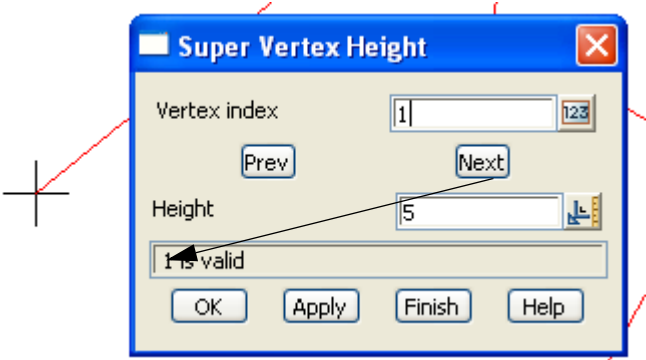

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the vertex in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 3d** menu.

3d - Height (Nav)

As soon as **Height (Nav)** is chosen, a **Super Vertex Height** panel is displayed on the screen with the string's current height (z value) in the **Height** field.

The **Super Vertex Height** panel is used to set the height value for vertices.

When the **Super Vertex Height** panel appears on the screen, the **vertex index** field is the vertex index of the selected vertex, with its associated height in the **Height** field of the panel. To select another vertex to alter, the vertex to modify is selected by typing the vertex index into the **Vertex**

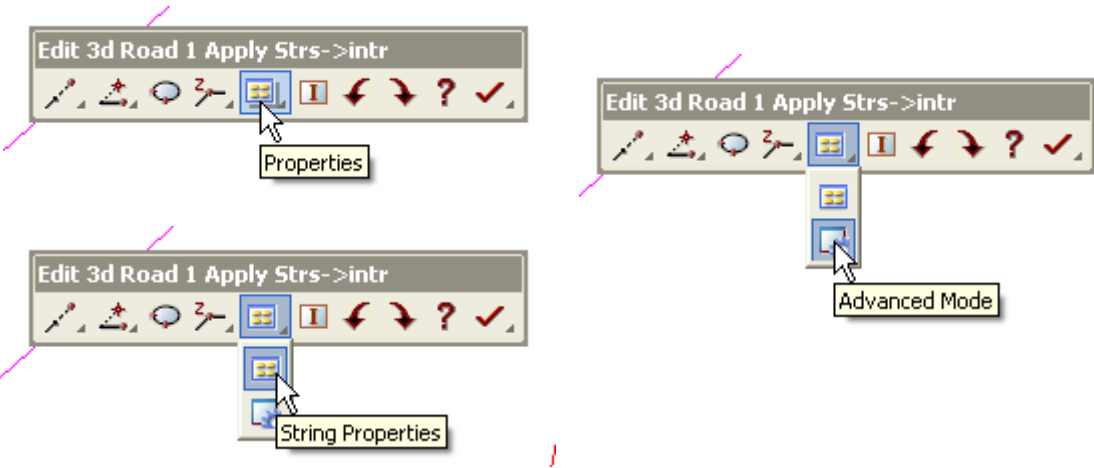

index field or by selecting **Prev** or **next** to switch to another vertex. The selected vertex is highlighted on the string and its *vertex index*, and *height* are written to the appropriate panel fields in the **Super Vertex Height** panel. The values can be changed and either **OK** or **Apply** the changed value to the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index <i>if a vertex is selected, then its vertex index is displayed in this field. An index can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>	input	selected vertex	
Prev <i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>	button		
Next <i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>	button		
Height <i>the height used for the vertex or for the entire string.</i>	input	height of vertex/string	
OK/Apply <i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

3d Properties

For information on the **Super String Properties** panel, go to [Properties](#)

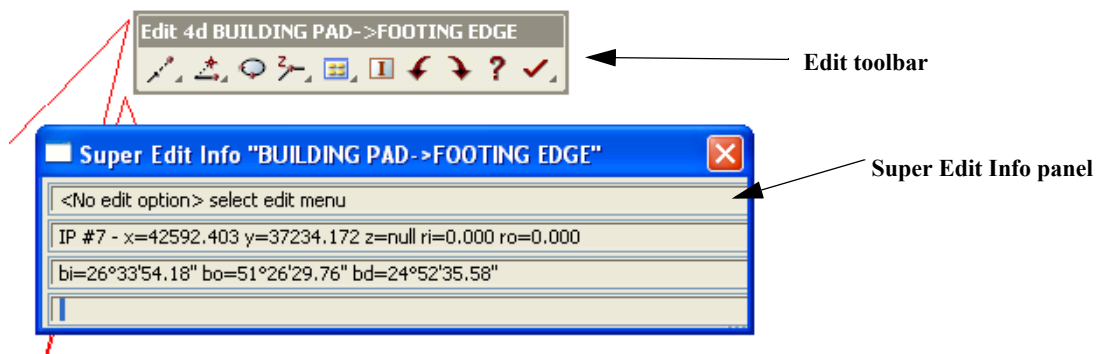

Edit 4d

Position of option on menu: Strings =>Editor

A **4d super string** is a *super string* with the restriction that it has:

- (a) vertices of (x,y,z) co-ordinates joined by straight segments only
- (b) Text at each vertex
- (c) All text has the same height, rotation etc. So it is controlled by the one Text Style for the entire string

On picking a 4d string, the **Edit 4d** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.

Only the options **append**, **Append + Text**, **text**, **size** and **angle** will be described in detail since all the other options are similar to the equivalent 3d string option (see the section [Edit 3d](#)).

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings, the panel **Super Edit Info**, and the options, [Delete](#), [Insert](#), [Move](#), [Between](#), [Extend](#), [Open/Close](#), [Properties](#), [Info](#), [Undo](#), [Redo](#), [Quit](#), ['? Help](#), [Finish](#) and [Typed input](#).

See [4d - Append +Text](#)

[4d - Height](#)

[4d - Height \(Nav\)](#)

[4d - Text \(Nav\)](#)

[4d - Text Info](#)

[4d Properties](#)

4d - Append +Text

The **append** operation for a 4d string is similar to the 3d string case except that a height and an optional text label is required for each new vertex.

Since in many cases a text label is not required at every vertex of a 4d string, there is an append option that asks for text at every vertex (**Append + Text**) and another that does not ask (**Append**).

Append + text is a three step process.

Step (a) - For an existing string - selecting the end of the string to append the vertex and text to.

After the **Append + text** option has been selected, the end of the string to append the vertex to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1 <Append + Text>
Screen message area
 <Pick end to append to> [picks][fast][menu]

Step (b) - selecting the position for the new appended vertex.

The position of the new appended vertex is set to the current cursor position by picking (LB) and accepting (MB).

message area 1 <Append + Text>
Screen message area
 <Pick location of vertex> [picks][fast][Menu]

Step (c) - Creating a text label for the vertex.

Once the new appended vertex is set to the current cursor position a **Description** typed-input box is displayed on the screen.

message area 1 <Append + Text>
Screen message area
 <Super edit> [[]][Menu]

Type the description into the typed-input box, finishing with <enter> and the typed-input box then disappears.

The appended vertex is now considered to be the selected string end and a new step (b) begins. The current cursor position indicates the new position for the next appended vertex.

Hence a **series** of string vertices is easily entered by first selecting the string end that the new vertices are to be appended to (step (a)) and then moving the cursor to the position of each new vertex and selecting them in turn (setup (b)).

The **append** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 4d** menu.

4d - Height

The **height** option is used to modify the height (z value) of any vertex in the string.

After the height option is chosen, the user selects which vertex is going to have its height modified.

After the vertex has been selected, a **Height** typed-input box is displayed on the screen with the vertex current height (z value).

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the vertex in the 4d string and the string redrawn with the new height at that vertex. The typed-input box then disappears.

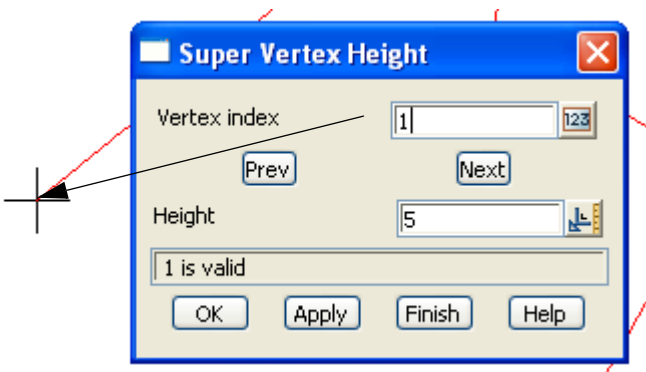

Another vertex can then be selected for modifying its height.

The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **Edit 4d** menu.

4d - Height (Nav)

Selecting **Height (Nav)** brings up the **Super Vertex Height** panel with the height at the first vertex of the string displayed.

The **Super Vertex Height** panel is used to set the height value for any vertex of the string.

Any vertex can then be selected by clicking on the number icon at the end of the Vertex index panel field and selecting the required vertex, or by typing in its Vertex index and pressing <Enter>, or by using the **Prev** and **Next** buttons used to move to adjacent vertices until the required vertex is selected.

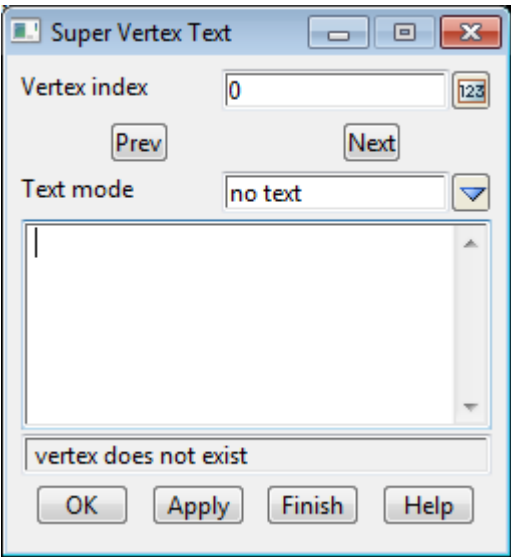

When the vertex to modify is selected, the vertex is highlighted on the string and its *vertex index*, and *height* are displayed in the appropriate panel fields in the **Super Vertex Height** panel. The new vertex height is stored by clicking either **OK** or **Apply**.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	
<i>if a vertex is selected, then its vertex index is displayed in this field. An index can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Height	input	height of vertex/string	
<i>the height used for the selected vertex.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

4d - Text (Nav)

Selecting **Text (Nav)** brings up the **Super Vertex Text** panel with the text at the first vertex of the string displayed. The **Super Vertex Text** panel is used to set the text for any vertex of the string.

Any vertex can then be selected by clicking on the number icon at the end of the **Vertex index** panel field and selecting the required vertex, or by typing in its Vertex index and pressing <Enter>, or by using the **Prev** and **Next** buttons used to move to adjacent vertices until the required vertex is selected.

When the vertex to modify is selected, the vertex is highlighted on the string and its *vertex index* and *vertex text* are displayed in the appropriate panel fields in the **Super Vertex Text** panel. The new vertex text is stored by clicking either **OK** or **Apply**.

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	
<i>if a vertex is selected, then its vertex index is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Text mode	choice box		no text, entire string, each vertex
<i>if no text, there is no text for the vertex.</i>			
<i>if entire string, then the string has the same text for each vertex.</i>			
<i>if each vertex, then each vertex has a separate text value.</i>			
Text	input	text of vertex/string	
<i>the text used for the vertex.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

4d - Text Info

For a 4d super string, the size, colour, slant, offset etc of vertex text is all the same and is controlled by the **Text Style** for the 4d super string.

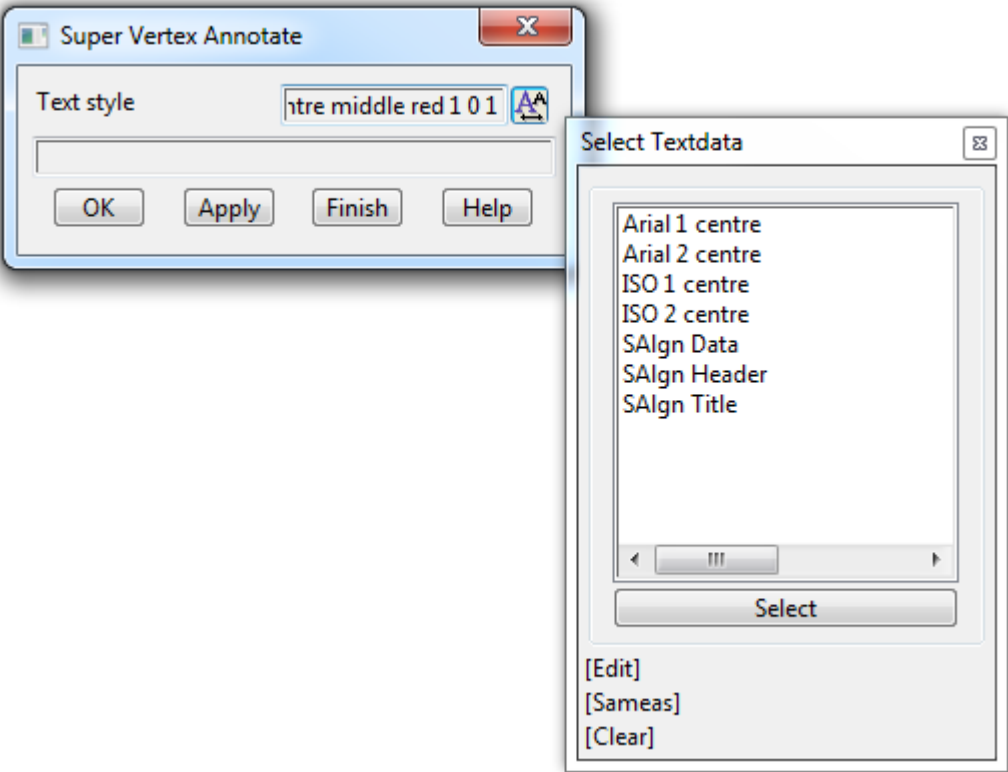

Selecting **Text Info** brings up the **Super Vertex Annotate** panel with the text style for the string displayed.

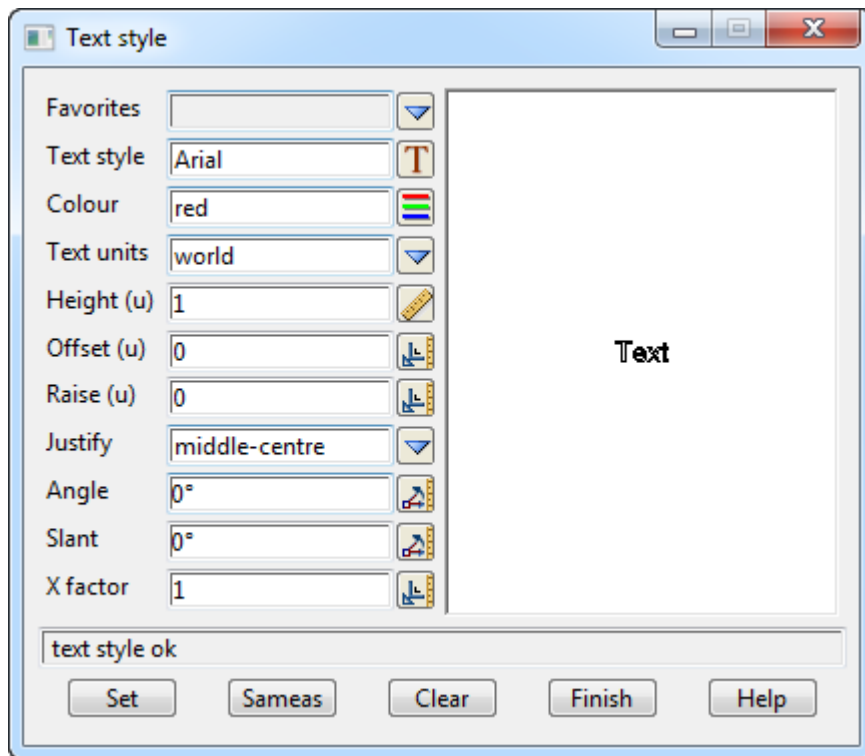

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Text style	text style box	string's text style	available text styles
<i>the text style string. This can be modified to change the values for all the text on the 4d string.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
OK/Apply	button		
<i>for the string being edited, OK sets the text style for the string and removes the panel. Apply sets the text style for the string and leaves the panel on the screen.</i>			

To modify any of the values of the **Text Style**, click on the **Text style** icon at the end of the **Text style** panel field to bring up the **Select Textdata** panel, and then select **[Edit]**.

To change any of the values in the **Text Style** panel:

1. Modify the value in the Text Style panel and then click on **Set** and **Finish**. The panel will then close.
2. Click on **Apply** or **OK** in the **Super Vertex Annotate** panel.

Modifying the Text Height

All the text labels in the 4d string have the same height.

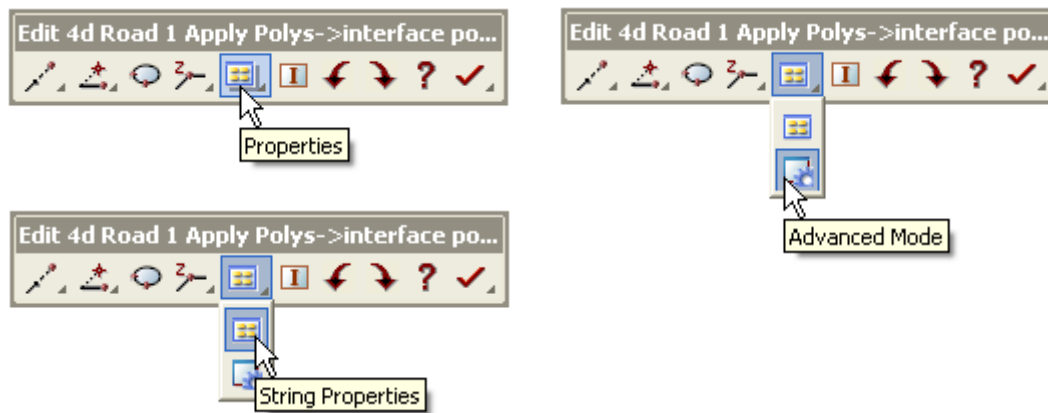

The height of all the text is modified by changing the **Height (u)** in the **Text Style Info** for the string (see [4d - Text Info](#))

Modifying the Text Angle

All the text labels in the 4d string are drawn rotated about their defining string point with the **same** rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The angle of all the text is modified by changing the **Angle** in the **Text Style Info** for the string (see [4d - Text Info](#))

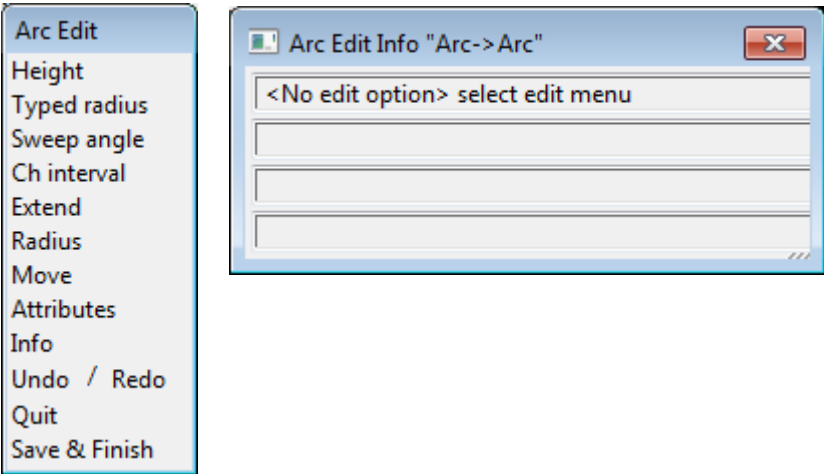

4d Properties

For information on the **Super String Properties** panel, go to [Properties](#)

Arc Edit

On picking an arc string, the **arc edit** menu and **arc edit info** panel are placed on the screen.

Each option in the **arc edit** menu will now be described.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Height

The **height** option is used to define the z-value at the start or end point of the arc.

The z-value at any point on the arc is an interpolation on arc length of the values at the end points. Hence, the arc is an arc in plan only - in three dimensions, it is a **helix**.

Height is a two step process.

Step (a) - selecting the start or end point of the arc

After picking **height**, the end point of the arc whose height is to be modified is selected.

message area 1 <Height of arc>
Screen message area
 <Select point to change height> [picks][][menu]
 <Select point to change height> [picks][accepts][menu]

Step (b) - entering the new height

After the start or end point of the arc is selected, an **enter value** typed-input box is placed on the screen with the points current height displayed in it.

The **enter value** typed-input box looks like:

The new height for the point is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **height** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **arc edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the height option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **height** option still current.

Typed Radius

The **typed radius** option is used to modify the radius of the selected arc.

After the **typed radius** option is chosen, an **enter value** typed-input box is placed on the screen with the arcs current radius displayed in it.

The **enter value** typed-input box looks like:

The arc radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc and the arc is redrawn with its new radius.

The typed-input box then disappears.

The **typed radius** option is automatically terminated and a new option needs to be selected from the **arc edit** menu.

Sweep Angle

The **sweep angle** option is used to modify the sweep angle of the selected arc.

After the **sweep angle** option is chosen, an **enter value** typed-input box is placed on the screen with the arcs current sweep angle displayed in it.

The **enter value** typed-input box looks like:

The arc sweep angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the sweep angle of the arc and the arc is redrawn with its new sweep angle.

The typed-input box then disappears.

The **sweep angle** option is automatically terminated and a new option needs to be selected from the **arc edit** menu.

Chainage interval

The **ch interval** option is used to modify the chainage interval of the selected arc.

After the **ch interval** option is chosen, an **enter value** typed-input box is placed on the screen with the arcs current chainage interval displayed in it.

The **enter value** typed-input box looks like:

The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the arc and the arc is redrawn with its new chainage interval.

The typed-input box then disappears.

The **ch interval** option is automatically terminated and a new option needs to be selected from the **arc edit** menu.

Move End

The **move end** option is used to re-position either the start or the end point of the arc.

Move end is a two step process.

Step (a) - selecting the start or end point of the arc

After selecting the **move end** option, the end point to be move is selected.

```
message area 1      <Move End>
Screen message area
    <Select point to move> [picks][ ][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the end point

After selecting the end point to move, the new position for the end point is selected.

```
message area 1      <Move End>
Screen message area
    <Select final position of point> [picks][ ][menu]
    <Select final position of point> [picks][accepts][menu]
```

The **move end** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **arc edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **move end** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **move end** option still current.

Radius

The **radius** option is used to change the radius of the arc by leaving the centre point alone and re-positioning a point on the arc. The new position for the point will define a new radius for the arc.

Radius is a two step process.

Step (a) - selecting the point on the arc to move

After selecting the **radius** option, the point on the arc to be moved is selected.

```
message area 1      <Radius>
Screen message area
    <Select point to move> [picks][ ][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

```
message area 1      <Radius>
Screen message area
    <Select final position of point> [picks][ ][menu]
    <Select final position of point> [picks][accepts][menu]
```

The **radius** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **arc edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **radius** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **radius** option still current.

Move

The **move** option is used to change the position of the entire arc by selecting and moving the arc centre or any point on the arc.

Move is a two step process.

Step (a) - selecting the point on the arc to move

After selecting the **move** option, the point on the arc to move is selected.

```
message area 1      <Move>
Screen message area
    <Select point to move> [picks][ ][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

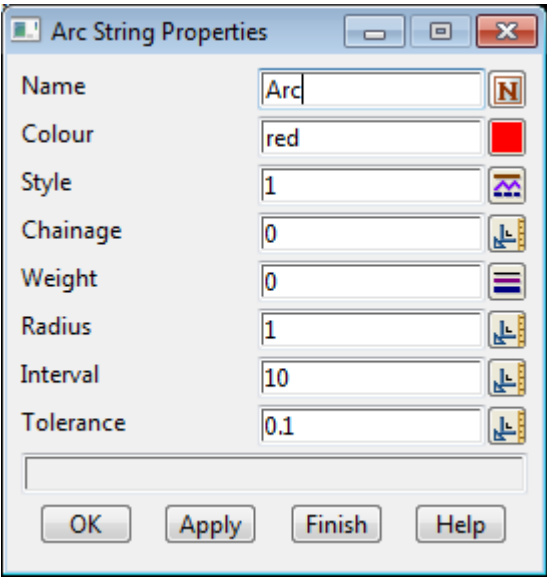

```
message area 1      <Move>
Screen message area
    <Select final position of point> [picks][ ][menu]
    <Select final position of point> [picks][accepts][menu]
```

The **Move** option repeats until cancelled by the user by either bringing up the **Pick ops** menu and selecting **Cancel** or by selecting a new option from the **Arc edit** menu.

If, after bringing up the **Pick ops** menu, it is decided to continue with the **move** option, simply select the **restart** option from the **Pick ops** menu and the **Pick ops** menu will disappear leaving the **move** option still current.

Properties

Selecting **Properties** brings up the **Arc String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create arc string** panel and the arc editor options. The only new field is

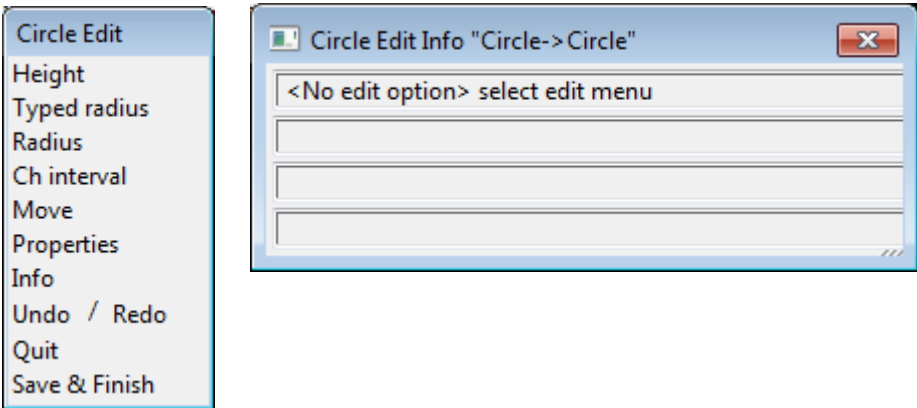

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel.*

Apply sets the string with the values in the panel fields and leaves the panel on the screen.

Circle Edit

On picking a circle string, the **circle edit** menu and **circle edit info** panel are placed on the screen.

Each option in the **circle edit** menu will now be described.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Height

The **height** option is used to define the z-value for the entire circle.

After selecting the **height** option, an enter value typed-input box is placed on the screen with the circles current height displayed in it.

The enter value typed-input box looks like:

The new height for the circle is entered into the typed-input box, terminated with <enter>.

The typed-input box then disappears.

The **height** option is automatically terminated and a new option needs to be selected from the **circle edit** menu.

Typed Radius

The **typed radius** option is used to modify the radius of the selected circle.

After the **typed radius** option is chosen, an enter value typed-input box is placed on the screen with the circles current radius displayed in it.

The enter value typed-input box looks like:

The circle radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the circle and the circle redrawn with its new radius.

The typed-input box then disappears.

The **typed radius** option is automatically terminated and a new option needs to be selected from the **circle edit** menu.

Radius

The **radius** option is used to change the radius of the circle by leaving the centre point alone and re-positioning a point on the circle. The new position for the point will define a new radius for the circle.

Radius is a two step process.

Step (a) - selecting the point on the circle to move

After selecting the **radius** option, the point on the circle to be moved is selected.

message area 1 <Radius>

Screen message area

<Select point to move> [picks][][menu]

<Select point to move> [picks][accepts][menu]

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

message area 1 <Radius>

Screen message area

<Select final position of point> [picks][][menu]

<Select final position of point> [picks][accepts][menu]

The **radius** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **circle edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **radius** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **radius** option still current.

Chainage Interval

The **ch interval** option is used to modify the chainage interval of the selected circle.

After the **ch interval** option is chosen, an **enter value** typed-input box is placed on the screen with the circles current chainage interval displayed in it.

The enter value typed-input box looks like:

The new chainage interval is entered into the typed-input box, terminated with <enter>. The entered value is taken as the chainage interval of the circle.

The typed-input box then disappears.

The **ch interval** option is automatically terminated and a new option needs to be selected from the **circle edit** menu.

Move

The **move** option is used to change the position of the entire circle by selecting and moving the circle centre or any point on the circle.

Move is a two step process.

Step (a) - selecting the point on the circle to move

After selecting the **move** option, the point on the circle to move is selected.

```
message area <Move>
Screen message area
    <Select point to move> [picks][ ][menu]
    <Select point to move> [picks][accepts][menu]
```

Step (b) - selecting the new position for the point

After selecting the point to move, the new position for the point is selected.

```
message area 1 <Move>
Screen message area
    <Select final position of point> [picks][ ][menu]
    <Select final position of point> [picks][accepts][menu]
```

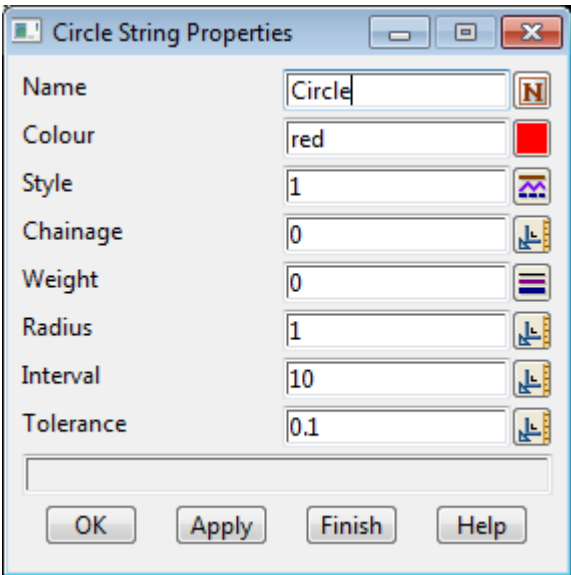

The **move** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **circle edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the **move** option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **move** option still current.

Note - the centre point of the circle can be selected and moved with the **move** option.

Properties

Selecting **Properties** brings up the **Circle String Properties** panel which is used to modify the string's header information.

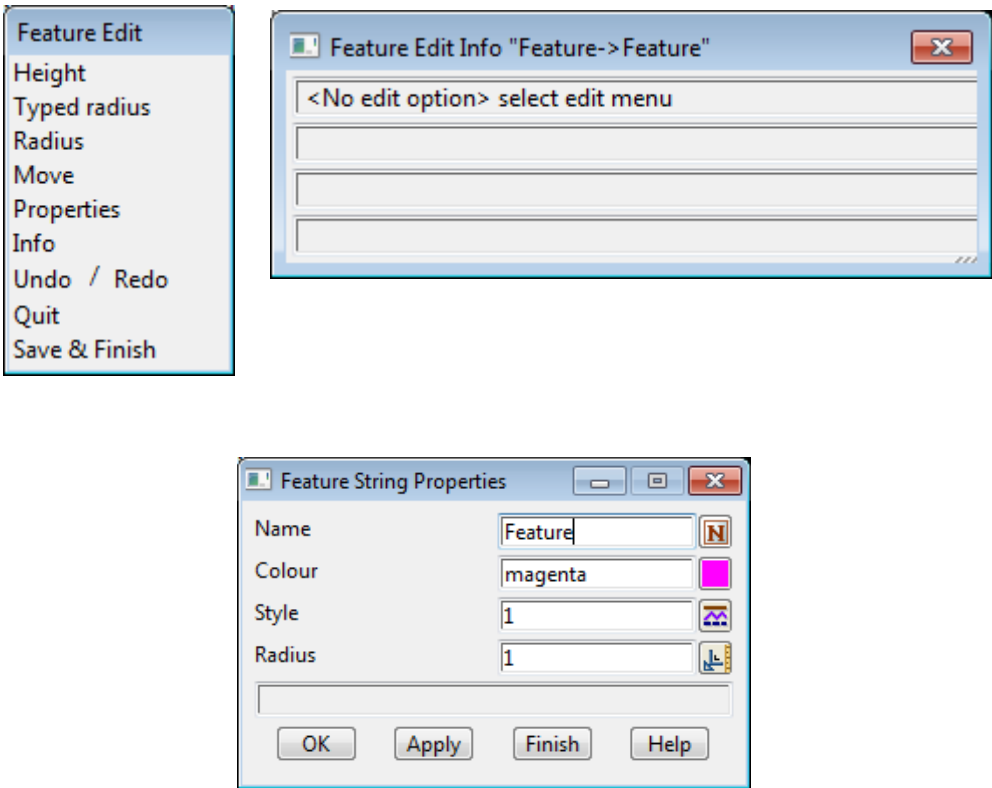

The fields in this panel are similar to those in the **create circle string** panel and the circle editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Set	button		

for the circle being edited, set all the items in the **circle string Properties** panel to the values given in the panel.

Feature Edit

On picking a feature string, the **feature edit** menu and panel are placed on the screen.

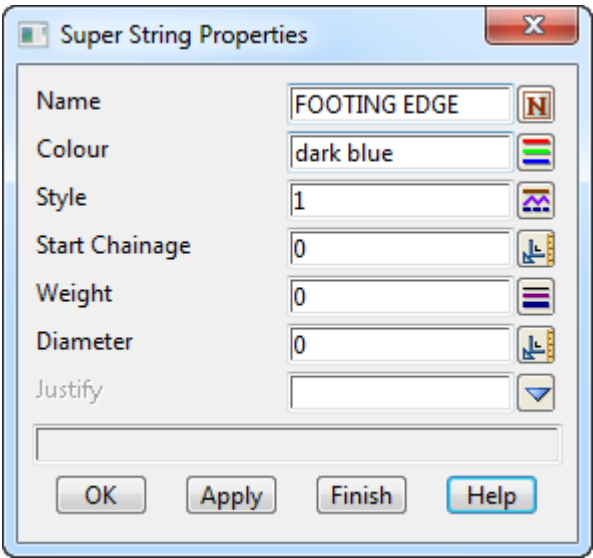

Each option in the **feature edit** menu is identical to those from the **circle edit** menu and will not be described again. See the section [Circle Edit](#)

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Edit Pipe

Position of option on menu: Strings =>Editor

On picking a **pipe** string, the **Edit Pipe** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (**Project =>Management =>Defaults**), an information panel, (the string's **Super Edit Info** panel) is also displayed.

The fields in this panel are similar to those in the **create pipe string** panel and the 3d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Diameter	real box		
Justify	choice box		invert, centre, obvert

The **diameter** field is used to modify the diameter of the pipe string.
Note - the default pipe string has only one diameter for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own diameter; or can be a box culvert rather than a pipe.

The **Justify** field is used to modify the justification of the pipe string.
Note - the default pipe string has only one justification for the entire string, however by using the Advanced mode, the pipe string can be turned into a more general super string where each segment can have its own justification.

OK/Apply button

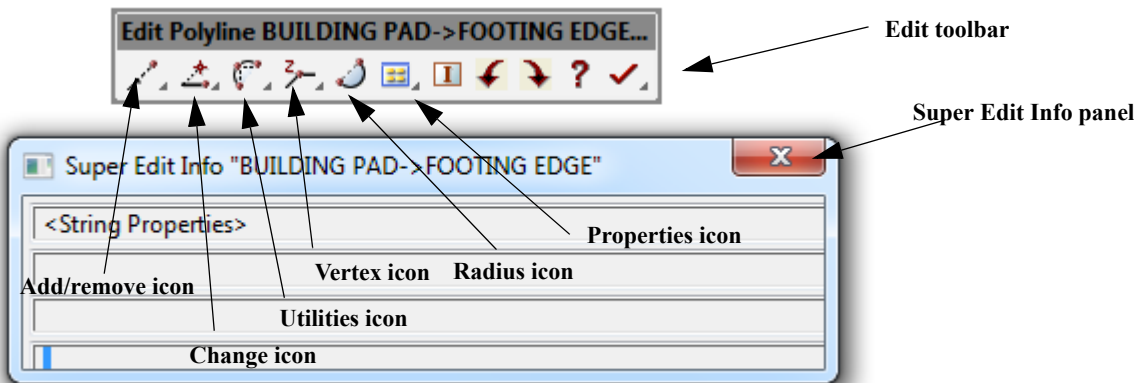

for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel.
Apply sets the string with the values in the panel fields and leaves the panel on the screen.

Edit Polyline

Position of option on menu: Strings =>Editor

On picking a **Polyline** string, the **Edit Polyline** toolbar is placed on the screen. If **Display edit info** is ticked on in the **Default** panel (Project =>Management =>Defaults), an information panel, (the string's **Super Edit Info** panel) is also displayed.

On picking a polyline string, the **polyline edit** menu and **polyline edit info** panel are placed on the screen.

The major difference between a **polyline** and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string vertices. Hence most of the options in the **Edit Polyline** toolbar are similar to the **Edit 3d** options of the same name, and only the differences for each option will be discussed. See the section [Edit 3d](#) for information on the 3d string editor.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

For the option *Add/ Remove Toolbar* go to

- Change Toolbar
- Utilities Toolbar
- Vertex Toolbar
- Radius Toolbar
- Properties Toolbar
- Info Toolbar

[Super String Edit - Common Information](#)

[Super String Edit - Common Information](#)

[Super String Edit - Common Information](#)

[Super String Edit - Common Information](#)

Add/Remove Toolbar

The **Add/remove** toolbar is

The **Append/Prepend** options allow for simply adding vertices, or adding vertices plus radii for the

segments.

Append

For the cases when no arc is required, the **Append** option simply places vertices.

Append + Radius

If an arc radius is required for every segment of the super string, there is an **Append + Radius** option that asks for the radius for every segment.

If the **Append + Radius** option is selected, then before each vertex is appended, a **Radius** typed-input box is placed on the screen.

The **Radius** typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

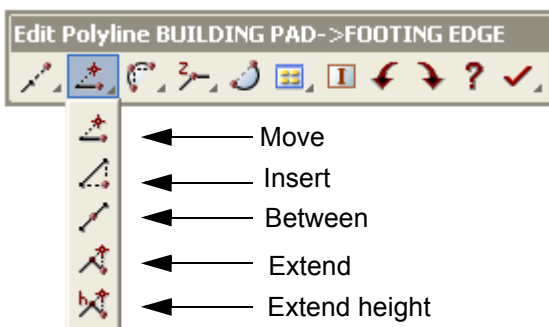

A **radius** value of **0** is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d string.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit polyline** toolbar

Go to the next section [Change Toolbar](#)

Change Toolbar

The **Extend ht** option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

The **Move**, **Insert** and **Between** options are the same as for a 3d string.

There are two **Extend** options for a polyline string - **Extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **Extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by

picking on the segment to extend along, near the vertex to extend. The segment to extend can be a straight or an arc segment.

Pick here to extend this vertex

Go to the next section [Utilities Toolbar](#)

Utilities Toolbar

The **utilities** toolbar contains a number of useful miscellaneous option for the polyline string. The menu is

Each of the new options will now be discussed.

Ins 3 Point Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent vertices.

After selecting the option, the middle vertex of the three adjacent vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

Del 3 Point Curve

The **del 3 pt curve** option is used to delete the curves on either side of a vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

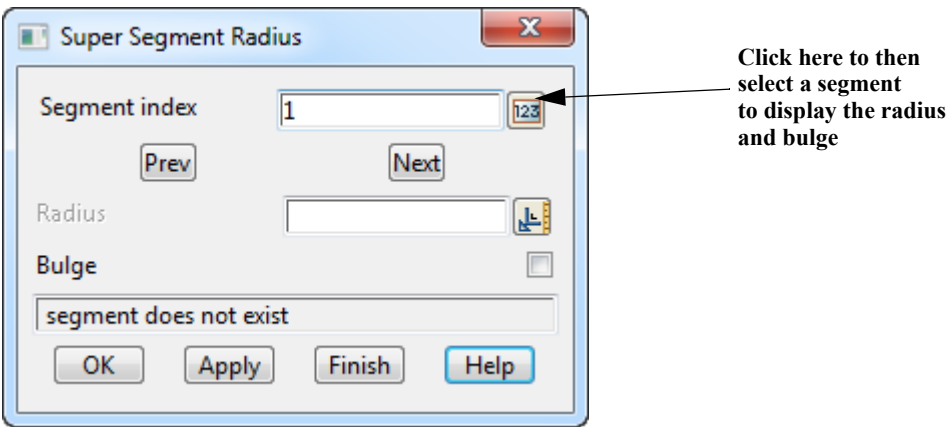

Open/Close

Toggles the string between being open and closed.

Go to the next section [Radius](#)

Radius

Selecting **Radius** icon brings up the **Super Segment Radius** panel which is used to modify the radius of any arc/line joining adjacent polyline points.

The panel displays the arc radius and bulge setting for segment 1 and the next/previous buttons can be used to display the values for any segment.

A particular segment can be selected by clicking on the value box for the **Segment index** field and then picking the segment. The current arc radius and bulge for the segment are displayed.

New values can then be entered into the panel field and the arc modified by selecting the **OK** or **Apply** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

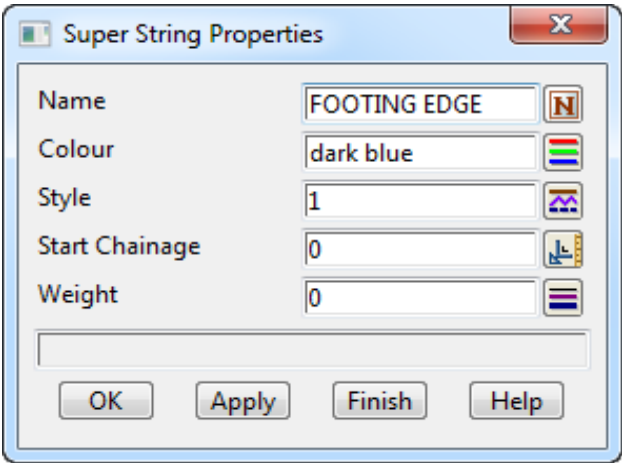

If **bulge** is ticked, the larger arc is used. The default is **bulge** turned off.

Go to the next section [Properties toolbar](#)

Properties toolbar

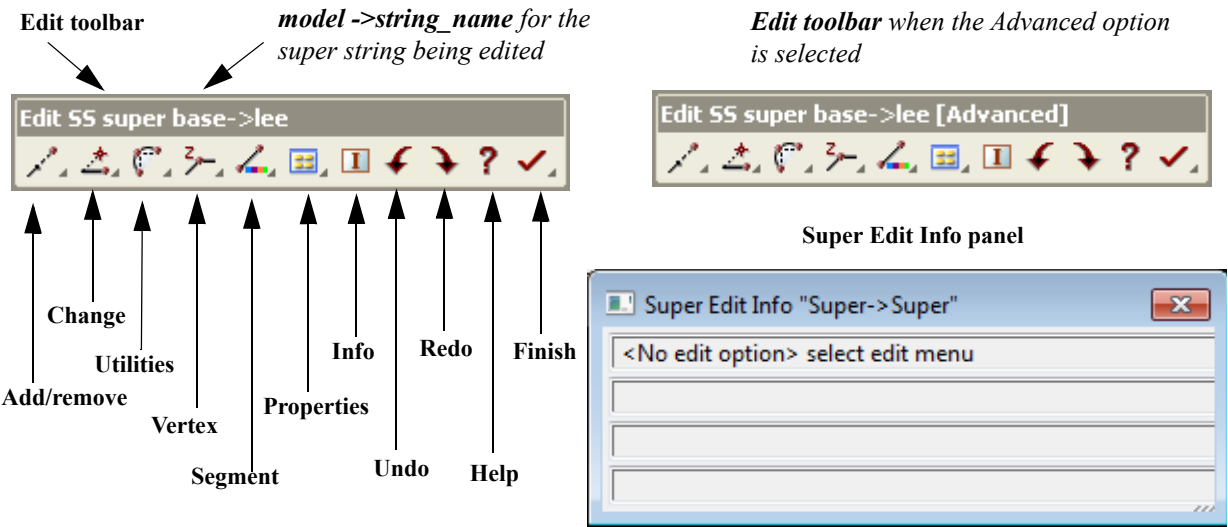

Selecting the **Properties** icon brings up the **Polyline String Properties** toolbar which is used to modify the string's header information.

The fields in this panel are the same as for a 3d string.

Edit Super

On picking a super string, the **Super Edit** menu and **Super Edit Info** panel are placed on the screen.

The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the **super edit** menu are similar to the **polyline edit** options of the same name, and only the differences for each option will be discussed.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

For the option Add/ Remove Toolbar go to

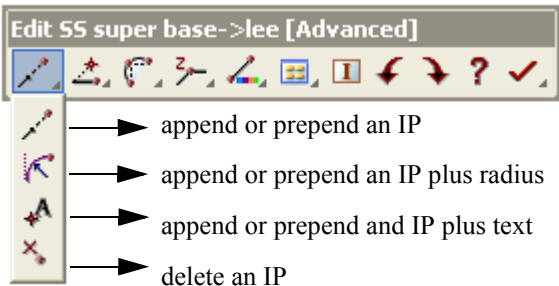

- Change Toolbar
- Utilities Toolbar
- Vertex Toolbar
- Segment Toolbar
- Properties Toolbar
- Info Toolbar
- Undo Toolbar
- Redo Toolbar
- Help Toolbar

[Super String Edit - Common Information](#)
[Super String Edit - Common Information](#)
[Super String Edit - Common Information](#)
[Super String Edit - Common Information](#)
[Super String Edit - Common Information](#)

Add/Remove Toolbar

The **Add/Remove** toolbar is

The **Append/Prepend** options allow for simply adding vertices, or adding a vertex plus a radius for the segment, or adding vertices and text for each vertex.

Append

For the cases when no arc or text is required, the **Append** option simply places vertices.

Append + Radius

If an arc radius is required for every segment of the super string, there is an **Append + Radius** option that asks for the radius for every segment.

If the **Append + Radius** option is selected, then before each vertex is appended, a **radius** typed-input box is placed on the screen.

The radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A **radius** value of **0** is taken to mean **no arc**.

Append + Text

If text is required at every vertex of the super string, there the **Append + Text** option that asks for the text at every vertex.

When **Append + Text** is selected, then before each vertex is appended, a **Description** typed-input box is placed on the screen.

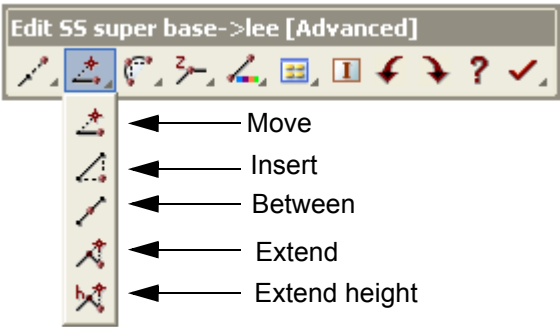

The text is entered into the typed-input box, terminated with <enter> and the entered text is taken as the vertex text,

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Super Edit** toolbar

Go to the next section [Change Toolbar](#)

Change Toolbar

The **Extend ht** option is used to move a vertex along the line joining the vertex to its neighbouring vertex plus the z-value is interpolated from the z-values at either end of the segment.

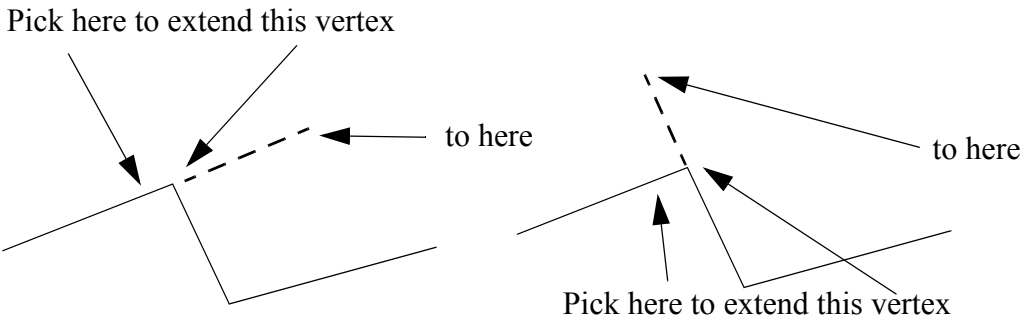

Move, Insert and Between

The **Move**, **Insert** and **Between** options are the same as for a 3d string. See

Extend and Extend Height

There are two **Extend** options for a super string - **Extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **Extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance (either along the straight or arc segment).

Most vertices are the end vertex of two segments and the extension could be along either segment. The vertex and the segment to extend along are both selected at the same time by picking on the segment to extend along, near the vertex to extend. The segment to extend can be a straight or an arc segment.

Please continue to the next section [Utilities Toolbar](#).

Utilities Toolbar

Insert 3 Point Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent vertices.

After selecting the option, the middle vertex of the three adjacent vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

Delete 3 Point Curve

The **del 3 pt curve** option is used to delete the curves on either side of a vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

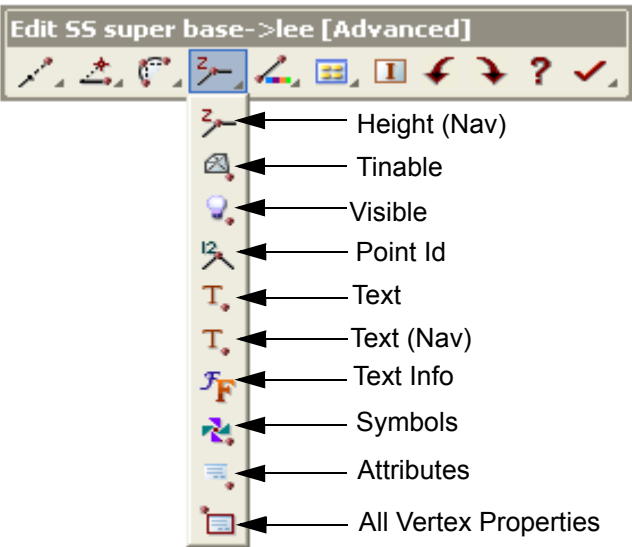

Open/Close

Toggles the string between being open and closed.

Please continue to the next section [Vertex Toolbar](#).

Vertex Toolbar

The **Vertex** toolbar contains options to modify information at any vertex of the super string.

For the option *Height (Nav)* go to

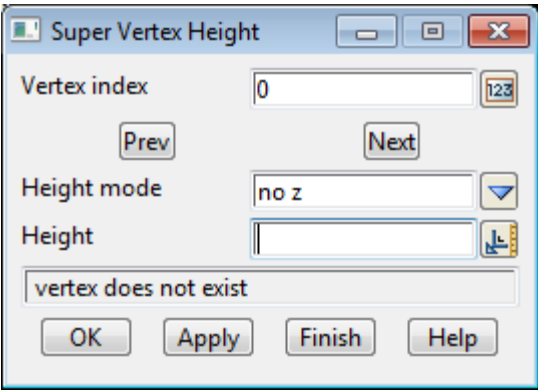

- Tinable*
- Visible*
- Point Id*
- Text*
- Text (Nav)*
- Text Info*
- Symbols*
- Attributes*
- All vertex properties*

- [Height \(Nav\)](#)
- [Tinable](#)
- [Visible](#)
- [Point Id](#)
- [Text](#)
- [Text \(Nav\)](#)
- [Text Info](#)
- [Symbols](#)
- [Attributes](#)
- [All Vertex Properties](#)

Height (Nav)

Selecting **Height (Nav)** brings up the **Super Vertex Height** panel which is used to set the height

value for vertices.

As soon as **Height (Nav)** is chosen, the height information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *vertex number*, *height mode* and *height* are written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index <i>if a vertex is selected, then its vertex number is displayed in this field.</i>	number box	selected vertex	
Prev <i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</i>	button		
Next <i>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</i>	button		
Height mode <i>if no z, there is no z value for the vertex.</i> <i>if entire string, then the string has the same z value for each vertex.</i> <i>if each vertex, then each vertex has a separate z value.</i>	choice box		no z, entire string, each vertex
Height <i>the height used for the vertex or for the entire string.</i>	input	height of vertex/string	
OK/Apply <i>for the vertex being edited, OK sets the vertex with the values in the panel fields and removes the panel.</i> <i>Apply sets the vertex with the values in the panel fields and leaves the panel on the screen.</i>	button		

Please continue to the next section [Tunable](#)

Tunable

Selecting **Tinable** brings up the **Super Vertex Tinable** panel which is used to set the tinability information for vertices.

As soon as **Tinable** is chosen, the tinability information for the first vertex is shown.
A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <enter>.
Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *tinability* information is written to the appropriate panel fields.
if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

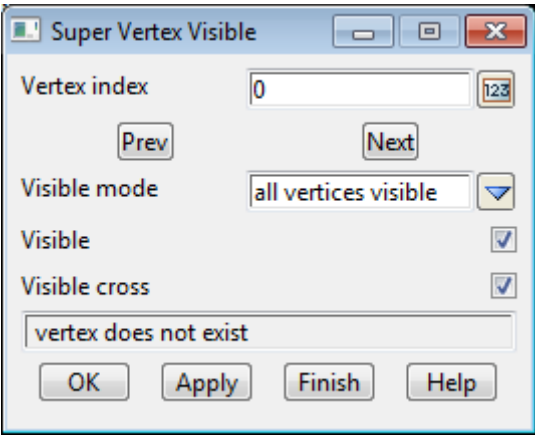

The fields and buttons used in the **Super Vertex Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex Index	number box	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</i>			
Tinable mode	choice box		all vertices tinable all vertices not tinable each vertex
<i>if all vertices tinable, all vertices are included in a triangulation.</i>			
<i>if all vertices not tinable, no vertices are included in a triangulation.</i>			
<i>if each vertex, then each vertex has a separate tinability value.</i>			
Tinable	tick box		
<i>if ticked, the vertex is tinable. That is, it is included in tins.</i>			
<i>if not ticked, then the vertex is ignored when triangulating.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Please continue to the next section [Visible](#)

Visible

Selecting **Visible** brings up the **Super Vertex Visible** panel which is used to set the visibility flag for vertices.

As soon as **Visible** is chosen, the visibility information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *visibility* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	number box	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</i>			
Visible mode	choice box		all vertices visible visibility for entire string visibility for each vertex
<i>if all vertices visible, all vertices are visible.</i>			
<i>if visibility for the entire string, the Visible and Visible cross setting is used for all vertices in the string.</i>			
<i>if visibility each vertex, then each vertex has its own Visible and Visible cross setting.</i>			

Visible tick box

*if **ticked**, the vertex is visible.
if **not ticked**, then the vertex is invisible.*

Visible cross tick box

*if **ticked**, when it is a point string, a cross is drawn at each vertex.
if **not ticked**, when it is a point string, no cross is drawn at each vertex.*
***Note** - this is important when there is a symbol at the vertex. In that case, the vertex needs to be visible so that the symbol is drawn, but the standard cross drawn at vertices is not wanted.*

OK/Apply button

*for the vertex being edited, **OK** sets the vertex/string with the values in the panel fields and removes the panel. **Apply** sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section [Point Id](#)

Point Id

Selecting **Point Id** brings up the **Super Vertex Point Id** panel which is used to set the point IDs for vertices.

As soon as **Point Id** is chosen, the Point id information for the first vertex is shown.
A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <enter>.
Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *Point id* information written to the appropriate panel fields.
if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Point Id** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	number box	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel</i>			

fields.

- Next** button
move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.
- Point id mode** choice box no ids, each vertex
*if **no ids**, there are no Point ids for any vertex.*
*if **each vertex**, then each vertex has a Point id.*
- Point id** text box point id of vertex
the point id for the vertex.
- OK/Apply** button
*for the vertex being edited, **OK** sets the vertex/string with the values in the panel fields and removes the panel. **Apply** sets the vertex/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section [Text](#)

Text

As soon as **Text** is chosen, the Vertex Select is running and the message

<Pick vertex to set text> [Picks][Accept][Menu]

is displayed in the screen message area.

The vertex to have its text modified is then selected and the **Description** typed-input box is displayed on the screen with the current text for the vertex in it.

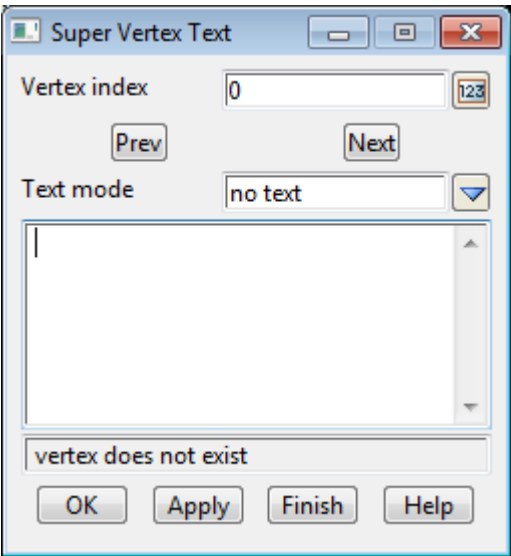

To modify the vertex text, type the new text into the **Description** typed-input box, finishing with <enter> and the vertex text is updated and the typed-input box.

Please continue to the next section [Text \(Nav\)](#)

Text (Nav)

Selecting **Text (Nav)** brings up the **Super Vertex Text** panel which is used to set the text for vertices.

As soon as **Text (Nav)** is chosen, the vertex text for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its vertex *text* is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

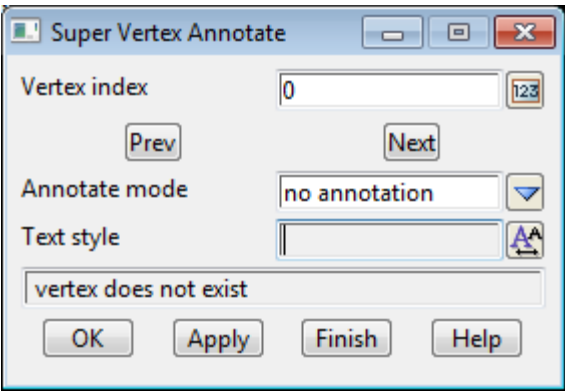

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex Index	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</i>			
Text mode	input		no text, entire string, each vertex
<i>if no text, there is no text for any vertex.</i>			
<i>if entire string, then the string has the same text for each vertex.</i>			
<i>if each vertex, then each vertex has a separate text value.</i>			
Text	input	text of vertex/string	
<i>the text used for the vertex or for the entire string.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Please continue to the next section [Text Info](#)

Text Info

Selecting **Text info** brings up the **Super Vertex Annotate** panel which is used to set the annotation styles for the text at vertices.

As soon as **Text info** is chosen, the text annotation information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *text annotation* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex Index	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</i>			
Annotate mode	input	no annotation, entire string, each vertex	
<i>if no annotation, then the text at the vertex is not displayed.</i>			
<i>if entire string, then the same annotation settings are used for each vertex.</i>			
<i>if each vertex, then each vertex has separate annotations settings.</i>			
Text style	input	1	available text styles
<i>text annotation for the text at the vertex.</i>			

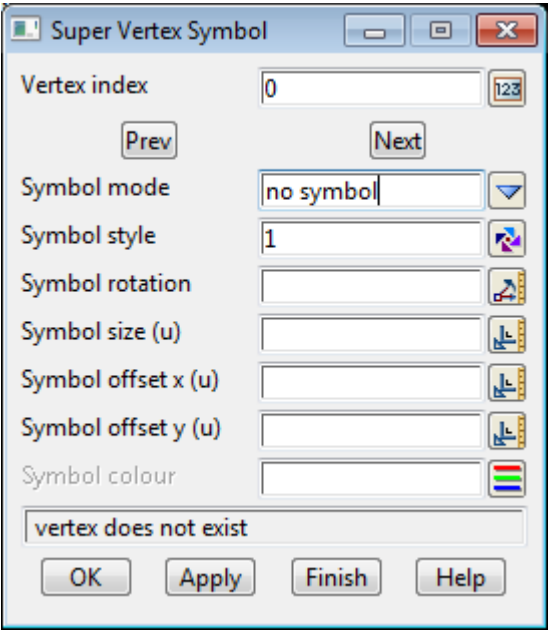

OK/Apply button

for the vertex being edited, **OK** sets the vertex/string with the values in the panel fields and removes the panel. **Apply** sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section [Symbols](#)

Symbols

Selecting **Symbols** brings up the **Super Vertex Symbol** panel which is used to set symbols and their display parameters at vertices.

As soon as **Symbols** is chosen, the symbol annotation information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *symbol* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields and buttons used in the **Super Vertex Symbol** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field.

Prev button

move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.

Next button

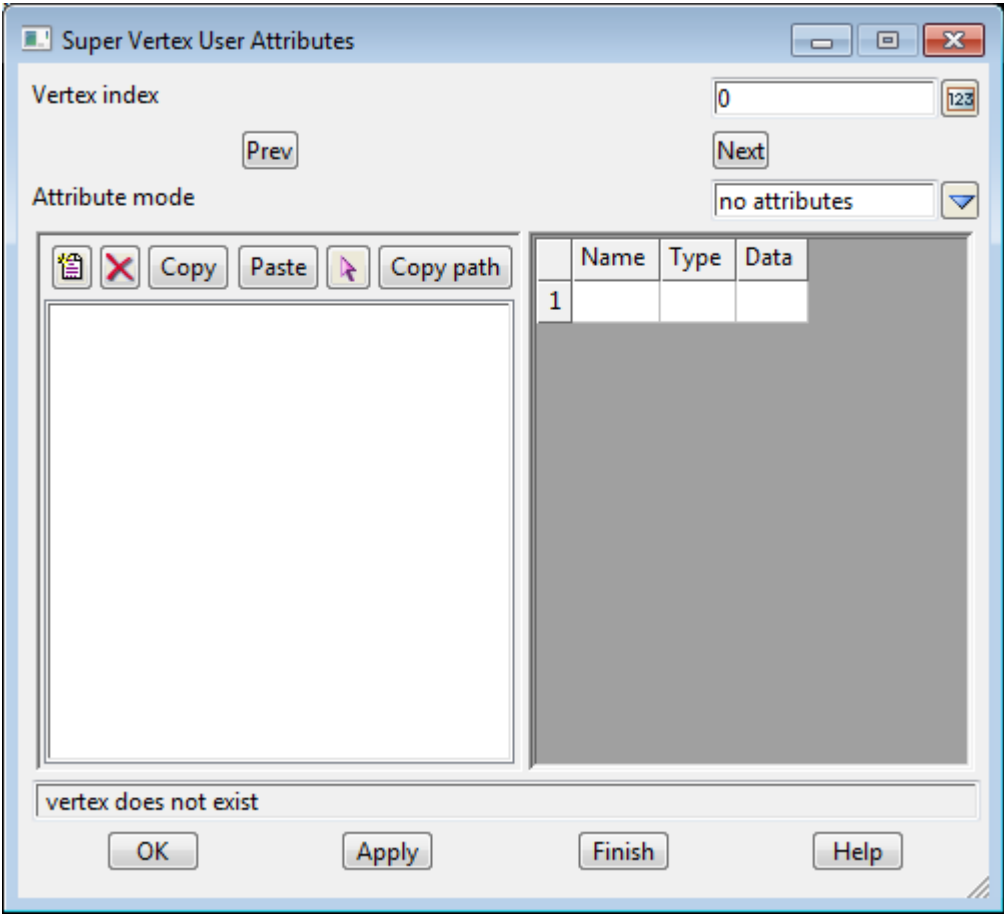

move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.

Symbol mode	input		no symbol, entire string, each vertex
<i>if no symbol, then there is no symbol at any vertex.</i>			
<i>if entire string, then the same symbol and settings are used for each vertex.</i>			
<i>if each vertex, then each vertex has separate symbols and settings.</i>			
Symbol style	symbol box	1	available symbols
<i>symbol at the vertex</i>			
Symbol rotation	angle box		
<i>rotation angle of the symbol (measured from the positive x-axis in the counter-clockwise direction).</i>			
Symbol size (u)	real box		
<i>size of the symbol (in units for the symbol).</i>			
Symbol offset x (u)	real box	0	
<i>distance (in units for the symbol) to offset the symbol in the x direction from its (x,y) placement position.</i>			
Symbol offset y (u)	real box	0	
<i>distance (in units for the symbol) to offset the symbol in the y direction from its (x,y) placement position.</i>			
Symbol colour	input		available colours
<i>colour of the symbol if none is defined in the symbol definition</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Please continue to the next section [Attributes](#)

Attributes

Selecting **Attributes** brings up the **Super Vertex User Attributes** panel which is used to display and edit user defined attributes at vertices of the super string.

As soon as **Attribute** is chosen, the attribute information for the first vertex is shown.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *attribute* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

- The fields and buttons used in the **Super Vertex User Attributes** panel have the following functions.
- | Field Description | Type | Defaults | Pop-Up |
|------------------------------------------------------------------------------------------------------------------------|--------|-----------------|--------|
| Vertex index | input | selected vertex | |
| <i>if a vertex is selected, then its vertex number is displayed in this field.</i> | | | |
| Prev | button | | |
| <i>move to the previous vertex (predecessor). The information for the new vertex is displayed in the panel fields.</i> | | | |
| Next | button | | |
| <i>move to the next vertex (successor). The information for the new vertex is displayed in the panel fields.</i> | | | |

Attribute mode choice box no attributes, each vertex
*if **no attributes**, then no vertices have user attributes.*
*if **each vertex**, then each vertex can have user attributes.*

Name/Type/Data Grid

Name input
name for the user attribute. This must be unique for all attributes at this vertex.

Type choice box integer, real, text
type of the attribute.

Data input
value for the attribute.

OK/Apply button
*for the vertex being edited, **OK** sets the vertex with the values in the panel fields and removes the panel.*
***Apply** sets the vertex with the values in the panel fields and leaves the panel on the screen.*

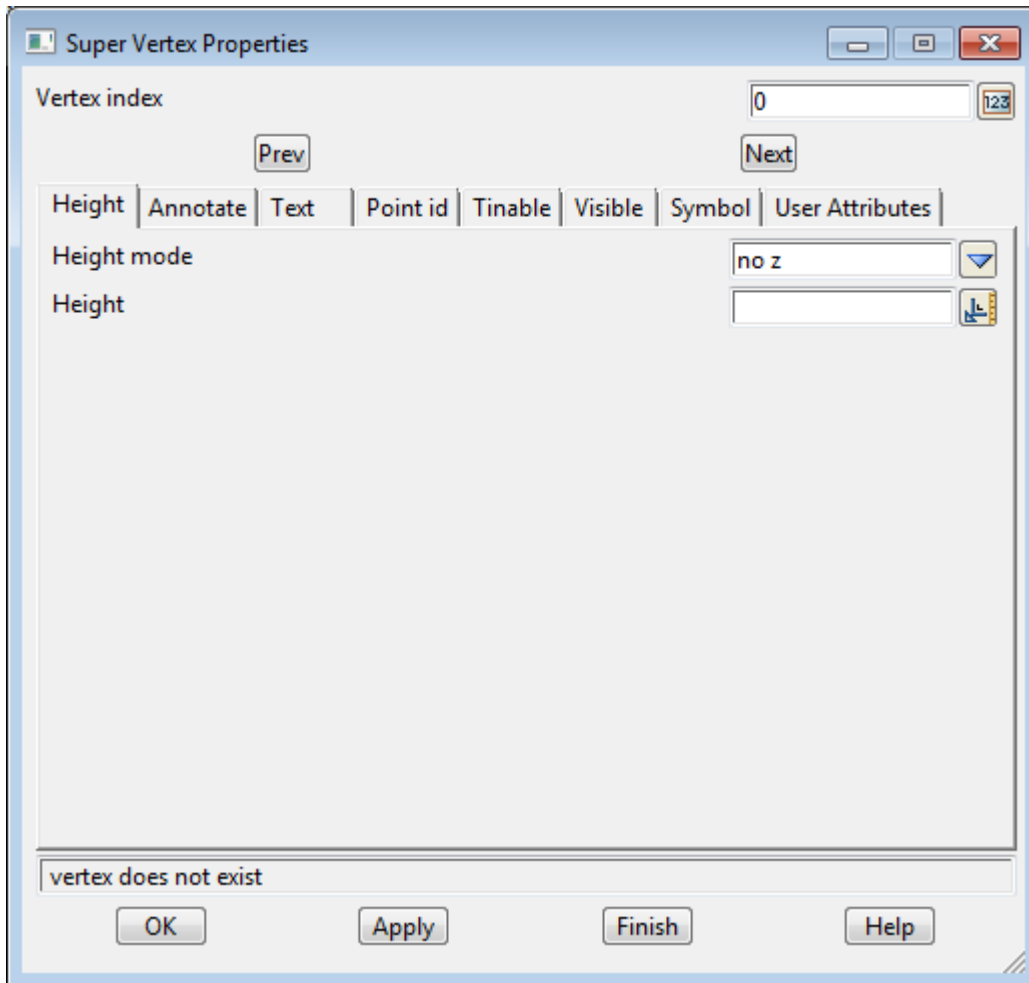

Please continue to the next section [All Vertex Properties](#)

All Vertex Properties

Selecting **All properties** brings up the **Super Vertex Properties** panel which is used to display all the properties for a vertex.

This option is also available from the *Strings* menu

Position of option on menu: Strings =>Properties =>Vertex (all)

As soon as **All vertex properties** is chosen, the height information for the first segment is shown in the panel. Clicking on the various tabs will show the various vertex information for the first vertex.

A particular vertex can be selected by first clicking on the icon at the end of the **Vertex index** field, and then selecting the required vertex, or by typing a number into the **Vertex index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent vertices.

When a vertex is selected, its *attribute* information is written to the appropriate tabs and panel fields.

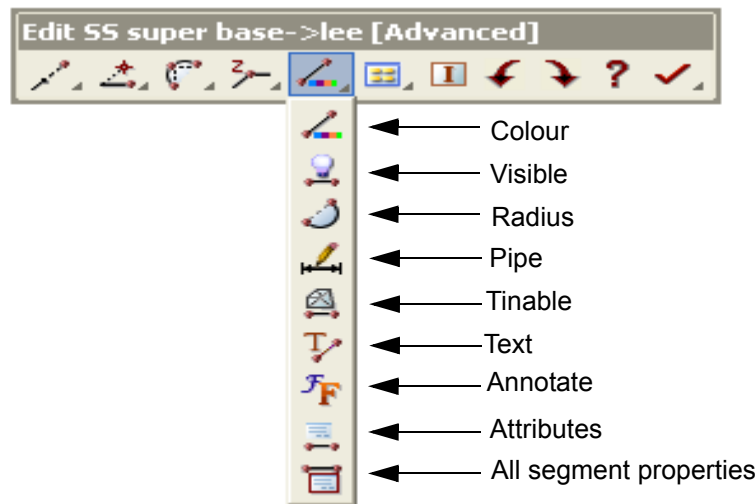

If any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the vertex.

The fields in each of the tabs for the **Super Vertex Properties** panel have already been described in the other options on the Vertex Toolbar. See [Vertex Toolbar](#).

For information on the Segment Toolbar, please continue to the next section [Segment Toolbar](#).

Segment Toolbar

The **Segment** toolbar contains options to modify information at any segment of the super string.

For the option <i>Colour</i> go to	Colour
<i>Visible</i>	Visible
<i>Radius</i>	Radius
<i>Pipe</i>	Pipe
<i>Tinable</i>	Tinable
<i>Text</i>	Text
<i>Annotate</i>	Annotate
<i>Attributes</i>	Attributes
<i>All segment properties</i>	All Segment Properties

Colour

Selecting **Colour** brings up the **Super Segment Colour** panel which is used to set the colour of the string segments.

As soon as **Colour** is chosen, the colour information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *colour* information is written to the appropriate panel fields.
if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

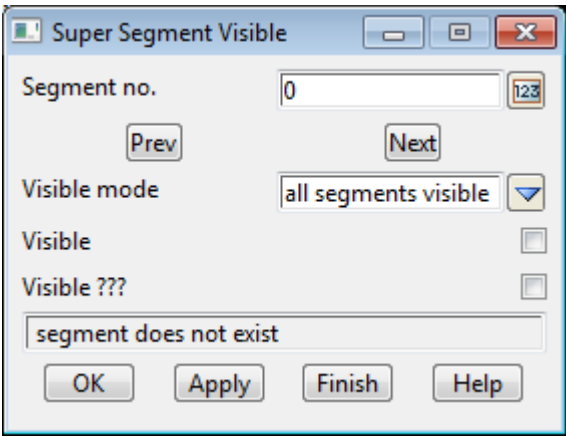

The fields and buttons used in the **Super Segment Colour** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next new is displayed in the panel fields.</i>			
Colour mode	choice box		string colour, each segment
<i>if string colour, then all the segments in the string have the same colour.</i>			
<i>If each segment, then each segment has a separate colour.</i>			
Colour	colour box	colour of segment/string	available colours
<i>the colour used for the segment or for the entire string.</i>			
OK/Apply	button		
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>			

Please continue to the next section [Visible](#)

Visible

Selecting **Visible** brings up the **Super Segment Visible** panel which is used to set the visibility flag for segments.

As soon as **Visible** is chosen, the visibility information for the first segment is shown.
A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <Enter>.
Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *visibility* information is written to the appropriate panel fields. if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next new is displayed in the panel fields.</i>			
Visible mode	choice box		all segments visible visibility for entire string visibility for each segment
<i>if all segments visible, all segments are visible.</i>			
<i>if visibility for the entire string, the Visible and Visible ??? setting is used for all vertices in the string.</i>			
<i>if visibility each segment, then each vertex has its own Visible and Visible ??? setting.</i>			
Visible	tick box		
<i>if ticked, the segment is visible.</i>			
<i>if not ticked, then the segment is invisible.</i>			
Visible ???	tick box		
<i>if ticked,</i>			
<i>if not ticked,.</i>			
OK/Apply	button		
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>			

Please continue to the next section [Radius](#)

Radius

When viewed in plan, the segments of a super string can be joined by string lines or arcs. If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

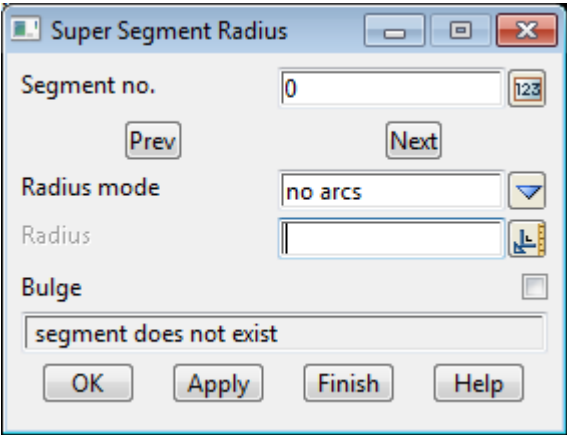

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned *on*, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.

Selecting **Radius** brings up the **Super Segment Radius** panel which is used to set the plan radius of the segment.

As soon as **Radius** is chosen, the radius information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *radius* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the new segment is displayed in the panel fields.</i>			

Radius mode choice box no arcs, each segment
*if **no arcs**, then no segments have a diameter (that is, they are all line segments).*
*If **each segment**, then each segment has a radius.*

Radius real box 0
radius of the segment arc. A radius of 0 mean no arc.

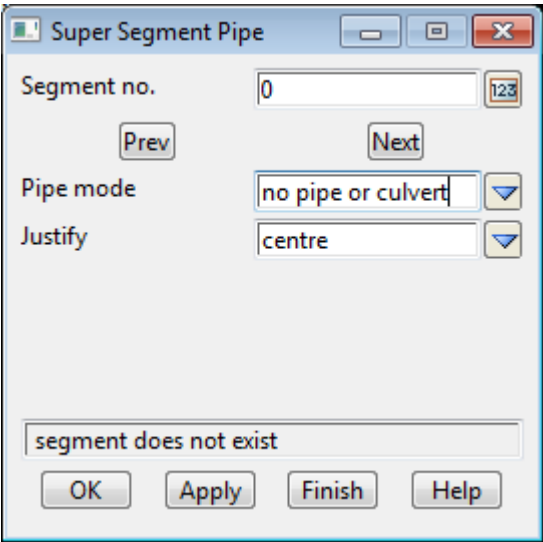

Bulge tick box
*if **ticked**, the larger arc is used.*
if not-ticked, the smaller arc is used.

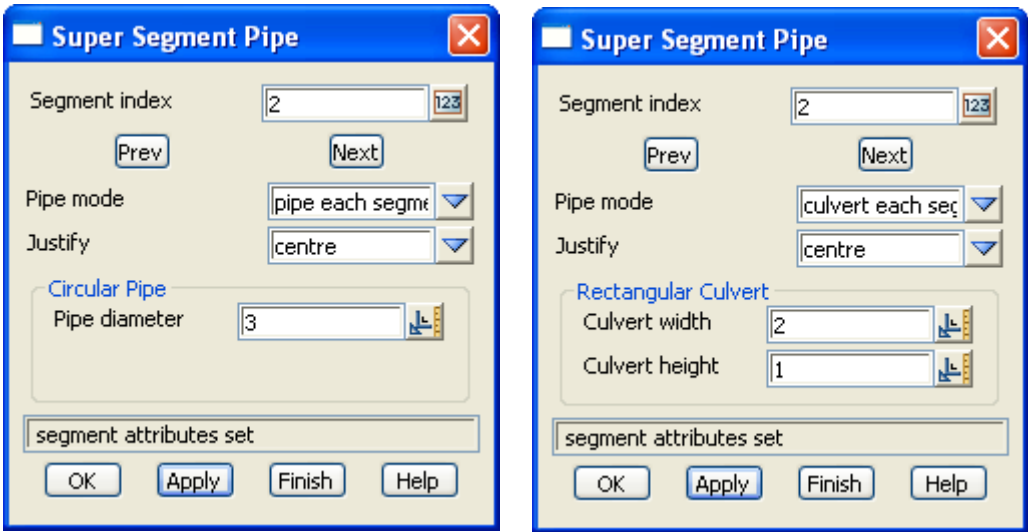

OK/Apply button
*for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Please continue to the next section [Pipe](#)

Pipe

The segments of a super string can have either a pipe or box cross section, or none.
Selecting **Pipe** brings up the **Super Segment Pipe** panel which is used to set the pipe mode and size for the string segments.

As soon as **Pipe** is chosen, the pipe information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *pipe* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Pipe** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the new segment is displayed in the panel fields.</i>			
Pipe mode	choice box		no pipe or culvert pipe entire string pipe each segment culvert entire string culvert each segment

if no pipe or culvert, there is no pipe or culvert for the segment.

If pipe entire string, then all the segments in the string are pipes and have the same diameter.

If pipe each segment, then each segment is a pipe and can have a different diameter.

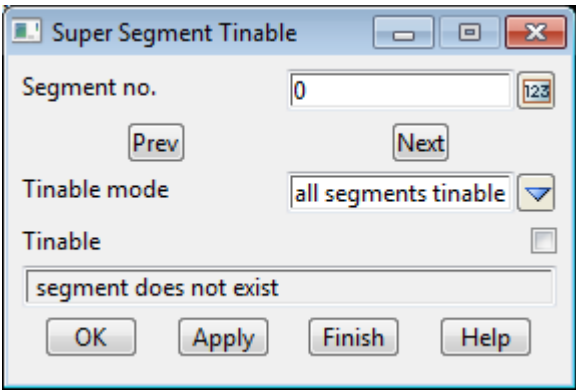

If culvert entire string, then all the segments in the string are culverts and have the same width and height.

If culvert each segment, then each segment is a culvert and can have a different width and height.

Justify	choice box	invert, centre, overt
<i>justification of the pipe/culvert with respect to the co-ordinates given for the vertices of the super string.</i>		
Pipe diameter	real box	
<i>diameter of the pipe in world units.</i>		
Culvert width	real box	
<i>width of the culvert section in world units.</i>		
Culvert height	real box	
<i>height of the culvert section in world units.</i>		
OK/Apply	button	
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>		
Please continue to the next section Tinable		

Tinable

Selecting Segment=>Tinable brings up the **Super Segment Tinable** panel which is used to set the tinable flag for segments.

As soon as **Tinable** is chosen, the tinability information for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *tinability* information is written to the appropriate panel fields.

if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			

- Prev

button

move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.
- Next

button

move to the next segment (successor). The information for the next new is displayed in the panel fields.
- Tinable mode

choice box

all segments tinable

all segments not tinable

each segment

if **all segments tinable**, all segments are included as break lines in a triangulation.

if **all segments not tinable**, no segments are included as break lines in a triangulation.

if **each segment**, then each segment has a separate tinability value.
- Tinable

tick box

if **ticked**, the segment is used as a break line in a triangulation. That is, the triangulation process tries to preserve the segment as a side of a triangle in the tin.

if **not ticked**, then the segment is used as a break line when triangulating.

Note - for a tinable segment to be used as a breakline, the vertex at the segment ends must also be tinable.
- OK/Apply

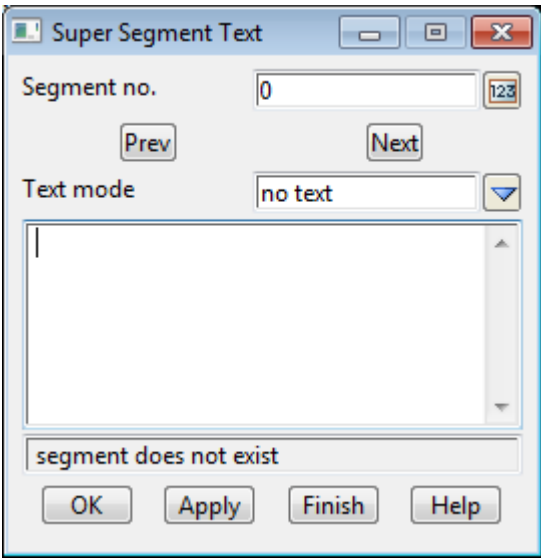

button

for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Please continue to the next section [Text](#)

Text

Selecting Segment=>Text brings up the **Super Segment Text** panel which is used to set the text for segments.

As soon as **Text** is chosen, the segment text for the first segment is shown.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *segment text* is written to the appropriate panel fields.
if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

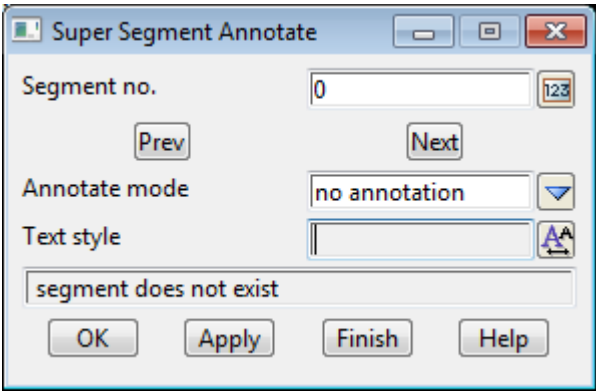

The fields and buttons used in the **Super Segment Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index <i>if a segment is selected, then its segment index is displayed in this field.</i>	number box	selected vertex	
Prev <i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>	button		
Next <i>move to the next segment (successor). The information for the next new is displayed in the panel fields.</i>	button		
Text mode <i>if no text, there is no text for the segment.</i> <i>if entire string, then the string has the same text for each segment.</i> <i>if each segment, then each segment has a separate text value.</i>	choice box		no text, entire string, each segment
Text <i>the text used for the segment or for the entire string.</i>	text box	text of segment/string	
OK/Apply <i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Please continue to the next section [Annotate](#)

Annotate

Selecting **Annotate** brings up the **Super Segment Annotate** panel which is used to set the annotation styles for the text at segments.

As soon as **Annotate** is chosen, the annotation information for the first segment is shown.
A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <enter>.
Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *annotation* information is written to the appropriate panel fields. if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

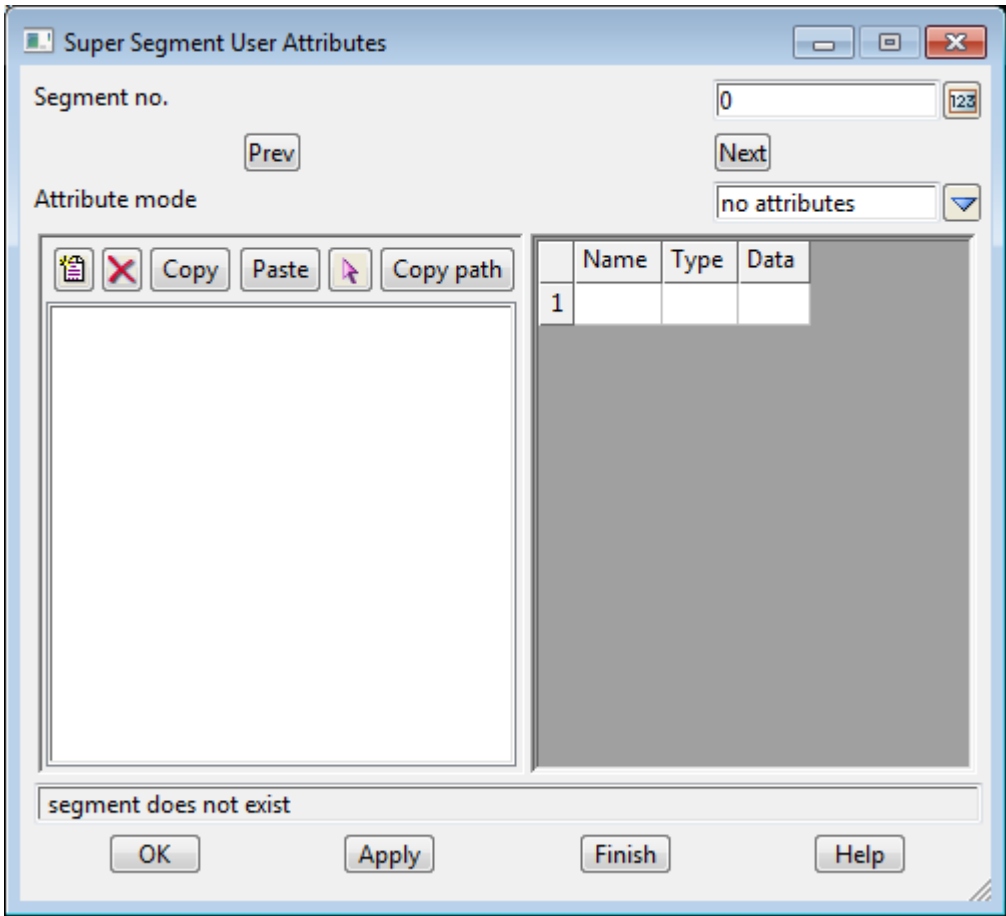

The fields and buttons used in the **Super Segment Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the new segment is displayed in the panel fields.</i>			
Annotate mode	choice box	no annotation, entire string, each segment	
<i>if no annotation, then the text at the segment is not displayed.</i>			
<i>if entire string, then the same annotation settings are used all each segments and the Text style information is given in the Text style field.</i>			
<i>if each segment, then each segment has separate annotations settings and the Text style information for each segment is given in the Text style field.</i>			
Text style	textstyle data box		
<i>textstyle information.</i>			
OK/Apply	button		
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>			

Please continue to the next section [Attributes](#)

Attributes

Selecting **Attributes** brings up the **Super Segment User Attributes** panel which is used to display and edit user defined attributes at segments of the super string.

As soon as **Attributes** is chosen, the attributes for the first segment are shown.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index** field, and then selecting the required segment, or by typing a number into the **Segment index** field and pressing <Enter>.

Similarly the **Prev** and **Next** buttons can be used to move to adjacent segments.

When a segment is selected, its *attribute* information is written to the appropriate panel fields. if any panel fields are modified, selecting either **OK** or **Apply** will store the new information for the segment.

The fields and buttons used in the **Super Segment User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment index	number box	selected vertex	
<i>if a segment is selected, then its segment index is displayed in this field.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the new segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the new segment is displayed in the panel fields.</i>			

Attribute mode choice box no attributes, each segment

*if **no attributes**, then no segments have user attributes.*

*if **each segment**, then each segment can have user attributes.*

Name/Type/Data Grid

Name input

name for the user attribute. This must be unique for all attributes at this segment.

Type choice box integer, real, text

type of the attribute.

Data Grid grid

values for the attributes.

OK/Apply button

*for the segment being edited, **OK** sets the segment with the values in the panel fields and removes the panel. **Apply** sets the segment with the values in the panel fields and leaves the panel on the screen.*

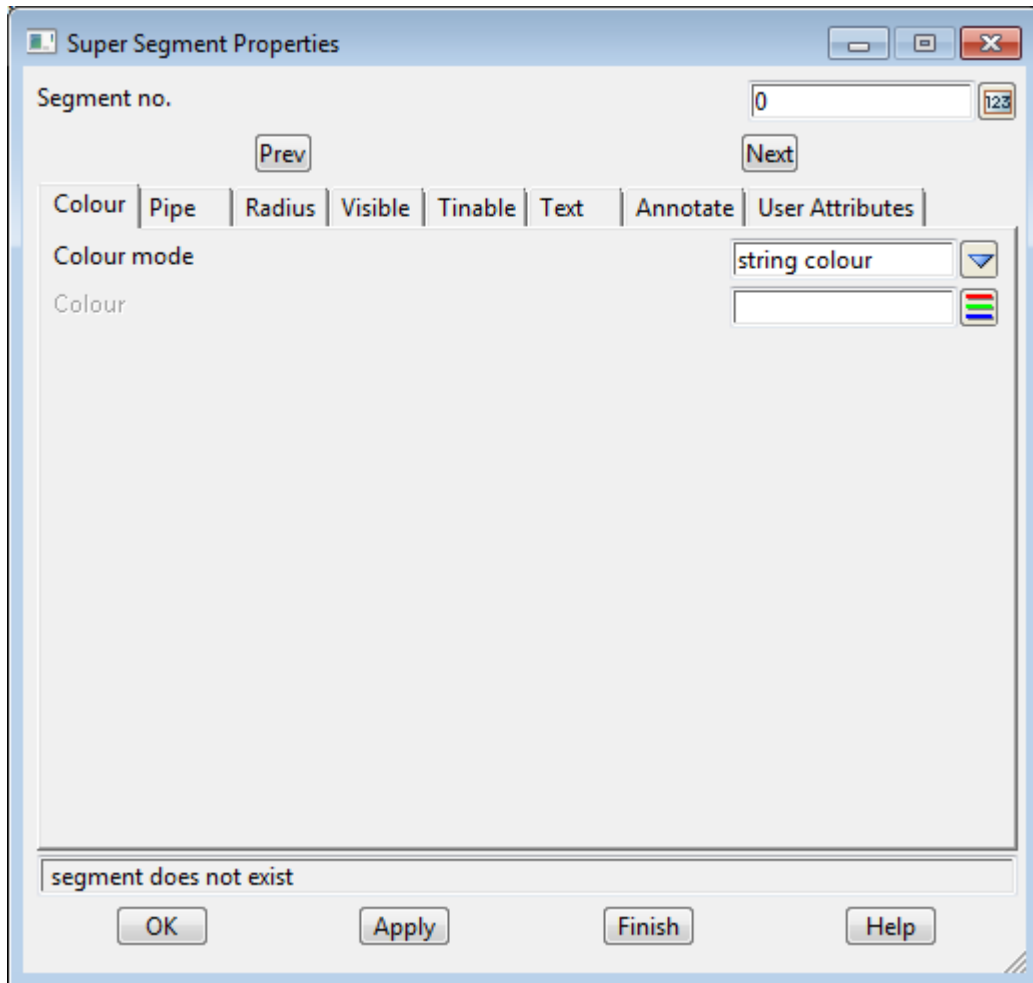

Please continue to the next section [All Segment Properties](#)

All Segment Properties

Selecting **All properties** brings up the **Super Segment Properties** panel which is used to display all the properties of a segment.

This option is also available from the *Strings* menu

Position of option on menu: Strings =>Properties =>Segment (all)

As soon as **All segment properties** is chosen, the colour information for the first segment is shown. Clicking on the various tabs will show the various segment information for the first segment.

A particular segment can be selected by first clicking on the icon at the end of the **Segment index field**, and then selecting the required segment.

When the segment to modify is selected, its *segment index* and all other *information* are written to the appropriate panel fields.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments and display data for that segment.

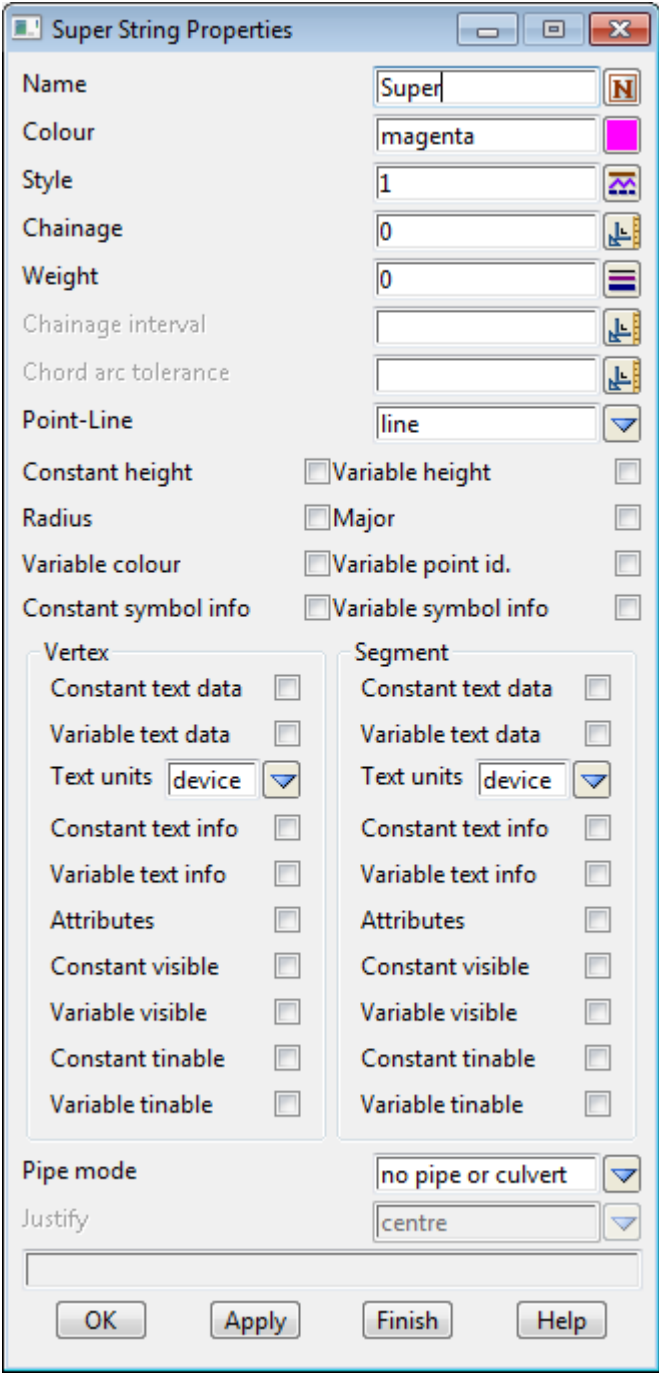

After any panel fields are modified, selecting either **OK** or **Apply** will change the information for the segment.

The fields in each of the tabs for the **Super Segment Properties** panel have already been described in the other options on the Segment Toolbar. See [Segment Toolbar](#).

For information on the Properties Toolbar, please continue to the next section [Properties Toolbar](#)

Properties Toolbar

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string’s header information.

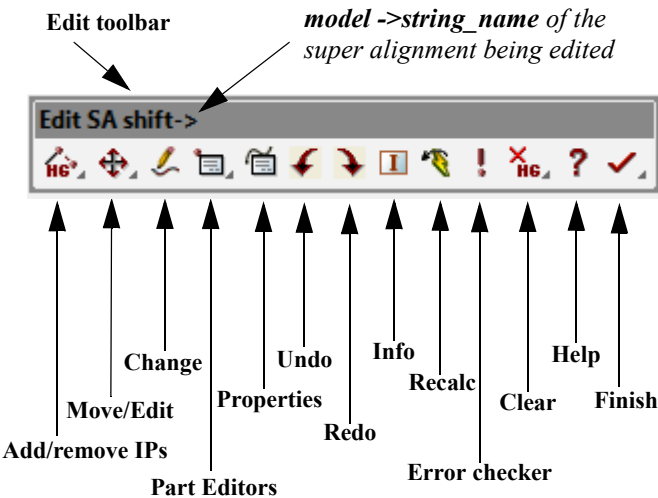

The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Edit Super Alignment

On picking a super alignment, the Super Alignment Edit menu is placed on the screen.

For the option Add/ Remove toolbar go to
Move/Edit toolbar
Change icon
Part Editors toolbar
Properties toolbar
Undo icon

SA - Add/Remove IPs Toolbar

The **Add/Remove IPs** toolbar is

The **Append** operations for a super alignment string are similar to the 2d string case except that there are separate **Append** options for the horizontal and vertical geometry of the string.

For the option *Append HIP* go to [SA - Append/Prepend HIP - Horizontal Geometry](#)
For the option *Append VIP* go to [SA - Append/Prepend VIP - Vertical Geometry](#)

The **Insert IP**, **Between IP** and **Delete IP** work on the horizontal geometry if used on a plan view, and if used on a section view that the super alignment is profiled on, they work on the vertical geometry.

For the option *Insert IP* go to [SA - Insert IP](#)
For the option *Between IP* go to [SA - Between IP](#)
For the option *Delete IP* go to [SA - Delete IP](#)

For the option *Insert VIP Height*, go to [SA - Insert VIP Height](#)
For the option *Insert VIP Grade* go to [SA - Insert VIP Grade](#)
For the option *Intersect VIP Grades* go to [SA - Intersect VIP Grades](#)
For the option *Filter IPs* go to [SA - Filter IPs](#)
For the option *Delete an IP* go to [SA - Delete IP](#)

SA - Append/Prepend HIP - Horizontal Geometry

The **Append HIP** option is used in a plan view to create the first horizontal intersection point (HIP) in a new super alignment string and then append further HIPs, or for an existing super alignment string to append news HIPs to the end of the string, or to new HIPs to the beginning of the string. In this option, both appending and prepending will be referred to as Appending.

Existing Super Alignment

Appending an HIP is a two step process.

Step (a) - selecting the end to Append the HIP to.

After picking **Append HIP**, the end of the string to append the point to is selected. Once the string end is selected, the new HIP is assumed to be at the current cursor location. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

screen message area <Pick end to append to> [picks][fast][Menu>

Step (b) - selecting the position for the new appended HIP.

The position of the new appended HIP is set to the current cursor position by picking (LB) and accepting (MB).

screen message area <Pick IP location or (r)elative, (b)earing/distance> [picks][fast][Menu

Once an HIP has been appended to the string, the appended HIP is considered to be the selected string end and a new Append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position of the next appended HIP.

Hence a **series** of HIPs is easily entered by first selecting the string end in a plan view that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting it.

Typed input: **r** for relative, **b** for bearing-distance can be used in either step.

New Super Alignment

When the **Append HIP** option is selected, a cross will appear on any plan views that have the super alignment string's model on them.

screen message area <Pick start IP location> [picks][fast][Menu>

The first HIP is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing super alignment string where the end HIP has already been accepted.

Typed input: **r** for relative, **b** for bearing-distance can be used in either step.

The **Append HIP** option is terminated by either pressing RB to bring up the **Pick Ops** menu and selecting **Cancel** or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Append HIP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Append HIP** option still current.

SA - Append/Prepend VIP - Vertical Geometry

The **Append HIP** option is used in a **section** view to create vertical geometry for a super alignment that **must already have some horizontal geometry**. The existing super alignment needs to be the **primary** string on the section view. That is, it is the string **profiled** on the section view that is going to be used to create the vertical geometry. This can be achieved by using either the **VG edit** or the **Profile** option from the section view menu

Note: on a section view, the option **Utilities =>VG edit** takes the selected super alignment and profiles it on the section view and also opens the **SA Editor** for the string.

The **Append HIP** option can the first vertical intersection point (VIP) in an existing super alignment string that has **no vertical geometry**, and then appends further VIPs, or for an existing super alignment string **with vertical geometry**, OR appends new VIPs to the end or the beginning of the vertical geometry of the string. In this option, both appending and prepending will be referred to as Appending.

Existing Vertical Geometry

Appending a VIP point is almost the same as for a HIP except that the co-ordinate system is (chainage,height) rather than (x,y) values.

Appending an VIP is a two step process.

Step (a) - selecting the end to Append the VIP to.

After picking **Append VIP**, the end of the vertical geometry to append the point to is selected in the section view. Once the vertical geometry end is selected, the new VIP is assumed to be at the current cursor location and as the cursor is moved, the string is redrawn reflecting the changing

position of the appended VIP

screen message area <Pick end to append to> [picks][fast][Menu>

Step (b) - selecting the position for the new appended HIP.

The position of the new appended VIP is set to the current cursor position by picking (LB) and accepting (MB).

screen message area <Pick IP location or (r)elative, (g)rade/height> [picks][fast][Menu

Once a VIP has been appended to the string, the appended VIP is considered to be the selected vertical geometry end and a new Append cycle begins. That is, stage (a) is already set up. The current cursor position in the section view indicates the new position of the next appended VIP.

Typed input: **r** for relative, **g** for grade-height can be used in either step.

Hence a **series** of VIPs is easily entered by first selecting the vertical geometry end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in.

New Vertical Geometry

Creating the **first VIP** is similar to the first HIP.

When the **Append VIP** option is selected, a cross will appear on any section views that have the super alignment string profiled on them.

screen message area <Pick start IP location> [picks][fast][Menu>

The first VIP is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

Typed input: **r** for relative, **g** for grade-height can be used in either step.

The **Append VIP** option is terminated by either pressing RB to bring up the **Pick Ops** menu and selecting **Cancel** or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Append VIP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Append VIP** option still current.

SA - Insert IP

The **Insert** option is designed to place a new HIP or VIP between two adjacent IPs.

Insert IP works on the horizontal or the vertical geometry depending on whether a plan or section view is used for the editing.

The inserted IP does not have to be on the line joining the two intersection points - the **Between IP** option is used to guarantee that the IP is on the IP-IP line.

Inserting an IP is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent IPs are chosen by selecting the **line** connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

For horizontal and vertical inserts

screen message area <Pick position to insert point> [picks][fast][Menu>

Step (b) - selecting the position for the new IP

The position of the new IP is set to the current cursor position by picking (LB) and accepting

(MB).

screen message area <Pick final position of point> [picks][fast][Menu>

Once the insert cycle is completed and the IP inserted, the Insert IP option is still current and can be repeated for other insertions (in either plan or section views) without having to re-select the Insert IP option.

The **Insert IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Insert IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Insert IP** option still current.

SA - Between IP

The **Between IP** option is similar to the **Insert IP** option (see [SA - Insert IP](#)) except the inserted point **does** have to be **on the line** joining the two IPs. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP position.

The **Between IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Between IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Between IP** option still current.

SA - Insert VIP Height

The **Insert VIP Height** option is used to insert a vertical intersection point (VIP) into the super alignment by clicking on the super alignment in either plan or section view to select the chainage that the VIP is to be inserted at, and then giving the height for the VIP.

So inserting the VIP is a two step process.

Step (a) - selecting the chainage for the VIP to inserted

After selecting **Insert VIP Height**, a chainage to insert the new VIP at is selected by picking (LB) and accepting (MB) at that position on the super alignment.

For horizontal and vertical inserts

screen message area <Select point to add VIP> [picks][fast][Menu>

Step (b) - giving the height for the new VIP

After the chainage of the new VIP is selected, a **Height** Typed Input box is placed on the screen with the height of the super alignment at the selected chainage already displayed.

The required value is type into the **Height** Typed Input box and <Enter>.

The **Height** Typed Input box is removed from the screen and the new VIP inserted into the super alignment.

Once the Insert VIP cycle is completed and the VIP inserted, the **Insert VIP Height** is still current and can be repeated for other insertions (in either plan or section views) without having to re-select the **Insert VIP Height** option.

The **Insert VIP Height** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

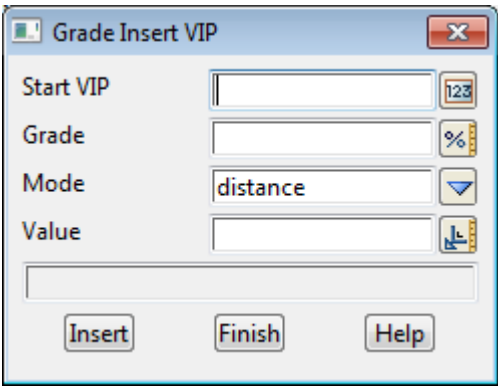

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Insert VIP Height** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Insert VIP Height** option still current.

SA - Insert VIP Grade

The **Insert VIP Grade** option inserts a vertical intersection point (VIP) at a given grade from an existing VIP.

The new VIP position is given by either a distance from the picked VIP or at given chainage on the super alignment.

After selecting **Insert VIP Grade**, the **Grade Insert VIP** panel is displayed.

The fields and buttons used in the panel have the following functions.

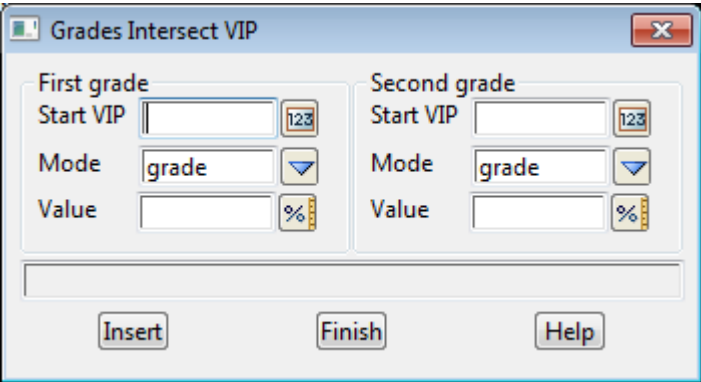

Field Description	Type	Defaults	Pop-Up
Start VIP	VIP number box		
<i>the VIP number whose (chainage, height) position is used to start the Grade Insert from.</i>			
<i>The number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the Start VIP field.</i>			
Grade	measure x-fall box		
<i>percent grade to be used.</i>			
Note	<i>positive is up when going in the direction of increasing chainage and negative is up when going in the direction of decreasing chainage.</i>		
Mode	choice	distance	distance, chainage
<i>if distance, the new VIP is inserted at the (chainage) distance given in the Value field from the start VIP, but with height determined by going with the given grade from the start VIP.</i>			
<i>If chainage, the new VIP is inserted at the chainage given in the value field but with height determined by going with the given grade from the start VIP.</i>			
Insert	button		
<i>insert the new VIP into the alignment string.</i>			

SA - Intersect VIP Grades

The **Intersect VIP Grades** option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs in the (chainage,height) plane.

The grades are either typed in or calculated by giving another VIP that the line goes through.

After selecting the option, the **Grades Intersect VIP** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

First Grade

Start VIP	input
------------------	-------

the VIP number whose (chainage,height) position is the start of a line.

*The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the **Start VIP** field.*

Mode	choice	grade	grade, VIP #
-------------	--------	-------	--------------

*if **grade**, the field **Value** is a percent grade and a line is defined as going through the start VIP and with the given grade.*

*If **VIP #**, the field is **End VIP** and is the number of a VIP and a line is defined as going through the start VIP and this End VIP.*

***Note for grades** **positive** is **up** when going in the direction of **increasing chainage** and **negative** is **up** when going in the direction of **decreasing chainage**.*

Value or End VIP	input
-------------------------	-------

*if **mode** is **grade**, the box is called **Value** and the value is a percent grade.*

*if **mode** is **VIP #**, the box is called **End VIP** and the value is the number of a VIP.*

*For **End VIP**, The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the **End VIP** field.*

Second Grade

Start VIP	input
------------------	-------

the VIP number whose (chainage,height) position is the start of a line.

*The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the **Start VIP** field.*

Mode	choice	grade	grade, VIP #
-------------	--------	-------	--------------

*if **grade**, the field **Value** is a percent grade and a line is defined as going through the start VIP and with the given grade.*

*If **VIP #**, the field is **End VIP** and is the number of a VIP and a line is defined as going through the start VIP and this End VIP.*

*Note for grades positive is **up** when going in the direction of **increasing chainage** and
negative is **up** when going in the direction of **decreasing chainage**.*

Value or End VIP input

*if **mode** is grade, the box is called **Value** and the value is a percent grade.*

*if **mode** is VIP #, the box is called **End VIP** and the value is the number of a VIP.*

*For **End VIP**, The VIP number can either be typed in, or if MB is clicked in the panel field, a VIP can be selected from a section view and its VIP number is piped into the **End VIP** field.*

Insert button

calculate in (chainage,height) space the intersection of the two lines given above and insert it as a new VIP into the super alignment.

SA - Filter IPs

The **Filter IPs** option tries to remove redundant HIPs and VIPs. That is, IP's that are very close to one another, or extra IPs on a straight line.

The extra IPs are often created when data is loaded from a CAD package and the elements are not tangential.

The **Filter IPs** option terminates after it is run and then a new option needs to be selected from the **Edit SA** toolbar.

SA - Delete IP

The **Delete IP** option is used to delete HIPs or VIPs points from the super alignment.

After picking **Delete IP**, any selected IP in the string is deleted. The string, minus the deleted IP, is redrawn after each deletion.

Once an IP has been deleted, another IP in the selected string can be deleted. Hence any number of the IPs can be deleted, one after another.

A HIP is deleted if the IP is chosen from a plan view and a VIP deleted if the IP is selected from a section view.

For HIP and VIP deletes

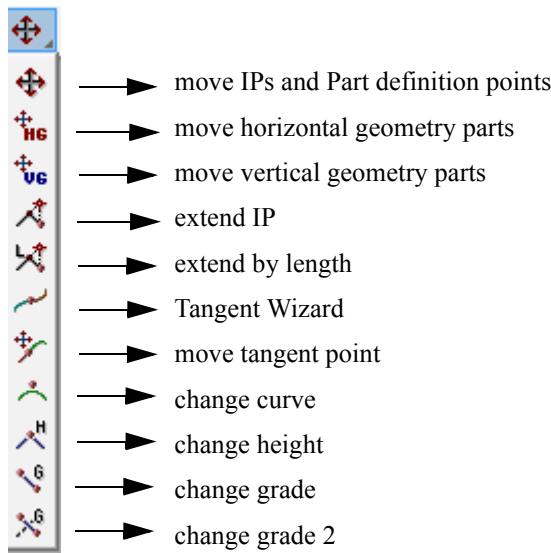

screen message area <Pick point to delete> [picks][fast][Menu>

The **Delete IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Delete IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Delete IP** option still current.

SA - Move/Edit Toolbar

The **Move/Edit** toolbar is

The **Move IP**, **Move Tangent** and **Extend IP** work on the horizontal geometry if used in a plan view and if used in a section view that the super alignment is profiled on, they work on the vertical geometry.

For the option *Move IP* go to
 Move HG parts
 Move VG parts
 Extend IP
 Extend by length
 Tangent Wizard
 Move Tangent
 Change curve
 Change height
 Change grade
 Change grade 2

[SA - Move](#)
[SA - Move HG Parts](#)
[SA - Move VG Parts](#)
[SA - Extend IP](#)
[SA - Extend by Length](#)
[SA - Tangent Wizard](#)
[SA - Move Tangent Point](#)
[SA - Change Curve](#)
[SA - Change Height](#)
[SA - Change Grade](#)
[SA - Change Grade 2](#)

SA - Move

The **Move** option allows the user to move

individual HIPs or Horizontal Parts definition points if the points are selected in a plan view

individual VIPs or Vertical Parts definition points if the points are selected in a section view
that the super alignment is profiled on.

The **Move** cycle consists of two steps:

- (a) selecting the point to be moved
- (b) selecting the new position for the point.

Step (a)

First the point to be moved is selected. The selected point will then move around the view as the cursor is moved. The IPs/Parts recalculate and redraw as the point is moved.

screen message area <Pick point to move> [picks][fast][Menu>

Step (b)

The current cursor position is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position and the string redrawn.

screen message area <Pick final position of point> [picks][fast][Menu>

Once the **Move** cycle is completed and the point moved, the **Move** option is still current and can be repeated for other points without having to re-select the **Move** option.

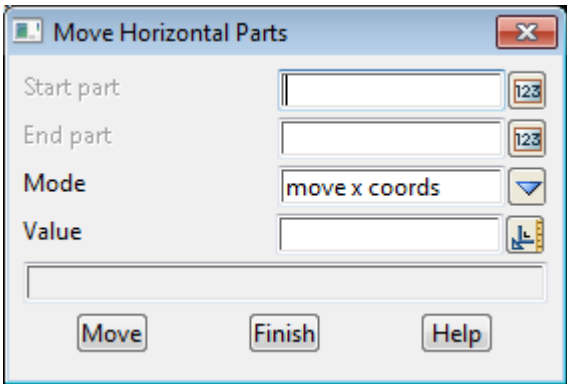

The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Move** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Move** option still current.

SA - Move HG Parts

Move HG Parts translates the X or the Y coordinates for a given range of Horizontal Parts in the super alignment being edited.

Clicking on the Move HG Parts icon brings up the Move Horizontal Parts panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start part <i>the number of the Part in the Horizontal Geometry to start translating in x or y. Clicking MB in the field or RB on the number icon brings up the Same as picker and a Horizontal Part from the super alignment can be selected from a plan view and the Part Number will be piped into the field.</i>	input box		
End part <i>the number of the Part in the Horizontal Geometry to end the translating in x or y. Clicking MB in the field or RB on the number icon brings up the Same as picker and a Horizontal Part from the super alignment can be selected from a plan view and the Part Number will be piped into the field.</i>	input box		
Mode <i>if Mode is move x coords, the x coordinates of all the parts from the Start part to End part are translated by Value. if Mode is move y coords, the y coordinates of all the parts from the Start part to End part are translated by Value.</i>	choice box	move x coords, move y coords	
Value <i>the distance to move the coordinates.</i>	measure box		Measure X or Measure Y
Move <i>move the specified coordinates for the given range of Horizontal Parts.</i>	button		

SA - Move VG Parts

Move VG Parts translates the chainages or the heights for a given range of Vertical Parts in the super alignment being edited.

Clicking on the Move VG Parts icon brings up the Move Vertical Parts panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start part <i>the number of the Part in the Vertical Geometry to start translating in chainage or height. Clicking MB in the field or RB on the Number icon brings up the Same as picker and a Vertical Part from the super alignment can be selected from a section view, and the Part Number piped into the field.</i>	input box		
End part <i>the number of the Part in the Vertical Geometry to end the translating in chainage or height. Clicking MB in the field or RB on the Number icon brings up the Same as picker and a Vertical Part from the super alignment can be selected from a section view and the Part Number will be piped into the field.</i>	input box		
Mode <i>if Mode is move chainages, the chainage coordinates of all the parts from the Start part to End part are translated by Value.</i> <i>if Mode is move heights, the height coordinates of all the parts from the Start part to End part are translated by Value.</i>	choice box	move x coords, move y coords	
Value <i>the distance to move the coordinates</i>	measure box		Measure Chainage or Measure Z
Move <i>move the specified coordinates for the given range of Vertical Parts</i>	button		

SA - Move Tangent Point

The **Move Tangent** option allows the user to move

individual horizontal tangent points in a plan view if the horizontal tangent point (HTP) is part of an HIP with a curve on it but no approaching or departing transitions.

individual vertical tangent points in a section view that the super alignment is profiled on if the vertical tangent point (VTP) is part of a VIP with a parabola or curve on it.

The **Move Tangent** cycle consists of two steps:

- (a) selecting the tangent point (TP) to be moved
- (b) selecting the new position for the TP.

Step (a)

First the tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a horizontal tangent point is selected, the string will be redrawn with the HTP moved to the cursor position and the circular curve radius will be modified appropriately.

If a vertical tangent point is selected, the string will be redrawn with the VTP moved to the cursor position and the vertical curve modified appropriately.

screen message area <Pick tangent to extend> [picks][fast][Menu>

Step (b)

The current cursor position is selected as the new position for the point by picking (LB) and accepting (MB). The tangent being moved is then anchored at the cursor position and the string redrawn.

screen message area <Pick final position of tangent> [picks][fast][Menu>

Once the Move Tangent cycle is completed and the TP moved, the **Move Tangent** option is still current and can be repeated for other tangent points without having to re-select the **Move Tangent** option.

The **Move Tangent** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Move Tangent** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Move Tangent** option still current.

SA - Extend IP

The **Extend IP** option is used to move an IP along the line joining the IP to its neighbouring IP.

That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving an IP, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line **and** the intersection point to be moved are chosen in the one operation by selecting a position near the IP-IP line and close to the intersection point to be moved along that line.

screen message area <Pick point to extend> [picks][fast][Menu>

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

Step (b) - selecting the final position for the IP

The current cursor position is selected as the new position for the IP by picking (LB) and accepting (MB). The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

screen message area <Pick final position of point> [picks][fast][Menu>

Once the **Extend IP** is completed, the extend option is still current and can be repeated without re-selecting the **Extend IP** option.

The **Extend IP** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Extend IP** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Extend IP** option still current.

Note - **Extend IP** can be used on the end points of the horizontal or vertical geometry of a super alignment string.

SA - Extend by Length

The **Extend by length** option is used to move a horizontal IP or vertical IP by a given length along the line joining the IP to its neighbouring IP.

A horizontal IP is modified in a plan view and the bearing of the HIP-HIP line is kept constant and the intersection point is moved by a given length along that line either **towards** or **away** from its neighbouring intersection point on the HIP-HIP line.

A vertical IP is modified in a section view and the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the VIP-VIP line.

To modify a horizontal IP, the string is edited in a plan view. To modify a vertical IP, the string is edited in a section view.

The IP-IP line **and** the intersection point to be moved are chosen in the one operation by selecting a position near the IP-IP line and close to the intersection point to be moved along that line.

screen message area <[F]orward: pick IP to extend, (or [B]ackward)> [picks][fast][Menu]

Once the line and IP are selected, a **Length Typed Input** box is displayed and the required length typed into the box and <Enter> pressed.

The IP then moves to its new position.

Note: When in Forward mode, the IP moves along the selected segment. When in Backward mode, the IP moves along the segment on the other side of the selected IP.

The default is Forward. To select Backward mode, type 'B'. To select Forward mode, type 'F'.

Once the **Extend by length** is completed, the extend option is still current and can be repeated without re-selecting the **Extend by length** option.

The **Extend by length** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

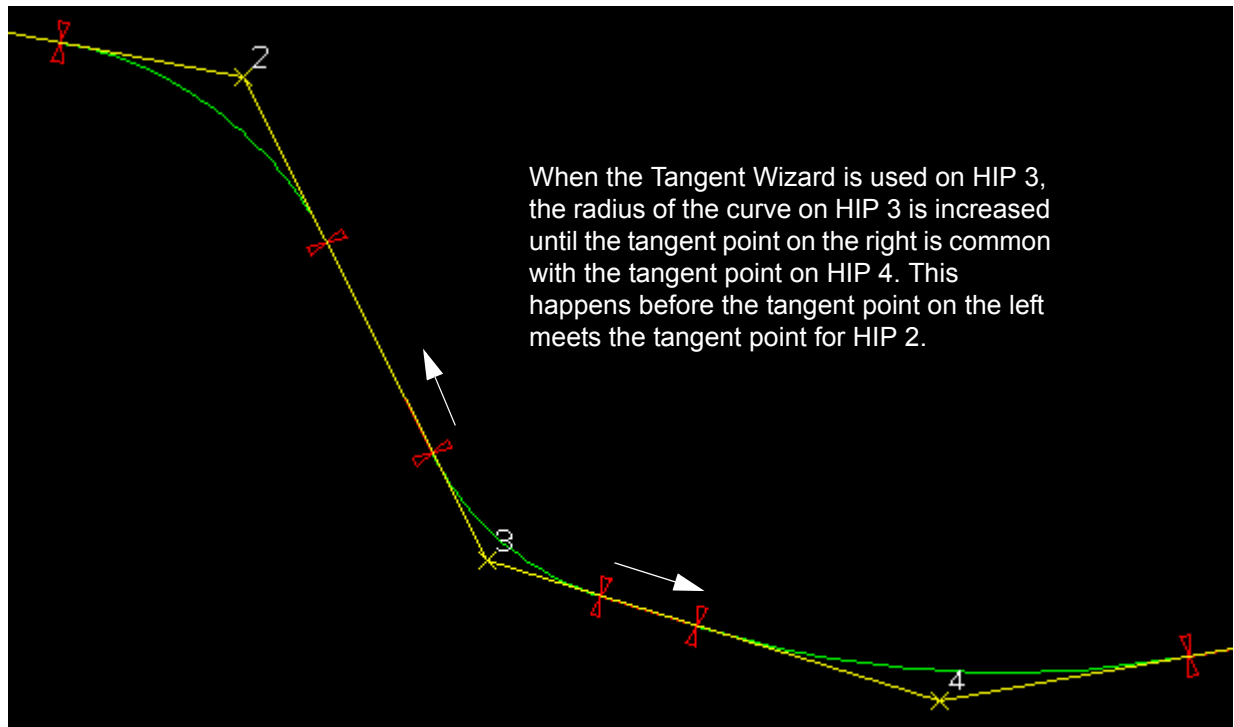

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Extend by length** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Extend by length** option still current.

Extend by length can be used on the end points of the horizontal or vertical geometry of a super alignment string.

SA - Tangent Wizard

The **Tangent Wizard** works for a HIP defined with just an arc on it and no transitions, or a VIP with a parabola or curve defined on it.

If a suitable HIP or VIP is selected, the **Tangent Wizard** modifies the curve/parabola on the selected HIP/VIP so that a common curve-curve tangent point is created on at least one side of the HIP/VIP.

When the **Tangent Wizard** run successfully, the **Tangent Wizard** option is still current and can be repeated without re-selecting **Tangent Wizard**. If an incorrect IP is selected, the **Tangent Wizard** terminates and an option needs to be selected from the **Edit SA** toolbar.

The **Tangent Wizard** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Tangent Wizard** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Tangent Wizard** option still current.

SA - Change Curve

The **Change Curve** option is used to change the defining value for the horizontal curve (radius or length) of a curve on a horizontal intersection point, or the defining value for the vertical curve (length, k-value or radius) on a vertical intersection point.

After selecting **Change Curve**:

screen message area <Pick IP to change curve info> [picks][fast][Menu>

If an HIP is selected from a plan view, the value defining the horizontal curve (radius or length) on the HIP is displayed.

The required Radius (or Length) is typed into the Typed Input box and <Enter> pressed.

The HIP is given the new value and the Typed Input box is removed from the screen.

If an VIP is selected from a section view that the super alignment is profiled on, the value defining the vertical curve (length, k-value or length) on the VIP is displayed.

The required Length (or k value or Length) is typed into the Typed Input box and <Enter> pressed.

The VIP is given the new value and the Typed Input box is removed from the screen.

Once the curve value is changed, the **Change Curve** is still current and can be repeated for other IPs in the super alignment without having to re-select the **Change Curve** option.

The **Change Curve** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Curve** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Curve** option still current.

SA - Change Height

The **Change Height** option is used to change the height of an existing vertical intersection point (VIP).

After selecting **Change Height**, a VIP is selected from a section view that the super alignment is profiled on:

screen message area <Pick IP to change height> [picks][fast][Menu>

After the VIP is selected, a **Height** Typed Input box is placed on the screen with the height of the selected VIP already displayed.

The required height is typed into the **Height** Typed Input box and <Enter> pressed.

The **Height** Typed Input box is removed from the screen and the VIP is given the new height.

Once the height is changed, the **Change Height** is still current and can be repeated for other VIPs in the super alignment without having to re-select the **Change Height** option.

The **Change Height** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Height** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Height** option still current.

SA - Change Grade

The **Change Grade** option is used to change the grade of the line between two consecutive vertical intersection points (VIPs) by moving the VIP at the selected end of the line up or down to achieve the given grade.

Note that the **chainage** position of the VIP remains the same and the **grade on both sides** of the moved VIP change.

After selecting **Change Grade**, the line joining consecutive VIP is **picked with direction** from a section view that the super alignment is profiled on

screen message area <Pick grade to change> [picks][fast][Menu>

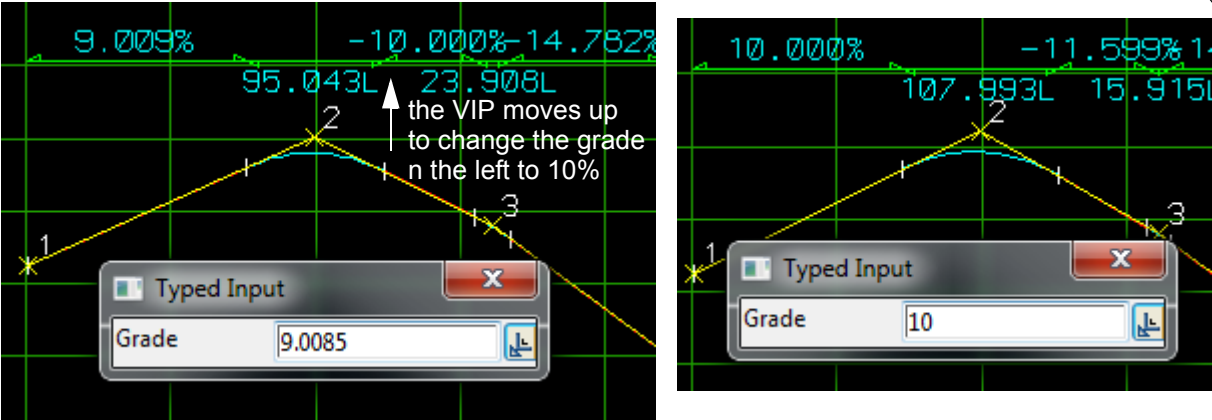

After the VIP is selected, a **Grade** Typed Input box is placed on the screen with the grade of the selected line, measured from left to right, is already displayed.

Note: going from left to right in the section view (that is, increasing chainage), **positive** grade is **up** and **negative** grade is **down**.

If the **line was picked with direction going from left to right** in the section view (increasing chainage), then the position of the **VIP at the left end of the line is kept constant** and the line is graded with the new grade and the **height of the VIP at the right end of the line is modified** so that it sits on the new graded line. The **chainage** of the VIP is kept **constant**. That is, the VIP just moves up or down until the new grade is reached.

The **Grade** Typed Input box is removed from the screen.

Change Grade: The line going from VIP 1 to VIP 2 with direction going from left to right. VIP 2 is moved up to give the new grade for the line between VIP 1 and VIP 2

If the **line was picked with direction going from right to left** in the section view (decreasing chainage), then the position of the VIP at the **right end of the line is kept constant** and the line is graded with the new grade and the **height of the VIP at the left end of the line is modified** so that it sits on the new graded line. The **chainage** of the VIP is kept **constant**. That is, the VIP just moves up or down until the new grade is reached.

The **Grade** Typed Input box is removed from the screen.

Once the grade is changed, the **Change Grade** is still current and can be repeated for other lines between VIPs in the super alignment without having to re-select the **Change Grade** option.

The **Change Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Grade** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Grade** option still current.

SA - Change Grade 2

The **Change Grade 2** option is used to change the grade of the line between two consecutive vertical intersection points (VIPs) by sliding the VIP at the selected end of the line along the VIP-VIP line on the other side of the VIP so that the grade of the other line is not modified.

Note that the **chainage** position of the VIP changes and only the **grade on the selected line** of the moved VIP changes.

After selecting **Change Grade**, the line joining consecutive VIP is **picked with direction** from a section view that the super alignment is profiled on

screen message area <Pick grade to change> [picks][fast][Menu>

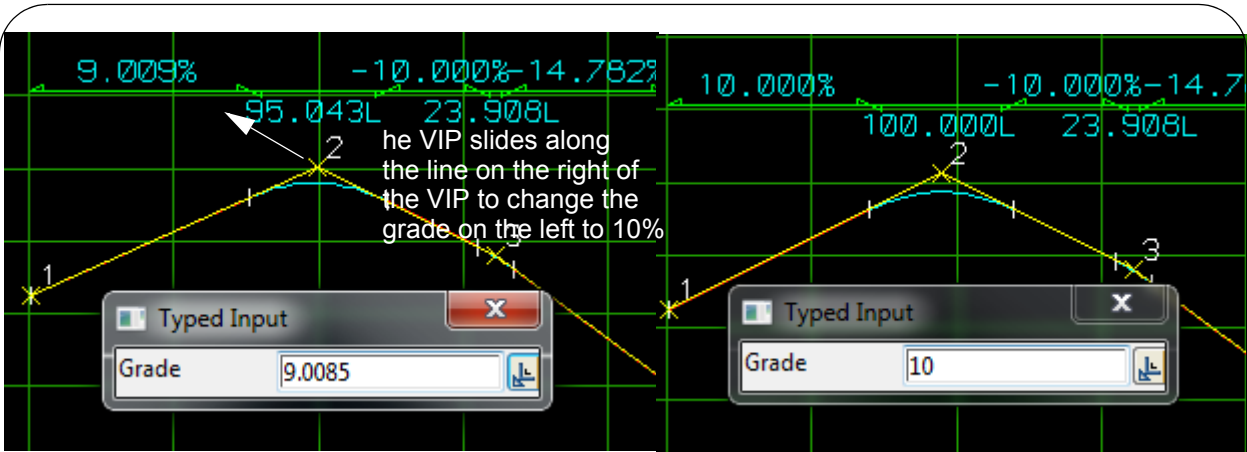

After the VIP is selected, a **Grade** Typed Input box is placed on the screen with the grade of the selected line, measured from left to right, is already displayed.

Note: going from left to right in the section view (that is, increasing chainage), **positive** grade is **up** and **negative** grade is **down**.

If the **line was picked with direction going from left to right** in the section view (increasing chainage), then the position of the **VIP at the left end of the line is kept constant** and the line is graded with the new grade by **sliding the VIP at the right end of the line** along the VIP-VIP line on the other side of the VIP to keep that grade constant. So the **grade on the other side** of the VIP is kept **constant**. That is, the VIP slides up or down the other line until the new grade is reached.

The **Grade** Typed Input box is removed from the screen.

Change Grade 2: The line going from VIP 1 to VIP 2 with direction going from left to right. VIP 2 is slid along the line between VIP2 and VIP 3 (keeping its grade constant) to give the new grade for the line between VIP 1 and VIP 2

If the **line was picked with direction going from right to left** in the section view (decreasing chainage), then the position of the **VIP at the right end of the line is kept constant** and the line is graded to the new grade by **sliding the VIP at the left end of the line** along the VIP-VIP line on the other side of the VIP to keep that grade constant. So the **grade on the other side** of the VIP is kept **constant**. That is, the VIP slides up or down the other VIP-VIP line until the new grade is reached.

The **Grade** Typed Input box is removed from the screen.

Once the grade is changed, the **Change Grade 2** is still current and can be repeated for other lines between VIPs in the super alignment without having to re-select the **Change Grade 2** option.

The **Change Grade 2** option is terminated by selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Edit SA** toolbar.

If, after bringing up the **Pick Ops** menu, it is decided to continue with the **Change Grade 2** option, simply select the **Restart** option from the **Pick Ops** menu and the **Pick Ops** menu will disappear leaving the **Change Grade 2** option still current.

SA - Change Icon

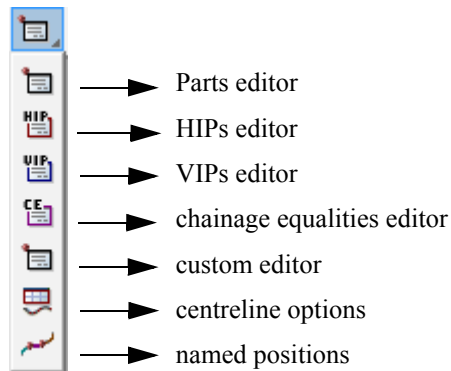

The **Change** icon is

Selecting this icon allows the user to change the radius of arcs placed by Parts.

SA - Part Editors Toolbar

The **Part Editors** toolbar is

SA - Parts Editor

Placing a super alignment consists of:

- (a) defining the horizontal geometry consisting of lines, arcs, transitions and tapers
- (b) defining the vertical geometry consisting of lines, parabolas and arcs.

A simple way to create horizontal and vertical geometry for the super alignment is by using horizontal intersection points (HIPs) with arcs and transitions (eg spirals), and vertical intersection points (VIP's) with parabolas or arcs for placing the vertical geometry.

However the super alignment also allows for more **complex construction methods** to define the lines, arcs and transitions (the horizontal elements) that within **12d Model** are be grouped together to make up the Parts of the horizontal geometry.

For example, a horizontal line is defined to be a given parallel offset of a selected line segment from another string. Or a more complex part such **Free Arc with Known Radius** that consists of the three elements: an arc of a known radius plus a leading and a trailing transition.

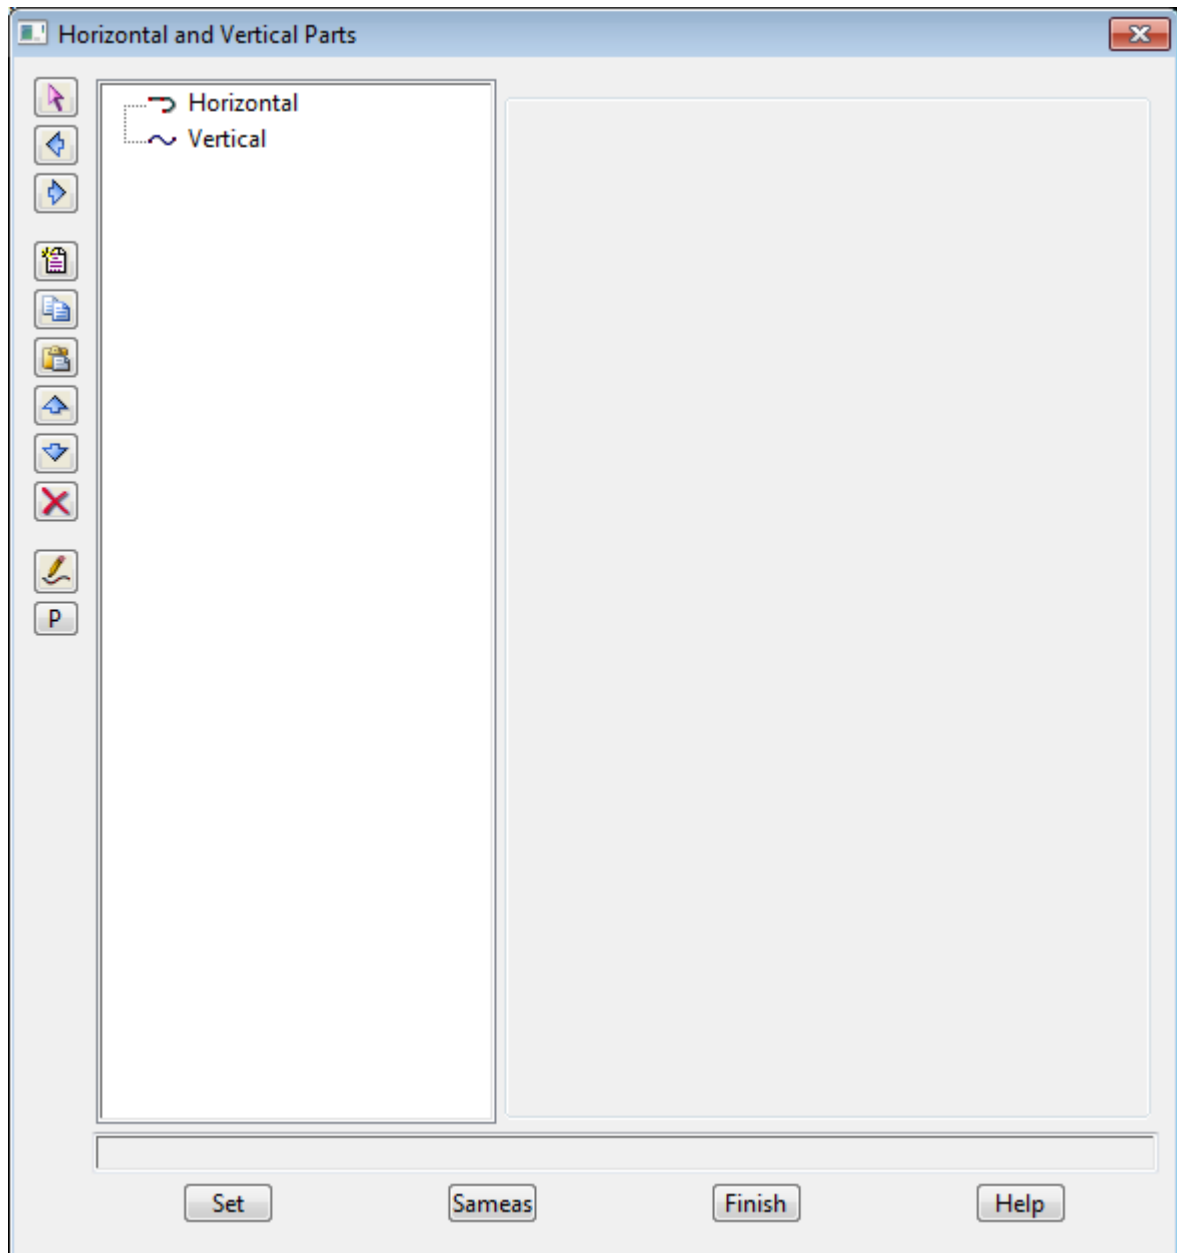

Similarly more **complex construction methods** are available to define the lines, parabolas and arcs (the vertical elements) that are grouped together within **12d Model** to make up the Parts of the vertical geometry.

Some of the Parts definitions have some degree of freedom in the definition of the elements in the Parts, and the sequencing and types of the Parts, plus the condition that, if possible, each element is tangential to the adjacent elements, allows **12d Model** to calculate and solve for some unknowns in the Part definitions that make up the super alignment.

For example, if a **Free Arc with Known Radius** placed between two known lines then the tangentiality condition means that the position of the **Free Arc with Known Radius** (arc and two transitions) is uniquely defined as a arc and leading and trailing transitions on the intersection point of the two lines. Or just a fillet between the two lines if the two transitions have zero length.

For more information on placing parts, fixed and floating parts and solving, go to [Placing Parts for Super Alignments](#).

The general creating and editing of the horizontal and vertical Parts inside **12d Model** is done in the **Horizontal and Vertical Parts** panel and this is brought up by clicking on the on the **Parts Editor** icon.

See [Icons on the Horizontal and Vertical Parts Panel](#)

See [Creating and Editing a Part](#)

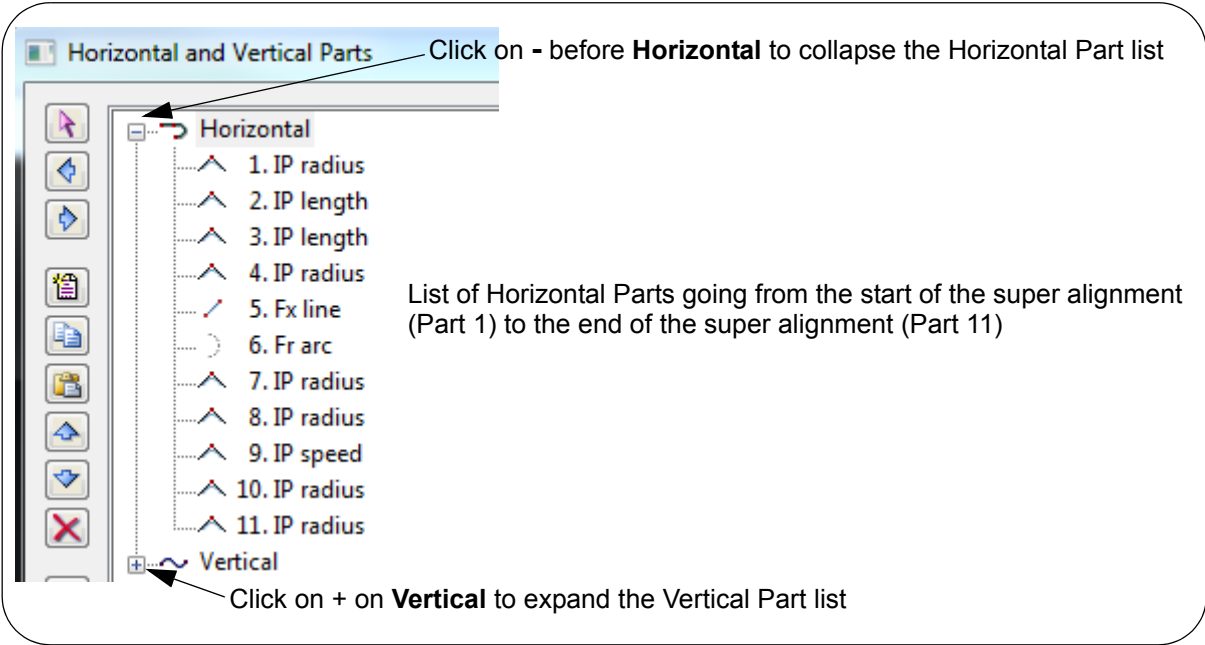

See [Types of Horizontal Parts](#)

See [Types of Vertical Parts](#)

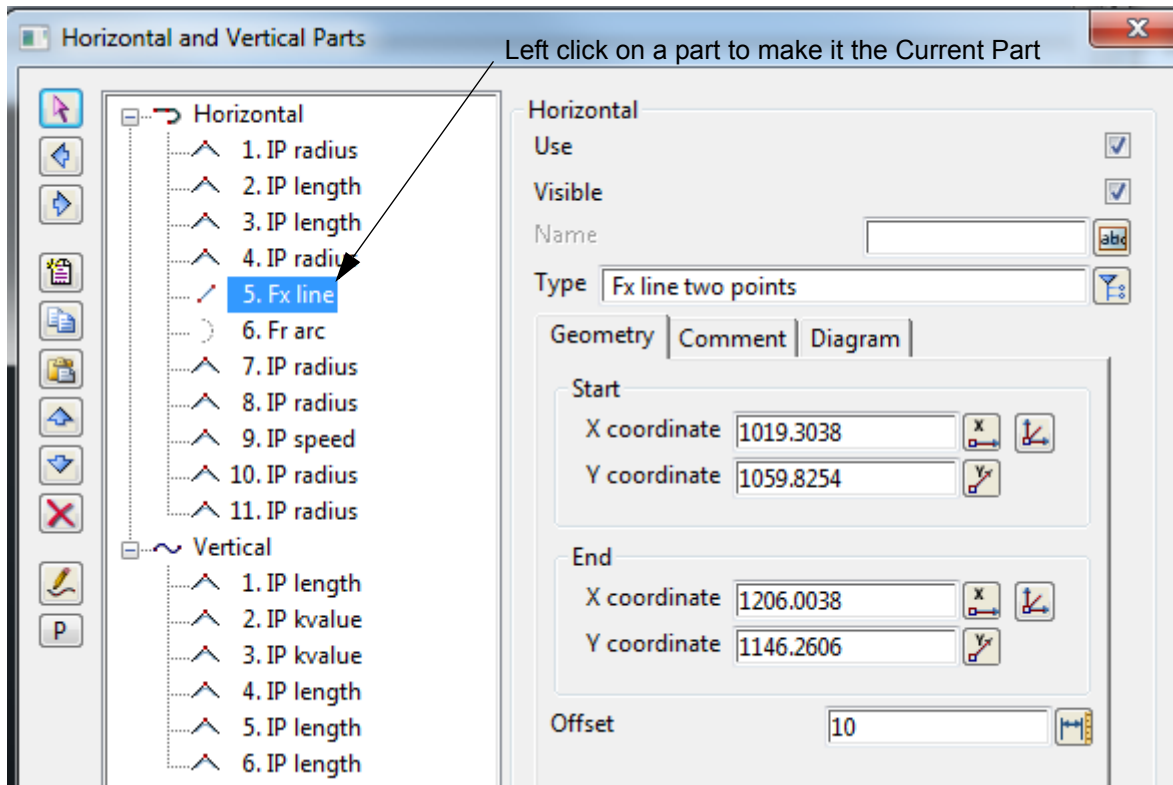

Icons on the Horizontal and Vertical Parts Panel

If there are any existing horizontal parts in the super alignment, then a + will appear to the left of **Horizontal** in the tree. Similarly if there are any existing vertical parts then a + will appear next to **Vertical** in the tree.

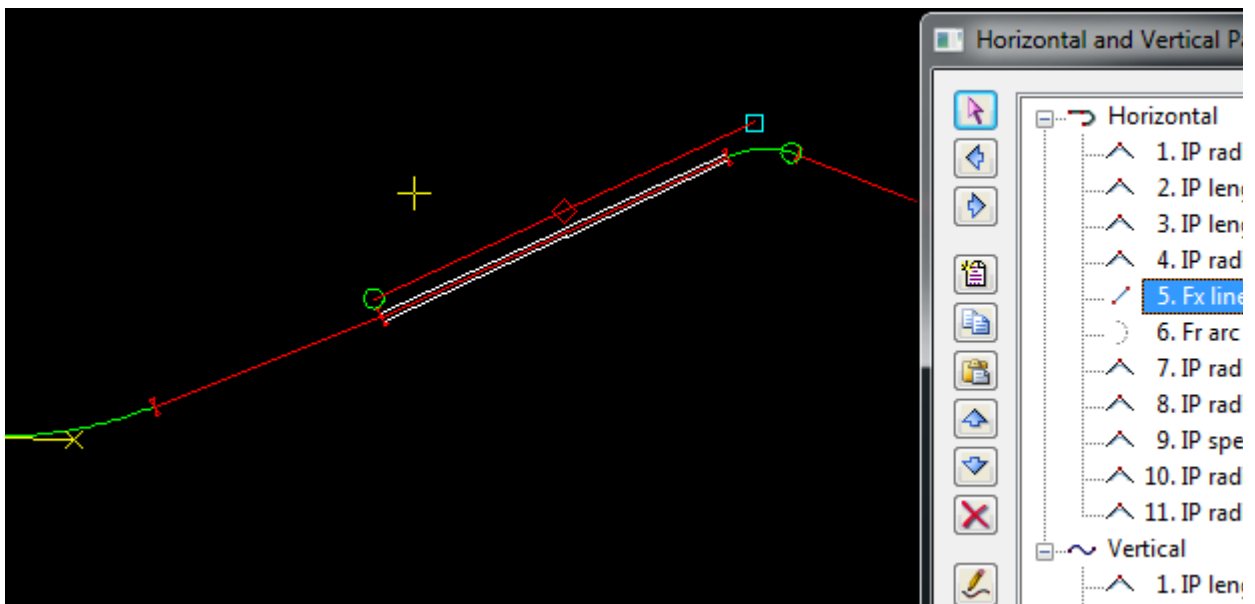

Clicking on the + next to **Horizontal/Vertical** will then list all the horizontal/vertical parts in order from the start of the super alignment to the end of the super alignment.

To make a Part the **current Part being edited**, simply **Left click on the Part** in the expanded list and the selected Part will be highlighted and the information about the part displayed on the right hand side of the panel.

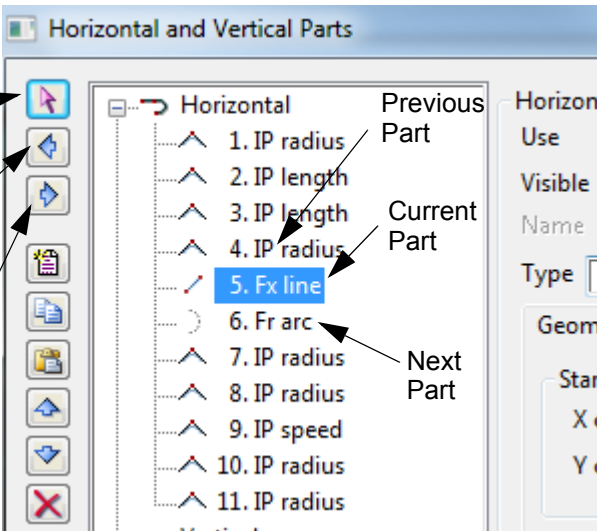

The selected part will also highlight in any Plan views the super alignment is on if it is a Horizontal Part, or any Section views that the super alignment is profiled on if it is a Vertical Part.

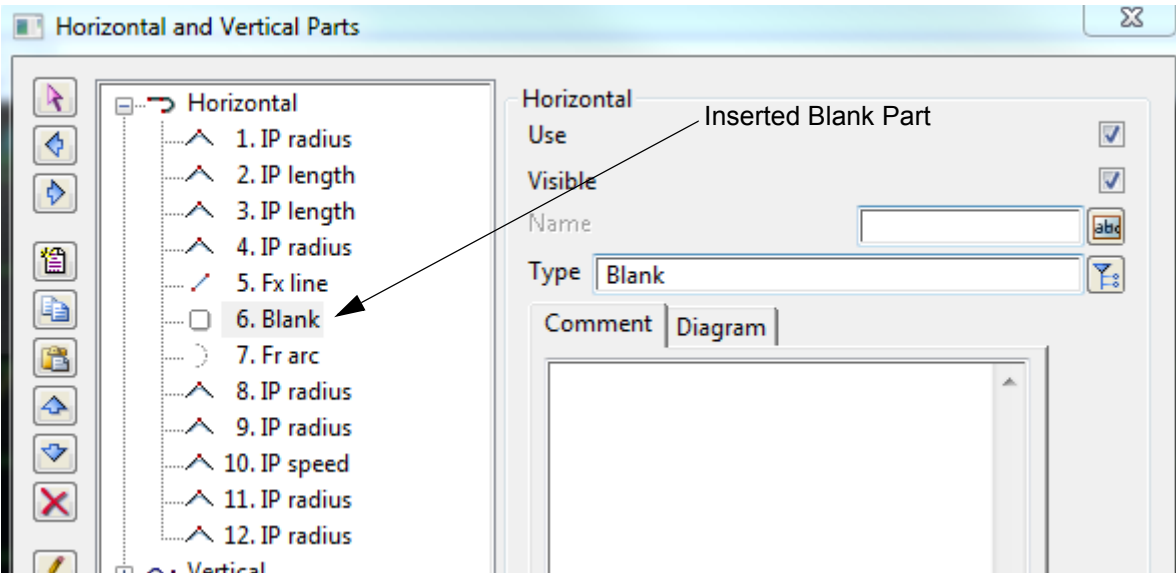

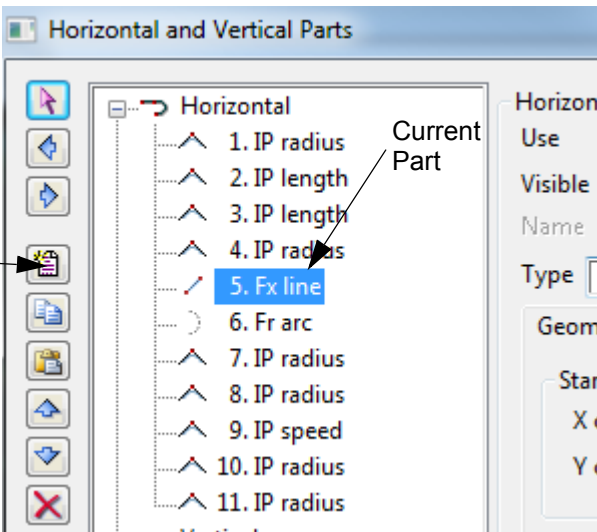

A Part can be selected from a Plan or Section View using the **Pick** icon. The selected part then becomes the current Part for editing

Clicking on the **Previous** icon makes the previous part in the list the current Part for editing

Clicking on the **Next** icon makes the following part in the list the current Part for editing

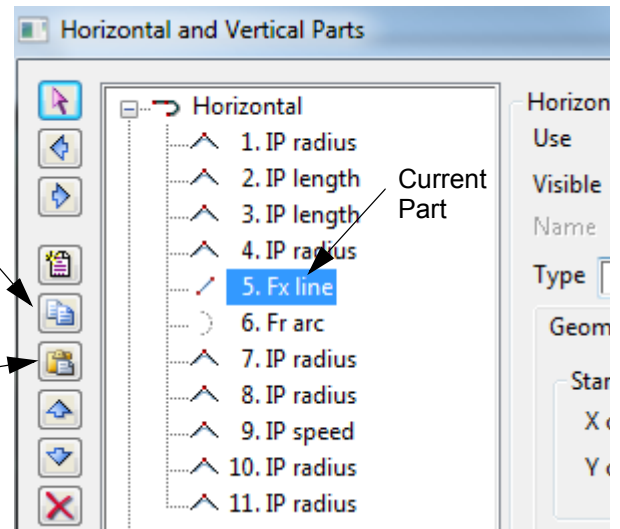

A new Blank Part is inserted after the current Part by clicking on the **Insert** icon.

The current Part can be copied by clicking on the **Copy** icon.

The part that the copied Part is to be inserted after is then made the current Part (by Picking, clicking on the Part in the Editor etc)

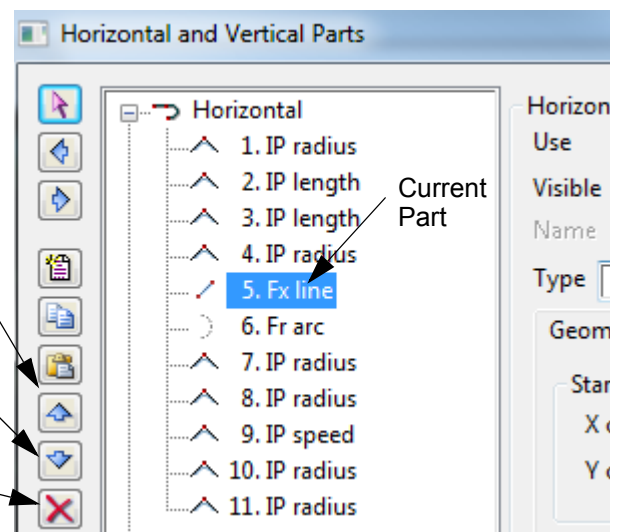

And clicking on the **Paste** icon then inserts the copied part **after** the current Part.

The current Part is moved one place closer to the start of the list by clicking on the **Move up** icon.

The current Part is moved one place down towards the bottom of the list by clicking on the **Move down** icon.

The current Part is deleted by clicking on the **Delete** icon.

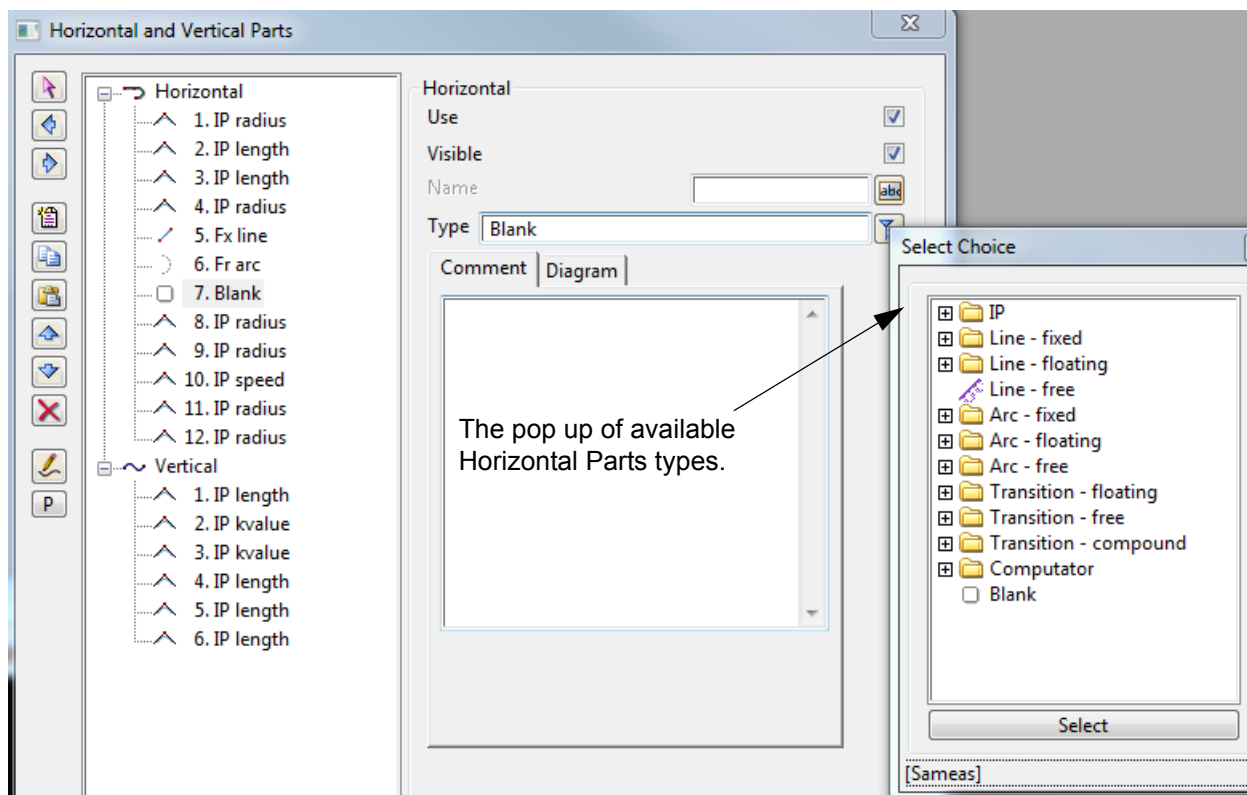

Creating and Editing a Part

A **new Part** is **created** by **Inserting** a new Blank Part and then clicking on the **Type** choice box to get the list of available Parts. After choosing a Part, the information required to define the selected part is displayed on the right hand side of the **Horizontal and Vertical Parts** panel. The required information is filled in and then the **Set** button at the bottom of the panel is clicked to create the new Part.

An **existing Part** can be **edited** by selecting it to make it the current Part which will display its defining information on the right hand side of the **Horizontal and Vertical Parts** panel. Any required changes to the information are made and then click on the **Set** button at the bottom of the panel to update the Part.

An **existing Part** can be **changed to a different type of Part** by selecting it to make it the current Part, then click on the **Type** choice box and select the new Type for the Part from the pop-up list.

The list of the available Horizontal and Vertical Parts for **Type** are given below with links to the full definition of each Part.

For definitions of the horizontal and vertical elements, go to [Placing Parts for Super Alignments](#)

SA - HIPs Editor

If the horizontal geometry of the super alignment consists of only HIP's (that is, no horizontal parts) then clicking on **HIPs Editor** brings up the **Horizontal IP Properties** panel which lists all the HIP's in the super alignment showing how the curves on the HIP are defined and the values for the HIP and accompanying arcs and transitions (spirals).

The **Horizontal IP Properties** panel is:

Super Alignment Profiled on a Plan View

Table of HIP Information

Clicking on the row number in the table draws a green circle around the corresponding HIP in any plan views where the HIP is visible.

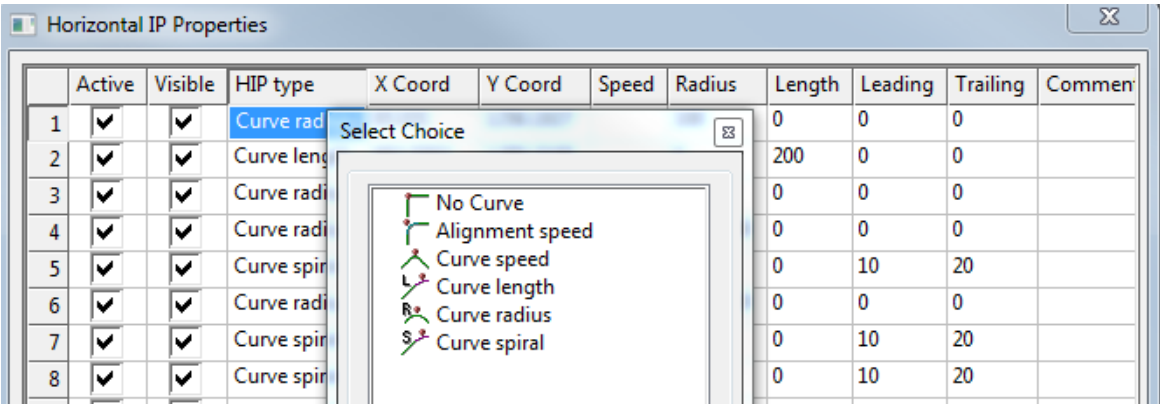

The **Left arrow** and **Right arrow** moves the highlighting to the previous HIP and next HIP respectively.

If **Active** is ticked for a row then that **HIP** is used in the super alignment.
If **Active** is not ticked for a row then that **HIP** is not used in the super alignment.

If **Visible** is ticked for a row then the curve at the **HIP** is used in the super alignment.
If **Visible** is not ticked for a row then the curve at the **HIP** is not used in the super alignment.

Warning: the **row number** will **not** be the same as the **HIP numbers** shown on a plan view if there are HIP's that are **not Active**.

The **HIP type** can be modified by clicking RB in the **HIP Type** column for the HIP to be modified to bring up the choices for the HIP.

When the **HIP Type** is changed, the new information can be typed into the appropriate cells for that HIP and then the **Set** button is pressed to make the change.

Note: if the entire line is already highlighted, you will need to first click LB in the appropriate **HIP Type** cell to get focus just on that cell and then click RB. If a pop-up with **Browse** comes up,

select **Browse** to get the **HIP Type** choices.

Any of the values in the other columns **X Coord**, **Y Coord**, **Speed**, **Radius**, **Length**, **Leading**, **Trailing** and **Comment** can be modified and the **Set** button pressed to use the new values (if they are appropriate for the **HIP Type**).

Note:

Length is the length of the arc when the **HIP Type** is *Curve length*

Speed is the design speed for the curves at the **HIP Type** is *Curve speed*.

Radius is the radius of the arc when **HIP Type** is *Curve radius* or *Curve spiral*.

Leading is the length of the leading transition (spiral) when **HIP Type** is *Curve spiral*.

Trailing is the length of the trailing transition (spiral) when **HIP Type** is *Curve spiral*.

Warning: the *not Active* HIP's are still listed in the HIP table but the labelling of the HIP's on a plan view does not include them so in that case, the line number in the **Horizontal IP Properties** panel is not the same as the HIP number displayed on a plan view.

SA - VIPs Editor

If the vertical geometry of the super alignment consists of only VIPs (that is, no vertical parts) then clicking on **VIPs Editor** brings up the **Vertical IP Properties** panel which lists all the VIP's in the super alignment showing how the parabolas, asymmetric parabolas and arcs on the VIP are defined and the values for the VIP and accompanying parabolas and arcs.

The **Vertical IP Properties** is:

and when there is VIP information to display, looks like:

	Active	Visible	VIP type	Chainage	Height	Speed	Radius	K Value	Length	Length 2	Comment
1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Length	0.9657	-7.6827		0	0	0		
2	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Kvalue	199.463	12.167		0	5	0		
3	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Kvalue	322.4306	-2.1147		0	5	0		
4	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Asymmetric	513.69	-30.3861		0	0	150	75	
5	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Circular arc	778.9741	-3.8577		500	0	0		
6	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Length	1148.8236	-30.3087		0	0	100		
7	<input type="checkbox"/>	<input type="checkbox"/>									

Super Alignment Profiled on a Section View

Table of VIP Information

Clicking on the row number in the table draws a green circle around the corresponding HIP in any plan views where the HIP is visible.

The **Left arrow** and **Right arrow** moves the highlighting to the previous VIP and next VIP respectively.

If **Active** is *ticked* for a row then that **VIP** is used in the super alignment.

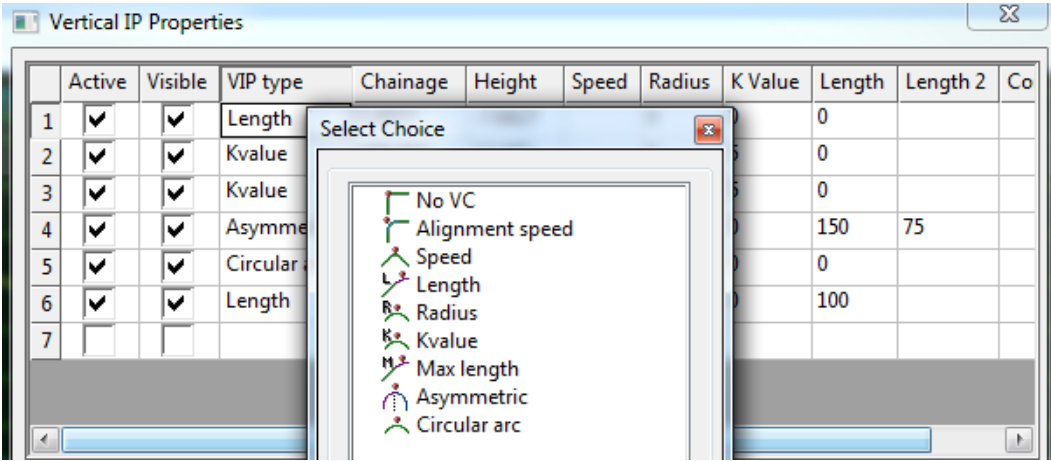

If **Active** is *not ticked* for a row then that **VIP** is **not** used in the super alignment.

If **Visible** is *ticked* for a row then the curve at the **VIP** is used in the super alignment.

If **Visible** is *not ticked* for a row then the curve at the **VIP** is not used in the super alignment.

Warning: the **row number** will **not** be the same as the **VIP numbers** shown on a section view if there are VIP's that are **not Active**.

The **VIP type** can be modified by clicking RB in the **VIP Type** column for the VIP to be modified to bring up the choices for the VIP.

When the **VIP Type** is changed, the new information can be typed into the appropriate cells for that VIP and then the **Set** button is pressed to make the change.

Note: if the entire line is already highlighted, you will need to first click LB in the appropriate **VIP Type** cell to get focus just on that cell and then click RB. If a pop-up with **Browse** comes up, select **Browse** to get the **HIP Type** choices.

Any of the values in the other columns **Chainage**, **Height**, **Speed**, **Radius**, **K Value**, **Length**, **Length2** and **Comment** can be modified and the **Set** button pressed to use the new values (if they are appropriate for the **VIP Type**).

Note:

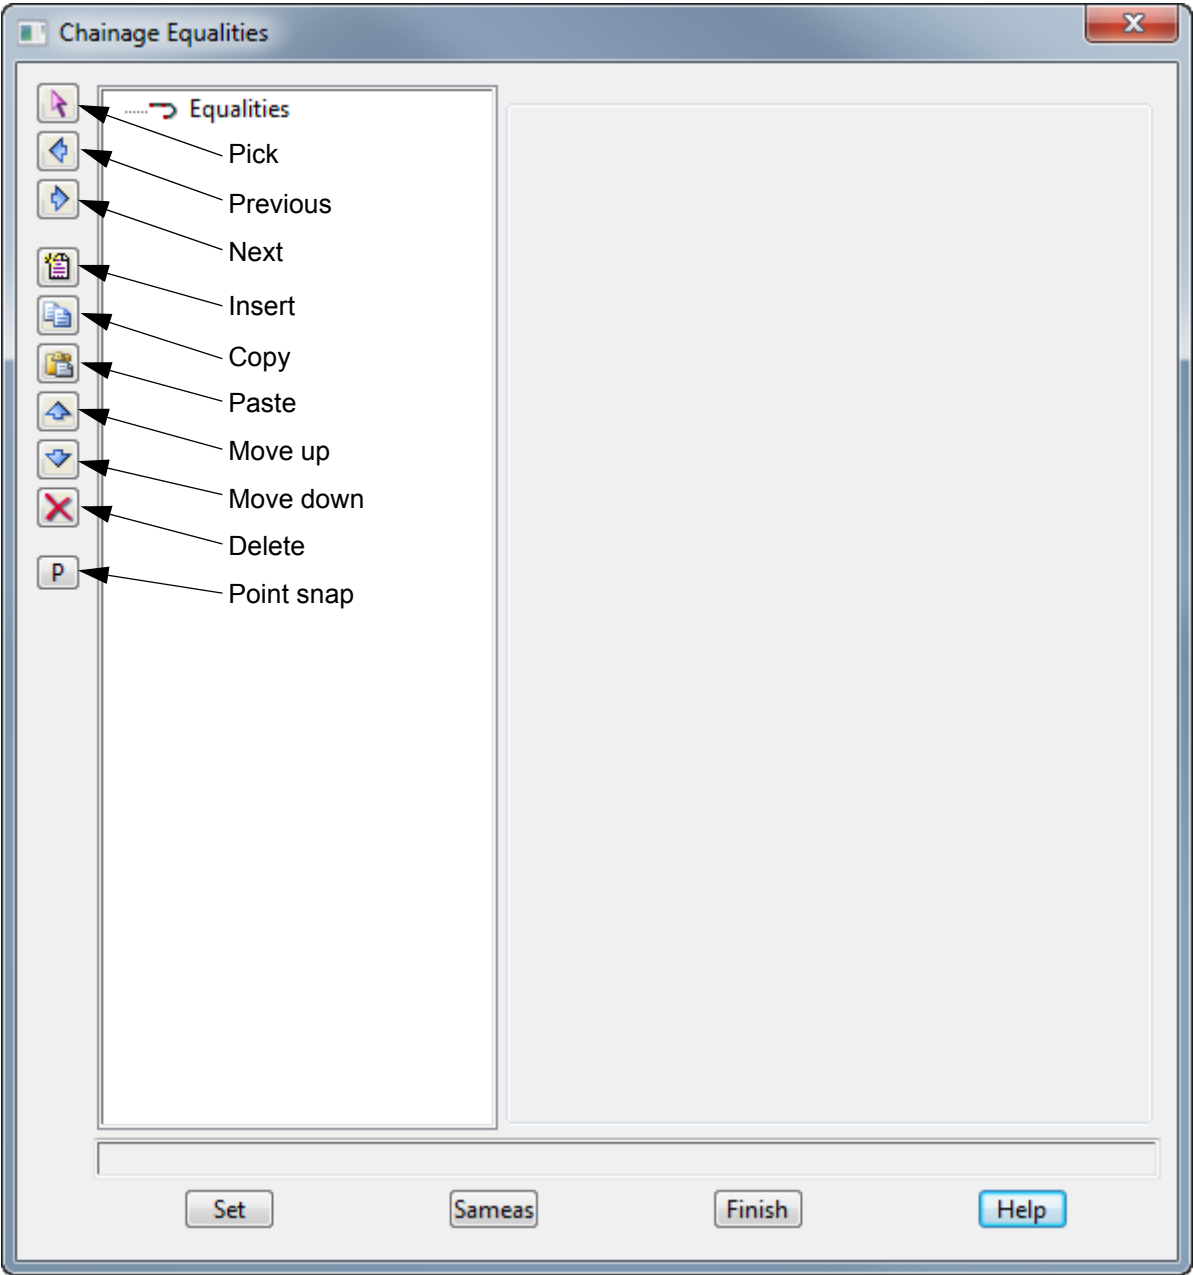

- Length** is the length of the parabola when the **VIP Type** is *Length*
- Length** and **Length2** are the lengths for an Asymmetric parabola when **VIP Type** is *Asymmetric*
- Speed** is the design speed for the parabola when **VIP Type** is *Speed*.
- Radius** is the radius of the arc when **VIP Type** is *Circular arc* or the effective radius for a parabola when **VIP Type** is *Radius*.
- K Value** is the K value for the parabola when **HIP Type** is *K value*.

Warning: the *not Active* are still listed in the VIP table but the labelling of the VIP's on a section view does not include them so in that case, the line number in the **Vertical IP Properties** panel is **not** the same as the VIP number displayed on a section view.

SA - Chainage Equalities Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

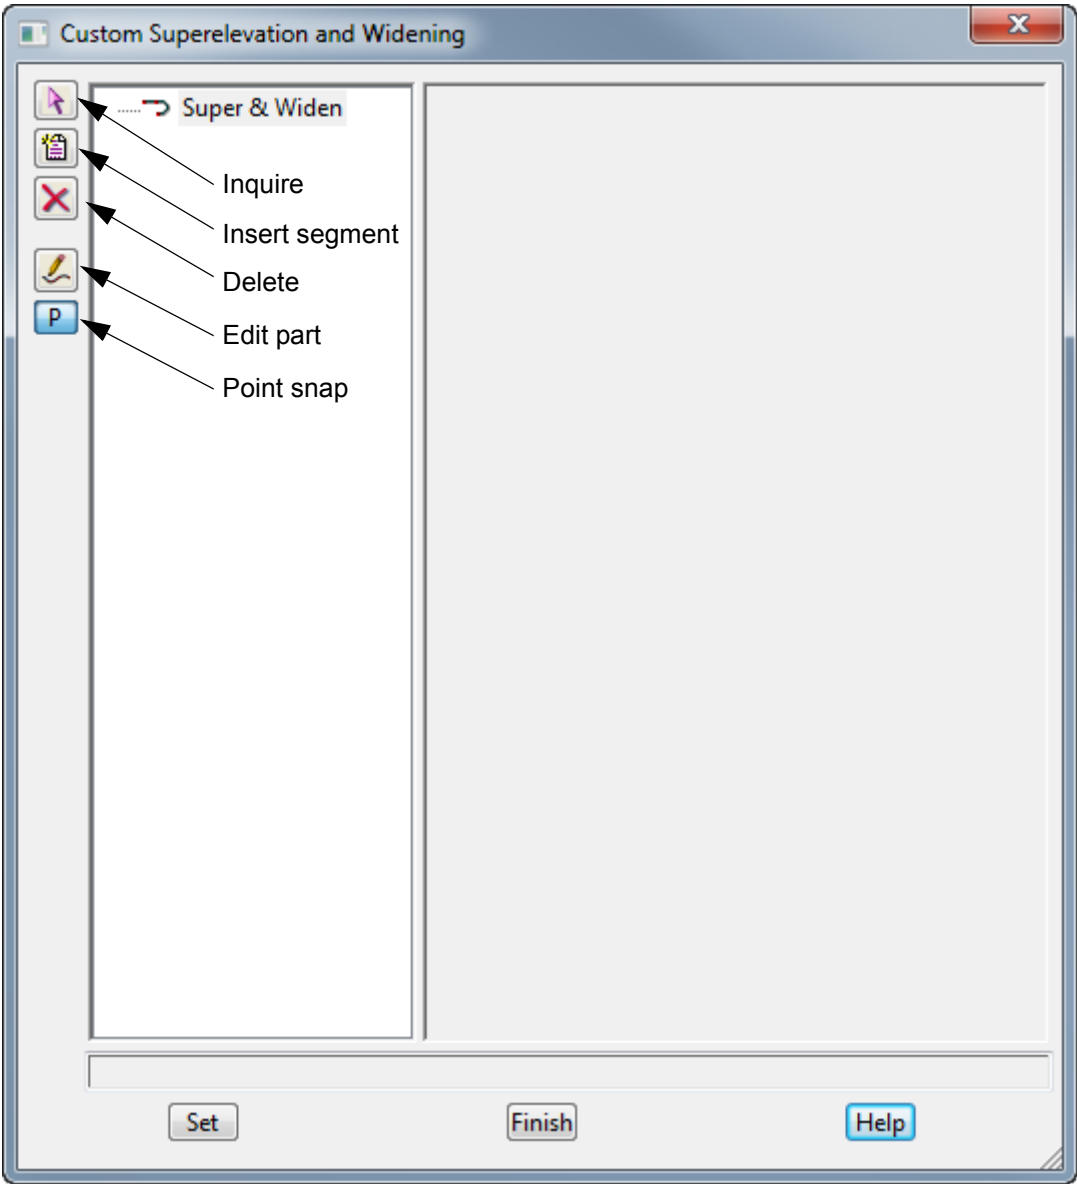

If **Use chainage equality** is ticked in the **Advanced > Equality** section of the **Properties** for the super alignment, then the **Chainage Equalities** panel is displayed.

SA - Custom Superelevation and Widening Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

If **Use design standards** is ticked in the **Advanced > Design** section of the **Properties** for the super alignment, then the **Custom Superelevation and Widening** panel is displayed.

SA - Centreline Options

At any time, a copy of the current horizontal or vertical geometry can be made and stored under an Option name.

So an Option is like a backup (safe copy) of the current horizontal or vertical geometry and can be restored as the super alignment geometry at a later time.

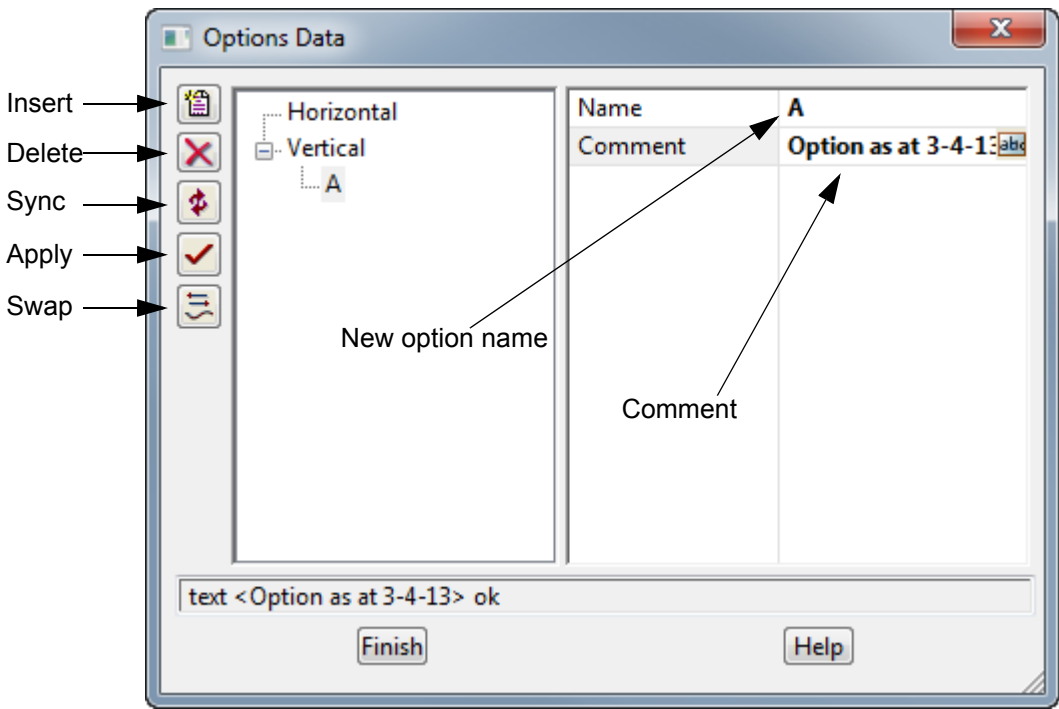

Clicking **Centreline Options** brings up the **Options Data** panel.

Insert

If the **Horizontal/Vertical** branch is highlighted and **Insert** clicked, a new Option is created under Horizontal/Vertical with the default name Horizontal/Vertical, and a copy of the current horizontal/vertical geometry of the super alignment is stored with the new option.

Name and **Comment** can be modified and are changed when <Enter> is pressed.

Delete

If the **Horizontal/Vertical** Option is highlighted and **Delete** clicked, then the Option is deleted.

Sync

If the **Horizontal/Vertical** Option is highlighted and **Sync** clicked, the horizontal/vertical geometry of the Option is deleted and replaced by the current horizontal/vertical geometry of the super alignment. That is, the Option geometry is taken from the super alignment.

Apply

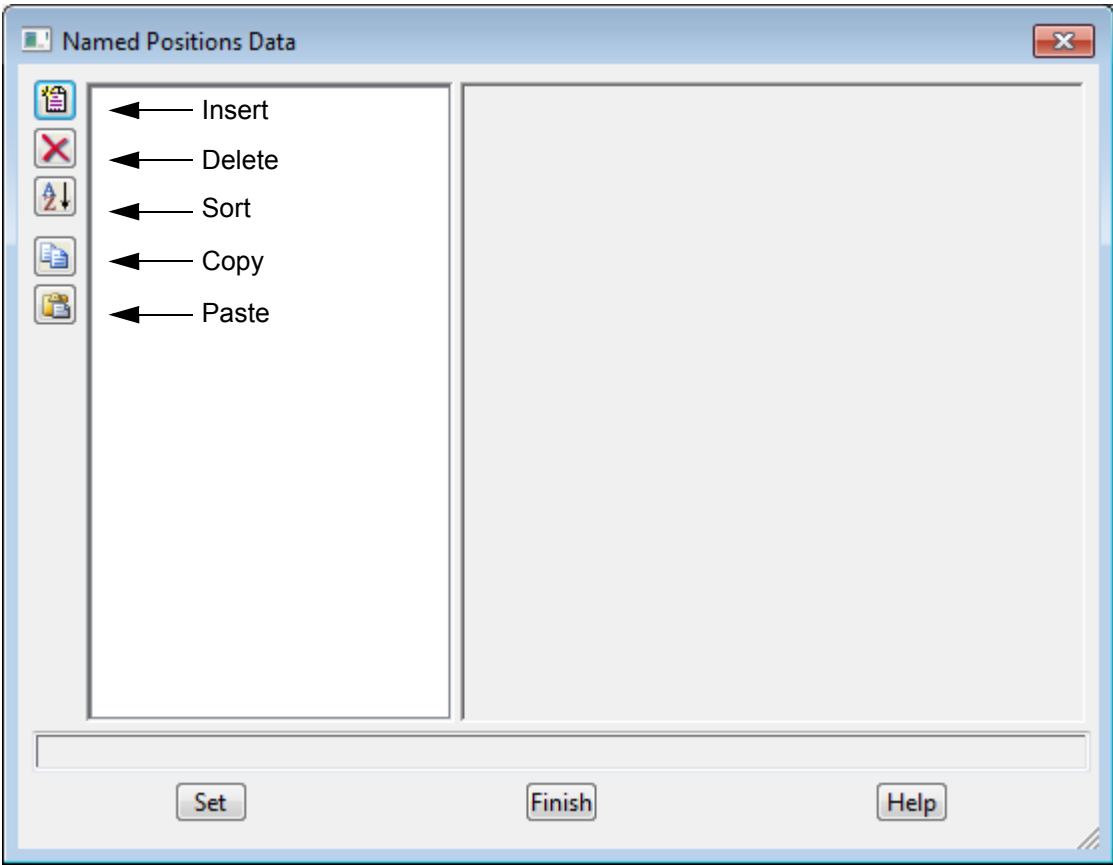

If the **Horizontal/Vertical** branch is highlighted and **Apply** clicked, the horizontal/vertical geometry of the super alignment is deleted and replaced by the horizontal/vertical geometry of the Option. That is, the super alignment geometry is taken from the Option.

Swap

If the **Horizontal/Vertical** branch is highlighted and **Swap** clicked, the current horizontal/vertical geometry of the super alignment is replaced by the horizontal/vertical geometry of the Option and the horizontal/vertical geometry of the Option is replaced by the current horizontal/vertical geometry of the super alignment. That is, the two geometries are swapped.

SA - Named Positions

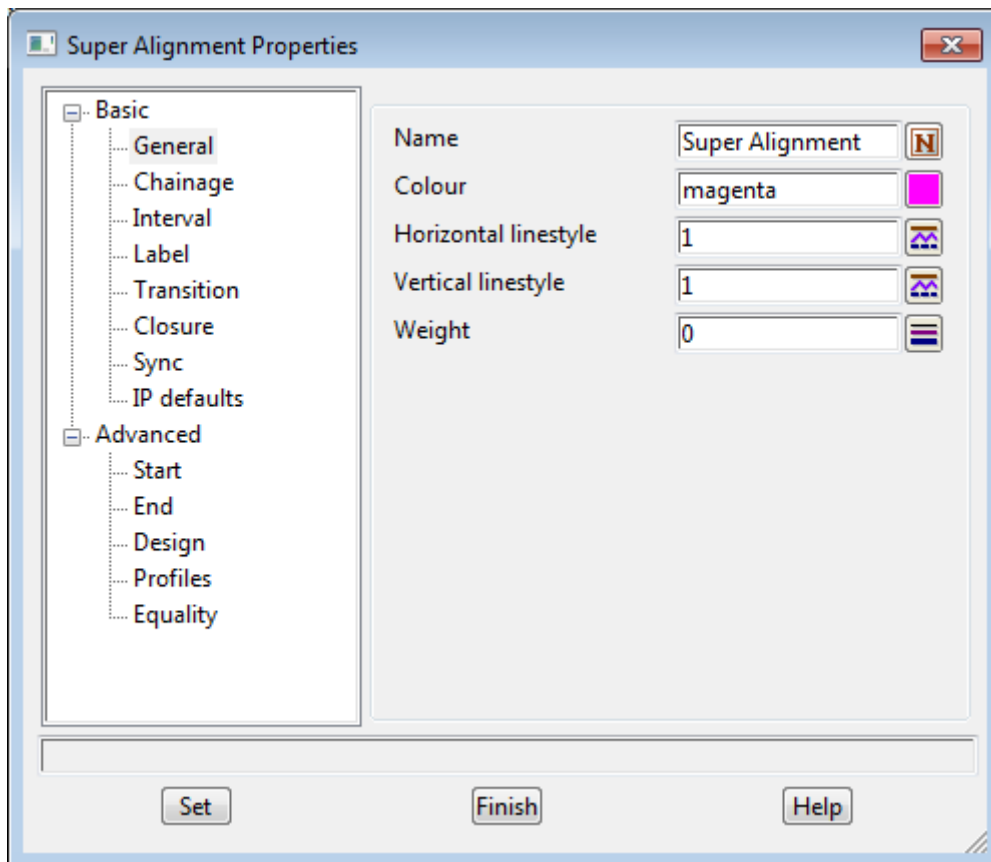

This section of documentation is a work in progress and will be updated in subsequent releases.
Clicking **Named Positions** brings up the **Named Positions Data** panel.

SA - Super Alignment Properties Icon

Selecting **Properties**  displays the **Super Alignment Properties** panel

The information in the **Super Alignment Properties** panel is the same as for the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on any branch, then the **Set** button must be clicked before leaving that branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Create - Super Alignment](#) for details on all the fields and values in the branches of this panel.

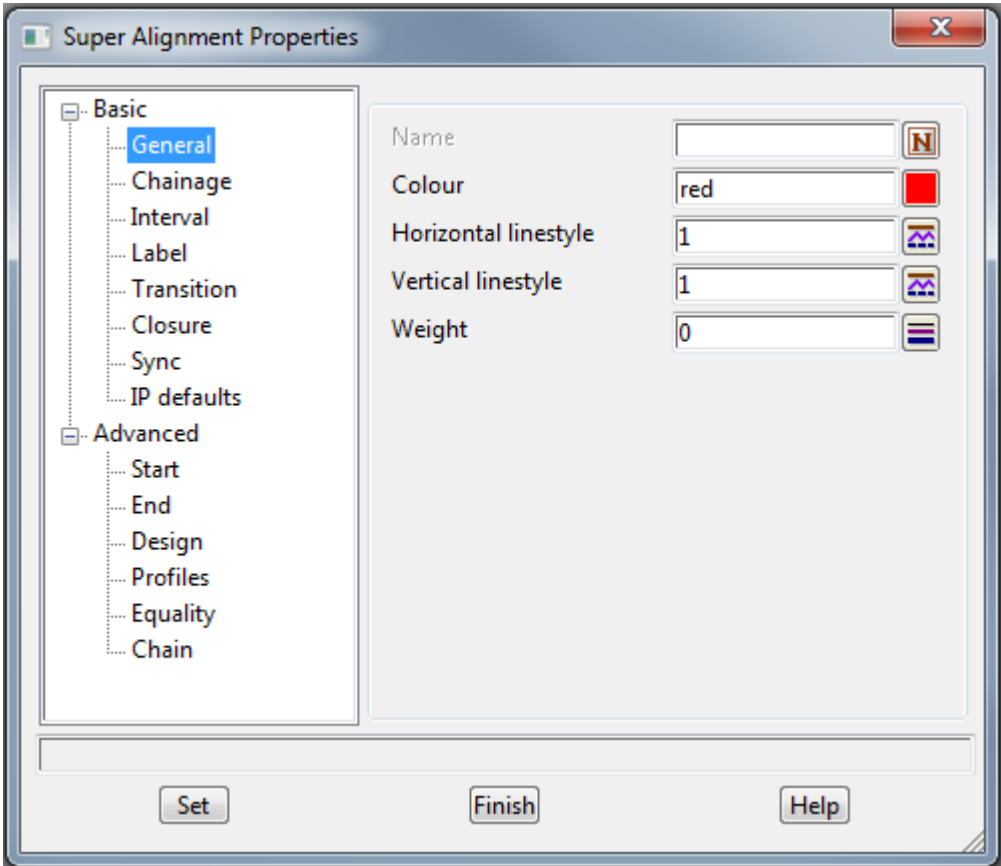

For information on each branch, go to:

[Basic > General branch](#)

[Basic > Chainage branch](#)

- [Basic > Interval branch](#)
- [Basic > Label branch](#)
- [Basic > Transition branch](#)
- [Basic > Closure branch](#)
- [Basic > Sync branch](#)
- [Basic > IP defaults branch](#)
- [Advanced > Start branch](#)
- [Advanced > End branch](#)
- [Advanced > Design branch](#)
- [Advanced > Profiles branch](#)
- [Advanced > Equality branch](#)
- [Advanced > Chain branch](#)

Basic > General branch

The information in the **Basic >General** branch is the same as for the **Basic >General** branch of the **Create Super Alignment** panel.

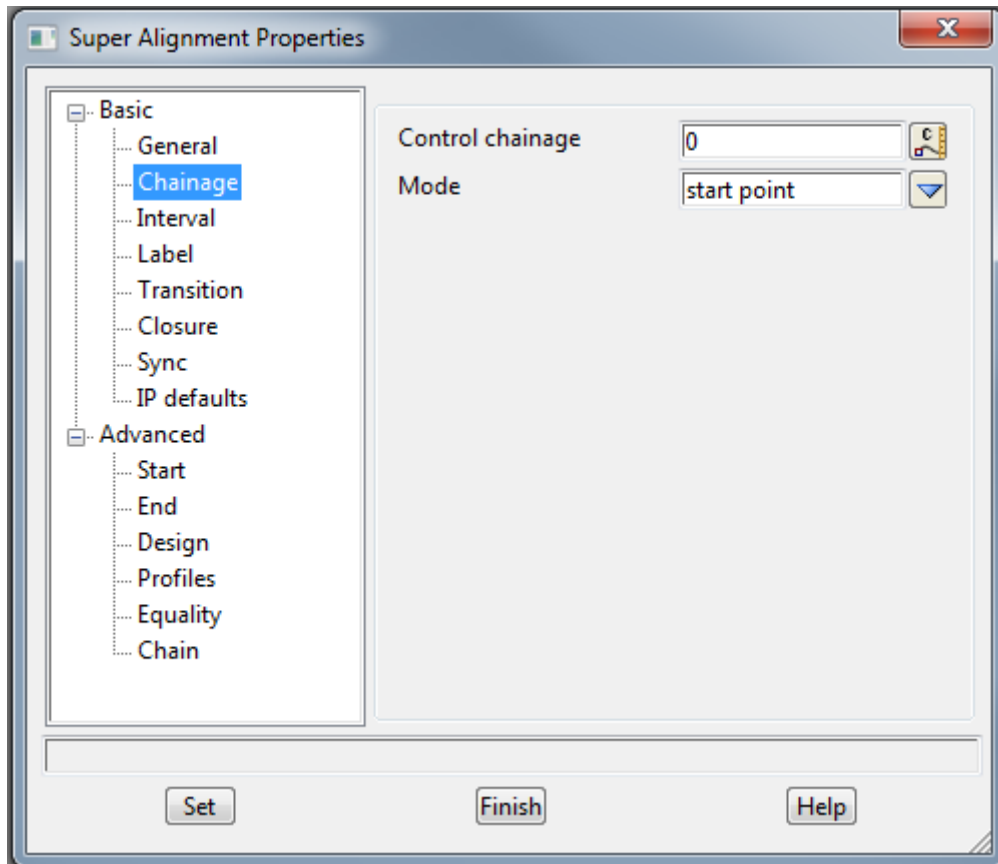

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >General** branch, then the **Set** button must be clicked before leaving the **Basic >General** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > General branch](#) for details on all the fields and values in the **Basic >General**

branch.

Basic > Chainage branch

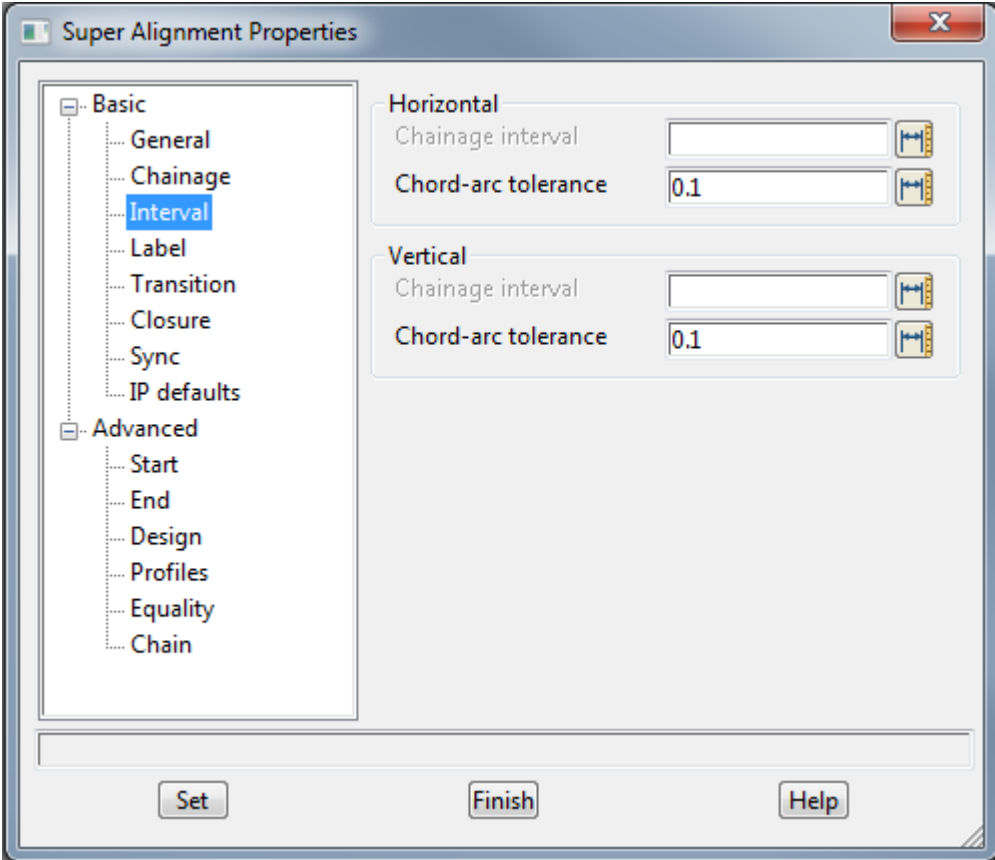

The information in the **Basic >Chainage** branch is the same as for the **Basic >Chainage** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >Chainage** branch, then the **Set** button must be clicked before leaving the **Basic >Chainage** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > Chainage branch](#) for details on all the fields and values in the **Basic >Chainage** branch.

Basic > Interval branch

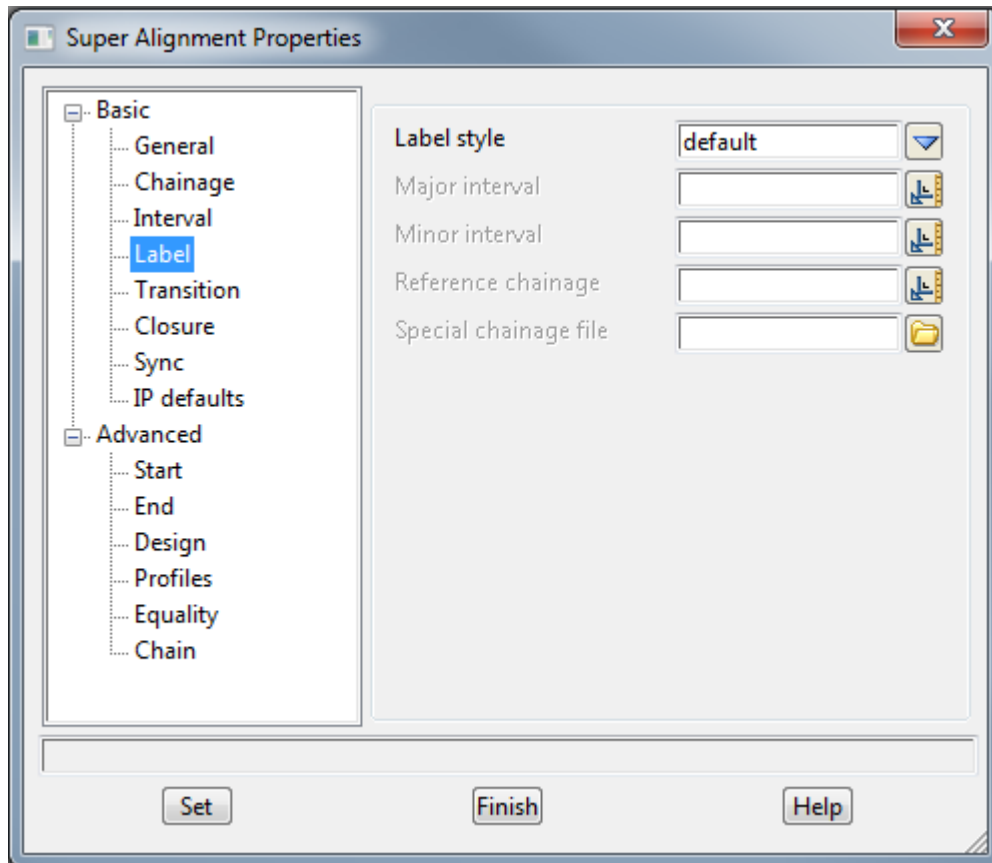

The information in the **Basic >Interval** branch is the same as for the **Basic >Interval** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >Interval** branch, then the **Set** button must be clicked before leaving the **Basic >Interval** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > Interval branch](#) for details on all the fields and values in the **Basic >Interval** branch.

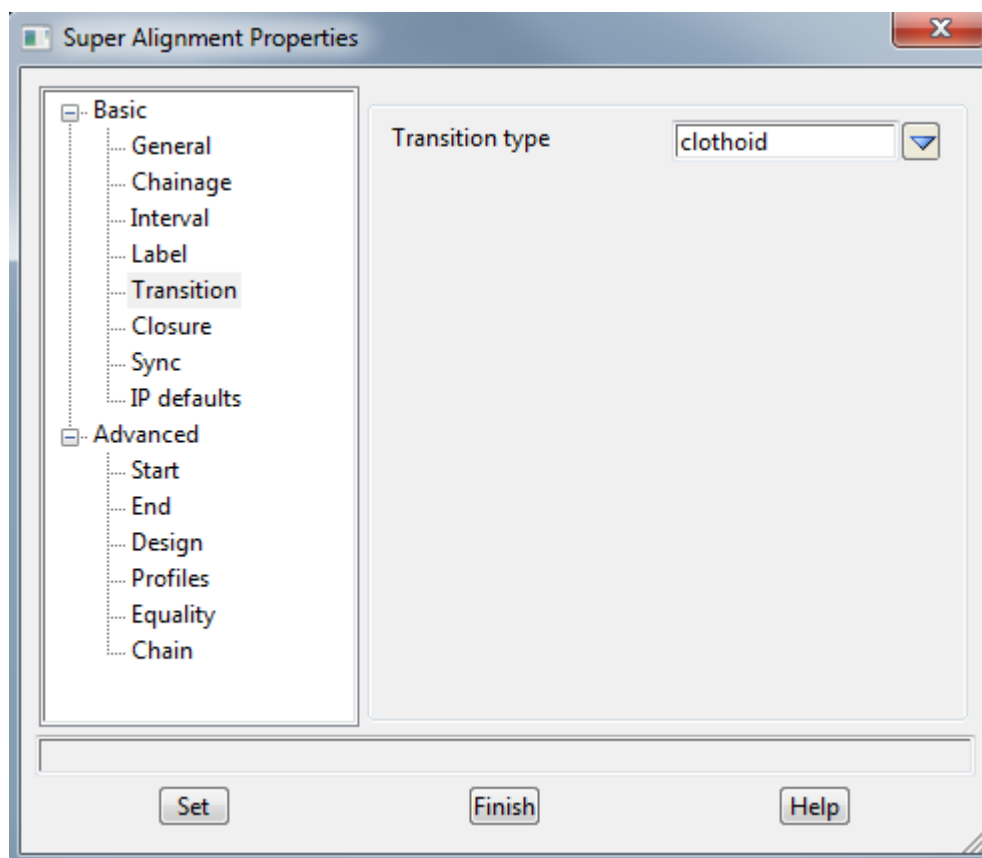

Basic > Label branch

The information in the **Basic >Label** branch is the same as for the **Basic >Label** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >Label** branch, then the **Set** button must be clicked before leaving the **Basic >Label** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > Label branch](#) for details on all the fields and values in the **Basic >Label** branch.

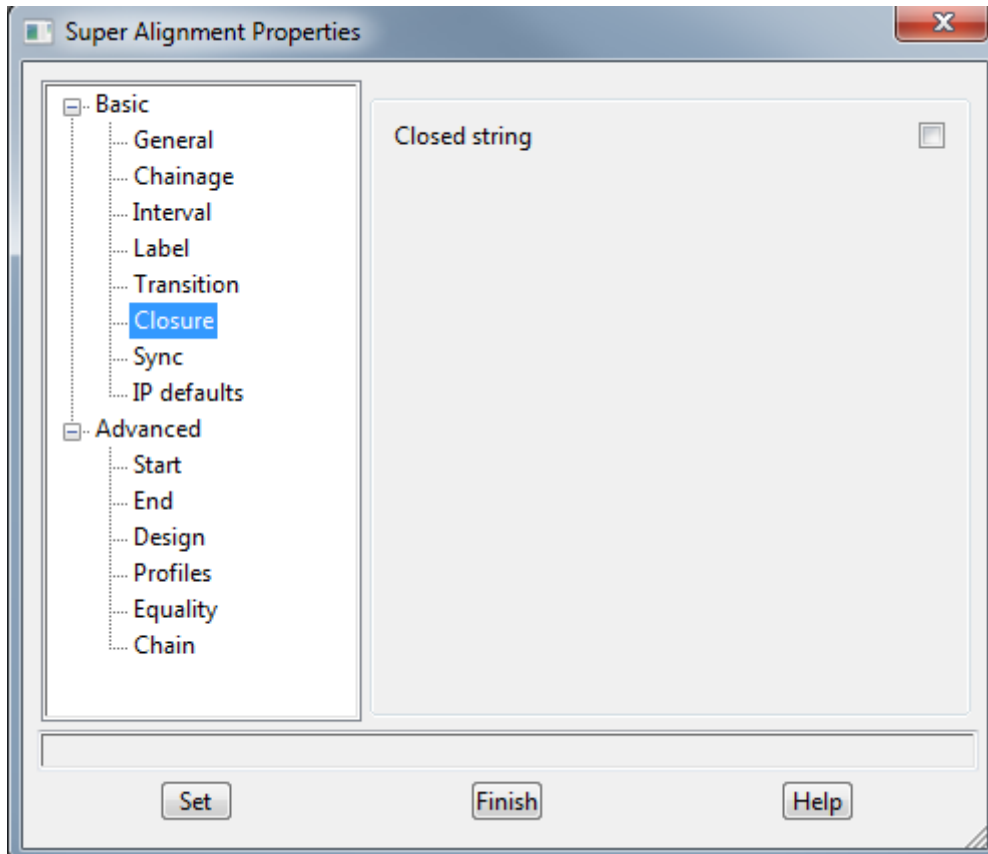

Basic > Transition branch

The information in the **Basic >Transition** branch is the same as for the **Basic >Transition** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >Transition** branch, then the **Set** button must be clicked before leaving the **Basic >Transition** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > Transition branch](#) for details on all the fields and values in the **Basic >Transition** branch.

Basic > Closure branch

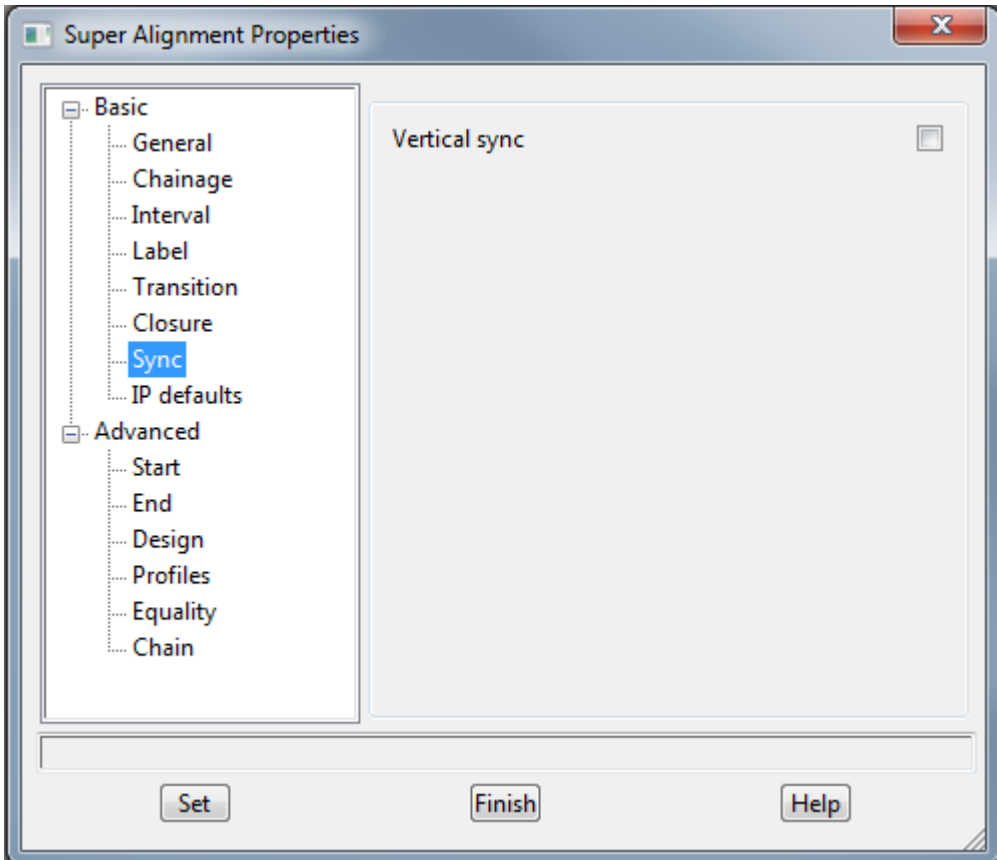

The information in the **Basic > Closure** branch is the same as for the **Basic > Closure** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic > Closure** branch, then the **Set** button must be clicked before leaving the **Basic > Closure** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > Closure branch](#) for details on all the fields and values in the **Basic > Closure** branch.

Basic > Sync branch

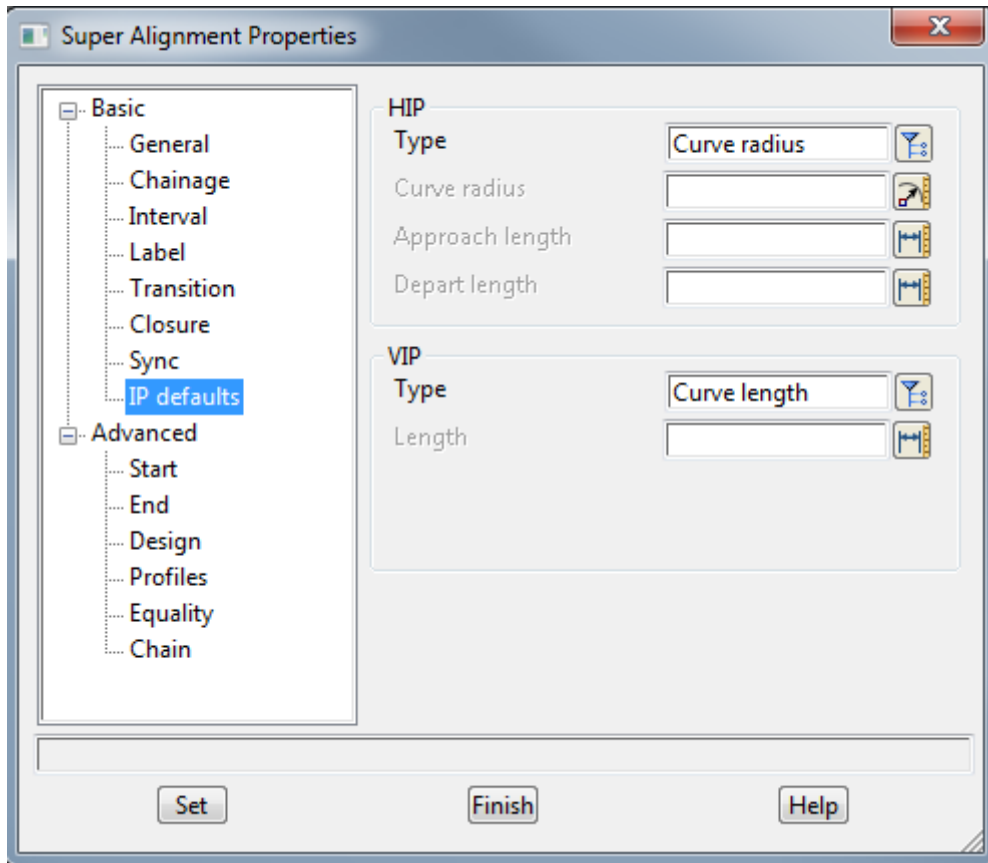

The information in the **Basic >Sync** branch is the same as for the **Basic >Sync** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >Sync** branch, then the **Set** button must be clicked before leaving the **Basic >Sync** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > Sync branch](#) for details on all the fields and values in the **Basic >Sync** branch.

Basic > IP defaults branch

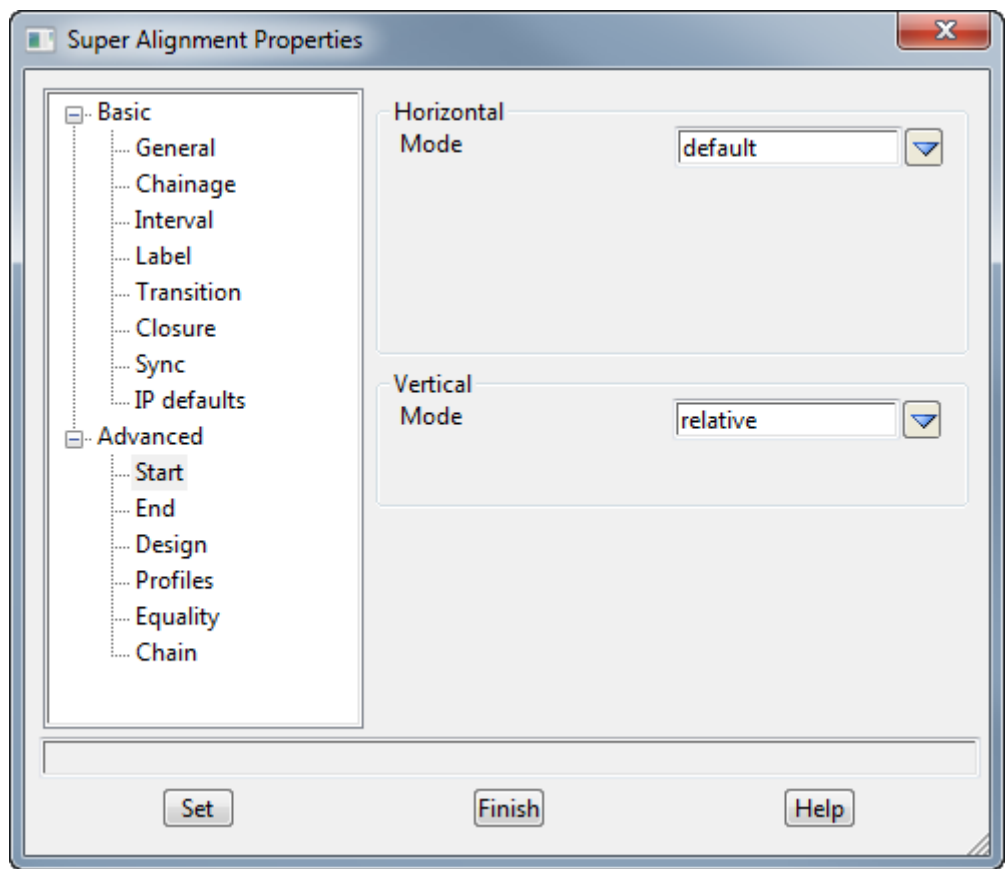

The information in the **Basic >IP defaults** branch is the same as for the **Basic >IP defaults** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Basic >IP defaults** branch, then the **Set** button must be clicked before leaving the **Basic >IP defaults** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Basic > IP defaults branch](#) for details on all the fields and values in the **Basic >IP defaults** branch.

Advanced > Start branch

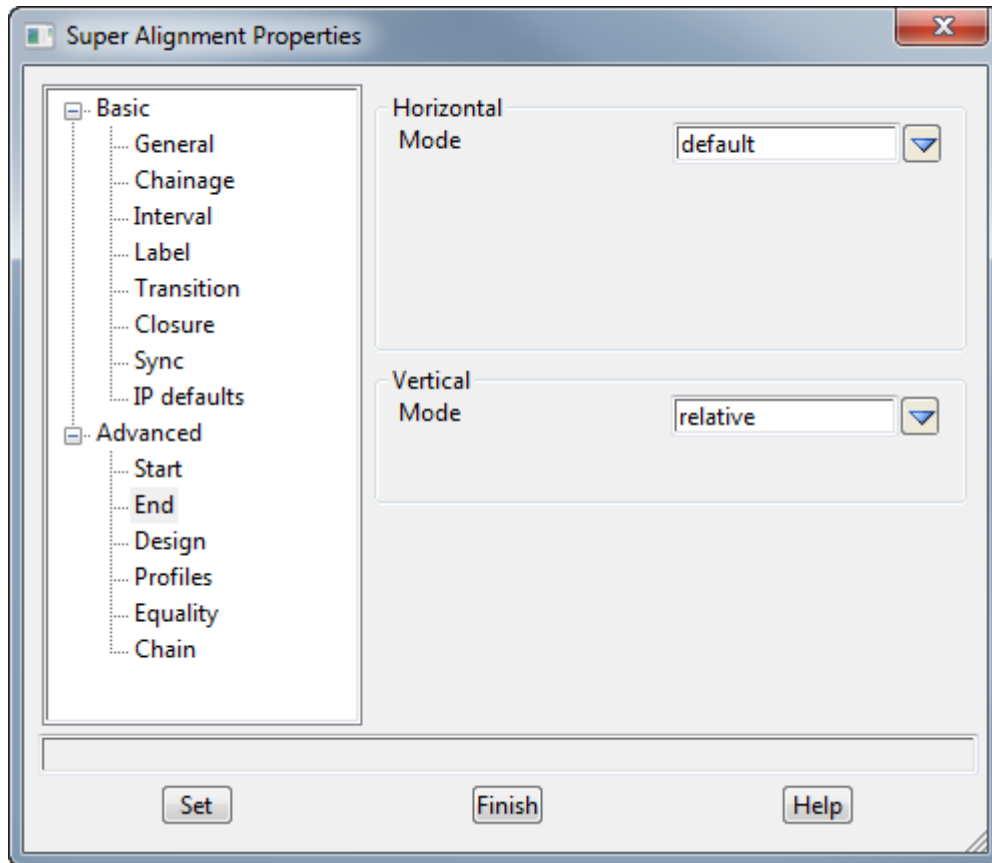

The information in the **Advanced >Start** branch is the same as for the **Advanced >Start** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Advanced >Start** branch, then the **Set** button must be clicked before leaving the **Advanced >Start** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Advanced > Start branch](#) for details on all the fields and values in the **Advanced >Start** branch.

Advanced > End branch

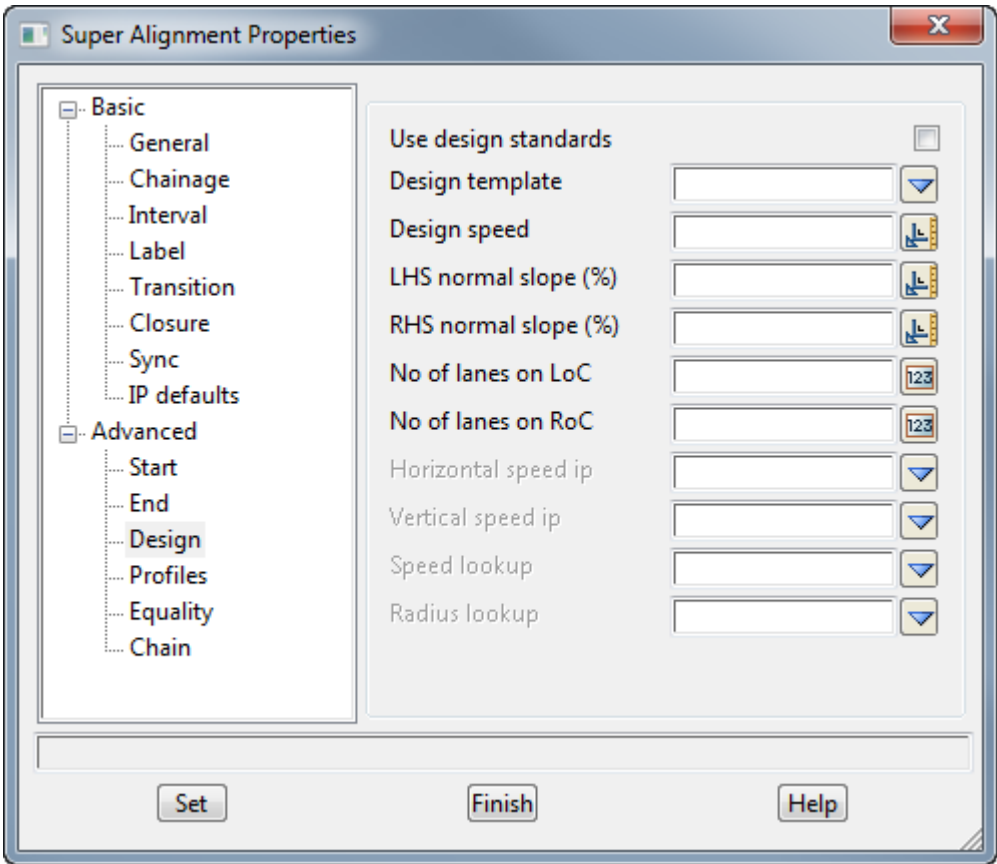

The information in the **Advanced >End** branch is the same as for the **Advanced >End** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Advanced >End** branch, then the **Set** button must be clicked before leaving the **Advanced >End** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Advanced > End branch](#) for details on all the fields and values in the **Advanced >End** branch.

Advanced > Design branch

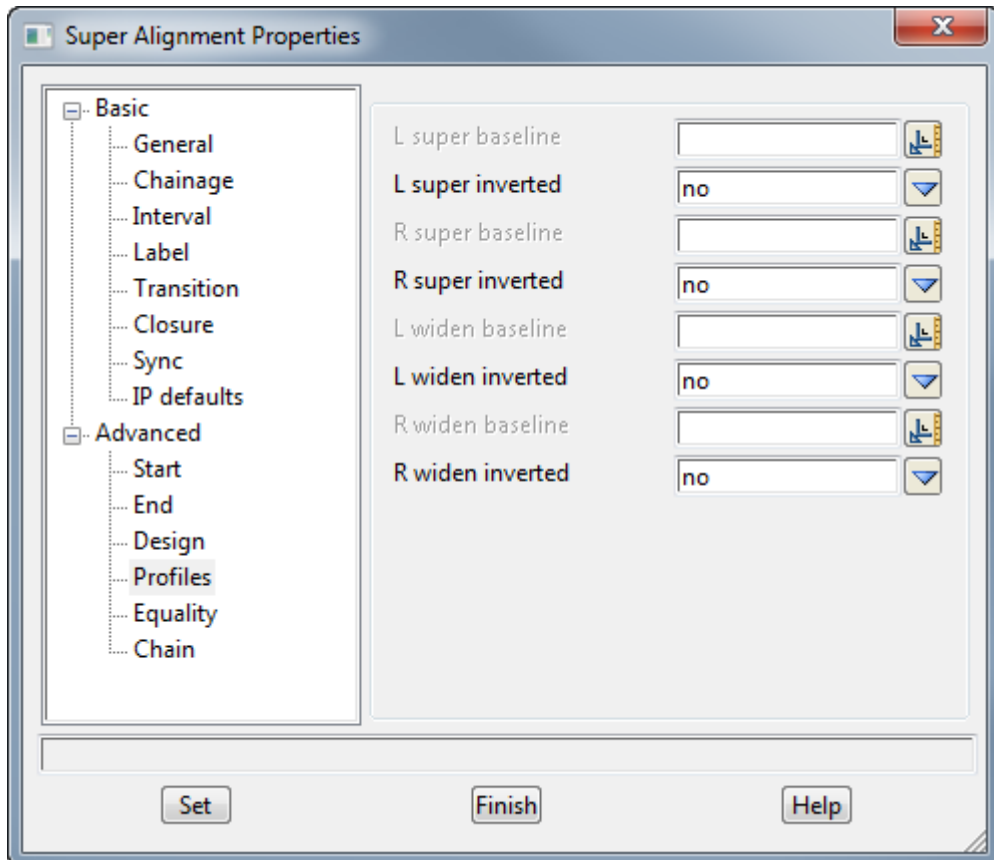

The information in the **Advanced >Design** branch is the same as for the **Advanced >Design** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Advanced >Design** branch, then the **Set** button must be clicked before leaving the **Advanced >Design** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Advanced > Design branch](#) for details on all the fields and values in the **Advanced >Design** branch.

Advanced > Profiles branch

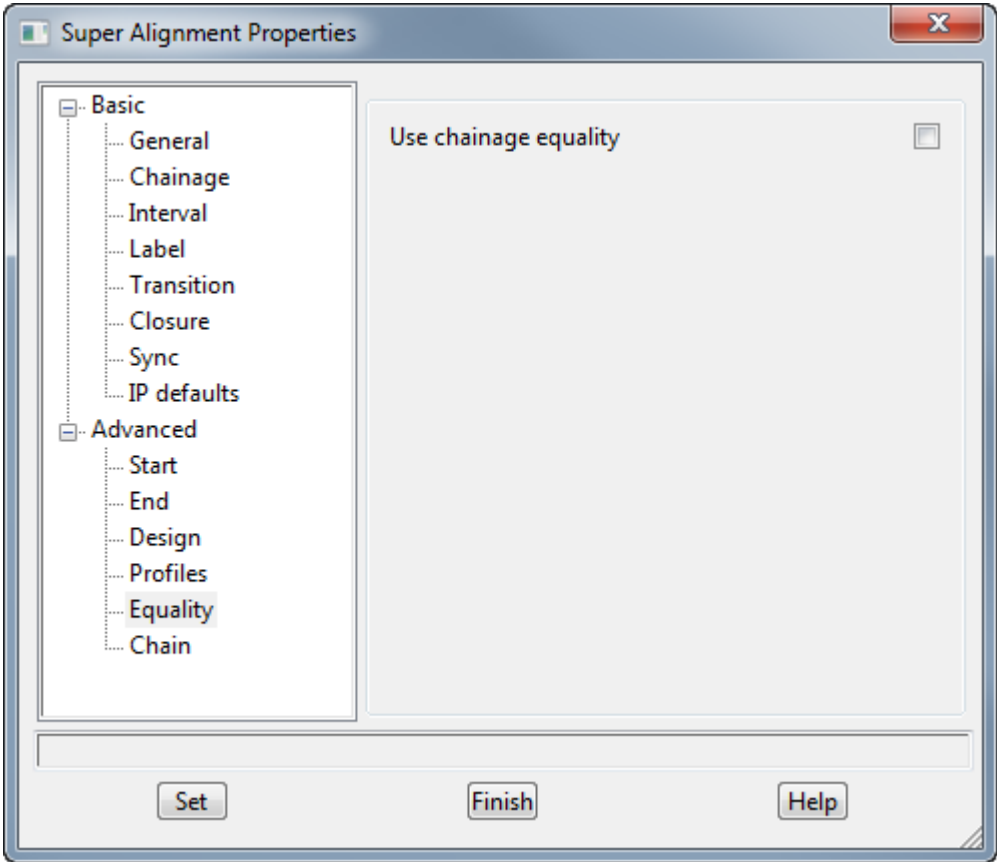

The information in the **Advanced > Profiles** branch is the same as for the **Advanced > Profiles** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Advanced > Profiles** branch, then the **Set** button must be clicked before leaving the **Advanced > Profiles** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Advanced > Profiles branch](#) for details on all the fields and values in the **Advanced > Profiles** branch.

Advanced > Equality branch

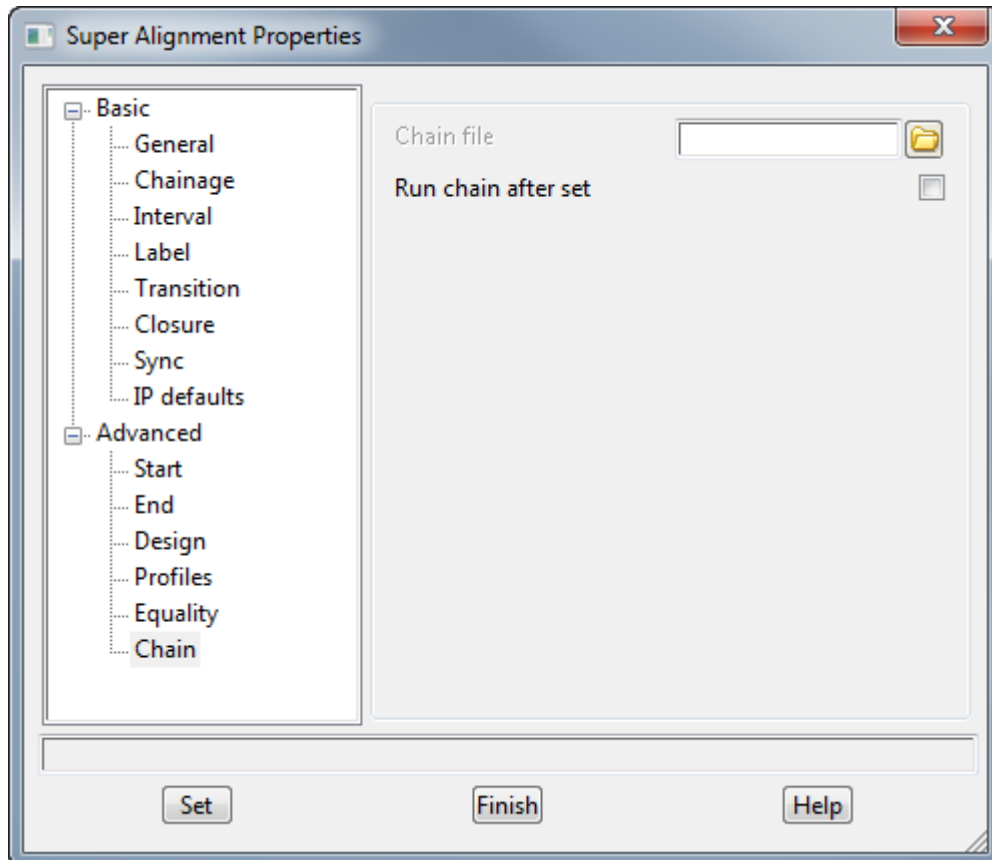

The information in the **Advanced >Equality** branch is the same as for the **Advanced >Equality** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Advanced >Equality** branch, then the **Set** button must be clicked before leaving the **Advanced >Equality** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Advanced > Equality branch](#) for details on all the fields and values in the **Advanced >Equality** branch.

Advanced > Chain branch

The information in the **Advanced >Chain** branch is the same as for the **Advanced >Chain** branch of the **Create Super Alignment** panel.

The only difference is that the **Set** button only exists on the **Super Alignment Properties** panel and if **any changes** are made to the values on the **Advanced >Chain** branch, then the **Set** button must be clicked before leaving the **Advanced >Chain** branch to modify the values for the string.

WARNING: this means that you must click on **Set** after modifying each branch - you can't change values on a number of branches and then click **Set**.

See [Advanced > Chain branch \(not yet implemented\)](#) for details on all the fields and values in the **Advanced >Chain** branch.

SA - Undo and Redo Icons

An **Undo** and **Redo** list is defined for **each** Editor open on the screen. That is, each open Editor has its own Undo/Redo lists.

As each option is performed in an open Editor, the reverse of the option is added to the Editors Undo list. Hence an option can be **undone** (reversed) by immediately clicking on the **Undo** icon.

Note: the **Undo** icon is.

If an option is **undone**, it is added to the **Redo** list so that it can be **redone**.

So clicking on the **Undo** icon undoes the last Editor operation for this super alignment and adds it to the top of the Redo list

Note: the **Redo** icon is

Clicking on the **Redo** icon redoes the last Editor operation that was **undone** for this super alignment and the undone operation is added to the top of the Undo list.

Important Note: as each option is added to an Undo or Redo list, the options already on the list are pushed down and none of the options pushed down can be undone/redone until all the options above it have been undone/redone. So both the Undo and Redo lists are last in, first out lists.

So the order in the Undo/Redo lists is important and can not be altered.

When the Editor is exited by either **Quit** or **Finish**, the undo and redo lists are deleted and are no longer usable.

SA - Info Icon

The **Info** icon is

and clicking on the **Info** icon brings up the **Super Alignment Info** panel (see [Super Alignment Info](#)).

Super Alignment Info

Selection

Style	Default
Chainage	0
Dynamic	on

General

Model	XX
Name	
Style	default
Length	3463.852

Position

Xcoord	65.031
Ycoord	1256.193
Level	
Angle	3.0412
Grade	

SA - Recalc Icon

The **Recalc** icon is

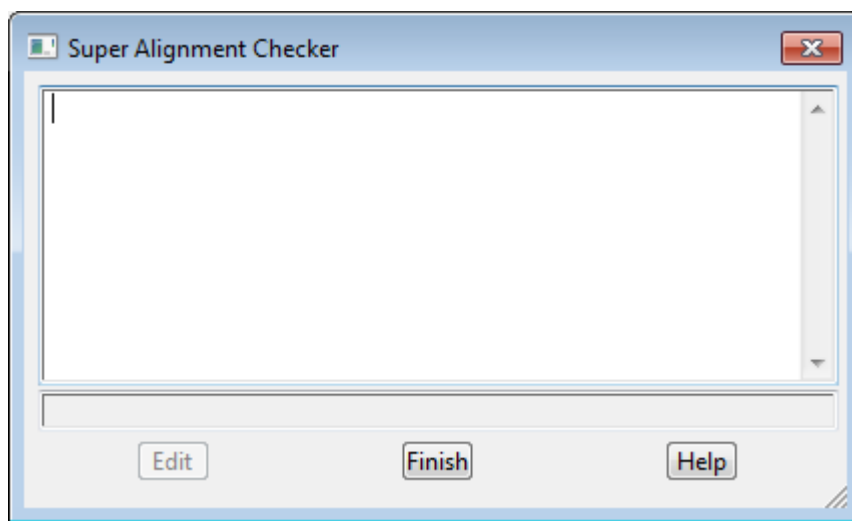

and clicking on the **Recalc** icon does a *recalc* for the super alignment.

SA - Error Checker Icon

The **Error Checker** icon is

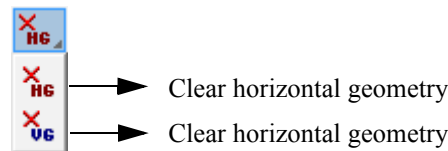

and clicking on the **Error Checker** icon brings up the **Super Alignment Checker** panel and runs the SA checking routines.

Warning: This options is still under development.

SA - Clear Toolbar

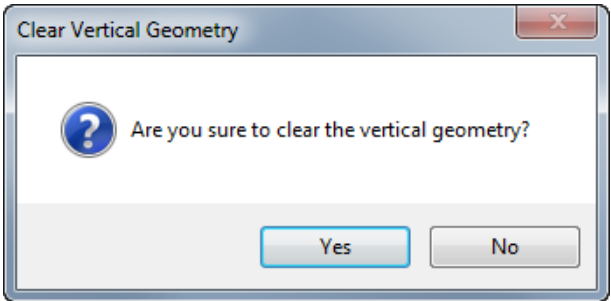

The **Clear** toolbar is

The **Clear VG** and **Clear HG** options are used to delete all the horizontal and/or vertical geometry points in the super alignment string.

SA - Clear VG

The **Clear VG** option removes all the vertical geometry from the string.
The horizontal geometry still exists plus all the other string properties (model, name, colour and type).

After a **Clear VG**, the vertical geometry can be re- entered using the SA Edit options.

SA - Clear HG

The **Clear HG** option removes all the horizontal **and** vertical geometry from the string.
The string still exists and keeps its other properties such as model, name, colour and type.

After a **Clear HG**, the horizontal and vertical geometry can be re- entered using the SA Edit options.

SA - Help Icon

The **Help** icon is

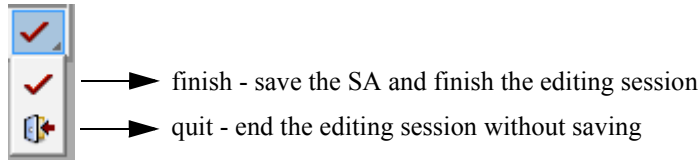

Clicking on **Help** icon opens the context sensitive Help and jumps to this section.

For more information on the super alignment options, see [Edit Super Alignment](#).

SA - Finish Toolbar

The **Finish** toolbar is

SA - Finish

When editing of the super alignment is completed, **Finish** is used to save the modifications and exit the SA Editor.

After selecting **Finish**, a **Yes-No-Cancel** panel is displayed to confirm that the edit session has ended and all the edits are to be kept. If **Yes** is selected, the edits will be stored and the SA Editor exited.

SA - Quit

At any time the Editing process can be **aborted** and all the edits thrown away by selecting the **Quit** option. That is, the super alignment is left as it was before the *Edit* was begun.

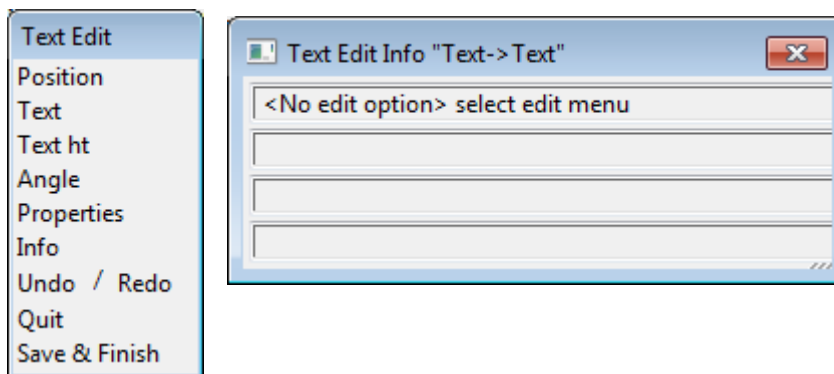

After selecting **Quit**, a **Yes-No-Cancel** panel is displayed to confirm that the edit is to be terminated. If **Yes** is selected, the edits will be ignored and the original unedited super alignment kept.

Note that if it was a new string being created, the Editor is terminated by **Quit** and **no** string is created.

Text Edit

On picking a text string, the **text edit** menu and the panel are placed on the screen.

Each option in the **text edit** menu will now be described.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Position

The **position** option is used to place the text string for the first time and to re-position (move) an existing text string.

Position is a one step process.

After selecting the **position** option, the new position for the text is selected. The text is then redrawn at the new position.

message area 1 <Position>

Screen message area

<Select point position> [picks][][menu]

<Select point position> [picks][accepts][menu]

The **position** option repeats until cancelled by the user by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **text edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the position option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the **position** option still current.

Typed input can be used at any stage

Text

The **text** option is used to modify the text of the text string.

After the **text** option is chosen, an enter text typed-input box is placed on the screen with the string's current text displayed in it.

The enter text typed-input box looks like:

The text is entered into the typed-input box, terminated with <enter>. The entered value is taken as the text of the text string and the string redrawn with the new text. The typed-input box then disappears.

The **text** option automatically terminates and a new option needs to be selected from the **text edit** menu.

Text ht

The **text ht** option is used to modify the height of the text in the text string.

After the **text ht** option is chosen, an **enter value** typed-input box is placed on the screen with the string's current text height displayed in it.

The enter value typed-input box looks like:

The text height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the text in the text string and the string redrawn with the new height.

The typed-input box then disappears.

The **height** option is automatically terminated and a new option needs to be selected from the **text edit** menu.

Angle

The **angle** option is used to modify the angle that the text in the text string is drawn at.

The text angle is measured in a counter-clockwise direction with respect to the horizontal axis.

After the **angle** option is chosen, an **enter angle** typed-input box is placed on the screen with the string's current text angle displayed in it.

The enter angle typed-input box looks like:

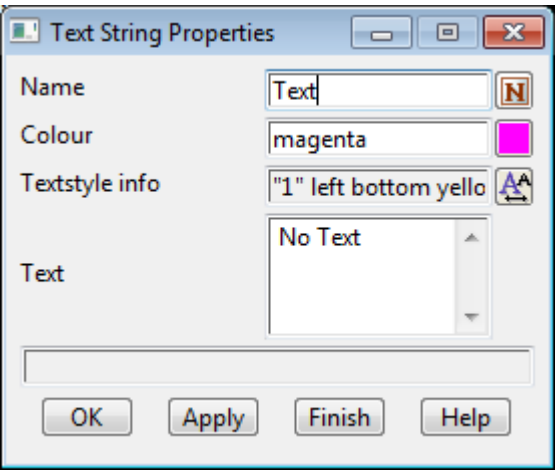

The text angle is entered into the typed-input box, terminated with <enter>. The entered value is taken as the angle of the text in the text string and the string redrawn with the new angle.

The typed-input box then disappears.

The **angle** option is automatically terminated and a new option needs to be selected from the **text edit** menu.

Properties

Selecting **Properties** brings up the **Text String Properties** panel which is used to modify the string's header information.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the string.</i>	name box		
Colour <i>the colour of the string.</i>	colour box	default colour	available colours
Textstyle info <i>textstyle information.</i>	textstyle info box		
Text <i>the actual text.</i>	multi-line text box		
OK/Apply	buttons	<i>for the string being edited, OK sets the string with the values in the panel fields and removes the panel. Apply sets the string with the values in the panel fields and leaves the panel on the screen.</i>	

Points Edit

Position of menu: Strings => Points Edit

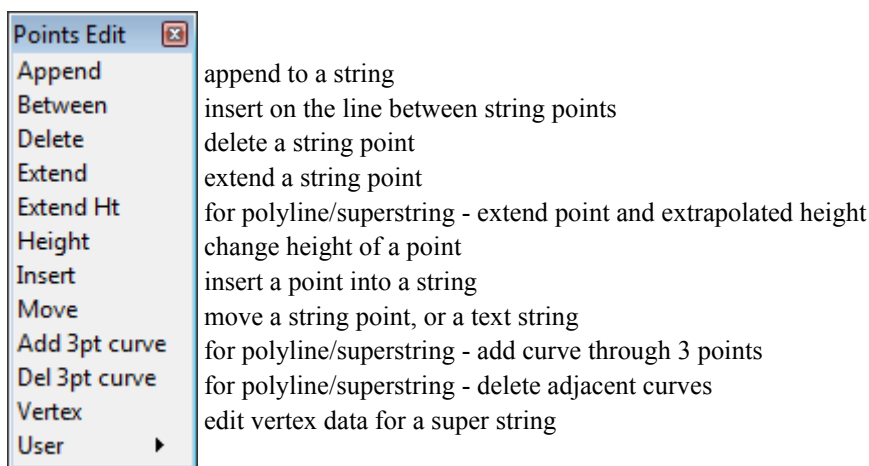

The points operations available in the **Points edit** menu are similar to the create/edit options.

However, in the **Points edit** options, the user does not begin by picking the particular string to be edited. Instead, the required option is selected followed by the point to be modified from any string.

The option can then be applied to another point on that or any other string, or another point operation chosen, and applied to any point.

If the user wants to make a large number of point edits to the one string, the **editor** option discussed in the last section is the easiest option to use. However, if a number of strings are going to be edited with the same operation or a selection of operations, then the **points edit** option is more suitable.

After selecting the **Points edit** option, the **Points edit** menu is displayed.

Each of the options performs the same work as the option of the same name in the **Edit string** option.

The individual options in the **Points Edit** menu will now be discussed in detail.

For the option *Append*, go to

[Height](#)

[Insert Point](#)

[Move Point](#)

[Add 3 Point Curve](#)

[Delete 3 Point Curve](#)

[Edit Vertex](#)

Append Point

Position of option on menu: Strings =>Points Edit => Append

The **append** option adds additional points to the end of a string. On selecting the **Append** option, an **append point** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **append** option, the particular end of the string to append points to is selected using the standard LB and MB pick and accept sequence.

The points to be appended are then selected. The option keeps adding points to the selected string until the **pick ops** menu is brought up using RB and **cancel** is selected.

After the *append* has been completed, the option repeats. That is, the user is asked to select another string to append to. This continues until **finish** or **[X]** is selected from the **append point** panel.

Between Point

Position of option on menu: Strings =>Points Edit => Between

On selecting the **between** option, a **between point** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **between** option, the particular segment to insert a point on is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the *between* has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until **finish** or **[X]** is selected from the **between point** panel.

Delete Point

Position of option on menu: Strings =>Points Edit => Delete

On selecting the **delete** option, a **delete point** message panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **delete** option, the particular point to delete is selected using the standard LB and MB pick and accept sequence. When the point is accepted, it is deleted.

After the *delete* has been completed, the option repeats. That is, the user is asked to select another point to delete (the point can be on any string). This continues until **finish** or **[X]** is selected from the **delete point** panel.

Extend Point

Position of option on menu: Strings =>Points Edit => Extend

On selecting the **extend** option, a **extend point** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **extend** option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted.

After the *extend* has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or **[X]** is selected from the **extend point** panel.

Extend Height

Position of option on menu: Strings =>Points Edit => Extend Ht

The extend point by height option is similar to the extend option except that the z-value of the moved point is modified by linearly interpolating the z-value from the original points at the end of the selected segment. On selecting the **extend by ht** option, an **extend point by ht** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **extend point by ht** option, the particular point on a segment to extend is selected by picking the segment near to the point using the standard LB and MB pick and accept sequence. The position of the point is then moved along the segment until the final position is selected and accepted. The z-value of the moved point is the linear interpolation of the selected segment.

After the *extend point by ht* has been completed, the option repeats. That is, the user is asked to select another segment to extend a point on. This continues until **finish** or **[X]** is selected from the **extend point by ht** panel.

Height

Position of option on menu: Strings =>Points Edit => Height

On selecting the **height** option, a **point height** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **height** option, the particular point to modify the height for is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the height existing height is displayed in a **height** box which can be modified and accepted by typing <enter>.

After the *height* has been completed, the option repeats. That is, the user is asked to select another point to modify the height for (the point can be on any string). This continues until **finish** or **[X]** is selected from the **point height** panel.

Insert Point

Position of option on menu: Strings =>Points Edit => Insert

On selecting the **insert** option, an **insert point** message panel is displayed.

The message area of this panel informs the user of any error messages.

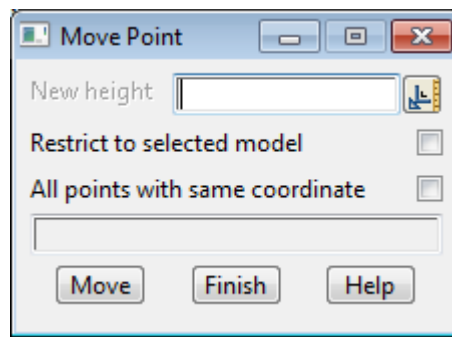

Once in the **insert** option, the particular segment to identify the two points to insert the point is selected using the standard LB and MB pick and accept sequence. The position of the point to insert is then selected and accepted.

After the *insert* has been completed, the option repeats. That is, the user is asked to select another segment to insert a point on. This continues until **finish** or **[X]** is selected from the **insert point** panel.

Move Point

Position of option on menu: Strings =>Points Edit => Move

On selecting the **move** option, a **move point** panel is displayed.

The message area of this panel informs the user of any error messages. There are similar panels for each of the other **points edit** options.

Once in the **move** option, the particular point to move is selected using the standard LB and MB pick and accept sequence. The position that the point is to be moved to is then selected and accepted.

After the move has been completed, the option repeats. That is, the user is asked to select another point to move (the point can be on any string). This continues until **finish** or **[X]** is selected from the **move point** panel.

Add 3 Point Curve

Position of option on menu: Strings => Points Edit => Add 3pt Curve

On selecting the **add 3pt curve** option, a **insert 3pt curve** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **add 3pt curve** option, the middle point of the three points of the super string to fit a curve for, is selected using the standard LB and MB pick and accept sequence. When the point is accepted, the curve is fitted between it and the left and right adjacent points of the super string.

After the **add 3pt curve** has been completed, the option repeats. That is, the user is asked to select another point to add a curve to (the point can be on any super string). This continues until **finish** or **[X]** is selected from the **insert 3pt curve** panel.

Delete 3 Point Curve

Position of option on menu: Strings => Points Edit => Del 3pt Curve

On selecting the **del 3pt curve** option, a **delete 3pt curve** panel is displayed.

The message area of this panel informs the user of any error messages.

Once in the **Delete 3pt curve** option, a vertex from a super string is selected using the standard LB and MB pick and accept sequence and if there is curves on both sides of the vertex, the radii are removed and the vertices are joined by straight line segments.

After the *Delete 3pt curve* has been completed, the option repeats. That is, the user is asked to select another point on a super string to remove the curves on either side (the point can be on any super string). This continues until **finish** or **[X]** is selected from the **Delete 3pt curve** panel.

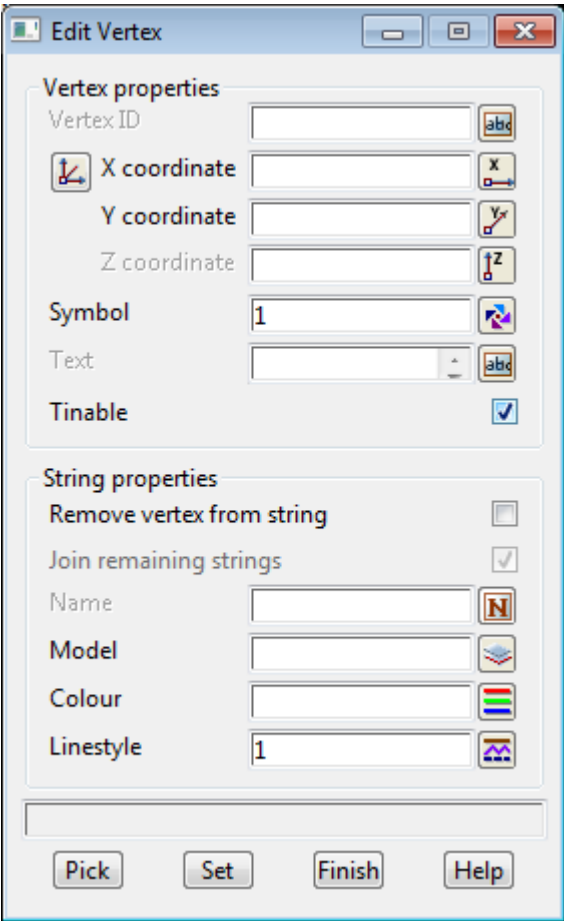

Edit Vertex

Position of option on menu: Strings =>Points Edit => Vertex

The Edit Vertex option allows the quick editing of the co-ordinates, vertex id, symbol, vertex text and tinability of a selected string vertex.

The name, model, colour and linestyle, which are string properties, can also be modified however the user has the choice of modifying the string properties for the entire string, or have the option remove the selected vertex from the string and only give the string properties to the newly created one vertex string. If a vertex is removed from the string, the adjacent vertices of the removed vertex can be joined.

On selecting the Vertex option, a **Edit Vertex** panel is displayed.

The **Edit Vertex** option is already running and a super string vertex is selected.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex properties			
Vertex id	input		
<i>the vertex id (point number) for the selected vertex. Change this to the required value.</i>			
X coordinate			Measure X panel
<i>the x coordinate (easting) of the selected vertex. Change this to the required value.</i>			
Y coordinate			Measure Y panel
<i>the y coordinate (northing) of the selected vertex. Change this to the required value.</i>			

Z coordinate		Measure Z panel
<i>the y coordinate (elevation) of the selected vertex. Change this to the required value.</i>		
Symbol	symbol box	available symbols
<i>the symbol on the selected vertex. Change this to the required symbol.</i>		
Text	input	
<i>the text on the selected vertex. Change this to the required text.</i>		
Tinable	tick box	
<i>ticked if the selected vertex is tinable. Change if required.</i>		

String/New vertex properties

Remove vertex from string	tick box	
<i>tick if the selected vertex is to be removed from its current string.</i>		
Join remaining points	tick box	
<i>only setable if Remove vertex from string is ticked.</i>		
<i>If ticked then the vertices on either side of the removed vertex are joined.</i>		
<i>If not ticked then the original string will be broken into two strings when the vertex is removed.</i>		

Name	input	
<i>the name of the string containing the selected vertex. Change this to the required name.</i>		
Model	model box	available models
<i>the model of the string containing the selected vertex. Change this to the required model.</i>		
Colour	colour box	available colours
<i>the colour of the string containing the selected vertex. Change this to the required colour.</i>		
Linestyle	linestyle box	
<i>the linestyle of the string containing the selected vertex. Change this to the required linestyle.</i>		

Pick	button	
<i>chose Pick and then select the vertex to be edited.</i>		
Set	button	
<i>apply the values in the panel to the selected vertex. Pick is still active so that another vertex can be selected.</i>		

Strings Edit

Position of menu: Strings => Strings Edit

The **Strings edit** option contains operations to be applied, not to individual points of a string, but to entire strings.

After selecting the **Strings edit** option, the **Strings edit** menu is displayed.

Strings Edit	
Change	change string colour, type, name or model
Clip	delete or keep part of a string
Close	connect the first and last points
Delete	delete a string
Duplicate	duplicate a string
Join	join two strings to form one string
Join many	join many strings to form one string
Link clip	delete a string link
Open	disconnect the first and last points
Parallel	parallel the string
Reverse	reverse the order of string points
Split	split a string into two strings
Translate	translate a string to a new position
Textdata info	change the text information
Arc to chords	create inner and outer chords for an arc
Segment strings	segment a super string
Corner splays	create corner splay
Surrounding polygon	form polygon from lines and arcs
User	

The individual options in the **Strings edit** menu will now be discussed in detail.

<i>Surrounding polygon</i>	Surrounding Polygon

Change

Position of option on menu: Strings =>Strings Edit =>Change

The **Change** option can be used to change the mode, colour, style, name and point-line type of a string.

On selecting the **Change** option, the **Change string** panel is displayed.

The **Change** option is already in progress and if a string is selected, the model, colour, style, name and point-line type are changed according to the fields in the **change string** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
New name	<i>if non-blank, the name of the selected string will be changed to the name given in the new name field.</i>	input		
New model	<i>if non-blank, the selected string will be moved to the model given in the new model field.</i>	input		available models
New colour	<i>if non-blank, the colour of the selected string will be changed to the colour given in the new colour field.</i>	input		available colours
New point-line	<i>if non-blank, the breakline type of the selected string will be changed to the type given in the new point-line field (point or line type).</i>	input		point, line
New style	<i>if non-blank, the style of the selected string will be changed to the name given in the new style field.</i>	input		

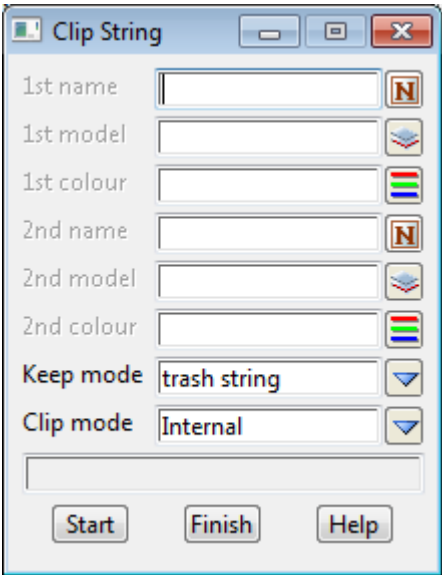

Please continue to the next section [Clip](#).

Clip

Position of option on menu: Strings =>Strings Edit =>Clip

The **Clip** option can be used to delete or keep part of a string.

On selecting the Clip option, the **Clip string** panel is displayed.

After selecting the **clip** option, the user is asked to select the string to be clipped. The user is then asked to select two points on the string to define the section to be clipped.

Depending on the **clip mode**, either

- (a) a new string is created from the section of the string between the two points
- (b) two new strings are created by deleting the section of the string between the two points
- (c) one new string is created by deleting the section of the string between the two points and then joining the two selected points.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the 1st half of the clipped string. Otherwise the values of the original string are used for the 1st half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the clipped string. Otherwise the values of the original string are used for the second half of the string.

If the **keep mode** is set to

- keep string**, the original string is kept
- trash string**, the original string is moved to the trash model
- delete string**, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		
<i>if blank, the first half of the clipped string is given the name of the original string.</i> <i>If non-blank, the first half of the clipped string is given the name in the 1st name field.</i>			
1st model	input		available models
<i>if blank, the first half of the clipped string is placed in the same model as the original selected string.</i> <i>If non-blank, the first half of the clipped string is placed in the model given in the 1st model field.</i>			

1st colour	input	available colours
<i>if blank, the first half of the clipped string is given the colour of the original string.</i> <i>If non-blank, the first half of the clipped string is given the colour specified in the 1st colour field.</i>		
2nd name	input	
<i>if blank, the second half of the clipped string is given the name of the original string.</i> <i>If non-blank, the second half of the clipped string is given the name in the 2nd name field.</i>		
2nd model	input	available models
<i>if blank, the second half of the clipped string is placed in the same model as the original selected string.</i> <i>If non-blank, the second half of the clipped string is placed in the model given in the 2nd model field.</i>		
2nd colour	input	available colours
<i>if blank, the second half of the clipped string is given the colour of the original string.</i> <i>If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour field.</i>		
Keep mode	input	keep string delete, keep, trash string
<i>if delete string, the string selected to be clipped is deleted.</i> <i>keep string, the selected string is not deleted.</i> <i>trash string, the string selected to be clipped is moved to the trash model.</i>		
Clip mode	input	internal internal, external, join external
<i>if internal, a new string is created from the section of string between the two selected points.</i> <i>external, two new strings are created by deleting the section of the string between the two points.</i> <i>join external, one new string is created by deleting the section of the string between the two points and then joining the two selected points.</i>		

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the first and second parts of the clipped string.
- (b) The string to be clipped is selected.
- (c) The points to be used as the clipped point are then selected.
- (d) The section of the string is then clipped between the selected points and depending on the **clip mode**, the selected string is then clipped or the clipped section kept.

Please continue to the next section [Close](#).

Close

Position of option on menu: Strings =>Strings Edit =>Close

A closed string is simply a string whose 1st and last points are the same.

The `close` string option adds to the end of the string, a point that is identical to the 1st string point. This then forms a closed string.

On selecting the `close` option, the **close string** panel is displayed.

The `close` option is already in progress and if a string is selected, it is closed.

Please continue to the next section [Delete](#).

Delete

Position of option on menu: Strings =>Strings Edit =>Delete

Entire strings can be deleted from the model using the **Delete** option.

On selecting the **Delete** string option, the **Delete string** panel is displayed.

The **delete** option is already in progress and if a string is selected (LB) and accepted (MB), it is deleted

If the **trash mode** in the **trash defaults** panel is set to **trash string**, the original string is not deleted but moved to the trash model.

Please continue to the next section [Duplicate](#).

Duplicate

Position of option on menu: Strings =>Strings Edit =>Duplicate

The **duplicate** option is used to make a copy of the string with the option of giving the duplicate string a new model, colour and/or name.

On selecting the **duplicate** option, the **duplicate string** panel is displayed.

The **duplicate** option is already is progress and if a string is selected, then a copy of the string will be created and possibly given a new model, colour or name depending on the fields in the **duplicate string** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		

if the **new name** field is blank, the duplicate string has the same name as the original string. If the

new name field is non-blank, then the duplicate string is given the name in the **new name** field.

New model

input

available models

*if **new model** is blank, the duplicate string is placed in the same model as the original string. If the **new model** field is non-blank, then the duplicate string is placed in the model given in the **new model** field.*

New colour

input

available colours

*if the **new colour** field is blank, the duplicate string has the same colour as the original string. If the **new colour** field is non-blank, then the duplicate string is given the colour specified in the **new colour** field.*

Please continue to the next section [Join](#).

Join

Position of option on menu: Strings =>Strings Edit =>Join

The **Join** option is used to create a new string by joining two existing strings together.

On selecting the **Join** option, the **Join strings** panel is displayed.

After selecting the **Join** option, the user is asked to select in turn the two strings that make up the joined string.

First, the string that will become the first half of the new joined string is selected with the direction that the string will have as the first half of the new string.

Next, the string that will become the second half of the new joined string is selected with the direction that the string will have as the second half of the new string.

The end of the first selected directed string and the beginning of the second selected directed string are joined to form the new joined string.

If the model, colour and/or name panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the **keep mode** is set to

- keep string**, the original strings are kept
- trash string**, the original strings are moved to the trash model
- delete string**, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description

Type

Defaults

Pop-Up

New name

input

*if the **new name** field is blank, the joined string is given the name of the first selected string. If the **new name** field is non-blank, the joined string is given the name in the **new name** field.*

New model	input	available models
<i>if new model is blank, the joined string is placed in the same model as the first selected string. If the new model field is non-blank, the joined string is placed in the model given in the new model field.</i>		
New colour	input	available colours
<i>if the new colour field is blank, the joined string is given the colour of the first selected string. If the new colour field is non-blank, then the joined string is given the colour specified in the new colour field.</i>		
Keep mode	input	keep strings delete string, keep strings
<i>if delete string, the selected strings selected are deleted.</i>		
<i>keep string, the selected strings are not deleted.</i>		
<i>trash string, the strings selected to be joined are moved to the trash model.</i>		

How to Use the Panel

- (a) Enter the new model, colour and name for the joined string.
- (b) The 1st string is selected by picking it with the required direction.
- (c) The string to be joined to the 1st selected string is selected by picking it with the required direction.
- (d) The last point of the 1st directed string and the 1st point of the second directed string are joined to create a new string with model, colour, name as specified in the **join strings** panel.

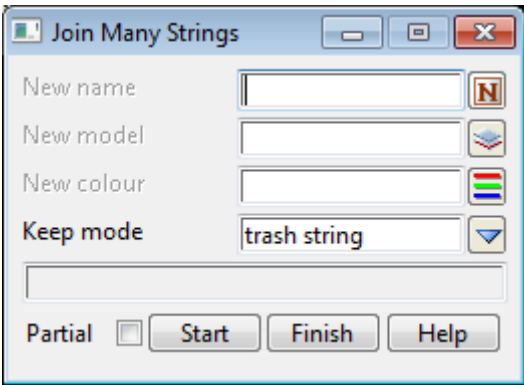

Please continue to the next section [Join Many](#).

Join Many

Position of option on menu: Strings =>Strings Edit =>Join many

The **Join many** option is used to create a new string by joining two or more existing strings, or parts or strings, together.

On selecting the **Join many** option, the **Join many strings** panel is displayed.

After selecting the **Join many** option, the user is asked to select in turn the strings that will make up the joined string. Using the partial mode, parts of strings can be joined.

First, the string that will become the first part of the new joined string is selected with the direction that the string will have as the first part of the new string.

If partial is **set (tick)**, two points are then picked on the string and only the part of the string between the picked points is used in the join.

Next, the strings that will become the subsequent parts of the new joined string are selected in order with the direction that the strings will have in the new joined string.

Again, whenever partial is **set (tick)**, two points are picked on the selected string and only the

part of the string between the picked points is used in the join.

The end of each selected directed string (or partial string) is joined to the beginning of the subsequent selected directed string (or partial string) when forming the joined string.

If the name, model and/or colour panel fields are non-blank, their values are used for the new joined string. Otherwise the values from the first selected string are used for the joined string.

If the **keep mode** is set to

- keep string**, the original strings are kept
- trash string**, the original strings are moved to the trash model
- delete string**, the original strings are deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	input		
<i>if blank, the joined string is given the name of the first selected string.</i>			
<i>If non-blank, the joined string is given the name in the new name field.</i>			
New model	input		available models
<i>if blank, the joined string is placed in the same model as the first selected string.</i>			
<i>If non-blank, the joined string is placed in the model given in the new model field.</i>			
New colour	input		available colours
<i>if blank, the joined string is given the colour of the first selected string.</i>			
<i>If non-blank, the joined string is given the colour specified in the new colour field.</i>			
Keep mode	input	keep strings	delete strings, keep strings
<i>if delete string, the selected strings are deleted.</i>			
<i>keep string, the selected strings are not deleted.</i>			
<i>trash string, the strings selected to be joined are moved to the trash model.</i>			
Partial	tick		
<i>if ticked, two points are then picked on the string and only the part of the string between the picked points is used in the join.</i>			
<i>if not ticked, no extra points are required and the entire string is used.</i>			

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the joined string.
- (b) The first string to be joined is then selected by picking the required string with the required direction, plus two points to restrict the string if partial is set on.
- (c) The second and subsequent strings to be joined are then selected (or partial string if partial is set on) in order and with the required direction.
- (d) The last point of each directed string is connected to the first point of the subsequent directed string to create a new joined string. The model, colour and name as specified in the **join many strings** panel are used for the new string.

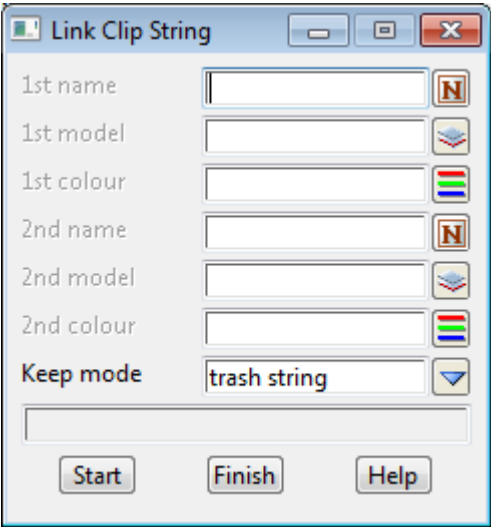

Please continue to the next section [Link Clip](#).

Link Clip

Position of option on menu: Strings =>Strings Edit =>Link clip

The **link clip** option can be used to **delete** the link joining two adjacent vertices of a string.

On selecting the link clip option, the **link clip string** panel is displayed.

After selecting the **link clip** option, the user selects the link of the string to be clipped. On acceptance, the selected link is deleted from the string, thus creating two new strings.

If the 1st name, 1st model and/or 1st colour panel fields are non-blank, the values are used for the first half of the link clipped string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the link clipped string. Otherwise the values of the original string are used for the second half of the string.

If the **keep mode** is set to

- keep string**, the original string is kept
- trash string**, the original string is moved to the trash model
- delete string**, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name	input		
<i>if blank, the first half of the clipped string is given the name of the original string.</i> <i>If non-blank, the first half of the clipped string is given the name in the 1st name field.</i>			
1st model	input		available models
<i>if blank, the first half of the clipped string is placed in the same model as the original selected string.</i> <i>If non-blank, the first half of the clipped string is placed in the model given in the 1st model field.</i>			
1st colour	input		available colours
<i>if blank, the first half of the clipped string is given the colour of the original string.</i> <i>If non-blank, the first half of the clipped string is given the colour specified in the 1st colour field.</i>			
2nd name	input		
<i>if blank, the second half of the clipped string is given the name of the original string.</i> <i>If non-blank, the second half of the clipped string is given the name in the 2nd name field.</i>			
2nd model	input		available models
<i>if blank, the second half of the clipped string is placed in the same model as the original selected string.</i> <i>If non-blank, the second half of the clipped string is placed in the model given in the 2nd model field.</i>			
2nd colour	input		available colours
<i>if blank, the second half of the clipped string is given the colour of the original string.</i> <i>If non-blank, the second half of the clipped string is given the colour specified in the 2nd colour field.</i>			

Keep mode input keep string delete, keep, trash string

if delete string, the string selected to be clipped is deleted.
keep string, the selected string is not deleted.
trash string, the string selected to be clipped is moved to the trash model.

Please continue to the next section [Open](#).

Open

Position of option on menu: Strings =>Strings Edit =>Open

A closed string is opened by removing the last point of the string.

On selecting the **open** option, the **open string** panel is displayed.

The **open** option is already in progress and if a closed string is selected, it is opened.

Please continue to the next section [Parallel](#).

Parallel

Position of option on menu: Strings =>Strings Edit =>Parallel

Strings, or parts of strings, can be translated perpendicularly to either the left or right using the **parallel** option. The z-values of the string can also be adjusted by a constant value.

The difference between a **translate** and a **parallel** is that for a straight **translate**, the translation vector is the same for the whole string. In a **parallel**, the translation is at right angles to each link of the string and hence the translation direction varies along the string.

For example, the edge of a road is a parallel of the centre-line, not a copy of the centre-line.

On selecting the **parallel** option, the **Parallel String** panel is displayed.

The user is then asked to select the string to parallel.

If partial is **not set**, the string is copied parallel through the distance given in the offset field.

If partial is **set (tick)**, two points are then picked on the string and only the part of the string

between the picked points is copied parallel through the distance given in the offset field.

The value in the **delta ht** field is then added to the z-values of the string.

The direction imposed upon the string when selecting it is used to determine what is the left and right side of the string in the **parallel** operation.

A positive offset parallels the string to the right with respect to the direction of picking. A negative offset parallels to the left with respect to the direction of picking.

Hence, the fields and buttons used in the **parallel string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name <i>if blank, the paralleled string is given the name of the original string.</i> <i>If non-blank, the parallel string is given the name in the new name field.</i>	input		
New model <i>if blank, the paralleled string is placed in the same model as the original selected string.</i> <i>If non-blank, the paralleled string is placed in the model given in the new model field.</i>	input		available models
New colour <i>if blank, the paralleled string is given the colour of the original string.</i> <i>If non-blank, the paralleled string is given the colour specified in the new colour field.</i>	input		available colours
Offset <i>distance (in world units) that the string will be copied parallel through. A positive distance denotes that the string will be paralleled to the right of the original string.</i>	input		
Delta ht <i>value to add to the z-values of the string.</i>	input		
Partial <i>if ticked, two points are then picked on the string and only the part of the string between the picked points is used in the parallel.</i> <i>if no ticked, no extra points are required and the entire string is used.</i>	tick		

How to Use the Panel

- (a) Enter the new model, colour and name for the paralleled string.
- (b) Enter the offset distance for the parallel - left and right is determined by picking direction.
- (c) Enter the height to add to the string's z-values in the delta ht field.
- (d) The selected string (or partial string if partial is set on) is then copied parallel as required.

Please continue to the next section [Reverse](#).

Reverse

Position of option on menu: Strings =>Strings Edit =>Reverse

The reverse string option simply reverses the order of the points in a string.

On selecting the reverse option, the **reverse string** panel is displayed.

After selecting the **reverse** option, the user simply picks (LB) the string that is to have its point order reversed and on acceptance (MB) of the string, the reversing takes place.

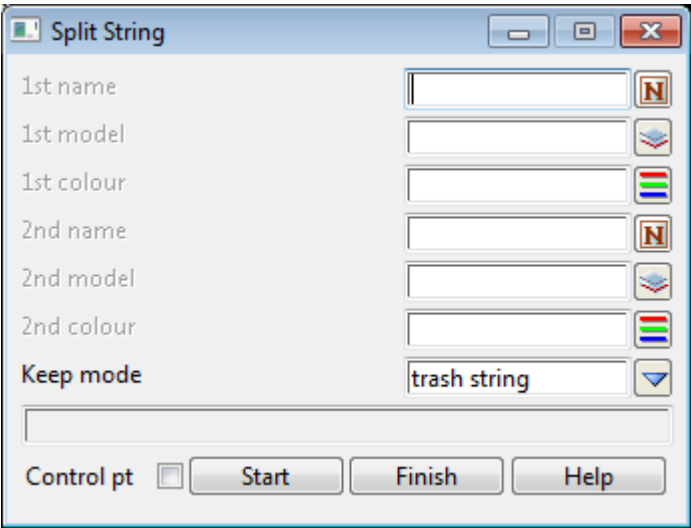

Please continue to the next section [Split](#).

Split

Position of option on menu: Strings =>Strings Edit =>Split

The **Split** option is used to create two new strings by splitting an existing string about a selected point on the string.

On selecting the **Split** option, the **Split string** panel is displayed.

If **control point** is set **off**, after selecting the **split** option, the user is asked to select the string and the selection point is **also** used as a split point. Hence the one point is used to select the string and as the split point.

If **control point** is set **on**, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point. Hence the **string select** and the **split point** are selected separately.

Two strings are then created by splitting the chosen string about the split point.

If the 1st name, 1st model and/or 1st colour panel fields are non- blank, the values are used for the first half of the split string. Otherwise the values of the original string are used for the first half of the string.

If the 2nd name, 2nd model and/or 2nd colour panel fields are non-blank, the values are used for the second half of the split string. Otherwise the values of the original string are used for the second half of the string.

If the **keep mode** is set to
keep string, the original string is kept
trash string, the original string is moved to the trash model
delete string, the original string will be deleted.

Hence, the fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
1st name <i>if blank, the first half of the split string is given the name of the original string.</i> <i>If non-blank, the first half of the split string is given the name in the 1st name field.</i>	input		
1st model <i>if blank, the first half of the split string is placed in the same model as the original selected string.</i> <i>If non-blank, the first half of the split string is placed in the model given in the 1st model field.</i>	input		available models
1st colour <i>if blank, the first half of the split string is given the colour of the original string.</i> <i>If non-blank, then the first half of the split string is given the colour specified in the 1st colour field.</i>	input		available colours
2nd name <i>if blank, the second half of the split string is given the name of the original string.</i> <i>If non-blank, the second half of the split string is given the name in the 2nd name field.</i>	input		
2nd model <i>if blank, the second half of the split string is placed in the same model as the original selected string.</i> <i>If non-blank, the second half of the split string is placed in the model given in the 2nd model field.</i>	input		available models
2nd colour <i>if blank, the second half of the split string is given the colour of the original string.</i> <i>If non-blank, then the second half of the split string is given the colour specified in the 2nd colour field.</i>	input		available colours
Keep mode <i>if delete string, the string selected to be split is deleted.</i> <i>keep string, the selected string is not deleted.</i> <i>trash string, the string selected to be split is moved to the trash model.</i>	input	keep string	delete, keep, trash string
Control pt <i>If ticked, the user is asked to select the string to split and then pick the point that is dropped perpendicularly onto the selected string as the point on the string to be used as a split point.</i> <i>If not ticked, the user is asked to select the string and the selection point is also used as a split point.</i>	tick		

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the first and second parts of the split string.
- (b) If control is on, the string is selected and then the split point is selected.
If control is off, the string is selected and the same point is to be used as the split point.
- (c) The chosen string is then split about the split point and the two halves given models, colours and names as defined by the split string panel.

Please continue to the next section [Translate](#).

Translate

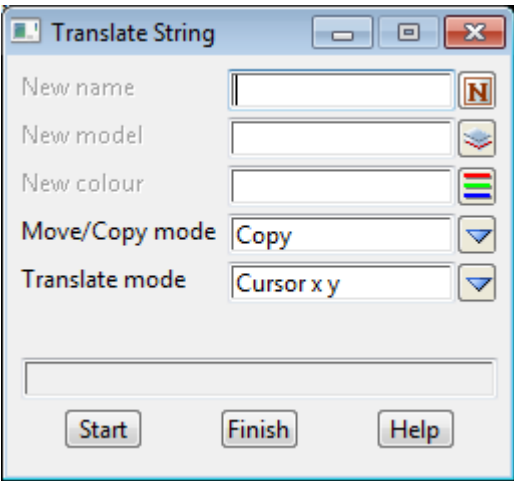

Position of option on menu: Strings =>Strings Edit =>Translate

Entire strings can be translated in the x,y and z directions using the **translate** option.

The translated string can either be moved or copied to its new translated position.

The difference between a **copy** or a **move** is simply that if a string is copied, a copy of the string is translated and the original string left untouched, whereas for a move, the actual string is moved from its original position to the new translated position.

On selecting the **Translate** option, the **Translate string** panel is displayed.

The selected string is translated by using the cursor to select a position on the string (the before point) and then selecting the position (not necessarily on a string) that the point will be translated to (after point).

Hence the translate operation requires two positions - a before and an after point - for the translation to be defined.

The first position (the before point) is selected using the normal select procedures. The second position (the after point) depends entirely on the **translate mode**.

If the **translate mode** is set to

cursor x y z OR **cursor x y**

the cursor is used to not only select the string point but also to indicate where it is to be moved/ copied to.

typed x y z

the second point has the absolute coordinates given in the **x y z** field.

typed dx dy dz

the second point is defined relative to the first point by the adding the dx dy dz given in the **dx dy dz** field.

Selected strings will be translated until the option is finished.

The fields and buttons used in the **translate** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
New name	<i>if blank, the string is given the name of the original string. If non-blank, the string is given the name in the new name field.</i>	input		
New model	<i>if blank, the string is placed in the same model as the original selected string. If non-blank, the string is placed in the model given in the New model field.</i>	input		available models
New colour	<i>if blank, the string is given the colour of the original string. If non-blank, then the string is given the colour specified in the new colour field.</i>	input		available colours

Translate mode	input	cursor xy	cursor xy, cursor xyz, typed xyz, typed dxdydz
-----------------------	-------	-----------	---------------------------------------------------

see comments about translate mode in the general description of move/copy

x y z	input
--------------	-------

*if **Translate mode** is **Typed x y z** then this field appears and the position on the string where the string was selected is translated to this co-ordinate.*

dx dy dz	input
-----------------	-------

*if **Translate mode** is **Typed dx dy dz** then this field appears and the selected string is translated by the given dx dy dz.*

Move/copy mode	input	move	copy, move
-----------------------	-------	------	------------

*if the mode is set to **move**, the string is translated as defined in the panel fields and the original string is deleted. If the mode is **copy**, the original string is left alone.*

How to Use the Panel and Panel Messages

- (a) Enter the new model, colour and name for the translated string.
- (b) The string to be translated and its “before” point is chosen.
- (c) The “after” point is chosen according to the translate mode.
- (d) The selected string is then translated (moved or copied) as required.

Please continue to the next section [Textdata Info](#).

Textdata Info

Position of option on menu: Strings =>Strings Edit =>Textdata info

The **Textdata info** option is used to change the information about the text for a text string, super strings and text for 4d strings.

Selecting the option, the **Change Textstyle Info** panel:

The parameters for the textstyle information are set and then any selected string is given the new textstyle parameters. If any of the parameters are left blank, then that parameter is not modified for the selected string.

To define the Textstyle info parameters, click on the text button and then the **edit** button.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New textstyle info	textstyle data		
<i>textstyle information to use for the selected strings.</i>			
Change	button		
<i>selected strings will have their text modified by the parameters in the new textstyle info field.</i>			

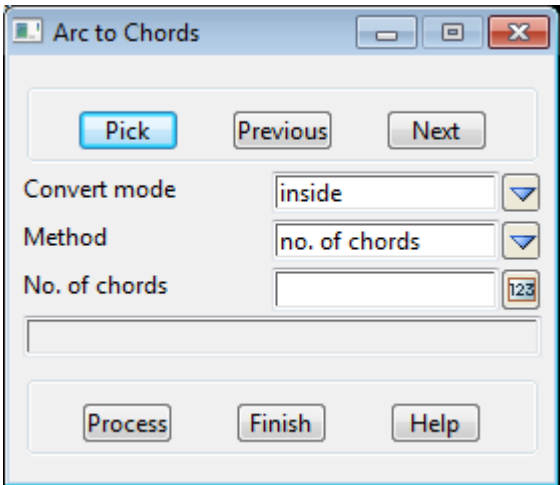

Arc to Chords

Position of option on menu: Strings =>Strings Edit =>Arc to chords

The *Arc to Chord* option works on a super string and creates inside or outside chords for any arc segments in the super string.

The number of chords created can be defined by giving the number of chords required, a chord length to use for each chord, or an arc to chord tolerance.

On selecting the **Arc to chords** option, the **Arc to Chords** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick <i>select the super string to edit.</i>	button		
Previous <i>move to the previous segment of the super string.</i>	button		
Next <i>move to the next segment of the super string.</i>	button		
Convert mode <i>create the chords on the inside or the outside of the arc.</i>	choice box	inside	inside outside
Method <i>method for creating the chord.</i>	choice box	no. of chords	no. of chords chord length arc to chord tolerance
No. of Chords, Chord length, Arc to chord tolerance <i>value to use with the Method.</i>			
Process <i>create chords for the selected segment of the super string.</i>	button		

Segment Strings

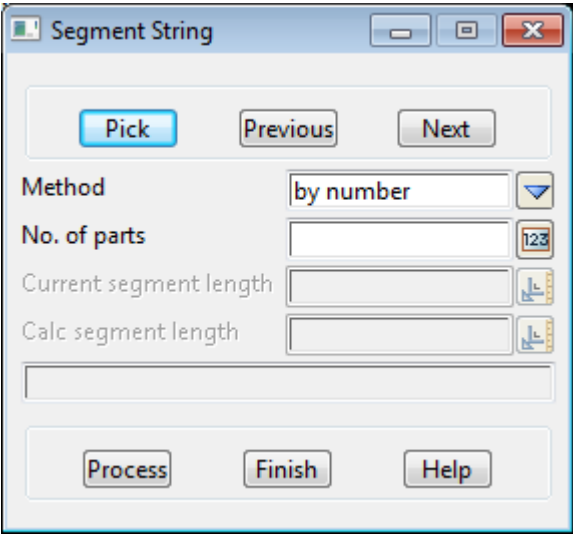

Position of option on menu: Strings =>Strings Edit =>Segment string

The *Segment string* option works on a super string and inserts extra points on an arc or line segment of the super string to break it into smaller arc or line segments.

The number of arcs/lines created can be controlled by specifying either

- (a) the number of sub-segments required
- (b) a single sub-segment length to break the start of the segment into that length
- (c) a sub-segment length to break the segment into as many sub-segments of that length as possible.

On selecting the *Segment strings* option, the **Segment String** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Pick		button		
-------------	--	--------	--	--

select the super string to edit.

Corner Splays

Position of option on menu: Strings =>Strings Edit =>Corner splays

The *Corner splays* option works on a super string and creates splays between two adjacent straight segments.

The number of chords created can be defined by giving the number of sub-segments required, one sub-segment length to beak of the segment or a sub-segment length to beak the segment into as many sub-segments as possible.

On selecting the **Corner splays** option, the **Corner splays** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
No of chords			
<i>value to use with the Method.</i>			
Convert mode	choice box	arc length	arc length arc radius chord length total chords length tangent length
<i>method for creating the corner splays.</i>			
Arc length, Arc radius, Chord length, Total chords length, tangent length			
<i>value to use with the Convert mode.</i>			
Name	input		
<i>the name of the new string.</i>			
Model	input		available models
<i>name of the model that the new string is in.</i>			
Colour	input	default colour	available colours
<i>the colour of the new string.</i>			
Keep original string	tick box	tick	
<i>if ticked, the original string is not modified and a new string is created with the corner splays. If not ticked, the original string is modified.</i>			

Pick

button

select a super string and the splays will be created.

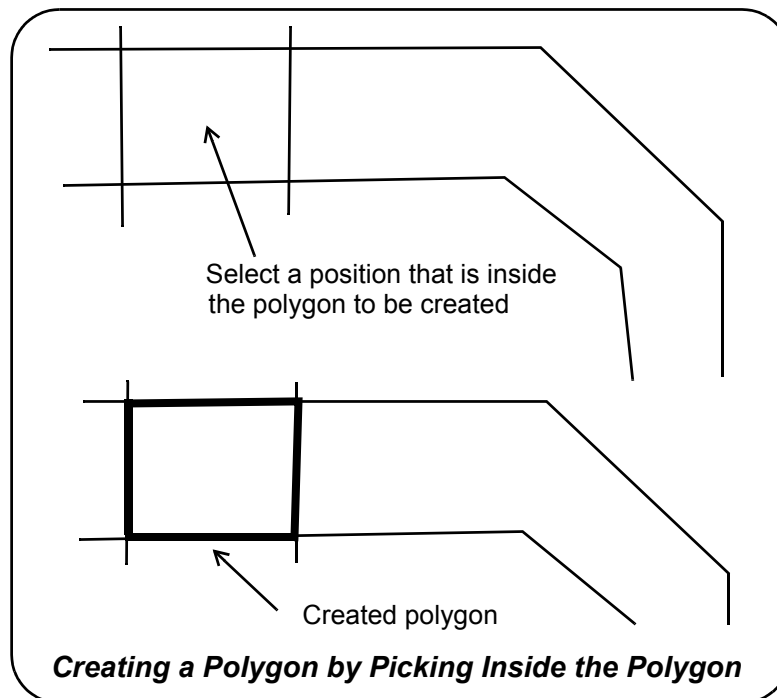

Surrounding Polygon

Position of option on menu: Strings =>Strings Edit =>Surrounding polygon

The *Surrounding polygon* option works on all the super strings on the view surrounding a selected position (point) and, if possible, creates a closed polygon from parts of the strings surrounding the selected point.

A straight line must be able to be drawn from the selected point to the lines/arcs that could be used in the surrounding strings.

This option creates a lot/polygon by a picking inside a collection of strings and the lot/polygon is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot/polygon can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot/polygon side without cutting any other segment.

On selecting the Surrounding polygon option, the **Create Polygon - Pick Point Inside** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new created polygon.</i>	input		
Model <i>model for the created polygon.</i>	input		available models
Colour <i>colour for the created polygon.</i>	input	default colour	available colours
Pick	button		
<i>pick a position on a view and the surrounding polygon will be created from all the super strings on the view.</i>			

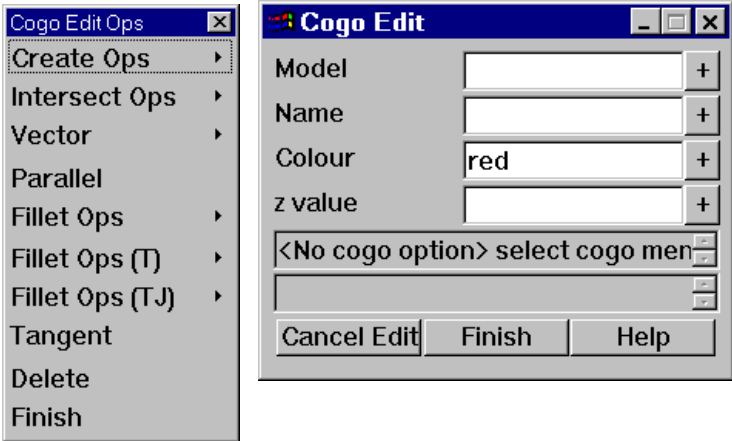

Cogo

Position on menu: Strings =>Cogo

Note: This option is no longer available.

The Cogo (co-ordinate geometry) options provide methods of constructing points, lines and arcs from a variety of operations such as picking, filleting, intersecting and finding tangents.

Selecting the cogo option creates the Cogo edit ops menu and the Cogo edit panel.

The options in the **cogo edit ops** menu all create either a point, string or arc and the **cogo edit** panel remains on the screen for each of the menu options and provides the string properties for any created objects.

All of the options chosen from the **Cogo edits ops** menu and its sub-menus repeat until cancelled by the user. That is, the option remains in force and can be applied repeatedly until terminated by the user.

The name of the current selected option is displayed in the first message area of the **cogo edit** panel.

To select a new **Cogo edits ops** option, simply select the new option from the **Cogo edit ops** menu or sub-menus. The current option is automatically terminated and the new option begun.

An option is also terminated when either the **cancel** or **finish** button is selected in the **Cogo edit** panel, or **finish** is elected from the **Cogo edit ops** menu.

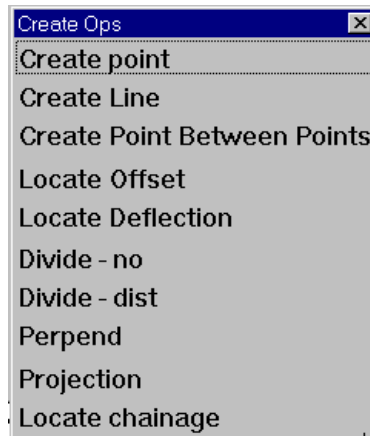

Each of the options in the **Cogo edit ops** menu will now be discussed.

For the option <i>Create ops</i> , go to	Create Ops
<i>Intersect ops</i>	Intersect Ops

Create Point

After selecting the **Create point** option, the user simply selects a point using the normal picking sequence.

The point will be created with name, colour and model from the **cogo edit** panel.

If no z-value is given in the **cogo edit** panel, then a null z-value is used.

If **height snap** is on and the point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. The snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the **cogo edit** panel. If no value exists in the **cogo edit**, an error message **please specify z value** is displayed in the **cogo edit** message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

<<Create Point> Select position for point> [picks][][][menu]

Create Line

After selecting the **create line** option, the user simply selects two points to be the end points of the line using the normal picking sequence.

The line will be created with **name**, **colour** and **model** from the **cogo edit** panel.

If either end point is created by snapping to an existing point or line, the z-value for the point is taken from the snapped point or if tin snap is on, from the underlying triangulation. If no z-value exists, the z-value is taken from the **cogo edit** panel.

If height snap is on, the snapped z-value will be displayed in an enter height typed input box.

If required, this value can be modified by typing into the enter height box. If the box is empty, the z-value is taken from the **cogo edit** panel. If no value exists in the **cogo edit**, an error message **please specify z value** is displayed in the **cogo edit** message area.

The z-value in the enter height box is accepted by entering a <enter> in the box. The enter height box then disappears.

Screen message area

```
<<Create Line> Select 1st point on line> [picks][ ][menu]  
<<Create Line> Select 2nd point on line> [picks][ ][menu]
```

Create Point Between Points

The **create point between points** option allows the user to select two point to act as the end points of a line and then create a new point a user supplied given distance along that line.

After selecting the **create point between points** option, the user simply selects two points to act as the end points of the line using the normal picking sequence.

An enter distance from 1st point box is then displayed on the screen and the user simply enters the appropriate distance into the box, terminated with a <enter>. The box then disappears.

The point is then created with name, colour and model and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

```
<<Between> Select 1st point> [picks][ ][menu]  
<<Between> Select 2nd point> [picks][ ][menu]  
<Between> Enter distance from 1st point [caret][ ][menu] select a button
```

Locate Offset

The **locate offset** option is used to create a point at a given perpendicular offset distance from a user defined point on a selected item.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the **locate offset** option needs

- (a) a selected item
- (b) a control point
- (c) a projection distance
- (d) an offset distance

After selecting the **locate offset** option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

A distance along item box is then displayed on the screen and the user enters the appropriate distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

Finally an offset distance box is displayed on the screen. The user enters the appropriate offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

```
<<Locate Offset> Select item to project along> [picks][ ][menu]
<<Locate Offset> Select control point> [picks][ ][menu]
<Locate Offset> distance along item [caret][ ][menu] select a button
<Locate Offset> offset distance [caret][ ][menu] select a button
```

Locate Deflection

The **locate deflection** option is used to create a point at a given deflection angle and distance from a user defined point on a selected item.

The **locate deflection** option is very similar to the **locate offset** option except instead of going out perpendicular to the item, the user provides a deflection angle. Hence the **locate offset** is a special case of the **locate deflection** option when the deflection angle is ninety degrees.

The point on the item to offset from is determined by picking a control point on the item and projecting along the item by a given distance.

Hence the **locate deflection** option needs

- (a) a selected item
- (b) a control point
- (c) a projection distance
- (d) a deflection angle
- (e) a deflection distance

After selecting the **locate offset** option, the user picks the item to project along using the normal picking sequence. The direction imparted when picking the item determines the sense for direction along the item and offset left and right.

Next a control point on the item is picked.

Boxes for the distance along item, deflection angle and deflection distance are then (sequentially) displayed on the screen and the user enters the appropriate values into each box, terminated with a <enter>. The box then disappears.

A positive distance is in the picking direction of the item and a positive angle is an angle to the right of the item when moving in the picking direction of the item.

The appropriate point is then created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Screen message area

```
<<Locate Deflection> Select item to project along> [picks][ ][menu]
<<Locate Deflection> Select control point> [picks][ ][menu]
<Locate Deflection> distance along item [caret][ ][menu] select a button
<Locate Deflection> deflection distance [caret][ ][menu] select a button
```

<Locate Deflection> deflection angle [caret][][menu] select a button

Divide - Number

The **divide - nos** option is used to place points at positions which would divide an arc or a line into an equal number of pieces.

For example, if the option was used to show how and an arc could be divided into seven pieces, points would be placed at the six division marks. No point is placed at the start or end of the arc. Hence, the start and end points plus the division points divide the arc into the required number of divisions.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the **divide - nos** option, the user picks the item to divide using the normal picking sequence.

A no of divisions box is then displayed on the screen and the user enters the required number of divisions into the box, terminated with a <enter>. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

Screen message area

```
<<Divide by #> Select item to divide> [picks][ ][menu]  
<Divide by #> no division [caret][ ][menu] select a button
```

Divide - Distance

The **divide - dist** option is used to place points at positions which would divide an arc or a line into pieces of a given distance.

Note - unless the arc or line is exactly divisible by the distance, the last division will be smaller than the required distance.

Since the option will only divide an arc or a line, when an item is selected only the picked line or arc sub-element of the item will be divided.

On selecting the **divide - dist** option, the user picks the item to divide using the normal picking sequence.

A distance box is then displayed on the screen and the user enters the required distance for each division into the box, terminated with a <enter>. The box then disappears.

A point string is then created containing points at each of the required division positions. The string has the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

Screen message area

```
<<Divide by distance> Select item to divide> [picks][ ][menu]  
<Divide by #> distance [caret][ ][menu] select a button
```

Perpendicular

The **perpend** option is used to create the point which is the perpendicular projection of a selected point onto a selected line or arc.

Since the option can only drop a point onto an arc or a line, when the item is selected to project onto, only the picked line or arc sub-element of the item is used.

On selecting the **perpend** option, the user picks the point to drop perpendicularly.

The item to drop perpendicularly onto is then selected.

The point representing the perpendicular projection of the chosen point onto the selected item is then created. The created point has the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

Screen message area

```
<<Perpend> Select point to drop> [picks][ ][menu]
<<Perpend> Select item to drop onto> [picks][ ][menu]
```

Projection

The **projection** option is used to create a point which is given distance along a line or arc.

Since the option can only project a point along an arc or a line, when the item is selected to project along, only the picked line or arc sub-element of the item is used.

On selecting the **projection** option, the user picks the item to project along.

A distance box is then displayed on the screen and the user enters the appropriate projection distance into the box, terminated with a <enter>. The box then disappears. A positive distance is in the picking direction of the item.

The point representing the projected point along the selected item is then created using the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

Screen message area

```
<<Projection> Select item to project along> [picks][ ][menu]
<Projection> distance [caret][ ][menu] select a button
```

Locate Chainage

The **locate chainage** option is used to create a point at a given chainage on a selected string.

On selecting the **locate chainage** option, the user picks the item to locate the chainage on.

A locate chainage box is then displayed on the screen and the user enters the appropriate chainage into the box, terminated with a <enter>. The box then disappears.

A point at the given chainage on the selected item is then created using the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

Screen message area

```
<<Locate chainage> Select item to locate on> [picks][ ][menu]
<Locate chainage> chainage [caret][ ][menu] select a button
```

Please continue to the next section [Intersect Ops.](#)

Intersect Ops

The **Intersection** options are for finding various intersections of lines and arcs.

Most of intersect cases can have more than one solution. For example, the intersection of a line with an arc.

To easily distinguish between the cases, 12d Model uses the sense of direction implied when picking items to determine which case was required by the user.

The **Intersect ops** walk-right menu is

Each of the options in the **Intersect Ops** menu will now be discussed.

For the option *Intersect*, go to

Create line

intersect offset

Bearings intersect

2 pts 2 dists

[Intersect](#)

[Create Line](#)

[Intersect Offset](#)

[Bearings Intersect](#)

[Two Points, Two Distances](#)

Intersect

The **Intersect** option creates a point at the intersection of lines and arcs.

That is, it will find the intersection of

(a) a line with a line

(b) a line with an arc

or

(c) an arc with an arc

After selecting the **Intersect** option, the user simply selects the two items to intersect using the normal picking sequence.

If an intersect exists, a point is created at the intersection with **name**, **colour**, **model** and **z-value** from the **Cogo edit** panel.

If no z-value exists in the panel, no point is created.

When there is more than one possible solution, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

<<Intersect> Select 1st item to intersect> [picks][][menu]

<<Intersect> Select 2st item to intersect> [picks][][menu]

Intersect Offset

Like the **Intersect** option, **Intersect offset** is for creating points at the intersection of lines and arcs.

However, before the line or arc is used, it is offset by a user supplied distance.

Hence the intersection is between displaced lines and arcs.

A practical example of **intersect offset** is for finding the position of a manhole in a subdivision which is three metres from one property line and two metres from the culdesac arc.

After selecting the **intersect** option, the user selects the first item to intersect using the normal picking sequence.

A 1st offset box is then displayed on the screen and the user enters the appropriate offset for the first line into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

The second item to intersect is then selected and a 2nd offset box is displayed on the screen for the user to enter the offset for the second line.

If an intersect exists for the two offset items, a point is created at the intersection with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

As in the **intersect** option, when more than one solutions is possible, the order of picking and the directions imparted when picking the items are used to determine which solution is required.

Since the option will only intersect arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the intersect.

Screen message area

```
<<Intersect Offset> Select 1st item to intersect> [picks][ ][menu]
<Intersect Offset> 1st offset [caret][ ][menu] select a button
<<Intersect Offset> Select 2st item to intersect> [picks][ ][menu]
<Intersect Offset> 2nd offset [caret][ ][menu] select a button
```

Bearings Intersect

The **Bearings intersect** option finds the intersect of the lines going through two user selected points at user supplied bearings.

Hence the option will calculate the point that is at given bearings from two selected points

After selecting the **bearings intersect** option, the user selects the first point using the normal picking sequence.

A bearing 1 box is then displayed on the screen and the user enters the bearing for the line through the point into the box, terminated with a <enter>. The box then disappears. The bearing is entered in degrees, minutes and seconds.

The second point is then selected and a bearing 2 box is displayed on the screen for the user to enter the bearing for the line through the second point.

The intersection of the two lines is then calculated and if it exists, a point is created at the intersection with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid **point** for the option

Screen message area

```
<<Bearings Intersect> Select 1st point> [picks][ ][menu]
<Bearings Intersect> bearing 1 [caret][ ][menu] select a button
<<Bearings Intersect> Select 2nd point> [picks][ ][menu]
<Bearings Intersect> bearing 2 [caret][ ][menu] select a button
```

Two Points, Two Distances

The **2 pts 2 dists** option find the point that given distances from two user selected points.

This problem is equivalent to finding the intersection of two circles centred on the points and with radii the same as the distances.

When there is more than one solution, the solution to the right of the line joining the two points is used. (the direction of the line is from the first point to the second point). To obtain the other solution, simply select the points in the opposite order.

After selecting the **2 pts 2 dists** option, the user selects the first point using the normal picking sequence.

A 1st distance box is then displayed on the screen and the user enters the distance that the new point is from the selected point into the box, terminated with a <enter>. The box then disappears.

The second point is then selected and a 2nd distance box is displayed on the screen for the user to enter the distance to the second point.

The point that is the required distances from the two points is created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel. If no z-value exists in the panel, no point is created.

Note

The selected points do not have to be actual points in a point string. Any snap or cursor position is a valid **point** for the option

Screen message area

```

<Locate 2 pts 2 dists> 1st distance [caret][ ][menu] select a button
<<Locate 2 pts 2 dists> Select 2nd point> [picks][ ][menu]
<Locate 2 pts 2 dists> 2nd distance [caret][ ][menu] select a button
```

Please continue to the next section [Vector](#).

Vector

The **vector** options are for creating points which are a given as at a given vector from another point.

The default definition of the vector is as (bearing, distance) but other combinations such as (angle, distance), relative (x,y) and absolute (x,y) are possible using normal typed input.

The methods for creating the new points are

- (a) locate - create a new point using a vector
- (b) radiation - the points created are all a vector from the initial point selected
- (c) traverse - the last point created becomes the next point to work from

The **vector** walk-right menu is

Each of the options in the **Vector Ops** menu will now be discussed.

For the option *Traverse*, go to [Traverse](#)

<i>Radiation</i>	Radiation
<i>Intersect offset</i>	Intersect Offset
<i>Locate</i>	Locate

Locate

In the **locate** option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

The sequence is then repeated by selecting another point and giving another vector.

After selecting the **locate** option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>. The box then disappears.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The sequence of picking a point and giving a vector is then repeated.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Locate> Select point> [picks][ ][menu]
<Locate> bearing distance [caret][ ][menu] select a button
```

Radiation

In the **radiation** option, a point is selected and a vector supplied to produce a new point which is the vector away from the initial point.

After selecting the **radiation** option, the user simply selects the point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point. The new point is given the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the new given bearing and distance from the original selected point.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Radiation> Select point> [picks][ ][menu]
<Radiation> bearing distance [caret][ ][menu] select a button
```

Traverse

In the **traverse** option, an initial point is chosen and a vector supplied to produce a new point which is the vector away from the initial point.

The created point is then taken to be the start point for the next sequence of creating a new point by a vector.

After selecting the **traverse** option, the user simply selects the first point to be used using the normal picking sequence.

A bearing distance box is then displayed on the screen and the user enters the required bearing and distance (separated by a space) into the box, terminated with a <enter>.

A new point is then created which is the given bearing and distance from the selected point.

The new point is given the **name**, **colour**, **model** and **z-value** from the **cogo edit** panel. If no z-value exists in the panel, the given z-value could be nonsense.

The bearing distance box remains on the screen.

If another value is entered into the box (or the previous one left) terminated by a <enter>, a new point is created which is the given bearing and distance from the last created point.

Hence, the last created point takes the place of the original selected point.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Traverse> Select point> [picks][ ][menu]  
<Traverse> bearing distance [caret][ ][menu] select a button
```

Please continue to the next section [Parallel](#).

Parallel

Items can be translated perpendicularly to either the left or right using the parallel option (also known as a copy parallel operation).

After selecting the **parallel** option, the user simply selects the item to paralleled using the normal picking sequence.

A offset box is then displayed on the screen and the user enters the required offset distance into the box, terminated with a <enter>. The box then disappears. A positive offset is to the right of the item when moving in the picking direction of the item.

A new item is then created which is a copy parallel of the selected item by the given offset distance. The new item has the **name**, **colour** and **model** from the **cogo edit** panel.

The option terminates when another cogo option is selected or the **cancel** button is selected on the **cogo edit** panel.

Screen message area

```
<<Parallel> Select item to parallel> [picks][ ][menu]  
<Parallel> offset> [caret][ ][menu] select a button
```

Please continue to the next section [Fillet Ops](#).

Fillet Ops

The **fillet** options are for creating an arc between lines and arcs.

That is, it will try and fit an arc between

(a) two lines

- (b) a line and an arc
- or
- (c) two arcs

The created arc is determined by tangents from the items it is a fillet for and another piece of information such as a radius or a start point.

Since the option can only fillet between arcs and lines, when an item is selected only the picked line or arc sub-element of the item is used in the fillet.

Most fillet cases can have more than one solution. For example, the fillet of a given radius between two lines can have up to four solutions.

To easily distinguish between the cases, **12d** Model uses the order of picking and the sense of direction implied when picking the items to determine which case was required by the user.

The direction is used as follows -

the arc comes off the first item in the direction that the first item is picked and lands on the second in the direction that the second item is picked.

The **fillet ops** walk-right menu is

Each of the options in the **Fillet Ops** menu will now be discussed.

For the option *Item Item Radius*, go to
 Item Item Point
 3 points

[Fillet Item Item Radius](#)
[Fillet Item Item Point](#)
[Fillet Three Points](#)

Fillet Item Item Radius

This fillet option creates an arc of a user given radius between two user selected items.

After selecting the **fillet item item radius** option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

An enter radius box is then displayed on the screen and the user types the appropriate radius for the fillet into the box, terminated with a <enter>. The box then disappears.

A positive radius implies that the arc travels in a clockwise direction and a negative radius for an arc travelling in an anti-clockwise direction.

If a fillet exists for the two items and the radius, an fillet arc is created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, no arc is created.

Screen message area

```
<<Fillet by radius> Select 1st item> [picks][ ][menu]
<<Fillet by radius> Select 2nd item> [picks][ ][menu]
<Fillet by radius> Enter radius [caret][ ][menu] select a button
```

Fillet Item Item Point

This fillet option creates an arc between two user selected items starting at a user defined control point.

After selecting the **fillet item item pt** option, the user selects the first item to be used in the fillet using the normal picking sequence.

Next the second item to be used in the fillet is selected.

Finally, a point is selected to act as the starting point for the fillet. This point, called the control point, must lie on the first item selected. If the selected point doesn't lie on the first item, the selected point is projected perpendicularly onto the item and the projected point used as the control point.

If a fillet exists for the two items and the control point, a fillet arc is created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

```
<<Fillet by start point> Select 1st item> [picks][ ][menu]
<<Fillet by start point> Select 2nd item> [picks][ ][menu]
<<Fillet by start point> Select start point> [picks][ ][menu]
```

Fillet Three Points

This option creates an arc between three user selected points.

After selecting the **fillet 3 pts** option, the user selects the three points one after another using the normal picking sequence.

The three arc points must be selected in the order

- (a) the start point
- (b) a point between the start and end point
- (c) the end point

If an arc does exist containing the three points, it will be unique including its direction. The arc will be created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used.

Screen message area

```
<<Fillet 3 points> Select 1st item> [picks][ ][menu]
<<Fillet 3 points> Select 2nd item> [picks][ ][menu]
<<Fillet 3 points> Select start point> [picks][ ][menu]
```

Please continue to the next section [Fillet Ops \(T\)](#).

Fillet Ops (T)

The **fillet (T)** options are the almost identical to the fillet options.

The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc.

The trimmed items are not joined to the fillet arc.

The original strings obey the trash defaults from the `utilities=>defaults=>trash defaults` option.

That is, if the trash mode is set to *keep string*, the original strings are untouched.

delete string,

deleted.

trash string,

moved to the trash model.

For information on the fillet options, see the section [Fillet Ops](#)

For the option *Item Item Radius*, please go to the section [Fillet Item Item Radius](#).

Item Item Point

[Fillet Item Item Point](#).

Please continue to the next section [Fillet Ops \(TJ\)](#).

Fillet Ops (TJ)

The **fillet (TJ)** options are the almost identical to the fillet and fillet (T) options.

The only difference is that after the fillet arc is created, the original items are trimmed back to the start and end of the arc and the three items joined to form a new item.

That is, the trimmed items are joined to the fillet arc.

The original strings obey the trash defaults from the `Utilities=>Defaults=>Trash defaults` option.

That is, if the trash mode is set to *keep string*, the original strings are untouched.

delete string,

deleted.

trash string,

moved to the trash model.

For information on the fillet options, see the section [Fillet Ops](#)

For the option *Item Item Radius*, please continue to the section [Fillet Item Item Radius](#).

Item Item Point

[Fillet Item Item Point](#).

Please continue to the next section [Tangent](#).

Tangent

The **tangent** option creates tangent lines between point and arcs.

That is, tangents can be defined between

(a) a point and an arc

(b) two arcs

or

(c) two points - simply a line between the two points

Since the option can only fillet between points and arcs, when an item is selected, only the picked sub-arc of the item is used as an arc.

Most tangent cases can have more than one solution. For example, two tangents from a point to an arc.

To easily distinguish between the cases, **12d Model** uses the order of picking the items and the sense of direction implied when picking an arc to determine which case was required by the user.

After selecting the **tangent** option, the user selects the first item to be used in the tangent calculations using the normal picking sequence.

Next the second item to be used is selected.

If a tangent line exists between the two items selected, a line string is created with **name**, **colour**, **model** and **z-value** from the **cogo edit** panel.

If no z-value exists in the panel, a null z-value is used for the line.

Screen message area

```
<<Tangent> Select 1st item> [picks][ ][menu]  
<<Tangent> Select 2nd item> [picks][ ][menu]
```

SA Tools

Position of Menu: Strings =>SA Tools

The SA Tools walk-right menu is

- information about a super alignment
- create a report on a super alignment
- resolve a super alignment
- dereference a super alignment
- reverse the super alignment direction
- parallel a super alignment
- translate a super alignment
- rotate a super alignment
- scale a super alignment
- split a super alignment
- join two super alignments
- copy the vertical geometry between super alignments
- convert fixed/floating to IPs
- change the style for super alignments
- explode the labelling to text and lines
- setting to lock the movement of IPs
- inquire about chainage equalities
- inquire about chainages
- make construction parts from super alignment segments
- run validation on a super alignment

<i>Validate</i>	Validate Super Alignment

Super Alignment Info

Position of option on menu: Strings =>SA tools =>Info

This section of documentation is a work in progress and will be updated in subsequent releases.

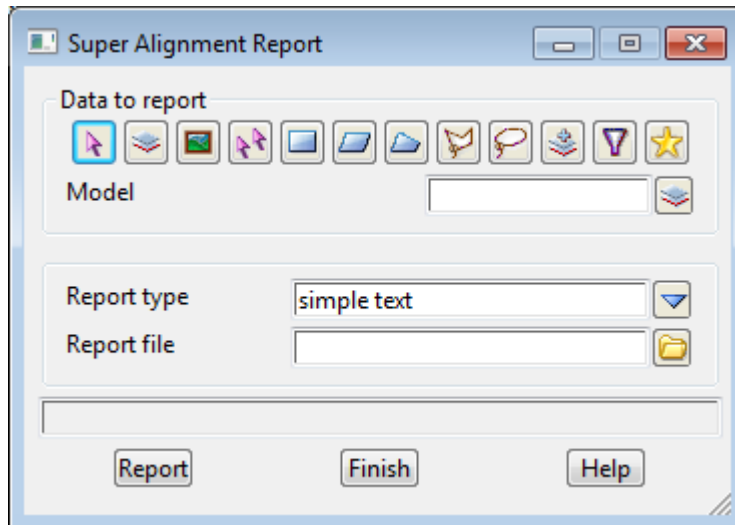

Selecting Info displays the **Super Alignment Info** panel.

Super Alignment Report

Position of option on menu: Strings =>SA tools =>Report

Selecting Report displays the **Super Alignment Report** panel.

For more information, please see [Super Alignment Report](#).

Resolve a Super Alignment

Position of option on menu: **Strings =>SA Tools =>Resolve**

When a super alignment is created using **computators**, the super alignment is defined with **references** to other strings. If the referenced strings are modified, then the super alignment will not automatically reflect the changes in the referenced strings.

Resolve forces the string to be resolved using the current position and properties of any referenced strings.

Selecting **Resolve** displays the **Resolve Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		
<i>select a super string to resolve.</i>			
Resolve	button		
<i>after the Resolve button is clicked, the super alignment is resolved using the new properties of any referenced strings.</i>			

Dereference Super Alignments

Position of option on menu: Strings =>SA Tools =>Deref

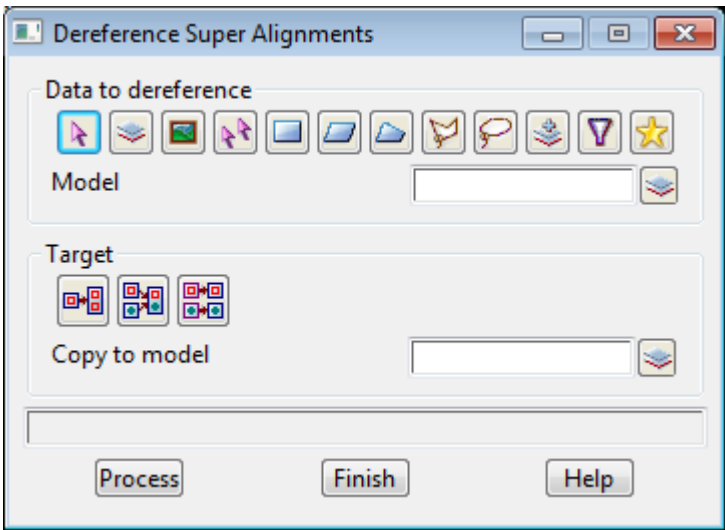

When a super alignment is created using **computators**, the super alignment is defined with **references** to other strings.

Dereferencing removes the *references* to other strings in a super alignment, and inserts copies of the referenced string in its place. Hence a dereferenced string looks like the original string, but it no longer has links to any other strings.

The **Deref** option copies the original string, and *dereferences* the copied string.

So after running **Deref** there are no longer any references to other strings in the copy of the super alignment.

Selecting **Deref** displays the **Dereference Super Alignments** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data to dereference			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data info		input		
	<i>extra information required for the Data source.</i>			
Target type				
	<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info		input		
	<i>extra information required for the target. Only the Copy Targets are allowed.</i>			
Process		button		
	<i>after the Process button is clicked, the selected strings are copied and dereferenced.</i>			

Dereference a Super Alignment

Position of option on menu: Super Alignment Toolbar =>Deref

When a super alignment is created using **computators**, the super alignment is defined with **references** to other strings.

Dereferencing removes the *references* to other strings in a super alignment, and inserts copies of the referenced string in its place. Hence a dereferenced string looks like the original string, but it no longer has links to any other strings.

The **Deref** option copies the original string, and *dereferences* the copied string.

So after running **Deref** there are no longer any references to other strings in the copy of the super alignment.

Selecting **Deref** from the Super Alignment Toolbar displays the **Dereference Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		
<i>selects the string to dereference.</i>			
Deref	button		
<i>after the Deref button is clicked, the selected string is copied and dereferenced.</i>			

Reverse Super Alignment

Position of option on menu: Strings =>SA Tools =>Reverse

Reverse creates a copy of the selected super alignment, and then reverses the direction of the copied super alignment.

If there are any computators in the super alignment, the copy of the super alignment will be dereferenced before being reversed.

Selecting Reverse displays the **Reverse Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

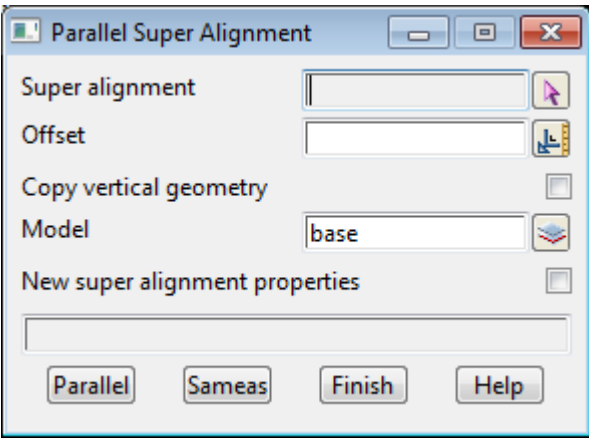

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		
<i>select the super alignment to copy and reverse the direction of the copied string</i>			
Reverse	button		
<i>after the Reverse button is clicked, the direction of the copied super alignment is reversed.</i>			

Parallel a Super Alignment

Position of option on menu: Strings =>SA Tools =>Parallel

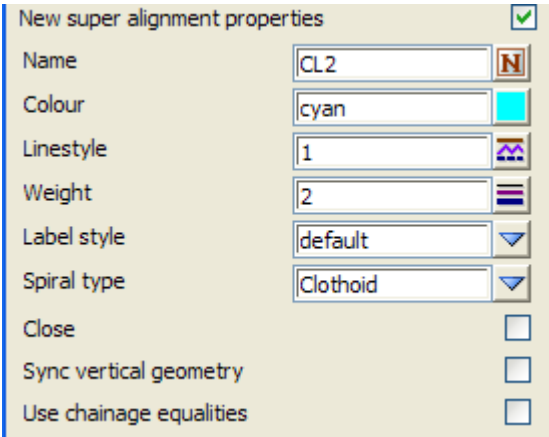

Parallel parallels the horizontal geometry of a super alignment by a user given offset.

Selecting **Parallel** displays the **Parallel Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to parallel</i>	string select		
Offset <i>distance to offset the selected super alignment</i>	input		
Model <i>if not blank, the model for the paralleled string. If blank, the model is the same as the selected string.</i>	model box		available models
New super alignment properties <i>if ticked, the panel is expanded to show all the properties that can be set for the new paralleled string.</i>	tick box		

Extra panel fields when
New super alignment properties
is ticked on

Name <i>the name of the new string</i>	input	from CAD controlbar
--------------------------------------------------	-------	---------------------

Colour	input	from CAD controlbar	available colours
<i>the colour of the new string</i>			
Linestyle	linestyle box	from CAD controlbar	available line styles
<i>line style of the string</i>			
Weight	input		
<i>thickness of the string</i>			
Label style	choice box	default	available label styles
<i>The super alignment style controls the way the super alignment draws and highlights on the screen.</i>			
<i>For more information please go to the section Super Alignment Style</i>			
Transition type	input	clothoid	clothoid, cubic parabola westrail-cubic, cubic spiral natural clothoid, blossom sinusoidal, cosinusoidal
<i>transition (for example clothoid spiral) to be used for this super alignment string. For more information see Transitions and Spirals File in the chapter Setting Up and Configuring 12d.</i>			

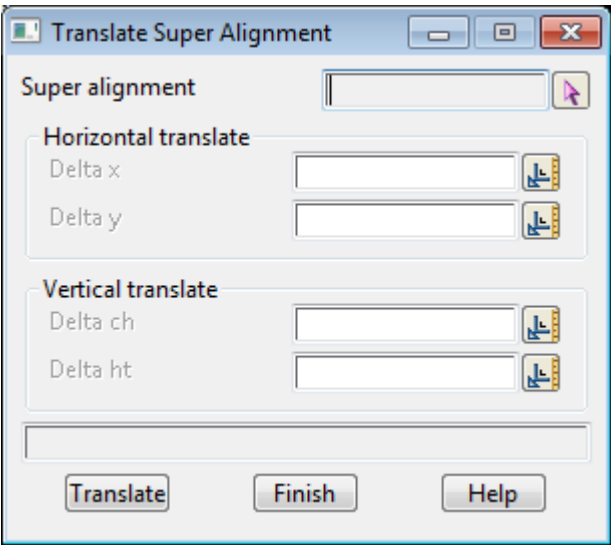

Chain file	file
<i>The chain parameter file to run every time the super alignment is resolved/recalced.</i>	
<i>For more information see the section Chains in the book Utilities</i>	
Close	tick box
<i>if ticked, the super alignment is automatically closed.</i>	
Sync vertical geometry	tick box
<i>if ticked, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.</i>	
<i>If not ticked, after horizontal geometry is modified, the vertical will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.</i>	
Use chainage equalities	tick box
<i>if ticked, chainage equalities can be defined and the automatic labelling of the string will use the equalities.</i>	
Parallel	button
<i>after the Parallel button is clicked, a dereferenced copy of the horizontal geometry of the super alignment is paralleled. The vertical geometry is deleted.</i>	
Same as	button
<i>after clicking Same as and then select a string. All the picked string properties will be loaded into the panel fields.</i>	

Translate Super Alignment

Position of option on menu: Strings =>SA Tools =>Translate

Translate copies the selected super alignment, and then dereferences and translates the copied string.

Selecting Translate displays the **Translate Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

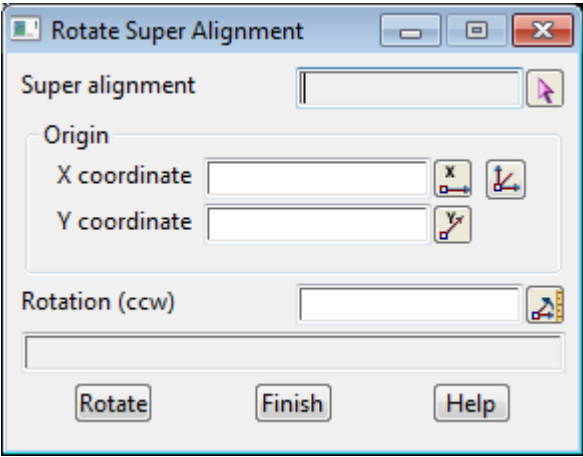

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select the super alignment to translate</i>	string select		
Horizontal translate <i>Delta x, Delta y: the x/y amounts to translate the string</i>			
Vertical translate <i>Delta ch, Delta z: the chainage/z amounts to translate the string</i>			
Translate <i>after the Translate button is clicked, the selected string is copied, and the copied string is translated.</i>	button		

Rotate Super Alignment

Position of option on menu: Strings =>SA Tools =>Rotate

Rotate copies the selected super alignment, and then dereferences and rotates the copied string about a user defined origin.

Selecting Rotate displays the **Rotate Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

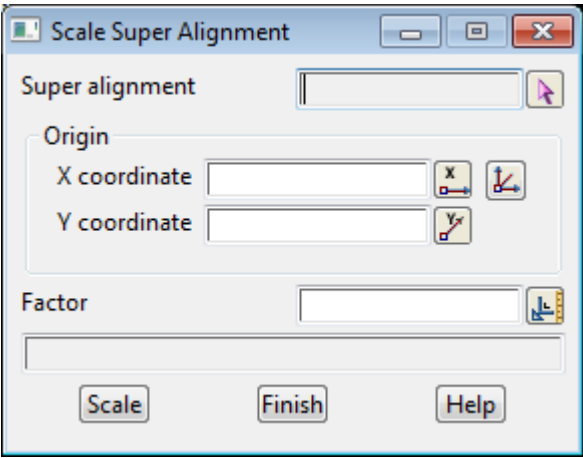

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		
<i>select the super alignment to copy and rotate the copied string</i>			
Origin			xyz ops
<i>select the centre (origin) of the rotation. The origin can be changed at any time.</i>			
Rotation	string select		
<i>the clockwise angle in dms to rotate through.</i>			
Rotate	button		
<i>after the Rotate button is clicked, the selected string is copied, and the copied string is rotated about the origin.</i>			

Scale Super Alignment

Position of option on menu: Strings =>SA Tools =>Scale

Scale copies the selected super alignment, and then dereferences and scales the copied string about a user defined origin.

Selecting Scale displays the **Scale Super Alignment** panel.

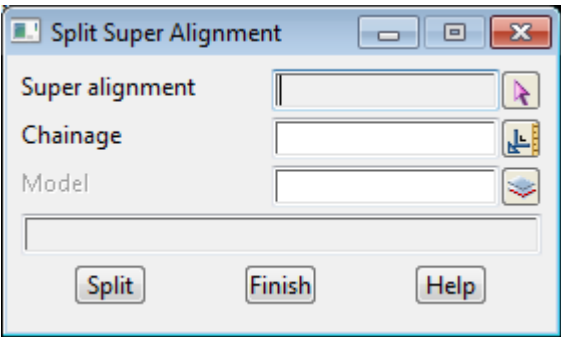

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select the super alignment to copy and scale</i>	string select		
Origin <i>select the origin to scale about. The origin can be changed at any time.</i>			xyz ops
Factor <i>amount to scale the copy of the super alignment by.</i>			
Scale <i>after the Scale button is clicked, the selected string is copied, and the copied string then scaled about the origin.</i>	button		

Split a Super Alignment

Position of option on menu: Strings =>SA Tools =>Split
Split copies and splits the copy of the super alignment at a user given chainage.
Selecting Split displays the **Split Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

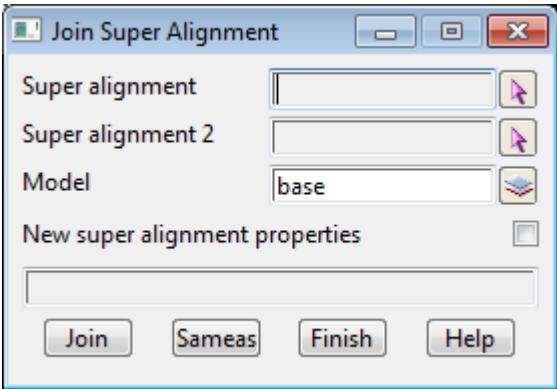

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to split</i>	string select		
Chainage <i>chainage to split the super alignment at</i>	input		
Model <i>if not blank, model for the split string</i> <i>If blank, use the model of the selected string</i>	model box		available models
Split <i>after the Split button is clicked, the super alignment is copied and split at the given chainage.</i>	button		

Joining Two Super Alignments

Position of option on menu: Strings =>SA Tools =>Join

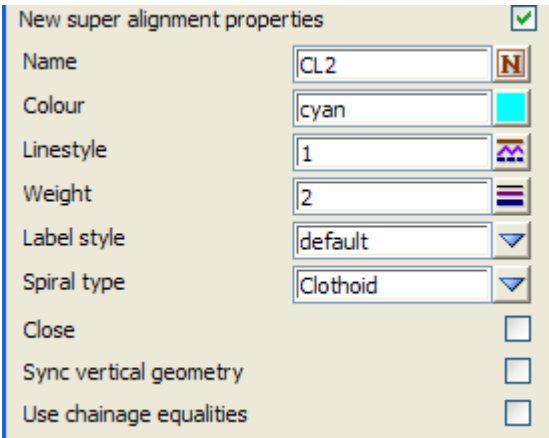

Join joins two super alignments at their ends to make a new super alignment.

Selecting **Join** displays the **Join Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to join</i>	string select		
Super alignment 2 <i>select a super alignment to join to the first selected super alignment</i>	string select		
Model <i>if not blank, model for the joined string</i> <i>If blank, use the model of the selected string for the joined string.</i>	model box		available models
New super alignment properties <i>if ticked, the panel is expanded to show all the properties that can be set for the new joined string.</i>	tick box		

Extra panel fields when
New super alignment properties
is ticked on

Join	button	<i>after the Join button is clicked, a new super alignments is created by joining the two super alignments</i>
Same as	button	<i>after clicking Same as and then select a string. All the picked string properties will be loaded into the</i>

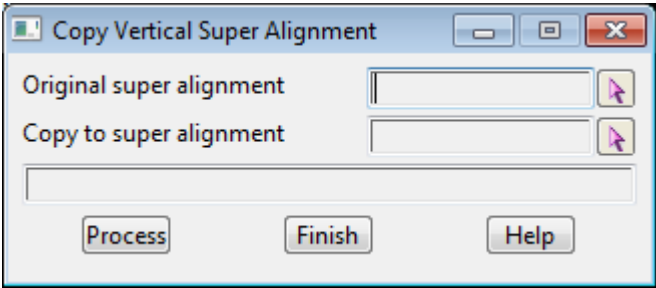

panel fields.

Copy Vertical Geometry

Position of option on menu: Strings =>SA Tools =>Copy vertical

Copies the vertical geometry from one super alignment to another super alignment. This will not work for a super alignment with computators.

Selecting **Copy vertical** displays the **Copy Vertical Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

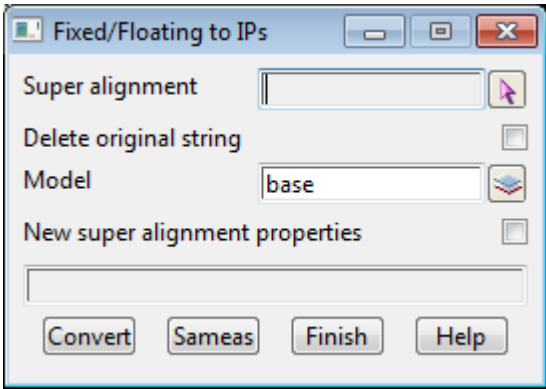

Field Description	Type	Defaults	Pop-Up
Original super alignment	string select		
<i>select the super alignment to copy vertical geometry from</i>			
Copy to super alignment	string select		
<i>select the super alignment to copy vertical geometry to</i>			
Process	button		
<i>after the Process button is clicked, the vertical geometry is copied from the original alignment to the second super alignment.</i>			

Convert Fixed/Floating Elements to IPs

Position of option on menu: Strings =>SA Tools =>Fixed/floating to IPs

Fixed/floating to IPs converts the fixed and floating elements of the horizontal and vertical geometry to horizontal and vertical intersection points joins with arcs and transitions for HIPs and parabolas or vertical arcs for VIPs.

Selecting Fixed/floating to IPs displays the **Fixed/floating to IPs** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment <i>select a super alignment to convert</i>	string select		
Tolerance <i>when the string is converted, the new IP string may be slightly different to the original string. The underlying vertices of the original and new strings are compared and if they differ by the given tolerance value, then a warning is given.</i> <i>If blank, the tolerance is 0.001 (1 mm)</i>	real box		
Delete original string <i>if ticked, the original super alignment is deleted after the conversion is successful</i>	tick box		
Model <i>if not blank, model for the converted string.</i> <i>If blank, use the model of the selected string for the converted string.</i>	model box		available models
New super alignment properties <i>if ticked, the panel is expanded to show all the properties that can be set for the new converted string.</i>	tick box		

Extra panel fields when **New super alignment properties** is ticked.

The tabs are the same as when Creating a Super Alignment - go to [On selecting the Super Alignment option, the Create Super Alignment panel is displayed.](#)

Please note that under **New Super Alignment properties => General Tab Many Strings** is not applicable to **Fixed/Floating to IPs**.

Convert button

*after the **Convert** button is clicked, a new super alignments is created by converting all the elements to IPs*

Same as button

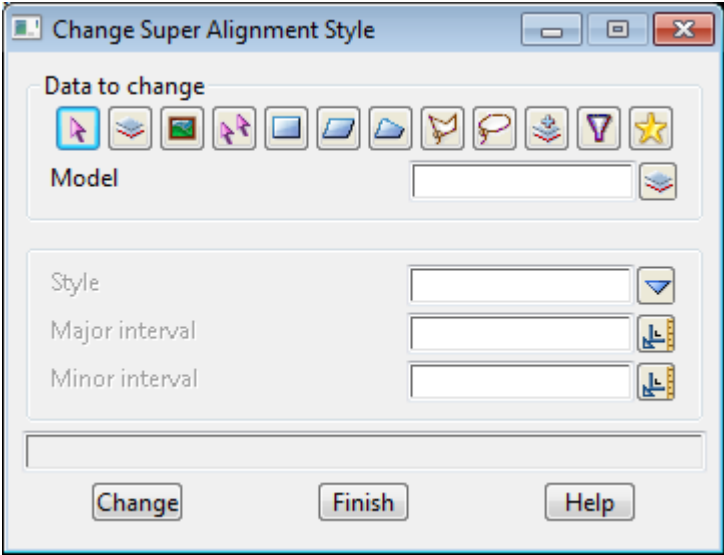

*after clicking **Same as** and then select a string. All the picked string properties will be loaded into the panel fields.*

Change the Styles for Selected Super Alignments

Position of option on menu: Strings =>SA Tools =>Change style

Change style changes the super alignment style for all the selected super alignments.

Selecting Change style displays the **Change Super Alignment Style** panel.

The new fields and buttons used in the panel have the following functions.

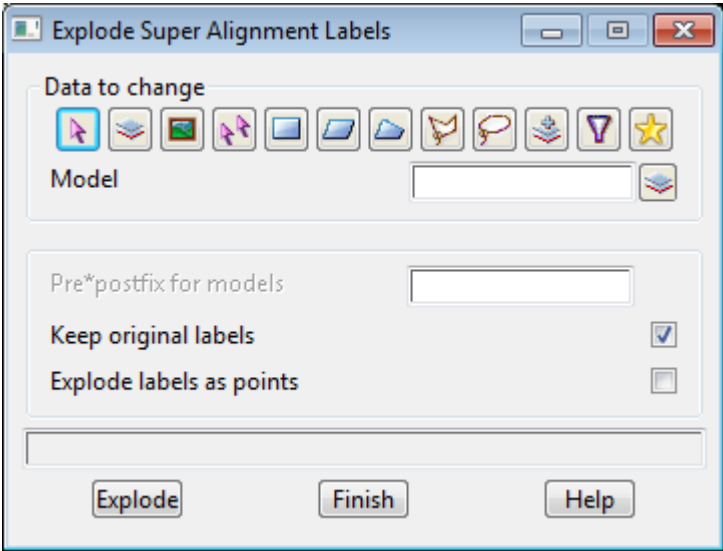

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source		input		
	source of data to be processed.			
Style		SA style box		available SA styles
	super alignment style to apply to all the selected super alignments			
Change		button		
	after the Change button is clicked, all the selected super alignments are given the super alignment style			

Explode the Super Alignments Labelling

Position of option on menu: Strings =>SA Tools =>Explode labels

Explode labels creates text and lines from the automatic labelling of the selected super alignments.

Selecting Explode labels displays the **Explode Super Alignment Labels** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
pre*postfix for models	text		
<i>the models for the text are the model name containing the super alignment, with prefixing and postfixing as given by this field</i>			
Keep original labels	tick box		
<i>if not ticked, the label style of the original strings are modified to no labels</i>			
Explode labels as points	tick box		
<i>if ticked, the labels are created as single point super strings with the label as vertex text. If not ticked, the labels are created in the one super string with the text as vertex text.</i>			
Explode	button		
<i>create text strings for all the text in the automatic labels of the selected super alignments</i>			

Constrain the Movement of Super Alignment Points

Position of option on menu: Strings =>SA Tools =>Move settings

Move settings constrains the movement of horizontal and vertical intersection points for any super alignment being edited.

Selecting Move settings displays the **Move Super Alignment Point Settings** panel.

The buttons are radio buttons - that is, only one can be selected:

Default

allows any movement in the selected HIP or VIP point

X-axis

constrains an HIPs to only move along the x-axis. That is, the y coordinate is fixed.

Constrains a VIPs to only move along the chainage-axis. That is, the height coordinate is fixed.

Y-axis

constrains an HIPs to only move along the y-axis. That is, the x coordinate is fixed.

Constrains a VIPs to only move along the height-axis. That is, the chainage coordinate is fixed.

Fwd Tgt

constrains an HIPs to only move along the incoming straight to the HIP.

Constrains a VIPs to only move along the incoming straight to the VIP.

Bwd Tgt

constrains an HIPs to only move along the outgoing straight from the HIP.

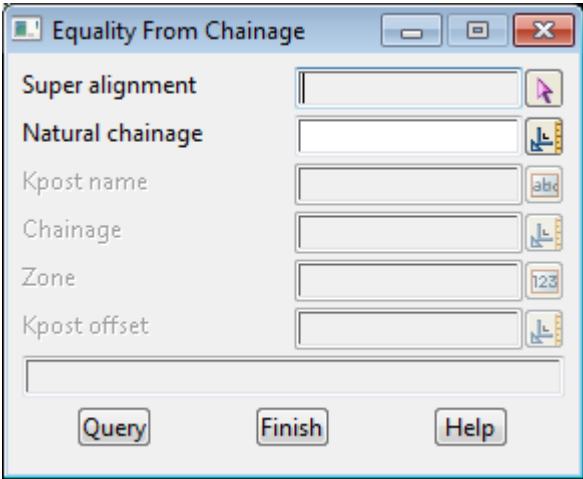

Constrains a VIPs to only move along the outgoing straight from the VIP.

Equality Query

Position of option on menu: Strings =>SA Tools =>Equality query

Displays the Kpost name, offset from Kpost and Zone of the Kpost for a selected position on a super alignment.

Selecting **Equality query** displays the **Equality From Chainage** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Super alignment	string select		
<i>select the super alignment to display the Kpost name, Offset and Zone for</i>			

Chainage			
<i>the raw chainage to calculate the Kpost name, Offset and Zone at. When the super alignment is first selected, the raw chainage of the selected position is written to the Chainage box.</i>			

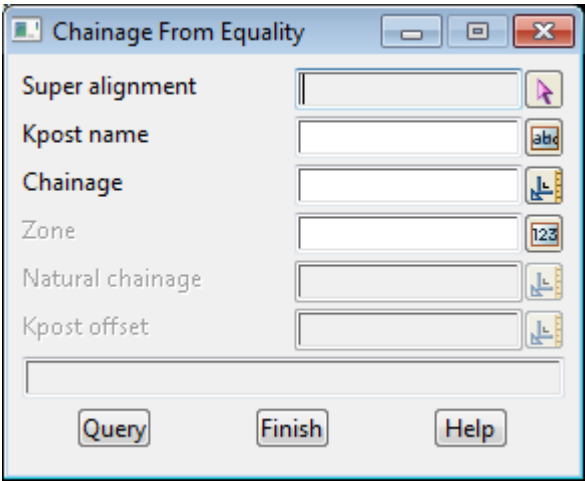

Query	button		
<i>after the Query button is clicked, the vertical geometry is copies from the original alignment to the second super alignment.</i>			

Chainage Query

Position of option on menu: Strings =>SA Tools =>Chainage query

For a user given Kpost name, offset from Kpost and Zone, this option displays the raw chainage of that point.

Selecting Chainage query displays the **Chainage From Equality** panel.

The new fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment	string select		
<i>select the super alignment to get the raw chainage for</i>			
Kpost name			
<i>name of a Kpost on the selected string</i>			
Offset			
<i>offset from the Kpost</i>			
Zone			
<i>Kpost zone</i>			
Query	button		
<i>after the Query button is clicked, the raw chainage of the point given by the Kpost name, Offset from Kpost and Zone.</i>			

Reverse Calc Parts

Position of option on menu: Strings =>SA Tools =>Reverse calc parts

A super alignment is made up of the methods for constructing each part of the super alignment (one set for the horizontal geometry and another set for the vertical geometry), and if the methods are consistent, then they define a string of tangential segments which defines the super alignment in plan and in section.

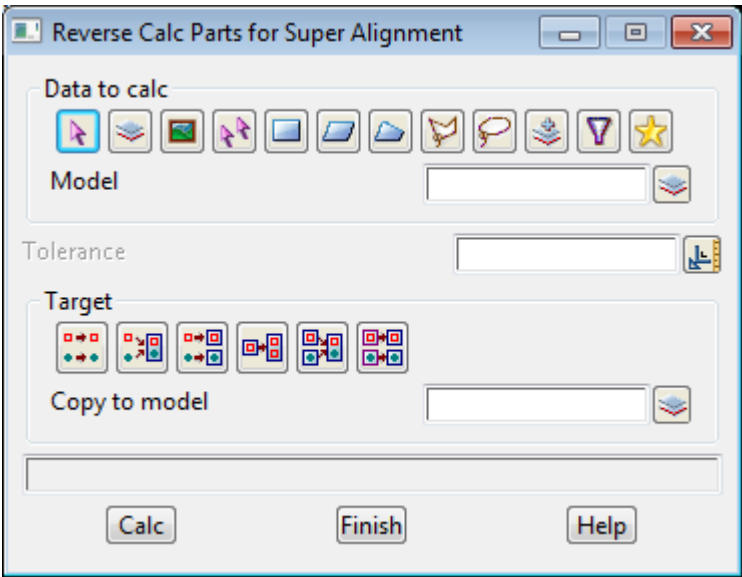

In plan the segments can be lines, arcs or transitions. In section the segments are lines, arcs or parabolas. Normally the segments are tangential to each other.

Sometimes a super alignment is missing the construction parts and only consists of the underlying segments. Then the super alignment can not be edited since there are no methods defining the string.

The **Reverse Calc Parts** option takes a super alignment consisting only of segments, and tries to build construction methods for the super alignment. If it is successful, then the super alignment can then be edited.

Note - the segments should be tangential to each other but if that is not the case, the option will try and move the vertices by a user defined tolerance to find a tangential solution.

Selecting **Reverse calc parts** displays the **Reverse Calc Parts For Super Alignment** panel.

The new fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type			Model	
-------------------------	--	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source		input		
--------------------	--	-------	--	--

source of data to be processed.

Tolerance		Measure box		
------------------	--	-------------	--	--

the segments need to be tangential to each other for the reverse calculation of parts to work. If segments are not tangential, the vertices will be moved by up to the given Tolerance to make them tangential. There is a warning if the resultant super alignment can't solve.

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Calc button

*after the **Calc** button is clicked, the option tries to create calculation parts for any super alignments with only segments and no calculation parts.*

Validate Super Alignment

Position of option on menu: Strings =>SA tools =>Validate

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Validate displays the **Super Alignment Parts Validation** panel.

Help

Convert

Position of option on menu: Strings =>Convert

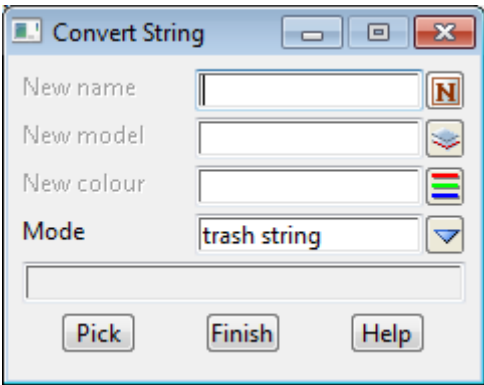

The **Convert** option is used to create a new string of possibly a different string type from a chosen string.

Since not all string conversion are possible, or even make sense (for example, converting a 3d string to a text string), the list of defined conversion depends on the type of the string chosen for conversion.

After selecting the string to convert, a menu containing the possible conversions is raised and the required conversion selected from it.

After the type of conversion is selected, a string Properties panel containing the attribute information for the new string is displayed and can be used to modify any properties of the new string.

After selecting the **Convert** option, the **Convert String** panel is placed on the screen.

If a new name, model or colour is required for the converted string, the new data is entered into the **Convert String** panel. If a change isn't required, leave the appropriate panel field blank.

The **Convert** option is already in progress and if a string is selected and accepted, a menu containing all the available conversions for that particular string type is displayed.

For example, for each string type the choices are:

Convert 2d String to	Convert 3d String to	Convert 4d String to	Convert Super Alignment String to
2d String	2d String	2d String	2d String
3d String	3d String	3d String	3d String
4d String	4d String	4d String	Interface
Interface	Interface	Interface	Alignment
Alignment	Alignment	Alignment	Super Alignment
Super Alignment	Super Alignment	Super Alignment	Pipeline
Pipe String	Pipe String	Pipe String	Polyline
Pipeline	Pipeline	Pipeline	Super
Polyline	Polyline	Polyline	Super 2d
Super	Super	Super	Super arc
- try again -	- try again -	- try again -	- try again -

After selecting the conversion to be made, a new string of the selected type is created and given the model, colour and name according to the fields in the **Convert String** panel.

The **Properties** panel for the new string is also displayed and hence any of the strings properties can be modified for the new string.

The fields and buttons used in the **Convert String** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
New name		input		
	<i>If blank, the converted string is given the same name as the original string.</i>			
	<i>If non-blank, then the converted string is given the name in the new name field.</i>			
New model		input		available models
	<i>if blank, the converted string is placed in the same model as the original string.</i>			
	<i>If non-blank, then the converted string will be placed in the model given in the new model field.</i>			
New colour		input		available colours
	<i>if blank, the converted string is given the same colour as the original string.</i>			
	<i>If non-blank, then the converted string is given the colour in the new colour field.</i>			
Mode		input	keep string	keep, delete, trash string
	<i>if delete string, the string selected to be converted is deleted.</i>			
	<i>keep string, the selected string is not deleted.</i>			
	<i>trash string, the string selected to be converted is moved to the trash model.</i>			

Inquire

Position of option on menu: Strings => Inquire

The **inquire** option is used to obtain information about a string displayed on the screen. The amount and type of information varies between string types.

On selecting the **Inquire** option, the **String Inquire** panel is displayed.

The panel is used for any special messages and to end the option.

After selecting the **inquire** option, the strings are selected using the normal 12d Model selecting mechanism (LB to pick a string, MB to accept a string, RB for the **pick ops** menu). Whenever a string is picked, the information about the picked string is displayed on the screen in the **Information** menu.

An example of the **Information** menu for an Alignment string is

For more details on the **Information** menu, go to the section [String Information](#)

Any number of string inquiries can be made with the option by repeated use of the mouse buttons LB and MB to pick and accept strings.

The inquire option is terminated by either selecting the **Cancel** option from the **Pick Ops** menu (raised by clicking RB) or selecting **Finish** or **[X]** from the **String Inquire** panel.

String Information

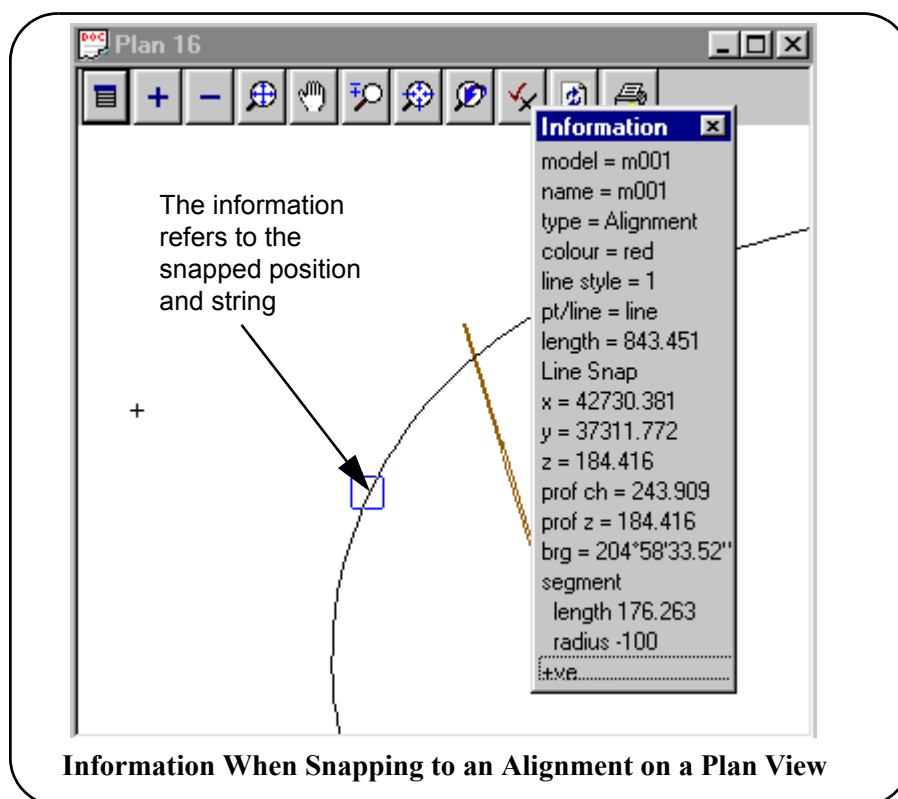

Whenever a string is picked, the information about the picked string is displayed on the screen in the **Information** menu

The **Information** menu displays different information depending on whether the string was picked in a Plan or Perspective view or in a Section view.

For a Plan or Perspective View

The details on the Information menu can include:

model =	- gives the model of the selected string
name =	- " name " " "
type =	- " type " " "
colour =	- " colour " " "
line style =	- " line style " " "
pt/line =	- " " breakline type " " "
# pts =	- " " number of points " " "
area =	- " " area if it is a closed string
length =	- " " length of the string
Snap type	- e.g. Line Snap, Point Snap
x =	- " " x co-ordinate of the selected position
y =	- " " y co-ordinate of the selected position
prof ch =	- " " chainage of the selected position on the string
prof z =	- " " z-value of the selected position on the string
brg =	- " instantaneous bearing of the selected position on the string
segment length	- " length of the string segment containing the selected position
+ve or -ve	- if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

For a Section View

For a section view, the x-axis of the view is defined by the chainage along the string that is being profiled on the section view (the **profiled** string). The profiled string is displayed on the section view.

For any tins in models added to the section view, the sections through the tins along the profiled string are also displayed in the section view.

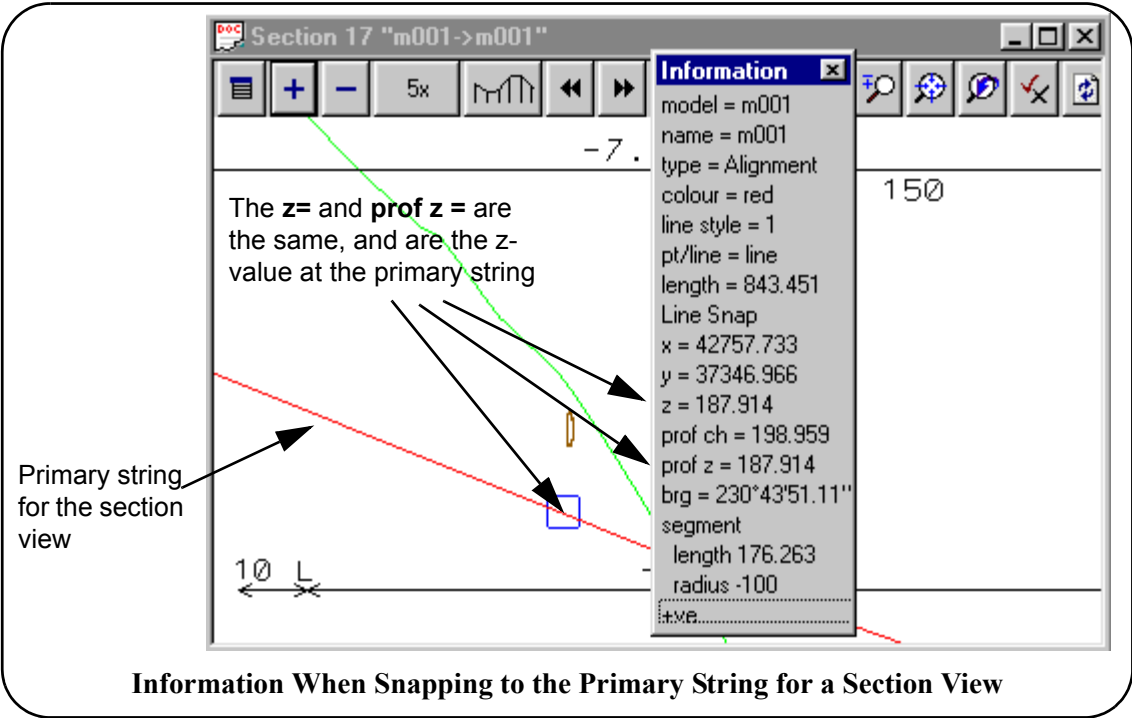

Finally, any parts of any strings in models added to the section view that are in the corridor defined for the section view are projected onto the section view and displayed.

The details on the Information menu can include:

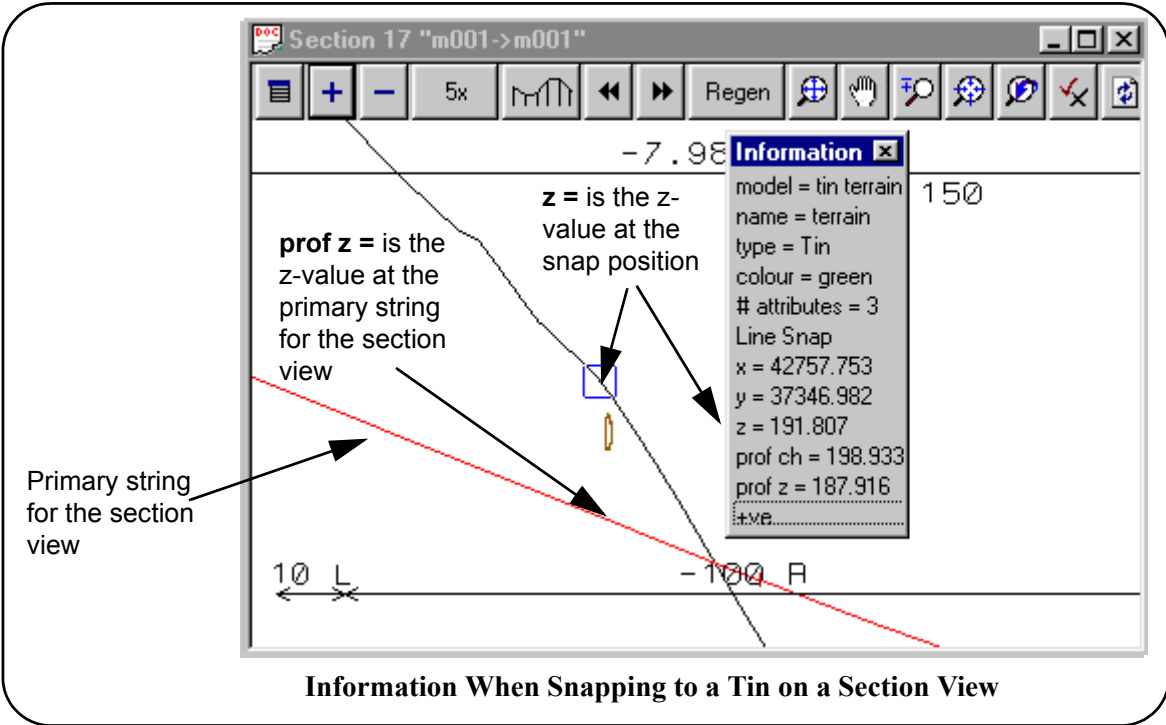

model =	- gives the model of the selected string
name =	- " name " " "
type =	- " type " " "
colour =	- " colour " " "
line style =	- " line style " " "
pt/line =	- " breakline type " " "
# pts =	- " number of points " " "
area =	- " area if it is a closed string
length =	- " length of the string
Snap type	- e.g. Line Snap, Point Snap
x =	- " x co-ordinate of the selected position
y =	- " y co-ordinate of the selected position
z =	- " z co-ordinate of the selected position
prof ch =	- " chainage of the <i>profiled</i> string at the selected position Note that this is not the chainage of the selected string unless the selected string is the profiled string
prof z =	- " " z-value of the <i>profiled</i> string at the profile chainage of the selected position Note that this is not the z of the selected position unless the selected string is the profiled string
brg =	- " instantaneous bearing of the selected position on the string
segment length	- " length of the string segment containing the selected position
+ve or -ve	- if the direction of the pick was the same as the direction of the string, then +ve is displayed otherwise the direction of the pick is opposite to the string direction and a -ve is displayed.

IMPORTANT NOTES

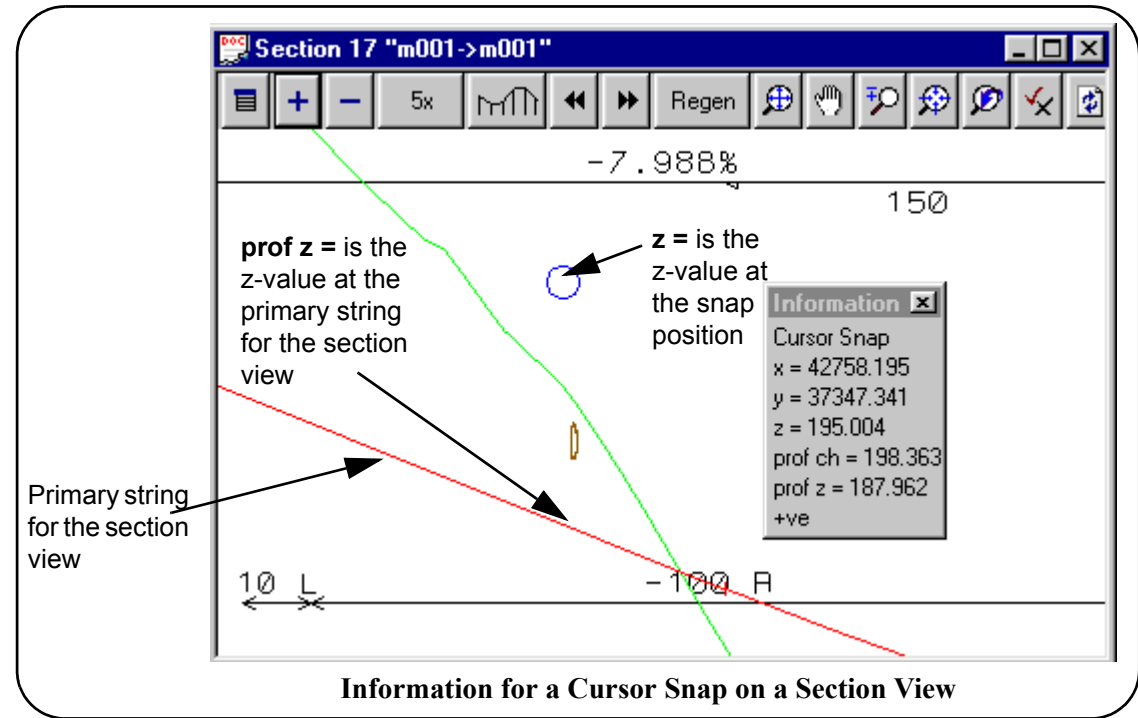

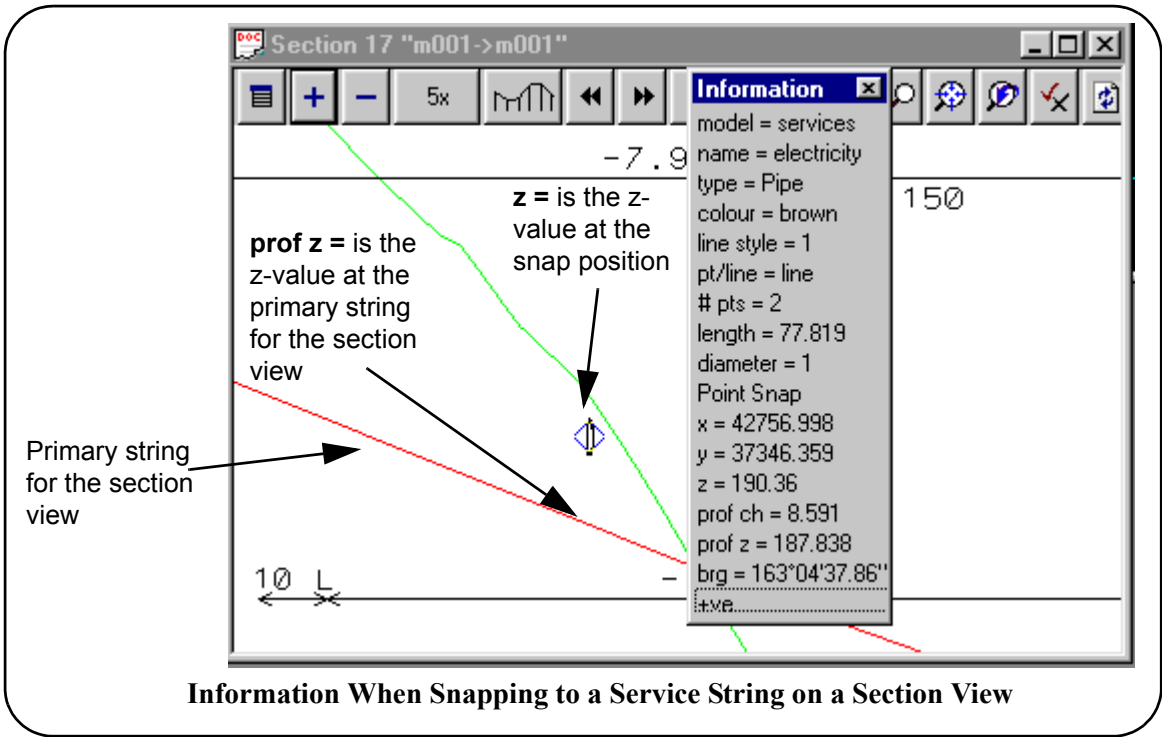

1. for a string selected on a section view, the "z =" value is the z co-ordinate of the selected position. The "**prof z** =" value is the z co-ordinate of the string profiled on the section view.
2. The "**prof ch** =" value is the chainage of the string profiled on the section view, not the chainage of the selected string.

Information When Snapping to the Primary String for a Section View

Information When Snapping to a Tin on a Section View

Properties

Position of menu: Strings =>Properties

The **Properties** walk-right menu contains options to obtain and/or modify the properties of any string displayed on the screen, or obtain and/or modify the vertices and segments of a super string.

The **Properties** walk-right menu is

For the option <i>String</i> , go to	<u>String</u>
<i>Vertex</i>	<u>Vertex</u>
<i>Vertex (all)</i>	<u>Vertex (all)</u>
<i>Segment</i>	<u>Segment</u>
<i>Segment (all)</i>	<u>Segment (all)</u>
<i>Vertex/Segment</i>	<u>Vertex/Segment</u>
<i>Attributes</i>	<u>Attributes</u>
<i>Super strings</i>	<u>Super Strings</u>
<i>Match</i>	<u>Match</u>

String

Position of option on menu: Strings =>Properties =>String

The **String** option obtains and/or modify property information about any string displayed on the screen.

For example, the string's name, colour and style are string properties. Each string type has its own particular set of properties.

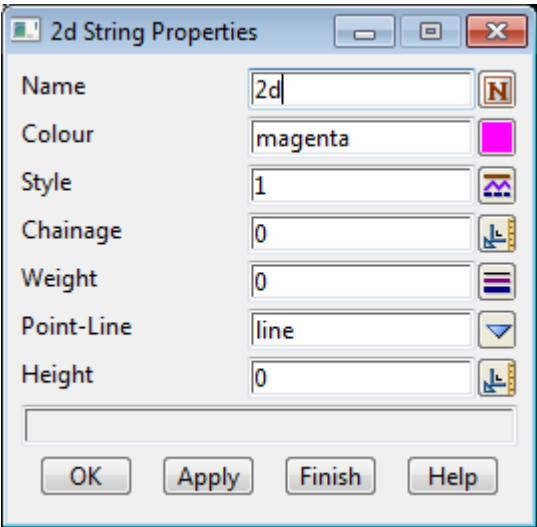

On selecting the **String** option, the **String Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The **String Properties** option is automatically in a pick mode and the user selects strings using the normal **12d** Model picking mechanism (LB to select a string, MB to accept a string, RB for the pick ops menu). Whenever a string is selected, the appropriate **Properties** panel for the string type is displayed on the screen with all the picked string's properties shown.

For example, for a 2d string, the **Properties** panel is

To modify any of the properties for the selected string, simply change the information in the appropriate panel field and select the **OK** or **Apply** button.

The **Properties** panel is also brought up by the **Properties** option on each string editor and the **Properties** panel have been shown for each string in the Editor section of the manual.

Please continue to the next section [Vertex](#).

Vertex

Position of option on menu: Strings =>Properties =>Vertex

The **Vertex** option obtains and/or modify property information about the vertex of any super string displayed on the screen.

For example, the height, symbol, annotation, point no are all properties of a super string vertex.

On selecting the **Vertex** option, the **String Vertex Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The **String Vertex Properties** option is automatically in a pick mode and the user selects the *vertex* of a super string using the normal 12d Model picking mechanism. Whenever a *vertex* is selected, a **Vertex** menu showing the properties of the vertex is displayed on the screen.

To modify any of the properties for the selected vertex, simply click on the appropriate item on the **Vertex** menu and the appropriate panel will come up to modify the vertex property.

Please continue to the next section [Segment](#).

Segment

Position of option on menu: Strings => Properties => Segment

The **Segment** option obtains and/or modify property information about the segment of any super string displayed on the screen.

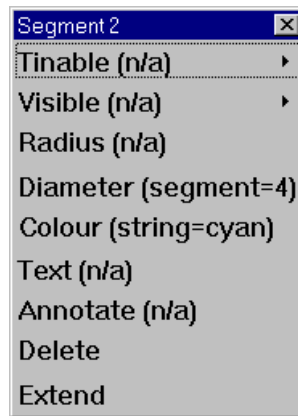

For example, the visibility, radius, colour, text are all properties of a super string segment.

On selecting the **Segment** option, the **String Segment Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The **String Segment Properties** option is automatically in a pick mode and the user selects the *segment* of a super string using the normal **12d** Model picking mechanism. Whenever a *segment* is selected, a **Segment** menu showing the properties of the segment is displayed on the screen.

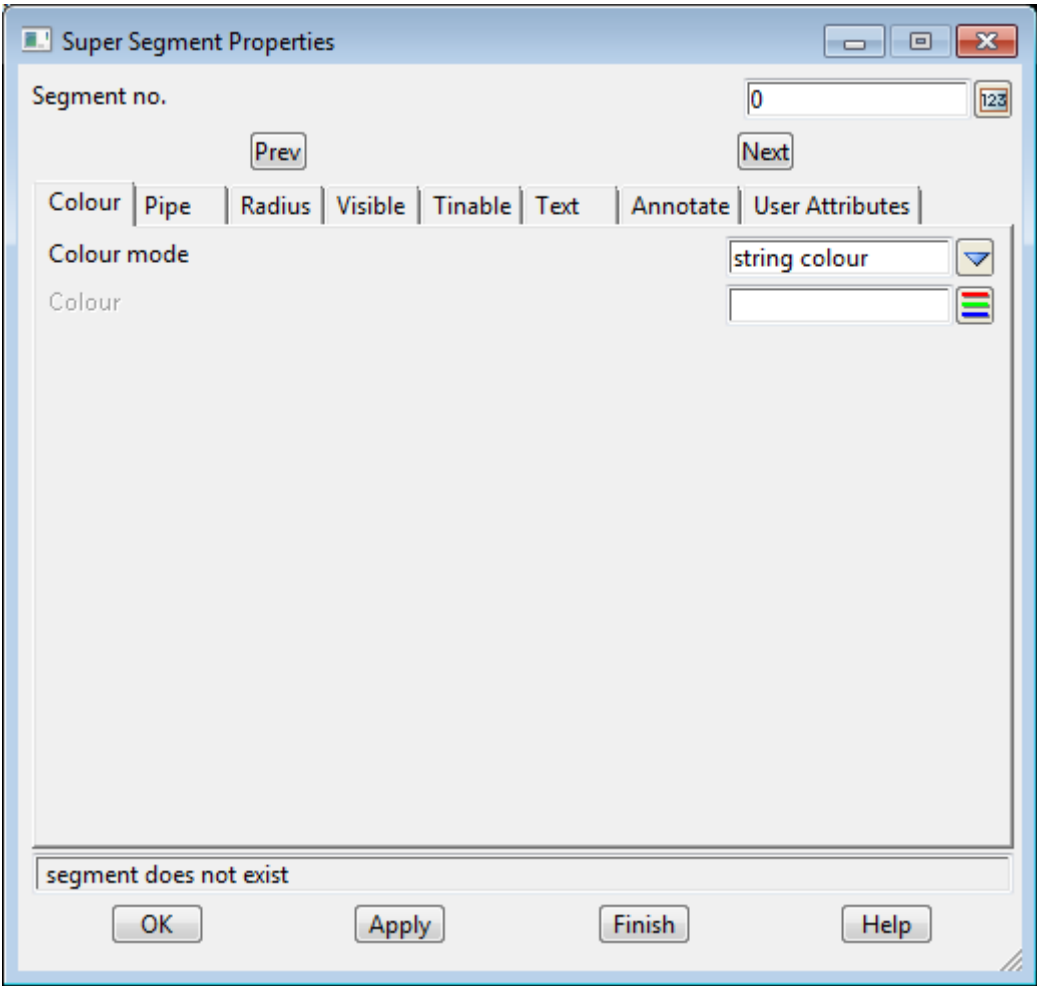

To modify any of the properties for the selected segment, simply click on the appropriate item on the **Segment** menu and the appropriate panel will come up to modify the segment property.

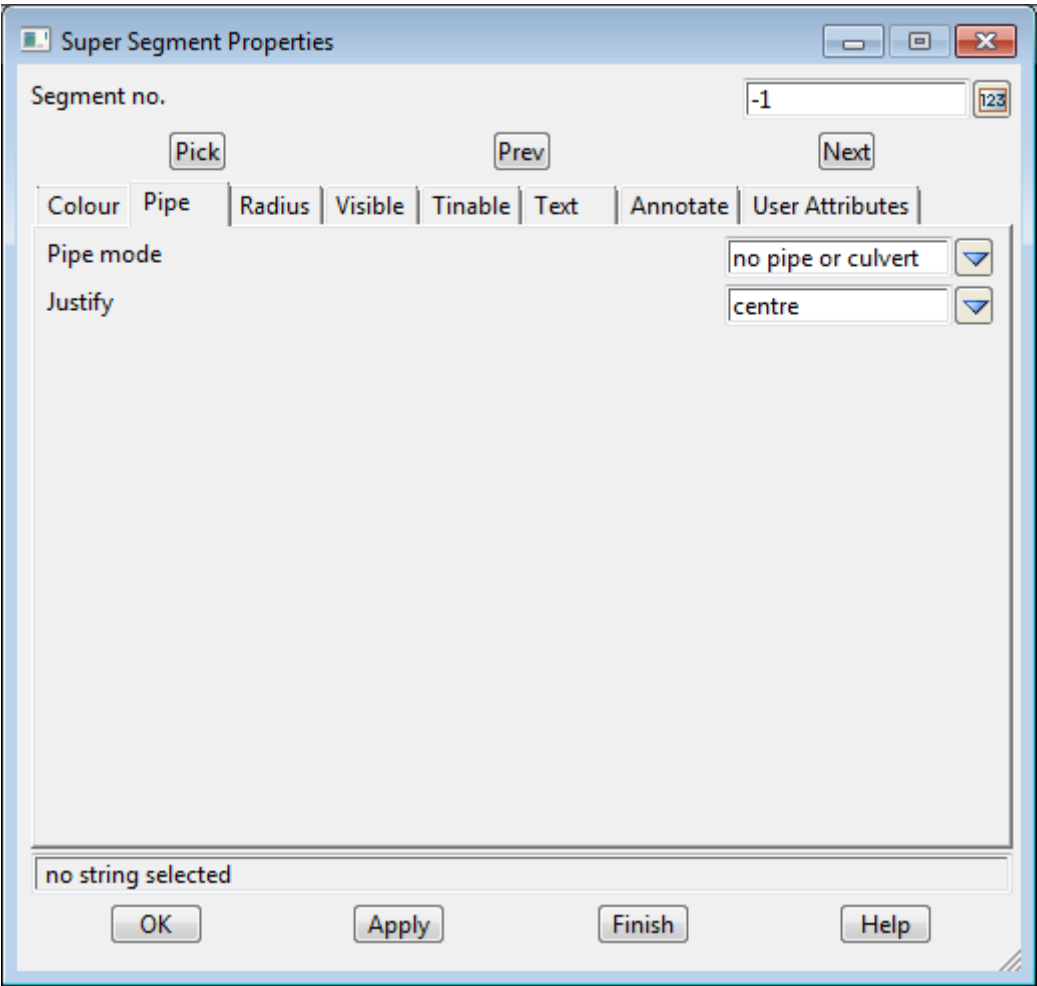

Please continue to the next section [Vertex/Segment](#).

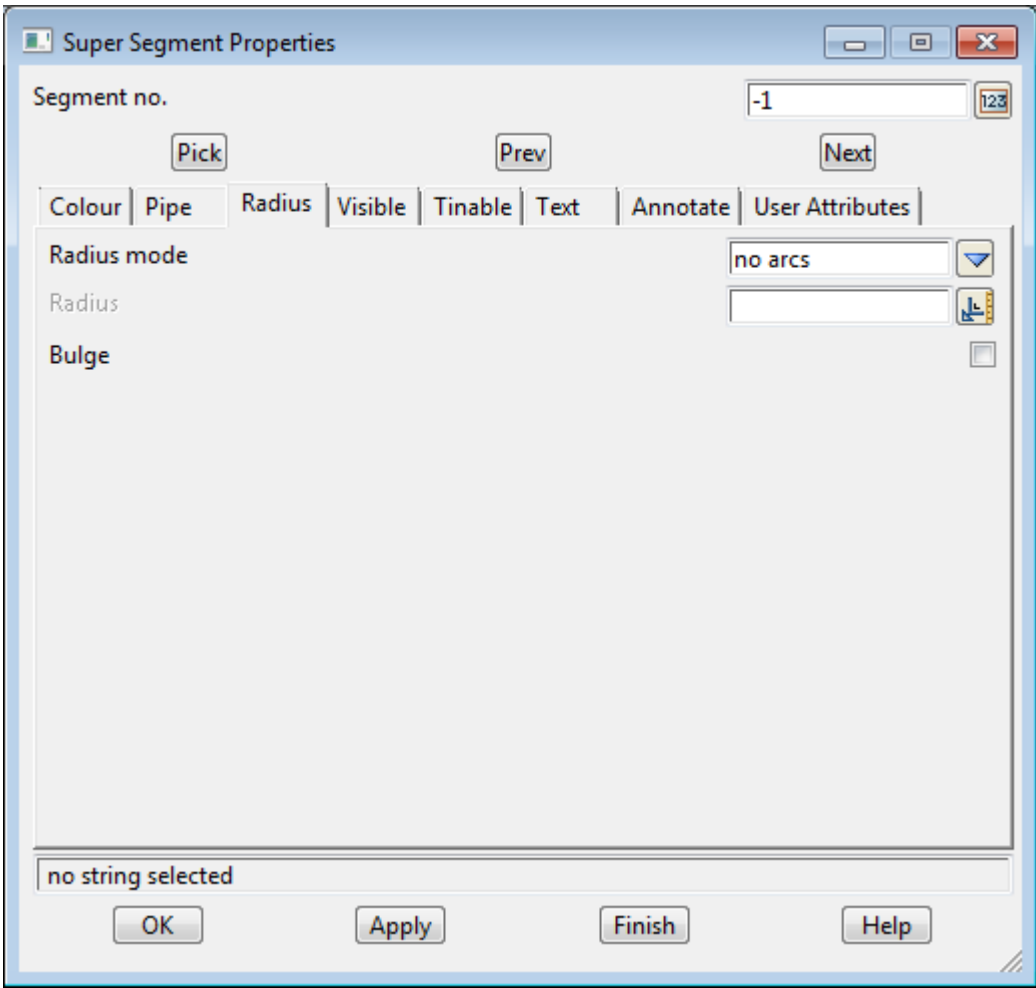

Segment (all)

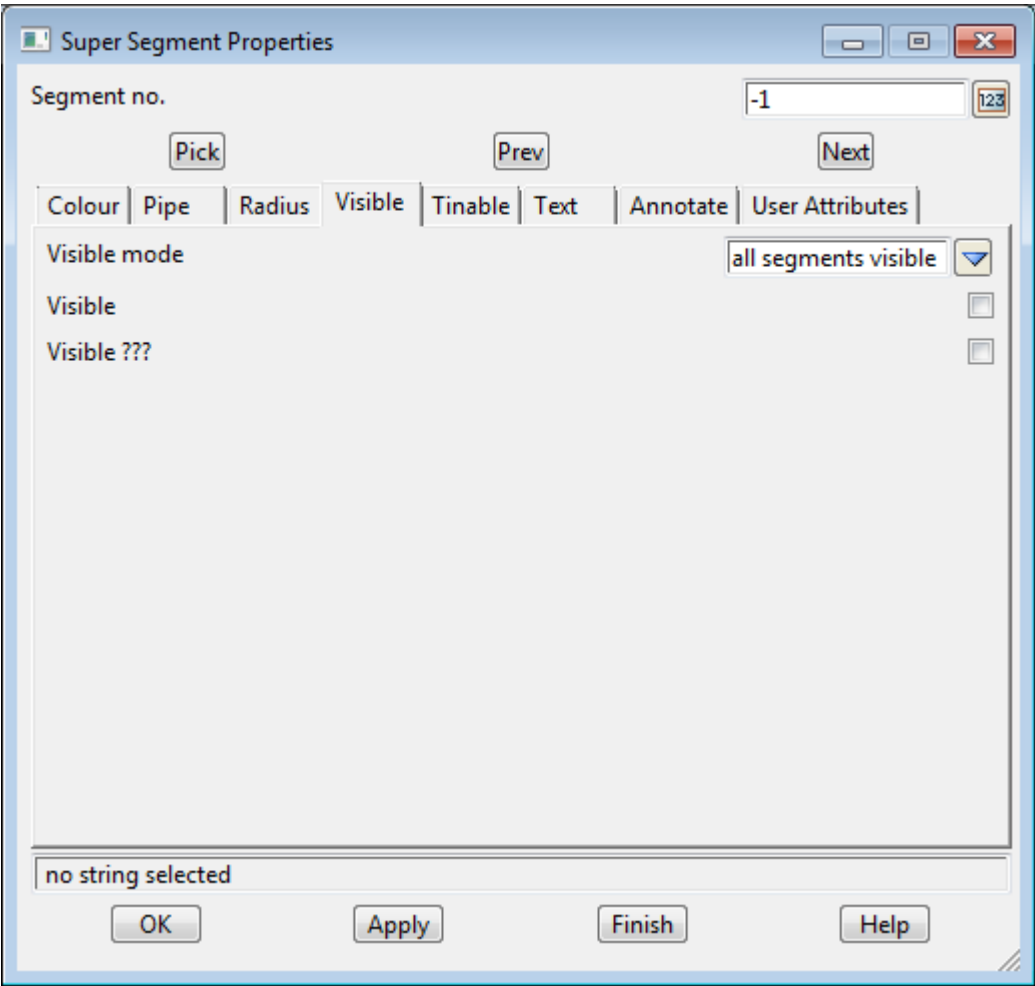

Position of option on menu: Strings =>Properties =>Segment (all)

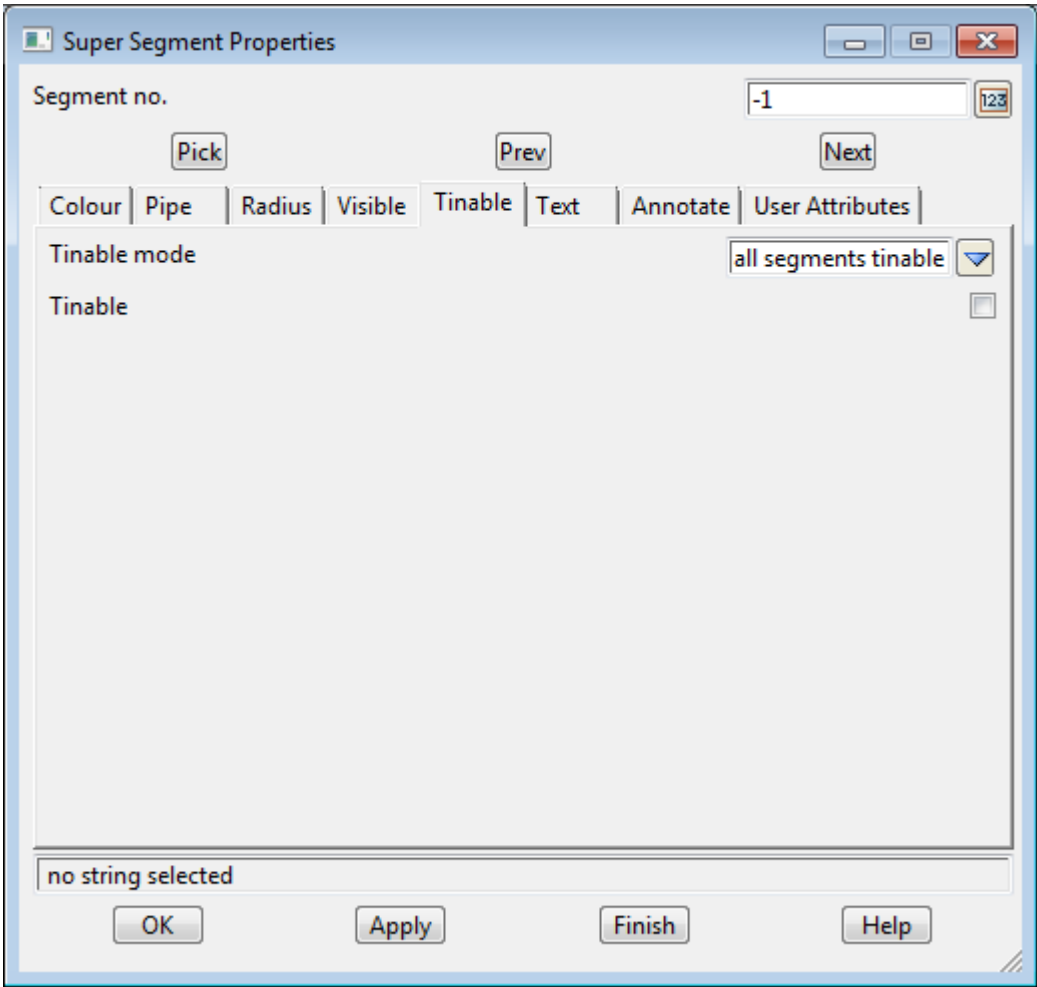

For more information please go to the section [All Segment Properties](#)

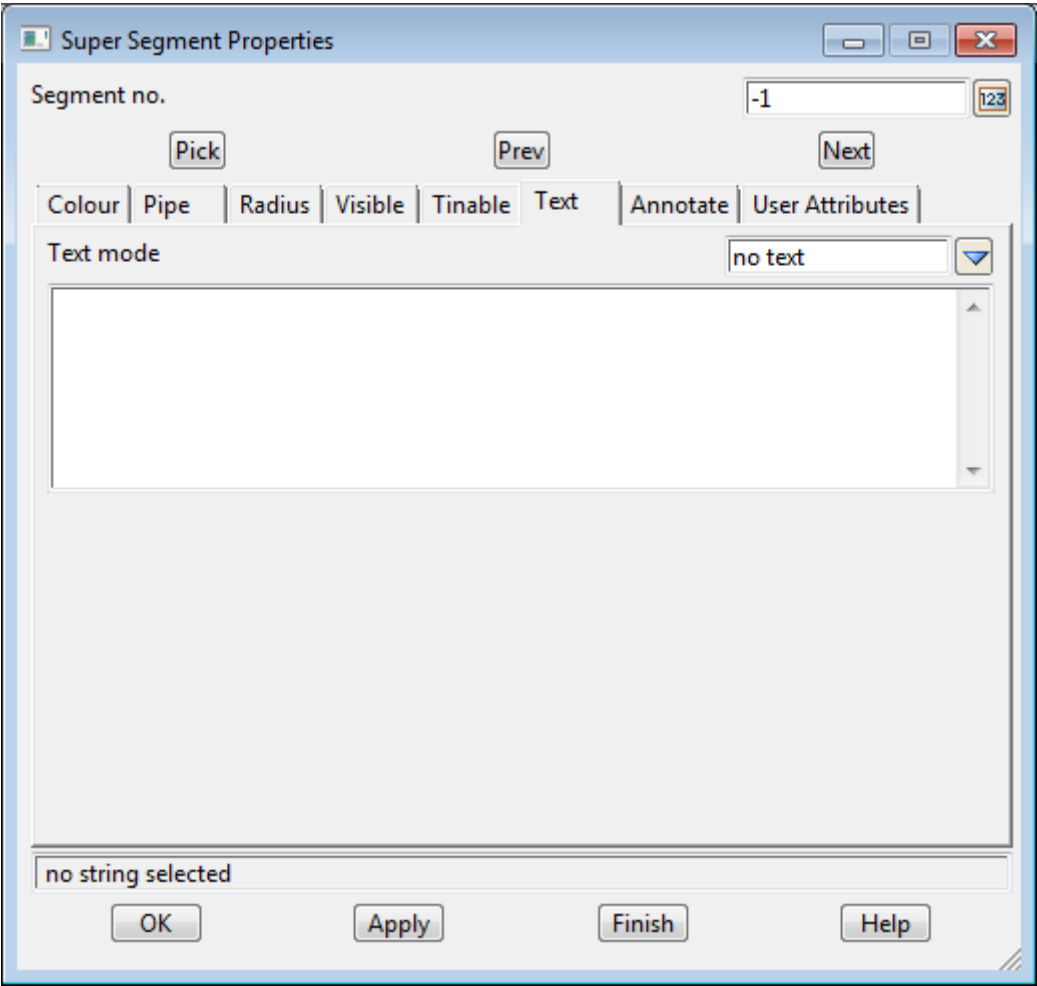

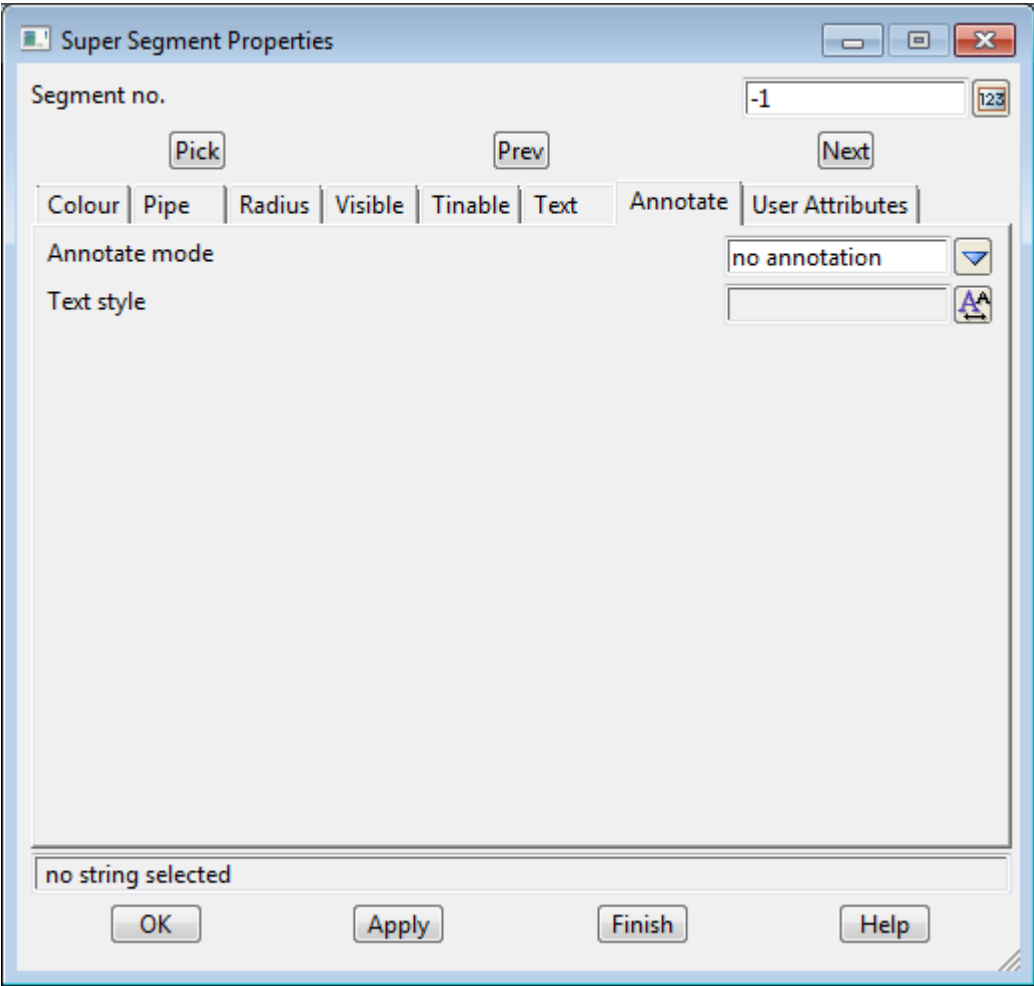

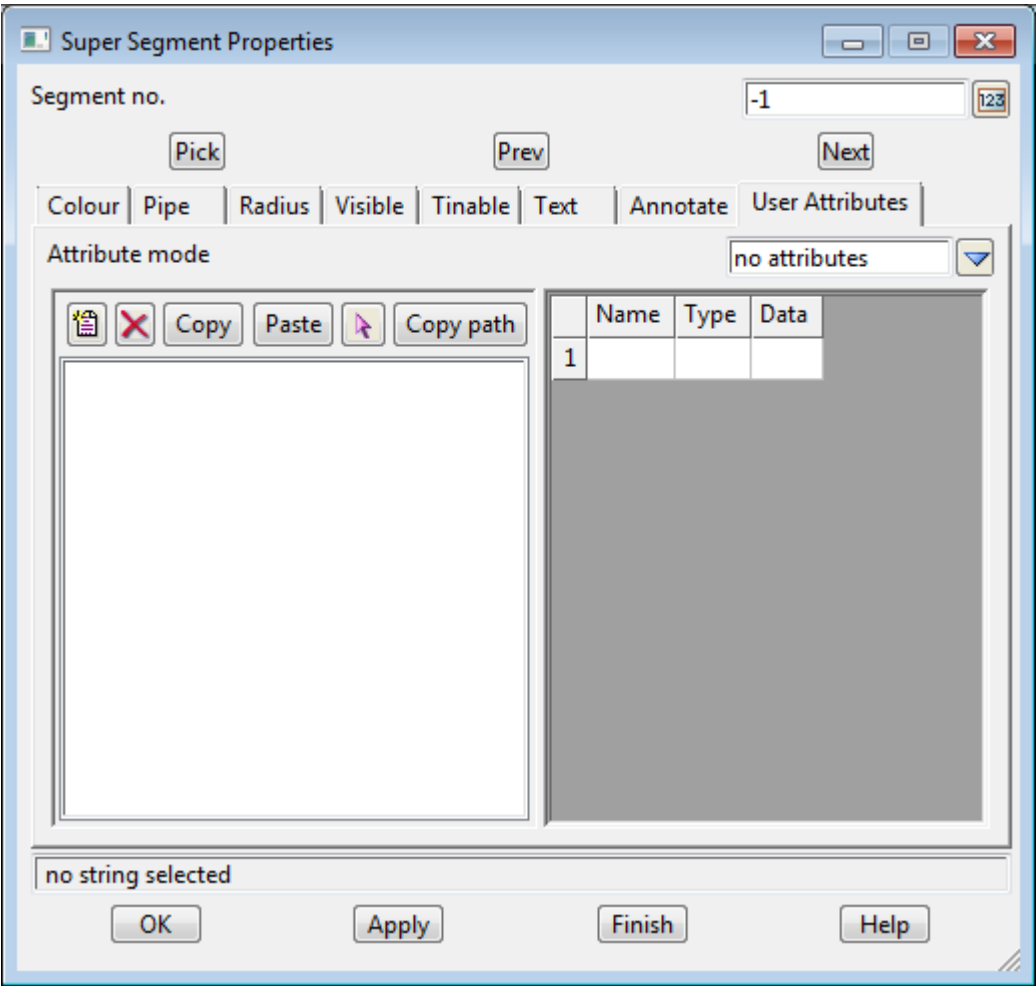

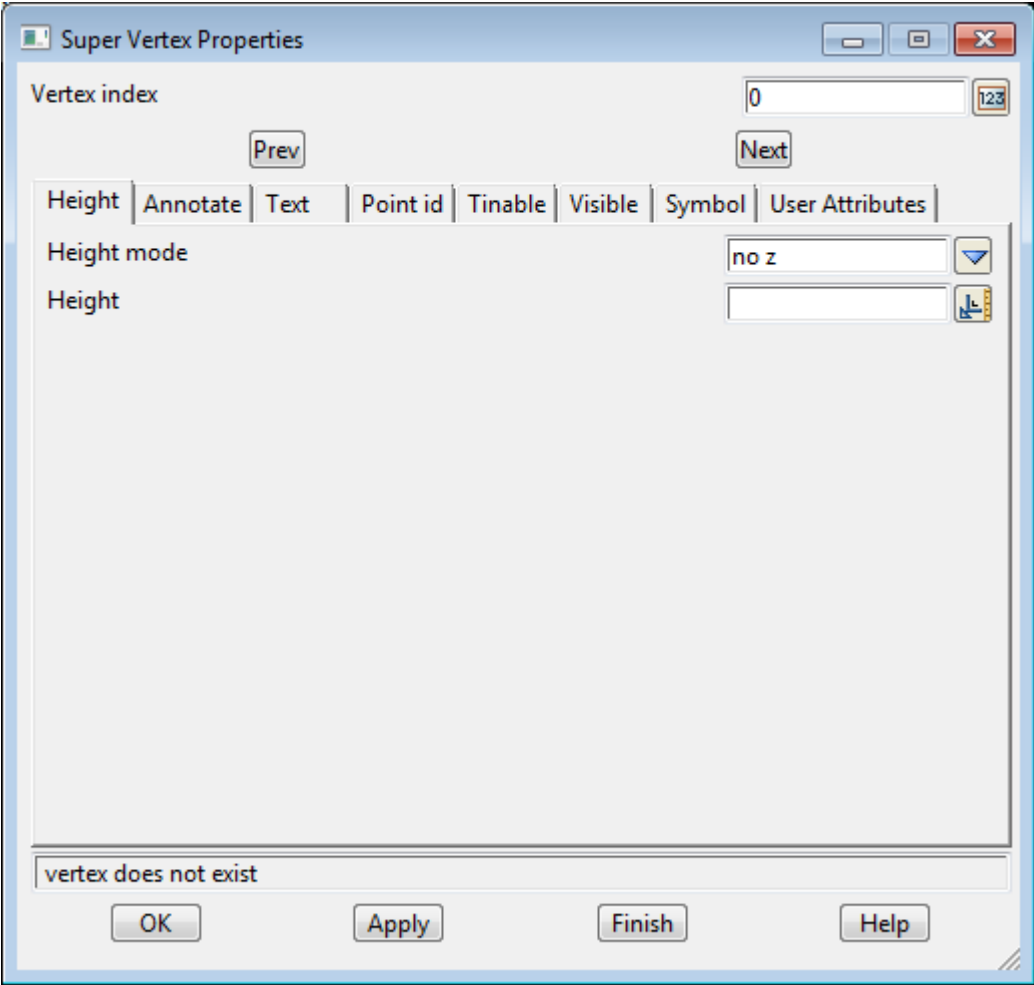

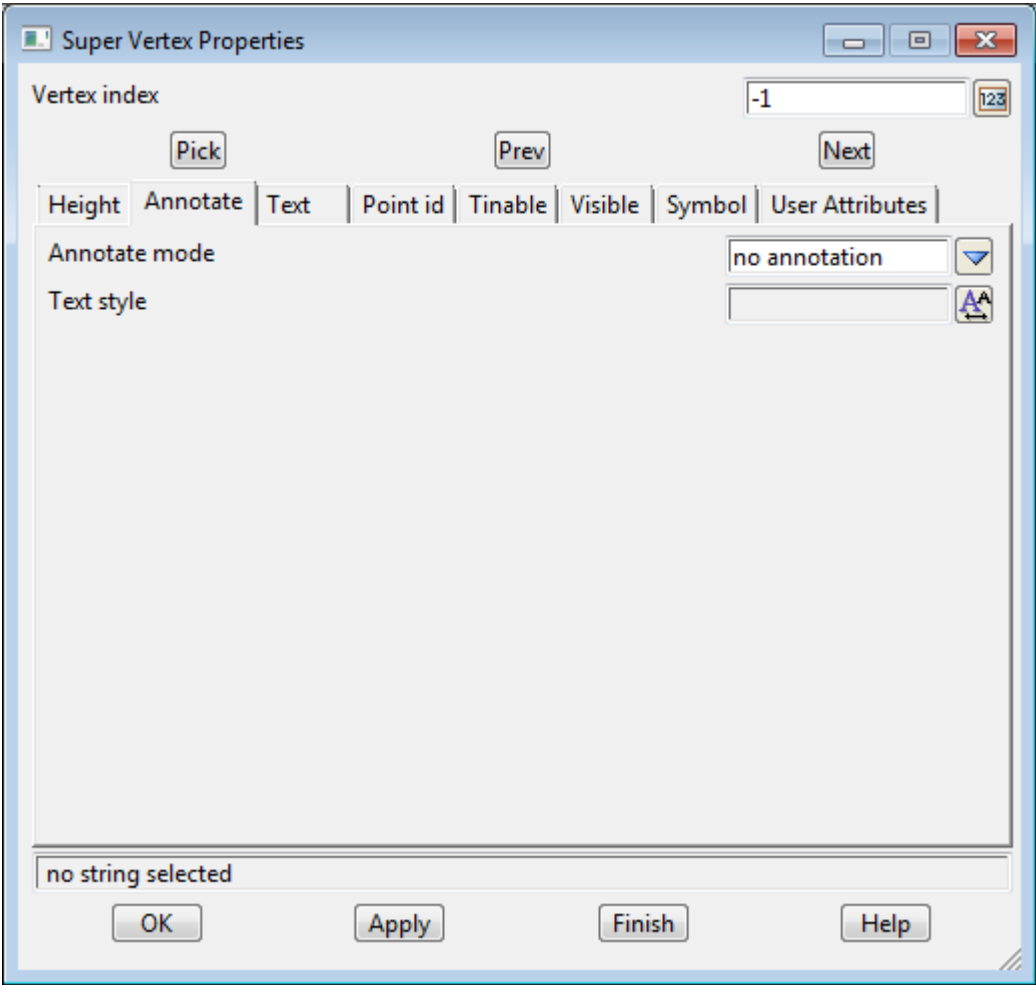

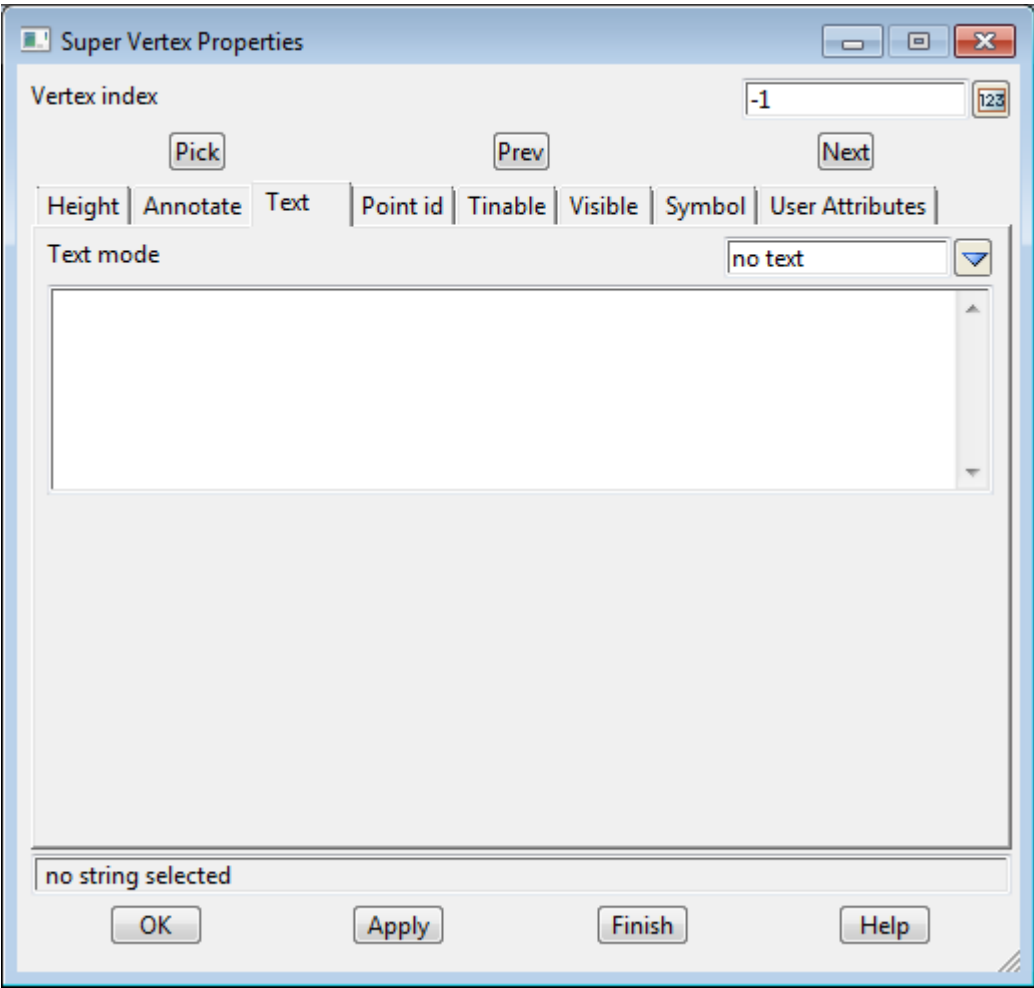

Vertex (all)

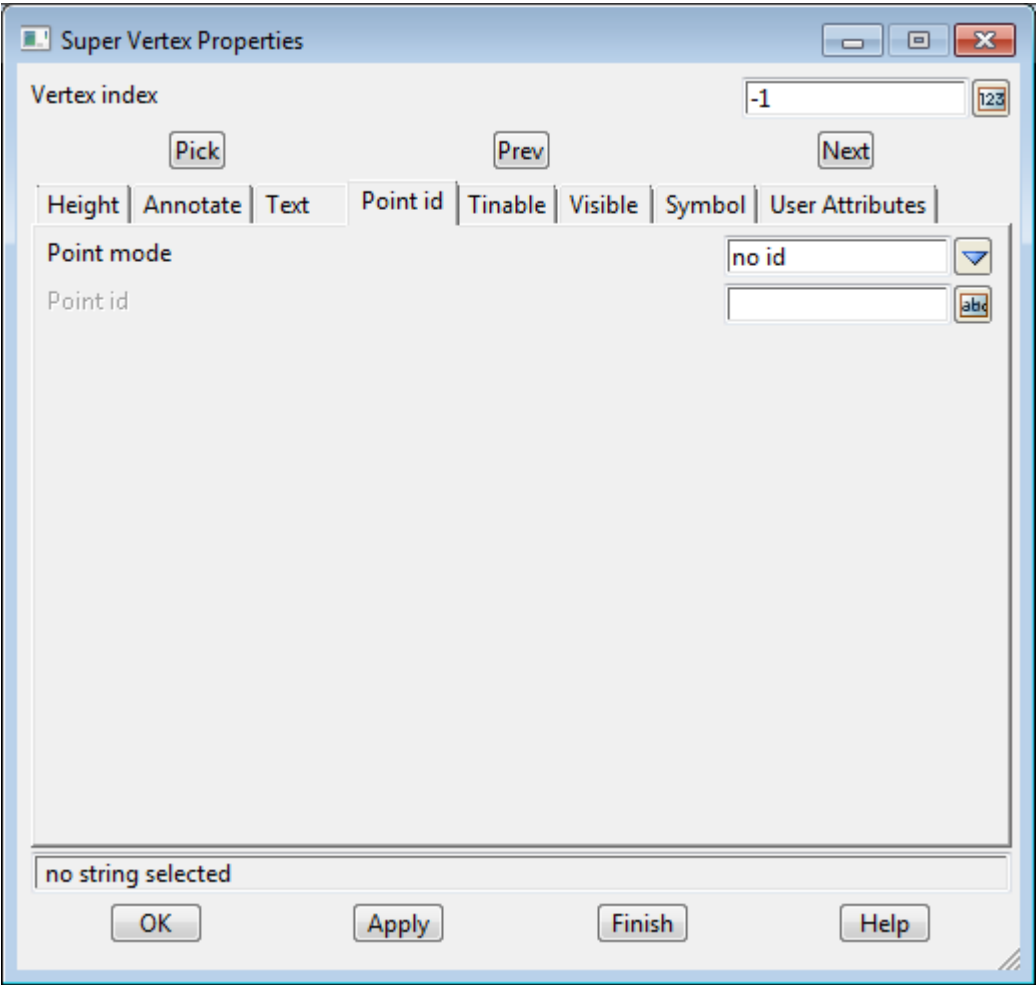

Position of option on menu: Strings =>Properties =>Vertex (all)

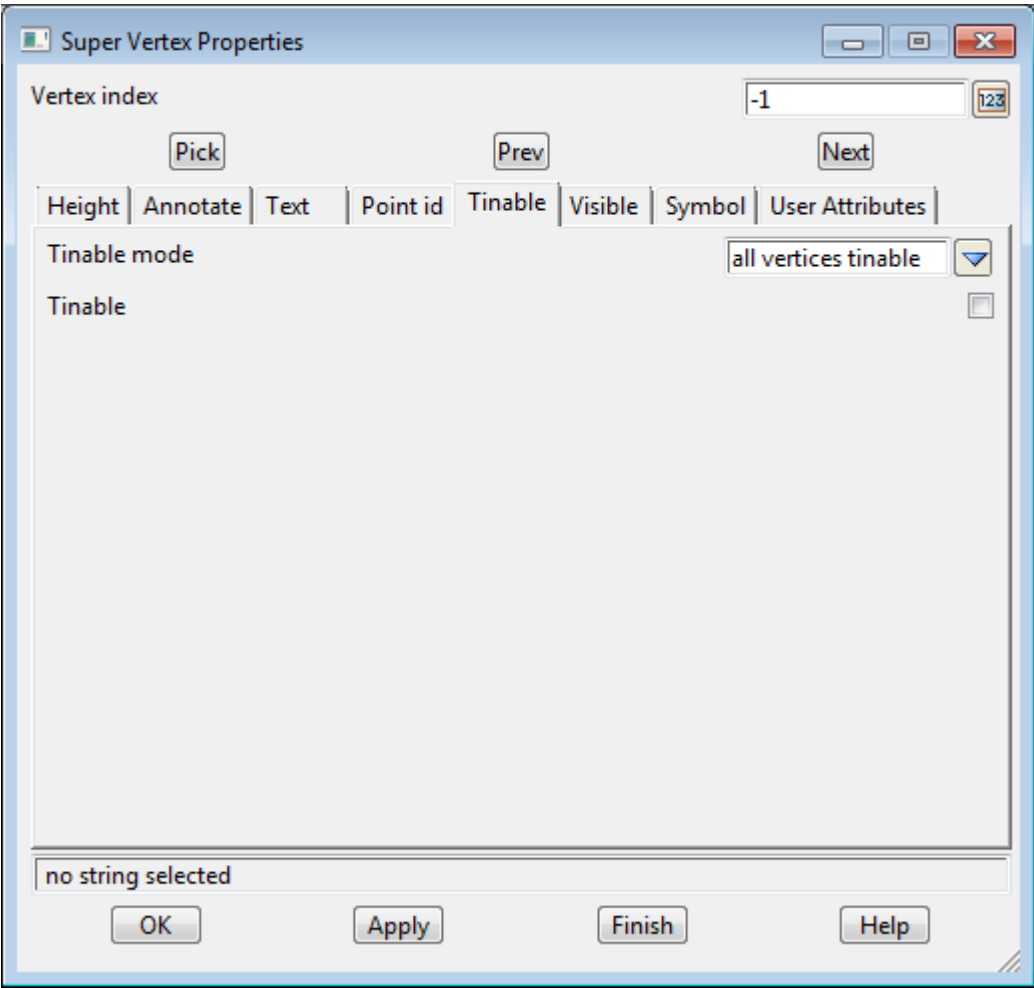

For more information please go to the section [All Vertex Properties](#)

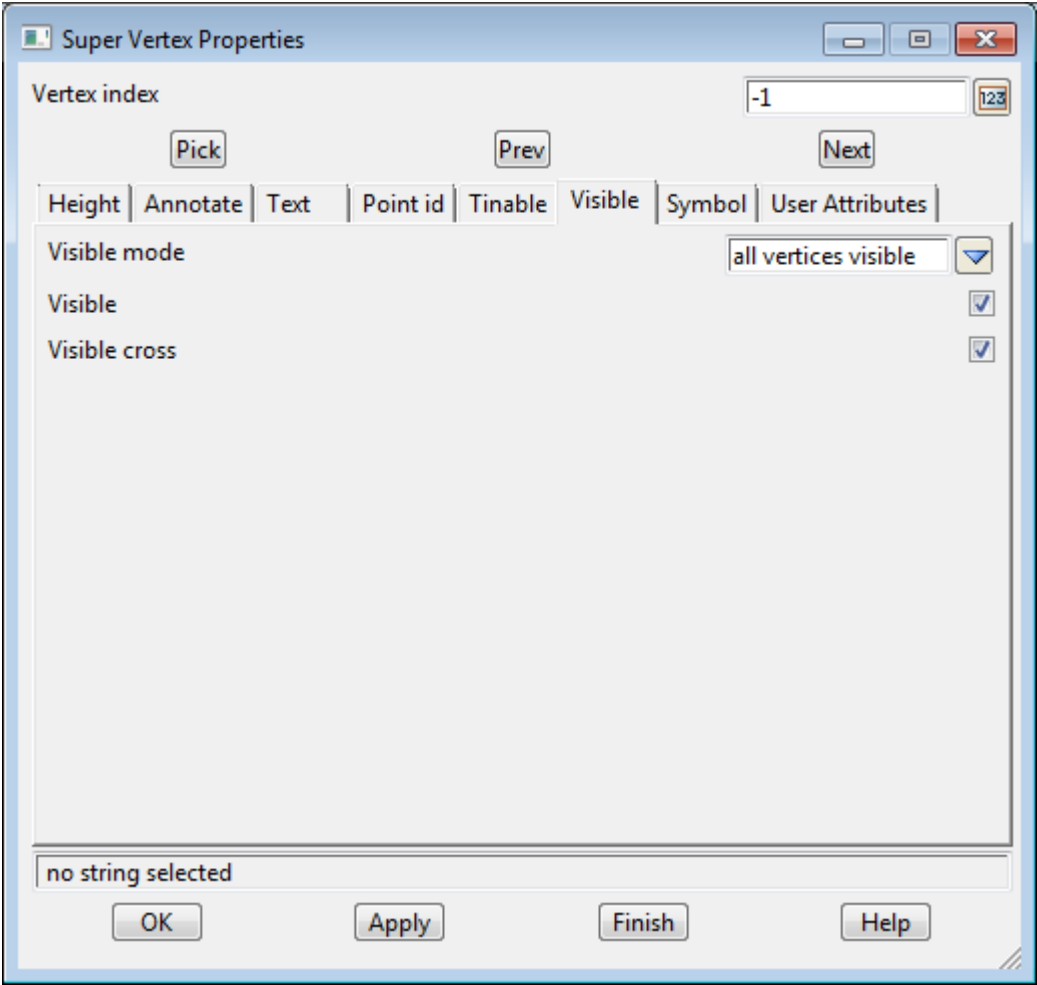

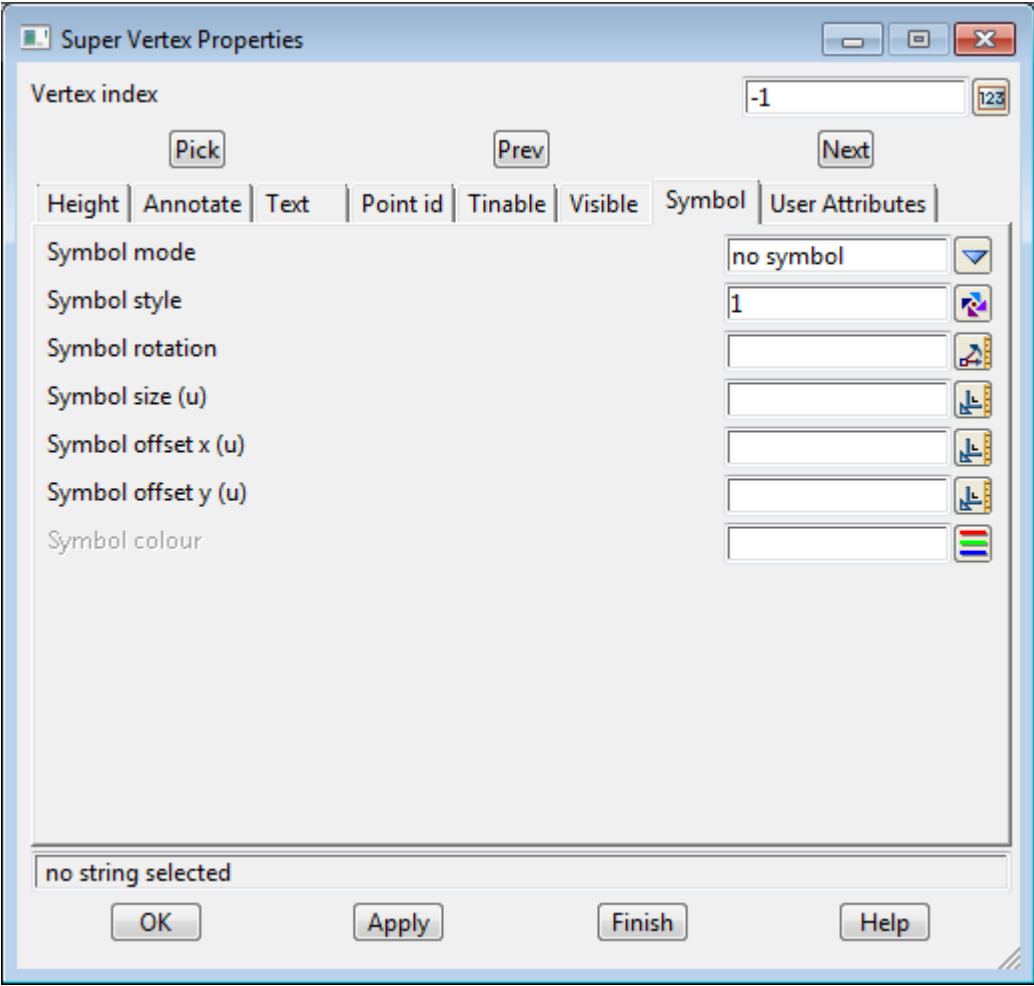

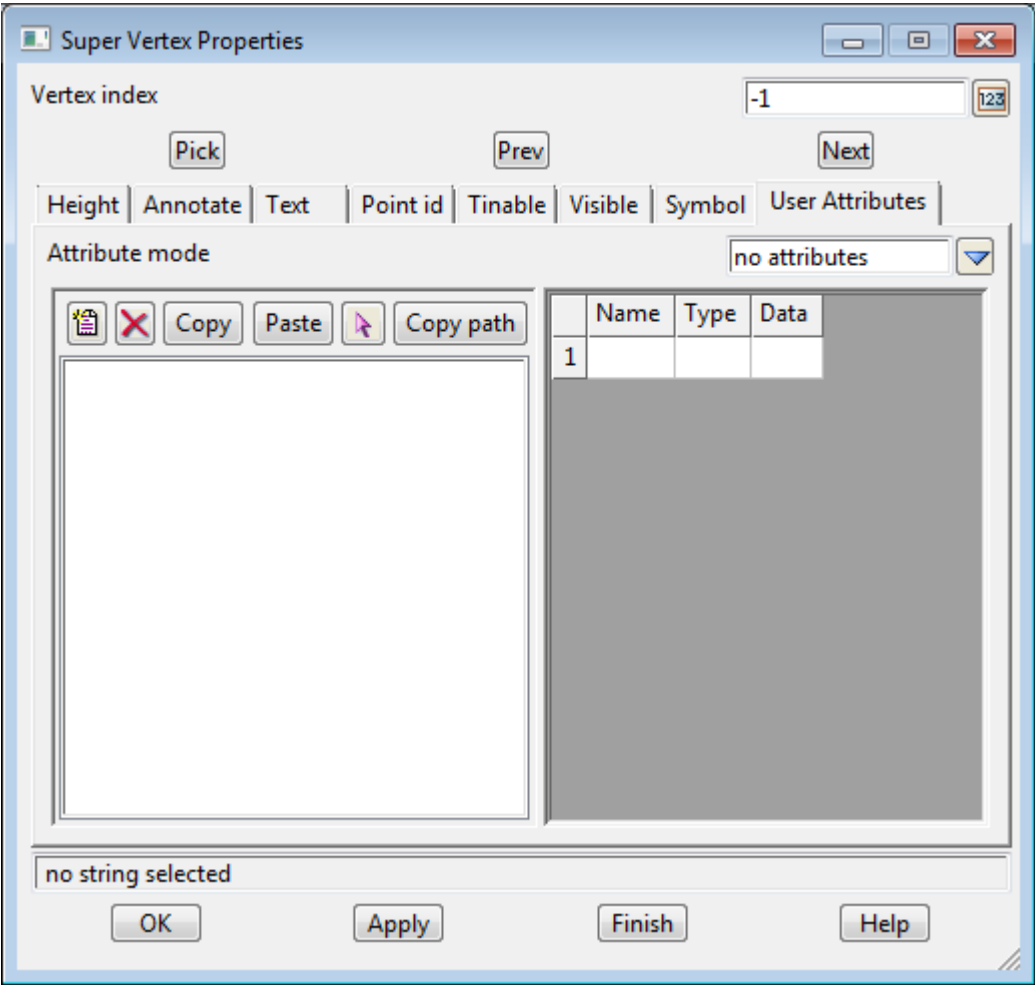

Vertex/Segment

Position of option on menu: Strings =>Properties =>Vertex/Segment

This option is a combination of the Vertex and Segment options already documented.

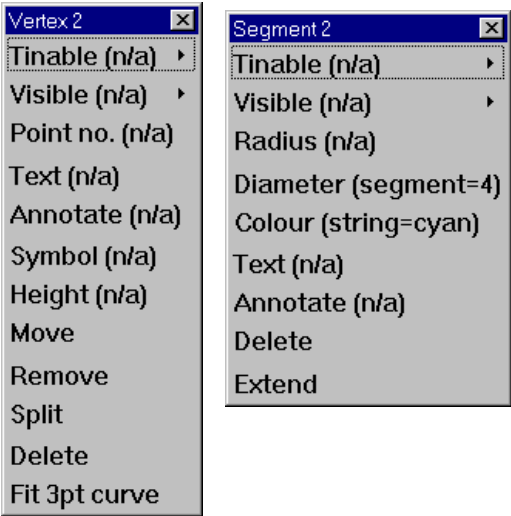

The **Vertex/ Segment** option obtains and/or modify property information about the vertex or segment of any super string displayed on the screen.

On selecting the **Vertex/Segment** option, the **String Vertex/Segment Properties** panel is displayed.

The panel is only used for any special messages and to end the option.

The **String Vertex/Segment Properties** option is automatically in a pick mode and the user selects either the *vertex* or the *segment* of a super string using the normal 12d Model picking mechanism. Whenever a *vertex* or *segment* is selected, the **Vertex** or **Segment** menu showing the properties of the selected vertex or segment is displayed on the screen.

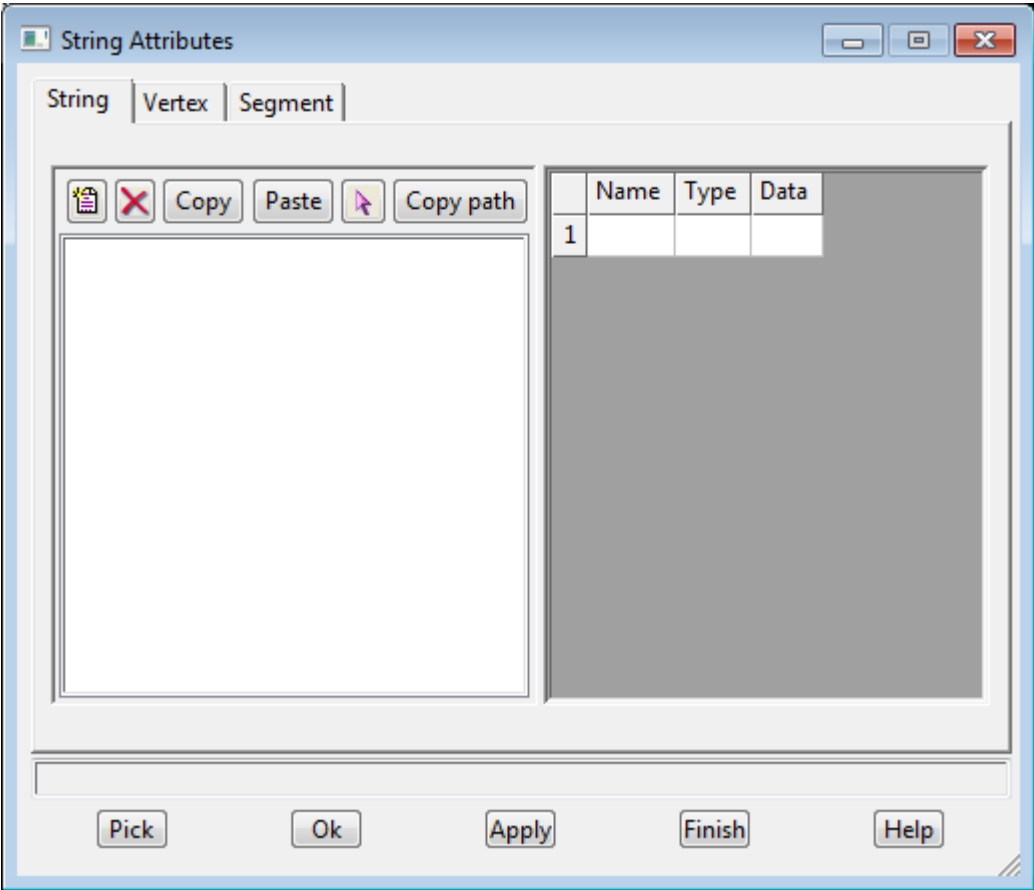

Attributes

Position of option on menu: String =>Properties =>Attributes

The **Attributes** options displays, creates and edits attributes for any strings in the project.

On selecting **Attributes**, the **String Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

String tab

this tab displays/edits the attributes that apply for the entire string. All string types have these.

Name

name of the string attribute

Type

integer, real, text

type of attribute - integer, real or text

Data

value for the string attribute

Segment tab

this tab displays/edits the attributes for each segment of a super string or pipe of a drainage or sewer string.

Segment no.

number of the segment of the string to display/edit attributes for

Prev

button

go to the previous segment of the string.

Next

button

go to the next segment of the string.

Name

name of the attribute for the segment

Type

integer, real, text

type of attribute - integer, real or text

Data

value for the attribute for the segment

Vertex tab

this tab displays/edits the attributes for each vertex of a super string or pit of a drainage or sewer string.

Vertex no.

number of the vertex of the string to display/edit attributes for

Prev

button

go to the previous vertex of the string.

Next

button

go to the next vertex of the string.

Name

name of the attribute for the vertex

Type

integer, real, text

type of attribute - integer, real or text

Data

value for the attribute for the vertex

Pick

button

pick the string to display/edit the attributes for

OK

button

set the attributes to the values in the panel and then exit the panel.

Apply

button

set the attributes to the values in the panel but don't exit the panel.

Super Strings

Position of menu: Strings =>Properties =>Super strings

Position of menu: Utilities =>Super strings

These options change many of the super string properties.

The Super strings walk-right menu is:

Super Strings	
Chainage interval	set/reset the chainage interval and chord/arc tolerance
Visible	set visibility flags to constant/variable or clear the flag
Compress	compress a super string
Tinable	set tinability to constant/variable or clear the flag
Fills	set fill styles for the string
Symbol	define symbols constant/each vertex or have no symbols
Segment colour	set a colour for every segment in the super string
Height	set the height(s) of the super string
Attribute	clear the super string attributes for the string, vertex and/or segment
Vertex id	set the Vertex IDs to sequential numbers or clears the existing vertex IDs
Pipe/culvert	ss segments can have a diameter or a box cross-section
Radius	clear any segment radii
Segment geometry	clear any segment geometry
Text	set or clear vertex and segment text and annotations
Convert same start/end point strings	convert strings with same start and end points to closed super strings
User	

For the option *Chainage interval*, go to

<i>Visible</i>	Chainage Interval
<i>Compress</i>	Visible
<i>Tinable</i>	Compress
<i>Fills</i>	Tinable
<i>Symbol</i>	Fills
<i>Segment colour</i>	Symbol
<i>Height</i>	Segment Colour
<i>Attribute</i>	Height
<i>Vertex id</i>	Attribute
<i>Pipe/culvert</i>	Vertex ID
<i>Radius</i>	Pipe/Culvert
<i>Segment geometry</i>	Radius
<i>Text</i>	Segment Geometry
<i>Convert same start/end points strings</i>	Text
	Same Start/End Point Strings

Chainage Interval

Position of option on menu: Strings =>Properties =>Super strings =>Chainage interval

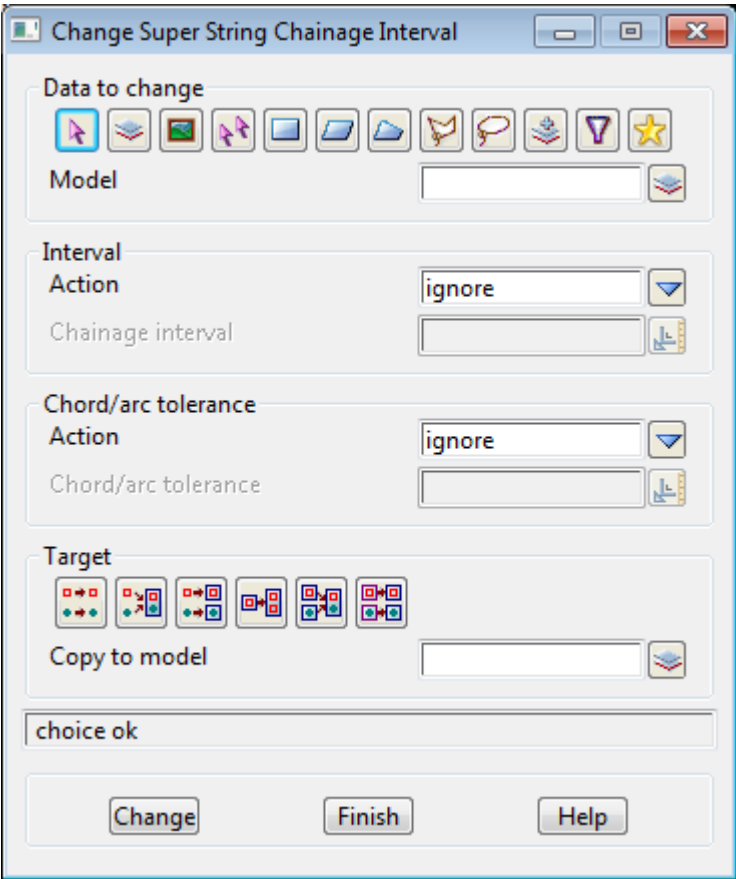

Position of option on menu: Utilities =>Super strings =>Chainage interval

A super string has one *chainage interval* value for the entire string. If the value is non-zero, then any line segments of the string are subdivided by the chainage interval when the super string is used in triangulations.

A super string also has one *arc-chord tolerance* value for the entire string. If the value is non-zero, then any curved segments are subdivided by the arc-chord tolerance when used in triangulations.

The **Chainage interval** option can set the *chainage interval* value and/or the *chord-to-arc tolerance* value for selected super strings.

On selecting the **Chainage interval** option, the **Change Super String Chainage Interval** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
Interval tab				
Action		choice box	ignore	set, clear, ignore
<i>if set, set the chainage intervals of the selected super strings to the value in Chainage interval.</i>				

*If **clear**, set all the selected super strings to not use a chainage interval.*
*If **ignore**, don't modify the chainage interval of the selected super strings.*

Chainage interval input
the chainage interval to use for a super string.

Chord/arc tolerance tab

Action choice box ignore set, clear, ignore
*if **set**, set the chord/arc tolerance of the selected super strings to the value in **Chord/arc tolerance**.*
*If **clear**, set all the selected super strings to not use a chord/arc tolerance.*
*If **ignore**, don't modify the chord/arc tolerance of the selected super strings.*

Chord/arc tolerance input
the chord/arc tolerance to use for a super string.

Target type
Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

Change button
process the selected strings

Visible

Position of option on menu: Strings =>Properties =>Super strings =>Visible

Position of option on menu: Utilities =>Super strings =>Visible

For selected super strings, the **Visible** option can set the flags that determine how visibility is defined for a super string.

Segment visibility can

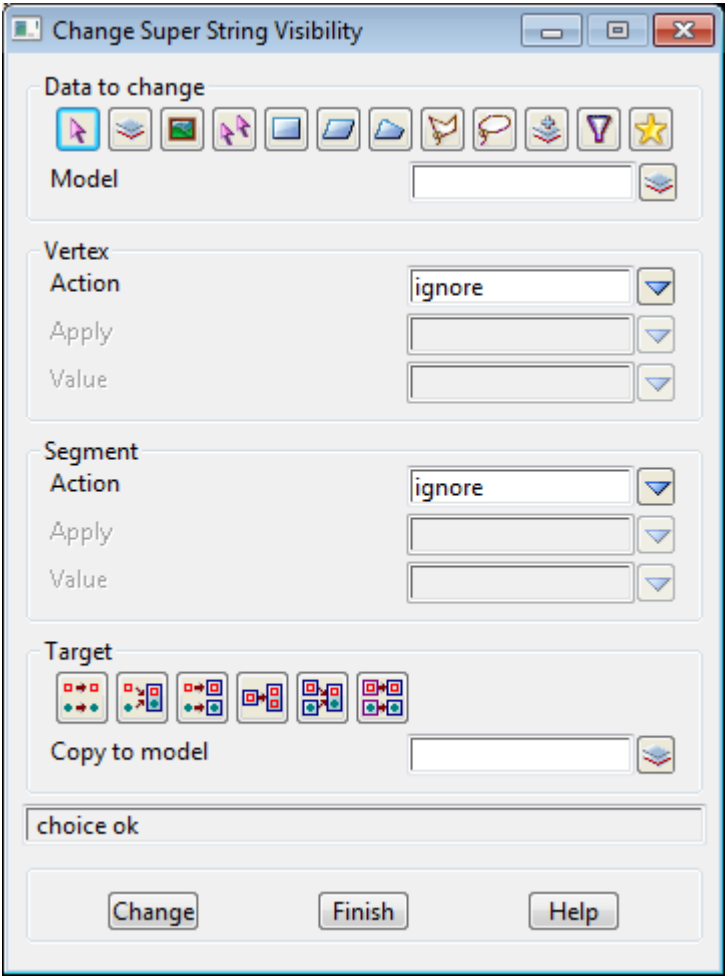

- (a) be not setable at all for the string - it is always visible
- (b) have one setting for the entire string - visible only
- (c) have separate settings for each segment (and all set to visible)

Similarly, vertex visibility can

- (a) be not setable at all for the string - it is always visible
- (b) have one setting for the entire string - visible only
- (c) have separate settings for each segment (and all set to visible).

The **Visible** option allows any of the above cases to be set up for the selected super strings.

On selecting the **Visible** option, the **Change Super String Visibility** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

Data source input
source of data to be processed.

Action	choice box	ignore	set, clear, ignore
	<i>if set, the vertex visibility can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.</i>		
	<i>If clear, the vertex visibility flags are removed for the string and the string vertices are always visible.</i>		
	<i>If ignore, don't modify the visibility flags for the vertices of the string.</i>		

*If **Action** is **set**, then the **Apply** field is used.*
*If **Apply** is **constant**, the string has only one visibility flag and it applies to all vertices in the string. It is set to visible.*
*If **Apply** is **variable**, each vertex in the string has its own visibility flag and each flag is set to visible.*

Action	choice box	ignore	set, clear, ignore
	<i>if set, the segment visibility can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.</i>		
	<i>If clear, the segment visibility are removed for the string and the string segments are always visible.</i>		
	<i>If ignore, don't modify the visibility flags for segments of the string.</i>		

*if **Action** is **set**, then the **Apply** field is used.*
*If **Apply** is **constant**, the string has only one visibility flag and it applies to all segments in the string It is set to visible*
*If **Apply** is **variable**, each segment in the string has its own visibility flag and each flag is set to visible.*

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Change button
process the selected strings.

Compress

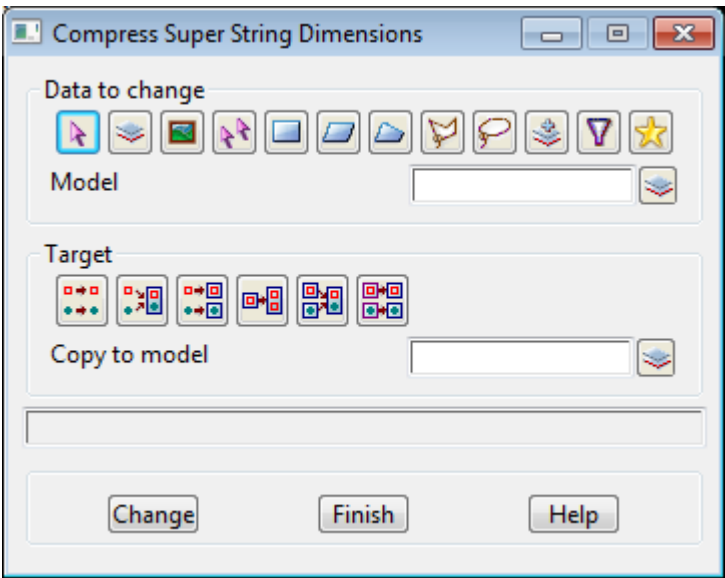

Position of option on menu: Strings =>Properties =>Super strings =>Compress

Position of option on menu: Utilities =>Super strings =>Compress

The compress option removes any super string dimensions that are not needed. For example, dimensions such radius, variable z etc. that are not being used in the string are removed.

This reduces the storage required for the super string.

On selecting the **Compress** option, the **Compress Super String Dimensions** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source		input		
	<i>source of data to be processed.</i>			
Target type				
	<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info		input		
	<i>extra information required for the target.</i>			
Change		button		
	<i>process the selected strings</i>			

Tinable

Position of option on menu: Strings =>Properties =>Super strings =>Tinable

Position of option on menu: Utilities =>Super strings =>Tinable

For selected super strings, the Tinable option can set the flags that determine how tinability is defined for a super string and can also set whether segments or vertices are tinable or not.

Segment tinability can

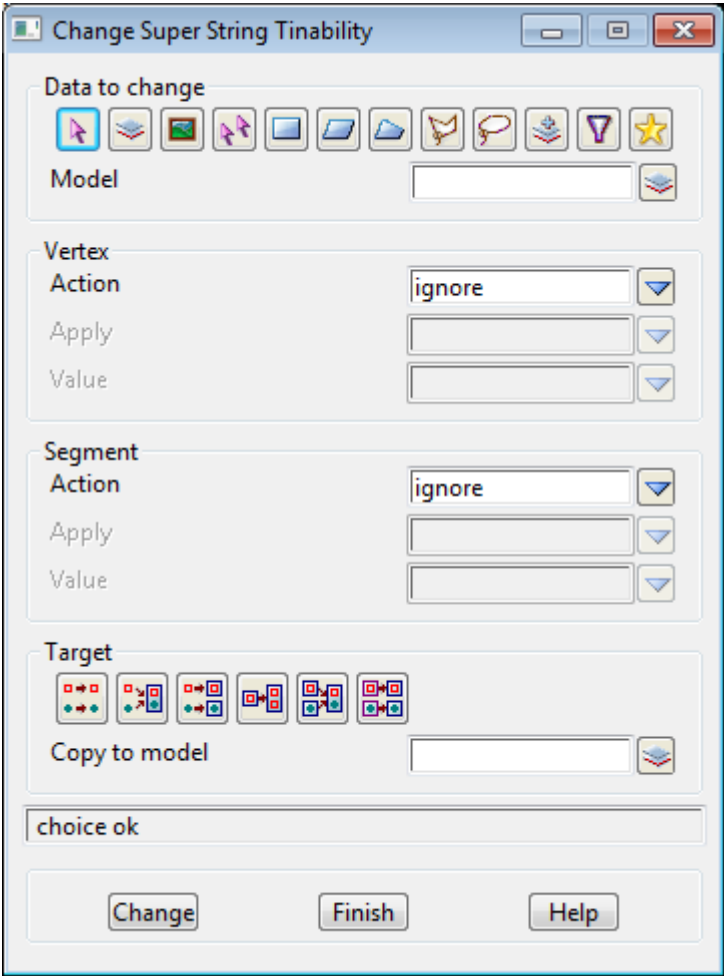

- (a) be not setable at all for the string - it is always tinable
- (b) have one setting for the entire string
- (c) have separate settings for each segment.

Similarly, vertex tinability can

- (a) be not setable at all for the string - it is always tinable
- (b) have one setting for the entire string
- (c) have separate settings for each segment.

The Tinable option allows any of the above cases to be set up for the selected super strings.

On selecting the Tinable option, the **Change Super String Tinability** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	

data source *input*
source of data to be processed.

Action	choice box	ignore	set, clear, ignore
	<i>if set, the vertex tinability can be allowed to be a constant for all vertices in the string, or to be different for each vertex in the string.</i>		
	<i>If clear, the vertex tinability can not be modified for the string and the string vertices are always tinable.</i>		
	<i>If ignore, don't modify the tinability flags for the vertices of the string.</i>		

*If **Action** is **set**, then the **Apply** field is used.*
*If **Apply** is **constant**, the string has only one tinability flag and it applies to all vertices in the string. The tinability flag it is set to the value in the **Value** field.*
*If **Apply** is **variable**, each vertex in the string has its own tinability flag. The tinability flag it is set to the value in the **Value** field.*

if *Value* is **on**, then the tinalbe flag is set to **tinalbe**.
If *Value*' is **off**, then the tinalbe flag is set to **not tinalbe**.

Action	choice box	ignore	set, clear, ignore
	<i>if set, the segment tinability can be allowed to be a constant for all segments in the string, or to be different for each segment in the string.</i>		
	<i>If clear, the segment tinability can not be modified for the string and the string segments are always tinable.</i>		
	<i>If ignore, don't modify the tinability flags for segments of the string.</i>		

*if **Action** is **set**, then the **Apply** field is used.*
*If **Apply** is **constant**, the string has only one tinability flag and it applies to all segments in the string. The tinability flag it is set to the value in the **Value** field.*
*If **Apply** is **variable**, each segment in the string has its own tinability flag. The tinability flag it is set to the value in the **Value** field*

if *Value* is **on**, then the tinnable flag is set to **tinable**.
If *Value* is **off**, then the tinnable flag is set to **not tinable**.

extra information required for the target.

```
process the selected strings
```

Fills

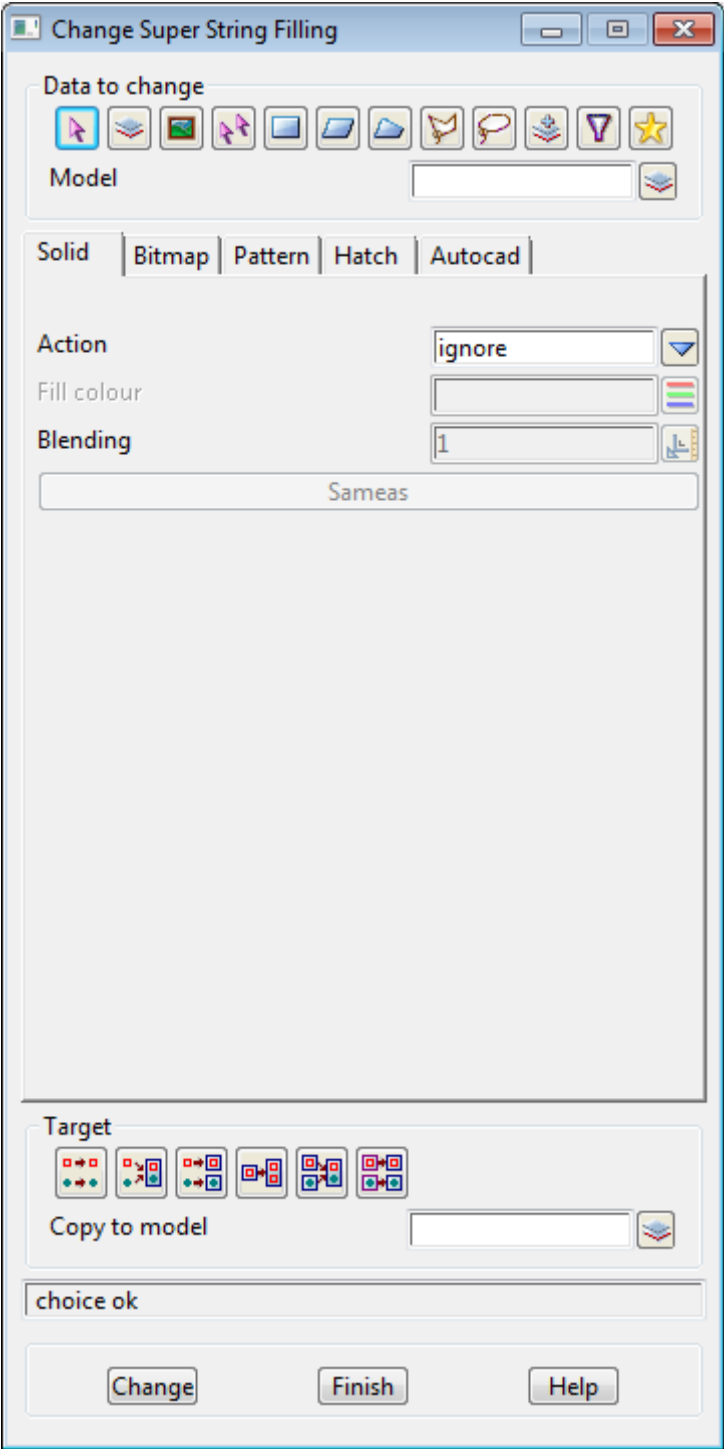

Position of option on menu: Strings =>Properties =>Super strings =>Fills

Position of option on menu: Utilities =>Super strings =>Fills

For selected super strings, the **Fills** option can set the flags that determine how filling is defined for a super string. If the string is not closed, the first and last vertices are joined to define the region to fill.

A string can have zero, one or more types of fills from the types solid, bitmap, pattern, hatch and Autocad.

On selecting the **Fill** option, the **Change Super String Filling** panel is displayed.

The fields and buttons used in the panel have the following functions.

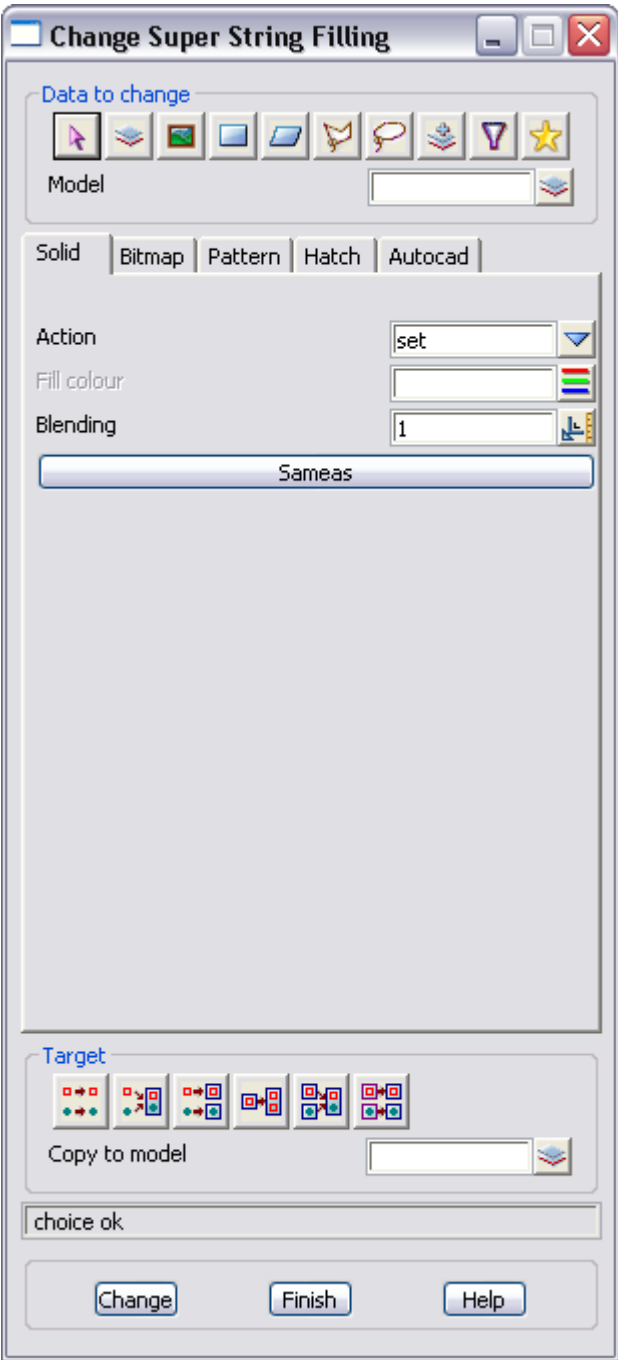

Field Description	Type	Defaults	Pop-Up
Data to change		Model	

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Solid, Bitmap, Pattern, Hatch and Autocad Tabs

each tab defines how that type of fill is applied to the string. Zero, one or more fill types can be applied to a string. Each tab will now be described.

Solid Tab

The fields and buttons used in the panel have the following functions.

Action choice box ignore set, clear, ignore

*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

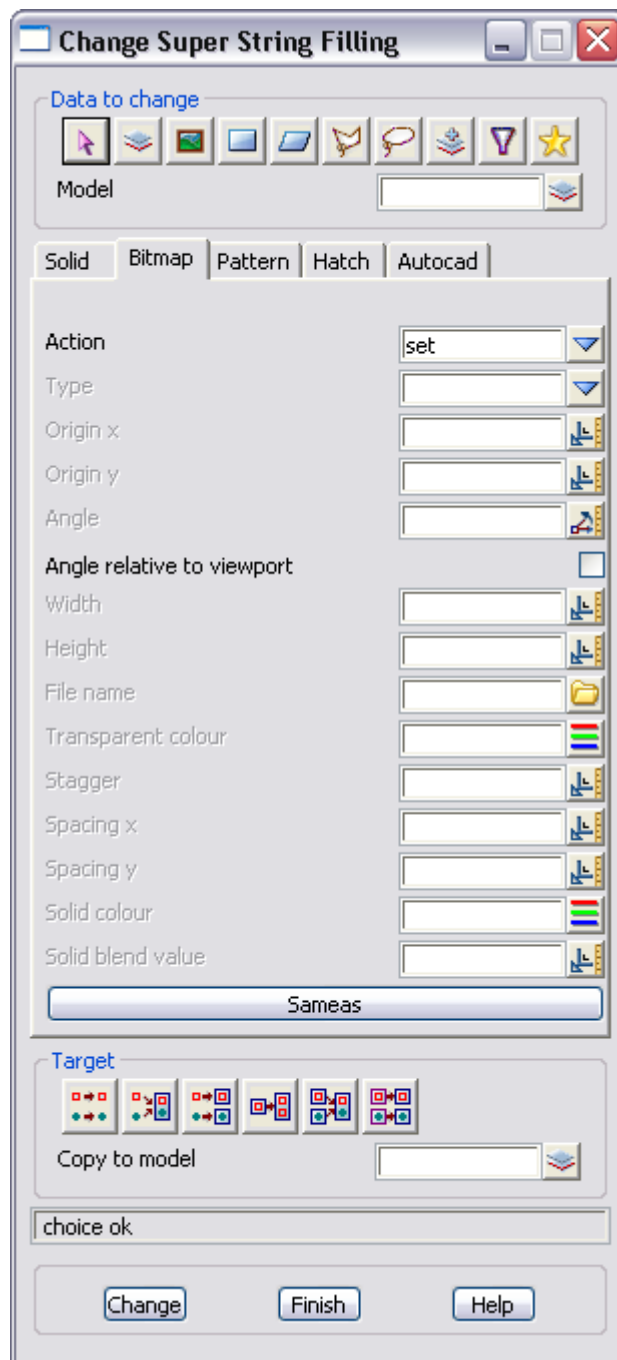

Fill colour colour box

The colour used to fill the super string. If the super string is not closed, the fill will apply as if the super string was closed.

Blending input

The blend value is used for the solid fill. This value is between 0.0 and 1.0 and controls the amount of transparency of the fill.
if blank, the blend value of 1.0 is assumed.

Bitmap Tab

The fields and buttons used in the panel have the following functions.

Action	choice box	ignore	set, clear, ignore
---------------	------------	--------	--------------------

*if **set**, this type of fill is set for the string.*

If **clear**, this type of fill is turned off for the string.

*If **ignore**, don't modify this type of fill for the string.*

Type	choice box	device, world, paper
------	------------	----------------------

The units of size. This means the bitmap can be drawn with either world size, paper size (mm) or device size.

Origin X input

The x co-ordinate of the origin point of the repeated pattern.

Origin Y input

The y co-ordinate of the origin point of the repeated pattern.

Angle	angle
--------------	-------

The orientation of the bitmap pattern relative to the x axis measured in the anti-clockwise direction in dms.

Angle relative to view tick box

*This field controls whether the Angle is relative to the x axis or to the plotting x axis.
if the value is ticked and we are plotting, **Angle** is measured relative to the x axis of the plot rotation.
if not ticked, **Angle** is always absolute to the world x axis.*

Height input

The height of the bitmap in the selected units.

File name	file box	.bmp
------------------	----------	------

The bitmap file to be used for filling. Only BMP files are currently supported.

Transparent colour colour box **Select Colour pop up**

The transparency colour within the bitmap. This means any pixel of this colour within the bitmap is not drawn.

Stagger

if non blank, this field allows each alternate row of bitmaps to be staggered (or offset) by the specified value. Stagger is measured in the selected units along the x axis in the rotated system. If blank, there a Stagger of 0.0 is assumed.

Spacing X input

The distance in the selected units along the x axis in the rotated system between each instance of the bitmap.

Spacing Y

The distance in the selected units along the y axis in the rotated system between each instance of the bitmap.

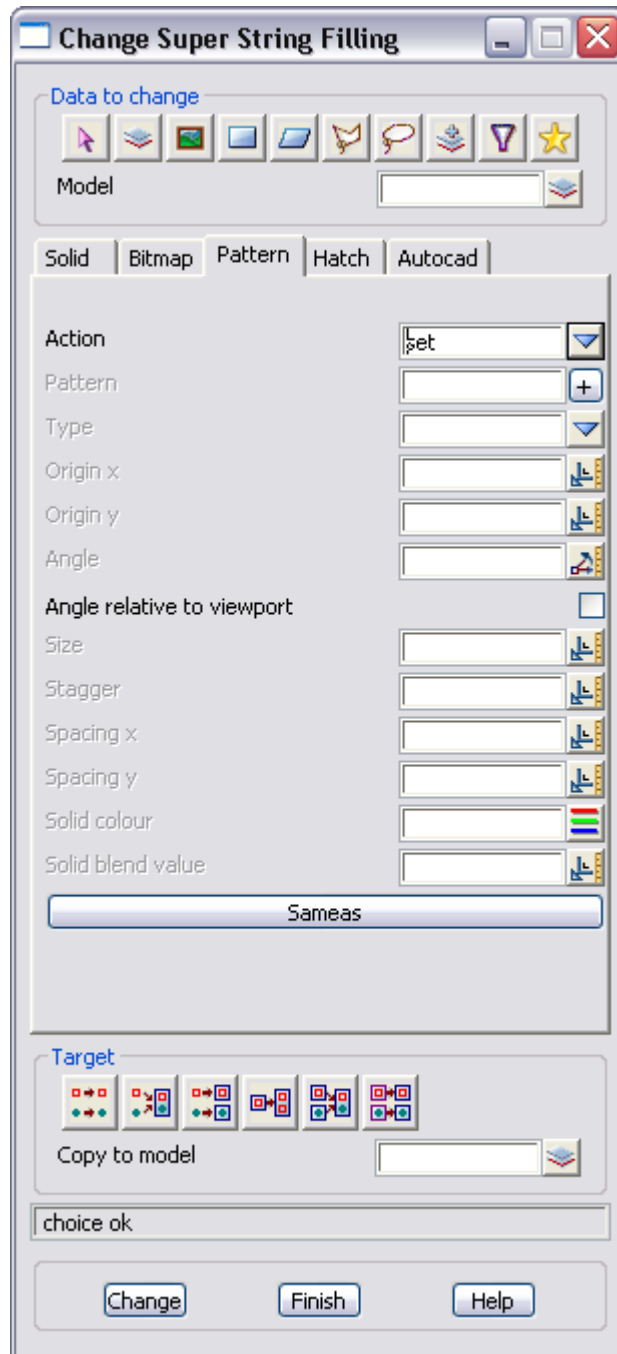

Solid colour colour box **Select Colour** pop up

*if non blank, when the bitmaps become too small to be legible, the super string is solid filled instead with **Solid colour**.*

Solid blend value input

if non blank, and **Solid Colour** is specified, the solid fill is drawn with transparency. The blend value is between 0.0 and 1.0 and controls the transparency of the solid colour.

Pattern Tab

The fields and buttons used in the panel have the following functions.

Action	choice box	ignore	set, clear, ignore
---------------	------------	--------	--------------------

*if **set**, this type of fill is set for the string.*

*If **clear**, this type of fill is turned off for the string.*

If ignore, don't modify this type of fill for the string.

Pattern select pattern pop up

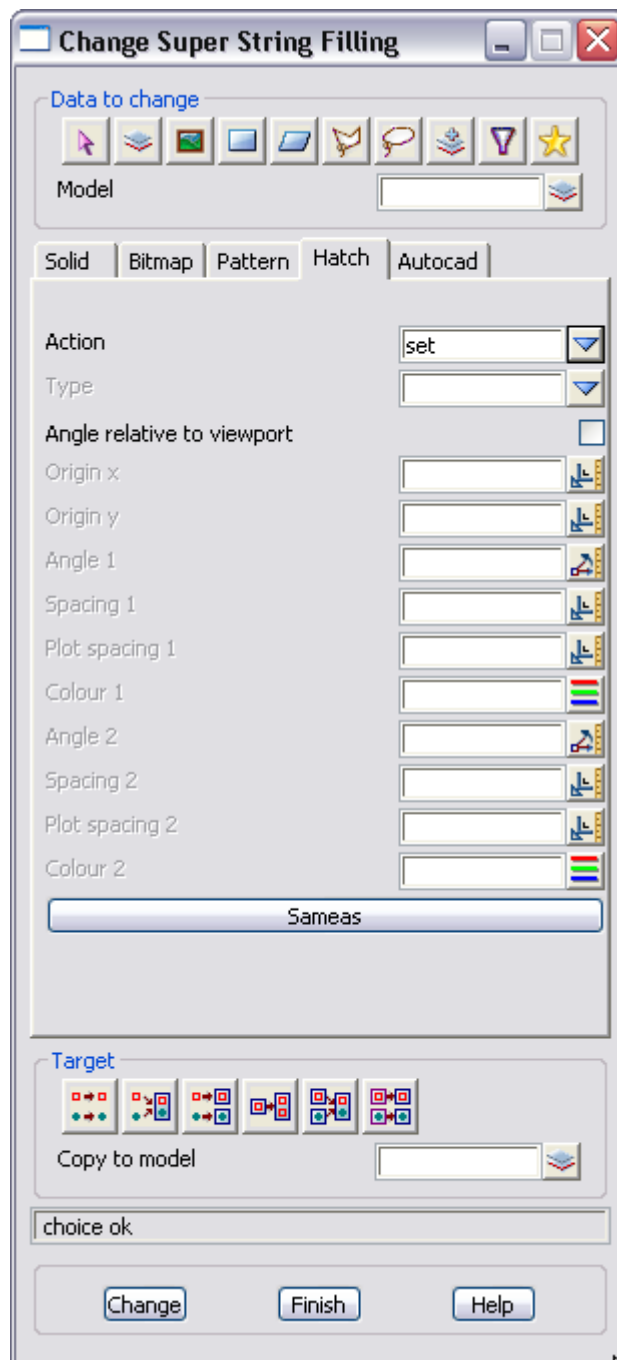

The pattern name to be applied. These patterns are defined via `patterns.12d`

For more information on the 12d pattern definition please go to the section [12d Patterns File](#) in the

chapter [Special File Formats](#)

Type	choice box	device, world, paper
<i>The units of size. This means the pattern can be drawn with either world size, paper size (mm) or device size.</i>		
Origin X	Input	
<i>The x co-ordinate of the origin point of the repeated pattern.</i>		
Origin Y	Input	
<i>The y co-ordinate of the origin point of the repeated pattern.</i>		
Angle	angle	
<i>The orientation of the pattern relative to the x axis measured in the anti-clockwise direction in dms.</i>		
Angle relative to view	tick box	
<i>This field controls whether the Angle is relative to the x axis or to the plotting x axis. if the value is ticked and we are plotting, Angle is measured relative to the x axis of the plot rotation. if not ticked, Angle is always absolute to the world x axis.</i>		
Size	input	
<i>The size of the pattern in the selected units.</i>		
Stagger	input	
<i>if non blank, this field allows each alternate row of patterns to be staggered (or offset) by the specified value. Stagger is measured in the selected units along the x axis in the rotated system. If blank, there a Stagger of 0.0 is assumed.</i>		
Spacing X	input	
<i>The distance in the selected units along the x axis in the rotated system between each instance of the pattern.</i>		
Spacing Y	input	
<i>The distance in the selected units along the y axis in the rotated system between each instance of the pattern.</i>		
Solid colour	colour box	Select Colour pop up
<i>if non blank, when the patterns become too small to be legible, the super string is solid filled instead with Solid colour</i>		
Solid blend value	input	
<i>if non blank, and Solid Colour is specified, the solid fill is drawn with transparency. The blend value is between 0.0 and 1.0 and controls the transparency of the solid colour.</i>		

Hatch

The fields and buttons used in the panel have the following functions.

Action	choice box	ignore	set, clear, ignore
---------------	------------	--------	--------------------

*if **set**, this type of fill is set for the string.*

If **clear**, this type of fill is turned off for the string.

*If **ignore**, don't modify this type of fill for the string.*

Type	choice box	device, world, paper
------	------------	----------------------

The units of size. This means the bitmap can be drawn with either world size, paper size (mm) or device size.

Angle relative to view tick box

This field controls whether the Angle is relative to the x axis or to the plotting x axis.

if the value is ticked and we are plotting, **Angle** is measured relative to the x axis of the plot rotation.
if not ticked, **Angle** is always absolute to the world x axis.

Origin X Input

The x co-ordinate of the anchor point of the repeated pattern.

Origin Y Input

The y co-ordinate of the anchor point of the repeated pattern.

Angle 1 angle

The first orientation of the hatch pattern relative to the x axis measured in the anti-clockwise direction in dms.

Spacing 1 input

*The first distance in the units selected in Type between the lines drawn at **Angle 1**.*

Plot spacing 1 input

*The first distance in the units selected in Type between the lines drawn at **Angle 1** except it is the value used when you are plotting to or doing a plot of the super string containing the fill.
if the field is blank it uses the **Spacing 1** value.*

Colour 1 colour box

Select Colour pop up

*The colour of all the lines drawn at **Angle 1**.*

Angle 2 angle

The second orientation of the hatch pattern relative to the x axis measured in the anti-clockwise direction in dms.

Spacing 2 input

*The second distance in the units selected in Type column between the lines drawn at **Angle 2**.*

Plot spacing 2 input

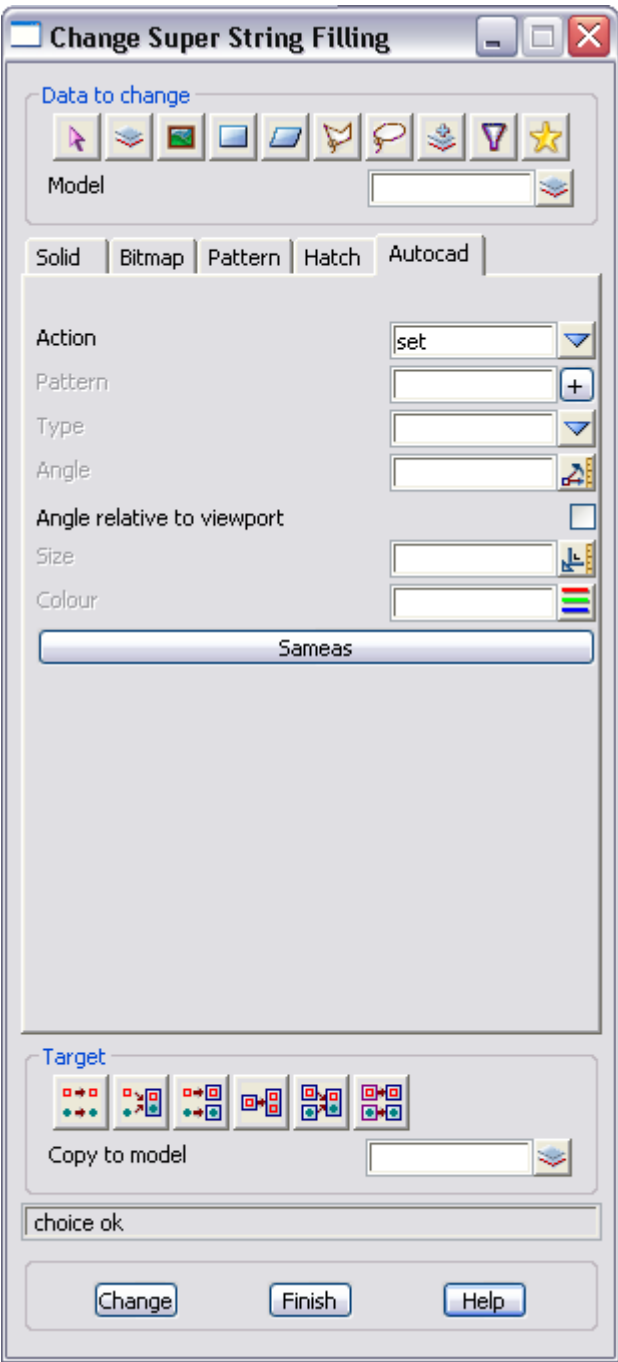

*The first distance in the units selected in Type between the lines drawn at **Angle 2** except it is the value used when you are plotting to or doing a plot of the super string containing the fill.
if the field is blank it uses the **Spacing 2** value.*

Colour 2 colour box

Select Colour pop up

*The colour of all the lines drawn at **Angle 2**.*

Autocad

The fields and buttons used in the panel have the following functions.

Action choice box ignore set, clear, ignore
*if **set**, this type of fill is set for the string.*
*If **clear**, this type of fill is turned off for the string.*
*If **ignore**, don't modify this type of fill for the string.*

Pattern select autocad pattern pop up
The autocad pattern name to be applied. These patterns are defined via acad.pat.
This is an autocad file.

Type choice box device, world, paper
The units of size. This means the bitmap can be drawn with either world size, paper size (mm) or device size.

Angle angle
The orientation of the pattern relative to the x axis measured in the anti-clockwise direction in dms.

Angle relative to view tick box
*This field controls whether the Angle is relative to the x axis or to the plotting x axis.
if the value is ticked and we are plotting, **Angle** is measured relative to the x axis of the plot rotation.
if not ticked, **Angle** is always absolute to the world x axis.*

Size input
The size of the pattern in the selected type.

Colour colour box **Select Colour** pop up
The colour of the pattern

Action choice box ignore set, clear, ignore
*if **set**, this type of fill is set for the string.
If **clear**, this type of fill is turned off for the string.
If **ignore**, don't modify this type of fill for the string.*

Target type
Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

Change button
process the selected strings

Symbol

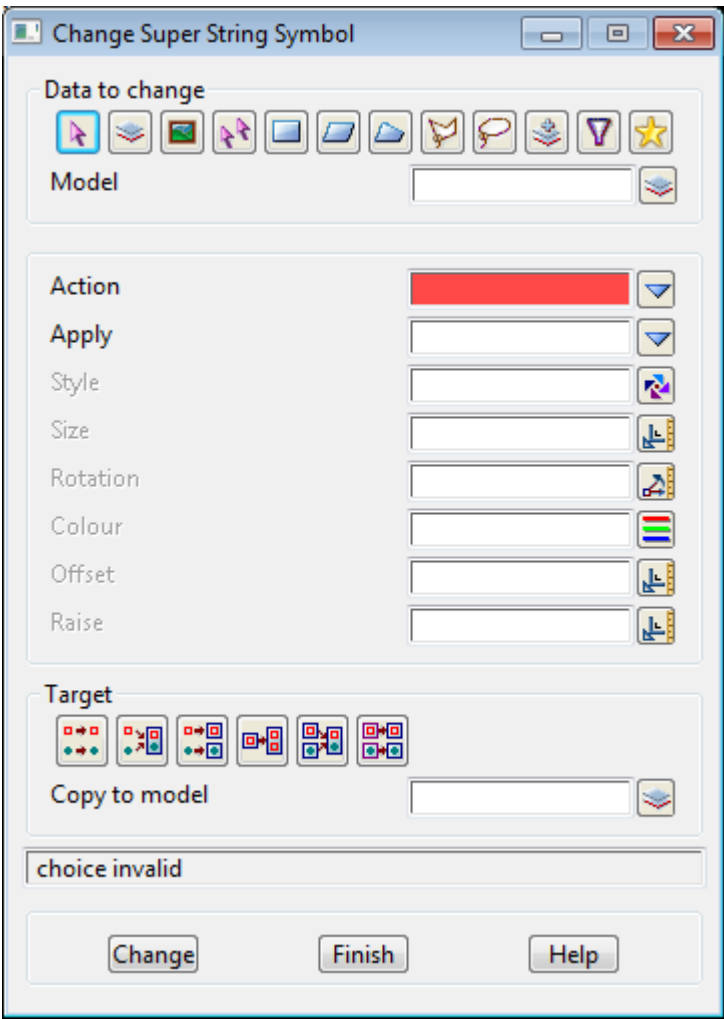

Position of option on menu: Strings =>Properties =>Super strings =>Symbol

Position of option on menu: Utilities =>Super strings =>Symbol

For selected super strings, the **symbols** option can set the flags that determine how symbols are defined for a super string.

A super string can have no symbols, a constant symbol definition for the entire string or different symbol definitions at each vertex.

On selecting the **symbol** option, the **Change Super String Symbols** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
Action		choice box	ignore	set, clear, ignore
<i>if set, a symbol can be constant for all vertices in the string, or can be different for each vertex in the string.</i>				
<i>If clear, there are no symbols for the string.</i>				
<i>If ignore, don't modify the symbol flags for the vertices of the string.</i>				

Apply	choice box	constant, variable
<i>if Action is set, then the Apply field is used.</i>		
<i>If Apply is constant, the string has only one symbol and it used for each vertices in the string. It is set to visible.</i>		
<i>If Apply is variable, each vertex in the string has its own symbol.</i>		
Symbol	symbol box

Segment Colour

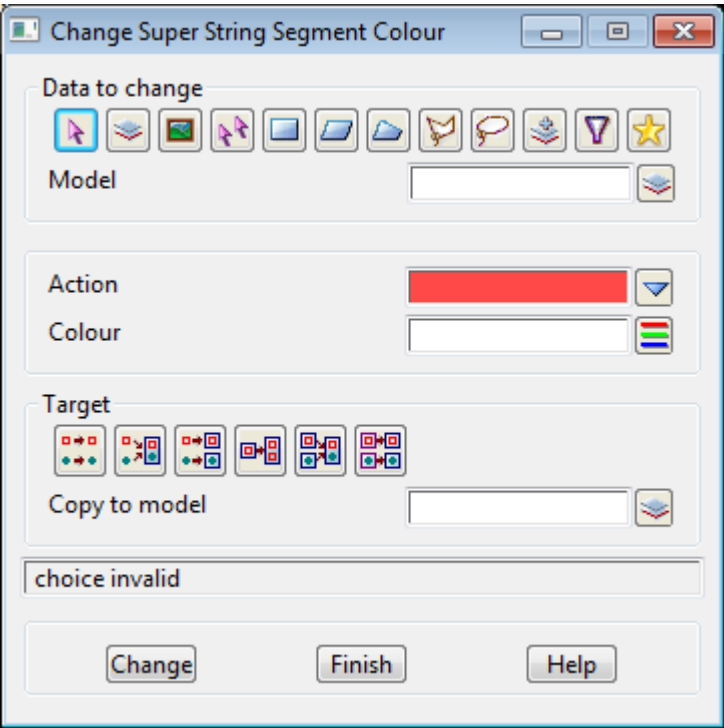

Position of option on menu: Strings =>Properties =>Super strings =>Segment colour

Position of option on menu: Utilities =>Super strings =>Segment colour

A super string has a default colour used for the entire string and segment colours setable for each segment which override the string colour for that segment.

The Segment colour option can set a segment colour for every segment in the super string or clear all the set segment colours so that the default string colour is used.

On selecting the Segment colour option, the Change Super String Segment Colour panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type

Model

Height

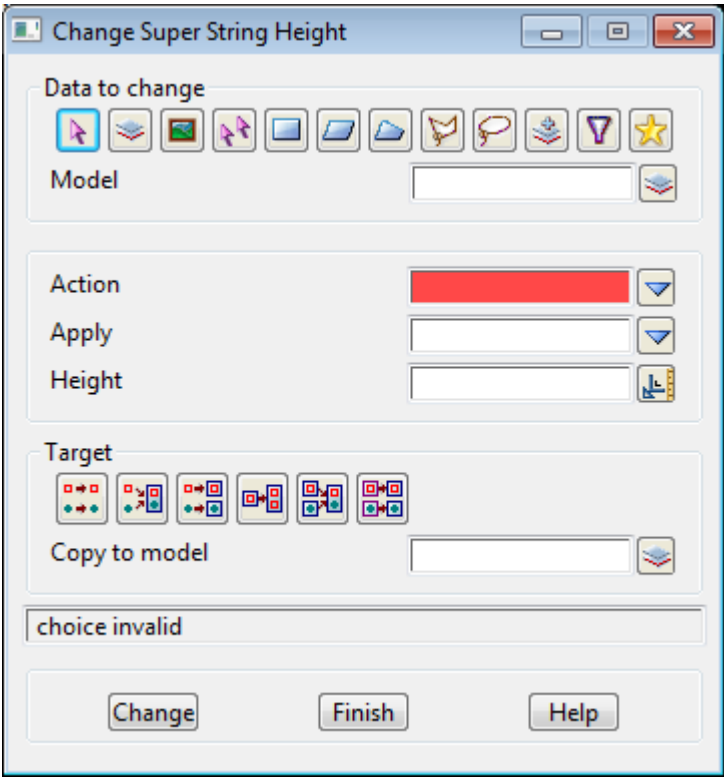

Position of option on menu: Strings =>Properties =>Super strings =>Height

Position of option on menu: Utilities =>Super strings =>Height

A super string can have the one height that is used for every vertex in the super string (constant height) or it can have a different height at each vertex.

The **Height** option can set the super string to either having a constant height or to allow each vertex to have independent heights.

On selecting the **Height** option, the **Change Super String Height** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Action	choice box	ignore	set, clear
<i>if set, the string height can be a constant for the entire string, or to be different for each vertex in the string.</i>			
<i>If clear, the entire string and each vertex has no height.</i>			
Apply	choice box		constant, variable
<i>if Action is set, then the Apply field is used.</i>			
<i>If Apply is constant, the string has only one height and no vertex has its own height. The height for the string is set to the height in the Height field.</i>			
<i>If Apply is variable, each vertex in the string is set to have has its own height and it is set to the value in the Height field.</i>			
Height			

*if Action is **set**, then either the entire string or every vertex is set to this height.*

--------------------	-------	--	--	--

source of data to be processed.

Justification

Action	choice box		set, clear, ignore	
---------------	------------	--	--------------------	--

*if **set**, the string justification is set to the type given in the **Pipe level** field.*

*If **clear**, the string justification information is cleared.*

If **ignore**, nothing is done to the string justification.

Pipe level

if **Action** is **set**, the string justification is set to this value.

Mode

Apply to choice box pipe, culvert

if **pipe**, the next section of the panel has fields for setting pipe information.

if **culvert**, the next section of the panel has fields for setting culvert information.

Pipe - when Mode is Pipe

Action choice box set, clear, ignore

if **set**, then the **Pipe Apply** field specifies how the pipe information is modified.

If **clear**, the pipe information is cleared at each segment.

If **ignore**, nothing is done to the pipe information.

Apply choice box constant, variable

if **Pipe Action** is **set**, then the **Apply** field is used.

If **Apply** is **constant**, the string has only one diameter and no segment has its own diameter. The diameter for the string is set to the value in the **Diameter** field.

If **Apply** is **variable**, each segment in the string is set to have has its own diameter and it is set to the value in the **Diameter** field.

Diameter

diameter for each pipe segment.

Culvert - when Mode is Culvert

Action choice box set, clear, ignore

if **set**, then the **Culvert Apply** field specifies how the culvert information is modified.

If **clear**, the culvert information is cleared at each segment.

If **ignore**, nothing is done to the culvert information.

Apply choice box constant, variable

if **Culvert Action** is **set**, then the **Apply** field is used.

If **Apply** is **constant**, the string has only one width and height and no segment has its own width and height. The width and height for the string is set to the values in the **Width** and **Height** fields.

If **Apply** is **variable**, each segment in the string is set to have has its own width and height and they are set to the values in the **Width** and **Height** fields.

Width/Height

width/height for each culvert segment.

Target info	input
-------------	-------

extra information required for the target.

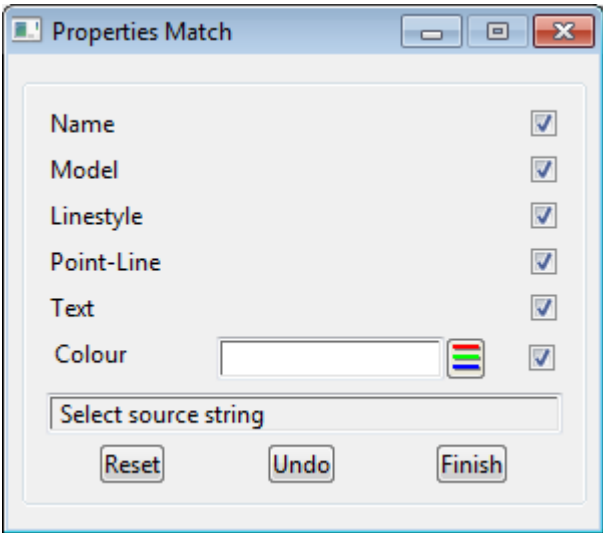

Change button
process the selected strings.

Match

Position of option on menu: Strings =>Properties =>Match

The **Match** option obtains information from a selected string and uses that to set information on another selected string.

On selecting the **Match** option, the **Properties Match** panel is displayed.

The **properties match** option is automatically in a pick mode for selecting the string whose properties you wish mimic (source string).

After the source string is selected, the values of the property from the source string are filled in on the panel and tick boxes turned on for each property. The tick boxes can be turned off if that property is not to be modified on the selected strings. The strings to change are then selected one after another.

If a new set of properties is required, selecting the **Reset** button is used to select a new source string.

The fields and buttons in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Name		tick box	tick	
	<i>if ticked, set the name of the selected string to the value displayed in the Name field.</i>			
Model		tick box	tick	
	<i>if ticked, set the model of the selected string to the value displayed in the Model field.</i>			
Linestyle		tick box	tick	
	<i>if ticked, set the model of the selected string to the value displayed in the Linestyle field.</i>			
Point-Line		tick box	tick	
	<i>if ticked, set the model of the selected string to the value displayed in the Point-Line field.</i>			
Text		tick box	tick	
	<i>if ticked, set the textstyle and height of a selected string to the values displayed in the Text field.</i>			
Colour		tick box	tick	
	<i>if ticked, set the colour of the selected string to the value displayed in the Colour field.</i>			
Reset		button		
	<i>Select a new source string to set the values of the properties on the panel.</i>			

Label

Position of menu: Strings => Properties => Label

The **Label** menu contains options to label string chainages, create tadpoles for cut and fill, label string vertices with their x, y, z or point numbers and names.

The **Label** walk-right menu is

For the option *Chainages*, go to

[Label Chainages](#)

Chainages (function)

[Chainages \(function\)](#)

Cut/fill

[Label Cut/Fill](#)

Names

[Label Names](#)

Vertices

[Label Vertices](#)

Label Chainages

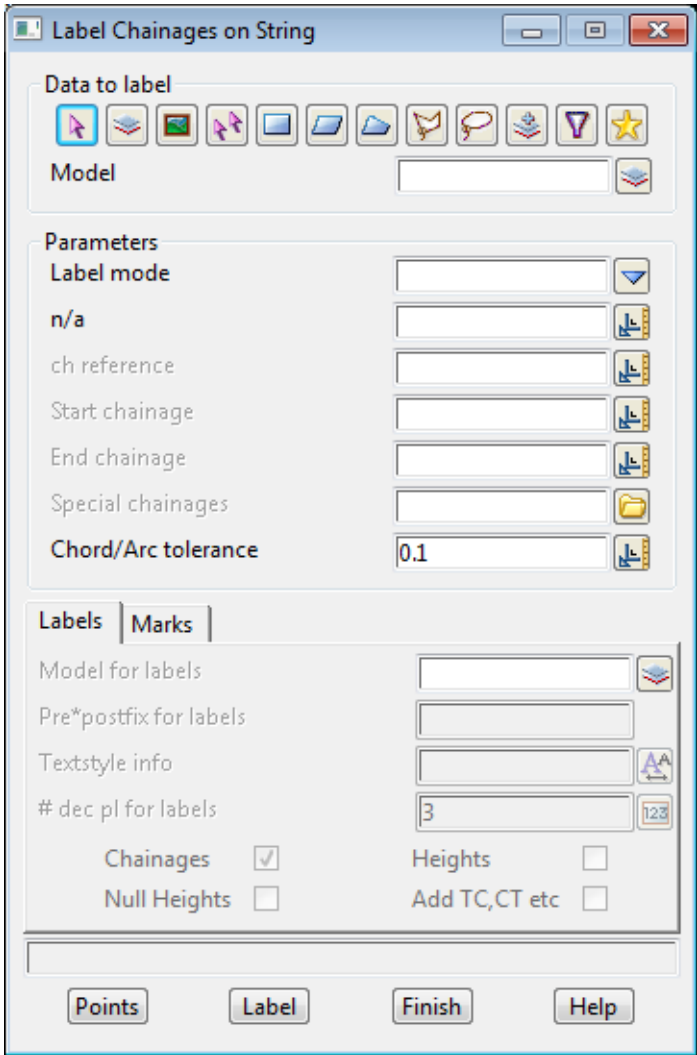

Position of option on menu: Strings => Label => Chainages

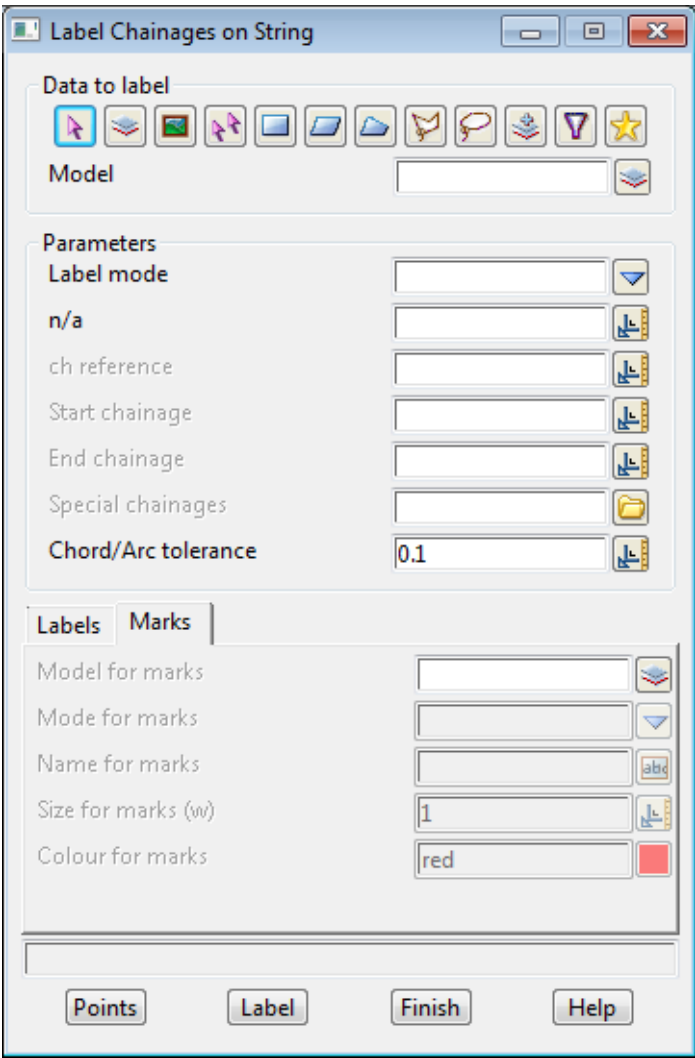

The **Label chainages** option is used to create text at regular chainages and special points on a string such as horizontal and vertical tangent points, crest and sag points and user selected points. It can also create tick marks at selected chainages.

The user has control over the label height, colour, angle, offset and the number of decimal places displayed, plus the size and colour of the tick marks.

As well as being used for labelling centre-lines, this option is used in conjunction with the sewer option to created special labels for sewer long section plots.

On selecting the **Label chainages** option, the **Label chainages on string** panel is displayed.

Individual points can be labelled by selecting them after picking the **Points** button.

The **marks** button brings up the **label chainages on string (marks)** panel which is used to place marks at the chosen chainages.

The fields and buttons used in the **label chainages on string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type			
<i>data source type.</i>			
Data source			
<i>data source for strings to label.</i>			
Label mode	input		regular interval, regular interval plus end pts end points only horizontal TPs, vertical TPs, horizontal discontinuities vertical discontinuities all discontinuities, crests/sags

all horizontal points

type of labelling required.

Ch interval or n/a input
the regular interval to use for labelling points.

Ch reference input 0
the chainages to be labelled are integer multiples of the chainage interval added to the reference chainage. For example, if the reference chainage is 23.2 and the chainage interval 10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be labelled.

Start chainage input
if non-blank, the string chainage to start labelling from.
If blank, start at the beginning of the string.

End chainage input
if non-blank, the string chainage to end the labelling at.
If blank, go to the end of the selected string.

Special chainage input
file of special chainages to create labels at.

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the strings being labelled for determining how many points are labelled around horizontal curves.

Labels tab

Model for labels model box available models
if **non-blank**, labels are generated and placed in this model.
If **blank**, no labels are created (but tick marks may be).

Pre*postfix for labels input
the beginning and ending of the label to be given at each point. Spaces are significant. This uses the standard 12d method of pre-text*post-text. That is, 'Ch * m' would add 'Ch ' before the value and ' m' after the label.

Textstyle info textstyle box 1 available textstyle data
textstyle data to use when creating the labels.

dec pl for labels input 0
number of decimal places used in the labels.

Chainages tick tick
if **ticked**, the chainage of each point is appended to the label stem to create the label for the point.
If **not ticked**, only the label stem is used as the label.

Heights tick
if **ticked**, the height of each point is used in the label for the point.
If **not ticked**, heights are not used in the label.

Null heights tick
if **ticked** and the height of a point null, (**null**) is used in the label for the point.
If **not ticked**, null heights are not used in the label.

Add TC, CT etc. tick
if **ticked** and labelling an alignment string, the critical point types are used in the label for the point.
If **not ticked**, critical point types are not used in the label.

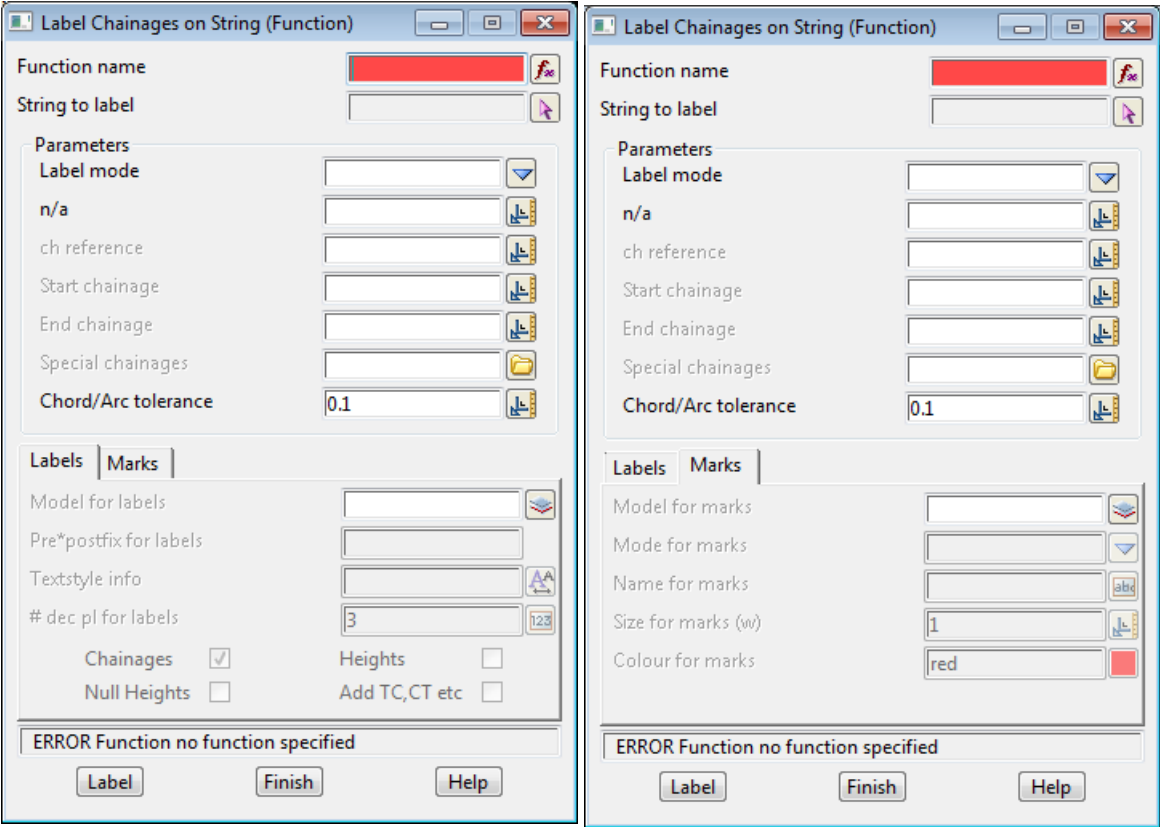

Marks tab

Model for marks	input	available models	
<i>if non-blank, tick marks are generated according to the label mode and placed in this model. If blank, no tick marks are created.</i>			
Mode for marks	input	ticks centred	ticks on lhs, ticks on rhs, ticks centred
<i>mode for the tick marks.</i>			
Name for marks	input	1	
<i>name to give the tick marks (mainly used for mapping files)</i>			
Size for marks (w)	input	1	
<i>size in world units for the tick marks</i>			
Colour for marks	input	orange	available colours
<i>colour of the tick marks.</i>			
Points	button		
<i>pick individual positions to label with a label stem and chainage (if the chainages field is set to tick).</i>			
Label	button		
<i>label the selected strings as specified by the label mode, mode for marks and other fields in the panel.</i>			

Chainages (function)

Position of option on menu: Strings =>Label => Chainages (function)

The parameters for this panel are identical to **Label Chainages on String**, however instead of selecting data source for labels this option will create a function associated with a specified string.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>The name of the function to run.</i>	function box		select function
String to label <i>The string to label.</i>	string select		
For more information on this panel and its fields and buttons, please go to Label Chainages .			
Please continue to the next section Label Cut/Fill .			

Label Cut/Fill

Position of menu: Strings =>Label => Cut/Fill

The **cut/fill** menu contains options to create cut and fill tick marks between selected strings.

The options can generate standard tadpoles, tick marks or use user specified model as the tick symbol.

For each option, a **reference** string is selected which defines the chainages used for labelling cut/fill. The cut/fill symbols are drawn perpendicular to the reference string.

Two strings, **str1** and **str2** are selected for labelling.

The tick symbols are drawn at right angles to the reference string at a user specified chainage going between the two strings, **str1** and **str2**, from the higher string point to the lower string point (which string is higher or lower may vary along the strings). The tick symbol is repeated at the given chainage interval.

The tick symbol is drawn as a **percentage** of the **distance from the high point to the low point** between the two strings, **str1** and **str2** and this percentage is specified separately for the odd and even numbered ticks.

The **cut/fill** walk-right menu is

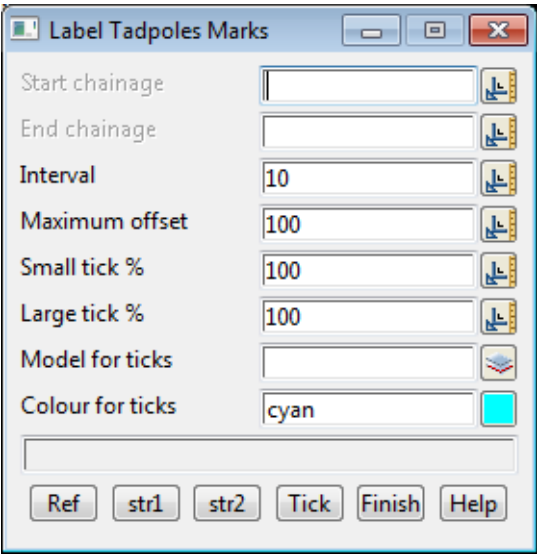

For the option <i>Tadpoles</i> , go to	Tadpoles
<i>Ticks</i>	Ticks
<i>User symbols</i>	User Symbols
<i>From file</i>	From File

Tadpoles

Position of option on menu: Strings =>Label => Cut/Fill => Tadpoles

The **Tadpoles** option is used to generate tadpole symbols between two strings.

On selecting the **Tadpoles** option, the **Label tadpoles marks** panel is displayed.

The fields and buttons in this panel are used as follows

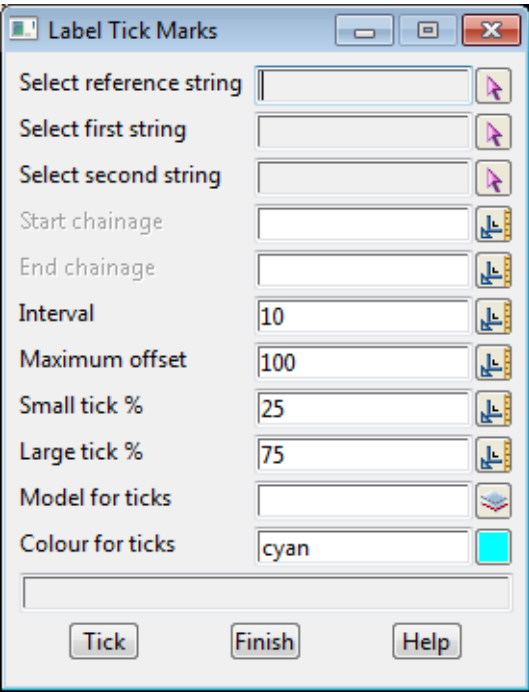

Field Description	Type	Defaults	Pop-Up
Start chainage <i>if non-blank, the reference string chainage to start creating tadpoles from. if blank, the reference string start chainage is used.</i>	input		
End chainage <i>if non-blank, the reference string chainage to end the tadpoles at. if blank, the reference string end chainage is used.</i>	input		
Interval <i>the chainage interval to use for creating tadpoles.</i>	input	10	
Maximum offset <i>the maximum distance to search from the reference string to find strings str1 and str2.</i>	input	100	
Small tick% <i>the percentage of the distance between the two strings, str1 and str2, that is taken up by the odd numbered tadpoles.</i>	input	100	
Large tick% <i>the percentage of the distance between the two strings, str1 and str2, that is taken up by the even numbered tadpole.</i>	input	100	
Model for ticks <i>the models for the tadpoles to placed into.</i>	input		available models
Colour for ticks <i>the colour for the tadpoles.</i>	input	cyan	available colours
Ref/Str1/Str <i>the selected string is used as the reference/str1/str2 string.</i>	button		

Ticks

Position of option on menu: Strings =>Label => Cut/Fill => Ticks

The ticks option is used to generate ticks (straight lines) between two strings.

On selecting the **ticks** option, the **label tick marks** panel is displayed.

The fields and buttons in this panel are used in exactly the same way as for the **label tadpoles marks** panels. The only difference is that the defaults for the **small tick %** and **large tick %** panel fields are 25 and 75 respectively.

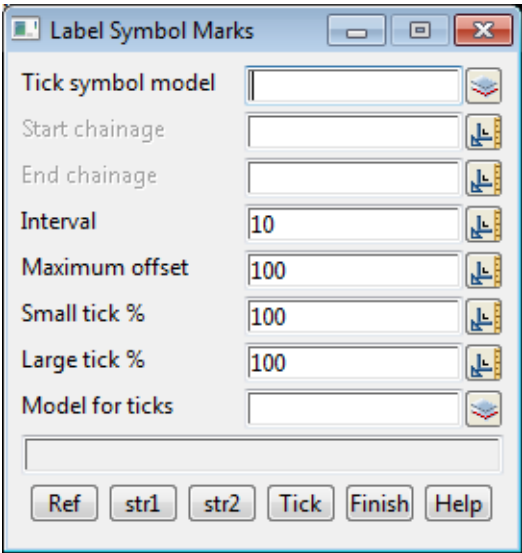

User Symbols

Position of option on menu: Strings =>Label => Cut/Fill => User symbols

The user symbols option uses a given model, the **tick symbol model**, as the symbol to drawn between the low and high points on the two strings.

The **tick symbol model** is aligned so that the model origin is at the high string point and the model's positive x-axis goes from the high string point to the low string point.

On selecting the ticks option, the **label tick marks** panel is displayed.

The fields and buttons in this panel are used in exactly the same way as for the **label tadpoles marks** panels except that a **tick symbol model** panel field is used to specify the symbol to be drawn for the cut/fill tick marks.

Field Description	Type	Defaults	Pop-Up
Tick symbol model	input		available models
<i>the model to be used as the tick mark symbols.</i>			

From File

Position of option on menu: Strings =>Label => Cut/Fill => From file

This is the same option as Drafting =>Create cut/fill symbols

Please go to the section [Label Cut/Fill](#) in the Chapter [Drafting](#).

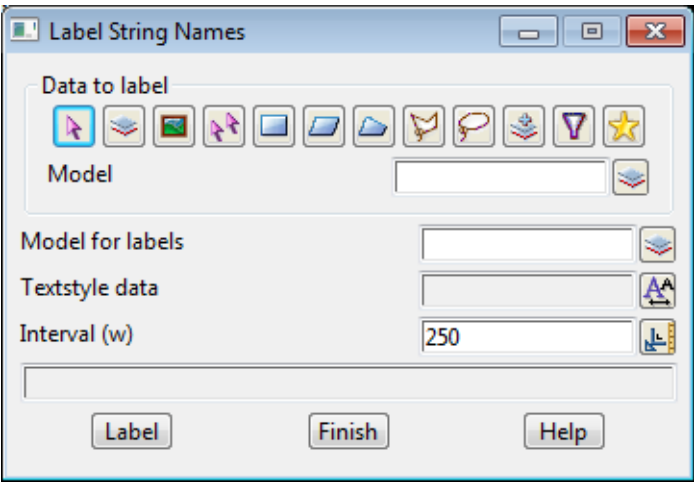

Label Names

Position of option on menu: Strings => Label => Names

The **label names** option is used to label individual strings or all the strings in a model, with their string names.

The user has control over the label height, colour, and the distance between the labels.

On selecting the **label names** option, the **label string names** panel is displayed.

By using the **pick** button, individual strings can be labelled using the values in the panel fields. The **model to label** field is ignored.

If the **label** button is selected, then all the strings in the model given by the **model to label** field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label names** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type

data source type.

Data source

data source for strings to label.

Textstyle data

input

textstyle information.

Interval (w)

input

250

chainage interval in world units between the labels.

Label

button

*label all the strings in the model given in the **model to label** field.*

Please continue to the next section [Label Vertices](#).

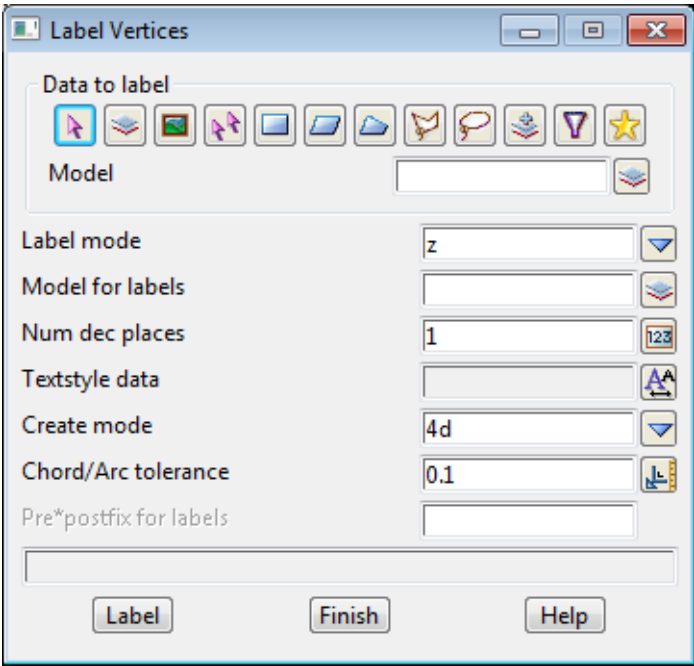

Label Vertices

Position of option on menu: Strings =>Label => Vertices

The **Label vertices** option can be used to label the x, y, z, z no nulls, point numbers, id-pt no, name and descriptions of strings selected by the data source.

The user has control over the label height, colour, the number of decimal places, the distance between the labels, the distance the label is from the point position, and the angle to draw the label at.

On selecting the **Label vertices** option, the **Label vertices** panel is displayed.

Individual strings can be labelled by using the **pick** button and then selecting the strings, to be labelled using the values in the panel fields. The **string model** field is ignored.

If the **label** button is selected, then all the strings in the model given by the **string model** field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the label strings panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type	<i>data source type.</i>			
Data source	<i>data source for strings to label.</i>			
Label mode		input	z	x,y,z, point number, Vertex no x and y id-vertex no z no nulls name
	<i>type of labelling required - x, y, z, point number, vertex no. for each point in the string.</i>			
String model		input		available models
	<i>name of the model containing the strings to be labelled. Not used with the pick button.</i>			

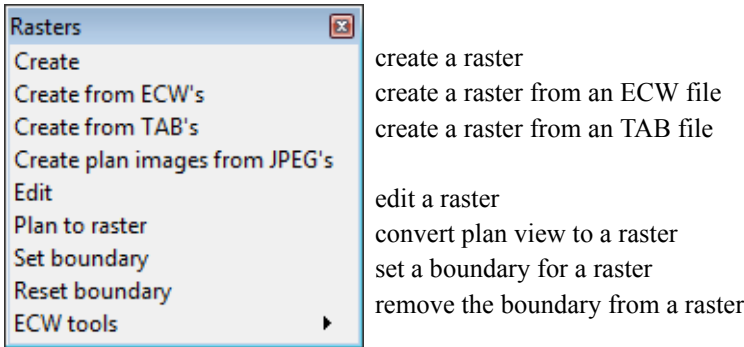

Model for labels	input		available models
<i>name of the model to place the labels in.</i>			
Num dec places	input	0	0,1,2,3,4,5
<i>number of decimal places used in the x,y,z labels.</i>			
Textstyle data	input		
<i>textstyle information.</i>			
Create mode	input	4d	4d, text
<i>if 4d, the vertex labels for the one string are placed in a 4d string.</i>			
<i>text, the vertex labels are created as individual text strings.</i>			
Chord/arc tolerance	input	default chord/arc tolerance	
<i>the chord to arc tolerance to use on any alignment string being labelled for determining how many points are labelled around horizontal curves.</i>			
Label	button		
<i>label all the strings in the model given in the string model field.</i>			

Rasters

Position of menu: Strings =>Rasters

The Rasters menu contains options for working with rasters.

The Rasters walk-right menu is

For the option <i>Create</i> go to	Create a Raster
<i>Create from ECW's</i>	Create Rasters from ECW Files
<i>Create from TAB's</i>	Create Rasters from TAB Files
<i>Create plan images from JPEG's</i>	Create Plan Images from JPEG Files
<i>Edit</i>	Edit a Raster
<i>Plan to raster</i>	Create Raster from Plan View in the chapter View Menus
<i>Set boundary</i>	Set a Boundary for a Raster
<i>Reset boundary</i>	Reset the Boundary for a Raster
<i>ECW tools</i>	ECW Tools - Not Supported!

Create a Raster

Position of option on menu: Strings =>Rasters =>Create

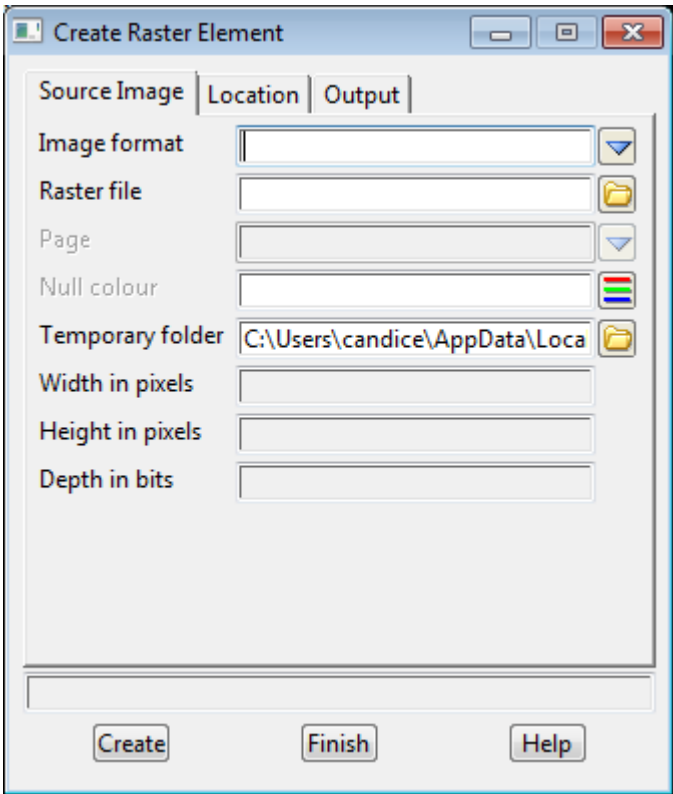

A raster element consists of a raster image and positioning information for the raster so that it can be mapped into world units.

A raster element is added to a model just like any other string but for convenience it is suggested that no other strings are in the same model as a raster.

To help speed up drawing on a view, there is toggle for displaying/not displaying rasters on plan views.

Raster Restrictions

- (a) The Raster file must have read/write permission
 - (b) Rasters are only supported on Win 2000 and above.
- Selecting **Create** brings up the **Create Raster Element** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Image tab			
Image format	choice box		BMP, DIB, GIF ECW, JPEG, JPEG 2000 PNG, TGA, TIFF
<i>format that the original image is in. Non ECW rasters must be 24 bit colour.</i>			
Raster file	file box		
<i>name of the original raster image. The file must have read/write access and be 24 bit colour.</i>			
Page			
<i>page number of the raster when the format can contain more than one image (e.g. in a TIFF)</i>			
Null colour	colour box		available colours
<i>colour when there is no pixel in the raster</i>			
Temporary folder	file box	c:\temp	select folder
<i>folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.</i>			
Width/Height in pixels	output only		
<i>the width/height in pixels of the selected raster</i>			
Depth in bits	output only		
<i>display the colour depth of the source data</i>			
Projection	output only		
<i>display the projection of the source data if available</i>			

Location tab

The location tab supplies the information for positioning the raster in world units in **12d Model**. Most rasters formats, other than ECW or Geotiff, do not include this information so it must be supplied by other means, either in a file or by typing in a world origin, anticlockwise rotation angle and world width and height.

Data format	choice box	Raw details	Raw Details, Autocad scr file ESRI world, Geo Tiff, Mapinfo tab
--------------------	------------	-------------	-----------------------------------------------------------------------

if **Raw details**, the location details are typed into the **World Location Details** section as rotation, world origin, world width and height.

If **Autocad scr file**, the location details are taken from the scr file given in **Location file**. An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner; bottom right hand corner; top left hand corner and top right hand corner. An example of a scr file is:

line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695

If **ESRI world**, the location details are taken from the **ESRI world** file given in **Location file**. An **ESRI world** file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.

If **Geo Tiff**, the Location details are taken from the geotiff file given in **Location file** panel field.

If **Mapinfo Tab**, the location details are taken from the Mapinfo tab file given in **Location file**.

Location file	file box
----------------------	----------

file with the location details

Anticlockwise rotation	angle box
-------------------------------	-----------

the world rotation of the raster.

X/Y co-ordinate	real box
------------------------	----------

the world x/y co-ordinate of the left hand bottom corner of the raster.

World width/height	real box
---------------------------	----------

the width/height in world units of the raster.

Output tab

the parameters for the created 12d raster.

Output size	output
--------------------	--------

an estimate of the amount of disk space the raster will use in **12d Model**

Fastest drawing speed	input
------------------------------	-------

only if raster is less than 24 bit depth - if selected, the raster is converted to a 24 bit image.

Minimum disk space	input
---------------------------	-------

only if raster is less than 24 bit depth - if selected, the raster is not converted to a 24 bit image and hence will take up less disk space. However it is converted at drawing time and so will be slower to display than a 24 bit image.

Create	button		
<i>after the Create button is chosen, the raster element is created.</i>			

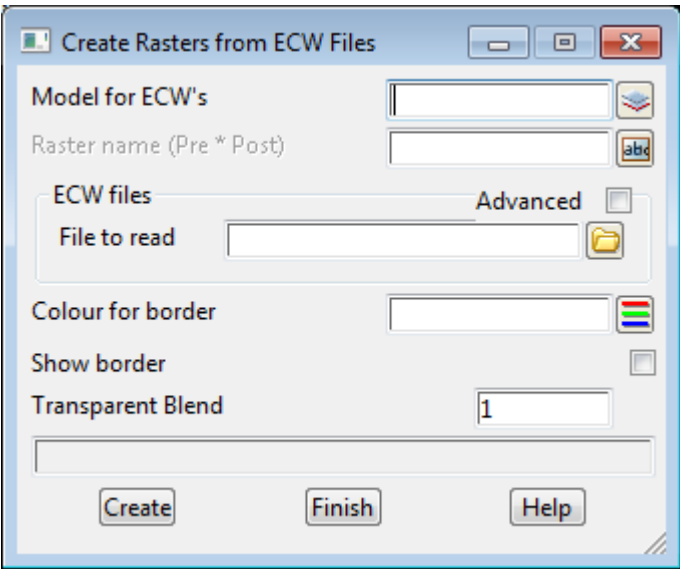

Create Rasters from ECW Files

Position of option on menu: Strings =>Rasters =>Create from ECWs

This option attaches one or more ECW files to a model.

Selecting **Create from ECWs** brings up the **Create Rasters from ECW Files** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for ECWs <i>name of the model to hold the new ECW rasters</i>	input		available models
Raster name (Pre*post) <i>if not blank, pre*post text to use for the name of the raster(s) from the ECW file(s) (see Pre*Postfix Panel Fields for information on using pre*postfix)</i>	text input		
ECW files			
Advanced <i>if not ticked, File To Read is visible.</i>	tick box	not ticked	
File to read <i>name of the ECW file to attach to the model</i>	file box		*.ecw files
Advanced <i>if ticked, the File To Read field is replaced by a grid to allow multiple ECW files to be read in, is opened. A wild card is used to select all the files to be read in.</i>	tick box		

Folder folder box

Create button

*after the **Read** button is chosen, the raster elements are created.*

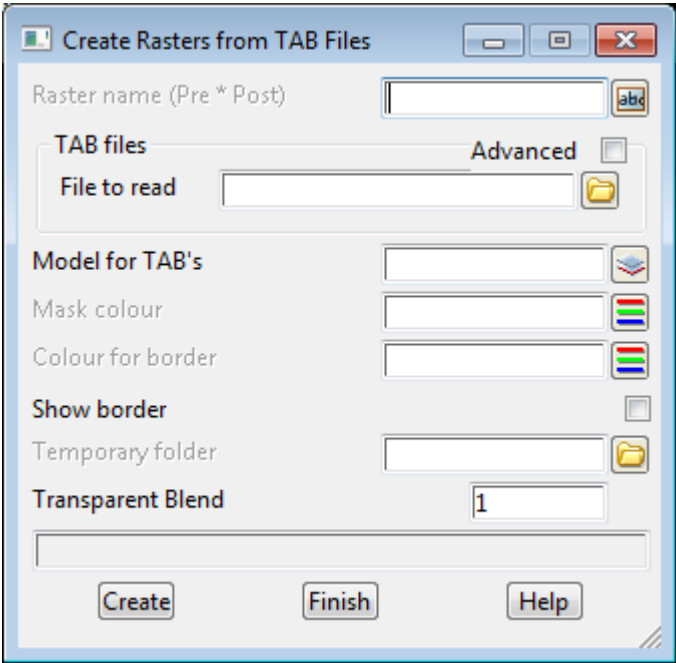

Create Rasters from TAB Files

Position of option on menu: Strings =>Rasters =>Create from TAB's

This option reads one or more rasters as define by TAB files and places them in a model.

Selecting Create from TAB's brings up the **Create Rasters from TAB Files** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster name (Pre*post)	text input		
<i>if not blank, pre*post text to use for the name of the raster(s) from the ECW file(s) (see Pre*Postfix Panel Fields for information on using pre*postfix)</i>			
TAB files			
Advanced	tick box	not ticked	
<i>if not ticked, File To Read is visible.</i>			
File to read	file box		*.tab files
<i>name of the TAB file to attach to the model</i>			
Advanced	tick box		
<i>if ticked, the File To Read field is replaced by a grid to allow multiple TAB files to be read in, is opened. A wild card is used to select all the files to be read in.</i>			

Folder folder box

folder to search for files using the **Wild card**

Wildcard choice box *.tab, *

wild card to use in search for files in the given folder

Grid

the colour of the border for the raster

Show border tick tick
if ticked then the border of the raster element is displayed

Temporary folder file box c:\temp select folder
folder to use as a temporary storage area whilst converting the raster to the 12d raster format. The temporary folder needs to have enough free disk space to convert the largest of the rasters to bmp format.

Transparent Blend
The degree of opacity, 1 = opaque, 0.1 = very transparent

Create button
after the **Read** button is chosen, the raster elements are created.

Create Plan Images from JPEG Files

Position of option on menu: Strings =>Rasters =>Create plan images from JPEG's

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Create plan images from JPEG's** brings up the **Create Plan Images from JPEG Files** panel.

The fields and buttons used in the panel have the following functions.

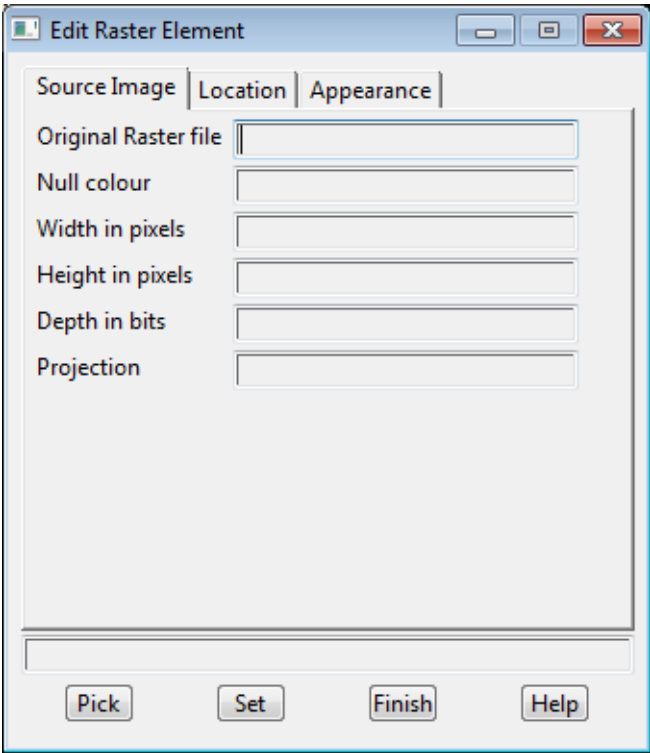

Field Description	Type	Defaults	Pop-Up
File to read <i>name of the JPEG file to attach to the model</i>	file box		*.jpg files
Advanced <i>if ticked, the File To Read field is replaced by a grid to allow multiple JPEG files to be read in, is opened. A wild card is used to select all the files to be read in.</i>	tick box		
Projection	choice box		
Rotate images	tick box		
Pixel to mm	measure box		
Model for images	model box		available models

Edit a Raster

Position of option on menu: Strings =>Rasters =>Edit

The Edit option modifies the properties of any raster displayed in a **12d Model** view.

Selecting Edit brings up the **Edit Raster Element** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Image tab			
Original raster file <i>file that the raster originally came from</i>	output		
Null colour <i>colour when there is no pixel in the raster</i>	colour box		available colours
Width/Height in pixels <i>the width/height in pixels of the selected raster</i>	output only		
Depth in bits <i>display the colour depth of the raster</i>	output only		
Projection <i>display the original projection of the raster (if available)</i>	output only		
Location tab			
<i>When the raster is selected, the raw details for the raster (or ECW details) are displayed. The location details can then be modified and hence how the raster is positioned in world units in 12d Model is modified.</i>			

Data format	choice box	Raw details	Raw Details, Autocad scr file ESRI world, Geo Tiff, Mapinfo tab
--------------------	------------	-------------	-----------------------------------------------------------------------

*if **Raw details**, the location details are typed into the **World Location Details** section as rotation, world origin, world width and height.*

*If **Autocad scr file**, the location details are taken from the scr file given in **Location file**. An Autocad scr file gives the world co-ordinates of the corners of the raster starting in the bottom left hand corner; bottom right hand corner; top left hand corner and top right hand corner. An example of a scr file is:*

```
line
22109.639,148090.695
23109.639,148090.695
22109.639,149090.695
23109.639,149090.695
```

*If **ESRI world**, the location details are taken from the ESRI world file given in **Location file**. An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.*

*If **Geo Tiff**, the Location details are taken from the geotiff file given in **Location file** panel field.*

*If **Mapinfo Tab**, the location details are taken the Mapinfo tab file given in **Location file**.*

Location file	file box

the colour of the border for the raster element

Buttons at Bottom

Pick	button
-------------	--------

select the raster element to edit by clicking on the border of the raster. The details for the selected raster are then displayed in the panel.

Set	button
------------	--------

give the raster element the new values from the panels fields

NOTE: A raster is **deleted** by using the string *Delete* option. The raster is selected for deleting by picking on the border of the raster.

Set a Boundary for a Raster

Position of option on menu: Strings =>Rasters =>Set boundary

The **Set boundary** option defines a boundary polygon for the raster. Only the parts of the raster inside the boundary polygon are displayed. The boundary polygon can have holes.

Selecting **Set boundary** brings up the **Raster Set Boundary String** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster	raster select box		
<i>select the raster to have a drawing polygon set for it</i>			
Boundary	string select box		
<i>select a polygon</i>			
Add	button		
<i>add the selected polygon as a boundary polygon for the selected raster</i>			

Reset the Boundary for a Raster

Position of option on menu: Strings =>Rasters =>Reset boundary

The **Reset boundary** option removes the boundary polygon from a raster.

Selecting **Remove boundary** brings up the **Raster Reset Boundary String** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raster	raster select box		
<i>select the raster to have its drawing polygon removed</i>			
Model for boundary	model box		available models
<i>model to place the removed boundary polygon in</i>			

Remove button
remove the boundary polygon from the selected raster

ECW Tools - Not Supported!

Position of option on menu: Strings =>Rasters =>ECW tools
Selecting ECW tools brings up the ECW tools -Not Supported! menu.
This section of documentation is a work in progress and will be updated in subsequent releases.

For the option Change ECW's projection go to [Change ECWs Projection](#)
Translate ECW's [Translate ECWs](#)

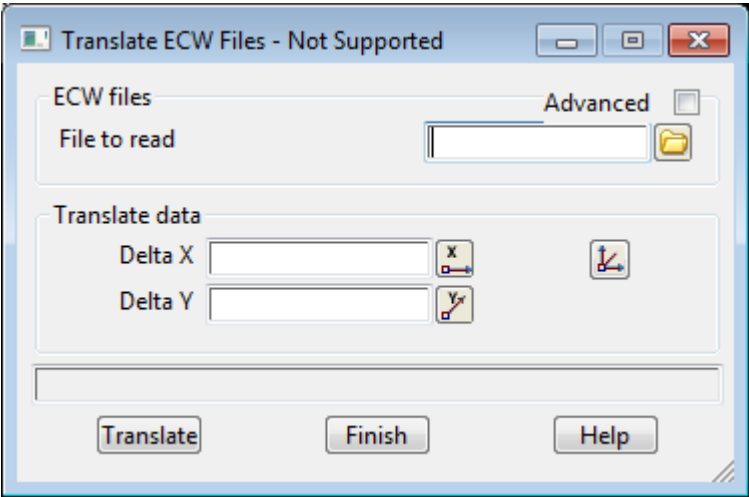

Change ECWs Projection

Chainage

Position of option on menu: Strings =>Utilities =>Chainage

The **chainage** menu option allows the user to specify the start chainage for a string by specifying what the chainage will be at a selected point on the string. The string's start chainage is then adjusted so that the point has the given chainage.

Selecting **chainage** fires up the **chainage at point on string** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Old chainage	<i>reports the initial chainage of the dropped point</i>	output		
New chainage	<i>the new chainage for the dropped point.</i>	input		
Pick	<i>two objects to pick - pick the string to modify the chainage at a point and then pick a point which will be dropped onto the selected string to give the point that will have its chainage modified. The existing chainage on the string of the dropped point is then written to the old chainage panel field.</i>	button		
Set	<i>on selecting set, the start chainage is modified so that the chainage at the picked point is the value in the new chainage field. The old chainage field is then updated with the new chainage.</i>	button		

Please continue to the next section [Depth String](#).

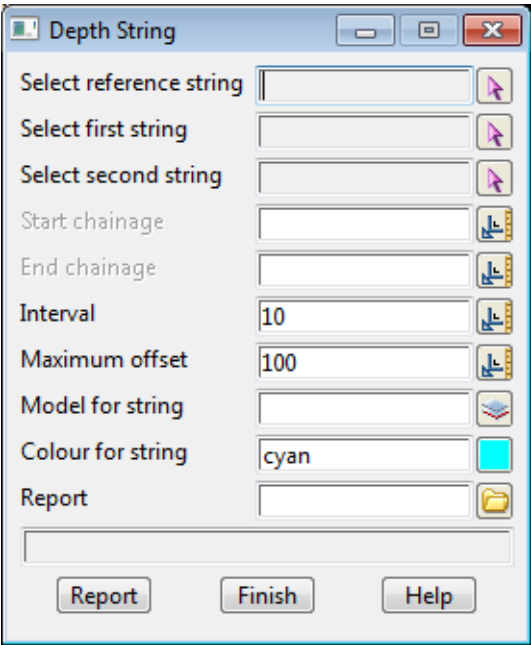

Depth String

Position of option on menu: Strings =>Utilities =>Depth string

The **depth string** option calculates the horizontal and vertical offsets and the cross-fall between two strings and then creates and/or reports on the string.

A reference string is selected which is used to define chainages. Lines perpendicular to the reference string are taken at regular chainages and intersected (in plan) with the first and second strings. The horizontal and vertical offsets and the cross-fall between the two strings are calculated at the intersection points.

On selecting the **Depth string** option, the **Depth string** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Start/End chainage	input		
<i>if blank, the start/end chainage of the reference string is used. if non-blank, the given chainage is used as the start/end chainage.</i>			
Interval	input		
<i>chainage interval to calculate values at.</i>			
Maximum offset	input		
<i>if non-blank, the maximum distance to search from the reference string to find the 1st and 2nd strings.</i>			
Model for string	input		available models
<i>if non-blank, a depth string is created and placed in this model.</i>			
Colour for string	input		available colours
<i>the colour for the depth string.</i>			
Report file	input		*.rpt
<i>if non-blank, the file for the offset and cross-fall report</i>			

Ref/1st/2nd button
select the reference/first/second string.

Report button
calculate a depth string and produce an offset and cross-fall report on it.

Please continue to the next section [Linear Regression](#).

Linear Regression

Position of option on menu: Strings =>Utilities =>Linear regression

Position of option on menu: Survey =>Extras =>Linear regression

This option is documented in [Linear Regression](#) in the chapter [Survey](#).

Please continue to the next section [Loop Removal](#).

Loop Removal

Position of option on menu: Strings =>Utilities =>Loop removal

The **loop removal** option tries to remove loops from strings by adding points where the string self intersects and removing the loops at those points. The level of the added points are the mean of the self intersect points.

Selecting **loop removal** fires up the **loop removal** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Loopy string <i>pick the string to try and remove loops from.</i>	string select		
Good point <i>If the automatic loop removal is incorrect, pick a good point on the string.</i>	xyz box		
Model for string <i>model for the processed string to go to.</i>	model box		available models
Process <i>try and remove string points from the loops in the string.</i>	button		

Please continue to the next section [Strings from Sections](#).

Strings from Sections

Position of option on menu: Strings =>Utilities =>Strings from sections

The **strings from sections** option creates strings by joining the common named points on successive 4d strings (usually generated as sections). This option is documented under

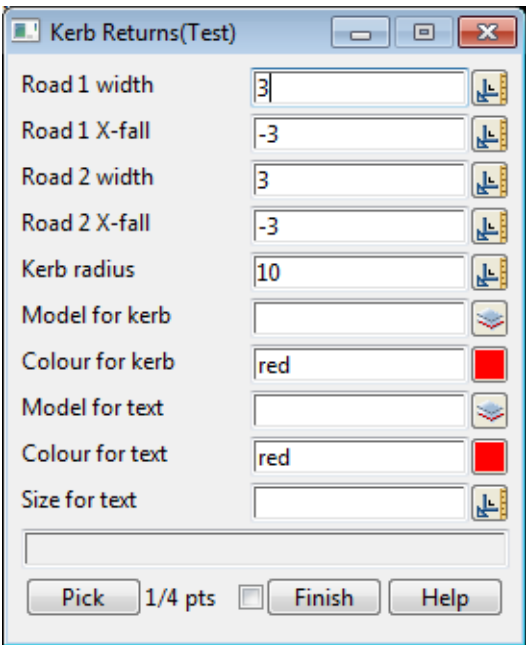

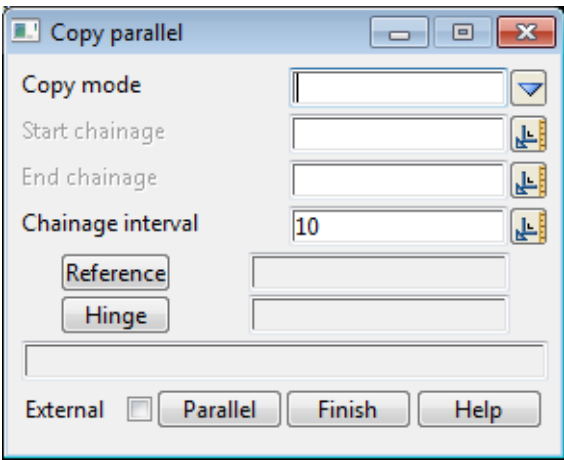

Design => X-Sections => Strings from Sections

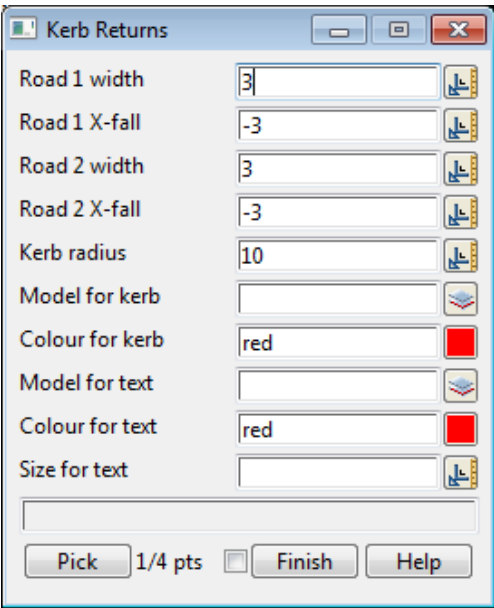

Please go to the section [Strings from Sections](#) in the Chapter [Design](#).

Developments

Position of menu: Strings =>Utilities =>Developments

Some of the options under **string utilities** are still under development, or are being phased out (Cogo (trial)) and won't be documented or released until future versions of 12d Model. The current options on the *Developments* menu are

On Grade

Position of option on menu: Survey =>Extras =>On grade

Position of option on menu: Strings =>Utilities =>On grade

For Information on this option please go to [On Grade](#) in the section [Extras](#)

Old Editor

Position of option on menu: Strings =>Utilities =>Old Editor

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Old editor** brings up the **Edit String Old** panel.

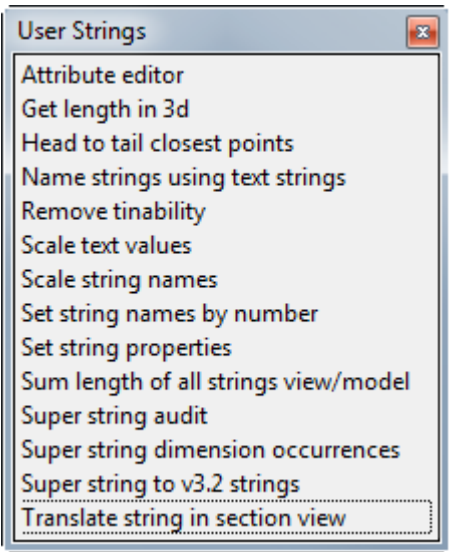

User

Position of option on menu: Strings =>User

The walk-right menu **Strings =>User** has extra macro options. These could be from 12d Solutions or users.

The **User Strings** walk-right menu is

Edit the top 10 attributes
Calculates 3d length

For the option *Attribute Editor*, go to

- Get length in 3d*
- Head to tail closest points*
- Name strings using text strings*
- Remove tinability*

- [XXX Transform V4 to V3.2](#)
- [XXX Section Move](#)

Attribute Editor

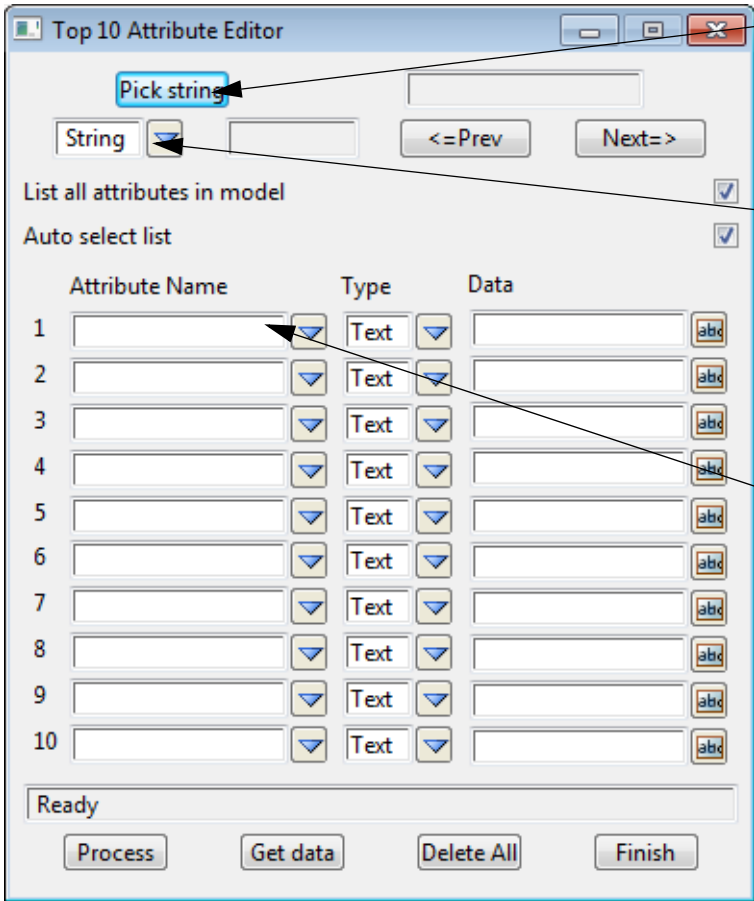

On selecting the **Attribute editor**, the **Top 10 Attribute Editor** panel is displayed.

This option displays ten (10) attributes of type string, vertex or segment for a selected string.

This option was written before the **Strings =>Properties =>Attributes** editor existed and was mainly used for editing drainage data. For more documentation, go to [Attribute Editor](#).

Most of the detailed catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or

add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d or edited inside 12d using this panel.

First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **Pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
pick string <i>used to pick the initial string in a model</i>	button		
string-pit-pipe <i>select the type of attribute to be displayed. Pit and pipe attributes are only available for drainage strings.</i>	choice box		string, pit, pipe
attribute name <i>3 top 10 attributes lists are maintained (pit, pipe and string). The attributes that you can select from are all of the attributes that exist on all of the strings in the model. If the attribute does not exist for the string/pit/pipe that you are displaying the data field will display Not found.</i>	input box		
type <i>for existing attributes this will display Text, Real or Integer. When defining a new attribute select the type of data to be stored in the attribute</i>	choice box		Text, Real, Integer
data	input box		

the data stored in the attribute is displayed/edited/created in this field.

<= prev	button
<i>move to next</i>	<i>string in the model</i>
	<i>pit on the string</i>
	<i>pipe on the string</i>

next =>	button
<i>move to next</i>	<i>string in the model</i>
	<i>pit on the string</i>
	<i>pipe on the string</i>

process	button
<i>updates the attributes displayed in the dialogue.</i>	

Notes:

First select Pick to select the string that contains the user attributes. All catchment data is stored with the pits in drainage strings. The strings will be highlighted in white when they are selected.

To access the pit attributes **LB** this field then select **Pit**. A circle will be drawn around the pit selected.

LB the **Attribute Name** field and then select from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in. They may not be defined for the string you are editing. If the string does not have that attribute defined **not found** will be displayed in the **Data** field.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The following message will be displayed whenever you are creating a new attribute.

For more documentation on setting the attributes for this option, go to [Attribute Editor](#)

Delete

Position of option on menu: Strings =>Delete

Entire strings can be deleted from **12d Model** using the **delete** option.

Any number of strings can be deleted by successively selecting the strings.

On selecting the **delete** string option, the **strings delete** panel is displayed.

Field Description	Type	Defaults	Pop-Up
Pick & Delete	button		
<i>any selected strings are deleted.</i>			
<i>The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.</i>			

Old String Create and Editors

Old

Position of option on menu: Strings =>Create =>Old

These old options are the string creation options that were available before **12d Model 8** was released.

The **Create** option is used to produce **new** strings. If a string already exists, the **Editor** option is used to modify it.

The **Create** walk-right menu contains options to create 2d, 3d, 4d, alignment, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Once a string has been created, it can be converted to most of the other string types using the string **Convert** option.

To create a new string of the same type and with similar header information as an existing string, the **same as** option is selected from the **String Create** menu.

Notes

1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.

2. The string vertices are also called intersection points (IP's).

The **String Create Old** walk-right menu is

The string creation process is similar for each string type and for editing strings as well.

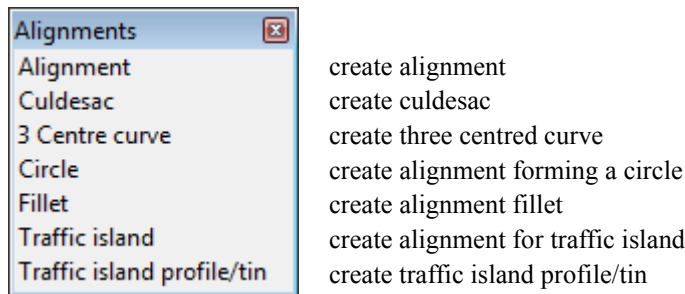

For the option <i>Alignments</i> , go to	Alignments
2d	Create - 2d (pre V8)
3d	Create - 3d (pre V8)
4d	Create - 4d (Pre V8)
Pipe	Create - Pipe (Pre V8)
Polyline	Create - Polyline (Pre V8)

Alignments

Position of menu: Strings =>Create =>Old =>Alignments

The **Alignment** walk-right menu contains options to create an alignment string, plus quick methods of creating an alignment string with horizontal geometry already created for culdesacs, circles

and fillets.

For the option *Alignment*, go to

Culdesac

3 centre curve

Circle

Fillet

Traffic island

Traffic island profile/tin

[Create - Alignment.](#)

[Create - Culdesac](#)

[Create - three centre curve](#)

[Create - circle](#)

[Create - fillet](#)

[Create Traffic Island](#)

[Traffic Island Profile/Tin](#)

Create - Alignment

Position of option on menu: Strings =>Create =>Old =>Alignments =>Alignment

An alignment string is defined by specifying both its horizontal and vertical geometry.

The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) with circular curves and transition spirals applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and either parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view.

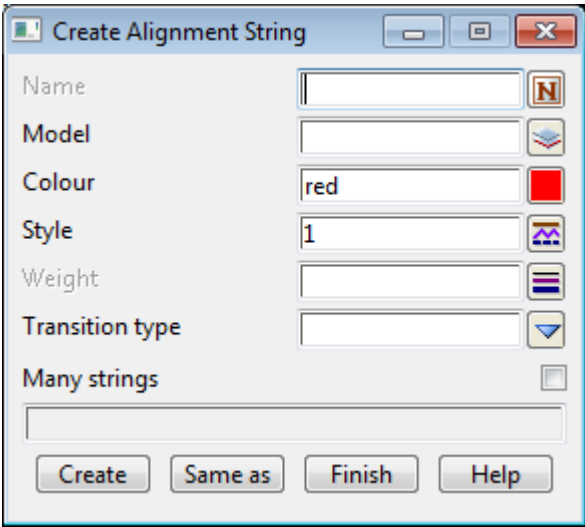

Alignment strings are often referred to as "centre-line strings" because road centre-lines are common examples of alignment strings.

Note vertical geometry can only be added to an **existing** string.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Alignment String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Alignment String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Alignment String** panel.

On selecting the **Alignment string** option, the **Create Alignment String** panel is displayed.

To create a new alignment string, the name, model, colour, style and transition spiral type of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **Create Alignment String** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Name	<i>the name of the new string.</i>	input		
Model	<i>name of the model that the new string is in.</i>	input		available models
Colour	<i>the colour of the new string.</i>	input	default colour	available colours
Style	<i>line style of the string.</i>	input	1	available line styles
Weight	<i>thickness of the string.</i>	input	0	
Transition type	<i>transition (for example clothoid spiral) to be used for this alignment string. For more information see Transitions and Spirals File in the chapter Setting Up and Configuring 12d.</i>	input	clothoid	clothoid, cubic parabola westrail-cubic, cubic spiral

Many strings tick
if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.

Create button

*After the **create** button is chosen, the **alignment edit** menu and **alignment edit info** panel are displayed.*

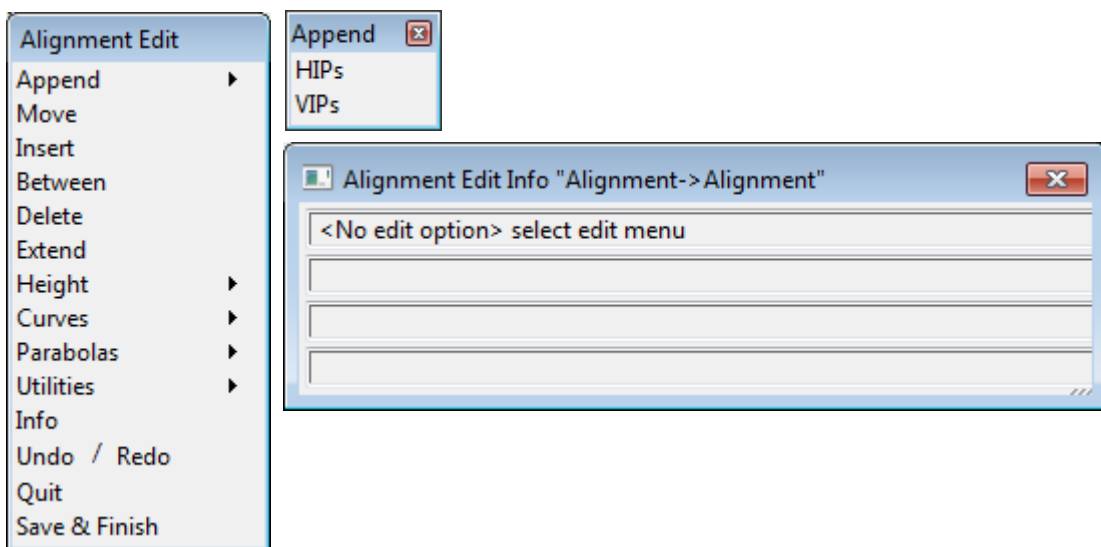

Same as button

*After the **same as** button is chosen, another string is selected and information about it is used for the fields in this panel.*

Alignment Edit

Selecting the **create** button in the **create alignment string** panel the **alignment edit** menu and **alignment edit info** panel are placed on the screen.

The **alignment edit** menu and **alignment edit info** panel for an alignment string are

To begin creating an alignment string, the user must select the **Append=>HIPs** option from the **Alignment Edit** menu and start placing points in a plan view.

To create a new alignment string, select the **Append => HIPs** option from the **Alignment Edit** menu.

The **Append =>HIPs** option is used to add horizontal intersection points to either end of an existing alignment string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all alignment strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Alignment Edit** menu are usable.

The options in the **Alignment Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Alignment edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

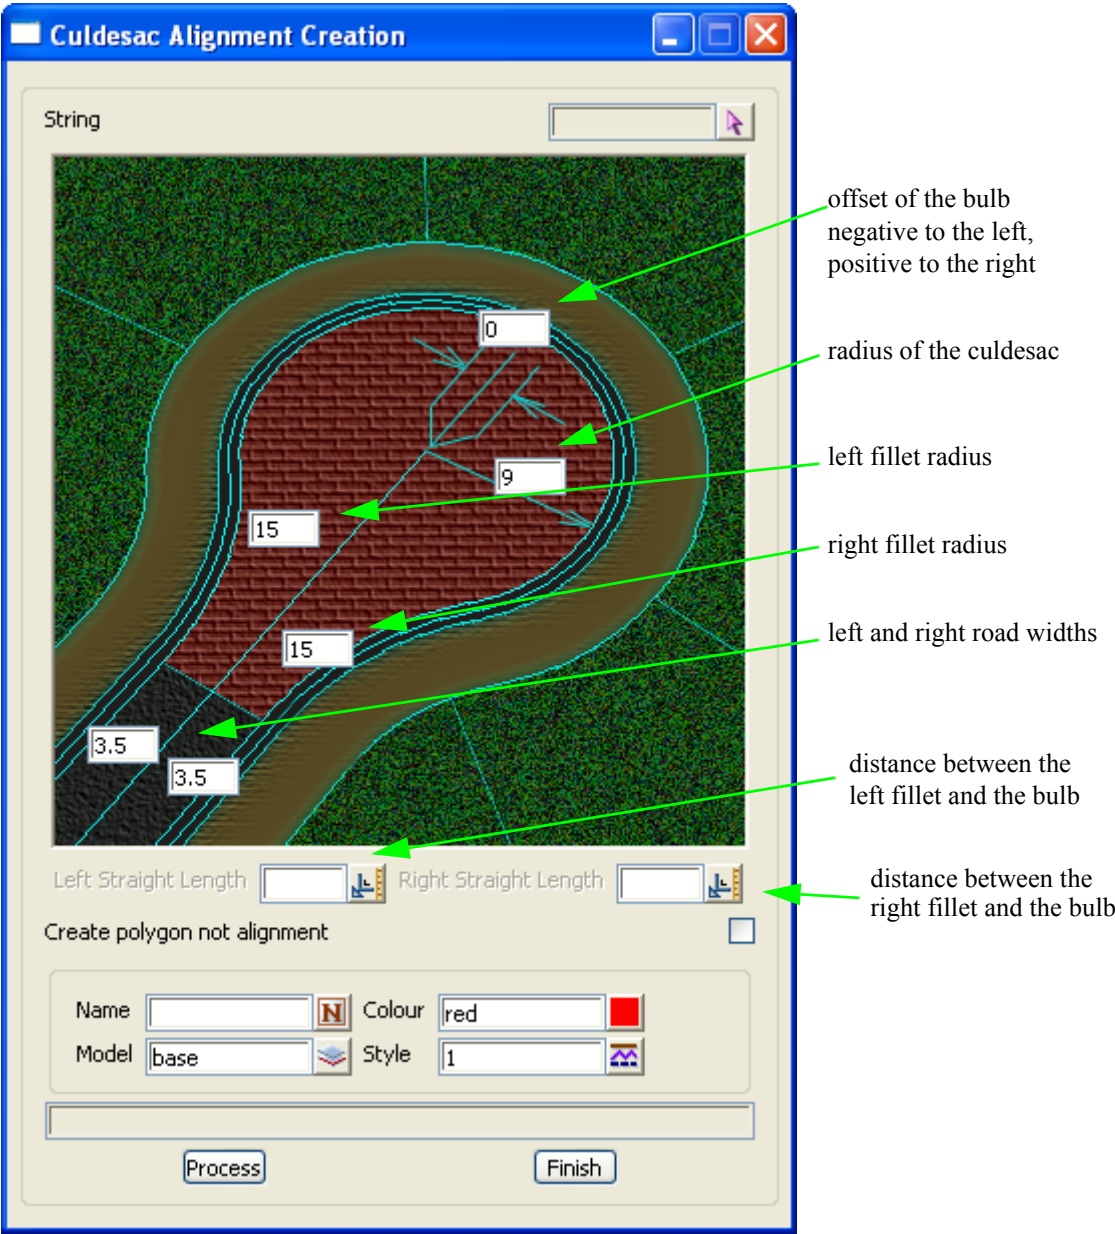

For full information on the Alignment Editor, go to the section [Alignment Edit](#)

Create - Culdesac

Position of option on menu: Strings =>Create =>Old =>Alignments =>Culdesac

Create an alignment string for a culdesac for user defined road widths, culdesac radius and offset. No vertical geometry is defined.

On selecting the Culdesac option, the Culdesac Alignment Creation panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Offset	input box		
<i>offset of the centre of the culdesac bulb. Use a negative value if the offset is to the left, positive if the offset is to the right.</i>			

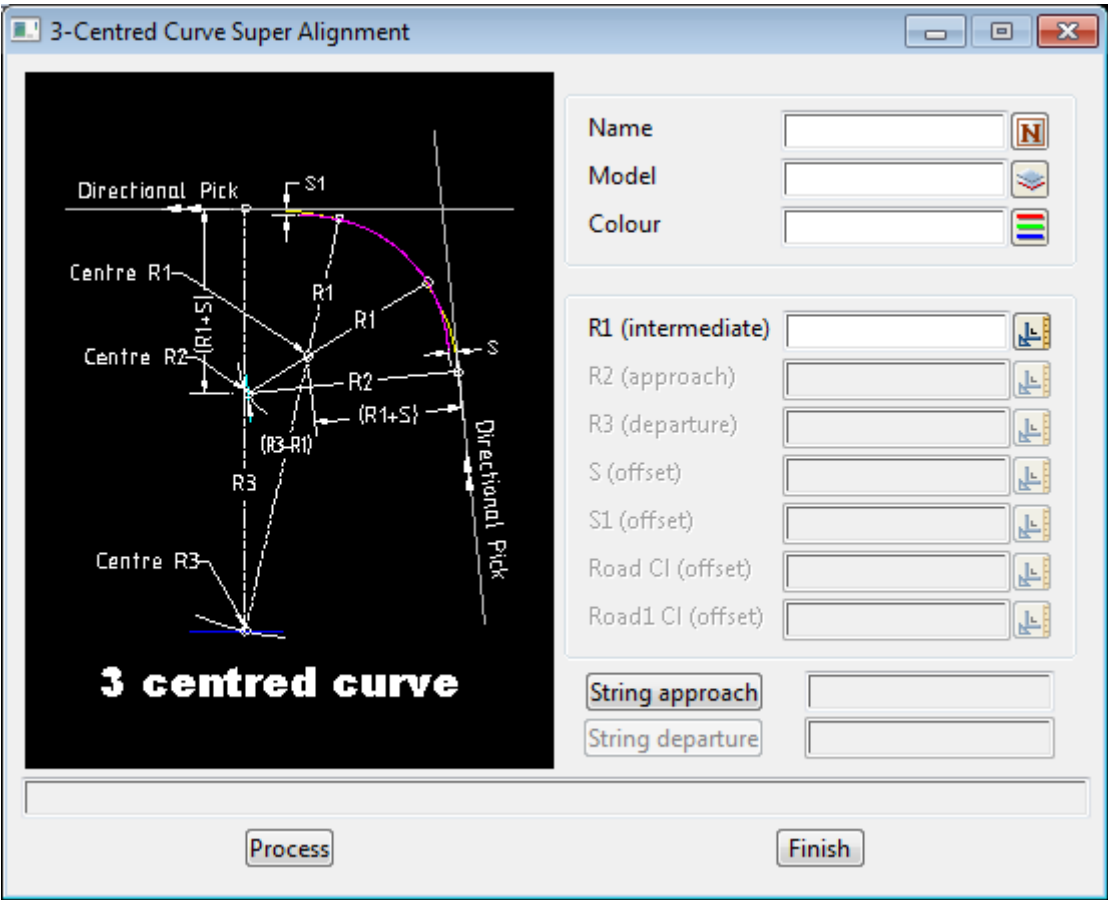

- Radius** input box
radius of the culdesac bulb
- Left/Right fillet radii** input box
radii for the left and right fillets from the roads to the culdesac bulb.
- Left/Right road widths** input box
left and right widths of the road.
- Name/Model/Colour/Style** input box
name/model/colour/style of the created alignment string.
- Select** string select
select with direction the string to create the culdesac for.
- Preview** string select
draw the culdesac with the given parameters in the panel draw box.
- Process** button
create the alignment string
- Undo** button
undo the last alignment string created whilst the panel has been active.

Create - three centre curve

Position of option on menu: Strings =>Create =>Old =>Alignments =>3 Centre Curve

Create an alignment string for a three centred curve for user defined parameters and selected strings.

On selecting the 3 centre curve option, the 3 centred curve construction panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Name/Model/Colour/Style	input box		
<i>name/model/colour/style of the created alignment string.</i>			
R1 (intermediate)	input box		
<i>radius of the intermediate curve. If a value is entered and <enter> typed, values for R2, R3, S and S1 are computed and place in the appropriate fields</i>			
R2 (approach)	input box		
<i>radius of the approach curve.</i>			
R3 (departure)	input box		
<i>radius of the departure curve.</i>			
S (offset)	input box		
<i>approach offset.</i>			
S1 (offset)	input box		

departure offset.

Kerb line approach string select
select the approach string

Kerb line departure string select
select the departure string

Process button
create the alignment string

Undo button
undo the last alignment string created whilst the panel has been active.

Create - circle

Position of option on menu: Strings =>Create =>Old =>Alignments =>Circle

Create an alignment string for a circle with a for user radius and selected centre or with a dynamic mode set, selected centre and interactively positioned circumference.

On selecting the curve option, the circle alignment construction panel is displayed.

The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Radius <i>the radius of the circle.</i>	input box		
Centre pick x,y <i>if Dynamic in not ticked, select the centre of the circle.</i>	x,y,z box		
Name/Model/Colour/Style	input box		

name/model/colour/style of the created alignment string.

Dynamic tick box

*if not ticked, then the **Centre pick x,y** and **radius** fields are used to define the circle.*

*if ticked, then the **Pick** button is used to select the centre and then the cursor is taken to be on the circle to dynamically define the radius.*

Pick button

pick the circle centre when in dynamic mode.

Process button

create the alignment string.

Undo button

undo the last alignment string created whilst the panel has been active.

Create - fillet

Position of option on menu: Strings =>Create =>Old =>Alignments =>Fillet

Create an alignment string for a fillet with a for user radius and selected in and out strings.

On selecting the fillet option, the fillet alignment construction panel is displayed.

The diagram indicates what the panel fields are for. Tool tips appear when the cursor is passed over the panel.fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select 1 <i>select the approach string. Pick with direction.</i>	string select		
Radius <i>the radius of the fillet.</i>	input box		
Select 2 <i>select the departure string. Pick with direction.</i>	string select		
Name/Model/Colour/Style <i>name/model/colour/style of the created alignment string.</i>	input box		
Process <i>create the alignment string.</i>	button		

Undo button

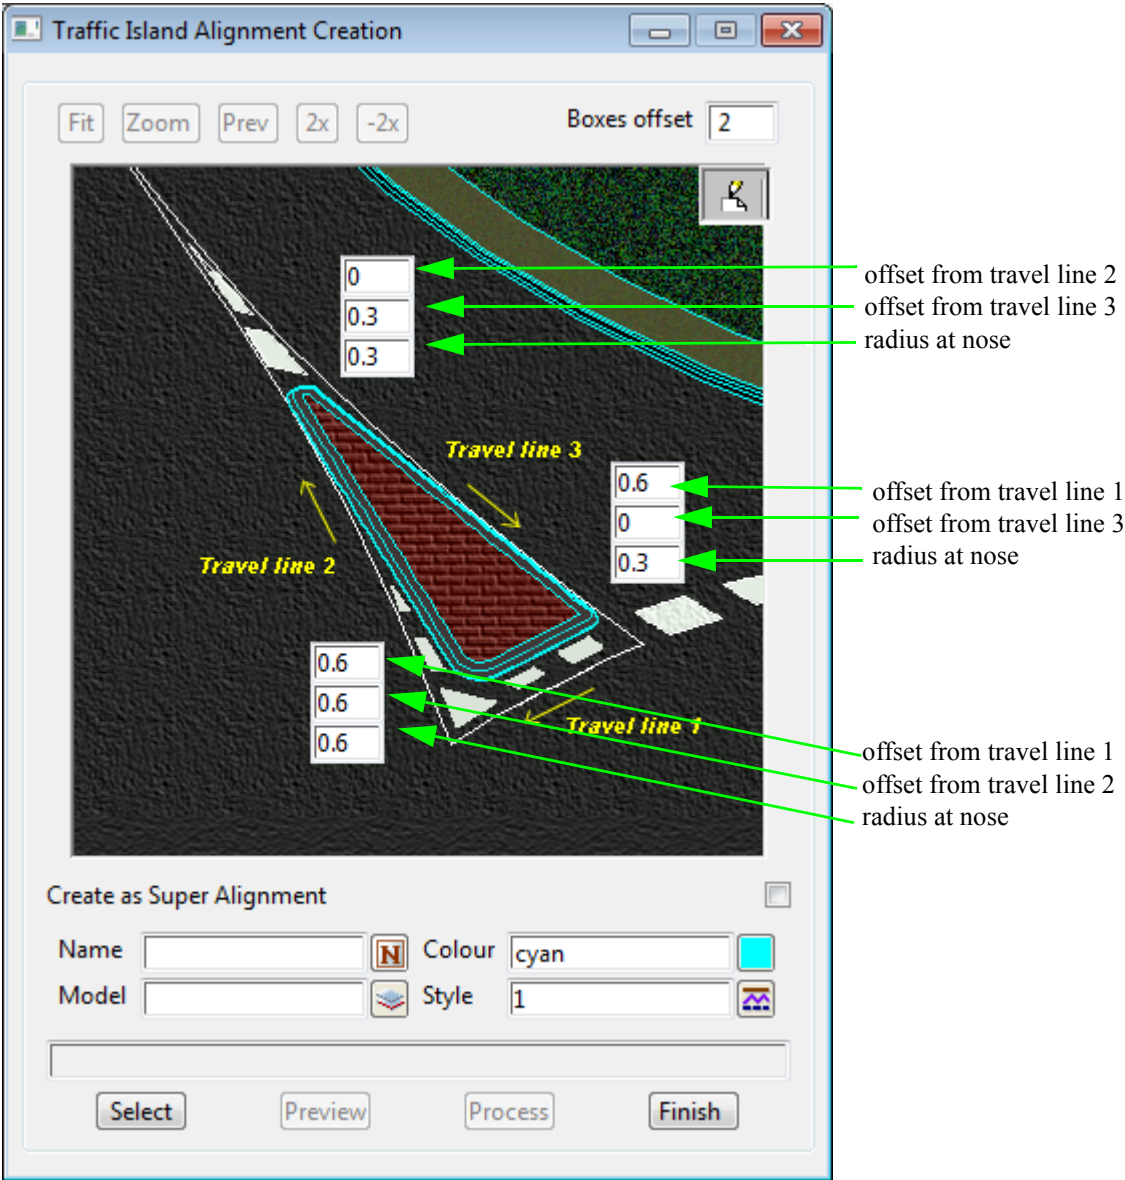

undo the last alignment string created whilst the panel has been active.

Create - Traffic Island

Position of option on menu: Strings =>Create =>Old =>Alignments =>Traffic Island

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. No vertical geometry is defined.

On selecting the traffic island option, the traffic island alignment creation panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Offset from travel lines	input box		
<i>offset distance from the selected travel lines.</i>			
Radius at nose	input box		
<i>radius of the corner of the traffic island between the selected travel lines.</i>			

Name/Model/Colour/Style input box

name/model/colour/style of the created alignment string.

Select strings select

select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.

Preview string select

draw the traffic island with the given parameters in the panel draw box.

Process button

create the alignment string

Undo button

undo the last alignment string created whilst the panel has been active.

Create - 2d (pre V8)

Position of option on menu: Strings =>Create =>Old =>2d

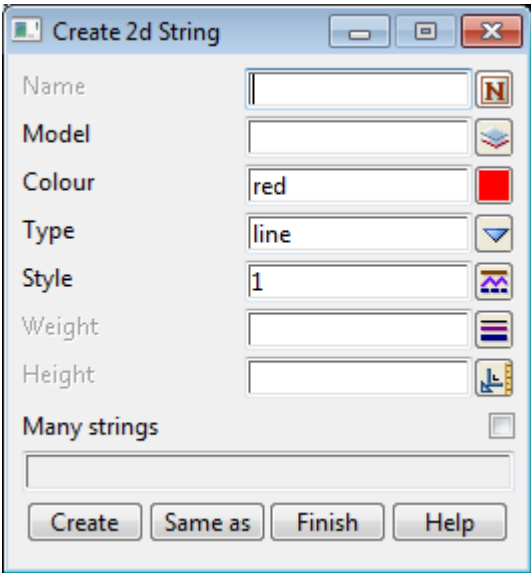

A 2d string consists of a series of (x,y) vertices all with the same z-value (height). 2d strings are often referred to as “contour strings” because contours are the most common example of a string with a constant height.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create 2d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 2d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style, breakline type and height field of the **Create 2d String** panel.

From **12d Model 8** onwards, the default is to create **2d super strings** rather than the **2d strings** used up to **12d Model 7**. A **2d super string** is a **super string** with **Constant height**. That is, there is only one z-value for the entire string. The advantage of using a **2d super string** is that all the CAD options will work for it and it can be given point id's for setout.

On selecting the 2d string option, the **create 2d string** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see [CAD, Symbol and Text Controlbars](#))

To **create a new** 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **create 2d string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models

Colour <i>the colour of the new string.</i>	input	default colour	available colours
Type <i>breakline type (point-line type) of the string.</i>	input	line	line, point
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
Height <i>height (z-value) of the entire string.</i>	input		
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the 2d edit menu and 2d edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		
Finish <i>end the option, don't proceed to the edit stage.</i>	button		

2d Edit for New String

On selecting the **Create** button in the **Create 2d String** panel the **2d edit** menu and **2d Edit Info** panel are placed on the screen.

The **2d edit** menu for a 2d string is and the **2d edit info** panel is

2d Edit Info "2d->2d"

<No edit option> select edit menu

To create a new 2d string, select the **Append** option from the **2d Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the 2nd vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **2d Edit** menu are usable.

The options in the **2d Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **2d Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 2d Editor, go to the section [2d Edit - Old](#)

Create - 3d (pre V8)

Position of option on menu: Strings =>Create =>Old =>3d

A 3d string consists of a series of (x,y,z) points.

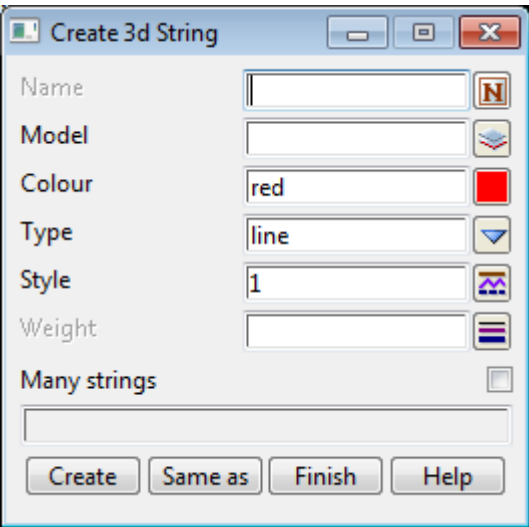

The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string point, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the points are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string point.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create 3d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 3d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 3d String** panel.

On selecting the 3d string option, the **create 3d string** panel is displayed.

To **create** a new 3d string, the name, colour, model and point-line type of the new string are entered into the appropriate fields and the **create** button selected.

To **create** a new 2d string, the name, colour, model, point-line type and height of the new string are entered into the appropriate fields and the **Create** button selected.

The new fields and buttons used in the **create 3d string** panel have the following functions.

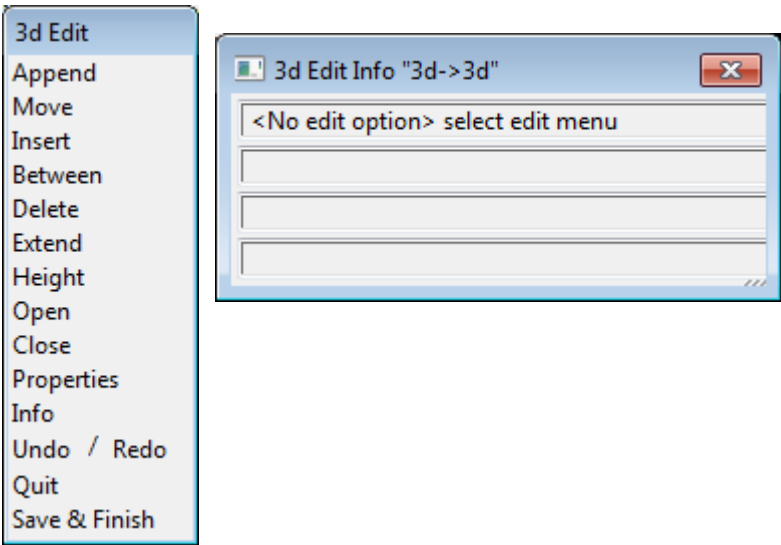

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours

Type	input	line	line, point
breakline type (point-line type) of the string.			
Style	input	1	available line styles
line style of the string.			
Weight	input	0	
thickness of the string.			
Many strings	tick		
if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.			
Create	button		
After the create button is chosen, the 3d edit menu and 3d edit info panel are displayed.			
Same as	button		
After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.			

3d Edit

Selecting the **create** button in the **create 3d string** panel the **3d edit** menu and **3d edit info** panel are placed on the screen.

The **3d edit** menu and panel for a 3d string are

To create the new 3d string, select the **Append** option from the **3d Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **3d Edit** menu are usable.

The options in the **3d Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **3d edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 3d Editor, go to the section [3d Edit - Old](#)

Create - 4d (Pre V8)

Position of option on menu: Strings =>Create =>4d

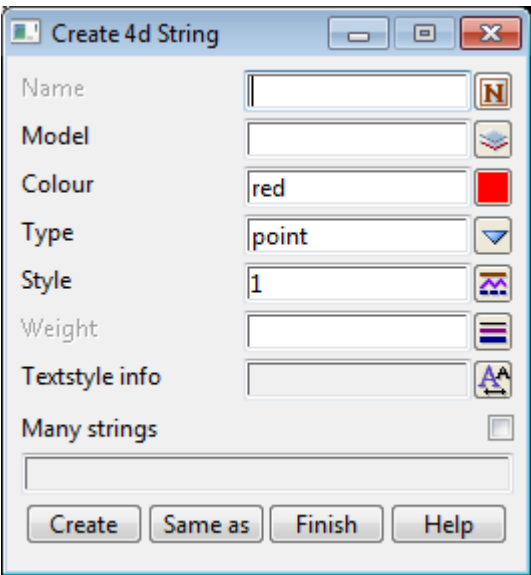

A 4d string consists of a series of (x,y,z) points and a text label at each point.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height and a text label is required at each string point.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create 4d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create 4d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create 4d String** panel.

On selecting the **4d string** option, the **create 4d string** panel is displayed.

To **create** a new 4d string, the name, colour, model, point-line type, text size and units, offset, justification and angle for the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create 4d string** panel have the following functions.

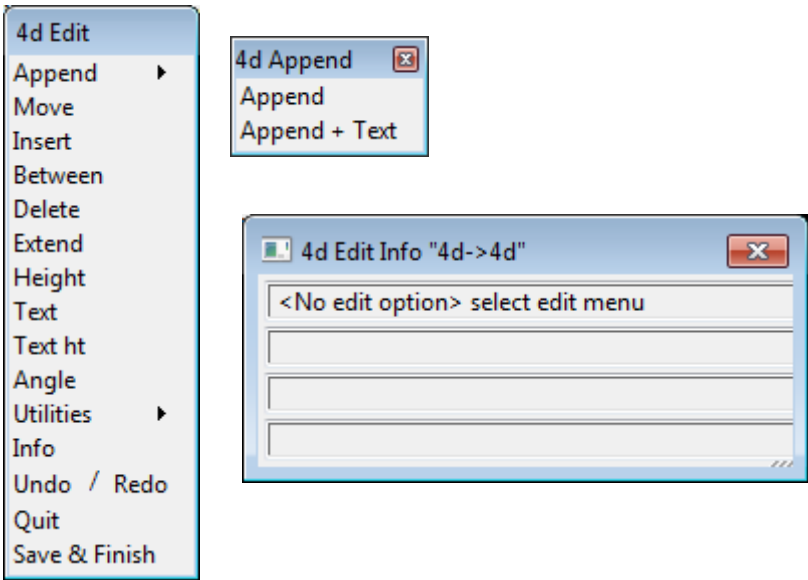

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Type <i>breakline type (point-line type) of the string.</i>	input	line	line, point

Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
Textstyle info <i>textstyle information.</i>	input		
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the 4d edit menu and 4d edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

4d Edit

Selecting the **create** button in the **create 4d string** panel the **4d edit** menu and **4d edit info** panel are placed on the screen.

The **4d edit** menu and panel for a 4d string are

To create a new 4d string, the user must select one of the two Append options on the **Append** walk-right of the **4d Edit** menu which has options to simply create points or to create points and text at the points.

The **Append** and **Append + text** options are used to add points and text (in a plan view) to either end of an existing string, or in the case of a new string, places the 1st point and text and then begins appending points and text to the 1st point.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB

selects the **1st** vertex of the string (using the appropriate snaps).

If **Append + text** was selected, the user will then be prompted for the text to be placed at that points.

The string and text is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **4d Edit** menu are usable.

The options in the **4d Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **4d edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 4d Editor, go to the section [4d Edit - Old](#)

Create - Pipe (Pre V8)

Position of option on menu: Strings =>Create =>Old =>Pipe

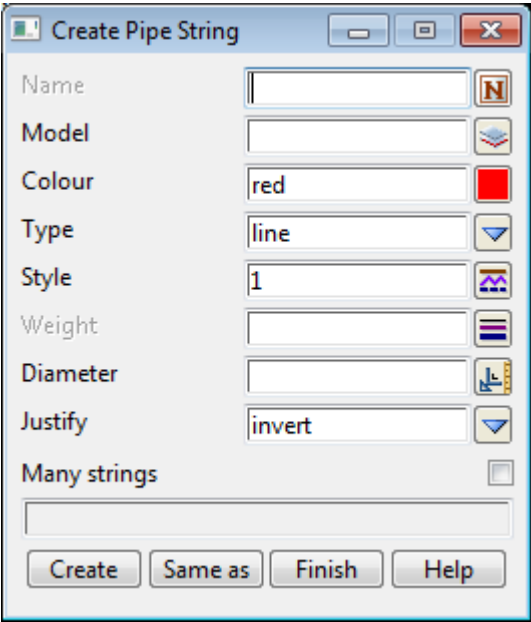

A pipe string is the same as a 3d string except that the pipe string also has a diameter hence the options for creating and editing a pipe string are almost the same as for a 3d string.

The main difference is that there are no options to open and close a pipe string and there is an additional option for modifying the pipe diameter.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Pipe String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Pipe String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Pipe String** panel.

On selecting the **Pipe string** option, the **Create Pipe String** panel is displayed.

To **create** a new pipe string, the name, colour, model, point-line type and diameter of the new string are entered into the appropriate fields and the **create** button selected.

The new fields and buttons used in the **create pipe string** panel have the following functions.

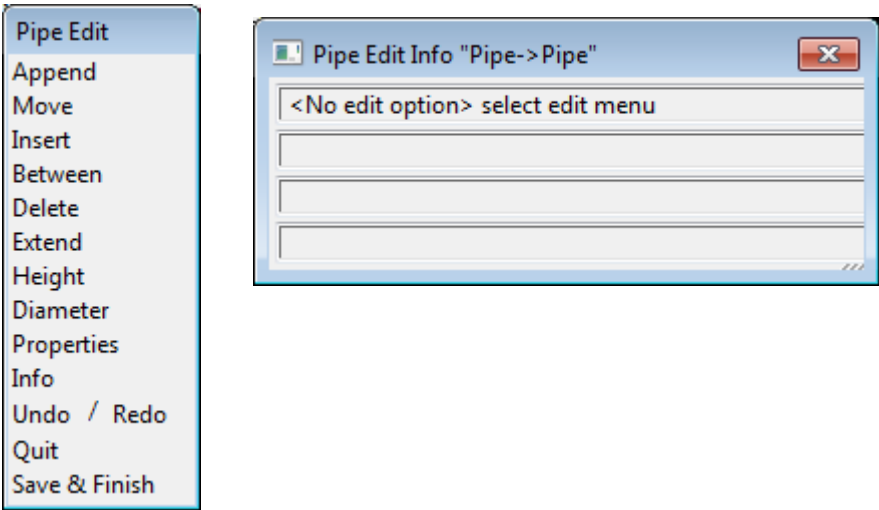

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles

Weight <i>thickness of the string.</i>	input	0	
Diameter <i>diameter of the pipe</i>	input	0	
Justify <i>justification of the pipe with respect to the co-ordinates given for the pipe string.</i>	input	invert	invert, centre, overt
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick		
Create <i>After the create button is chosen, the pipe edit menu and pipe edit info panel are displayed.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		

Pipe Edit

On selecting the **Create** button in the **Create Pipe String** panel the **Pipe Edit** menu and **Pipe Edit info** panel are placed on the screen.

The **Pipe Edit** menu and panel for a pipe string are

To create a new pipe string, select the **Append** option from the **Pipe Edit** menu.

The **Append** option is used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all pipe strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Pipe Edit** menu are usable.

The options in the **Pipe Edit** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Pipe Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Pipe Editor, go to the section [Pipe Edit - Old](#)

Create - Polyline (Pre V8)

Position of option on menu: Strings =>Create =>Old =>Polyline

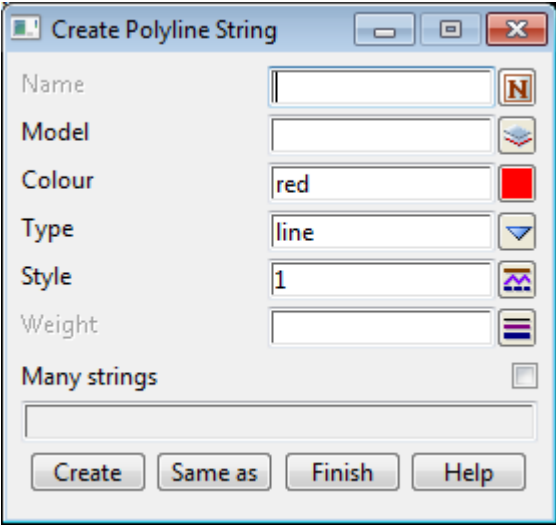

A polyline string is similar to a 3d string except that it can have either straight lines or arcs joining the (x,y,z) points of the string. The arcs are plan arcs with possibly a different z at either end and the z values are linearly interpolated between the end points. Hence in a long section, the end points are joined by a straight lines for both line and arc segments of the polyline.

Creating and editing a polyline string is very similar to a 3d string. The only major difference is that a radius is required at each string segment (a radius of 0 means no arc, just a straight line).

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Polyline String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Polyline String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Polyline String** panel.

On selecting the **polyline string** option, the **create polyline string** panel is displayed.

To **create** a new polyline string, the name, colour, model, point-line type and linestyle of the new string are entered into the appropriate fields and the **create** button selected.

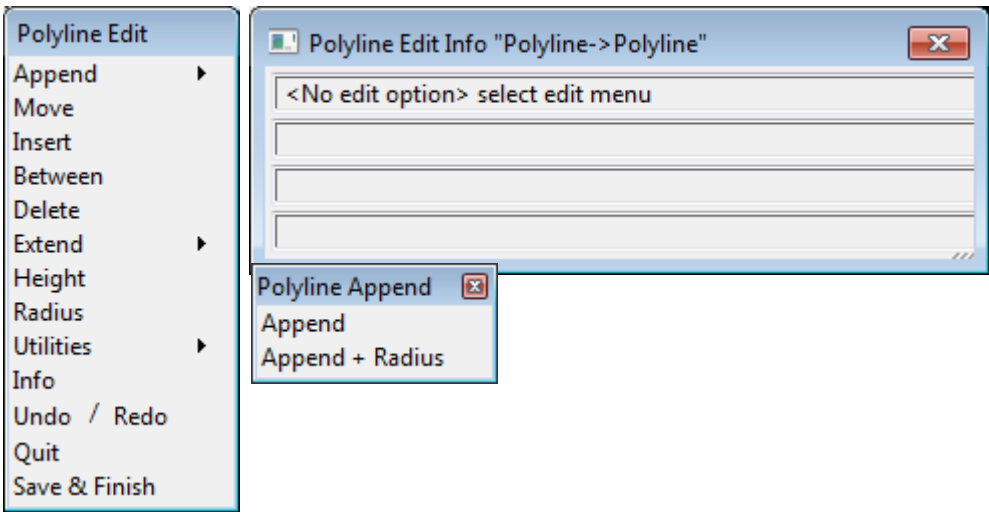

The new fields and buttons used in the **create pipe string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles

Weight	input	0
<i>thickness of the string.</i>		
Many strings	tick	
<i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>		
Create	button	
<i>After the create button is chosen, the polyline edit menu and polyline edit info panel are displayed.</i>		
Same as	button	
<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>		

Polyline Edit

Selecting the **create** button in the **create polyline string** panel the **polyline edit** menu and **polyline edit info** panels are placed on the screen.

To create a new polyline string, the user must select one of the two append options (**Append** or **Append + radius**) on the **Append** walk-right of the **Polyline Edit** menu. The which **Append** option to simply creates points which are joined by a straight segment whereas the **Append + radius** create points with a radius for the segment.

The **Append** options are used to add points to either end of an existing string, or in the case of a new string, places the 1st point and then begins appending points to the 1st point.

For all polyline strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **1st** vertex of the string (using the appropriate snaps).

If **Append + radius** was selected, the user will then be prompted for the radius of the segment being placed.

The string is then drawn from the 1st vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Polyline Edit** menu are usable.

The options in the **Polyline Edit** menu are not only used for placing the initial vertices of the string,

but for editing the string once it is created. Since the **Append** and other options in the **Polyline Edit** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the Polyline Editor, go to the section [Polyline Edit - Old](#)

Alignment Edit

Position of option on menu: Strings =>Editor

An alignment string is defined by specifying the horizontal and vertical geometry as separate operations.

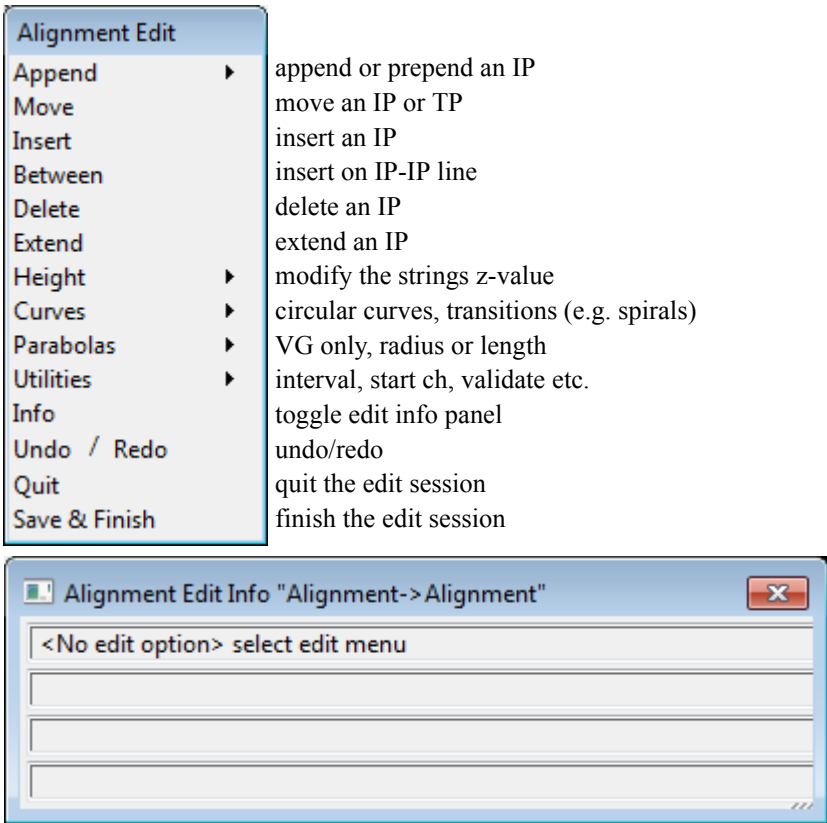

The **horizontal geometry** consists of a series of (x,y) points (called horizontal intersection points, **HIP**'s) and circular curves and transitions (eg clothoid spiral) applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points called vertical intersection points (**VIP**'s) and parabolic or circular curves applied to the vertical intersection points.

The horizontal geometry is defined in a plan view and the vertical geometry in a section view. Hence the alignment string editor can edit information for the string on both plan and section views.

Since a section view is only defined in relation to a specific string (called the primary string for the section view), the vertical geometry of the picked string can only be edited in a section view if the string is the primary string for that section view. That is, the string can only be edited on a section view if the string being edited is profiled on that section view.

On selecting an alignment string, the **alignment edit** menu and the **alignment edit info** are placed on the screen.

Most of the options are applicable to either horizontal or vertical geometry. The meaning of the option depends on whether the string is being edited in a plan or a section view. Hence the description of the option will often need to be split into its separate action on horizontal or vertical geometry.

See the earlier section [Super String Edit - Common Information](#) for general information about

editing strings.

Each option will now be discussed in detail.

Alignment Append

The **append** operation for an alignment string is similar to the 3d string case except that there are separate append options for the horizontal and vertical geometry of the string.

The **append** walk-right is

Append HIPs - Horizontal Geometry

The **append=>HIPs** option in a plan view is used to create the 1st horizontal point in a new alignment string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

Existing Alignment String

Appending a point is a two step process.

Step (a) - selecting the end to append the point to.

After picking **append=>HIPs**, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for an IP
message area 4	select final position - after pick
Screen message area	
	<Select string end to append to> [picks][][menu]
	<Select string end to append to> [picks][accepts][menu]

Step (b) - selecting the position for the new appended point.

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for closest IP

message area 4 select final position - before pick
Screen message area
 <Select final position of point> [picks][][menu]
 <Select final position of point> [picks][accepts][menu]

Once an intersection point has been appended to the string, the appended intersection point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position of the next appended intersection point.

Hence a **series** of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point in turn and selecting them in turn.

Typed input can be used in either step.

The **append** option is terminated by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **alignment edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the append option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the append option still current.

New Alignment String

When the **append=>HIPs** option is selected, a cross will appear on any plan views that have the alignment string's model on them.

The first horizontal intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing alignment string where the end point has already been accepted.

Append VIPs - Vertical Geometry

The **append=>VIPs** option is used to create and edit the vertical geometry of the picked string if the string is a **primary** string on any section view. This can be achieved by using either the **VG edit** or the **profile** option from the section view **view=>utilities** menu.

Vertical geometry can only be defined for a string with **existing** horizontal geometry.

On a section view, **Append=>VIPs** is used to create the first vertical intersection point in an existing string, to append a new vertical intersect point to the end of the string or to prepend a new vertical intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

Existing Vertical Geometry

Appending a vertical point is the same as for a horizontal intersection point except that the co-ordinate system is (chainage,height) rather than (x,y) values and the information messages displayed in the **alignment edit info** panel show chainage, height and percentage grade rather than x,y,z and bearings.

For example -

message area 1	<Append Points>
message area 2	VIP point number, chainage,height of VIP
message area 3	curve length, %grade-in, %grade-out, grade difference for an VIP
message area 4	edit finished - before pick select final position - after pick

New Vertical Geometry

Creating the **1st vertical intersection point** (VIP) in a string is similar to the 1st horizontal IP.

When the **append=>VIPs** option is selected, a cross will appear on any section views that have the alignment string profiled on them.

The 1st vertical intersection point is then selected by the standard pick (LB) and accept (MB).

The option then continues as if appending to an existing vertical geometry where the end point has already been accepted.

Typed input can be used at any stage of the append.

Alignment Move

The **move** option allows the user to move

- (a) individual horizontal intersection points (HIPs)
- (b) individual tangent points (HTPs) if their is no transition on the HIP.
- (c) individual vertical intersection points or tangent points (VIPs or VTPs).

move acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

Move - Horizontal Geometry

The **move** option in a plan view is for moving individual horizontal intersection points (HIP's) or horizontal tangent points (HTPs) of the string.

The move cycle consists of two steps:

- (a) selecting the point to be moved
- (b) selecting the new position for the point.

Step (a)

First the horizontal intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a **horizontal intersection point** is selected, the string will be redrawn with the intersection point moved to the cursor position and the circular curve radius and transition lengths left constant.

A **horizontal tangent point** only occurs on a line connecting two adjacent horizontal intersection points (the HIP-HIP line). Hence, a horizontal tangent point can only move along its HIP-HIP line. Moving a horizontal tangent point actually means that the **radius** of the circular curve at the tangent point is **modified** so that the new position of the point is still a tangent point on the HIP-HIP line for the new circular curve.

To guarantee that the new position for the tangent point is on the HIP-HIP line, the cursor position is automatically projected perpendicularly onto the HIP-HIP line to give the new tangent point.

message area 1	<Move Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	
	<Select point to move> [picks][][menu]
	<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position (or its projection for a HTP) is selected as the new position for the point by picking (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the HIP (or at the projected point for a HTP), and the string redrawn.

message area 1	<Move Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the move option.

move is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **alignment edit** option.

Move - Vertical Geometry

The **move** option is used in a section view to move individual vertical intersection points (VIP's) or vertical tangent points (VTP's).

The move cycle consists of two steps:

- (a) selecting the point to be moved
- (b) selecting the new position for the point.

Step (a)

First the vertical intersection or tangent point to be moved is selected. The selected point will then move around the view as the cursor is moved.

If a **vertical intersection point** (VIP) is selected, the string will be redrawn with the vertical intersection point moved to the cursor position and the parabolic curve length or the circular curve radius left constant.

A **vertical tangent point** (VTP) only occurs on a line connecting two adjacent vertical

intersection points (the VIP-VIP line). Hence, a vertical tangent point can only move along its VIP-VIP line. Moving a vertical tangent point actually means that the **length** of the parabolic curve at the vertical tangent point is **modified** so that the new position of the point is still a vertical tangent point on the VIP-VIP line for the new parabolic curve.

To guarantee that the new position for the vertical tangent point is on the VIP-VIP line, the cursor position is automatically projected perpendicularly onto the VIP-VIP line to give the new vertical tangent point.

message area 1	<Move Point>
message area 2	VIP point number, ch, ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - after pick
Screen message area	
	<Select point to move> [picks][][menu]
	<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position (or its projection for a VTP) is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for an VIP (or at the projected point for a VTP), and the string redrawn.

message area 1	<Move Point>
message area 2	VIP point number, ch, ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the **move** option is still current and can be repeated for other points without having to re-select the move option.

The **move** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **alignment edit** option.

Alignment Insert

The **insert** option is designed to place a new intersection point in a string between two adjacent intersection points. The inserted point does not have to be on the line joining the two intersection points - the **between** option is used to guarantee that the IP is on the IP-IP line.

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the **line** connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

Like the **move** option, the **insert** works on the horizontal or the vertical geometry depending on whether a plan or section view is used to select the connecting line.

For horizontal inserts

message area 1	<Insert Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	

<Select line to insert on> [picks][][menu]
 <Select line to insert on> [picks][accepts][menu]

For vertical inserts

message area 1	<Insert Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - after pick
Screen message area	
	<Select line to insert on> [picks][][menu]
	<Select line to insert on> [picks][accepts][menu]

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is set to the current cursor position by picking (LB) and accepting (MB).

horizontal

message area 1	<Insert Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

vertical

message area 1	<Insert Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the insert option.

The **insert** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Typed input can be used in either step.

Alignment Between

The **between** option is similar to the **insert** option except the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The **between** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Alignment Delete

The **delete** option is used to delete intersection points from the string.

After picking the delete option, any selected intersection point in the string is deleted. The string, minus the deleted point, is redrawn after each deletion.

Once an intersection point has been deleted, another intersection point in the selected string can be selected for deletion. Hence any number of the string points can be deleted one after another.

A horizontal intersection point is deleted if the point is chosen from a plan view and a vertical intersection point deleted if the point is selected from a vertical view.

For horizontal deletes

message area 1	<Delete Points>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
Screen message area	
	<Select point to delete> [picks][][menu]
	<Select point to delete> [picks][accepts][menu]

For vertical deletes

message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
Screen message area	
	<Select point to delete> [picks][][menu]
	<Select point to delete> [picks][accepts][menu]

The delete option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Typed input can be used to select a point for deletion.

Alignment Extend

The **extend** option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, in a plan view, the bearing of the HIP-HIP line is kept constant and the intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the HIP-HIP line.

In a section view, the grade of the VIP-VIP line is kept constant and the vertical intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the VIP-VIP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by selecting a co- ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and IP are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line. As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

For horizontal extends

message area 1	<Extend Point>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - after pick
Screen message area	
	<Select line to extend> [picks][][menu]
	<Select line to extend> [picks][accepts][menu]

For vertical extends

message area 1	<Extend Point>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP

message area 4 select final position - after pick
 Screen message area
 <Select line to extend> [picks][][menu]
 <Select line to extend> [picks][accepts][menu]

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the current cursor position onto the IP-IP line.

horizontal -

message area 1 <Extend Points>
 message area 2 IP point number, x, y co-ords of IP, radius, start spiral, end spiral
 message area 3 bearing-in, bearing out, bearing difference for the inserted IP
 message area 4 select final position - before pick, edit finished- after pick
 Screen message area
 <Select final position of point> [picks][][menu]
 <Select final position of point> [picks][accepts][menu]

vertical

message area 1 <Extend Points>
 message area 2 VIP point number, Ch, Ht co-ords of VIP
 message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP
 message area 4 select final position - before pick, edit finished- after pick
 Screen message area
 <Select final position of point> [picks][][menu]
 <Select final position of point> [picks][accepts][menu]

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **extend** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Typed input can be used in either step.

Note - **Extend** can be used on the end points of the string

Alignment Height

The **height** option is used to insert and/or modify the height of a vertical intersection point in a plan view, or to modify the height of a vertical intersection point in a section view.

Hence the height option is unique - it only affects the vertical geometry of the string but can be used in a plan or section view.

The **height** walk-right is

By Plan - Height in a Plan View

In a plan view, the **height=>by plan** option is used to create a **vertical intersection point** of a given height, or modify the height of an existing vertical point, at a selected plan position on the string.

After the **height** option is chosen, the user selects a position on the string in a plan view. The use of point and line snap will important for selecting the correct position.

If a vertical intersection point already exists at the chainage of the selected position, it will be selected for modification. Otherwise a new vertical intersection point will be inserted into the vertical geometry at the chainage of the selected position.

A **new height** typed-input box is then displayed on the screen with the vertical intersection point's current height (z value).

The **new height** typed-input box looks like:

The height is entered into the typed-input box, terminated with <Enter>. The entered value is taken as the new height of the vertical intersection point in the alignment.

The typed-input box then disappears.

By Section - Height in a Section View

In a section view, the **height=>by section** option can only be used to modify the height of an **existing** vertical intersection point.

After the **height** option is chosen, the user selects the vertical intersection point that will have its height modified from a section view. After selecting the VIP, a **new height** typed-input box is displayed on the screen with the point's current height (z value).

The **new height** typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new height of the vertical intersection point in the alignment string and the string redrawn with the new height at that point.

The typed-input box then disappears.

For either **height=>by plan** or **height=>by section**, the **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **alignment edit** menu.

Alignment Curves

The **curves** option allows the user to

- (a) add a circular curve of a specified radius or curve length to a horizontal intersection point
- (b) add start and end transition (eg spiral) to an intersection point with and existing circular curve
- (c) add a circular curve of a specified radius or curve length to a vertical intersection point

The **Curves** walk-right menu is

The **radius** option is used to create or modify the radius of a circular curve at a horizontal or vertical intersection point. **radius** acts on the horizontal geometry if the point is selected in a plan

view, or the vertical geometry if the point is selected in a section view.

Similarly the **length** option is used to set a circular curve by giving its total curve length rather than the radius. **length** acts on the horizontal geometry if the point is selected in a plan view, or the vertical geometry if the point is selected in a section view.

The **spiral** option is for adding transitions to a **horizontal intersection point with a curve already on it**.

Radius

In a plan view, the **radius** option is used to **add** a circular curve to an intersection point with no curve or to **modify** the radius of the circular curve if one already exists.

In a section view, the **radius** option is used to **add** a circular curve to an intersection point with no curve or to **modify** the radius of a circular curve if one already exists.

Radius is a two step process.

Step (a) - selecting the intersection point

First the intersection point whose curve is to be modified is selected.

For horizontal radius

message area 1	<Radius>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing difference for the inserted IP

For vertical radius

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	radius, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value- after pick
Screen message area	
	<Select point to change radius> [picks][][menu]
	<Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius

after an intersection point is chosen, a **new radius typed-input box** is displayed on the screen with either the intersection point's current curve radius or, if no curve exists, zero.

The new radius typed-input box looks like:

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the curve at that intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing curve is to be **removed** from an intersection point, enter the value zero into the new radius typed-input box.

horizontal

message area 1	<Radius>
message area 2	IP point number, x, y co-ords of IP, radius, start spiral, end spiral
message area 3	bearing-in, bearing out, bearing diff for the inserted IP
message area 4	enter value - before value entered edit finished- after value entered

vertical

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP

message area 3	radius, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value - before value entered edit finished- after value entered

Like most of the other **alignment edit** options, after a radius has been modified the option is still current and another intersection point can be chosen to have its curve radius modified.

The **radius** option is terminated by selecting a different **alignment edit** option.

Length

Although the circular curve on an intersection point is stored as a radius, it is possible to define the radius indirectly by giving the total curve length by using the **length** option.

The option works in plan or section views.

To use **length**, first select the intersection point to add a new circular curve to, or to modify the existing curve.

A new length **typed-input box** is then displayed on the screen with either the current curve length, or if no curve exists, zero.

The new length typed-input box looks like:

The total curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new curve length. The typed-input box then disappears.

If an existing circular curve is to be **removed**, zero is entered into the new length typed-input box.

Like most of the other **alignment edit** options, after the **length** has been modified the option is still current and another IP can be chosen to have its curve modified.

The **length** option is terminated by selecting a different **alignment edit** option.

WARNING - when **length** is used, the equivalent radius is computed and stored with the curve. If the IP is moved, the **radius** is kept **constant** and the total curve **length** is **modified**.

Spiral

In a plan view, the **spiral** option is used to **add** a start or end transitions (eg spirals) to a curve on an intersection point, or to **modify** an existing transition. Spiral does not work on a section view.

After picking **spiral**, select the end of the curve to add a new transition to, or the existing transition to be modified. A new length **typed-input box** is displayed on the screen with either the current transition length, or zero if no transition exists.

The new length typed-input box looks like:

The transition length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the new transition length. The typed-input box then disappears.

If an existing transition is to be **removed**, zero is entered into the new length typed-input box.

Like most of the other **alignment edit** options, after the **spiral** has been modified the option is still current and another curve can be chosen to have its transitions modified.

The **spiral** option is terminated by selecting a different **alignment edit** option.

Reverse

12d Model normally creates a curve on the side of the IP that has the smallest angle. The sign of the radius (positive or negative) is automatically determined by **12d Model**.

The **Reverse** option creates a circular curve that is the part left over from the standard curve.

On selecting **Reverse**, the **Reverse IP** panel is displayed.

The HIP is chosen by either typing in the HIP number in the **IP number** field, or by clicking on the **123** button and then selecting the HIP.

To change the curve from reversed/not reversed, simply tick on/off the **Reversed** tick box and then click on **Set**.

Alignment Parabolas

The **parabolas** option is for adding, removing or modifying parabolic curves to the **vertical geometry**. It allows the user to

- (a) add a parabolic curve of a given curve length to a vertical intersection point
- (b) add a parabolic curve of a given effective radius to a vertical intersection point

The **parabolas** walk-right menu is

The **radius** option is used to set a parabolic curve of given effective radius to a vertical intersection point.

The **length** option is used to set a parabolic curve of a given curve length to a vertical intersection point.

Note - the option only works on the vertical geometry if the VIP is selected in a section view. Points cannot be selected in any other view.

Radius

In a section view, the **radius** option is used to **add** a parabolic curve to an intersection point with no curve or to **modify** the radius of the parabolic curve if one already exists.

Radius is a two step process.

Step (a) - selecting the intersection point

First the intersection point whose parabola is to be modified is selected.

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP

message area 4 enter value- after pick
 Screen message area
 <Select point to change radius> [picks][][menu]
 <Select point to change radius> [picks][accepts][menu]

Step (b) - entering the new radius

After an intersection point is chosen, a **new radius typed-input box** is displayed on the screen with either the intersection point's current parabolic radius or, if no parabola exists, the last value entered into the radius typed-input box.

The new radius typed-input box looks like:

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the parabola at that intersection point and the string redrawn with the new parabola. The typed-input box then disappears.

If an existing parabola is to be **removed** from an intersection point, enter the value zero into the radius typed-input box.

message area 1	<Radius>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	enter value - before value entered edit finished- after value entered

Like most of the other **alignment edit** options, after the radius has been modified the option is still current and another intersection point can be chosen to have its parabolic radius modified.

The **radius** option is terminated by selecting a different **alignment edit** option.

WARNING - when **radius** is used, the equivalent parabolic length is computed and stored with the curve. If the VIP is moved, the **parabolic length** is kept **constant** and the **effective radius** is **modified**.

Length

The **length** option is used to **add** a parabolic curve to a vertical intersection point with no curve or to **modify** the length of the parabolic curve if one already exists.

Adding or modifying curve length is a two step process.

Step (a) - selecting the vertical intersection point

First the vertical intersection point whose parabola is to be modified is selected.

message area 1	<Length>
message area 2	VIP point number, Ch, Ht co-ords of VIP
message area 3	VC length, %grade-in, %grade-out, grade diff for the moved VIP
message area 4	edit finished - before pick enter value - after pick
Screen message area	
	<Select point to change length> [picks][][menu]
	<Select point to change length> [picks][accepts][menu]

Step (b) - entering the new curve length

After a VIP is selected, a **new length typed-input box** is displayed on the screen with the point's current parabolic curve length.

The new length typed-input box looks like

The curve length is entered into the typed-input box, terminated with <enter>. The entered value is taken as the length of the parabolic curve at that vertical intersection point and the string redrawn with the new curve. The typed-input box then disappears.

If an existing parabola is to be **removed** from a vertical intersection point, enter the value zero into the curve length typed-input box.

message area 1 <Length>

message area 2 VIP point number, Ch, Ht co-ords of VIP

message area 3 VC length, %grade-in, %grade-out, grade diff for the moved VIP

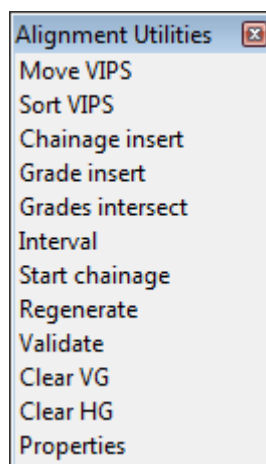

message area 4 enter value- before value entered edit finished- after value entered

Like most of the other **alignment edit** options, after the parabolic curve length has been modified the option is still current and another vertical intersection point can be chosen to have its parabola modified.

The **length** option is terminated by selecting a different **alignment edit** option.

Alignment Utilities

The **Utilities** walk-right menu contains a number of useful miscellaneous option for the alignment string. The menu is

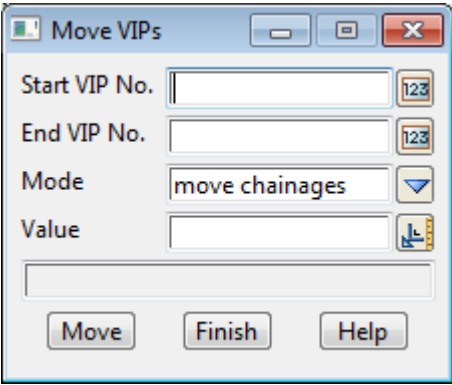

Each of the options will now be discussed.

Move VIPS

The **Move VIPS** option is for moving a range of vertical intersection points (VIPs) by a chainage or an elevation increment.

After selecting the option, the **Move VIPS** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP No.	input		
the VIP number of the 1st VIP in the range to be moved. If blank, then 1.			
End VIP No.	input		
the VIP number of the last VIP in the range to be moved.If blank, then the last VIP.			
Mode	input	move chainage	move chainage move hts
if move chainage , the chainage of all the points in the specified range are incremented by the given value. If move hts , the heights (elevations) of all the points in the specified range are incremented by the given value.			
Value	input	0	
value to increment either the chainage or the height for all the VIPs in the specified range.			
Move	button		
move the VIPs in the range given by the start and end ip field by the chainage or height given in the value field.			

Sort VIPs

The **sort VIPs** option is for sorting VIP's into increasing chainage order.
After selecting the option, the **sort VIPs** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP No.	input		
if not blank, the VIP number of the 1st VIP in the range to be sorted. If blank, then 1.			

End VIP No. input
 the VIP number of the last VIP in the range to be sorted. If blank, then the last VIP.

Sort button
 sort the VIPs in the range given by the start and end ip field into chainage order.

Chainage Insert

The **chainage insert** option inserts a vertical intersection point (VIP) at a given chainage and height. After selecting the option, the **chainage insert VIP** panel is displayed.

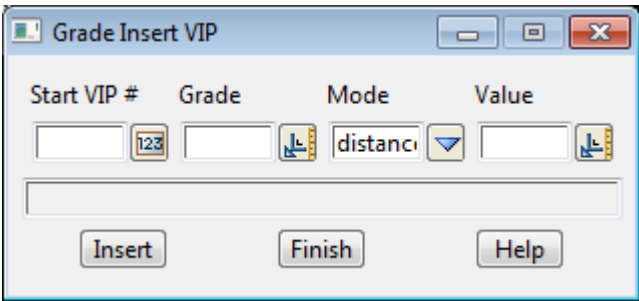

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Ch ht	input		
<i>the chainage and height of the VIP to insert - separate values by spaces.</i>			
Insert	button		
<i>insert the VIP point given in the Ch ht field into the alignment string.</i>			

Grade Insert

The **grade insert** option inserts a VIP at a given grade from an existing VIP. The new VIP position is given by either a distance from the picked VIP or at given chainage.
After selecting the option, the **grade insert VIP** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP #	input		
the VIP number whose position is used to start the grade insert from.			
Grade	input		
percent grade to be used.			
Note	positive is up when going in the direction of increasing chainage and negative is up when going in the direction of decreasing chainage .		
Mode	choice	distance	distance, chainage
if distance , the new VIP is inserted at the given grade and distance (given in the value field) from the start VIP.			
if chainage , the new VIP is inserted at the chainage (given in the value field but having the given grade from the start VIP.			
Insert	button		
insert the new VIP into the alignment string.			

Grades Intersect

The **grades intersect** option inserts a VIP which is given by intersecting lines of given grades from two existing VIPs. The grades are either typed in or calculated by giving another VIP that the line goes through.
After selecting the option, the **Grades Intersect VIPs** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start VIP # <i>the VIP number which is used in defining a line.</i>	input		
Mode <i>if grade, the field value is a percent grade and a line is defined as going through the start VIP and with the given grade.</i> <i>if VIP #, the field value is the number of a VIP and a line is defined as going through the start VIP and this VIP.</i> <i>Note for grades positive is up when going in the direction of increasing chainage and negative is up when going in the direction of decreasing chainage.</i>	choice	grade	grade, VIP #
Value <i>if mode is grade, value is a percent grade.</i> <i>if mode is VIP #, value is the number of a VIP.</i>	input		
Insert <i>calculate the point which is the intersection of the two lines and insert it as a new VIP into the alignment string.</i>	button		

Interval

Each alignment string has a chainage interval that is used to define regular points along the string. The chainage interval is used for approximation the alignment in operations such as triangulating and applying templates to an alignment string.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current chainage interval placed in it.

The new chainage interval is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **interval** option terminates after use.

Start Chainage

Each alignment string has a start chainage which can be positive, negative or zero.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current start chainage in it.

The new start chainage is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

When a new start chainage is entered, the vertical intersection points are automatically moved so that they retain their same relative chainage with respect to the start point on the alignment.

The **start chainage** option terminates after use.

Regenerate

If the horizontal geometry of an alignment string is modified, then the profile through any triangulations would also change. Hence, if the alignment string being edited was profiled on any section views, then the profile would be need to be recalculated after any horizontal geometry changes.

On selecting the **regenerate** option, **any** section view that has the alignment string being edited as its primary string (that is, as the string defining the chainage for the section view) is automatically re-profiled.

Hence the **regenerate** option is equivalent to running the **regenerate** option for each section view with the edited alignment string as its primary string.

Validate

When constructing horizontal and vertical geometry, it is possible to end of with invalid constructs such as overlapping tangent points.

On selecting the **validate** option, the alignment string will be checked for

horizontal geometry checks

- s at least two horizontal intersection points
- s no co-incident horizontal intersection points
- s no overlapping horizontal tangent points

vertical geometry checks

- s at least two vertical intersection points
- s no co-incident vertical intersection points
- s no overlapping vertical tangent point
- s vertical intersection points chainages are in ascending order

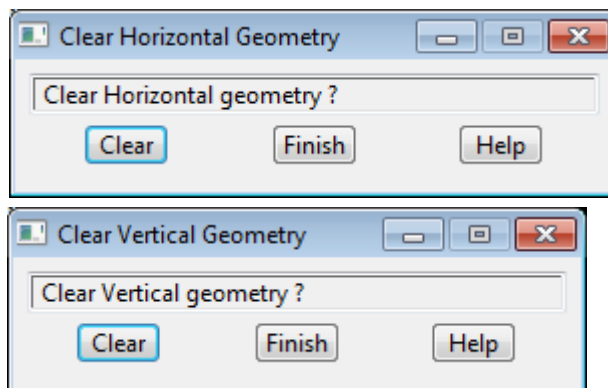

If any errors occur, an **errors** menu is placed on the screen.

The **errors** menu remains on the screen and only disappears when either the **[X]** is picked or one of the error messages is picked with LB.

Note - the **validate** option is automatically run when the edit is finished.

Clear VG and Clear HG

The **Clear VG** and **Clear HG** options are used to delete all the horizontal and/or vertical intersection points in the string.

The **Clear VG** option removes all the vertical geometry from the string.

The horizontal geometry still exists plus all the other string properties (model, name, colour and type).

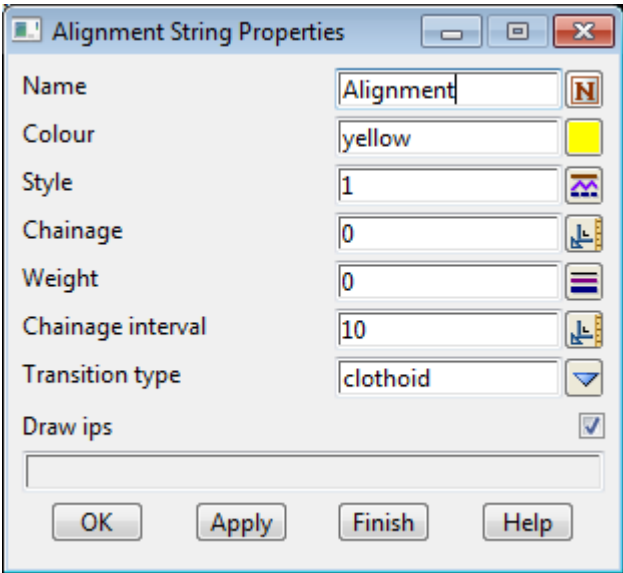

The **Clear HG** option removes all the horizontal and vertical geometry from the string.

The string still exists and keeps its other properties such as model, name, colour and type.

After a **Clear**, the horizontal or vertical geometry can be re- entered using the edit options.

Properties

Selecting **Properties** brings up the **Alignment String Properties** panel which is used to modify the string’s header information.

The fields in this panel are similar to those in the **Create Alignment String** panel and the alignment string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
Draw ips	tick	tick	
<i>if tick, the horizontal and vertical intersection points are draw on plan and section views.</i>			
<i>If not tick, the ips are not draw on the plan and section views.</i>			

OK/Apply	button
<i>for the string being edited, OK sets the string with the values in the panel fields and removes the panel.</i>	
Apply sets the string with the values in the panel fields and leaves the panel on the screen.	

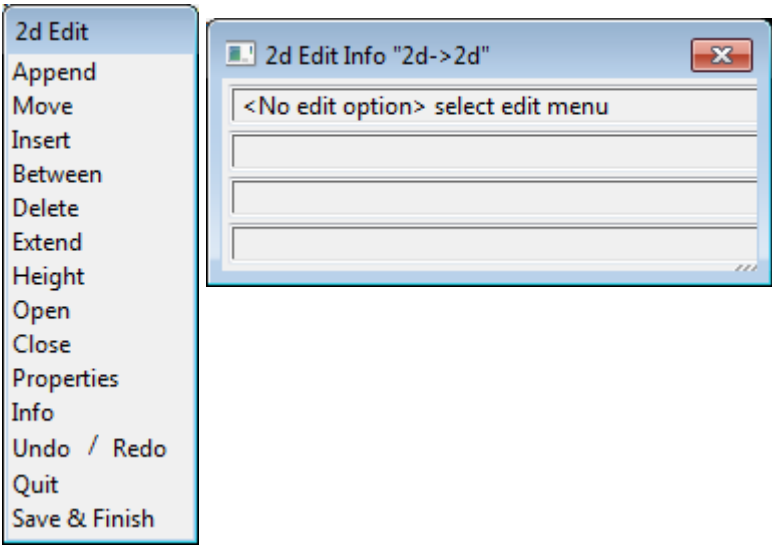

Finish

The **finish** option is used to terminate the alignment string edits. After selecting the **Finish** option, the string is checked for overlapping horizontal or vertical tangent points and any errors reported.

2d Edit - Old

Position of option on menu: Strings =>Editor

On picking a 2d string, the 2d edit menu and the 2d edit info panel are placed on the screen.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Each option in the 2d edit menu will now be described.

Append

The **append** option is used to create the 1st point in a new string, to append a new intersect point to the end of the string or to prepend a new intersection point to the beginning of the string. In this option, both appending and prepending will be referred to as appending.

Existing 2d Strings

Appending a point is a two step process.

Step (a) - selecting the end to append the point to.

After the **append** option has been selected, the end of the string to append the point to is selected. Once the string end is selected, the new intersection point is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the appended intersection point

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for an IP
message area 4	select final position- after pick
Screen message area	
	<Select string end to append to> [picks][][menu]
	<Select string end to append to> [picks][accepts][menu]

Step (b) - selecting the position for the new appended point.

A cross indicates where the cursor currently is. The position of the new appended point is set to the current cursor position by picking (LB) and accepting (MB).

message area 1	<Append Points>
message area 2	IP point number, x, y, z co-ords of IP

message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position- before pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Once a point has been appended to the string, the appended point is considered to be the selected string end and a new append cycle begins. That is, stage (a) is already set up. The current cursor position indicates the new position for the next appended point.

Hence a **series** of string points is easily entered by first selecting the string end that the new points are to be appended to (step (a)) and then moving the cursor to the position of each new point and selecting them in turn.

Typed input can be used in either step.

The **append** option is terminated by either bringing up the **pick ops** menu and selecting **cancel** or by selecting a new option from the **2d edit** menu.

If, after bringing up the **pick ops** menu, it is decided to continue with the append option, simply select the **restart** option from the **pick ops** menu and the **pick ops** menu will disappear leaving the append option still current.

New 2d String

For creating a new string, the cursor is used to select the 1st point of the string. The option then continues as if appending to an existing 2d string where the end point has already been selected.

Move

The **move** option is for moving individual points (intersection points - IP's) of the string.

The move cycle consists of two steps:

- (a) selecting the point to be moved
- (b) selecting the new position for the point.

Step (a)

First the point to be moved is selected. The selected point will then move around the view and the string redrawn to show the change as the cursor is moved.

message area 1	<Move Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the closest IP
message area 4	select final position- after pick
Screen message area	
	<Select point to move> [picks][][menu]
	<Select point to move> [picks][accepts][menu]

Step (b)

The current cursor position is selected as the new position for the point by selecting (LB) and accepting (MB). The point being moved is then anchored at the cursor position for the IP, and the string redrawn.

message area 1	<Move Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the moved IP
message area 4	select final position- before pick, edit finished- after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Typed input can be used in either step.

Once the move cycle is completed and the point moved, the move option is still current and can be repeated for other points without having to re-select the **move** option.

The **move** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new **2d edit** option.

Insert

The **insert** option is designed to place a new intersection point in a string between two adjacent intersection points (note that the inserted point **does not** have to be on the line joining the two intersection points).

Inserting a point, like moving a point, is a two step process.

Step (a) - selecting the IP's to be on either side of the new intersection point

The two adjacent intersection points are chosen by selecting the **line** connecting the two intersection points. Once the line is selected, the new IP is assumed to be at the current cursor position. As the cursor is moved, the string is redrawn reflecting the changing position of the inserted IP.

message area 1	<Insert Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for closest IP
message area 4	select final position- after pick
Screen message area	
	<Select line to insert on> [picks][][menu]
	<Select line to insert on> [picks][accepts][menu]

Step (b) - selecting the position for the new intersection point

The position of the new intersection point is selecting

message area 1	<Insert Point>
message area 2	IP point number, x, y, z co-ords of IP
message area 3	bearing-in, bearing out, bearing difference for the inserted IP
message area 4	select final position - before pick, edit finished - after pick
Screen message area	
	<Select final position of point> [picks][][menu]
	<Select final position of point> [picks][accepts][menu]

Once the insert cycle is completed and the point inserted, the insert option is still current and can be repeated for other insertions without having to re-select the **insert** option.

The **insert** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit** menu.

Typed input can be used in either step.

Between

The **between** option is similar to the **insert** option except that the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is projected onto the IP-IP line to give the new IP point position.

The **between** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit**.

Delete

The **delete** option is used to delete selected intersection points from the string.

The point to be deleted is picked (LB) and accepted (MB). When the point is accepted, it is **deleted**. The string, minus the deleted point, is then redrawn.

Once a point has been deleted, another point in the string can then be selected and deleted. Hence any number of points from the string can be deleted one after another.

```
message area 1 <Delete Points>
message area 2      IP point number, x, y, z co-ords of IP
message area 3      bearing-in, bearing out, bearing difference for closest IP
message area 5
Screen message area
      <Select point to delete> [picks][ ][menu]
      <Select point to delete> [picks][accepts][menu]
```

The **delete** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit** menu.

Typed input can be used to select a point for deletion.

Extend

The **extend** option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

That is, the bearing of the IP-IP line is kept constant and the intersection point is moved along that line either **towards** or **away** from its neighbouring intersection point on the IP-IP line.

Extending, like moving a point, is a two step process.

Step (a) - selecting the IP-IP line and the IP to be moved along that line

The IP-IP line and the intersection point to be moved are chosen in the one operation by picking (LB) and accepting (MB) a co-ordinate point near the IP-IP line and close to the intersection point to be moved along that line.

Once the line and intersection point (IP) are selected, the new position of the selected IP is assumed to be at the current cursor position projected perpendicularly onto the IP-IP line.

As the cursor is moved, the string is redrawn reflecting the changing position of the moved IP.

```
message area 1      <Extend Point>
message area 2      IP point number, x, y, z co-ords of IP
message area 3      bearing-in, bearing out, bearing difference for closest IP
message area 4      select final position- after pick
Screen message area
      <Select line to extend> [picks][ ][menu]
      <Select line to extend> [picks][accepts][menu]
```

Step (b) - selecting the final position for the intersection point

The final position for the intersection point is set to the projection of the selected cursor position onto the IP-IP line.

```
message area 1      <Extend Points>
message area 2      IP point number, x, y, z co-ords of IP
message area 3      bearing-in, bearing out, bearing difference for closest IP
message area 4      select final position - before pick, edit finished - after pick
Screen message area
      <Select final position of point> [picks][ ][menu]
      <Select final position of point> [picks][accepts][menu]
```

Once the extend is completed, the extend option is still current and can be repeated without re-

selecting the **extend** option.

The **extend** option is terminated by selecting **cancel** from the **pick ops** menu or by selecting a new option from the **2d edit** menu.

Typed input can be used in either step.

Note - Extend can be used on the end points of the string

Height

The **height** option is used to modify the height (z value) of the 2d string.

After the height option is chosen, an **enter value** typed-input box is displayed on the screen with the string's current height (z value).

The enter value typed-input box looks like:

The height is entered into the typed-input box, terminated by <enter>. The entered value is taken as the height of the 2dstring and the string redrawn with the new height. The typed-input box then disappears.

The height option automatically terminates and a new option is selected from the **2d edit**.

Note - all the points in a 2d string have the same height.

Open

If the string is closed (that is, the end points have the same x and y values), selecting the **open** option removes the last point of the string.

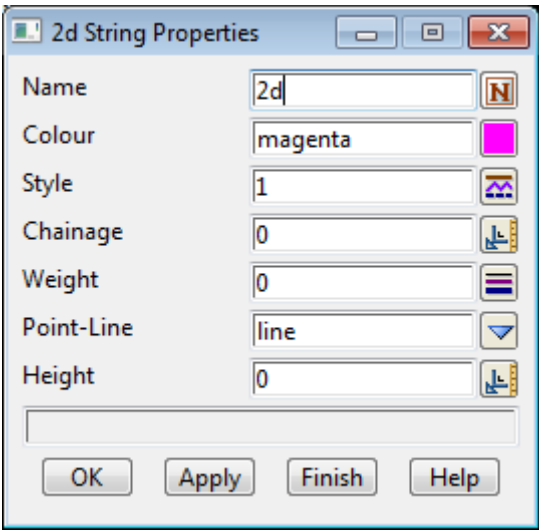

If the string is not closed, the **open** option does nothing.

Close

Selecting the **close** option adds a point to the end of the string with the same co-ordinate values as the 1st point in the string.

Properties

Selecting **Properties** brings up the **2d String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **Create 2d String** panel and the 2d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

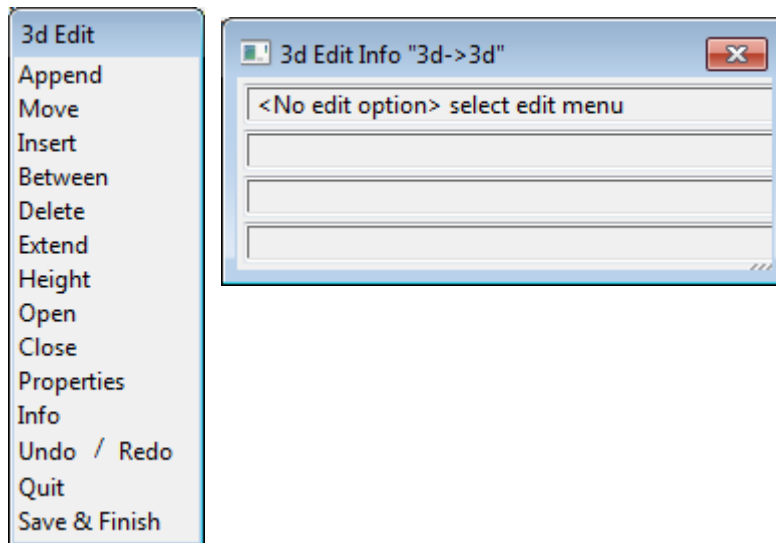

Set	button		
------------	--------	--	--

*for the 2d string being edited, set all the items in the **2d String Properties** panel to the values given in the panel.*

3d Edit - Old

Position of option on menu: Strings => Editor

On picking a 3d string, the **3d edit** menu and **3d edit info** panel are placed on the screen.

The difference between a 2d and a 3d string is that all points in a 2d string have the same z-value, whereas for a 3d string, each point can have a different z-value.

Hence most of the options in the **3d edit** menu are similar to the **2d edit** options of the same name, and only the differences for each option will be discussed. The *2d Edit* options are given in the section [Edit 2d](#)

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Append

The **append** operation for a 3d string is similar to that for a 2d string except that a height (z-value) is required for each new point.

Since in most cases, it would be tiresome to ask for a height every time a point is added, the entry of a new height is controlled by the **height** toggle in the **snaps** menu. If **height** is toggled to on, then every time a point is placed or moved an **enter height** typed-input box is displayed on the screen.

The enter height typed-input box looks like:

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the 3d string point and the string redrawn with the new height at the point. The typed-input box then disappears.

When the enter height box is placed on the screen, it will already have a value in it depending on the circumstances preceding the operation.

For example, if a point or line was snapped to, the height at that point or line will be displayed in the box.

Height

The **height** option is used to modify the height (z value) of any point in the string.

After the height option is chosen, the user must select which point is going to have its height modified.

After the point has been selected, an **New height** typed-input box is displayed on the screen with the point's current height (z value).

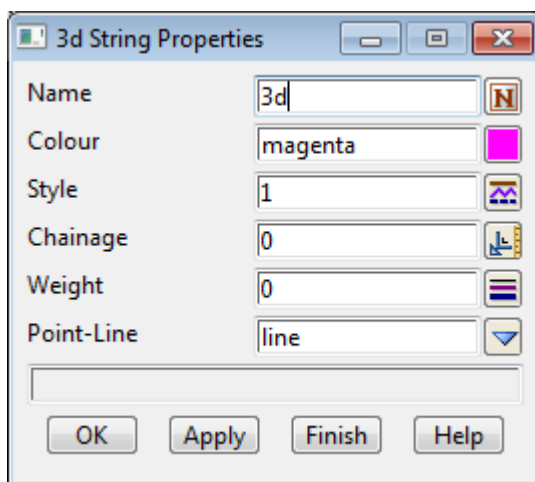

The height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the point in the 3d string and the string redrawn with the new height at that point. The typed-input box then disappears.

The **height** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **3d edit** menu.

Properties

Selecting **Properties** brings up the **3d String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **create 3d string** panel and the 3dd string editor options. The only new field is

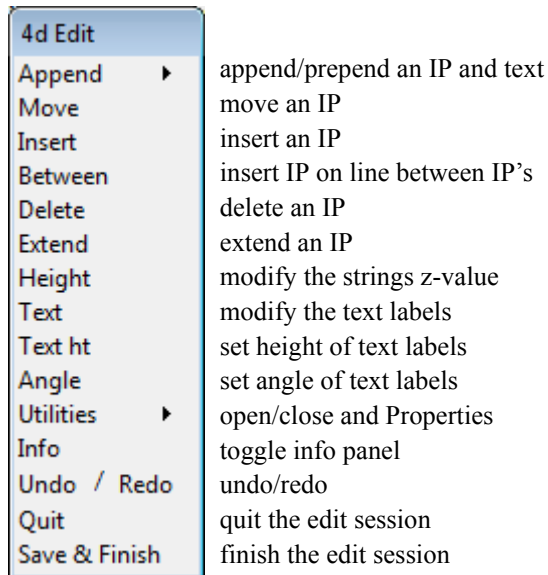

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the 3d string with the values in the panel fields and leaves the panel on the screen.*

4d Edit - Old

Position of option on menu: Strings => Editor

On picking a 4d string, the 4d edit menu and 4d edit info panel are placed on the screen.

Only the options append, text, size and angle will be described in detail since all the other options are similar to the equivalent 3d string option (see the section [Edit 3d](#)).

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Append

The **append** operation for a 4d string is similar to the 3d string case except that a height and an optional text label is required for each new point.

Since in many cases a text label is not required at every point of a 4d string, there is an append option that asks for text at every point and another that does not ask.

The 4d **append** walk-right is

The **height** question for each point is toggled on or off in the snaps menu just as it was for a 3d string.

The **append** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the 4d edit menu.

Text

The **text** option is used to modify the text label of any point in the 4d string.

After the **text** option is chosen, the user must select which point is going to have its text label modified. Once the point has been selected, an **enter text** typed-input box is displayed on the screen with the point's current text label placed in it.

The new text label is entered into the typed-input box, terminated with <enter>. The entered

value is taken as the text label of the point in the 4d string and the string redrawn with the new text at that point. The typed-input box then disappears.

The **text** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **4d edit** menu.

Text ht

All the text labels in the 4d string have the same height (given in pixel or world units). The **text ht** option is used to modify this text label height.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current text label height placed in it.

The new text label height is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text label height for all the points in the 4d string and the string redrawn using the new height. The typed-input box then disappears.

The **text ht** option automatically terminates after use.

Angle

All the text labels in the 4d string are drawn rotated about their defining string point with the same rotation angle. The angle, in degrees, is measured in a counter-clockwise direction about the horizontal axis.

The **angle** option is used to modify the text rotation angle.

After selecting the option, an **enter value** typed-input box is displayed on the screen with the string's current text rotation angle placed in it.

The new text rotation angle is entered into the typed-input box, terminated with <enter>.

The entered value is taken as the text rotation angle for all the points in the 4d string and the string redrawn using the new angle. The typed-input box then disappears.

The **angle** option automatically terminates after use.

Utilities

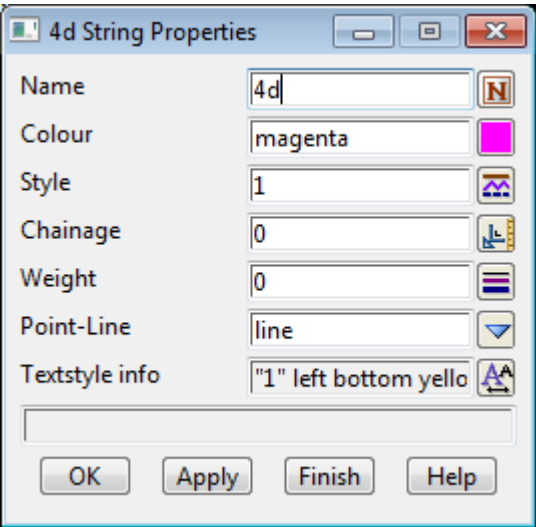

Position of option on menu: **Strings =>Editor**

The **4d utilities** walk-right is

Properties

Selecting **Properties** brings up the **4d String Properties** panel which is used to modify the string's header information.

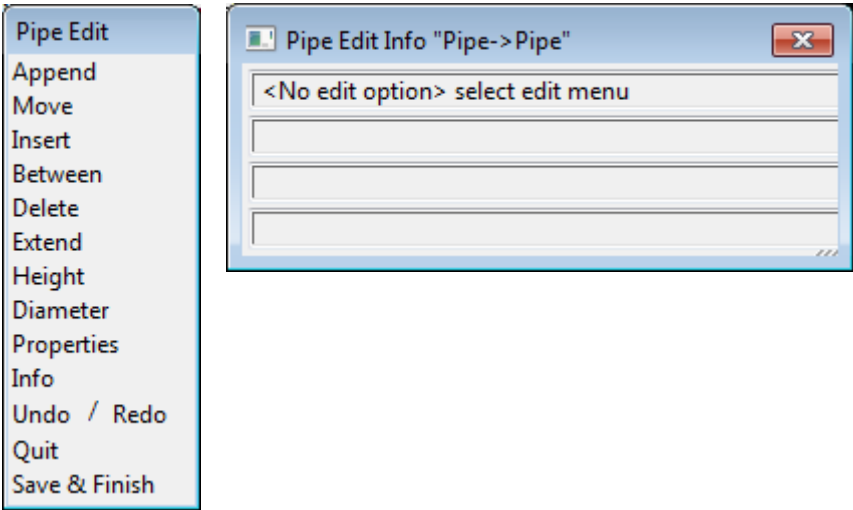

The fields in this panel are similar to those in the **create 4d string** panel and the 4d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Pipe Edit - Old

On picking a pipe string, the pipe edit menu and panel are placed on the screen.

The only difference between a 3d and a pipe string is that the pipe string has a diameter. Hence most of the options in the **pipe edit** menu are similar to the **3d edit** options of the same name, and only the **diameter** and **Properties** options need to be discussed. See the section [Edit 3d](#) for information on the 3d string editor.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Diameter

The **diameter** option is used to modify the diameter of the pipe string.

After the **diameter** option is chosen, an enter value typed-input box is displayed on the screen with the string's current diameter.

The enter value typed-input box looks like:

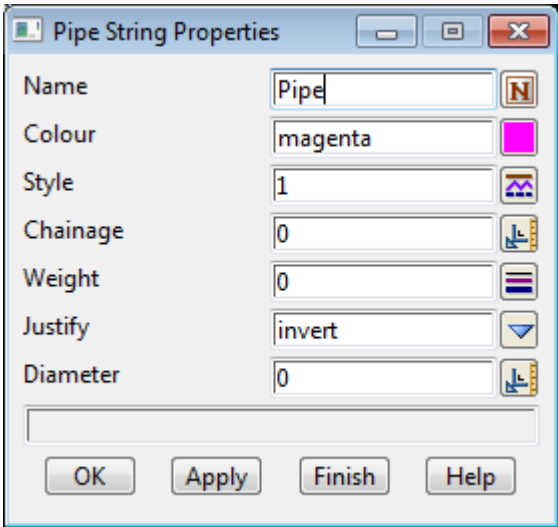

The diameter is entered into the typed-input box, terminated with <enter>. The entered value is taken as the diameter of the pipe string. The typed-input box then disappears.

The **diameter** option automatically terminates and a new option is selected from the **pipe edit** menu.

Note - the pipe string has only one diameter for the entire string.

Properties

Selecting **Properties** brings up the **Pipe String Properties** panel which is used to modify the string's header information.

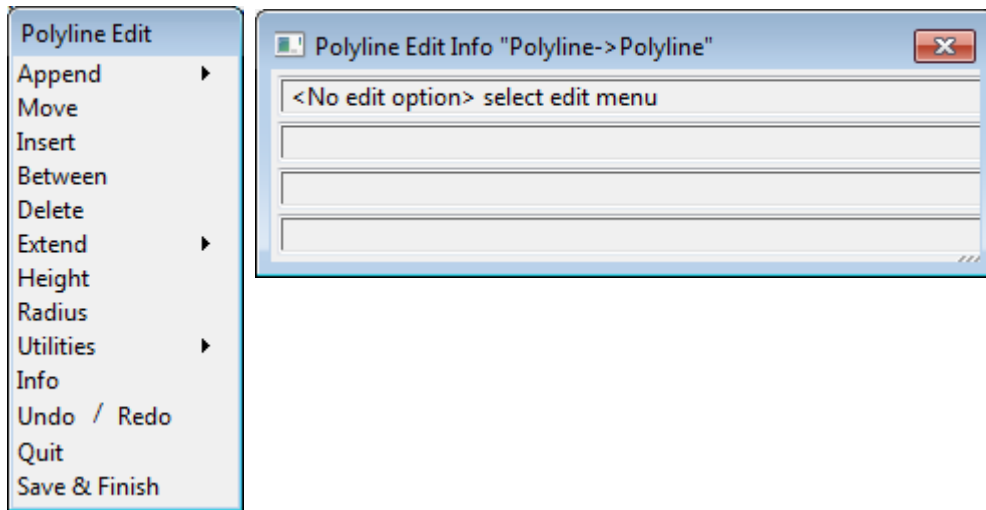

The fields in this panel are similar to those in the **create pipe string** panel and the 3d string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		
<i>for the string being edited, OK sets the string with the values in the panel fields and removes the panel.</i>			
<i>Apply sets the string with the values in the panel fields and leaves the panel on the screen.</i>			

Polyline Edit - Old

On picking a polyline string, the **polyline edit** menu and **polyline edit info** panel are placed on the screen.

The major difference between a polyline and a 3d string is that a polyline string can have an arc instead of a line joining adjacent string points. Hence most of the options in the **polyline edit** menu are similar to the **3d edit** options of the same name, and only the differences for each option will be discussed. See the section [Edit 3d](#) for information on the 3d string editor.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Append

The **append** operation for a polyline string is similar to the 3d string case except that an arc radius can be given for each new line segment.

Since in many cases an arc radius is not required at every segment of a polyline string, there is an append option that asks for the radius at every point and another that does not ask.

The **append** walk-right is

If the **append + radius** option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next polyline string point and the arc will be drawn correctly as the cursor is moved to the next point.

A **radius** value of **0** is taken to mean no arc.

The height question for each point is toggled on/off in the snaps menu just as it was for a 3d

string.

The **append** option is terminated on selecting **cancel** from the **pick ops** menu or by selecting a new option from the **polyline edit** menu

Extend

There are two **extend** options for a polyline string - **extend=>extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **extend=>extend ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

The **extend** walk-right is

Extend

extend=>extend that is identical to the 3d string case where the z-value of the point being extended is kept constant.

Extend by ht

extend=>extend ht not only moves the point but also linearly interpolates the z-value of the point being extended.

Radius

Selecting **radius** brings up the **change radius** panel which is used to modify the radius of any arc/line joining adjacent polyline points.

After selecting the **radius** option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the **change radius** panel.

New values can then be entered and the arc modified by selecting the **set** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

Utilities

The **utilities** walk-right menu contains a number of useful miscellaneous options for the polyline string. The menu is

Each of the new options will now be discussed.

Ins 3 Pt Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent polyline points.

After selecting the option, the middle IP of the three adjacent polyline points is selected.

When the IP is accepted, the radius required to fit a curve through the IP and the two adjacent IP's is calculated, and this radius is then applied to the segments joining the adjacent IP's.

Del 3 Pt Curve

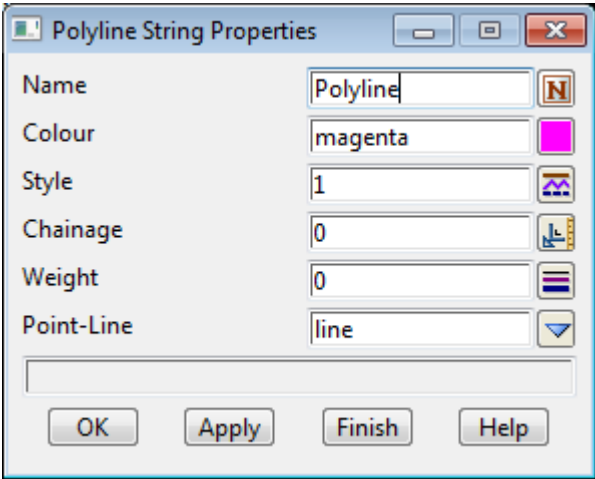

The **del 3 pt curve** option is used to delete the curves on either side of a polyline point.

After selecting the option, an IP is selected and when the IP is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the IP are effectively removed.

Properties

Selecting **Properties** brings up the **Polyline String Properties** panel which is used to modify the string's header information.

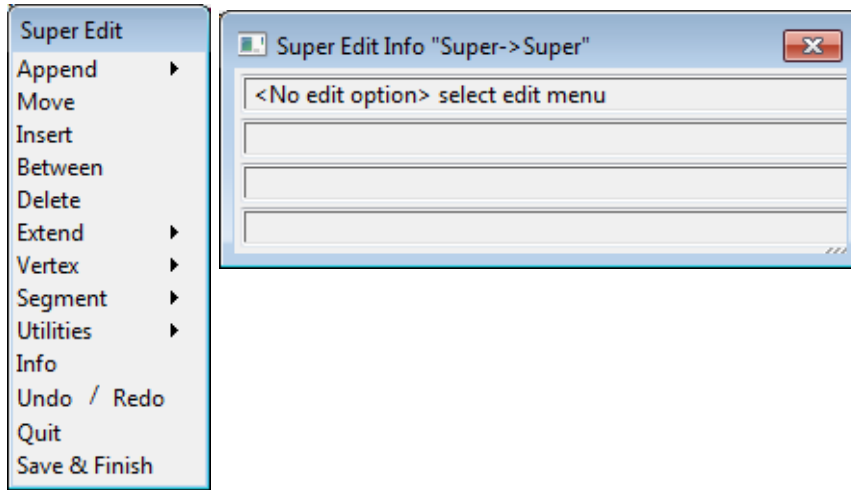

The fields in this panel are similar to those in the **create polyline string** panel and the polyline string editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

*for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.*

Super Edit - Old

On picking a super string, the **Super Edit** menu and **Super Edit Info** panel are placed on the screen.

The super string is similar to a polyline string in that it can have an arc instead of a line joining adjacent string points. Hence most of the options in the **super edit** menu are similar to the **polyline edit** options of the same name, and only the differences for each option will be discussed.

See the earlier section [Super String Edit - Common Information](#) for general information about editing strings.

Append

The **Append** operation for a super is the same as the polyline case and an arc radius can be given for each new line segment.

Since in many cases an arc radius is not required at every segment of a super string, there is an append option that asks for the radius at every point and another that does not ask.

The **append walk-right** is

If the **Append + Radius** option selected, then before each vertex is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next super string vertex and the arc will be drawn correctly as the cursor is moved to the next vertex.

A **radius** value of **0** is taken to mean **no arc**.

The height question for each vertex is toggled on/off in the snaps menu just as it was for a polyline string.

The **Append** option is terminated on selecting **Cancel** from the **Pick Ops** menu or by selecting a new option from the **Super Edit** menu

Extend

There are two **extend** options for a polyline string - **Extend=>Extend** that is identical to the 3d string case where the z-value of the point being extended is kept constant, and a second option, **Extend=>Extend Ht** where the z-value of the point being extended is linearly interpolated by the extension distance.

The **Extend** walk-right is

Extend

Extend=>Extend that is identical to the 3d string case where the z-value of the point being extended is kept constant.

Extend by Ht

Extend=>Extend Ht not only moves the point but also linearly interpolates the z-value of the point being extended.

Vertex

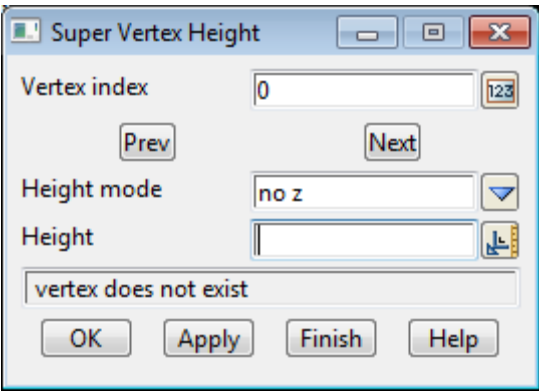

The **Vertex** menu contains options to modify information at any vertex of the super string.

The **Vertex** walk-right is

Height

Selecting **Vertex=>Height** brings up the **Super Vertex Height** panel which is used to set the height value for vertices.

As soon as **Height** is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *height mode* and *height* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Height** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Height mode vertex	input		no z, entire string, each
<i>if no z, there is no z value for the vertex.</i>			
<i>if entire string, then the string has the same z value for each vertex.</i>			
<i>if each vertex, then each vertex has a separate z value.</i>			
Height	input	height of vertex/string	
<i>the height used for the vertex or for the entire string.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Tinable

Selecting **Vertex=>Tinable** brings up the **Super Vertex Tinable** panel which is used to set the tinable flag for vertices.

As soon as **Tenable** is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *tenable flag* are displayed in the panel. The *tenable flag* can be changed and either **OK** or **Apply** selected to change the *tenable flag* of the vertex.

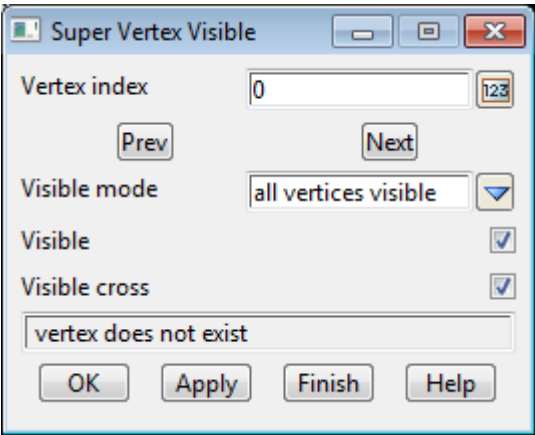

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Tenable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Tenable	tick		
<i>if ticked, the vertex is included in tins. if not ticked, then the vertex is ignored when triangulating.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Visible

Selecting **Vertex=>Visible** brings up the **Super Vertex Visible** panel which is used to set the visibility flag for vertices.

As soon as **Visible** is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *visibility flag* are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Vertex no.	<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>	input	selected vertex	
Prev	<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>	button		
Next	<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>	button		
Visible	<i>if ticked, the vertex is visible. if not ticked, then the vertex is invisible.</i>	tick		
OK/Apply	<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>	button		

Point no

Selecting **Vertex=>Point no** brings up the **Super Vertex Point Number** panel which is used to set the point numbers for vertices.

As soon as **Point no** is chosen, a **<Select vertex> [Picks][Menu]** message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and *point number* are displayed in the panel. The point number can be changed and either **OK** or **Apply** selected to change the point number of the vertex.

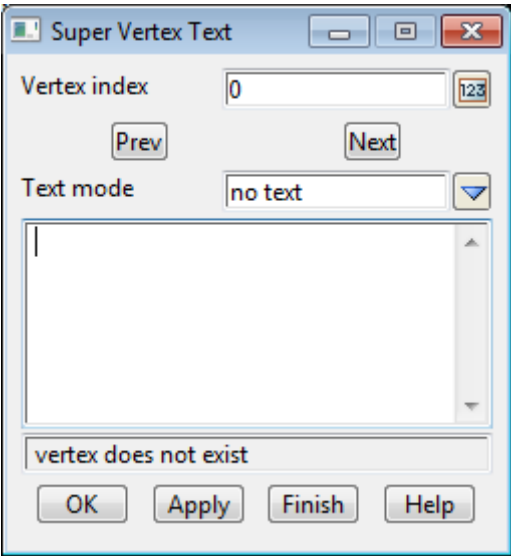

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Visible** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Point no.	input	point no of vertex	
<i>the point number used for the vertex.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Text

Selecting **Vertex=>Text** brings up the **Super Vertex Text** panel which is used to set the text for vertices.

As soon as Text is chosen, a `<Select vertex> [Picks][Menu]` message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *text mode* and *text* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

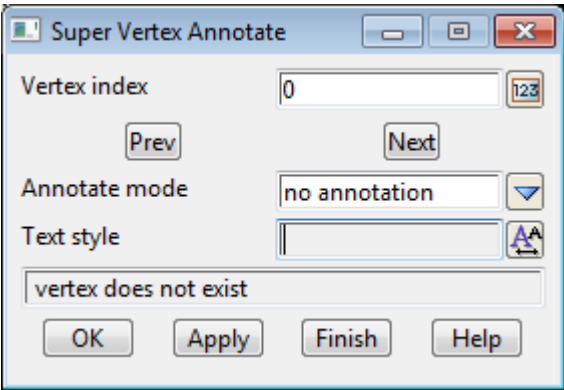

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Text mode	input		no text, entire string, each vertex
<i>if no text, there is no text for the vertex.</i>			
<i>if entire string, then the string has the same text for each vertex.</i>			
<i>if each vertex, then each vertex has a separate text value.</i>			
Text	input	text of vertex/string	
<i>the text used for the vertex or for the entire string.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Text Info

Selecting `Vertex=>Text info` brings up the **Super Vertex Annotate** panel which is used to set the annotation styles for the text at vertices.

As soon as **Text info** is chosen, a **<Select vertex> [Picks][Menu]** message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *annotate mode* and *annotation information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

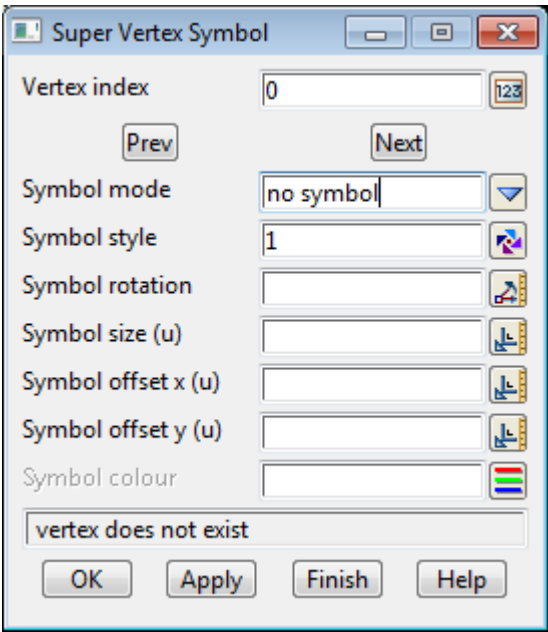

The fields and buttons used in the **Super Vertex Annotate** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Vertex no.	<i>if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that vertex if OK or Apply is selected.</i>	input	selected vertex	
Prev	<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>	button		
Next	<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>	button		
Annotate mode	<i>if no annotation, then the text at the vertex is not displayed. if entire string, then the same annotation settings are used for each vertex. if each vertex, then each vertex has separate annotations settings.</i>	input		no annotation, entire string, each vertex
Text style	<i>text style for the text at the vertex.</i>	input	1	available text styles
Text units	<i>units for the height of the text.</i>	input	pixels	pixels, world
Height (u)	<i>height of the text (in text units).</i>	input		
X factor	<i>x factor of the text.</i>	input	1	
Offset (u)	<i>distance (in text units) to offset the text from its (x,y) placement position.</i>	input	0	
Raise (u)	<i>distance (in text units) to raise the text above the line for its (x,y) placement position.</i>	input	0	

Justify	input	bottom-left	bot-left/cent/right, mid-left/cent/right top-left/cent/right
<i>text justification (about the offset position).</i>			
Angle	input		
<i>angle of the text.</i>			
Slant	input	0	
<i>slant, in degrees, of the text.</i>			
Colour	input		available colours
<i>colour of the text.</i>			
OK/Apply	button		
<i>for the vertex being edited, OK sets the vertex/string with the values in the panel fields and removes the panel. Apply sets the vertex/string with the values in the panel fields and leaves the panel on the screen.</i>			

Symbol Info

Selecting Vertex=>Symbol info brings up the **Super Vertex Symbol** panel which is used to set symbols and their display parameters at vertices.

As soon as **Symbol info** is chosen, a **<Select vertex> [Picks][Menu]** message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number*, *symbol mode* and *symbol information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the vertex.

Another vertex can then be selected or the **Prev** and **Next** buttons used to move to adjacent vertices.

The fields and buttons used in the **Super Vertex Symbol** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	

if a vertex is selected, then its vertex number is displayed in this field. A number can also be typed in

and any information in the panel will then be applied to that vertex if **OK** or **Apply** is selected.

Prev button
move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.

Next button
move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.

Symbol mode input no symbol, entire string, each vertex
if **no symbol**, then there is no symbol at the vertex.
if **entire string**, then the same symbol and settings are used for each vertex.
if **each vertex**, then each vertex has separate symbols and settings.

Symbol style input 1 available line styles
line style for the symbol at the vertex.

Symbol rotation input
rotation angle of the symbol.

Symbol size (u) input
size of the symbol (in xxx units).

Symbol offset (u) input 0
distance (in xxx units) to offset the symbol from its (x,y) placement position.

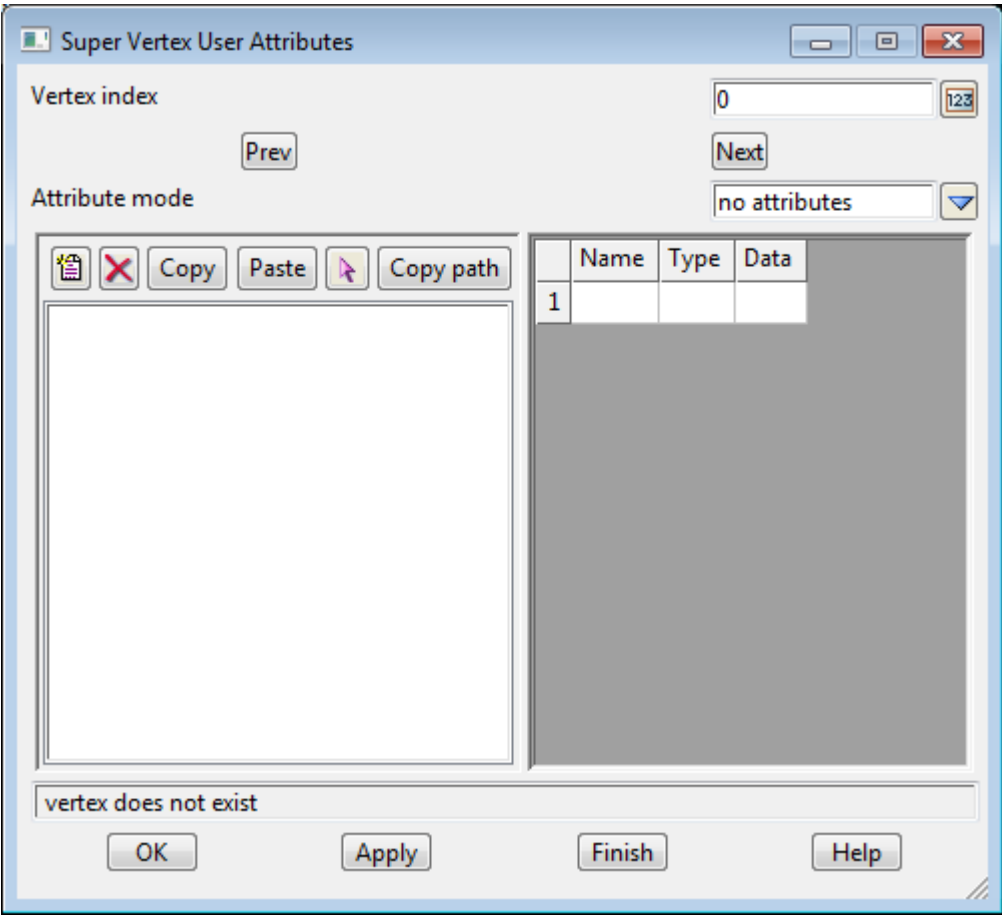

Symbol raise (u) input 0
distance (in xxx units) to raise the symbol above the line for its (x,y) placement position.

Symbol colour input available colours
colour of the symbol if none is defined in the symbol definition

OK/Apply button
for the vertex being edited, **OK** sets the vertex/string with the values in the panel fields and removes the panel. **Apply** sets the vertex/string with the values in the panel fields and leaves the panel on the screen.

Attributes

Selecting Vertex=>Attributes brings up the **Super Vertex User Attributes** panel which is used to display and edit user defined attributes at vertices of the super string.

The **Prev** and **Next** buttons are used to cycle through and display the attributes for each vertex in the super string in the *Name/Type/Data* grid.

The data in the *Name/Type/Data* grid can be deleted, modified or added to and then updated for the vertex using the **OK** or **Apply** button.

The fields and buttons used in the **Super Vertex User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex no.	input	selected vertex	
<i>when the option starts, the user attributes for the first vertex is displayed. The Next and Prev buttons will move onto other vertices. Also a number can be typed into the field and any information in the panel will then be applied to that vertex if OK or Apply is selected. Typing <Enter> after entering a number will go to that vertex number and display the attributes.</i>			
Prev	button		
<i>move to the previous vertex (predecessor). The information for the previous vertex is displayed in the panel fields.</i>			
Next	button		
<i>move to the next vertex (successor). The information for the next vertex is displayed in the panel fields.</i>			
Attribute mode	choice box		no attributes, each vertex
<i>if no attributes, then no vertices have user attributes.</i>			
<i>if each vertex, then each vertex can have user attributes.</i>			

Name/Type/Data Grid

Name	input	
	name for the user attribute. This must be unique for all attributes at this vertex.	
Type	choice box	integer, real, text
	type of the attribute.	
Data	input	
	value for the attribute.	

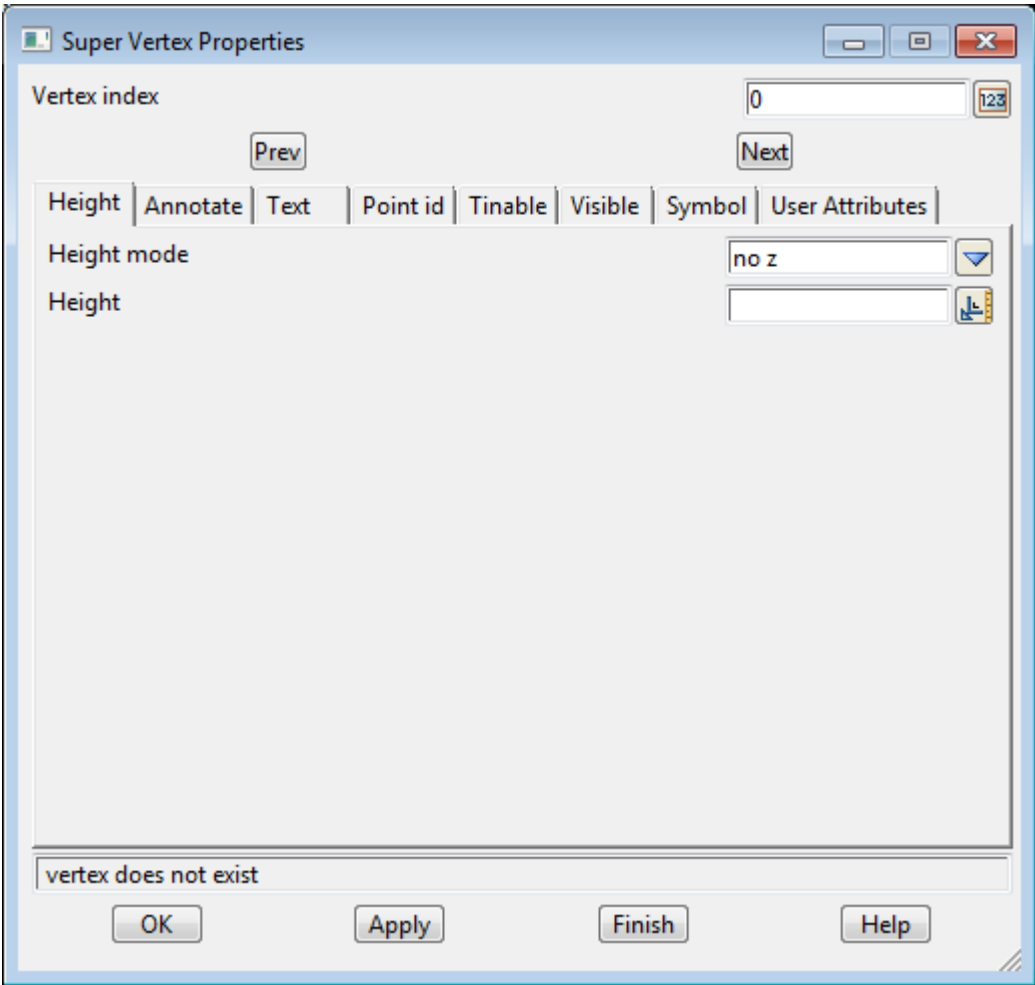

OK/Apply button
for the vertex being edited, **OK** sets the vertex with the values in the panel fields and removes the panel. **Apply** sets the vertex with the values in the panel fields and leaves the panel on the screen.

Vertex - All above

Selecting Vertex=>All above brings up the **Super Vertex Properties** panel which is used to display all the properties for a vertex.

This option is also available from the *Strings* menu

Position of option on menu: Strings =>Properties =>Vertex (all)

As soon as All above is chosen, a <Select vertex> [Picks][Menu] message is written to the **Status Bar** and vertices can be selected.

When the vertex to modify is selected, its *vertex number* and all other *information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the vertex.

The fields in the **Super Vertex Properties** panel have already been described in the other Vertex options and so will not be described again.

Please continue to the next section [Segment Toolbar](#).

Segment

The **Segment** menu contains options to modify information at any segment of the super string.
The **Segment** walk-right is

Colour

Selecting **Segment=>Colour** brings up the **Super Segment Colour** panel which is used to set the colour of the string segments.

As soon as **Colour** is chosen, a **<Select segment> [Picks]]][Menu]** message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *colour mode* and *colour* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Colour** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
<i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed</i>			

in and any information in the panel will then be applied to that segment if **OK** or **Apply** is selected.

Prev button
move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.

Next button
move to the next segment (successor). The information for the next segment is displayed in the panel fields.

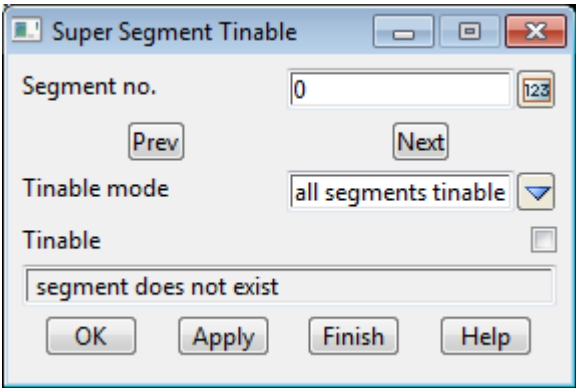

Colour mode input string colour, each segment
if **no z**, there is no z value for the vertex.
if **string colour**, then all the segments in the string have the same colour.
if **each segment**, then each segment has a separate colour.

Colour input colour of segment/string available colours
the colour used for the segment or for the entire string.

OK/Apply button
for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Tinable

Selecting Segment=>Tinable brings up the **Super Segment Tinable** panel which is used to set the tinable flag for segments.

As soon as **Tinable** is chosen, a <Select segment> [Picks][Menu] message is written to the **Status Bar** and vertices can be selected.

When the segment to modify is selected, its *segment number* and *tinable flag* are displayed in the panel. The tinable flag can be changed and either **OK** or **Apply** selected to change the tinable flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Tinable** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected segment	
if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.			
Prev	button		
move to the previous segment (predecessor). The information for the previous segment is displayed in			

the panel fields.

- Next

button

move to the next segment (successor). The information for the next segment is displayed in the panel fields.
- Tinable

tick

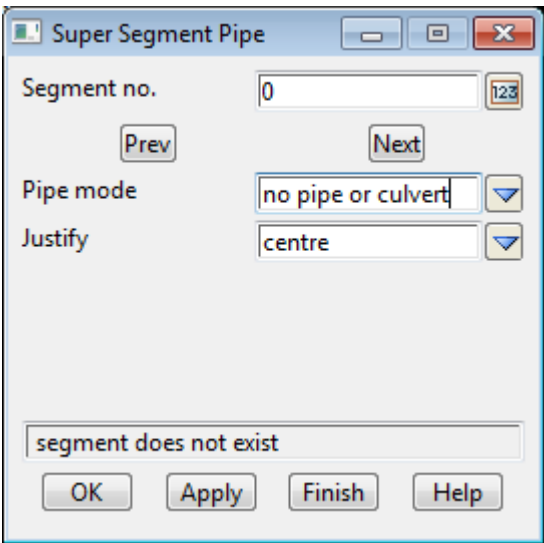

if *ticked*, the triangulation process tries to preserve the segment as a side of a triangle in the tin.
- OK/Apply

button

for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

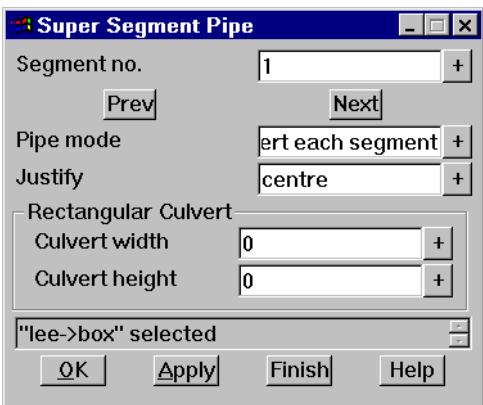

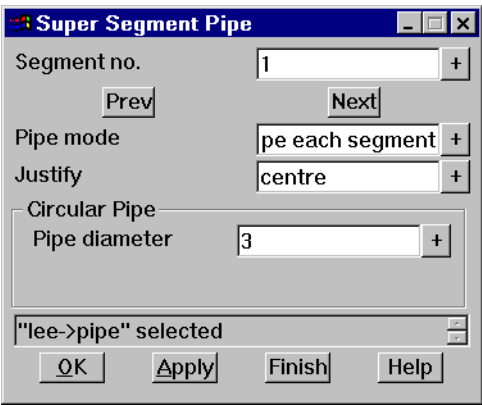

Diameter

The segments of a super string can have either a pipe or box cross section, or none. Selecting Segment=>Diameter brings up the **Super Segment Pipe** panel which is used to set the pipe mode and size for the string segments.

As soon as **Diameter** is chosen, a **<Select segment> [Picks][Menu]** message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *pipe mode* and *information* are written to the appropriate panel fields and the **Super Segment Pipe** panel will change depending on whether it was a pip or box cross-section for the string.

After any panel fields are modified, selecting either **OK** or **Apply** will change the pipe information for the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Pipe** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
<i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>			
Pipe mode	input		no pipe or box pipe entire string pipe each segment box entire string box each segment
<i>if no pipe or box, there is no z value for the vertex.</i>			
<i>if string colour, then all the segments in the string have the same colour.</i>			
<i>if each segment, then each segment has a separate colour.</i>			
Justify	input		invert, centre, overt
<i>justification of the pipe/box with respect to the co-ordinates given for the vertices of the super string.</i>			
<i>rotation angle of the symbol.</i>			
Pipe diameter	input		
<i>diameter of the pipe in world units.</i>			
Box width	input		
<i>width of the box section in world units.</i>			
Box height	input		
<i>height of the box section in world units.</i>			
OK/Apply	button		
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>			

Radius

When viewed in plan, the segments of a super string can be joined by string lines or arcs. If the radius is positive, the arc is drawn from the start vertex to the end vertex of the segment in a clockwise direction. If the radius is negative, the arc is drawn from the start vertex to the end vertex on the segment in a counter-clockwise direction.

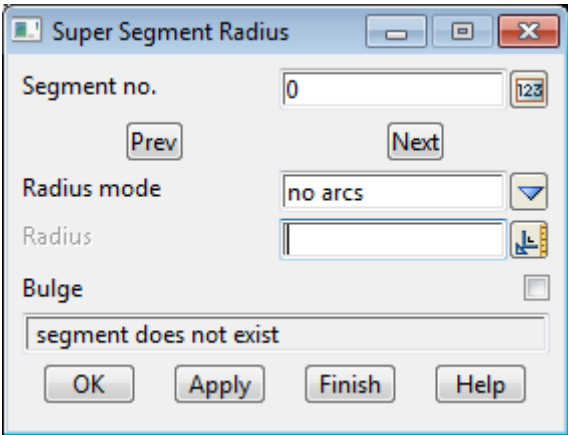

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

A zero radius is interpreted to be a just a straight line segment with no arc.

Selecting **Segment=>Radius** brings up the **Super Segment Radius** panel which is used to set the plan radius of the segment.

As soon as **Radius** is chosen, a **<Select segment> [Picks][Menu]** message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *radius* and *bulge* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments. The appropriate segment highlights when the **Prev** and **Next** buttons are used.

The fields and buttons used in the **Super Segment Radius** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
<i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>			
Colour mode	input		string colour, each segment
<i>if no z, there is no z value for the vertex.</i>			
<i>if string colour, then all the segments in the string have the same colour.</i>			

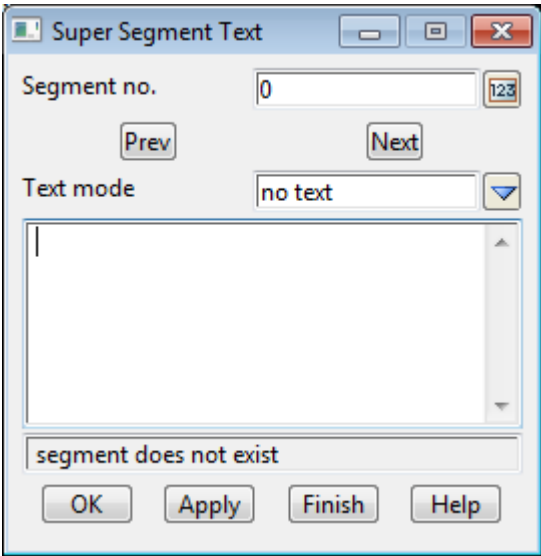

if each segment, then each segment has a separate colour.

Radius tick
if ticked, the larger arc is used.
if not-ticked, the smaller arc is used.

Bulge input 0
radius of the segment arc. A radius of 0 mean no arc.

OK/Apply button
for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.

Text
Selecting Segment=>Text brings up the **Super Segment Text** panel which is used to set the text for segments.

As soon as Text is chosen, a <Select segment> [Picks][Menu] message is written to the **Status Bar** and vertices can be selected.

When the segment to modify is selected, its *segment number*, *text mode* and *text* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

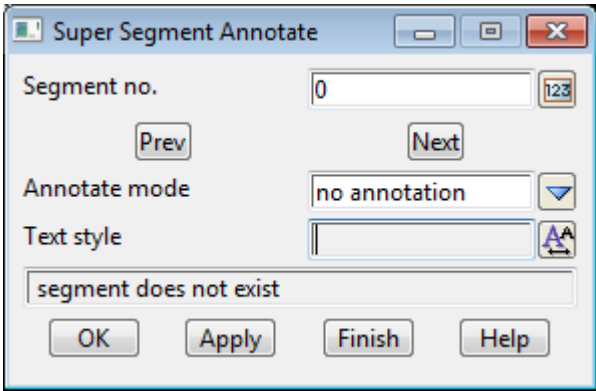

The fields and buttons used in the **Super Segment Text** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.			
Prev	button		
move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.			

Next	button	
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>		
Text mode	input	no text, entire string, each segment
<i>if no text, there is no text for the segment.</i>		
<i>if entire string, then the string has the same text for each segment.</i>		
<i>if each segment, then each segment has a separate text value.</i>		
Text	input	text of segment/string
<i>the text used for the segment or for the entire string.</i>		
OK/Apply	button	
<i>for the segment being edited, OK sets the segment/string with the values in the panel fields and removes the panel. Apply sets the segment/string with the values in the panel fields and leaves the panel on the screen.</i>		

Text Info

Selecting Segment=>Text info brings up the **Super Segment Annotate** panel which is used to set the annotation styles for the text at segments.

As soon as Text info is chosen, a <Select segment> [Picks][Menu] message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number*, *annotate mode* and *annotation information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Annotate** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
<i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>			

Annotate mode input no annotation, entire string, each segment

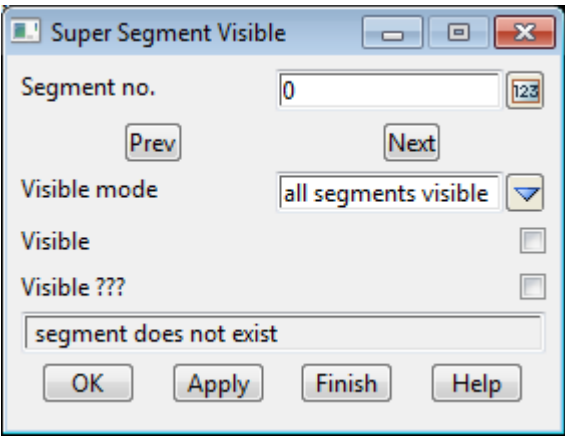

*if **no annotation**, then the text at the segment is not displayed.
if **entire string**, then the same annotation settings are used for each segment.
if **each vertex**, then each segment has separate annotations settings.*

Textstyle info input
textstyle information.

OK/Apply button
*for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Visible

Selecting Segment=>Visible brings up the **Super Segment Visible** panel which is used to set the visibility flag for segments.

As soon as **Visible** is chosen, a **<Select segment> [Picks][Menu]** message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number* and *visibility flag* are displayed in the panel. The visibility flag can be changed and either **OK** or **Apply** selected to change the visibility flag of the segment.

Another segment can then be selected or the **Prev** and **Next** buttons used to move to adjacent segments.

The fields and buttons used in the **Super Segment Visible** panel have the following functions.

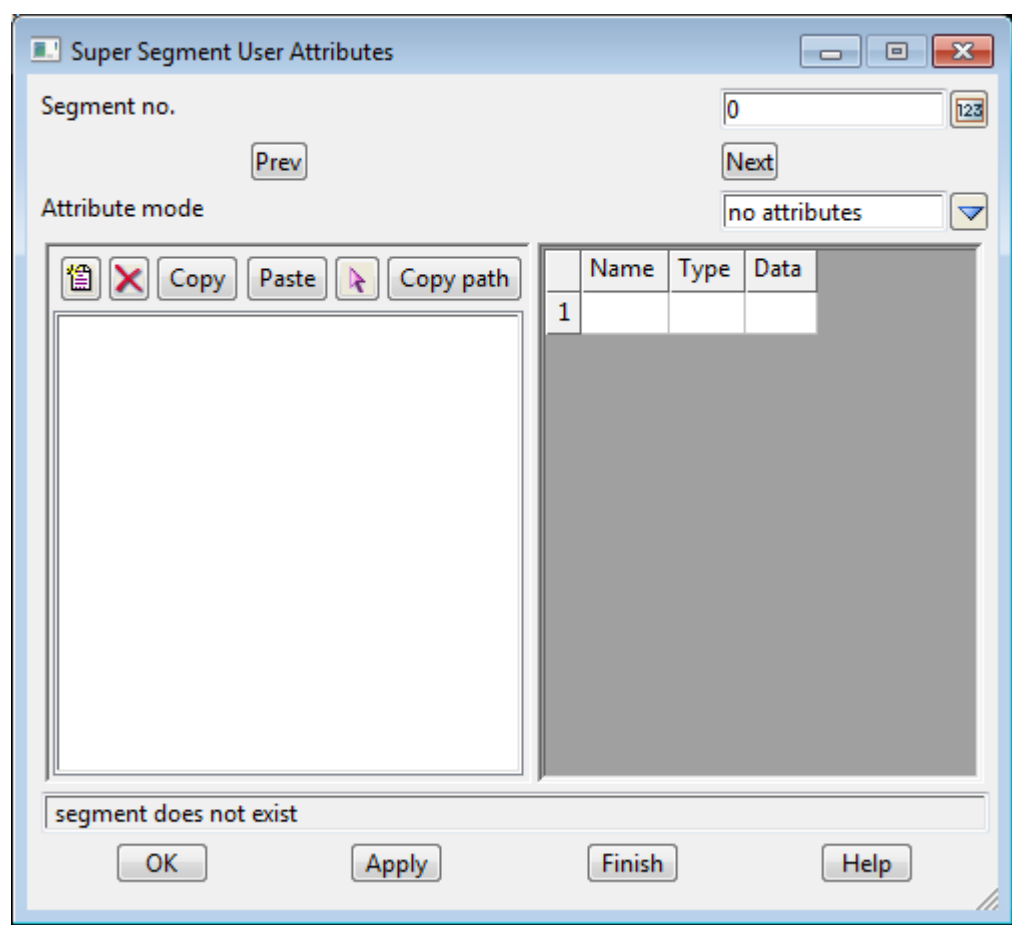

Field Description	Type	Defaults	Pop-Up
Segment no.	input	selected vertex	
<i>if a segment is selected, then its segment number is displayed in this field. A number can also be typed in and any information in the panel will then be applied to that segment if OK or Apply is selected.</i>			
Prev	button		
<i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>			
Next	button		
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>			

Visible tick
*if **ticked**, the segment is visible.*
*if **not ticked**, then the segment is invisible.*

OK/Apply button
*for the segment being edited, **OK** sets the segment/string with the values in the panel fields and removes the panel. **Apply** sets the segment/string with the values in the panel fields and leaves the panel on the screen.*

Attributes

Selecting **Segment=>Attributes** brings up the **Super Segment User Attributes** panel which is used to display and edit user defined attributes at segments of the super string.

The **Prev** and **Next** buttons are used to cycle through and display the attributes for each segment in the super string in the *Name/Type/Data* grid.

The data in the *Name/Type/Data* grid can be deleted, modified or added to and then updated for the segment using the **OK** or **Apply** button.

The fields and buttons used in the **Super Segment User Attributes** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Segment no.
*when the option starts, the user attributes for the first segment is displayed. The **Next** and **Prev** buttons will move onto other segments. Also a number can be typed into the field and any information in the panel will then be applied to that segment if **OK** or **Apply** is selected. Typing <Enter> after entering a number will go to that segment number and display the attributes.*

Prev	button	
<i>move to the previous segment (predecessor). The information for the previous segment is displayed in the panel fields.</i>		
Next	button	
<i>move to the next segment (successor). The information for the next segment is displayed in the panel fields.</i>		
Attribute mode	choice box	no attributes, each segment
<i>if no attributes, then no segments have user attributes.</i>		
<i>if each segment, then each segment can have user attributes.</i>		

Name/Type/Data Grid

Name	input	
<i>name for the user attribute. This must be unique for all attributes at this segment.</i>		
Type	choice box	integer, real, text
<i>type of the attribute.</i>		
Data	input	
<i>value for the attribute.</i>		

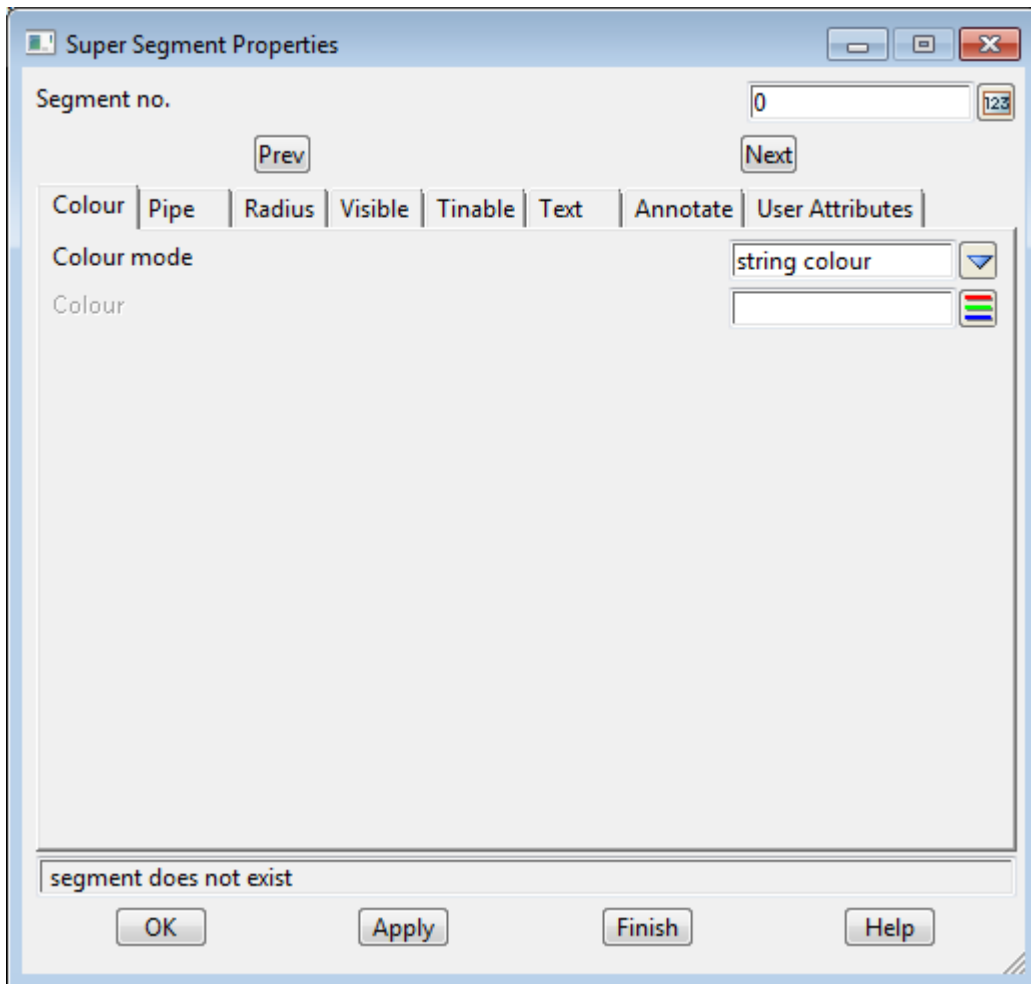

OK/Apply	button	
<i>for the segment being edited, OK sets the segment with the values in the panel fields and removes the panel. Apply sets the segment with the values in the panel fields and leaves the panel on the screen.</i>		

Segment - All above

Selecting Segment=>All above brings up the **Super Segment Properties** panel which is used to display all the properties of a segment.

This option is also available from the *Strings* menu

Position of option on menu: Strings =>Properties =>Segment (all)

As soon as **All above** is chosen, a `<Select segment> [Picks][Menu]` message is written to the **Status Bar** and segments can be selected.

When the segment to modify is selected, its *segment number* and all other *information* are written to the appropriate panel fields. The values and modes can be changed and either **OK** or **Apply** selected to change the values for the segment.

The fields in the **Super Segment Properties** panel have already been described in the other Segment options and so will not be described again.

Utilities

The **Utilities** walk-right menu contains a number of useful miscellaneous option for the super string. The menu is

Each of the new options will now be discussed.

Ins 3 Pt Curve

The **Ins 3 Pt Curve** option is used to insert a curve through three adjacent super string vertices.

After selecting the option, the middle vertex of the three adjacent super string vertices is selected.

When the vertex is accepted, the radius required to fit a curve through the vertex and the two adjacent vertices is calculated, and this radius is then applied to the segments joining the adjacent vertices.

Del 3 Pt Curve

The **del 3 pt curve** option is used to delete the curves on either side of a super string vertex.

After selecting the option, a vertex is selected and when the vertex is accepted, the radii of the segments on either side are set to zero.

Hence the curves on either side of the vertex are effectively removed.

Open

If the string is closed, selecting the **open** option removes the segment between the 1st and last vertex of the super string.

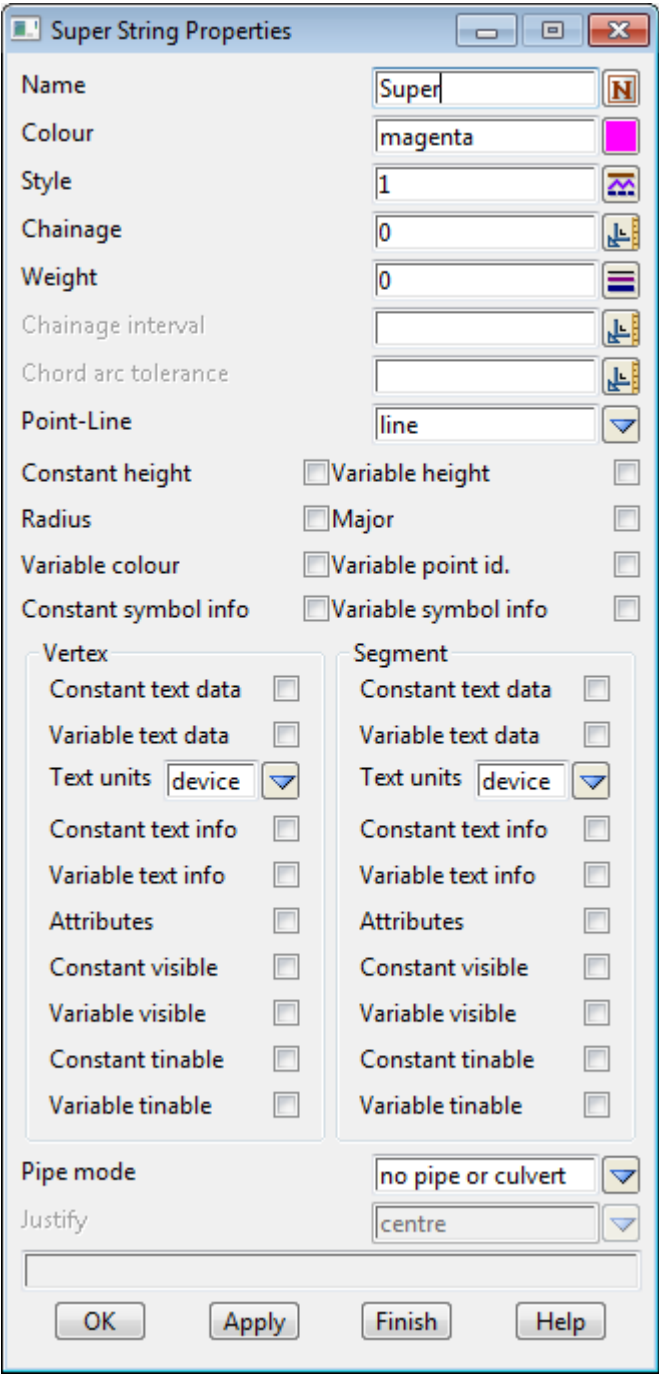

If the string is not closed, the **open** option does nothing.

Close

Selecting the **close** option adds a segment between the 1st and the last vertices of the super string. Note that unlike other strings, no extra vertices are added.

Properties

Selecting **Properties** brings up the **Super String Properties** panel which is used to modify the string's header information.

The fields in this panel are similar to those in the **Create Super String** panel and the Super String Editor options. The only new field is

Field Description	Type	Defaults	Pop-Up
OK/Apply	button		

for the string being edited, **OK** sets the string with the values in the panel fields and removes the panel. **Apply** sets the string with the values in the panel fields and leaves the panel on the screen.

17 Triangles

Position of menu: Tins

A **tin** (triangulated irregular network) is an accurate method of representing surfaces, especially those described by strings. **12d** Model uses tins in most operations involving surfaces. For example, contouring, interfacing and volume calculations.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be displayed in a view or used for profiling on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called "tin tin_name". This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins.

The Triangles walk-right menu is

Tins

Position of menu: Tins=>Tins

The **tins** walk-right menu provides options to list all the tins in the project (project tins) and all the tins in the project area but not in the project (removed tins).

The **tins** walk-right menu is

For the option Project tins, go to [Project Tins](#)
Removed tins [Removed Tins](#)

Project Tins

Position of option on menu: Tins =>Tins => Project Tins

The **project tins** walk-right menu provides a list of all the tins in the project and there is a walk-right on each tin name showing what models the tin is in. If a tin name is selected from the list of tins, the **tin information** panel is fired up with the selected tin name already in the tin field.

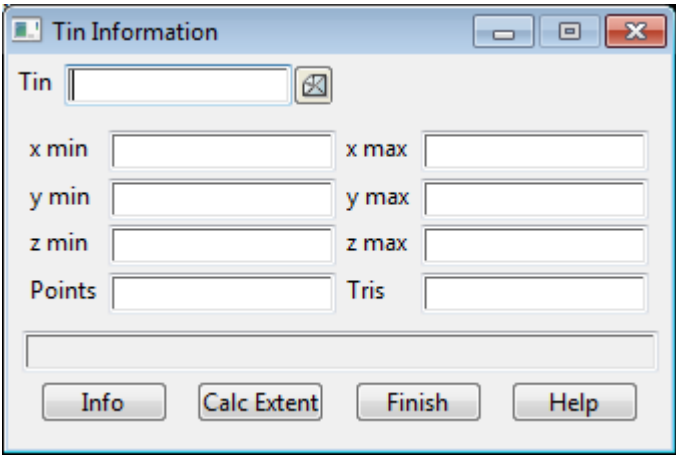

Removed Tins

Position of option on menu: Tins =>Tins => Removed Tins

The **removed tins** walk-right menu provides a list of all the tins in the project area that have been removed from the project (using the **removed from project** option).

Tin Info

Position of option on menu: Tins =>Tin info
Selecting tin info fires up the tin information panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin <i>input the name of the tin to get information on</i>	tin box		available tins
xmin, xmax	output		
ymin, ymax	output		
zmin, zmax <i>returns the tin x, y, z limits</i>	output		
Points <i>returns the number of points in the tin</i>	output		
Tris <i>returns the number of triangles in the tin</i>	output		
Info <i>get the information for the tin given in the tin field.</i>	button		
Calc Extent <i>recalculate the x, y, z bounding box for the tin given in the model field.</i>	button		

How to Use the Panel

The information for the tin given in the tin field is retrieved and placed in the appropriate panel fields when the tin name is piped into the tin field from the pop-ups, or an <enter> is entered after typing the tin name into the tin field, or on selecting the **info** button.

Check Breaklines, Duplicate Vertices, Identicals

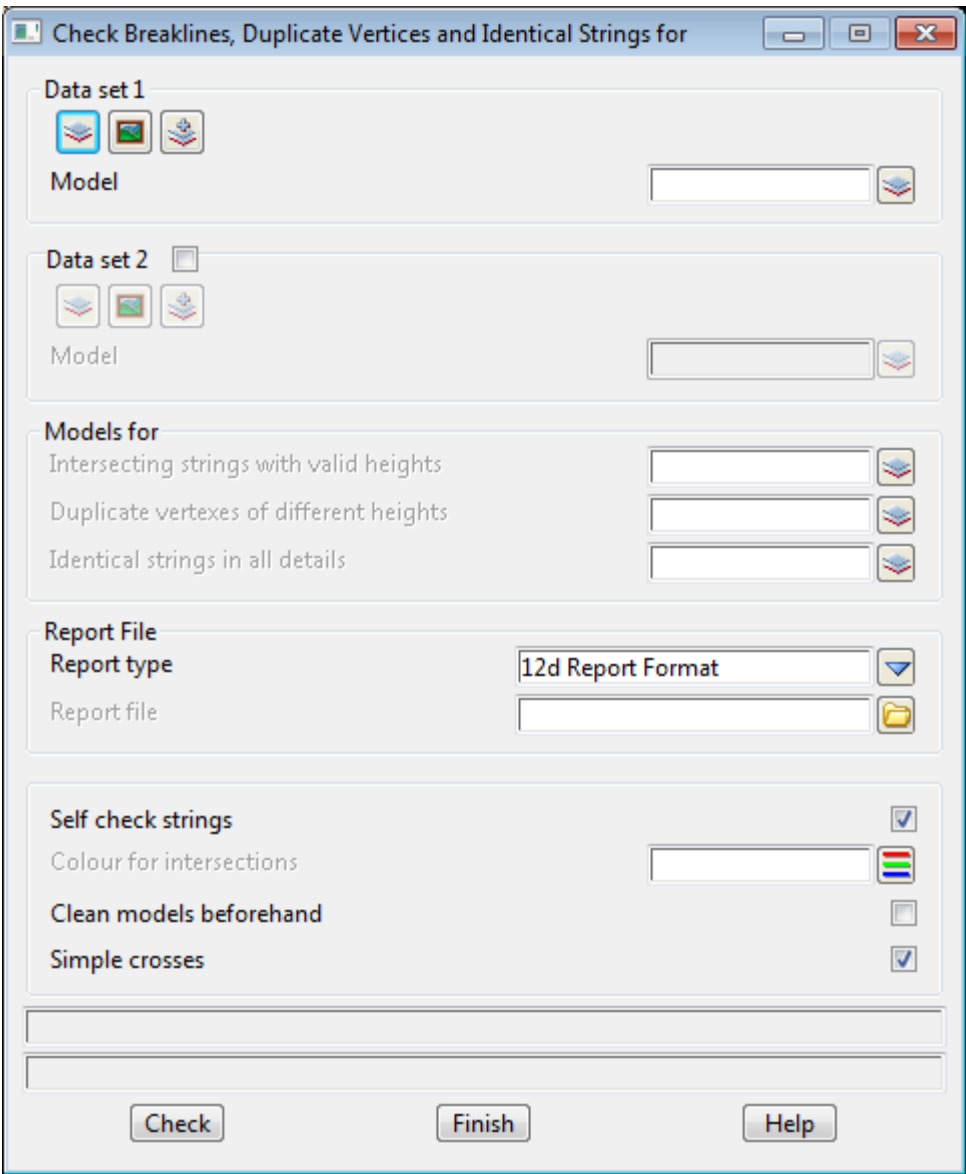

Position of option on menu: Tins =>Check breaklines
 Utilities =>A-G =>Check/clash =>Check breaklines

The **check breakline** option is used to test whether any of the line segments from any line strings in a model or view intersect (cross) the line segments from any other string in the model/view. This includes self intersections of strings.

The option also checks for any points with the same x and y coordinates (same plan position) but different z-values, and for totally duplicated strings (identicals).

Intelligent log lines are written to the output window for showing any crossing breaklines, duplicate vertices etc.

Selecting **Check breaklines** displays the **Check Breaklines, Duplicate Vertices and Identical Strings for** panel.

The fields and buttons in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data set 1			
<i>if Data set 2 is ticked off, then all the selected strings in Data set 1 are checked against all the other selected strings from Data set 1.</i>			
<i>If Data set 2 is ticked on, then all the selected strings in Data set 1 are checked against all the selected strings in Data set 2, BUT the strings in Data set 1 are not checked against each other and the strings in Data set 2 are not checked against each other.</i>

This is especially for the case when a second copy of some data has been supplied.*

Self check strings tick box tick

*if ticked, a string is not check against itself for crossing breaklines etc.
If not ticked, a string is not checked against itself for crossing breaklines. This speeds up processing.*

Colour for intersections colour box available colours

colour for the copies of the crossing segments.

Clean models beforehand tick box tick

*if **ticked**, the models for intersecting string, duplicate points, identicals are cleaned before the option is run.*

Report file file box

if non-blank, a report file of this name is created giving details of all the crossing breaklines and duplicate plan points with different z-values.

Simple crosses tick box tick

*if **ticked**, create diamonds at the position where strings cross, otherwise create a string in the shape of a cross with parts of the crossing strings.*

Check button

*after selecting the **check** button, all the strings in the model/view are tested for any crossing line segments or duplicate points. If requested, a report is generated.*

<esc> can be used to abort the checking option.

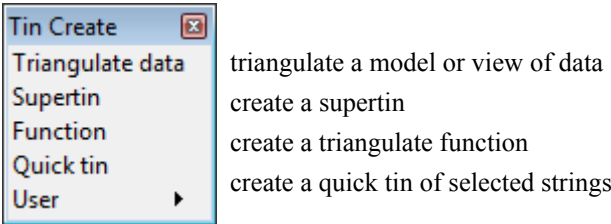

Create

Position of menu: Tins =>Create

The input data for a triangulation is either all the data in a selected model or all the data from all the models on a selected view or a list of models. The options for each method of selecting data are on the **Create** walk-right menu.

A SuperTin™ is a list of Tins and a Tin function creates a re-calc function name for an existing Tin. Each of these options are also on the **Create** walk-right menu.

The **Create** walk-right menu is

For the option <i>Triangulate data</i> , go to	Triangulate Data
<i>Supertin</i>	Create SuperTin™
<i>Function</i>	Function
<i>Quick tin</i>	Quick Tin

Triangulate Data

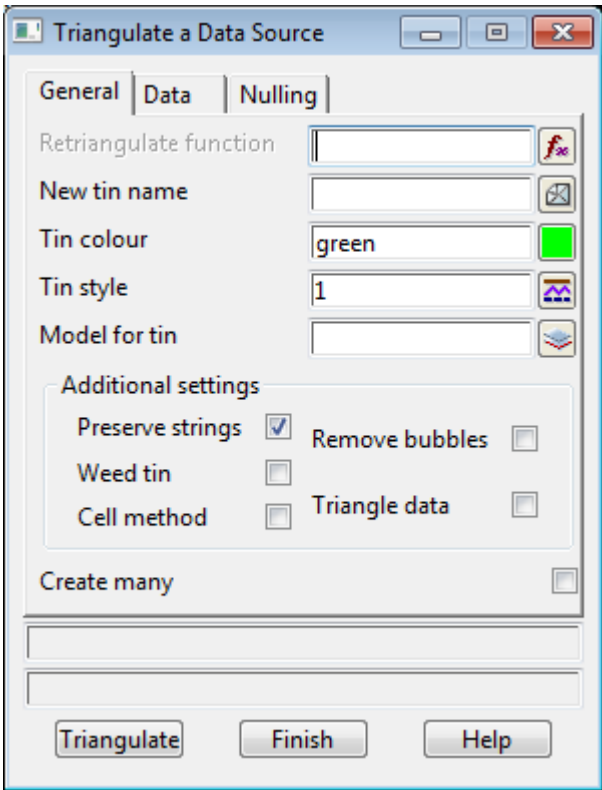

Position of option on menu: Tins =>Create =>Triangulate data

For simple jobs, the data to triangulate is all in the one model. However, it often occurs that the data one needs to triangulate is not in one model but is in the models displayed on a particular view.

The **Triangulate data source** option allows use to either select the data to triangulate from a single model, a list of models or to it uses the data points from all the models attached to a particular view, rather than the data from a particular model.

In each case, the models used in creating the triangulation are recorded so that the models can be easily retriangulated if any of the data changes.

Selecting **Triangulate data** displays the **triangulate a Data Source** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
General tab			
Retriangulate function	function box	box	
<i>if non blank, name of the tin function. The function can be recalcd to recreate a new tin from the current data in the models used to construct the original tin. This is optional.</i>			
New tin name	input		
<i>name of the tin created from the triangulation of the model/view.If <enter> is type after the name, the model for tin field is filled out with the name tin new_tin_name.</i>			
Tin colour	input	default tin colour	available colours
<i>colour to draw the triangles whenever they are displayed in a view. This is called the base tin colour. It is possible to change the colour of individual triangles so they are different to base tin colour.</i>			
Tin style	input	1	available line styles
<i>line style used for drawing sections through the tin on the section view.</i>			
Model for tin	input		available models
<i>if non-blank, the created tin will be added to the model given in this field. if blank, the name tin new_tin_name will be placed in the field when the triangulate button is selected.</i>			
Preserve strings	tick box	tick	
<i>if ticked, all strings with breakline type line or segment type tinable will be preserved as sides of triangles. Otherwise, all line strings or segments of type tinable will be treated as point strings for the triangulation.</i>			
Remove bubbles	tick box		

if *ticked*, post-processing occurs to try and stop all the points of a triangle coming from the same string. This helps prevent triangles with all three points coming from the one contour string and hence forming a flat triangle.

Weed tin tick box

if *ticked*, all duplicate points are removed from the tin database. This helps to reduce the size of the tin files if there was a large amount of duplicate data. This flag is automatically set to tick for triangle data.

Triangle data tick box

if *ticked*, then it is assumed the original data was triangles and 12d will ensure that the triangles produced by the triangulation exactly match (including null regions) the original triangle data. Weed tin is automatically set to tick if face data is set to tick.

Cell method tick box

if *ticked*, try to create the triangles in cells - an alternate method of ordering the data which is often faster when the data comes in lines rather than randomly.

Create many tick box

if *ticked*, once the tin has been triangulated, the panel will stay up so you can create another tin. If *not ticked*, after the tin has been created, the panel is replaced by a Retriangulate Tin panel so if there are any mods to be made, no time is wasted in needing to select the panel.

Data tab

Data source type Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#). For this option, only data types involving models can be used - model, view, model list and the models from a favourite.

Data source input

source of data is to be triangulated - only Model or View allowed for this option.

Data polygon string-select

if a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.
If no string is selected, then all the points in all the model/view are used in the triangulation.

Nulling tab

Apply nulling tick box

if *ticked*, null the resultant tin using Angle, Length, Combined angle and Combined length.

Angle angle box 5

if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time.
If blank then no triangles are nulled by this test.

Length real value 100

if a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.
If blank then no triangles are nulled by this test.

Combined angle angle box 60

Combined length real box 20

For the Combined case, a triangle is nulled if it:
has an external side (that is not a breakline) and the **sum** of the two angles on it is **less** than Combined angle (the default value works most of the time)

and

*has an external side (that is not a breakline) whose length is **greater** than Combined length. A suggested value is one third to one half of Length.*

If either Combined angle or Combined length is blank, then no triangles are nulled by this test.

Null polygon

string-select

if a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

Triangulate

button

Triangulate the model/view given in the model/view to triangulate field. The created tin will be stored with the name given in the new tin name field. The tin will be the colour given in the tin colour field. If the model/view for tin field is non-blank, the created tin will be added to the model given in that field - if the model does not exist, it will be created.

Panel Messages

Progress messages - sent to the panel message area

no of points in model/view = *no. of points*

no. points pts *no. break lines* break lines

no. points pts *no. of secs* s *no. pts/s* *no. dup*

break lines finished. time taken = *secs*

Completion message - sent to the panel message area

average no of pts per sec = *no.*

<esc> can be used to abort the triangulation option.

Create SuperTin™

Position of option on menu: Tins =>Create =>Supertin

The SuperTin™ option is designed to create a super triangulation from other triangulations.

With SuperTins, existing triangulations can be combined to form the equivalent of a merged triangulation without having to completely re-build a merged model and retriangulating it.

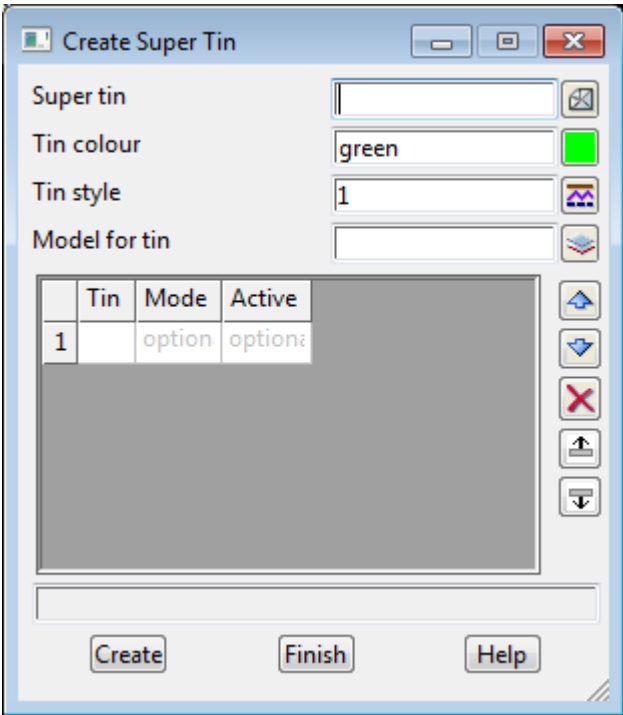

This means there are less steps in creating a SuperTin merged triangulation so a lot less time is required and there is less opportunity for errors. Also, if any of the component triangulations of the SuperTin are modified, then the SuperTin is also instantly modified.

The SuperTin is defined by a list of triangulations in increasing number order. Wherever two triangulations overlap, the triangulation of higher number takes precedence and is used to defined z-values and sections.

Hence, for any (x,y) point, the z-value on the SuperTin is defined to be the z-value from the triangulation of the highest number which is under the (x,y) point.

A section through a SuperTin is made up of the sections through the tin of highest number at each point along the section and so may involve more than one tin.

Selecting Supertin brings up the **Create Super Tin** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Super tin	name of the tin created from the triangulation of the model/view.If <enter> is type after the name, the model for tin field is filled out with the name tin new_tin_name.	input		
Tin colour	the tin colour is used as the section colour when sectioning through the supertin.When displayed on plan or section views, the each tin making up the supertin is drawn in its own colour.	input	default tin colour	available colours
Tin style		input	1	available line styles

line style used for drawing sections through the SuperTin on the section view.

Model for tin	input	available models
----------------------	-------	------------------

if non-blank, the created SuperTin will be added to the model given in this field.
if blank, the name tin new_tin_name will be placed in the field when the **Create** button is selected.

Tin Grid

Tin	table	available tins
------------	-------	----------------

name of the tin to be included in the SuperTin. The order is critical since the higher number tins take precedence over the lower number tins.

Mode	replace, subtract
-------------	-------------------

Replace
where ever this tin exists, use it instead of any tins of a lower number in the Tin column of the grid.

Subtract
where ever this tin exists, all parts of the tins of a lower number in the Tin column, are removed. So where ever the tin exists, it creates holes in all the tins of a lower number.
An example would be a tin that is the position of many gully pits. Using this tin in subtract mode will punch holes in all the tins of a lower number in the Tin column. So in effect, it does a nulling that also nulls parts of triangles from the tins of a lower number.

Active
if yes, the tin is included in the supertin.
If no, the tin is not included in the supertin. So the tin can be taken out of the supertin without having to remove it from the Tin list.

Create	button
---------------	--------

create a SuperTin from the tins in the Tins to include table. The created SuperTin will be stored with the name given in the New tin name field.

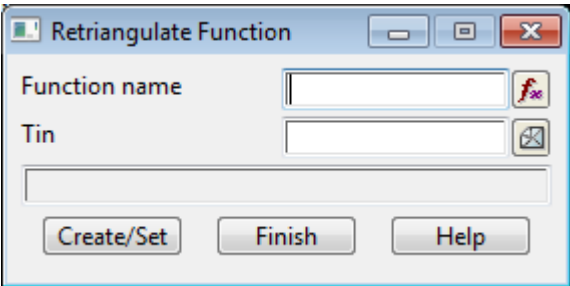

If there are no errors in creating the supertin, the panel then turns into a [Edit SuperTin](#) panel to allow any other edits to be made before finishing.

Function

Position of option on menu: Tins =>Create =>Function

The **function** option is used to construct a function which when recalced, will run a retriangulate on the tin. Since a function name can be given when a tin is first created, this option is rarely needed.

Selecting **function** displays the **Retriangulate Function** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Function name	input	available functions
the name to give to the retriangulate function.		
Tin	input	available tins
name of the tin to be retriangulated when the function is recalcd.		
Create/Set	button	
create or modify the retriangulate function.		

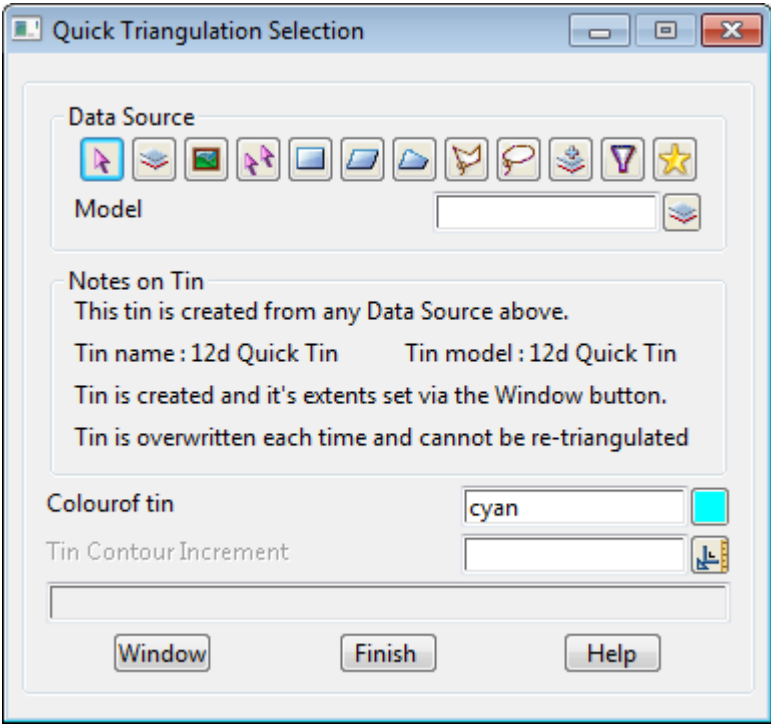

Quick Tin

Position of option on menu: Tins =>Create =>Quick tin

The **quick tin** option create a temporary tin from strings selected in a data source, and restricted to a user selected rectangular window. Contours of a user given increment can also be generated.

Each time the option is run, is creates a tin called **12d Quick Tin** in the model **12d Quick Tin** so the tin is over written each time the option is run.

Selecting **Quick tin** displays the **Quick Triangulation Selection** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
data selection type - for a full description go to Data Source in the chapter Tools and Concepts .			
Data source	input		
source of data is to be triangulated - only Model or View allowed for this option.			
Colour of tin	colour box		available colours
the colour or the tin, and any contours.			

Tin contour increment real value box

in non blank, contours are created at the given increment and displayed on the view where the Window is created. Fast contours are turned on for the view so contours are displayed for the tin.

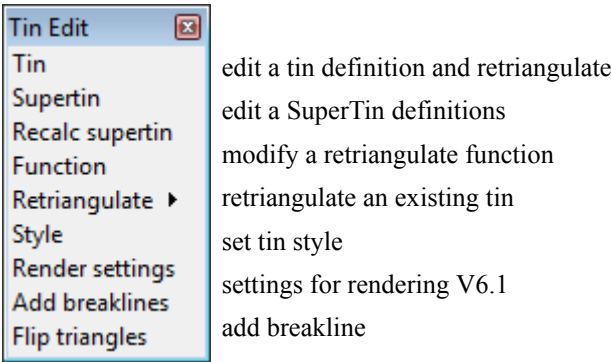

Window button

after clicking on Window, two corners to define a window are selected in a view. The tin for the selected data restricted to the Window is then created with the name 12d Quick Tin, added to the model 12d Quick Tin, and then the model added to the view that the Window was defined. Tin contours is also turned of for the view.

Edit

Position of menu: Tins =>Edit

Once a tin is created, it can be edited in a variety of ways. The **Edit** walk-right menu is

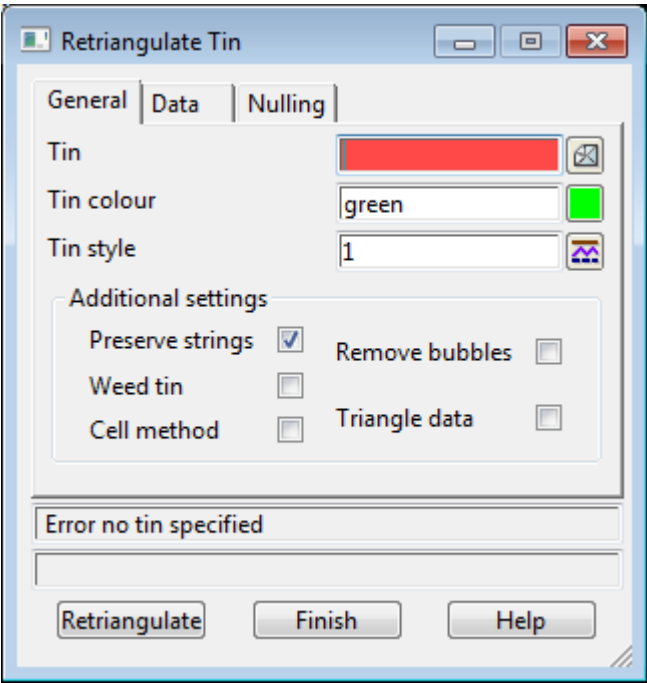

For the option <i>Tin</i> , go to	Edit a Tin
<i>Supertin</i>	Edit SuperTin
<i>Function</i>	Edit Tin Function
<i>Retriangulate</i>	Retriangulate
<i>Style</i>	Style
<i>Render settings</i>	Render Settings
<i>Add breaklines</i>	Add Breaklines
<i>Flip triangles</i>	Flip Triangles

Edit a Tin

Position of option on menu: Tins =>Edit =>Tin

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The **Edit => Tin** option can be used to modify the models and setting used to define the tin and then recreate the tin from the new models and settings.

Selecting **Edit => Tin** displays the **Retriangulate Tin** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
General tab				
Tin		tin box	original tin name	
<i>name of the tin to be retriangulated. When the tin name is given, the list of models used for the tin and other settings, are displayed.</i>				
Tin colour		colour box	original colour	available colours
<i>original colour of the tin - this can be modified. Note that this only modifies the base tin colour and any triangles that have had their colour modified, will keep the modified colour.</i>				
Tin style		line style box	original line style	available line styles
<i>original line style of the tin - this can be modified.</i>				
Preserve strings		tick box	original setting	
<i>if ticked, all strings with breakline type line will be preserved as sides of triangles. Otherwise, all line strings will be treated as point strings for the triangulation.</i>				
Remove bubbles		tick box	original setting	
<i>if ticked, post-processing occurs to try and stop all the points of a triangle coming from the same string.</i>				
Weed tin		tick box	original setting	
<i>if ticked, all duplicate points all removed from the tin database.</i>				
Triangle data		tick box	original setting	
<i>if ticked, only triangles in the tin that are under the centroid of a string representing a triangle in the model/view are considered valid, all others are set to null. That is, any triangles not under the centroid of a string from the model/view will be set to null. This is extremely useful when the original string data represents triangles and it will ensure that the triangles produced by the triangulation will exactly match, including null regions, the original triangle data. Weed tin is automatically set to tick if face data is set to tick.</i>				

Cell method tick box original setting

*if **ticked**, try to create the triangles in cells - an alternate method of ordering the data for use when the triangulation takes too long by the non-cell method.*

Data tab

Model List models in the tin

list of models used to create the original tins. The models and the order can be modified.

Data polygon string-select original data polygon

*if a string is selected as a data polygon, only string points that are inside the data polygon are used in the triangulation.
If no string is selected, then all the points in all the models are used in the triangulation.*

Nulling tab

Apply nulling tick box original setting

*if **ticked**, null the resultant tin using Angle, Length, Combined angle and Combined length.*

Angle angle box original setting

*if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time.
If blank then no triangles are nulled by this test.*

Length real value original setting

*if a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.
If blank then no triangles are nulled by this test.*

Combined angle angle box original setting
Combined length real box original setting

*For the Combined case, a triangle is nulled if it:
has an external side (that is not a breakline) and the **sum** of the two angles on it is **less** than Combined angle (the default value works most of the time)
and
has an external side (that is not a breakline) whose length is **greater** than Combined length. A suggested value is one third to one half of Length.
If either Combined angle or Combined length is blank, then no triangles are nulled by this test.*

Null polygon string-select original null polygon

if a string is selected as a null polygon, any triangle whose centroid is outside the null polygon is automatically nulled.

Retriangulate button

The original tin is deleted and the data in the models to include table used to create a new triangulation which is given the original tin name. The settings in this panel are used for the retriangulation.

Edit SuperTin

Position of option on menu: Tins =>Edit =>Supertin

When a Supertin is created, the tins and settings used to create the SuperTin are recorded.

The **Edit=>Supertin** option modifies the tins and setting used to define the SuperTin.

On selecting the **edit=>supertin** option, the **edit super tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super tin name <i>name of the SuperTin to be modified.</i>	sup tin box	original super tin name	existing Super Tins
Tin colour <i>original colour for drawing sections through the SuperTin - this can be modified.</i>	colour box	existing super tin colour	available colours
Tin style <i>original linestyle for drawing sections through the SuperTin - this can be modified.</i>	line style box	existing supertin style	available line styles

Tin Grid

Tin <i>name of the tin to be included in the SuperTin. The order is critical since the higher number tins take precedence over the lower number tins.</i>	table	available tins
Mode <i>Replace</i> <i>where ever this tin exists, use it instead of any tins of a lower number in the Tin column of the grid.</i> <i>Subtract</i> <i>where ever this tin exists, all parts of the tins of a lower number in the Tin column, are removed. So where ever the tin exists, it creates holes in all the tins of a lower number.</i> <i>An example would be a tin that is the position of many gully pits. Using this tin in subtract mode will</i>		replace, subtract

punch holes in all the tins of a lower number in the Tin column. So in effect, it does a nulling that also nulls parts of triangles from the tins of a lower number.

Active

if yes, the tin is included in the supertin.

If no, the tin is not included in the supertin. So the tin can be taken out of the supertin without having to remove it from the Tin list.

Update

button

update the SuperTin definition with the information in the above panel fields.

Edit Tin Function

Position of option on menu: Tins =>Edit =>Function

The `edit=>function` option is used to edit a tin function.

On selecting the `function` option, the **retriangulate function** panel is displayed which is the same as for the option `Tins =>Create =>Function` (see [Function](#)).

Retriangulate

Position of option on menu: Tins =>Edit =>Retriangulate

When a tin is created, the settings and models used in the triangulation are recorded with the tin data. The `retriangulate` option is used to recreate the tin from the same models and settings.

The `retriangulate` menu item operates two ways.

- (a) The **retriangulate** walk-right brings up the **tins** menu which is a list of all the existing tins. By choosing one of the tins from the **tins** menu, the tin is retriangulated.
- (b) If **retriangulate** itself is activated (by clicking LB when **retriangulate** is highlighted), the **retriangulate tin** panel appears. The **retriangulate tin** panel can be used to modify the tin definition and retriangulate the tin.

Style

Position of option on menu: Tins =>Edit =>Style

When a tin is created, it is given a linestyle (the tin linestyle) which is used for drawing the tin whenever it is profiled on a section view or plotted in long and cross section plots.

The `style` option is used to modify the tin linestyle.

On selecting the `style` option, the **tin linestyle** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to modify the linestyle of.</i>	tin box		available tins
Style <i>linestyle for the tin.</i>	linestyle box	1	available linestyles
Set <i>set the tin linestyle to that given in the style panel field.</i>	button		

Render Settings

Position of option on menu: Tins =>Edit =>Render settings

Position of option on menu: Tins =>Visualiation =>Tin render settings

This option sets blending, texture mappings, raster draping, one/two sides, draping of polygons, text, billboards and images for triangles in a tin. It has already been documented as

Tins =>Visualiation =>Tin render settings

in the section [Tin Render Settings](#) in the chapter [View](#).

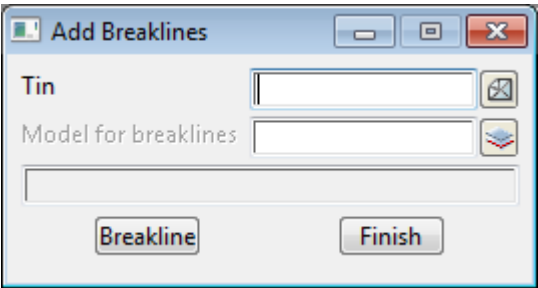

IMPORTANT NOTE: the **Visualisation** module is required for the *Tin Render Settings* to be used on a Perspective OpenGL view.

Add Breaklines

Position of option on menu: Tins =>Edit =>Add breaklines

This option allows extra breaklines joining existing vertices in the tin to be created. The new breaklines can be added to a model so that the results can be reproduced on a retriangulation.

Selecting Add breakline displays the **Add Breaklines** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to add a breakline to.</i>	tin box		available tins
Model for breaklines <i>if non-blank, then as breaklines are created with this option, then the breakline is automatically added to this model so that the breakline modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).</i>	model box	1	available models
Breakline <i>add a breakline by clicking near the two vertices of the tin that are to be connected by a breakline (cursor snap will do). As each breakline is added, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.</i>	button		

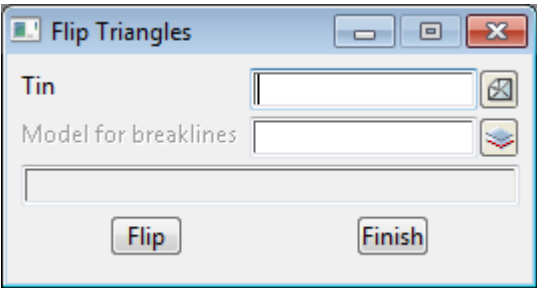

Flip Triangles

Position of option on menu: Tins =>Edit =>Flip triangles

This option works on a triangle side and if it is possible, it finds the two triangles with this common side, removes the common side and replaces it with a new common side which joins the non common triangle points in the original triangle. Note that this can't be done when the new side goes outside the two triangles.

A new breaklines can also be automatically added to a model so that the results can be reproduced on a retriangulation.

Selecting Flip triangles displays the **Flip Triangles** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to add a breakline to.</i>	tin box		available tins
Model for breaklines <i>if non-blank, then as triangles are selected and flipped, then breaklines are automatically added to this model so that the flip modifications will try to be preserved on a retriangulation (this may not be possible with crossing breaklines).</i>	model box	1	available models
Flip <i>flip a triangle by clicking near the common edge (cursor snap will do). As each flip is done, the triangles are rearranged. If fast contours are turned on, the effect will be immediate. Note that you can have fast contours and tin edges toggled on at the same time.</i>	button		

Boundary

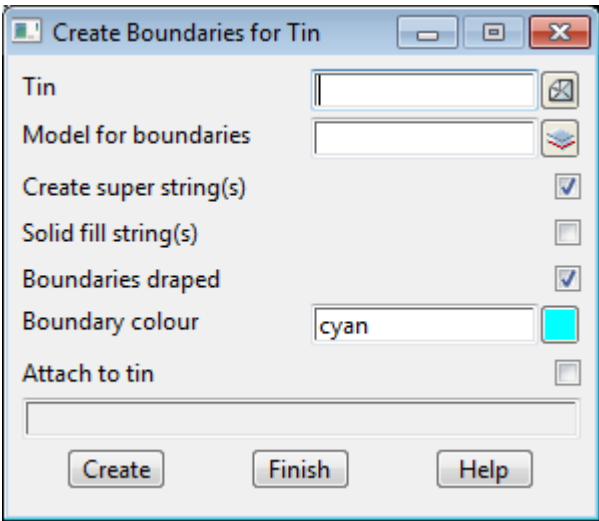

Position of option on menu: Tins =>Boundary

The **Boundary** option is used to construct the boundary strings for a tin, i.e. the strings going around the edges between the null and non-null triangles in the tin.

If the tin has holes (internal null regions), then there will be more than one boundary string created.

Often the boundary strings is used as a first step in creating a polygon to be used to null out further triangles not required in the tin.

Selecting **Boundary** displays the **Create Boundaries for Tin** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin	<i>name of the tin (not a super tin) to calculate the boundary strings for.</i>	tin box		available tins
Model for boundaries	<i>the model to place the boundary strings in.</i>	model box		available models
Create super string(s)	<i>if ticked, the boundary strings are super strings. If not ticked, the boundary strings are 3d strings.</i>	tick box	ticked	
Solid fill string(s)	<i>if ticked, each of the boundaries is solid filled with the tin colour.</i>	tick box	not ticked	
Boundaries draped	<i>if ticked, the points of the boundary have the z-values from the tin. If not ticked, the z-value is set to 1.</i>	tick box	ticked	
Boundary colour	<i>the colour for the boundary strings.</i>	input	cyan	available colours
Attach to tin	<i>if ticked, the boundaries are remembered with the tin and when you have the 250M version of 12d Model and have Model Density turned on, if the density is such that the tin would only be drawn as</i>	tick box	not ticked	

a red rectangle, the boundaries are drawn instead of the red rectangle.

Create button

create the boundary polygons for the tin.

Colour

Position of menu: Tins =>Colour

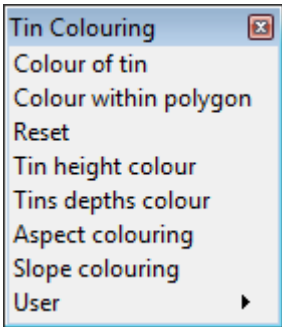

When a tin is created, all the triangles have the same colour (called the tin's **base** colour). This is the colour given by the user when creating the tin with the **Triangulate a Data Source** panel. The **base** colour can be changed at any time using the **colour of tin** option.

However, it often necessary to colour specific triangles in some other colour than the base colour. The option **Colour within polygon** is designed to do just that.

When the **Triangles** menu is torn off the main menu, the **Colour** menu item on it operates in two ways:

First, clicking on **Colour** without walking right brings up the **Colour of Tin** panel (see the next section). Secondly, the **Colour** walk-right brings up the **Tin Colouring** menu.

The **Tin Colouring** walk-right menu is

	
Colour of tin	change base colour of tin
Colour within polygon	colour triangles within a polygon
Reset	reset all triangles to base colour
Tin height colour	colour height ranges
Tins depths colour	colour depth ranges between two tins
Aspect colouring	colour aspect ranges
Slope colouring	colour slope ranges
User	

For the option *Colour of tin*, go to
Colour within polygon
Reset
Tin height colour
Tins depths colour
Aspect colouring
Slope colouring,

[Tin Height Colour](#)
[Tins Depths Colour.](#)
[Aspect Colouring.](#)
[Slope Colouring.](#)

Colour of Tin

Position of option on menu: Tins =>Colour =>Colour of tin

A tin is given a base colour when it is originally constructed. The **colour of tin** option allows the user to change the base colour of the tin.

On selecting the **Colour of tin** option, the **Tin Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to have its base colour modified. The tin must exist in 12d Model. When the tin name is entered, the existing colour of the tin is displayed in the Colour panel field.</i>	tin box		available tins
Colour <i>the new base colour for the tin given.</i>	colour box	default tin colour	available colours
Colour <i>colour all the base triangles with the colour given in the Colour field.</i>	button		

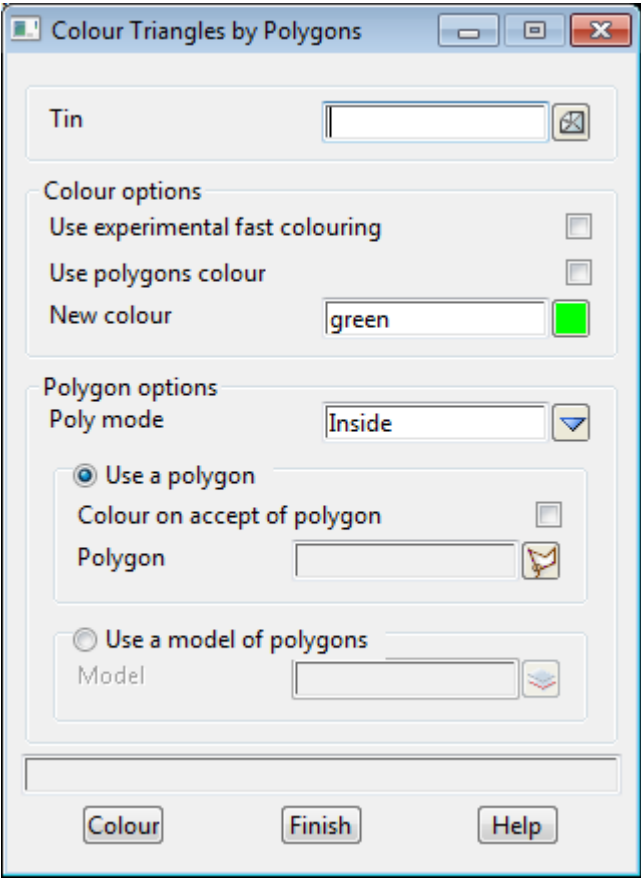

Colour Within Polygon

Position of option on menu: Tins =>Colour =>colour within polygon

Although a tin is given a base colour when constructed, it is useful to be able to change the colour of selected triangles. For example, in a design tin with a road and terrain, the road and the terrain could be displayed in different colours. This is particularly effective in shades.

The **colour within polygon** option allows the user to colour all the triangles whose centroids lie inside (or outside) a selected polygon, or for all the polygons in a given model, with either a user specified colour or the colour of each polygon. If a model of polygons is used, the polygons are processed in the order that they occur in the model. The option can be applied any number of times to a tin.

On selecting the **colour within polygon** option, the **colour triangles by polygons** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin		tin box		available tins
<i>name of the tin to have some of its triangles coloured. The tin must exist in 12d Model.</i>				
Use experimental fast colouring		tick box		
<i>if ticked, an experimental fast colouring algorithm is used.</i>				
Use polygons colour		tick box		
<i>if ticked, the colour of the polygons is used as the colour for the triangles.</i>				
New colour		input	default tin colour	available colours
<i>if Use polygons colour is not set to tick, this is the colour to set all the triangles within/out a polygon to.</i>				

Poly mode	choice	inside	inside, outside
<i>mode to select whether the triangles with centroids inside or outside the selected polygons are to be coloured.</i>			
Use a polygon	tick box		
<i>if ticked, then individual polygons are selected and the tin coloured within them.</i>			
Colour on accept of polygon	tick box		
<i>if ticked, then the colouring is done as soon as a polygon is accepted.</i>			
Polygon	polygon select		string pop-up

- this is used to*
- (a) select an individual string to use as a polygon for colouring*
 - (b) dynamically define a rectangle to use as a polygon for colouring*
 - (c) dynamically define a parallelogram to use as a polygon for colouring*
 - (d) dynamically define a lasso to use as a polygon for colouring*
 - (e) edit a string already selected with the polygon select*
 - (f) get information on a string already selected with the polygon select*
 - (g) delete a string already selected with the polygon select*
 - (h) clear any selection already made by the polygon select*
 - (i) toggle on/off the checks made the string selected by the polygon select*

Use a model of polygons	tick box	
<i>if ticked, then all the polygons in the given model are used for colouring.</i>		
Model	model box	available models
<i>model of polygons which are used for selecting triangles to be coloured. Colour happens when the Colour button is selected.</i>		
Colour	button	
<i>for a model of polygons, each string in the Model of polygons is used to colour the triangles in the tin given in the tin field. If Colour on accept of polygon is off, colour within the selected string.</i>		

Reset

Position of option on menu: Tins =>Colour =>Reset

The **reset** option is used to change all the non base-coloured triangles in a tin back to the base colour.

On selecting the **reset** option, the **reset colour of triangles** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin		tin box		available tins
	<i>name of the tin to have any non base-coloured triangles reset to the base colour. The tin must exist in 12d Model.</i>			
Reset		button		
	<i>change any selectively coloured triangles back to the base colour.</i>			

Tin Height Colour

Position of option on menu: Tins =>Colour =>Tin height colour

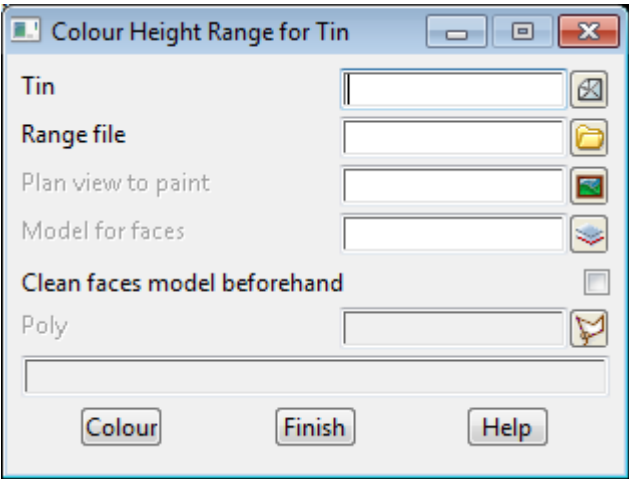

The **tin height colour** option is used to calculate height bands for the tin and colour a view and/or create faces for the height bands. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated heights and colours are given in a user supplied height range file. A plan view can be temporarily coloured on the height basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the height range file, see [Height Range File](#).

Selecting **Tin height colour** displays the **Colour Height Range for Tin** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin to calculate the height ranges of the triangles and colour a view.</i>			
Range file	height range file box		*.hrf
<i>the user supplied range file is used to give the colour ranges for heights of the tin. See Height Range File.</i>			
Plan view to paint	view box		available views
<i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>			
Model for faces	model box		available models
<i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>			
Clean faces model beforehand	tick box		
<i>if ticked, the model of faces is cleaned out before the option runs.</i>			
Poly	polygon-select		
<i>if selected, this string is used as the bounding polygon for the height calculations.</i>			
Colour	button		

On selecting this button, the heights of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during height calculations.

Tins Depths Colour

Position of option on menu: Tins =>Colour =>Tin depths colour

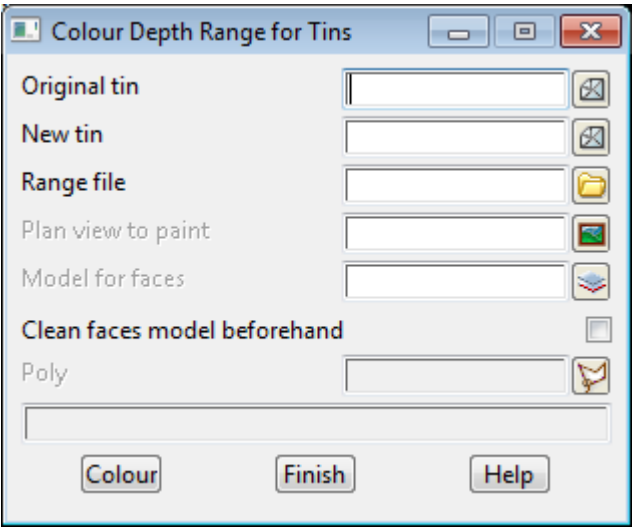

The **Tins depths colour** option calculates colour bands for the **depths** between two tins, and colours a view and/or create faces. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the common portions of the tins are used.

The calculated depths and colours are given in a user supplied depth range file. A plan view can be temporarily coloured on the depth basis using the **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the depth range file, see [Depth Range File](#).

On selecting the **Tins depths colour** option, the **Colour Depth Range for Tins** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin <i>name of the original/new tin to colour depths between. Cut is when the new tin is below the original tin.</i>	tin box		available tins
Range file <i>the user supplied depth range file is used to give the colour ranges for depths. See Depth Range File.</i>	depth range file box		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand <i>if tick, the model of faces is cleaned out before the option runs.</i>	tick box		
Poly <i>if selected, this string is used as the bounding polygon for the depth calculations.</i>	polygon-select		
Colour	button		

colour the depths between the tins within the selected bounding polygon.

<esc> can be used to terminate the option during depth calculations.

Aspect Colouring

Position of option on menu: Tins =>Colour =>Aspect colouring

The **aspect colouring** option is used to colour the triangles according to the aspect (direction) of the triangles in the tin. An *aspect range file* is used to define the colour ranges.

Note that the actual colours of the triangles are changed - not a face model produced.

For more information on the aspect range file, see [Aspect Range File](#).

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the **Aspect colouring** option, the **Aspect Analysis Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin for which the aspects of the triangles will be calculated and then the tin coloured.</i>			
Range file	aspect range file box		*.arf
<i>the user supplied range file is used to give the colour ranges for aspects to use to colour the triangles. See Aspect Range File.</i>			
Aspect	button		
<i>On selecting this button, the aspects of the triangles of the tin are calculated and the triangle coloured according to the range file.</i>			

<esc> can be used to terminate the option during aspect calculations.

Slope Colouring

Position of option on menu: Tins =>Colour =>Slope colouring

The **Slope colouring** option is used to colour the triangles in the tin according to the slope of the triangles. A slope range file is used to define the colour ranges.

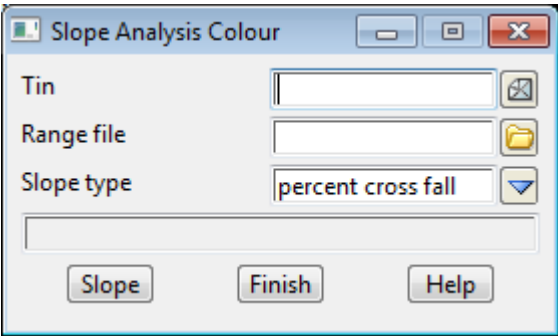

Note that the actual colours of the triangles are changed - not a face model produced.

For more information on the slope range file, see [Range Files](#).

The values can be percent cross fall, "1v in" slope or degrees (in 12d Model dms format).

The range_colour is used to colour all triangles in the tin satisfying the range.

On selecting the Slope colouring option, the **Slope Analysis Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin for which the slope of the triangles will be calculated and then the tin coloured.</i>			
Range file	slope range file		*.srf
<i>the user supplied range file is used to give the colour ranges for slopes to use to colour the triangles. See Range Files.</i>			
Slope type	input	percent cross fall	percent cross fall, degrees, 1v in
<i>the units used for slope in the range file.</i>			
Slope	button		
<i>On selecting this button, the slopes of the triangles of the tin are calculated and coloured according to the slope range file.</i>			
<esc> can be used to terminate the option during aspect calculations.

For information on creating contours, go to the section [Creating, Smoothing and Labelling Contours](#).

Creating, Smoothing and Labelling Contours

Creating Contours

Contours (or level lines) for a surface are the strings of constant height. Contours are often produced on maps and labelled with the height of the contours.

A 12d Model tin represents a surface in three dimensions and there is an option in 12d Model for producing the contours for the tin.

For a triangle in three dimensions, a string of constant height is actually a straight line across the triangle and the contour lines of different heights for a triangle are parallel lines.

Because triangles in a tin have common sides, a contour of a given height for one triangle will

connect to the contour of the same height in an adjacent triangle.

So the contour lines on adjacent triangles join up to form continuous contour strings, each segment of which is straight across a triangle.

The contours for a tin lie on the surface of the tin.

The options to create contours in **12d** Model has five parameters to define which contours are calculated. They are the

- minimum contour value
- maximum contour value
- contour increment
- contour reference
- bold increment

The elevation range over which the contours are to be produced is defined by the minimum and maximum contour values. If the minimum (maximum) value is not specified, the tin minimum (maximum) z-value is used.

The increment between successive contours is given by the contour increment.

For example, if contours are required every two metres from 100.0 metres to 200.0 metres, the parameters needed are

- contour minimum = 100.0
- contour maximum = 200.0
- contour increment = 2.0

This would be sufficient information to produce the contours

100.0, 102.0, 104.0... 198.0, 200.0.

However, **12d** Model also provides a parameter to allow the following contours to be produced

101.0, 103.0, 105.0 197.0, 199.0

For this and similar cases, the **contour reference** value is used.

When a contour reference value is specified, all the contour increments are taken from the contour reference value.

In the first example, the contour reference value is the default value of 0.0. In the second example, the contour reference value is 1.0.

If **major** (or **bold** or **index**) contours are required, the major contour increment is given a non-zero value. Major contours will be drawn at the integer multiples of the major increment instead of the standard contours.

For information on **labelling contours**, go to the section [Labelling Contours](#).

For information on **smoothing contours**, go to the section [Smoothing Contours](#).

Smoothing Contours

If the triangles in a tin, or sections of a tin, are large then the contours for that section of the tin may appear angular. Consequently some people like to **smooth** the contours to take out the angularity.

Be careful of smoothing because smoothing of contours produces strings that no longer sit on the triangulation.

12d Model smooths contours by apply a smoothing algorithm to each of the contour strings that were produced from the triangulation.

Two smoothing algorithms are available

- (a) Preserve string points - this method ensures that the smoothed contour goes through all the vertices from the original contour string.
- (b) Don't preserve string points - this method does not have to include the vertices from the original contours in the smoothed contour.

For information on **creating contours**, go to the section [Creating Contours](#).

For information on **labelling contours**, go to the section [Labelling Contours](#).

Labelling Contours

12d Model labels contours by placing text labels at user controlled distances along the contour string.

The position and frequency of the contour labels along a contour string is controlled by two parameters, the *start distance* and the *separation distance*.

The first contour label is placed at a chainage distance of *start distance* from the beginning on the contour and the labels are repeated at a chainage distance of *separation distance* from the previous contour label.

There is also a parameter to specify that contours are to be labelled at the start and the end regardless of the *start distance* and *separation distance*.

The number of decimal places used for the contour label is also user specified.

12d Model has seven methods for positioning the contour labels. They are the

- (a) above line contour direction

contour labels are created with the text parallel to the contours line and in the same direction as the contour string. The text is raised slightly above the contour string.

- (b) above line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the

contour string but at an angle between -90 and $+90$ degrees. The text is raised slightly above the contour string.

(c) centre line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and $+90$ degrees. The text is centred on the contour string so the contour string goes through the text.

(d) line removal & centred line read from below

contour labels are created with the text parallel to the contour line and in the same direction as the contour string but at an angle between -90 and $+90$ degrees. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.

(e) above line facing up hill

contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that it faces uphill. The text is raised slightly above the contour string.

(f) centre line facing up hill

contour labels are created with the text parallel to the contours line in the same direction as the contour string. The text is orientated so that it faces uphill. The text is centred on the contour string so the contour string goes through the text.

(g) line removal & centred line facing up hill

contour labels are created with the text parallel to the contour line. The text is orientated so that it faces uphill. The text is centred on the contour string so the contour string goes through the text. Also the contours are cut so that gaps are left for the labels.

For information on **creating contours**, go to the section [Creating Contours](#).

For information on **smoothing contours**, go to the section [Smoothing Contours](#).

Contour, Smooth and Label

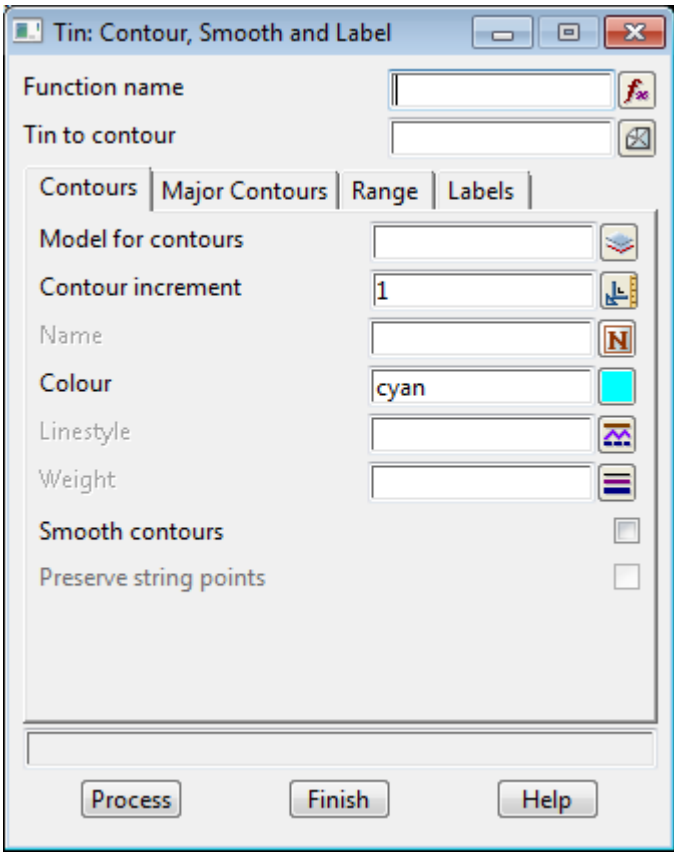

Position of option on menu: Tins =>Contour =>Contour, smooth and label

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

This option creates contours and can also smooth and label them. It is a function and so if a function is re-run it will remove any data from its last run.

For more information on contouring, smoothing and labelling in 12d Model, go to the section [Creating Contours](#)

Selecting Contour, smooth and label displays the **Contour, Smooth and Label** panel.

The fields and buttons used in this panel have the following functions.

	<i>if non-blank, name to give the major contour strings. If blank, the same name is used as for the ordinary contours.</i>		
Colour	input	off yellow	available colours
	<i>colour of the major contours. If blank, the same colour is used as for the ordinary contours.</i>		
Linestyle	input	1	available linestyles
	<i>if non blank, linestyles for the major contour strings. If blank, the same linestyle is used as for the ordinary contours.</i>		
Weight	input		
	<i>if non-blank, weight to give the major contour strings. If blank, the same weight is used as for the ordinary contours.</i>		

Range tab

Contour minimum	input	
	<i>minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.</i>	
Contour maximum	input	
	<i>maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.</i>	

Contour reference input 0

reference value for the contour increments.

Colour by range tick box

if ticked, then the contours are coloured according to a height range file rather than bold colour. See [Height Range File](#).

Height range file height range file box *.hrf

the range file used to colour the contours.

Interpolate colours tick box

*if **ticked**, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file.*

*If **not ticked**, all contours in the same range in the height range file will have the same colour*

Colour text labels tick box

if ticked, then any contour height text is also coloured the same colour as the contour.

Labels tab

Label contours tick box

if ticked, then the contours are labelled.

Label major contours only tick box

if ticked, then only the major contours are labelled.

Model for labels model box available models

if non blank, the name of the model to place the contour labels in. If blank, the same model is used as for the contours.

Contour method choice box above line contour direction
above line read from below
centred line read from below
line removal and centred line read from below
above line facing uphill
centred line facing uphill
line removal & centred facing uphill

For information on each of the methods of labelling contours, go to the section [Labelling Contours](#).

Decimal places

number of decimal places used in the contour label.

Textstyle data 1 textstyle favourites

textstyle information to use for the contour labels.

Start dist (w) input 0

chainage distance to the first label on the string - world units

Separation (w) input 250

chainage interval between the labels - world units

Model of label lines model box available models

if non blank then instead of using the start distance and separation parameters to define where the contour labels are placed, the Model of label lines is used. In this case, a label is created where ever s string in the Model of label lines cuts a contour.

Label start and end tick box tick

if ticked, the start and end of the contours are labelled regardless of the values of start distance and separation.

Process

button

contour, smooth and label the tin given in the tin field and place the contours in the model given in the model field.

Change Contours

Position of option on menu: Tins =>Contour =>Change

The **Change** option is for changing the model and/or colour of contours with a given height interval.

The main purpose of the option is to separate contours to be used as index contours from other contours. For example, when contours are supplied by a third party and all the contours are in the same model with the same colour, **change contour colour** can move contours to be used as index contours to a different model and give them a different colour.

For this option the selection process for a Data source is extended.

After the data is selected as defined by the Data source, the two extra parameters, interval and reference, are used to further specify which contours are to be moved and/or coloured.

Only contour strings whose heights satisfy

$$\text{height} = \text{reference} + \text{integer} * \text{interval}$$

are selected.

For example, if the contours 5, 10, 15 etc. are required, the reference and interval would be

$$\text{reference} = 0$$

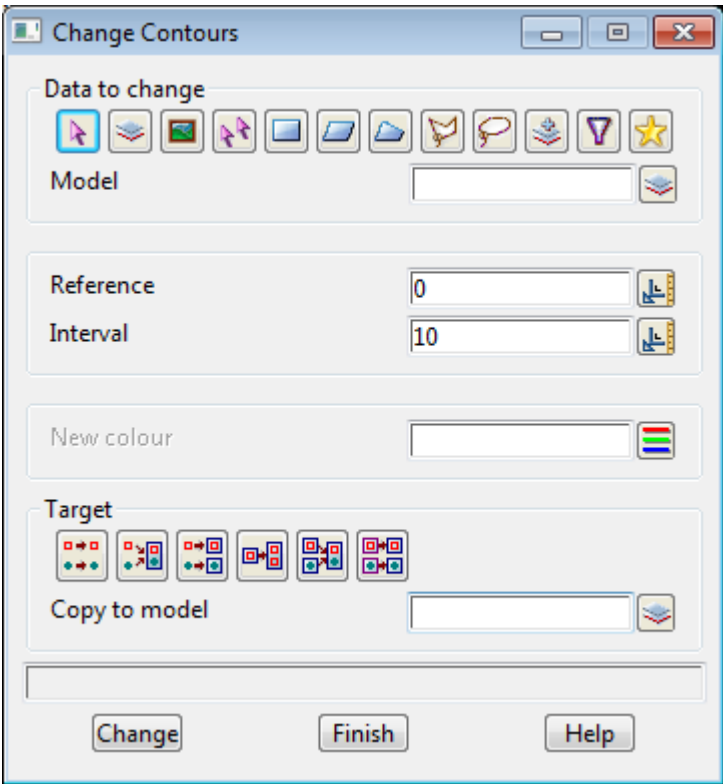

$$\text{interval} = 5$$

However, to modify the contours 6, 11, 16 etc., the required parameters are

$$\text{reference} = 1$$

$$\text{interval} = 5$$

Selecting **Change** displays the **Change Contours** panel.

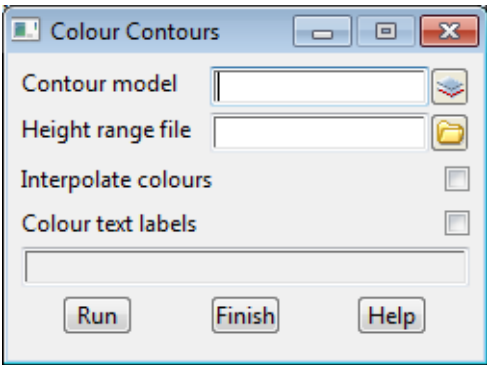

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Reference	input	0	
<i>the reference value to use to select contours.</i>			
Interval	input	10	
<i>the interval to use to select contours.</i>			
New colour	input		available colours
<i>if non-blank, then the colour of the selected strings will be changed to the colour given in the New colour field.</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Change	button		
<i>process the selected strings</i>			

Colour

Position of option on menu: Tins =>Contour =>Colour

The **Colour** option is used to colour contours in a model according to a selected height range file.
For more information on the height range file, see [Height Range File](#).
On selecting **Colour**, the **Colour Contours** panel is displayed.

The fields and buttons in this panel are used as follows

Field Description	Type	Defaults	Pop-Up
Contour model <i>model of contours to colour</i>	model box		available models
Height range file <i>height range file to specify the colour of the contour. See Height Range File.</i>	height range file box		.hrf files
Interpolate colours <i>if ticked, the colour of the contour will be interpolated between the colour for the range and the colour for the next range in the height range file. If not ticked, all contours in the same range in the height range file will have the same colour</i>	tick box		
Colour text labels <i>if ticked, any text labels in the model will also be coloured.</i>	tick box	tick	
Run <i>colour the contours and text according to the height range file.</i>	button		

Contour

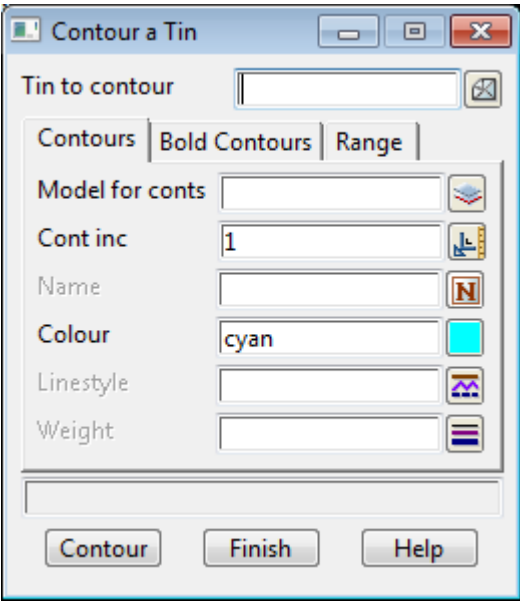

Position of option on menu: Tins =>Contour =>Contours

One method of visualizing tin data is with contours. In 12d Model, contour strings can be produced over any user defined elevation range and at any interval.

For more information on contouring in 12d Model, go to the section [Creating Contours](#)

The **contour** option can be applied to a tin any number of times. This may be necessary if the contour parameters vary over the total range to be contoured.

On selecting the **contour** option, the **contour a tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin to contour	<i>name of the tin to be contoured.</i>	tin box		available tins

Contours tab

Model for conts	<i>name of the model to place the contours in.</i>	model box		available models
Cont inc	<i>increment between contoured values.</i>	input	1.0	
Name	<i>if non-blank, name to give the contour strings.</i>	input		
Colour	<i>colour of the contours</i>	colour box	cyan	available colours
Linestyle	<i>linestyles for the contour strings.</i>	linestyle box	1	available linestyles
Weight	<i>if non-blank, weight to give the contour strings.</i>	weight box		

Bold Contours tab

Model for bolds	model box	available models	
<i>name of the model to place the bold contours in. If blank, the same model is used as for the ordinary contours.</i>			
Bold inc	input	5.0	
<i>increment for the bold contours.</i>			
<i>If blank or zero, then no bold contours are drawn. If non-zero, it must be an integer multiple of the contour increment</i>			
Name	input		
<i>if non-blank, name to give the bold contour strings.</i>			
Colour	colour box	cyan	available colours
<i>colour of the bold contours</i>			
Linestyle	input	1	available linestyles
<i>linestyles for the bold contour strings.</i>			
Weight	input		
<i>if non-blank, weight to give the bold contour strings.</i>			

Range tab

Cont min	input	
<i>minimum value of the z range to be contoured. If blank, the tin's minimum z-value is used.</i>		
Cont max	input	
<i>maximum value of the z range to be contoured. If blank, the tin's maximum z-value is used.</i>		
Cont ref	input	0.0
<i>reference value for the contour increments.</i>		

Contour	button
<i>contour the tin given in the tin field and place the contours in the model given in the model field. The contour range, contour increment and bold contour increment are used specify which contours are calculated.</i>	

Panel Messages

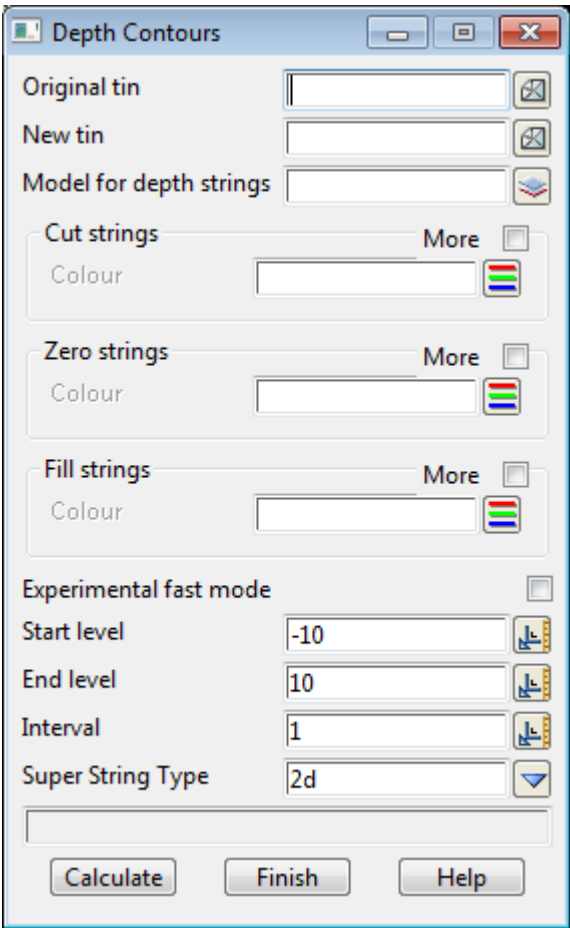

- Progress messages - sent to the panel message area
 - start contouring
 - contouring level z-value
 - Completion message - sent to the panel message area
 - finished contouring - no. contours
- <esc> can be used to abort the calculation of contours.

Depth Contours

Position of option on menu: Tins =>Contour =>Depth contours

The **depth contours** option finds the contours lines for the difference between two tins. That is, it calculates the isopachs between the two tins.

Selecting **Depth contours** displays the **Depth Contours** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New tin	tin box		available tins
<i>name of the original/new tin to contour between. Cut is when the new tin is below the original tin.</i>			
Model for depth strings	model box		available models
<i>name of the model to contain the depth strings.</i>			
Cut/Zero/Fill strings section	More tick box		
<i>if no tick then only the Colour panel field is displayed</i>			
Colour	colour box	cyan	available colours
<i>if non-blank, colour for the strings</i>			
<i>if tick then Name, Colour, Linestyle and Weight fields are displayed</i>			

Name	input		
<i>if non-blank, name to give the strings.</i>			
Colour	colour box	cyan	available colours
<i>if non-blank, colour for the strings</i>			
Linestyle	linestyle box	1	available linestyles
<i>linestyles for the strings.</i>			
Weight	weight box		
<i>if non-blank, weight to give the strings.</i>			
Start level	input	-10	
<i>the minimum depth to start the depth contours at.</i>			
End level	input	10	
<i>the maximum depth to calculate the depth contours to.</i>			
Interval	input	1	
<i>the interval between the depth contours.</i>			
Super string type	choice box	2d	2d, 3d original, 3d new
<i>If 2d, the created strings are 2d strings with a z-value equal to the depth.</i>			
<i>If 3d original, the depth strings are draped over the original tin to form 3d strings.</i>			
<i>If 3d new, the depth strings are draped over the new tin to form 3d strings.</i>			
Calculate	button		
<i>calculate the depth contours between two tins given in the panel fields. The resulting strings are added to the model given in the Model for depth strings field.</i>			

Label Contours

Position of option on menu: Tins =>Contour =>Label

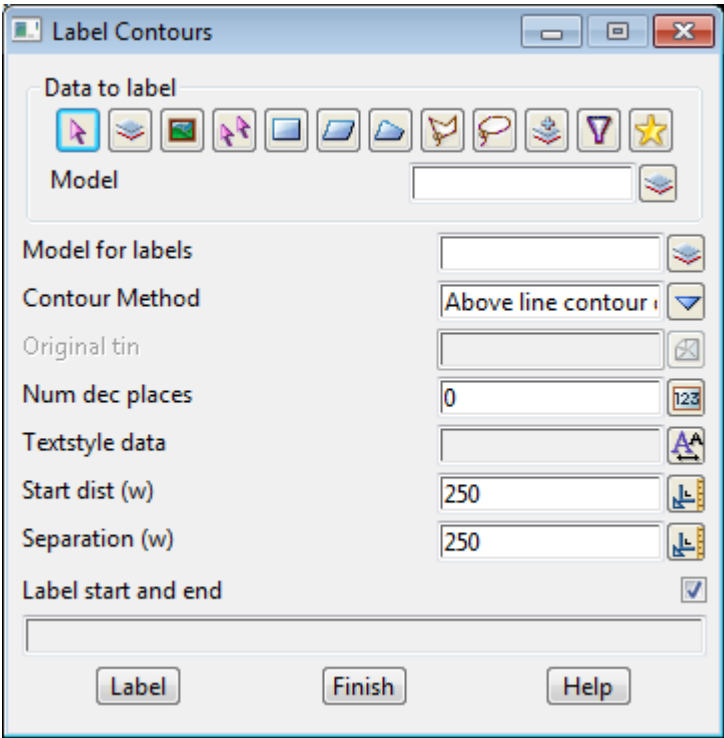

The **label contours** option can be used to label individual contour (2d) strings, or all the contour strings in a model.

The user has control over the label size, colour, number of decimal places, the distance between the labels and the distance to the first label on a string (start distance).

Note - this option cannot label fast contours. Contours strings must already exist or be generated using **Tins => Contour=> Contour, Smooth and Label** Or **Tins => Contour=> Contour**

For more information on labelling contours, go to the section [Labelling Contours](#).

On selecting the **label contours** option, the **label contours** panel is displayed.

When the **Label** button is selected, all the contour strings given by the data source field will be labelled according to the parameters in the panel fields.

The fields and buttons used in the **label contours** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type	Model		
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts.</i>			
Data source	input		
<i>source of data is to be triangulated - only Model or View allowed for this option.</i>			
Model for labels	model box		available models
<i>name of the model to place the contour labels in.</i>			
Label method	choice box		above line contour direction above line read from below centred line read from below

line removal and centred line read from below
above line facing uphill
centred line facing uphill
line removal & centred facing uphill

in all cases, contour labels are created and added to the model Model for contours.

For information on each of the methods of labelling contours, go to the section [Labelling Contours](#).

Original tin	tin box		available tins
<i>only needed for the "facing uphill" methods - name of the tin used to generate the contours. This is needed to calculate which direction is uphill.</i>			
Num dec places	input	1	0,1,2,3,4,5
<i>number of decimal places used in the contour label.</i>			
Textstyle data	textstyle data box	1	textstyle favourites
<i>textstyle information to use for the contour labels.</i>			
Start dist (w)	input	0	
<i>chainage distance to the first label on the string - world units</i>			
Separation (w)	input	250	
<i>chainage interval between the labels - world units</i>			
Pick	button		
<i>if a number of individual contour strings need to be labelled, the pick button is used. After pick is chosen, any strings selected are then labelled using the information in the panel fields. After labelling one string, another pick and label cycle automatically begins.</i>			
<i>The cycle is terminated by clicking RB to raise the pick ops menu and selecting cancel from it.</i>			
Label	button		
<i>label all the contour strings selected by the "Data to label" data source.</i>			

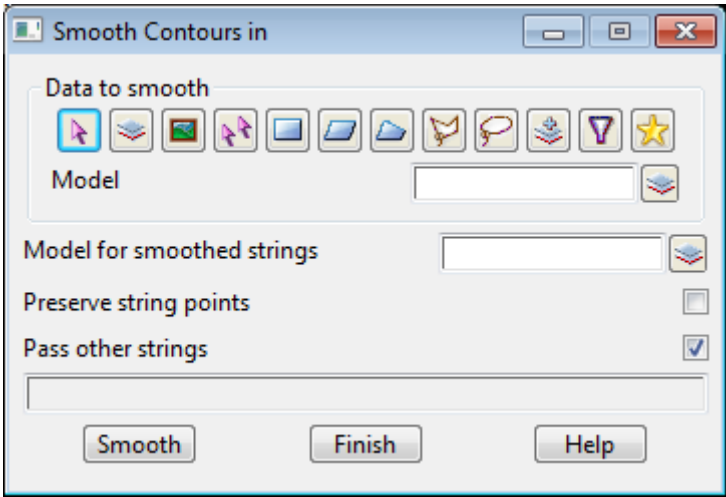

Smooth

Position of option on menu: Tins =>Contour =>Smooth

The **smooth** options are used to add extra points into a contour string (2d strings) to make a smoother string.

For more information on labelling contours, go to the section [Smoothing Contours](#).

Selecting **Smooth** displays the **Smooth Contours in** panel.

The fields and buttons in this panel are used as follows

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts.</i>			
Data source		input		
	<i>data source to be smoothed.</i>			
Model for smoothed strings		model box		available models
	<i>model for the smoothed strings to go to</i>			
Preserve string points		tick box		
	<i>if ticked, the smoothed contour will still contain all the original points. if not ticked, the smoothed contour may deviate from the original string points</i>			
Pass other strings		tick box	tick	
	<i>if ticked, any non-contour string is copied and added to the smoothed strings model.</i>			
Smooth		button		
	<i>smooth the selected contour (2d) strings.</i>			

Drape

Position of menu: Tins =>Drape

The **drape** option sections along a string and creates a new 3d-string which sits over the original string in plan view (with line approximations for arcs and spirals) but with z-values taken from a triangulated surface (a tin).

The drape alignment option takes an alignment string and creates a new alignment string with the identical horizontal geometry and vertical intersection points with z-values taken from a tin.

The tin drape walk-right menu is

The options in the tin contours menu will now be discussed.

For the option <i>Drape</i> , go to	Drape
<i>Alignment</i>	Drape Alignment
<i>Alignment (macro)</i>	Drape Alignment (Macro)
<i>Heights for boundary</i>	Heights for Tin Boundary or Drape Using Closest Tin Node

Drape

Position of option on menu: Tins =>Drape =>Drape

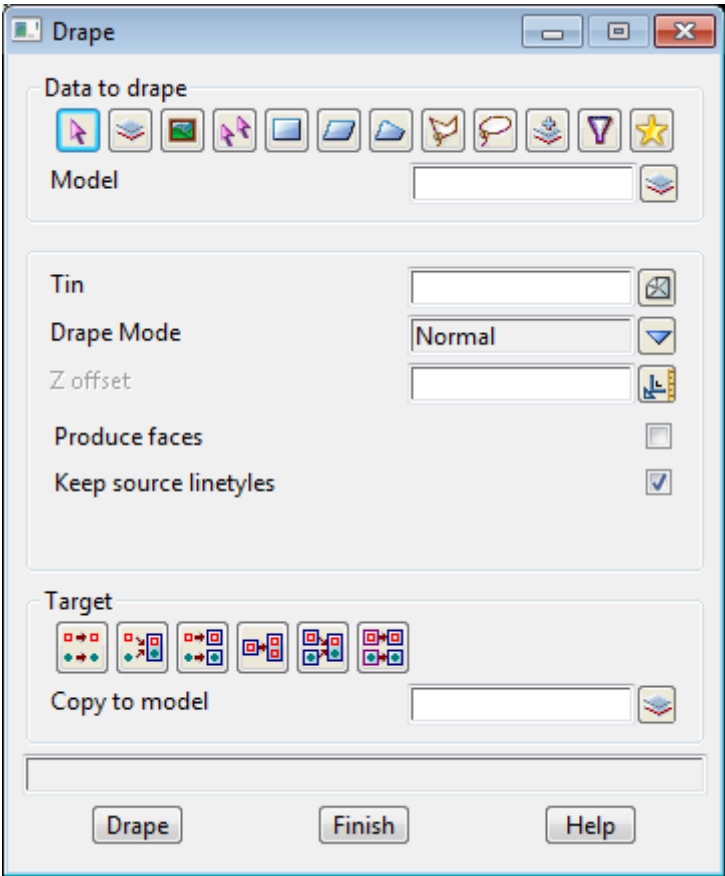

The **drape** operation is simply sectioning along a string.

Draping is a very useful method for attaching a z-value for strings defined in plan only. For example, cadastral information often has only (x,y) co-ordinates. The drape operation could be used to apply z-values to the cadastral information, for example, z-values from the natural surface tin. The draped cadastral information would then sit on the natural surface and could be used effectively in perspective views as well as plan views to delineate properties etc.

The draped strings can also have a z-offset applied so that the draped strings are a constant distance above or below the tin.

Instead of simply producing a section along a string, **drape** can also be used to produce a face for every segment of the string by draping the segment onto the tin and forming a face by perpendicularly connecting the end points of the segment and the draped segment. For example, if the strings represented the tops of buildings, the created faces would be the sides of the buildings down to the terrain.

On selecting **Drape**, the **Drape** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>data to drape.</i>			
Tin	tin box		available tins
<i>name of the tin to drape the strings over.</i>			
Drape mode	choice box	Normal	Normal, Vertices only
<i>if Normal, the section through the tin is created.</i>			
<i>If Vertices only, only the z-value from the tin is calculated at the vertices of the strings.</i>			
Z offset	real value box		
<i>if non-blank, the z-value of all the draped strings is increased by this value.</i>			
Produce faces	tick-box		
<i>if ticked, drape each segment of the string to form faces.</i>			
<i>If not ticked, simply drape the string onto the tin.</i>			
Keep source linestyles	tick box		
<i>if ticked, the linestyles of the draped strings are the same as the original string that was draped.</i>			
Target type			

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

models where the draped strings are placed.

Drape button

drape the strings selected by the "data to drape" data source over the tin given in the tin field.

Note: if faces rather than sections are to be produced, tick on the produce faces.

<esc> can be used to abort the drape option.

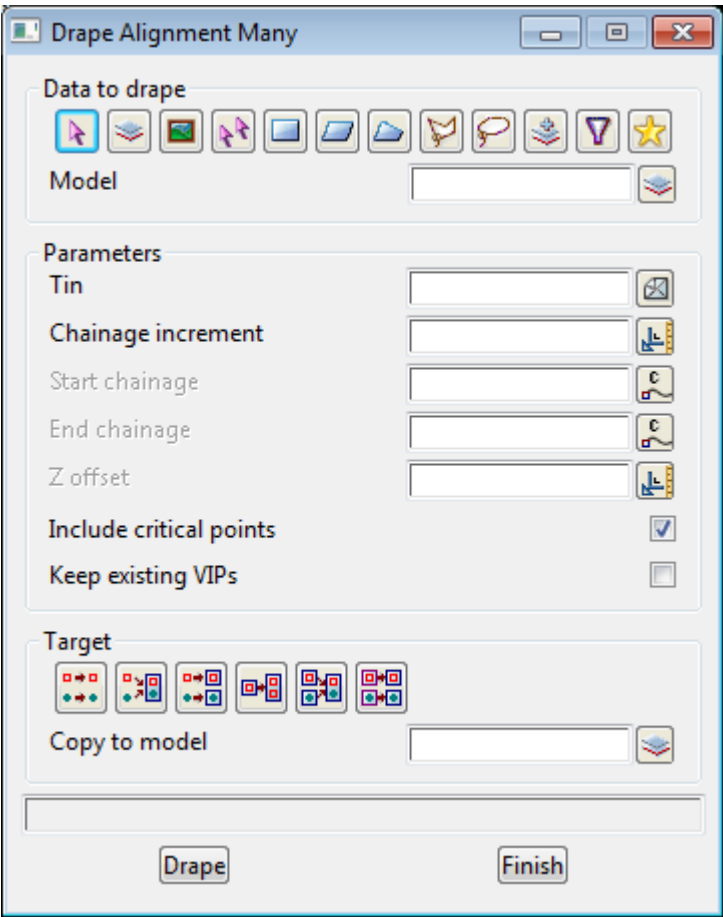

Drape Alignment

Position of option on menu: Tins =>Drape =>Alignment

The **Drape alignment** operation takes an alignment/super alignment string and creates a new alignment/super alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

The draped alignments can also have a z-offset applied so that the draped alignments are a constant distance above or below the tin.

On selecting **Alignment**, the **Drape Alignment Many** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Data source type			Model	
	<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts.</i>			
Data source		input		
	<i>source of data of alignment/super alignment strings to drape.</i>			
Tin		tin box		
	<i>triangulation to take z-values from.</i>			
Chainage increment		input		

the chainage interval to create VIP points for. Each created VIP point is given the z-value from the tin and the (x,y) position of the VIP.

Start/End chainage input

*if **non blank**, the chainage range to create VIP's over.
If **blank**, use the start/end chainage of the selected string.*

Z offset input

*if **non blank**, the value is added to the z-values from the tin.*

Include critical points tick box tick

if ticked, VIP's are created at the horizontal tangent points.

Keep existing VIPs tick box

*if ticked, any existing VIP's outside the given chainage range are kept.
If not ticked, don't create any VIP points outside the chainage range.*

Target type

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Drape button

create new alignment/super alignment strings with the same horizontal geometry as the selected strings and the z-value for VIP points taken from the given tin.

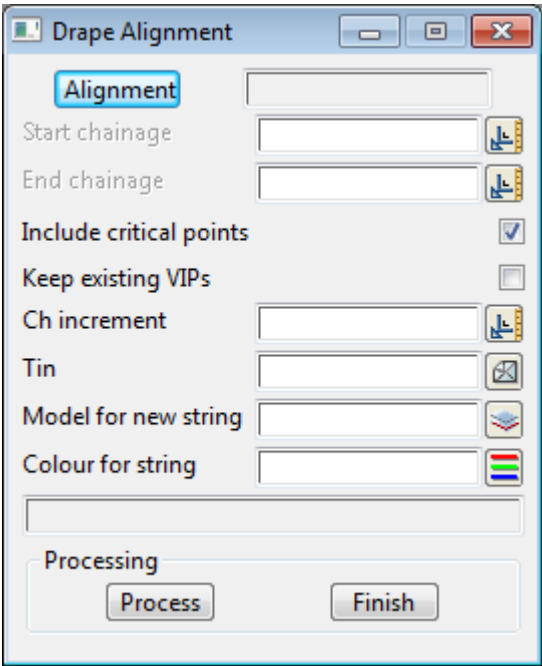

Drape Alignment (Macro)

Position of option on menu: Tins =>Drape =>Alignment (macro)

This is the **Drape =>Alignment** option from V7C1f. It has now been superseded.

The **Drape alignment (macro)** operation takes an alignment string and creates a new alignment string with identical horizontal geometry and the z-value for vertical intersection points taken from a tin. The z-values are taken over a user specified chainage interval and chainage increment. Vertical intersection points outside the chainage range can be kept.

On selecting **Alignment (macro)**, the **drape alignment** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Alignment <i>alignment string to drape.</i>	string select		
Start/End chainage <i>the chainage range to create VIP's over: if blank, use the start/end chainage of the selected string.</i>	input		
Include critical points <i>if ticked, VIP's are created at the horizontal tangent points.</i>	tick box	tick	
Keep existing VIPs <i>if ticked, any existing VIP's outside the given chainage range are kept. If not ticked, don't create any VIP points outside the chainage range.</i>	tick box		
Ch increment <i>the chainage interval to create VIP points for. Each created VIP point is given the z-value from the tin and the (x,y) position of the VIP.</i>	input		
Tin <i>triangulation to take z-values from.</i>	tin box		

Model for new string model box
model for the draped string.

Colour for string colour box
Colour for the draped string.

Process button
create a new alignment string with the same horizontal geometry as the selected string and the z-value for VIP points taken from the given tin.

Heights for Tin Boundary or Drape Using Closest Tin Node

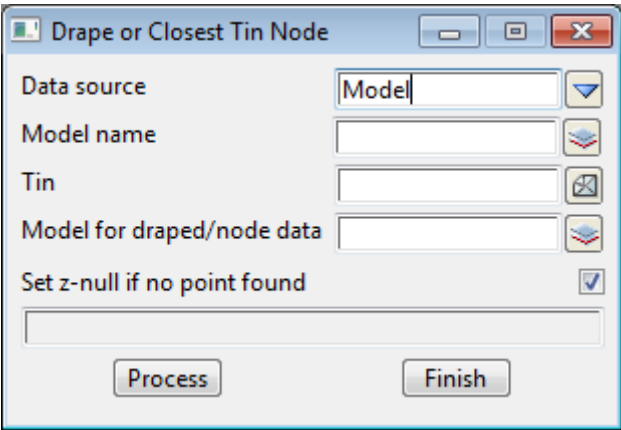

Position of option on menu: Tins =>Drape =>Heights for boundary

This option takes strings and for each vertex of each string, replaces the z-value by the z-value at the same (x,y) position from a given tin, or if there is no tin at the (x,y) position, takes the z-value from the closest non-null tin node to the (x,y) position.

The option is useful for taking a tin boundary with no z-values and creating z-values for each vertex from the tin.

Since V8 the option **Tins =>Boundary** option has a *Boundaries draped* flag which performs the same calculations as this option.

On selecting **Heights from boundary**, the **Update Z-values from Tin** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>type of the data source</i>	choice box	model	model, view, string
Model/View/String name <i>source of the data to drape vertices for.</i>			
Tin <i>tin to drape the vertices onto.</i>	tin box		
Model for draped/node data <i>model for the draped strings.</i>	model box		
Set z-null if no point found <i>if ticked, the vertex z-value is set to null if no tin exists at the vertex. If not ticked and the tin does not exist at the vertex, the z-value for the vertex is taken from the closest non-null tin node.</i>	tick box	tick	
Process <i>run the option.</i>		button	

Tin Analysis

Position of menu: Tins =>Tin analysis

The tin analysis options are used to calculate the direction and slope of triangles, the intersection between tins, surface areas, flow arrows, ridge and valley lines and viewsheds.

The tin analysis walk-right menu is

Tin Analysis	
Aspect	colour and report for ranges of aspects
Slope	colour and report for ranges of slopes
Intersection	lines of intersection between two tins
Surface area	report surface area within a polygon
Surface area 2	report surface area for a model of polygons
Viewshed	calculate viewshed
Viewshed dynamic	dynamically create viewshed lines
Viewshed old	viewshed option from V8
Flow arrows	create flow arrows for a tin.
Ridges/Valleys	create ridge and valley lines for a tin
Depth range polygons	create polygons for depth ranges
Polygons from colours	creates polygons around coloured regions of tin
Rain drop	creates flow lines from a selected point

For the options <i>Aspect</i> , go to	Aspect
<i>Slope</i>	Slope
<i>Intersection</i>	Intersection
<i>Surface area</i>	Surface Area
<i>Surface area 2</i>	Surface Area 2
<i>Viewshed</i>	Viewshed
<i>Viewshed dynamic</i>	Dynamic Viewshed
<i>Viewshed old</i>	Viewshed Old
<i>Flow arrows</i>	Flow Arrows
<i>Ridge/Valleys</i>	Ridge/Valleys
<i>Depth range polygons</i>	Depth Range Polygons
<i>Polygons from colours</i>	Polygons from Tin Colours
<i>Rain drop</i>	Raindrop/Teardrop

Aspect

Position of menu: Tins =>Tin analysis =>Aspect

The Tin aspect options calculate and report on the directions of the triangles. The Tin aspect walk-right menu is

The options in this menu will now be discussed.

For the option Aspect analysis, go to
Aspect analysis 2
Aspect analysis 2 (new)

[Aspect Analysis](#)
[Aspect Analysis 2 and 2 \(new\)](#)
[Aspect Analysis 2 and 2 \(new\)](#)

Aspect Analysis

Position of option on menu: Tins =>Tin analysis =>Aspect => Aspect Analysis

This panel is used to calculate the aspect or direction that the triangles of a tin face. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

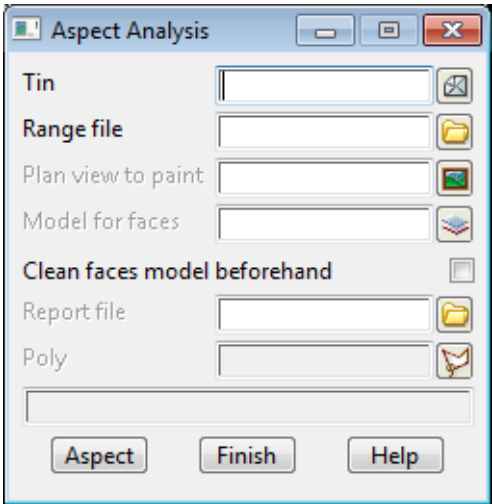

The calculated aspects can be produced and reported over user supplied bearing ranges. Similarly, a plan view can be temporarily coloured on an aspect basis using the same range file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the aspect range file, see [Aspect Range File](#).

For each range in the file, the plan and slope areas of the triangles in the bearing range will be reported on, and the range_colour can be used to colour all areas on a plan view satisfying the range.

On selecting the aspect analysis option, the **Aspect Analysis** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Tin	tin box	available tins
<i>name of the tin for which the aspects of the triangles will be calculated.</i>		
Range file	aspect range file box	*.arf
<i>the user supplied range file is used to split up the aspect report and define the range colours used for painting a plan view. See Aspect Range File.</i>		
Plan view to paint	view box	available views
<i>if non-blank, the given plan view will be painted according to the range colours given in the range file.</i>		
Model for faces	model box	available models
<i>if non-blank, faces will be created with colours according to the range colours given in the range file. The z-value for a face is the line number in the range file of the range that the face satisfies.</i>		
Clean faces model beforehand	tick box	
<i>if ticked, the model of faces is cleaned out before the option runs.</i>		
Report file	file box	*.rpt
<i>name of the file to contain the aspect report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>		
Poly	string-select	
<i>if selected, this string is used as the bounding polygon for the aspect calculations.</i>		
Aspect	button	
<i>the aspects of the triangles of the tin within the selected bounding polygon are calculated.</i>		
<esc> can be used to terminate the option during aspect calculations.		

Example of an Aspect Range File

```
// aspect range file
// format:  lower_bearing    upper_bearing    colour_for_range
0  45   red    // colour red the triangles with bearing greater than 0 and less than or equal to 45
45  90   green  // colour green the triangles with bearing > 45, and <= 90
90 123.30 "dark green" // colour dark green triangles with bearing > 90 and <= 123 deg 30'
```

Aspect Analysis 2 and 2 (new)

Position of option on menu: Tins =>Tin analysis =>Aspect => Aspect Analysis 2

Position of option on menu: Tins =>Tin analysis =>Aspect => Aspect Analysis 2 (new)

As with the aspect analysis option, the aspect analysis 2 option is used to calculate the aspect or direction that the triangles in the tin face.

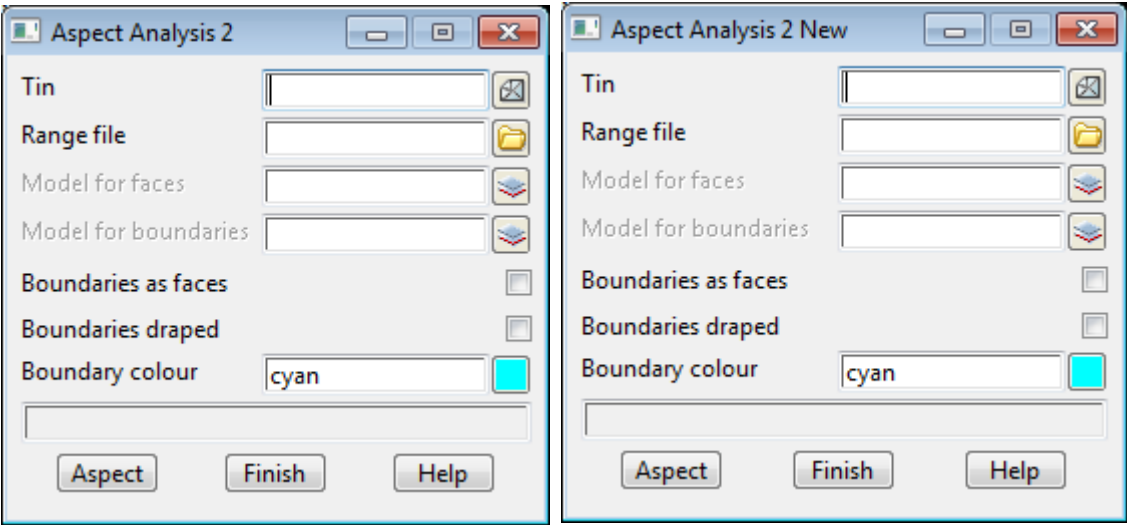

However, this option can also create the strings that bound the triangles in the same aspect range. The aspect analysis 2 (new) option is the same as aspect analysis 2 except the boundary polygons have slightly different names.

One restriction for this option is that the calculations can not be restricted to be within a polygon and the entire tin is used.

For more information on the aspect range file, see [Aspect Range File](#).

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the Aspect analysis 2 option, the **Aspect Analysis 2** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the aspects of the triangles will be calculated.</i>	tin box		available tins
Range file <i>the user supplied range file is used to split the triangles into groups of common aspects so that boundary strings can be created and the range colours used for faces and the boundary strings. See Aspect Range File.</i>	aspect range file box		*.arf
Model for faces <i>if non-blank, a faces will be created (with the colour given in the range file) for each triangle. The z-value for a face is the line number in the range file of the range that the face satisfies.</i>	model box		available models
Model for boundaries <i>if non-blank, for each range of aspects in the range file, boundary strings will be created for regions of common aspect. The boundary strings are given the name "aspect boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but will have a different colour and name. For aspect analysis 2 (new), the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.</i>	model box		available models
Boundaries as faces <i>if ticked, output the regions of common aspect as faces.</i>	tick box		
Boundaries draped <i>if ticked, the z-values for the boundary are taken from the tin. If not ticked, the z-value for a boundary is the line number in the range file of the range that the boundary satisfies.</i>	tick box		
Boundary colour <i>not used - was the colour for the aspect boundaries.</i>	colour box	cyan	available colours
Aspect <i>On selecting this button, the aspects of the triangles of the tin are calculated and the appropriate</i>	button		

boundaries and faces created.

<esc> can be used to terminate the option during aspect calculations.

Slope

Position of menu: Tins =>Tin analysis =>Slope

The tin slope options calculate and report on the slopes of the triangles. The tin slope walk-right menu is

Slope Analysis

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis

This panel is used to calculate the slopes of triangles in the tin. The calculations can be restricted to within a user selected polygon, or if no polygon is selected, the entire tin is used.

The calculated slopes can be produced and reported over user supplied slope ranges. Similarly, a plan view can be temporarily coloured on a slope basis using the same **range** file. The temporary colours will disappear next time the view is refreshed.

For permanency, the option can also create coloured faces with the appropriate range colour. The faces can be displayed on any plan view using a solid fill colour or a hatch pattern.

For more information on the slope range file, see [Range Files](#).

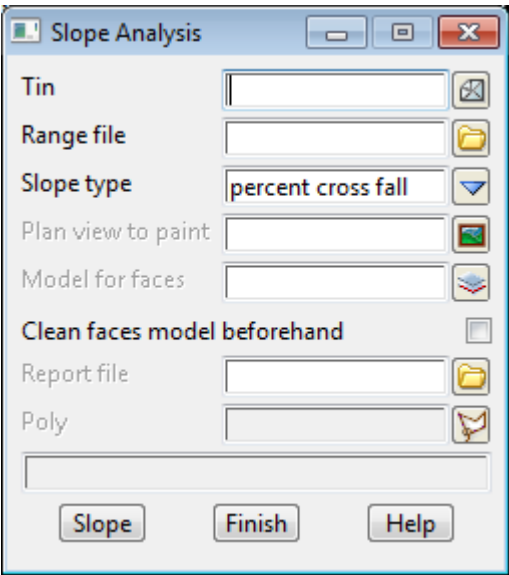

The slopes in the file can be percent cross fall, “1v in” slope or degrees (in 12d Model dms format) but they must all be of the same type in the file.

Note - if **1v in** is used, the range is converted to:

$$\text{smaller_slope_as_percent_cross_fall} < \text{slope} \leq \text{larger_slope_as_percent_crossfall}$$

For each range in the file, the plan and slope areas of the triangles in the range will be reported on, and the range_colour used to colour all areas on a plan view satisfying the range.

On selecting the **Slope analysis** option, the **Slope Analysis** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the slopes of the triangles will be calculated.</i>	tin box		available tins
Range file <i>the user supplied range file is used to split up the slope report and define the range colours used for painting a view. See Range Files.</i>	slope range file		*.srf
Slope type <i>the units used for slope in the range file.</i>	choice box		percent cross fall, degrees, 1v in

Plan view to paint

view box

available views

if non-blank, the given plan view will be painted according to the range colours given in the range file.

Clean faces model beforehand tick box

if ticked, the model of faces is cleaned out before the option runs.

Model for faces

model box

available models

*if non-blank, faces will be created with colours according to the range colours given in the range file.
The z-value for a face is the line number in the range file of the range that the face satisfies.*

Report file

file box

*.rpt

name of the file to contain the slope report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly

string-select

if selected, this string is used as the bounding polygon for the slope calculations.

Slope

button

On selecting this button, the slopes of the triangles of the tin within the selected bounding polygon are calculated.

<esc> can be used to terminate the option during slope calculations.

Example of a Slope Range File

```
// slope range file in percent cross fall
// format:  lower_slope    upper_slope    colour_for_range
0  5    red    // colour red the triangles with slope greater than 0% and less than
               // or equal to 5% x-fall
5  10   green  // colour green the triangles with slope > 5%, and <= 10% x-fall
10 300 "dark green" // colour dark green triangles with slope greater than 10%
                  // and less than or equal to 300% x-fall

// slope range file in 1v in slopes
// format:  lower_slope    upper_slope    colour_for_range
0  20    red    // colour red the triangles with slope greater than flat and
               // less than or equal to 1:20
20 10   green  // colour green the triangles with slope between 1:20 and equal to 1:10
10  1    blue  // colour blue triangles with slope between 1:10 and equal to 1:1
```

Slope Analysis 2 and 2 (new)

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis 2

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis 2 (new)

As with the Slope analysis option, the slope analysis 2 option is used to calculate the slope of triangles in the tin. However, this option can also create the strings that bound the triangles in the same slope range.

The Slope analysis 2 (new) option is the same as Slope analysis 2 except the boundary polygons have slightly different names.

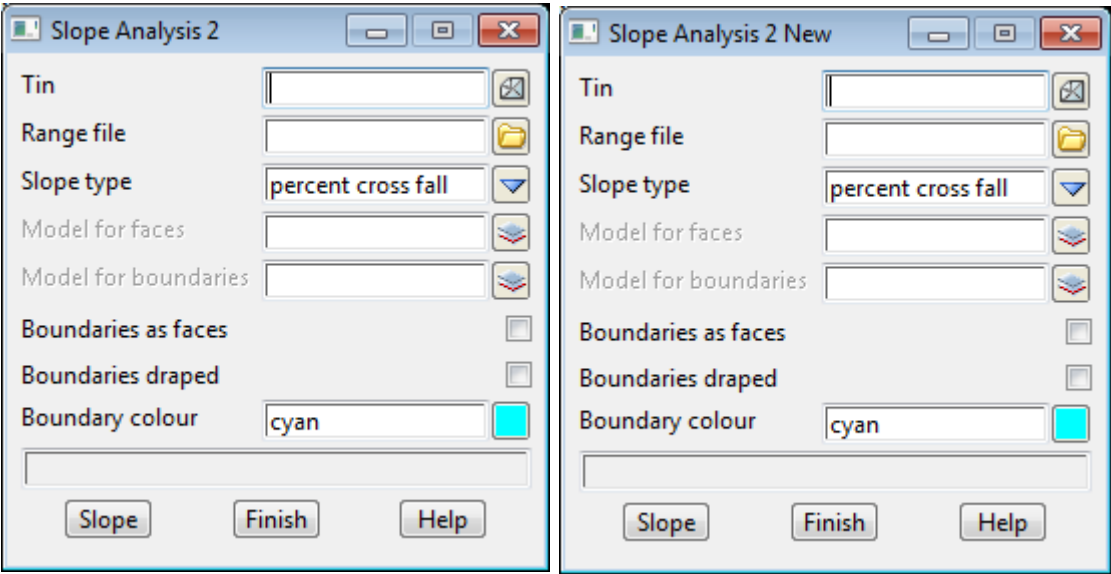

One restriction for this option is that the calculations can not be restricted to be within a polygon and the entire tin is used.

The range file for Slope analysis 2 has the same format as for Slope analysis.

For more information on the slope range file, see [Range Files](#).

For each range in the file, the boundary strings for areas of common range can be created and also coloured faces that can be displayed on any plan view.

On selecting the Slope analysis 2 option, the Slope Analysis 2 new panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the slopes of the triangles will be calculated.</i>	input		available tins
Range file <i>the user supplied range file is used to split the triangles into groups of common slopes so that boundary strings can be created and the range colours used for faces. See Range Files.</i>	input		*.srf
Slope type <i>the units used for slope in the range file.</i>	input		percent cross fall, degrees, 1v in
Model for faces <i>if non-blank, a faces will be created (with the colour given in the range file) for each triangle. The z-value for a face is the line number in the range file of the range that the face satisfies.</i>	input		available models

Model for boundaries input available models

if non-blank, for each range of slopes in the range file, boundary strings will be created for regions of common slope. The boundary strings are given the name "slope boundaries" plus the number of the entry in the range file. Many of the boundaries will exist twice since they are the upper boundary for one range and the lower boundary for the next range but they will have a different colour and name. For slope analysis 2 (new), the boundary name also has the addition of "face" and a number to more clearly differentiate the boundaries of the same range.

Boundaries as faces tick box

if ticked, output the regions of common slope as faces.

Boundaries draped tick box

*if ticked, the z-values for the boundary are taken from the tin.
If not ticked, the z-value for a boundary is the line number in the range file of the range that the boundary satisfies.*

Boundary colour input cyan available colours

not used - was the colour for the slope boundaries.

Slope button

On selecting this button, the slopes of the triangles of the tin are calculated and the appropriate boundaries and faces created.

<esc> can be used to terminate the option during slope calculations.

Slope Analysis - Flag Slopes

Position of option on menu: Tins =>Tin analysis =>Slope =>Slope analysis (flag)

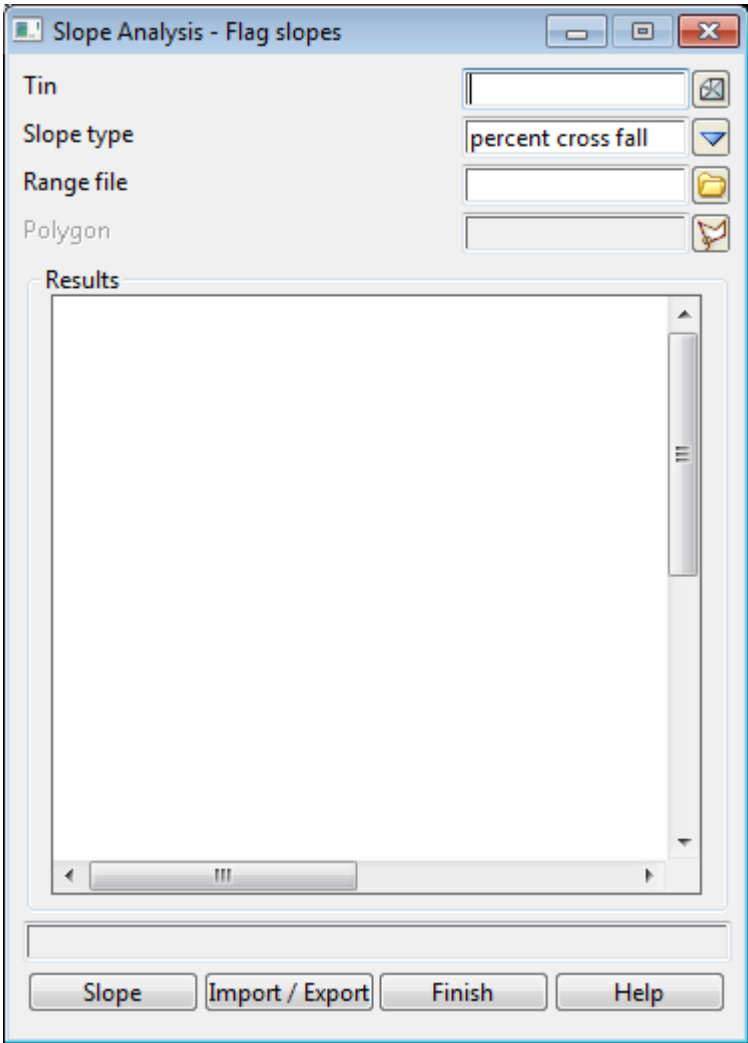

This panel analyses the slope of triangles in a tin and reports on triangles that fall within the supplied range file.

For more information on the slope range file, see [Range Files](#).

The results are listed in the results box.

Selecting a result line will pan the last selected view to display that triangle, as well as highlighting it on screen.

Selecting **Slope analysis (flag)** displays the **Slope Analysis - Flag Slopes** panel on the screen.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin the tin to analyse			
Slope type the type of range file	choice box		percent cross file, 1v in, degrees minute seconds

Polygon

an optional polygon to constraint the analysis within

Results

the list of results

button

performs the analysis

Import/Export

button

opens the [Import/Export Slope Analysis \(Flag\)](#) panel

Import/Export Slope Analysis (Flag)

This panel imports and exports the results of a slope analysis.

The fields and buttons used in this panel have the following functions.

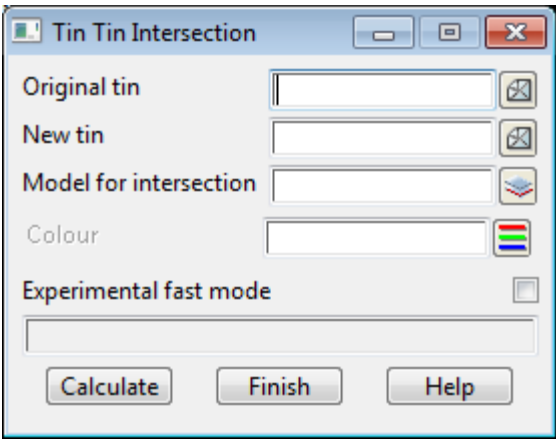

Field Description	Type	Defaults	Pop-Up
Report file <i>the file to read / write from</i>	file		
Export <i>exports the results to the supplied file</i>	button		
Import <i>imports the results from the supplied file</i>	button		

Intersection

Position of option on menu: Tins =>Tin analysis =>Intersection

The intersection option finds the lines of intersection between two tins.

Selecting intersection displays the Tin Tin Intersection panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original tin <i>name of one of the tins to be intersected.</i>	tin box		available tins
New tin <i>name of the other tin to be intersected.</i>	tin box		available tins
Model for intersection <i>name of the model to contain the intersection strings.</i>	model box		available models
Colour for intersection <i>colour to make the intersection strings</i>	colour box	default colour	available colours
Experimental fast mode <i>if ticked, a faster method is used to calculate the intersection strings</i>	tick box		
Calculate <i>calculate the intersection between two tins given in the panel fields. The resulting intersection strings are added to the model given in the model for intersection field.</i>	button		

Surface Area

Position of option on menu: Tins =>Tin analysis =>Surface area

The **surface area** option is used to calculate the surface area of a tin within a user selected string.
Selecting **surface area** displays the **surface area within a polygon** panel.

The fields and buttons have the following functions.

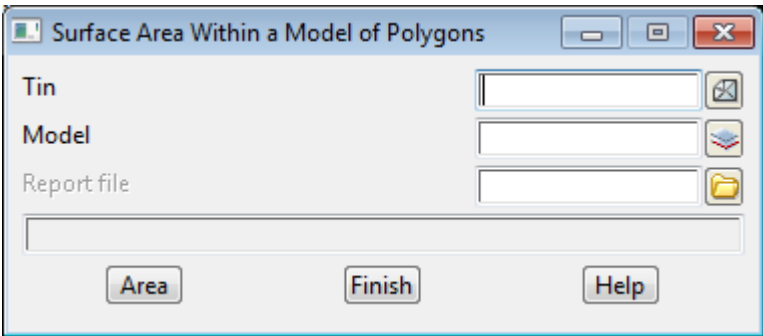

Field Description	Type	Defaults	Pop-Up
Tin <i>the tin to calculate the surface area on.</i>	tin box		available tins
Report file <i>if non-blank, the name of the file to write the surface area within the selected polygon to.</i>	file box		*.rpt files
Poly <i>select the string to find the slope area within.</i>	poly-select		
Area <i>calculate the surface area of the tin within the selected polygon.</i>	button		

Surface Area 2

Position of option on menu: Tins =>Tin analysis =>Surface area 2

The **surface area 2** option is used to calculate the surface area of a tin within each polygon in a model.

Selecting **surface area 2** displays the **Surface Area Within a Model of Polygons** panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>the tin to calculate the surface area on.</i>	tin box		available tins
Model <i>the model of polygons for calculating surface area within.</i>	model box		available models
Report file <i>if non-blank, the name of the file to write the surface area within each polygons in the model, plus the total of the surface area.</i>	file box		*.rpt files
Area <i>calculate the surface area of the tin within each polygons in the model, and sum the areas.</i>	button		

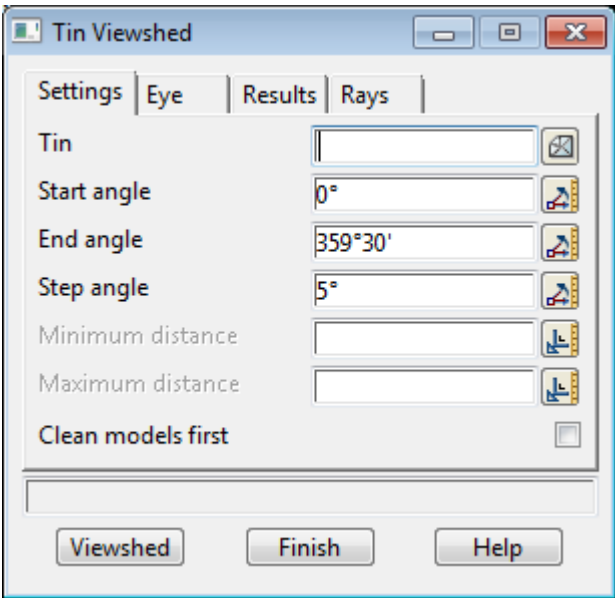

Viewshed

Position of option on menu: Tins =>Tin analysis =>Viewshed

This panel is used to calculate the points that are visible and invisible from a user selected eye position. This is equivalent to calculating the points that can or can not see a selected point.

The calculations are made along rays emanating from the eye point from a minimum to a maximum distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

Selecting **Viewshed** displays the **Tin Viewshed** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Setting tab				
Tin		tin box		available tins
	<i>name of the tin to be used for the viewshed analysis.</i>			
Start angle		angle box	0	
	<i>the angle to begin taking sight rays emanating from the eye point.</i>			
End angle		angle box	359.30	
	<i>the angle to stop taking sight rays emanating from the eye point.</i>			
Step angle		angle box	5	
	<i>the angle between successive sight rays emanating from the eye point.</i>			
Minimum distance		input		
	<i>if not blank, the minimum distance from the eye point along the sight ray to begin recording visible/invisible points.</i>			
	<i>If blank, the minimum distance is zero.</i>			
Maximum distance		input		
	<i>the maximum distance from the eye point along the sight ray to record visible/invisible points.</i>			
	<i>If blank, the entire tin is considered.</i>			

Clean model first tick box

if ticked, the models of results are cleaned out before the option runs.

Eye tab

Eye XYZ input/output xyz ops menu

X/Y/Z coordinate

*the XYZ co-ordinates of the eye point.
Each co-ordinate can be individual entered or the point pick icon used to select an existing point.*

Note - the z-value is normally above the surface of the tin and should not be on the tin.

Results tab

More tick box

*if ticked, ask for name, model, linestyle, weight.
if not ticked, only ask for model.*

Name input

name for the created strings

Model model box available models

the model for the visible/invisible sight strings.

Linestyle linestyle box

linestyle for the created strings

Weight weight box

weight for the created strings

Colour of visible bits colour box default line colour

*if not blank, the colour for the visible parts of the rays.
If blank, the visible parts are not created.*

Colour of invisible bits colour box default point colour

*if not blank, the colour for the invisible parts of the rays.
If blank, the invisible parts are not created.*

Separate strings tick box

*if ticked, the visible and invisible sections are separate strings.
If not ticked, the visible and invisible sections are combined into one super string.*

Rays tab

Visible Rays

the visible rays are the lines from the eye point to the point on the tin where the terrain goes from being visible to invisible.

*If **Colour of visible bits** is not blank then this is the colour used for these rays.*

*If **Colour of visible bits** is blank then the colour is the default line colour.*

The ray will be coloured where it is over invisible terrain with the colour for the invisible bits (this happens in undulating country. That is where there are valleys).

More tick box

*if ticked, ask for name, model, linestyle, weight.
if not ticked, only ask for model.*

Name	input	
	<i>name for the created strings</i>	
Model	model box	available models
	<i>if not blank, the model for the visible ray strings. If blank, don't create the visible ray strings</i>	
Linestyle	linestyle box	
	<i>linestyle for the created strings</i>	
Weight	weight box	
	<i>weight for the created strings</i>	

Invisible Rays

*the invisible rays are the lines from the eye point to the point on the tin where the terrain goes from being invisible to visible.
If **Colour of invisible bits** is not blank then this is the colour used for these rays.
If **Colour of invisible bits** is blank then the colour is the default point colour.*

*The ray comes from the eye and is coloured with the **Colour of visible bits** to the change over from visible to invisible and then coloured with the **Colour of invisible bits** to where the ray ends (the change over visible to invisible).*

More	tick box
	<i>if ticked, ask for name, model, linestyle, weight. if not ticked, only ask for model.</i>

Name	input	
	<i>name for the created strings</i>	
Model	model box	available models
	<i>if not blank, the model for the invisible ray strings. If blank, don't create the invisible ray strings</i>	
Linestyle	linestyle box	
	<i>linestyle for the created strings</i>	
Weight	weight box	
	<i>weight for the created strings</i>	

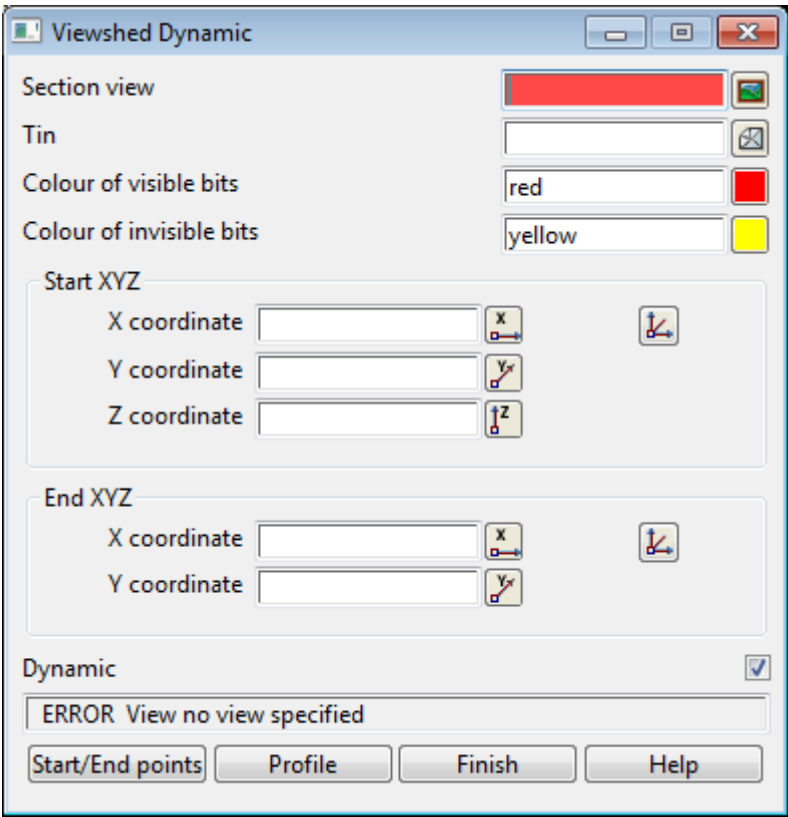

Viewshed	button
<i>On selecting this button, the lines of sight emanating from the eye XYZ point are calculated.</i>	
<esc> can be used to terminate the option during viewshed calculations.	

Dynamic Viewshed

Position of option on menu: Tins =>Tin analysis =>Viewshed dynamic

Dynamic viewshed is used to calculate and display on a section view, the points that are visible and invisible from a user selected eye position to a user selected end position.

Selecting Viewshed dynamic displays the **Viewshed Dynamic** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Section view <i>section view to display the sight lines on</i>	view box		available section view
Tin <i>name of the tin to be used for the viewshed analysis.</i>	tin box		available tins
Colour of visible bits <i>the colour for the visible parts of the viewshed string</i>	colour box		default line colour
Colour of invisible bits <i>the colour for the invisible parts of the viewshed string</i>	colour box		default point colour
Start XYZ X/Y/Z coordinate <i>the XYZ co-ordinates of the start of the line to determine viewshed for.</i> <i>Each co-ordinate can be individual entered or the point pick icon used to select an existing point.</i>	input/output		xyz ops menu

End XY

input/output

xyz ops menu

X/Y coordinate

the XY co-ordinates of the end of the line to determine viewshed for.

Each co-ordinate can be individual entered or the point pick icon used to select an existing point.

No Z is required.

Dynamic

tick box

*if ticked and the **Start/End points** button is used, once the Start point is selected, the viewshed analysis is carried out from the start point to the cursor position which represents the end point. The results are displayed in the section view.*

Start/End points

button

*if picked, an start point is selected and then the height displayed in an **enter height** input box. If*

required, a new height can be typed into the **enter height** box. After typing an <enter> into the input box, the box is removed from the screen and the x, y and height is piped into the **Start XYZ** panel field.

The cursor is then used to select the End point.

If Dynamic is ticked, as the Cursor position is moved, the viewshed is carried out to the new cursor position and the results displayed in the section view.

Profile

button

Selecting this button calculates the line of sight from the start to the end position.

Viewshed Old

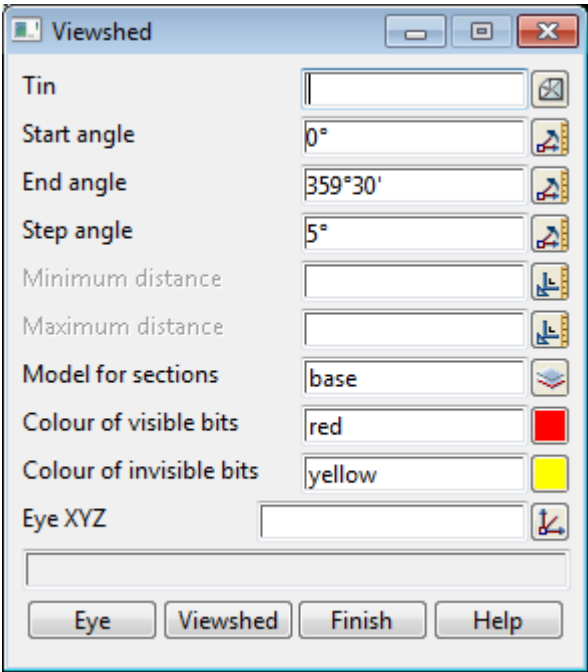

Position of option on menu: Tins =>Tin analysis =>Viewshed old

This option has been superseded in 12d Model 9.

This panel is used to calculate the points that are visible and invisible from a user selected eye position. This is equivalent to calculating the points that can or can not see a selected point.

The calculations are made along rays emanating from the eye point from a minimum to a maximum distance from the eye point. The rays are created at regular angular steps from a start angle to an end angle.

On selecting Viewshed, the Viewshed panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to be used for the viewshed analysis.</i>	input		available tins
Start angle <i>the angle to begin taking sight rays emanating from the eye point.</i>	input	0	
End angle <i>the angle to stop taking sight rays emanating from the eye point.</i>	input	359.30	
Step angle <i>the angle between successive sight rays emanating from the eye point.</i>	input	5	
Minimum distance <i>if non-blank, the minimum distance from the eye point along the sight ray to begin recording visible/ invisible points. If blank, the minimum distance is zero.</i>	input		
Maximum distance	input		

*the maximum distance from the eye point along the sight ray to record visible/invisible points.
If blank, the entire tin is considered.*

Model for sections input available models
the model for the visible/invisible sight strings.

Colour of visible bits input default line colour
*if non-blank, the colour for the visible parts of the rays.
If blank, the visible parts are not created.*

Colour of invisible bits input default point colour
*if non-blank, the colour for the invisible parts of the rays.
If blank, the invisible parts are not created.*

Eye XYZ input/output xyz ops menu
the XYZ co-ordinates of the eye point.

Eye button
*if picked, an eye point is selected and then the height displayed in an **enter height** input box. If required, a new height can be typed into the **enter height** box. After typing an <enter> into the input box, the box is removed from the screen and the x, y and height is piped into the eye XYZ panel field.*

Viewshed button
On selecting this button, the lines of sight emanating from the eye XYZ point are calculated.

<esc> can be used to terminate the option during viewshed calculations.

Flow Arrows

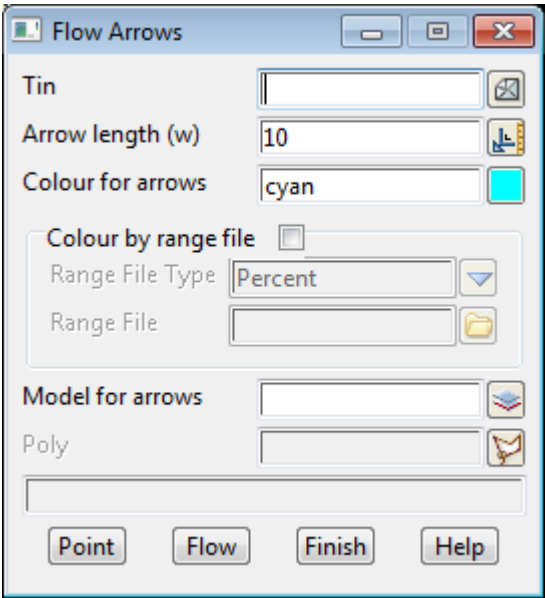

Position of option on menu: Tins =>Tin analysis =>Flow arrows

The flow arrows option draws arrows indicating the flow direction across triangles in a tin.

The flow arrows can be drawn for selected points, for all the triangles within a polygon, or if no polygon is selected, for all triangles in the tin.

The arrows are drawn at the centroid of the triangle and have a fixed user given length.

On selecting the **flow arrows** option, the **flow arrows** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to calculate flow arrows for.</i>	tin box		available tins
Arrow length (w) <i>length in world units to draw the flow arrows.</i>	real value box		
Colour for arrows <i>colour for the arrows.</i>	colour box	cyan	available colours
Colour by range file <i>if ticked, the flow arrows are coloured by the their slope using a slope range file. See Range Files.</i>	tick box		
Range file type <i>the units used for slopes in the range file</i> <i>Percent - percent cross fall</i> <i>1v in - one vertical in ? horizontal</i>	choice box	Percent	Percent, 1v in
Range file	slope range file box		.srf files
Model for arrows <i>model to put flow arrows in. Must be non-blank.</i>	model box		available models
Poly	polygon select		

*if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.*

Point button

*after selecting **Point**, a flow arrow is drawn at each selected point. This continues until cancel is selected from the **pick ups** menu.*

Flow button

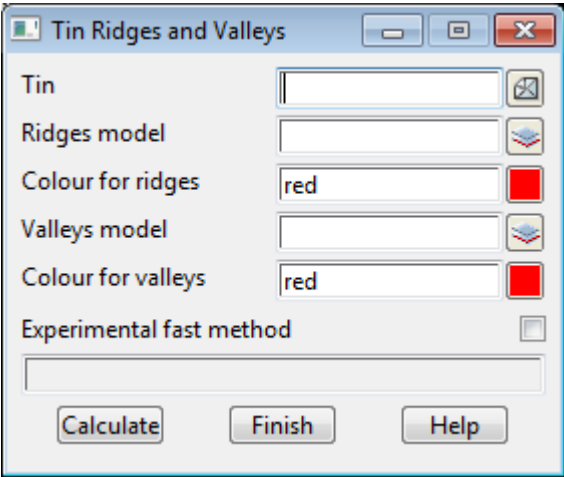

calculate the flow arrows for all the triangles in the tin, or if a polygon has been selected, for the triangles whose centroid is inside the polygon.

Ridge/Valleys

Position of option on menu: Tins =>Tin analysis =>Ridges/Valleys

In the ridge/valleys option, ridge and valley lines are calculated for the given tin.

On selecting the ridge/valley option, the tin ridges and valleys panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to calculate ridge and valley lines for:</i>	tin box		available tins
Ridges model <i>if non-blank, the name of the model to contain the ridge lines. If blank, the ridge lines are not created.</i>	model box		available models
Colour for ridges <i>colour for the ridge lines</i>	colour box	default colour	available colours
Valleys model <i>if non-blank, the name of the model to contain the valley lines. If blank, the valley lines are not created.</i>	model box		available models
Colour for valleys <i>colour for the valley lines</i>	colour box	default colour	available colours
Calculate <i>ridge and valley lines will be calculated for the given tin and placed in the ridge and valley models.</i>	button		

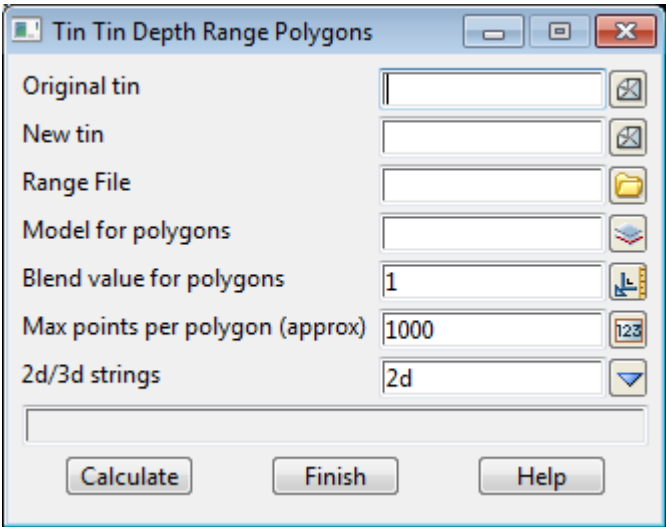

Depth Range Polygons

Position of option on menu: Tins =>Tin analysis =>Depth range polygons

In the **Depth range polygons** option, polygons are created around the regions given by a depth range file.

For more information on the depth range file, see [Depth Range File](#).

On selecting the **Depth range polygons** option, the **Tin Tin Depth Range Polygons** panel is displayed.

The fields and buttons used in this panel have the following functions.

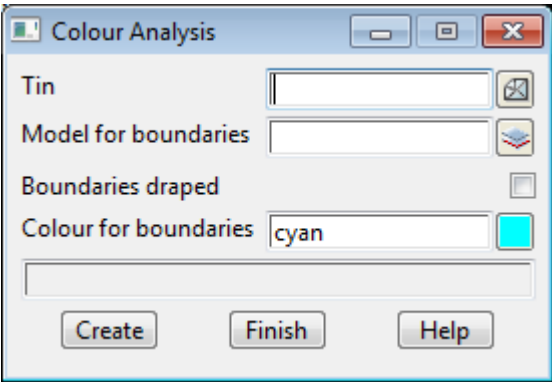

Field Description	Type	Defaults	Pop-Up
Original/New Tin <i>name of the original/new tin for determining depths between.</i>	tin box		available tins
Range file <i>the user supplied range file for splitting up the depths and colouring the polygons. See Depth Range File.</i>	input		*.drf
Model for polygons <i>model to contain the polygons.</i>	model box		available models
Blend value for polygons <i>The value of blending is between 0 and 1. 0 means the polygon is totally transparent (and hence invisible) and 1 means that the polygon is opaque (non-translucent) and can't be seen through at all. If blank, then the value is taken as 1 and the polygon is opaque (non-translucent).</i>	real value	1	
Max points per polygon (approx) <i>when a polygon is created and the number of vertices in it is greater than this value, the polygon will be split into a number of polygons.</i>	real value	1000	
2d/3d strings <i>If 2d, the created strings are 2d strings with a z-value equal to the depth. If 3d original/new, the depth strings are draped over the original/new tin to form 3d strings.</i>	choice box	2d	2d, 3d original, 3d new
Calculate <i>create the polygons surrounding regions of different heights between the tins.</i>	button		

Polygons from Tin Colours

Position of option on menu: Tins =>Tin analysis =>Polygons from colours

In the **Polygons from colours** option, polygons are created around the different coloured regions of the tin.

On selecting the **Polygons from colours** option, the **Colour Analysis** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to calculate polygons around the coloured regions.</i>	tin box		available tins
Model for boundaries <i>model to contain the polygons.</i>	model box		available models
Boundaries draped <i>if ticked. the z-values for the vertices for the boundary strings come from the vertices of the coloured triangles. If not ticked, the boundaries have constant z-values.</i>	tick box		
Colour for boundaries <i>colour for the polygons</i>	colour box	default colour	available colours
Create <i>create the polygons surrounding regions of different colours on the tin.</i>	button		

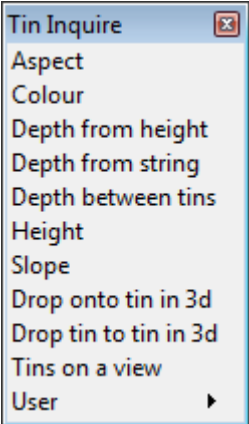

Inquire

Position of menu: Tins =>Inquire

The **inquire** options are used to display at the current cursor position the height (z-value) on a tin, the colour of the triangle, the depth from a fixed height to a tin, and the depth between two tins,.

Once the user specifies which tin or tins are to be analysed, then as the cursor moves around in any plan view, the triangles below the cursor are examined and the appropriate information displayed.

The **tin inquire** walk-right menu is

	
Aspect	display aspect of triangles
Colour	display colour of tin
Depth from height	calculate depth from height to tin
Depth from string	calculate depth from string to a tin
Depth between tins	calculate depth between tins
Height	display height on tin
Slope	display slope of triangles
Drop onto tin in 3d	drop onto a tin in 3d
Drop tin to tin in 3d	display perpendicular height between two tins
Tins on a view	dynamically list all tins under the cursor
User	

The options in the **Tin inquire** menu will now be discussed.

For the options <i>Aspect</i> , go to	Aspect Inquire.
<i>Colour</i>	Colour Inquire
<i>Depth from height</i>	Depth from Height
<i>Depth from string</i>	Depth from String
<i>Depth between tins</i>	Depth Between Tins
<i>Height</i>	Height Inquire
<i>Slope</i>	Slope Inquire
<i>Drop onto tin 3d</i>	Tin Drop Point 3d
<i>Drop tin to tin in 3d</i>	Tin Tin Drop Point 3d
<i>Tins on a view</i>	Tins on View Inquire

Aspect Inquire

Position of option on menu: Tins =>Inquire =>Aspect

The **aspect inquire** option calculates and displays the aspect (direction) of the triangles under the current plan view cursor position. The aspect is displayed in bearings in degrees, minutes and seconds.

Selecting **tin aspect inquire** displays the **tin aspect inquire** panel.

The fields and buttons used in this panel have the following functions.

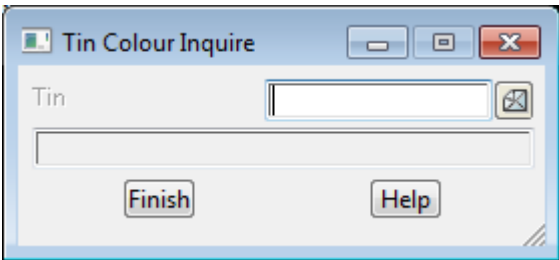

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin for which the aspect of the triangle that the cursor is above will be displayed in the panel's message area.</i>			

Colour Inquire

Position of option on menu: Tins =>Inquire =>Colour

colour inquire displays the colour of the triangles under the current plan view cursor position.

Selecting **tin colour inquire** displays the **tin colour inquire** panel.

The fields and buttons used in this panel have the following functions.

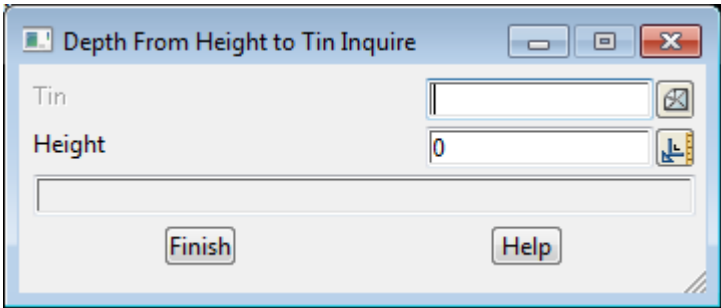

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin for which the colour of the triangle at the current cursor position is displayed in the panel's message area.</i>			

Depth from Height

Position of option on menu: Tins =>Inquire =>Depth from height

The **depth from height** option calculates and displays the difference between the z-value of a tin and a given height for the current plan view cursor position.

Selecting **depth from height** displays **depth from height to tin inquire** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin used for calculating the distance from the tin to the given height at the cursor position.</i>	tin box		available tins
Height <i>the difference between the tin value and the value given in this field is displayed in the panel's message area.</i>	input	0	

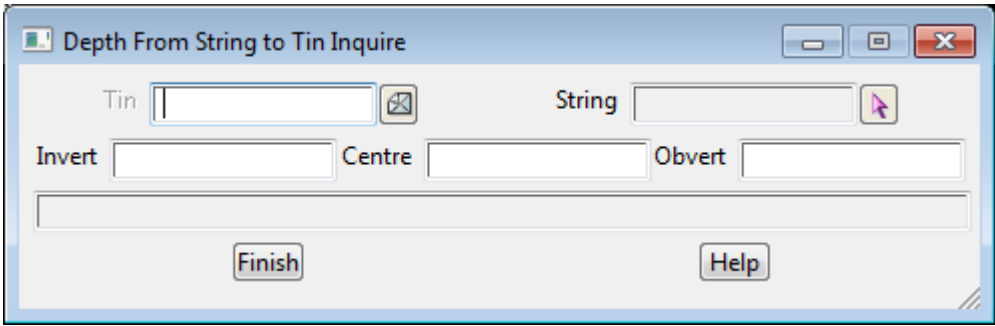

Depth from String

Position of option on menu: Tins =>Inquire =>Depth from string

The **depth from string** option calculates and displays the difference between the z-value of a tin and the height of a selected string at the current plan or section view cursor position projected back onto the selected string.

The obvert (top of the string) value is also known as the cover above a string to a tin.

Selecting **Depth from string** displays the **Depth From String to Tin Inquire** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin used for calculating the z-value at the cursor position.</i>			
String	string-select		
<i>if a string is selected, the difference between the tin value and the height of the selected string (to the invert, centre and obvert of the string) at the current plan or section view cursor position, projected back onto the selected string, is displayed in the panel's message areas.</i>			
Invert/Centre/Obvert	output		
<i>displays the distance between the tin and the invert (bottom), centre (axial) and obvert (top) of the selected string</i>			

Depth Between Tins

Position of option on menu: Tins =>Inquire =>Depth between tins

The **depth between tins** option calculates and displays the difference between the z-values of two given tins at the current plan view cursor position.

Selecting **depth between tins** displays the **depth between tins inquire** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/new tin	tin box		available tins
<i>name of the two tins or which the z-value is to be calculated at the current plan view cursor position and the difference between the z-values (z_new - z_original) is displayed in the panel's message area.</i>			

Height Inquire

Position of option on menu: Tins =>Inquire =>Height

The **height inquire** option calculates and displays the height (z-value) of triangles from a tin at the current plan view cursor position.

Selecting **tin height inquire** displays the **tin height inquire** panel.

The fields and buttons used in this panel have the following functions.

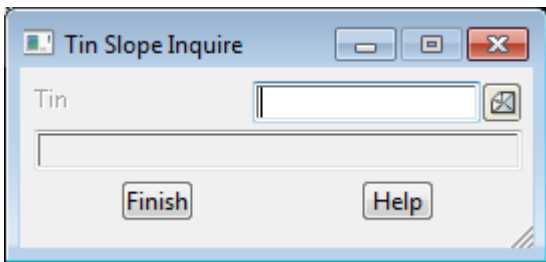

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin for which the z-value at the current plan view cursor position is displayed in the panel's message area.</i>			

Slope Inquire

Position of option on menu: Tins =>Inquire =>Slope

The **slope inquire** option calculates and displays the slope of triangles from a tin at the current plan view cursor position. The slope is displayed as a percent cross fall, a “1v in “slope and as an angle in degrees, minutes and seconds.

Selecting **tin slope inquire** displays the **tin slope inquire** panel.

The fields and buttons used in this panel have the following functions.

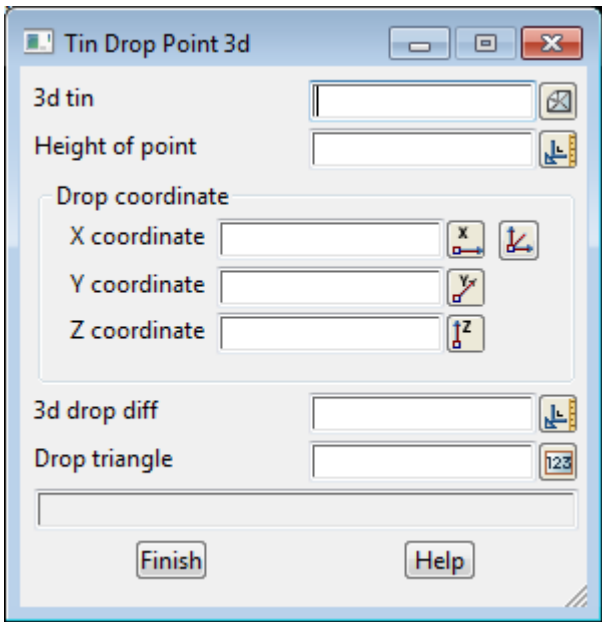

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin for which the slope of the triangle that the cursor is above is displayed in the panel's message area.</i>			

Tin Drop Point 3d

Position of option on menu: Tins =>Inquire =>Drop onto tin in 3d

The **Drop onto tin in 3d** option takes a cursor position and a user defined height of the point and drops perpendicularly onto the closest triangle.

Selecting **Drop onto tin in 3d** displays the **Tin Drop Point 3d** panel.

The fields and buttons used in this panel have the following functions.

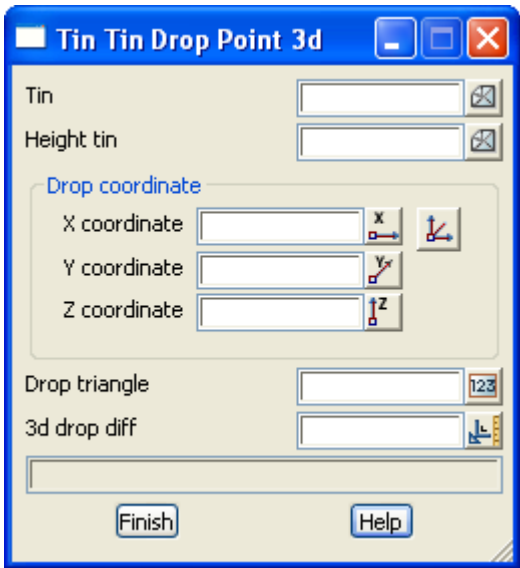

Field Description	Type	Defaults	Pop-Up
3d tin <i>name of the tin to drop the point perpendicularly onto. This cannot be a supertin.</i>	tin box		available tins
Height of point <i>the height to use at the (x,y) cursor position.</i>	real value		
Drop coordinates <i>X, Y, Z coordinate of the point dropped perpendicularly to the tin from the (x,y) cursor position and height from Height of point field</i>			
3d drop diff <i>the perpendicular distance to the tin. positive if the point being dropped is above the tin negative if the point being dropped is below the tin</i>	real		
Drop triangle <i>the number of the triangle the point was dropped to.</i>	number box		

Tin Tin Drop Point 3d

Position of option on menu: Tins =>Inquire =>Drop tin to tin in 3d

The **Tin Tin Drop Point 3d** panel allows the 3d, (perpendicular) height difference between 2 tins to be displayed at any position. Once both tins are selected and a valid 3d drop can occur the difference is displayed and the triangle dropped to highlighted.

Selecting **Drop tin to tin in 3d** brings up the **Tin Tin Drop Point 3d** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

3d Tin

the tin to drop the point to perpendicularly in 3d, this tin cannot be a supertin.

Height tin

the tin to get a z value for the current position to use in the 3d drop, this tin can be a supertin.

Drop coordinate

*the x, y, z positions of the drop on the **3d Tin**.*

3d drop diff

*the 3d, (perpendicular) difference between the 2 tins, a +ve value means the **3d Tin** is below the **Height tin** at the current position, a -ve value the **3d Tin** is above the **Height tin**.*

Drop triangle

*the index of the triangle dropped to in the **3d Tin**.*

Tins on View Inquire

Position of option on menu: Tins =>Inquire =>Tins on a view

As the cursor is moved over any plan view, the **Tins on a view** option lists all the tins and super tins on that view, and at the (x,y) location of the cursor, dynamically displays the z-value of each tin or super tin at that (x,y) location, and the colour, slope and aspect of the triangle from the tins or super tins currently under the cursor.

For a super tin, it also displays the name of the tin being used from the super tin at that cursor location.

Selecting **Tins on a view** brings up the **Tins on View Inquire** panel.

The fields and buttons used in the this panel have the following functions.

Field Description Type Defaults Pop-Up

Tin output

when the cursor is over a plan view, the Tin column list all the tins and super tins in the view.

When the cursor is actually over a tin or super tin, on the row in the grid for that tin or super tin, the height of the tin or super tin at the cursor (x,y) location, and the colour, slope and aspect of the triangle under the cursor is displayed in the rest of the columns of the grid.

If it is a super tin and the cursor is over the super tine, then the name of the super tin is given and then a "/" and then the name of the tin from the super tin that is being used to give the height, colour, slope and aspect. For example, in the Tin column the name "combined/final" means that the tin the cursor is over is a super tin called "combined" and it is using the tin called "final" from the super tin "combined" at that location.

Height output

when in a plan view and the cursor is actually over the tin given in the Tin column, this is the height

from the tin/super tin at the cursor location.

Colour/Slope/Aspect output

when in a plan view and the cursor is actually over the tin or super tin given in the Tin column, this is the colour/slope/aspect of the triangle from the tin or super tin at that cursor location.

Null

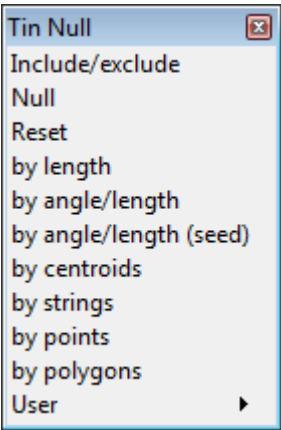

Position of menu: Tins =>Null

The triangulation process forms triangles throughout the convex polygon enclosing the data set. This means that triangles may cross regions where there is very little data and may produce strange results in the ill-defined regions.

In 12d Model, it is possible to make triangles invisible (called nulling triangles) so that they are not used in any options.

Note - nulled triangles are not deleted and can be made visible again at any time.

The null walk-right menu is

	set a polygon to include/exclude all triangles inside the polygon
Null	null triangles outside a polygon
Reset	reset all null triangles
by length	null triangles by length of sides
by angle/length	null triangles by length of sides and angle
by angle/length (seed)	null by angle and length starting at a seed point
by centroids	null/reset triangle under the centroid of strings
by strings	null triangles that are crossed by strings
by points	
by polygons	
User	pick triangles to null/reset

The three options in the tin colouring menu will now be discussed.

For the options <i>Include/exclude</i> , go to	Include/Exclude Boundaries.
<i>Null</i>	Null
<i>Reset</i>	Reset
<i>by length</i>	Null by Length
<i>by angle/length</i>	Null by Angle and Length
<i>by angle/length (seed)</i>	Null by Angle and Length (Seed)
<i>by centroids</i>	Null by Centroids
<i>by string</i>	Null by Strings
<i>by points</i>	Null by Points
<i>by polygons</i>	Null by polygons

Include/Exclude Boundaries

Position of option on menu: Tins =>Null =>Include/excludes

The **Include/exclude** option is used to tag a polygon that is part of the data set for a Tin so that all the triangles inside the polygon are either set to null or non-null.

On selecting the **Include/exclude** option, the **Tin Include/Exclude Boundaries** panel is displayed.

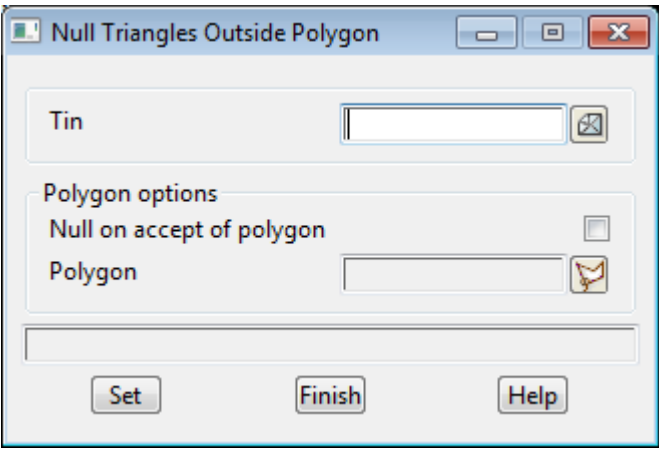

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boundary mode <i>mode to set the polygon to.</i> <i>If exclude, then any triangles inside the polygon are set to null.</i> <i>If include, then any triangles inside the polygon are reset so that they aren't null.</i> <i>If none, then the polygon is not used for automatically nulling/resetting triangles.</i>	choice box	none	none, include, exclude
Pick <i>select the polygon to define a boundary mode for.</i>	button		
Set <i>set the boundary mode for the selected polygon.</i>	button		

Null

Position of option on menu: Tins =>Null =>Null

The **null** option is used to null any triangle whose *centroid* is outside a user selected polygon.
Selecting **Null** displays the **Null Triangles Outside Polygon** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null triangles in.</i>	tin box		available tins

Null on accept of polygon tick box
*if ticked, the triangles will be nulled as soon as the string is accepted.
If not ticked, the triangles will not be nulled until the **Set** button is selected.*

Polygon polygon select
the string to be used as the polygon is selected after choosing this button. If Null on accept of polygon is set, then the polygon is processed immediately.

Set button
process the selected string/. Any triangle whose centroid is outside the selected boundary polygon is set to null.

Reset

Position of option on menu: Tins =>Null =>Reset

The reset option is used to change all the nulled triangles in a tin back to the visible triangles.

Selecting reset displays the **Null Triangles Reset** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin to have any nulled triangles reset to being visible triangles.</i>			
Reset	button		
<i>the reset button resets all null triangles in the tin to the base colour.</i>			

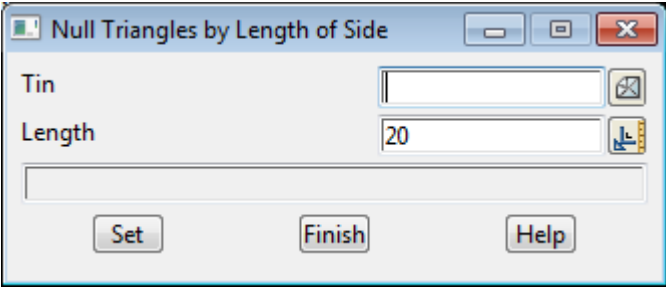

Null by Length

Position of option on menu: Tins =>Null =>by length

The **null by length** option is used to null any triangle with a side of length greater than a user specified length.

Warning - this option will null out *internal* triangles. The next option, Null by angle/length will only null triangles on the outer shell.

On selecting the **by length** option, the **null triangles by length of side** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null triangles in.</i>	tin box		available tins
Length <i>length to check triangle sides against.</i>	input		
Set <i>after selecting the set button, the tin will be processed and any triangle with a side of length greater than the value given in the length panel field, will be nulled.</i>	button		

Null by Angle and Length

Position of option on menu: Tins =>Null =>by angle/length

The **null by angle/length** option is a more powerful nulling option which tries to remove most of the external triangles that one expects should be removed. For example, for a T-intersection, all the long, thin outer triangles should be removed. The option has two sets of tests - one to remove long thin triangles and the other which uses a combined test to remove squat triangles.

Unlike the **null by length** option, **null by angle/length** only works on triangles which have an outer null triangle on one or two sides (it does not work on internal holes). These triangles are called **external triangles** and sides with an outer null triangle on them are called **external sides**.

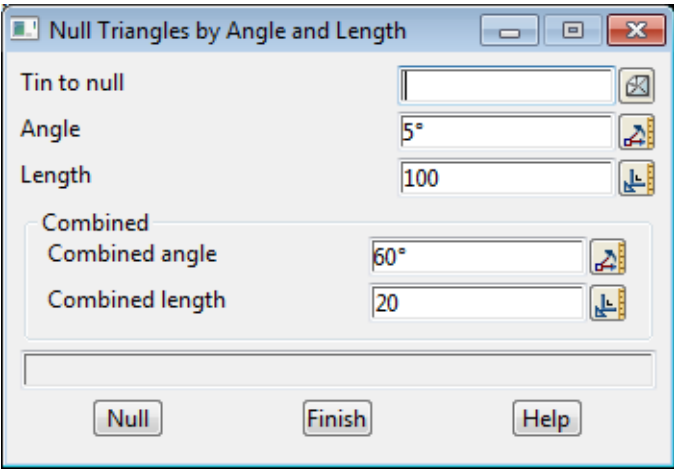

The **null by angle and length** option *does not* remove triangles whose external side is a breakline. Hence, as expected, breaklines will stop the nulling process.

Note that **null by angle and length** keeps processing the remaining non-nulled triangles until no more can be nulled or are stopped by breaklines. Hence the nulling works inwards as outer triangles are nulled revealing new external triangles to be tested. The nulling process is like peeling off layers of an onion.

Important note - the setting for this option are **stored** by the triangulation and the option is automatically re-run if the triangulation is re-run. To turn off the tests, just set the panel fields to blank.

Warning - this option should be the first nulling option used because all null triangles are first reset to valid triangles before this option is applied.

On selecting the **null by angle/length** option, the **Null Triangles by Angle and Length** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to null	tin box		available tins
<i>name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.</i>			
Angle	angle box	5	
<i>if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time.</i>			
<i>If blank then no triangles are nulled by this test.</i>			

after selecting the **Null** button, all nulled triangles are reset to be valid triangles and the tin then processed and triangles nulled.

Null by Angle and Length (Seed)

Position of option on menu: Tins =>Null =>by angle/length (seed)

The **null by angle/length (seed)** option is similar to the powerful null by angle/length option (see [Null by Angle and Length](#)) except it has the additional **start point**.

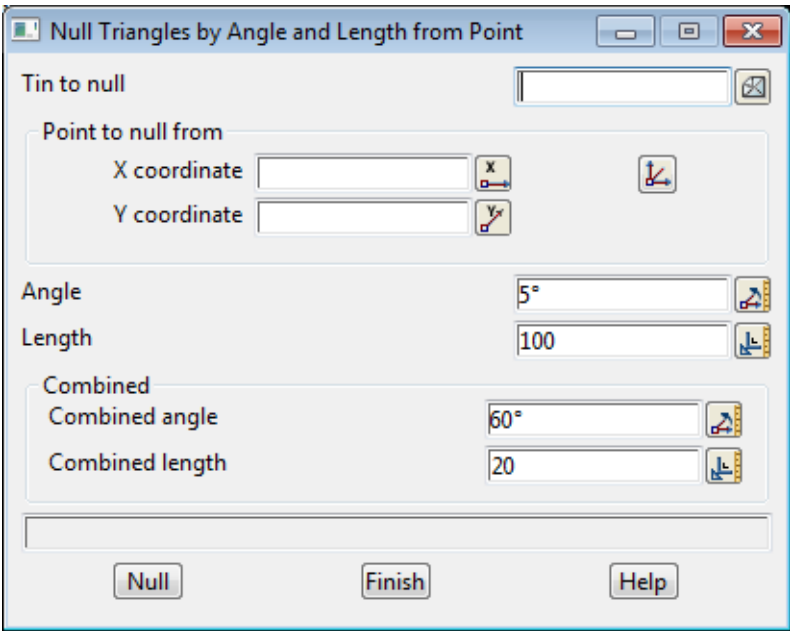

That is, a start triangle is selected by the cursor and the nulling starts from the triangle under the cursor.

The *null by angle/ length (seed)* option then starts nulling triangles from the start triangle using the angle/length parameters until stopped by breaklines.

Hence the nulling works **outwards** from the start triangle revealing new triangles to be tested until stopped by breaklines.

This option is particularly useful for nulling internal areas of a tin.

Selecting null by angle/length (seed) displays the **Null Triangles by Angle and Length from Point** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to null <i>name of the tin to have triangles nulled. If this option has been previously run on the tin, the previous panel values are written into the panel fields.</i>	tin box		available tins
Point to null from <i>the X/Y co-ordinates of a position to start nulling from.</i>			
Angle <i>if a triangle has an external side (that is not a breakline) with an angle on it less than Angle, then the triangle is nulled. The default value works most of the time. If blank then no triangles are nulled by this test.</i>	angle box	5	
Length	input	100	

*if a triangle has an external side (that is not a breakline) greater than Length, the triangle is nulled.
If blank then no triangles are nulled by this test.*

Combined angle	input	60
Combined length	input	20

*For the Combined case, a triangle is nulled if it:
has an external side (that is not a breakline) and the **sum** of the two angles on it is **less** than Combined
angle (the default value works most of the time)
and
has an external side (that is not a breakline) whose length is **greater** than Combined length. A
suggested value is one third to one half of Length.
If either Combined angle or Combined length is blank, then no triangles are nulled by this test.*

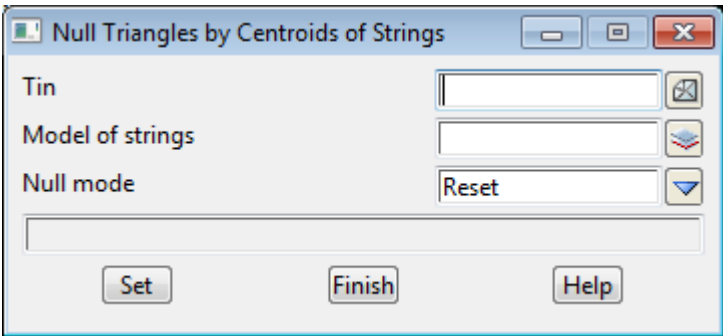

Null button

*after selecting the **Null** button, the triangle under the (X,Y) position is determined and null processing
starts from that triangle.*

Null by Centroids

Position of option on menu: Tins =>Null =>by centroids

null by centroids is used to null/reset any triangle that lies under the centroid of a string.
On selecting the by centroids option, the null triangles by centroids of strings panel is displayed.

The fields and buttons used in this panel have the following functions.

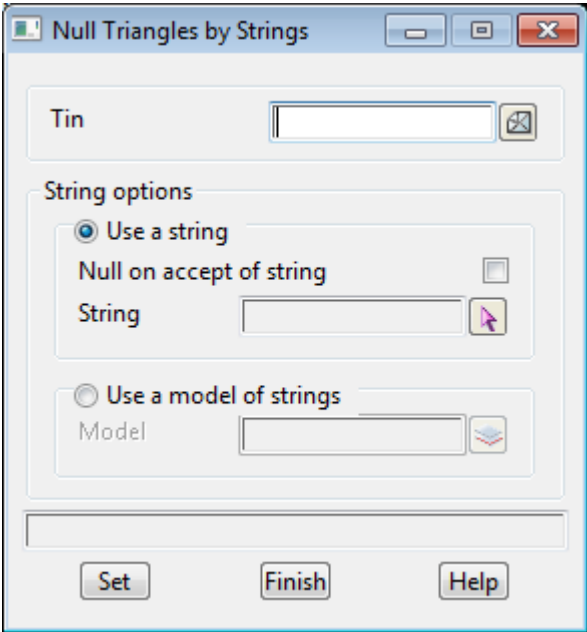

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null/reset triangles in.</i>	tin box		available tins
Model of strings <i>model of strings to be used to select triangles that are under a centroid of one of the model's strings.</i>	model box		available models
Null mode <i>if null, any triangle under the centroid of a string from the model of strings, will be nulled. reset, any triangle under the centroid of a string from the model of strings, will be made visible again.</i>	choice box	Reset	Reset, Null
Set <i>after selecting the set button, the tin will be processed and any triangle under the centroid of a string will be set according to the null mode panel field.</i>	button		

Null by Strings

Position of option on menu: Tins =>Null =>by strings

The **null by strings** option is used to null any triangle that is cut by a string.

On selecting the **by strings** option, the **null triangles by strings** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null triangles in.</i>	tin box		available tins
Use a string <i>if set, strings will be selected and used to null any triangle that the string passes through.</i>	radio button		
Null on accept of string <i>if ticked, the triangles will be nulled as soon as the string is accepted. If not ticked, the triangles will not be nulled until the Set button is selected.</i>	tick box		
String	string select	existing string	string pop-up

*if string, a strings will be selected and used to null any triangle that the string passes through.
If line, a temporary two point line is drawn and used to null any triangle that the line passes through
If polyline, a temporary polyline is drawn and used to null any triangle that the string passes through
If closed polyline, a temporary closed polyline is drawn and used to null any triangle that the string passes through*

Use a model of strings radio button

if set, a model of strings is used and a triangle is nulled if it is cut by any one of the strings.

Model model box available models

model of strings to cut the triangles.

Set button

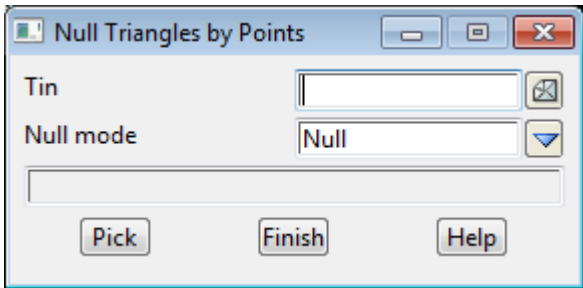

*after selecting the **set** button, the tin will be processed and any triangle that is cut by a string from the Model, or a selected string for the User a string case, will be nulled.*

Null by Points

Position of option on menu: Tins =>Null =>by points

The **null by points** null or reset any triangle that the user clicks LB whilst over the triangle in a plan view.

On selecting the **by points** option, the **null triangles by points** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to null/reset triangles in.</i>	tin box		available tins
Null mode <i>if null, any triangles under a cursor pick will be nulled.</i> <i>reset, any nulled triangles under a cursor pick will be turned back on.</i>	choice box	Null	Reset, Null
Pick <i>any triangle under the cursor select will be processing according to the null mode panel field.</i>	button		

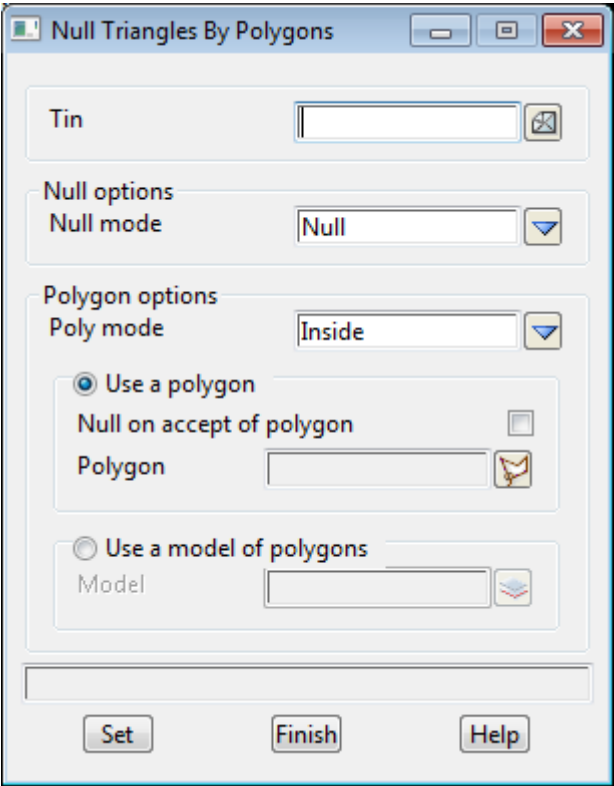

Null by polygons

Position of option on menu: Tins =>Null =>by polygons

The **null by polygons** option is used to null/reset any triangles that are inside or outside a user selected polygon, or model of polygons.

If a string is selected to use and it is not closed, then a polygon is formed by joining the first and the last points of the string.

On selecting the **by polygons** option, the **null triangles by polygons** panel is displayed

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin	<i>name of the tin to null/reset triangles in.</i>	tin box		available tins
Null mode	<i>if null, any triangles selected will be nulled. reset, any nulled triangles selected will be turned back on.</i>	choice box	Null	Reset, Null
Poly mode	<i>mode to select whether the triangles with centroids inside or outside the selected polygons are to be nulled.</i>	choice box	inside	inside, outside
Use a polygon	<i>if set, strings will be selected and used as the polygon to null/reset all triangles with centroids inside/ outside the polygon.</i>	radio button		
Null on accept of polygon	<i>if ticked, the triangles will be nulled/reset as soon as the polygon (string) is accepted. If not ticked, the triangles will not be nulled/reset until the Set button is selected.</i>	tick box		

Null on accept of string tick box

*if ticked, the triangles will be nulled as soon as the string is accepted.
If not ticked, the triangles will not be nulled until the **Set** button is selected.*

Polygon polygon select polygon pop-up

polygon to null or rest triangles when the centroid is inside/outside the polygon

Use a model of polygons radio button

*if set, a model of strings will be used as the polygons to null/reset triangles whose centroids are inside/
outside one of the polygons.*

Model model box available models

model of strings to provide the polygons for nulling/resetting triangles.

Set button

*each string in the model of polygons is used to null/reset the triangles in the tin given in the tin field
according to the null mode and poly mode panel field.*

Utilities

Position of option on menu: Tins =>Utilities =>Tin Utilities

The triangles=>utilities menu contains miscellaneous options involving tins.

The Utilities walk-right menu is

Tin Utilities	
Add	add tins to project and models
Copy	create a copy of a tin
Copy project tin	copy a tin from another project
Create TIN faces	create faces from a tin
Grid DTM	create regular grid of points on a tin
Rotated grid DTM	create a rotated grid of points on a tin
DEMs	create Digital Elevation Models
Remove	remove tins from project and models
Rename	rename a tin
Report	create report of a tin
Save	save tins to disk
Tin to strings	create points and breaklines from a tin
Translate/copy	translate/copy a tin
Weed	weed duplicate points from the tin database
Z diffs from tins	create vertices with z-difference between two tins
Z diffs from string to tin	create vertices with z-difference between string and a tin
Min/Max of tins	calculate a grid of mi and max values for the tin
User	

Each option will now be described.

For the options <i>Add</i> , go to	Add
<i>Copy</i>	Copy
<i>Copy project tin</i>	Copy Project Tin
<i>Create Tin faces</i>	Create Tin Faces
<i>Grid DTM</i>	Grid DTM
<i>Rotated grid DTM</i>	Rotated Grid
<i>DEMs</i>	DEMs
<i>Remove</i>	Remove
<i>Rename</i>	Rename
<i>Report</i>	Report
<i>Save</i>	Save
<i>Tin to strings</i>	Tin to Strings
<i>Translate/copy</i>	Translate/Copy
<i>Weed</i>	Weed
<i>Z diffs from tins</i>	Z Differences from Tins
<i>Z diffs from string to tin</i>	Z Differences from String to Tin
<i>Min/ Max of tins</i>	Grid of Min / Max of Tins

Add

Position of menu: Tins =>Utilities =>Add

Tins can be added to the project and to models.

The tin adds walk-right menu is

The options in this menu will now be described.

For the option Add to project, go to [Add to Project](#)
Add all to project [Add All To Project](#)
Add to model [Add to Model](#)

Add to Project

Position of option on menu: Tins =>Utilities =>Add =>Add to project

The add to project option is used to add a removed tin back into the project.

On selecting the add tin to project option, the add tin to the project panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed tin <i>name of the tin to be added to the working project. The tin must exist on the disk in the project area and not already be in the project.</i>	tin box		available tins
Model for tin <i>if non-blank, the loaded tin will be added to the model given in this field.</i>	model box		available models
Add <i>Add the tin given in the Tin field to the working project. If the model for tin field is non-blank, the tin will be added to the model given in that field - if the model does not exist, it will be created.</i>	button		

Add All To Project

Position of option on menu: Tins =>Utilities =>Add =>Add all to project

The **add all tins** option is used to add all the removed tins back into the project.
On selecting the **add all to project** option, the **add all tins to project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		
<i>after selecting this button, all removed tins in the working project will be added to the project.</i>			

Add to Model

Position of option on menu: Tins =>Utilities =>Add =>Add to model

On selecting the **add to model** output option, the **add tin to a model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin to be added to a model.</i>			
Add to model	model box		available models
<i>name of the model to which the tin given in the tin field will be added.</i>			
Add	button		
<i>add the tin given in the tin field to the model given by the add to model field.</i>			

Copy

Position of option on menu: Tins =>Utilities =>Copy

A copy of an existing tin can be made using the `copy` option.

A SuperTin can also be copied and what is created is a new super tin with a new name but with exactly the same tins making it up as the original tin.

On selecting `copy`, the **tin copy** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Old tin	<i>name of the tin to be copied.</i>	tin box		available tins
New tin	<i>name of the copy of the tin - this can't be the same as any existing tin in the project.</i>	tin box		available tins
Colour of tin	<i>if non-blank, the colour of the new tin. If blank, use the old tin colour</i>	colour box		available colours
Model for tin	<i>if non-blank, the name of the model for the new tin. If blank, the tin is not put in any model.</i>	model box		available models
Copy	<i>after selecting this button, the tin given in the old tin field will be copied and the copy given the name in the new tin field and placed in the model given in the model for tin field.</i>	button		

Copy Project Tin

Position of option on menu: Tins =>Utilities =>Copy project tin

On selecting the copy project tin option, the copy project tin panel is displayed.

The fields and buttons used in this panel have the following functions.

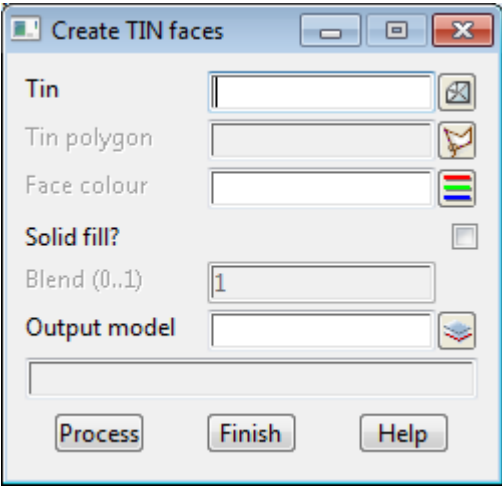

Field Description	Type	Defaults	Pop-Up
Copy on selection	tick box		
<i>if ticked, the project is copied as soon as it is selected. The same tin name and default model containing the tin is used.</i>			
Folder	folder box		working folder
<i>name of the working folder containing the project from which the tin should be copied</i>			
Project	project box		current projects
<i>name of the project in the folder given in the Folder field, from which the tin should be copied.</i>			
Tin	tin box		available tins
<i>name of the tin to be copied.</i>			
New name	tin box		
<i>if non-blank, the new name to be given to the copied tin which must be different to all the exiting tins names in the working project.</i>			
<i>If blank, keep the name of the original tin (as long as it is different to the existing tins).</i>			
New model	model box		available models
<i>if non-blank, the tin will be placed in this model.</i>			
Copy	button		
<i>copy to this project, the tin given in the Tin field from the project given in the Project field.</i>			

Create Tin Faces

Position of option on menu: Tins =>Utilities =>Create tin faces

This options creates a separate face for each triangle in a tin.

Selecting Create tin faces displays the **Create Tin Faces** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin	<i>name of the tin to have faces created for each triangle.</i>	tin box		available tins
Tin polygon	<i>if selected, faces are created fro triangles whose centroid is inside the selected polygon.</i>	polygon select		
Face colour	<i>if blank, the tin triangle colour is used for the face colour. If not blank, this colour is used for all faces.</i>	colour box		
Solid fill ?	<i>if ticked, the faces are solid filled with a blend value</i>	tick box		
Blend (0 ... 1)	<i>The value of blending is between 0 and 1. 0 means the face is totally transparent (and hence invisible) and 1 means that the face is opaque (non-translucent) and can't be seen through at all. If blank, then the value is taken as 1 and the polygon is opaque (non-translucent).</i>	real value		
Output model	<i>model for the faces</i>	model box		available models
Process	<i>create faces for selected triangles.</i>	button		

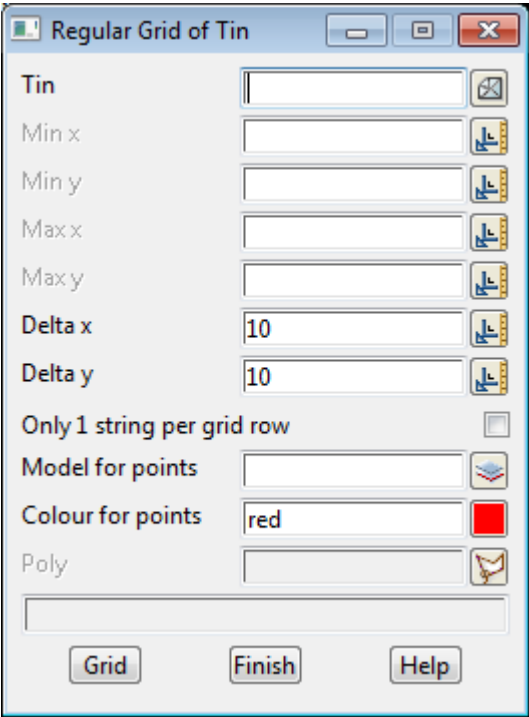

Grid DTM

Position of option on menu: Tins =>Utilities =>Grid

The grid option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Also see the [DEMs](#) options for creating a file of a regular grid to different formats (Arc View, Quantm, Sokkia).

On selecting the Grid option, the **Regular Grid of Tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the spot heights will be calculated.</i>	tin box		available tins
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Delta x/y <i>difference between the x/y-values for the grid.</i>	input		
Only 1 string per grid row <i>if ticked, all the grid points for a row are joined in a point string. If not ticked, individual one vertex strings are created for each grid point.</i>	tick box		
Model for points <i>if blank, no point strings will be created. If non-blank, points strings of the spots heights will be created and stored in this model.</i>	model box		available models

Colour for points colour box default colour available colours

colour to make the point strings.

Poly poly-select

if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.

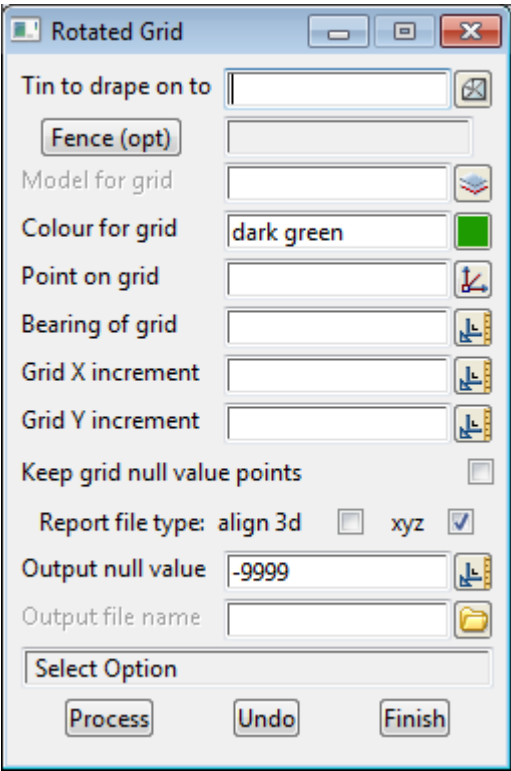

Grid button

calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

Rotated Grid

Position of option on menu: Tins =>Utilities =>Rotated Grid

This panel is used to create a grid of points with z-values from a given tin. The grid can be rotated and a polygon can be used to restrict the created points. A report of grid points can also be calculated in either simple x y z (one point per line) form or if no polygon is used, in a format accepted by Quantm (formerly Align 3d).

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin to drape on to <i>Tin to get the z-values from.</i>	tin box		available tins
Fence (opt) <i>Optional – if selected, the grid is restricted to being inside the polygon.</i>	string select		
Model for grid <i>Model for the created grid.</i>	model box		available models
Colour for grid <i>Colour for the created grid</i>	colour box	dark green	available colours
Point on grid <i>The selected point is on the grid. The other grid points are integer multiples of the “Grid X increment” and “Grid Y increment” (with the bearing “Bearing of grid”) from this point.</i>	point select box		
Bearing of grid <i>Bearing of the side of the grid.</i>	bearing box		

Undo the last grid created whilst the panel is up.

DEMs

Position of menu: Tins =>Utilities =>DEMs

Position of menu: File I/O =>Data output =>DEMs

DEMS (Digital Elevation Models) can be created from a tin. DEMS are only regular arrays of z-values, rather than the random values and break lines supported by Tins.

Unfortunately there is not just one formats for DEMs.

The DEMS walk-right menu is

For the option *Arc View*, go to

Arc View Act/Min/Max/Avg

Sokkia

Quantm

[Write Arc View DEM](#)

[Write Arc View DEM \(Actual, Min, Max, Av\)](#)

[Sokkia](#)

[Quantm](#)

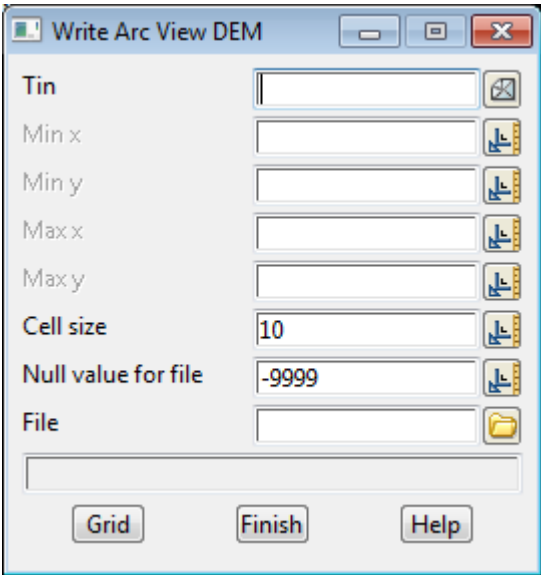

Write Arc View DEM

Position of option on menu: Tins =>Utilities =>DEMs =>Arc View

Position of menu: File I/O =>Data output =>DEMs =>Arc View

The Arc View option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values and writes out the data in the Arc View DEM format.

On selecting the Arc View option, the Write Arc View DEM panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the DEM heights will be calculated.</i>	tin box		available tins
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Cell size <i>size of the delta x and delta y - cell is a square.</i>	input		
Null value for file <i>value to use when writing null z-values out to the file.</i>	input	-9999	
File <i>the file name for the spot height values in Arc View DEM format.</i>	file box		*.grd
Grid <i>calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.</i>	button		

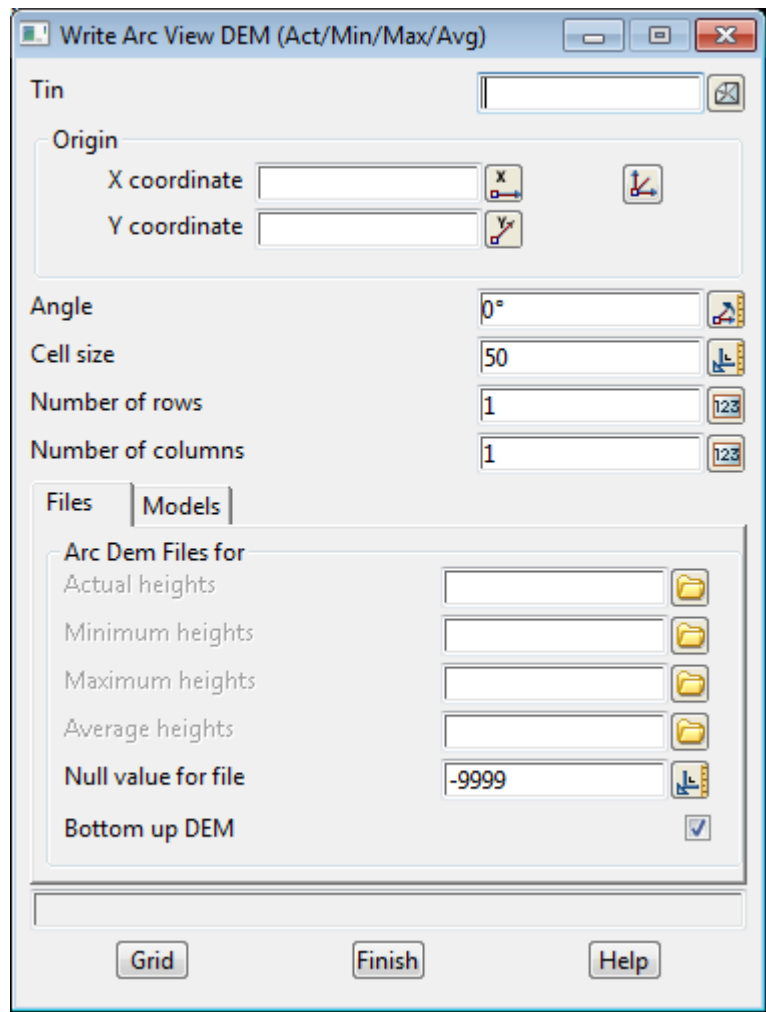

Write Arc View DEM (Actual, Min, Max, Av)

Position of option on menu: Tins =>Utilities =>DEMs =>Arc View Act/Min/Max/Avg

Position of menu: File I/O =>Data output =>DEMs =>Arc View Act/Min/Max/Avg

The Arc View Act/Min/Max/Agg option calculates heights at points at regular x and y increments (cell size) between given minimum and maximum x and y values, and also the minimum, maximum and average values for the cell. The data is written out in the Arc View DEM format.

On selecting the Arc View Act/Min/Max/Avg option, the Write Arc View DEM (Act/Min/Max/Avg) panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the DEM heights will be calculated.</i>	tin box		available tins
X/Y coordinate <i>X/Y coordinates for the origin of the DEM</i>	input		
Angle <i>angle of rotation of the DEM</i>	angle box		
Cell size <i>size of the delta x and delta y - cell is a square.</i>	input		

Number of rows/columns input 1
number of rows/columns in the DEM

Files tab - Arc DEM files for

Actual heights file box
if non blank, write the z-values for the tin at the middle of each cell, out to a dem file

Minimum heights file box
if non blank, write the minimum z-values for the tin for the each cell, out to a dem file

Maximum heights file box
if non blank, write the maximum z-values for the tin for the each cell, out to a dem file

Average heights file box
if non blank, write the average z-values for the tin for the each cell, out to a dem file

Null value for file input -9999
value to use when writing null z-values out to the DEM files.

Bottom up DEM tick box
*if ticked, the DEM files are written from the bottom row of the grid and work up.
If not ticked, the DEM files are written from top row of the grid and work down*

Models tab - Models for

Actual heights model box
if non blank, create points of z-values for the tin at the middle of each cell

Minimum heights model box
if non blank, create points of minimum z-values for the tin for the each cell

Maximum heights model box
if non blank, create points of maximum z-values for the tin for the each cell

Average heights model box
if non blank, create points of average z-values for the tin for the each cell

Colour for points colour box
colour for the point strings

Grid button
calculate the spot heights at regular points over the area given by the min and maximum x and y values and write out the file.

Quantm

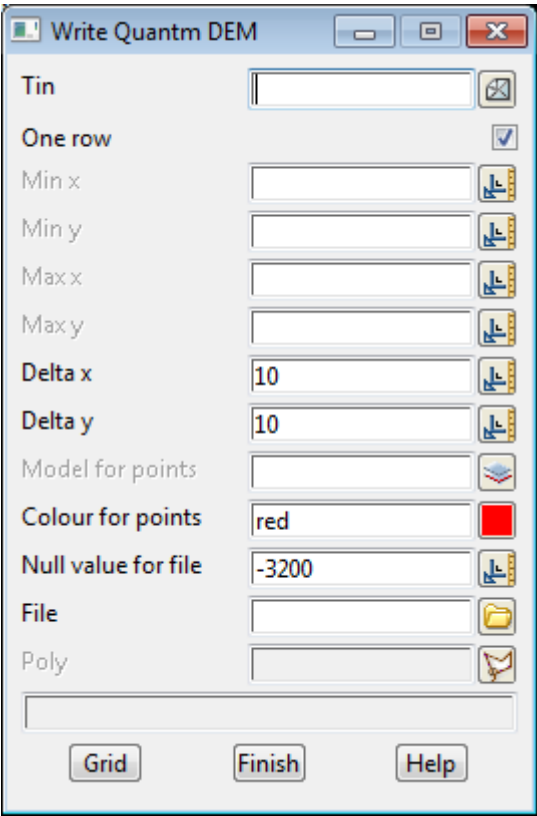

Position of option on menu: Tins =>Utilities =>DEMs =>Quantm

Position of menu: File I/O =>Data output =>DEMs =>Quantm

The **Quantm** option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon.

Actual point strings and/or a file of heights at the points in Quantm (formerly Align 3D) format can be generated. For Quantm no polygon should be used and if there is no z-value (no tin) at a point, then a null z-value is written to the output file.

On selecting the **Quantm** option, the **Write Quantm DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the spot heights will be calculated.</i>	tin box		available tins
One row <i>If ticked, null points are added in for any missing (x,y) so that there is only one row of data (one string) for each x-value.</i>	tick box		
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Delta x/y	input		

difference between the x/y-values.

Model for points model box available models
if blank, no point strings will be created.
If non-blank, points strings of the spots heights will be created and stored in this model.

Colour for points colour box default colour available colours
colour to make the point strings.

Null value for file input -3200
value to use when writing null z-values out to the file.

File file box *.grd
If non-blank, a file of the spot height values in Quantm format is created.

Poly poly-select
if a polygon is selected, then the spot heights will be restricted to within the polygon.
If no polygon is selected, the spot heights will be calculated over the entire tin.

Grid button
calculate the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.

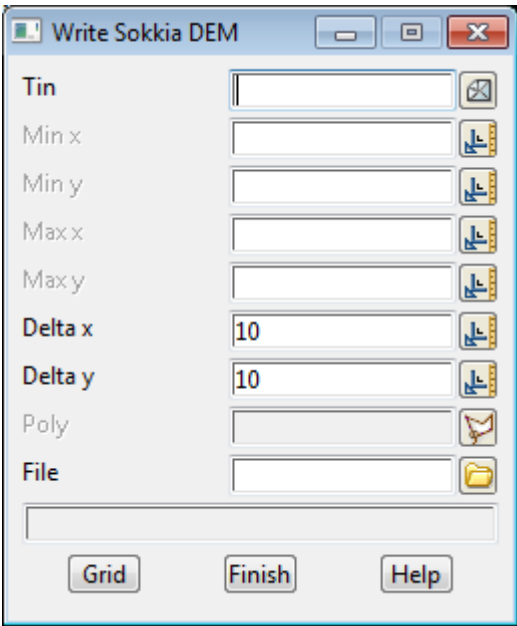

Sokkia

Position of option on menu: Tins =>Utilities =>DEMs =>Sokkia

Position of menu: File I/O =>Data output =>DEMs =>Sokkia

The Sokkia option calculates heights at points at regular x and y increments between given minimum and maximum x and y values. If a polygon is given, a z-value is only calculated for points inside the polygon. A file of heights at the points in Sokkia format is generated.

On selecting the Sokkia option, the Write Sokkia DEM panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin on which the spot heights will be calculated.</i>	tin box		available tins
Min x/y <i>minimum x/y values to calculate spot heights for.</i>	input		
Max x/y <i>maximum x/y values to calculate spot heights for.</i>	input		
Delta x/y <i>difference between the x/y-values.</i>	input		
Poly <i>if a polygon is selected, then the spot heights will be restricted to within the polygon. If no polygon is selected, the spot heights will be calculated over the entire tin.</i>	poly-select		
File <i>If non-blank, a file of the spot height values in Sokkia format is created.</i>	file box		*.grd
Grid <i>calculate and write a file of the spot heights at regular points over the area given by the min and maximum x and y values and restricted to be inside the polygon.</i>	button		

Remove

Position of menu: Tins =>Utilities =>Remove

Tins can be removed from models and from the project. Remove tins are not deleted but simply taken off the tin list in the project. Removed tins are left in the project area and can be added in again using the **add** option.

The **tin removes** walk-right menu is

The options in the menu will now be described.

For the option Remove from project, go to
Remove all from project
Remove from model

[Remove From Project](#)
[Remove All From Project](#)
[Remove From Model](#)

Remove From Project

Position of option on menu: Tins =>Utilities =>Remove =>Remove from project

On selecting the remove from project option, the remove tin from the project panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
<i>name of the tin to be removed from the working project.</i>			
Remove	button		
<i>remove the tin given in the tin field from the project.</i>			

Remove All From Project

Position of option on menu: Tins =>Utilities =>Remove =>Remove all from project

On selecting the remove all from project option, the remove all tins from project panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Remove	button		
<i>remove all the tins from the working project. If no errors occur, the panel will be removed after the tins have been removed.</i>			

Remove From Model

Position of option on menu: Tins =>Utilities =>Remove =>Remove from model

On selecting the remove from model option, the **remove tin from a model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to be removed from a model.</i>	tin box		available tins
Model <i>name of the model from which the tin given in the tin field will be removed.</i>	model box		available models
Remove <i>remove the tin given in the tin field from the model given in the model field.</i>	button		

Rename

Position of option on menu: Tins =>Utilities =>Rename

On selecting the `rename` option, the **tin rename** panel is displayed.

This panel can be used to change the names of existing tins

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old tin <i>name of the tin to be renamed.</i>	tin box		available tins
New tin <i>new name for the tin</i>	tin box		
Rename <i>change the name of the tin in the old tin field to the name given in the new tin field.</i>	button		

Report

Position of option on menu: Tins =>Utilities =>Report

This panel produces a report on the tin including the models making up the tin and all the settings used when creating the tin.

On selecting the **Tin** report option, the **Report Tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin	<i>name of the tin to create report for.</i>	tin box		available tins or super tins
File	<i>name of the report file</i>	file box		*.rpt files
Report	<i>create the tin report.</i>	button		

Save

Position of menu: Tins =>Utilities =>Save

Tins are automatically saved on disk when they are first created but various operations can then be applied to tins which may not be immediately updated on disk.

The tin saves walk-right menu is

The options in the menu will now be described.

For the option Save a tin, go to

Save all tins

Forced Save all tins

[Save a Tin](#)

[Save/Forced Save All Tins](#)

[Save/Forced Save All Tins](#)

Save a Tin

On selecting the save a tin option, the **save tin** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin		tin box		available tins
<i>name of the tin to be saved to disk.</i>				
Save		button		
<i>after selecting this button, the tin given in the tin field will be saved to disk.</i>				

Save/Forced Save All Tins

Position of option on menu: Tins =>Utilities =>Save =>Save all tins

Position of option on menu: Tins =>Utilities =>Save =>Forced Save all tins

On selecting the save/force save all tins option, the save/forced save all tins panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Save		button		

for save all tins: after selecting this button, all tins in the working project that have been modified since their last save, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

for force save all tins: after selecting this button, all tins in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Tin to Strings

Position of option on menu: Tins =>Utilities =>Tin to strings

The points and breaklines of an existing tin can be extracted using the **Tin to strings** option.

Note that only the final points and breaklines used in creating the tin are extracted. Original string name, colours etc. are not obtainable.

Selecting **Tin to strings** displays the **Tin to Strings** panel:

The fields and buttons used in this panel have the following functions.

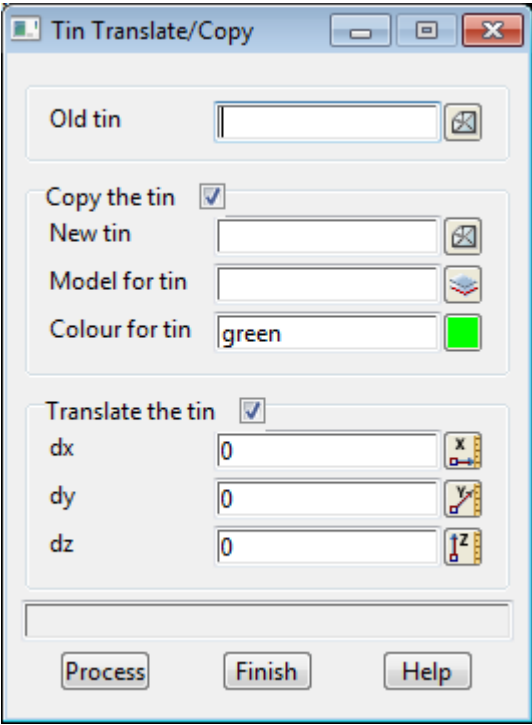

Field Description	Type	Defaults	Pop-Up
Tin to extract strings <i>name of the tin to extract points and breaklines from.</i>	tin box		available tins
Model for strings <i>model to hold the extracted point and breakline strings.</i>	input		available models
Extract <i>extract the points and breaklines that make up a tin.</i>	button		

Translate/Copy

Position of option on menu: Tins =>Utilities =>Translate/copy

An existing tin can be translated and/or copied using the Translate/copy option.

Selecting Translate/copy, displays the **Tin Translate/Copy** panel:

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Old tin	<i>name of the tin to be copied/translated.</i>	tin box		available tins
Copy the tin	<i>if ticked, the New tin, Model for Tin and Colour for tin fields are activated and supply the information for the new tin.</i>	tick box	tick	
New tin	<i>name of the copy of the tin - this can't be the same as any existing tin in the project.</i>	tin box		available tins
Model for tin	<i>if non-blank, the name of the model for the new tin. If blank, the tin is not put in any model.</i>	model box		available models
Colour for tin	<i>if non-blank, the colour of the new tin. If blank, use the old tin colour</i>	colour box		available colours
Translate the tin	<i>if ticked, the dx, dy and dz fields are activated and supply the information for translating the tin</i>	tick box	tick	
dx/dy/dz	<i>the delta amounts to translate the tine by.</i>	real box	0	
Process		button		

translate/copy the tin.

Weed

Position of option on menu: Tins =>Utilities =>Weed

When a tin is created, a copy of all the points and lines used in creating the tin is saved with the tin, including any duplicate points and lines.

The **weed** option will remove all the duplicate points and lines from the tin database.

On selecting the **Weed** option, the **tin weed** panel is displayed.

The fields and buttons used in this panel have the following functions.

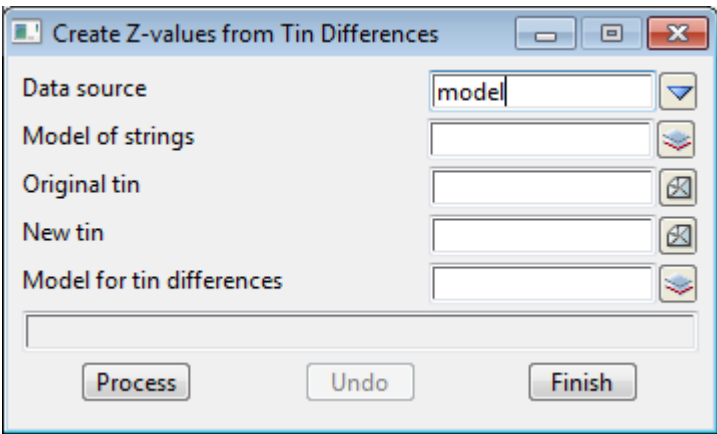

Field Description	Type	Defaults	Pop-Up
Tin to weed <i>name of the tin to weed.</i>	tin box		available tins
Weed <i>remove all duplicate points and lines from the tin database.</i>	button		

Z Differences from Tins

Position of option on menu: Tins =>Utilities =>Z diffs from tins

This option takes a data source and for each point in the data source, creates a new point whose z-value is the difference in z-values from two given tins at the plan position of the data source point.

On selecting the **Z diffs from Tins** option, the **Create Z-Values from Tin Differences** panel is displayed.

The fields and buttons used in this panel have the following functions:

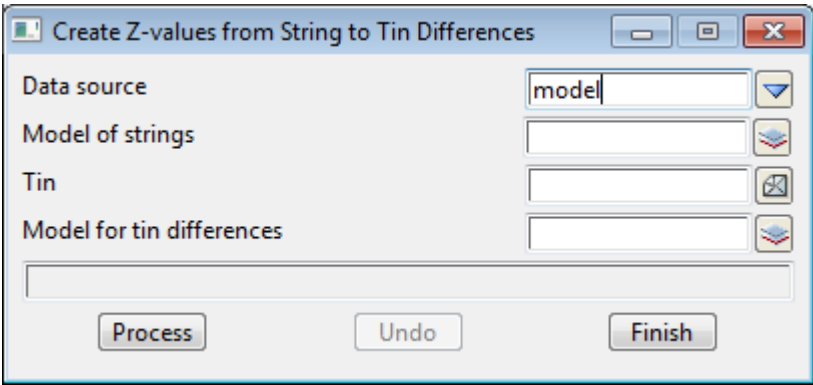

Field Description	Type	Defaults	Pop-Up
Data to settle			
Data source type <i>data selection type</i>	choice box	Model	model. string, view
Data source <i>data to be processed.</i>	input		
Original tin <i>name of the tin to get the z-value from.</i>	tin box		available tins
New tin <i>name of the tin to get the z-value from.</i>	tin box		available tins
Model for tin differences <i>model to place the strings containing the z values with the difference between the tins.</i>	model box		available models
Process <i>for all strings in the data source, calculate the difference in the z-values from the two tins at the string vertices.</i>	button		

Z Differences from String to Tin

Position of option on menu: Tins =>Utilities =>Z diffs from string to tin

This option takes a data source and for each string in the data source, creates a plan copy of the string and for each vertex in the new string, the z-value at a vertex is the difference in z-values from the original string vertex and the z-value of the tin at the (x,y) position of the vertex.

On selecting the **Z diffs from string to tin** option, the **Create Z-Values from String to Tin Differences** panel is displayed.

The fields and buttons used in this panel have the following functions:

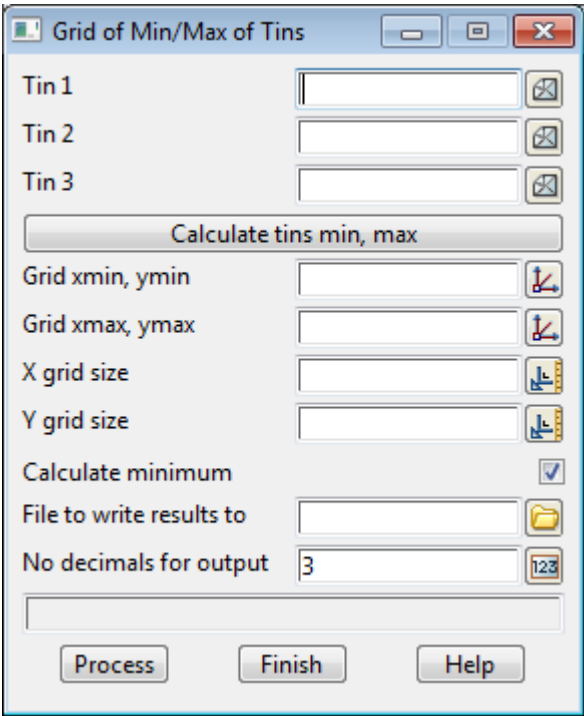

Field Description	Type	Defaults	Pop-Up
Data source type <i>data selection type</i>	choice box	Model	model, string, view
Data source <i>data to be processed.</i>	input		
Tin <i>name of the tin to get the z-value from.</i>	tin box		available tins
Model for tin differences <i>model to place the strings containing the z values with the difference between the original string and the tin.</i>	model box		available models
Process <i>for all strings in the data source, calculate the difference in the z-values from the string to the tin.</i>	button		

Grid of Min / Max of Tins

Position of option on menu: Tins =>Utilities => Min/ Max of Tins

This option takes one to three tins and creates a regular grid of points where the z-value at each point is the minimum of the tins at that point.

Selecting Min/ Max of Tins brings up the **Grid of Min / Max of Tins** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin 1, Tin 2, Tin 3	tin box		available tins
<i>if non blank, this tin is used to use in the calculation to find the minimum of the tins at each grid point.</i>			
Calculate tins min, max	button		
<i>when pressed, the minimum and maximum x and y values for the union of the three tins is calculated and the values written to the Grid xmin, ymin, Grid xmax, ymax fields.</i>			
Grid xmin, ymin	input		
<i>the minimum x value, then one or more spaces, and then the minimum y values, to be used for creating the grid.</i>			
Grid xmax, ymax	input		
<i>the maximum x value, then one or more spaces, and then the maximum y values, to be used for creating the grid.</i>			
x grid size	input		
<i>the x coordinates for the grid points are created starting at the Grid xmin and then incremented by "x grid size" for as long as the x value is less than or equal to Grid xmax</i>			
y grid size	input		

the y coordinates for the grid points are created starting at the Grid ymin and then incremented by "y grid size" for as long as the y value is less than or equal to Grid ymax

Calculate minimum tick box ☒

*if ticked, then grid points are created with the z-value being the minimum of tins Tin1, Tin 2, Tin3.
If not ticked, then grid points are created with the z-value being the maximum of tins Tin1, Tin 2, Tin3.*

File to write results to File

name of the file to write the grid points out to. The format of the file is x, y and z, separated by spaces and with one point per line. The "File to write results to" must be non-blank.

No decimals for output input 3

number of decimal places to use for the x, y and z values

Process button

when this button is pressed, the grid of either the tin minimums or maximums is created and written to the file

Sections

Position of menu: Tins =>Sections

The triangles=>sections menu contains options involving sections through the tin.

The sections walk-right menu is

- section along a string
- create sets of sections through tin at right angles
- limit sections to a polygon
- x-sections along a string

For the option *Long section*, go to
Mesh,
Polygon sections
X-sections

- [Long Sections.](#)
- [Mesh](#)
- [Polygon Sections](#)
- [X-Sections](#)

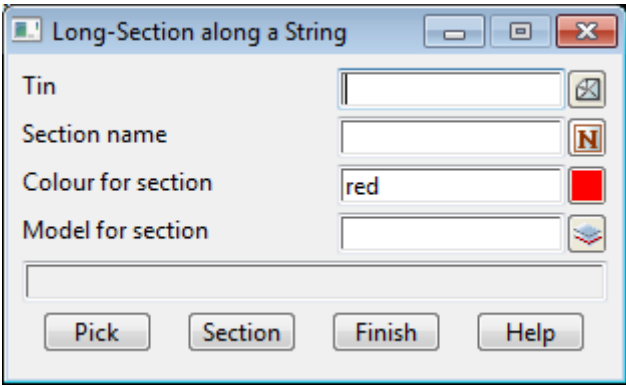

Long Sections

Position of option on menu: Tins =>Sections =>Long Section

The long section option calculates the section through a tin along a particular string. This option is rarely used because tins are automatically profiled through on the section view and in long section and x-section plots.

On selecting the **long section** option, the **long section along a string** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin	<i>name of the tin that the string will be sectioned against.</i>	tin box		available tins
Section name	<i>name to give the long section string</i>	input		
Colour for section	<i>colour to make the long section string</i>	colour box	default colour	available colours
Model for section	<i>name of the model to contain the long section string.</i>	model box		available models
Pick	<i>select the string to be sectioned along.</i>	string-select		
Section	<i>calculate the long section along the string selected by the pick button, against the tin given in the tin field. The resulting section string is added to the model given in the Model for Section field.</i>	button		

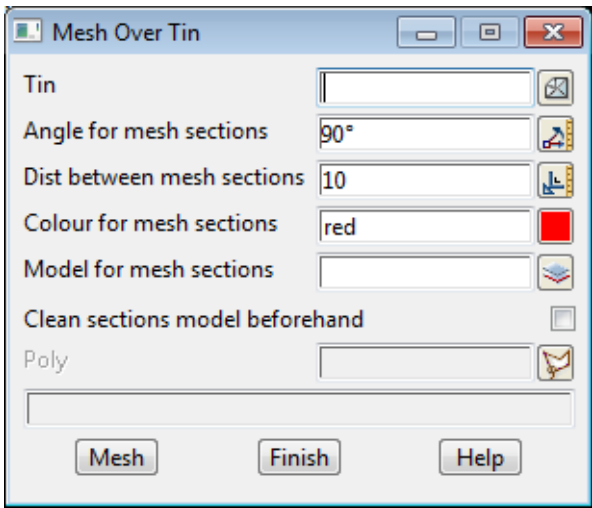

Mesh

Position of option on menu: Tins =>Sections =>Mesh

A 12d Model mesh is simply a series of lines cutting through the tin (sections) at a given angle and spacing, and at right angles to the given angle with the same spacing.

A mesh is an effective method of visualizing a triangulation when displayed in a perspective view and for hidden views.

On selecting the mesh option, the mesh over tin panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin that the mesh sections will be calculated through.</i>	tin box		available tins
Angle for mesh sections <i>angle (in degrees) of the lines to section along. The sections are also created at rights angles to this angle as well.</i>	angle box	90.0	0,45,90
Dist between mesh sections <i>distance between the lines to section along</i>	input	10.0	1,10,100
Colour for mesh sections <i>colour to make the calculated sections</i>	colour box	default colour	available colours
Model for mesh sections <i>name of the model to contain the calculated sections.</i>	model box		available models
Clean sections model beforehand <i>if ticked, the model of sections is cleaned out before the option runs.</i>	tick box		
Poly <i>if a polygon is selected, then the sections are restricted to remaining within the polygon.</i>	polygon select		
Mesh <i>two sets of sections through the tin given in the tin field are created within the selected polygon, or if no polygon is selected, the bounding polygon for the tin. One set of sections are calculated along straight lines at the angle given by the angle field and at a separation given by the dist field and the second set at right angles to the first set.</i>	button		

<esc> can be used to abort the mesh option.

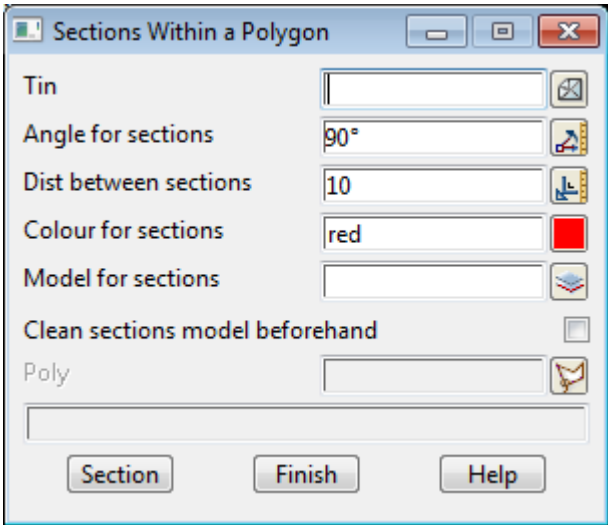

Polygon Sections

Position of option on menu: Tins =>Sections =>Polygon sections

In the **polygon sections** option, sections are calculated for a series of parallel lines covering the polygon, or if no polygon is given, the tin. The angle of the parallel lines and the distance between them are set by the user.

This option provides a quick method for producing a one directional set of sections covering a polygonal region on a tin.

On selecting the **polygon sections** option, the **sections within a polygon** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin that the sections will be calculated through</i>	tin box		available tins
Angle for sections <i>angle (in degrees) of the lines to section along</i>	angle box	90.0	0,45,90
Dist between sections <i>distance between the lines to section along</i>	input	10.0	1,10,100
Colour for sections <i>colour to make the calculated sections</i>	colour box	default colour	available colours
Model for section <i>name of the model to contain the calculated sections.</i>	model box		available models
Clean sections model beforehand <i>if ticked, the model of sections is cleaned out before the option runs.</i>	tick box		
Poly <i>A polygon is selected from a view. If no polygon is selected, sections are created over the entire tin.</i>	polygon-select		
Section <i>Sections within the polygon selected by poly will be calculated along parallel straight lines at the angle given by the angle field and at a separation given by the dist field. The sections are made against the tin given by the Tin field. The sections colour is that given in the colour field and the section strings are</i>	button		

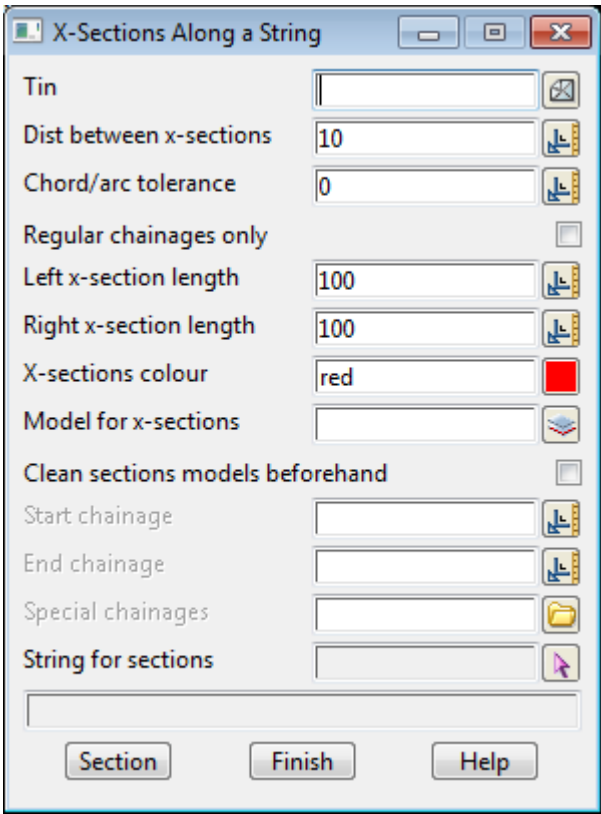

placed in the model given in the model field.

X-Sections

Position of option on menu: Tins =>Sections =>X Sections

The X-sections (cross sections) option calculates cross sections at a given interval along a string.

On selecting the x-section option, the **x-sections along a string** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin that the x-sections will be calculated through.</i>	tin box		available tins
Dist between x-sections the distance between points on the selected string where the x-sections are calculated.	input	10	
Regular chainages only <i>if ticked, sections are only calculated at points at the given chainage distance apart. If not ticked, extra sections are created at horizontal tangent points and horizontal IPs.</i>	tick box		
Left x-section length <i>the plan distance for the left side of the x-section - that is, the distance that the x-section extends to the left of the selected string.</i>	input	100	
Right x-section length <i>the plan distance for the right side of the x-section - that is, the distance that the x-section extends to the right of the selected string.</i>	input	100	
X-sections colour <i>colour to make the x- sections</i>	colour box	default colour	available colours

Model for x-sections model box available models
name of the model to contain the x-sections.

Start/End chainage input
the string chainage to start/end the x-sections. If blank, the start/end chainage is taken to be the chainage at the beginning/finish of the string.

Special chainages file box *.spc files
if non blank, a file of special chainages to also create x-sections at

String for sections string-select
select the string to calculate the x-sections along.

Section button
*calculate the x-sections along the string selected by the **pick** button, against the tin given in the tin field. The resulting x-section strings are added to the model given in the model for x-sections field.*

Sharing

Position of menu: Tins =>Sharing

Sharing allows tins from a project (the server project) to be added to other projects (client projects).

Before any tins can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The **Sharing** walk-right menu is

Shared Tins

Share

Add

Remove

Synchronize

allow tins in this project to used by other projects

add a shared tin from another project

remove a tin shared from another project

updated tins shared from other projects

For the option *Share*, go to

Add

Remove

Synchronize

[Share Tins](#)

[Add Shared Tins](#)

[Remove Shared Tins](#)

[Synchronize Shared Tins](#)

Share Tins

Position of option on menu: Tins =>Sharing =>Share

Before tins in a server project can be added to client projects, the tins must be made available for sharing in the server project by using the **Share** option.

All tins that have been made available for sharing are displayed in tin lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

This option also can reverse the process. That is, remove the availability of a tin for sharing. If this is done then clients who have shared this tin will be warned.when starting up their project and/or synchronizing occurs.

Selecting **Share** displays the **Share Project Tins** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Default	Pop-Up
<i>All the models in the project are listed in the Share Project Tins panel and if a tin has been tagged for</i>				

*Sharing, a ticked will be displayed in the **Share** column of the grid.*

Pattern

*if a pattern is typed then all the tins matching the pattern will have a tick placed in the **Share** column. If * is typed then all tin are ticked for sharing.*

Share grid column

*tick if the tin is to be made available for sharing when the **Set** button is pressed.
All tins that have been made available for sharing are displayed in tin lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).
Clicking RB on **Share** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Tin grid column

this column lists all the tins in the project

Share as grid column

an optional name with which the tin will be shared out to clients. Leave it blank to share under the original name.

Set button

*clicking **Set** marks all the tins with a tick in the **Tick** column as being available for sharing. Those tins without a tick will not be available for sharing.*

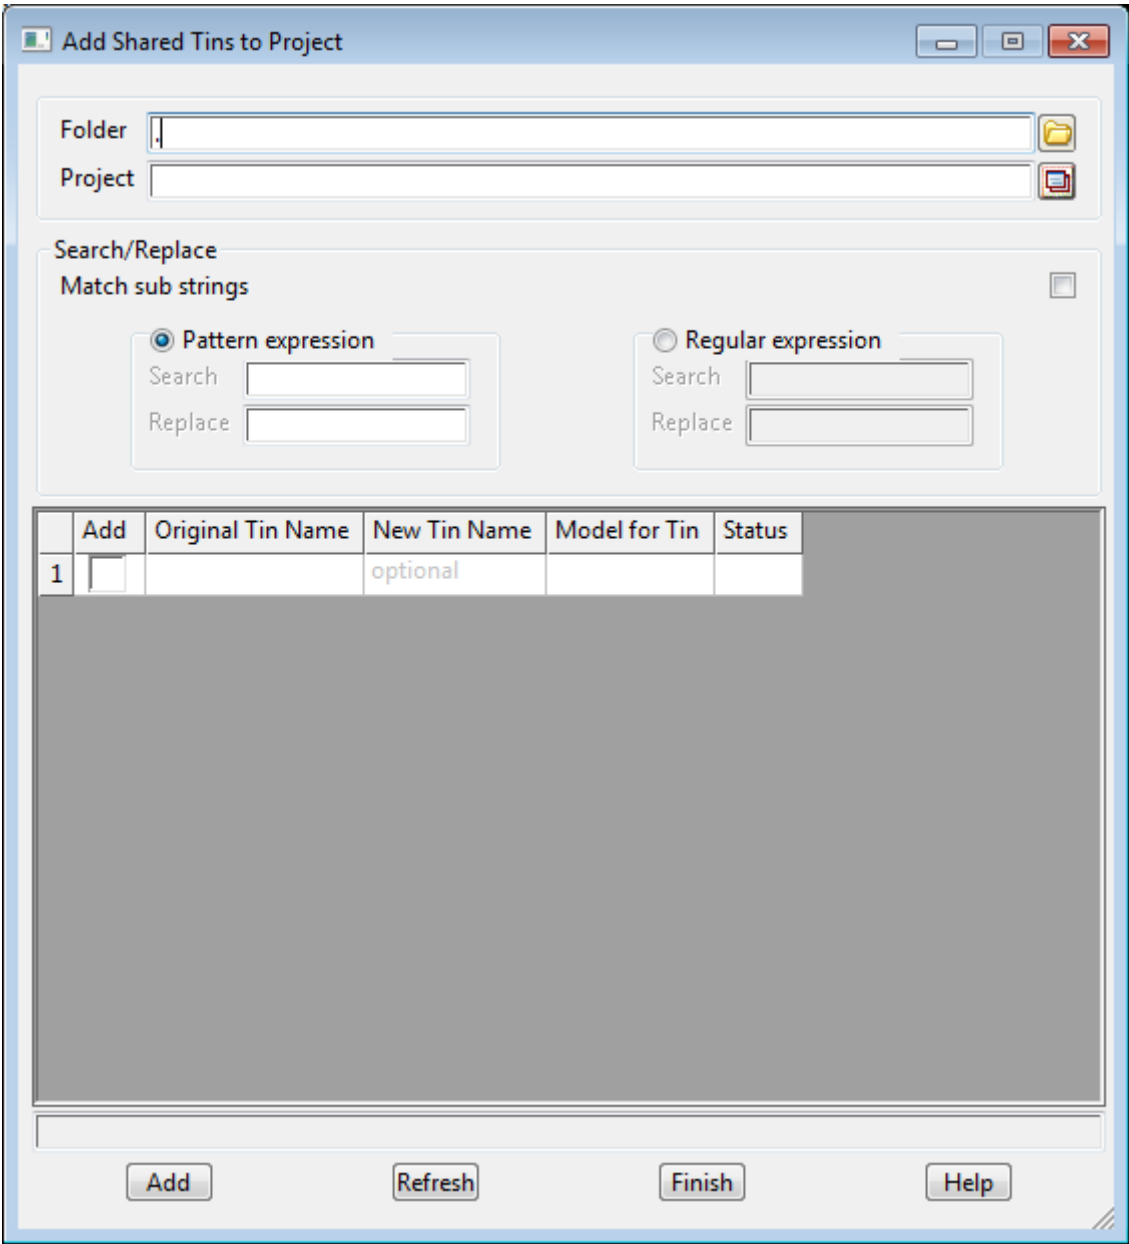

Add Shared Tins

Position of option on menu: Tins =>Sharing =>Add

The **Add** option is used to add shared tins from a server project, to this project (a client project).

All tins that have been added as shared tins are displayed in tin lists in a colour defined by an environment variable. The default colour is blue.

Selecting **Add** displays the **Add Shared Tins to Project** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box		select folder
<i>folder to look for 12d Model projects. When a folder is selected, all the 12d Model projects in the folder will be displayed in a Projects pop-up list.</i>			

Project	folder box	select folder
<i>name of the 12d Model project in the folder given in the Folder field, to search for tins marked for sharing. Once a project is selected, all the tins marked for sharing from that project will be listed in the Original Tin Name column.</i>		
Search/Replace	<i>section for renaming tins from the selected server project</i>	
Match sub strings	tick box	
<i>if ticked, the Search expression is used to match against part of each tin name. If not ticked, the Search expression is used to match against the entire tin name.</i>		
Pattern expression	radio button	
<i>if set on, then Pattern expressions given in the Search and Replace fields are used to modify tin names. Pattern expressions include the standard wild card * and wild character !.</i>		
Search	input	
<i>pattern to search for in the tin names. For example "*" exist" will select all tins with a name ending with " exist"</i>		
Replace	input	
<i>replacement for the search pattern found in the tin name. For example, "exist " in the Replace field, takes the matched part of the tin name and adds "exist " to the front of it. Hence the Search pattern "*" exist" and Replace pattern "exist *" finds all tin with names ending in " exist" and renames them with the name starting with "exist " (and the " exist" at the end of the name is dropped off).</i>		
Regular expression	radio button	
<i>if set on, then Regular expressions given in the Search and Replace fields are used to modify tin names.</i>		
Search	input	
<i>regular expression to search for in the tin names.</i>		
Replace	input	
<i>replacement for the search expression found in the tin name.</i>		
Tin Names Grid	<i>The tins available for sharing in the selected project are shown in the Original Tin Name column. Any renaming by the Search and Replace expressions are shown in the New Tin Name column. Note that if the tin already exists in the current project, then the cell for that model in Original Tin Name column will be displayed in yellow.</i>	
Add	tick boxes in grid column	
<i>if ticked, the tin will be added to the project when the Add button is pressed. If not ticked, the tin will not be added to this project as a shared tin. Clicking RB on Add at the top of the column brings up a menu to Clear which turns all the ticks off. Note - a shared tin that has been previously added can only be removed by using the Tins =>Sharing =>Remove option.</i>		
Original Tin Name	column	
<i>this column lists all the tins in the server project that are available for adding to this client project.</i>		
New Tin Name	column	
<i>if non blank, the name to use instead of the Original Tin Name when the tin is added t the project. If blank, the Original Tin Name is used for the tin when it is added to the project. The New Tin Names can be from applying the Search and Replace, or by just typing them in.</i>		
Model for Tin	grid column	
<i>if non blank, the model name to use in the client project for this tin added to the project If blank, the model name is the same as that in the server project.</i>		

displays if there has been a match or no match for the search/replace for renaming tins

add to this project (a client project) as a shared tin, the ticked tins given in the Original Tin Name field from the project given in the Project field, and add them to the model in the Model for Tin field.

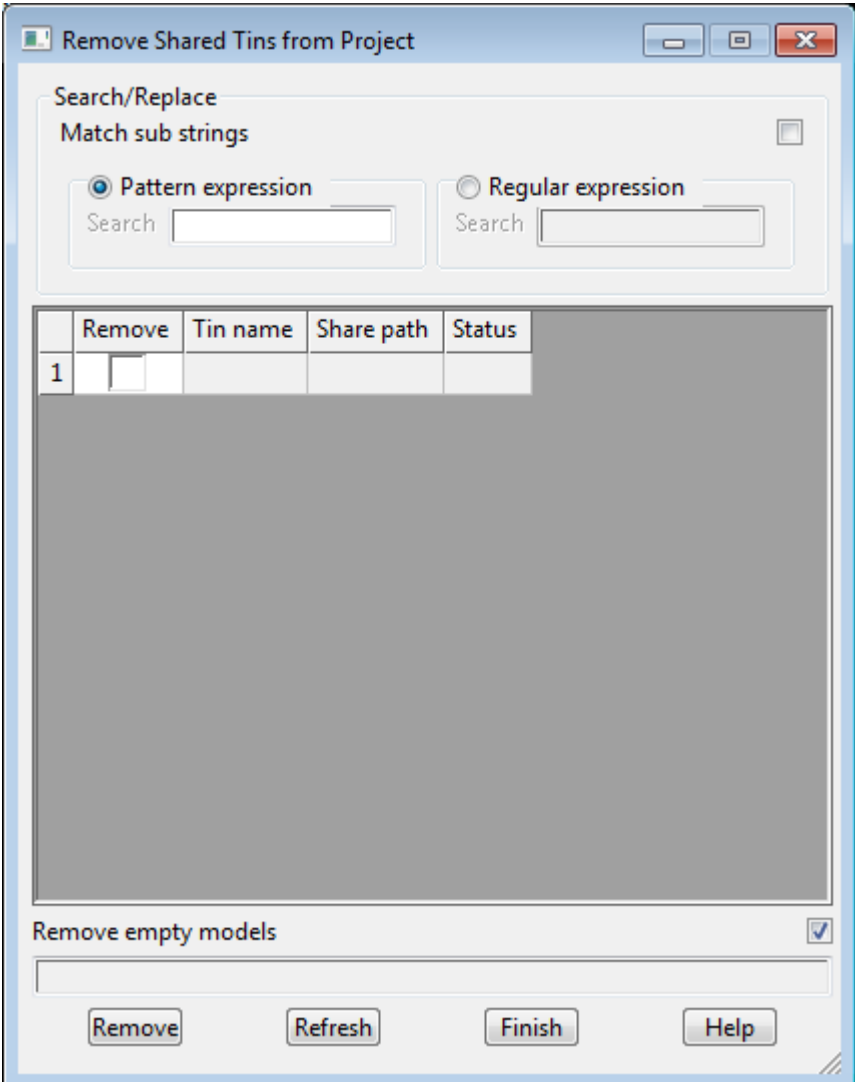

clicking Refresh refreshes the list of all tins available for sharing in the selected **12d Model** project (server project).

Remove Shared Tins

Position of option on menu: Tins =>Sharing =>Remove

The **Remove** option is used to remove shared tins from the project. The shared tins would have been previously added to the project with the **Tins =>Sharing =>Add** option.

Selecting **Remove** displays the **Remove Shared Tins from Project** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Search/Replace				
<i>section for selecting by expressions, tins shared from other projects</i>				
Match sub strings		tick box		
<i>if ticked, the Search expression is used to match against part of each tin name.</i>				
<i>If not ticked, the Search expression is used to match against the entire tin name.</i>				
Pattern expression		radio button		
<i>if set on, then Pattern expressions given in the Search field are used to select tin names. Pattern expressions include the standard wild card * and wild character !.</i>				

Search input

pattern to search for in the tin names. For example "** exist*" will select all tins with a name ending with " *exist*"

Regular expression radio button

if set on, then **Regular** expressions given in the Search field are used to select shared tin names.

Search input

regular expression to search for in the shared tin names.

Tin Names Grid

list of all shared tins added to the project.

Remove tick boxes in grid column

if ticked, the tin will be removed from this project as a shared tin when the **Remove** button is pressed. Clicking RB on **Remove** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.

Tin Name grid column

this column lists all the tins in this project added as shared tins from other server projects

Share path

this column lists the path name to the server project and the original tin name in the server project

Status grid column

displays if there has been a match or no match for the Search for selecting shared tins

Remove button

clicking **Remove** removes as shared tins from this project, all the tins with a tick.

Refresh button

clicking **Refresh** refreshes the list of all shared tins previously added to the project

Synchronize Shared Tins

Position of option on menu: Tins =>Sharing =>Synchronize

The **Synchronize** option is used to updated any added shared tins. The shared tins would have been previously added to the project with the **Tins =>Sharing =>Add** option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section [Project Share Settings](#).

Selecting **Synchronize** displays the **Synchronize Shared Tins** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Synchronize	tick boxes in grid column		
<i>if ticked and the tin has changed in the server project, then it will be re-copied from the server project when the Synchronize button is pressed.</i>			
<i>Clicking RB on Copy at the top of the column brings up a menu to Toggle the ticks, Set all the ticks on, Clear to turn all the ticks off.</i>			
Tin	grid column		
<i>this column lists all the tins in this project that have been added from other (server) projects</i>			
Synchronize	button		
<i>clicking Synchronize re-copies any tins with a tick from the server projects</i>			
Status			
<i>Status will either be Ok or No Longer Shared to reflect the status of the tin on that row.</i>			

Redraw views tick box

Whether or not to redraw all the views any of the synchronized tins are on.

Refresh button

*clicking **Refresh** refreshes the list of all shared tins previously added to the project*

Delete

Position of menu: Tins =>Delete

The **delete** option is used to delete tins from the project and from the computer disk so that they no longer can be accessed or take up disk space.

To help protect against disasters, a **yes-no** pop-up menu is used to confirm that the user did intend deleting the tin. If deletion is confirmed, the selected tin is removed from the project (if its in the project) and deleted from the disk.

If a **12d Model trash bin** is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see [Trash Bin](#)).

The tin Deletes walk-right menu is

For the option *Delete a tin*, go to
Delete all tins

[Delete a Tin](#)
[Delete All Tins](#)

Delete a Tin

Position of option on menu: Tins =>Delete =>Delete a tin

The delete a tin option can be used to delete a tin in the project.

If a **12d Model trash bin** is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see [Trash Bin](#)).

On selecting the delete a tin option, the delete tin panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to be deleted from the computer disk.</i>	input		project tins
Delete tin models if empty <i>if ticked then the models containing the tin are also deleted if they are empty after the tin is deleted.</i>	tick box		
Permanently delete <i>if tick, the deleted tins will not go to the trash bin but will be permanently deleted from disk.</i>	tick box		
Delete <i>after selecting this button, the tin given in the tin field will be deleted from the computer disk. A yes-no pop-up is used to confirm that deletion is required.</i>	button		

Delete All Tins

Position of option on menu: Tins =>Delete =>Delete all tins

The **delete all** option will delete all tins in the working project. It does not delete tins that are in the working project area but not yet added to the project.

If a **12d Model trash bin** is being used, the deleted tins may be moved to the trash bin rather than deleted from disk (see [Trash Bin](#)).

On selecting the **delete all** option, the **delete all tins** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Delete tin models if empty	tick box		
-----------------------------------	----------	--	--

if ticked then the models containing the tins are also deleted if they are empty after the tins are deleted.

Permanently delete	tick box		
---------------------------	----------	--	--

if ticked, the deleted tins will not go to the trash bin but will be permanently deleted from disk.

Delete	button		
---------------	--------	--	--

*after selecting this button, a **yes-no** pop-up is used to confirm that deletion is required. If it is, all tins in the working project will be deleted from disk. Unless an error occurs, the panel will be removed.*

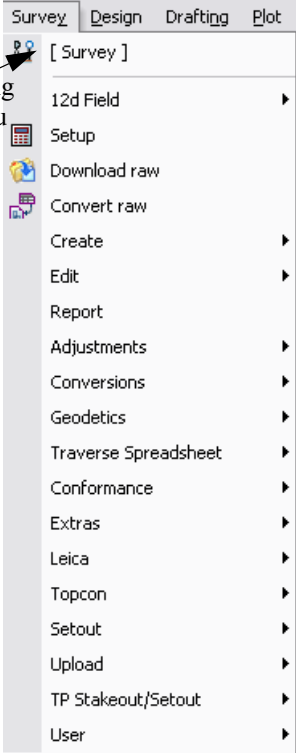

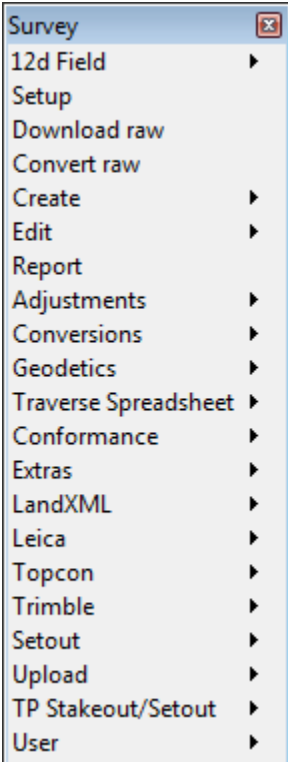

18 Survey

Position of menu: Survey

The Survey walk-right menu is laid out to reflect the normal sequence of operations when handling field survey data.

The description of the options on the Survey menu assumes that the reader is familiar with surveying, the **12d** Model method of field coding for their particular data collector, data collector definitions and the **12d** Model field file.

A description of the **12d** Model field coding and data collector definitions is given in the Appendix [12d Survey Guide](#).

on Main menu	on 12d Model menu and floating Survey menu
 <p>create floating Survey menu</p>	
	<p>12d Field options</p> <p>select data collector (DC)</p> <p>transfer data from DC to 12d field file</p> <p>convert raw DC data to 12d field file</p> <p>create 12d Survey function</p> <p>edit 12d Survey function - text & graphically</p> <p>report on 12d Survey function</p> <p>bowditch, least squares etc.</p> <p>conversion functions</p> <p>Geodetic measure functions</p> <p>traverse spreadsheet functions</p> <p>conformance reporting options</p> <p>extra survey functions - bd entry etc.</p> <p>outputs for Leica instruments</p> <p>outputs for Topcon instruments</p> <p>outputs for Trimble instruments</p> <p>setout macros</p> <p>create upload file & upload to data collectors</p> <p>TP Stakeout/Setout macros</p> <p>Survey User menu</p>

12d Field

Position of menu: Survey =>12d Field

The **12d Field** module is for communicating directory with survey grade GPS units and Total Station theodolites through radio, blue tooth, Wi-Fi and cable. Survey data is displayed live on screen in conjunction with full road project design and existing surface data.

Because of its specialist nature, the documentation of **12d Field** module is in the **12d Field Training** manual.

The **12d Field** walk-right menu is:

.

For the option <i>Setout</i> , go to	Setout
<i>GPS Localisation</i>	GPS Localisation
<i>Setout FLD file to strings</i>	12dField Setout FLD File To Strings
<i>12d Pickup</i>	
<i>12d Pickup Codes</i>	12d Field Codes

Setout

Position of menu: Survey =>12d Field=>Setout

This section of documentation is a work in progress and will be updated in subsequent releases.

This manual will only refer to the **TPS** and **GPS simulators**, for connection details to actual instruments refer to the supplied 12dField documentation.

TPS

This section of documentation is a work in progress and will be updated in subsequent releases.

For the **TPS Simulator** this is the only panel to enter 12dField. Press **Set** and you will enter 12dField proper.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Instrument

choice box

Select the instrument you wish to use with 12dField, dependent on the instrument selected the panel flow will vary.

Surveyor

Enter the name for the surveyor using 12dField.

*After selecting **Set the 12d Field - Setout TPS Simulator** is displayed on the screen. For more information please go to [12d Field - Setout \(TPS Simulator\)](#)*

Set

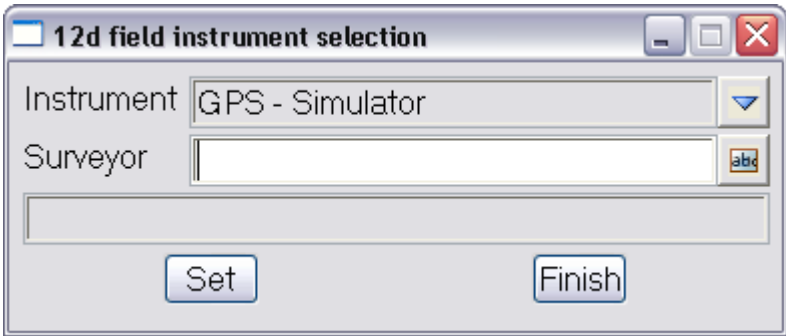

Enter 12dField

GPS

This section of documentation is a work in progress and will be updated in subsequent releases.

For the **GPS-Simulator** 2 more panels are required

Select **GPS-Simulator** from the choice box.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Instrument	choice box		
<i>Select the instrument you wish to use with 12dField, dependent on the instrument selected the panel flow will vary.</i>			
Surveyor			
<i>Enter the name for the surveyor using 12dField.</i>			
Set			
<i>Brings up the Configure GPS Simulator panel.</i>			

For more information on the **Configure GPS Simulator** panel please go to [Configure GPS Simulator](#)

Configure GPS Simulator

This section of documentation is a work in progress and will be updated in subsequent releases.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

NMEA file folder *.nmea

The GPS simulator needs a NMEA file to run, this can be a file recorded from an actual instrument or constructed from within 12dField itself by 'driving' along an existing string. A default file "Default_LLQ.NMEA" is created automatically for 1st up usage.

Overwrite time tick box

if ticked the time in the NMEA string is ignored and the current computer time used instead.

Set button

proceed to the next panel

Change instrument button

go back to the instrument selection panel.

Cancel button

exit 12dField

Selecting **Set** displays the next **Configure GPS Simulator** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Base Projection	choice box		
------------------------	------------	--	--

Select the projection to use, these are located in the carto.4d file. This projection is used to convert the WGS84 lat/long/elevation into cartesian coordinates which can be used directly or have a localisation applied to them.

Perform transformation	tick box		
-------------------------------	----------	--	--

if ticked a user defined localisation will be applied to the GPS reading.

12dF Helmert Params

*Select the *.TDF_HEL file containing the transformation details to apply, this file is created with the "GPS Localisation" panel in the main 12dField menu.*

Set	button		
------------	--------	--	--

Enter 12dField

Change instrument	button		
--------------------------	--------	--	--

Go back to the instrument selection panel.

Cancel	button		
---------------	--------	--	--

Exit 12dField

*After selecting **Set the 12d Field - Setout GPS Simulator** is displayed on the screen. For more information please go to [12d Field - Setout \(GPS Simulator\)](#)*

12d Field - Setout (TPS Simulator)

This section of documentation is a work in progress and will be updated in subsequent releases.

The control bar has one user definable setting, In the settings panel under the general tab you can toggle on or off whether you want the current string name on the control bar, this is "Str Name on Control Bar", 12dField will need to be restarted for this setting to change.

Names.4d

controls the string details used by 12dField when storing a point, e.g. model/linestyle/weight etc.

Setup

*brings up the **Store Point Setup** panel.*

*For more information on **Store Point Setup** panel, please go to [Store Point Setup](#)*

*brings up the **Target Heights Panel***

*Show the current number of satellites and status, pressing the button brings up the **GPS Status** panel.
In the settings panel the user defines the thresholds for **GPS** errors.*

Shift

is used by 12dField panels to change buttons to add extra functionality.

*Show the current measuring style, pressing brings up the **GPS/TPS settings** panel.*

Select button, for tablet PC, allow selection with a press.

Menu

brings up the 12d Field panels menu. For more information please go to [Options](#)

Exit

Exits 12d Field.

12d Field - Setout (GPS Simulator)

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting this option brings up
the **12d Field - GPS Status** panel.

For information on the **12d Field - GPS Status** panel please go to [12d Field - GPS Status](#)

12d Field - GPS Status

The **12d Field - GPS Status** panel provides information about the current state of the **GPS** instrument such as fix quality and satellites used.

GLN Latency	12dF double box
<i>The latency of the measurements from the Glonass satellites.</i>	

Position Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Running Easting	12dF double box		
<i>The current easting of the GPS.</i>			
Running Northing	12dF double box		
<i>The current northing of the GPS.</i>			
Running Level	12dF double box		
<i>The current level of the GPS.</i>			
WGS84 Lat	12dF angle box		
<i>The WGS84 latitude of the running measurement.</i>			
WGS84 Long	12dF angle box		
<i>The WGS84 longitude of the running measurement.</i>			

WGS84 Elev 1 12dF double box

The WGS84 elevation of the running measurement.

Proj'n X 12dF double box

The WGS84 cartesian X of the running measurement.

Proj'n Y 12dF double box

The WGS84 cartesian Y of the running measurement.

Proj'n Z 12dF double box

The WGS84 cartesian Z of the running measurement.

Store Point Setup

The **12d Field - Store Point Setup** panel is called up the 1st time a user attempts to store a point to a model in a 12dField setout panel or if the user presses the **Setup** button on the 12dField control bar.

This panel must be validly completed before a point can be stored.

The panel is grouped into 4 separate areas each described below.

12d Field - Store Point Setup

Model/string settings

Name

Model

Point/Line type

Colour

Linestyle

Weight

Pre*postfix for models

FLD backup files

File names from

File name

FLD settings

Surveyor

Description

Lot Number

Category

Vertex Id settings

Pickup Id Type

Pickup Id

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model/string settings

These settings work the same as your typical 12d settings work, they control the look of the stored string in the model.

Name

enter the name of the string to be stored manually or from the pop up select a predefined name (from

names.4d) which will also populate the other settings.

Model	model box	
	the model to store the string in. (This model will automatically be added to your defined 12dField plan view)	
Point/Line type	choice box	Point, Line
	whether the string is a point or line string.	
Colour	colour box	
	the colour of the string.	
Linestyle		
	linestyle of the string	
Weight		
	the thickness of the string.	
Same as	button	
	select an existing point/line and the fields will set to it's properties.	
Pre*postfix for models		
	if non blank the pre-postfix will be applied to the nominal model when storing the point.	

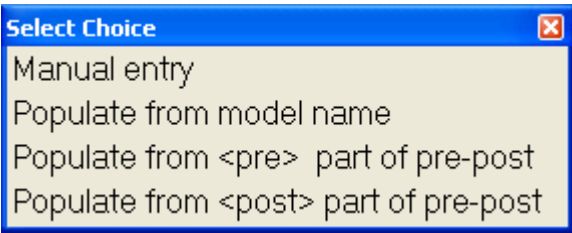

FLD backup files

All 12dField points are stored to a FLD file as well as a model. This is done for backup reasons as every shot is stored to the FLD file on disk when a shot is taken ensuring no data should be lost in the event of an unexpected shutdown of 12d.

The 12dField files have sufficient attributes in them that they can be read directly back into 12d without going through the survey data reduction functions.

File names from

Manual Entry, Populate from model name, Populate from <pre> part of pre post, Populate from <post> part of pre-post

Manual Entry - enter the name of the file in the **File name** box.
Populate from model name - the name of the model in the **model box** is used as the file name.
Populate from <pre> part of pre-post - the name of the file is the pre part.
Populate from <post> part of pre-post - the name of the file is the post part.

For example a surveyor might enter a model name of "Asphalt Conformance" in the **model box**. They then for a pre fix enter the year month and day and their initials "20113006MG " and they select "**Populate from model name**" for the FLD file name.
The model and field file written will be "20113006MG Asphalt Conformance"

FLD Settings

Surveyor

the name of the surveyor

Description

a description of the survey (Populated from 12dF_JOB_DESCRIPTIONS.4D)

Lot number

a lot number of the survey (Populated from 12dF_JOB_LOT_NUMBERS.4D)

Category

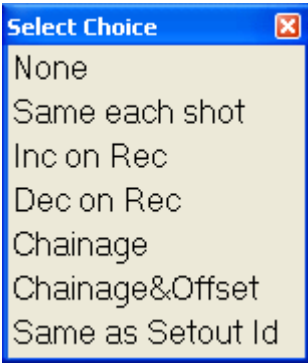

the category of the survey (Populated from 12dF_JOB_CATEGORIES.4D)

Vertex Id settings

This choice box controls the way the id of each vertex in the string is written.

Pickup Id Type

None, Same each shot,
Inc on Rec, Dec on Rec,
Chainage, Chainage&Offset.
Same as Setout Id

None - no vertex id is written.
*Same each shot - the value in the **Pickup Id** box will be used for all points stored.*
*Inc on Rec - the value in the **Pickup Id** box will be used for the next point stored then incremented.*
*Dec on Rec - the value in the **Pickup Id** box will be used for the next point stored then decremented.*
Chainage - the chainage of the point being stored will be used as it's vertex id.
Chainage&Offset - the chainage and offset of the point being stored will be used as it's vertex id.
Same as Setout Id - the vertex id of the point being setout will be used.

Notes on the incrementing of the Id.
The id is alphanumeric and the number of characters does not change. The increment/decrement applies to the either the numeric or alpha ending of the id, not to a combination of both.

Increment examples 1->2, 9->0, A1>A2, A9->A0, AA->AB, AZ->BA,
S099->S100, S999->S000
Decrement examples 6->5, 0->9, A2>A1, A0->A9, AB->AA, AA->ZZ,
S100->S099, S000->S999

Pickup Id

This is the id of the next vertex to be stored

Cancel

button

if cancel is pressed the panel will close but the next time a point is stored it will open again.

Finish

button

if the panel validates correctly it will close and the point will be stored. The panel will only open again if called manually from the control bar or a new setout is started.

Options

This section of documentation is a work in progress and will be updated in subsequent releases.

Common Measurement Buttons

A description of the common measurement buttons on 12dField Setout panels is described below.

The measurement buttons are on a dialog as such:

The INFO and DLG buttons

These buttons do not change in behaviour between all of the different measure modes.

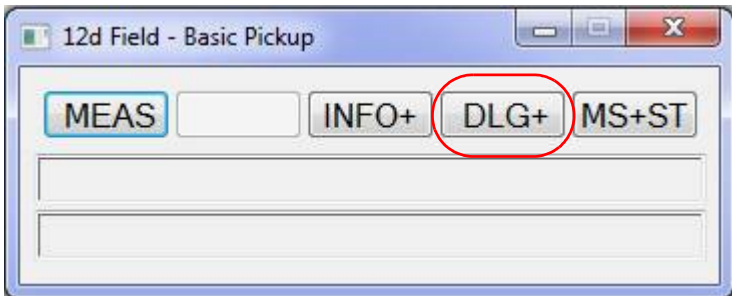

INFO+

Displays the information panel, this panel contains extra information about the current setout that is not displayed in the standard panel, the contents of the information panel is user configurable via the text file 12dF_INFO_PAGE_CONFIG4D. When the information panel is active the button changes to INFO-.

DLG-

When pressed the dialog minimises to maximise the screen area, the button changes to **DLG+** which when pressed will bring the panel back to full size.

Single (GPS/TPS) and Multiface (TPS only) measurement modes.

The **MEAS** button.

MEAS

Starts the measurement, on completion the button state changes to this

MEAS

Start another measurement.

STORE

Store the point as per the settings in the [Store Point Setup](#) panel, the first store of a point brings this panel up automatically. Once stored the **STORE** button will be blanked out until a new measurement is taken.

The **MS+ST** button

MS+ST

Starts a measurement and stores the point as per the settings in the [Store Point Setup](#) panel. The **STORE** button remains disabled.

Continuous (GPS/TPS) measurement mode

In continuous mode the **MS+ST** button is disabled.

MEAS

Start continuous measurement

STOP

*Stop the continuous measurement, the **STORE** button will remain active until pressed. When the point is stored the button is disabled until a new measurement is started.*

STORE

Store the point as per the settings in the [Store Point Setup](#) panel, the button state does not change meaning the user can continue to move storing points at a single press of the button.

Averaging measurement mode (GPS only)

In averaging mode the **MS+ST** button is disabled.

MEAS

Start the averaging measurement, the details of the averaging, std deviations xy&z are displayed in the 3rd message line of the dialog.

STOP

Stop the averaging measurement.

MEAS

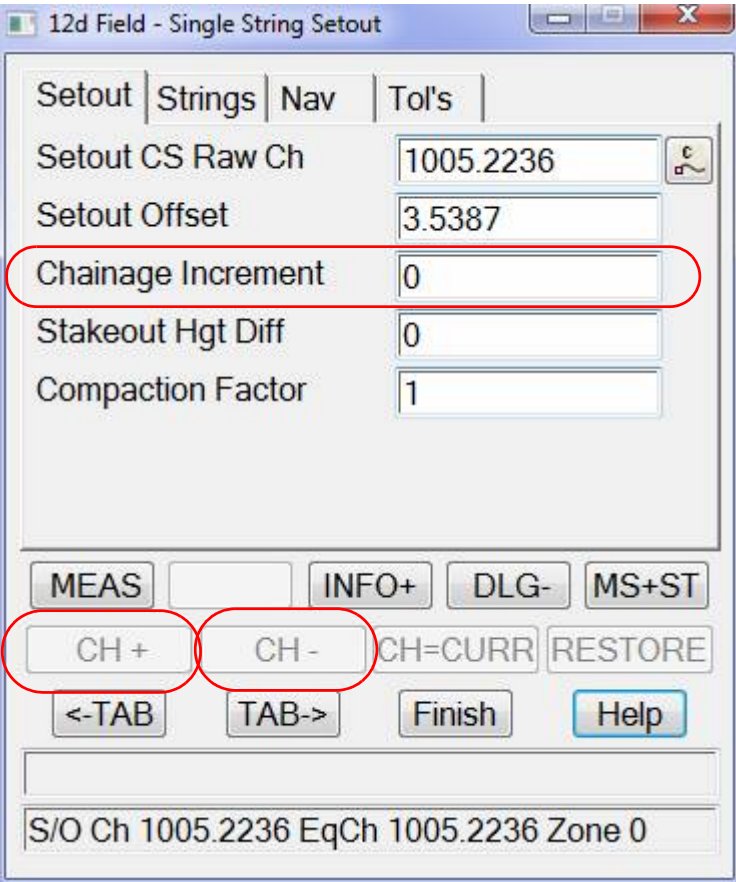

Start a new averaging measurement.

STORE

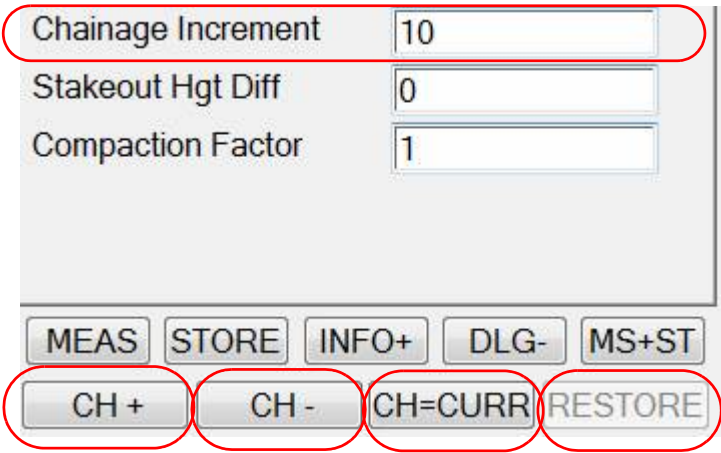

Store the point as per the settings in the [Store Point Setup](#) panel.

The Chainage Buttons

The chainage buttons commonly appear as the middle row of buttons in a 12dField setout panel.

The **CH+** and **CH-** buttons are used to quickly increment to the next chainage to be setout, the buttons are activated when the **Chainage Increment** field in the panel has a value other than 0.

CH+

When pressed the value in the **Chainage Increment** field is added to the current setout chainage. The value in **Chainage Increment** field can be +ve or -ve.

CH-

When pressed the value in the **Chainage Increment** field is subtracted from the current setout chainage. The value in **Chainage Increment** field can be +ve or -ve.

The **CH=CURR** and **RESTORE** buttons are used for where the user has a need to temporarily

use the current chainage for setout purposes.

CH=CURR

The button is activated when a measurement has been taken.

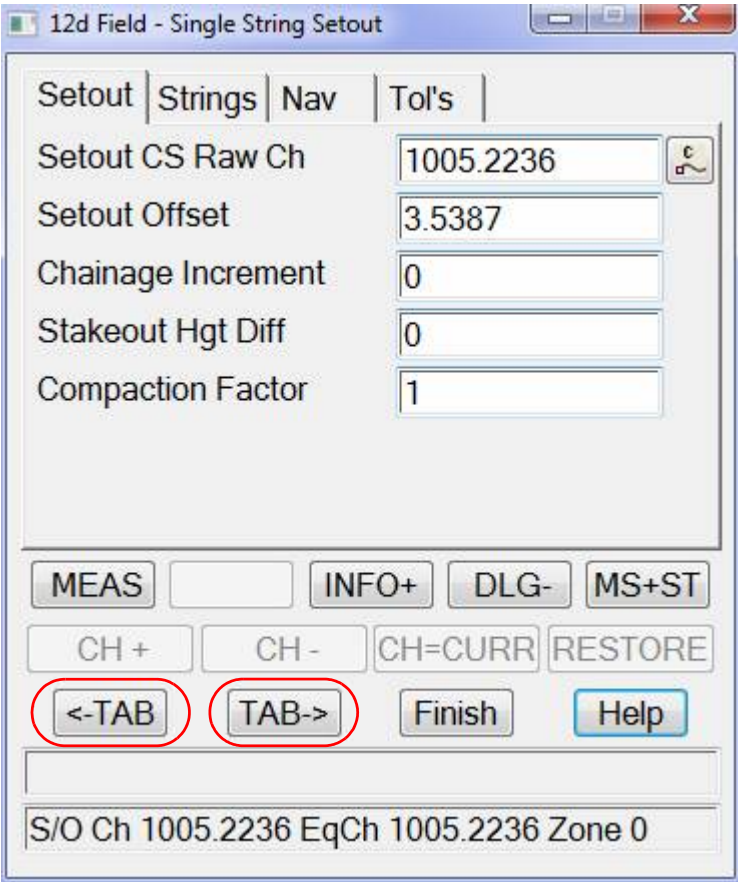

*When pressed the setout chainage is set to the current chainage, the **RESTORE** button is then activated and the **CH+** and **CH-** buttons disabled.*

RESTORE

*When pressed the setout chainage is set back to the chainage when **CH=CURR** was pressed and the **CH+** **CH-** buttons enabled if possible.*

The Bottom Button Row.

<-TAB

changes the active tab in the setout panel to the next left.

TAB->

changes the active tab in the setout panel to the next right.

The **<-TAB** and **TAB->** keys can be overwritten for special user behaviour.

Overwriting the **<-TAB** and **TAB->** keys.

The functionality of the TAB keys can be defined in "**12dF_DLG_USER_KEYS.4D**".

The file allows the user to enter the text for the key and the functionality for the key to take on.

"bt_tab_left" "P2d" "tps_position_hz"

"bt_tab_right" "P XY" "tps_position_xy"

The 1st field is the keyword for the button to override.

The 2nd field is the text for the button to override.

The 3rd field is the action for the button to perform, any of the 12dField hot keys defined in "**12dF_USER_KEYS.4D**" can be assigned.

Single String Setout

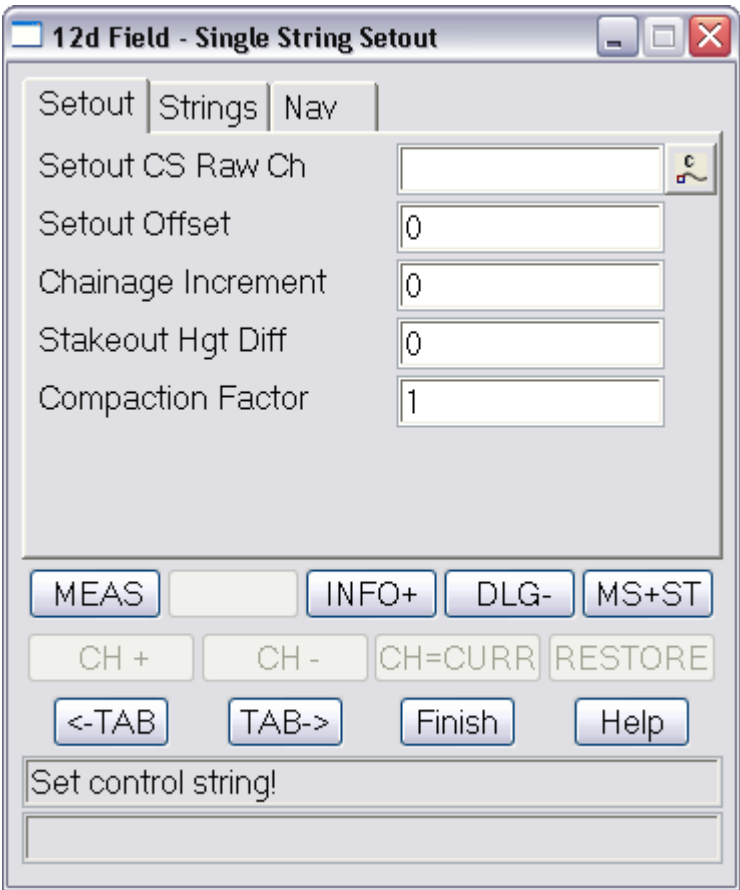

The **12d Field Single String Setout** panel is used when the setout point is relative both horizontally and vertically to one string, for example a traffic island or kerb and gutter.

Single string setout works by dropping a point to a nominated control string, then the setout string is cut normal to the dropped point on the control string.

When setting out the setout string is cut normal from a point at the setout chainage on the control string, then the setout offset is then applied from here to create the setout point.

Note the control string and the setout string could be the same string or all different, this dependant on the task being performed.

Selecting the **Single String Setout** option brings up the **12d Field - Single String Setout** panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Setout CS Raw Ch	12dF chainage box		
<i>The raw, no equalities setout chainage on the control string, start chainage plus distance along string</i>			

Setout Offset	12dF double box		
<i>The offset from the setout string to setout, +ve is to the right of the string, -ve left</i>			

Chainage Increment	12dF double box		
<i>The value the setout chainage will be changed by when chainage increment/decrement is called.</i>			

Stakeout Hgt Diff	12dF double box		
<i>The height diff from the setout surface/string. +ve is above.</i>			

Compaction Factor	12dF double box		
<i>A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).</i>			

Buttons

MEAS	button
<i>Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the</i>	

control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog.

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

CH + button

Increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the "**CH=CURR**" button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

DLG+ button

Restore a minimised panel to it's full size.

INFO- button

Close the user configurable information panel.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

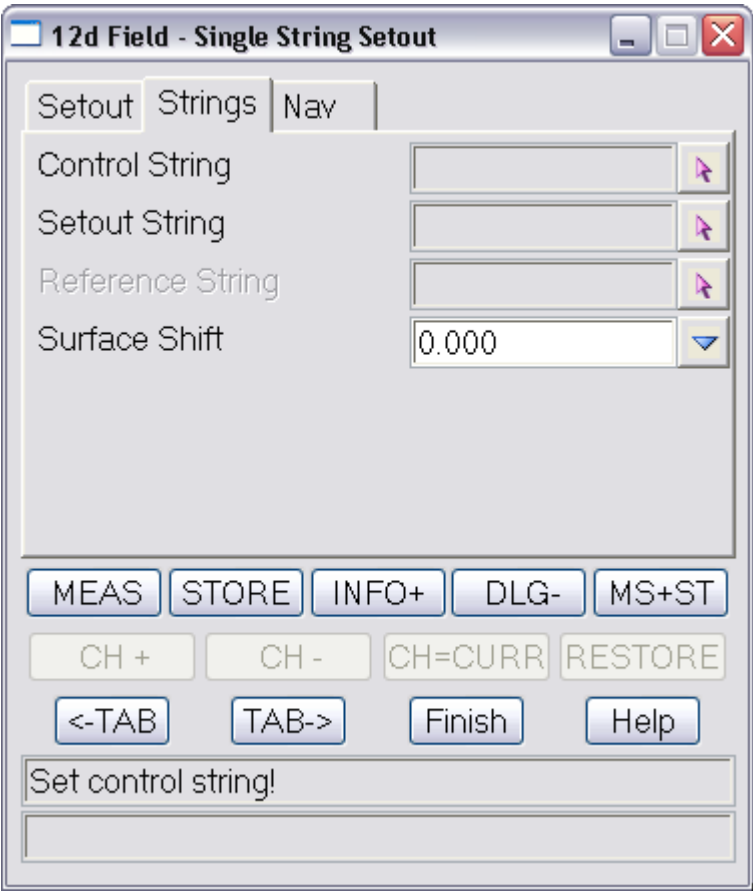

SAVE button

Save the current setout settings for reuse at a later date.

STOP button

Stop the measurement in process.

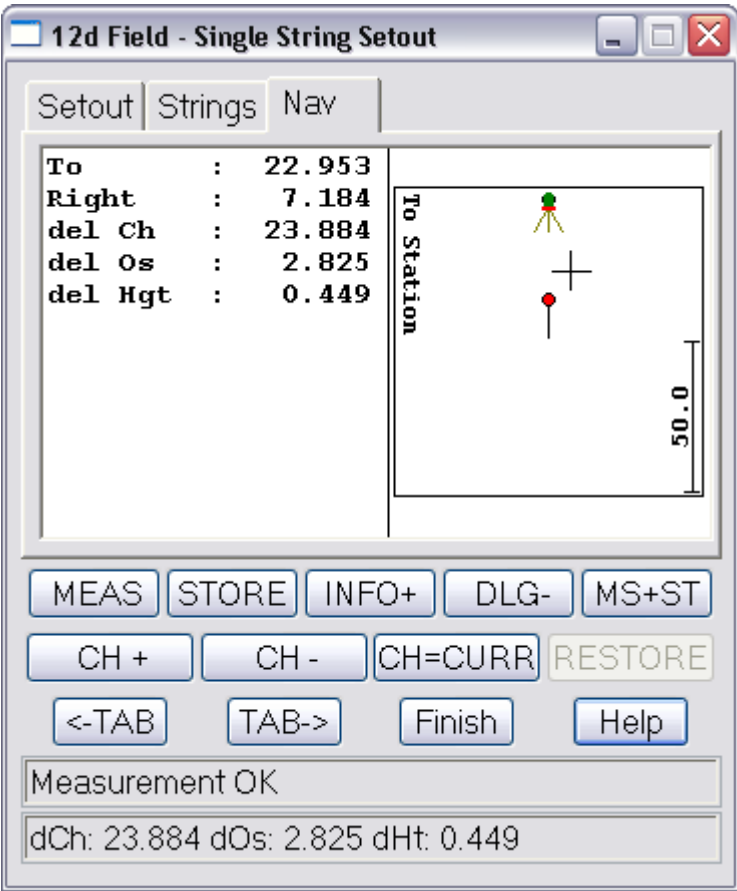

STORE button
Store the last measured point.

Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control String	12dF string select box		
<i>Control string, the string to which the other strings are cut normal to for calculations.</i>			
Setout String	12dF string select box		
<i>Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline</i>			
Reference String	12dF string select box		
<i>Reference string, a string to which the current point is dropped normally to for information only.</i>			
Surface Shift	choice box		-0.0000
<i>A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”)</i>			

Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Navigation Box		draw box	

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Batter Setout

The **12d - Field Batter Setout** panel is used to dynamically locate the intersection point of a slope defined by the cut of 2 strings and the natural surface at the users current position. It is designed around the user wishing to place batter rails in place for guiding the cut/fill.

Note, unlike other string setout routines the batter setout does not have a setout string, just the control string and the 2 design strings.

The user is able to set a shift to move the design surface up or down once the strings are cut. There are manual modes available for setting the design slope when 2 strings are not able to be cut.

Batter setout works by dropping a point to a nominated control string, the 2 strings used to determine the slope are cut normal to the dropped point on the control string, the delta offset for the pole is dependant on the users height rather than a setout string.

Selecting the **Batter Setout** option brings up the **12d - Field Batter Setout** panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Setout CS Raw Ch	12dF chainage box		
<i>The raw, no equalities setout chainage on the control string, start chainage plus distance along string</i>			

Chainage Increment	12dF double box		
<i>The value the setout chainage will be changed by when chainage increment/decrement is called.</i>			

Hgt Rail over Batter	12dF double box		
<i>The height of the batter rail above the design batter, say 0.1 for cut and 1.0 for fill.</i>			

Hgt Rail over Ground	12dF double box		
<i>The height of the batter rail above the natural ground, typically as large as number as possible to get the rail away from the top/toe of the batter.</i>			

Compaction Factor	12dF double box		
<i>A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated the Settings panel.)</i>			

Buttons

MEAS	button
-------------	--------

*Start a measurement, the behaviour is determined by the **TPS/GPS** measurement setting set from the control bar.*

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

Minimises the dialog so only the first 2 rows of buttons are shown.

MS+ST button

Start a measurement and store it on completion.

CH + button

Increment the setout chainage by the value in the chainage increment field.

CH - button

Decrement the setout chainage by the value in the chainage increment field.

CH=CURR button

Set the setout chainage to the chainage of the last measured point.

RESTORE button

*Restore the setout chainage to the chainage prior to the "**CH=CURR**" button being pressed.*

<-TAB button

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

STOP button

Stop the measurement in process.

STORE button

Store the last measured point.

Nav P button

Load a saved navigation page configuration.

Sh M button

Start a measurement with a touch on the screen.

Sh M+S button

Start a measurement with a touch on the screen, store it on completion.

READ button

Load previously saved setout settings for reuse.

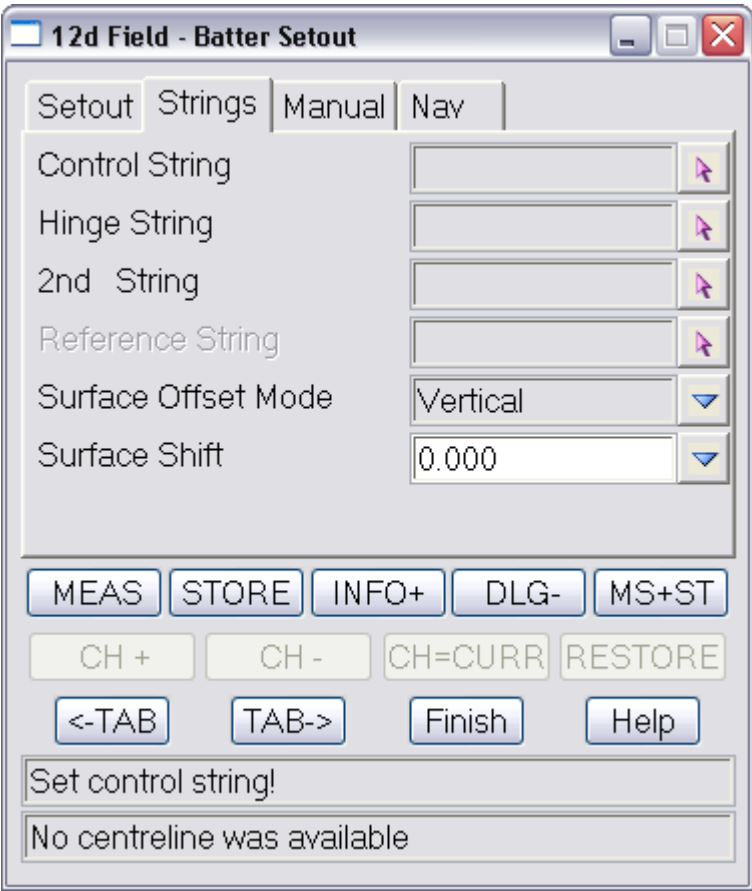

SAVE button

Save the current setout settings for reuse at a later date.

DLG+ button

Restore a minimised panel to it's full size.

INFO- button
Close the user configurable information panel.

Strings Tab

The fields and buttons used in this panel have the following functions.

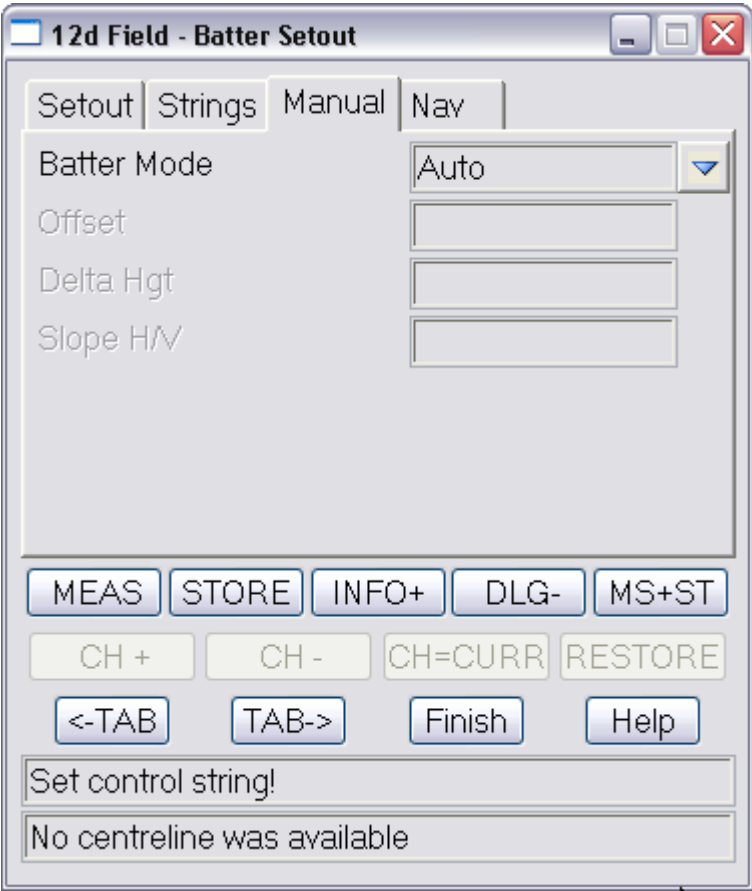

Field Description	Type	Defaults	Pop-Up
Control String	12dF string select box		
<i>Control string, the string to which the other strings are cut normal to for calculations.</i>			
Hinge String	12dF string select box		
<i>The hinge string is the string the batter is being cut or filled to. Slope distances etc. are given to this string.</i>			
2nd String	12dF string select box		
<i>The other string along with the hinge string defining the batter slope.</i>			
Reference String	12dF string select box		
<i>Reference string, a string to which the current point is dropped normally to for information only.</i>			
Surface Offset Mode	choice box		vertical, normal
<i>Whether the offset to the surface is normal or vertical</i>			
Vertical: The height offset is applied vertically to the design slope.			
Normal: The height offset is applied normal/perpendicular to the design slope.			

Surface Shift

choice box

0.000

A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “*TDF_SURFACE_SHIFTS.4D*”)

Manual Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Batter Mode	choice box		Auto Centreline, hinge & slope Manual relative (dOS&dHgt), Manual absolute (dOS&RL) Manual, use current slope

Choose the method to generate the batter slope.

Auto: The batter slope is determined by cutting the hinge and secondary string.

Centreline, hinge & slope: The batter setout is done by cutting the hinge and applying a manually entered slope from this.

Manual relative (dOS&dHgt): The user manually enters the hinge offset from the control line, the hinge height relative to the control line and the batter slope.

Manual absolute (dOS&RL): The user manually enters the hinge offset from the control line, the absolute hinge height and the batter slope.

Manual, use current slope: The batter setout is done by cutting the hinge and applying the last

measured slope.

Offset 12dF double box

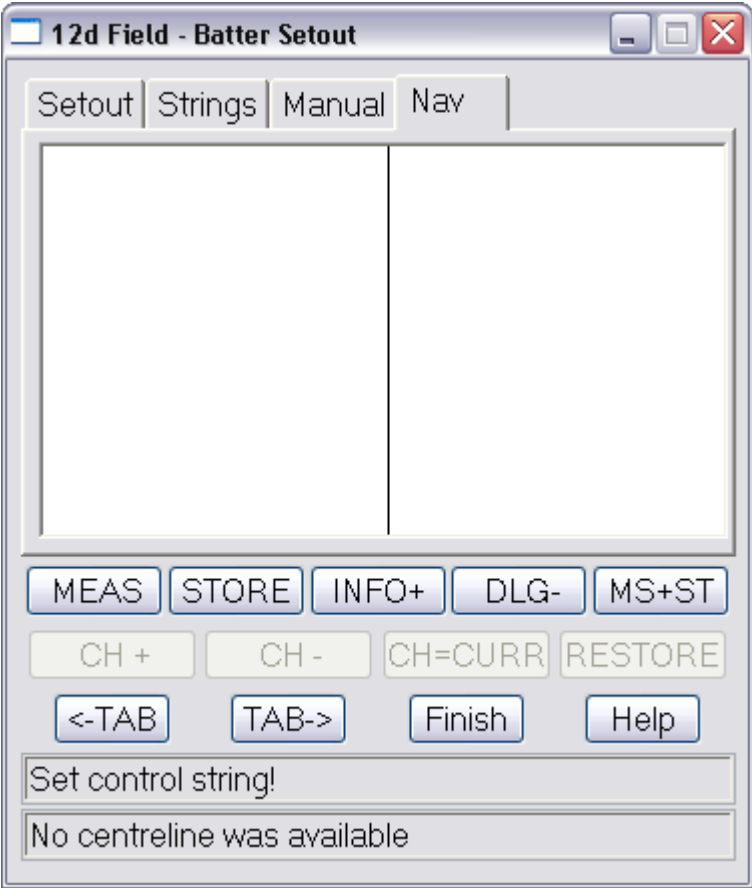

Dependant on the '**Batter Mode**' setting in use, see description of the options in '**Batter Mode**'.

Delta Hgt/Absolute Height 12dF double box

Dependant on the '**Batter Mode**' setting in use, see description of the options in '**Batter Mode**'.

Slope H/V 12dF double box

The slope of the batter in horizontal/vertical from, e.g. 2:1

Nav Tab

The fields and buttons used in this panel have the following functions.

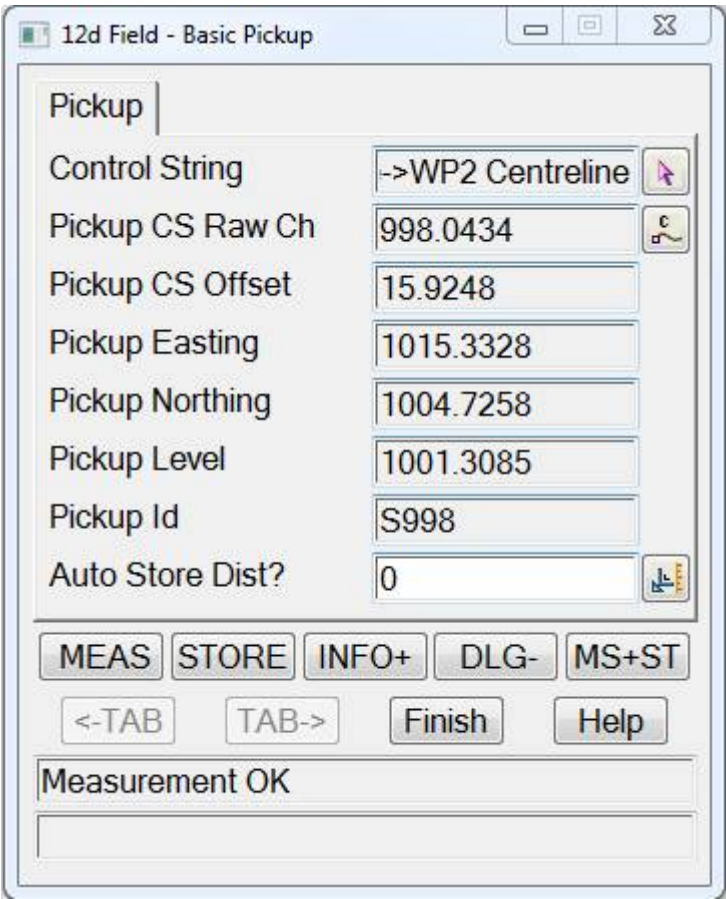

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Navigation Box	draw box		
-----------------------	----------	--	--

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

12d Field -Basic Pickup

The **12d Field - Basic Pickup** panel enables the user to pickup and store points. Basic Pickup is only for points and simple lines, it has no edit facilities, recalculations for target height corrections etc.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Control String	12dF string select box		
<i>If selected the chainage and offset of the current point on this string will be displayed.</i>			

Pickup CS Raw Ch	12dF chainage box		
<i>The raw/non equality chainage of the current point on the control string.</i>			

Pickup CS Offset	12dF double box		
<i>The offset of the current point from the control string, +ve is right</i>			

Pickup Easting	12dF double box		
<i>The measured easting.</i>			

Pickup Northing	12dF double box		
<i>The measured northing.</i>			

Pickup Level	12dF double box		
<i>The measured level.</i>			

Pickup Id 12dF input box

The Id of the measured point, the behaviour of the Id is controlled from the [Store Point Setup](#) panel.

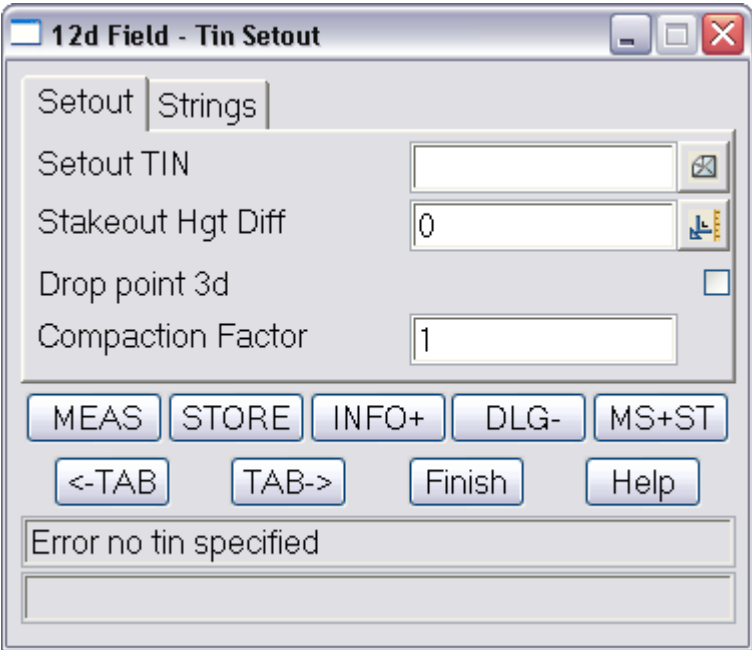

Auto Store Dist? 12dF double box

If non zero the distance between shots to automatically store points, the measurement mode must be continuous.

Please see [Common Measurement Buttons](#) for information on the buttons.

Tin Setout

The **12d Field - Tin Setout** panel is used when the user needs to get design levels from a tin. The point can be dropped either vertically to the tin or 3d/normal to the tin. Selecting the **Tin Setout** option brings up the **12d Field - Tin Setout** panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Setout TIN	12dF tin box		
-------------------	--------------	--	--

The TIN to use for setting out

Stakeout Hgt Diff	12dF double box		
--------------------------	-----------------	--	--

The height diff from the setout surface/string. +ve is above.

Drop point 3d	named tick box		
----------------------	----------------	--	--

When this is toggled on the point is dropped normal to the tin.

In the event the point cannot be dropped to triangle face it will try drop to the edge of a triangle that lies inside the 2d boundary of the tin.

Compaction Factor	12dF double box		
--------------------------	-----------------	--	--

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel).

Buttons

MEAS button

Start a measurement, the behaviour is determined by the TPS/GPS measurement setting set from the control bar.

INFO+ button

Display the user configurable information panel to view extra information not available on the standard dialog

DLG- button

SAVE button

Save the current setout settings for reuse at a later date.

INFO- button

Close the user configurable information panel.

Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Reference String	12dF string select box		
<i>Reference string, a string to which the current point is dropped normally to for information only.</i>			
Surface Shift	choice box	0.000	
<i>A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”)</i>			

Crossfall Setout

The **12d Field - Crossfall Setout** panel is used when the user wants to generate their design height by cutting 2 strings and projecting the plane of the cuts to their position.

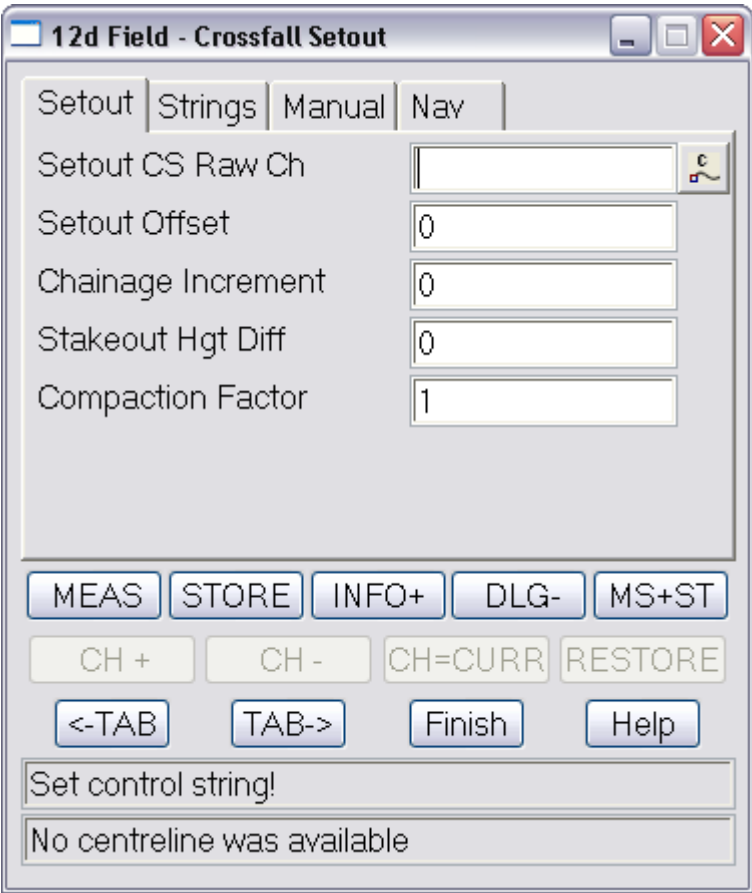

The user is able to set a shift to move the design surface up or down once the strings are cut.

There are manual modes available of setting the design crossfall when 2 strings are not able to be cut.

Crossfall Setout works by dropping a point to a nominated control string, then a setout string and the 2 strings used to determine the crossfall are cut normal to the dropped point on the control string.

Note the control string, the setout string and 1 of the level strings could be the same string or all different, this dependant on the task being performed.

Selecting the **Crossfall Setout** option brings up the **12d Field - Crossfall Setout** panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Setout CS Raw Ch	12dF chainage box		
<i>The raw, no equalities setout chainage on the control string, start chainage plus distance along string</i>

Strings Tab

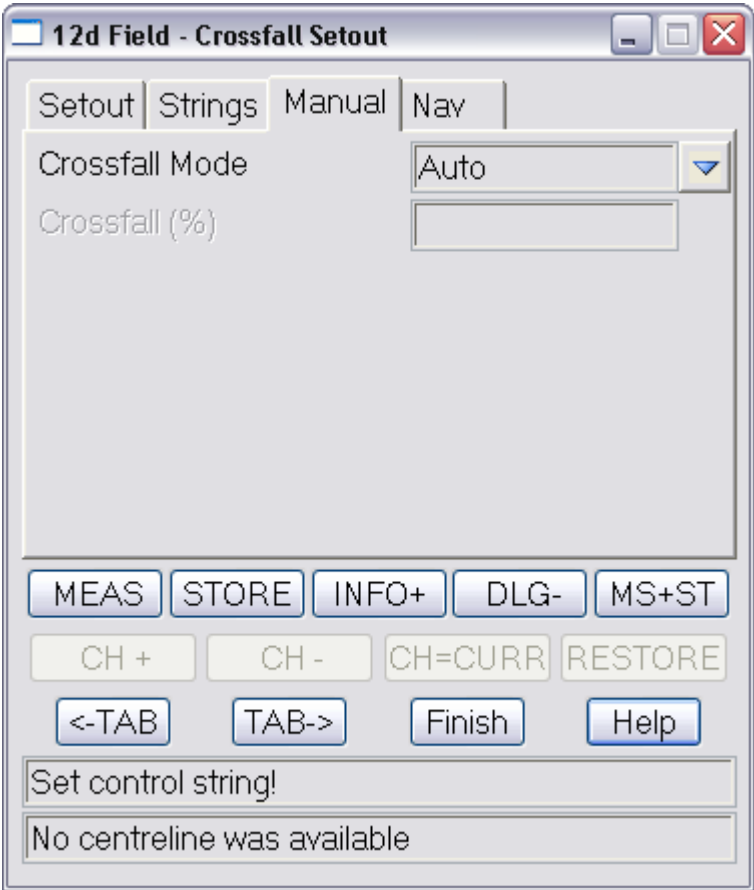

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control String	12dF string select box		
<i>Control string, the string to which the other strings are cut normal to for calculations.</i>			
Setout String	12dF string select box		
<i>Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline</i>			
1st level string	12dF string select box		
<i>Level string 1, the string cut for one of the design heights.</i>			
2nd level string	12dF string select box		
<i>Level string 2, the string cut for a 2nd design height.</i>			
Reference String	12dF string select box		
<i>Reference string, a string to which the current point is dropped normally to for information only.</i>			
Surface Offset Mode	choice box		Vertical, Normal
<i>Whether the offset to the surface is normal or vertical</i>			

Vertical: The height offset is applied vertically to the design surface.
Normal: The height offset is applied normal/perpendicular to the design surface.

Surface Shift choice box

A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “**TDF_SURFACE_SHIFTS.4D**”).

Manual Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Crossfall Mode	choice box		Auto, Centreline, string & x-fall, Manual, use current x-fall

The method used to generate the design crossfall

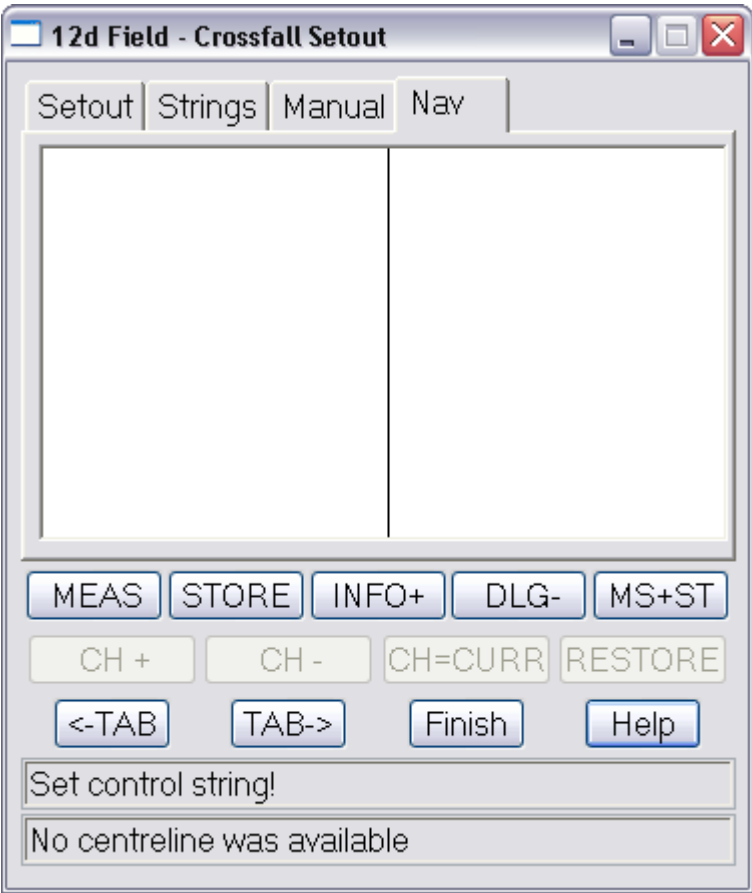

***Auto:** The crossfall is calculated by cutting the 1st and 2nd strings.*

***Centreline, string & x-fall:** The crossfall is entered manually, only the 1st string is cut and the crossfall projected from this.*

***Manual, use current x-fall:** The crossfall is entered manually defaulting to last calculated crossfall, only the 1st string is cut and the crossfall projected from this.*

Crossfall (%) 12dF double box

The manual crossfall entered by the user in the crossfall setout routine

Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Navigation Box	draw box		

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

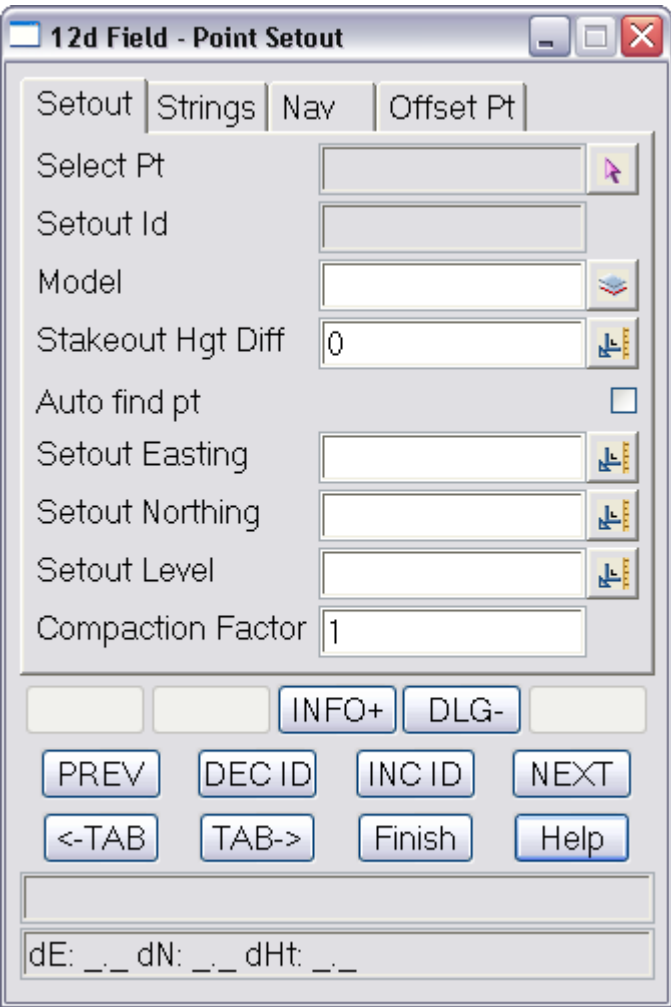

Point Setout

The **12d Field - Point Setout** panel enables the user to setout individual points, optionally referenced to a control string.

The point can be either selected from a view, be found automatically or be manually entered.

The panel also allows the offsetting of the point by a defined bearing and distance.

Selecting the **Point Setout** option brings up the **12d Field - Point Setout** panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Point Selection

The point can be picked from a view, in this case the Id and Model boxes will be automatically filled out.

The point id can be manually changed but in this case must be unique in the model.

If auto find is on the point will be set to the closest point in the setout model to the current position in the field

Select Pt	12dF new select box
<i>Select the point to setout, will update the Point Id and Model boxes</i>	

Setout Id	12dF input box
<i>The id/name of the setout point.</i>	

Model	model box
<i>The model containing the setout point.</i>	

Stakeout Hgt Diff	12dF double box
--------------------------	-----------------

The height diff from the setout surface/string. +ve is above.

Auto find pt named tick box

Auto find pt

Setout Easting, Setout Northing, Setout Level

The coordinate boxes are only added to the panel if ticked on under survey in the settings panel.

Setout Easting 12dF double box

The easting to setout.

Setout Northing 12dF double box

The northing to setout.

Setout Level 12dF double box

The height to setout.

Compaction Factor 12dF double box

A compaction factor applied to the delta heights, e.g. if you know say asphalt will compact by 23% and you need to cover this enter the value as 1.23. (Note this widget is optional and only appears if activated in the Settings panel.)

Buttons

MEAS button

INFO- button

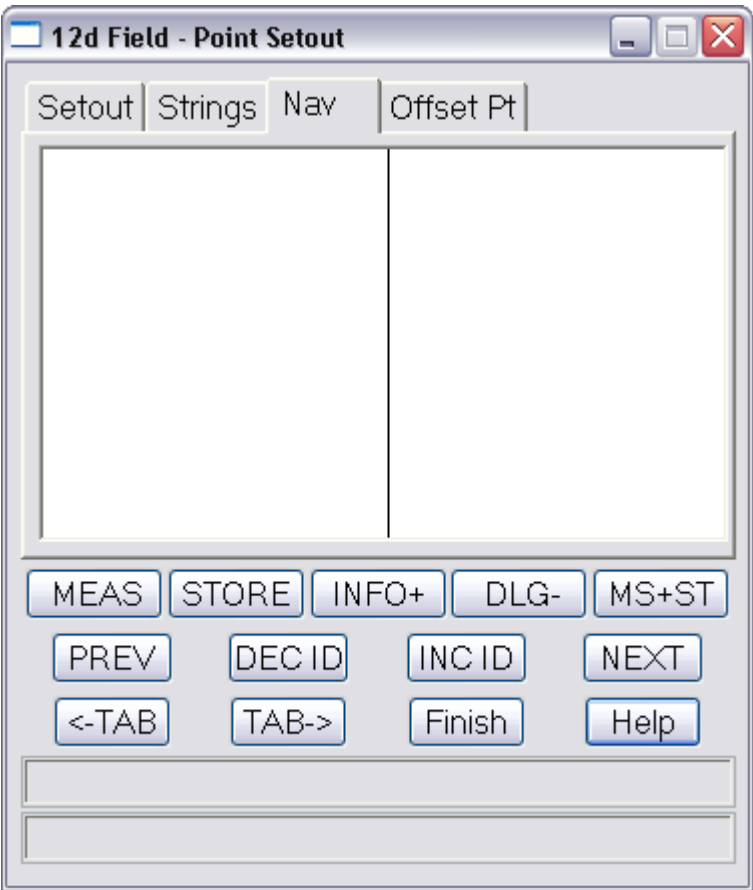

Close the user configurable information panel.

Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control String	12dF new select box		
<i>Control string, the string to which the other strings are cut normal to for calculations.</i>			
Reference String	12dF new select box		
<i>Reference string, a string to which the current point is dropped normally to for information only.</i>			

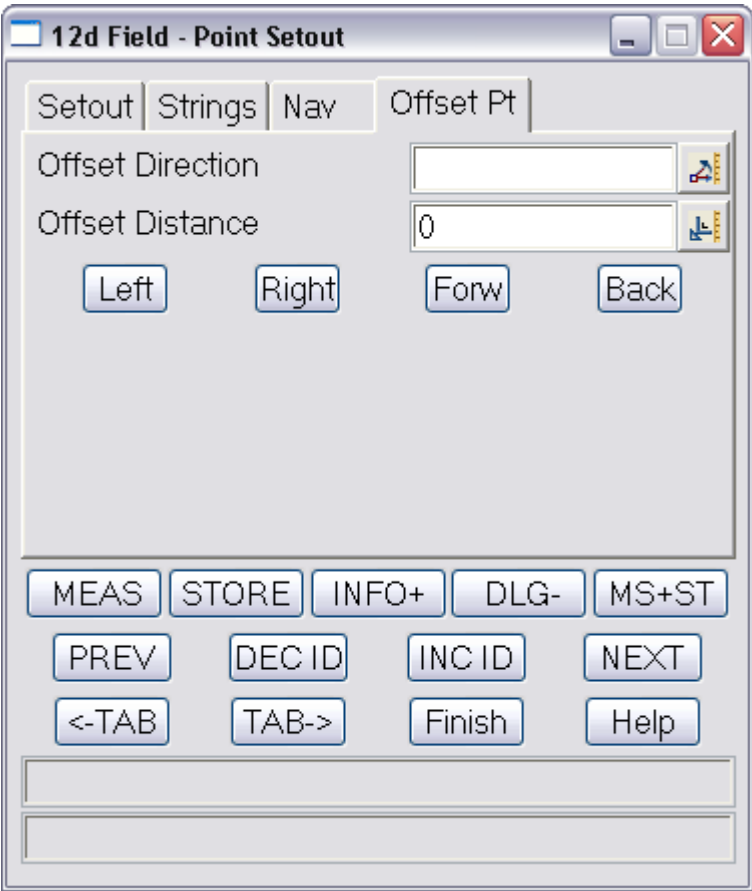

Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Navigation Box	draw box		
----------------	----------	--	--

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Offset Pt Tab

The **Offset Point** tab allows the current setout point to be offset in a defined direction and distance.

For example if the offset direction was 45° and the offset distance 5m pressing Left would move the point 5m at 315°.

If a control string is nominated then when the point is originally selected it is dropped to the control string and the bearing at this point is the default for the offset direction.

For example, to place offset pegs to a drainage pit select the road centreline and then select the pit. The bearing is that of the road, enter the offset distance and press Right or Left and the point is updated.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Offset Direction	12dF angle box		
<i>Direction to offset base point in.</i>			
Offset Distance	12dF double box		
<i>Distance to offset base point by.</i>			
Left	button		
<i>Offset the point by the offset distance to the left of the offset direction.</i>			
Right	button		

Offset the point by the offset distance to the right of the offset direction.

Forw button

Offset the point by the offset distance in the offset direction.

Back button

Offset the point by the offset distance against the offset direction.

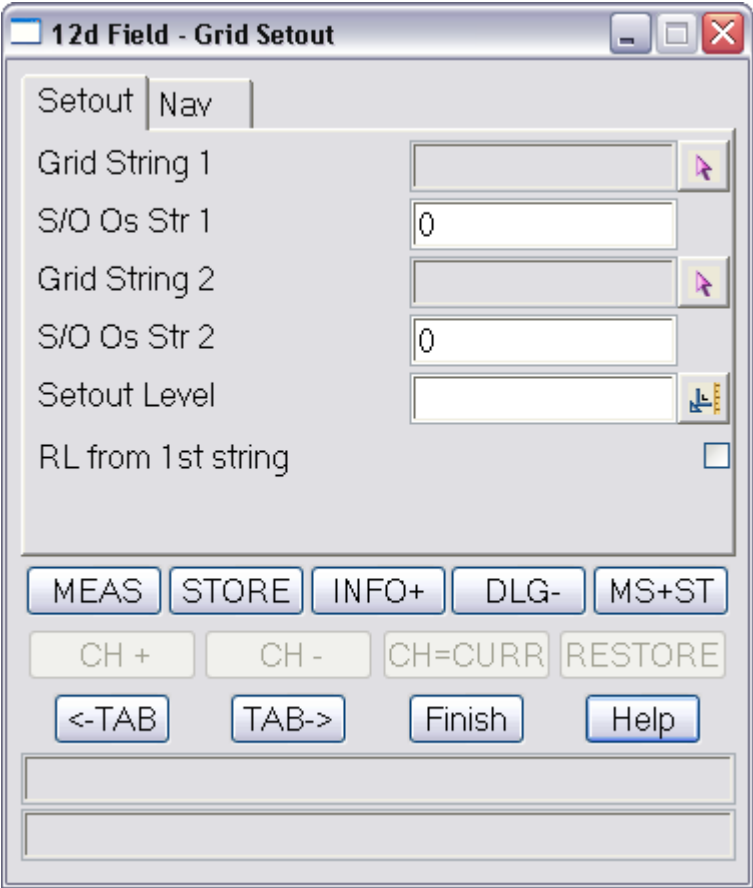

Grid Setout

This section of documentation is a work in progress and will be updated in subsequent releases.

The **12d Field - Grid Setout** panel creates a setout point at offsets from 2 strings.

Most typically used in buildings where points are dimensioned off setout grids

Selecting the **Grid Setout** option brings up the **12d Field - Grid Setout** panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Grid String 1	12dF new select box		
----------------------	---------------------	--	--

The first string for grid setout

S/O Os Str 1 12dF double box

The setout offset from the first string

Grid String 2 12dF new select box

The second string for grid setout

S/O Os Str 2 12dF double box

The setout offset from the second string

Setout Level 12dF double box

The height to setout.

RL from 1st string tick box

If ticked then the level of the 1st string selected will be the setout level

Buttons

Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

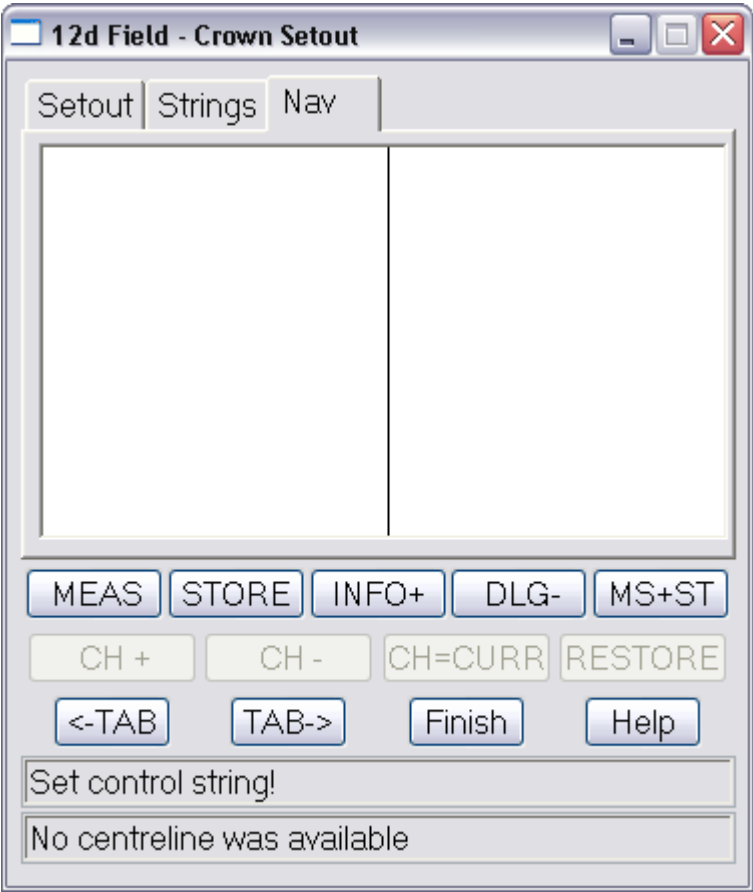

Control String	12dF new select box		
-----------------------	---------------------	--	--

Control string, the string to which the other strings are cut normal to for calculations.

Setout String	12dF new select box		
----------------------	---------------------	--	--

Setout String, setout offset & heights are relative to this string at a point cut normal from the setout chainage on the control string/centreline

1st Level String	12dF new select box	
<i>Level string 1, a string cut for one of the design heights.</i>		
Crown String	12dF new select box	
<i>Crown string, the middle string for design heights in crown setout</i>		
2nd Level String	12dF new select box	
<i>Level string 2, the string cut for a 2nd design height.</i>		
Reference String	12dF new select box	
<i>Reference string, a string to which the current point is dropped normally to for information only.</i>		
Surface Shift	choice box	0.0000
<i>A vertical shift to be applied to the design level, +ve raises the level, can be manually entered or selected from the choice list, (defined in “TDF_SURFACE_SHIFTS.4D”)</i>		

Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

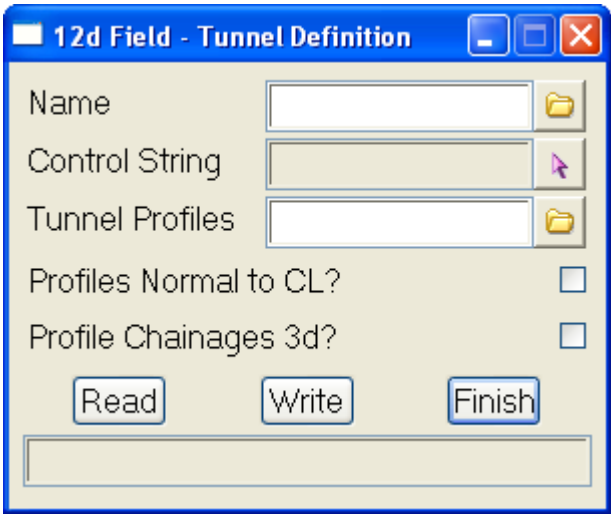

Navigation Box	draw box
-----------------------	----------

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Tunnel Definition

The **Tunnel Definition** panel combines a centreline, the **PRO/PRA** tunnel definition files and information on how the profiles are applied to the centreline into a single file for use by the **Tunnel Setout** panel.

For more information on **PRO/PRA** tunnel definition files please see [Definition of the PRO and PRA definition files](#)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name

*The name of the tunnel, this a file with the extension **12dF_TUN_DEF**.*

Control string

*The centreline the tunnel definitions are applied to, the centreline must have valid vertical geometry for the chainage ranges in the **PRA** file.*

Tunnel Profiles

*The **PRO/PRA** files containing the tunnel definition. For more information on **PRO/PRA** tunnel definition files please see [Definition of the PRO and PRA definition files](#)*

Profiles Normal to CL? tick box

if ticked the tunnel is calculated perpendicular/normal to the vertical alignment of the centreline resulting in a true 3d model.

if not ticked the tunnel is calculated vertical to the vertical alignment of the centreline, this means an effective loss of clearance on steeper grades.

Profile Chainages 3d? tick box

*if not ticked the chainages in the **PRA** file are taken as plan chainages.*

if ticked the chainages are interpreted as 3d, this is the plan/2d chainage of the 1st point where the horizontal and vertical geometry coincide plus the 3d length along the centreline from there.

Read button

Read in a 12dField tunnel definition file.

Write button

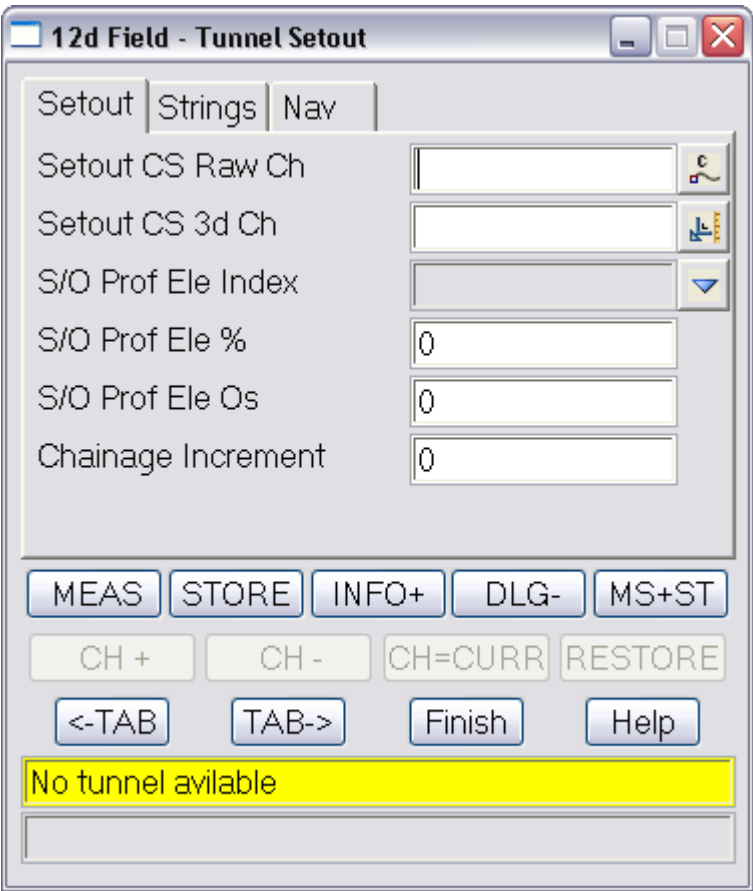

Write to a 12dField tunnel definition file.

Finish

Exit the panel.

Tunnel Setout

The **Tunnel Setout** option, (available in TPS only) allows the user to locate and setout points on a tunnel previously defined in the [Tunnel Definition](#) panel.

Setout Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Setout CS Raw Ch

The plan chainage of the point you wish to setout. If the tunnel chainages are defined as 3d this will be read only and be updated when a 3d chainage is entered.

Setout CS 3d Ch

The 3d chainage of the point you wish to setout. If the tunnel chainages are defined as 2d this will be read only and be updated when a 2d chainage is entered.

S/O Prof Ele Name

The name of the element in the profile to setout.

S/O Prof Ele %

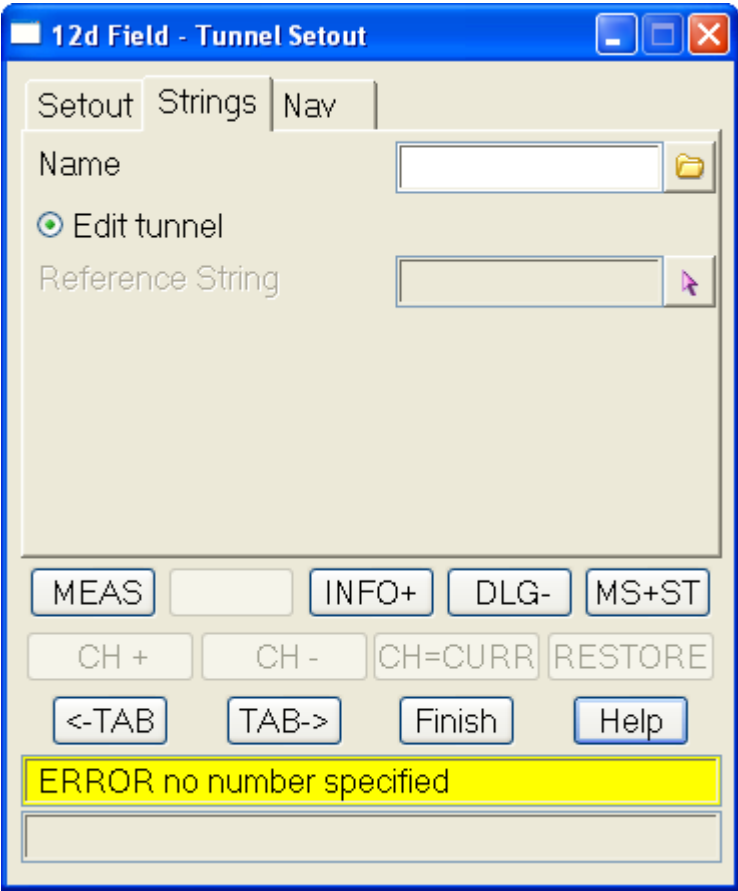

The percentage around the element to setout, 0% means the start of the element, 100% the end of the element.

S/O Prof Ele Os

The offset from the element to setout, +ve is to the right of the element.

Chainage Increment 12dF double box

The value the setout chainage will be changed by when chainage increment/decrement is called.

Strings Tab

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Name

Select the tunnel to setout.

Edit tunnel

If pressed will open up the [Tunnel Definition](#) panel with the currently defined tunnel, on closure of the **Tunnel Definition** panel the definition will be read in again.

Reference String 12dF new select box

Reference string, a string to which the current point is dropped normally to for information only.

Attributes specific to tunnel setout for display on the information and navigation pages.

pu_tun_ele_name

Name of the tunnel element at the shot taken

pu_tun_ele_idx

Index, (zero based) of the tunnel element in the profile at the shot taken, 0 is the first element

pu_tun_ele_per

Percentage around the tunnel element at the shot taken.

pu_tun_ele_os

Offset from the tunnel element at the shot taken, +ve is to the right hand side.

so_tun_ele_name

Name of the tunnel element at the point setout

so_tun_ele_idx

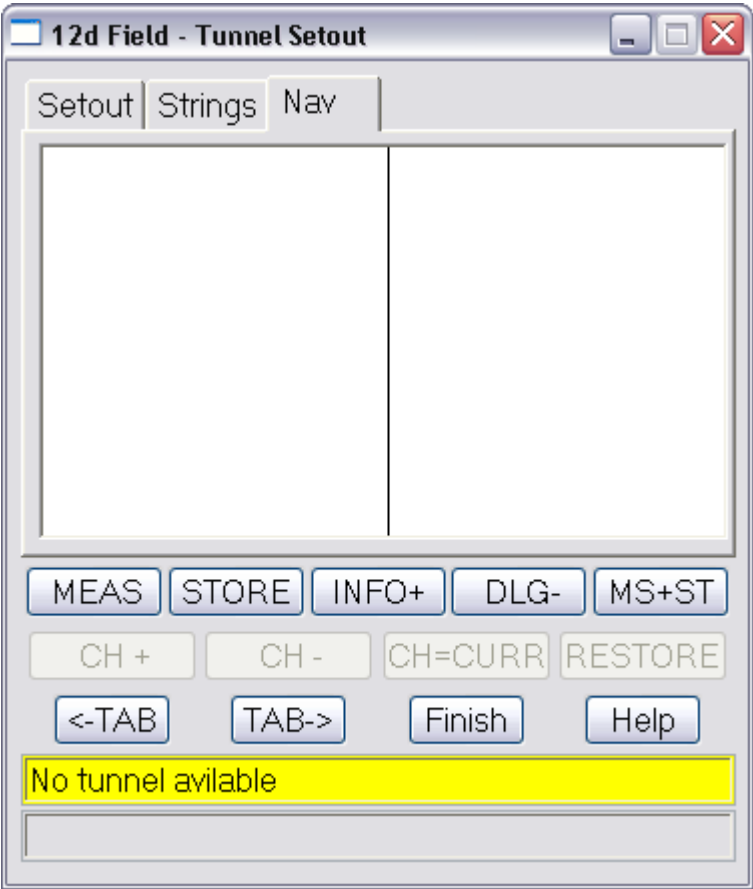

Index, (zero based) of the tunnel element in the profile at the point setout, 0 is the first element

so_tun_ele_per

Percentage around the tunnel element at the point setout.

so_tun_ele_os

Offset from the tunnel element at the point setout, +ve is to the right hand side.

Nav Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Navigation Box draw box

The 12d Field navigation box augments setout by displaying user definable information rows plus a bulls-eye as a visual aid.

Station Helmert

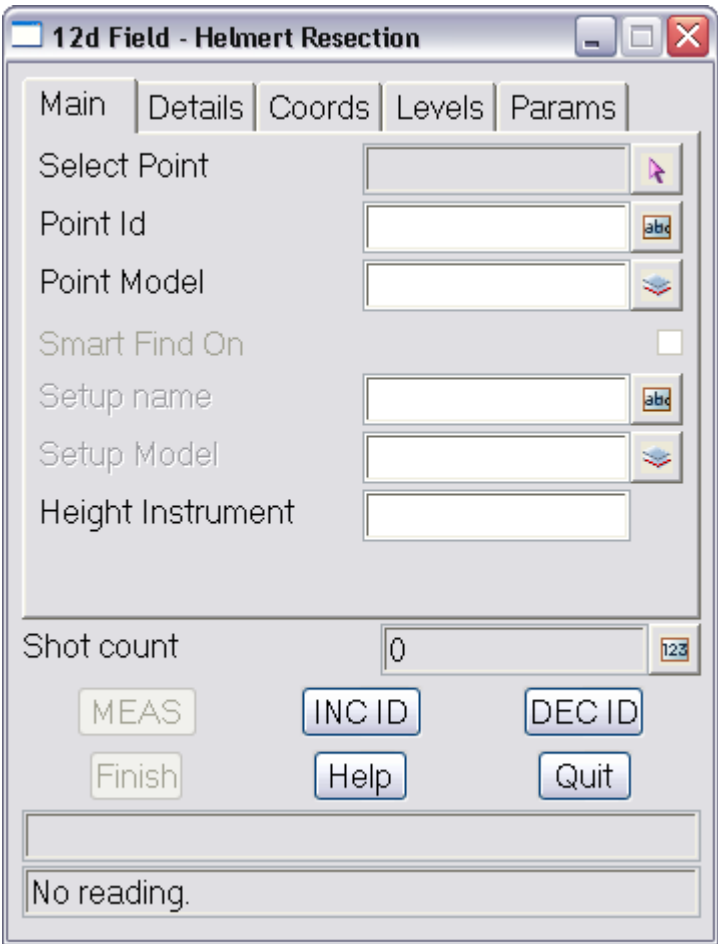

The **12d Field - Helmert Resection** panel can be used to establish a station setup by taking readings to up to 6 known points.

The horizontal position is obtained by a Helmert transformation; translation, rotation and uniform scaling of the readings.

The vertical position is obtained by meaning the z values of the readings, the z value is not weighted on distance measured.

Readings can be used for either horizontal position, vertical position or both.

Selecting **Station Helmert** displays the **12d Field - Helmert Resection** panel on the screen.

Main Tab

A point for use in the resection can either be picked from the screen or manually entered.

If picked from the screen the Id and Model boxes will be filled automatically.

If entered manually the Id must be unique in the point model.

Note in 12dField the Id always refers to the Vertex Id.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select Point	string select box		
<i>Select the point for the next shot to be used in the resection</i>			
Point Id	12dF input box		
<i>The Id/name of the target point.</i>			
Point Model	model box		
<i>The model containing the point for use in the resection.</i>			
Smart Find On	tick box		
<i>Smart find can be used when you can clearly identify one point in a resection, e.g. in a tunnel you can see multiple targets but only identify the one closest to you.</i>			
<i>Smart find can be used after you have measured to the identified point.</i>			
<i>If ticked on then after a reading to a station smart find will look through the points model to find one that the reading matches, both horizontally and vertically.</i>			
<i>The horizontal and vertical tolerances can be set on the parameters tab.</i>			
<i>Use smart find to identify all stations measured to automatically.</i>			
<i>The surveyor can optionally store the resection point to a model if need be.</i>			
Setup name	input box		
<i>The Id of the setup to be stored.</i>			
Setup Model	model box		
<i>The model to store the setup to.</i>			
Height Instrument	12dF double box		
<i>The height of the instrument above the setup point.</i>			
Buttons			
MEAS	button		
<i>Take a measurement to a station.</i>			
INC ID	button		
<i>Increment the point ID and make this the setout point. E.g. BOLT30 -> BOLT31</i>			
DEC ID	button		
<i>Decrement the point ID and make this the setout point. E.g. BOLT31 -> BOLT30</i>			
Shot Count			
<i>Number of shot used so far in the resection.</i>			
Finish	button		
<i>Leave the panel and make this the new station setup, if any of the position tolerances nominated on the parameters tab are exceeded you will get a warning box allowing you to re-enter or continue.</i>			
Quit	button		
<i>Quit the resection and restore the previous station setup.</i>

Details Tab

The details tab displays the overall details of the current setup.

The level of detail is different for 2 and 3+ shots where redundancies in the helmert calcs are available. For 3+ shot the estimation error can be displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Hz-Dist PPM	12dF long box		
<i>The scale factor to be applied to measured horizontal distances.</i>			
Easting	double box		
<i>The calculated easting of the station setup.</i>			
Northing	double box		
<i>The calculated northing of the station setup.</i>			
Level	double box		
<i>The calculated level of the station setup.</i>			
Pos error	double box		
<i>The estimated horizontal error in the station setup.</i>			
Calc'd scale factor	double box		

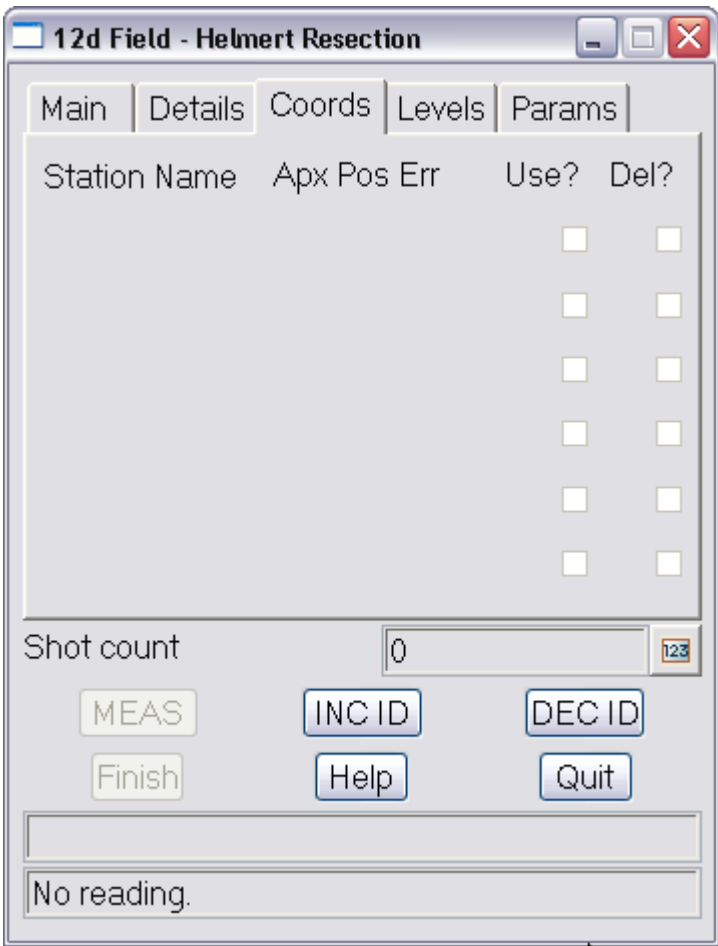

The scale factor applied to the measurements to get the best fit.

Calc'd PPM double box

The scale factor in ppm applied to the measurements to get the best fit.

RL Diff double box

The height difference range between the readings.

Coords Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Station Name

The name of the station this reading refers to.

Apx Pos Err

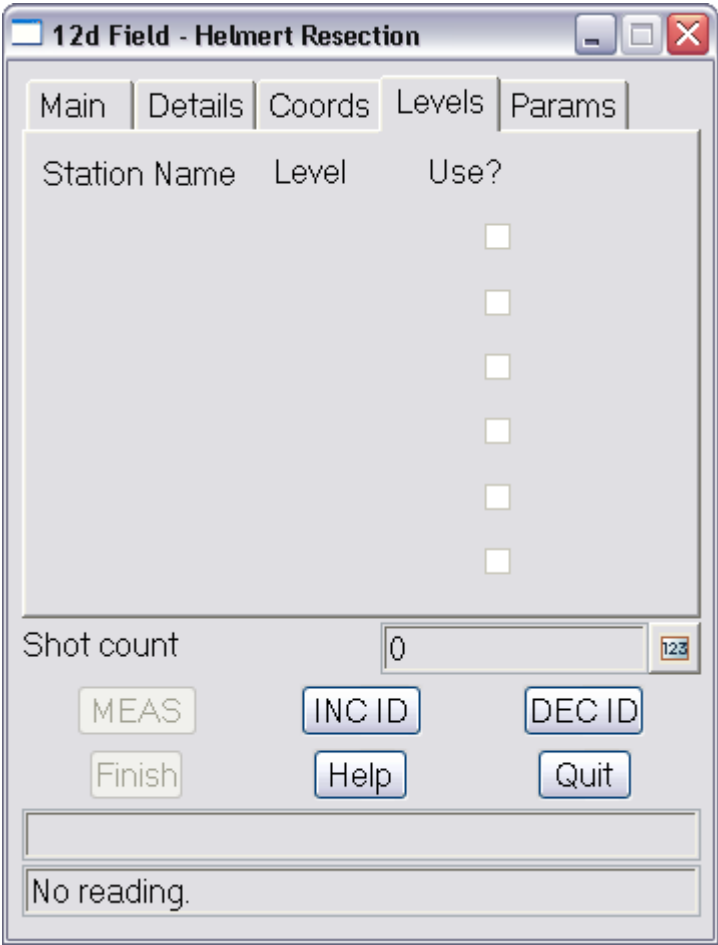

The approximate horizontal position error of this reading calculated in conjunction with all other readings in use. A high error for this reading in comparison to others might indicate a problem with this reading.

Use? tick box

if ticked this reading will be used in the horizontal calculation. Ticking or unticking the box will trigger the recalculation of the horizontal position.

Del? tick box

If ticked a confirmation box will be displayed and the reading removed from the resection. Removal will trigger the recalculation of the horizontal position.

Levels Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Station Name

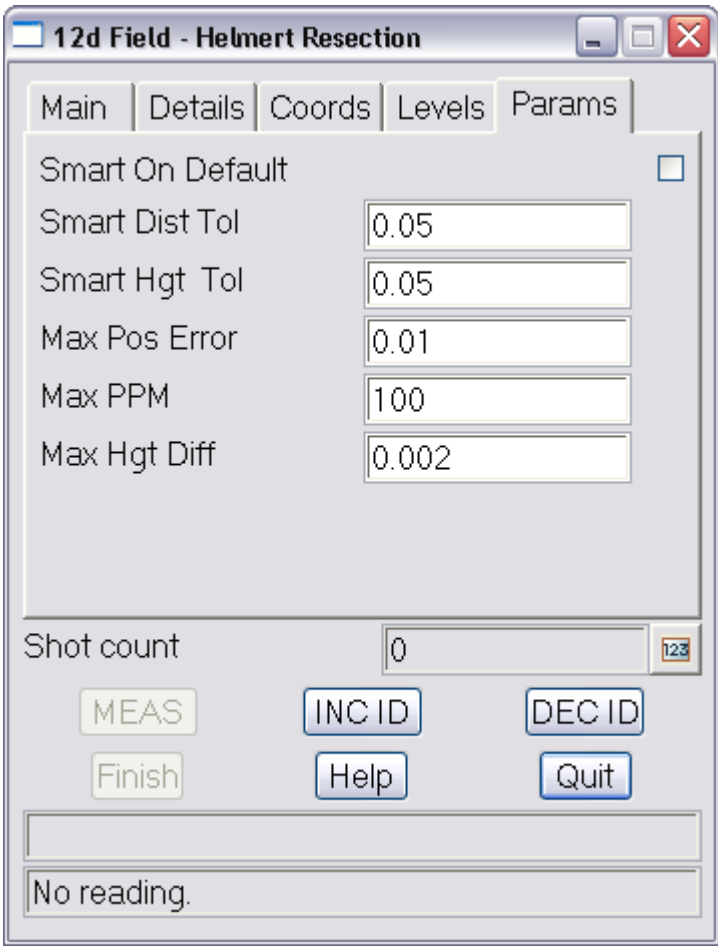

The name of the station this reading refers to.

Level

The level of the station calculated by this reading. A large difference for this reading in comparison to others might indicate a problem with this reading.

Use? tick box

If ticked this reading will be used in the vertical calculation. Ticking or unticking the box will trigger the recalculation of the vertical position.

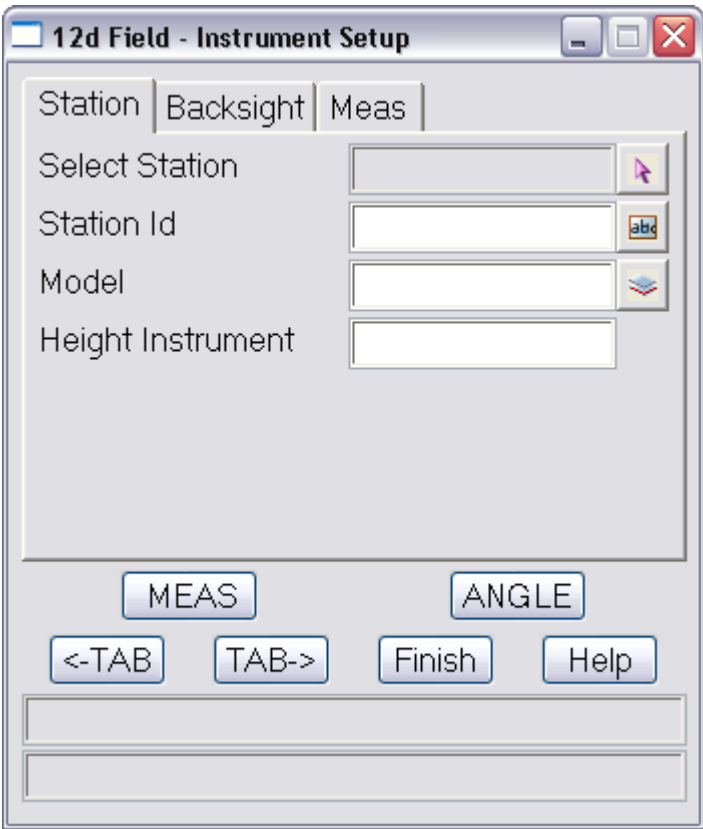

Params Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Smart On Default	tick box		
<i>The smart find feature is ticked on by default</i>			
Smart Dist Tol	12dF double box		
<i>The distance tolerance for a point to be used in the smart find</i>			
Smart Hgt Tol	12dF double box		
<i>The level tolerance for a point to be used in the smart find</i>			
Max Pos Error	12dF double box		
<i>The maximum position error allowed, a warning will be shown if exceeded.</i>			
Max PPM	12dF double box		
<i>The maximum ppm's allowed, a warning will be shown if exceeded.</i>			
Max Hgt Diff	12dF double box		
<i>The maximum height variation allowed, a warning will be shown if exceeded.</i>			

Station Standard

The **12d Field - Instrument Setup** panel is used to establish a station setup over a known point. Orientation is established by measuring/sighting a backsight station. It is not necessary to set an orientation on the instrument, 12dField handles the angle difference internally. Selecting the **Station Standard** option brings up the **12d Field - Instrument Setup** panel.

Station Tab

The point for use in the setup can either be picked from the screen or manually entered. If picked from the screen the Id and Model boxes will be filled automatically. If entered manually the Id must be unique in the point model. **Note** in 12dField the Id always refers to the Vertex Id.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select Station	string select box		
<i>Select the control station you are setting up over.</i>			
Station Id	12dF input box		
<i>The Id/name of the instrument setup.</i>			
Model	model box		
<i>The model containing the instrument station.</i>			
Height Instrument	12dF double box		
<i>The height of the instrument above the setup point.</i>			

Buttons

- MEAS

button

Start a full measurement, distance and angles.
- ANGLE

button

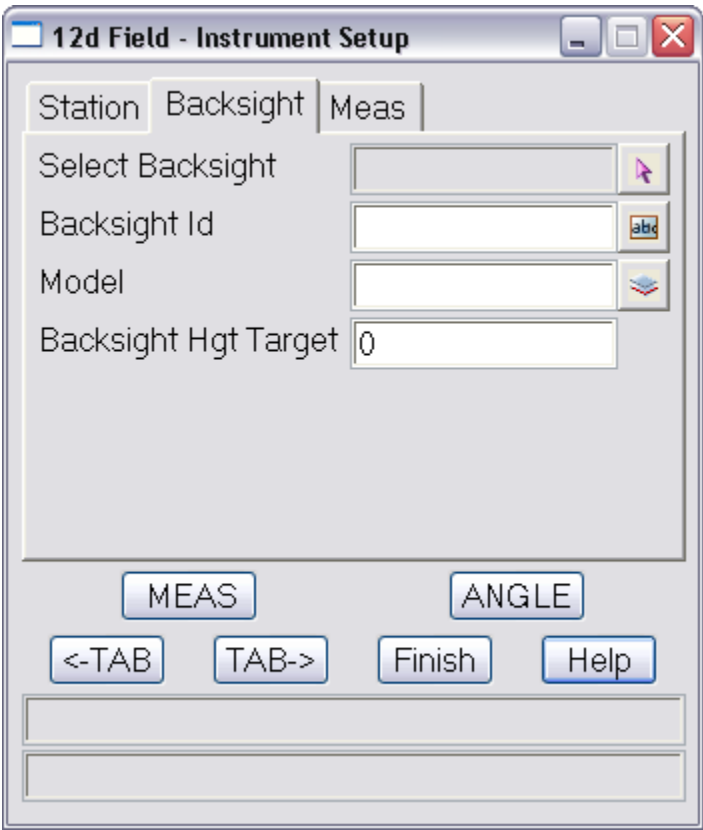

Start a horizontal/vertical angular measurement, no distance.
- <-TAB

button

Go to the previous tab in the dialog.
- TAB->

button

Go to the next tab in the dialog.

Backsight Tab

The backsight for use in the setup can either be picked from the screen or manually entered. If picked from the screen the Id and Model boxes will be filled automatically. If entered manually the Id must be unique in the point model.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select Backsight	string select box		
<i>Select the point to be used for the backsight.</i>			
Backsight Id	12dF input box		

The Id/name of the backsight point.

Backsight Hgt Target 12dF double box

The height of the backsight target above the backsight point.

The screenshot shows a software window titled "12d Field - Instrument Setup". It has three tabs: "Station", "Backsight", and "Meas". The "Backsight" tab is currently active. Inside the tab, there are seven input fields with labels to their left: "BkSt Diff Horz Dist", "BkSt Diff Meas East", "BkSt Diff Meas North", "BkSt Diff Meas Hgt", "Bearing Swing", "Max Diff Horz Dist", and "Max Diff Meas Hgt". The "Bearing Swing" field contains "0°". The "Max Diff Horz Dist" field contains "0.005". The "Max Diff Meas Hgt" field contains "0.002". Below the input fields, there are four buttons: "MEAS", "ANGLE", "<-TAB", and "TAB->". At the bottom right, there are two more buttons: "Finish" and "Help".

Meas Tab

The fields and buttons used in this panel have the following functions.

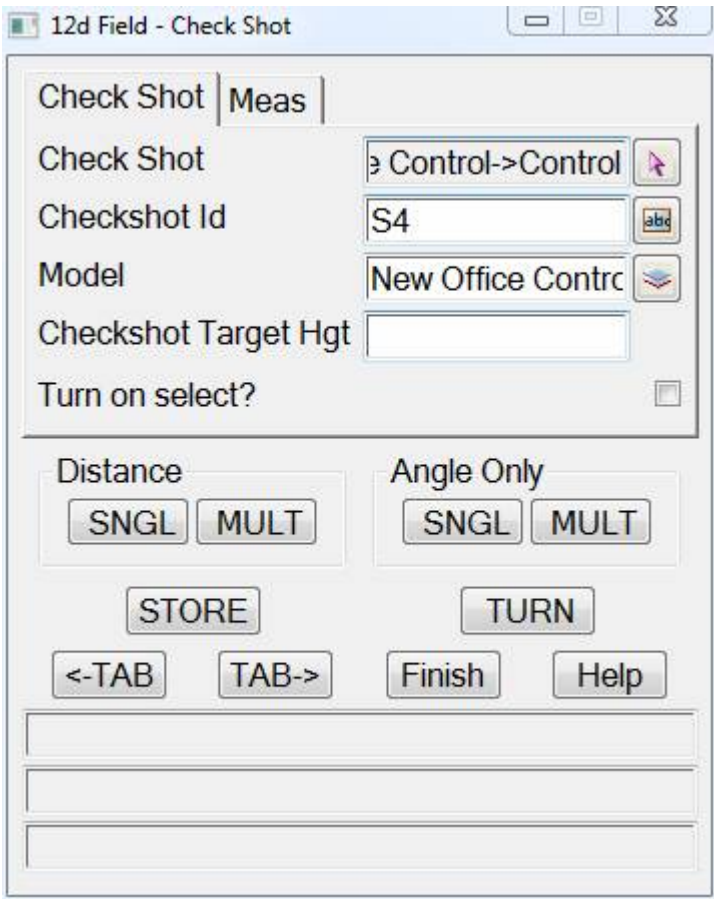

Field Description	Type	Defaults	Pop-Up
BkSt Diff Horz Dist	12dF double box		
<i>Measured difference in horizontal distance to the backsight point.</i>			
BkSt Diff Meas East	12dF double box		
<i>Measured difference in easting to the backsight point.</i>			
BkSt Diff Meas North	12dF double box		
<i>Measured difference in northing to the backsight point.</i>			
BkSt Diff Meas Hgt	12dF double box		
<i>Measured difference in height to the backsight point.</i>			
Bearing Swing	12dF angle box		
<i>A bearing swing applied to the instrument reading to get the correct grid bearing.</i>			
Max Diff Horz Dist	12dF double box		
<i>Difference in horizontal distance that brings up a warning message.</i>			

Max Diff Meas Hgt 12dF double box

Difference in height that brings up a warning message.

Check Shot

The **12d Field - Check Shot** panel allows a measurement to a known point to check the validity of the current setup. The measurement can be a full measurement or angle only.

Check Shot Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Check Shot	string select box		
-------------------	-------------------	--	--

select a point for the check shot measurement

Checkshot Id

the vertex id of the selected point, this can be populated from the select or manually entered.

Model

model box

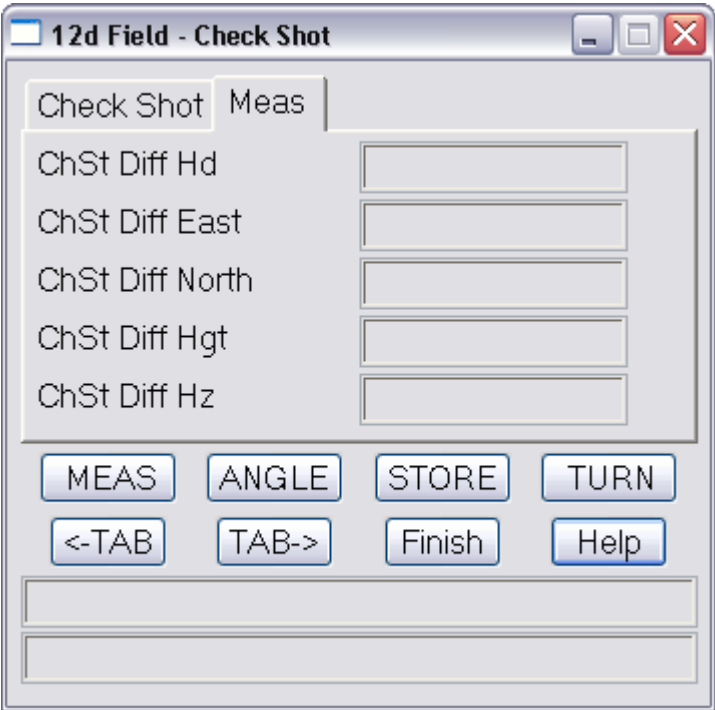

the model containing the checkshot point.

Checkshot Target Hgt

the height of target for the checkshot.

Turn on select? tick box

if ticked on selecting a checkshot point the instrument will rotate automatically to that point.

Meas Tab

Once a measurement is completed the focus will change to the **Meas** tab.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

ChSt Diff Hd

the difference in horizontal distance to the checkshot point, actual - observed

ChSt Diff East

the difference in eastings to the checkshot point, actual - observed

ChSt Diff North

the difference in northings to the checkshot point, actual - observed

ChSt Diff Hgt

the difference in level to the checkshot point, actual - observed

ChSt Diff Hz

the difference in horizontal angle to the checkshot point, actual - observed

Buttons

Distance

SNGL button

Take a single distance measurement to the checkshot dependent on the current TPS measurement settings

MULT button

Take a multiface distance measurement to the checkshot dependent on the current TPS measurement settings

Angle Only

SNGL button

Take a single angular measurement to the checkshot dependent on the current TPS measurement settings

MULT button

Take a multiface angular measurement to the checkshot dependent on the current TPS measurement settings

STORE button

Write the measurement to the checkshot to the current field file (.FLD), this does not store the reading to a model.

TURN button

rotate the instrument to the selected checkshot point.

<-TAB button

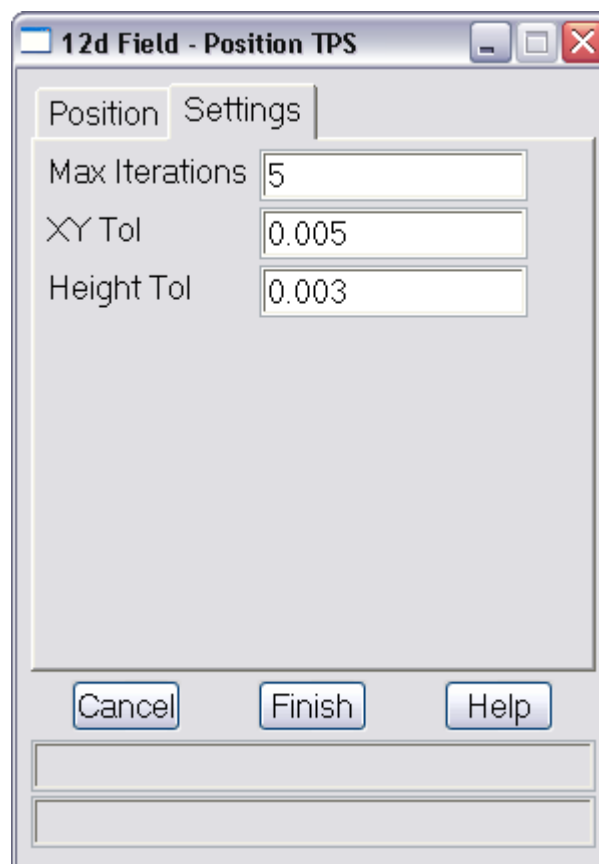

Go to the previous tab in the dialog.

TAB-> button

Go to the next tab in the dialog.

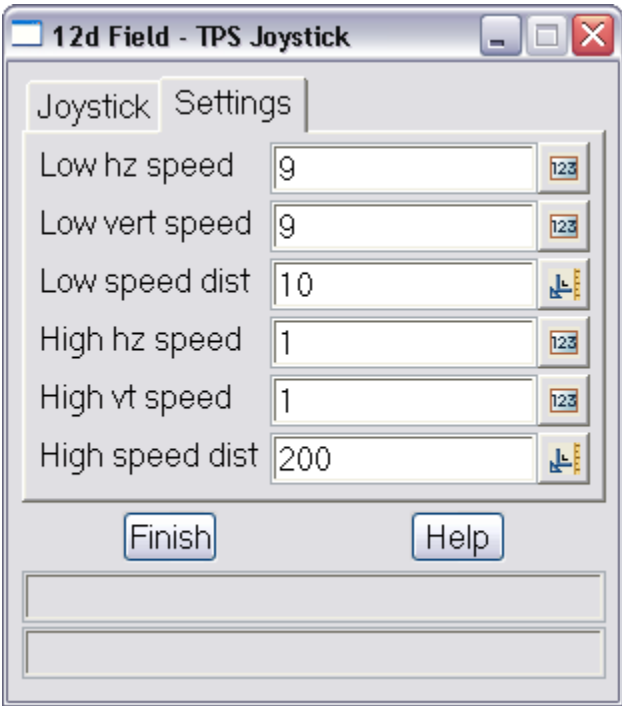

Position TPS

This section of documentation is a work in progress and will be updated in subsequent releases.

Joystick TPS

This section of documentation is a work in progress and will be updated in subsequent releases.

Status TPS

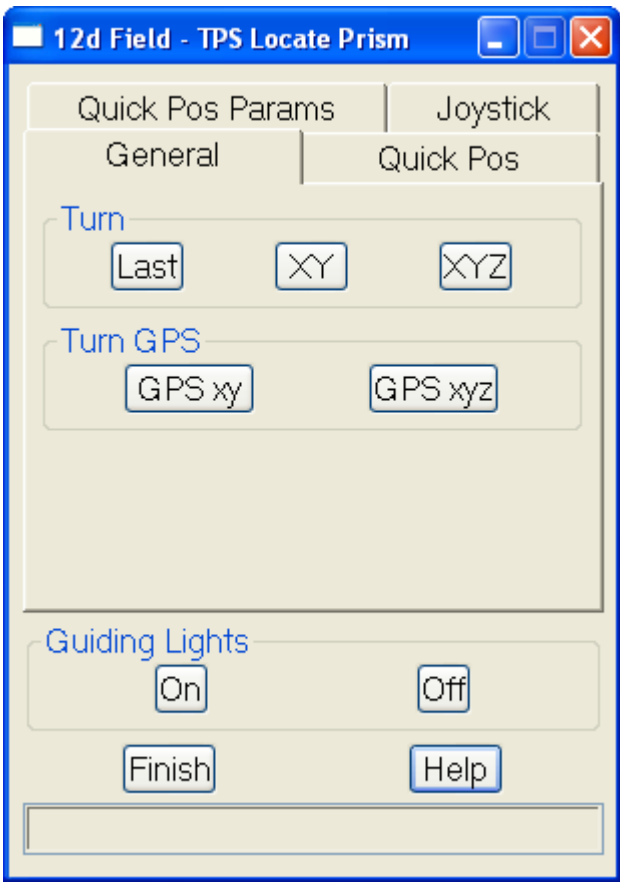

This section of documentation is a work in progress and will be updated in subsequent

releases.

Locate Prism TPS

The **12d Field - TPS Locate Prism** panel is an aid to remotely position the TPS to the current prism location.

Common fields and buttons

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Guiding lights			

The guiding lights button group is available if the TPS in use has guide lights. The naming of the guiding lights group depends on the primary instrument.

Trimble SPSx30

Topcon 9000

Leica 1200

On

Activate the instruments guiding lights.

On

Deactivate the instruments guiding lights.

General Tab

Turn

Last

The instrument will turn to the last position a measurement was taken at.

XY

A screen select will be activated and the instrument will turn horizontally only to the selected position.

XYZ

A screen select will be activated and the instrument will turn horizontally and vertically to the selected position.

Turn GPS

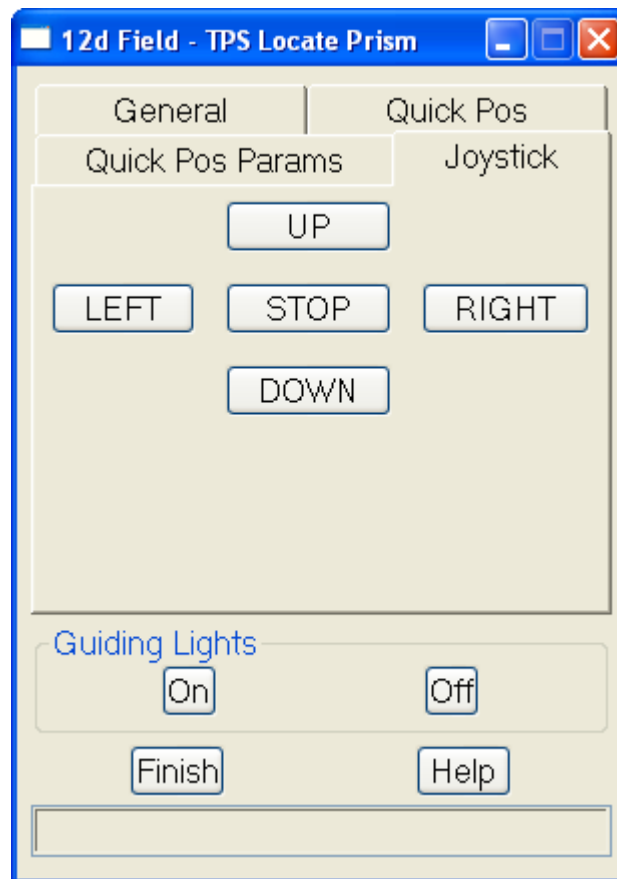

Note these buttons are only available if a GPS instrument is selected as the secondary instrument.

GPS xy

The instrument will turn horizontally only to the current GPS position.

GPS xyz

The instrument will turn horizontally and vertically to the current GPS position.

Joystick Tab

LEFT

Rotate the instrument to the left as viewed from the prism back to the instrument, **LEFT** can be pressed twice more to increase the speed of rotation.

RIGHT

Rotate the instrument to the right as viewed from the prism back to the instrument, **RIGHT** can be pressed twice more to increase the speed of rotation.

UP

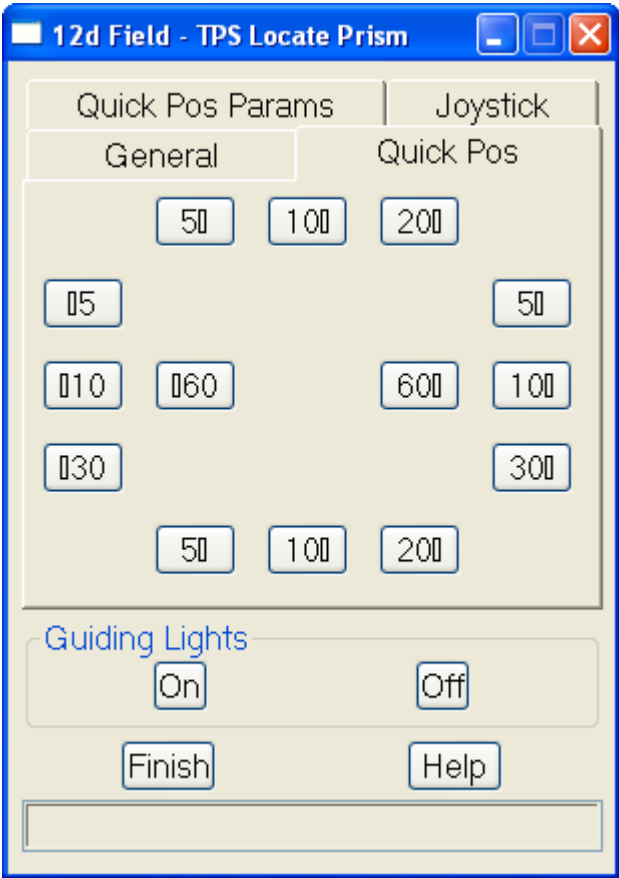

Rotate the Up, **UP** can be pressed twice more to increase the speed of rotation.

DOWN

Rotate the Down, **DOWN** can be pressed twice more to increase the speed of rotation.

STOP

Stop the instrument rotating.

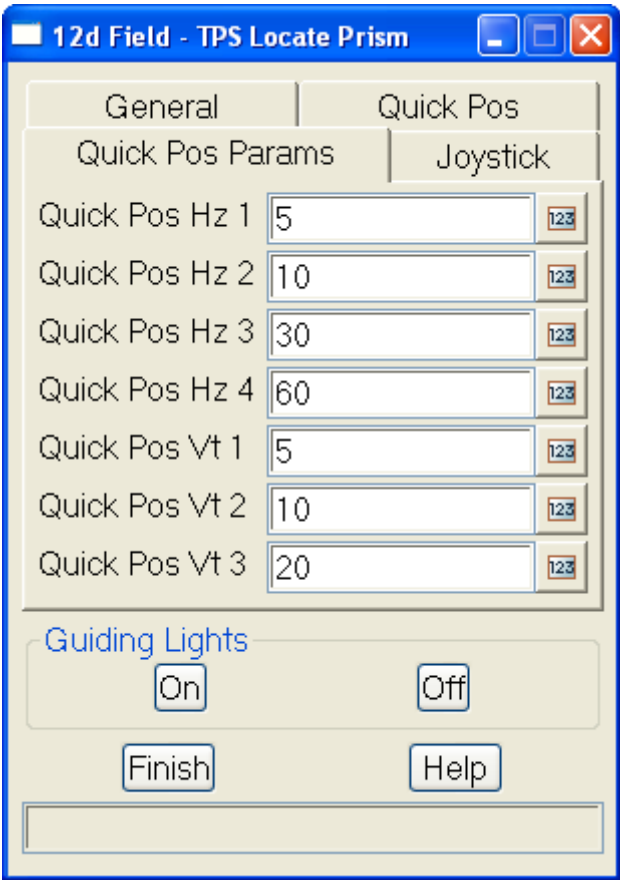

Quick Pos Tab

The **Quick Pos** tab allows the user to manually rotate the instrument in the horizontal and vertical directions by preset amounts. This is sometimes easier to use to orientate the instrument correctly than the joystick controls. There are 4 user definable rotations in the horizontal directions and 3 in the vertical.

The buttons show the direction of rotation and the amount of rotation in degrees, the amount of the rotation is defined on the [Quick Pos Params Tab](#).

When a rotation button is pressed the instrument will rotate by a specified amount and direction, all buttons are disabled until the rotation has completed

Quick Pos Params Tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

The **Quick Pos Params** define the rotation available in the [Quick Pos Tab](#).

Quick Pos Hz 1

*the amount of rotation in degrees for the top button in the horizontal groups for **Quick Pos***

Quick Pos Hz 2

*the amount of rotation in degrees for the outer middle button in the horizontal groups for **Quick Pos***

Quick Pos Hz 3

*the amount of rotation in degrees for the lower button in the horizontal groups for **Quick Pos***

Quick Pos Hz 4

*the amount of rotation in degrees for the inner middle button in the horizontal groups for **Quick Pos***

Quick Pos Vt 1

*the amount of rotation in degrees for the left button in the vertical groups for **Quick Pos***

Quick Pos Vt 2

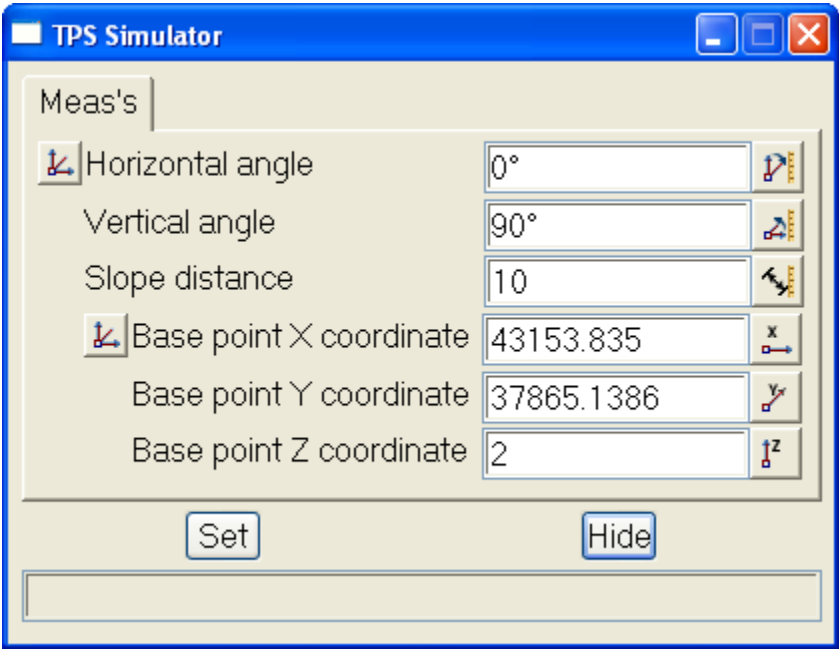

*the amount of rotation in degrees for the middle button in the vertical groups for **Quick Pos***

Quick Pos Vt 3

*the amount of rotation in degrees for the right button in the vertical groups for **Quick Pos***

Reconnect

Selecting **Reconnect** will attempt to disconnect from the current instrument and then reconnect. This may be required when the instrument has been restarted.

GPS Localisation

Position of option on menu: Survey =>Field 12d=>GPS Localisation

The panel is used to create the localisation parameters used inside 12dField for reducing GPS observations into a local system.

Points collected with 12dField as raw WGS84 cartesian coordinates can be matched with local control points to calculate the parameters to convert GPS readings directly into the local system.

The 12dField localisation treats horizontal and vertical components separately. The horizontal transformation is a Helmert translation, translation, rotation and uniform scaling of the x and y axes.

The vertical translation can either be a simple z translation or be taken from a tin, the tin can be manually created outside of the panel, e.g. from AusGeoid98 or created by the panel via a plane of best fit.

The basic workflow for this panel is to observe known control points in the field with 12dField with just the ellipsoid set, e.g. MGA56.

Then use this panel to match the observed points with the control points to create the

localisation.
Selecting GPS Localisation brings up the **Helmert 2.5D Params** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File			*.tdf_hel

The TDF_HEL file to be read in or written to. This is the file used by 12dField to localise GPS reading.

Read	button
-------------	--------

Read in the TDF_HEL file

Write	button
--------------	--------

Write out the TDF_HEL file

Geoid Tin

If selected the value of the tin at the local coordinate is added to the height of the raw GPS coordinate.

Create Local TIN	tick box
-------------------------	----------

*If unticked and the **Local Tin** box is blank the points are adjusted by the straight mean z difference of the observations.
If unticked and the **Local Tin** box is not empty the points are adjusted by the value of the TIN at the xy location.*

If ticked and the **Local Tin** box is not empty a plane of best fit is used to create the local TIN and the points are adjusted by the value of the TIN at the current xy location. The extent of the local TIN is 1000m outside the control used.

Local Tin

The **Local Tin** as described above.

Control model model box
the model containing the control points.

Obsrv'd model model box
the model containing the observed points.

Rotate(cw) measure box At Point, Point to Point,
String from Point, String to
Point

The clockwise rotation parameter of the helmert transformation.

Scale measure box At Point, Point to Point,
String from Point, String to
Point

The scaling parameter of the helmert transformation.

X translate measure box At Point, Point to Point,
String from Point, String to
Point

The x translation of the helmert transformation.

Y translate measure box At Point, Point to Point,
String from Point, String to
Point

The y translation of the helmert transformation.

Z translate measure box At Point, Point to Point,
String from Point, String to
Point

The z translation of the helmert transformation, (note this is 0.0 if a local TIN is being used).

The grid

Please note changing the level of a control station to "null" means the station and corresponding observed point will not be used in the height calculations.

Use pt tick box
if ticked this point is used in the transformation calculations

Use z tick box
If unticked this point is not used to calculate the transformation height parameter.

Control Stat Id

The Id of the control station, will normally match the observed Id.

Control Easting/Northing/Level
the coordinate of the control station.

Observed Easting/Northing/Level

the coordinate of the observed point.

Residual Easting/Northing/Level

the delta of the observed point with the control point after the transformation has been applied.

Buttons

Control button

Start the selection of the control/observed point pairs. Note the environment variable PICK_ORDER_OBSERVED_FIRST_4D can be set to make the selection order 'observed' then 'control'. For ease of use 2 plan views should be used, one with the observed points and one with the control points.

Calculate button

Calculate the transformation and update the residuals in the grid control.

Finish button

Exit the panel, a warning message will appear if the transformation parameters have not yet been written to file.

12dField Setout FLD File To Strings

Position of option on menu: Survey =>12d Field =>Setout FLD file to strings

A field file, (.FLD) created by **12dField Setout** is attributed in such a way it can be read directly into **12d Model** without going through a Survey Data Reduction function, the string data will be read in with the original name, model, colour, linestyle and weight. Field files created by **12dField Setout** from version **V9C1e** can be read in with this panel.

Selecting **Setout FLD file to strings** displays the**12dField Setout FLD File To Strings** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
FLD file to convert	file		
<i>the field file to be read in.</i>			

Pre*post for models

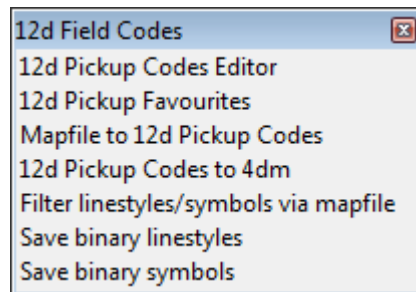

*For more information please go to the section [Pre*Postfix Panel Fields](#) in the chapter [Tools and Concepts](#)*

Read button

the FLD file will be read in, if a point in the field file is not correctly attributed a message will be displayed in the output window and no point will be created.

Programming

It is possible to generate macro code for GIS post processing, for any feature or attribute. The **programming tab** is used to assist you in doing so.

See [12d Pickup Codes to Macro](#) for more information on how to generate a GIS post processing 4dm file.

To assist you, this is broken into sections: [Header Tab](#), [Declaration Tab](#), [Process Tab](#), [Footer Tab](#).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Variable	input		
<i>For use with attributes or opcodes, defines the variable that the data should be stored in for use later.</i>			

Header Tab

The **Header tab** defines any header that should be output into the macro file for the current item.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use header?	tick box		
<i>if ticked, the header will output to the generated file</i>			
<i>if not ticked, no header will be used</i>			

Text field
the macro code to output into the GIS post processing file

Declaration Tab

The **Declaration tab** defines the 'declaration' to be output into the macro, which can be used for defining variables.

Header

Declartion

Process

Footer

Use declaration?

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use declaration?	tick box		
<i>if ticked, a declaration will be output to the generated file</i>			
<i>if not ticked, no declaration will be output</i>			

Text field
the macro code to output into the GIS post processing file.

Process Tab

The **Process tab** defines the main processing part of the macro code, which could be used to process a selected feature code and associated attributes, or other items such as opcodes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use process?	tick box		
<i>if ticked, the process data will be output into the generated file</i>			
<i>if not ticked, no process data will be output.</i>			

Text field
the macro code to output into the GIS post processing file

Footer Tab

The **Footer tab** is used to define any macro code that should be added to the footer.

Header

Declartion

Process

Footer

Use footer?

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use footer?	tick box		
<i>if ticked, the footer will output to the generated file</i>			
<i>if not ticked, no footer will be output</i>			

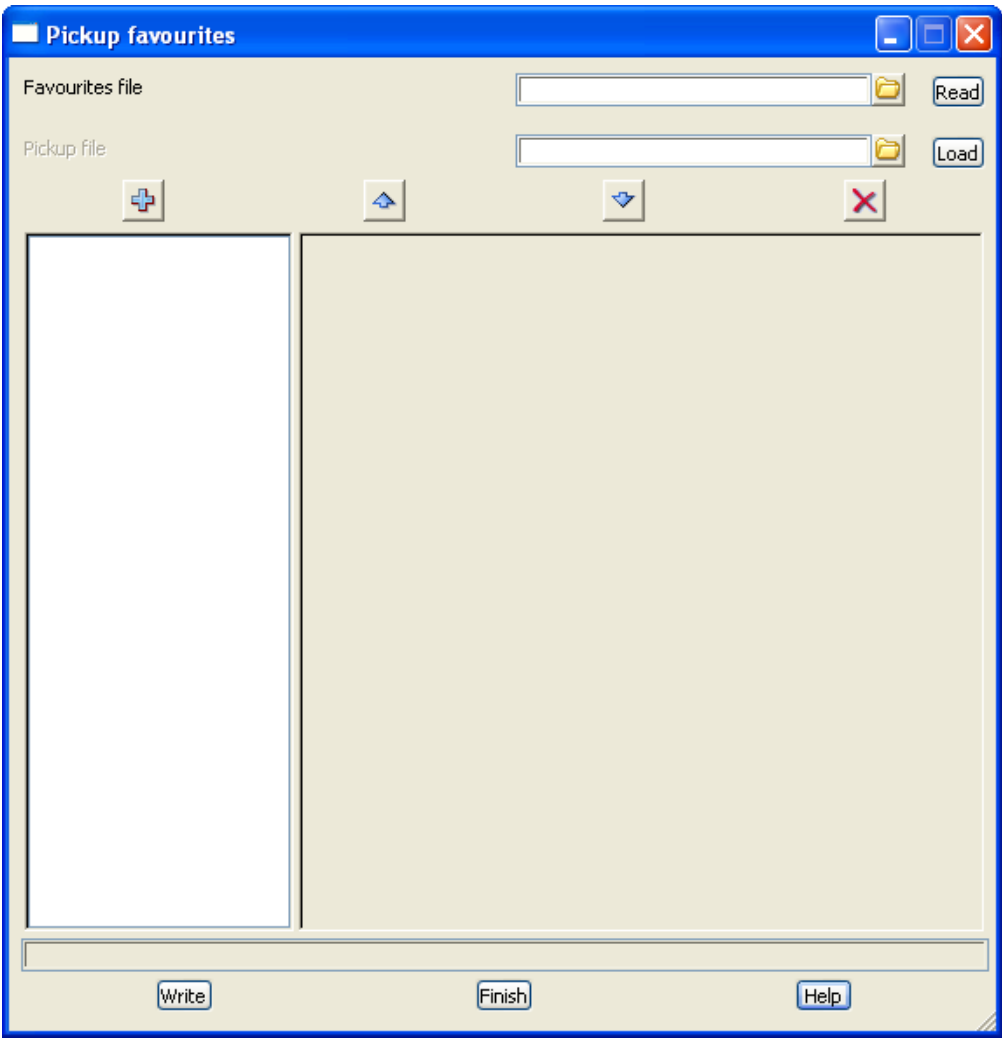

Text field
the macro code to output into the GIS post processing file

Pickup Favourites

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => 12d Pickup Favourites

This panel is used to create and edit 12d field pickup favourites files. They contain a list of feature codes and associated information for use within **12d Field Pickup**.

Selecting 12d Pickup Favourites brings up the **Pickup Favourites** panel.

The fields and buttons used in this panel have the following functions.

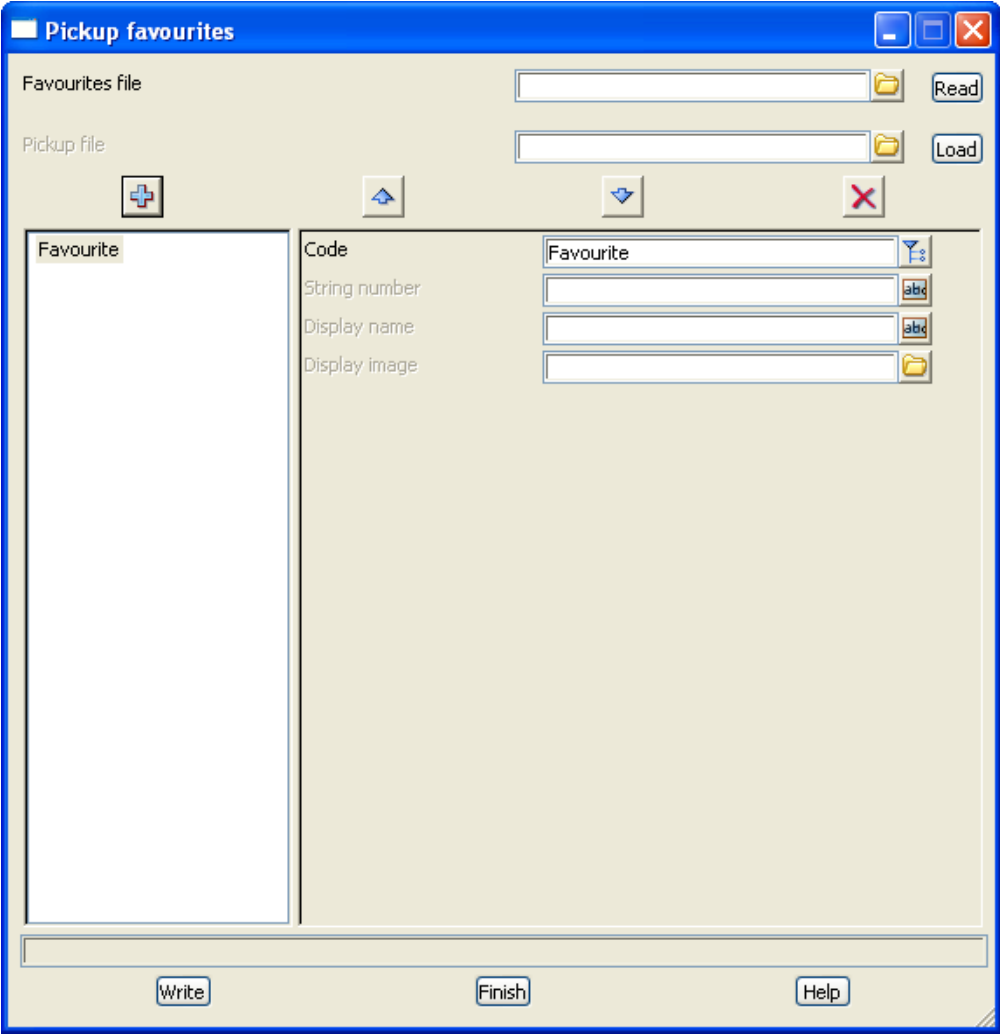

Field Description	Type	Defaults	Pop-Up
Favourites file <i>the favourites file to create or edit</i>	file		*.12dfieldfavourites
Read <i>reads the favourites file, if it exists</i>	button		
Pickup file <i>the optional 12d field pickup codes file to use as the source of feature codes available as favourites.</i>	file		*.12dfieldcodes
Load <i>loads the optional 12d field pickup codes file for use</i>	button		

 adds a new favourite

 moves a favourite up

 moves a favourite down

 delete a favourite

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Code

the name of the favourite.
if a pickup codes file has been loaded, the list of codes in the pickup codes file will be available as a choice in the browse box.
if no pickup codes file has been loaded, nothing will appear in the browse box.

String number	input
----------------------	-------

the optional string number for the favourite

Display name input

the optional cosmetic name of the favourite to display
If not specified, the favourite will display using the code name

Display image file

the optional cosmetic image of the favourite to display
If not specified, no image will be displayed.

Write button

writes the Pickup favourites to the specified file.

Mapfile to 12d Pickup Codes

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Mapfile to 12d Pickup Codes

This option is used to create a 12d Field Pickup Coding file from an existing map file. Only the following information from the Basic section of the mapfile is used

- Key
- Model
- Comment

Selecting Mapfile to 12d Pickup Codes brings up the Mapfile to 12d Pickup Codes panel

The fields and buttons used in this panel have the following functions.

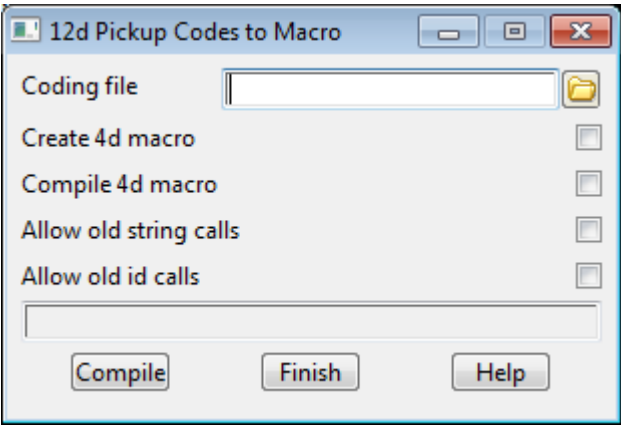

Field Description	Type	Defaults	Pop-Up
Mapfile <i>name of the 12d mapfile to convert from.</i>	file		*.mapfile *.mf
Coding file <i>name of the coding file to convert to.</i>	file		*.12dfieldcodes
Use mf comments prompts tick box <i>if ticked, the Comment field is used as the display prompt that the user sees when selecting the current feature code.</i> <i>If not ticked, the Key field is used as the display prompt.</i>			
Create <i>convert the file.</i>	button		

12d Pickup Codes to Macro

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => 12d Pickup Codes to 4dm

This panel generates a macro based on any programming defined in a 12d field pickup codes file. It will create a new file of the same name as the 12d field pickup codes file, with the extension 4dm

Selecting 12d Pickup Codes to 4dm brings up the **12d Pickup Codes to Macro** panel

The fields and buttons used in this panel have the following functions.

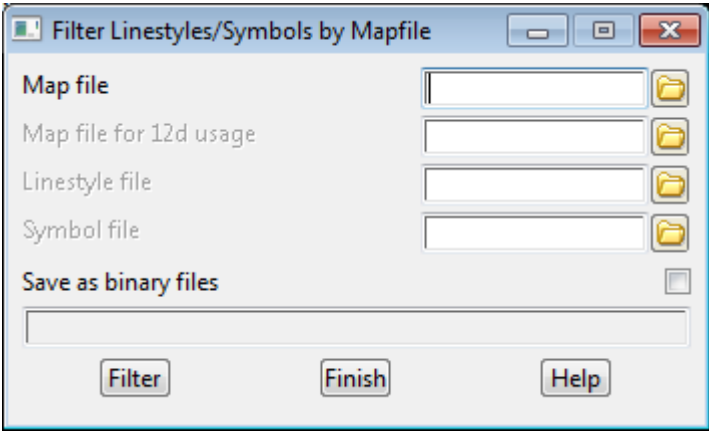

Field Description	Type	Defaults	Pop-Up
Coding file <i>the 12d field pickup codes file to read</i>	file		*.12dfieldcodes
Create 4d macro <i>if ticked, it creates the 4dm file from the 12d field pickup codes file programming.</i>	tick box		
Compile 4d macro <i>if ticked, the created 4dm file will be compiled into a 4do file if not ticked, no compilation will take place</i>	tick box		
Allow old string calls <i>if ticked, old string calls will be allowed by the compiler. if not ticked, old string calls will not be allowed by the compiler.</i>	tick box		
Allow old id calls <i>if ticked, old id calls will be allowed by the compiler. if not ticked, old id calls will not be allowed by the compiler.</i>	tick box		
Compile <i>creates and/or compiles the 12d field pickup codes file into a macro</i>	button		

Filter Linestyles/Symbols via Mapfile

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Filter linestyles/symbols via mapfile

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Filter linestyles/symbols via mapfile** brings up the **Filter Linestyles/Symbols by Mapfile** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	file box		available mapfiles
Map file for 12d usage	file box		available mapfiles
Linestyle file	file box		
Symbol file	file box		
Save as binary files	tick box	not ticked	
Filter	button		

Save Binary Linestyles

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Save binary linestyles

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Save binary linestyles brings up the **Save all Linestyles to Binary File** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Linestyle file	file box		available *.4d files
Save	button		

Save Binary Symbols

Position of option on menu: Survey =>12d Field =>12d Field Pickup Codes => Save binary symbols

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Save binary symbols brings up the **Save all Symbols to Binary File** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Symbols file	file box		available *.4d files
Save	button		

Setup

Position of option on menu: Survey =>Setup
Selecting **setup** brings up the **survey data setup** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data collector <i>name of the data collector definition used to define how to read and interpret the raw survey data file. The list of available data collectors definitions is given in the file pointed to by the environment variable DATA_COLLECTORS_4D.</i> <i>A data collector definition can be created/edited by</i> <i>(a) clicking on the choice button at the end of the Data collector panel field and selecting [Edit] at the bottom of the pop-up list of defined data collectors to bring up the Survey.4d Edit/Create panel.</i> <i>(b) using Project=>Browse=>Survey data collectors the create/edit the Survey.4d file.</i> <i>Please see the Data Collector Definitions of Appendix 12d Survey Guide for more information on setting up a data collector definition.</i>	input		available data collectors
Station prefix <i>if non-blank, the prefix to be used for any text given for new instrument stations.</i>	input		
Set <i>store the selected data collector as being the currently selected one.</i>	button		
Note: Selecting [Edit] at the bottom of the pop-up list of data collectors will bring up the Survey.4d Create/Edit panel.			

Download Raw

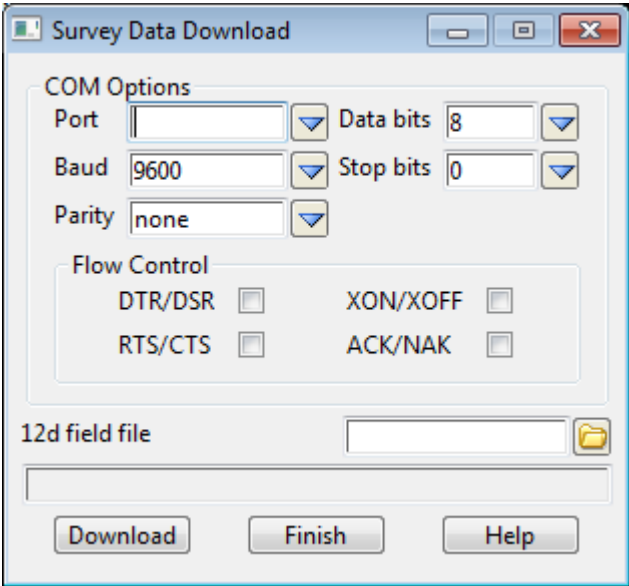

Position of option on menu: Survey =>Download raw

The **download raw** option will read data from the data collector connected to the computer's serial port, save it in a file (the raw data file) and once the download is completed, automatically convert the raw data file into a 12d field file using the currently defined data collector.

Hence the **download** option downloads data from the data recorder and creates a data collector raw file and an equivalent 12d field file.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

Selecting **Download raw** brings up the **Survey Data Download** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Port <i>name of the computer serial port that the data collector is connected to. The default port is specified in the data collector configuration file.</i>	input	from configuration file	
Data bits <i>number of bits</i>	input	from configuration file	5,6,7,8
Baud rate <i>speed of the serial port</i>	input	from configuration file	
Stop bits <i>number of stop bits</i>	input	from configuration file	
Parity <i>parity</i>	input	from configuration file	
DTR/DSR <i>if ticked, use DTR/DSR flow control</i>	tick	from configuration file	

RTS/CTS	tick	from configuration file
<i>if ticked, use RTS/CTS flow control</i>		
XON/XOFF	tick	from configuration file
<i>if ticked, use Xon/Xoff</i>		
ACK/NAK	tick	from configuration file
<i>if ticked, use ACK/NAK</i>		

12d Field file input *.fld files

name of the 12d field file that the raw file is to be converted to. The raw file is given the same name but with the extension specified in the configuration file, e.g., “.gre”.

Download button

On clicking the download button, the software will read a data stream from the serial port and store the raw data into a file. The extension of this file, will be specified in the configuration file. The name will be the same as the field file, with any “.fld” removed.

On completion of the download, the raw data file is automatically converted to a 12d field file of name given in the field file field.

Convert Raw

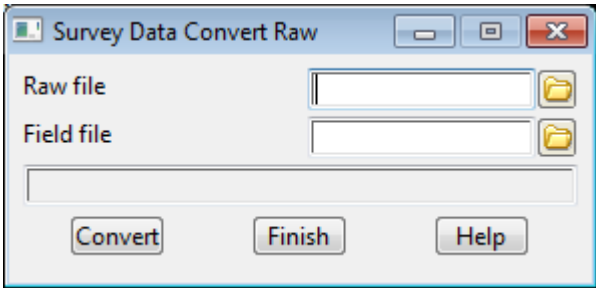

Position of option on menu: Survey =>Convert raw

The **convert raw** option is used to convert an existing raw data file of the type given by the data collector setup, into a 12d field file.

The raw data file may have been previously down loaded by **12d Model** or obtained via another mechanism.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

Selecting **Convert raw** brings up the **Survey Data Convert Raw** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Raw file	input		available raw files
<i>name of the raw data file to be converted to a 12d field file. The popup will contain all files with the extension specified in the configuration file for raw data files, e.g. “.gre”.</i>			
Field file	input		*.fld files
<i>name of the 12d field file that the raw file is to be converted to. When the raw file name is given, the file of the same name but with the extension .fld is automatically piped into the field file field.</i>			
Convert	button		
<i>convert the raw data given in the raw file field into the 12d field file format and save it in the file given in the field file field.</i>			

Create Survey Function

Position of menu: Survey =>Create

The create walk-right menu contains options to create a **12d Model** Survey function from either a 12d field file or from scratch using *Survey Reduction edit commands*.

Basically, a **Survey** function keeps track of the field data, the information involved in the survey reduction and all the strings and models created by the *Survey* function. The field data for the *Survey* function can be edited and the reduction re-run and all the old reduced strings automatically deleted and replaced by the updated reduced strings.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

The field data can be read in from a *12d field file* using the **Field file** option, or the **Typed entry** option can be used to enter all the data by hand.

The create walk-right menu is:

create survey reduction function from a 12d field file - reduces data
create survey reduction function by typed entry into 12d field file.

For the option *Field file*, go to
Typed entry

[Field File](#)
[Typed Entry](#)

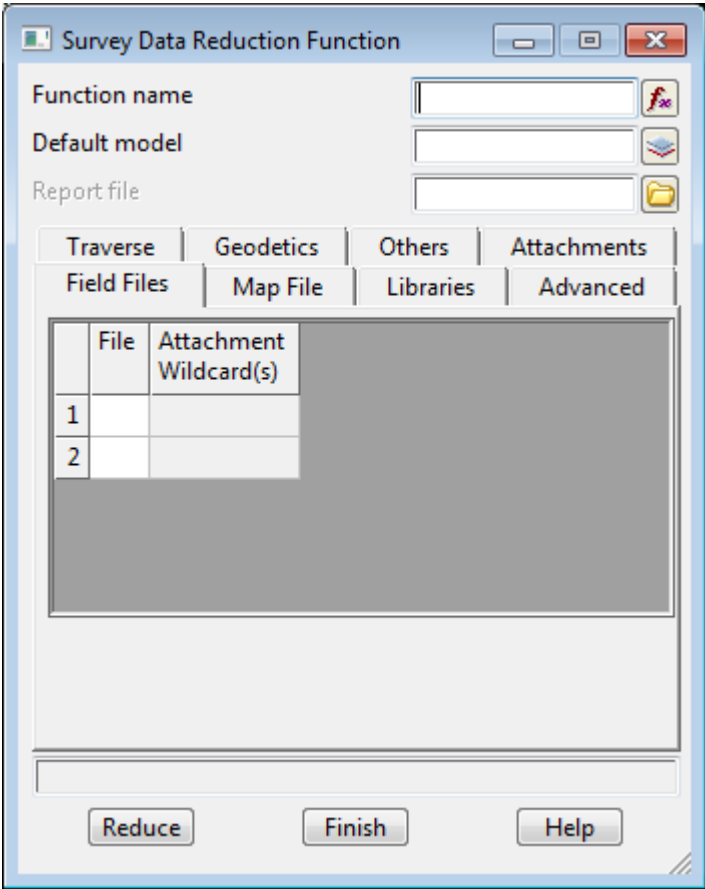

Field File

Position of option on menu: Survey =>Create =>Field file

The **field file** option creates a *Survey function* from a 12d field file.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

Selecting **field file** brings up the **survey data reduction function** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	input		available Survey functions
<i>name of the 12d Survey function. If the Survey function exists, then it is loaded into the panel. If the Survey function does not exist, then a new Survey function is created.</i>			
Default model	input		available models
<i>if a feature code is not found in the map file, or no map file is selected, the strings and points of that feature code will be placed in the default model. The colour used will be the default line or point colour for 12d Model. The default model field is compulsory. Check measurements will be always placed in the default model if a check model is not given (on the Advanced tab).</i>			
Report file	input		*.rpt
<i>if non-blank, a log of the reduction steps, including new instrument stations, new target heights, scale factors, backsights and check measurements is created. Any errors are also logged.</i>			

Button at Bottom

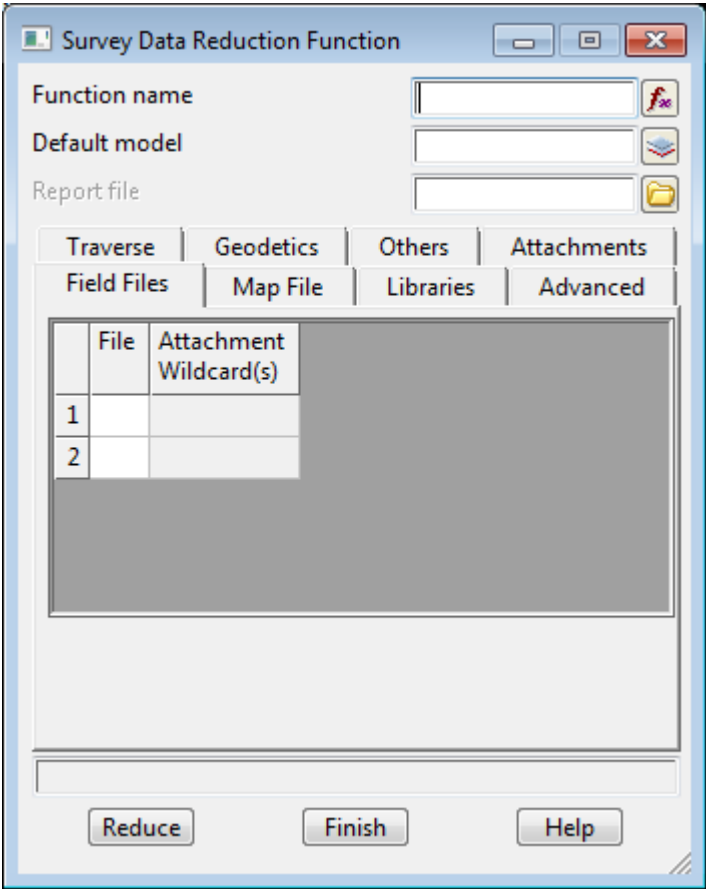

Reduce	button
<i>On clicking the reduce button, the software converts the field measurements in the selected 12d field file, using coordinates from the control model if necessary, and produces super strings. The super strings will be assigned names and models using the name library and map file.</i>	

For descriptions of each of the tabs on the panel, go to:
[Field Files tab](#)

- [Map File tab](#)
- [Libraries tab](#)
- [Advanced tab](#)
- [Traverse tab](#)
- [Geodetics tab](#)
- [Others tab](#)
- [Attachments tab](#)

Field Files tab

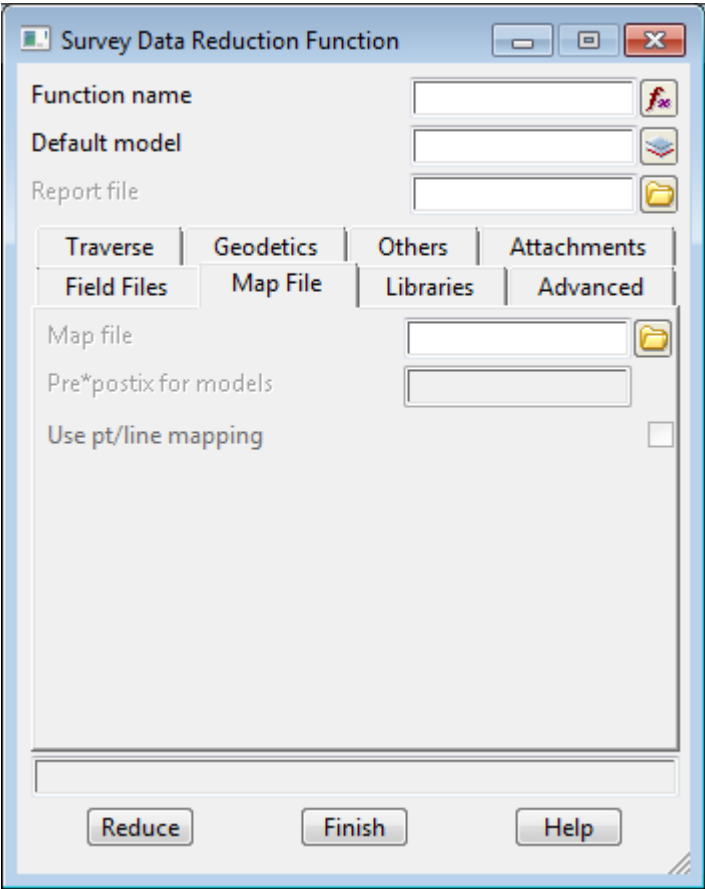

list of field files to read in

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Field file	input		*.fld files
<i>name of the 12d field file to be read into the function as its initial field data, and then reduced. The field data in the Survey function can be edited either by command or graphically.</i>			
Attachment wildcards	input		
<i>not yet used</i>			

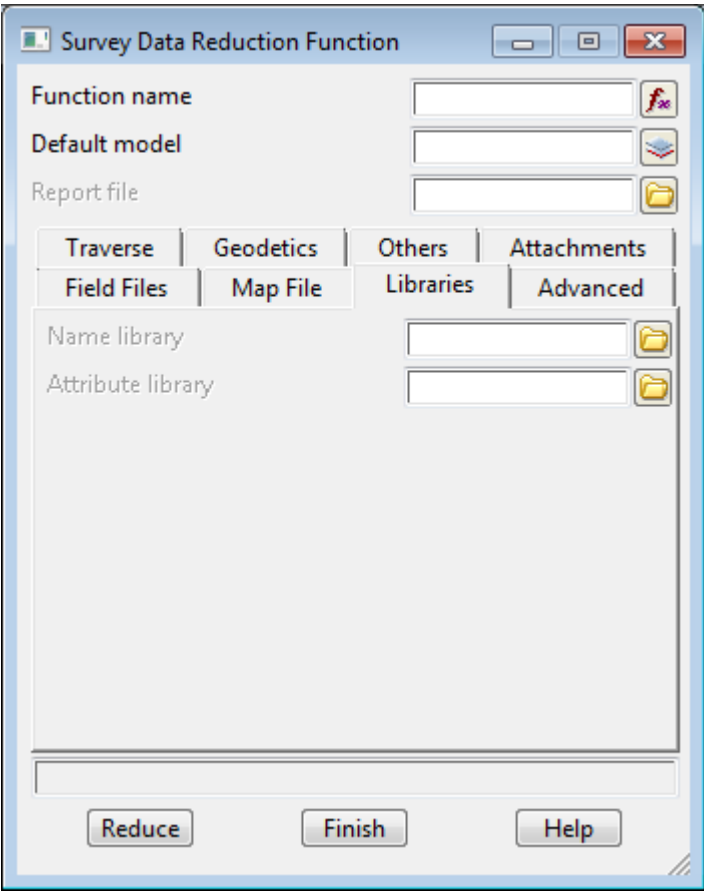

Map File tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.mf files
<i>if non-blank, the map file is used to map feature codes to string names, models, colours, line styles, etc. In general, strings will be created as line strings by assigning a non-zero string number in the field, and strings will be created as point strings by assigning a zero string number in the field. This behaviour may be overridden with field codes 92, 93 and 94.</i>			
Pre*postfix for models	input		available models
<i>the pre*postfix for models text is applied to all model names in the map file.</i>			
Use pt/line mapping	tick		
<i>if ticked and a map file is used, the column in the map file that specifies the point/line type of the string is be used to set the point/line type of the string.</i>			
<i>If not ticked and a map file is used, the column is ignored (not used for setting point/line type of the string).</i>			

Libraries tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name library	input		*.nl files

*if **non-blank**, the name library can be used to automatically create vertex text for the string if no vertex text is given in the field. A name library file contains two columns separated by one or more spaces. The text in the first column is matched against the feature code (wild cards * and ? can be used). The second column contains the vertex text to use if a match occurs.*

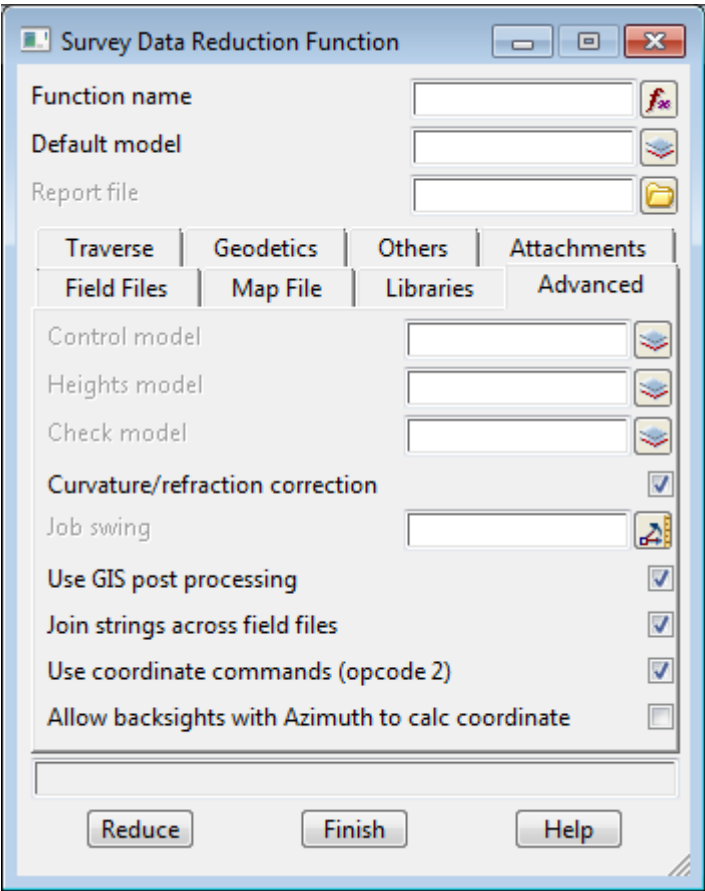

Note that if vertex text is given in the field then it is used instead of the text in the name library.

*Pre-super strings: if **non-blank**, the name library will be used to automatically create 4d strings and to assign text to 4d strings. Name library files will contain two columns. The first column in the name library will be matched against the feature code. Note that if a match is found, a 4d string is always created, as opposed to another string type. The second column will contain the text for the 4d string.*

Attribute library	input	*.al files
--------------------------	-------	------------

*if **non-blank**, the attribute library is used to give names to any unnamed attributes. The first word of each line in the file is the code to define the attribute for (can include wild cards) and the next n words are the names for each unnamed attributes in order. If the attribute library is mission, then the unnamed attributes will be given the names **unnamed attribute i** for $i=1, \dots$.*

Advanced tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control model	input		available models
<i>if not blank, name of the model containing instrument and backsight stations that can be referenced during the reduction. The name of the string is taken as the station name and if the string contains more than one point, the first point in the string is used for the co-ordinates of the station.</i>			
Heights model	input		available models
<i>in not blank, name of the model containing points that are used for the heights of points during reduction. The points in the heights model have the point id of required point and a height which is used whenever that point id is found in the reduction. The (x,y) co-ordinates of the point are ignored.</i>			
Check model	input		available models
<i>if non-blank, then all check shots will go to this model. If blank then check shots go to the default model.</i>			
Curvature/refraction correction	tick box	tick	
<i>if ticked, during the reduction, each EDM tacheometry measurement (field code 7) has a correction for earth curvature and refraction applied to the measurement.</i>			
Job swing			
<i>if non-blank, then the job is swung through this value. The rotation is in a clockwise direction and the value is in hp dms format.</i>			
Use GIS post processing	tick box	tick	

if ticked, run the given 12d macro to process attribute blocks

Join strings across field files tick box tick

if **ticked**, points with the same code and string number will be included in the same string in any of the field files. The order that the points are placed in the string is the order of the field files in the **Field File** tab.

if **not ticked**, any strings will terminate at the end of a field file. Even if the string has the same name and string number is any following field file, a new string is started in the following field files.

Use coordinate commands (opcode 2) tick box tick

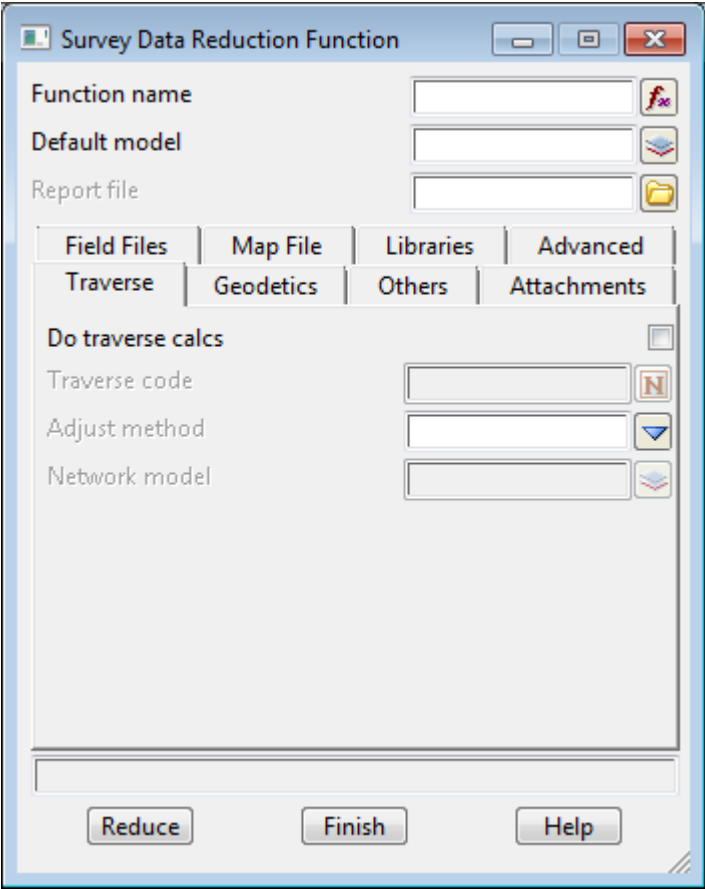

if ticked,

Allow backsights with Azimuth to calc coordinate tick box

If ticked, for backsight commands that reference unknown backsight points, and the backsight has the horizontal angle, vertical angle, slope distance, and Azimuth defined, the backsight point will be created from that information.

This option was only included to allow reduction from legacy external formats, and should not be used as it is not good survey practise.

Traverse tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Do traverse calcs	tick box	not tick	

if **ticked**, the traverse coded points are placed into a network model, and an adjustment done at the time of reduction.

Traverse code input

if valid, this code will be used to identify traverse data. This will effectively be the same as stringing features in the field except the user has the option of isolating the model, adjusting the strings etc.

E.g. TL. The reduction function will look at the field file and extract any observations involving field codes with the TL code. Only backsights and measurements with the point name field populated will be processed.

Each traverse will have a separate string number. i.e. The main traverse with a feature code/string number of e.g. TL7 and a side traverse having a feature code/string number of e.g. TL3. Note the string numbers do not have to be in any particular order. The reduction will determine the order on which the separate traverses will be processed (by dependencies).

See [Traverse coding](#) in Appendix [12d Survey Guide](#).

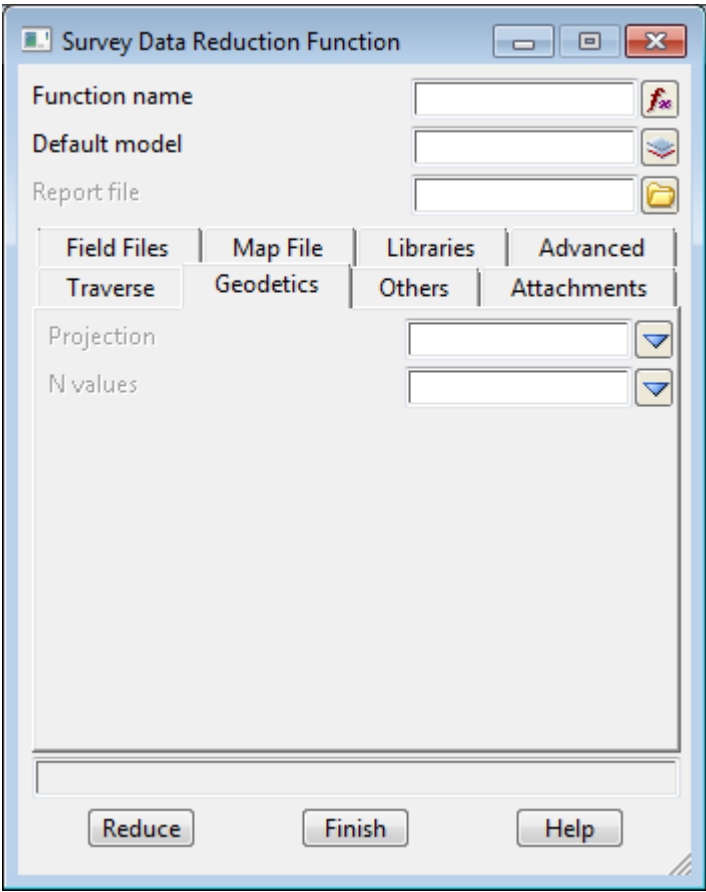

Adjustment method choice bowditch, compass, transit, least square, none

*method of adjustment. The adjustment will be made to the extracted traverse strings from known point to known point. **If a traverse string goes through a number of known points (known coordinates), the adjustment will made from known point to known point rather than the first known to the last known point.***

Network model model box

if non blank, any valid traverse strings are placed in this model

Geodetics tab

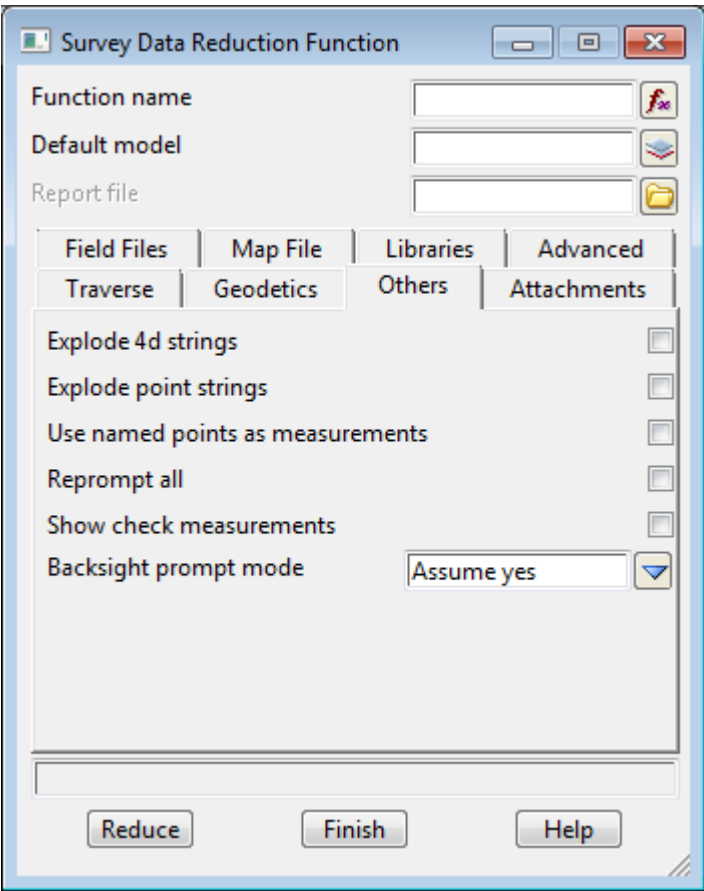

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection <i>the projection of the data to be reduced. If a valid projection is specified, the reduction will be done taking into account the projection scale factors. If this method is used it is paramount that the known coordinates(e.g station setups) are in terms of the projection coordinates and are not truncated (i.e. full coordinate values). These coordinates will allow the calculation of the relative longitude and latitude values which are used to compute coordinates from observations from the setup points. For more information about how to setup different projections see the section Projections.</i>	projection box	current projection	available projections
N values <i>the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are defined in the project n value settings. For more information on the n value settings see the section N values</i> <i>The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculations only. The original z value for the point will remain unchanged</i>	choice box	currently set method	Available n value methods

For more information about geodetic terminology including projections and N values, see the Appendix [Geodetics Summary](#).

Others tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Explode 4d strings <i>if ticked, any 4d strings created during the reduction process will have only one vertex (point), i.e., no</i>	tick box		

stringing of 4d strings will occur.

Explode point strings tick box

if **ticked**, point strings are created as one vertex (point) strings i.e., no stringing of any point strings will occur.

Use named points as measurements tick box

if **ticked**, named points are also created as measurements.

Reprompt all

if **ticked**, all check measurements are redisplayed on recalcs. Also if Backsight prompt mode is set to prompt, then backsights are redisplayed on recalcs.

if **not ticked**, check measurements are not redisplayed on a recalc and backsights depend on the backsight prompt mode.

Show check measurements tick box

if **ticked**, when a check measurement is processed a panel is displayed showing the calculated (x,y,z) for the check measurement.

Backsight prompt mode choice box

prompt, assume yes
assume no

if **prompt**, then the backsight panel is brought up in a command has not been answered adequately previously or if something has changed that warrants a redisplay of the panel.

If **assume yes**, then **yes** is assumes for all the backsights and the panel is not brought up.

If **assume no**, then **no** is assumes for all the backsights and the panel is not brought up.

Attachments tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Wildcard(s)

space delimited list of wildcards for attaching files to shots. For example, photo images taken in the field.

Tolerance (seconds)	input	600
----------------------------	-------	-----

the shot must be taken first and then any files with time less than this number of seconds after the shot, but before any subsequent shots, are attached to the shot

Photos to plan images	tick box
------------------------------	----------

*if **ticked**, 12d plan images are created for ay attached image in jpeg, tiff, bmp or png format*

During the reduction, the coordinates of a point may need to be supplied. This occurs when:

- s an undefined point is named as the new instrument point (field code 3)
- s backsight measurements are made to an undefined point (field code 4)
- s check measurements are made to an undefined point (field code 6)

In this situation, a **define station coordinate** panel will pop up:

The coordinates may be typed in, or selected from existing strings. The station may also be added to a model to allow it to be used as a station later.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Station name	output
---------------------	--------

the station name

Use control model	radio button
--------------------------	--------------

*if **ticked**, the point is added to the control model.
if not **ticked**, the point is created but is not placed in the control model.*

Easting/Northing/Height	input	xyz ops menu
--------------------------------	-------	--------------

the easting (x)/northing (y)/height (z) co-ordinates for the station.

Station prefix input

if non-blank, the created station name will be prefixed by this value.

Add to model input control model available models

if not blank, a 4d string is created using the Easting/Northing/Height values as co-ordinates, and the station name (with a possible prefix) as the text and name of the 4d string. The station can then be referred to later in the reduction.

Pick button

pick a point whose co-ordinates are piped into the Easting/Northing/Height fields.

OK button

*on selecting **ok**, the coordinates entered in the station xyz field are used as the station co-ordinates and if the add to model field is not blank, a 4d string created.*

Edit button

*on selecting **Edit**, the next new instrument station entry is shown which allows the station number and associated fields to be edited.*

Cancel button

the cancel button will remove the panel and terminate the reduction.

If the Backsight prompt mode is set on, then at each backsight measurement, the **bearing datum difference** panel is displayed

:

Bearing Datum Difference

Station name: 901
Backsight name: 902

	Observed	Calculated	Observed - Calculated	Corrected	Corrected - Calculated
Easting	982.767	982.770	-0.003	982.770	0.000
Northing	5096.699	5096.700	-0.001	5096.700	-0.000
Height	115.976	115.750	0.226	115.976	0.226
Bearing	349° 53' 42"	349° 53' 49"	- 0° 0' 7"	349° 53' 49"	0° 0' 0"
Distance		98.223			

No distance was measured on this check measurement.
We assume the correct distance so that we get a measure of the accuracy of the check.

Horizontal collimation: +
Vertical collimation: +

Apply Swing:

If **yes** button is selected, the bearing datum difference is applied to this horizontal circle reading.

If **yes to all** button is selected, the bearing datum difference is applied to all subsequent horizontal circle readings.

The **cancel** button terminates the reduction.

If **no** is selected, this horizontal circle reading is treated as actual bearing.

If **no to all** is selected, all the horizontal circle reading are treated as actual bearings.

This facility allows the horizontal circle to have any orientation during data capture.

At each check measurement, the **check measurement** panel is displayed giving information about the measurement, the point it was a check measurement for and the differences between the two.

:

Check Measurement

Station name901

Check name902

	Observed	Calculated	Difference
Easting	982.770	982.770	-0.000
Northing	5096.687	5096.700	-0.013
Height	115.749	115.750	-0.001
Bearing	349° 53' 44"	349° 53' 49"	- 0° 0' 5"
Distance	98.211	98.223	-0.013

Continue

Cancel

If the **Continue** button is selected, the reduction continues.

The **Cancel** button terminates the reduction

Typed Entry

Position of option on menu: Survey =>Create =>Typed entry

The **Typed entry** option creates a *Survey function* from scratch using the edit commands.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

Selecting **Typed entry** brings up the **survey Data Typed Entry Function** panel

Survey Data Typed Entry Function

The fields and buttons are identical to those in the **Survey Data Reduction Function** panel in the previous section [Field File](#).

Edit Survey Function

Position of menu: Survey =>Edit =>Edit Reduction

The Edit walk-right menu is

The **Edit reduction** walk-right menu contains options to create a **12d Model Survey function** from either a *12d field file* or from scratch using *Survey Reduction edit commands*.

Basically, a *Survey* function keeps track of all the information involved in the survey data reduction and all the strings and models created by the *Survey* function. The *Survey* function can be re-run and all the old information automatically deleted and replaced by the updated information.

Once the *Survey* function is created, it then reduces the data according to the information supplied and stored with the *Survey* function. As with other **12d Model** functions, the *Survey* function information can be modified and the function recalculated.

Many errors in a raw data file are only detected after the reduction has taken place. These are then corrected and the function recalculated to re-reduce the data.

Some of the types of problems that regularly occur during electronic field surveys are:

- s Instrument height incorrectly entered
- s Target height incorrectly entered
- s Change of target height not entered
- s Backsight station incorrectly named
- s Instrument station incorrectly named
- s Feature code and string number errors

The *12d Survey* edits allow for all commands in the field data to be modified and new commands added. Selection for some edits can be done graphically (for example incorrect target height) and others through interactive editing of the *Survey* field data. In all cases, once the edit is completed, the effect is immediately calculated and displayed.

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

Each option will now be described in detail.

For the option <i>Function</i> , please go to	Function
<i>Field data</i>	Field Data
<i>Field data by string</i>	Field Data by String
<i>Coding</i>	Coding
<i>Order</i>	Order
<i>Points</i>	SDR Point Edits
<i>Stringing</i>	SDR Strings Edit
<i>Target height</i>	Target Height

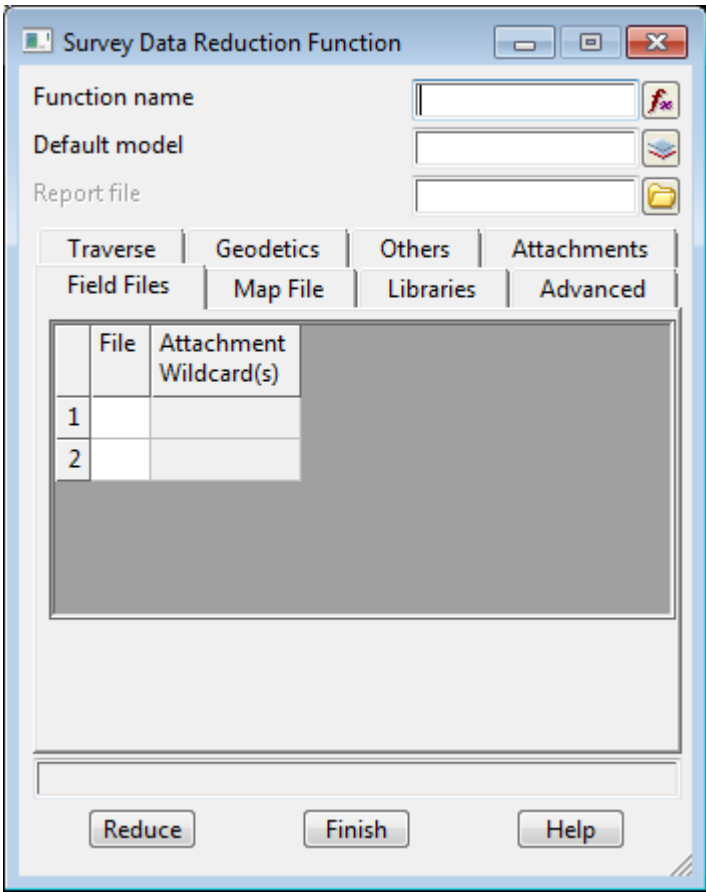

Function

Position of option on menu: Survey =>Edit =>Function

The **function** option is used to edit the set-up panel values for a *Survey* function.

Note - to edit the *field data* rather than the set-up panel, the **Field data** option is used.

Selecting **Function** brings up the **Survey Data Reduction Function** panel (which is the same panel used to create the function in the Survey =>Create =>Field file option).

A *Survey* function is selected for editing by choosing the survey function from the Function name pop-up list which loads up the panel information for that function.

The panel information is then modified and the new values stored and used by selecting the **Reduce** button. This recalcs the function which re-reduces the data using the new panel fields.

For more information on the fields in the panel, go to the section [Edit Survey Function](#).

For information on the *Survey Field Data Editor*, go to the section [Survey Field Data Editor](#).

For more detailed information on the survey reduction process in **12d Model**, go to the Appendix [12d Survey Guide](#).

Please continue to the next section [Field Data](#).

Field Data

Position of option on menu: Survey =>Edit =>Field data

The **field data** option is used to edit the *field data* from a Survey function. As the changes are made, the field data is automatically reduced to reflect the changes.

Selecting **Field data** brings up the **Edit Survey Field Data** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		all survey functions
<i>name of the Survey function to have the field data modified.</i>			

Edit	button
<i>clicking edit will start the Survey Field Data Editor for the given Survey function. This will be documented in the section Survey Field Data Editor.</i>	

For information on the *Survey Field Data Editor*, go to the section [Survey Field Data Editor](#).

Please continue to the next section [Field Data by String](#).

Field Data by String

Position of option on menu: Survey =>Edit =>Field data by string

The **Field data by string** option is used to edit the *field data* by selecting a string created from a Survey function.

Selecting **Field data by string** brings up the **Edit MTF/Survey Function Data** panel:

After selecting the **Pick Edit** button, a string created by Survey function is selected and the Survey Field Data Editor is started for the given Survey function.

For information on the *Survey Field Data Editor*, go to the section [Survey Field Data Editor](#).

Please continue to the next section [Coding](#).

Coding

Position of menu: Survey =>Edit =>Coding

The coding options are used to modify the feature code and/or string number of selected points. The 12d field file is automatically updated.

The coding walk-right menu is

.

change for feature code, string number
change feature code, string number for many point

Each option will now be described in detail.

For the option <i>Change</i> , go to	Change
<i>Quick change</i>	Quick Change
<i>Quick multi-code</i>	Quick Multi Coding

Change

Position of option on menu: Survey =>Edit =>Coding =>Change

Change is used to modify a points feature code and/or string number. When a point is selected, its point id, station name and target height are displayed as well as feature code and string number. If either the feature code or string number is then modified in the panel, selecting the set button will give the selected point the new values for feature code and/or string number.

Selecting **Change** brings up the **SDR Change Code/String** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		
<i>select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.</i>			
Prev	button		
<i>move to the previous point in the string.</i>			
Next	button		

move to the next point in the string.

Point id display only
point id of the selected point.

Station name display only
name of the station that the point was surveyed from.

Target height display only
height of the target when the point was surveyed.

Feature code input/output
*when a point is selected, its feature code is displayed in this field. The value can then be changed by the user and if **set** is selected, the point is given the new feature code.*

String number input/output
*when a point is selected, its string number is displayed in this field. The value can then be changed by the user and if **set** is selected, the point is given the new string.*

Same as button
*after selecting **same as**, a point is selected and its feature code and string number are piped into the panel fields.*

Set button
*selecting **set** gives the selected point the values in the panel fields.*

Reset button
***reset** undoes the changes.*

Please continue to the next section [Quick Change](#).

Quick Change

Position of option on menu: Survey =>Edit =>Coding =>Quick change

The **quick change** option is for more advanced users wishing to modify the same feature code and/or string number for many points.

The new feature code and/or string number is entered into the panel and whenever a point is selected and accepted, it is given the new feature code and/or string number. The picking of points continues until the picking is cancelled from the **pick ops** menu.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Feature code	input/output		
<i>if not blank, when a point is accepted its feature code is changed to the value in this field.</i>			
String number	input		
<i>if not blank, when a point is accepted its string number is changed to the value in this field.</i>			
Same as	button		
<i>after selecting same as, a point is selected and its feature code and string number are piped into the panel fields.</i>			
Pick	button		
<i>selecting pick starts the picking sequence and any accepted point will have its feature code and/or string number modified if the corresponding panel field is not blank. The pick is terminated by selecting cancel from the pick ops menu.</i>			

Please continue to the next section [Quick Multi Coding](#).

Quick Multi Coding

Position of option on menu: Survey =>Edit =>Coding =>Quick multi-code

The fields and buttons used in this panel have the following functions.

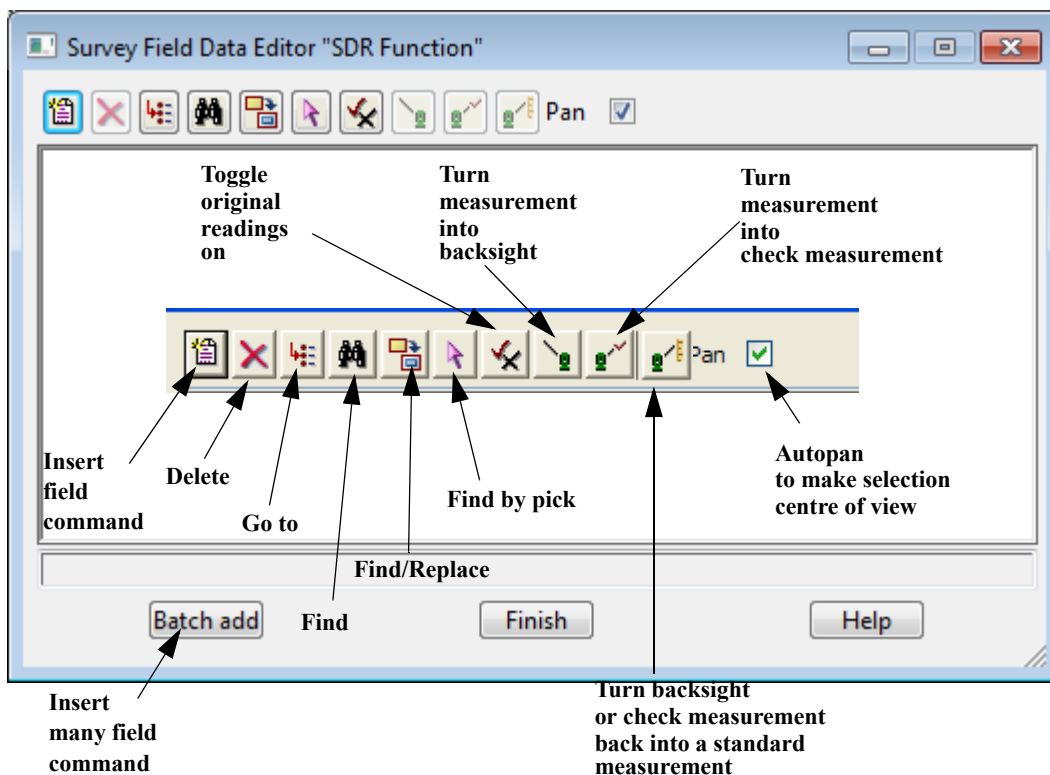

Field Description	Type	Defaults	Pop-Up
Pick	button		
<i>after selecting Pick, pick the vertex that you want to multi-code, and then pick a string and the code and string number from the string will be added to the selected vertex as a multi-code.</i>			
<i>The sequence start again and continues until the pick is terminated by selecting Cancel from the Pick ops menu.</i>			

Please continue to the next section [Survey Field Data Editor](#).

Survey Field Data Editor

The **Survey Field Data Editor** is used to interactively edit the field data of a **Survey** function. All the commands in the field data can be modified or deleted, or new commands added. When changes are made, the field data is automatically re-reduced so the effects can be immediately checked.

If the Editor is opened using the Survey=>Create=>Typed Entry option the editor will appear blank.

For information on using things inside the panel, go to [Using the Survey Field Data Panel](#)

For information on the field commands, go to [List of Field Data Commands and Panels](#)

For information on the icons and buttons on the panel:

Using the Survey Field Data Panel

Colour Coding of the Field Data

Normally data has been loaded into the Survey function by a raw data file being downloaded from a data collector, converted to a 12d field file and then loaded into a Survey function.

When **12d Model** converts the raw file to a 12d field file, all the raw data can be included in the

12d field file as comments.

All **comments** lines are displayed in **green**.

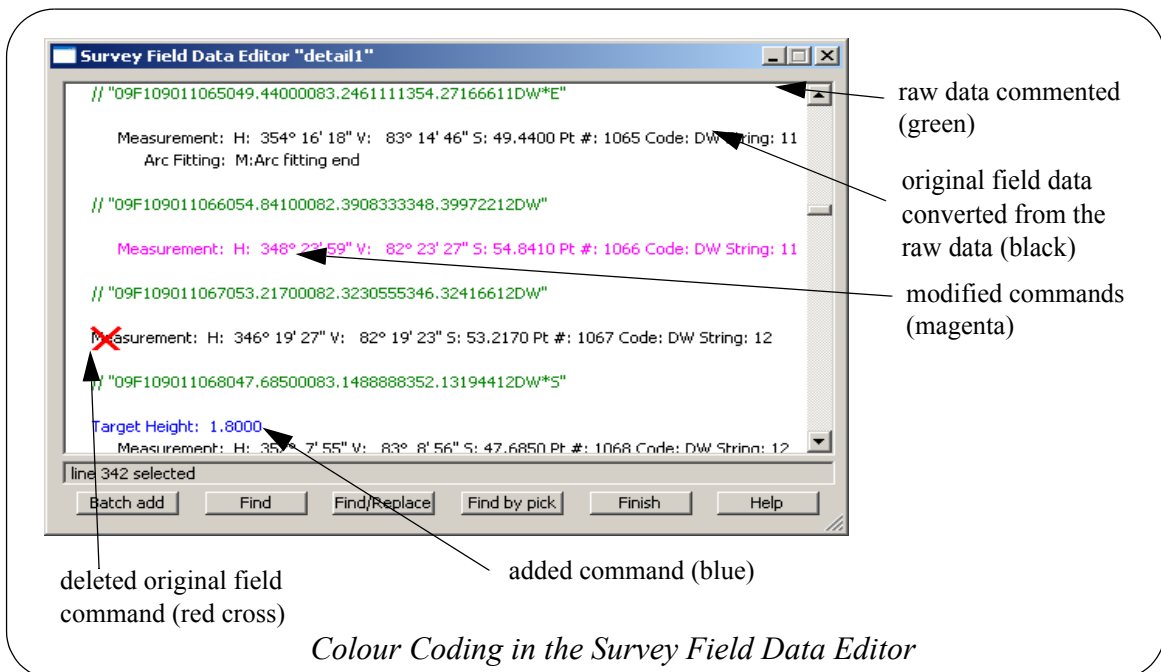

Each line (or lines if necessary) of raw data is converted into one or more equivalent 12d field file commands. These field file commands are placed straight after the commented line containing the raw data lines so it is easy to see what the raw data was converted to.

The **original 12d field commands** converted from the raw data are displayed in **black**.

If a field command has been **inserted**, it is coloured in **blue**. If a comment has been inserted, it will still be displayed in green but the word **: added** will be appended to the end of the comment.

If a field command has been **modified**, it is displayed in **magenta**.

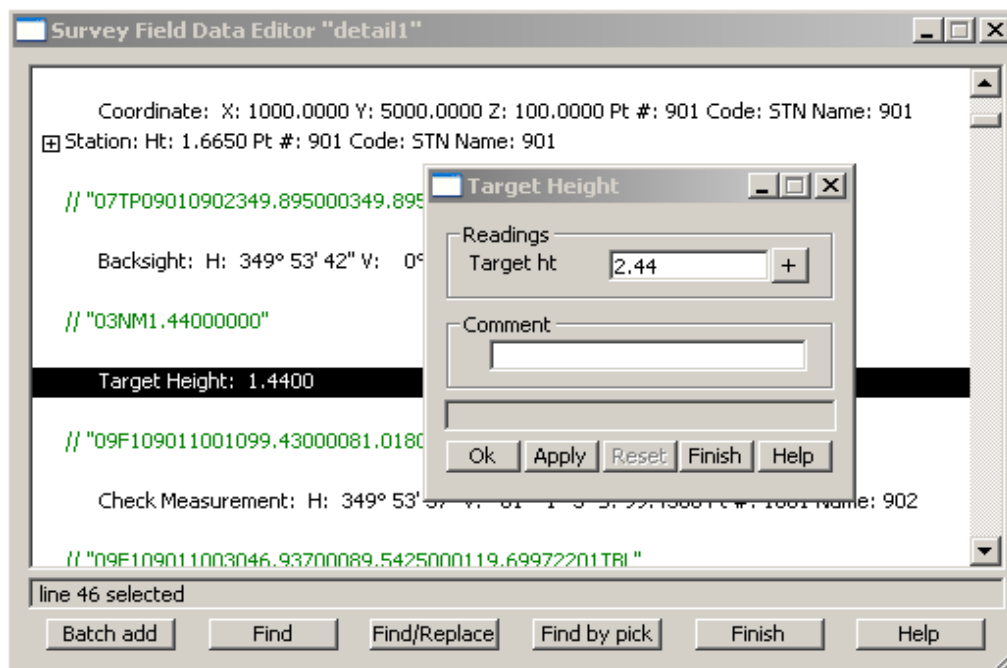

If an **original** command has been **deleted**, the original command is left in the file but it has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply deleting the command again.

Modifying the Field Data

To modify an existing command in the field data, double click on the line to be modified and the appropriate panel for the line of field data is displayed. The data in the panel can then be modified and stored by selecting either the **OK** or **Apply** buttons. The colour of the line of modified field data is then magenta.

For example, double clicking on **target height** command in the field file brings up the **Target Height** panel with the values loaded into the appropriate panel field. The data in the panel can be modified and saved by clicking **OK**.

Deleting Field Data

To delete a line from the field data, simply highlight the data by clicking in the line and then delete key on the keyboard or select the delete icon from the top of the panel. If the line was an original command, a red cross is placed

If an **original** command has been **deleted**, the original command is left in the file but it has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleting command and pressing the delete icon or delete key again.

If an **inserted** command has been **deleted**, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the delete key on the keyboard or select the delete icon from the top of the panel. Similarly to undelete multiple commands.

For information on the field commands, go to [List of Field Data Commands and Panels](#)

For information on the icons and buttons on the Survey Field Data panel, go to [Icons and Buttons on the Survey Field Data Editing Panel](#)

Icons and Buttons on the Survey Field Data Editing Panel

The use of the buttons at the bottom of the survey field data editing panel will now be described.

Insert and *Batch Add* button

To insert a new command into the field data, simply click on the line where the data is to be inserted and press the **Batch Add** button or select the **Insert** icon from the top of the panel.

The difference between the button and the icon, is that the button allows multiple entries whilst the icon allows one entry at a time.

Selecting either the icon or the **Batch Add** button, displays the **New Field Data Command** panel.

By clicking on the Command choice box selector, a full list of field commands is displayed and the required command is selected from the list.

Clicking **Create** then brings up the panel for the selected command type. The description of the field data commands panels is given in the section [List of Field Data Commands and Panels](#)

Alternatively, if the **12d Field Data Op Code** is known, this can be entered into the choice box instead of selecting from the list. For example, to enter a **Measurement EDM** field data command, the number **7** can be inserted in the choice box field.

When using **Batch Add**, once a command is selected, it will remain as a default for subsequent entries until another type is chosen. This allows a number of the same command to be quickly entered such as in the case of **Measurement EDM** by entering data into the appropriate fields and continuing to press <enter> through the default choices

For a more detailed explanation on each of the fields within the panels and the appropriate field **12d Field File Op Codes** see the section [Full Description of 12d Field File Op Codes](#).

For a summary of just the field file op codes, see the section [Summary of 12d Field File Op Codes](#)

Delete

To delete a line from the field data, highlight the data by clicking in the line and then either use the **Delete** key on the keyboard or select the **Delete** icon from the top of the panel.

If an **original** command has been **deleted**, the original command is left in the file but has a **large red cross** placed on the left hand side of the line to indicate that it has been deleted. Any original command that has been deleted can be undeleted by simply highlighting the deleted command and pressing the **Delete** icon or **Delete** key again.

If an **inserted** command has been **deleted**, the command is removed from the field data.

More than one line can be selected for deletion by using the standing Windows selection commands to highlight the commands and then press the **Delete** key on the keyboard or the **Delete** icon from the top of the panel. Similarly to undelete multiple commands.

Goto

Selecting the **Goto** icon brings up the **Field Data Goto** panel.

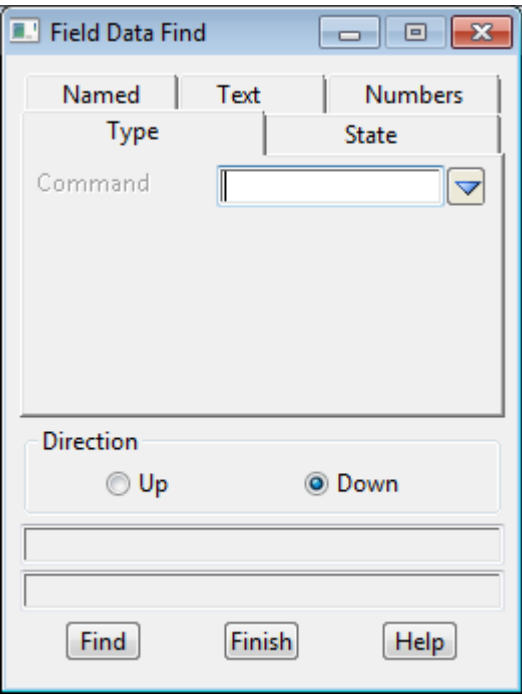

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Line number <i>line number to go to</i>			
Goto <i>go to the given line number</i>	button		

Find

Selecting **Find** brings up the **Field Data Find** panel.

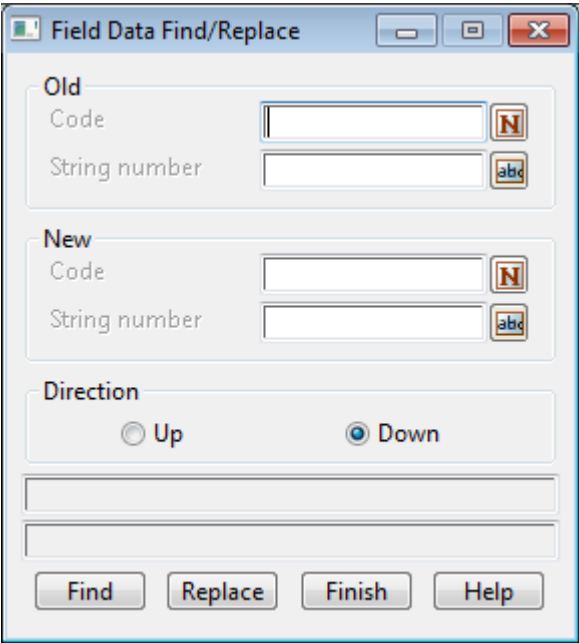

Each of the tabs sets the panel for the required data.

Named	find given code, string number, point id etc.
Numbers	find numbers between given minimum and maximum.
State field)	find a field command in a given modification state (added, changed, deleted,
Text	find text containing given text.
Type	find a field command of a given type. For example "New String".

The up/down radio button define which direction to search in the field data.

Find/Replace

Selecting the **Find/replace** icon brings up the **Field Data Find/Replace** panel.

The dialog box titled "Field Data Find/Replace" contains two sections: "Old" and "New". Each section has two input fields: "Code" and "String number", each with a small icon to its right. Below these sections is a "Direction" section with two radio buttons: "Up" and "Down". At the bottom are four buttons: "Find", "Replace", "Finish", and "Help".

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

The user specifies the old and new **Code** and old and new **String number** fields, and the search and replace is done using those parameters.

The **Up/Down** radio button define which direction to search in the field data.

Find by Pick

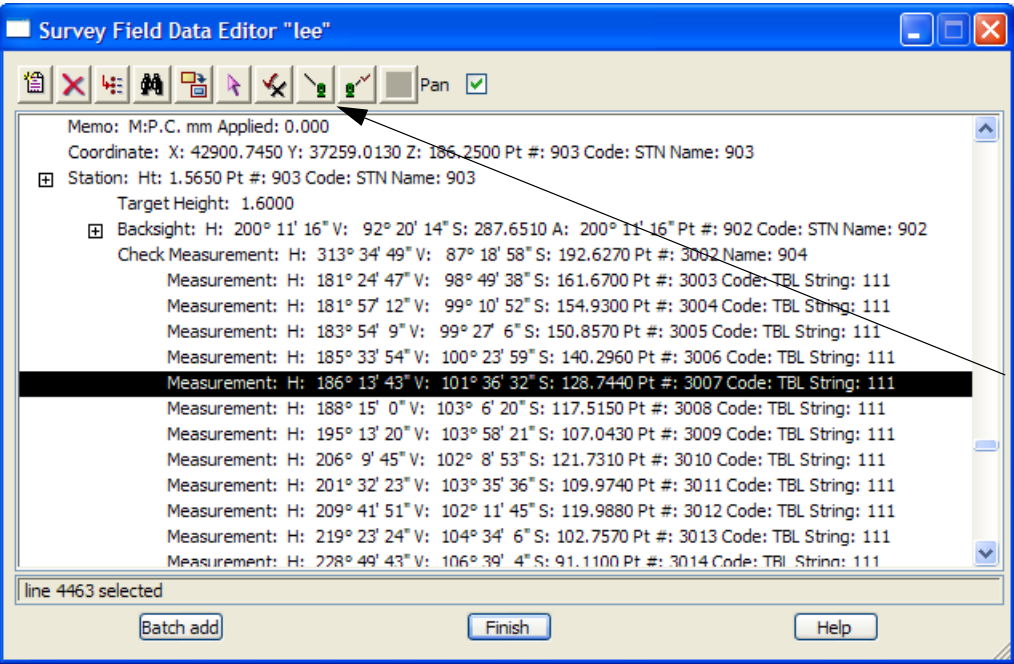

After selecting **Find by pick**, the user selects a point created by the Survey function and the field data editor will scroll to the line of the field data that created the point.

Toggle

The toggle button allows commented information to be shown/ not shown. Simply press the **Toggle** icon to move from one state to another.

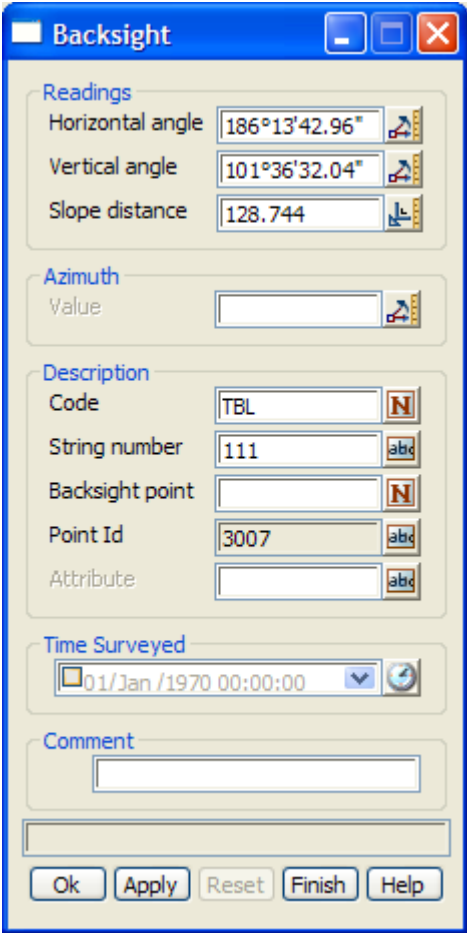

Make Measurement into a Backsight

The **Make Backsight** icon is visible when a **measurement** line has been selected (highlighted) in the field data.

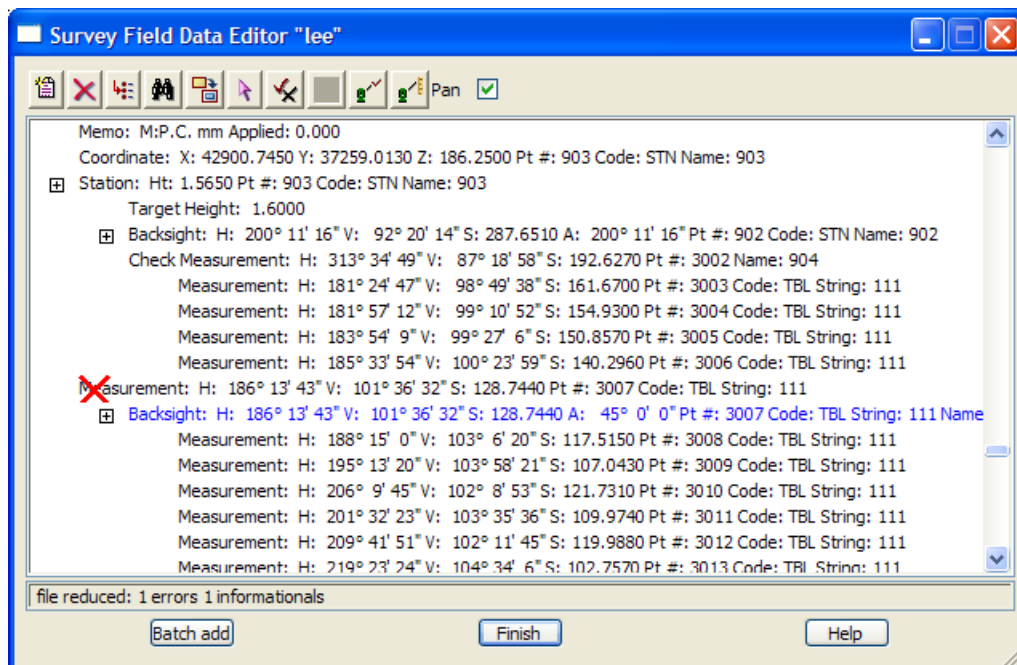

Highlighting a **Measurement** then displays the **Make Backsight** and **Make Check Measurement** icons

When the measurement line is highlighted, clicking on the **Make Backsight** icon brings up the **Backsight** panel with the highlighted measurement details filled in.

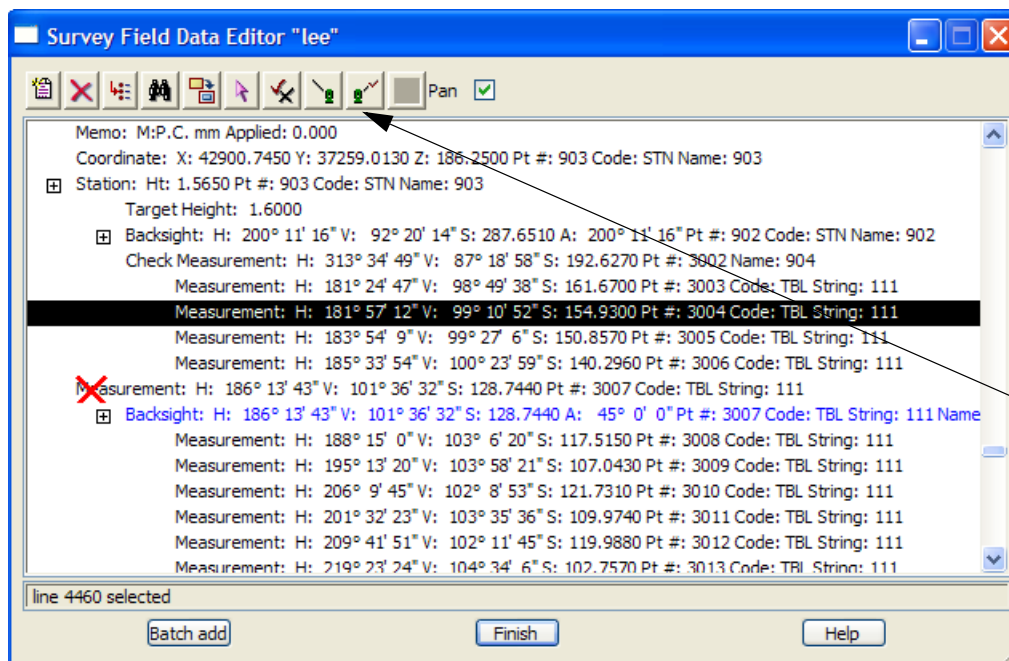

The **Azimuth** and **Backsight point** fields are filled in and the **OK** or **Apply** button selected. The original measurement will then be shown as deleted and a new Backsight record created.

Make Measurement into a Check Measurement

The **Make Check Measurement** icon is only visible when a **measurement** or **backsight** line has been selected (highlighted) in the field data.

Highlighting a **Measurement** or **Backsight** then displays the **Make Check Sight** and **Make Check Measurement** icons

When the measurement line is highlighted, clicking on the **Make Check Measurement** icon brings up the **Check Measurement** panel with the details from the highlighted measurement filled in.

Autopan

Ticked on - when a line is selected (highlighted) in the survey data editor panel, if the point is not visible in a plan view that the model for the data is on, the view is modified so that the selected point is at the centre of the view (keeping the same scale for the view).

Please continue to the next section [List of Field Data Commands and Panels](#).

List of Field Data Commands and Panels

Panel buttons

The buttons that appear on the bottom of the panels used in this section have the following functions.

OK

Changes field data and closes the panel

Apply

Changes the field data but keeps the panel in view

Reset

If the record was an original field record (i.e. the command was not inserted manually) pressing the reset button will revert the record back to the original values.

Help and Finish

standard 12d buttons.

Existing point search

Some commands such as **Backsight**, **New instrument** and **Check** allow the user to enter existing *point names* (i.e. backsight point, Setup point and Check point) or in the case of measurements from a data collector, both *point name* and *point ids*.

The difference between *point names* and *point ids* is that *point names* are usually specified by the user and should be a unique identifier for a point, whilst for that same physical point a number of measurements (and hence point ids) may be assigned (usually by the data collector). This may be particularly true of control station measurements where measurements are made to a given point name but each measurement is given a different point id by the data collector.

In most instances, a measurement to a point has a point id (from the data collector) and 12d automatically gives it the same point name as it is rare to measure a non-control point more than once (the point name can be over ridden by the user).

The names allow the reduction routine to search for the details of that point (eg coordinates) to allow for the reduction of further measurements. The order in which this searching takes place is as follows:

First search the Control model (if it exists):

1. A search is made of the control model for a string whose name is the same as the specified *point name*. If a string is found, the first point of the string is used for the (x,y,z) co-ordinates.
2. A search is made of the control model for a vertex of a string whose point id is the same as the specified *point name*. If a vertex is found its (x,y,z) co-ordinates are used.
3. If only a *point id* was specified, a search is made of the control model for a vertex of a string whose point id is the same as the specified *point id*. If a vertex is found its (x,y,z) co-ordinates are used.

Next search the already entered directly entered co-ordinates (DEC) in the field file:

4. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point name* is the same as the specified *point name*. If a DEC is found, its

(x,y,z) co-ordinates are used.

- 5. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point id* is the same as the specified *point name*. If a DEC is found, its (x,y,z) co-ordinates are used.
- 6. A search is made of previously entered directly entered co-ordinates in the field file for a directly entered co-ordinate whose *point id* is the same as the specified *point id*. If a DEC is found, its (x,y,z) co-ordinates are used.

Next search the previous measurements in the field file:

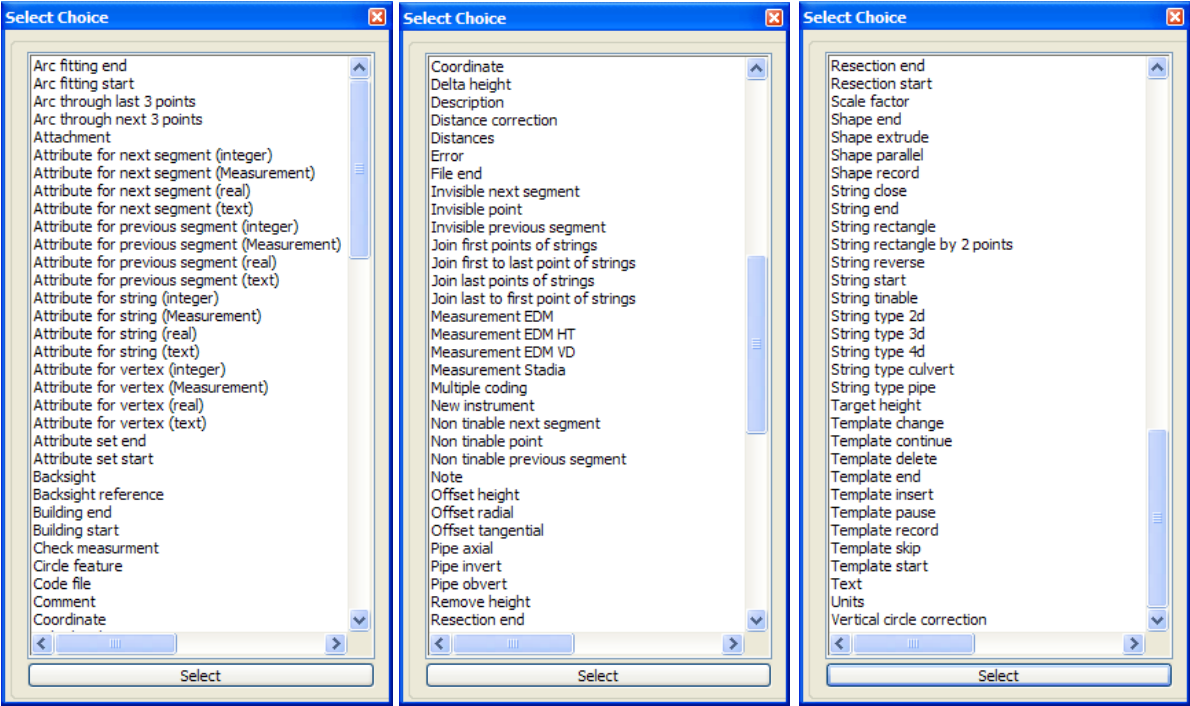

- 7. A search is made of previous measurements in the field file for a measurement whose *point name* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
- 8. A search is made of previous measurements in the field file for a measurement whose *point id* is the same as the specified *point name*. If a measurement is found, its (x,y,z) co-ordinates are used.
- 9. A search is made of previous measurements in the field file for a measurement whose *point id* is the same as the specified *point id*. If a measurement is found, its (x,y,z) co-ordinates are used.

Finally

- 10. If no match is found, the user will be prompted for the details of the previously undefined point. The user is asked to type in the (x,y,z) co-ordinates in the **Define Station coordinate** panel. If a model is specified in the Add to model field of the panel, then a new one point super string is created with the name *point name*, and as the vertex text for the point, the Station label prefix field value followed by *point name*

Field Data commands

The list of field commands in the pop-up from **Insert** or **Batch Add** are:

For a summary of the field file op codes see the section [Summary of 12d Field File Op Codes](#)

Arc Fitting (opcodes 17, 60, 61, 62)

Fitting arcs through measurements.

See [Arcs Through Points](#) in Appendix [12d Survey Guide](#).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Arc through last 3 points (opcode 17) Arc through next 3 points (opcode 60) Arc fitting start (opcode 61) Arc fitting end (opcode 62)

for Arc through last 3 pts

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, then the current measurement point and the two previous points with the same feature code and string number as the current measurement point, are joined by an arc. If there is less than three such points, no arc is fitted.

If the *feature code* and *string number* exist, the last three previous measurement points of the same *feature code* and *string number* are joined by an arc. If the current measurement point has that *feature code* and *string number*, then it is the third of the three points used. If there is less than three points, no arc is fitted.

If a *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id. That point and two measurement points previous to the predefined point of the same *feature code* and *string number*, are joined by an arc. If there is less than three points, no arc is fitted

for Arc through next 3 pts

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, an arc is inserted through the current measurement point and the next two measured points with the same *feature code* and *string number* as the current measurement point. If there is less than three points, no arc is fitted.

If a *feature code*, *string number* or *point id* exists, then either the *feature code* and/or *string number* and/or the *point id* section of the *point description* can be used.

If the *feature code* or *string number* exist, a search is made for a previously defined measurement with the same *feature code* or *string number*. An arc is inserted through this previous measurement and the next two measured points following this previous measurement with the same *feature code* and *string number*. If the current point has that *feature code* and *string number*, then it is the first of the three points. If there is less than three points, no arc fitted.

If the *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id, and an arc is inserted through that point and the next two measurement points with the same *feature code* and *string number*. If there is less than three points, no arc is fitted

for Start arc fitting

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, arcs are inserted through the following sets of measurement points with the same *feature code* and *string number* as the current measurement point. The current measurement point is the first of the points.

The arcs are fitted as follows - the first arc is fitted through points one, two and three, the next arc through points three, four and five etc. If the current point has that *feature code* and *string number*, then it is the first of the points. If there is less than three points, then no arc is fitted.

If the *feature code* and *string number* exist, a search is made for a previously defined measurement with the same *feature code* or *string number*. An arc is inserted through the following measured points with the same *feature code* and *string number* as given. If the current point has that *feature code* and *string number*, then it is the first of the points.

If the *point id* exists, then the *feature code* and *string number* are taken from the previous measurement point **with** that point id, and arcs are inserted through that point and the following measured points with the same *feature code* and *string number*.

for End arc fitting

Named point is not used.

If no *feature code*, *string number*, *named point* or *point id* is given, the fitting of arcs through the current string is stopped. The current measurement point is the last of the points used in the arc fitting.

If the *feature code* and *string number* exist, then the fitting of arcs through the points of the previous string with the same *feature code* and *string number* is stopped. If the current measurement point has that *feature code* and *string number*, then it is the last point used in the arc fitting.

If the *point id* from the *point description* exists, then the point with that point id is the last point used in the arc fitting.

If **12d Model** encounters an *End Arcs* (62) but no *Start Arcs through sets of three points* (61) command for the string, then a *Start Arcs through sets of three points* (61) is assumed to apply at the beginning of the string and hence arc fitting will be applied to the entire string.

Code

feature code. See the description of the panel field Arc mode for usage

String number

string number. See the description of the panel field Arc mode for usage

Named point

not used

Point id

point id. See the description of the panel field Arc mode for usage

Attachment (opcode 126)

Attach a file to the measurement.

The image shows a software dialog box titled "Attachment". It contains several input fields: a "Data" section with a "File name" text box and a folder icon; a "Time Surveyed" section with a date/time picker showing "01/ Jan /1970 00:00:00" and a refresh icon; and a "Comment" section with a text area. At the bottom, there are five buttons: "Ok", "Apply", "Reset", "Finish", and "Help".

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

File name

file to attach to the measurement

Time surveyed

time when the command (op code) was created

Measurement Attributes (Opcode 120 to 123)

This section of documentation is a work in progress and will be updated in subsequent releases.

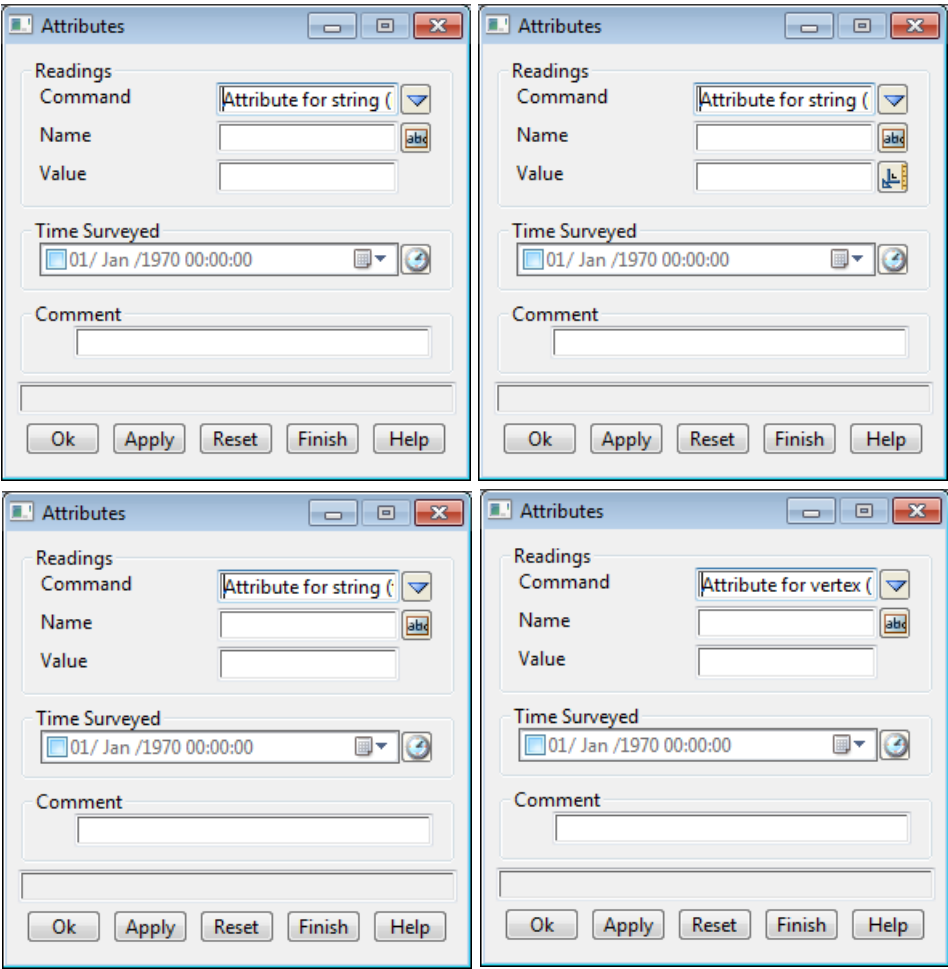

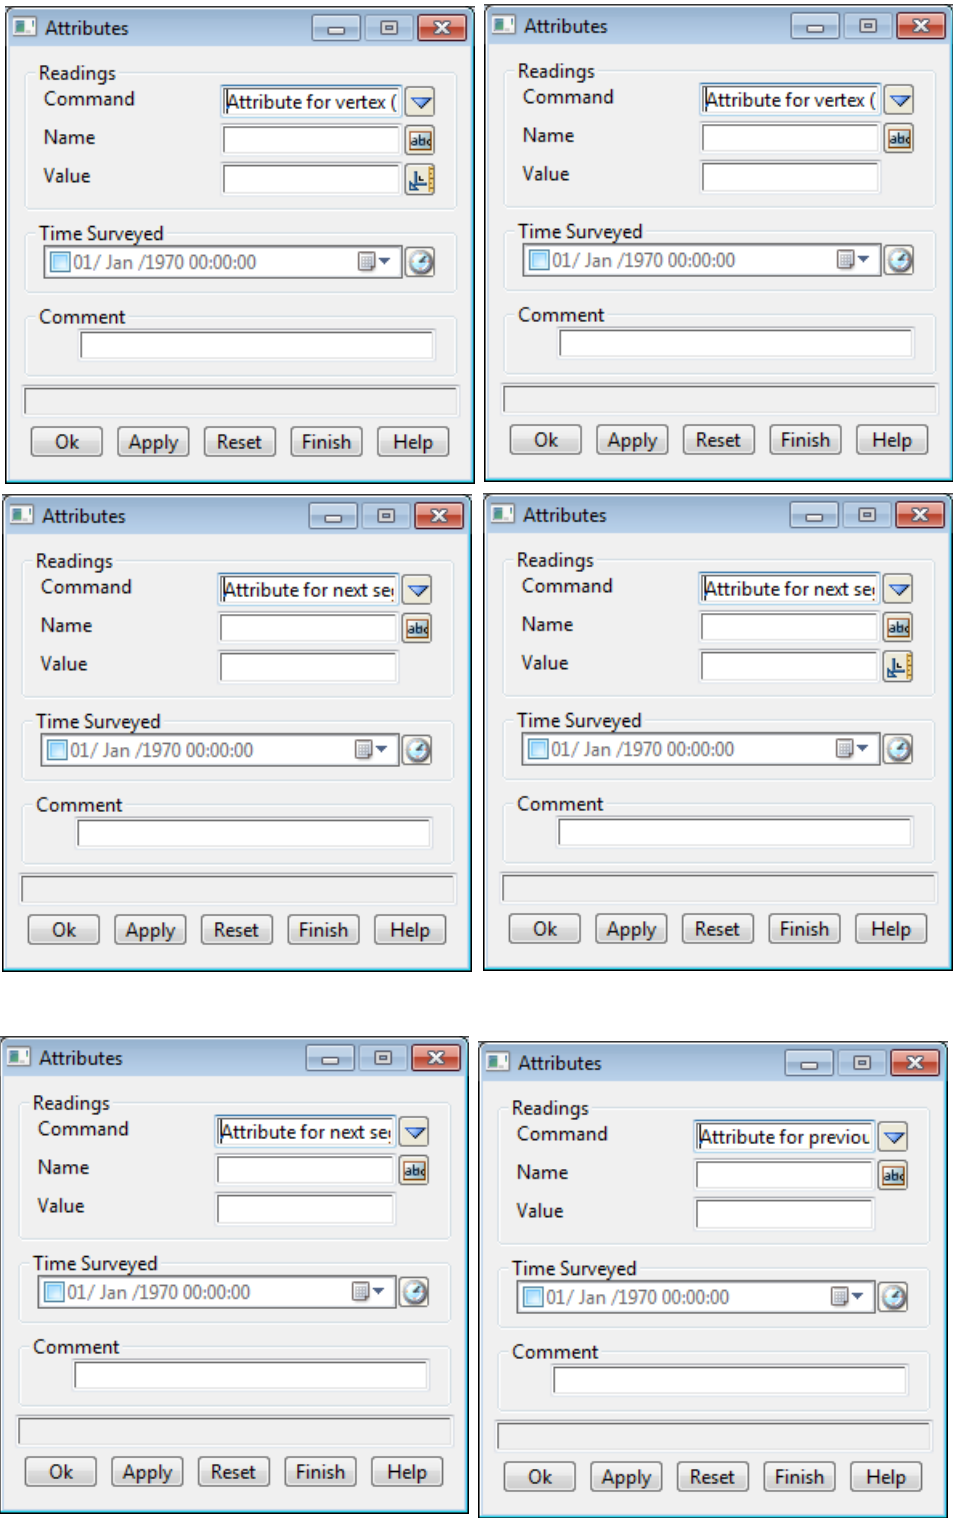

The fields and buttons used in this panel have the following functions.

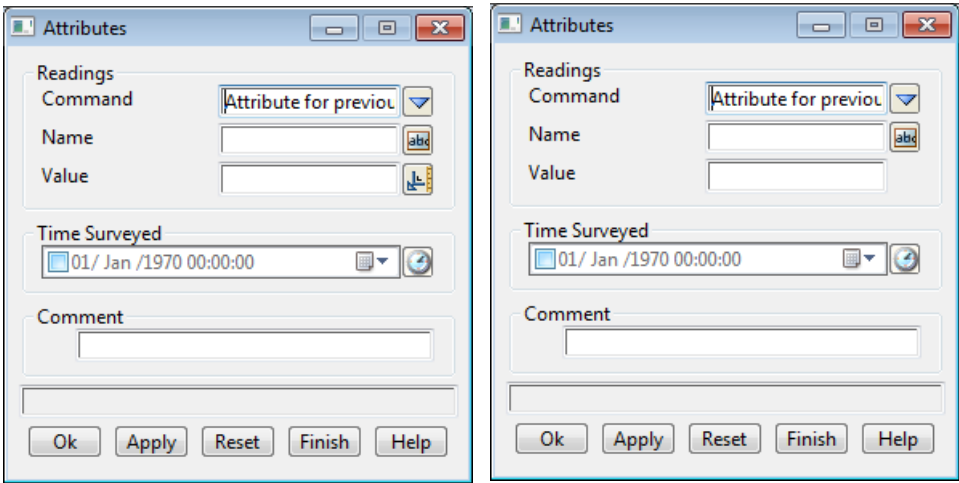

Field Description	Type	Defaults	Pop-Up
			Attribute for string (Measurement) (opcode 120)
			Attribute for vertex (Measurement) (opcode 121)
			Attribute for next segment (Measurement) (opcode 122)
			Attribute for previous segment (Measurement) (opcode 123)

Attributes (opcode 68 to79)

Create attributes of type measurement, integer, real or text, to string, vertices or segments.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Attribute for string (integer) (opcode 68) Attribute for string (real) (opcode 69) Attribute for string (text) (opcode 70) Attribute for vertex (integer) (opcode 71)) Attribute for vertex (real) (opcode 72)) Attribute for vertex (text) (opcode 73) Attribute for next segment (integer) (opcode 74) Attribute for next segment (real) (opcode 75)) Attribute for next segment (text) (opcode 76)) Attribute for previous segment (integer) (opcode 77)) Attribute for previous segment (real) (opcode 78) Attribute for previous segment (text) (opcode 79)

for String (integer)

Add an user defined integer attribute to the current string.

for String (real)

Add a real (floating point) user defined attribute to the current string.

for String (text)

Add a text user defined attribute to the current string.

for Vertex (integer)

Add an integer user defined attribute to the current measurement point.

for Vertex (real)

Add a real (floating point) user defined attribute to the current measurement point.

for Vertex (text)

Add a text user defined attribute to the current measurement point.

for Next segment (integer)

Add an integer user defined attribute to the next segment from the current measurement point.

for Next segment (real)

Add a real (floating point) user defined attribute to the next segment from the current measurement point.

for Next segment (text)

Add a text user defined attribute to the next segment from the current measurement point.

for Previous segment (integer)

Add an integer user defined attribute to the previous segment for the current measurement point.

for Previous segment (real)

Add a real (floating point) user defined attribute to the previous segment for the current measurement point.

for Previous segment (text)

Add a text user defined attribute to the previous segment for the current measurement point.

Name

The name of the attribute.

Value

The attribute data in the form specified by the mode.

Time surveyed

time when the command (op code) was created

Attribute Set (opcode 124 and 125)

This section of documentation is a work in progress and will be updated in subsequent releases.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
			Attribute set start (opcode 124)
			Attribute set end (opcode 125)

Backsight (opcode 4)

Denote the measurement as a backsight measurement.

Individual backsight measurements can be entered, or they can consist of pairs of Face1/Face2 measurements.

To enter a Face1/Face2 measurement, the backsight command should be entered twice, with the appropriate values entered into the panel each time.

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Horizontal angle

the horizontal angle to the backsight in dd.mmss format.

Vertical angle

the vertical angle to the backsight in dd.mmss format. If the value is in the range 0 -180 degrees the measurement is considered a Face 1 measurement, and for measurements in the range 180-360 degrees they are considered Face2.

Slope distance

the slope distance to the measurement to the backsight. If a pair of face1/face2 measurements exist, the mean value of the slope distance is used for reduction purposes.

Value

the azimuth to the backsight in dd.mmss format. This allows backsights to be specified by azimuth only. In the case of a differing azimuth and horizontal angle, a swing will be computed by the subtraction of the azimuth value and the horizontal angle.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Backsight point

point name.of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#)

Point id

point id.of the backsight point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new backsight entry is inserted into the file, this field will be non-editable since only the backsight point is required.

Backsight Reference (opcode 50)

Specify an angle (measured positive, clockwise from north) to swing the following measurements by.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Bearing swing			

the angle (measured positive, clockwise from north) to swing following measurements. It is equivalent to the bearing datum difference. Note, this swing is only current for measurements following the command and for that particular station setup. It also negates any previous swings calculated from

backsight measurements (bearing datum difference) for that station setup. Therefore, measurements after the command will use the new swing value. The direction of the swing is positive in the clockwise direction

Buildings (opcodes 110, 111)

Create a building face.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command			Building end (opcode 111)
			Building start (opcode 110)

for Building end

If no *name* exists, the current building face observation set is finished (including the current measurement point).

for Buildings start

Start recording a building face with the given name. If *name* is non-blank, then the default building face is defined by the *feature code* and *string number*.

The following measurements until a *Finish* code (111), are stored as the building face. There is no limit to the number of points in a building face.

Name

Name has the meaning as outlined above in Building end/start definition.

Time surveyed

time when the command (op code) was created

Field Description	Type	Defaults	Pop-Up
Command	choice box		Invisible previous segment (opcode 107) Invisible next segment (opcode 108) Invisible point (opcode 109)

for Make the previous segment invisible

If no *description* is given, the previous segment containing the current measurement point is set to

invisible.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to invisible.

for Make the next segment invisible

If no *description* is given, the next segment containing the current measurement point as a starting point is set to invisible. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to invisible.

for Make a point invisible

If no *description* is given, the current measurement point is set to invisible. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to invisible.

If the *point id* exists, then the point with that point id is set to invisible.

Code

the feature code of the nominated point.

String number

the string number of the nominated point.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#)

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

Strings Join (opcodes 21 to 24)

Join two strings together.

See [Joining Strings](#) in Appendix [12d Survey Guide](#).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Join last points of strings (opcode 21) Join first to last point of strings (opcode 22) Join first points of strings (opcode 23) Join last to first point of strings (opcode 24)

for Join last points of strings

In the final reduction, the last point of the string with the given *feature code* and *string_number_1* is joined to the last point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

for Join first to last point of strings

In the final reduction, the first point of the string with the given *feature code* and *string_number_1* is joined to the last point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

for Join first points of strings

In the final reduction, the first point of the string with the given *feature code* and *string number 1* is joined to the first point of the string with given *feature code* and *string number 2*. The created string has the given *feature code* (no string number is needed since it is the final reduction when the string numbers are then dropped).

for Join last to first point of strings

In the final reduction, the last point of the string with the given *feature code* and *string_number_1* is joined to the first point of the string with given *feature code* and *string_number_2*. The created string has the given *feature code* (no string number is needed since it is the final phase of reduction when the string numbers are dropped).

Code

the feature code of the strings to be joined

String number 1

the string number of the first string

String number 2

the string number of the second string

Multiple Coding (opcode 16)

Record a new point at the same position as the current measurement point but with possibly a different feature code and string number.

The image shows a software dialog box titled "Multiple Coding". It has a standard Windows-style title bar with minimize, maximize, and close buttons. The dialog contains several input fields: "Description Code", "String number", "Named point", "Point Id", and "Attribute", each followed by a small icon (a box with 'N' or 'abc'). Below these is a "Time Surveyed" field with a date/time picker showing "01/ Jan /1970 00:00:00". At the bottom is a "Comment" text area and a row of five buttons: "Ok", "Apply", "Reset", "Finish", and "Help".

A new point is created at the same position as the current measurement point but with the specified *feature code* and *string number*.

The *point id* and *text* are recorded as the point id and text for that vertex of the super string.

If a *point name* exists, then it is a **named measurement** and a 4d point string of name *point name* is created and mapped using the mapping file. The 4d text is the station prefix followed by *point name*. The *point name* is added to the internal list of named points for searching for co-ordinates.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Code

the feature code of the new point.

String number

the string number of the new point.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#)

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Non tinable previous segment (opcode 39) Non tinable next segment (opcode 38) Non tinable point (opcode 40)

for Make the previous segment non-tinable

If no *description* is given, the previous segment containing the current measurement point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the last segment of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as an end point, is set to non-tinable.

for Make the next segment non-tinable

If no *description* is given, the next segment containing the current measurement point as a starting point is set to non-tinable. That is, it will not be treated as a breakline in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the *description* can be used.

If the *feature code* and *string number* exist, then the segment that is created in the future from the last point of the previous string with that *feature code* and *string number* is set to non-tinable.

If the *point id* exists, then the segment containing the point with that point id as a start point, is set to non-tinable.

for Make a point not tinable

If no *description* is given, the current measurement point is set to not tinable. That is, it will not be included in triangulations.

If a *description* exists, then either the *feature code* and *string number* or the *point id* section of the

description can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is set to not tinalbe.

If the *point id* exists, then the point with that point id is set to not tinalbe.

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command			Offset radial (opcode 42) Offset tangential (opcode 43) Offset height (opcode 44)

for Radial

The *radial offset* is used to adjust the position of the specified point by a plan distance from the specified points original position, along the plan line joining the current station to the specified point. A positive offset is away from the station, negative is toward the station.

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

for Tangential

The *tangential offset* is used to adjust the position of the specified point by a plan distance from the specified points original position, at rights angles to the plan line joining the current station to the specified point. A negative offset is to the left (looking from the station), and positive is to the right (looking from the station).

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

for Height

If the height of the specified point is not null, then the *height offset* adjusts the height of the point. A positive offset adds to the height, a negative offset reduces the height.

If no *point description* is given, the offset is used to adjust the position of the current measured point.

If a *point description* exists, then either the *feature code* and *string number* or the *point id* section of the *point description* can be used.

If the *feature code* and *string number* exist, then the last point of the previous string with that *feature code* and *string number* is adjusted.

If the *point id* exists, then the point with that point id is adjusted.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command			Pipe invert (opcode 80) Pipe axial (opcode 81) Pipe obvert (opcode 82)

for Pipe invert (opcode 80)

If no *point description* is given, the current measurement point is on the invert (bottom) of a pipe. This is the default for measurements to points on pipe strings. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the invert (bottom) of a pipe. If the point is not part of a pipe string, it is ignored.

for Pipe axial (opcode 81)

If no *point description* is given, the current measurement point is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the axis (centre) of a pipe. If the point is not part of a pipe string, it is ignored.

for Pipe obvert (opcode 82)

If no *point description* is given, the current measurement point is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *feature code* and *string number* exist, the last point of the previous string with the same *feature code* and *string number* as given in *point description* is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

If the *point id* exists, then the point with that point id is on the obvert (top) of a pipe. If the point is not part of a pipe string, it is ignored.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Remove Height (opcode 30)

Set the height of a measurement to null.

The 'Remove Height' dialog box is a standard Windows-style window. It features a title bar with minimize, maximize, and close buttons. The main area is divided into sections. The 'Description' section contains four input fields: 'Code', 'String number', 'Named point', and 'Point Id'. Each field has a small icon to its right: a numeric keypad for 'Code' and 'Named point', and an alphanumeric keypad for 'String number' and 'Point Id'. Below the 'Description' section is the 'Time Surveyed' section, which includes a date and time field showing '01/ Jan /1970 00:00:00', a calendar icon, and a refresh icon. A 'Comment' section with a text area follows. At the bottom of the dialog are five buttons: 'Ok', 'Apply', 'Reset', 'Finish', and 'Help'.

If no *point description* is given, the height of the current measurement point is set to null.

If the *feature code* and *string number* exist, then the height of the last point of the previous string with that *feature code* and *string number* is set to null.

If the *point id* exists, then the height of the point with that point id is set to null.

Shaping (opcodes 83 to 86)

See [Shape field coding](#) in Appendix [12d Survey Guide](#).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command	choice box		Shape end (opcode 84) Shape record (opcode 83) Shape extrude (opcode 86) Shape parallel (opcode 85)

for Shape end

Stops using the current shape or stops recording a shape.

for Shape record

Start recording a shape with the shape name. If *Shape_name* is not blank, then the default field Shape is defined by the *feature_code* and *string_number* of the following measurements until a *shape end* co. There is no limit to the number of points in a shape.

for Shape extrude

extrude the current shape along the specified super string.

for Shape parallel

parallel the current shape along the specified super string. This creates a number of strings to represent each feature code of the shape record. In the case of shapes which contain curves, a number of strings will be created according to an arc/chord tolerance.

Name

the name of the shape.

Rectangle (opcode 45)

Create a parallelogram (squashed rectangle) from three points.

See [Rectangle](#) in Appendix [12d Survey Guide](#).

If no *Description* is given, the current measurement point and the two previous points from the current string are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the *feature code* and *string number* exist, the last three points with that *feature code* and *string number* are used and a fourth point is created to form a parallelogram (squashed rectangle) and the height of the fourth point is set to null. The string is then closed.

If the *point id* exists, then the *feature code* and *string number* of the point with that point id are used and processed as above. Note that the point with the point id is not necessarily used.

The rectangle is defined by two points (reference side) and a offset.

If a positive offset value is given, two points will be created to the right of the reference side.

If a negative offset value is given, two points will be created to the left of the reference side.

If no *Description* is given, the two new points will be joined to the given points in a closed rectangular string, and will have the same feature code as the points given.

If the *feature code* and *string number* exist, then a search is made for the last occurrence of two points with the same *feature code* and *string number*. If found, then these points are used to define the reference side of the rectangle.

If the *point id* exists, then a search is made for the last occurrence of two points with the same *feature code* and *string number* as the point given by the point id. If found, then these points are used to define the reference side of the rectangle.

Two consecutive rectangles are unable to be defined side by side. In other words if the two points given are part of string of greater than two vertices, the command will only work for sets of two points that are exclusively defined. i.e. For a 5 point string, a rectangle can be defined by points 1 and 2, and 4 and 5.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#)

Point id

point id.of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section [Panel buttons](#)

String Start (opcode 47)

Start a new string.

See [Start New String](#) in Appendix [12d Survey Guide](#).

The image shows a 'String Start' dialog box with a title bar containing a minimize, maximize, and close button. The dialog is divided into several sections. The 'Description' section has four rows: 'Code' with a text input and a button with 'N', 'String number' with a text input and a button with 'abc', 'Named point' with a text input and a button with 'N', and 'Point Id' with a text input and a button with 'abc'. The 'Time Surveyed' section has a date-time input showing '01/ Jan /1970 00:00:00' with a calendar icon and a refresh icon. The 'Comment' section has a large text area. At the bottom, there are five buttons: 'Ok', 'Apply', 'Reset', 'Finish', and 'Help'.

If no *Description* is given, the current string is terminated (without including the current

measurement point) and the current measurement point becomes the first point of a new string with the same feature code and string number.

If the *feature code* and *string number* exist, then the last point of the previous string with that feature code and string number becomes the first point of a new string with the same *feature code* and *string number*.

If the *point id* exists, then the previous string containing the point with that point id is terminated *before* the point id point, and the point becomes the first point of a new string with the *same feature code* and *string number*.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Code

the feature code of the measurement.

String number

the string number of the measurement.

Help

The *point description* is used to select a string and the *mode* is used specify if the string is a breakline or not.

If no *point description* is given, the current string is selected.

If the *feature code* and *string number* exist, the last string with that *feature code* and *string number* is selected.

If the *point id* exists, then the string containing the point with that point id is selected.

If no *mode* is given, the selected string is set as a point string (that is, not a breakline).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Breakline mode			not a breakline breakline

for Not a breakline

the selected string is set to a point string and hence is not a breakline (however the points are tinable).

for Breakline

the selected string is set to a line string (all vertices and segments are tinable) and is therefore a breakline.

Code

the feature code of the measurement.

String number

the string number of the measurement.

Named point

point name of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#)

Point id

point id of the point. This can be an integer, real, text or alphanumeric. For a more detailed description of how the reduction finds/uses the appropriate point see the section [Existing point search](#). If a new check point entry is inserted into the file, this field will be non-editable since only the check point is required.

Help

Culvert strings are always line strings and are stored with the justification of the majority of the string points. Individual culvert points are picked up either top (obvert), centre (axial) or bottom (invert) of the culvert using op codes 80, 81 and 82.

If no *point_description* is given, the current string is created as a culvert string with the given width and height.

If a *point_description* exists, then either the *feature code* and *string number* or the *point id* section of the *point_description* can be used.

If the *feature code* and *string number* exist, the last string with the same *feature code* and *string number* is created as a culvert with the given width and height.

If the *point id* exists, then the string containing that point id is created as a culvert string with the given width and height.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Width			
<i>the width of the culvert</i>			
Height			
<i>the height of the culvert</i>			
Code			
<i>the feature code of the measurement</i>			

String number

the string number of the measurement

[buttons](#)

Templating (opcodes 51 to 59)

Record and use field templates when picking up string.

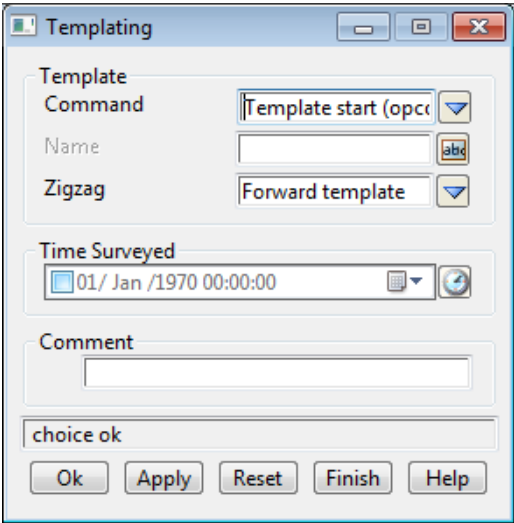

See [Field Templates](#) in Appendix [12d Survey Guide](#).

For <i>Template start</i> (opcode 51),go to	Template start
<i>Template end</i> (opcode 52)	Template end
<i>Template pause</i> (opcode 53)	Template pause
<i>Template continue</i> (opcode 54)	Template continue
<i>Template record</i> (opcode 55)	Template record
<i>Template skip</i> (opcode 56)	Template skip
Template insert (opcode 58)	Template insert
Template delete (opcode 57)	Template delete
<i>Template change</i> (opcode 59)	Template change

Template start

Selecting *Template start* (opcode 51) brings up the **Templating** panel with the *Command* field set to **Template start**

Template start starts using the field template given in the field **Name**.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template start	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)
Name	Text box		
Name of the field template to use. If <i>Name</i> is blank, the default field template is used.			
Zigzag	choice box	Forward template	Forward template

Reverse template
Start on zig of zigzag
Start of zag of zigzag

If zigzag is **forward template**, then the field template is used as a *forward* template. See [Forward Direction](#) in Appendix [12d Survey Guide](#)

reverse template, then the field template is used as a *reverse* template. See [Reverse Direction](#) in Appendix [12d Survey Guide](#)

start on zig, then the field template is used as a zig_zag template and is used in the *forward* definition direction first (that is starts on a zig). See [Zig-Zag](#) in Appendix [12d Survey Guide](#).

start on zag, then the template is used as a zig_zag template and is used in the *reverse* direction first (that is, starts on a zag). See [Zig-Zag](#) in Appendix [12d Survey Guide](#).

If zigzag is **blank**, or anything other than **forward**, **reverse**, or **start on zag** then the field template is used as a zig-zag template starting on a **zig**.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section [Panel buttons](#)

Template record

Selecting *Template record* (opcode 55) brings up the **Templating** panel with the *Command* field set to **Template record**

Template record stores the *feature code* and *string number* of the following measurements as a field template until a *Finish* code (52) is given.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Command		Template record	Template start (opcode 51) Template end (opcode 52) Template pause (opcode 53) Template continue (opcode 54) Template record (opcode 55)

Name

name of the template being created

Start recording a field template with the name Name. If Name is blank, then it is the default field template that is defined.

The feature code and string number of the following measurements are stored as the field template until a Finish code (52) is given. There is no limit to the number of feature code and string number pairs that can be stored in a field template.

Time surveyed

time when the command (op code) was created

Comment

comment for the command within the field file.

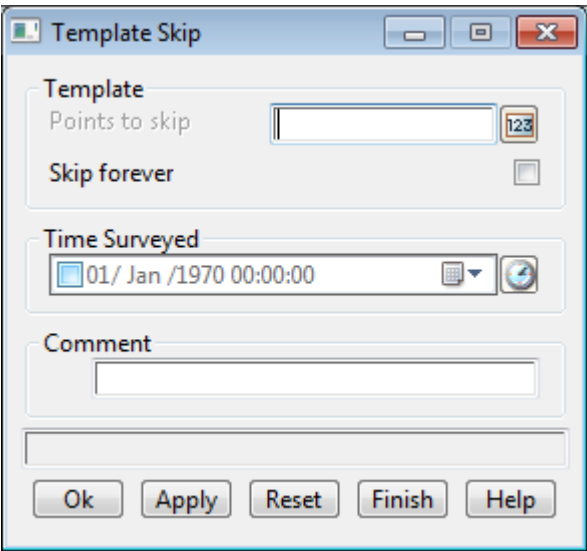

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section [Panel buttons](#)

Template skip

Selecting *Template skip* (opcode 56) brings up the **Template Skip** panel.

This panel allows the user to skip picking up one or more points (feature code and string number pairs) from the field template currently being used. The next measurement takes the *feature code* and *string number* from the next point after the skipped points, from the field template definition.

See [Skipping Field Template Points](#) in Appendix [12d Survey Guide](#)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Points to skip

*the number of points (feature code and string number pairs) of the template to skip.
If Points to skip is blank or zero, then only one point is skipped otherwise Points to skip points are skipped.*

Skip forever	tick box
---------------------	----------

*if ticked, the given number of feature code and string number pairs are not used from then on.
If not ticked, only skip for this one used of the template.*

Time surveyed

time when the command (op code) was created

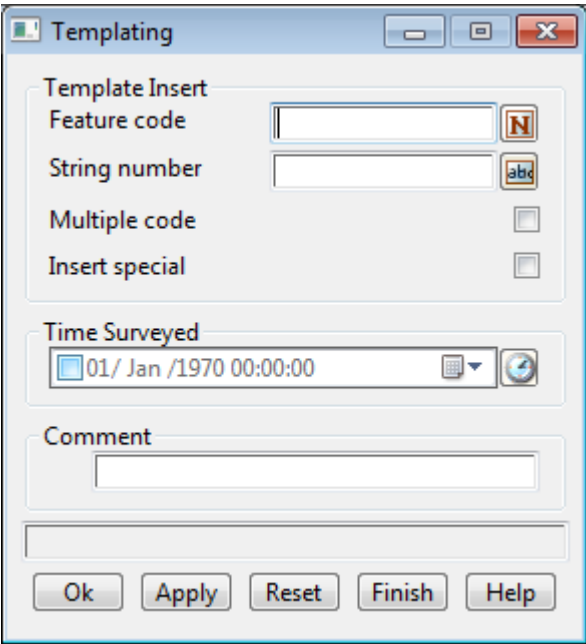

Comment

comment for the command within the field file.

OK, Apply, Reset, Finish, Help See the description for the panel buttons in the section [Panel buttons](#)

Template insert

Selecting *Template insert (opcode 58)* brings up the **Templating** panel.
This option allows the user to insert new point definitions into the template.
These may be **new points** or to **add a multiple code** to an **existing point** in the template.
See [Insert Template Points or Insert Multiple Codes](#) in Appendix [12d Survey Guide](#)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Feature code

feature code to be inserted (as a new point or a multiple code) with the string number, into the template

String number

string number to be inserted (as a new point or a multiple code) with the feature code, into the template

Multiple code	tick box
----------------------	----------

If ticked off (the default), a new point is inserted into the template with the Feature code and String number given in the panel.

If ticked on, no new point is inserted but the current template point will be made a multiple coded point with the Feature code and String number given in the panel. The multiple coding will be used each time the template point is used.

Insert special	tick box
-----------------------	----------

If ticked on, the point will be added to the current template being picked up (that is, to the end of the template).

If not ticked, the point will be added to the next template being picked up (that is, to the beginning of the template).

SDR Point Edits

Position of menu: Survey =>Edit =>Points

The Points walk-right menu contains options that work on individual points (vertices).

Note - a point may be individual point (one vertex strings) or a vertex of a string.

The Points walk-right menu is:

SDR Point Edits	
Additional text	add text to the vertex
Attachment	attach an image to the vertex
Arc next 3 points	put an arc through the next 3 points
Arc previous 3 points	put an arc through the preceding 3 points
Arc fitting start	start arc fitting
Arc fitting end	end arc fitting
Circle feature	make the vertex a feature
Invisible	make the vertex invisible
Invisible previous seg	make the last segment invisible
Invisible next seg	make the next segment invisible
Non tinable	make the vertex non tinable
Non tinable previous seg	make the last segment non tinable
Non tinable next seg	make the next segment non tinable
Pipe invert	the z-value is the invert of a pipe
Pipe axial	the z-value is the centre of a pipe
Pipe obvert	the z-value is the overt of a pipe
Rectangle last 3 points	make a rectangle of the last 3 points
Rectangle last 2 points	make a rectangle of the last two points
Remove point	delete a point
Remove height	

For the option *Additional text*, go to

<i>Attachment</i>	Additional Text
<i>Arc next 3 points</i>	Attach a File
<i>Arc last 3 points</i>	Arc Through Next Three Points
<i>Arc fitting start</i>	Arc Through Last Three Points
<i>Arc fitting end</i>	Start Arc Fitting
<i>Circle feature</i>	End Arc Fitting
<i>Invisible</i>	Create a Feature String
<i>Invisible last seg</i>	Make a Vertex Invisible
<i>Invisible next seg</i>	Make the Previous Segment Invisible
<i>Non tinable</i>	Make the Next Segment Invisible
<i>Non tinable last seg</i>	Make a Vertex Non Tinable
<i>Non tinable next seg</i>	Make the Previous Segment Non Tinable
<i>Pipe invert</i>	Make the Next Segment Non Tinable
<i>Pipe axial</i>	Make a Vertex an Invert Level of a Pipe
<i>Pipe obvert</i>	Make a Vertex an Axial Level of a Pipe
<i>Rectangle last 3 points</i>	Make a Vertex an Obvert Level of a Pipe
<i>Rectangle last 2 points</i>	Make a Parallelogram from the Last Three Points
<i>Remove point</i>	Make a Rectangle from the Last Two Points
<i>Remove height</i>	Delete a Vertex
	Set a Vertex Height to Null

Additional Text

Position of option on menu: Survey =>Edit =>Points =>Additional text

Additional text adds text to selected vertices. The user selects the vertex to add text to, and then types in the text.

Selecting *Additional text* brings up the **SDR Additional Text** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

- As soon as the option is selected, the **Pick** is active and vertices can be selected.*
- Each time a vertex is picked and accepted, an **Additional text** typed input panel is displayed to type the text into. A **Text** code is then inserted into the 12d field file.*
- The option continues until the **Finish** button is selected.*
- If the **pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Attach a File

Position of option on menu: Survey =>Edit =>Points =>Attachment

Attachment adds files to selected vertices. The user selects the vertex to add an attachment to, and then enters the name of the file to attach.

Selecting **Attachment** brings up the **SDR Attachment** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an **Attachment file name** typed input panel is displayed to enter the file name into. An **Attachment** field code is then inserted into the 12d field file.*

*The option continues until the **Finish** button is selected.*

*If the **pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Arc Through Next Three Points

Position of option on menu: Survey =>Edit =>Points =>Arc next 3 points

Arc next 3 points adds an arc through the selected vertex and the next two vertices of the same string.

Selecting **Arc next 3 points** brings up the **SDR Arc Next 3 Points** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the next two vertices of the same string by inserting an **Arc through next 3 points** field code.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Arc Through Last Three Points

Position of option on menu: Survey =>Edit =>Points =>Arc last 3 points

Arc last 3 points adds an arc through the selected vertex and the previous two vertices of the same string.

Selecting Arc last 3 points brings up the SDR Arc Last 3 Points panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

- As soon as the option is selected, the **Pick** is active and vertices can be selected.
- Each time a vertex is picked and accepted, an arc is placed through the selected vertex and the previous two vertices of the same string by inserting an **Arc through last 3 points** field code.
- The option then repeats and continues until the **Finish** button is selected.
- If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

Start Arc Fitting

Position of option on menu: Survey =>Edit =>Points =>Arc fitting start

Arc fitting start starts arc fitting through from the selected vertex until the end of the string or an stop arc fitting field code is encountered for that string.

Selecting Arc fitting start brings up the SDR Arc Fitting Start panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

- As soon as the option is selected, the **Pick** is active and vertices can be selected.
- Each time a vertex is picked and accepted, arc fitting is started at the selected vertex by inserting an **Arc fitting start** field code.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

End Arc Fitting

Position of option on menu: Survey =>Edit =>Points =>Arc fitting end

Arc fitting end ends any arc fitting for that string at the selected vertex.

Selecting Arc fitting end brings up the **SDR Arc Fitting End** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, any arc fitting for the string is stopped at the selected vertex by inserting an **Arc fitting end** field code.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

Create a Feature String

Position of option on menu: Survey =>Edit =>Points =>Circle feature

Circle feature creates a feature string of a given radius at the selected vertex.

Selecting Circle feature brings up the **SDR Feature** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, an **Feature radius** typed input panel is displayed to type the

radius into. A **Feature** code is then inserted into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

Make a Vertex Invisible

Position of option on menu: Survey =>Edit =>Points =>Invisible

Invisible turns the selected vertex invisible.

Even if the segments on either side of the invisible vertex **are** tagged as visible, the segments can not be drawn because the start/end point of the segment is invisible.

Selecting **Invisible** brings up the **SDR Invisible Point** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, the vertex is turned invisible by inserting an **Invisible Point** code into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

Make the Previous Segment Invisible

Position of option on menu: Survey =>Edit =>Points =>Invisible previous segment

Invisible previous segment turns the segment ending on the selected vertex invisible. The vertex itself is not invisible.

Selecting **Invisible previous segment** brings up the **SDR Invisible Previous Segment** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick button

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the segment ending on the vertex is turned invisible by inserting an **Invisible Previous Segment** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make the Next Segment Invisible

Position of option on menu: Survey =>Edit =>Points =>Invisible next segment

Invisible next segment turns the segment starting on the selected vertex invisible. The vertex itself is not invisible.

Selecting **Invisible next segment** brings up the **SDR Invisible Next Segment** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the segment starting on the vertex is turned invisible by inserting an **Invisible Next Segment** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a Vertex Non Tenable

Position of option on menu: Survey =>Edit =>Points =>Non tenable

Non tenable sets the selected vertex to be non tenable (that is, the vertex is not included in any triangulation).

Even if the segments on either side of the non tenable vertex **are** tenable, the segments can not be included in any triangulation because the start/end point of the segment is non tenable.

Selecting **Non tenable** brings up the **SDR Non Tenable Point** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to non tinable (that is, the vertex is not included in any triangulations) by inserting a **Non tinable point** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make the Previous Segment Non Tinable

Position of option on menu: Survey =>Edit =>Points =>Non tinable previous segment

Non tinable previous segment sets the segment ending on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations) The vertex itself can be tinable.

Selecting **Non tinable previous segment** brings up the **SDR Non Tinable Previous Segment** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the segment ending on the vertex is set to non tinable by inserting a **Non tinable previous segment** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make the Next Segment Non Tinable

Position of option on menu: Survey =>Edit =>Points =>Non tinable next segment

Non tinable next segment sets the segment starting on the selected vertex non tinable. That is, the segment is not included as a breakline in any tins (triangulations) The vertex itself can be tinable.

Selecting **Non tinable next segment** brings up the **SDR Non Tinable Next Segment** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the segment starting on the vertex is set to non tinable by inserting an **Non tinable next segment** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a Vertex an Invert Level of a Pipe

Position of option on menu: Survey =>Edit =>Points =>Pipe invert

Pipe invert sets the z-value of the selected vertex to be used as an invert level (pipe top) when the vertex is in a pipe string.

Selecting **Pipe invert** brings up the **SDR Pipe Invert Justification** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to be an invert level (top of the pipe) for any pipe string it is in by inserting a **Pipe invert** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a Vertex an Axial Level of a Pipe

Position of option on menu: Survey =>Edit =>Points =>Pipe axial

Pipe axial sets the z-value of the selected vertex to be used as an axial level (pipe centre) when the vertex is in a pipe string.

Selecting Pipe axial brings up the **SDR Pipe Axial Justification** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to be an axial level (centre of the pipe) for any pipe string it is in by inserting a **Pipe axial** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a Vertex an Obvert Level of a Pipe

Position of option on menu: Survey =>Edit =>Points =>Pipe obvert

Pipe obvert sets the z-value of the selected vertex to be used as an obvert level (bottom of pipe) when the vertex is in a pipe string.

Selecting Pipe obvert brings up the **SDR Pipe Obvert Justification** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the vertex is set to be an obvert level (bottom of the pipe) for any pipe string it is in by inserting a **Pipe obvert** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick***

button can be used to restart the option.

Make a Parallelogram from the Last Three Points

Position of option on menu: Survey =>Edit =>Points =>Rectangle last 3 points

Rectangle last 3 points creates a parallelogram (squashed rectangle) from the selected vertex and the previous two vertices in the same string.

Selecting Rectangle last 3 points brings up the SDR Rectangle panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

As soon as the option is selected, the **Pick** is active and vertices can be selected.

Each time a vertex is picked and accepted, a parallelogram (squashed rectangle) is created using the selected vertex and the previous two vertices of the same string (three vertices in total) and creating a four vertex to form the parallelogram of four vertices. The three vertices are removed from the original string and any following vertices are used in a new string.

A **String rectangle** code is inserted into the 12d field file.

The option then repeats and continues until the **Finish** button is selected.

If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.

Make a Rectangle from the Last Two Points

Position of option on menu: Survey =>Edit =>Points =>Rectangle last 2 points

Rectangle last 2 points creates a rectangle from the selected vertex and the previous vertex in the same string, and a width supplied by the user.

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to form the rectangle.

Selecting Rectangle last 2 points brings up the SDR Rectangle by 2 Points panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, a **Rectangle width** type input box is displayed and filled in.*

The rectangle is formed by using the two vertices as the base of the rectangle and using the given width as the length of the other side of the rectangle. Two new vertices are created to form the rectangle.

The two vertices are removed from the original string and any following vertices are used in a new string.

*A **String rectangle by 2 points** code is inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Delete a Vertex

Position of option on menu: Survey =>Edit =>Points =>Remove point

Remove point deleted the selected vertex.

The adjacent vertices in the string containing the deleted vertex will then be joined together.

Selecting **Remove point** brings up the **SDR Delete Point** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

Each time a vertex is picked and accepted, the vertex deleted from the field file.

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Set a Vertex Height to Null

Position of option on menu: Survey =>Edit =>Points =>Remove height

Remove height sets the height of the selected vertex to null.

Selecting **Remove height** brings up the **SDR Remove Height** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and vertices can be selected.*

*Each time a vertex is picked and accepted, the height of the selected vertex is set to null by inserting a **Remove height** code into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

SDR Strings Edit

Position of menu: Survey =>Edit =>Stringing

The **Stringing** walk-right menu contains options that work on strings rather than individual points.
The **Stringing** walk-right menu is:

SDR String Edits	
New string	start a new string
End string	end a string
Close	close a string
Join	join two strings
Reverse	reverse a string
2d string	make a string 2d
3d string	make a string 3d
4d string	make a string 4d
Pipe string	make a string a pipe
Culvert string	make a string a culvert
Assign string numbers	

For the option *New string*, go to

End string
Close
Join
Reverse
2d string
3d string
4d string
Pipe string

[New String](#)
[End String](#)
[Close String](#)
[Join Two Strings of Same Feature Code](#)

[Make a 2d String](#)
[Make a 3d String](#)
[Make a 4d String](#)
[Make a Pipe String](#)

Culvert string
Assign string numbers

[Make a Culvert String](#)
[Assign String Numbers](#)

New String

Position of option on menu: Survey =>Edit =>Stringing =>New string

New string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With new string, the user selects the incorrect link and a **new string** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting New string brings up the **SDR Start New String** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string links can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string segment is picked and accepted, a **string start** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

End String

Position of option on menu: Survey =>Edit =>Stringing =>End string

End string corrects the problem of not changing string numbers which creates the error of the last point of one string being joined to the first point of what should have been the next string. Hence there is a link between the two points that should not exist.

With end string, the user selects the incorrect link and a **end string** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.

Selecting End string brings up the **SDR End String** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string links can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string segment is picked and accepted, an **string end** command is inserted into the 12d field file which removes the link by starting a new string at the end point of the link.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Close String

Position of option on menu: Survey =>Edit =>Stringing =>Close

With **Close**, the user selects any part of the string to be closed and a **close string** command is inserted into the 12d field file.

Selecting **Close** brings up the **SDR Close String** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **string close** command is inserted in the 12d field file which closes the selected string.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Join Two Strings of Same Feature Code

Position of option on menu: Survey =>Edit =>Stringing =>Join

With **Join**, the two strings of the same name (code) are selected with direction and the strings are joined by inserting the appropriate **join string** command in the 12d field file.

Selecting **Join** brings up the **SDR Join Strings** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time two strings of the same name (code) are picked with direction, the appropriate join string field code (**Join first points of strings**, **Join first to last point of strings**, **Join last points of strings**, **Join last to first point of strings**) is inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Reverse String Direction

Position of option on menu: Survey =>Edit =>Stringing =>Reverse

With **Reverse**, the selected strings is reversed by inserting the **String reverse** command into the 12d field file.

Selecting **Reverse** brings up the **SDR Reverse String** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is selected, a **String reverse** field code is inserted into the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a 2d String

Position of option on menu: Survey =>Edit =>Stringing =>2d string

With 2d string the user selects any vertex of a string and a **string type 2d** command is then inserted into the 12d field file.

Selecting 2d string brings up the **SDR String Type 2d** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **String type 2d** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a 3d String

Position of option on menu: Survey =>Edit =>Stringing =>3d string

With 3d string the user selects any vertex of a string and a **string type 3d** command is then inserted into the 12d field file.

Selecting 3d string brings up the **SDR String Type 3d** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **String type 3d** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a 4d String

Position of option on menu: Survey =>Edit =>Stringing =>4d string

With 4d string the user selects any vertex of a string and a **string type 4d** command is then inserted into the 12d field file.

Selecting 4d string brings up the **SDR String Type 4d** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **String type 4d** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a Pipe String

Position of option on menu: Survey =>Edit =>Stringing =>Pipe string

With Pipe string, the user selects any vertex of a string, gives a pipe diameter and then a **string type pipe** command is inserted into the 12d field file.

Selecting Pipe string brings up the **SDR Pipe Diameter** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, a **Pipe diameter** text input is displayed and after a value is typed in, a **String type pipe** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Make a Culvert String

Position of option on menu: Survey =>Edit =>Stringing =>Culvert string

With Culvert string, the user selects any vertex of a string, gives a culvert width and height and then a **string type culvert** command is inserted into the 12d field file.

Selecting Culvert string brings up the **SDR Culvert** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		

*As soon as the option is selected, the **Pick** is active and string can be selected. If the pick is cancelled for some reason, the **Pick** button can be used to restart the option.*

*Each time a string is picked and accepted, **Culvert width** and **Culvert height** text inputs are displayed and after values are typed in, a **String type culvert** command is inserted in the 12d field file.*

*The option then repeats and continues until the **Finish** button is selected.*

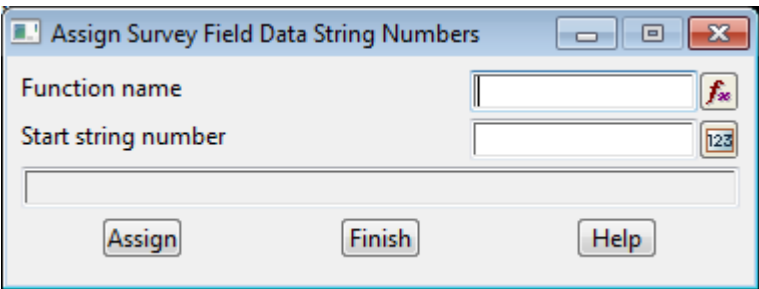

*If the **Pick** is cancelled by hitting the <Esc> key or selecting **Cancel** from the **Pick Ops** menu, the **Pick** button can be used to restart the option.*

Assign String Numbers

Position of option on menu: Survey =>Edit =>Stringing =>Assign string numbers

Assign string numbers XXX

Selecting Assign string numbers brings up the **Assign Survey Field Data String Numbers** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		SDR functions

name of the SRD function to give string numbers to.

Start string number

string number to start numbering at.

Assign button

Target Height

Position of menu: Survey =>Edit =>Target height

The **Target height** option is used to correct target height errors. This includes giving an incorrect value for a target height or forgetting to change the target height.

The **Target height** walk-right menu is

.

insert an new target height
change existing target height

Each option will now be described in detail.

Insert Target Height

Position of option on menu: Survey =>Edit =>Target height =>Insert

The **insert** option inserts a new target height command into the 12d field file at a user selected point. The user can choose whether the new target height only applied for that one point or for all following points until a new target height is set.

Selecting **insert** brings up the **insert target height** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Target height	input/output		

*when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if **set** is selected, the target height is modified and all affected points updated.*

Just one point tick

*if ticked, the new target height only applied for that one point and then reverts pack to the previous target height.
if not tick, the new target height applies for all following points until a new target height is set.*

Pick button

pick the point to insert a new target height.

Set button

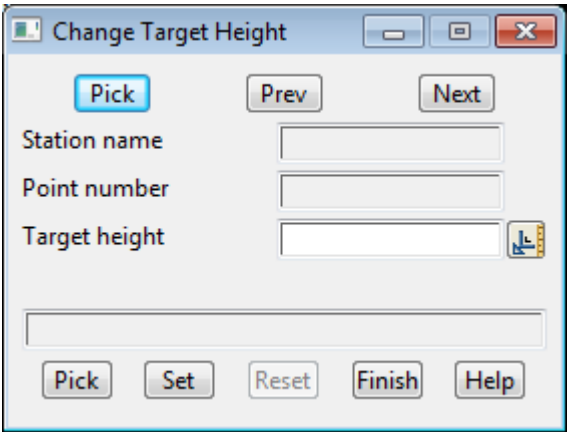

*selecting **set** inserts the new target height command into the 12d field file.*

Change Target Height

Position of option on menu: Survey =>Edit =>Target height =>Change

The Change option changes an existing target height to a new value.

Selecting Change brings up the **change target height** panel:

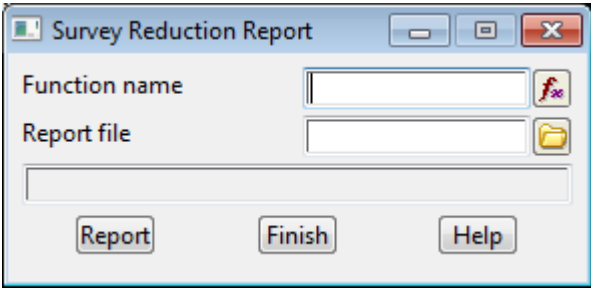

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	button		
<i>select a point whose information will be displayed in the panel fields. A highlighted line joining the point to the station that it was surveyed from is also displayed.</i>			
Prev	button		
<i>move to the previous point in the string.</i>			
Next	button		
<i>move to the next point in the string.</i>			
Station name	display only		
<i>name of the station that the point was surveyed from.</i>			
Point id	display only		
<i>point id of the selected point.</i>			
Target height	input/output		
<i>when a point is selected, the target height for that point is displayed. The value can then be changed by the user and if set is selected, the target height is modified and all affected points updated.</i>			
Pick	button		
<i>pick the point to change the target height.</i>			
Set	button		
<i>selecting set changes the target height command in the 12d field file and updates affected points.</i>			
Reset	button		
<i>reset undoes the changes.</i>			

Report

Position of option on menu: Survey =>Report
Report produces a report on the field data from a *Survey* function.
Selecting **report** brings up the **survey reduction report** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the 12d Survey function to report on.</i>	input		available Survey functions
Report file <i>name of the file for the Survey function report.</i>	input		*.rpt
Report <i>create the Survey report.</i>	button		

Adjustments

Position of menu: Survey =>Adjustments

The Adjustments walk-right menu is

Survey Adjustments	
2D Helmert (Advanced)	2D Helmert with fixed scale
3D Helmert	3D Helmert
Least squares network	least squares network adjustment
Level network	least squares level adjustment
Network	adjustment of level nets
Height adjustment	adjust heights of data
Traverse adjustment	traverse adjustment
Traverse Adjustment (new)	traverse adjustment (new)
Utilities	various utilities for massaging Leica files

For 2D Helmert (Advanced), go to	2D Helmert (Advanced) in the chapter Utilities
3D Helmert	3D Helmert in the chapter Utilities
Least squares network	Least Squares Network
Level network	Level Network
Height adjustment	Height Adjustment
Traverse Adjustment	Traverse Adjustment
Traverse Adjustment (new)	Traverse Adjustment
Utilities	Survey Adjustments Utilities

2D Helmert (Advanced)

Position of option on menu: Survey =>Adjustments =>2D Helmert (Advanced)

A **2D Helmert** transformation is a two dimensional linear transformation consisting of a scaling, rotation and a 2D- translation (shift) of data. Hence there are four parameters to be specified.

The 2D Helmert (Advanced) option calculated and applied a Helmert transformation, and also allows the user to **fix the scale** for the transformation.

For information on the 2D Helmert transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

The *2D Helmert (Advanced)* panel is documented in the section [2D Helmert \(Advanced\)](#) in the chapter [Utilities](#)

3D Helmert

Position of option on menu: Survey =>Adjustments =>3D Helmert

A **3D Helmert** transformation is a three dimensional linear transformation consisting of a scaling, three rotations, and a 3D-translation (shift) of data. Hence there are 7 parameters to be specified.

For information on the 3D Helmert transformation, please go to the section [Coordinate Transformations - Helmert and Affine](#)

The *3D Helmert* panel is documented in the section [3D Helmert](#) in the chapter [Utilities](#)

Least Squares Network

Position of option on menu: Survey =>Adjustments =>Least squares network

The **Least square network** option performs a least square adjustment on a set of observations that can be manually entered into predefined grid box columns or by reading an existing input file. These observations can be of the form of distances, angles, azimuths or a combination of these.

Selecting **Least squares network** brings up the **Least Squares Horizontal Network Adjustment** panel

	Use	From	To	Distance	S(in mm)	ppm
1	<input checked="" type="checkbox"/>					

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	input box		*.in

a pre existing .in input file can be specified. For the format of the .in file, go to [Format of the LSA .in](#)

File

Format of the LSA .in File

The data in each line of the .in file is space delimited. That is, each piece of data on the line is separated by one or more spaces.

Line 1:

The layout of the data on the first line is as follows:

Position	Description	Variable	Type
1	Number of distance observations	N-Dist	Integer
2	Number of angle observations	N-Ang	Integer
3	Number of true azimuth observations	N-Azi	Integer
4	Number of control (fixed) stations	N-Fix	Integer
5	Number of stations (including control stations)	N-Stn	Integer
6	Distance standard deviation (positive if used)	D-Std	Double
7	Distance part per million (non-negative if used)	D-Ppm	Double
8	Angle standard deviation (positive if used)	A-Std	Double
9	Azimuth standard deviation (positive if used)	Z-Std	Double
10	Scale factor		Double

Note: *D-Std*, is in millimetres, *A-Std* and *Z-Std* are in seconds.

Example:

63 71 0 16 35 5.00000 5.00000 15.00000 5.00000 1.00000

Next N-Stn lines:

The next *N-Fix* lines are *control station* records, followed by (*N-Stn - N-Fix*) *station* records.

The layout of the line of a *station record* is as follows:

Position	Description	Type
1	Flag (1 if the station is used, otherwise 0)	Integer
2	Point number	Text
3	X-coord	Double
4	Y-coord	Double

Example:

1 9338 3889.23700 5341.54800

....

....

0 9712a 4007.45700 5168.68700

....

Next N-Dist lines

The next *N-Dist* lines are *distance observation* records.

The layout of the line of a *distance observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Start point number	Text
3	End point number	Text
4	Distance	Double
5	Standard deviation (in meter, negative if not used)	Double
6	Part per million*	Double

Note: * Part per million is different to D-Ppm by a factor of 1000. That is, if you want a ppm value of 5, the number in the file should be 0.005

Example:

```
1 9542 9702 100.20200 0.00300 0.00200
1 9542 9703 142.98200 -1.00000 -1.00000
0 9700 9506 72.10700 -1.00000 -1.00000
```

....

Next *N-Ang* lines

The next ***N-Ang*** lines are *angle observation* records.

The layout of the line of a *angle observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Backsight point number	Text
3	Instrument point number	Text
4	Foresight point number	Text
5	Degree	Integer
6	Minute	Integer
7	Second	Double
8	Standard deviation (in mm, negative if not used)	Double

Example:

```
1 19206 9506 9701 174 29 20.00000 -1000.00000
```

....

Next *N-Azi* lines

The next ***N-Azi*** lines are *true azimuth observation* records.

The layout of the line of a *true azimuth observation record* is as follows:

Position	Description	Type
1	Flag (1 if the observation is used, otherwise 0)	Integer
2	Backsight point number	Text
3	Instrument point number	Text
4	Foresight point number	Text
5	Degree	Integer
6	Minute	Integer
7	Second	Double
8	Standard deviation (in mm, negative if not used)	Double

Example:

1 19206 9506 174 29 20.00000 3.00000

....

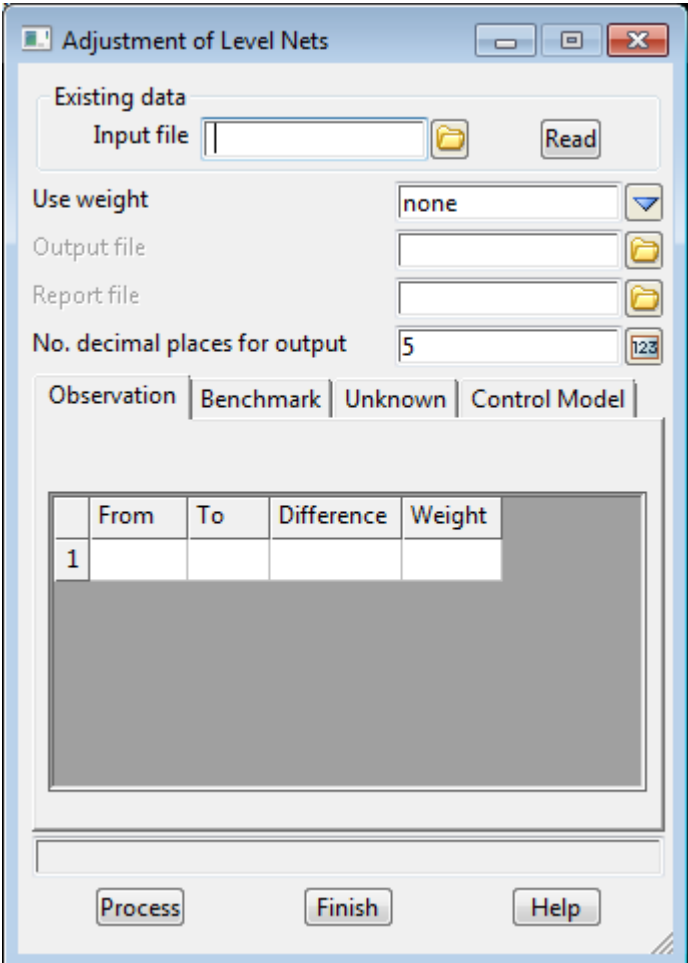

That is the end of data in the file.

Level Network

Position of option on menu: Survey =>Adjustments =>Level network

The **level network** option performs a least square adjustment on a set of level observations that can be manually entered into predefined grid box columns or by reading an existing input file.

Selecting **Level network** brings up the **Adjustment of Level Nets** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	input box		*.in
<i>a pre existing input file can be specified.</i>			
Read	button		
<i>on selection of the read button, if a valid input file has been specified, the relevant parameters will be read into the grid controls.</i>			
Use weight	choice box	none	none, distance, standard deviation
<i>a weighting per observation can be made according to the none, distance, and standard deviation choices</i>			
<i>None - no weighting will be applied.</i>			
<i>Distance - if the distance of the level network legs are to be used. The horizontal distance is entered into the weight field. eg 101.23</i>			
<i>Standard deviation - to define a standard deviation. e.g. 0.005</i>			
<i>Note: The method of defining the weight should be kept consistent. i.e. one of the 3 options.</i>			
Output file	input box		*.in
<i>an output file can be defined which will allow for the reading of the file in the future.</i>

1	<input checked="" type="checkbox"/>						

Add pt

Calculate

the grid control values can be entered to build up the bench mark points from which the plane will be fitted to.

Use pt. the point (bench mark point) can be included in the derivation of the parameters by selecting the **Use pt** option. If the point is not to be included, then uncheck the box.

Point. The point id of the bench mark

Northing. The northing value of the bench mark

Easting. The Easting value of the bench mark

Current_Ht. The current level value of the bench mark

Correct_Ht. The correct height in the adjusted level plane.

Adjusted_Ht. This field shows the adjusted height after the adjustment is performed.

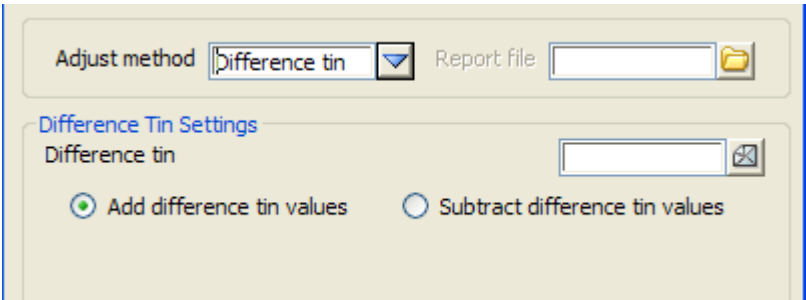

Residual. This field shows the difference between the correct height and the adjusted height. This value is shown after the adjustment is performed.

The **Add pt** button used in this panel can be used to add points into the grid control from

selecting points from a current view. After the button is selected, consequent selection and acceptance of points from the view will add the value into the grid. The **Correct_Ht** parameter will then have to be filled out by the user.

The **Calculate** button can be used to calculate the adjustment parameters and residuals so that they can be inspected before the adjustment is made.

Difference tin adjustment method

This option allows a difference tin to be specified as the adjustment reference. The selected points to be adjusted will be projected onto the difference tin to establish an interpolated adjustment value. This value is then applied to the data according to the add or subtract options. The fields used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Difference tin	tin box		available tins

the difference tin to be used to interpolate adjustment values.

Add difference tin values radio button

*if the button **Add difference tin values** is checked the interpolated value from the difference tin will be added to the existing levels of the adjusted points.*

Subtract difference tin values radio button

*if the button **Subtract difference tin values** is checked the interpolated value from the difference tin will be subtracted from the existing levels of the adjusted points.*

if Constant, a given value is subtracted from each z-value

Corr constant

the value to be subtracted from all z-values

Origin points

the value to be added to all z-values

if Plan parameters, a 3d-plane is defined and the z-value of the plane subtracted from any points

Corr constant

z-correction at the original point

Corr per unit N

z-correction per unit is the North (y) direction about the origin point

Corr per unit E

z-correction per unit is the East (x) direction

Origin point 2d select box

pick box for selected a pint to use for North and East coordinates about the origin point

North coordinate

East coordinate

if Constant, a given value is subtracted from each z-value

Corr constant

the value to be subtracted from all z-values

Partial ☐ Pick Adjust Finish Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Adjust Settings tab			
Traverse type <i>the traverse can be a closed loop or a non loop.</i>	choice box	loop	loop, non-loop
Last point coord <i>co-ordinates of the last point of the traverse. Only applicable for a non-loop traverse.</i>	xyz		
Adjustment method <i>method of adjustment.</i>	choice box	transit	Transit, Bowditch, Compass, Least Square
Distribute angular misclose <i>if ticked, the closing azimuth and bearing fields are enabled, allowing the entry of the values so that a calculation of an angular misclose can be made. i.e. angular misclose = closing azimuth - closing bearing.</i> <i>This requires a closing observation to be recorded separately to the adjustment string chosen.</i> <i>This angular misclose can be distributed around the traverse before adjustment. The distribution follows standard survey practice, calculating a misclose value per setup station and then adding this constant to every traverse leg in a accumulative manner.</i> <i>i.e. The 1st leg angle adjusted bearing = orig bearing 1st leg + 1*misclose/setup stn.</i> <i>The 2nd leg angle adjusted bearing = orig bearing 1st leg + 2*misclose/setup stn. and so forth.</i> <i>The closing observation is not taken from the traverse string to be adjusted, but by direct entry into the closing azimuth and bearing fields.</i>	tick box	unticked	

Closing azimuth angle box

The closing azimuth is the bearing as calculated from the last point (known coordinate; equal to the start point if a loop traverse) to the closing station (known coordinate or bearing).

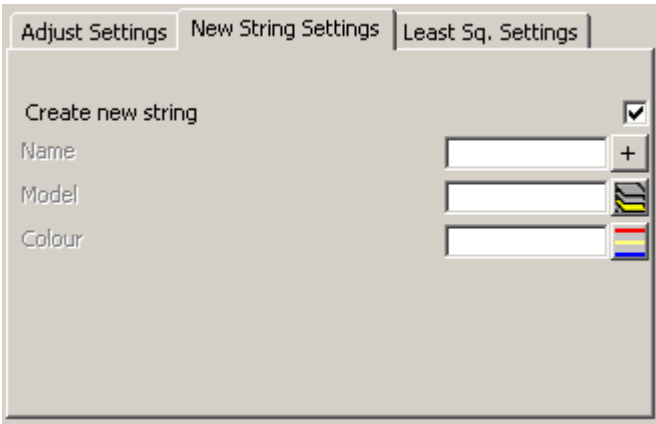

Closing bearing angle box

The closing bearing is the observation from the last traverse point to the closing station (known coordinate or bearing)

Tolerance (relative acc) 1:

The accuracy can be set which will be used to assess the misclose value before the adjustment is made. If the misclose is out of tolerance, a message box will appear notifying the user that the linear tolerance has not been met and prompting for further action. This may force the adjustment to continue or the exit of the process.

New String Settings tab

Create new string tick box tick

if ticked, a new adjusted string is created. If not tick, the selected string is adjusted.

Name name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model model box available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour colour box available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

*if the least square method is chosen the following parameters can be set in the **Least Sq. Settings** tab. If a different method is chosen the least square parameters are shown **greyed out** indicating that they are not used in the adjustment.*

Least Sq. Settings tab

Adjust Settings	New String Settings	Least Sq. Settings
Direction obs std (sec)		<input type="text"/>
Distance obs std (mm)		<input type="text"/>
Distance ppm		<input type="text"/>
Maximum number of iterations		<input type="text" value="10"/>
Stop when coords differ <		<input type="text" value="0.0001"/>
Stop when variance increase		<input checked="" type="checkbox"/>

Direction obs std (sec)

standard deviation of a single angular measurement in seconds of arc.

Distance obs std (mm)

standard deviation of a single distance measurement.

Distance ppm

distance error in parts per million.

This value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations	input box	10
-------------------	-----------	----

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ	input box	0.0001
---------------	-----------	--------

the calculation of the adjustment can be stopped when the difference between successive calculations meets the defined tolerance.

Variance increase	tick box	ticked
--------------------------	----------	--------

the calculation of the adjustment can stopped when the variance between successive calculations increases

The remaining values are as follows:

Report file	*.rpt files
--------------------	-------------

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial ☐ tick box

if ticked, only part of the selected string is adjusted.

Pick button

select the string to adjust.

Adjust button

perform the adjustment.

Survey Adjustments Utilities

Position of option on menu: Survey =>Adjustments =>Utilities

The options on the **Survey Adjustment Utilities** menu are designed to get data from external sources into the Least Squares Network and Level Network formats, (.IN .LIN files respectively) for processing by 12d.

The data conversion is a multistep process as it is designed to bring in several different formats into the 12d .IN/.LIN formats.

.SOA files

The SOA files are an intermediate text file generated onboard a Leica 1200/Viva TPS/GPS instrument.

The format files to generate these files from a Leica DBX are shipped in the library directory.

- **ANG_Code_Office.FRT** is the format file used when the Station number is put in as a code
- **ANG_ID_Office.FRT** is the format file used when the Station number is put in as a Point ID

The use of format files is out of the scope of this manual and described in the Leica documentation.

The SOA file format is intermediary and not documented.

.ANG files

ANG files are a text file containing rounds of angles, they are generated by the **Leica DBX to ANG** panel or can be generated in TP-Setout or TP-Stakeout.

The format of an **.ANG** is such

```
<Backsight ID> <Backsight Height> <Station ID> <Station Height>
<Foresight ID> <Foresight Height> <Backsight bearing> <Backsight
Vertical angle> <Backsight slope distance> <Foresight bearing>
<Foresight Vertical angle> <Foresight slope distance>
```

Bearing and angles are in radians and station IDs must be quoted if they have spaces.

```
"34748A" 1.300 "34872A" 1.660 "34978B" 0.000 5.49580322 1.58360594
159.477 2.83371620 1.53209318 117.170
```

.LSF files

LSF files are a TP-Setout/ TP-Stakeout format for a least squares network adjustment.

The format consists of several sections, each section is terminated by an **END**.

The first a list of station coordinates and weighting definitions.

```
<Station name> <Easting> <Northing> <Weight> <Level> <Weight>
GB117 9808.1480 168635.6450 1000 4.0314 1000
```

A weight of 1000 means fixed, 1 completely free.

The second section is the horizontal observations.

```
<Backsight ID> <Station ID> <Foresight ID> <Backsight bearing>
```

```
<Foresight bearing>  
KHABB KHP14 KHP13 0.0000 3.15157367
```

Bearing and angles are in radians and station ids must be quoted if they have spaces.

The 3rd section is the horizontal distances.

```
<Station name> < Station name > < Horizontal distance>  
KHABB GB117 68.909
```

The 4th section is the height difference information.

```
<Station name> < Station name > < Vertical distance>  
KHABB GB117 -11.138
```

A complete sample:

```
GB117 9808.1480 168635.6450 1000 4.0314 1000  
KHP17 9839.3686 168651.5200 1 18.2912 1000  
KHABB 9813.0536 168704.3997 1 15.1675 1  
END  
GB117 KHABB KHP17 0.0000 5.74994583  
KHABB KHP17 KHP16 0.0000 3.13833713  
END  
KHABB KHP17 59.053  
KHABB GB117 68.909  
KHP17 KHP16 71.045  
END  
KHABB KHP17 3.119  
KHABB GB117 -11.138  
KHP17 KHP16 3.757  
END
```

The Utilities walk-right menu is

For the option Leica DBX to ANG go to [Leica DBX to ANG](#)
ANG to LSF [ANG to LSF](#)
LSF to 12d [LSF to 12d](#)
Leica DNA to 12d [Leica DNA to 12d](#)

Leica DBX to ANG

Position of option on menu: Survey =>Adjustments =>Utilities => Leica DBX to ANG
This option converts the **.SOA** file produced on the Leica instrument into a rounds of

angles **.ANG** file.

Selecting Leica DBX to ANG brings up the **Leica DBX to ANG** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

SOA file	file box		
-----------------	----------	--	--

select the SOA file produced from a Leica DBX to process.

ANG file	file box		
-----------------	----------	--	--

enter the ANG to be created, if existing you will be warned it will be overwritten.

Report file	file box		
--------------------	----------	--	--

a report file is generated to allow scrutiny of the conversion process to detect gross errors.

if it looks as below containing details of each collated measurement, this report should be checked before further processing of the created ANG file.

Report for conversion of "6404-CONTROL.SOA" to "QQ.ANG"

Overall stations 50

Overall measures 1816

17 meas's from SSM139008 to target PM42949

Hz: mean 49°54'55.7" std dev 0°00'03.0"

Va: mean 87°34'50.4" std dev 0°00'05.0"

Sd: mean 385.938 std dev 0.0003

TH: mean 1.784 std dev 0.0000

Process	button		
----------------	--------	--	--

process the SOA file and produce the ANG file.

ANG to LSF

Position of option on menu: Survey =>Adjustments =>Utilities => ANG to LSF

The panel converts a round of angles **ANG file** into the **LSF** least squares network format.

As a prerequisite to using this panel a **PTA file** of the fixed control points must be created.

The PTA format is a space delimited **<Easting> <Northing> <Level> <"ID">**

12343.345 234435.236 500.127 "STN1"

12654.877 234435.345 501.457 "STN2"

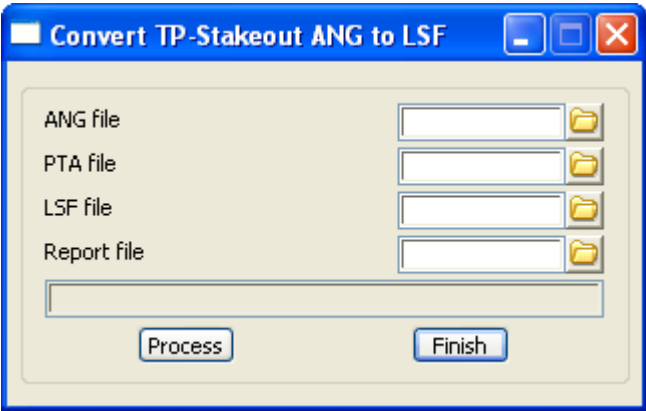

```
12456.345 234543.866 499.345 "STN3"
```

The **PTA file** can come in from **TP-Setout/TP-Stakeout** or it can be written out using the **File I/O->Data output->x y z general** option. See [User X Y Z and Attributes Output](#)

Set the following fields in the xyz output for creating a **PTA** format file.

Selecting **ANG to LSF** brings up the **Convert TP- Stakeout ANG to LSF** panel.

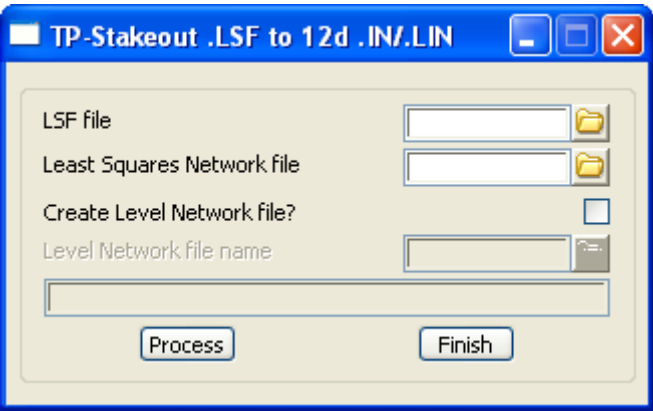

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ANG file <i>the ANG file to be converted.</i>	file box		
PTA file <i>the PTA file containing the fixed control points.</i>	file box		
LSF file <i>the LSF file to be created.</i>	file box		
Report file <i>a report file is generated to allow scrutiny of the conversion process to detect gross errors. It has simple statistics on the angle, distances and height differences.</i>	file box		

Process button
create a LSF file from the ANG file.

LSF to 12d

Position of option on menu: Survey =>Adjustments =>Utilities => LSF to 12d
This panel converts a **LSF** format file into the **12d** Least squares network and Level network file formats.
Selecting LSF to 12d brings up the **TP- Stakeout .LSF to 12d .IN/.LIN** panel.

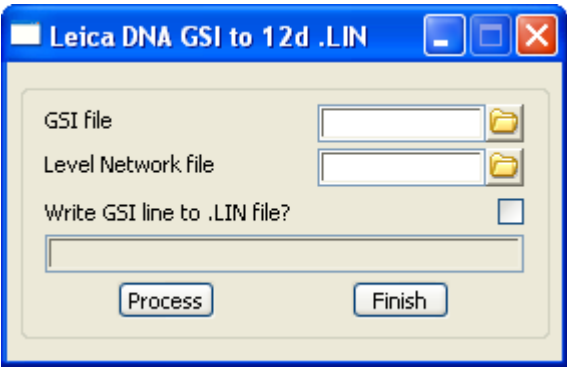

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
LSF file	file box		
<i>the LSF file to be processed.</i>			
12d Least squares network file	file box		
<i>the 12d .IN file to be created.</i>			
Create Level Network file?	tick box		
<i>if ticked enter the Level Network .LIN file will be created.</i>			
Level Network file name			
<i>the Level Network .LIN file to be created.</i>			
Process	button		
<i>create the .IN and optional .LIN file form the LSF file.</i>			

Leica DNA to 12d

Position of option on menu: Survey =>Adjustments =>Utilities => Leica DNA to 12d
This panel converts a **GSI** format file from a Leica digital level into the 12d Level network file format.
Selecting Leica DNA to 12d brings up the **Leica DNA GSI to 12d .LIN** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
GSI file <i>the GSI file to process</i>	file box		
Level Network file <i>the .LIN file to create</i>	file box		
Write GSI line to .LIN file? <i>if ticked the raw data from the GSI file will be written as a comment line into the .LIN file.</i>	tick box		
Process <i>create the level network LIN file.</i>	button		

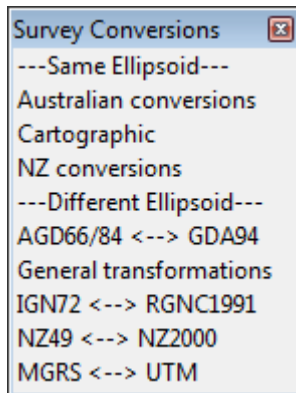

Conversions

Position of menu: Survey =>Conversions

The **Conversions** walk-right menu contains survey transformations for converting between most projections (or longitude, latitude) including Transverse Mercator, UTM etc.conversion options.

Conversions can involve the same ellipsoid or different ellipsoid. When using different ellipsoids, either a 7-parameter transformation or NTVT2 grids can be used to convert between the ellipsoids.

The **Conversion** walk-right menu is

Australian conversions (eg zone to zone) fro the same datum

Cartographic conversion from one projection to another (same datum)

NZ conversions (eg circuit to circuit) for the same datum

AGD 66/84 <--> GDA94 conversions (AMG <--> MGA

General conversions with ellipsoid change

IGN72 <-->RGNC1991 conversions

For converting between projections using the same ellipsoid:

For the option *Australian conversions*, go to

[Australian Conversions](#).

Cartographic,

[Cartographic](#)

NZ conversions,

[NZ Conversions](#)

For converting between projections with different ellipsoids:

For the option *AGD66/84<-->GDA94*, go to

[AGD66/84 <--> GDA94](#).

[IGN72 <--> RGNC1991](#)

NZ49<-->NZ2000,

[NZ49 <--> NZ2000](#)

MGRS<-->UTM,

[MGRS <--> UTM](#)

For more information about terminology used in these sections, see the Appendix [Geodetics Summary](#).

Australian Conversions

Position of option on menu: Survey =>Conversions =>Australian conversions

The **Australian conversions** option converts data from one form (AMG/MGA, Long Lat, Global XYZ) to another for the same common datum (AGD66/84 or GDA94). The option also allows for the conversion from one zone to another for a common datum. (e.g. from zone 54 to 55 in MGA).

For converting ISG co-ordinates in the same datum, use the option

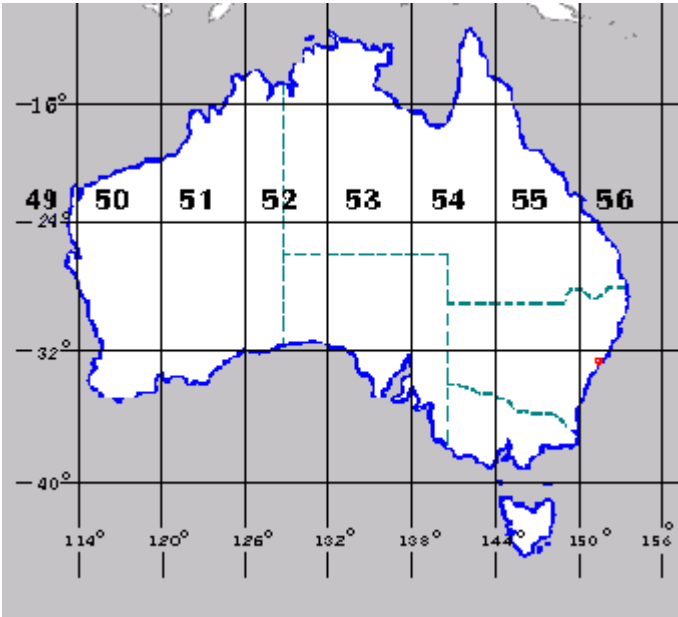

Survey =>Conversions =>Cartographic (see [Cartographic](#)).

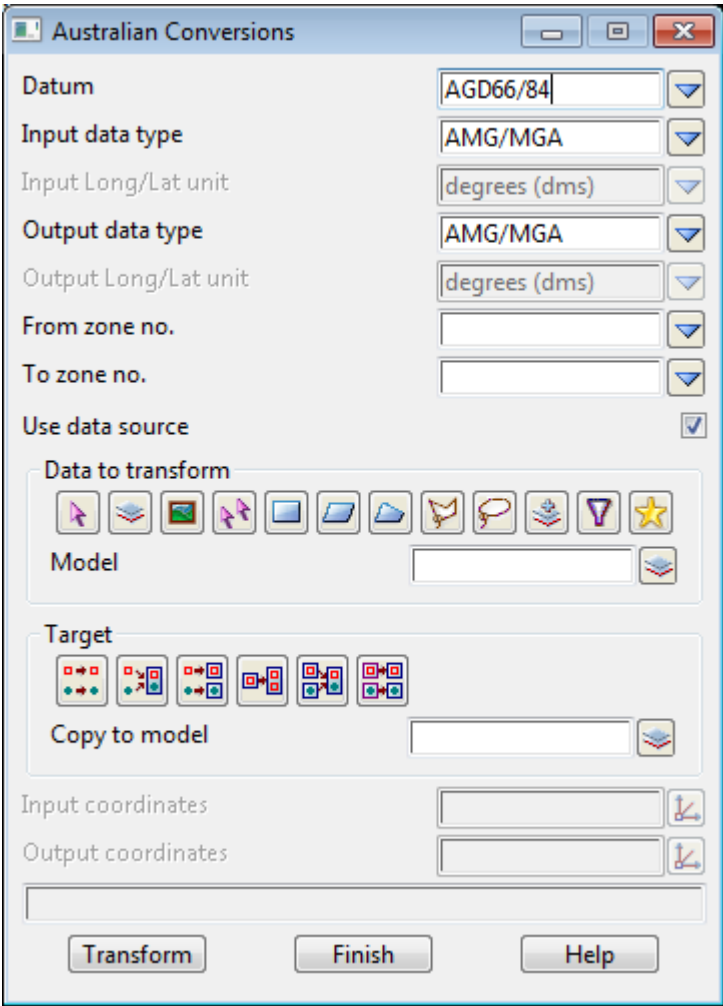

For converting between the **different** datums AGD66/84 and GDA94, use the option

Survey =>Conversions =>AGD66/84 <--> GDA94 (see [AGD66/84 <--> GDA94](#)).

For more information, go to the section [Converting Between AMG, ISG and MGA](#) in the Appendix [Geodetics Summary](#).

Selecting **Australian conversions** brings up the **Australian conversions** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum <i>either AGD66/84 or MGA94 is selected.</i>	choice box	AGD66/84	AGD66/84, GDA94
Input data type <i>type of the input data type.</i>	choice box	AMG/MGA	AMG/MGA, Long Lat Global XYZ
Input Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees
Output data type <i>type of the input data type.</i>	choice box	AMG/MGA	AMG/MGA, Long Lat Global XYZ
Output Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees

From zone no.	49 -> 59	
<i>if AMG/MGA was selected for the input data type, the AMG/MGA zone is given is this field.</i>		
To zone no.	49 -> 59	
<i>if AMG/MGA was selected for the output data type, the AMG/MGA zone is given is this field.</i>		
Use data source	tick box	tick
<i>if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.</i>		
Data source	input	
<i>if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see Data Source</i>		
Target	target	
<i>if use data source in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see Data Target</i>		
Input coordinates	XYZ box	
<i>if use data source is not ticked, the co-ordinates in this field is transformed.</i>		
Output coordinates	XYZ box	
<i>if use data source is not ticked, the transformed co-ordinates are displayed in this field.</i>		
Transform	button	
<i>perform the transformation.</i>		

Cartographic

Position of option on menu: Survey =>Conversions =>Cartographic
Position of option on menu: Utilities =>A-G =>Cartographic

The **Cartographic** option is used to transform data based on the same datum between

- (a) two different cartographic projections (based on the same datum)
- (b) longitude and latitude and a cartographic projection (based on the same datum)
- (c) a cartographic projection and longitude and latitude (based on the same datum).

The datum, relates to the ellipsoid model used. This should be the same for both the to and from fields. i.e. a transform between data based on the ANS ellipsoid, to data based on the WGS84 ellipsoid would be incorrect.

(a) Transforming Between Two Cartographic Projections

For the first case, the data starts in one cartographic projection and is to be transformed into another cartographic projection.

This is achieved by converting the data in (x,y) co-ordinates in the original projection, to (longitude, latitude) and then converting from (longitude, latitude) to (x,y) in the new projection.

For example, to transform from MGA zone 50 to MGA zone 51, the original data starts in MGA zone 50, is transformed to (longitude, latitude) and then transformed from (longitude, latitude) to

MGA zone 51.

Note that to make the transformation, the two cartographic projection must already be defined. That is in the example above, the two projections MGA zone 50 and MGA zone 51 must already be defined.

In **12d** Model, a *Cartographic projection* is defined by the option

Project => Projections => Create/edit

and is documented in the section [Create/Edit Projection](#) in the chapter [Projects](#).

The two cartographic projection definitions for the conversion are given in the **Cartographic** panel.

(b) Transform Between Longitude-Latitude and a Cartographic Projection

For the second case, the data starts in (longitude, latitude) is to be transformed into (x,y) co-ordinates in a cartographic projection.

(longitude, latitude) \longrightarrow cartographic projection

For example, to transform (longitude, latitude) to MGA zone 51.

To make the transformation, the required cartographic projection must already be defined by the option

Project => Projections => Create/edit

which is documented in the section [Create/Edit Projection](#) in the chapter [Projects](#).

Notes

1. In the southern hemisphere, the latitude values are **negative**. If the latitude is given as positive rather than negative, then the option **Factor** can be used to multiply the latitude by -1.
2. If the information is given in (latitude, longitude) rather than the required (longitude, latitude), then the option **Swap XY** can be used to swap the order of the co-ordinates.

(c) Transform Between a Cartographic Projection and Longitude-Latitude

For the third case, the data starts in (x,y) co-ordinates in a cartographic projection and need to be transformed to (longitude, latitude).

cartographic projection \longrightarrow (longitude, latitude)

For example, to transform from MGA zone 51 to (longitude, latitude).

To make the transformation, the required cartographic projection must already be defined by the option

Project => Projections => Create/edit

which is documented in the section [Create/Edit Projection](#) in the chapter [Projects](#).

Notes

1. In the southern hemisphere, the latitude values are **negative**. If a positive value for latitude is required, then the option **Factor** can be used to multiply the latitude by -1.
2. If the information is required to be given in (latitude, longitude) rather than the (longitude, latitude) produced by the transformation, then the option **Swap XY** can be used to swap the order of the co-ordinates.

On selecting the **Cartographic** option, the **Cartographic** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data source type				
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>				
Data source		input		
<i>source of data to be processed.</i>				
X/Y Coordinates to Long/Lat		input		available projections
<i>if non-blank, the name of the cartographic projection to map the selected string co-ordinates into longitude-latitude values.</i>				
<i>If blank, the initial co-ordinates are not transformed from (x,y) to (longitude, latitude). Hence the initial co-ordinates are then assumed to be in (longitude, latitude) form ready to be transformed to (x,y) by the transformation given in the Long/Lat to x/y coordinates field. Note that in the southern hemisphere, the latitude values must be given as negative.</i>				
Long/Lat to X/Y Coordinates		input		available projections
<i>if non-blank, the cartographic projection to apply to the longitude-latitude values.</i>				
<i>If blank, the co-ordinates are not transformed from (longitude, latitude) to (x,y). Hence the initial (x,y) co-ordinates are transformed to (longitude, latitude) by the transformation given in the x/y co-ordinates to Long/Lat field and then left in (longitude, latitude). Note that in the southern hemisphere, the latitude values are negative.</i>				
Long/Lat stored as		input	degrees	radians degrees decimal
degrees				
<i>format for the longitude and latitudes - either radians, degrees (in HP Notation for degrees, minutes and seconds) or decimal degrees.</i>				
Target type				

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input

extra information required for the target.

Transform button

transform the selected strings to longitude-latitude co-ordinates using the x/y coordinates to long/lat (radians) transformation, and then project those longitude-latitude co-ordinates into the new co-ordinate system using the long/lat (radians) to x/y coordinates transformation.

Note

The **Cartographic** option can be used to transform just *x/y coordinates* to *long/lat* or *long/lat* to *x/y coordinates* by simply leaving the appropriate panel field blank. The units for *longitude* and *latitude* are either degrees (dms), decimal degrees or radians.

NZ Conversions

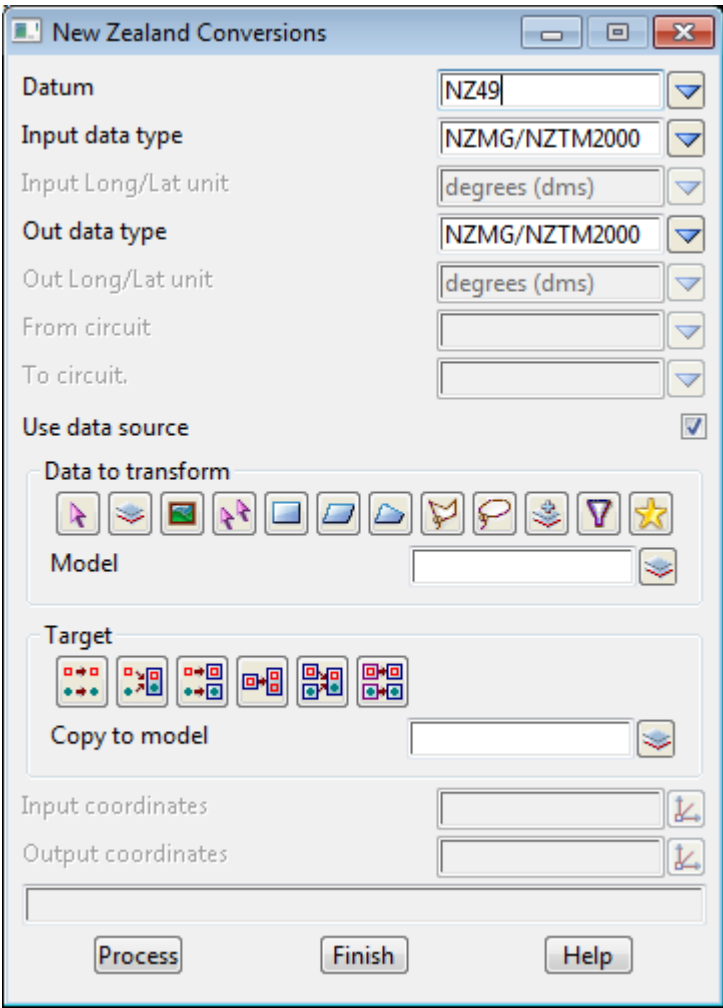

Position of option on menu: Survey =>Conversions =>NZ conversions

The **NZ conversions** option converts data from one form (NZMG/NZTM2000, Long Lat) to another for the same ellipsoid (i.e. datum NZ49 or NZ2000).

For converting between the **different** datums NZ 49 and NZ 2000, use the option

Survey =>Conversions =>NZ49 <-> NZ2000 (see [NZ49 <---> NZ2000](#)).

Selecting **NZ conversions** brings up the **New Zealand Conversions** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum <i>either NZ49 or NZ2000 is selected.</i>	choice box	NZ49	NZ49, NZ2000
Input data type <i>type of the input data type.</i>	choice box	NZMG/NZTM2000	NZMG. Circuit, Long Lat
Input Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees
Output data type <i>type of the input data type.</i>	choice box	NZMG/NZTM2000	NZMG. Circuit, Long Lat
Output Lat/Long unit <i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>	choice box	degrees	radians, degrees, decimal degrees
From Circuit <i>if Circuit was selected for the input data type, the NZ Circuit is given is this field.</i>			

To Circuit

*if **Circuit** was selected for the output data type, the NZ Circuit is given is this field.*

Use data source tick box tick

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source type Model

*if **use data source** is ticked, the data selection type*

Data source input

*if **use data source** is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see [Data Source](#)*

Target target

Input coordinates XYZ box

*if **use data source** is not ticked, the co-ordinates in this field is transformed.*

Output coordinates XYZ box

*if **use data source** is not ticked, the transformed co-ordinates are displayed in this field.*

Transform button

perform the transformation.

AGD66/84 <---> GDA94

Position of option on menu: Survey =>Conversions =>AGD66/84 <-> GDA94

This option converts data between the two Australian Datums, AGD 66/84 and GDA 94. The transformation between the two datums can be by either a seven parameter similarity transformation for a State, or a NTV2 grid for either a State or Australia.

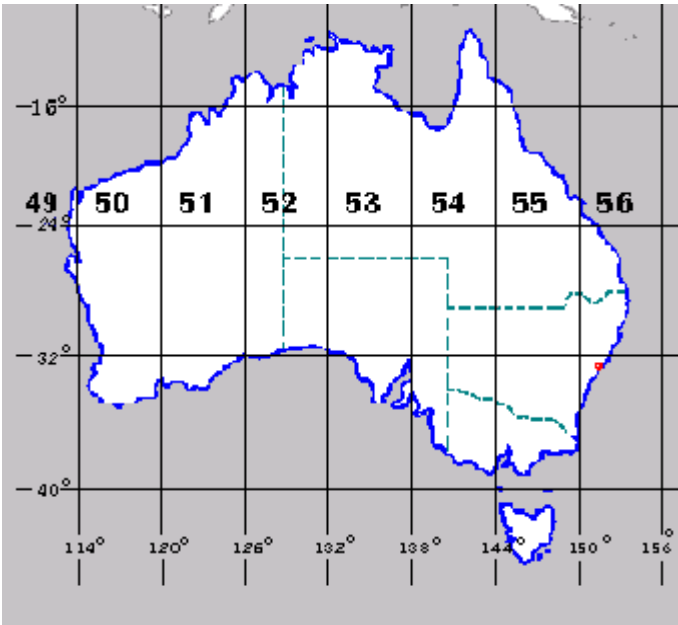

12d Model is GDA compliant for both the similarity transformations and NTV2 grids.

The AGD 66/84 data can be either longitude and latitude, co-ordinates in an AMG Zone or co-ordinates in an ISG Zone.

The GDA 94 data can be either longitude and latitude, Global XYZ or co-ordinates in a MGA Zone.

Hence the option will converts data from AMG 66/84 or ISG 66/84 to MGA 94 and vice-versa.
For more information, go to the section [Converting Between AMG, ISG and MGA](#) in the Appendix [Geodetics Summary](#)

Selecting agd66/84 <----> gda94 brings up the agd66/84 <----> gda94 panel

A screenshot of a software dialog box titled "AGD66/84 <----> GDA94". The dialog has two tabs: "Transformation Settings" and "Data Source". Under "Transformation Settings", there are sub-tabs for "AGD Settings" and "GDA Settings". The "AGD Settings" sub-tab is active. It contains the following fields and controls:

- Datum:** Two radio buttons, "AGD66" (selected) and "AGD84".
- Data Type:** Three radio buttons, "AMG" (selected), "Long/Lat", and "ISG".
- AMG zone no.:** A text input field with a dropdown arrow.
- Long/Lat unit:** A text input field with a dropdown arrow, currently showing "degrees (dms)".
- ISG zone no.:** A text input field with a dropdown arrow.

At the bottom of the dialog are three buttons: "Transform", "Finish", and "Help".

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

AGD Settings

AGD66 AGD84	radio button		
---------------------------	--------------	--	--

either AGD66 or AGD84 is selected. (AGD = Australian Geodetic datum)

AMG Lat/Long ISG radio button

either AMG, Lat/Long or ISG is selected. (AMG = Australian Map Grid, ISG = Integrated Survey Grid). The ISG relates to the state of New South Wales

AMG Zone no. choice box 49 -> 59

if AMG was selected, the AMG zone is given is this field.

Lat/Long unit choice box degrees radians, degrees, decimal degrees

if Lat/Long was selected, the Lat-Long coords have the selected units.

ISG Zone no. choice box ISG54/2 -> ISG56/3

if ISG was selected, the ISG zone is given is this field.

GDA Settings

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

MGA Lat/Long Global XYZ radio button

one of the three choices is selected.

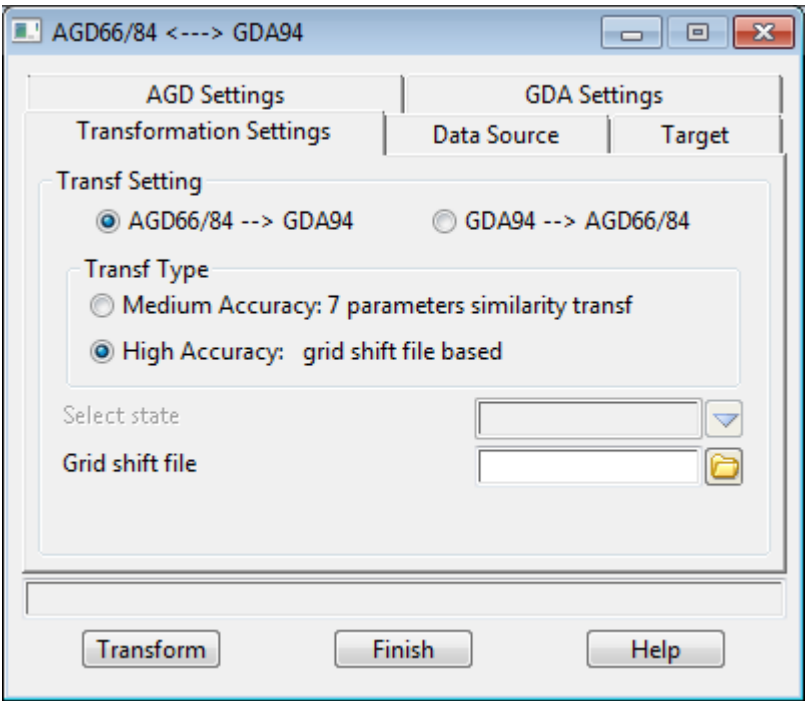

MGA Zone no. choice box 49 -> 59

if MGA was selected, the MGA zone is given is this field.

Lat/Long unit choice box degrees radians, degrees, decimal degrees

if Lat/Long was selected, the Lat-Long coordinates have the selected units.

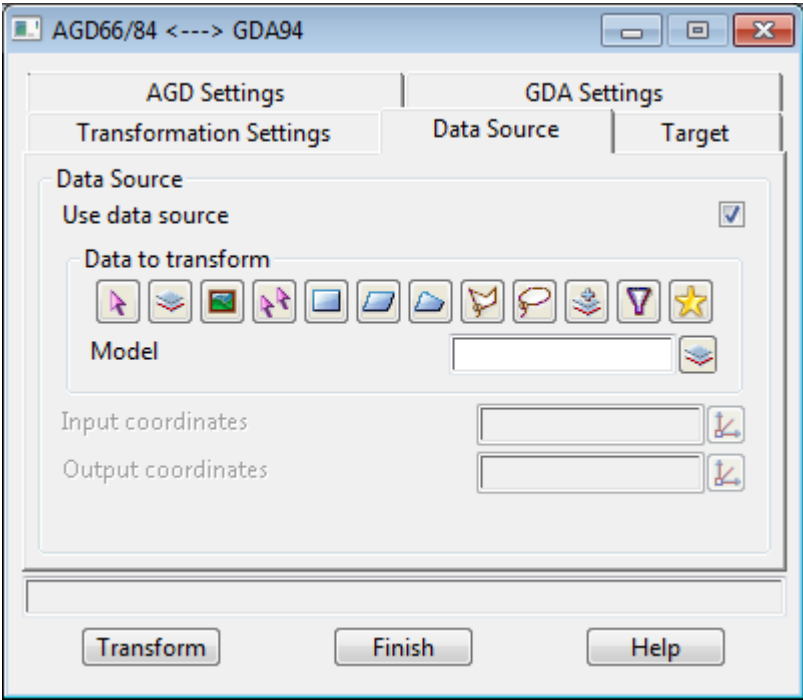

Transformation Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
AGD66/84 --> GDA94	GDA94 --> AGD66/84	radio button <i>one of the two choices is selected.</i>	
Medium accuracy	radio box	tick	<i>if ticked, a seven parameter similarity transformation for the selected Australian State is used.</i>
High accuracy	radio button		<i>if ticked, the NT V2 grid shift file is used.</i>
Select State	choice box	ACT, NSW,TAS, VIC	<i>if the AGD66 datum has been selected, and the 7 parameter transformation is to be used, the seven parameter transformation parameters are different for each state. (i.e the states which adopted the AGD66 datum) By selecting the appropriate state, the corresponding values will be used.</i> <i>If the AGD84 datum has been selected, the parameters used are the australian wide values and therefore the state selection is not appropriate.</i>
Grid shift file	file box	*gsb	<i>for high accuracy, the NTv2 grid shift files can be used.</i>

Data Source

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Use data source	tick box	tick	
<i>if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.</i>			

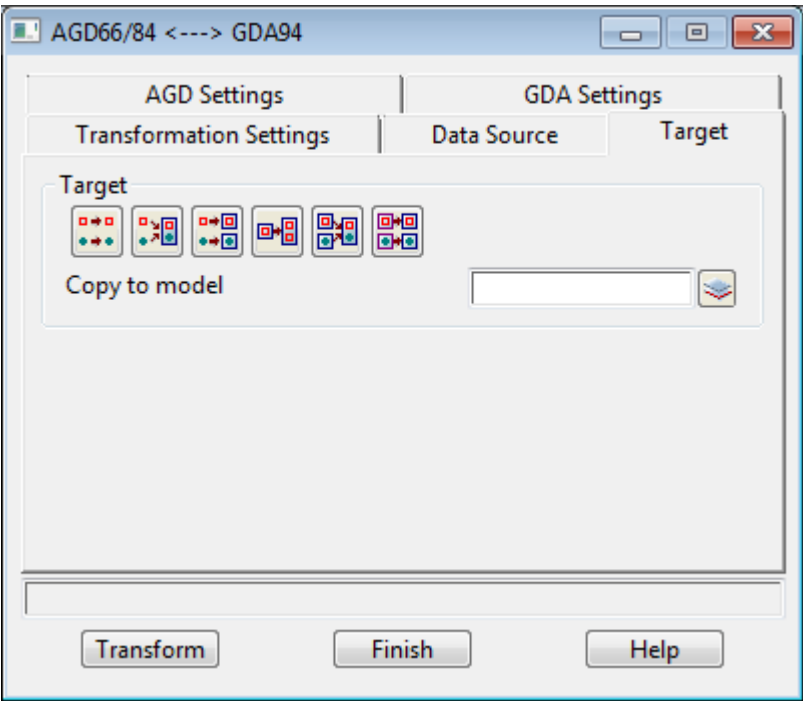

Data source	input		
<i>if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see Data Source</i>			

Input coordinates	XYZ box		
<i>if use data source is not ticked, the co-ordinates in this field is transformed.</i>			

Output coordinates	XYZ box		
<i>if use data source is not ticked, the transformed co-ordinates are displayed in this field.</i>			

Transform	button		
<i>perform the transformation.</i>			

Target

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Target	target		
---------------	--------	--	--

*if use data source in the data source is ticked, the target of the transformed data should be specified
The target for the data is selected using the data target box. For more information on the data target
box see [Data Target](#)*

NZ49 <---> NZ2000

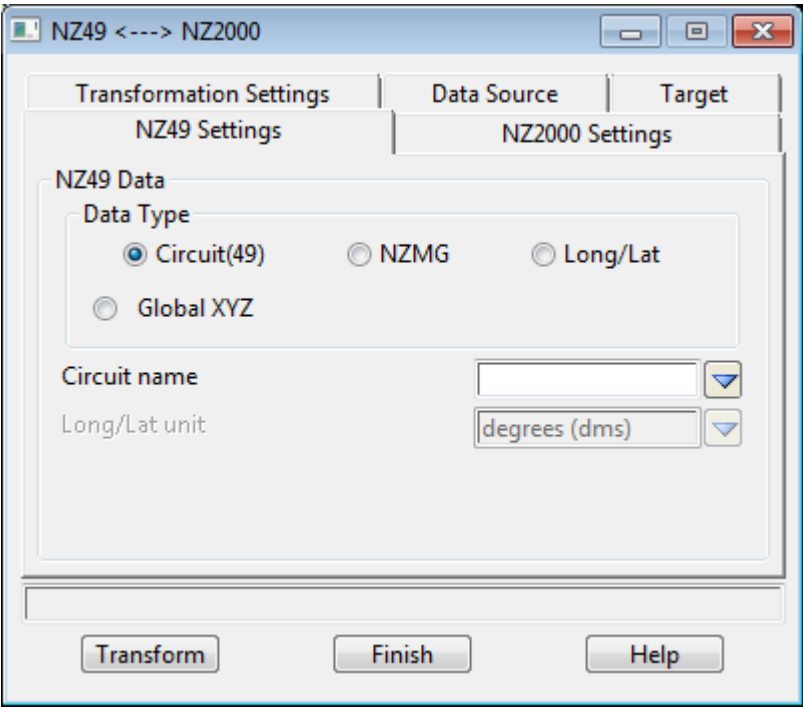

Position of option on menu: Survey =>Conversions =>NZ49 <-> NZ2000

This option converts data from the NZ 49 datum to the NZ 2000 datum and vice-versa.

The transformation between the two datums can be by either the NZ seven parameter similarity transformation or a NTv2 grid.

The data to be converted can be longitude and latitude, NZMG, circuits or Global XYZ.

Selecting NZ49<---> NZ2000 brings up the **NZ49 <---> NZ2000** panel

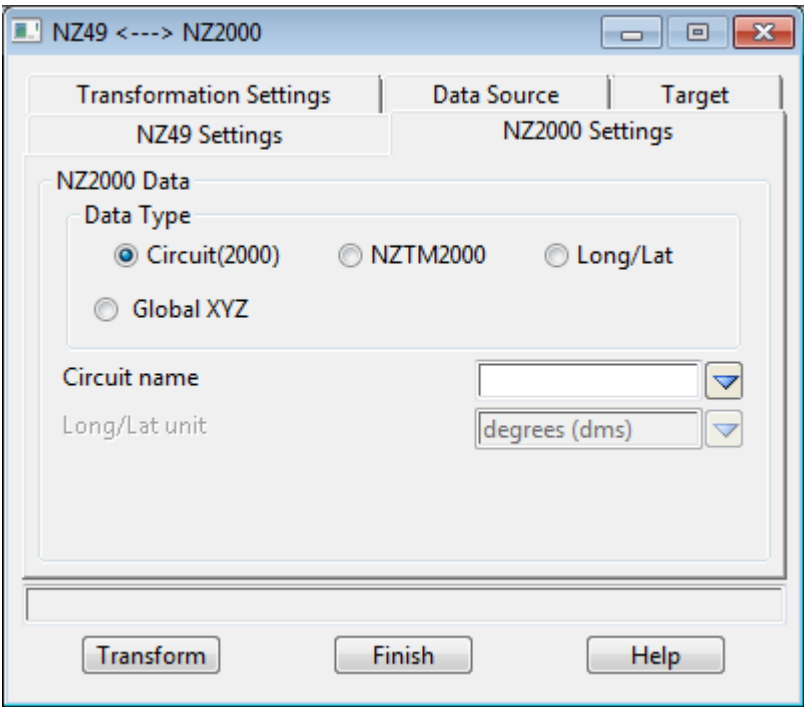

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

NZ 49 Settings

Circuit (49)	radio button		
<i>if the data in the NZ49 datum is of circuit type the circuit radio button is selected.</i>			
NZMG	radio button		
<i>if the data in the NZ49 datum is of NZMG type the radio button is selected.</i>			
Lat/Long	radio button		
<i>if the data in the NZ49 datum is of Lat/Long type the radio button is selected.</i>			
Global XYZ	radio button		
<i>if the data in the NZ49 datum is of Global XYZ type the radio button is selected.</i>			
Circuit name	choice box		All NZ 1949 circuits
<i>if Circuit (49) was selected, the specific NZ Circuit should be selected.</i>			
Lat/Long unit	choice box	degrees	radians, degrees, decimal degrees
<i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>			

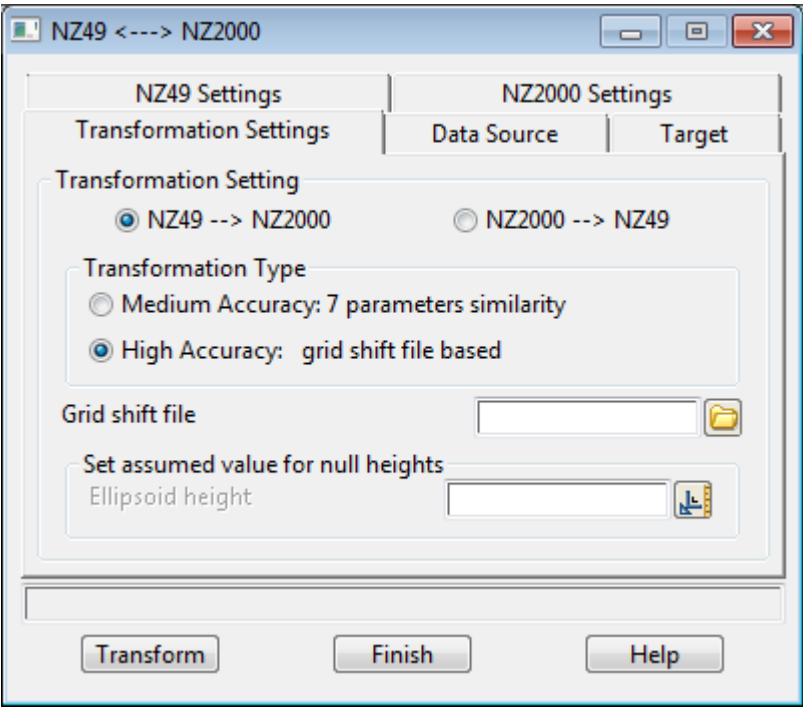

NZ 2000 Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Circuit (2000)	radio button		
<i>if the data in the NZ2000 datum is of circuit type the circuit radio button is selected.</i>			
NZTM2000	radio button		
<i>if the data in the NZ2000 datum is of NZTM2000 type the radio button is selected.</i>			
Lat/Long	radio button		
<i>if the data in the NZ2000 datum is of Lat/Long type the radio button is selected.</i>			
Global XYZ	radio button		
<i>if the data in the NZ2000 datum is of Global XYZ type the radio button is selected.</i>			
Circuit name	choice box		All NZ 1949 circuits
<i>if Circuit (2000) was selected, the specific NZ Circuit should be selected.</i>			
Lat/Long unit	choice box	degrees	radians, degrees, decimal degrees
<i>if Lat/Long was selected, the Lat-Long coords have the selected units.</i>			

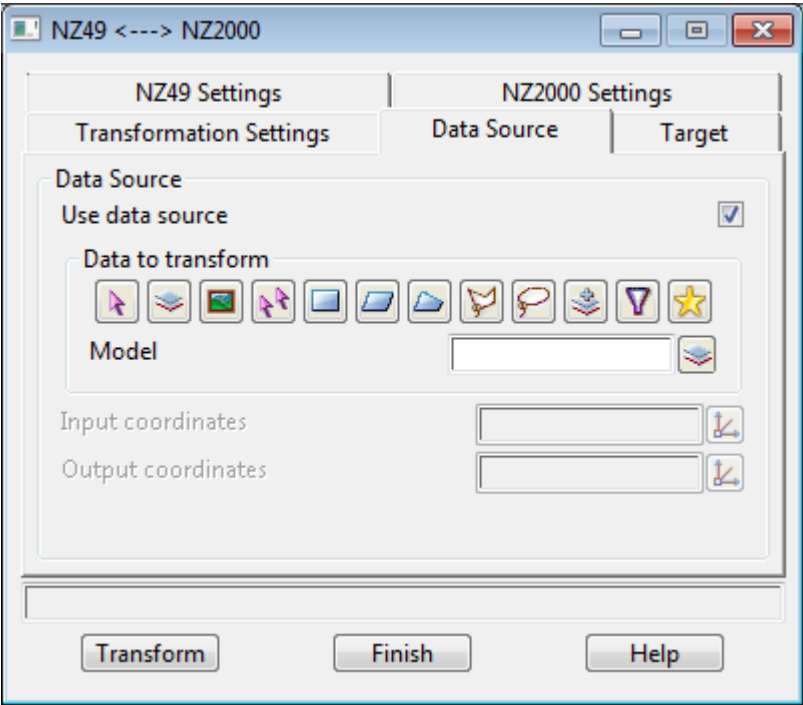

Transformation Settings

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
NZ49 --> NZ2000 NZ2000 --> NZ49	radio button		
<i>the direction of the transformation is specified by the selection of one of the two choices.</i>			
Medium accuracy	tick box	tick	
<i>if ticked, a seven parameter similarity transformation for NZ is used.</i>			
High accuracy	tick box		
<i>if ticked, the NT V2 grid shift file is used.</i>			
Grid shift file	file box		
<i>if High accuracy is ticked, a NTv2 grid shift should be selected. A single file for New Zealand can be used.</i>			
Ellipsoid Height	input box		
<i>this is only required if the data to be transformed contains null values and when</i>			
<i>1) The 7 parameter similarity transformation is used and/or</i>			
<i>2) When either the input or output types are of Global XYZ type</i>			
<i>An approximate ellipsoid level needs only to be +/- 100 m from the true value for most accuracy requirements. (An error in estimation of the ellipsoid height of a few hundred metres will introduce an error in the transformed horizontal position in the order of millimetres only).</i>			

Data Source

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

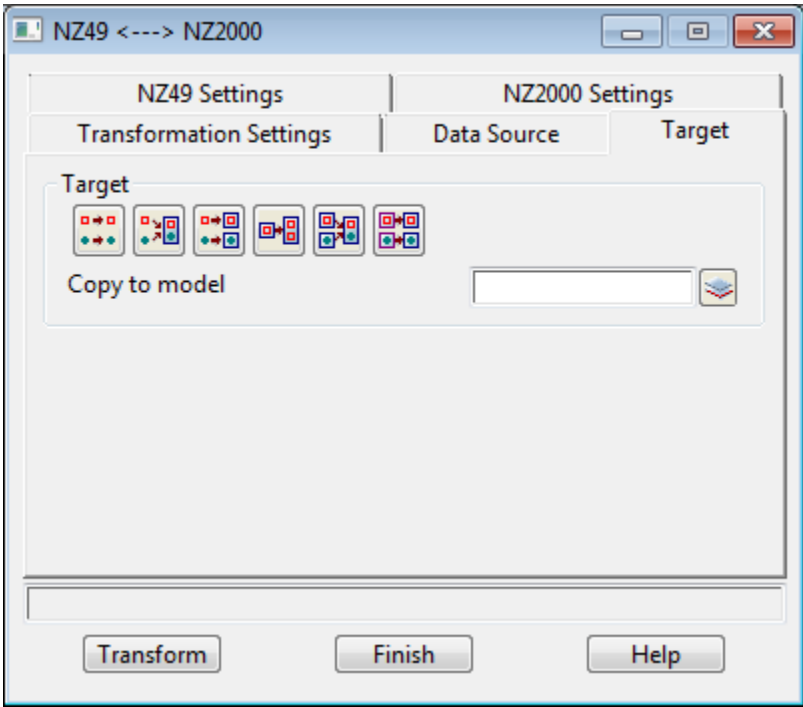

Use data source	tick box	tick	
<i>if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.</i>			

Data source	input		
<i>if use data source is ticked, the source of data to transform. The source of the data to be adjusted is selected using the data source box. For more information on the data source box see Data Source</i>			

Input coordinates	XYZ box		
<i>if use data source is not ticked, the co-ordinates in this field is transformed.</i>			

Output coordinates	XYZ box		
<i>if use data source is not ticked, the transformed co-ordinates are displayed in this field.</i>			

Target

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Target	target		
---------------	--------	--	--

*if **use data source** in the data source is ticked, the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see [Data Target](#)*

Transform	button		
------------------	--------	--	--

perform the transformation.

General Transformations

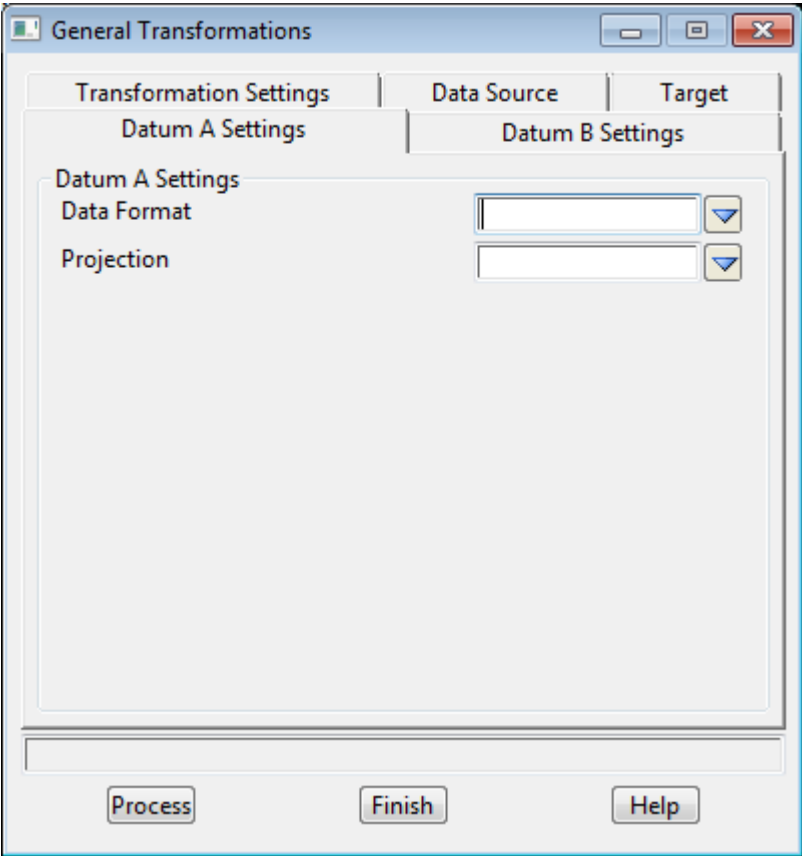

Position of option on menu: Survey =>Conversions =>General transformations

This option converts data between two datums (i.e. different ellipsoids).

The transformation between the two datums can be by either a seven parameter similarity transformation or a NTv2 grid.

The data to be converted can be longitude and latitude, a 12d supported projection (eg TM, UTM) or Global XYZ.

Selecting **General transformations** brings up the **General Transformations** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Datum A Settings, Datum B Settings

Data format	choice box		Global XYZ Easting Northing Long Lat - radians Long Lat - degrees (dms) Long Lat - decimal degrees
--------------------	------------	--	----------------------------------------------------------------------------------------------------------------

the type of data to be transformed/ transformed to.

*if **Easting, Northing**, the data is co-ordinates in the projection defined by the Projection field.*

*if **Long Lat - radians**, the data is (longitude, latitude) with the angles given in radians.*

*if **Long Lat - degrees (dms)**, the data is (long, lat) with the angles given in hp format (i.e. ddd.mmssss).*

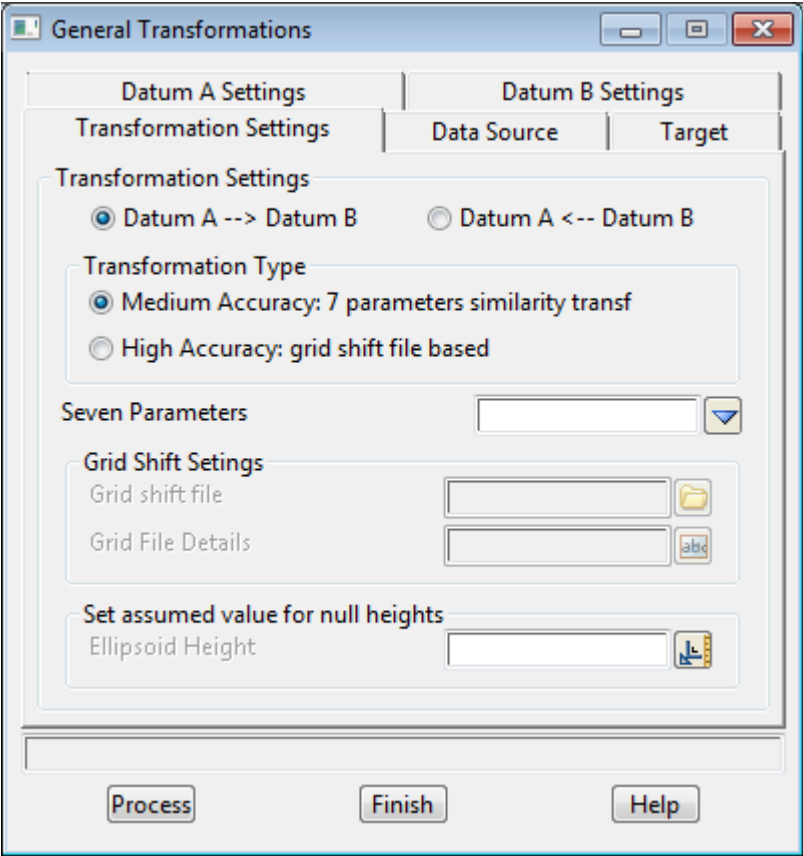

*if **Long Lat - decimal degrees**, the data is (long, lat) with the angles given decimal degrees.*

*if **Global XYZ**, the data is in the Global XYZ system.*

Projection	projection box	defined projections
-------------------	----------------	---------------------

the name of the cartographic projection that the data is in.

Transformation Settings

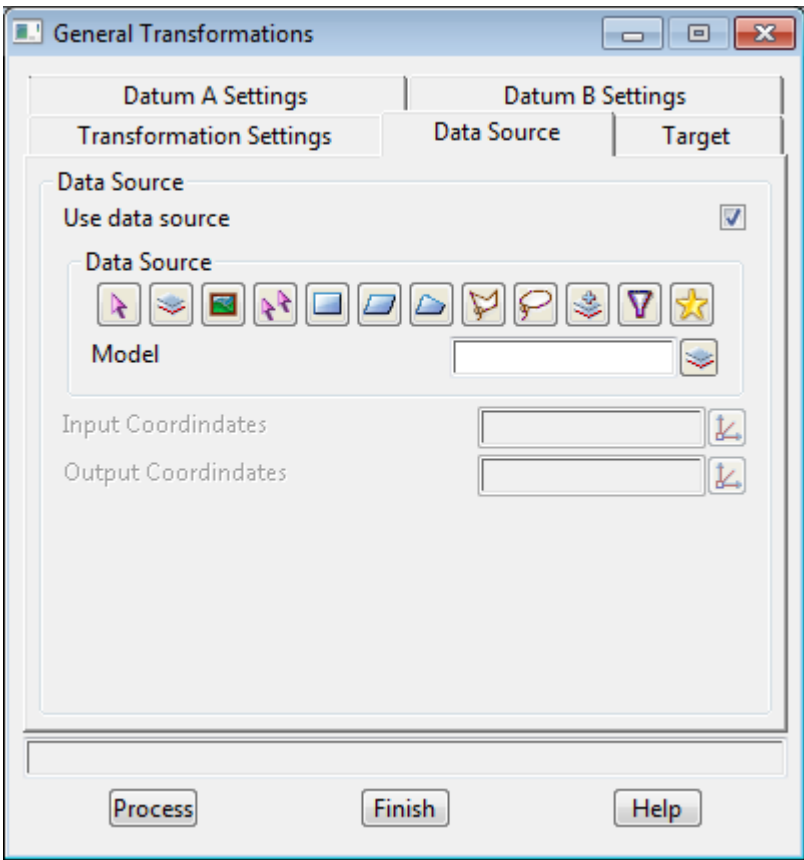

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum A --> Datum B	Datum B --> Datum A	radio button	
<i>the direction of the transformation is specified by the selection of one of the two choices.</i>			
Medium accuracy	tick box	tick	
<i>if ticked, a seven parameter similarity transformation is used.</i>			
High accuracy	tick box		
<i>if ticked, a NT V2 grid shift file is used.</i>			
Seven parameters	file box		available 7 param definitions
<i>if Medium accuracy is ticked, a seven parameter similarity transformation is selected.</i>			
Grid shift file	file box		available gsb files
<i>if High accuracy is ticked, a NTv2 grid shift is selected.</i>			
Ellipsoid Height	input box		
<i>this is only required if the data to be transformed contains null values and when</i>			
<i>1) The 7 parameter similarity transformation is used and/or</i>			
<i>2) When either the input or output types are of Global XYZ type</i>			
<i>An approximate ellipsoid level needs only to be +/- 100 m from the true value for most accuracy requirements. (An error in estimation of the ellipsoid height of a few hundred metres will introduce an</i>			

error in the transformed horizontal position in the order of millimetres only).

Data Source

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use data source	tick box	tick	

if ticked, a data source is used to select the data to be transformed. If not ticked, a given co-ordinate is transformed.

Data source	input

Projection Bearing/Distance Entry

Position of option on menu: Survey =>Geodetics =>Projection bearing/distance entry

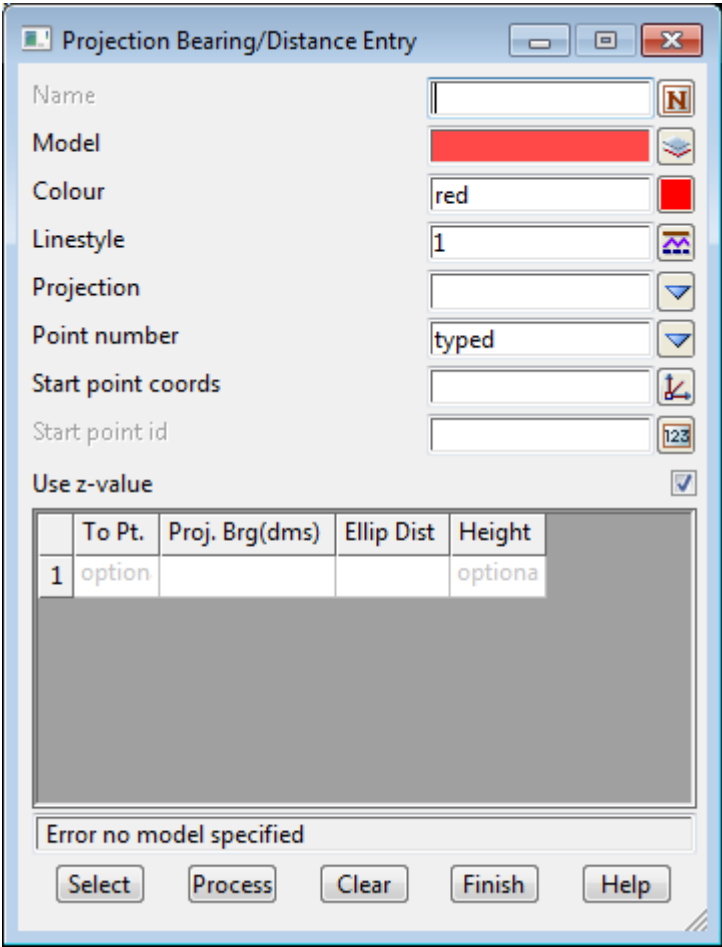

This section of documentation is a work in progress and will be updated in subsequent releases.

The **Projection bearing/distance entry** option allows the input of a traverse by manual input of projection bearings (the plane bearing) and ellipsoid distances or by selecting an existing string.

For each point, the projection co-ordinates are used with the projection bearing and ellipsoid distance from that point to calculate the projection co-ordinates for the new point taking the map

projection into account.

Selecting **Projection bearing/distance** entry brings up the **Projection Bearing/Distance Entry** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file
<i>this field is optional. If non-blank, the name of the new string.</i>			
Model	model box		available models
<i>if non-blank, the model of the new string. If blank, the original string model is used.</i>			
Colour	colour box	red	available colours
<i>if non-blank, the colour of the new string. If blank, the original string colour is used.</i>			
Linestyle	input	1	available line styles
<i>line style of the string.</i>			
Projection	input	project projection	available projections
<i>This is the projection that is used for calculating the (Easting, Northing) values.</i>			
Point number	choice box		
Start point coords	measure box		

Use z- value tick box transit

*if **ticked**, the z-values for each point are entered.*

*If **no ticked** then z-values are not entered and are not displayed in the grid.*

Point id input typed none, auto increment, typed

*if **none**, no point ids are entered and the grid control will not show a column for point ids.*

*If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.*

*if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.*

VALUES IN GRID grid box

*The columns shown in the grid will depend on the selection of the **Use z- value** and **Point id** fields.*

	To Pt.	Proj. Brg(dms)	Ellip Dist	Height
1				

To Pt. input

*if **none** is selected for the **Point id** field, this column will not be displayed.*

*if **auto increment** is selected for the **Point id** field, this column will not be displayed.*

*if **typed** is selected for the **Point id** field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.*

Proj.Brg angle box

The user should enter the projection bearing for the segment into this field. The projection bearing can be defined as the bearing resulting from plane geometry calculations between the two projection coordinates. This is sometimes called the grid bearing in some countries (e.g. New Zealand) and the plane bearing in others such as Australia as defined in the GDA technical manual (ICSM)).

Ellip Dist input box

the user should enter the ellipsoid distance. This distance is the measured horizontal distance that has been reduced onto the ellipsoid taking into account the heights above the ellipsoid at each end of the measured line. This reduction may be by the use of a height scale factor for example. Distances that are measured near mean sea level approximate the ellipsoid distance (since the MSL approximates the ellipsoid in many reference ellipsoids (eg AGD)). The amount of correction will be dependant on the length of line, the heights above the ellipsoid and the reference ellipsoid being used.

Height input box

*This column will only be visible in the grid if the **Use z- value** tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.*

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

E,N from Ellipsoid Distance and Plane Bearing

Position of option on menu: Survey =>Geodetics =>E,N from ellip dist, plane bearing

The E,N calc from ellip dist, plane brg option allows users to calculate projection coordinates given the projection, start coordinate, plane bearing and ellipsoid distance. The results are given inside the panel.

On selecting the E,N calc from ellip dist, plane brg option, the Projection Coords from plane brg and ellipsoid dist panel is displayed.

Position of option on menu: Survey =>Geodetics =>Plane bearing/distance measure

Measures the plane angle and plane distance between two selected points.

This option has already been documented in the section [Bearing and Distance](#) in the chapter [Utilities](#).

On selecting the **Projection bearing and dist** option, the **Measure Projection Plane bearing and ellipsoid dist** panel is displayed.

This panel is principally used to display the distances between, and bearing of the line joining, pairs of user selected points.

- message area 1: point selection comment
- message area 2: $dx =$ $dy =$
- message area 3: plane brg = plane dist = ellipsoid dist =
- message area 4: t-T fwd = t-T rev = l.s.f =

where dx is the x coordinate difference between the points, dy is the y coordinate difference between the points

plane brg is the angle measured clockwise from north and is calculated using the coordinate values (Inverse value)

plane dist is the distance calculated using the coordinate values (Inverse value)

ellipsoid dist is the ellipsoid distance calculated using the specified projection and coordinate values.

t-T fwd is the forward arc-to chord correction.

t-T rev is the reverse arc-to chord correction.

l.s.f is the line scale factor. It is calculated by plane distance/ellipsoid distance.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	disjoint	disjoint, continuous
<i>In disjoint mode, only the distance between the two points and the bearing (in degrees, minutes and seconds) of the (imaginary) line connecting the two points are displayed.</i>			
<i>In continuous mode, after the initial reporting of the bearing/distance, the user is prompted to select the next point(2nd point). In this case the previously selected second point becomes the first point.</i>			
Projection	choice	current projection	available projections
<i>the projection of the data to be used.</i>			
Clear	button		
<i>when this button is selected, the selection sequence is re-initialised.</i>			

GDA94/AGD66-84 Bearing and Distance Measure

Position of option on menu: Survey =>Geodetics =>GDA94/AGD66-84 bearing/distance measure

The **Bearing and distance (GDA94/AGD66-84)** is specifically for Australian use. It allows users to select two AMG/MGA coordinates and return the calculated geodetic parameters.

On selecting the **Bearing and distance (GDA94/AGD66-84)** option, the **Bearing and distance (GDA94/AGD66-84)** panel is displayed.

			52
			53
			54
			55
			56
			57
			58
			59

the zone of the data to be used.

Select N value setting radio button selected
if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the N value interpolation method choice box.

Note: The ellipsoid height is required to calculate the values. However most level datums, such as AHD approximate geoid heights. Therefore, one of the selected points should at least have a non-null value and a means for computing a ellipsoid height. If one point has a valid height and the other does not, an option will be given to assume the other point has the same value.

Various options of converting non-ellipsoid geoid heights to ellipsoid are given by the N value interpolation method choice box or the user can enter N values for the first and second points.

N value interpolation method choice box currently set method Available n value methods
the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section [N values](#)

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Input N values radio button unselected

if an *N* value is known for the area or for the selected points, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + *N* value. The conversion is used for the calculation only. The original *z* value for the point will remain unchanged

1st pt N value input box
if the Input *N* value option is chosen, an *N* value is entered for the first point.

2nd pt N value input box
if the Input *N* value option is chosen, an *N* value is entered for the second point.

How to Use the Panel and Panel Messages

The results are returned to the panel in the following format:

message area 1	Messages
message area 2	plane brg =, plane dist, dx =, dy =
message area 3	grid brg =, ellipsoid dist =, line scale factor =
message area 4	Mean height factor =, (Plane dist/level terrain dist) scale factor =
message area 5	Mean level terrain distance =

Note: Mean height factor is the factor to apply to a measured horizontal distance (usually measured at a height above or below the ellipsoid) to reduce it down to an ellipsoid distance. The other geodetic values and terminology are clearly defined in the GDA technical manual. See <http://www.anzlic.org.au/icsm/gdatm/>

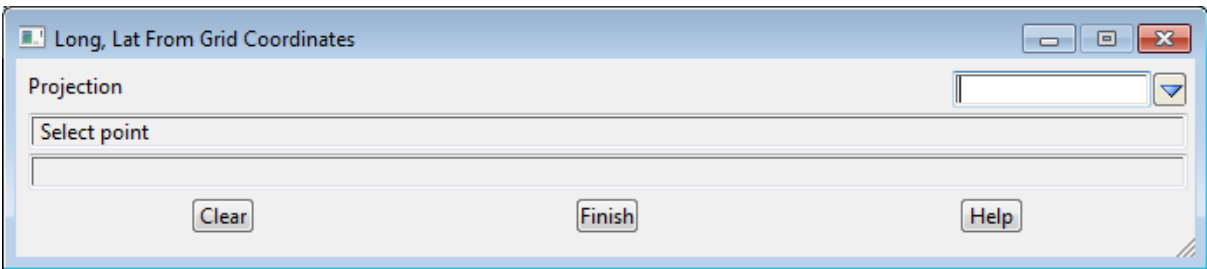

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

Longitude, Latitude from Grid Coordinates

Position of option on menu: Survey =>Geodetics =>Long, lat from grid coordinates

The **Longitude, latitude from grid coordinates** option allows a user to calculate Longitude, latitude and convergence of a point, given a projection and selection of a grid coordinate.

On selecting the **Longitude, latitude from grid coordinates** option, the **Longitude, latitude from grid coordinates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection	choice	current projection	available projections
the projection of the data to be used.			

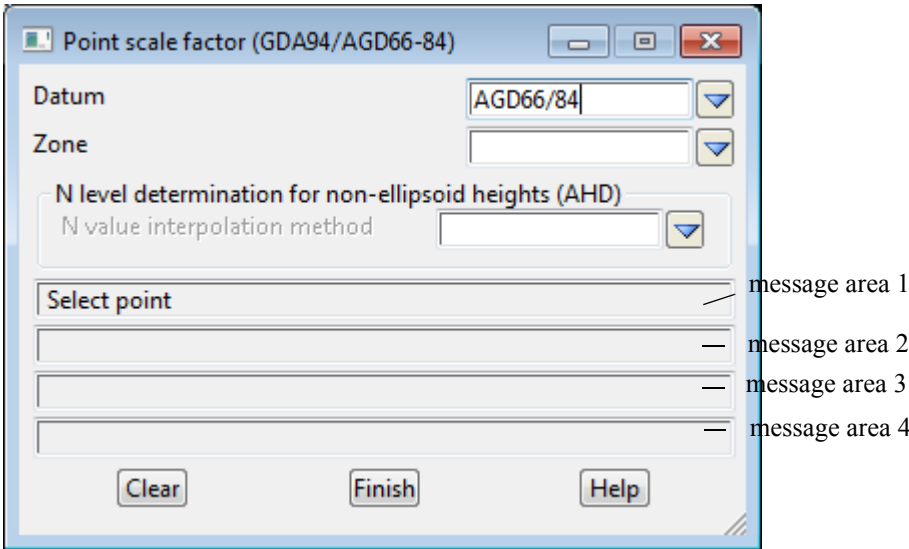

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

GDA94/AGD66-84 Point Scale Factor

Position of option on menu: Survey =>Geodetics =>GDA94/AGD66-84 point scale factor

The Point scale factor (GDA94/AGD66-84) is specifically for Australian use. It allows users to select AMG/MGA coordinates and return the point scale factor and latitude and longitude of the point.

On selecting the Point scale factor (GDA94/AGD66-84) option, the Point scale factor (GDA94/AGD66-84) panel is displayed.

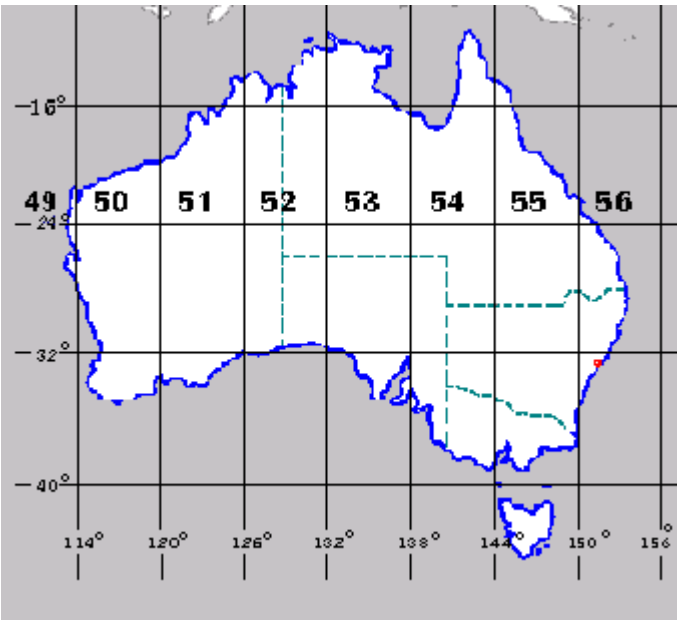

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum	choice	current projection	AGD66/84 GDA94

the datum of the data to be used.

|

			58
			59

the zone of the data to be used.

Note: The ellipsoid height is required to calculate the point scale factor. However most level datums, such as the AHD approximate geoid heights. Therefore, selected points should at least have a non-null value and a means for computing a ellipsoid height. Various options of converting non-ellipsoid geoid heights to ellipsoid are given.

Select N value setting

radio button selected

if the data has non-ellipsoid heights then a conversion to ellipsoid heights is available using a method defined in the **N value interpolation method choice box**.

N value interpolation method choice box currently set method Available n value methods

the N value method allows the conversion of non-ellipsoid heights to ellipsoid. The methods are define d in the project n value settings. For more information on the n value settings see the section [N values](#)

The N value will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Input N value radio button unselected

if an N value is known for the area or for the selected point, it will be used to convert a geoid height (e.g. AHD) into an ellipsoid height. Ellipsoid height = geoid height + N value. The conversion is used for the calculation only. The original z value for the point will remain unchanged

Enter N value input box

if the Input N value option is chosen, an N value is entered.

How to Use the Panel and Panel Messages

The results are returned to the panel in the following format:

message area 1	Messages
message area 2	Point scale = , Interpolated or entered N value = (if applicable)
measure area 3	Combined point scale/height factor =
message area 4	Longitude = Latitude =

The cycle can then be repeated for another point by simply selecting another point without leaving the option. The **clear** button resets the message areas.

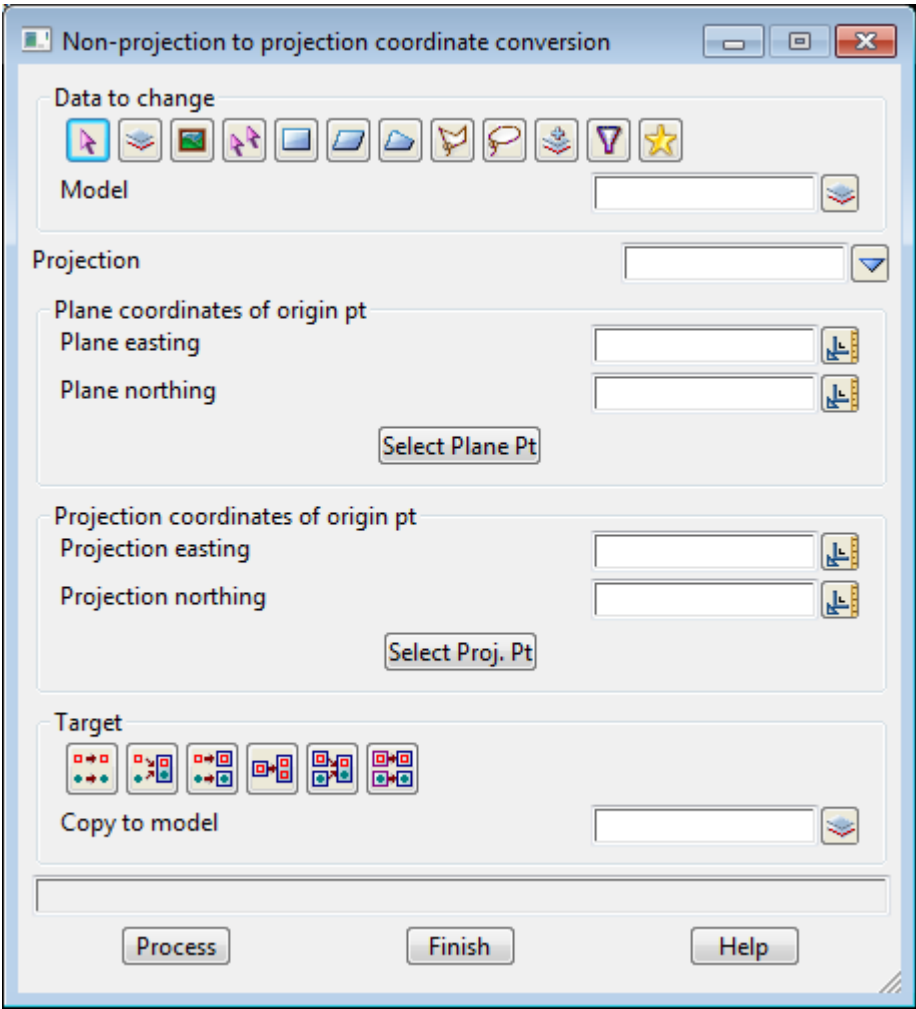

Non-Projection to Projection Coordinates

Position of option on menu: Survey =>Geodetics =>Non-projection to projection coordinate conversion

The **Non-projection to projection coordinate conversion** is for the conversion of non-projection coordinates (plane) to a specified projection system. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The plane vector is calculated between the origin and other selected points. Then using the projection coordinates of the origin and the plane vector a projection vector is calculated which allows the projection coordinates of the selected points to be calculated. **The azimuth orientation should be the same in both systems, i.e. no swing should be required.**

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP's that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the Non-projection to projection coordinates option, the Non-projection to projection coordinate conversion panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to change	source box	model	
<i>the source of objects to be converted are selected using the data source box. For more information on the data source box see Data Source</i>			
Projection	projection box	current projection	available projections

the projection to which the data is to be converted to is specified in the projection box.

Plane easting input box

the plane easting value of the origin point.

Plane northing input box

the plane northing value of the origin point.

Select Plane Pt button

selection of the button allows the point to be picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Projection easting input box

the projection easting value of the origin point.

Projection northing input box

the projection northing value of the origin point.

Select Projection Pt button

selection of the button allows the point to be picked from a view. The user selects and accepts the point and then the values are placed into the relevant input boxes.

Target target

the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see [Data Target](#)

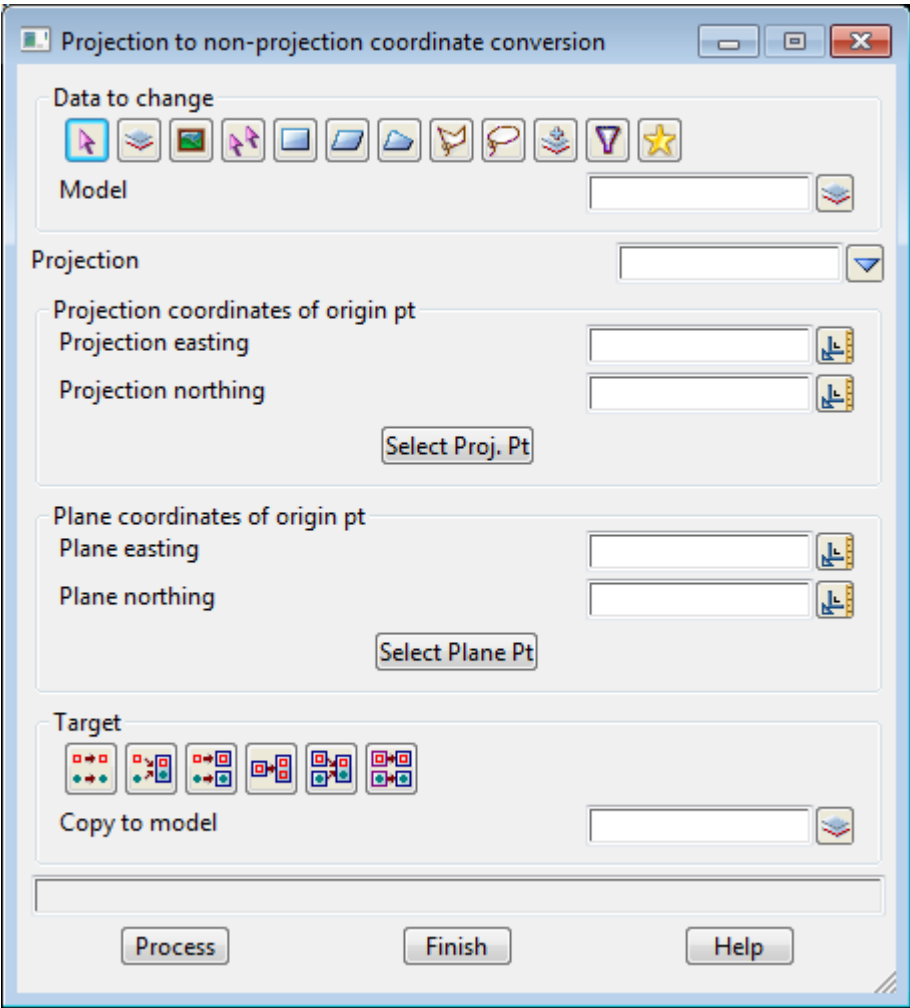

Projection to Non-Projection Coordinates

Position of option on menu: Survey => Geodetics => Projection to non-projection coordinate conversion

The **Projection to non-projection coordinate conversion** is for the conversion of projection coordinates to plane coordinates. This is done by calculating a series of vectors from an origin point. The origin coordinates in both the plane and projection are known. The projection vector is calculated between the origin and other selected points. Then using the plane coordinates of the origin and the projection vector a plane vector is calculated which allows the projection coordinates of the selected points to be calculated. **The azimuth orientation should be the same in both systems, i.e. no swing should be required.**

The process will convert the vertex of straight segments very effectively. However, care should be taken when trying to convert non-linear segments such as curves. These may have construction entities such as TP's that no longer have the same relationship with a centre point after conversion for example. This is due to differing scale factors of points due to the projection.

On selecting the **Projection to non-projection coordinates** option, the **Projection to non-projection coordinate conversion** panel is displayed.

The fields and buttons used in this panel have the following functions.

Target target

the target of the transformed data should be specified. The target for the data is selected using the data target box. For more information on the data target box see [Data Target](#).

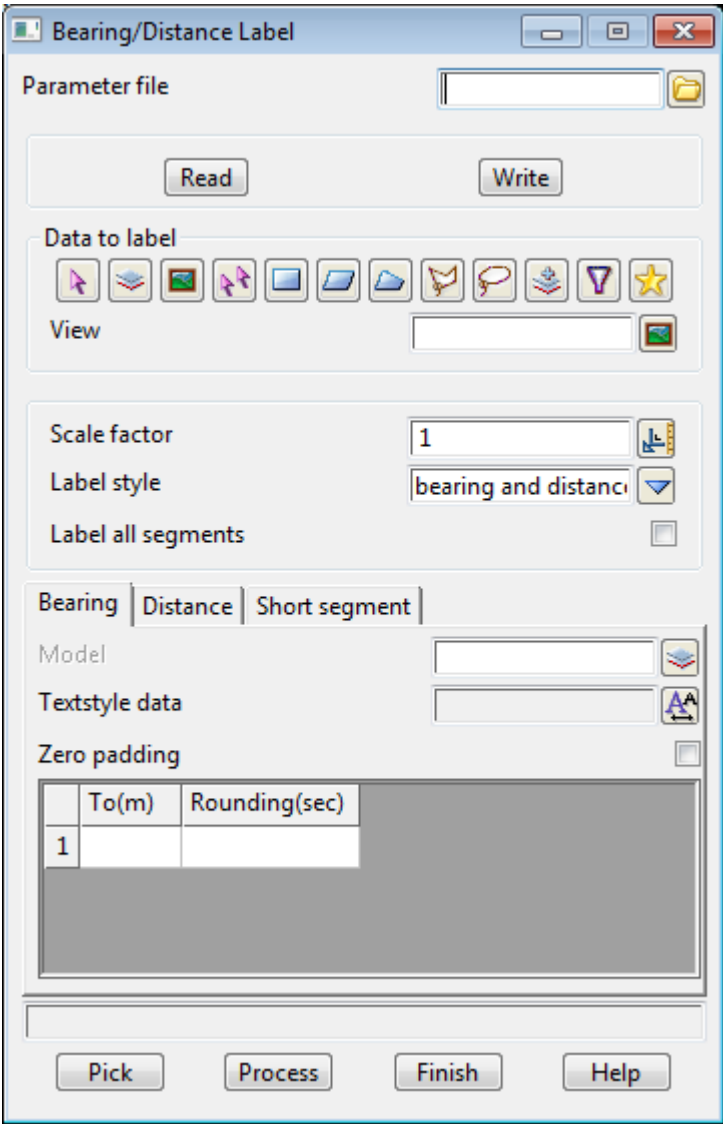

Bearing/Distance Label

Position of option on menu: Survey =>Geodetics => Bearing/distance label

The Bearing/distance label is for the labelling of a selected string with bearing and distance information. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees).

On selecting the Bearing/distance label option, the **Bearing/distance label** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter file	file box		*.lbf files

the parameter file can be read in which will fill in the remaining values within the panel. The user can make changes and save the choices as a different file, thus enabling a library of labelling options to be created.

Read	button
-------------	--------

if a valid parameter file is entered into the parameter file field, the user can press the read button to load the information in the file into the panel.

Write button

if a valid parameter file name is entered into the parameter file field, the user can press the write button to save the edited panel information into a file so that it can be read in at a later date.

Scale factor input box Current Scale factor at Central meridian if set

if a scale factor is specified, the distance values labelled will use the scale factor to compute the label distance. This scale factor will be applied to the calculated plane distance from coordinates in the following manner:

label distance = plane distance /scale factor.

Label style choice box bearing and distancebearing and distance
bearing distance
distance bearing

the label style.

Bearing and distance equates to having the bearing and distance justification point at the same point on the midpoint of the segment (the text justification can make the bearing bottom-middle and the distance top-middle for example to show the bearing above the line and the distance below)

Bearing distance equates to having the bearing and distance justification point along side. For example, a label may be a bearing on the left and a distance on the right

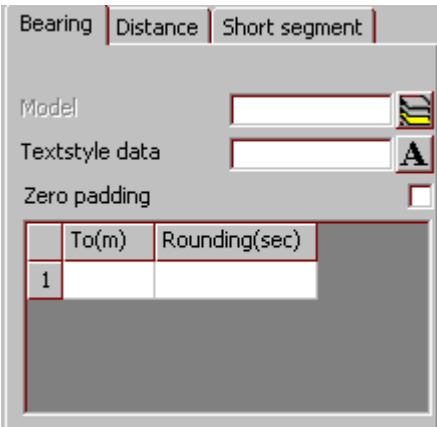

Distance bearing equates to having the distance and bearing justification point along side. For example, a label may be a distance on the left and a bearing on the right

Label all segments tick box unticked

if ticked all the segments of the selected string will be labelled.

Bearing tab

the following fields are located on the bearing tab.

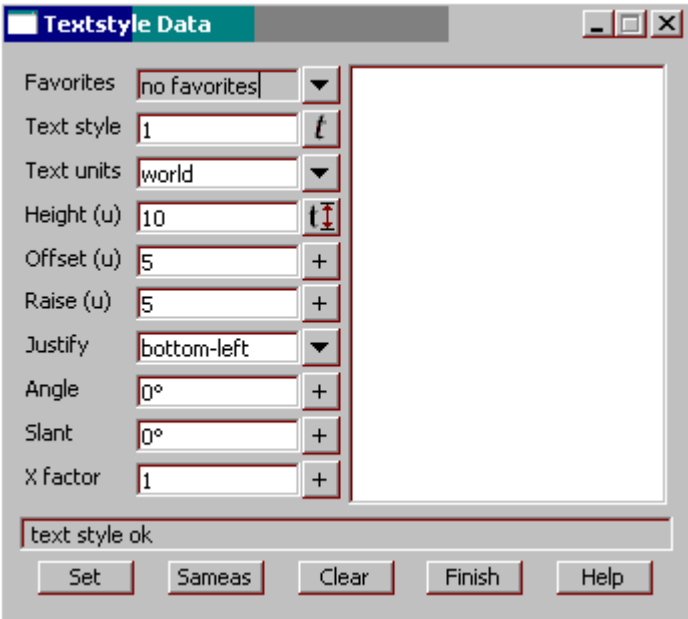

Field Description	Type	Defaults	Pop-Up
Model	model box		current models
if a valid model name is specified, the bearing text will be created in that model.			
Textstyle data	textstyle box		current textstyle names
on pressing the textstyle data button a list of available txtdata predefined names read from the			

texstyles_name.4d file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** panel. This allows for definition of textstyle, units, height offset raise etc.

The textstyle data panel enables the user to define multiple text parameters.

Zero padding tick box unticked

if ticked, the labels will have zero's inserted so that at least 2 characters exist for the minutes and second part of the label. For example, A bearing of 10° 6' 5" would become 10° 06' 05" with padding.

The values in the grid relate to the rounding of bearings for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

the rounding upper range limit in meters. This value together with the rounding specified, allow the bearings between certain distance ranges to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** value in the previous line for the lower limit to the **To(m)** value in that line.

Rounding (sec) input box

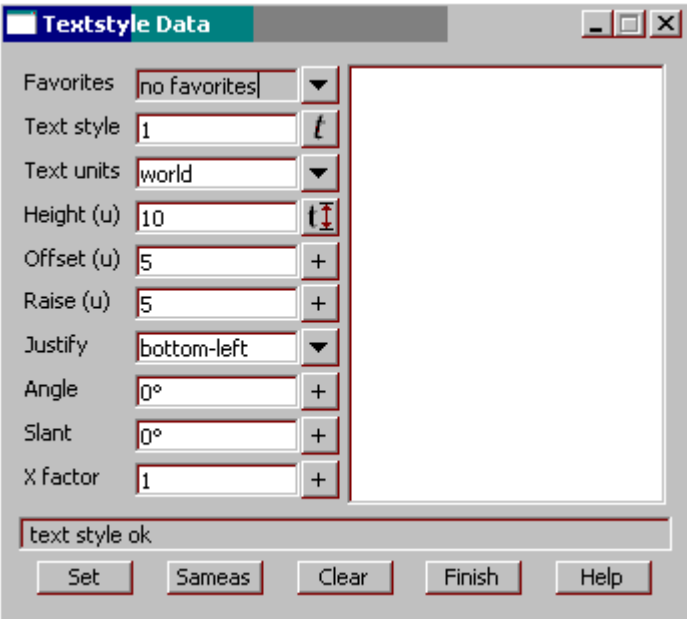

the rounding value given relates to the distance range. Any bearing within the distance range specified will be rounded to the value in seconds. e.g for a rounding value of 60 seconds the bearing will be rounded to the nearest minute.

Distance tab

the following fields are located on the distance tab.

Field Description	Type	Defaults	Pop-Up
Model	model box		current models
<i>if a valid model name is specified, the distance text will be created in that model.</i>			
Textstyle data	textstyle box		current textstyle names
<i>on pressing the textstyle data button a list of available textdata predefined names read from the <code>textstyles_name.4d</code> file are displayed.</i>			

*If no names exist, the user can edit the current settings by selecting the edit button and bring up the **textstyle data** panel. This allows for definition of textstyle, units, height offset raise etc.*

The textstyle data panel enables the user to define multiple text parameters.

Suffix input box

if entered, this suffix will be appended to the end of the distance label.

The values in the grid relate to the rounding of distances for labelling. Many different ranges can be specified in the grid with each line representing a valid rounding range.

To(m) input box

*the rounding upper range limit in meters. This value together with the rounding and number of decimals specified, allow the distance to be rounded to a certain value. The first line in the grid is from 0 to the specified distance range. Any following lines in the grid use the **To(m)** value in the previous line for the lower limit to the **To(m)** value in that line.*

Rounding (m) input box

the rounding value given relates to the distance range. Any distance within the distance range specified will be rounded to the value in metres. e.g for a rounding value of 0.05 a distance of 125.261 will be rounded to a value of 125.25

Decimals input box

the number of decimal places can be specified. For a distance of 125.261, rounding of 0.05 and Decimals equal to 3, the label will be 125.250.

Select Textdata

Select

[Edit]

[Sameas]

*If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Textstyle data** panel. This allows for definition of textstyle, units, height offset raise etc.*

The textstyle data panel enables the user to define multiple text parameters.

Max. length input box

if entered, this value will be compared with the selected segment distance. If the selected distance is less than this distance, the short line labelling will override any bearing and distance labelling.

Number input box

if entered, this value will be used for the short segment text.

Pick button

on selection the user can then select a segment/line from a view with direction. The direction will give the bearing direction which is usually +/- 180 degrees different. eg a segment with a bearing of 24 degrees can be labelled with a bearing of 204 by picking in a south west direction.

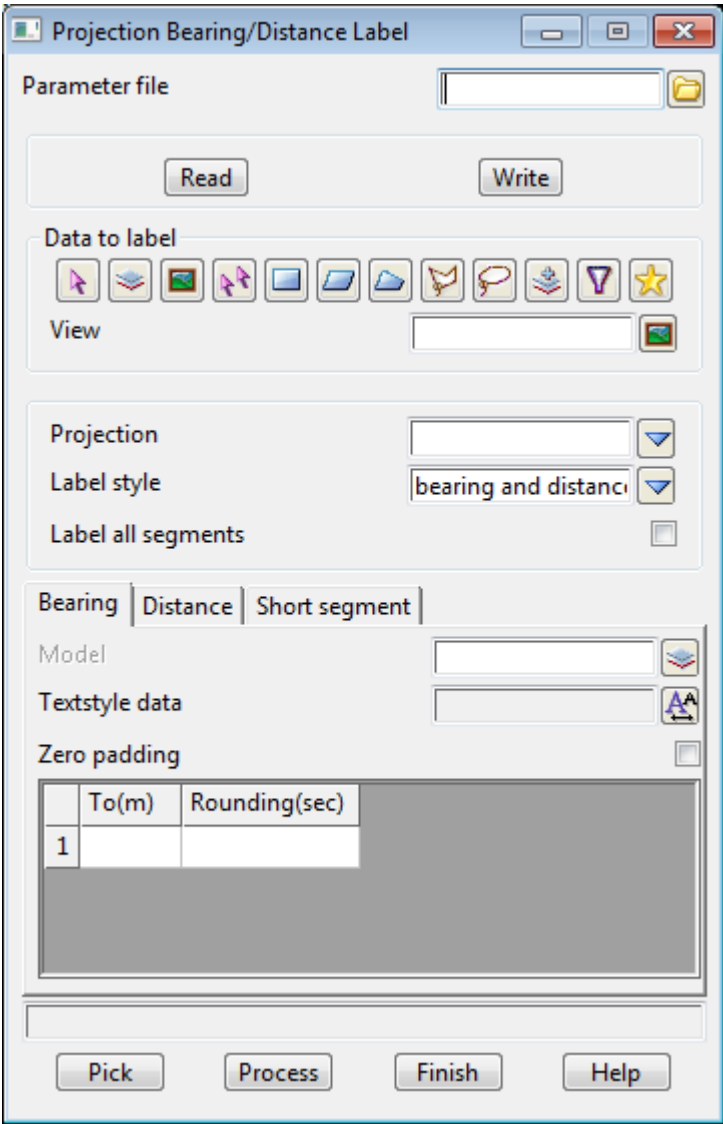

Projection Bearing/Distance Label

Position of option on menu: Survey =>Geodetics => Projection bearing/distance label

The **Projection bearing/distance label** is for the labelling of a selected string with plane bearing and ellipsoid distance information that is in terms of a selected projection. It allows a parameter file to be setup (*.lbf) which can be written and read into the option. This file allows the setting of panel parameters such as rounding, textstyle data etc.

The pick should be with direction. This will effect the bearing that is labelled (+/-180 degrees of actual direction).

On selecting the **Projection bearing/distance label** option, the **Projection bearing/distance label** panel is displayed.

The fields and buttons used in this panel have the following functions.

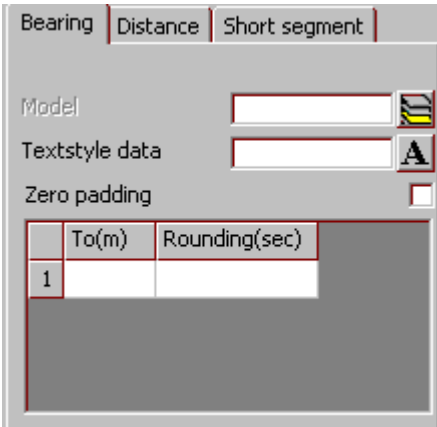

Field Description	Type	Defaults	Pop-Up
Parameter file	file box		*.lbf files

the parameter file can be read in which will fill in the remaining values within the panel. The user can make changes and save the choices as a different file, thus enabling a library of labelling options to be created.

Solar Reduction

Position of option on menu: Survey =>Geodetics => Solar reduction

The Solar reduction option allows the reduction of observations to the sun by the hour angle method. The user can specify either limb or the centre of the sun, and a number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory.** These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the Solar reduction option, the **Solar Observations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	file box		*.ast files
<i>a filename can be specified for reading or writing a file.</i>			
Read	button		
<i>if a valid file exists, the file contents can be loaded into the panel.</i>			
Write	button		
<i>if a valid name is specified and the valid values are entered into all of the fields, the user can write the input data to a file.</i>			
Projection	choice	current projection	available projections
<i>a projection can be specified so that a grid convergence value can be computed. This value will be used to compute the grid or projection bearing to the RO. If left blank, only the True azimuth will be reported.</i>			
Report file	input		*.rpt
<i>name of the file to report to.</i>			
Origin station	input		

name of the origin station

RO station input

name of the reference object station

Origin longitude input

the observation station's longitude should be specified in DMS format.

Origin latitude input

the observation station's latitude should be specified in DMS format.

Date date box current system date

the date of the observations as at the observers position should be entered. This can be by direct entry into the date field or by selecting the day, month, year from a date pop-up panel. The user can scroll through different months by selecting the arrow buttons on the pop-up date panel.

Time zone time zone box major time zones

a valid time zone for the observers position and local time should be selected from the pop-up list.

Timing corr.(hh.mmss) input

the correction to apply for any timing error including stopwatch corrections should be entered. The value should be in a hours, minutes seconds in hp format.

GRID VALUES: input

	Local Time	Horiz obs to RO	Horiz obs to SUN	Limb of sun	Az to Cen. SUN	Az to RO	Conv. angle	Grid brg to RO
1								

Local time input

the local time of the observation specified in 24 hour time in HMS. eg. 18.121002

Horiz obs to RO input

the horizontal angle (bearing) observed to the RO for the set of measurements. A set in this case includes a pointing to the RO and sun (at a certain time) in the same face.

Horiz obs to SUN input

the horizontal angle (bearing) observed to the Sun for the set of measurements.(The observation should not be corrected for the suns semi diameter as this is done internally by the reduction process)

If observation s are made on both faces, a separate line should be entered for each face. e.g Face 1 to RO may be 0.0000 and the face 1 to the sun may be 50.0000 which would be on the same line, then the observer may change face to face 2 and observe to the sun again followed by the RO. The face 2 observations should appear on the next line eg 180.0004 230.0110.

Limb of sun choice box Centre
Left limb
Right limb

the limb of the sun observed should be specified. This enables the suns semi diameter correction to be applied. This also allows the observations to be read in any order.

Az to cen. SUN output

the true azimuth to the sun will be displayed in this field on successful reduction of the observations.

Az to RO output

the true azimuth to the RO will be displayed in this field on successful reduction of the observations.

[illegible]

the convergence angle at the observation point will be displayed in this field if a valid projection is specified and there is a successful reduction of the observations.

Grid brg to RO output

the grid bearing to the RO will be displayed in this field if a valid convergence angle is calculated and there is a successful reduction of the observations. The grid bearing is calculated by:

$$\text{Grid brg} = \text{True azimuth} + \text{convergence}$$

The fields and buttons used in this panel below the grid have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Average RO azimuth output

if there is as successful reduction, the average RO azimuth value will be reported in this field.

Average RO grid bearing output

if there is as successful reduction, and the projection given, the average RO grid bearing value will be reported in this field.

Standard deviation in the mean output

this is a statistical measure of the reduced observations.

Star Reduction

Position of option on menu: Survey =>Geodetics => Star reduction

The **Star reduction** option allows the reduction of observations to the nominated star by the hour angle method. A number of observations can be processed together. **The option does not require almanac details as these are processed internally using algorithms supplied by the US naval observatory.** These algorithms will produce accuracy in the order of 2 arc seconds in azimuth for the period AD1800 - 2050

On selecting the **Star reduction** option, the **Star Observations** panel is displayed.

Standard deviation in the mean	output		
---------------------------------------	--------	--	--

this is a statistical measure of the reduced observations.

Traverse Spreadsheet

Position of menu: Survey =>Traverse spreadsheet

The **Traverse Spreadsheet** options allow the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop). Traverse Spreadsheet will often be abbreviated as TSS.

There are two types of traverse spreadsheets (TSS) - Plane and Projection.

For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculate co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and **12d Model** calculates the correct co-ordinate position using full projection calculations.

The **Traverse spreadsheet** walk-right menu contains the traverse spreadsheet options.

Traverse Spreadsheet

TSS Create

Position of option on menu: Survey => Traverse spreadsheet => Create

A traverse spreadsheet (TSS) can either use a constant scale factor or a cartographic projection to define the relationship between bearings/distances and the (x,y) co-ordinates.

The **Traverse Spreadsheet Create** option allows the entry of traverse and radiation blocks from the keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

Selecting Traverse Spreadsheet **Create** brings up the **Create Traverse Spreadsheet** panel:

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Projection spreadsheet	radio button			
<i>if selected then the Projection field must be filled in.</i>				

Projection	projection box	first projection	project projections	
<i>the cartographic projection used in the TSS. For more information on projections go to Projections in the chapter Projects. This is a Projection TSS.</i>				

Scaled spreadsheet radio button
if selected then the Scale factor field must be filled in.

Scale factor real box
the constant scale factor used in the TSS. This is a Plane TSS.

Details section

Spreadsheet name text box
the name for the TSS

File name text box
*name of the *.tf file to store all the TSS data in. The TSS can be brought back for editing by giving this filename.*

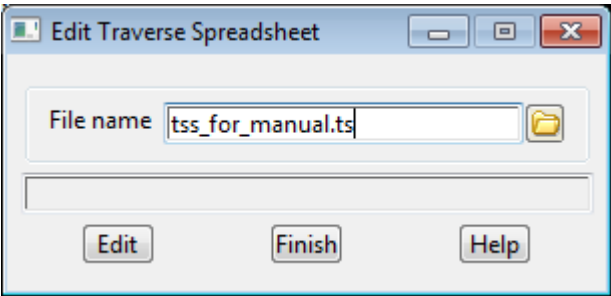

Create button
*create a new traverse spreadsheet using the parameters entered in the above panel field. The appropriate editor (either for a **Projection Traverse Spreadsheet** or a **Plane Traverse Spreadsheet** panel) is then brought up for the TSS data to be entered and/or edited.*

TSS Edit

Position of option on menu: Survey =>Traverse spreadsheet =>Edit

The traverse spreadsheet editor reads in an existing TSS file and loads the information into either the **Projection Traverse Spreadsheet** or the **Plane Traverse Spreadsheet** panel.

Selecting Traverse Spreadsheet Edit brings up the **Edit Traverse Spreadsheet** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File name	file box		*.ts files
<i>name of the file containing the traverse spreadsheet information to be edited.</i>			

Edit button
*read the information in the traverse spreadsheet file and load it into either a **Projection Traverse Spreadsheet** or a **Plane Traverse Spreadsheet** panel.*

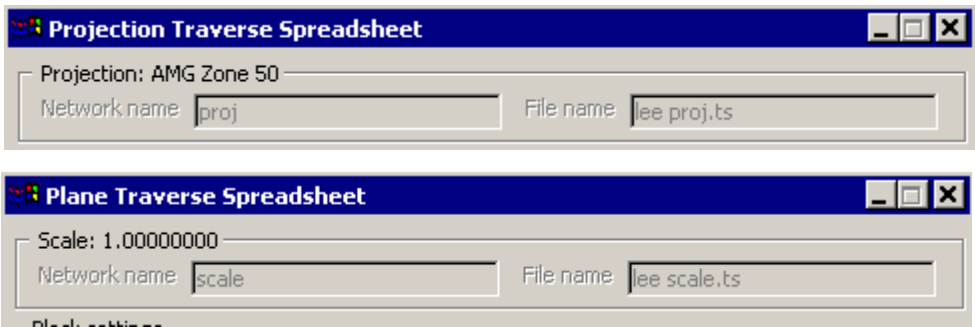

For entering/editing either a Projection TSS or Plane TT, please go to the section [Traverse Spreadsheets](#)

Traverse Spreadsheets

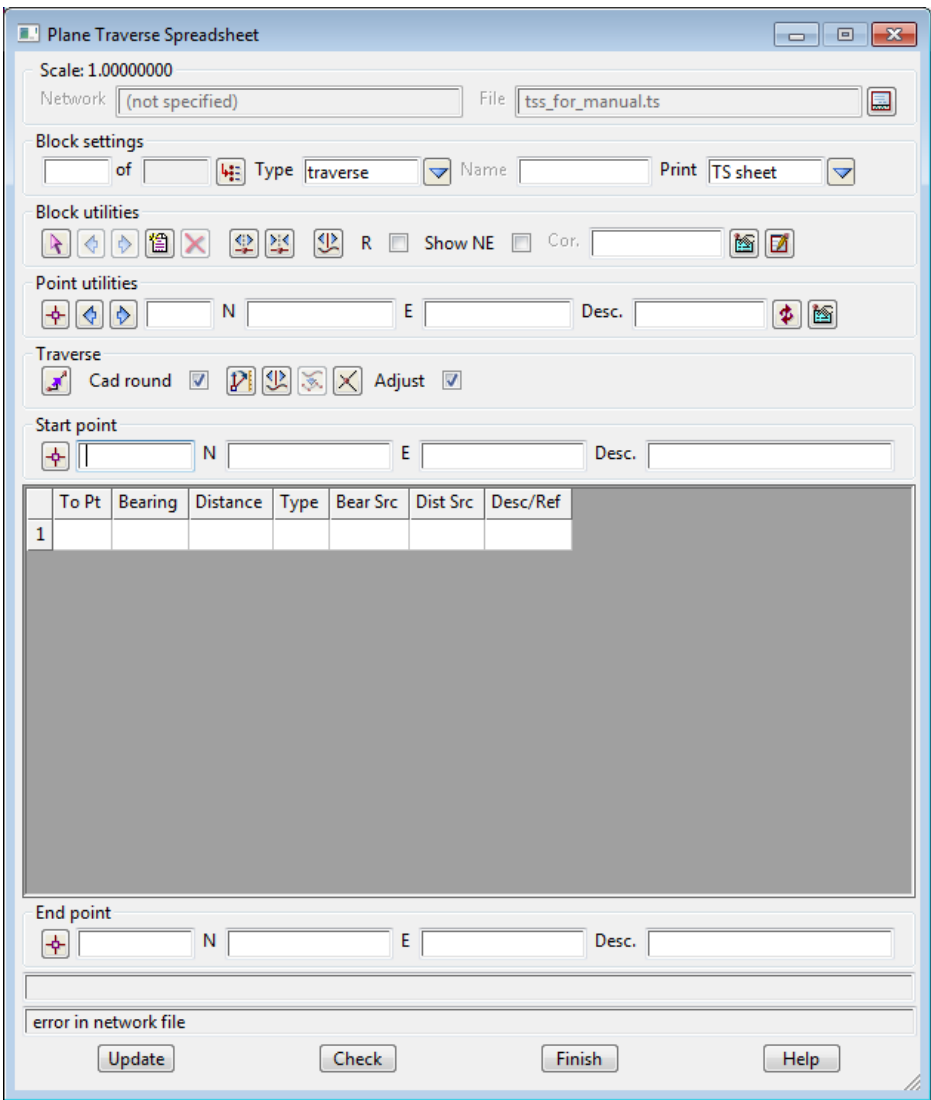

The **Projection** and **Plane** TSS panels allows the entry of traverse and radiation blocks from the

keyboard, selection of strings from the current view or by reading from a file. Adjustments can then be made including transit, Bowditch, compass or least square adjustment. The adjustment can be for a closed string (loop) or an open string (non-loop).

The two panels are very similar and only the top section is different. The Projection Traverse Spreadsheet requires a Projection rather than a Scale factor.

For more information about terminology used in the projection option, see the Appendix [Geodetics Summary](#).

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network name	display only		
<i>the entire spreadsheet can be given a name for identification purposes. This was defined when the TSS was created and can only be changed using the TSS Utilities option.</i>			
File name	display only		
<i>the file name containing the TSS information. This was defined when the TSS was created and can only be changed using the TSS Utilities option.</i>			

The only visible difference between the Plane and Projections Traverse Spreadsheet panel is that the Scale or Projection is given at the top of the panel. All the panel fields are the same.

Of course the calculations are different for the two types of spreadsheets. For the Plane TSS, entered distances are multiplied by the scale factor to give final distances and hence calculated co-ordinates, whereas for the Projection TSS, ellipsoid distances are entered and **12d Model** calculates the correct co-ordinate position using full projection calculations.

Block Settings

Position	input		
<i>the order of a block within the spreadsheet can be specified by nominating the block position. Numbering within the list starts at 1. This parameter is used for inserting new blocks into the list. If a user nominates to insert in position 5 and there is only 2 blocks already defined, the block will be placed at the end of the list (i.e. position 3)</i>			
Count	input		
<i>the number of blocks within the spreadsheet.</i>			
Type	choice	traverse	traverse, radiation, radiation backsight, parcel, irregular trace, balance

the type of a block within the spreadsheet can be specified by nominating the block type.

The **traverse** block is for the entry of loop and non-loop traverses starting and ending at points with known coordinate values.

For a hanging traverse, i.e. a traverse that does not close onto a known point, the data can be entered by entering a 0 (zero) in the point id field of the grid control, as well as the end point - point id field.

The **radiation** block consists of a number of radiations or **side shots** from a point with known coordinates. This point may be defined in a previous traverse block or it may be from a known point. A valid coordinate must exist for the radiation start point for the radiation block to be used.

A **radiation backsight** block is the same as a radiation block except that the value set to the backsight is included. After adjustment of previous blocks, the coordinates of setup and backsight points often change. This will introduce swing errors into calculations if not accounted for. By entering the backsight value as set in the field, a comparison is made between what was set and the adjusted value. The difference is then applied to the radiations in the block to reflect the corrected angle measurements.

XXXX - need 12d NZ documentation on TSS

Name	input
-------------	-------

a spreadsheet can consist of a number of different blocks. For each block, a name can be given which can help identify a particular traverse/radiation block within the spreadsheet.

Flag	input	
	<i>the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.</i>	
Prev	button	
	<i>allows the navigation to the previous block in the list.</i>	
Next	button	
	<i>allows the navigation to the next block in the list.</i>	
New	button	
	<i>allows for the definition and entry of a new block in the list.</i>	
Update	button	
	<i>allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the update button will ensure the new value will be used in further calculations and adjustments</i>	
Insert	button	
	<i>allows for the insertion of a block into the list in the position defined by the Block position entry.</i>	
Append	button	
	<i>allows for the insertion of a block at the end of the list.</i>	
Delete	button	
	<i>allows for the deletion of the currently displayed block.</i>	
Show EN	tick box	ticked
	<i>if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.</i>	
Copy b dsc	tick box	ticked
	<i>if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.</i>	
Pick string	button	
	<i>allows for the loading of the current block by selecting a string from the current view.</i>	
Adjustment method	choice	bowditch, compass, transit, least square
	<i>method of adjustment.</i>	
Loop	tick box	unticked
	<i>For loop traverses the tick box should be checked. This assumes that the start and end points are the same.</i>	

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

Least square tab

Angular std (sec).

The standard deviation of a single angular measurement in seconds of arc.

Linear std (mm)

this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)

ppm

this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations input box 10

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ input box 0.0001

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase tick box ticked

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point button/input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N input

the start point's northing value.

E input

the start point's easting value.

Desc input

the start point's description.

the grid control values can be entered using valid inputs into the various fields.

To Point. *The point id of the next traverse station.*

Bearing (dms). *The bearing of the traverse line.*

Distance. *The distance of the traverse line.*

Point Desc. *The description of the traverse point*

Easting *The easting coordinate of the traverse point. NB. This field is only displayed when the calc or adjust buttons are selected.*

Northing *The northing coordinate of the traverse point. NB. This field is only displayed when the calc or adjust buttons are selected.*

The fields in end point group specify the end point parameters

end point button/input

the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N input

the end point's northing value.

E input

the end point's easting value.

Desc input

the end point's description.

the misclose line near the bottom of the panel have the following functions.

Bearing input box

the closing bearing for the traverses.

Distance input box

the closing distance of the traverse

Delta east input box

the closing vector's delta east component

Delta east input box

the closing vector's delta east component

Misclosure input box

the ratio of the closing distance to the total traverse distance.

The buttons at the bottom of the panel have the following function.

Calc button

*the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list **before** this can be done.*

Adjust button

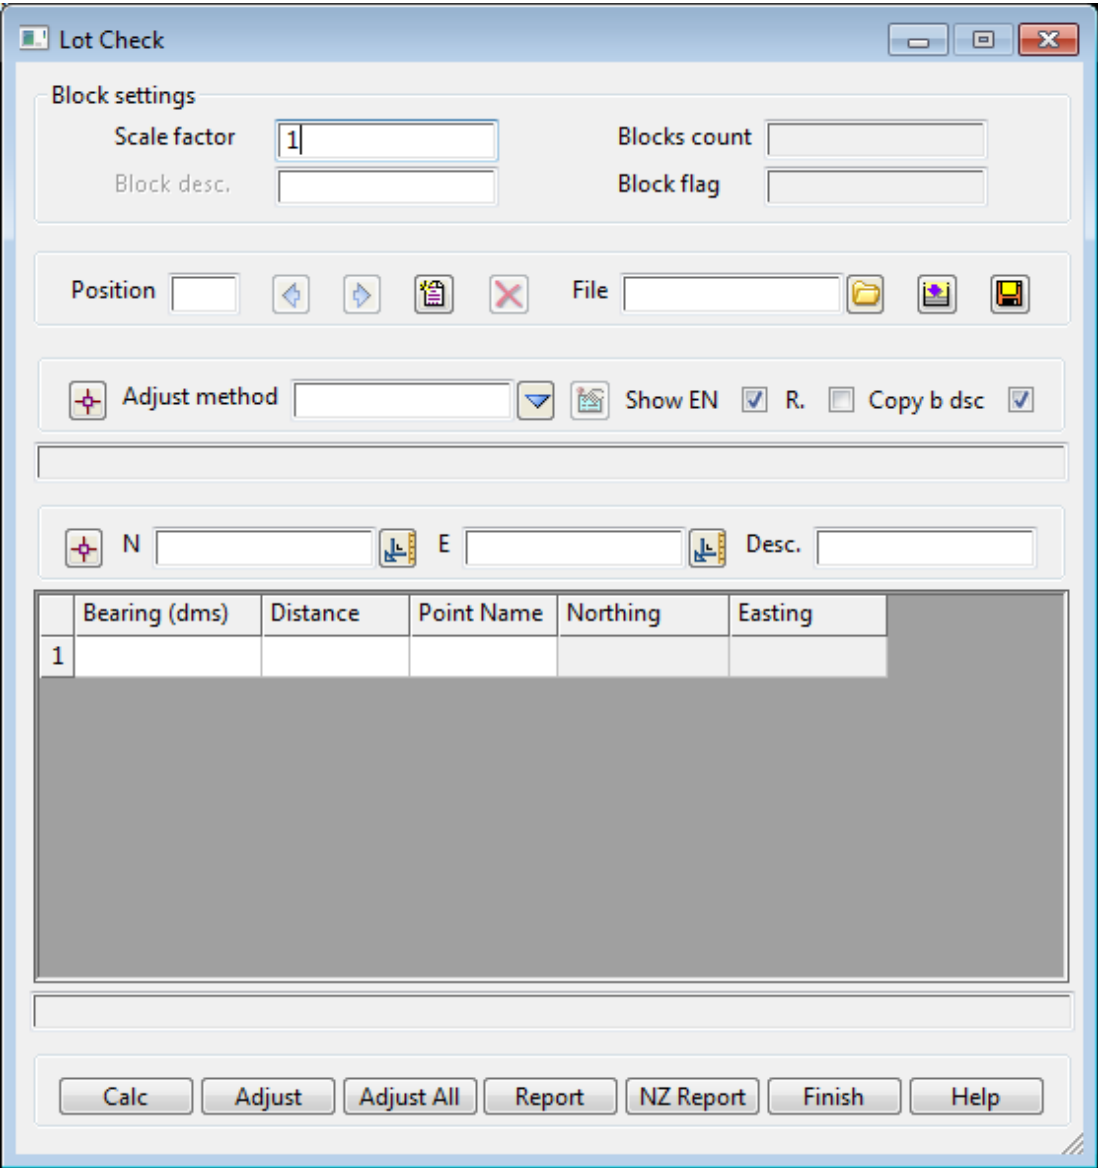

the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All button

the adjustment of all of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Save button

*saves the current data in the panel to the TSS file (displayed in the **file name** box).*

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

The scale and datum fields are the only difference between the plane and datum lot check panels.

Scale factor	input	project scale factor
---------------------	-------	----------------------

a scale factor can be defined which will be applied to any entered distances. Final distances used in calculations are derived by multiplying the entered distance by the scale factor.

Block count	input
--------------------	-------

the number of blocks within the spreadsheet.

Desc.	input
--------------	-------

a spreadsheet can consist of a number of different blocks. For each block, a block description can be given which can help identify a particular traverse/radiation block within the spreadsheet.

Block flag	input
-------------------	-------

the adjustment mode of the current block. The mode is either adjusted or unadjust. All blocks are set to

unadjusted on reading of a file, and the user specifies which blocks are to be adjusted.

Prev button
allows the navigation to the previous block in the list.

Next button
allows the navigation to the next block in the list.

New button
allows for the definition and entry of a new block in the list.

Update button
*allows for the updating of entries when changes have been made. For example, if a distance measurement were to be changed, pushing the **update** button will ensure the new value will be used in further calculations and adjustments*

Insert button
*allows for the insertion of a block into the list in the position defined by the **Block position** entry.*

Append button
allows for the insertion of a block at the end of the list.

Delete button
allows for the deletion of the currently displayed block.

File name input box *.ts
a file name can be defined which will allow for the reading of an existing file and for defining a new file name for reading in the future.

Read button
*the read button allows for the loading of an existing file as specified by the **file name** box.*

Write button
*the write button allows for the saving of the current file as specified in the **file name** box.*

Pick string button
allows for the loading of the current block by selecting a string from the current view.

Adjust method choice bowditch, compass, transit, least square, none
method of adjustment.

Show EN tick box ticked
if ticked the easting and northing columns will be shown in the grid. If unticked the columns will not be shown.

Copy b dsc tick box ticked
if ticked the bearing and description from the previous line in the grid will automatically be copied down to the next entered line.

The fields in this panel define the start and end point details. If the **loop** option is chosen the end point details are assumed to be the same as the start point In this case the end point group is disabled.

Least square tab

The fields in this panel define the values to be used for least square adjustments.

Angular std (sec).

The standard deviation of a single angular measurement in seconds of arc.

Linear std (mm)

this value is defined by the standard deviation of a single distance measurement (e.g. 5 mm)

ppm

this value is defined by the edm scale error which is dependant on the length of line measured (e.g. 5ppm = 5mm error over a 1km distance)

Iterations	input box	10
-------------------	-----------	----

the calculation of the adjustment can be aborted if a solution is not found after the specified number of iterations.

Coords differ	input box	0.0001
---------------	-----------	--------

the calculation of the adjustment can stopped when the difference between successive calculations meet the defined tolerance.

variance increase	tick box	ticked
--------------------------	----------	--------

the calculation of the adjustment can stopped when the variance between successive calculations increases

The fields in start point group specify the start point parameters

Start point button/input

the start point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the start point is to be entered manually, the point id should be entered into the field adjacent to the start point button.

N input

the start point's northing value.

E input

the start point's easting value.

Desc	input
------	-------

the start point's description.

the grid control values can be entered using valid inputs into the various fields.

To Point. *The point id of the next traverse station.*

Bearing (dms). The bearing of the traverse line.

Distance. The distance of the traverse line.

Point Desc. The description of the traverse point

Easting The easting coordinate of the traverse point. **NB.** This field is only displayed when the calc or adjust buttons are selected.

Northing The northing coordinate of the traverse point. **NB.** This field is only displayed when the calc or adjust buttons are selected.

The fields in end point group specify the end point parameters

end point button/input
the end point can be selected by selecting the button and then selection and acceptance of a point in an open view. If valid a point id, easting, northing and description of the selected point will be copied into the appropriate fields.

If the end point is to be entered manually, the point id should be entered into the field adjacent to the end point button.

N input
the end point's northing value.

E input
the end point's easting value.

Desc input
the end point's description.

the misclose line near the bottom of the panel have the following functions.

Bearing input box
the closing bearing for the traverses.

Distance input box
the closing distance of the traverse

Delta east input box
the closing vector's delta east component

Delta east input box
the closing vector's delta east component

Misclosure input box
the ratio of the closing distance to the total traverse distance.

The buttons at the bottom of the panel have the following function.

Calc button
*the calc button is used to calculate coordinate values based on the information input into the grid control and the points tab. The block has to be inserted or appended into the list **before** this can be done.*

Adjust button
the adjustment of the current block can be done after the calc stage has been reached. This will use the method of adjustment as stipulated by the user.

Adjust All button
the adjustment of all of the blocks in the list can be done after the calc stage has been reached in each of the individual blocks. This will use the method of adjustment as stipulated by the user.

Report button
on selecting this button the NZ traverse spreadsheet report panel appears.

NZ TSS Report

Position of option on menu: Survey => Traverse spreadsheet => NZ report

The NZ report option allows the user to define the report header etc. so as to produce a spreadsheet report which can be printed to a pre-printed NZ sheet.

Selecting NZ report brings up the NZ Traverse Spreadsheet Report panel

NZ Traverse Spreadsheet Report

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input format	choice box	*.ts	*.ts, *.lch
<i>either a TSS file (*.ts) or a lot check file (*.lch) can be reported.</i>			

Input file	input box	*.ts
<i>name of the TSS or lot check file.</i>		
Print	choice box	TS sheet
<i>TS sheet, Calc sheet, Other either TS sheet.</i>		
Report parcels	tick box	
<i>If tick, parcel block types are included in the report.</i>		

Traverse Title section

Traverses of, line 2, line 3, line 4

*The title of the traverses can be entered into the **traverses of** box as well as the following **line 2**, **line 3** and **line 4** input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the **traverse of** line and 33 characters (inclusive of space characters) for **lines 2 to 4**.*

*The input into the **traverses for** line is compulsory but for **lines 2 to 4** it is optional.*

Datum Information section

NZ Circuit	choice box	existing NZ circuits
<i>the circuit in which the current spreadsheet file relates to should be specified.</i>		
Projection	choice box	Geodetic 1949 Geodetic 2000 Old Cadastral

the appropriate NZ geodetic datum should be selected.

Coords in terms of section

these parameters are only required to be entered for the Old cadastral datum case. For other datums, the values are automatically updated.

Point name	input box
<i>the name of the origin point should be entered.</i>	
Northing	input box
<i>the nothing coordinate of the origin point should be entered.</i>	
Easting	input box
<i>the easting coordinate of the origin point should be entered.</i>	

Other Details section

Field book	input box	
<i>the name of the field book used.</i>		
Plan no	input box	
<i>the plan no to be created if known.</i>		
NZ Land District	choice box	Existing NZ land districts
<i>the appropriate NZ land district should be selected.</i>		
Report file	files box	*.rpt files
<i>file name for the report.</i>		

Report file button
a report using the nominated file name is created.

Standard TSS Report

Position of option on menu: Survey => Traverse spreadsheet => Standard report

The **Standard report** allows the user to define the report header etc. so as to produce a standard TSS report which can be printed, saved or edited.

Selecting **Standard report** brings up the **Standard Traverse Spreadsheet Report** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input format	choice box	*.ts	*.ts, *.lch
<i>either a TSS file (*.ts) or a lot check file (*.lch) can be reported.</i>			
Input file	input box		*.ts
<i>name of the TSS or lot check file.</i>			
Print	choice box	TS sheet	TS sheet, Calc sheet, Other
<i>either TS sheet.</i>			
Report parcels	tick box		

If ticked, parcel block types are included in the report.

Traverse Title section

Job id text input box

text to use as the Job id.

Traverses of, line 2, line 3, line 4

The title of the traverses can be entered into the **traverses of** box as well as the following **line 2**, **line 3** and **line 4** input boxes. Due to the limitation of space on the pre-printed forms supplied by LINZ the number of characters should be limited to 20 characters (inclusive of space characters) for the **traverse of** line and 33 characters (inclusive of space characters) for **lines 2** to **4**.

The input into the **traverses for** line is compulsory but for **lines 2** to **4** it is optional.

Surveyor id text input box

text to use as the Surveyor id.

Computer operator text input box

text to use as the Computer operator.

Report file files box *.rpt files

file name for the report.

Report file button

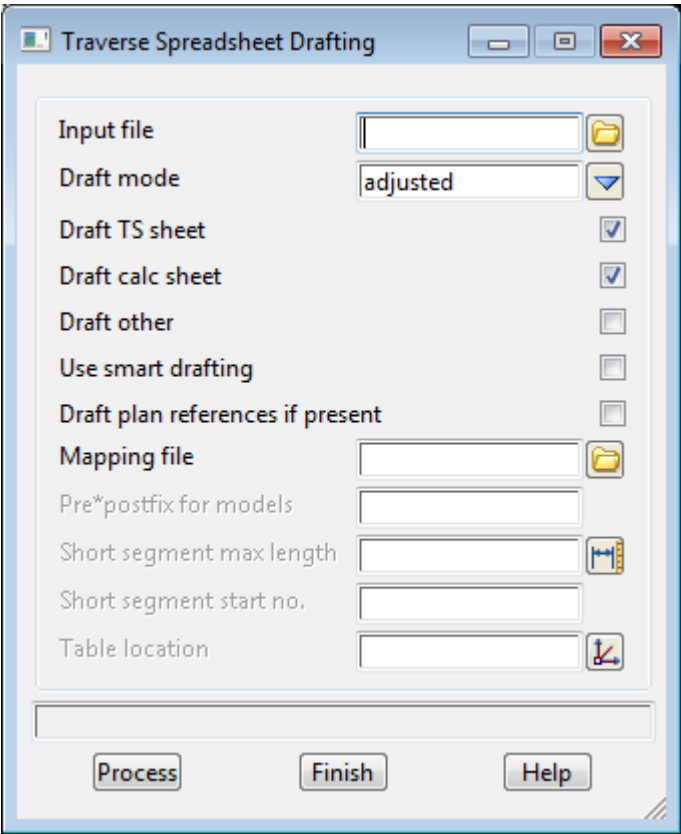

a report using the nominated file name is created.

TSS Drafting

Position of option on menu: Survey => Traverse spreadsheet=> Drafting

The Traverse spreadsheet **drafting** produce models, linestyles and colours for data within the TSS.

Selecting **Drafting** brings up the **Traverse Spreadsheet Drafting** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file <i>name of the existing spreadsheet file to create drafting for.</i>	file box		*.ts
Draft mode <i>the draft mode will determine if adjusted strings are used for drafting or if the unadjusted values (initial) values are used</i>	choice box	adjusted	adjusted initial
Draft TS sheet <i>if ticked,</i>	tick box		
Draft calc sheet <i>if ticked,</i>	tick box		
Draft other <i>if ticked,</i>	tick box		
Mapping file <i>mapping file to define the drafting</i>	mapping file box		*.mf
Pre*postfix for models <i>pre and post text to add to the model names given in the mapping file</i>	text input box		
Short segment max length	real input box		

maximum size for a segment to be considered a short segment. Short segments are labelled with a number and the details placed in a table.

Short segment start no. integer input box
start number for any short segments.

Table location xyz box
world position for the short segment table.

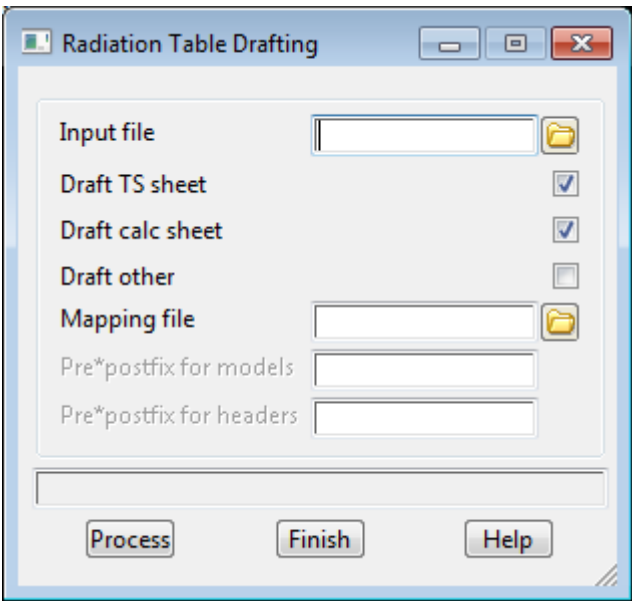

Process button
process the traverse spreadsheet and create the drafting and short segment table.

TSS Radiation Table Drafting

Position of option on menu: Survey => Traverse spreadsheet=> Radiation table

The Traverse spreadsheet **radiation table** option produces radiation tables for the radiation data in a traverse spreadsheet.

Selecting **Radiation table** brings up the **Radiation Table Drafting** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	file box		*.ts
name of the existing spreadsheet file to create radiation tables for.			
Draft TS sheet	tick box		
if ticked,			
Draft calc sheet	tick box		
if ticked,			
Draft other	tick box		

if ticked,

Mapping file mapping file box *.mf
mapping file to define the drafting

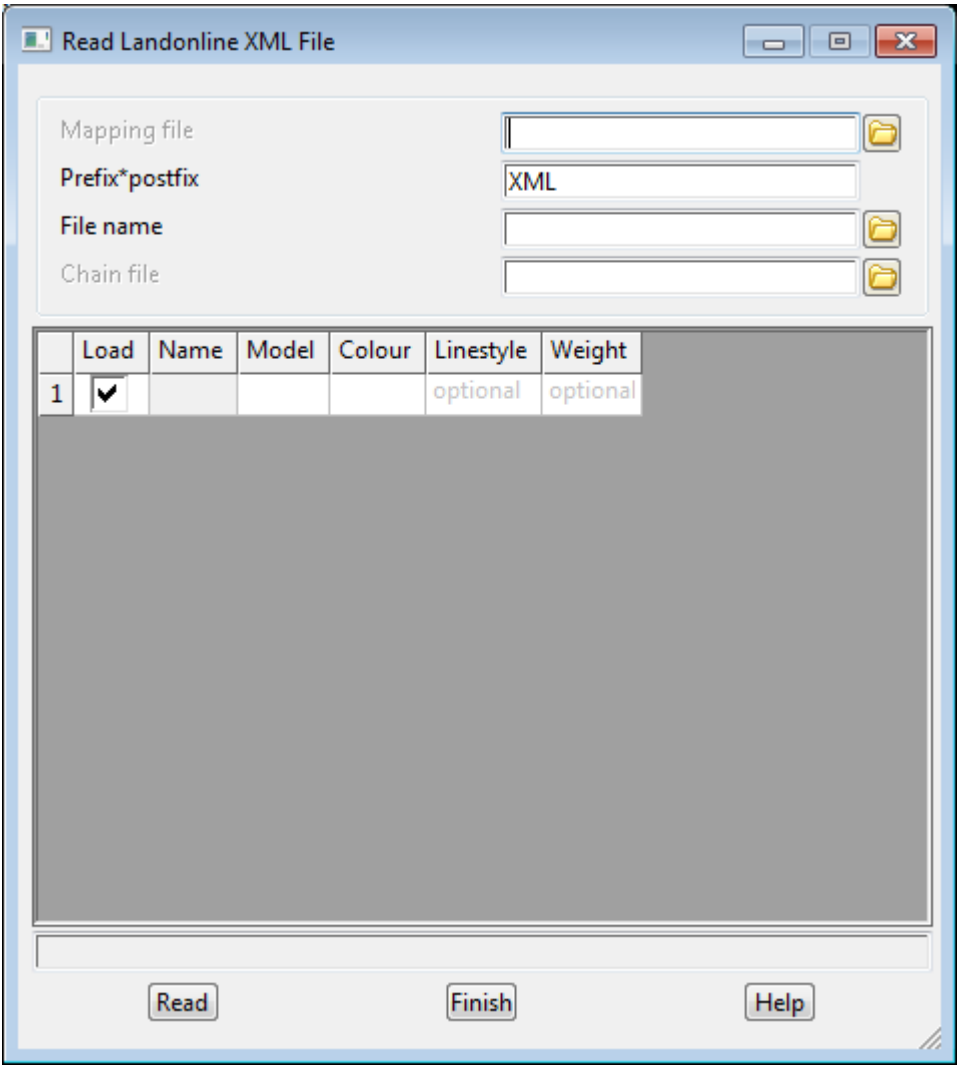

Pre*postfix for models text input box
pre and post text to add to the model names given in the mapping file

Pre*postfix for headers text input box
pre and post text to add to the header names for the radiation tables.

Process button
process the traverse spreadsheet and create the radiation tables.

Landonline XML Read

Position of menu: Survey =>Traverse spreadsheet => Landonline XML read
The Landonline XML Read option reads in data in the XML format for Landonline New Zealand.
Selecting Landonline XML read brings up the Read Landonline XML File panel

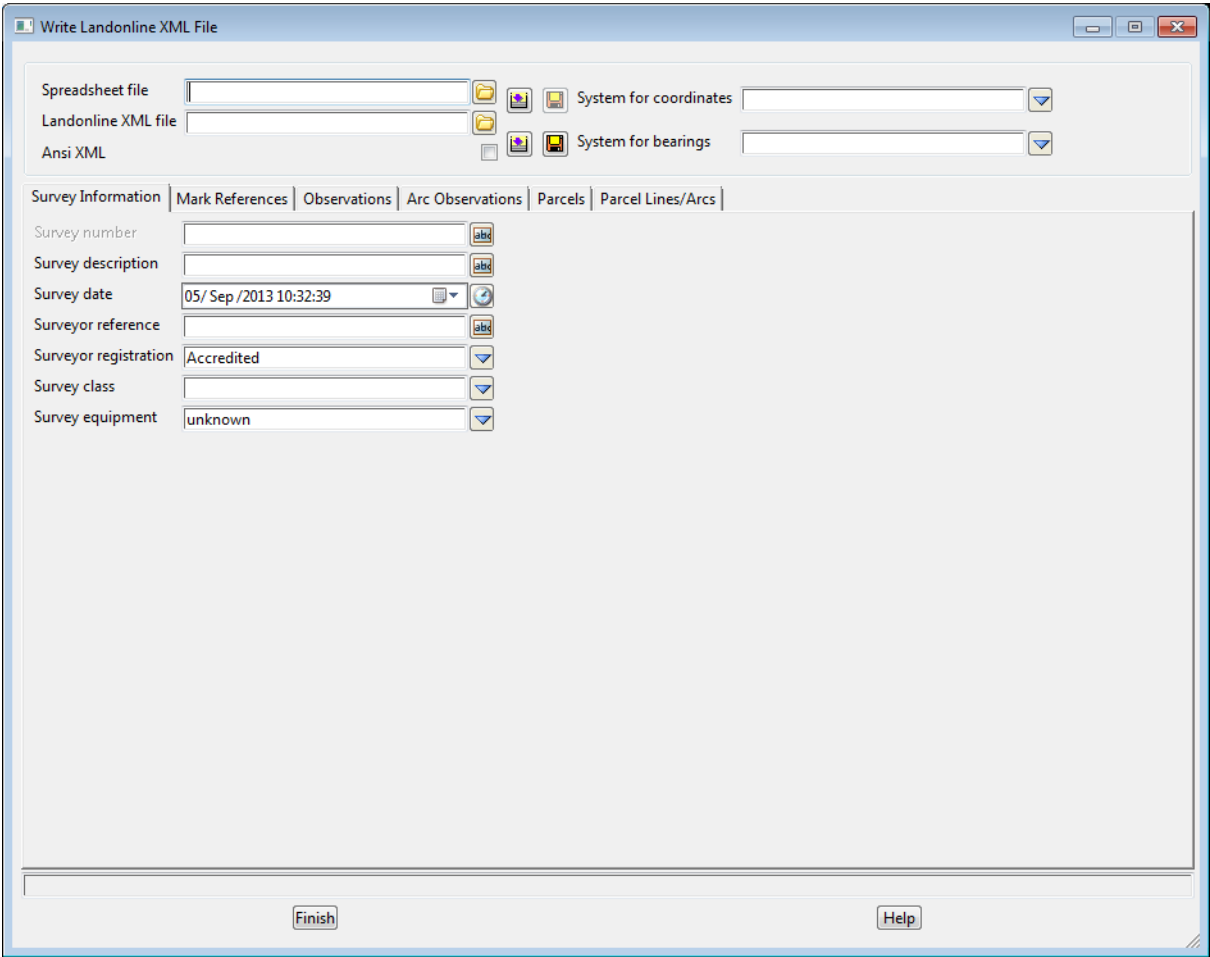

Documentation is available from 12d NZ Ltd.

Landonline XML Write

Position of menu: Survey => Traverse spreadsheet => Landonline XML write

The Landonline XML Write option writes out data in the XML format for Landonline New Zealand.

Selecting Landonline XML write brings up the Write Landonline XML File panel

Documentation is available from 12d NZ Ltd.

Conformance

Position of menu: Survey =>Conformance

The **Conformance** walk-right menu contains survey options for generating conformance reports and models on surveyed points representing as-built batter slopes and pavements, compared against string data representing designed batter slopes and pavements.

The **Conformance** walk-right menu is

Generate batter slope conformance report
Generate pavement conformance report

For the option *Batter slope report*, go to
Pavement report

[Batter slope report](#)
[Pavement report](#)

Batter slope report

Position of option on menu: Survey =>Conformance =>Batter slope report

The **Batter slope report** option generates a conformance report on surveyed points representing an as-built batter slope, compared against string data representing a designed batter slope.

In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance*, *above tolerance*, *below tolerance*, and *not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, and point error.

Note1: the term *point conformance* is used here to refer to a point's distance from design (distance from the conformance line on diagram below), while the term *point error* refers to a point's distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero error.

Note2: the point conformances and errors can be measured either vertically or perpendicular to the conformance line. It is perhaps worthwhile to note, especially in the case of the *sliding critical zone*, that the perpendicular measurements are determined from the vertical measurements, and **not** vice versa. That is, if the slope of the conformance line, measured from horizontal, is denoted by the angle *A*, then a surveyed point *Q*, has a perpendicular conformance *Qcp*, and error *Qep*, determined from the point's vertical conformance *Qcv*, and error *Qev*, via the following relationships:

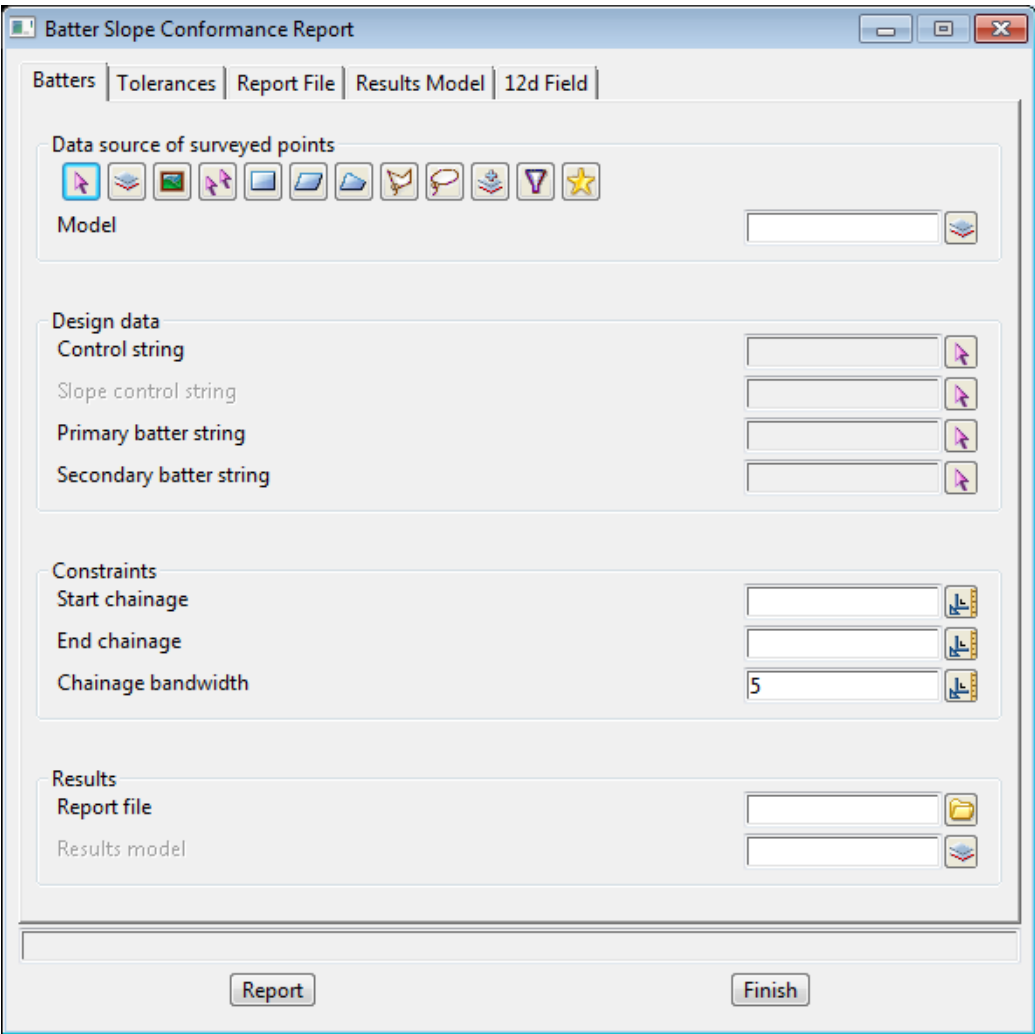

$$Qcp = Qcv.\cos A$$
$$Qep = Qev.\cos A$$

Note3: the conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design batter slope line. When testing a sub-grade survey, the conformance line will normally be below the design batter slope line, but when testing a completed-construction survey, the two lines should normally coincide.

Typical sections through excavation and embankment batters are shown in the diagram below, along with schematics showing how the surveyed points are tested for conformance:

Selecting Batter slope report brings up the Batter Slope Conformance Report panel

Batters Tab:

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source of points		source box		
-----------------------	--	------------	--	--

all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.

***Note:** the data for the Point Description column in the report will be taken from the string names of the selected points. If **all** the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.*

Design data

Control string	string box
----------------	------------

the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

Slope control string	string box
----------------------	------------

the Slope control string is optional (and is not shown on the diagram above). If no string is selected, the Primary string, below, will be used as the Slope control string. The line that is formed in plan, from a surveyed point to the nearest point on the Slope control string, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.

Primary string string box

the string selected with this box should represent one edge of the designed batter (normally the edge closer to the road - i.e. the toe string of an excavation batter, or the crest string of an embankment batter).

The Primary string represents the start of the Critical Zone, which continues horizontally in the direction of the Secondary string, for a distance specified in the Critical zone range field (on the Tolerances Tab).

Secondary string string box

the string selected with this box should represent the other edge of the designed batter (normally the edge further away from the road - i.e. the interface string)

Constraints

Start chainage real box

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string is selected, but a different value can be typed in.

End chainage real box

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string is selected, but a different value can be typed in.

Chainage bandwidth real box 5.0

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.

Results

Report file file box *.rpt

the name of the conformance report file to be created. If no extension is given, it will be given an extension of ".rpt".

Results model model box available models

the name of the results model to be created. If blank, the results model is not created.

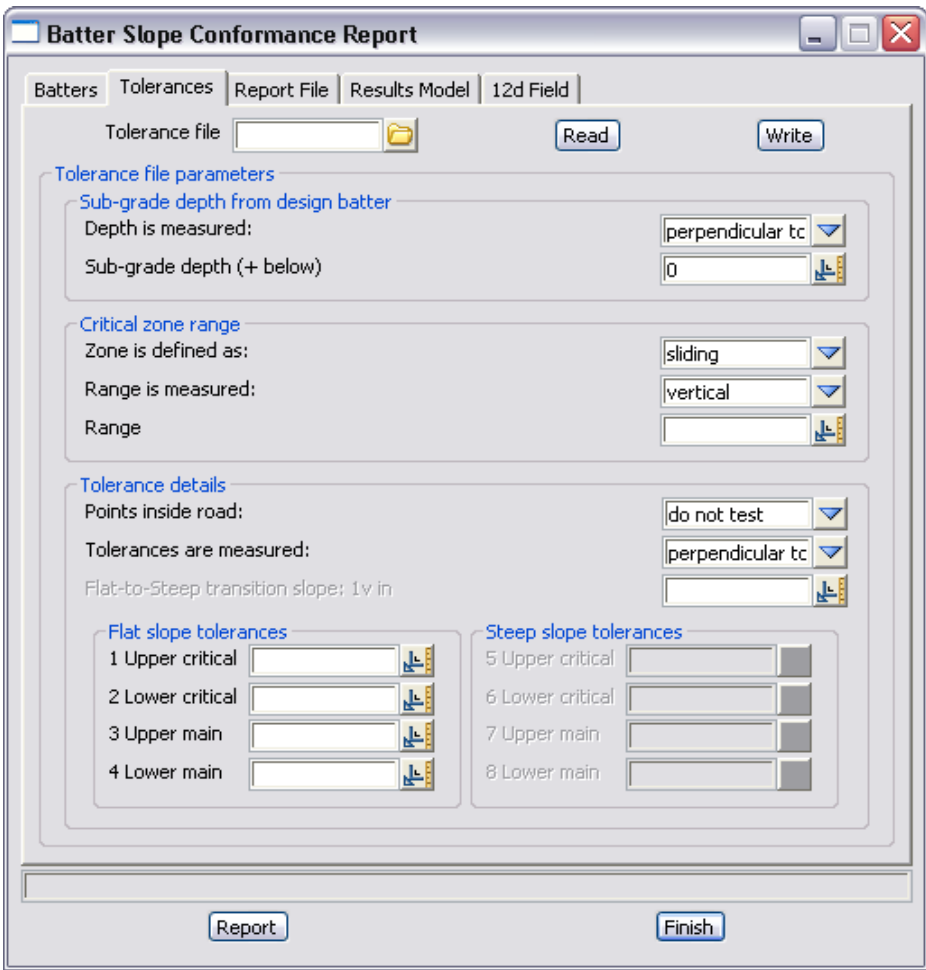

Report button

generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

Finish button

exits the option and closes the panel. This button can be activated regardless of which panel tab is currently active.

Tolerances Tab:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tolerance file	file box		*.tol

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of ".tol". The tolerance file stores the details of every field on the Tolerances Tab, the Report File Tab, and the Results Model Tab. The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.

Read	button
-------------	--------

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write	button
--------------	--------

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Sub-grade depth from design batter

Depth is measured	choice box	perpendicular	perpendicular to batter vertical
--------------------------	------------	---------------	-------------------------------------

whether the sub-grade depth is measured perpendicular to the batter or vertically (refer to parameters

Dp and Dv on the diagram above)

Sub-grade depth real box 0.0

the depth of the conformance line from the design batter (refer to parameters Dp and Dv on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design batter slope line.

Critical zone range

Zone is defined as choice box sliding sliding fixed

determines whether the Critical Zone is defined as sliding or fixed (refer to diagram above). For excavation batters, the zone is normally sliding, whilst for embankment batters, it is normally fixed.

Range is measured choice box vertical along batter vertical horizontal

determines how the size of the Critical Zone is measured (refer to parameters Cb, Cv, and Ch on the diagram above)

Range real box

the size of the Critical Zone, measured in the specified direction (refer to parameters Cb, Cv, and Ch on the diagram above). This distance must be zero or greater.

Tolerance details

Points inside road choice box do not test do not test test with zero tolerance test with fixed crit. tolerance

*determines what to do with any surveyed points found inside the road. If such points are found, and this field is set to **do not test**, the points will be classified as untested, and in the results model, will have their vertex text set to **INR**.*

***Note:** untested points do not appear in the conformance report.*

Tolerances measured choice box perpendicular perpendicular to batter vertical

*whether the conformance tolerances are measured perpendicular to the batter or vertically (refer to parameters T**p and T**v on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendicular or vertically.*

Flat-to-Steep transition slope: 1v in real box

It is possible to use two different sets of batter slope tolerances, when producing the conformance report. The Flat slope tolerance set will be used whenever the design slope is equal to the transition slope or flatter; and the Steep slope tolerance set will be used whenever the design slope is steeper than the transition slope. The transition slope must be specified as a positive number; and will be interpreted as a slope in the form

1[v] : transition slope[h]. Leaving this field blank will disable the Steep slope tolerance set, ensuring that only the Flat slope tolerance set will ever be used.

Flat slope tolerances

The following four tolerances are used if the *transition slope* is not specified, or whenever the design slope is equal to the *transition slope* or flatter.

1 Upper critical real box

refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.

2 Lower critical real box
refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.

3 Upper main real box
the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.

4 Lower main real box
the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

Steep slope tolerances

The following four tolerances are used only if the *transition slope* is specified, and the design slope is steeper than the *transition slope*.

5 Upper critical real box
refer to parameters Tucp and Tucv on the diagram above. This value is normally zero or greater.

6 Lower critical real box
refer to parameters Tlcp and Tlcv on the diagram above. This value is normally zero or less.

7 Upper main real box
the upper allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tump and Tumv on the diagram above). This value is normally zero or greater.

8 Lower main real box
the lower allowable distance that a surveyed point, found to be in the Main Zone, may be from the conformance line, in order to be conformant (refer to parameters Tlmp and Tlmv on the diagram above). This value is normally zero or less.

Report

Finish

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Max lines per page	integer box	70	

the maximum number of report lines that can fit on a printed page. This number is needed so that page breaks (form feed characters) can be inserted into the report file at the appropriate places. The number of lines per page will vary depending on the editor/word-processor used for printing, the desired page size and margin widths, the desired page layout (portrait or landscape), and the desired font and font size. As such, the number needs to be tuned for the user's particular report specifications/requirements.

***Note1:** you may find that MS Notepad is not a good program for printing out the report file (Notepad doesn't seem to interpret form feed characters).*

***Note2:** if Max lines per page is set to a large enough number, there will be no page breaks in the report file.*

Header information

Original survey file input box
optional line of text in the report header to identify the original survey data file

Re-check file
optional line of text in the report header to identify the survey data file where the pavement was rechecked.

- Lot number

input box

optional line of text in the report header to identify the lot number
- Lot location

input box

optional line of text in the report header to identify the lot location
- Lot description

input box

optional line of text in the report header to identify the lot description

Table options

- Show design levels

tick box

off

whether to show the design levels in the column after the point levels

Note: the design levels are always vertically above or below the point levels, even if the tolerances are measured perpendicular to the design slope.

- Show non-conformance errors

tick box

off

whether to show the point errors for non-conformant points (i.e. the distances the points are out of tolerance). If turned on, the point errors will appear in parentheses, (=, after the conformance and tolerance details.

- Show non-conformance slopes

tick box

off

whether to show the surveyed slopes at non-conformant points. The surveyed slope is the slope between the previous and current point in the report, within a single, offset-sorted chainage band. The slope is calculated as though the previous point lies in the same vertical plane as that of the current point's design slope. As such, the slope is adjusted for any differences in bearing direction between the two design slopes, and for any incline in the road, as shown in the diagram, below:

If turned on, the surveyed slopes will appear in square brackets, [=, after the conformance, tolerance and point error details.

***Note:** if the Chainage bandwidth on the Batters Tab is zero or blank, then the points will only be sorted by chainage, and not sub-sorted by offset within chainage bands. In this case, surveyed slopes will never be reported.*

Show vertex ids

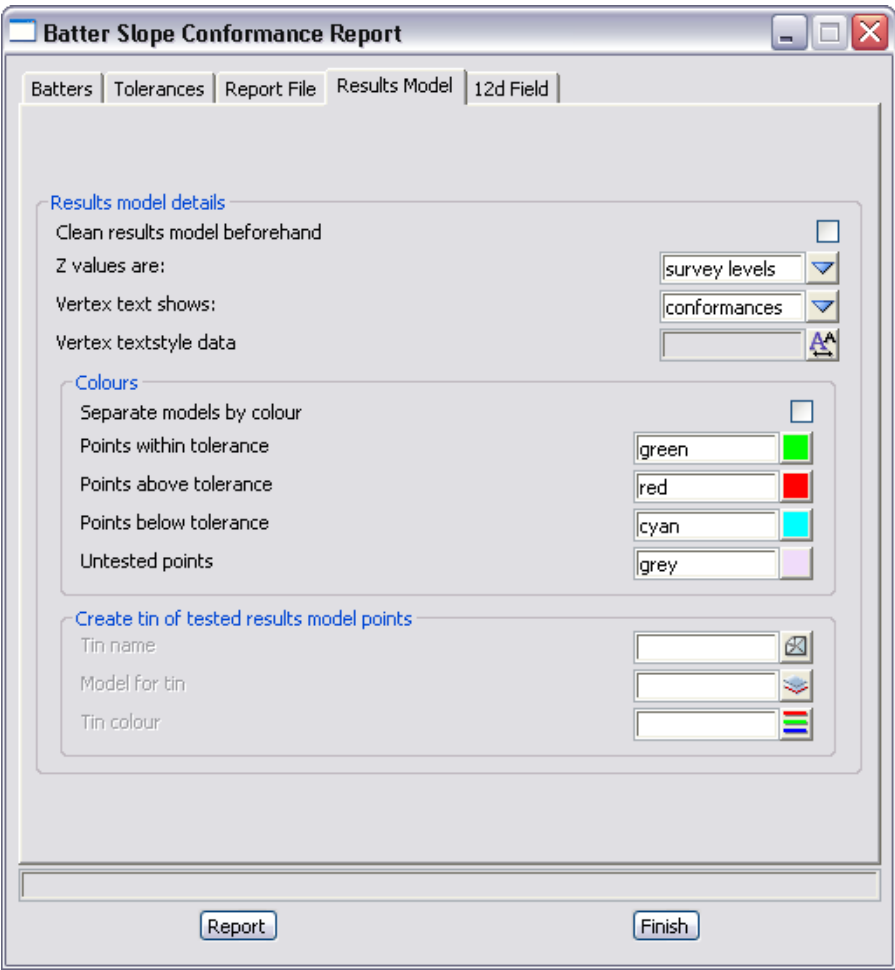

if ticked the vertex id of the point rather than the name of the string containing the point will be shown in the report file.

Footer information

Surveyor name input box
name of the person required to sign the report (optional)

Surveyor title input box
title of the person required to sign the report (optional)

Results Model Tab:

The fields have the following functions:

Field Description	Type	Defaults	Pop-Up
Clean results model beforehand	tick box	off	
<i>whether to clean the contents of an existing results model before re-running the option</i>			
Z values are	choice box	levels	levels conformances

errors

determines what z values to give the points generated in the results model

Note: any untested points in the model will have their z values set to their original point levels, regardless.

Vertex text shows	choice box	conformances	levels conformances errors
--------------------------	------------	--------------	----------------------------------

determines what values to show in the vertex text of the points generated in the results model

Note1: any points within tolerance will have a zero error. For these points, if the vertex text is set to **errors**, no text will be set.

Note2: any untested points in the model will have the vertex text set to show one of four possible error codes, explaining why the point was not tested. The error codes are **NUL** (invalid z-value), **OCR** (outside chainage range), **ERR** (intersection error or similar), and **INR** (inside road).

Vertex textstyle data	textdata box	user textdata favourites
------------------------------	--------------	--------------------------

controls the appearance of the vertex text for the points generated in the results model

Colours

Separate models by colour tick box

if ticked the results model will be several models, each result colour going to a separate model named with a suffix of the colour name.

Points within tolerance	colour box	green	available colours
--------------------------------	------------	-------	-------------------

colour for points within tolerance

Points above tolerance	colour box	red	available colours
-------------------------------	------------	-----	-------------------

colour for points above tolerance

Points below tolerance	colour box	cyan	available colours
-------------------------------	------------	------	-------------------

colour for points below tolerance

Untested points	colour box	grey	available colours
------------------------	------------	------	-------------------

colour for untested points

Note: untested points do not appear in the conformance report.

Create tin of tested results model points

Tin name	tin box	available tins
-----------------	---------	----------------

name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model field (on the Batters Tab) is blank, no tin will be created.

Note: the tin will be created only with the set of tested points created in the Results model, and can be used to quickly display contour maps of the results. When creating the tin, an attempt is made to null any triangles outside the **shrink-wrapped** boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see Chainage bandwidth on the Batters Tab).

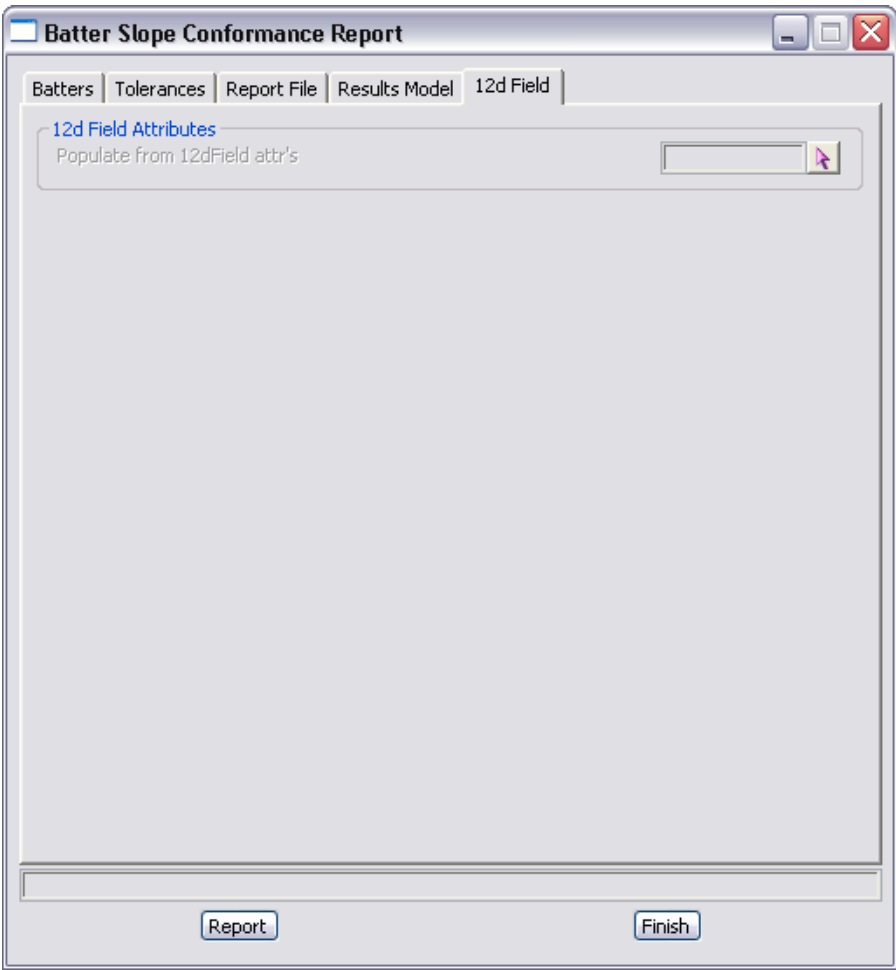

Model for tin	model box	available models
----------------------	-----------	------------------

model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour	colour box	available colours
-------------------	------------	-------------------

colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.

12d Field Tab:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Populate from 12dField attr's

if 12dField was used to pickup the points then the attributes can be used to populate the conformance panel automatically, for example the control lines and primary and secondary edge strings. On selecting the string the panel will be updated.

Pavement report

Position of option on menu: Survey =>Conformance =>Pavement report

The **Pavement report** option generates a conformance report on surveyed points representing the top of an as-built pavement, compared against string data representing the top of a designed pavement (level conformance), and compared against tin data representing the bottom of an as-built pavement (thickness conformance).

In addition to the conformance report, an output results model of the surveyed points can be generated, grouping the points by colour into their conformance zones (i.e. *within tolerance*, *above tolerance*, *below tolerance*, and *not tested*). The points in the results model can have z-values and vertex text set to show various combinations of point level, point conformance, point error, pavement thickness and pavement thickness error.

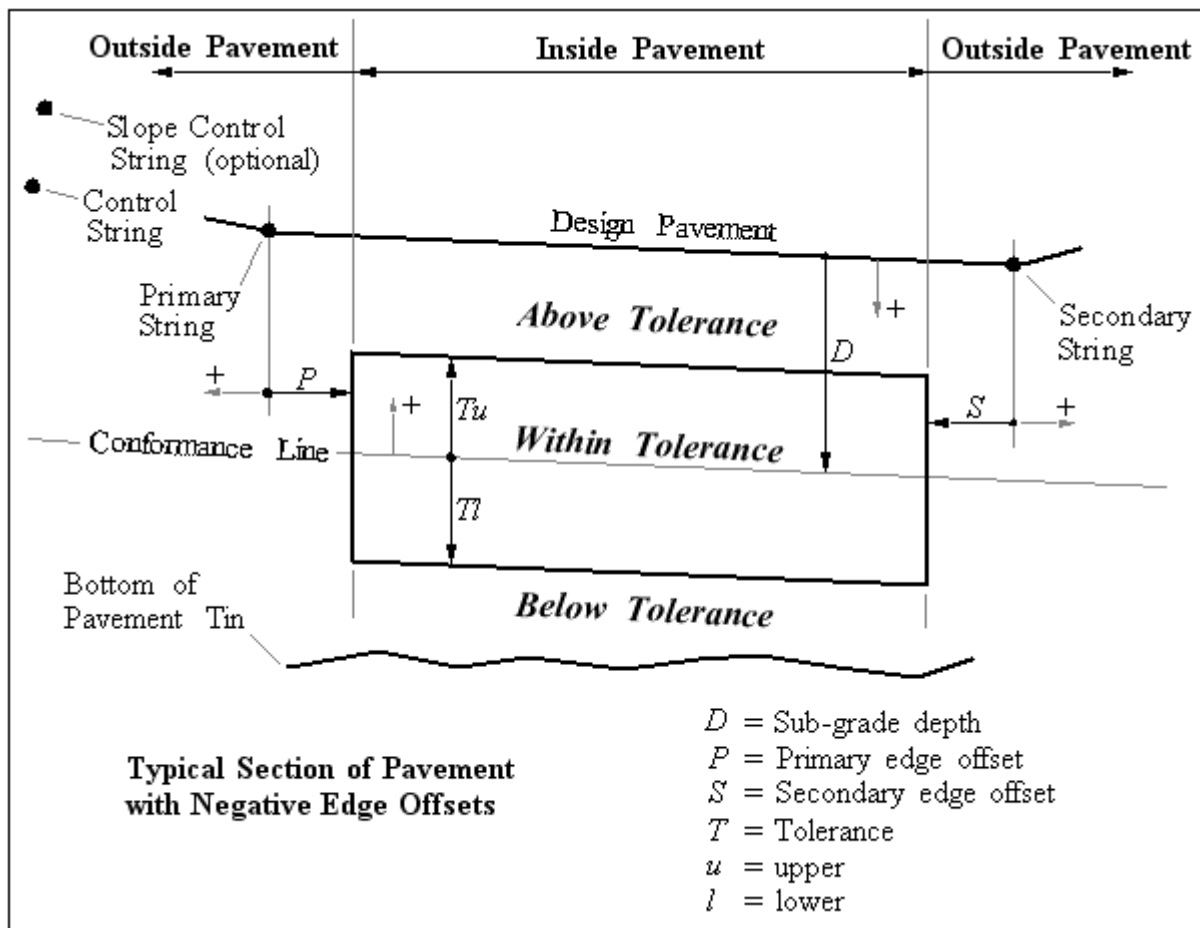

Note1: the term *point conformance* is used here to refer to a point's distance from design

(distance from the conformance line on diagram below), while the term *point error* refers to a point's distance out of tolerance. As such, a point that is within tolerance (i.e. a *conformant point*) will, in general, have a non-zero conformance and a zero error, while a point that is out of tolerance (i.e. a *non-conformant point*) will have both a non-zero conformance and a non-zero error.

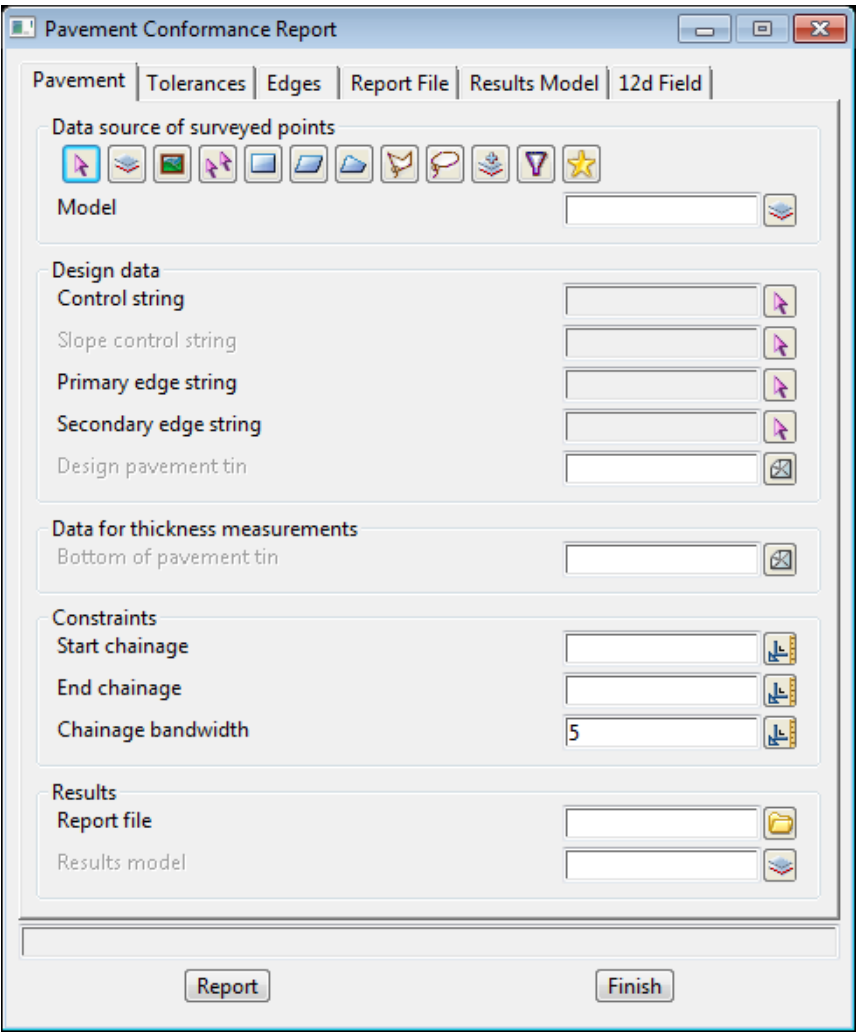

Note2: the point conformances and errors can be measured either vertically or perpendicular to the conformance line. The conformance line is the line from which all point conformances and tolerances are measured, and is always parallel to the design pavement line. When testing a sub-grade survey, the conformance line will normally be below the design pavement line, but when testing a completed-construction survey, the two lines should normally coincide.

Note3: the optional pavement thickness measurements are always made vertically downwards from the surveyed points, to the tin representing the bottom of pavement. Pavement thickness errors will be non-zero wherever the pavement is found to be too thick or too thin. When testing for both level conformance and thickness conformance, both tests must pass for a point to be considered conformant.

A typical section of pavement is shown in the diagram below, along with a schematic showing how the surveyed points are tested for level conformance:

Selecting Pavement report brings up the Pavement Conformance Report panel

Pavement Tab:

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source of points		source box		
-----------------------	--	------------	--	--

all points selected with this source box (whether they exist in point-string form or line-string form) will be considered as the set of surveyed points to be tested for conformance.

***Note:** the data for the Point Description column in the report will be taken from the string names of the selected points. If **all** the string names are blank, however, the point description data in the report will show point ids representing the sequential order that the points are reported in. The results model (if generated) will always have the string names of each point set to match the reported point description.*

Design data

Control string	string box
----------------	------------

the string selected with this box should normally represent the road centreline, and will be used to determine the chainage and offset of each surveyed point

Slope control string string box

the Slope control string is optional. If no string is selected, the Control string, above, will be used as the Slope control string. The line that is formed in plan, from a surveyed point to the nearest point on the Slope control string, defines the vertical plane used to conform that surveyed point. The slope formed between the primary and secondary strings on this vertical plane, is the design slope for that surveyed point.

Primary string string box

the string selected with this box should represent one edge of the designed pavement (normally the edge that is closer to the Control string)

Secondary string string box

the string selected with this box should represent the other edge of the designed pavement (normally the edge that is further away from the Control string).

Note: *If the selected string is the same as the Primary string, or if no string is selected, then the pavement is defined by one string and is considered to be flat (i.e. zero cross-fall), and to have a width defined by the Primary and Secondary edge offsets (on the Tolerances Tab). This feature can be useful for identifying any surveyed points that are close to an edge line.*

Design pavement tin

if selected this tin will be used for design levels rather than the primary and secondary strings.

Data for thickness measurements**Bottom of pavement tin** tin box available tins

the Bottom of pavement tin is optional. If not selected, the pavement is not tested for thickness conformance. The tin selected with this box should represent the as-built bottom surface of the pavement currently being tested.

Constraints**Start chainage** real box

the start chainage of the surveyed points to be conformed. Any point with a chainage less than the start chainage will not be tested. By default, the start chainage is set when the Control string is selected, but a different value can be typed in.

End chainage real box

the end chainage of the surveyed points to be conformed. Any point with a chainage greater than the end chainage will not be tested. By default, the end chainage is set when the Control string is selected, but a different value can be typed in.

Chainage bandwidth real box 5.0

if zero or blank, the surveyed points are simply sorted in ascending chainage order. However, if a value greater than zero is entered, the surveyed points will also be sub-sorted into chainage bands, in ascending offset order. Within each chainage band, the difference between the maximum and minimum chainage will be less than the Chainage bandwidth. This is a useful feature if the surveyed points are set out in rows of roughly equivalent chainage.

Results**Report file** file box *.rpt

the name of the conformance report file to be created. If no extension is given, it will be given an extension of .rpt.

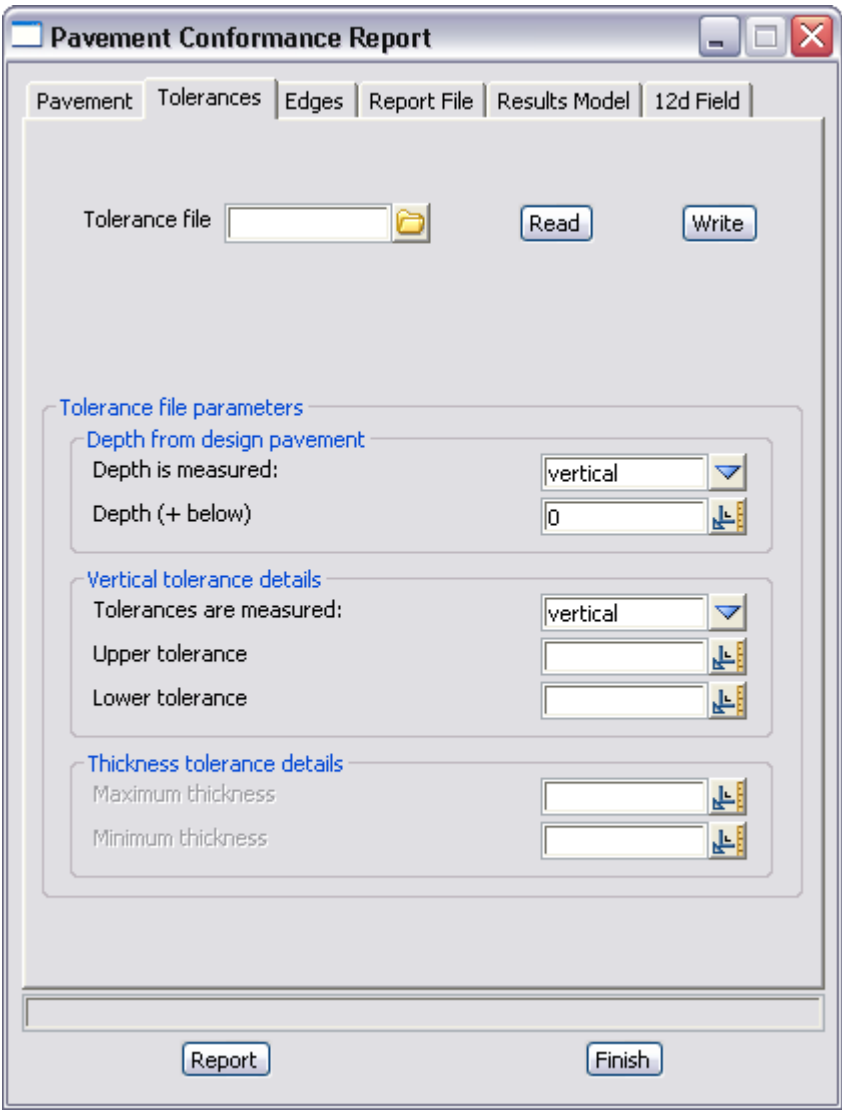

Results model model box available models

the name of the results model to be created. If blank, the results model is not created.

Report button
generates the conformance report file and the results model. This button can be activated regardless of which panel tab is currently active.

Finish button
exits the option and closes the panel. This button can be activated regardless of which panel tab is currently active.

Tolerances Tab:

The fields and buttons have the following functions:

Field Description	Type	Defaults	Pop-Up
Tolerance file	file box		*.tol

the name of the tolerance file used to load and/or save the details of the conformance. If no extension is given, it will be given an extension of .tol. The tolerance file stores the details of every field on the Tolerances Tab, the Report File Tab, and the Results Model Tab. The tolerance file itself is not required to run a conformance test - it is merely provided as a convenience.

Read button

Pressing this button will populate the panel fields on the last three panel tabs, with the data stored in the tolerance file. If data for a particular field is not found, that field remains unaffected.

Write button

Pressing this button will create a new tolerance file or replace an existing one. The contents of all non-blank fields on the last three panel tabs, are written to the file at this time.

Depth from design pavement

Depth is measured choice box vertical perpendicular to pavement vertical

whether the sub-grade depth is measured perpendicular to the pavement or vertically (refer to parameter D on the diagram above)

***Note:** since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.*

Depth (+ below) real box 0.0

the depth of the conformance line from the design pavement (refer to parameter D on the diagram above). If testing a sub-grade survey, this value will normally be greater than zero. If testing a completed-construction survey, however, this value will normally be zero, and the conformance line will coincide with the design pavement line.

Vertical tolerance details

Tolerances are measured choice box vertical perpendicular to pavement vertical

whether the conformance tolerances are measured perpendicular to the pavement or vertically (refer to parameters Tu and Tl on the diagram above). This field also determines whether the reported point conformances and point errors are measured perpendicular or vertically.

***Note:** since pavements typically have cross-fall slopes of less than 7%, the value of this setting should make very little difference to the results.*

Upper tolerance real box

the upper allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter Tu on the diagram above). This value is normally zero or greater.

Lower tolerance real box

the lower allowable distance that a surveyed point may be from the conformance line, in order to be conformant (refer to parameter Tl on the diagram above). This value is normally zero or less.

Thickness tolerance details

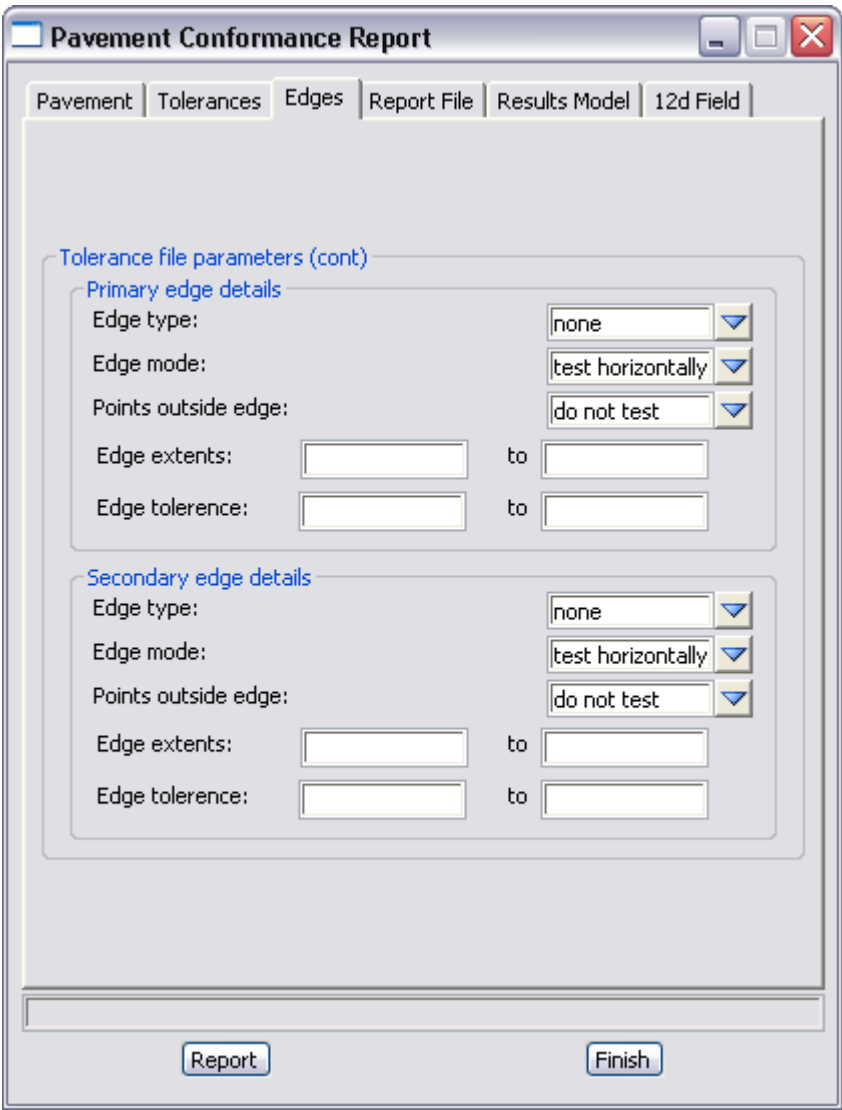

Maximum thickness real box

the maximum allowable vertical distance that a surveyed point may be above the Bottom of pavement tin, in order to be conformant. If blank, there will be no upper limit to the pavement thickness.

Minimum thickness real box

the minimum allowable vertical distance that a surveyed point may be above the Bottom of pavement tin, in order to be conformant. If blank, there will be no lower limit to the pavement thickness.

Edges Tab:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
The settings for Primary edge details and Secondary edge details are the same.			

Tolerance file parameters (cont).

Primary edge details /Secondary edge details

Edge type	choice box	left, right, join, none
<i>left:</i> the string is the left hand edge of the pavement. <i>right:</i> the string is the right hand edge of the pavement. <i>join:</i> the string is joint between pavements. <i>none:</i> the string is not used for edge checks.		
Edge mode	choice box	test horizontally, test vertically & horizontally
<i>test horizontally:</i> the edge is only tested for horizontal conformance <i>test vertically & horizontally:</i> the edge is only tested for both horizontal and vertical conformance		
Points outside edge	choice box	do not test, test vertically
<i>Determines what to do with any surveyed points found outside the pavement.</i>		

***do not test:** points outside the edge are not tested. The points will be classified as untested, and in the results model, will have their vertex text set to EDG **Note:** untested points do not appear in the conformance report.*

***test vertically:** points outside the edge are tested vertically.*

Edge extents

Enter the range around the nominal edge in which a point is considered to be an edge check. This is relative to the 'left/right' setting for the edge, +ve is outside the pavement and -ve into the pavement.

Edge tolerance

Enter the tolerances from the design edge, this is relative to the 'left/right' setting for the edge, +ve is outside the pavement and -ve into the pavement.

title of the person required to sign the report (optional)

The next tab on the panel is the Results Model Tab:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Clean results model beforehand	tick box	off	
<i>whether to clean the contents of an existing results model before re-running the option</i>			
Z values are	choice box	levels	levels conformances errors thicknesses thickness errors

determines what z values to give the points generated in the results model

***Note:** any untested points in the model will have their z values set to their original point levels, regardless.*

Vertex text shows	choice box	conformances	levels conformances errors thicknesses
--------------------------	------------	--------------	-------------------------------------------------

thickness errors

determines what values to show in the vertex text of the points generated in the results model

Note1: any points that pass the level conformance test will have a zero error. For these points, if the vertex text is set to **errors**, no text will be set. Likewise, any points that pass the thickness conformance test will have a zero thickness error. For these points, if the vertex text is set to **thickness errors**, no text will be set.

Note2: any untested points in the model will have the vertex text set to show one of five possible error codes, explaining why the point was not tested. The error codes are **NUL** (invalid z-value), **OCR** (outside chainage range), **ERR** (intersection error or similar), **EDG** (outside pavement edge), and **NTN** (bottom of pavement tin not defined at point).

Vertex textstyle data	textdata box	user textdata favorites
------------------------------	--------------	-------------------------

controls the appearance of the vertex text for the points generated in the results model

Colours

Separate models by colour tick box

if ticked the results model will be several models, each result colour going to a separate model named with a suffix of the colour name.

Points within tolerance	colour box	green	available colours
--------------------------------	------------	-------	-------------------

colour for points within tolerance (i.e. points that pass both the level and thickness conformance tests)

Points above tolerance	colour box	red	available colours
-------------------------------	------------	-----	-------------------

colour for points above tolerance (i.e. points that are above the Upper tolerance or points where the pavement is thicker than the Maximum thickness)

Points below tolerance	colour box	cyan	available colours
-------------------------------	------------	------	-------------------

colour for points below tolerance (i.e. points that are below the Lower tolerance or points where the pavement is thinner than the Minimum thickness)

Untested points	colour box	grey	available colours
------------------------	------------	------	-------------------

colour for untested points

Note: untested points do not appear in the conformance report.

Create tin of tested results model points

Tin name	tin box	available tins
-----------------	---------	----------------

name of the tin to create. If the tin already exists, a prompt will ask if it should be replaced. If this field is blank, or if the Results model field (on the Pavement Tab) is blank, no tin will be created.

Note: the tin will be created only with the set of tested points created in the Results model, and (depending on what the points' z-values are set to in the Results model) can be used to quickly display contour maps of the results, or to create a Bottom of pavement tin for the next pavement layer to be tested. When creating the tin, an attempt is made to null any triangles outside the shrink-wrapped boundary of the tested points. The boundary polygon used for this nulling procedure is determined from the extremity points of each offset-sorted chainage band (see Chainage bandwidth on the Pavement Tab).

Model for tin	model box	available models
----------------------	-----------	------------------

model for tin to be placed in, for viewing purposes. If blank, the tin is not placed into a model.

Tin colour	colour box	available colours
-------------------	------------	-------------------

colour for tin. If blank, the tin will adopt the colour selected for Points within tolerance.

12d Field Tab:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Populate from 12dField attr's

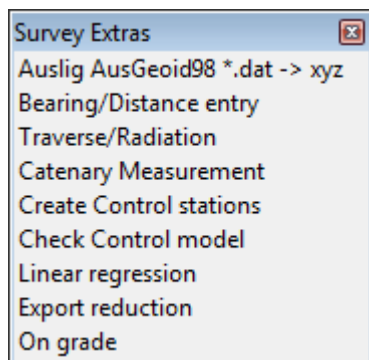

if 12dField was used to pickup the points then the attributes can be used to populate the conformance panel automatically, for example the control lines and primary and secondary edge strings. On selecting the string the panel will be updated.

Extras

Position of menu: Survey =>Extras

The extras walk-right menu contains extra survey options. some of which are still being developed.

The extras walk-right menu is

Convert AusGeoid98 file into XYZ format
entry and edit by plane bearing and plane distance
bearing distance entry to produce traverse or radiations
create points in a vertical plane
create control stations
check unique point id in control model
Linear regression
write out a field file from a survey function

For the option *Auslig AusGeoid98 *.dat ->xyz*, go to

Bearing/Distance entry

Traverse/Radiation

Catenary measurement

Create Control Station

Check control model

Linear regression

Reduction to field file

On grade

[AusGeoid98 *.dat -> xyz](#)

[Plane Bearing/Distance Entry](#)

[Bearing/Distance Entry for Traverse/Radiation](#)

[Catenary Measurement](#)

[Create Control Stations](#)

[Check Control Model](#)

[Linear Regression](#)

[Survey Function to Field File](#)

[On Grade](#)

AusGeoid98 *.dat -> xyz

Position of option on menu: Survey =>Extras =>Auslig AusGeoid98 *.dat->xyz

The *Ausgeoid98 *.dat -> xyz* option allows the conversion of a standard AusGeoid98 *.dat file into a XYZ format. This format can then be read into 12d. The values in the XYZ file will have the following meaning

X value will represent the Longitude

Y value will represent the Latitude

Z value will represent the N value

Selecting *Ausgeoid98 *.dat -> xyz* brings up the *Ausgeoid98 *.dat -> xyz* panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input file	file box		*.dat
<i>this filename of the AusGeoid file. The .dat extension is added by default.</i>			
Output file	file box		
<i>this filename of the XYZ file to be produced.</i>			
Ignore header	tick box	ticked	
<i>if ticked, the first line in the *.dat file is ignored (usually the header)</i>			
Convert	button		
<i>convert the file.</i>			

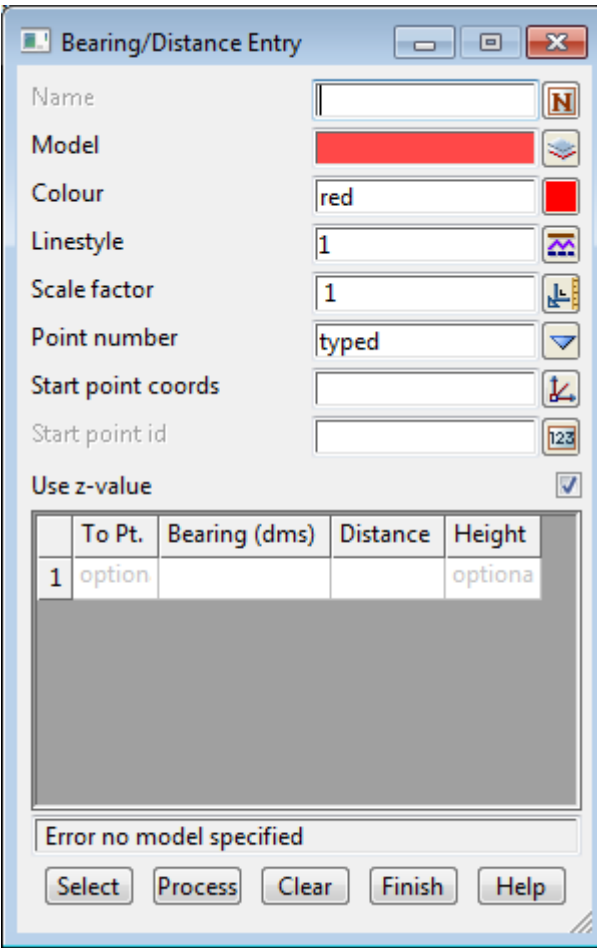

For more information about terminology used in this option, see the Appendix [Geodetics Summary](#).

Plane Bearing/Distance Entry

Position of option on menu: Survey =>Extras =>Bearing/distance entry

The **bearing/distance entry** option allows the input of a traverse by manual input of plane bearings and plane distances or by selecting an existing string.

Selecting **Bearing/distance entry** brings up the **Bearing/Distance Entry** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file
<i>this field is optional. If non-blank, the name of the new string.</i>			
Model	model box		available models
<i>if non-blank, the model of the new string. If blank, the original string model is used.</i>			
Colour	colour box	red	available colours
<i>if non-blank, the colour of the new string. If blank, the original string colour is used.</i>			
Linestyle	input	1	available line styles
<i>line style of the string.</i>			
Scale factor	input	projection scale	
<i>This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor</i>			
<i>The scale factor could be a point scale factor, a line scale factor or a combined scale factor.</i>			
<i>The final distance will be used for coordinate calculations.</i>			
Use z- value	tick box	transit	
<i>if ticked, the z-values for each point can be entered.</i>			
<i>If no ticked then z-values are not entered.</i>			

Point id	input	typed	none, auto increment, typed
-----------------	-------	-------	-----------------------------

if **none**, no point ids are entered and the grid control will not show a column for point ids.

If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.

if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.

VALUES IN GRID grid box

*The columns shown in the grid will depend on the selection of the **Use z- value** and **Point id** fields.*

	To Pt.	Bearing (dms)	Distance	Height
1				

To Pt.

*if **none** is selected for the **Point id** field, this column will not be displayed.*

*if **auto increment** is selected for the **Point id** field, this column will not be displayed.*

*if **typed** is selected for the **Point id** field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.*

Bearing (dms) angle box

The user should enter the bearing for the segment into this field.

Distance

the user should enter the distance of the segment.

Height

*This column will only be visible in the grid if the **Use z- value** tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be assigned to the newly created vertex.*

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

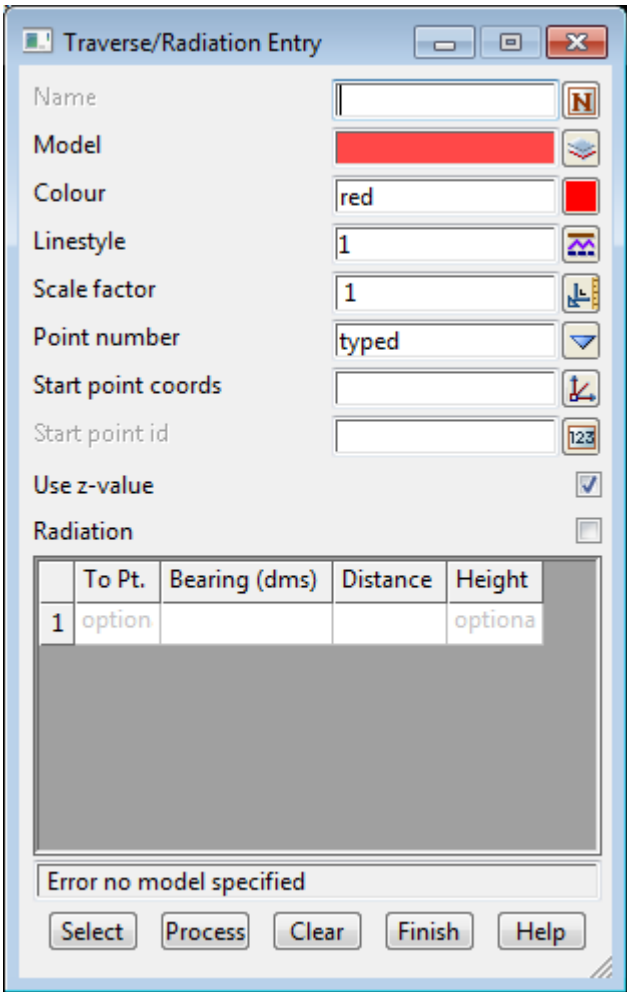

Bearing/Distance Entry for Traverse/Radiation

Position of option on menu: Survey =>Extras =>Traverse/Radiation

The Traverse/radiation option allows the input of a traverse or radiations by manual input of plane bearings and plane distances or by selecting an existing string.

Bearing/Distance Traverse/Radiation Entry

Selecting Traverse/Radiation brings up the **Bearing/Distance Traverse/Radiation Entry** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name	name box		defined names from names.4d file
<i>this field is optional. If non-blank, the name of the new string/strings.</i>			
Model	model box		available models
<i>if non-blank, the model of the new string. If blank, the original string model is used.</i>			
Colour	colour box	red	available colours
<i>if non-blank, the colour of the new string. If blank, the original string colour is used.</i>			
Linestyle	input	1	available line styles
<i>line style of the string.</i>			

Scale factor input projection scale

*This value will be applied to any entered distances. i.e. final distance = entered distance * scale factor*
The scale factor could be a point scale factor, a line scale factor or a combined scale factor.
The final distance will be used for coordinate calculations.

Start point coords xyz pick box

coordinates of the first point. The bearing/distances start from this point.

Start point id input

if Point ids is auto increment, point id of the first point.

Point id input typed none, auto increment, typed

*if **none**, no point ids are entered and the grid control will not show a column for point ids.*

*If **auto increment** then the values of point ids will be incremented by a value of 1 starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated. No column for point ids is shown in the grid control.*

*if **typed** then the values of point ids will be incremented by a value of 1, starting from the specified **Start point id**. If no **Start point id** is specified then no point ids will be allocated unless a value is entered in the grid control on which time the next value in the grid will have a incremented value. The column for point ids is shown in the grid control.*

Use z- value tick box

*if **ticked**, the z-values for each point can be entered.*
*If **not ticked** then z-values are not entered.*

Radiation tick box

*if **ticked**, the bearing distances are used to create points that are radiations from the start point.*
*If **not ticked** the bearing/distances are used to create a traverse string beginning at the start point.*

Values In Grid grid box

*The columns shown in the grid will depend on the selection of the **Use z- value** and **Point id** fields.*

	To Pt.	Bearing (dms)	Distance	Height
1				

To Pt. input

*if **none** is selected for the **Point id** field, this column will not be displayed.*

*if **auto increment** is selected for the **Point id** field, this column will not be displayed.*

*if **typed** is selected for the **Point id** field, this column will be displayed. In this case, the point id will increment automatically by entering over the field. If a new value is typed into the To Pt. field, the next line will increment from that number.*

Bearing (dms) angle box

The user should enter the bearing for the segment into this field.

Distance input box

the user should enter the distance of the segment.

Height input box

*This column will only be visible in the grid if the **Use z- value** tickbox has been ticked. The user should enter the height of the point. This value will not be used for calculation of the segment. It will simply be*

assigned to the newly created vertex.

Select button

on pressing the select button, a user is able to pick an existing string from the current view. If a non-traverse type string is selected an option to convert it to a traverse string will be given. The grid control will be filled with the relevant information for the traverse string.

If a traverse string has been modified by some other process (e.g. move) an option will be given to adopt the new characteristics of the string as displayed or revert back to the information that originally defined the traverse string. Depending on which option is selected, the grid will be filled with the relevant information.

Process button

changes to the traverse can be made in the grid control for lines already defined. For example, a distance entry may be incorrectly typed in and edited some time later. By using the process button the traverse string is re-calculated using the current values in the grid control.

Catenary Measurement

Position of option on menu: Survey =>Extras =>Catenary measurement

The **Catenary measurements** option allows for the picking up of data in the vertical plane between two known points using only a bearing and a vertical angle. For example, picking up wires between towers where a distance measurement to the cable is not possible.

Selecting **Catenary measurements** brings up the **Catenary Measurements** panel

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Instrument setup

Coords	xyz box
---------------	---------

the xyz coordinates of the instrument.

Id input box
the vertex id (point id) of the instrument.

Height input box
the height of the instrument.

1st Attachment

Coords xyz box
the xyz coordinates of the attachment point of the cable on the first tower.

Id input box
the vertex id (point id) of the first tower.

2nd Attachment

Coords xyz box
the xyz coordinates of the attachment point of the cable on the second tower.

Id input box
the vertex id (point id) of the second tower.

Reading

Horizontal angle correction angle box
angle to be subtracted from the Horizontal Angle reading to give true bearing.

Reading No input box
number for the reading.

Horz. Angle angle box
Horizontal Angle reading. The Horizontal angle correction is subtracted from this to give the true bearing.

Vert. Angle angle box
Vertical Angle reading.

Results

Create string tick box ticked
if ticked, a string of the observed points is created.

Name input box
name of the created string.

Model model box available models
name of the model for the created string.

Colour colour box red available colours
the colour of the created string.

Linestyle input 1 available linestyles
linestyle of the created string.

- Report file

file box

*.rpt files
- if non-blank, the name of the file to write the report to.
- Process

button

reduce the angle readings.

Create Control Stations

- Position of option on menu:

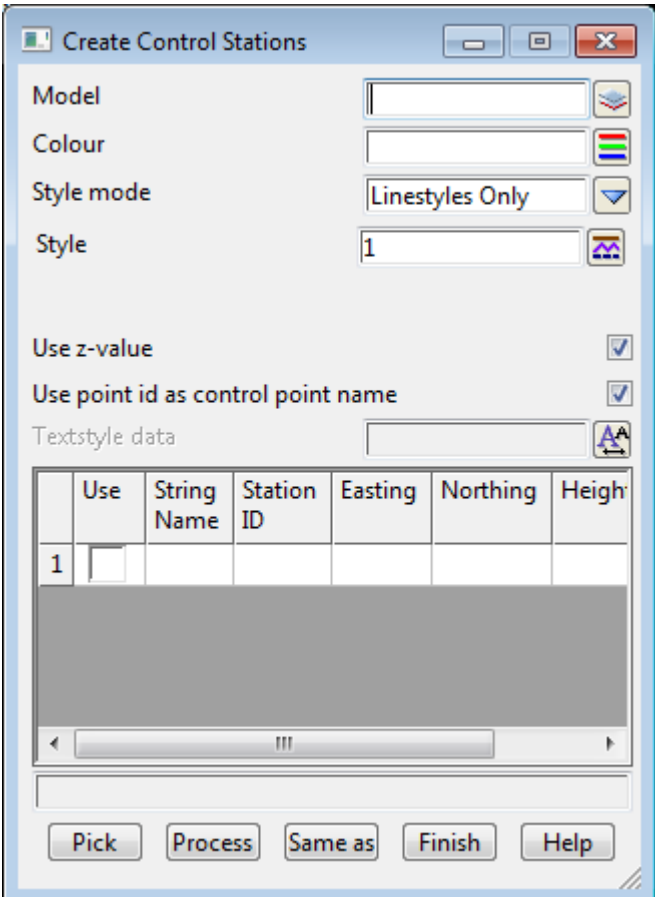

Survey =>Extras =>Create Control stations
- Position of option on menu:

Strings =>Create =>Create Control Stations

A *control station* (for surveying) consists of a one point string. For V6, the *point name* is the name of the control station. For V5 and before, the *string name* is used as name of the control station. Control stations are used when reducing 12d field files in the *Survey Reduction* module.

The **Create Control Stations** options allows the user to define control stations in a given model. The option checks that the point ids are unique in the control model.

Selecting **Create Control Stations** brings up the **Create Control Station** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models
<i>name of the model for the control stations.</i>			
Colour	colour box	red	available colours

the colour of the new control stations.

Line style input 1 available line styles
line style of the control station.

Use z-value tick box ticked
if ticked, the height value must be specified for all of the stations.

Use point id as control point name tick box ticked
*if ticked, the point names are used as the names of the control points and the **point names** are checked for uniqueness.
If not ticked, the name of the string is used as the names of the control points and the **string names** are checked for uniqueness. This is only for compatibility in pre **12d Model V6.0**.*

Station name Easting Northing Height Remark
*the information for stations to be created is entered into the grid. The stations are created by selecting the **Process** button.*

*If a station name is typed in and the <enter> key pressed then the Model is searched and if a control station already exists of the same name (either point name or string name depending on the **Use point id as control point name** flag), the co-ordinates are displayed in the grid.*

The grid control values can be entered/displayed using valid inputs into the various fields.

Station name. *The associated text that identifies the control point.*
Easting *The easting coordinate of the control point.*
Northing *The northing coordinate of the control point.*
Height *The height of the station. (Only displayed if the use z-value tickbox is selected.)*
Remark *The description of the control station.*

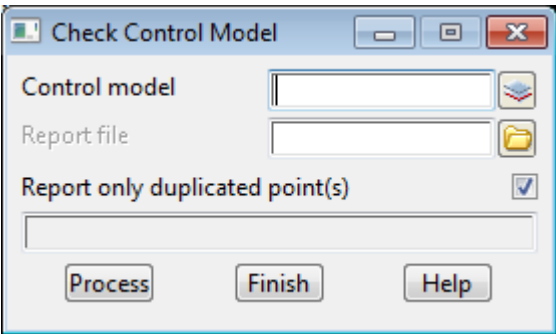

Process button
*After the **Process** button is chosen, the control stations in the grid are created. If a station of the given name already exists in the control Model, the user is asked if the co-ordinates of the station are to be updated by the values given in the grid.*

Same as button
*After the **Same as** button is chosen, another string is selected and information about it is used for the Model, Colour and Point style fields in this panel.*

Check Control Model

Position of option on menu: Survey =>Extras =>Check Control model

The **Check control model** option checks that there are no points in the control model with the same point id. A report of all the points in the control models, or only those with clashing point ids, is created.
Selecting **Check control model** brings up the **Check Control Model** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Control model <i>the model the check for unique point ids.</i>	model box		available models
Report file <i>if non-blank, the name of the file to write the report to.</i>	file box		*.rpt files
Report only duplicated point(s) <i>if ticked, only those points with duplicated point ids are reported. If not ticked, all points in the control model are written out.</i>	tick box	ticked	
Process <i>check the Control model for duplicated point ids.</i>	button		

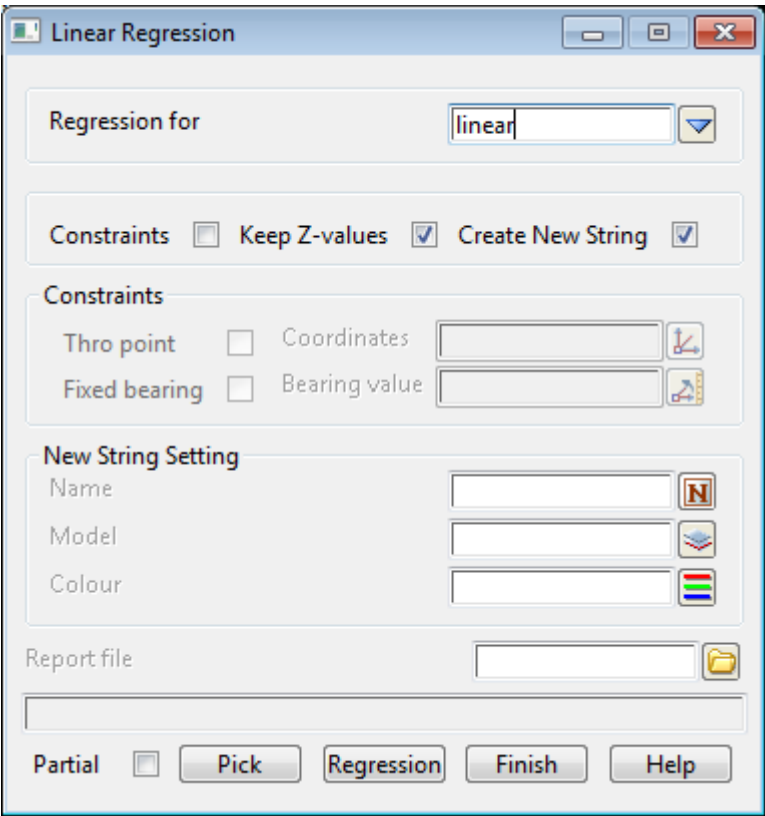

Linear Regression

Position of option on menu: Survey =>Extras =>Linear regression

Position of option on menu: Strings =>Utilities =>Linear regression

The linear regression option will create a line, circle or arc of best fit through points on a string. The line can be constrained to go through a selected point or have a given bearing.

Selecting **linear regression** brings up the **linear regression** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Regression for	choice box	line	line, circle, arc
<i>if line/circle/arc, the line/circle/arc of best fit through the points is created.</i>			
Constraints	tick box		
<i>if ticked, the regression line can be restrained to go through a selected point or be given a selected bearing.</i>			
Keep z-values	tick box	tick	
<i>if ticked, the z-values of the selected string are used on the regression string.</i>			
Create new string	tick box	tick	
<i>if ticked, a new adjusted string is created. If not ticked, the selected string is adjusted.</i>			

Constraints

Thro point	tick box
<i>if ticked, the regression line is constrained to go through the point with co-ordinates given in the Coordinates field.</i>	
Coordinates	
<i>if thro point is ticked, the regression line is constrained to go through the point given in this field.</i>	
Fixed bearing	tick box
<i>if ticked, the regression line is constrained to have the bearing given in the Bearing value field.</i>	

Bearing value

if **thro point** is ticked, the regression line is constrained to have the bearing given in this field.

Name

name box

if non-blank, the name of the new string. If blank, the original string name is used.

Model

model box

available models

if non-blank, the model of the new string. If blank, the original string model is used.

Colour

colour box

available colours

if non-blank, the colour of the new string. If blank, the original string colour is used.

Report file

*.rpt files

if non-blank, a report for the adjustment is created with this name. If non-blank, no report is created.

Partial

tick box

if ticked, only part of the string is used in the regression.

Pick

button

select the string to create a regression line/circle/arc from.

Regression

button

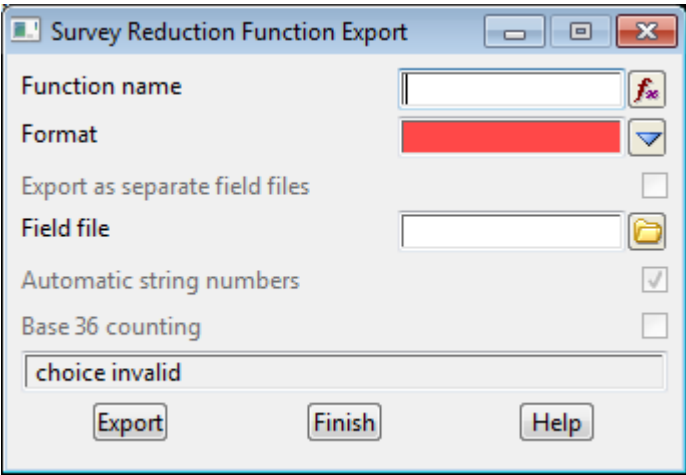

perform the regression.

Survey Function to Field File

Position of option on menu: Survey =>Extras =>Reduction to field file

The **reduction to field file** option writes out the field data from a Survey function to a file in the standard 12d field file format.

Selecting **reduction to field file** brings up the **survey reduction function export** panel

The fields and buttons used in this panel have the following functions.

Field Description

Type

Defaults

Pop-Up

Function name

input

available Survey functions

name of the 12d Survey function to write out a 12d field file for.

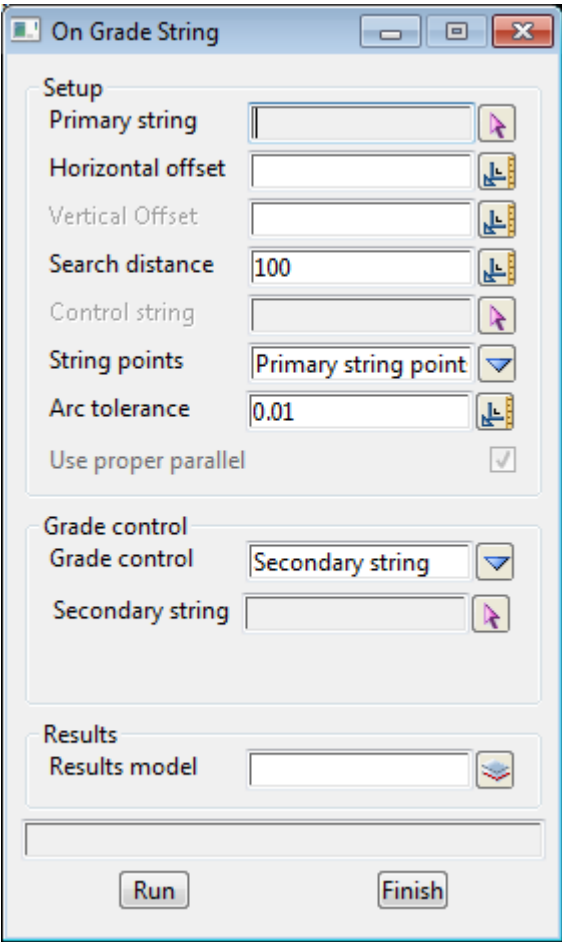

Field file	input	*.fld
<i>name of the 12d field file to write out the Survey field data to.</i>		
Export	button	
<i>create the 12d field file.</i>		

On Grade

- Position of option on menu: Survey =>Extras =>On grade
- Position of option on menu: Strings =>Utilities =>On grade

The **on grade** option produces a string that is a fixed horizontal distance from a selected string with z-values produced by extrapolating the grade from two strings or from a tin.

Selecting **On grade** brings up the **On Grade String** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Primary string	string select		
<i>string to produce the on grade string from</i>			
Horizontal offset	input		
<i>horizontal distance to offset the on grade string from the primary string, relative to the direction of the primary/control string, +ve to the right</i>			

Vertical offset	input	
<i>vertical distance to offset the on grade string from the primary string</i>		
Search distance	input	
<i>only string cuts inside this distance will be considered</i>		
Control string	string select	
<i>if selected, the horizontal distance is measured at right angles to the control string. In this case, the on-grade may not be parallel to the primary string.</i>		
<i>If not selected, the horizontal distance is measured at right angles to the primary string.</i>		
String points	choice box	Primary string points Chainage interval Special chainage file
<i>if Primary string points, the on-grade string has vertices on it where ever there is a vertex on the primary string. Extra points will also be include for the given arc tolerance.</i>		
Arc tolerance	input	
<i>if non zero, chord to arc tolerance to use for adding additional vertices</i>		
Use proper parallel	tick box	
<i>if ticked, the primary string is parallellled to from the on-grade string</i>		
<i>If Chainage interval, vertices are created on the on-grade string corresponding to the given chainage interval along the primary/control string.</i>		
Interval	input	
<i>the chainage interval the use along the primary/control string for creating on-grade vertices.</i>		
<i>If Special chainage file, vertices are created on the on-grade string from chainages on the primary or control string, corresponding to the special chainages file.</i>		
Special chainages	file box	.spc files
<i>the chainage interval the use along the primary/control string for creating on-grade vertices.</i>		
Grade control	choice box	Secondary string Tin
<i>if Secondary string, the grade to use to create z-values on the on-grade string is the grade between the secondary string and the primary string.</i>		
Secondary string	string select	
<i>the grade to use is taken from the secondary to the primary string</i>		
<i>If Tin,</i>		
Tin	tin box	
<i>the tin to use</i>		
Offset	input	
<i>offset from the primary string to the point on the tin to create the grade, relative to the primary string direction, +ve to the right</i>		
Results model	model box	available models
<i>the model for the created on-grade string</i>		
Run	button	
<i>create the on grade string</i>		

Leica

Position of menu: Survey =>Leica

3DP Strings	Write TP Stakeout 3DP String
Alignments to HZA/VTA	TP Alignment

Write TP Stakeout Binary Triangles (TSC Format)

Position of option on menu: Survey => Leica => 1100 =>Triangles (TSC)

The Write *TP Stakeout Binary triangles TSC* option writes out a tin as a TP Stakeout binary file.

On selecting the Triangles (TSC) option, the **Write TP Stakeout Binary Triangles (TSC Format)** panel is displayed.

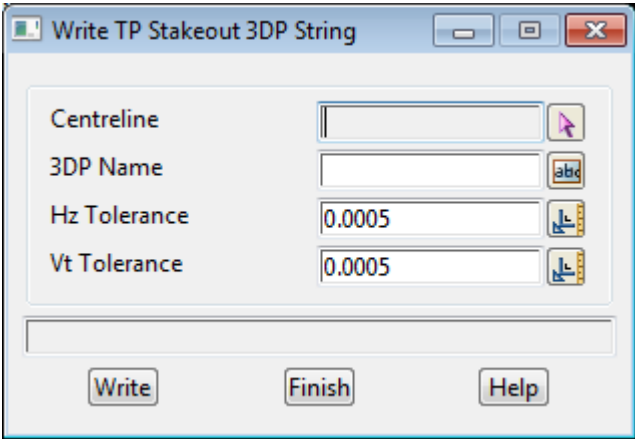

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to write out in TP Stakeout binary format.</i>	tin box		available tins
Tin polygon selection <i>if selected, only triangles with their centroid inside this string are written out</i>	poly string-select		
TP Stakeout binary file <i>name of the file for the triangles</i>	input		*.tsc
Triangles per cell <i>a TP Stakeout parameter</i>			
Copy to GradeSmart 3D <i>if ticked, copy file to GradeSmart folder</i>	tick box		
GradeSmart 3D folder <i>folder for GradeSmart files</i>	folder box		
Write <i>write out the tin in TP Stakeout binary format.</i>	button		

Write TP Stakeout 3DP String

Position of option on menu: Survey => Leica => 1100 =>3DP Strings

This panel creates a TP-Stakeout 3DP format file
Selecting **3DP Strings** brings up the **Write TP Stakeout 3DP String** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Centreline	string select		
<i>select the super alignment or super string to convert, the string must have valid vertical geometry or an error will occur when processing.</i>			
3DP Name			
<i>the name of the 3DP file to be created, the name of the file must be <= 8 characters.</i>			
Hz Tolerance			
<i>the arc to chord tolerance of the created horizontal points.</i>			
Vt Tolerance			
<i>the arc to chord tolerance of the created vertical points.</i>			
Write	button		
<i>write the 3DP file, any errors in processing the selected string will be displayed.</i>			

TP Alignment

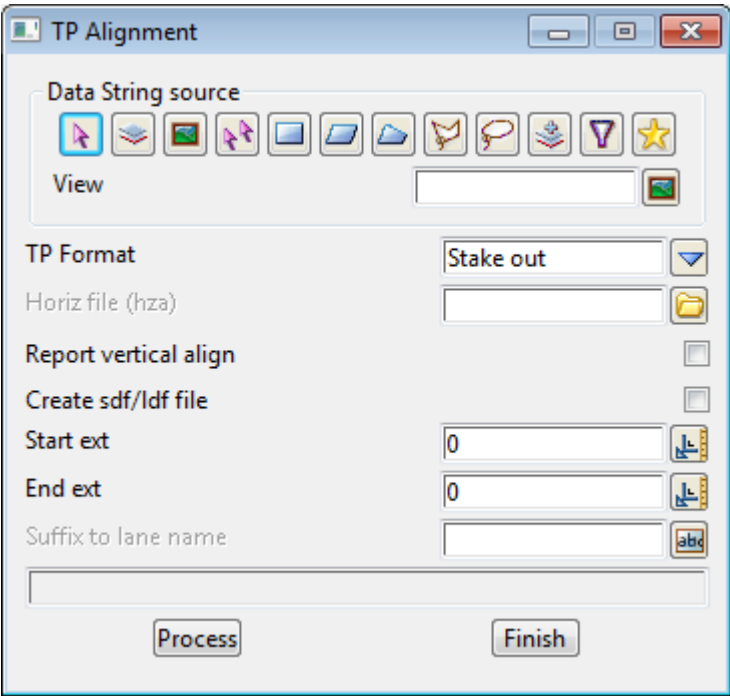

Position of option on menu: Survey => Leica => 1100 =>Alignments to HZA/VTa

This option converts alignments or super alignments into the TP-Setout/TP-Stakeout alignment format. These programs support the clothoid/natural clothoid and cubic parabola transition types. Due to restrictions in the software using these files the file names and alignment names must be <= 8 characters.

On selecting the **Alignments to HZA/VTa** option, the **TP Alignment** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data String source			

Data source type

for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source model

Source of the alignment/super alignment strings to convert.

TP Format choice box Stake out Stake out, Set out

Stake out - write the data out in TP-Stakeout format.
Set out - write the data out in TP-Setout format.

Horiz file (hza) file

The HZA file to create, the name must be 8 characters or less.

Report vertical align tick box

if ticked the vertical alignment will be written to a .VTA file of the same name as the HZA file.

Create sdf/ldf file tick box

if ticked a surface/lane entry will be created for the alignments being written in the SDF/LDF file of the same name as the HZA file.

Start ext input

The start extension to all alignments being written, +ve extends before the start chainage, -ve invalidates that distance +into the alignment.

End ext input

The end extension to all alignments being written, +ve extends after the end chainage, -ve invalidates that distance back into the alignment.

Suffix to lane name

A suffix will be added to the alignment name in the SDF/LDF file entry.

Process button

Create the TP-Stakeout/Setout format files, if errors are encountered during the conversion such as

names > 8 characters the appropriate warnings will be displayed.

Leica 1200

The **Leica 1200** walk-right menu collects under the one menu, options that can work with Leica 1200 instruments.

Create Leica 1200 String Files

Position of menu: Survey=>Leica => 1200 => Strings

This panel creates a points and lines database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate LandXML file and then calling a Leica provided converter to create the DBX files.

Selecting **Strings** brings up the **Create Leica 1200 String Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Jobname

The internal jobname seen inside the Leica software.

Create database tick box

*If ticked will create the 1200 DBX
if not ticked just the LandXML file is created.*

LeicaXML file

The name of the Leica LandXML file to create.

Transition mapping file

*Due to the inadequate specification of transitions in the LandXML schema users must explicitly map
12d transition types to other vendors types.*

Allow discontinuities tick box

If ticked super string discontinuities will not be written to the DBX.

Line vertex ids to CgPoints? tick box

If ticked will write all of the string vertices to CgPoints as well as writing the strings as plan features.

Ignore pts without ID's tick box

If ticked, points without a Point ID will be ignored.

Folder for DBXs file

The folder to create the databases in.

Data Strings

Data source type model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source model

The data source to write to the DBX files

Write button

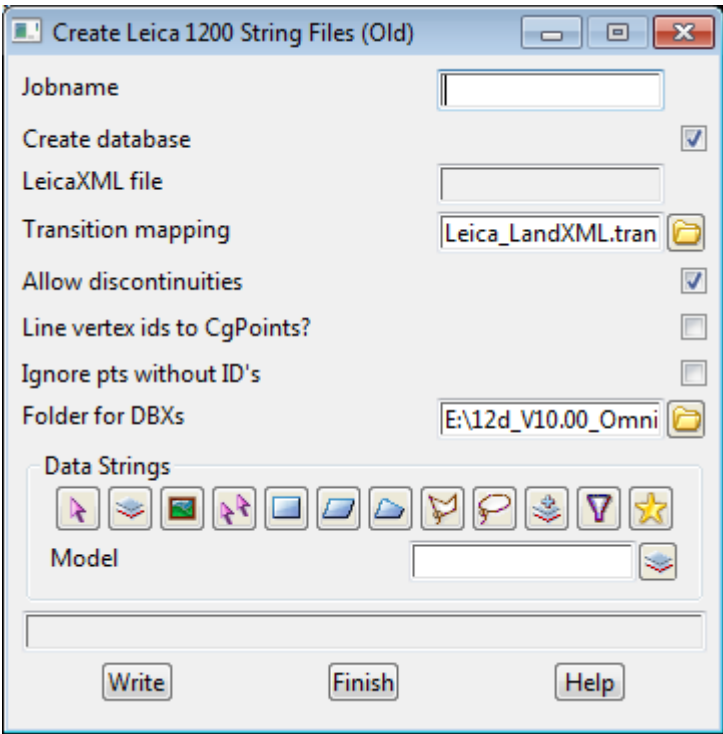

Create the Leica 1200 Strings DBX files.

Create Leica 1200 String Files (Old)

Position of menu: Survey =>Leica => 1200 => Strings (V4)

This panel is identical to [Create Leica 1200 String Files](#) but calls an older version of the Leica LandXML/DBX converter.

Selecting **Strings (V4)** brings up the **Create Leica 1200 String Files (Old)** panel

Create Leica 1200 Triangle Files

Position of menu: Survey => Leica => 1200 => Triangles

This panel creates a triangle database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate LandXML file and then calling a Leica provided converter to create the DBX files.

Selecting **Triangles** brings up the **Create Leica 1200 Triangle Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Jobname			

The internal jobname seen inside the Leica software.

Create database tick box

*if ticked will create the 1200 DBX,
if not ticked just the LandXML file is created.*

LeicaXML file

The name of the Leica LandXML file to create.

Folder for DBXs file

The folder to create the databases in.

Tin input

The tin to write to the DBX.

Tin Polygon selection

Select a polygon for the region of the tin to write out.

Write button

Create the Leica 1200 Triangle DBX files.

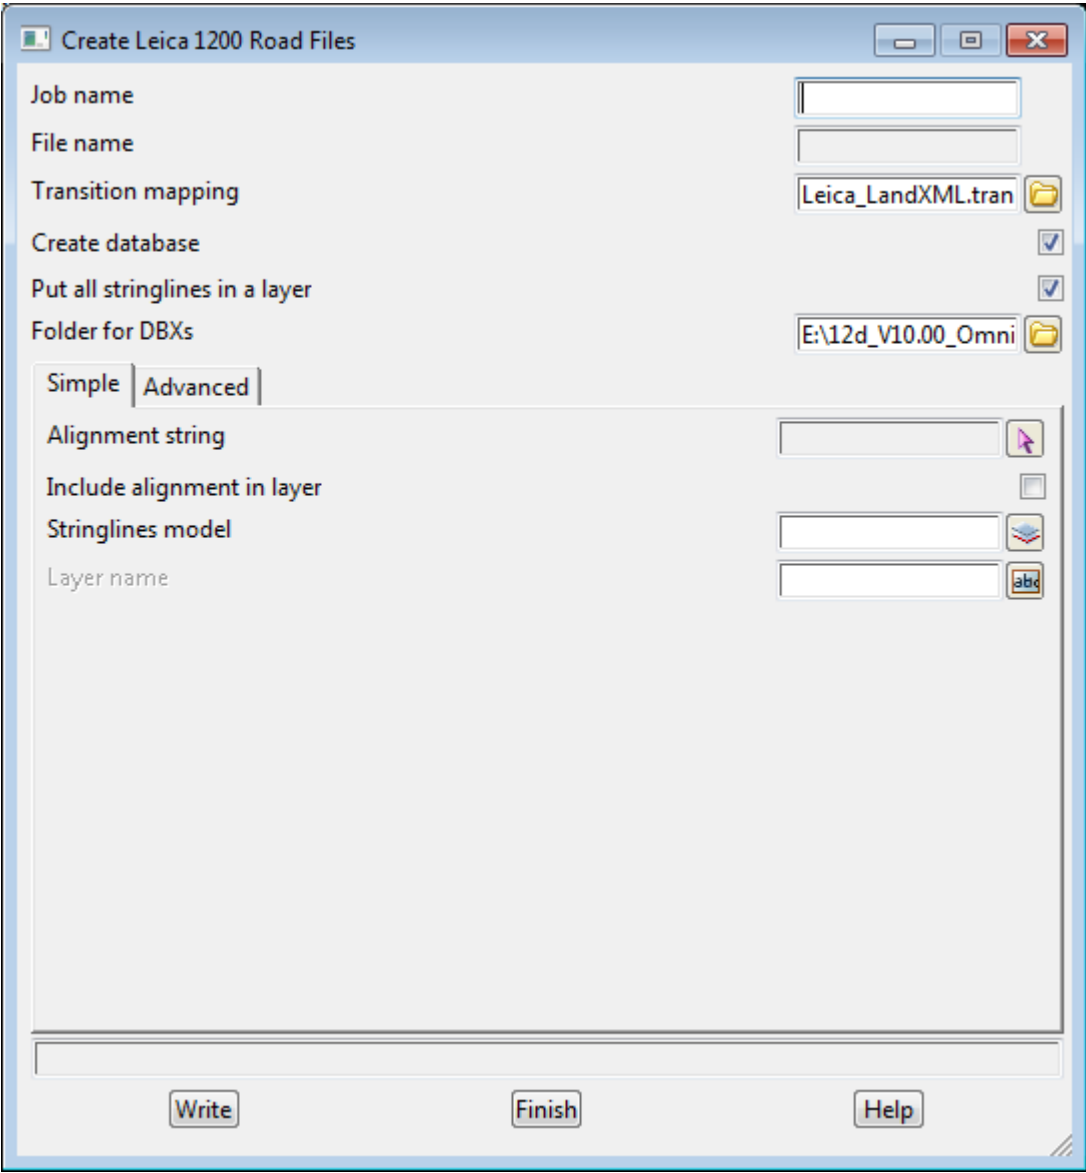

Create Leica 1200 Road Files

Position of menu: Survey =>Leica => 1200 => Roads

This panel creates a roads database for use on the Leica 1200 series of TPS/GPS instruments. This is done by creating an intermediate Leica LandXML file and then calling a Leica provided converter to create the DBX files.

This panel allows either a flat group of strings to be written to the DBX or multiple roads and layers in those roads dependent on the users needs.

Selecting **Roads** brings up the **Create Leica 1200 Road Files** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Jobname

The internal jobname seen inside the Leica software.

File name

The name of the Leica LandXML file to create.

Transition mapping	file
---------------------------	------

Due to the inadequate specification of transitions in the LandXML schema users must explicitly map 12d transition types to other vendors types.

Create database	tick box
------------------------	----------

*if ticked will create the 1200 DBX,
if not ticked just the LandXML file is created.*

Put all stringlines in a layer	tick box
---------------------------------------	----------

if not ticked then the strings in the model selected in the **Stringlines model** box in the "**Simple**" tab are written to the LandXML file with no layer grouping.
if ticked there are 2 options.

Folder for DBXs file

The folder to create the databases in.

Simple Tab

The "**Simple**" tab allows a centreline and model of strings to be written to a single layer in the DBX.

Alignment string string select

The centreline for the layer.

Include alignment in layer tick box

if ticked the centreline is included in the layer, is cut as part of the road surface.

Stringlines model model box

The model of strings forming the road surface/layer.

Layer name

The default layer name is the model name, this can be changed here.

Advanced Tab

The "**Advanced**" tab allows multiple centrelines and strings to be written to layers in the DBX. For each alignment string there can be up to 10 layers, e.g. an entire subdivision can be uploaded by nominating the centreline for each road and adding the models for the final surface layers, boxing layers etc.

Alignment string

The centreline for the 10 optional layers.

Alignment in layer 1

If ticked the centreline is included in the 1st layer, is cut as part of the road surface.

Stringlines models 1

The model of strings forming the road surface/layer.

Layer name 1

The default layer name is the model name, this can be changed here.

For the rest of the option layer enter the model and layer name to suit.

To create extra roads/centrelines right click on the row number in the grid box to insert an extra row and fill out to suit.

Write button

Create the Leica 1200 Road DBX files.

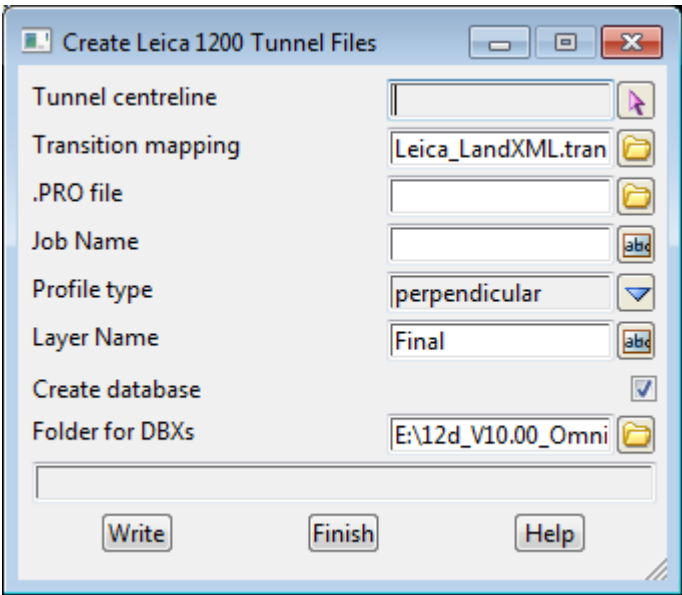

Create Leica 1200 Tunnel Files

Position of menu: Survey =>Leica => 1200 =>Tunnel

This panel creates a tunnel database for use on the Leica 1200 series of TPS instruments. This is done by creating an intermediate Leica LandXML file and then calling a Leica provided converter to create the tunnel DBX files.

This panel allows a single centreline and layer to be written to a tunnel DBX, it uses some industry standard tunnel definition files (.PRO,.PRA) to define the shape of profiles and the chainages they are applied at, these files are created via a text editor or other software packages.

Selecting **Tunnel** brings up the **Create Leica 1200 Tunnel Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tunnel centreline	string select		
<i>The centreline for the tunnel.</i>			
Transition mapping	file	Leica_LandXML.trans_map	
<i>Due to the inadequate specification of transitions in the LandXML schema users must explicitly map 12d transition types to other vendors types.</i>			
.PRO file	file		
<i>The profiles file containing the definition of the tunnel elements.</i>			
Create database			
<i>If ticked will create the 1200 tunnel DBX if not ticked, just the Leica LandXML file is created.</i>			
Jobname			
<i>The internal jobname seen inside the Leica software.</i>			
Profile type	choice box	perpendicular	perpendicular, vertical
<i>perpendicular - the profiles are to be interpreted normal to the grade of the tunnel vertical alignment. vertical - the profiles are not adjusted to the grade of the tunnel vertical alignment.</i>			

Layer name Final

The name of the tunnel DBX layer.

Create database tick box

*if ticked will create the 1200 DBX
if not ticked just the LandXML file is created.*

Folder for DBXs file

The folder to create the databases in.

Write button

Create the tunnel DBX files.

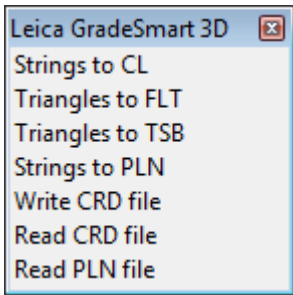

For more information on PRO/PRA tunnel definition files please see [Definition of the PRO and PRA definition files](#)

Leica GradeSmart 3D

The name of the layer in the LN3 file.

Layer colour colour yellow

*The colour of the strings in the Topcon LN3 file.
Please note that the LN3 format colour string by layer and hence individual string colours cannot be mapped to a LN3 file.*

LN3 file name

The name of the LN3 file.

Internal name

The name of the LN3 file you see inside the Topcon software.

Read Topcon LN3 Strings Files

Position of menu: Survey =>Topcon=> Read LN3 file

This panel reads in strings from the Topcon LN3 linework files.

Selecting **Read LN3 file** brings up the **Read Topcon LN3 String Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Topcon string file	file		

The LN3 file you wish to read.

Pre* postfix for models

*for information please go to [Pre*Postfix Panel Fields](#) in the chapter [Tools and Concepts](#)*

Create Topcon TN3 Triangle Files

Position of menu: Survey =>Topcon=> Write TN3 file
This panel writes triangles to the Topcon TN3 triangulation files.
Selecting Write TN3 file brings up the **Create Topcon TN3 Triangle Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	input		
<i>The tin to write to the TN3 file.</i>			

Internal Tin name
The name of the tin you see inside the Topcon software.

Tin Polygon selection
Select a polygon for the region of the tin to write out.

Topcon tin file file
The name of the TN3 file to create.

Read Topcon TN3 Triangle Files

Position of menu: Survey =>Topcon=> Read TN3 file
This panel reads in triangles from the Topcon TN3 triangulation files.
Selecting Read TN3 file brings up the **Read Topcon TN3 Triangle Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Topcon tin file	file		
<i>The TN3 file you wish to read.</i>			

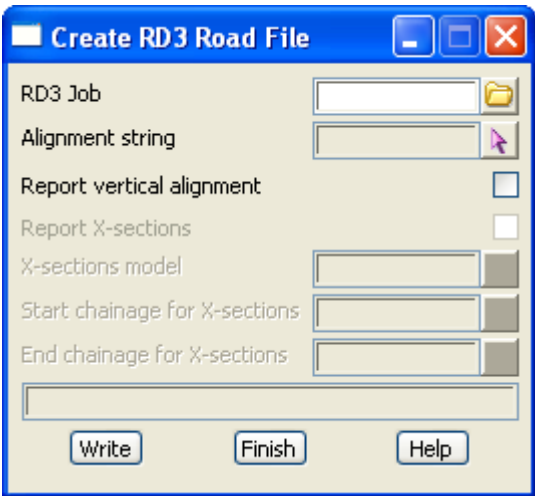

Pre* postfix for models
*for information please go to [Pre*Postfix Panel Fields](#) in the chapter [Tools and Concepts](#)*

Create RD3 Road File

Position of menu: Survey =>Topcon=> Write RD3 file

This panel uploads the centreline and cross sections for a Topcon RD3 road definition file. The RD3 file can contain just a centreline, a centreline with vertical alignment or the full definition including cross sections.

Selecting **Write RD3 file** brings up the **Create RD3 Road File** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
RD3 Job	file		
<i>The RD3 file you wish to create.</i>			
Alignment string	string select		
<i>The centreline of the road.</i>			
Report vertical alignment	tick box		
<i>If ticked the vertical alignment is uploaded to the RD3 file</i>			
Report X-sections	tick box		
<i>If ticked cross sections are uploaded to the RD3 file</i>			
X-sections model			
<i>The model containing the cut cross section strings to upload to the RD3 file. These must have been cut normal to the nominated alignment string or the upload will fail. Start chainage for X-sections</i> <i>If non blank the start chainage to upload cross sections from.</i>			

End chainage for X-sections

If non blank the end chainage to upload cross sections to.

Read Topcon RD3 Road File

Position of menu: Survey =>Topcon=> Read RD3 file

This panel reads in the centreline and cross sections from a Topcon RD3 road definition file.

Selecting Read RD3 file brings up the **Read Topcon RD3 Road File** panel.

The fields and buttons used in this panel have the following functions.

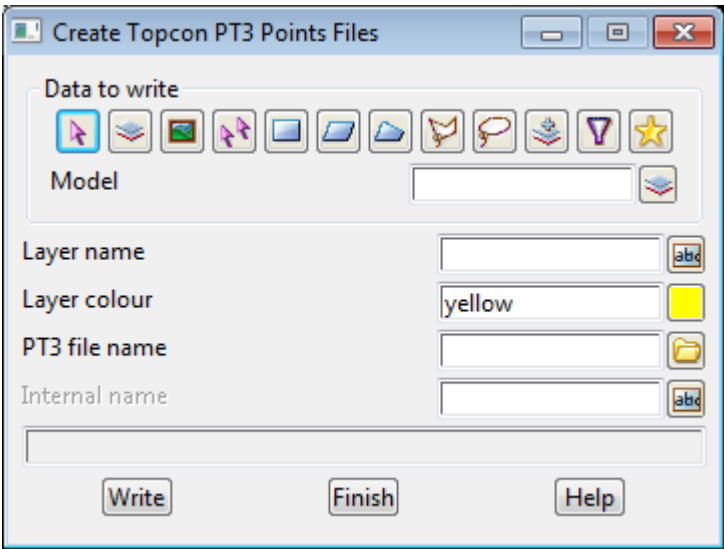

Field Description	Type	Defaults	Pop-Up
Topcon Road file			
<i>The RD3 file you wish to read.</i>			
Output Model	model		
<i>The model for the centreline and cross sections.</i>			
Sections Colour	colour box	yellow	
<i>The colour for the cross section strings.</i>			

Create Topcon PT3 Points Files

Position of menu: Survey =>Topcon=> Write PT3 file

This panel writes strings to Topcon PT3 points files.

Selecting Write PT3 file brings up the **Create Topcon PT3 Points Files** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data to write

The data to write to the PT3 file.

Data source type

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	model
--------------------	-------

Layer name

The name of the layer in the PT3 file.

Layer colour	select colour	yellow	available colours
---------------------	---------------	--------	-------------------

The colour of the points in the Topcon PT3 file. Please note that the PT3 format colours points by layer and hence individual point colours cannot be mapped to a PT3 file.

PT3 file name	file box
----------------------	----------

The name of the PT3 file.

Internal name

The name of the PT3 file you see inside the Topcon software.

Read Topcon PT3 Points Files

Position of menu: Survey =>Topcon=> Read PT3 file

This panel reads in points from the Topcon PT3 points files.

Selecting Read PT3 file brings up the **Read Topcon PT3 Points Files** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Topcon points file	file box		

The PT3 file you wish to read.

Pre* postfix for models

*for information please go to [Pre*Postfix Panel Fields](#) in the chapter [Tools and Concepts](#)*

Trimble

The **Trimble** walk-right menu is:

For the option *Write TTM file*, go to

Trimble Link points

Trimble Link triangles

Trimble Link roads

SCS900 CSV to XYZ ID Code

[Write TTM File](#)

[Trimble Link Points](#)

[Trimble Link Triangles](#)

[Trimble Link Roads](#)

[SCS900 CSV to XYZ ID Code](#)

Write TTM File

Triangles from a tin (not a super tin) can be written out as a Trimble TTM file.
Note that the Trimble TTM is binary and so can not be viewed or edited.
Selecting **Write TTM file** brings up the **Create Trimble TTM Triangles File** panel:

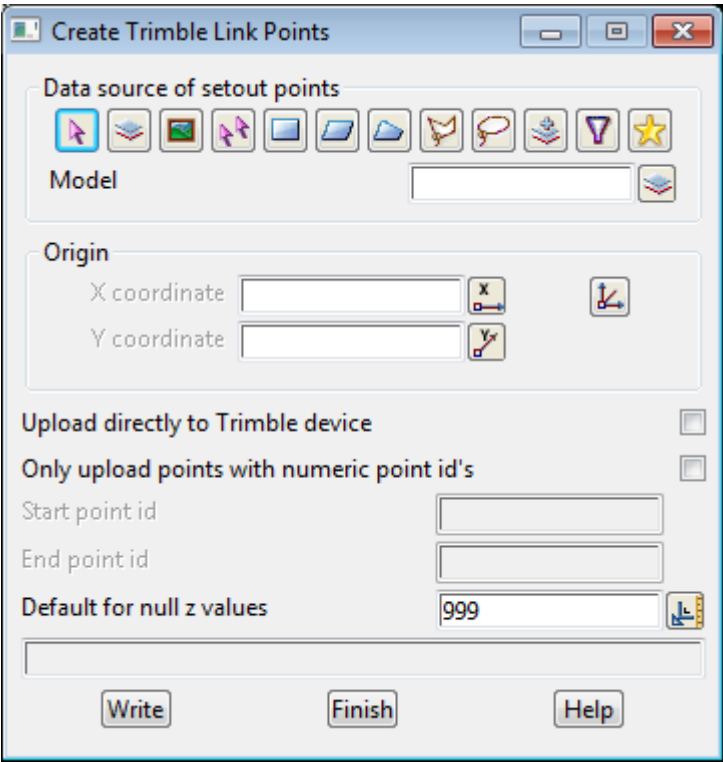

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Tin	<i>the tin (not a super tin) to write out to a Trimble TTM file. A super tin can not be written out to a TTM file.</i>	tin box		available tins
Job name	<i>name of the job to write into the Trimble TTM file</i>	text input		
Tin Polygon selection	<i>if a string is selected, then only those triangles whose centroid is inside the polygon are written to the TTM file. If no string is selected, then all the triangles in the tin are written to the TTM file.</i>	polygon box		
Trimble tin file	<i>name of the Trimble TTM file. If it is not present, ".TTM" will be automatically added to the end of the file name.</i>	file box		
Write	<i>write out the triangles to the given TTM file.</i>	button		

Trimble Link Points

This option uploads selected vertices with point IDs to a Trimble device or writes the (X, Y, Z, point ID) data to a file.

Selecting **Trimble Link points** brings up the **Create Trimble Link Points** panel:

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source of setout points

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

data source of setout points to create the upload data from.

Origin X coordinate/Origin Y coordinate

If non-zero, subtract the value from the x/y value before uploading/writing out.

Upload directly to Trimble device tick box not ticked

if ticked, the selected points are uploaded to the Trimble device.

If not ticked, the data is written to a Trimble DC file with the name as the 12d Model project and ending in .DC

Only upload points with numeric point id's tick box not ticked

if ticked, only vertices with numeric point IDs are uploaded to the Trimble device or written out.

If not ticked, all vertices (whether numeric or alpha-numeric point IDs) are uploaded to the Trimble device or written out.

- Start point id**

input box

point ID to start creating upload data from.
- End point id**

input box

last point ID to create upload data to.
Note: Start and End point IDs may be left blank, and all point IDs are uploaded.
- Default for null z values**

measure box

999

value to write for null z-values.
- Write**

button

send the vertices directly to the Trimble device or write them to a DC file.

Trimble Link Triangles

Triangles from a tin (not a super tin) can be uploaded to a Trimble device or written out as a Trimble TTM file.

Note that the Trimble TTM is binary and so cannot be viewed or edited.

Selecting **Trimble Link triangles** brings up the **Create Trimble Link Triangles** panel:

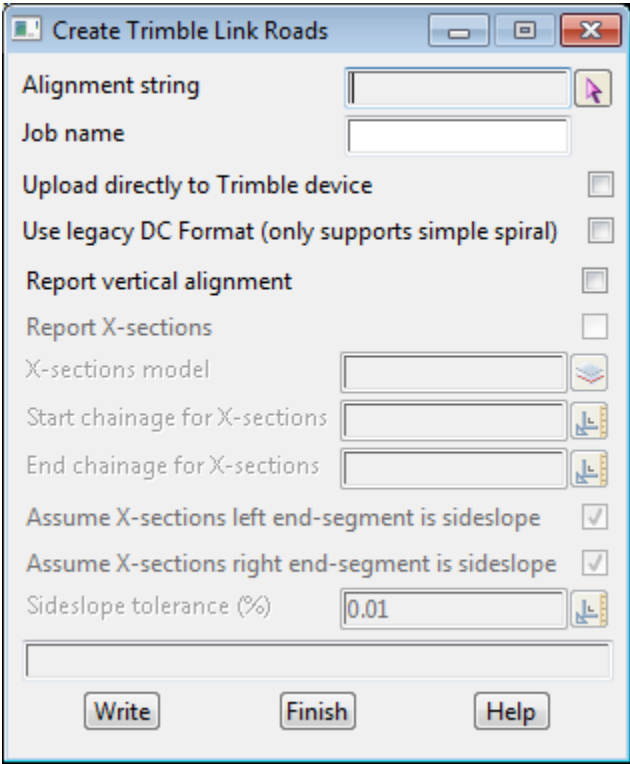

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tin <i>the tin (not a super tin) to either upload directly to the Trimble device or write out to a Trimble TTM file. A super tin can not be written out to a TTM file.</i>	tin box		available tins
Job name <i>name of the Trimble job</i>	text input		
Tin Polygon selection <i>if a string is selected, then only those triangles whose centroid is inside the polygon are processed. If no string is selected, then all the triangles in the tin are processed.</i>	polygon box		
Upload directly to Trimble device <i>if ticked, the selected triangles are uploaded to the Trimble device. If not ticked, the data is written to a Trimble TTM file with the given job name and ending in .TTM</i>	tick box	not ticked	
Write <i>send the triangles directly to the Trimble device or write them to the given TTM file.</i>	button		

Trimble Link Roads

This option uploads an alignment string and associated x-sections to a Trimble device, or writes the data to a specific roading file.

Selecting **Trimble Link roads** brings up the **Create Trimble Link Roads** panel:

The Trimble upload/DC file has certain limitations and criteria. These include:

- 1. The alignment string must exist on the X-sections. This allows us to calculate the *zero pt* so we can split the template into left and right.
- 2. The X-sections model should be representative of the alignment string, *i.e.* not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
- 3. The alignment string cannot exist above or below the X-sections, *i.e.* it should be on the section as per 1.
- 4. The number of points on successive section templates (left and right) should be the same, *i.e.* if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the upload data by using the chainage range between areas where the number of points on each side of the X-sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Alignment string <i>the alignment string to be uploaded/written to the file.</i>	input		
Job name <i>name of the Trimble job</i>	input		
Upload directly to Trimble device	tick box	not ticked	

*if ticked, the selected data is uploaded to the Trimble device.
If not ticked, the data is written to a Trimble DC file with the given job name and ending in .DC*

Use legacy DC Format tick box not ticked

Report vertical alignment tick box not ticked

if ticked, include vertical alignment details in the upload/file.

Report X-sections tick box not ticked

if ticked, the X-sections in X-section model will be uploaded/output to the file.

X-sections model model box

the model of X-sections to be uploaded/written to the file. This can only be filled in if Report vertical alignment and Report X-sections are ticked.

Start chainage for X-sections measure box

if non blank, only X-sections whose chainage is greater than or equal to the Start chainage for X-sections and less than or equal to the End chainage for X-sections are uploaded/written out.

If blank, all X-sections that are less than or equal to the End chainage for x-sections are uploaded/written out.

End chainage for X-sections measure box

if non blank, only X-sections whose chainage is less than or equal to the End chainage for X-sections and greater than or equal to the Start chainage for X-sections are uploaded/written out.

If blank, all X-sections that are greater to or equal to the Start chainage for X-sections are uploaded/written out.

Assume X-sections left end-segment is sideslope tick box ticked

if ticked, the first segment is considered to be a sideslope, and the Sideslope tolerance (%) field is enabled.

Assume X-sections right end-segment is sideslope tick box ticked

if ticked, the last segment is considered to be a sideslope, and the Sideslope tolerance (%) field is enabled.

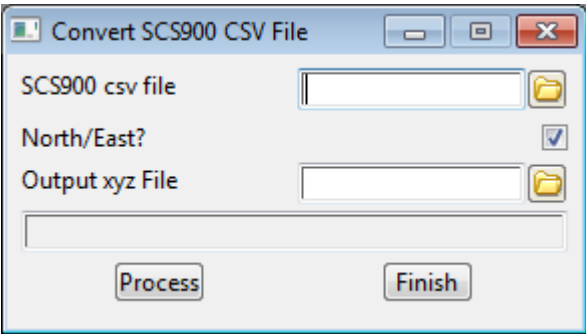

Sideslope tolerance (%) measure box 0.01

Write button

send the data directly to the Trimble device or write it to the given DC file.

SCS900 CSV to XYZ ID Code

This option converts a Trimble SCS900 CSV file to an xyz file.
Selecting **SCS900 CSV to XYZ ID Code** brings up the **Convert SCS900 CSV File** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
SCS900 csv file <i>name of the SCS900 CSV file</i>	file box		*.csv files
North/East? <i>if ticked,</i>	tick box	ticked	
Output xyz File <i>name of the xyz file to convert the SCS900 CSV file to</i>	file box		*.xyz files
Process <i>convert teh SCS900 file to a xyz file</i>	button		

Setout

Position of menu: Survey =>Setout

The **Setout** walk-right menu contains options for creating points numbers and files for uploading to data recorders.

The **Setout** walk-right menu is

.

- setout centres of string curves
- create text at centre of HIP's
- setout lip line
- create setout points
- create setout points using super strings

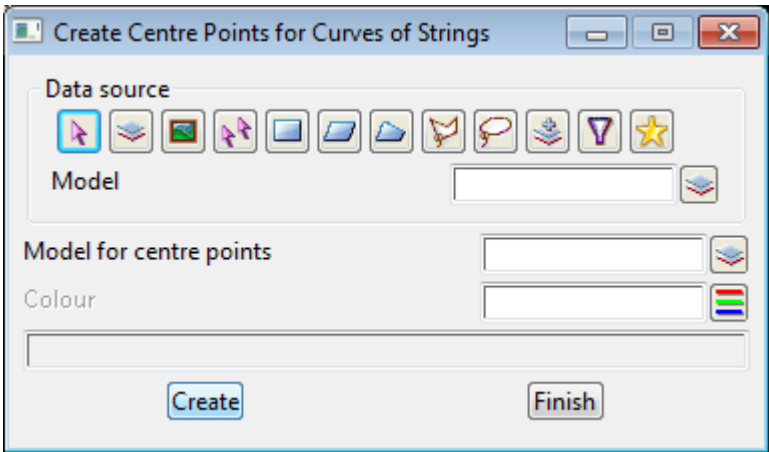

For *Create centres of string curves*, go to
Create x,y,z,text of centres of HIPs
Setout lip line
Setout points
Setout points using super string

[Create Centre Points for Curves of Strings](#)
[Create X Y Text for Centre Points of Alignments](#)
[Setout Lip Line.](#)
[Create Setout Points.](#)
[Create Setout Points Using Super String.](#)

Create Centre Points for Curves of Strings

Position of option on menu: Survey =>Setout =>Create centres of string curves

This option is used to create points at the centres of arcs in alignment strings, polylines, arcs or circles.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type	Model		

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

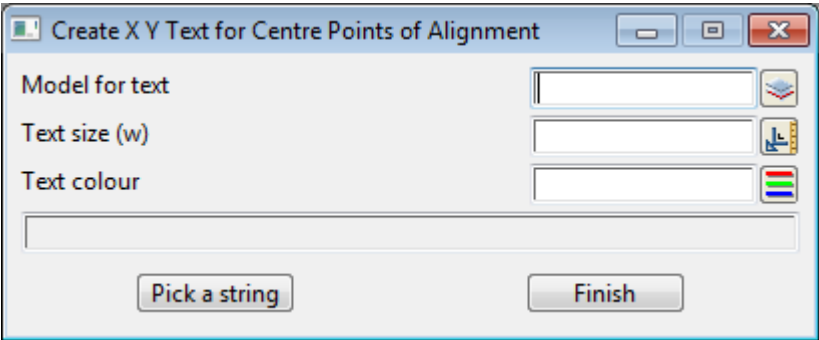

data source for strings to process

Model for centre points	input box	
<i>model for the created points</i>		
Colour	colour box	available colours
<i>colour of centre points</i>		
Create	button	
<i>create the points</i>		

Create X Y Text for Centre Points of Alignments

Position of option on menu: Survey =>Setout =>Create x y text of centres of HIPs

This option creates text for the x and y co-ordinates of the horizontal arcs on an alignment string.

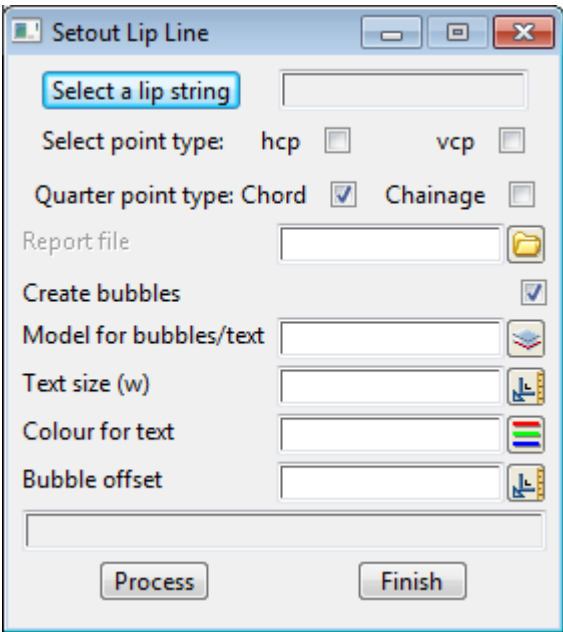

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model for text	input box		
<i>model for the text of the x and y co-ordinates</i>			
Text size (w)	input box		
<i>size of text in world units.</i>			
Text colour	input box		
<i>colour of text</i>			
Pick a string	button		
<i>select string to create text for.</i>			

Setout Lip Line

Position of option on menu: Survey =>Setout =>Setout lip line

This panel is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select a lip string	string select		
<i>pick the alignment string to have bubbles created for.</i>			

Select point type:

hcp	tick box
<i>if ticked, the horizontal tangent points are included.</i>	
vcp	tick box
<i>if ticked, the vertical tangent points are included.</i>	

Quarter point type:

Chord	tick box	tick
<i>if ticked, the quarter points by chord distance are included.</i>		
Chainage	tick box	
<i>if ticked, the quarter points by chainage distance are included.</i>		

Report file	input box	
<i>name of the report file.</i>		
Create bubbles	tick box	tick
<i>if ticked, bubbles are created with the string name and bubble number inside.</i>		

Model for bubbles/text	input box
<i>model for the bubbles and text.</i>	
Text size (w)	input box
<i>size (in world units) for the text inside the bubble.</i>	
Colour for text	input box
<i>Colour for the bubble and bubble text.</i>	
Bubble offset	input box
<i>offset distance from the alignment string to place the bubble.</i>	
Process	button
<i>run the option.</i>	

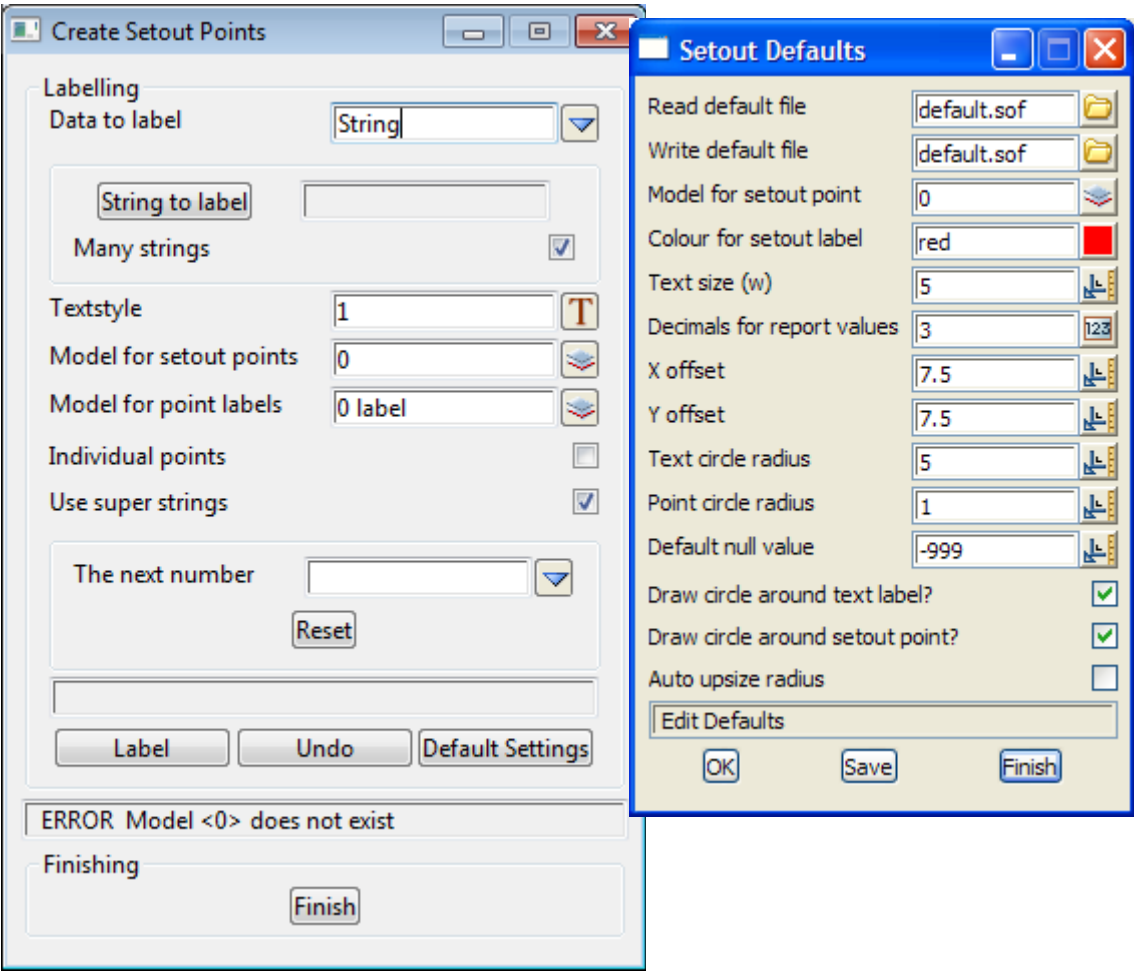

Create Setout Points

Position of option on menu: Survey =>Setout =>Setout points

This panel is used to create points with numbers for use in setting out data. This option is usually run before the option to create an instrument upload file. The setout point is created as a 4d string with the point at the data point and with the point id as the text for the 4d string, with a text size of zero.

Separate text for the numbers and circles surrounding the data points and the text numbers are also created. By default, a file called "defaults.sof" is read in containing settings required for the option.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Textstyle <i>textstyle for the created point ids</i>	input box	1	
Model for setout points <i>model to place the setout points in</i>	input box	0	
Model for points labels <i>model to place the setout point ids and circles in.</i>	input box	0	
Individual points <i>if ticked, the setout points are created as point strings If not ticked, individual one point strings are created.</i>	tick box		
Use super strings <i>if not ticked, super strings are created for the setout points. The super string point id is set to the setout point id. If not ticked, 4d strings are created for the setout points strings with the 4d text as the setout point id (with text size set to zero).</i>	tick box	tick	
The next number	input box	1 or highest number in model for setout points	

next numeric point id to use for creating point ids. If a **Model for setout points** is given, the model is searched for any super strings or 4d strings with numbers as text and the **The next number** is set to one more than the highest numeric point id in the model.

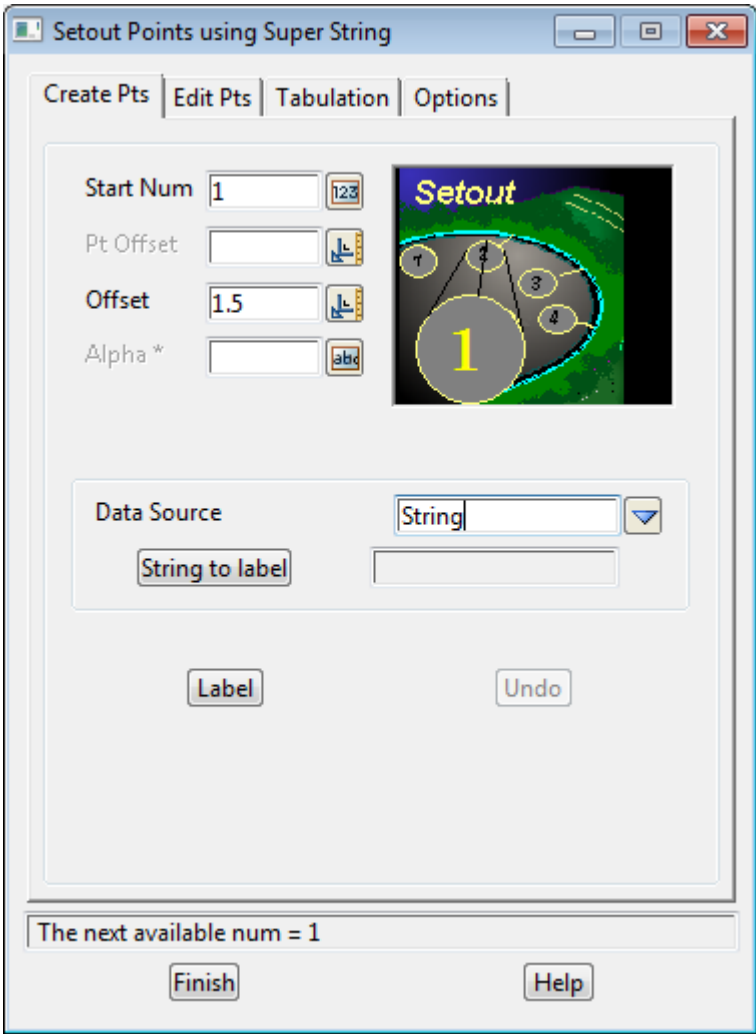

Reset	button		
reset the The next number to the highest point in the model for setout points.			
Data to label	input box	string	string, model, view, point
type of data source.			
Model/View/String/Point to output box			
data to create point ids for.			
Many points/strings	tick box	tick	
if ticked, the each time a string/point is selected, the string/point is processed without having to click on the Label button. After a string/point is processed, another string/point can then be selected. If not ticked, the Label button must be clicked before the selected string/point is processed.			
Label	button		
create setout points and circles for the selected data.			
Undo	button		
undo the last setout points and s created whilst the panel has been up.			
Default settings	button		
default settings for the s. These can be read in from a file.			

Create Setout Points Using Super String

Position of option on menu:	Survey =>Setout =>Setout points using super string
Position of option on menu:	Road Toolbar

This option creates a super string over the top of the data selected. The super string allows point numbers. The incremental point numbers are displayed at each vertex inside a circle symbol. The setout numbers are identified on a setout model and incremented each time the panel is activated.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Create Pts			
Start Num	integer	1 (or next available number on subsequent runs of the option)	
<i>Type in number and <enter> or accept default</i>			
Pt Offset	real		
<i>Offset of the setout point, typically a distance behind the back of kerb. (This will be the setout point x,y location but the z value refers to the original string selected e.g. the kerb return)</i>			
Offset	real		
<i>Offset of the setout point text and circle, from the actual setout point.</i>			
Alpha*	text		
<i>If non-blank, Alpha point number prefix is used</i>			
Data Source	choice box	String	String, Point, Model, View
<i>String: Allows the selection of a string (using 12d pick with direction), where the setout number is</i>			

*always placed on the right hand side in relation to the pick direction, perpendicular to the string.
Alignment choices: A selection panel is displayed with 3 choices:-*

- s by number <divides the string into equal parts>
- s by distance <divides the string and may have a remainder>
- s by special chainage file

String to label button

***Point:** Allows the selection of a point. There is no direction involved.*

Point to label button

***Model and View:** Allows the setout of multiple strings and points but again there is no control over the pick direction or the orientation of the setout number in relation to any string.*

Model to label model

existing model selection required

View to label view

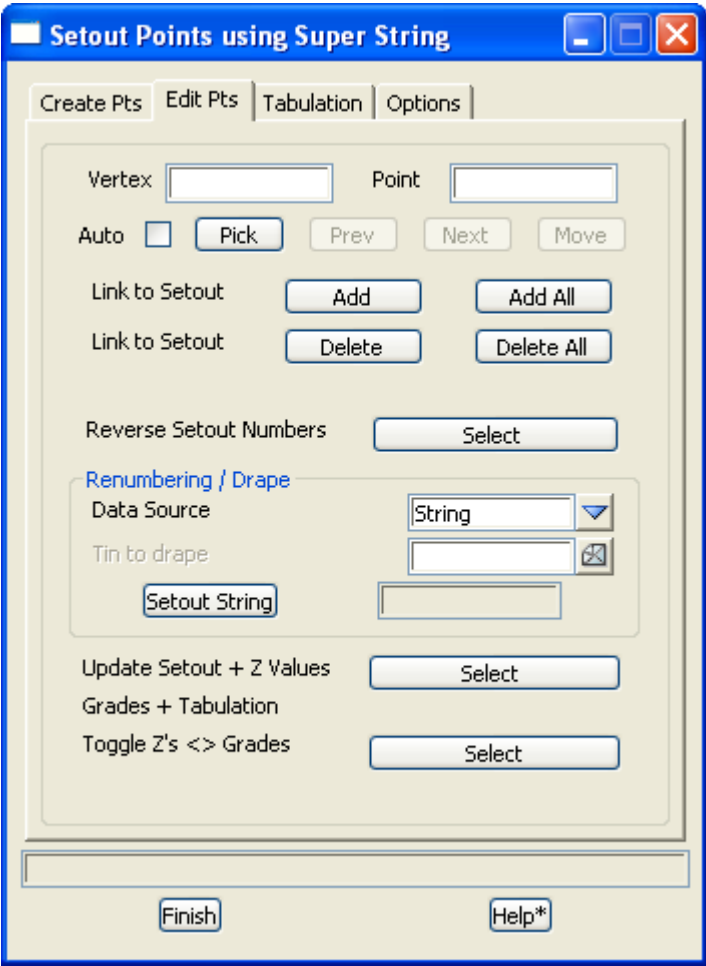

Existing view to be selected

Label button

Runs the option and adds the setout model to the view from which the Data Source was selected

Undo button

Each <Label> creation has an undo

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Edit Pts

Vertex	Integer
---------------	---------

Point	Integer
--------------	---------

The Vertex and Point fields above are automatically filled in after a setout string has been picked

Auto	tick box	false
-------------	----------	-------

When ticked on, and a setout point is selected using <Pick>, then the <Move> option is automatically activated

Pick	button
-------------	--------

Select setout point to move text bubble

Prev	button
-------------	--------

Steps backward and highlights the previous point on setout string

Next	button
-------------	--------

Steps forward and highlights the next point on setout string

Move	button
-------------	--------

Activates the move option allowing the setout text bubble to be dynamically relocated on screen, but still remain attached to the actual setout point

Link to Setout:

Add button

Draws a leader line from the actual setout point to the setout text value bubble

Add All button

Draws a leader line from the actual setout point to the setout text value bubble at all vertices on the selected setout string

Link to Setout:

Delete button

Deletes the leader line from the actual setout point to the setout text value bubble, if it exists

Delete All button

Deletes the leader line from the actual setout point to the setout text value bubble at all vertices on the selected setout string

Reverse Setout Numbers:

Select button

This option reverses the numbering order only on a setout string.

Renumbering / Drape:

This option can renumber the start number used on setout data. When a string or model is selected a prompt for a new start number is displayed.

The tin to drape is used to reset the z value of the setout point. A design tin can be used, but care should be taken to have a design point in the tin, close to the setout point, as a “drop onto the tin” is used to calculate the new z value.

Data Source choice box String String, Model

String or model are the choices

Tin to drape tin

if non-blank, setout vertices will be draped to get new z value

Setout String button

*Select the setout string to perform the above **Renumbering / Drape***

Update Setout + Z Values + Grades + Tabulation:

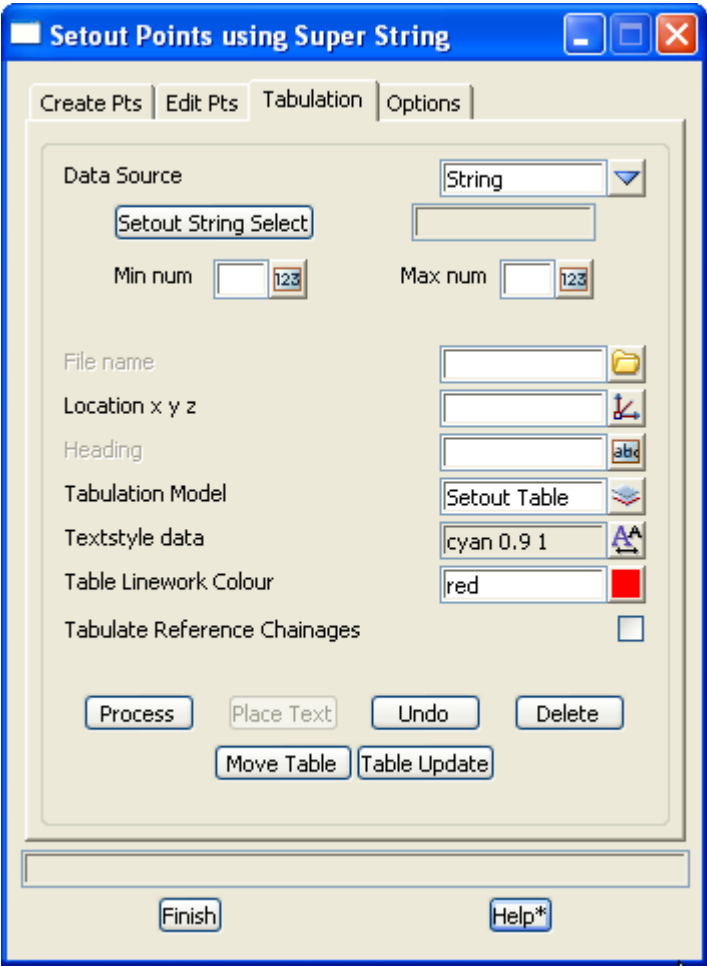

Select button

Setout features can be updated as the original string selected for setout (e.g. Kerb return alignment) has been stored as an attribute on the setout string. Care must be taken to re-select the original string.

Toggle Z's <> Grades:

Select button

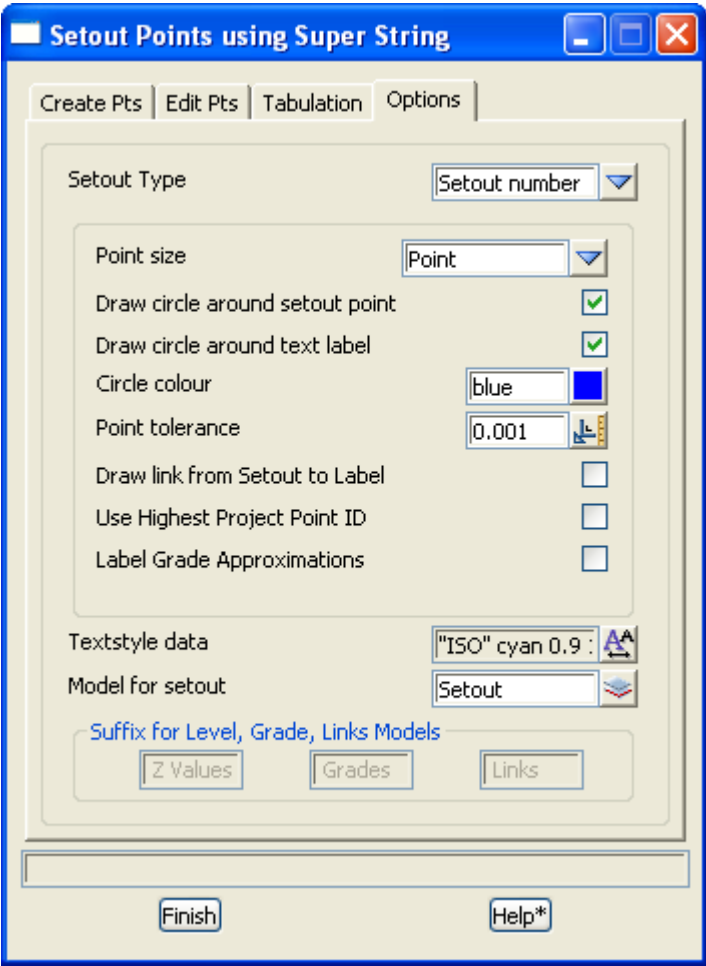

Setout features such as labelling Z values and grades on segments are discussed under [Options](#) tab. This option toggles the display between the two

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Tabulation			
Data Source	choice box	String	String, Model
<i>String or model are the choices</i>			
Setout String Select	button		
<i>Select a setout string to tabulate</i>			
Model to Tabulate	model		
<i>Select existing setout string to tabulate</i>			
Min num	integer		
Max num	integer		
<i>Fields are filled out once setout data is selected, but can be changed manually.</i>			
File name	file		
<i>If non-blank an xyz file will be created</i>			
Location xyz	xyz pick		
<i>Select on screen or enter a coord for the top left hand corner of table</i>			

Heading	Input	
<i>if non-blank entry used as heading for tabulation</i>		
Tabulation Model	model	available models
<i>Enter a model name for the tabulation</i>		
Textstyle Data	textstyle box	select Textdata
<i>Setup text colour, height and width</i>		
Table Linework Colour	colour box	available colours
<i>Colour for any linework in tabulation</i>		
Tabulate Reference Chainages	tick box	false
<i>Chainages can be displayed from the original selected string (e.g. Reference kerb return alignment) in relation to setout vertices</i>		
Process	button	
<i>runs the option</i>		
Place Text	button	
<i>Creates the tabulation on the tabulation model</i>		
Undo	button	
<i>Undo for that operation</i>		
Delete	button	
<i>Deletes all the entities on the table selected</i>		
Move Table	button	
<i>Moves the complete table on screen (select table and destination point)</i>		
Table Update	button	
<i>Table can be updated if text parameters are changed or Reference Chainages is ticked on or off. Select the tabulation.</i>		

Options

Setout Type	choice box	Setout number	Setout number, Z value
-------------	------------	---------------	------------------------

Setout number or Z values are the choices

Setout Number:

Point size	choice box	Point	Point, Point 0.5
------------	------------	-------	------------------

Selections are Point and Point 0.5 (refer to the size of the point shown at the setout z, y)

Draw circle around setout point	tick	true
---------------------------------	------	------

Refers to the linestyle circle at each setout z, y.

Draw circle around text label	tick	true
-------------------------------	------	------

Refers to the circle surrounding each setout point number text value

Circle colour	colour box	blue
---------------	------------	------

The colour of the circle surrounding each setout point number text value

Point tolerance	real	
-----------------	------	--

X,Y Tolerance between setout points to handle duplicate or near duplicate points

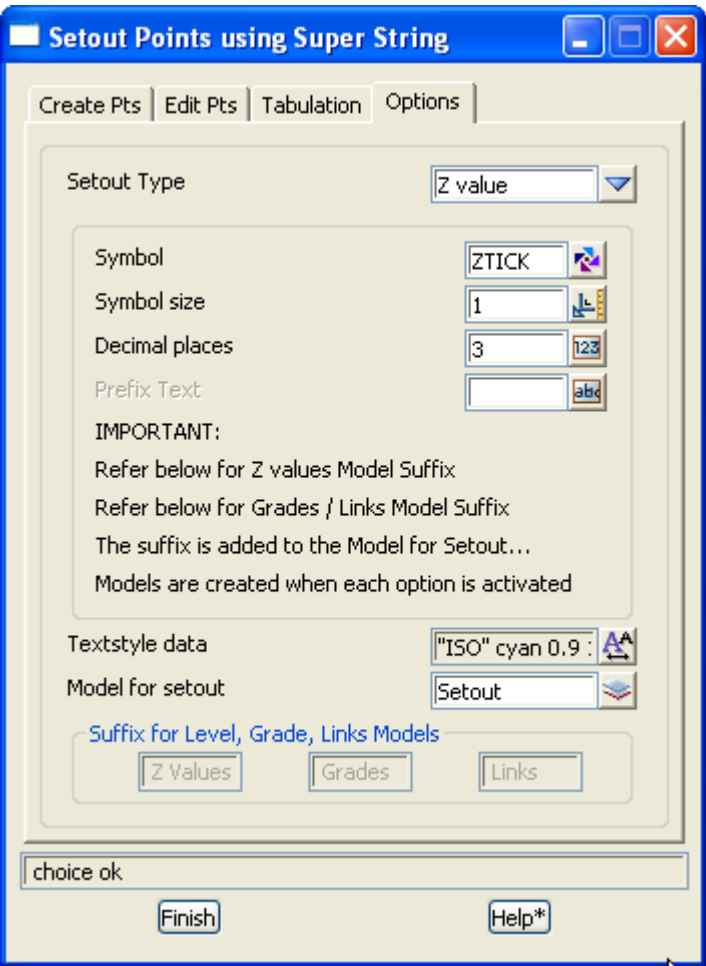

Draw link from Setout to Label	tick box	false
--------------------------------	----------	-------

Use Highest Project Point ID	integer	
------------------------------	---------	--

Search for the highest point number available in the project

Label Grade Approximations tick box false

(Grades can be labelled between setout points, but care must be taken as the z value is used from the setout points, the length from the original reference string selected.
The grade is only correct if the points are on grade and or on a parabola. So the grades are reported as approximate only and for a visual check.)

Z Value:

Symbol	input	ZTICK
Symbol Size	real	1
Decimal Places	Integer	3
Prefix Text	input	

if non-blank text value added to text Z value. <e.g. R.L.>

Textstyle Data textstyle box

Setup text style, colour, height and width

Model for setout model box available models

Enter a model name for the setout data

Suffix for Level, Grade, Links Models

Display default values for models that may be created if you choose to draw link lines, label levels or grades. If setout model is "Setout"....then these models would default to "Setout Level" "Setout Link" "Setout Grade"

Upload

Position of menu: Survey =>Upload

The Survey Upload walk-right menu contains survey options to upload data the most survey instruments. There are options to upload points, triangulations and road geometry.

The Survey Upload walk-right menu is

- Create triangle upload file
- Create points upload file
- Create roads upload file
- Create points upload file (new) - only for *Trimble Link*
- Create roads upload file (new) - only for *Leica XML* and *Trimble Link*

For the option *Create unique coordinates*, go to
Create triangle upload file
Create points upload file
Create road upload file
Create points upload file (new)
Create road upload file (new)
Create Paveset upload file
Upload

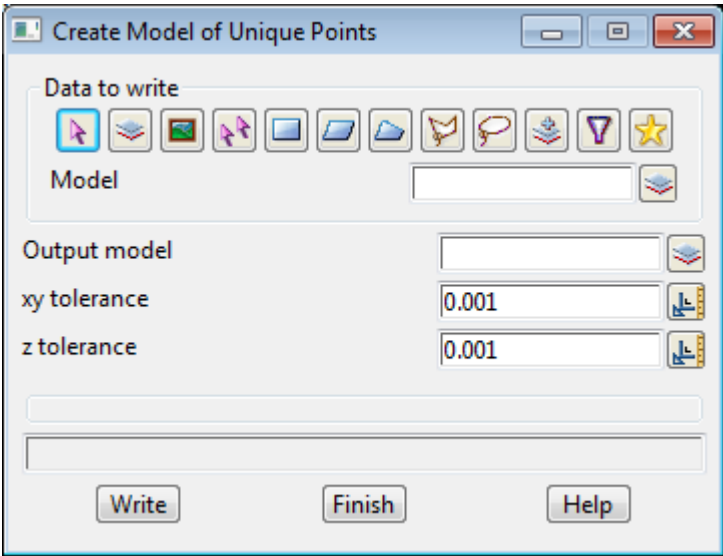

- [Create Unique Coordinates](#)
- [Create Triangle Upload File](#)
- [Create Points Upload File](#)
- [Create Road Upload File](#)
- [Create Points Upload File \(New\)](#)
- [Create Road Upload File \(New\)](#)
- [Create Paveset Upload File](#)
- [Survey Data Upload](#)

Create Unique Coordinates

Position of option on menu: Survey =>Upload => Create unique coordinates

This option creates points from the selected data so that there is only one point for all vertices within user defined xy and z tolerances.

Selecting *Create unique coordinates* brings up the **Create Model of Unique Points** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source of setout points

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

data source of strings to create unique points from

Output model	model box
---------------------	-----------

model for the created vertices.

xy tolerance	real value box	-0.001
---------------------	----------------	--------

z tolerance	real value box	-0.001
--------------------	----------------	--------

all vertices closer than these tolerances are considered to be the same vertex and only one point will be created for all of them.

Process	button
----------------	--------

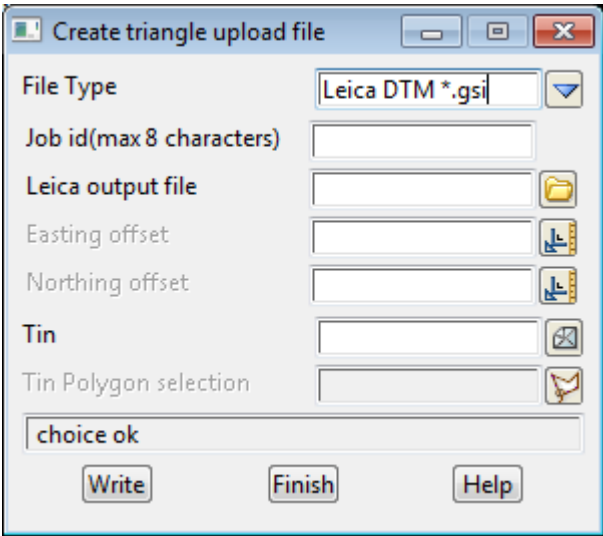

create the distinct points

Create Triangle Upload File

Position of option on menu: Survey =>Upload => Create triangle upload file

The **Create triangle upload file** option allows the creation of a triangle file based on a tin. Various file formats can be selected

Selecting **Create triangle upload file** brings up the **Create triangle upload file** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Common parameters at bottom:

Tin	input
<i>name of tin from which the triangle file will be based.</i>	

Tin polygon selection	selection
<i>allows the user to select a specific area of the tin to be exported as a triangle file.</i>	

Write	button
<i>On clicking the write button, 12d Model will write the specified file.</i>	

File type	choice box	Leica DTM *.gsi 12d xyzs *.dat Ortho 12d *.T12 Sokkia *.tri TP Setout/Stakeout *.tsa LandXML *.xml
<i>file type to be produced.</i>		

For Leica DTM *.gsi format:

Job id	input
<i>job id to be included in file. (max 8 characters)</i>	

Leica output file input
name of file to be produced

Easting offset input
easting offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

Northing offset input
northing offset to be applied to data. This is important where large coordinate values are used, such as in map projections.

For 12D xyzs *.dat format:

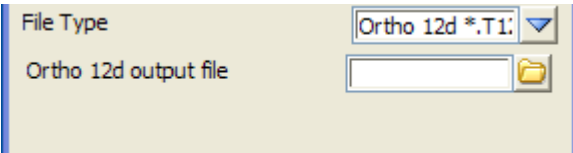

.

A screenshot of a software dialog box for file type selection. It has a light beige background. At the top, 'File Type' is written in a small font. To its right is a dropdown menu showing '12D xyzs *.dat' with a downward arrow. Below this, the text '12d output file' is on the left, and on the right is a text input field followed by a folder icon.

Create Points Upload File

Position of option on menu: Survey =>Upload => Create points upload file

The **Create points upload file** option allows the creation of a file of point ids, x, y and z, for string data (super strings and 4d strings only). Various file formats can be selected

Selecting **Create points upload file** brings up the **Create Instrument Points Upload File** panel.

Upload files for points can be created for various Leica, Geodimeter, Sokkia, Topcon, UPL, QuikDraw, Trimble XYZ formats as well as a text file of point id, x,y,z data.

[Topcon GT700 Roading File](#)
[Trimble Roading File](#)

Geodimeter Roadline 3D file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Geodimeter Roadline 3d

The **Geodimeter Roadline 3d** option allows the creation of a specific roading file.

Selecting Geodimeter Roadline 3d brings up the Report Geodimeter Roadline 3D panel

The Geodimeter (trimble), has certain limitations and criteria associated with the 3d file. These include:

- 1. Each section template (i.e. right or left) has a max number of 12 points.
- 2. The first and last segments of the alignment must be a straight (for both horizontal and vertical).
- 3. The start and end chainages of the horizontal alignment should be the same for the vertical alignment.
- 4. The alignment string must exist on the xsec's. This allows the calculation of the *zero pt* so we can split the section into left and right templates.
- 5. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
- 6. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 4)
- 7. The number of points on consecutive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, cannot handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections is the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align	Select box		
<i>select valid alignment string.</i>			
Report vertical alignment	tick box	no	
<i>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</i>			
Report cross sections	tick box	no	
<i>if selected, the cross section model box will be enabled.</i>			
Cross section model	model box		
<i>This will ask for the model of cross sections. These sections will be written out to the file.</i>			

XSec start ch input box min alignment ch
chainage value to start writing cross sections.

XSec end ch input box max alignment ch
chainage value to end writing cross sections.

Ignore points on RHS/LHS sections >12 tick box ☒ **ticked**
if ticked, where there are more than 12 points in either the RHS or LHS template (derived from the xsection) the outlying points are ignored. e.g. if there was 14 points on the RHS template, only 12 will be written to the file with 2 pts being ignored.

File name input box
the name to be used for file creation

Write button
write appropriate files.

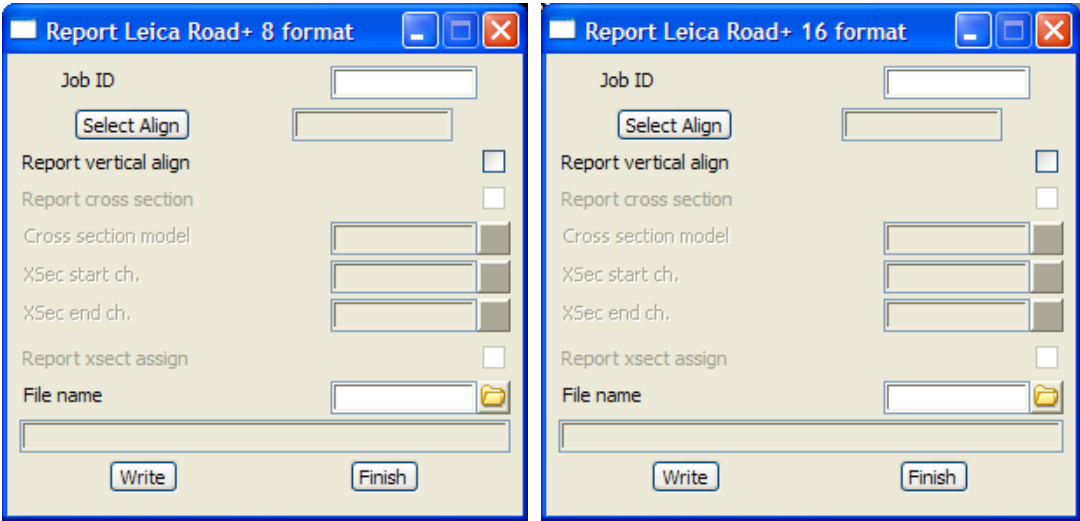

Leica road plus 8 / 16 file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Leica roadplus 8 or Leica roadplus 16

The Leica roadplus 8 and Leica roadplus 16 options allow the creation of specific Leica roading files.

Selecting Leica roadplus 8 brings up the **Report Leica roadplus 8** panel.

Selecting Leica roadplus 16 brings up the **Report Leica roadplus 16** panel.

The 8 and 16 formats are different file formats for the leica range of instruments. The user should be aware of the required format for the particular instrument. Please refer to the Leica documentation for specifications

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Job id	input box		
<i>job id (max 8 characters).</i>			
Select alignment	String select box		
<i>select valid alignment string.</i>			

Report vertical alignment tick box no

*write vertical alignment details to file mode. If yes vertical alignment details written to appropriate file.
i.e. (PRF*****.gsi)*

Report cross sections tick box no

if selected, the cross section model box will be enabled.

Cross section model model box

*This will ask for the model of cross sections. These sections will be written out to the appropriate file.
i.e. (CRS*****.gsi)*

XSec start ch input box min alignment ch

chainage value to start writing cross sections.

XSec end ch input box max alignment ch

chainage value to end writing cross sections.

Report cross section assignment tick box no

*If ticked, a cross section assignment file (STA*****.gsi) file will be made.*

File name input box

the name to be used for file creation. NB depending on what files are specified, the name given will be appended with the correct prefix eg ALN for alignment file. As Leica only takes 8 character file names, the name may be truncated.

Write button

write appropriate files.

LMGS - D45 file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = LMGS - D45 file

The **LMGS - D45 file** option allows the creation of a specific file format suitable for upload to Leica's grader and paver control systems. The format has a number of rules that must be satisfied for correct file creation. These include:

1. There must be an equal number of points on each section
2. Points should not be closer than 5cm in both directions
3. Azimuth changes between cross section points should not be greater than 20gon (18 degrees).

Selecting **LMGS - D45 file** brings up the **LMGS - D45 file** panel

The fields and buttons used in this panel have the following functions:

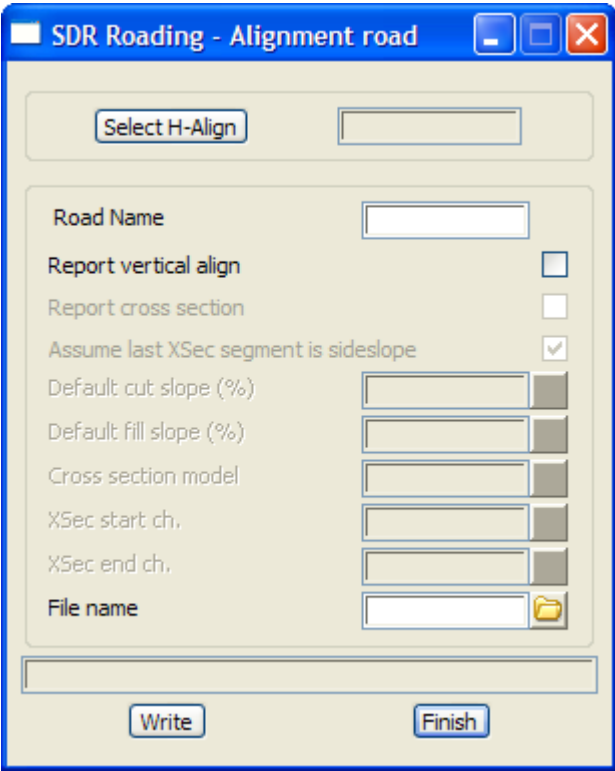

Field Description	Type	Defaults	Pop-Up
Cross section model	model box		
<i>the model of cross sections. These sections will be written out to the file.</i>			
XSec start ch	input box	min alignment ch	
<i>chainage value to start writing cross sections.</i>			
XSec end ch	input box	max alignment ch	
<i>chainage value to end writing cross sections.</i>			
File name	input box		
<i>the name to be used for the file creation. The file will automatically be given a .D45 extension.</i>			
Write	button		
<i>write appropriate file.</i>			

Sokkia Roding - Alignment Road file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Sokkia Roding - Alignment road

The Sokkia Roding - Alignment road option allows the creation of a specific roding file.

Selecting Sokkia Roding - Alignment road brings up the SDR Roding - Alignment Road panel

The sdr33 roding file has certain limitations and criteria. These include:

- 1. The alignment string must exist on the xsec's. This allows us to calculate the **zero pt** so we can split the template into left and right.
- 2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
- 3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).
- 4. The number of points on adjacent section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align <i>select valid alignment string.</i>	Select box		
Road Name <i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>	input box	Name of selected alignment string	
Report vertical alignment <i>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</i>	tick box	no	
Assume last XSec segment is sideslope <i>if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the default cut and fill slope fields are enabled.</i>	tick box	ticked	

Default cut slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the **default cut slope** field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Default fill slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the **default fill slope** field. If no value is set for the default, the fill slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Cross section model model box

This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch

chainage value to start writing cross sections

XSec end ch input box max alignment ch

chainage value to end writing cross sections

File name input box

the name to be used for file creation

Write button

write appropriate file

Sokkia Roding - String Road file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Sokkia Roding - String road

The Sokkia Roding - String road option allows the creation of a specific string roading file.

Selecting Sokkia Roding - String road brings up the **SDR Roding - String Road** panel

The fields and buttons used in this panel have the following functions:

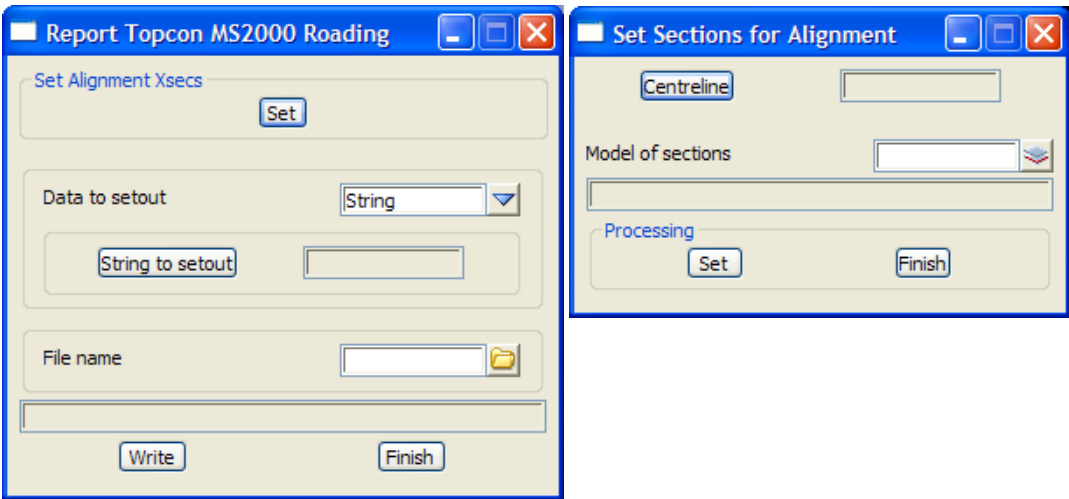

Field Description	Type	Defaults	Pop-Up
Road Name <i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>	input box	Name of selected alignment string	
Cross section model <i>model of cross sections to write out in SDR33 string format</i>	Model box		available models
XSec start ch. <i>chainage of the first cross sections to write out</i>	input box	min alignment ch	
XSec end ch. <i>chainage of the last cross sections to write out</i>	input box	max alignment ch	
File name <i>the name to be used for file creation</i>	file box		
Write <i>write appropriate file.</i>	button		

Topcon MS2000 Roding file

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Topcon MS2000

The **Topcon MS2000** option allows the creation of a specific roading file.

Selecting **Topcon MS2000** brings up the **Report topcon MS2000 Roding** panel

The fields and buttons used in this panel have the following functions:

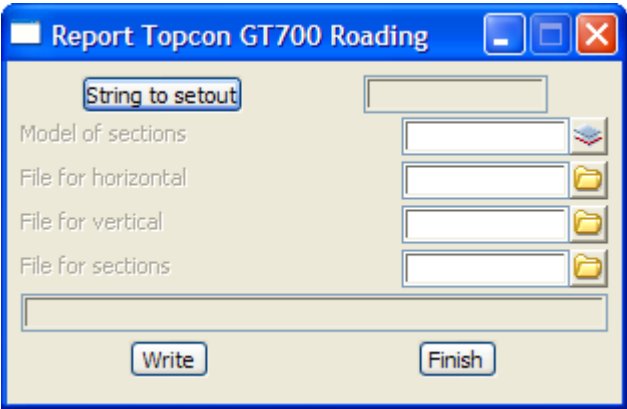

Field Description	Type	Defaults	Pop-Up
Set	button		Set section for alignment panel
<i>the set button will bring up the set sections for alignment panel. This panel allows the user to select multiple alignment/xsection combinations for the one file. The alignment is selected (using the Centreline selection button) followed by the Model of sections for that alignment. The Set button is pressed to accept the selection. This can be repeated for a number of alignments. Finish will close the set sections for alignment panel and return to the original panel</i>			
Data to setout	choice box	string	model view string
<i>the data to be included in the file can be selected by choosing a valid model, view or string. Depending on which data source is selected, the appropriate selection button will appear. The user then selects the button and then the items of interest.</i>			
File name	input box		
<i>the name to be used for file creation</i>			
Write	button		
<i>write appropriate files.</i>			

Topcon GT700 Roading File

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Topcon GTS-700 Roads

The **Topcon GTS-700 Roads** option allows the creation of a specific roading file.

Selecting **Topcon GTS-700 Roads** brings up the **Report Topcon GT700 Roading** panel

The fields and buttons used in this panel have the following functions:

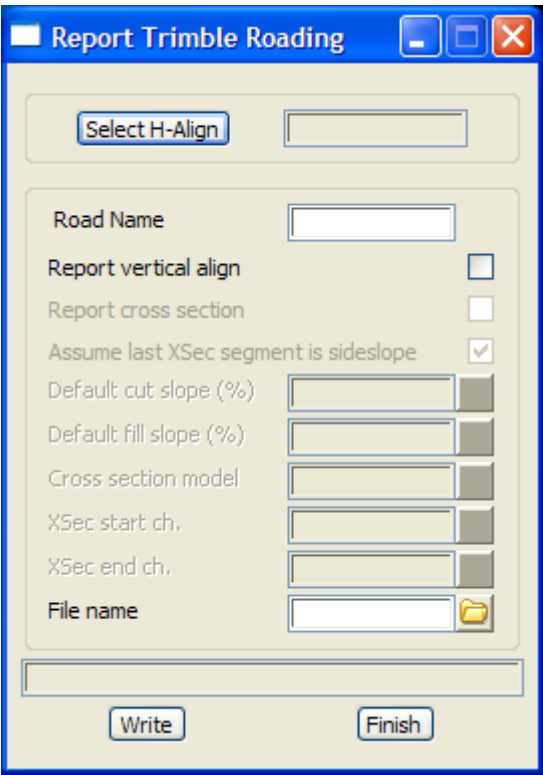

Field Description	Type	Defaults	Pop-Up
String to setout	select button		
<i>after pressing the string to setout button, the user can select a valid string. This string will be used for setting out.</i>			
Model of sections	model box		
<i>the model of cross sections. These sections will be written out to the file.</i>			
File for horizontal	input box		
<i>the name to be used for horizontal file creation. The file will automatically be given a .hg extension.</i>			
File for vertical	input box		
<i>the name to be used for the vertical file creation. The file will automatically be given a .vg extension.</i>			
File for sections	input box		
<i>the name to be used for the section file creation. The file will automatically be given a .xs extension.</i>			
Write	button		
<i>write appropriate files.</i>			

Trimble Roding File

Position of option on menu: Survey =>Upload => Create roads upload file, Instrument choice = Trimble Roding

The **Trimble Roding** option allows the creation of a specific roading file.

Selecting **Trimble Roding** brings up the **Report Trimble Roding** panel

The Trimble DC file has certain limitations and criteria. These include:

- 1. The alignment string must exist on the xsec's. This allows us to calculate the **zero pt** so we can split the template into left and right.
- 2. The xsec model should be representative of the alignment string used in the macro. i.e. not generated from a different alignment. Therefore the alignment string should have a 0 offset on the xsections.
- 3. The alignment string cannot exist above or below the xsection. I.e. it should be on the section as per 1).
- 4. The number of points on successive section templates (left and right) should be the same. i.e. if 5 points are on the LHS template for ch0 then the same number of points should exist for the LHS template for ch20. The instruments using this file, may not handle transitions between different number of points effectively and can give incorrect results. The user should limit the file by using the chainage range between areas where the number of points on each side of the cross sections are the same.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Select H-Align	Select box		
<i>select valid alignment string.</i>			
Road Name	input box	Name of selected alignment string	
<i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>			
Report vertical alignment	tick box	no	
<i>write vertical alignment details to file mode. If yes vertical alignment details written to the specified file.</i>			
Assume last XSec segment is sideslope	tick box	ticked	
<i>if box is selected, the last segments left and right of 0.0 offset are considered to be side slopes, and the</i>			

default cut and fill slope fields are enabled.

Default cut slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a fill sideslope is calculated, the cut sideslope definition in the file will be given the value as entered into the **default cut slope** field. If no value is set for the default, the cut slope in this instance will be given a null value. The default value if entered, should be in whole percent e.g. 50.0 for a 1v in 2h slope.*

Default fill slope (%) input box

this field is optional. From the section data it is only possible to calculate either the cut or fill sideslope. A default value can be specified to be used for the non calculated value.

*When the segment is rising (i.e has a positive slope) it is considered a cut slope. Similarly, if the grade is negative the sideslope is considered a fill. If a cut sideslope is calculated, the fill sideslope definition in the file will be given the value as entered into the **default fill slope** field. This will ask for the model of cross sections. These sections will be written out to the file.

XSec start ch input box min alignment ch

chainage value to start writing cross sections.

XSec end ch input box max alignment ch

chainage value to end writing cross sections.

File name input box

the name to be used for file creation

Write button

write appropriate files.

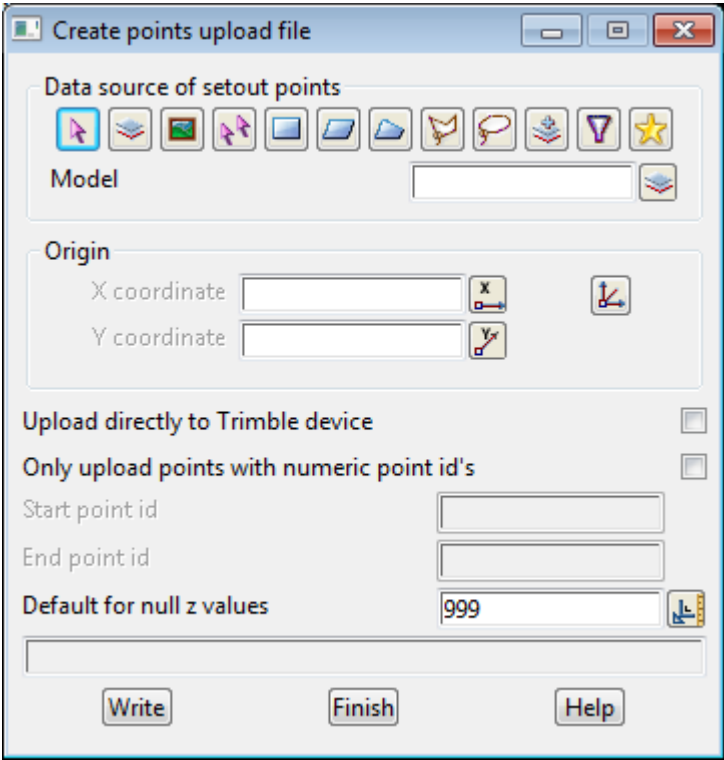

Create Points Upload File (New)

Position of option on menu: Survey =>Upload => Create points upload file (new)

The **Create points upload file (new)** option creates or uploads directly to a Trimble instrument a file of point ids, x, y and z, for string data (super strings and 4d strings only).

Only Trimble file formats is supported as this stage - the option **Create points upload file** ([Create Points Upload File](#)) is used to create files for most other instruments.

Selecting **Create points upload file (new)** brings up the **Create Points Upload File** panel.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Upload directly to Trimble device	tick box			
<i>if ticked, the points are uploaded to the attached Trimble instrument</i>				
<i>if not ticked, a dc file will be created.</i>				

Data source type
data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source
source of data to be processed.

Default for null value	input box	999
<i>value to write for null z-values.</i>		

Only upload points with numeric point names tick box
if ticked, only points with numeric (integer) point names are used.
if not ticked, alphanumeric point names are used.

Start point id	input box
<i>point id to start creating upload file from.</i>	

End point id	input box
<i>last point id to write to upload file.</i>	

Note: Start and End point ids may be left blank, and all point ids (whether numeric or alphanumeric) will be written to the upload file.

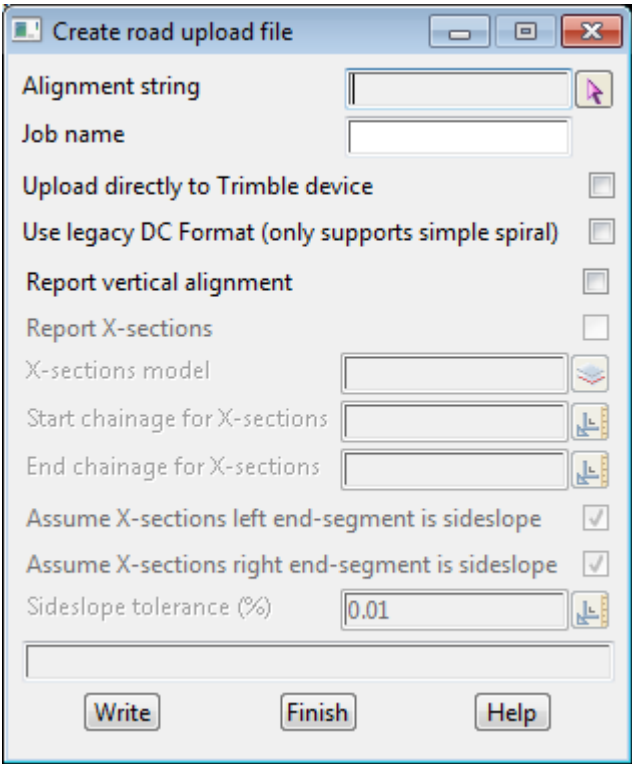

Origin x/Origin y	input box
<i>If non-zero, subtract the value from the x/y value before writing out.</i>	

Upload File button
create the upload file

Create Road Upload File (New)

Position of option on menu: Survey =>Upload => Create road upload file (new)
The **Create road upload file (new)** option allows the creation of road files or uploads directly to a Trimble instrument and Leica using *Leica XML* format.
Only *Trimble* and *Leica LandXML* file formats are supported as this stage- the option **Create road upload file** ([Create Road Upload File](#)) is used to create files for most other instruments.

Selecting **Create road upload file (new)** brings up the **Create Road Upload File** panel

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File type	choice box		Trimble Link Leica X-sections LandXML

For the choice Trimble Link, go to
Leica X-Sections LandXML

[Trimble Link](#)
[Leica X-Sections LandXML](#)

Trimble Link

Position of option on menu: Survey =>Upload => Create roads upload file (new), File type = Trimble Link
The **Trimble Link** options creates a file in Trimble dc format or uploads the date directly to the

instrument using *Trimble Link*.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Upload directly to Trimble device	tick box			
	<i>if ticked, the points are uploaded to the attached Trimble instrument if not ticked, a dc file will be created.</i>			
Alignment string	String select box			
	<i>select valid alignment string.</i>			
Road Name	input box		Name of selected alignment string	
	<i>input road name. If a valid alignment is selected, the name of that alignment will be the default road name.</i>			
Report vertical alignment	tick box			
	<i>If ticked, vertical alignment details written to file.</i>			
Report cross sections	tick box			
	<i>if ticked, the cross section model box will be enabled.</i>			
X- sections model	model box			
	<i>model of cross sections to be written out.</i>			
Start chainage for X-sections				
	<i>chainage value to start writing cross sections. If blank, start with first x-section.</i>			
End chainage for X-sections				
	<i>chainage value to stop writing cross sections. If blank, end with last x-section.</i>			

Assume X-sections left end-segment is sideslope tick box

If ticked, left end segments are tagged as sideslopes.

Assume X-sections right end-segment is sideslope tick box

If ticked, right end segments are tagged as sideslopes.

Sideslope tolerance (%) input 0.01

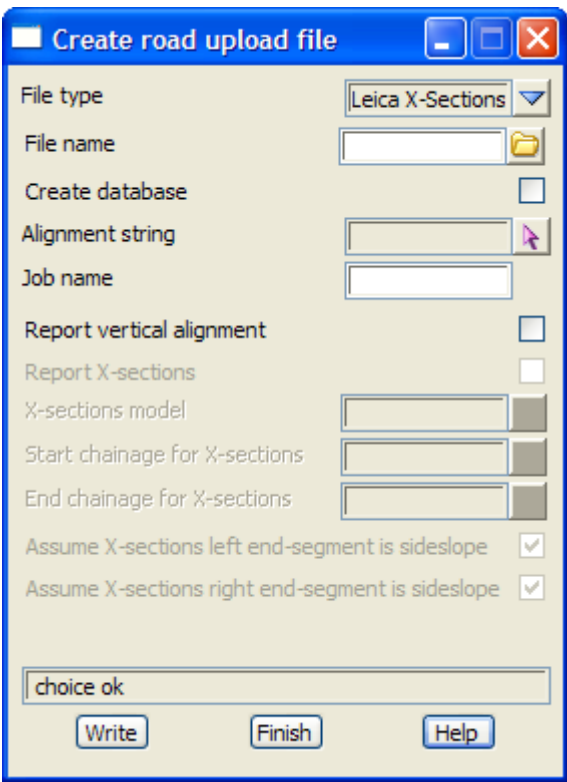

Write button

write out or upload the data.

Leica X-Sections LandXML

Position of option on menu: Survey =>Upload => Create roads upload file (new), File type = Leica X-Sections LandXML

The Leica X-Sections LandXML options creates a file in LandXML format suitable for *Leica* instruments

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File name <i>the name of the Leica LandXML file.</i>	input box		*.xml
Create database <i>if ticked, a DBX file is created</i>	tick box		
Alignment string <i>select valid alignment string.</i>	string select		

Job Name	input box	name of selected alignment string
<i>input job name. If a valid alignment is selected, the name of that alignment will be the default job name.</i>		
Report vertical alignment	tick box	
<i>if ticked, vertical alignment details written to file.</i>		
Report cross sections	tick box	
<i>if ticked, the cross section model box will be enabled.</i>		
X- sections model	model box	available models
<i>model of cross sections to be written out.</i>		
Start chainage for X-sections		
<i>chainage value to start writing cross sections. If blank, start with first x-section.</i>		
End chainage for X-sections		
<i>chainage value to stop writing cross sections. If blank, end with last x-section.</i>		
Assume X-sections left end-segment is sideslope	tick box	
<i>If ticked, left end segments are tagged as sideslopes.</i>		
Assume X-sections right end-segment is sideslope	tick box	
<i>If ticked, right end segments are tagged as sideslopes.</i>		
Write	button	
<i>write out file.</i>		

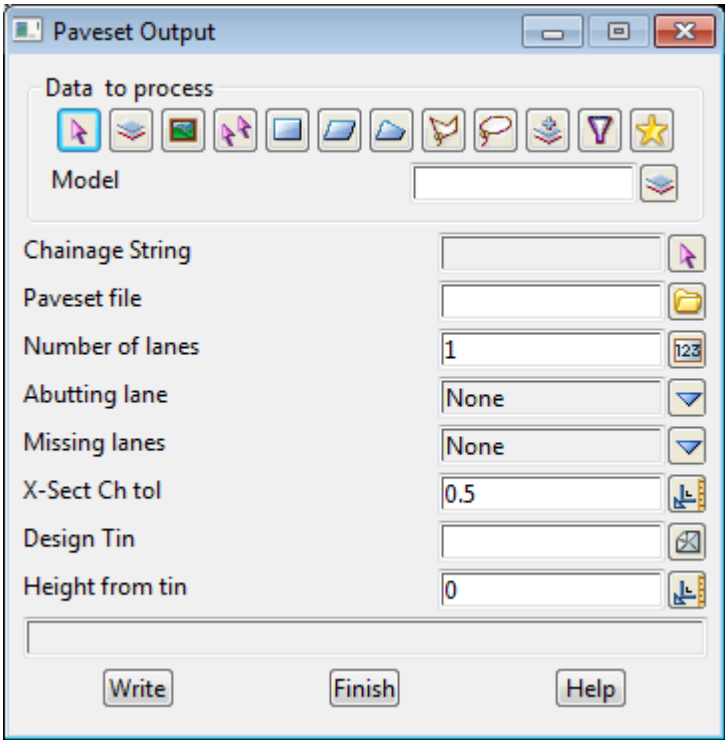

Create Paveseet Upload File

Position of option on menu: Survey =>Create Paveseet upload file

The **Paveseet Output** panel produces data in a format used by Paveseet machine guidance software used in laying asphalt and other materials.

Selecting **Create Paveseet upload file** brings up the **Paveseet Output** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to process	Model		
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Chainage String	string select		
<i>The string for chainages</i>			
Paveseet file	file select		
<i>File to write the output data to</i>			
Number of lanes	number box		
<i>The number of lanes for this paving run</i>			
Abutting lane	choice box	None	None, Left, Right
<i>If the paving run is abutting an existing lane choose that here</i>			
Missing lanes	choice box	None	None, Left, Right
<i>If the paving runs have missing points in some areas choose the side they are missing from here.</i>			

None - the same number of points exist at each cross section, an error will occur in processing if a difference is detected.

Left/Right - the output to paveset is padded on the nominated side to match the nominal number of lanes, when processing is finished you will display a list of chainages where this occurred

X- Sect Ch tol input box 0.5

The chainage variation allowed for each cross section

Design Tin input

The design TIN to drop the selected points against for level differences

Height from tin input box

The height from the design TIN

Templates in 12d Model

In **12d Model**, Templates provide a quick and easy method for defining design details along a string for use in conceptual designs and detailed designs, and visualisations.

An easy way of visualising a template is to look at its affect in a cross section.

A template can be thought of as simply a number of links, which are ultimately defined by width and slope, and are connected sequentially (according to rules for each link type) to form a cross section.

The point defined at the end of each link creates a **string** of the given link name when the template is used to create a design. The default colour of the string is the link colour and polygons created for each link are given the link colour.

For example, a template consisting of just the three links kerb, shoulder, verge could look like:

Templates are “applied” to a hinge string at right angles to a user selected reference string to produce a design model. That is, for a given string, specified templates are used as the cross-sectional definition of the geometry at a regular chainage interval down the string.

Both design cross sections and longitudinal strings (created by joining together the same points from each cross section) are created. The longitudinal strings are given the name of the template points used to define them

12d Model supports templates with an unlimited number of fixed links, followed by

(a) a decisions table

and

(b) an unlimited number of variable cut and fill links and a cut/fill slope to be applied at the end

of the last cut or fill template link.

The definition of a template with a fixed link table, a cut and fill tables and the final cut/fill links is discussed under the option **Create/edit Template**. The definition of the **Decision Table** is given in the section [Full Definition of Template Decisions](#) in the chapter [Advanced Design](#).

Fixed Template Links

The **fixed template links** are applied to the selected hinge string and are always used when applying the template regardless of whether the template points are in cut or fill. Each link is defined by two of the three variables, width, height and crossfall, and has a name and colour.

At the end of the fixed links, **12d Model** checks to see if a **Decisions** table exists.

If a **Decisions** table exists, then it is used and the Decision commands processed.

If a **Continue Cut/Fill** command is reached in the decision command processing, then this stops the Decision command processing, and the processing moves onto the **Cut**, **Fill** and **Final Cut/Fill** tables.

If no **Continue Cut/Fill** command is reached in the decisions, then the processing stops after the decision commands are exhausted and the **Cut**, **Fill** and **Final Cut/Fill** tables **ARE NOT USED**.

If no **Decisions** table exists, then the **Cut**, **Fill** and **Final Cut/Fill** tables are used after the **Fixed** table.

Template Decisions

The decisions table is used for

- s complicated cut and fill requirements including multiple strata, decisions based on depth below one or more strata or strings, multi-level decisions (i.e. depth decisions followed by fixed links, more depth decision etc.); and
- s extended battering including repetitive battering, fixed width batters, and battering relative to a string or strata.

The **decisions** table is documented in the section [Full Definition of Template Decisions](#) in the chapter [Advanced Design](#).

Cut and Fill Template Links and Final Cut/Fill

At the end of the fixed links, if there is **no** Decisions table, or if a *Continue Cut Fill* command is reached in the Decisions, the **Cut**, **Fill**, **Final Cut/Fill** tables are used.

If the end of the last link of the fixed template/last decision is in cut, then the Cut links are used. If the end of the fixed template/last decision is in fill, the fill links are used. There can be an unlimited number of cut and fill links and they are used sequentially starting with the first link.

If the surface tin is intersected when using a link, the section is terminated at that intersection point. Otherwise, the entire link is included in the section, and next link is then used. This is repeated until the surface is intersected or all the links have been used.

If there is still no intersection with the surface after using all of the cut or fill links, then the final cut/fill slope is used to try and intersect with the tin.

The unlimited cut/fill links are called **variable** template links because at each section, a different number of them may be needed - the number of links used varies from section to section depending on the tin above it.

Applying Templates

Once templates are defined, they can be “applied” to strings to produce the required design model. That is, for a given string, specified templates are used as the cross-sectional definition of the geometry at a regular chainage interval down the string.

Note

Around any curves, the string is approximated by chords spaced at the string's chainage interval or, if it is different, the section separation interval, or extra points as determined by the horizontal and vertical chord-arc tolerances.

If the chord-to-arc distance is greater than the chord/arc tolerance given in the **apply** options panels, then extra points are inserted around the curve so that the chord/arc tolerance is met.

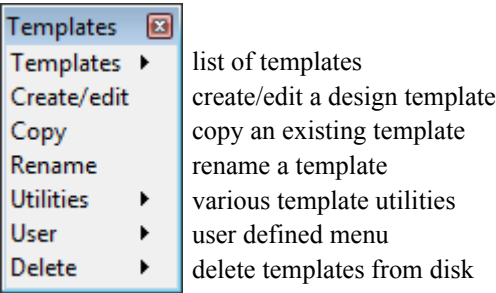

Templates

Position of menu: Design =>Templates

The **templates** walk-right menu has options to create and edit templates, copy, rename and other template utilities.

The **Project templates** walk-right menu provides a list of all the templates in the project.

Removed Templates

The **Removed templates** walk-right menu provides a list of all the templates in the project area that

have been removed from the project (using the **removed from project** option).

Create/Edit

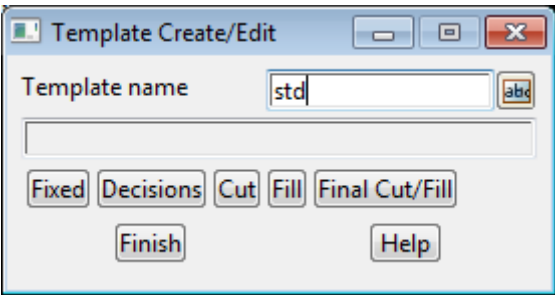

Position of option on menu: **Design =>Templates =>Create/edit**

12d Model supports templates with an unlimited number of fixed links, followed by either

- (a) a decisions table
- and/or
- (b) an unlimited number of cut and fill links and a final cut/fill slope the be applied at the end of the last template link.

To collect the different types of link information needed in the template, the **Template Create/Edit** panel was designed with five buttons **fixed**, **decisions**, **cut**, **fill** and **final cut/fill** used to bring up and display the panels for creating and editing the fixed, decisions, cut, fill and final cut/fill tables.

Selecting **Create/edit** displays the **Template Create/Edit** panel.

The description of the fields and buttons used in the **Template Create/Edit** panel now follows.

The associated panels created by the buttons fixed, cut, fill, final cut/fill will be described in the next four sections and the **Decisions** panel will be described in the section [Full Definition of Template Decisions](#) in the chapter [Advanced Design](#).

Field Description	Type	Defaults	Pop-Up
Template name <i>name of the template being created/edited. If the template already exists, then the associated panels will already contain the information for that template. The buttons fixed, decisions, cut, fill and final cut/fill can only be selected after the template name is given.</i>	input		available templates
Fixed <i>On selecting this button, the fixed template panel is displayed. See Fixed Template.</i>	button		
Decisions <i>On selecting this button, the Decisions Template panel is displayed.</i> <i>For the complete definition of decisions, please go to the section Full Definition of Template Decisions in the Chapter Advanced Design.</i>	button		
Cut or Fill <i>The variable cut or fill template panel is displayed on selecting this button. See Variable Cut or Fill Template.</i>	button		
Final Cut/Fill	button		

The **final cut/fill template** panel is displayed on selecting this button. See [Final Cut/Fill Template](#).

Note - the buttons can only be selected after the template name has been given in the **template name** panel field.

How to Use the Panel

- (a) A new template is created, or an existing template modified, by first entering the template name into the template field (typed or picked from the pop-up).
- (b) To define or edit the fixed sections of the template, select the **Fixed** button and the **Fixed Template** panel will appear.
- (c) use the **Decisions** button to define or edit the decisions table
- (d) use the **Cut**, **Fill** and **Final Cut/Fill** button to define or edit the variable cut, fill or final cut/fill sections of the template respectively.

The four panels controlled by the buttons **Fixed**, **Cut**, **Fill** and **Final Cut/Fill** from the **Template Create/Edit** panel will now be described in detail. The **Decisions** button is described in the section [Full Definition of Template Decisions](#) in the chapter [Advanced Design](#).

Go to the next section [Fixed Template](#).

Fixed Template

If the template already exists, the current fixed template links will be displayed in the panel. If the template is new, the panel will be empty.

The **Fixed Template** panel is

An unlimited number of fixed links can be defined in the template. For each link, any two of the three values of width, height and percent crossfall can be used to defined the link. The colour and name are also defined for the link.

The name is given to the sting created by the end of the link and the colour is used as either the string colour, or when a **map file** is used in the **Apply Many** option, is the colour of the created polygon joining the two ends of the link.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Width		input		
<i>width of the link being defined</i>				

Height		input		
<i>height of the link being defined. For a fixed link, height is positive in the up direction. Hence for a fixed link, height is positive up and negative down.</i>				

NOTE - if height and cross-fall are being used to go down, then define height to be negative and cross-fall to be negative.

X-fall %		input		
-----------------	--	-------	--	--

percent cross-fall of the link being defined - units are percent grade. For cross fall, positive is up and negative down.

NOTE - if height and cross-fall are being used to go down, then define height to be negative and cross-fall to be negative.

Colour colour box available colours

colour of the link being defined. If no colour is supplied, the default colour is used.

Name input

name of the link being defined - this is used as the name of the string created by the end point of the link.

OK/Apply button

OK stores the values in the fields and exits the panel. **Apply** stores the values but doesn't exit the panel.

*Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded.*

Draw button

draws the fixed template at the bottom of the panel. Automatically does a fit.

NOTE - if height and cross-fall are being used to go down, then define height to be negative and cross-fall to be negative.

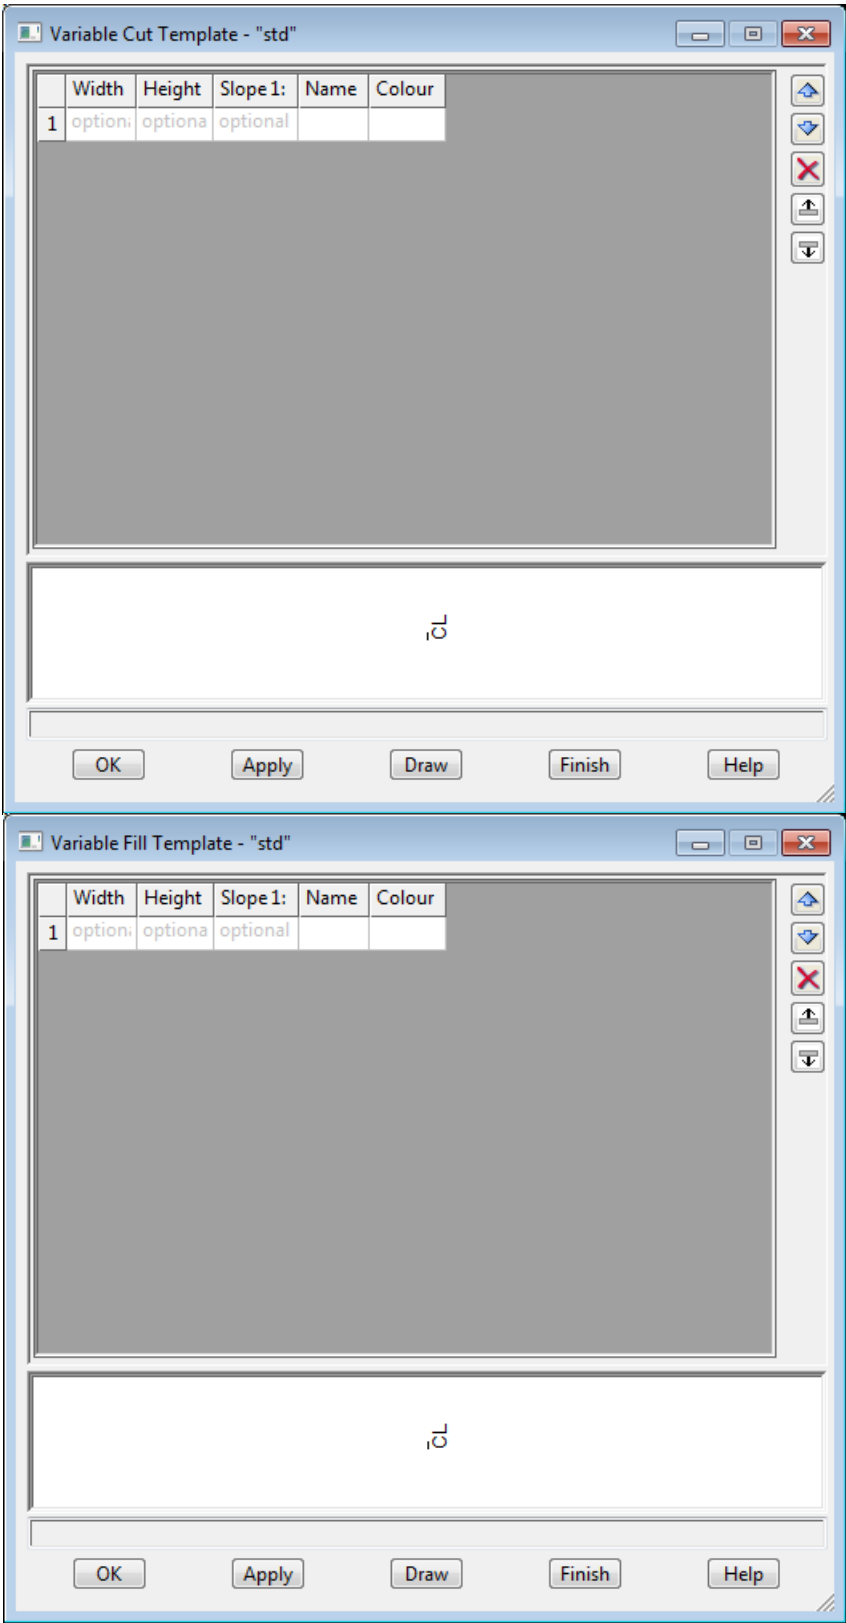

Go to the next section [Variable Cut or Fill Template](#).

Variable Cut or Fill Template

The definition of the cut or fill template links are similar to the fixed template links except the slope is given as a “one vertical in a user given horizontal value” rather than a percent crossfall.

If the template already exists, the current cut (fill) template links will be displayed in the panel. If the template is new, the panel will be empty.

The **Variable Cut Template** panel and the **Variable Fill Template** panel are similar and look like

An unlimited number of links can be defined in the variable template. For each link, any two of the three values of width, height and slope can be used to define the link. The colour and name are also defined for the link.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Width	input		
<i>width of the link being defined</i>			

Height	input		
<i>height of the link being defined</i>			

Important note:
For cut link, height is positive in the up direction. That is, for a cut link, height is positive up and negative down.
*For fill link, height is positive in the **down** direction. That is, for a fill link, height is positive down and negative up.*
This definition for fill links of down being positive for heights may seem strange but it is to fit in with the definition of slope for fill links where a positive slope is down. This was done so that most of the entries in the Slope table did not need a negative sign in front of them.

Slope 1:	input		
<i>slope of the cut link being defined. The units are “one vertical in the given horizontal value”. The value 0 is used to designate a horizontal slope - a vertical slope is not allowed.</i>			
<i>In the Variable Cut Template, for cut slopes, positive is up and negative down</i>			
<i>In the Variable Fill Template, for fill slopes, positive is down and negative is up.</i>			

Important note:
This definition of slope for fill links of down being positive may seem strange but it was done so that most of the entries in the Slope table did not need a negative sign in front of them.

NOTE -in cut: *if height and slope are being used to go down, then define height to be negative **and** slope to be negative.*

In fill: *if height and slope are being used to go up, then define height to be negative **and** slope to be negative.*

Colour	colour box	available colours
<i>colour of the link being defined. If no colour is supplied, the default colour is used.</i>		

Name	input		
<i>name of the link being defined - this is used as the name of the string created by the end point of the link.</i>			

OK/Apply button

OK stores the values in the fields and exits the panel. **Apply** stores the values but doesn't exit the panel.

Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded.

NOTE -in cut: if height and slope are being used to go down, then define height to be negative and slope to be negative.

In fill: if height and slope are being used to go up, then define height to be negative and slope to be negative.

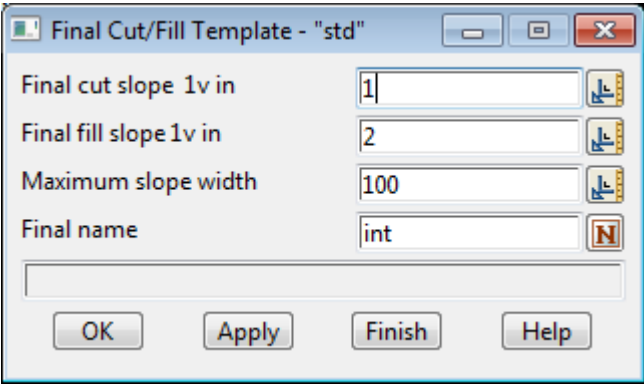

Go to the next section [Final Cut/Fill Template](#).

Final Cut/Fill Template

The final cut/fill template is used if the links in either the cut or fill templates are exhausted without an intersection with the tin being found.

If the template already exists, the current final cut/fill values will be displayed in the panel. If the template is new, the default values are displayed.

The **Final Cut/Fill Template** panel is

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Final cut slope 1 v in	input	0	no slope, 0,1,2,3,4,5,10
<i>cut slope for the interface calculation to be done at the end of the last link of the template. A cut slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed.</i>			
<i>For final cut slope, positive is up and negative down</i>			
Final fill slope 1 v in	input	0	no slope, 0,1,2,3,4,5,10
<i>fill slope for the interface calculation to be done at the end of the last link of the template. A fill slope of one vertical to the given value of horizontal units is used. The value 0 is used to designate a horizontal slope - vertical slopes are not allowed.</i>			
<i>For final fill slope, positive is down and negative is up.</i>			
<i>This definition of fill slope being positive when going down is used so that the value in the Final fill slope 1 v in field is normally positive.</i>			

Maximum slope width input 100

the maximum width for the final slope.

Final name input int

name for the string created by this link (normally this string lies on the tin - the interface string).

OK/Apply button

OK stores the values in the fields and exits the panel. **Apply** stores the values but doesn't exit the panel.

Warning - If the **OK** or **Apply** button is **not** selected, then **no** new information will be recorded.

Copy

Position of option on menu: **Design =>Templates =>Copy**

A copy of an existing template can be made using the **Copy** option. This is often useful when a new template that is similar to an existing template is needed. The existing template can be copied and the copy then edited and modified.

On selecting the **Copy** option, the **Copy Template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old template <i>name of the template to be copied.</i>	template box		available templates
New template <i>name of the template copy.</i>	template box		available templates
Copy <i>after selecting this button, the template given in the Old template field will be copied and the copy given the name in the New template field.</i>	button		

Rename

Position of option on menu: **Design =>Templates =>Templates =>Rename**

On selecting the **Rename** option, the **Template Rename** panel is displayed.

This panel can be used to change the names of existing templates

The fields and buttons used in this panel have the following functions.

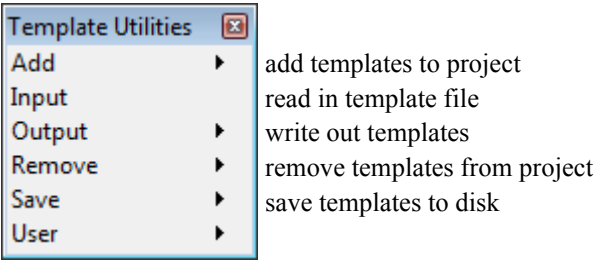

Field Description	Type	Defaults	Pop-Up
Old template <i>name of the template to be renamed.</i>	template box		available templates
New template <i>new name for the template</i>	template box		
Rename	button		
<i>Change the name of the template in the old template field to the name given in the new template field.</i>			

Utilities

Position of menu: Design =>Templates =>Utilities

The Utilities menu contains miscellaneous options involving templates.

The Utilities walk-right menu is

Each option will now be described.

Field Description	Type	Defaults	Pop-Up
Remove	button		
<i>after selecting this button, all templates in the working project will be removed.</i>			

Save

Position of menu: Design =>Templates =>Utilities =>Save

Templates can be saved on disk. This is done automatically by the **Save** option on the **12d Model** but this option allows just the templates to be saved.

The **Template saves** walk-right menu is

For the option *Save a template*, go to
Save all templates

[Save Template](#)
[Save All Templates](#)

Save Template

Position of option on menu: Design =>Templates =>Utilities =>Save =>Save a template

On selecting the Save a template option, the Save Template panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Template	template box <i>name of the template to be saved.</i>			available templates
Save	button <i>after selecting this button, the template given in the template field will be saved to disk.</i>			

Go to the next section [Save All Templates](#).

Save All Templates

Position of option on menu: Design =>Templates =>Utilities =>Save =>Save all templates
On selecting the Save all templates option, the **Save All Templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		
<i>after selecting this button, all templates in the working project will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.</i>			

Delete

Position of menu: Design =>Templates =>Delete

Using the **Delete** option, templates can be deleted from the project and moved to the Trash Bin, or permanently deleted from the computer disk so that they can no longer be accessed or take up disk space.

To help protect the user against disasters, when a template is selected for deletion, a **Yes-No** pop-up menu is used to confirm that the user did intend deleting the template.

The **Template Deletes** walk-right menu is

For the option <i>Delete a template</i> , go to	Delete Template
<i>Delete all templates</i>	Delete All Templates

Delete Template

Position of option on menu: Design =>Templates =>Delete =>Delete a template
The **delete a template** option is used to delete individual template from the project.
On selecting the **Delete a template** option, the **Delete Template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template <i>name of the template to be deleted.</i>	template box		project templates
Permanently delete? <i>if ticked, the deleted template will not go to the trash bin but will be permanently deleted from disk</i>	tick box		
Delete <i>after selecting this button, the template given in the template field will be deleted. A Yes-No pop-up is used to confirm that deletion is required.</i>	button		

Go to the next section [Delete All Templates](#).

Delete All Templates

Position of option on menu: Design =>Templates =>Delete =>Delete all templates

The **Delete all** option will delete all templates in the working project. It does not delete templates that are in the working project area but not yet added to the project.

On selecting the **Delete all** option, the **Delete All Templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete <i>after selecting this button, a Yes-No pop-up is used to confirm that deletion is required. If it is, all templates in the project will be deleted from disk. Unless an error occurs, the panel will be removed.</i>	button		
Permanently delete	tick box		

if ticked, the deleted templates will not go to the trash bin but will be permanently deleted from disk.

Apply

Position of menu: Design =>Apply

The **Apply** options are for producing design strings using templates and modifiers to create strings along a reference or reference and hinge string - “applying the template to a string”. This method can be used to quickly produce roads, canals, trenches, site batters etc.

When applying the templates, design x-sections and strings are automatically produced, plus the cut and fill volumes for the design.

Creating a design in this way is the first job of the **Apply** options.

However, after applying a template and examining the results, it is normally necessary to make changes to either the template, the string that the template was applied to or even the tin used for interfacing.

In all cases, the strings, sections and volumes created during the **Apply** will no longer be valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them with new ones by re-applying the template, this would be a time consuming if repeated over and over again. Hence in **12d Model**, a concept called **Apply functions** was introduced.

Basically, an **apply function** keeps track of all the information involved in applying a template and all the strings and models created during the **Apply/Apply many**. If either the template, the tin or the string that the template was applied to is subsequently modified, the apply functions can be re-run and all the old information automatically deleted and replaced by the updated information.

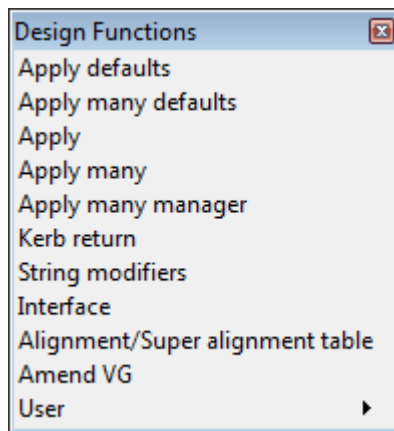

NOTES ABOUT THE STRING CHOSEN TO APPLY TEMPLATES TO

1. If vertical geometry does not exist for the entire length of the string, then the template(s) is/are only applied to the section of the string where vertical geometry exists.
2. If the horizontal or vertical geometry has overlapping tangent points at any section of the string, then the option terminates without any calculations being made.
3. Any curves will be approximated by chords spaced at chainage interval given by the section separation value. If the chord-to-arc distance for the chords is greater than the chord/arc tolerance given in the **Apply/Apply many** panel, then extra points are inserted around the curve so that the chord/arc tolerance is met.
4. The **Apply** options create sections and strings using a **reference** string to define the chainage and what is perpendicular at each chainage, and a **hinge** string from where the template links are defined. The template defines a point name and colour for each template link.

Cross sections can be created with point names corresponding to the template links, and strings formed by joining the same named points from consecutive cross sections.

The **Apply** walk-right menu is

Each option in this menu will now be described.

Apply and Apply Many Defaults

Position of option on menu: Design =>Apply =>Apply defaults

Design =>Apply =>Apply many defaults

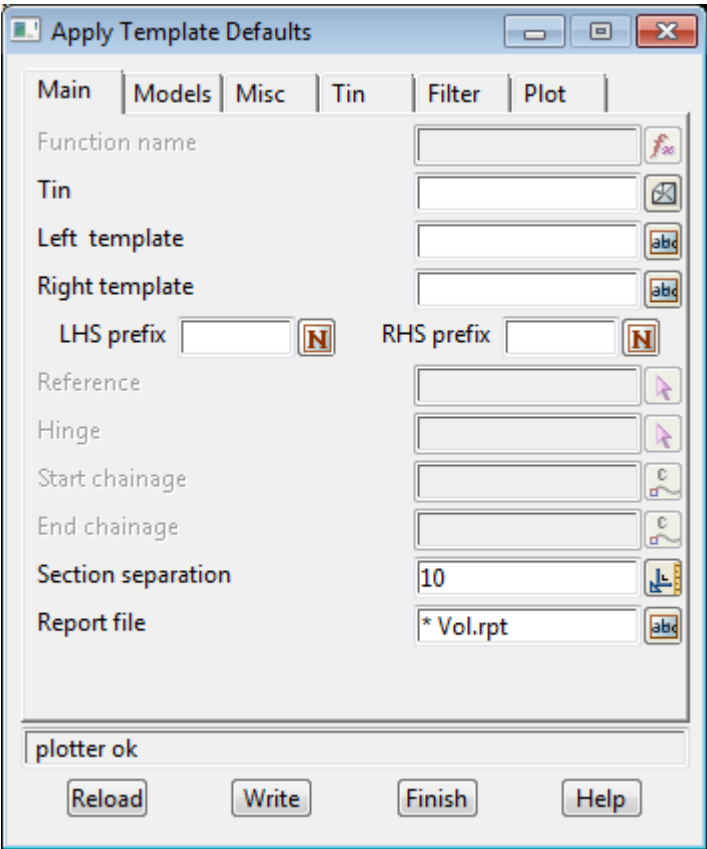

There are two files *apply_defaults.4d* and *apply_many_defaults.4d* which contain the **pre** or **post text** to be added to the name of the function to automatically create many entries in the panel fields for *Apply* and *Apply Many* plus default values for all the other panel fields.

After the name of a new function is typed in and an <enter> typed, all the fields mentioned in the default files are automatically filled in using the function name and the defined **pre-post text** as supplied in the file, plus setting any other panel fields from default values supplied in the file. If the files are missing, no panel fields are automatically filled in.

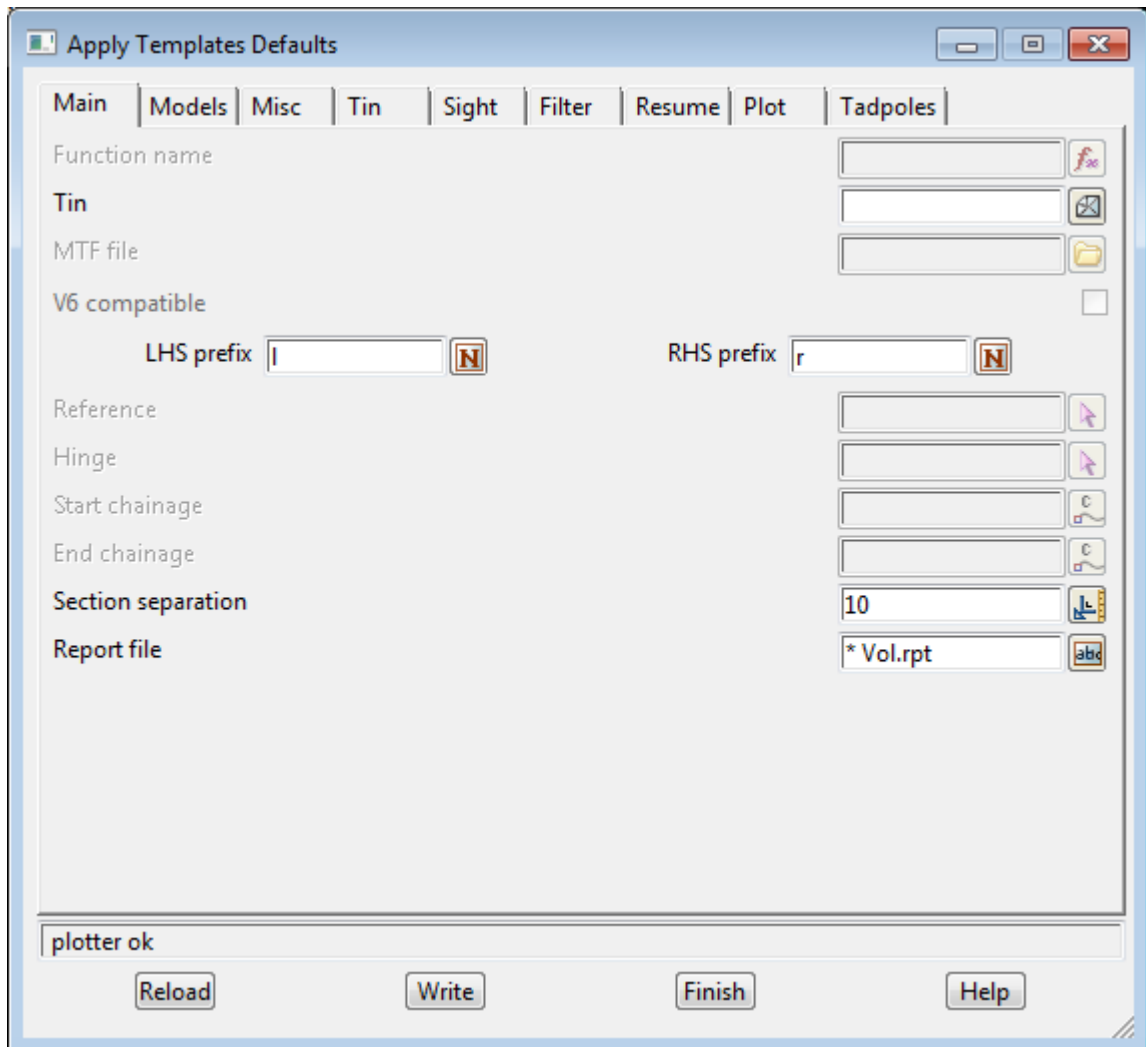

The files can be created and edited using the **Apply defaults** or **Apply many defaults** option which brings up the **Apply Template Defaults** or **Apply Templates Defaults** panels respectively.

Each of the fields in the **Apply Template Defaults** panel matches a field in the **Apply** panel and so for the documentation see [Apply](#).

Each of the fields in the **Apply Templates Defaults** panel matches a field in the **Apply Templates Function** panel and so for the documentation see [Apply Many](#).

Each of the fields in the **Apply Template Defaults** panel matches a field in the **Apply** panel and so for the documentation see [Apply](#).

Each of the fields in the **Apply Templates Defaults** panel matches a field in the **Apply Templates Function** panel and so for the documentation see [Apply Many](#).

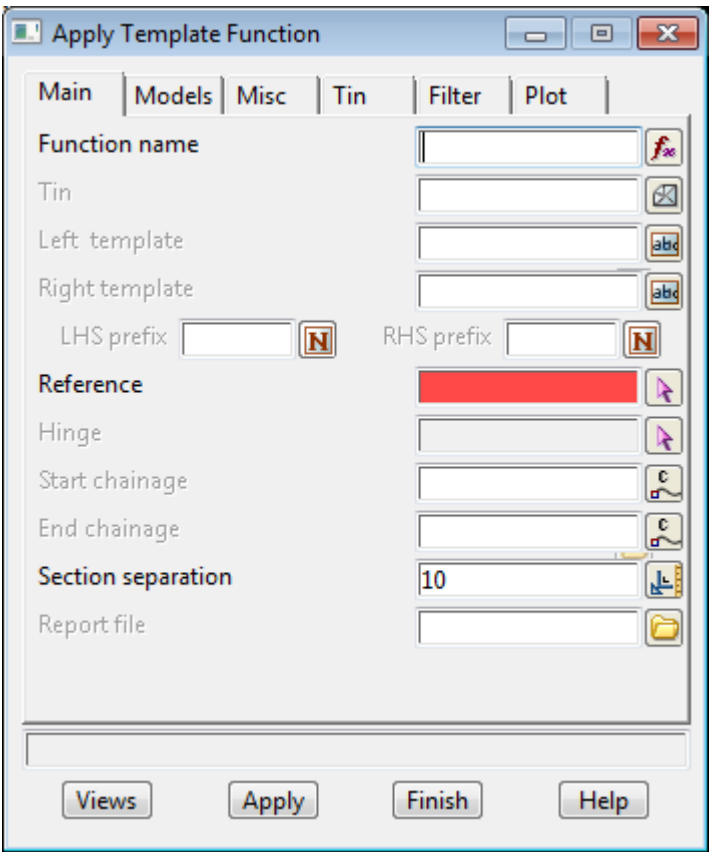

Apply

Position of option on menu: **Design =>Apply =>Apply**

On selecting the **Apply** option, the **Apply Template Function** panel is displayed.

This panel is used to create the information for applying a new template function or to modify the information for an existing template function.

The **Apply Template Function** panel is

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Buttons at bottom			
Views	button		
<i>perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section Views</i>			
Apply	button		

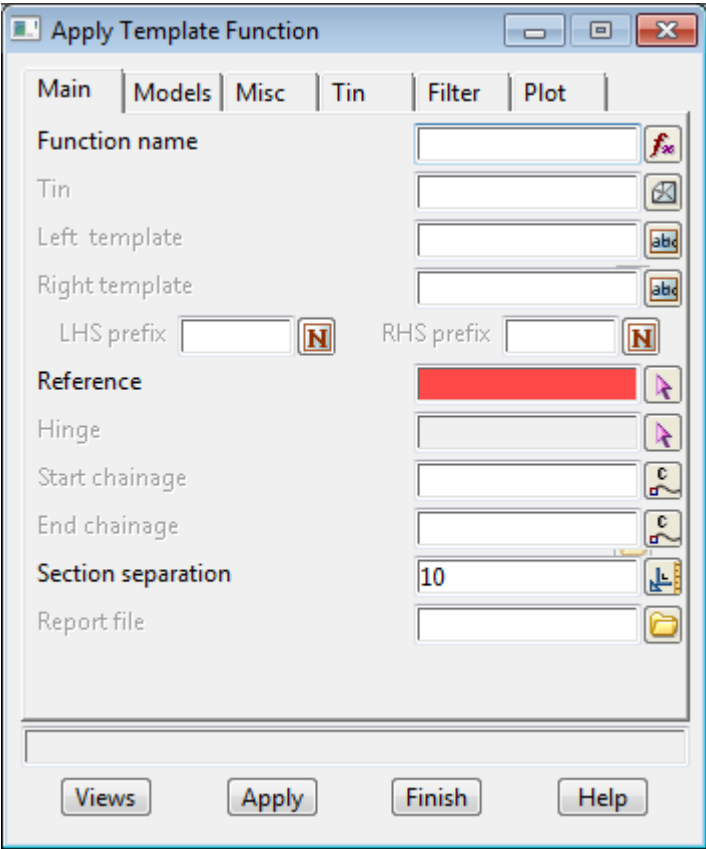

apply the template information to the selected reference and hinge strings, between the start and end chainages. The cut, fill and balance volumes are also calculated and written to the message area.

For the information on each **Apply Template Function** tab, go to

- [Apply Main tab](#)
- [Apply Models tab](#)
- [Apply Misc tab](#)
- [Apply Tin tab](#)
- [Apply Filter tab](#)
- [Apply Plot tab](#)

Apply Main tab

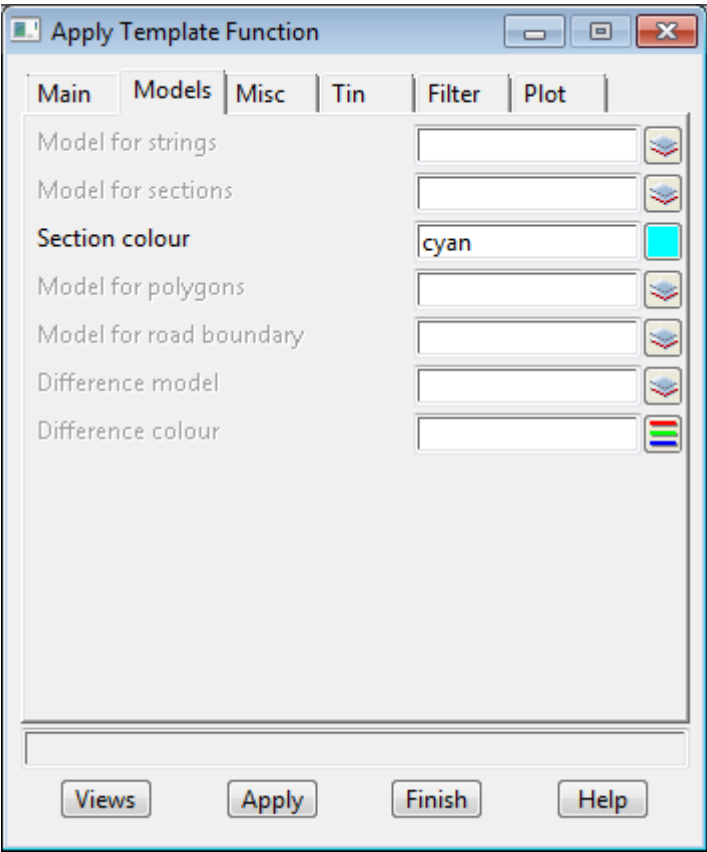

Function name function box available template functions

*name of the function to define the **apply** for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.*

Tin	tin box	available tins
<i>if non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the left and right template fields.</i> <i>If blank, then only the fixed part of the templates are used unless a tin is specified in the decisions section of the templates.</i>		
Left/right template	template box	available templates
<i>name of the template to be applied to the left/right of the string. If a template is used on the left/right, the template definitions go from the hinge string out to the left/right.</i>		
LHS/RHS prefix	input	
<i>prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.</i>		
Reference	string-select	
<i>the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.</i>		
Hinge	string-select	
<i>the reference string defines chainage and bearing but the templates are actually applied to the hinge string. For a given chainage, a line is taken at right angles to the point of that chainage on the reference string and extended until it cuts the hinge string. The templates are applied at that point on the hinge string along the direction of the line.</i> <i>If no hinge string is selected, the reference string is also the hinge string.</i>		
Start/End chainage	input	
<i>the reference string start/end chainage for applying the template. If blank, the start/end chainage of the reference string is used.</i>		
Section separation	input	10.0
<i>sections are created at right angles to points on the reference string that are the section separation chainage distance apart.</i>		
Report file	file box	*.rpt
<i>if non-blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be appended to the file.</i> <i>If blank, no report is produced.</i>		

Apply Models tab

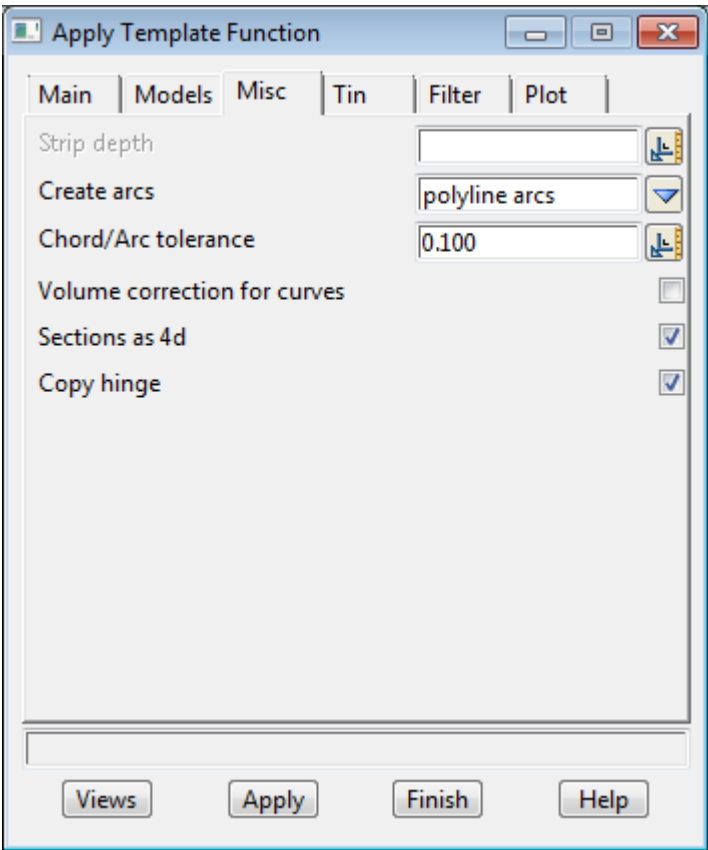

Model for strings	model box	available models
<i>if non-blank, the name of the model to contain the template and interface strings. The string colour is the template link colour.</i>		
<i>If blank, the strings will not be stored.</i>		
Model for sections	model box	available models
<i>if non-blank, the name of the model to contain the design sections generated by the templates.</i>		
<i>If blank, the sections will not be stored.</i>		
Section colour	colour box	default colour available colours
<i>the colour for the sections strings</i>		
Model for polygons	model box	available models
<i>if non-blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.</i>		
<i>If blank, the polygons will not be stored.</i>		
Model for road boundary	model box	available models
<i>if non-blank, the name of the model to contain the polygon created by joining the outside links of the road.</i>		
<i>If blank, the polygon will not be stored.</i>		
Difference model	model box	available models

if non-blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field. If blank, the sections are not kept.

Difference colour colour box available colours
colour for the difference sections strings

Apply Misc tab

Strip depth input 0
the stripping depth to be used on the tin before the apply is done.

Create arcs choice box super arcs no arcs, alignment arcs, polyline arcs, super arcs
*if **no arcs**, the strings are created as 3d strings with no arcs.*
***alignment arcs**, the strings are created as alignment strings with arcs*
***polyline arcs**, the strings are created as polyline strings with arcs.*
***super arcs**, the strings are created as super strings with arcs.*

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

Volume correction for curves tick box
if ticked, volume corrections are made when going around curves.

Sections as 4d tick box tick

if ticked, the section strings will be created as 4d super strings with the appropriate template string names as the vertex text at each vertex of the section. These are needed for boxing and some options on x-section plots.

Copy hinge tick box tick

if ticked, a string with points at the apply chainages is created on top of the hinge string.

Apply Tin tab

Create road tin tick box

if ticked, the fields in this tab are used to create a road tin

Road tin tin box available tins

name for the tin created from the design strings and sections

Colour for tin colour box available colours

colour of the road tin

Model for tin model box available models

model for the road tin

Create depth range polygons tick box

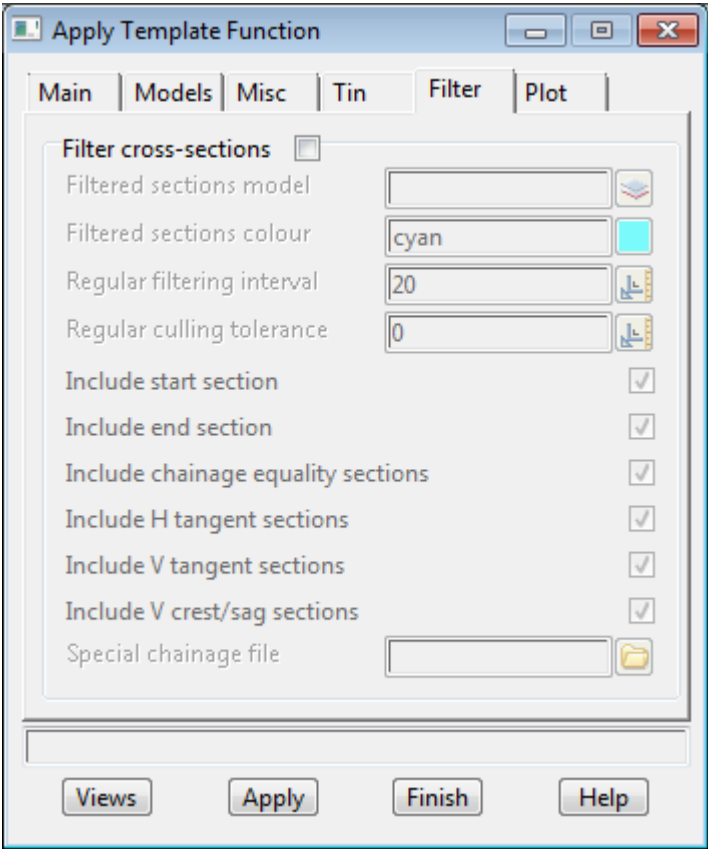

if ticked, depth polygons are created

Depth range file file box *.drf files

depth range file used when creating polygons

Model for polygons	model box	available models
<i>model for the depth polygons</i>		

Apply Filter tab

Filter cross-sections tick box
if ticked, the fields in this tab are used to filter cross sections

Filter sections model	model box	available models
<i>model for the filtered cross sections</i>		

Filtered sections colour	colour box	available colours
<i>colour of the filtered cross sections</i>		

Regular filtering interval input
regular interval to use for filtering the cross sections

Regular culling tolerance input 0
tolerance to use when selecting a cross section

Include start sections tick box
if ticked, a section at the start chainage is included even if the start chainage is not at a regular interval

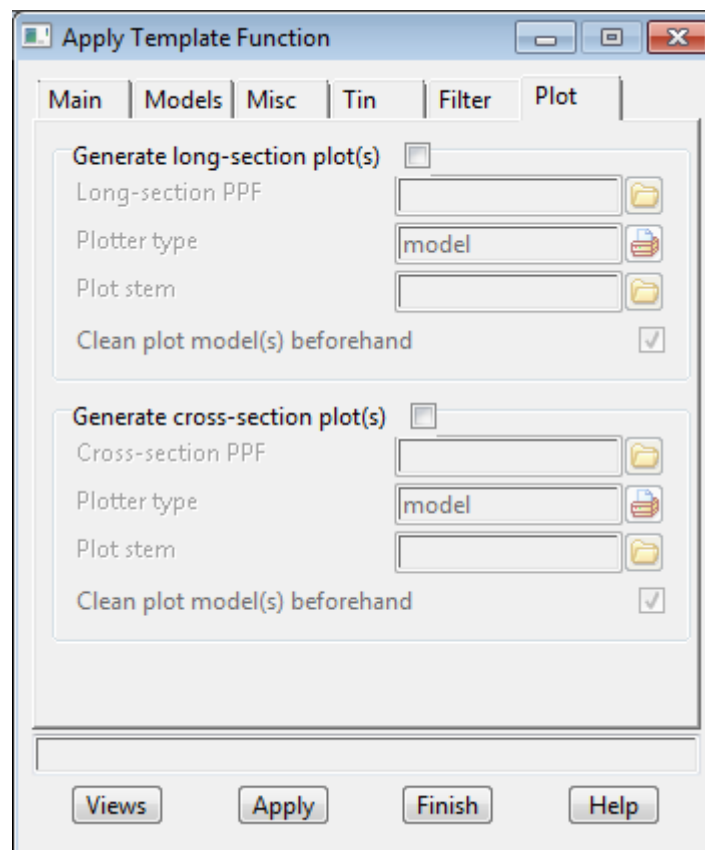

Include end sections tick box

if ticked, include sections where there is a chainage equality

if ticked, a sections at the horizontal/vertical tangent points are included even if they are not at a regular interval

if ticked, a sections at the crest and sag points are included even if they are not at a regular interval

if non blank, a file of chainages to include sections at even if they are not a regular interval

if ticked, long section plots are created

binary ppf file to use for the long section plots

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created

Generate cross section plot(s) tick box

if ticked, cross section plots are created

Cross section PPF file box *.lplotppf files

binary ppf file to use for the cross section plots

Plotter type plotter box model available plotters

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

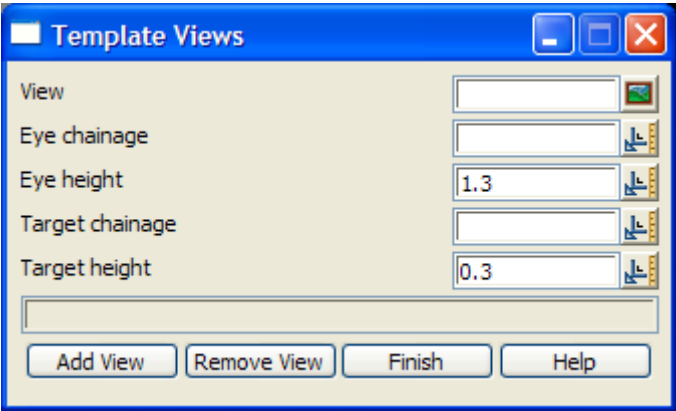

if ticked and the **plotter type is model**, the plot models are cleaned before the plots are created

Views

This option locks perspective views to the reference string of the **Apply/Apply Many** function, It defines the eye and target co-ordinates for the perspective views in terms of the chainage and height above an existing reference string (as in the perspective view-ops option, string-walk) rather than entering the (x,y,z) eye and target co-ordinates.

If the string is modified, then the perspective eye and target points will also change.

Selecting **Views** fires up the **Template Views** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		available views
the perspective view to define the eye and target points for.			
Eye chainage	input		

the string chainage of the eye viewing point.

Eye height input 1.3

height of the eye viewing point above the string.

Target chainage input

the string chainage the target viewing point.

Target height input 0.3

height of the target viewing point above the string.

Add View button

add the view to the template function and then redraw the view using the above eye and target parameters.

Remove View button

remove the view from the Apply/Apply Many function.

Apply Many

Position of option on menu: **Design =>Apply =>Apply many**

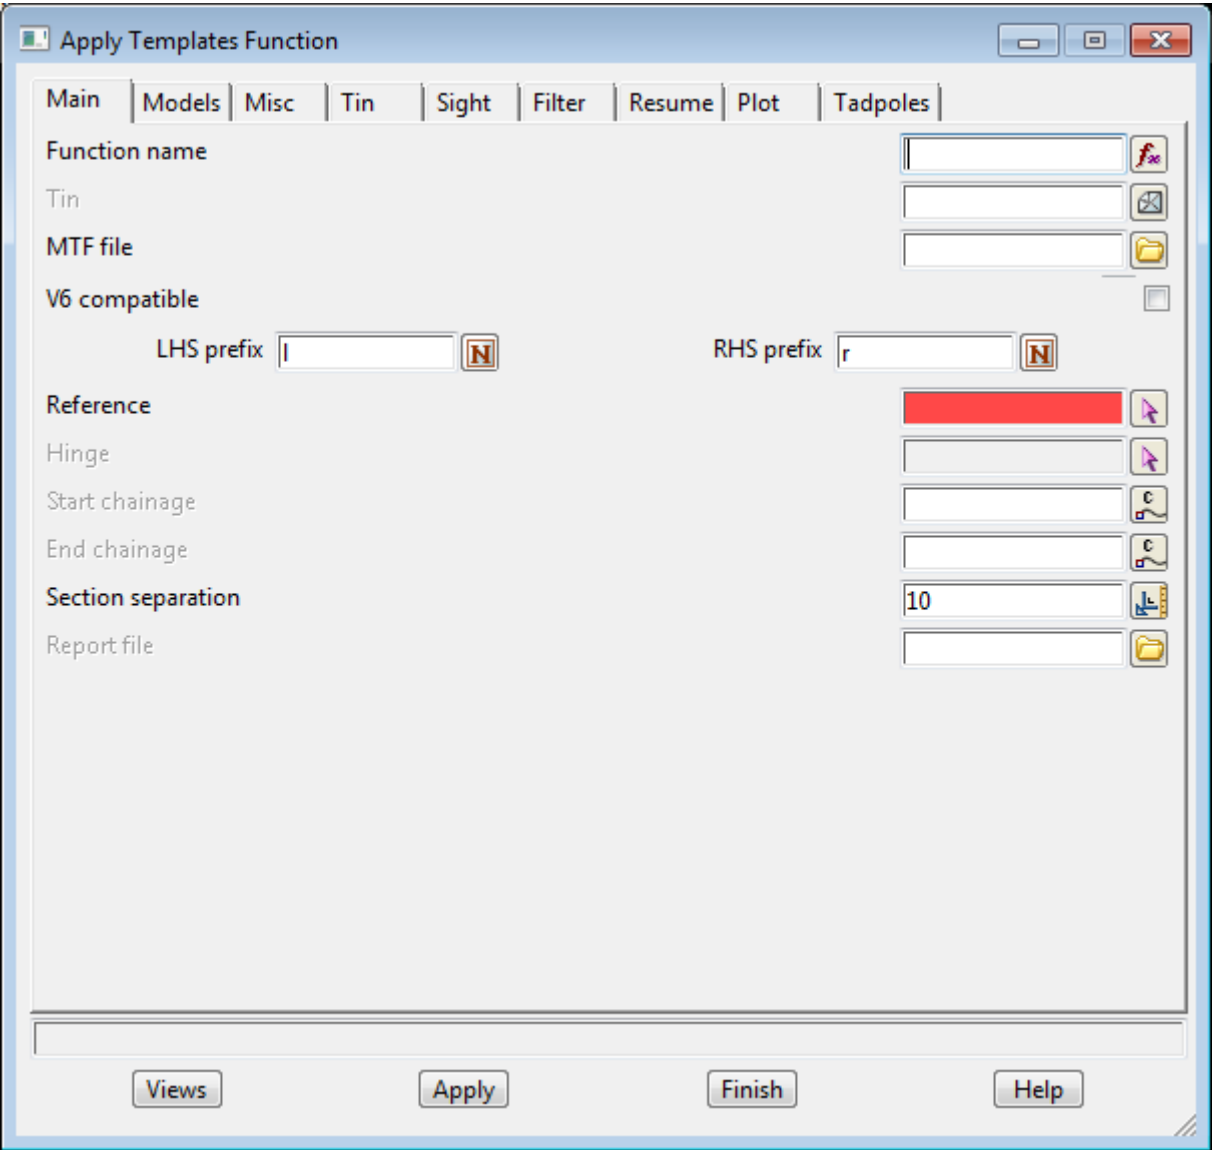

The **Apply Many** option is used for more complex design work.

It includes defining different templates over different chainage ranges, modifiers for advanced control of the strings created by the **Apply Many**, stripping depths and boxing, a road tin and depth polygons, sights lines, tadpoles, plus long section and cross section plots.

The **Apply Many** can also create up to eight layers of boxing.

For **Apply Many**, the templates and all the modifiers are supplied in a file called the **Many Templates File** or **MTF** file. The definition of the **MTF** will follow after the description of the **Apply Many** option.

Selecting **Apply many** displays the **Apply Templates Function** panel.

This panel can be used to create the information for applying a new template function or to modify the information for an existing template function.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Buttons from bottom

Views button

perspective views can be defined with respect to chainages on the string. This option is described in more detail in the section [Views](#).

Apply button

apply the template information to the selected reference and hinge strings, between the start and end chainages. The cut, fill and balance volumes are also calculated and written to the message area.

For the information on each **Apply Templates Function** tab, go to

[Apply Many Models tab](#)

[Apply Many Misc tab](#)

[Apply Many Tin tab](#)

[Apply Many Sight tab](#)

[Apply Many Filter tab](#)

[Apply Many Resume tab](#)

[Apply Many Plot tab](#)

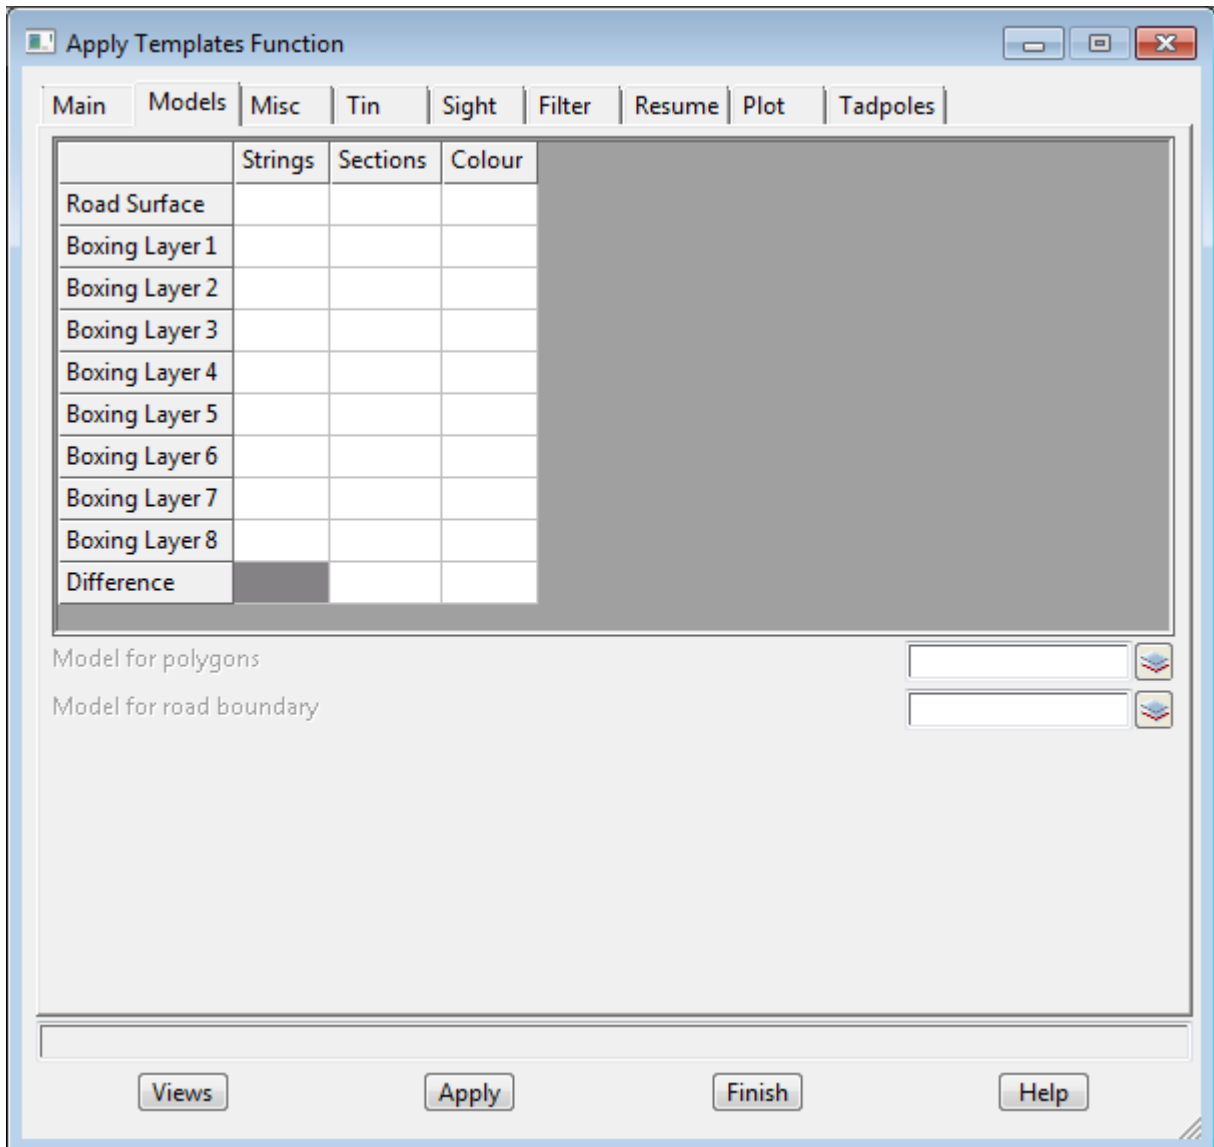

[Apply Many Tadpoles tab](#)

V6 compatible	tick box	
<i>if ticked, the template is used as it was in 12d Model version 6</i>		
LHS/RHS prefix	input	
<i>prefix/postfix (pre*post) to be applied to the left/right template string names. If pretext only, just give the text. If post text is required, precede it by a *.</i>		
Reference	string-select	
<i>the selected string is used to defined the meaning of chainage and bearing for each point in the apply. Sections are defined at right angles to the reference string at the appropriate chainage points on the reference string.</i>		
Hinge	string-select	
<i>the reference string defines chainage and bearing but the templates are actually applied to the hinge string. For a given chainage, a line is taken at right angles to the point of that chainage on the reference string and extended until it cuts the hinge string. The templates are applied at that point on the hinge string along the direction of the line. If no hinge string is selected, the reference string is also the hinge string.</i>		
Start/End chainage	input	
<i>the reference string start/end chainage for applying the template. If blank, the start/end chainage of the reference string is used.</i>		
Section separation	input	10.0
<i>sections are created at right angles to points on the reference string that are the section separation chainage distance apart.</i>		
Report file	input	*.rpt
<i>if non-blank, the name of the file to contain the volume report for the template calculations. If the file already exists, the report will be automatically over written. If blank, no report is produced.</i>		
<i>Also if boxing is included in the MTF file definition, the volumes in the report can include not only the volumes from the stripped natural surface tin to the design, but also the interboxing layer volumes and the volumes from the last boxing layer to the design and to the stripped natural surface.</i>		

Apply Many Models tab

the model tab consists of a grid for defining the design strings forming the road surface and design cross section, up to eight layers of boxing and models for the difference sections between the design and the natural surface.

The last boxing layer is also referred to as the **subgrade** layer.

Road Surface:

Strings

model box

available models

if non-blank, the name of the model to contain the design and interface strings. The default string colours are the template link colours but that can be overridden by a map file.

If blank, the strings are stored.

Sections

model box

available models

*if non-blank, the name of the model to contain the design sections generated by the apply.
If blank, no sections are stored.*

Colour	colour box	available colours
---------------	------------	-------------------

the colour for the design sections strings

Boxing Layer 1-8:

if non blank, boxing strings and sections will be created for that layer.
*The last boxing layer is also referred to as the **subgrade** layer.*
For more information on boxing, see [What is Boxing ?](#).

Strings	model box	available models
----------------	-----------	------------------

if non-blank, the name of the model to contain the boxing strings for this layer.
If blank, the strings will not be stored.

Sections	model box	available models
-----------------	-----------	------------------

if non-blank, the name of the model to contain the boxing sections generated by the templates and boxing rules. If blank, the sections will not be stored.

Colour	colour box	available colours
---------------	------------	-------------------

colour for the boxing sections for this layer

Difference

Sections	model box	available models
-----------------	-----------	------------------

if non-blank, the sections which are the difference between the tin sections and the template x-sections are retained and placed in the model given in this field.
If blank, the sections are not kept.

Colour	colour box	available colours
---------------	------------	-------------------

colour for the difference sections strings

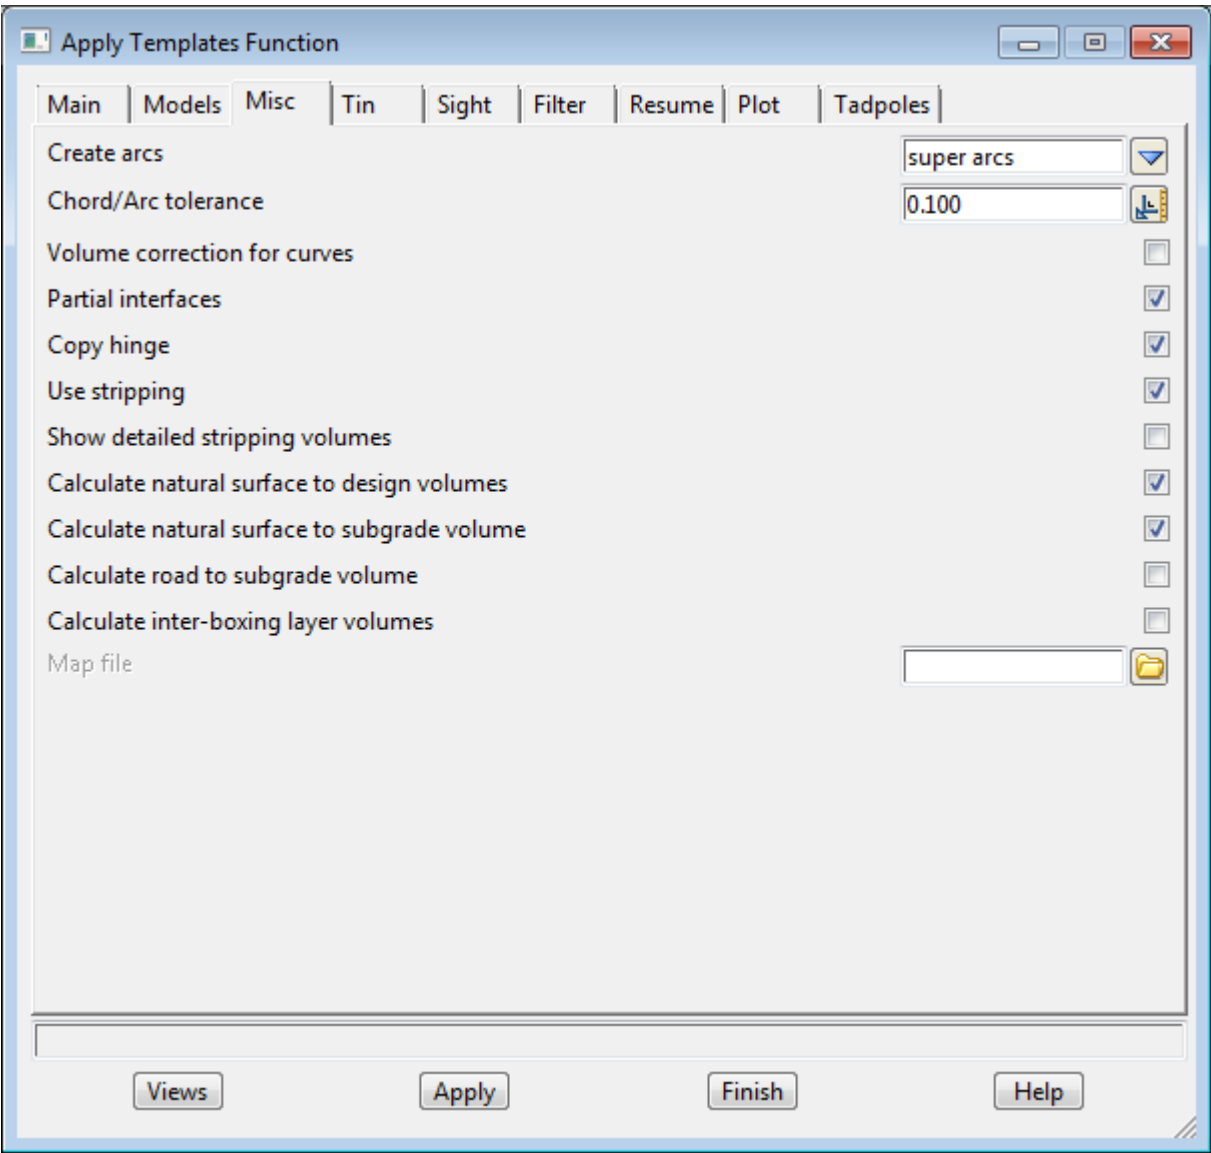

Model for polygons	model box	available models
---------------------------	-----------	------------------

if non-blank, the name of the model to contain the polygons created for each link of the template. The polygon is given the colour of the template link.
If blank, the polygons will not be stored.

Model for road boundary	model box	available models
--------------------------------	-----------	------------------

if non-blank, the name of the model to contain the polygon created by joining the outside links of the road.
If blank, the polygon will not be stored.

Apply Many Misc tab

Create arcs choice box super arcs no arcs, alignment arcs, polyline arcs, super arcs

*if **no arcs**, the strings are created as 3d strings with no arcs.
alignment arcs, the strings are created as alignment strings with arcs
polyline arcs, the strings are created as polyline strings with arcs.
super arcs, the strings are created as super strings with arcs.*

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the reference string for determining how many sections are created around horizontal curves.

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Partial interfaces tick box tick

if ticked, an interface string is not produced when no intersection is made with the tin. The interface may then be broken into a number of interface strings.

If not ticked, a yellow segment is created in the interface string when no intersection is made with the tin. Only one interface string will then be produced.

Copy hinge tick box tick

if ticked, a string with points at the apply chainages is created on top of the hinge string.

Use stripping tick box tick

if ticked, the stripping depths in the mtf file are used.

Show detailed stripping volumes tick box

if ticked, end area stripping volumes are written to the report file

Calculate natural surface to design volumes tick box tick

if ticked, end area volumes between the natural surface and the design strings are written to the report file. If stripping is used, then the cut and fill areas and volumes are calculated from the design to the stripped natural surface.

Calculate natural surface to subgrade volume tick box tick

if ticked, end area volumes between the natural surface to the subgrade (the last boxing layer) are written to the report file. If stripping is used, then the cut and fill areas and volumes are calculated from the last layer of boxing, to the stripped natural surface.

Calculate road to subgrade volumes tick box tick

if ticked, end area volumes between the design strings and the subgrade (the last boxing layer) are written to the report file.

Calculate inter-boxing layer volumes tick box tick

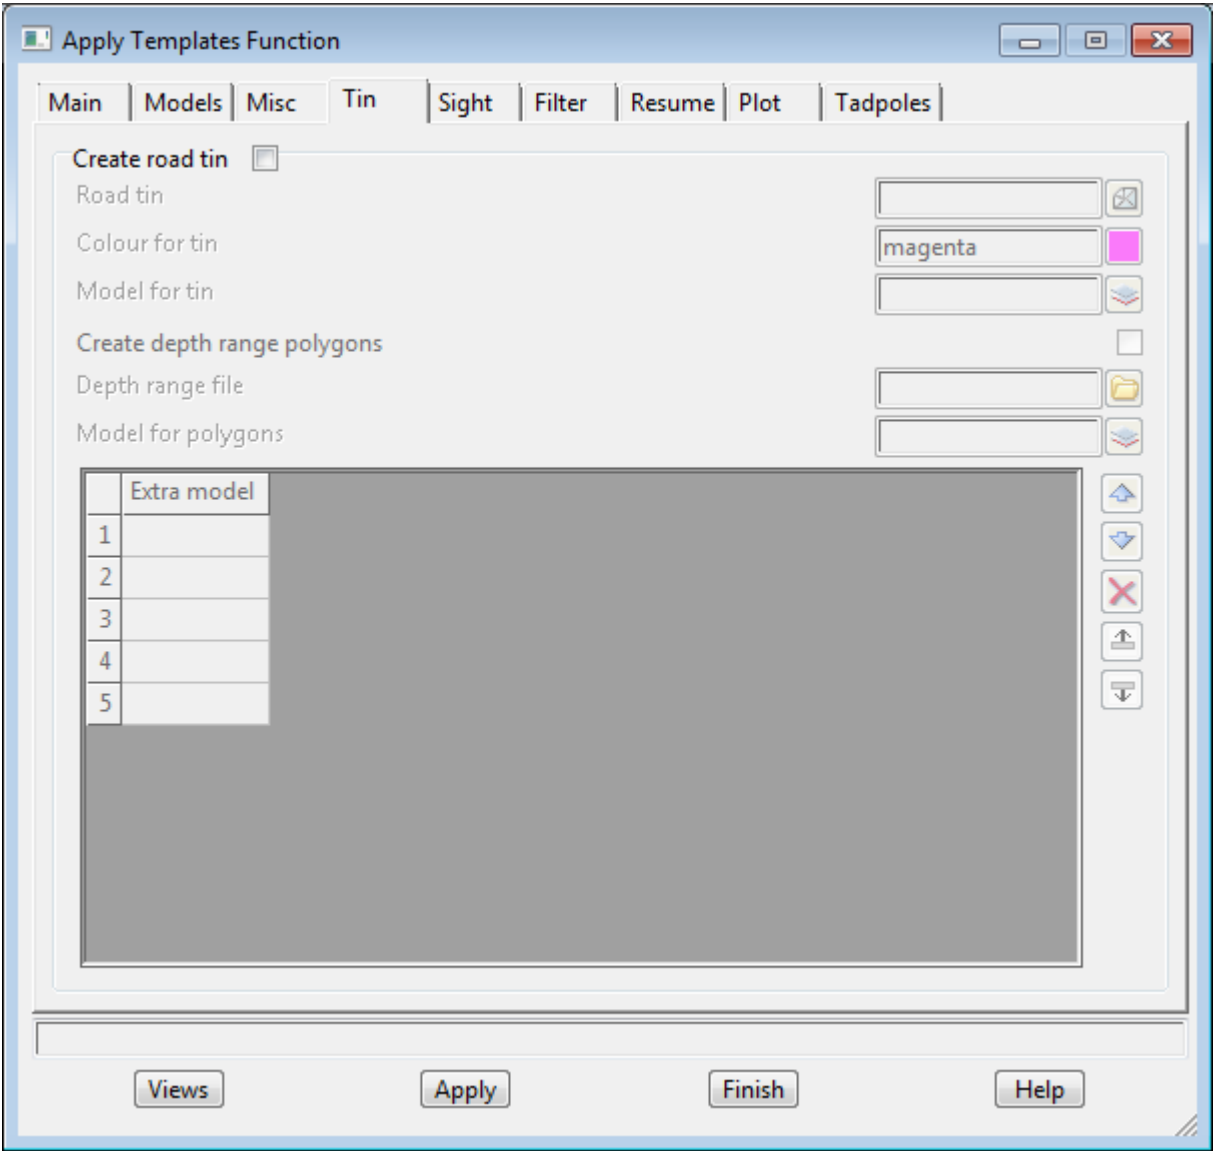

if ticked, end area volumes between each of the boxing layers are written to the report file.

Map file file box *.mapfile files

*if **non blank**, the given map file is applied to all the design strings created by the **Apply Many**. The map file overrides any default colours from the templates. The map file can colour strings, apply linestyles, apply hatch patterns to polygons, apply extrudes to super strings etc. For more details on the map file, see [Create/Edit a Map File](#) in the chapter [File I/O](#).*

Apply Many Tin tab

the Tin tab controls the creation of a design tin and depth polygons

Create road tin	tick box	
if ticked, the fields in this tab are used to create a road tin		
Road tin	tin box	available tins
name for the tin created from the design strings and sections		
Colour for tin	colour box	available colours
colour of the road tin		
Model for tin	model box	available models
model for the road tin		
Create depth range polygons	tick box	
if ticked, depth polygons are created		
Depth range file	file box	*.drf files

depth range file used when creating polygons

Model for polygons	model box	available models
<i>model for the depth polygons</i>		

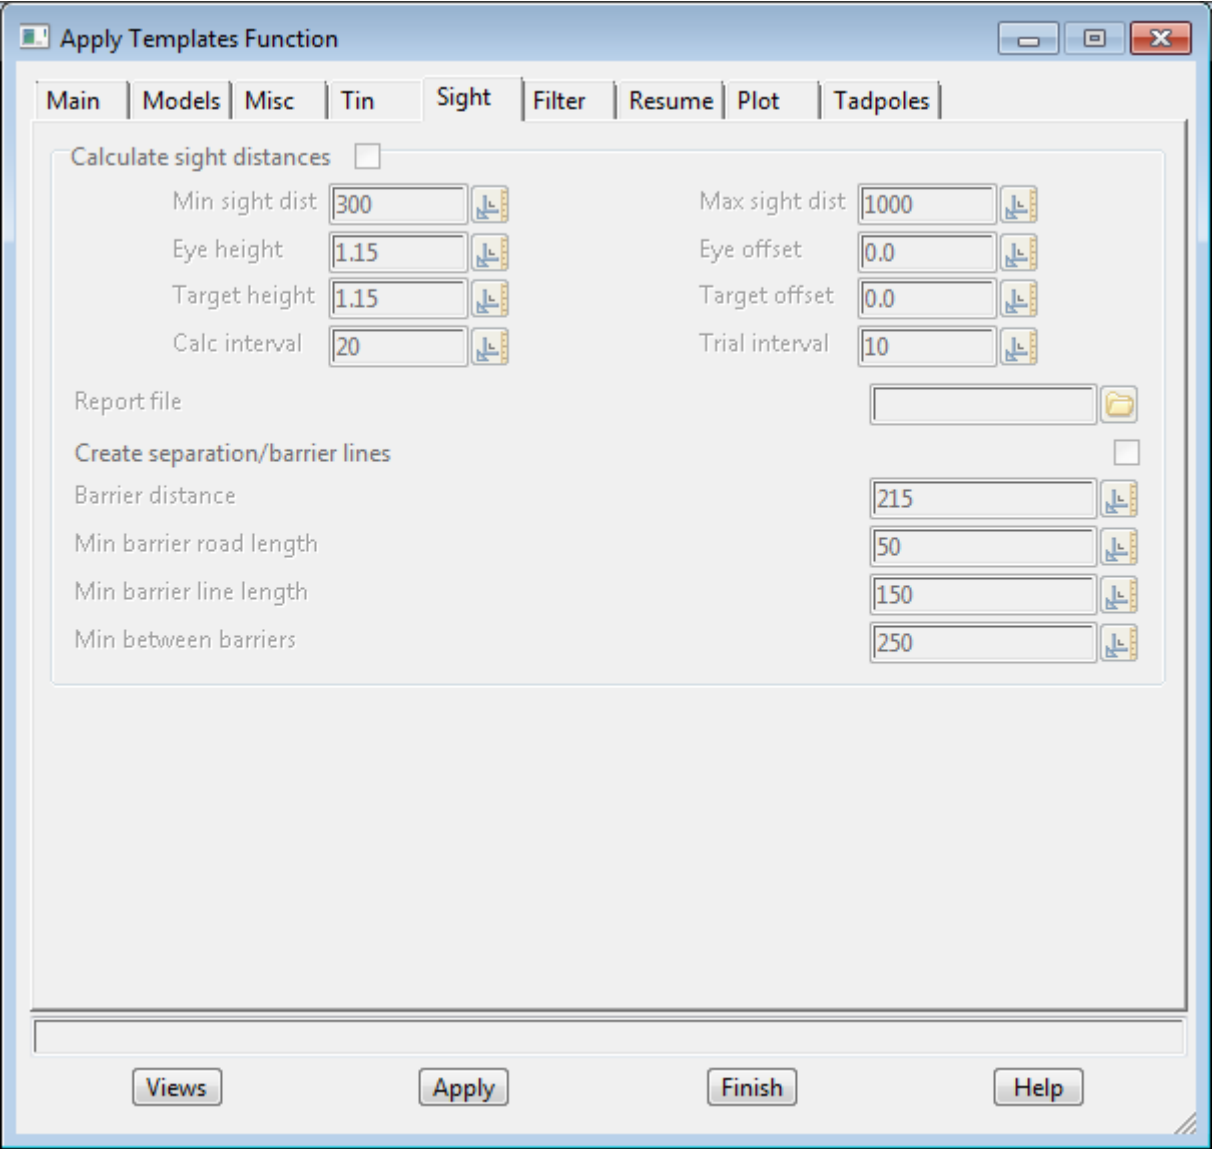

Extra Models grid

extra models to be included in creating the road tin

Extra Model	model box in column	available models
<i>name of a model to include in the road tin</i>		

Apply Many Sight tab

the **Sight** tab controls the reporting of sight distance lines between the reference line and a super tin formed from the natural surface tin and the design tin, and barrier lines on the reference line if it is a super alignment. For more information on sight distance calculations and for the option that will also create sight lines/no-lines and take bridge tins into consideration, go to the section [Sight Distance](#).

- Calculate sight distance

tick box

if ticked, sight distance lines are created and barrier lines calculated and applied to the reference string if it is a super alignment.
- Min sight distance

input

100

minimum chainage distance to use for placing the test target point.
- Max sight distance

input

3000

maximum chainage distance to use for placing the test target point.
- Eye height

input

1.3

height of the eye point above the picked string

Eye offset input 1.3

offset of the eye point from the picked string.

Target height input 0.3

height of the test target point above the picked string

Target offset input 1.3

offset of the target point from the picked string.

Calc interval input 20

chainage increment to move the eye point for the next sight distance calculation.

Trial interval input 10

chainage increment to move to test target point.

Report file file box *.rpt files

if non blank, a sight distance report is produced and written out to this file name.

Create separation/barrier lines tick box

if ticked, and the reference string is a super alignment, barrier and separation lines are created and defined in the super alignment.

Barrier distance input

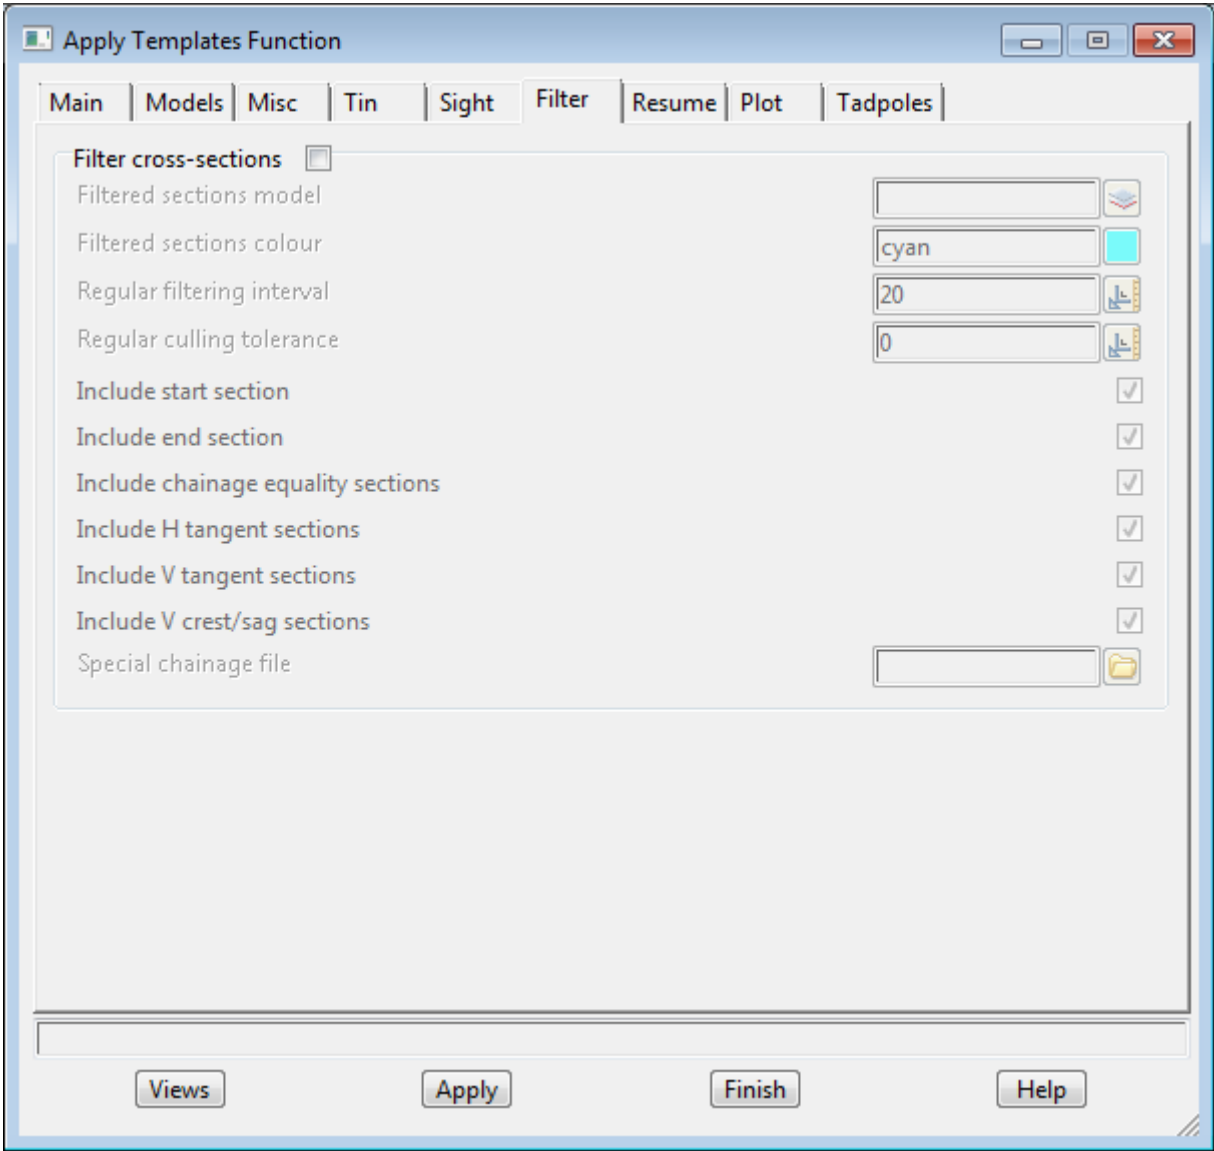

Min barrier road length input

Max barrier road length input

Min between barriers input

Apply Many Filter tab

the *Filter* tab controls the filtering of cross sections

Filter cross-sections	tick box	
<i>if ticked, the fields in this tab are used to filter cross sections</i>		
Filter sections model	model box	available models
<i>model for the filtered cross sections</i>		
Filtered sections colour	colour box	available colours
<i>colour of the filtered cross sections</i>		
Regular filtering interval	input	
<i>regular interval to use for filtering the cross sections</i>		
Regular culling tolerance	input	0
<i>tolerance to use when selecting a cross section</i>		
Include start sections	tick box	

if ticked, a section at the start chainage is included even if the start chainage is not at a regular interval

Include end sections tick box

if ticked, a section at the end chainage is included even if the end chainage is not at a regular interval

Include H tangent sections tick box

if ticked, a sections at the horizontal tangent points are included even if they are not at a regular interval

Include V create/sag sections tick box

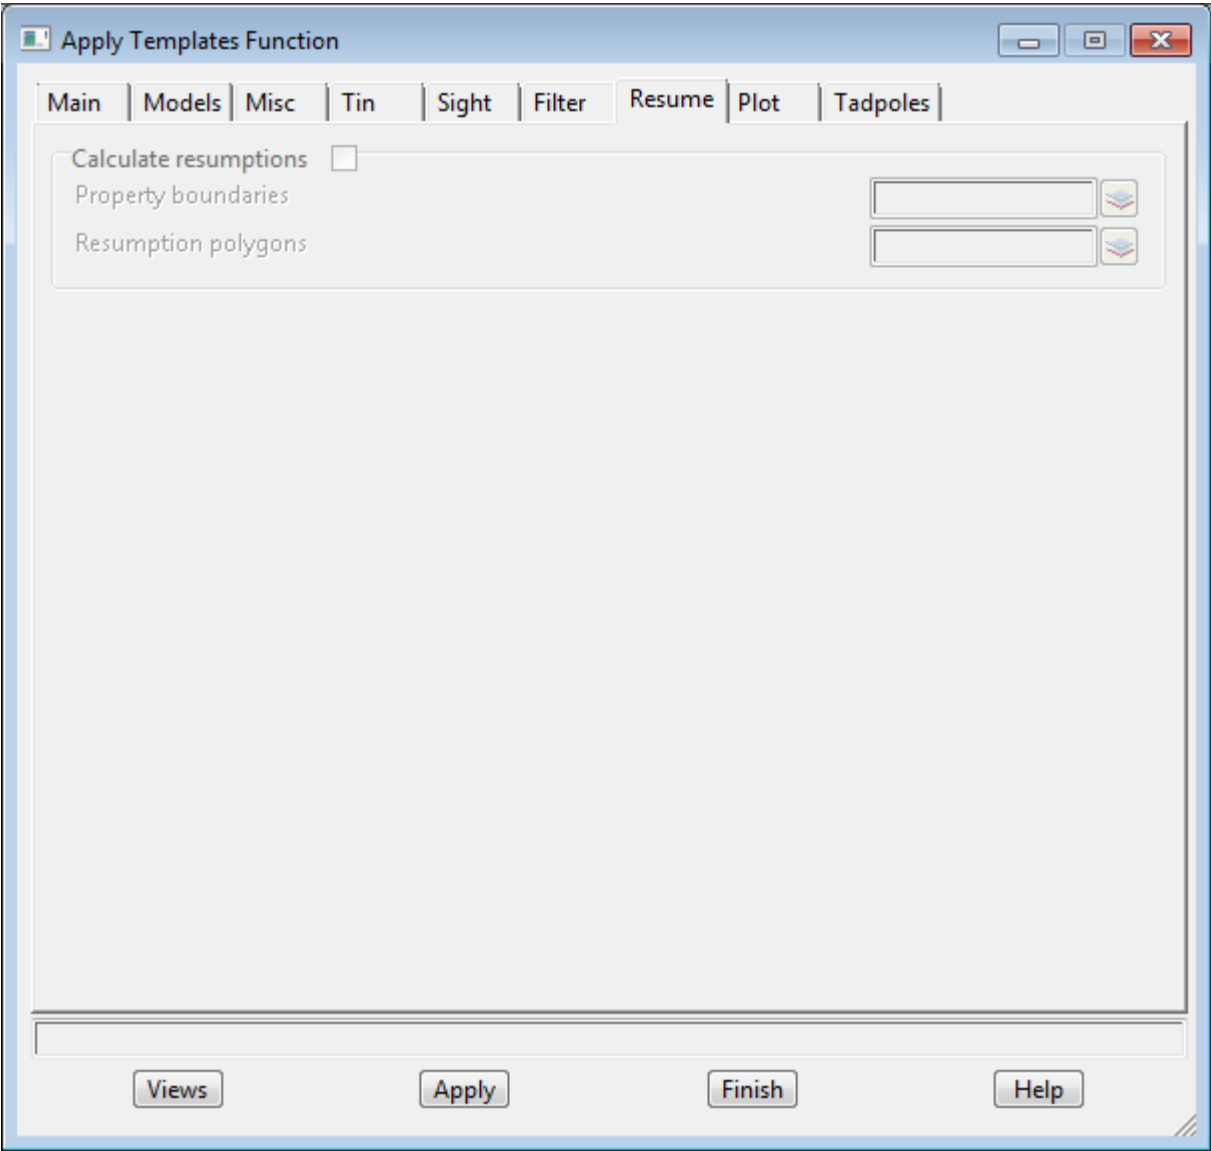

if ticked, a sections at the crest and sag points are included even if they are not at a regular interval

Special chainage file file box *.spc files

if non blank, a file of chainages to include sections at even if they are not at regular intervals

Apply Many Resume tab

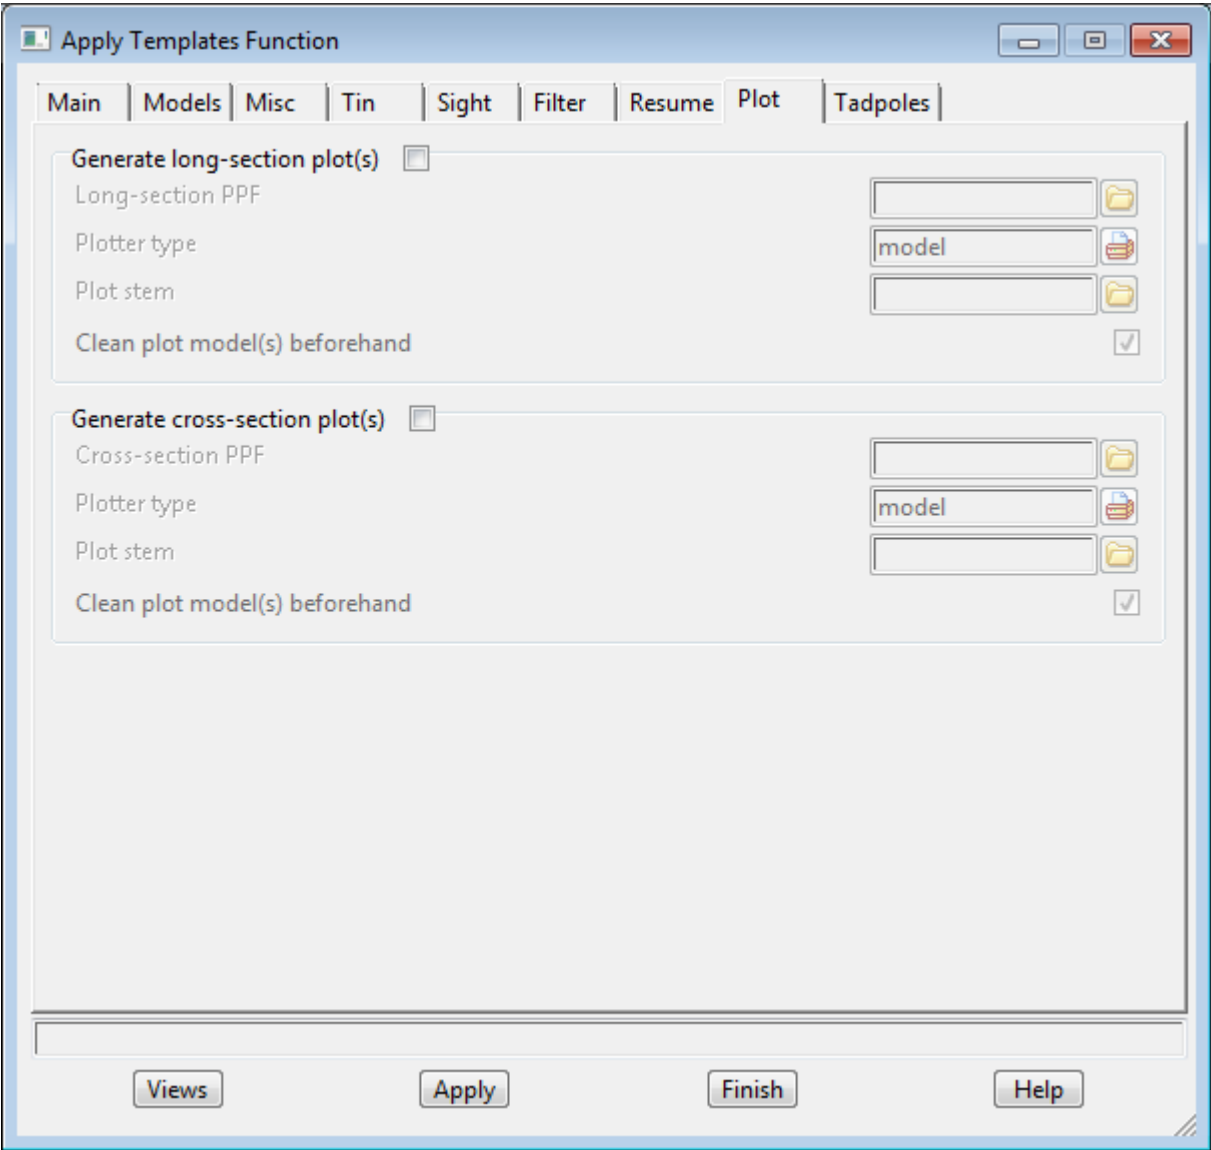

This section of documentation is a work in progress and will be updated in subsequent releases.

Calculate resumptions	tick box	
Property boundaries	model box	available models
Resumption polygons	model box	available models

Apply Many Plot tab

the *Plot* tab controls the generation of long section and cross section plots

Generate long section plot(s) tick box

if ticked, long section plots are created

Long section PPF

file box

*.lplotppf files

binary ppf file to use for the long section plots

Plotter type

plotter box

model

available plotters

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

*if ticked and the **plotter type** is **model**, the plot models are cleaned before the plots are created*

Generate cross section plot(s) tick box

if ticked, cross section plots are created

Cross section PPF file box

*.lplotppf files

binary ppf file to use for the cross section plots

Plotter type	plotter box	model
--------------	-------------	-------

available plotters

type of plotter to use for the cross section plots

Plot stem

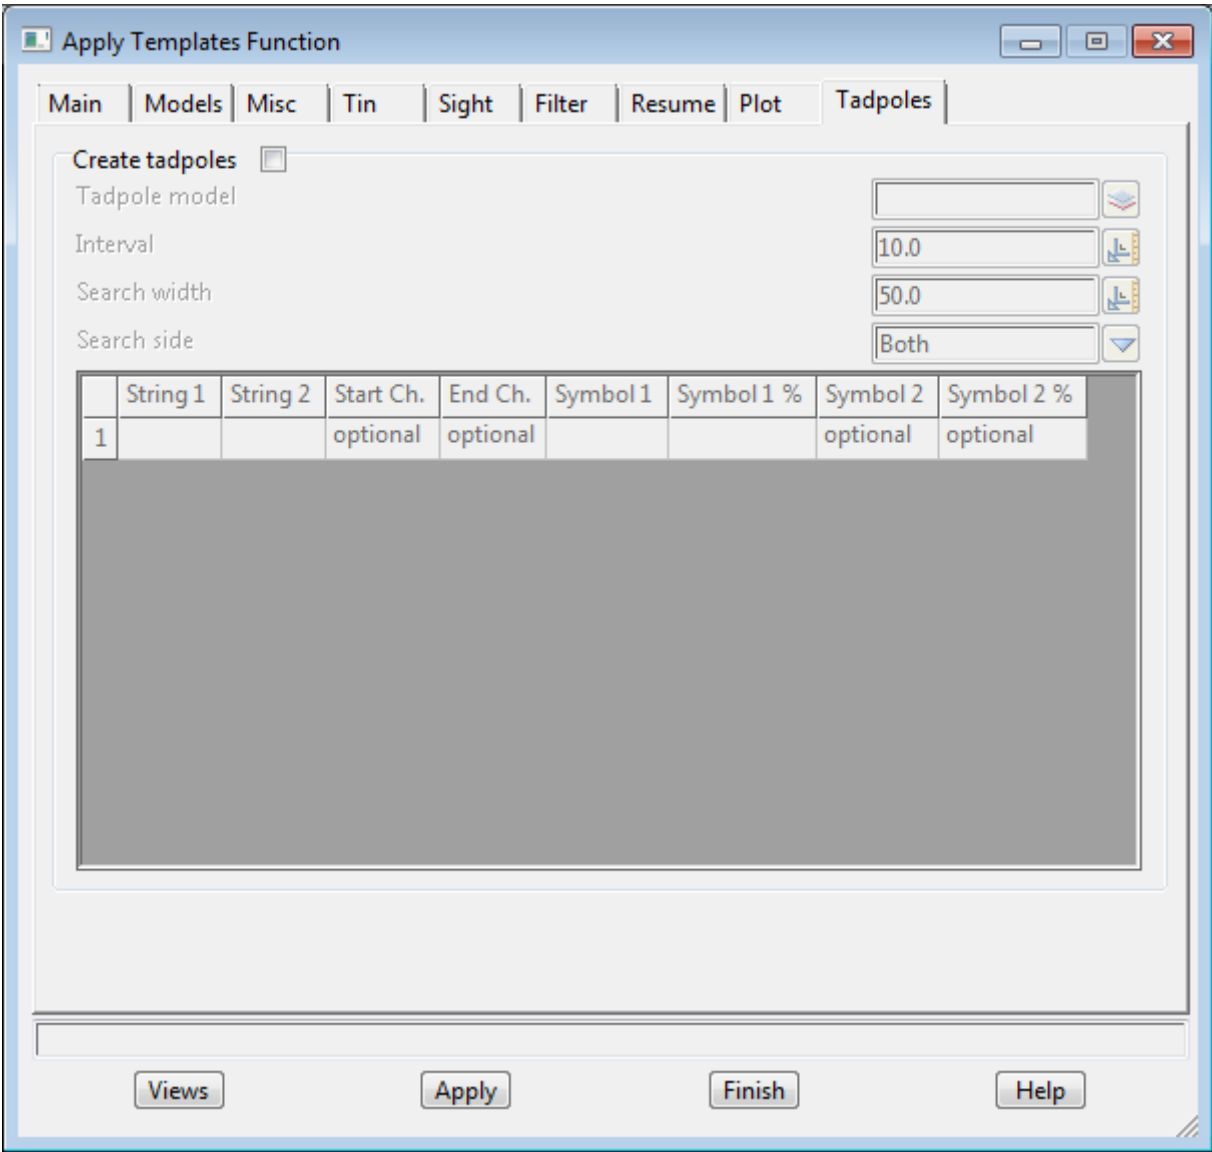

the name to use for the plots - a number will be added when more than one page is produced

Clean plot model(s) beforehand tick box

*if ticked and the **plotter type** is **model**, the plot models are cleaned before the plots are created*

Apply Many Tadpoles tab

the *Tadpole* tab controls the generation of batters ticks and tadpoles (hachure notation). For more information see the section [Create Cut/Fill Symbols](#) in the chapter [Drafting](#).

Create tadpoles tick box
if ticked, cut/fill symbols are created between given strings

Tadpole model model box available models
model for the created cut-fill symbols

Interval input 10
chainage distance between the symbols

Search width input 50
maximum distance to search to cut the strings for creating symbols. This is important for cases such as a bend in a road where multiple sets of string may then exist even when only searching out on one side of the road

Search side choice box both both, left side only

right side only

side of the reference string to search for strings to apply symbols to.

String 1 input

name of the point on the template to start symbol.

String 2

name of the point on the template to stop symbol.

Start Ch.

if blank, use the start chainage of the apply many.

If non blank, the chainage to start applying this symbol to.

End Ch. input

if blank, use the end chainage of the apply many.

If non blank, the chainage to stop applying this symbol to.

Symbol 1 symbol data

definition of the symbol to create at the given interval, or at twice the given interval if Symbol 2 is defined

Symbol 1 % input

if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol.

If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)

Symbol 2 symbol data

definition of a second symbol to create at twice the given interval

Symbol 2 %

if non-blank, percentage of the distance between String 1 and String 2 to apply the symbol.

If blank, the symbol is applied to the full distance between String 1 and String 2 (i.e. 100%)

Apply Many Manager - Create/Update

Position of option on menu: **Design =>Apply =>Apply many manager**

This option is part of a process to manage your Apply Many Functions in conjunction with the Apply Many Defaults.

The Manager is in part an extension of the model naming convention within the defaults.

All models, except ROAD SURFACE STRINGS and ROAD SURFACE SECTIONS, can be toggled on and off when creating an Apply Many Function,

e.g.

BOXING STRINGS

BOXING SECTIONS

POLYGONS AND BOUNDARY POLYGONS

DESIGN TIN

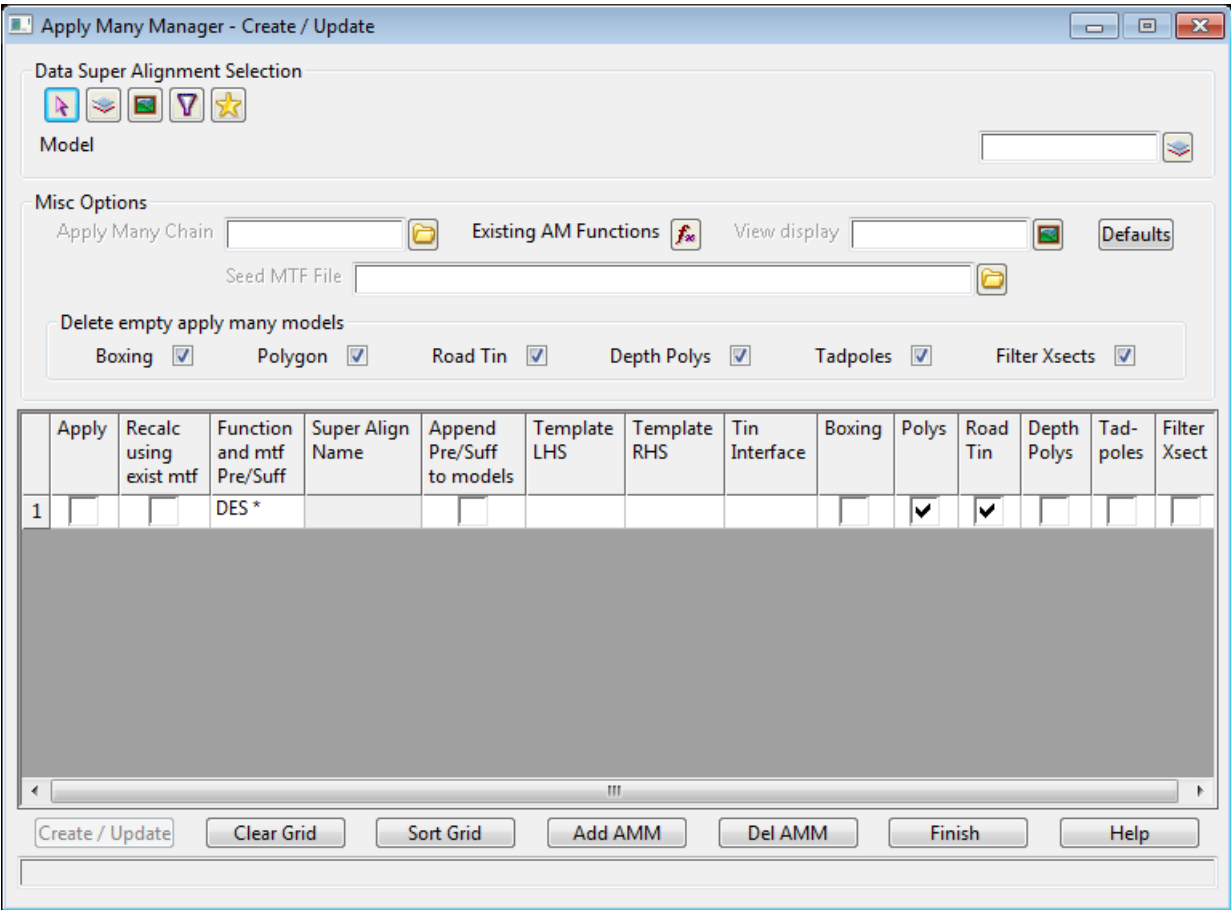

DEPTH POLYGONS

FILTER SECTIONS

TADPOLES

The Manager also allows one project model for ROAD SURFACE STRINGS, ROAD SURFACE SECTIONS, POLYGONS AND BOUNDARY POLYGONS and TADPOLES by using a new syntax in the Apply Many Defaults.

Selecting the **Apply many manager** option displays the **Apply Many Manager - Create / Update** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Misc Options

Apply Many Chain	file box	available *.rcn files
-------------------------	----------	-----------------------

If non-blank entry used as chain file of all the Apply Many Functions that are created at the time of process...optional

Existing AM Functions	function box	available functions
------------------------------	--------------	---------------------

This option will give you a list of all the existing AM Functions in the project, as a quick reference when creating new ones

View Display	view box	available views
---------------------	----------	-----------------

If non-blank entry used as view onto which design strings and sections models will be automatically added, for ease of viewing...optional

Defaults	button
-----------------	--------

*If selected a separate panel will appear that allows you to set up defaults that relate to how the main panel appears. Selecting **Defaults** brings up the **Defaults for startup** panel. For more information on the **Defaults for startup** panel, go to [Defaults For Startup](#)*

Seed MTF File	file box
----------------------	----------

If non-blank, entry used as a seed from which any default names for the application of future Superelevation/Widening will be set

Delete empty apply many models

Boxing	tick box	ticked
---------------	----------	--------

If ticked then any empty boxing models will be deleted when an existing AM is updated

Polygon	tick box	ticked
----------------	----------	--------

If ticked then any empty polygon models will be deleted when an existing AM is updated

Road Tin	tick box	ticked
-----------------	----------	--------

If ticked then any empty road tin models will be deleted when an existing AM is updated

Depth Polys	tick box	ticked
--------------------	----------	--------

If ticked then any empty depth polys models will be deleted when an existing AM is updated

Tadpoles	tick box	ticked
-----------------	----------	--------

If ticked then any empty tadpoles models will be deleted when an existing AM is updated

Filter Xsects	tick box	ticked
----------------------	----------	--------

If ticked then any empty filter xsects models will be deleted when an existing AM is updated

Grid

Apply tick box not ticked

Set to ticked once a SA selection string is accepted

If ticked and the <Create/Update> is selected, then the Apply Many will be created or an existing one recalced

If ticked and the <Del AMM> button is also selected, then the Apply Many Manager reference to that alignment will be deleted

If not ticked and the <Create/Update> is selected, then the Apply Many will NOT be created or an existing one recalced

Note: It is up to the user to delete the actual Apply Many Function and all associated data including the mtf

Recalc using exist mtf tick box

This tick box is an automatic indication of whether or not a Reference Super Alignment has an Apply Many Function already linked to it

There is no need for the user to use this box when creating or updating an Apply Many Function

It will be unticked if the reference has no Apply Many Function attached

In this case templates are required for Left, Right or both

It will be ticked if the reference does have one or more Apply Many Functions attached

In this case the existing AM will be updated using the existing MTF and reflect any changes in regards to models required

Function & mtf Pre/Suff input DES*

If non-blank, entry used as a prefix or suffix in conjunction with the Apply Many Reference Super Alignment Name

Example:

Reference SA name:	MC00
Pre/Suff:	DES*
Apply Many Function Name:	DES MC00
Reference SA name:	MC00
Pre/Suff:	* DES
Apply Many Function Name:	MC00 DES

If blank, the Apply Many Reference Super Alignment Name is used only

Apply Many Function Name:	MC00
---------------------------	------

Super Align Name input

Automatically populated, after the SA reference is selected

The Super Alignment Name entry cannot be changed as it comprises part of the Apply Many Function

name....refer above

Append Pre/Suff to models tick box not ticked

If ticked then the prefix or suffix will be combined with the SA name (refer above) and passed down to any default extensions from the Apply Many Defaults

*refer **Design=>Apply=>Apply Many Defaults***

Model Format for Apply Many Defaults:

Road Surface Strings e.g.

"DESIGN *" used in conjunction with a Pre/Suff of DES * and a SA name MC00, would result in a strings model called "DES DESIGN MC00"

"* DESIGN" used in conjunction with a Pre/Suff of DES * and a SA name MC00, would result in a strings model called "DES MC00 DESIGN"

There is a new addition to the format used by the Apply Many Manager, that allows one design strings model. That model can be used in all Apply Many Functions

"DESIGN &" would result in a strings model called just "DESIGN"

Note: The above format can also be used for the following Apply Many Models:

Model for Cross Sections"CROSS SECTIONS &"
Model for Polygons "VIS POLYGONS &"
Model for Road Boundary"ROAD BOUNDARIES &"
Model for Tadpoles "TADPOLES &"

Template LHS input

name of the template to be applied to the left side of the reference SA

Template RHS input

name of the template to be applied to the right side of the reference SA

Tin interface input

If non-blank, the name of the tin to calculate the cut/fill interfaces against at the end of the fixed part of the templates given in the left and right template fields

If blank, then only the fixed part of the templates is used unless a tin is specified in the decisions section of the templates

Boxing tick box not ticked

If ticked then all boxing models will be created

Polys tick box ticked

If ticked then both polygon models will be created

Road Tin tick box ticked

If ticked then road tin and model will be created

Depth Polys tick box not ticked

If ticked then depth polygon models will be created

Tadpoles tick box not ticked
If ticked then tadpole model will be created

Filter Xsect tick box not ticked
If ticked then filter xsection model will be created

Buttons

Create/Update button
A validation on the panel is carried out along with a check if an Apply Many Function being created, exists or not

Appropriate warning messages in the output window will be displayed

The Apply Many Function is created or an existing one is updated

If a new Apply Many is being created, then the grid on the AMM panel is refreshed and the tick box <Recalc using exist mtf> is set to ticked

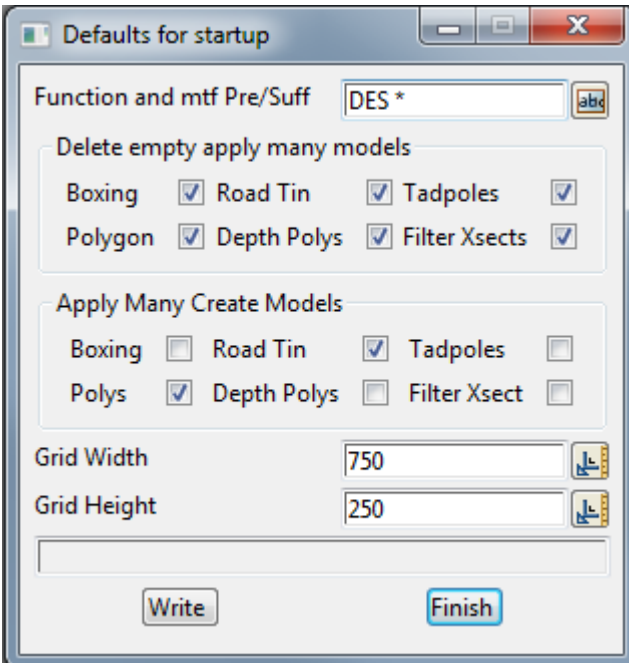

Clear Grid button
Clears the selection lines in the grid

Sort Grid button
Sorts the grid lines by placing lines where the <Recalc using exist mtf> box is ticked on, at the top of the grid

Add AMM button
For clarity...clear the grid first and then select the Super Alignment you wish to add another Apply Many Function to

Del AMM button
In order to delete (or remove) from the Apply Many Manager any connection to a Super Alignment, then first clear the grid, select the Super alignment and UNTICK the <Apply> box

Defaults For Startup

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function & mtf Pre/Suff	input	DES*	
<i>If non-blank, entry used as a prefix or suffix in conjunction with the Apply Many Reference Super Alignment Name</i>			
Example:			
Reference SA name:		MC00	
Pre/Suff:		DES*	
Apply Many Function Name:		DES MC00	
Reference SA name:		MC00	
Pre/Suff:		* DES	
Apply Many Function Name:		MC00 DES	
<i>If blank, the Apply Many Reference Super Alignment Name is used only</i>			
Apply Many Function Name:		MC00	

Delete empty apply many models

Boxing	tick box	ticked
<i>If ticked then any empty boxing models will be deleted when an existing AM is updated</i>		
Polygon	tick box	ticked
<i>If ticked then any empty polygon models will be deleted when an existing AM is updated</i>		

Road Tin	tick box	ticked
<i>If ticked then any empty road tin models will be deleted when an existing AM is updated</i>		
Depth Polys	tick box	ticked
<i>If ticked then any empty depth polys models will be deleted when an existing AM is updated</i>		
Tadpoles	tick box	ticked
<i>If ticked then any empty tadpoles models will be deleted when an existing AM is updated</i>		
Filter Xsects	tick box	ticked
<i>If ticked then any empty filter xsects models will be deleted when an existing AM is updated</i>		

Apply Many Create Models

Boxing	tick box	not ticked
<i>If ticked then all boxing models will be created</i>		
Polys	tick box	ticked
<i>If ticked then both polygon models will be created</i>		
Road Tin	tick box	ticked
<i>If ticked then road tin and model will be created</i>		
Depth Polys	tick box	not ticked
<i>If ticked then depth polygon models will be created</i>		
Tadpoles	tick box	not ticked
<i>If ticked then tadpole model will be created</i>		
Filter Xsect	tick box	not ticked
<i>If ticked then filter xsection model will be created</i>		
Grid Width	real	750
<i>If non-blank entry used as width of grid on main panel</i>		
Grid Height	real	250
<i>If non-blank entry used as height of grid on main panel</i>		
Write	button	
<i>If selected, the defaults file (Create_Apply_Many_Manager_Panel.def) will be written out to the <.project> directory</i>		

Kerb Return

Position of option on menu: Design =>Apply =>Kerb return

The **kerb return** option is used to help create the vertical geometry for an alignment string being used as a kerb return.

The standard situation is that in the plan view, the kerb return joins two kerb lines which already have z-values.

It is then necessary to define vertical geometry for the kerb return, usually taking into consideration the z-values and incoming grades from selected strings (often the centre lines and kerb strings).

A standard first guess at the kerb return vertical geometry is known as the quarter point vertical geometry and it is defined by

- break the section along the kerb return into four equal pieces
- project the incoming grade from a selected start grade string to intersect the first quarter point line
- project back the outgoing grade from a selected end grade string to intersect the last quarter point line
- join the two projected intersection points
- define vertical intersection points (VIP's) at the intersection points
- create back to back vertical curves for the VIP's

Plan View of the Horizontal Geometry of the Kerb Return

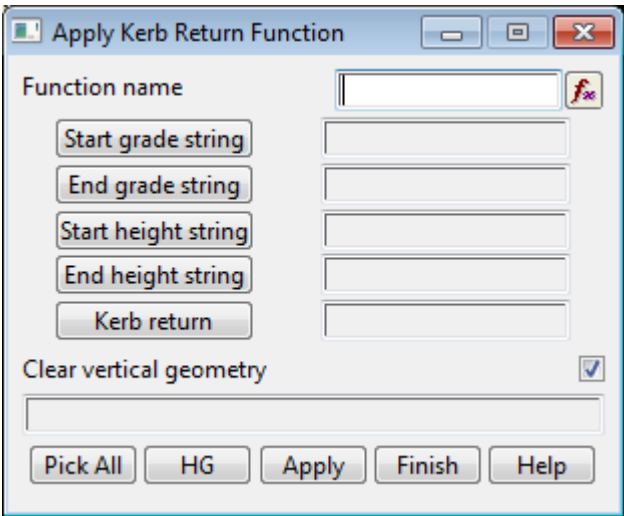

Section View of the Quarter-Point Vertical Geometry for the Kerb Return

The **kerb return** option creates a function which will automatically create the quarter-point vertical geometry for the kerb return and will recalculate it as required.

Note: the actual **direction** of the kerb is important - start grade and start height apply to the **start** of the kerb and end grade and end height apply to the **end of the kerb** where start and end are determined by the **actual direction** of the kerb (**not the picking direction**).

On selecting the **kerb return** option, the **apply kerb return function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function to define the apply for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>	function box		available kerb functions
Start grade string <i>select the string to be used for the in grade at the start of the kerb return.</i>	string-select		
End grade string <i>select the string to be used for the out grade at the end of the kerb return.</i>	string-select		
Start height string <i>select the string to be used for the height at the start of the kerb return - this is used for the z-value at the start of the kerb return.</i>	string-select		
End height string <i>select the string to be used for the height at the end of the kerb return - this is used for the z-value at the end of the kerb return.</i>	string-select		
Kerb return <i>select the alignment string that is the kerb return.</i>	string-select		
Clear vertical geometry	tick box		

if ticked, the vertical geometry of the kerb return string is cleared as soon as the **apply** button is selected, or a recalc done.

Pick all button

if **pick all** is selected, the user is asked to sequentially select the four strings: the Start grade string, End grade string, Start height string and End height string. The strings are automatically assigned to the appropriate string-select panel fields.

HG button

brings up the **kerb return function create HG** panel. This option is currently under development.

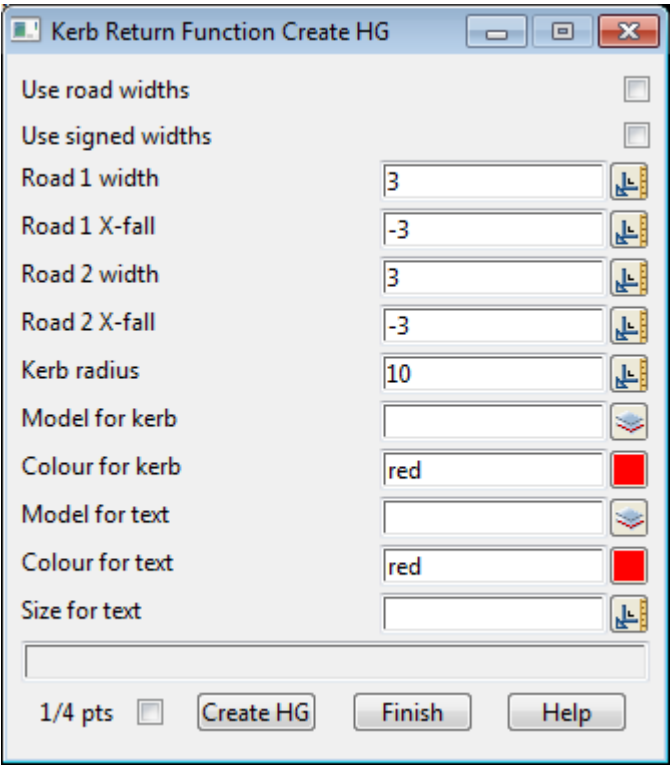

Apply button

if the kerb return has no vertical geometry (it will be automatically be deleted if the clear vertical geometry is set to **tick**) or the vertical geometry is the quarter-point geometry for the previous apply, then new quarter-point vertical geometry is created for the kerb return string.

Otherwise, nothing happens when the **apply** button is selected. That is, if the kerb return already has vertical geometry which is not the quarter-point geometry for the previous apply, and the clear vertical geometry is set to **no tick**, then **nothing happens** when the **apply** button is selected.

Note

The experimental **Kerb Return Function Create HG** panel is

String Modifiers

Position of option on menu: **Design =>Apply =>String modifiers**

The **String Modifiers** option is used to create vertical intersection points for an alignment string, or heights for a 2d, 3d, 4d, polyline or super string, using projection of heights from a selected string and user given cross-falls or cross-fall between two selected strings.

The **String Modifier** commands are actually part of an mtf file and are documented in the [Advanced Design](#) chapter of this manual.

This option allows the user to run just the **string_modifiers** section of the **mtf**.

Selecting **String Modifiers** displays the **String Modifiers Function** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function to define the apply for. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>	function box		available template functions
Template file <i>the name of the many template file to use the string_modifiers section from.</i>	file box		available mtf files
Apply <i>apply the string_modifiers section of the many template file.</i>	button		

Interface

Position of option on menu: **Design =>Apply =>Interface**

An **interface** string is where the design meets the natural terrain - it shows the **extent** of the design. The method used for calculating the **interface string** for a given string, tin and cut and fill slopes, is as follows:

For a point on a string, an interface point is calculated by going off at right angles to the string along a line of fixed slope until either the tin is cut or a fixed (plan) distance is travelled. The slope of the line is either the cut or fill slope depending on whether the string point is below the tin (cut point) or above the tin (fill point).

The interface string for a string is constructed by calculating the interface points at regular intervals along the string and then joining the interface points together to form the interface string.

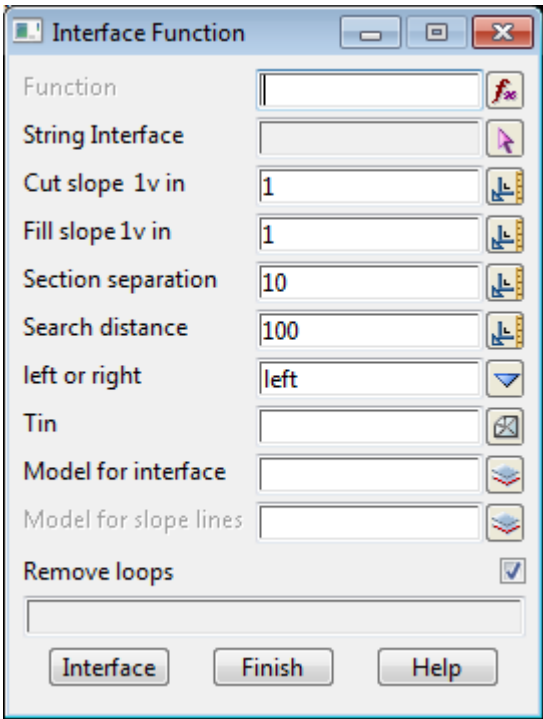

After calculating an interface string and examining the results, it is often necessary to make

changes to either the original string, the cut and fill slopes used, or even the tin used for interfacing against. The interface string and slope strings created during the **interface** would no longer be valid and need to be replaced by new information.

Although this can be accomplished by deleting the incorrect models and replacing them by new ones by re-applying the interface, this is would be time consuming if repeated over and over again. The **interface function** has been introduced to help reduce the work involved when re-calculating an interface string.

Basically, an **interface function** keeps track of all the information involved in creating an interface string and all the strings and models created during the **interface**. If either the original string, the cut and fill slope or the tin is subsequently modified, the interface functions can be re-run and all the old information automatically deleted and replaced by the updated information.

On selecting **interface**, the **interface function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Function	<i>name of the function to define the interface for. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields.</i>	function box		available interface functions
String interface	<i>select the string to calculate the interface from.</i>	string select box		
Cut slope 1 v in	<i>the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is up for a cut slope. A value 0 is used to designate a horizontal line.</i>	input	1.0	
Fill slope 1 v in	<i>the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is down for a fill slope. A value 0 is used for a horizontal line.</i>	input	1.0	

Section separation	input	10	
<i>the distance between the points on the selected string that interface points will be calculated from.</i>			
Search distance	input	100	
<i>the (plan) distance to search along the interface line to see if the tin has been intersected. If the tin has not been intersected then the z-value at the end of the interface line is taken as the interface point z-value.</i>			
Left or right	choice box	left	left, right
<i>the interface point is calculated by going out at right angles to the selected string. It is possible to go to either the left or the right depending on the value of this field.</i>			
Use super strings	tick box		
<i>if ticked, the interface and cut and fill slope lines are created as super strings.</i>			
Tin	tin box		available tins
<i>name of the tin that the interface points will be calculated against.</i>			
Model for interface	model box		available models
<i>name of the model to contain the calculated interface string.</i>			
Model for slope lines	model box		available models
<i>if not blank, name of the model to contain the lines connecting the string points with the interface points (the slope lines). If the field is blank, no slope lines are recorded. If blank, the slope lines are not created.</i>			
Remove loops	tick box		tick
<i>if tick, the strings and sections created by the Interface function are process to try an remove any loops from the strings, and create sections that don't cross each other. That is, remove any places where a string crosses over itself, or sections cross each other. Loops in the strings and crossing sections often occur on the inside of curves or the inside of adjacent lines.</i>			
Interface	button		
<i>An interface string is calculated using the selected string and the parameters defined in the panel. The interface string points are coloured red if the original string point was in cut and green if the original string point was in fill.</i>			
<esc> can be used to abort the interface option.			

Amend VG

Position of option on menu: **Design =>Apply =>Amend VG**

Amend VG is used to modify the vertical geometry of an alignment string using a variety of methods including linear interpolation cubic reverse and circular reverse interpolating or by extending crossfall between two given strings.

Selecting **Amend VG**, the **Amend VG** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Amend mode	choice box		linear, cubic reverse, circular reverse, VG linear, Extend Xfall

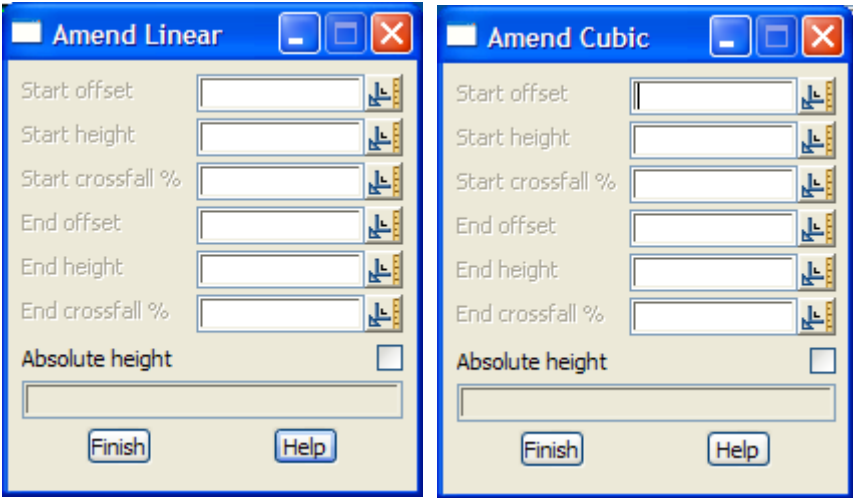

*if **linear**, a panel to input the values for **Start offset/height/crossfall %**, **End offset/height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If **cubic reverse**, a panel to input the values for **Start offset/height/crossfall %**, **End offset/height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If **circular reverse**, no extra information is needed to define how to modifying the vertical geometry of the **Amend** string*

*If **VG linear**, a panel to input the values for **Start height/crossfall %**, **End height/crossfall %** and **Absolute height** is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

*If **Extend Xfall**, a panel to select the two strings to extend the crossfall from is displayed and filled in to define how to modifying the vertical geometry of the **Amend** string*

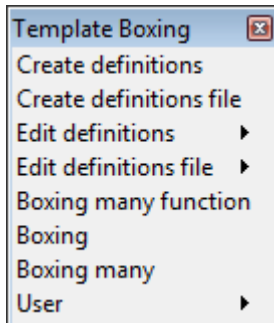

- Start chainage** input
chainage to start modifying the vertical geometry of a string
- End chainage** input
chainage to stop modifying the vertical geometry of a string
- Chainage interval** input 10
chainage interval to apply the vertical geometry modification
- Reference** string select box
*select the reference string to define chainage and perpendicular. If there is no **Hinge** string, then z-values are only taken from the Reference string.*
chainage interval to apply the vertical geometry modification
- Amend** string select box
*select the reference string to define chainage and perpendicular. If there is no **Hinge** string, then z-values are only taken from the Reference string.*
- Hinge** string select box
if selected, the string to take z-values from
- Amend** string select box
the string to have its vertical geometry amended
- Amend** button
amend the vertical geometry of the Amend string between the start and end chainages

Boxing

Position of menu: Design =>Boxing

The Boxing walk-right menu is

In the **Apply Many** option, **boxing** can be applied to the generated design sections by special commands in the **MTF**.

However, it is also possible to apply boxing as a post process to a model of x-sections as long as the x-sections were generated in the 4d super string format (this is done by both Apply options and the Cuts options - see [Cuts](#)).

For more information on boxing, see [What is Boxing ?](#) and for more information on the various scenarios for generating boxing, see [Applying Boxing](#).

The rules for calculating different types of boxing are known as **Boxing Definitions** and *Boxing Definition* are created and stored in a **Boxing** file.

The **Boxing**, and the different **Boxing Definitions** contained within the file, are created/edited using the options **Create** and **Edit** from the **Template Boxing** menu.

The options **Boxing many function**, **Boxing many** and **Boxing** use the *Boxing Definitions* to generate boxing.

For the option <i>Create definitions</i> , go to	Create Boxing Definitions
<i>Create definitions file</i>	Create Definitions Text File
<i>Edit definitions</i>	Edit Boxing Definitions
<i>Edit definitions file</i>	Edit Definitions Text File
<i>Boxing many function</i>	Boxing Many Function
<i>Boxing</i>	Boxing
<i>Boxing many</i>	Boxing Many

Create Boxing Definitions

Position of option on menu: Design =>Boxing =>Create definitions

The rules for calculating different types of boxing are known as **Boxing Definitions** and *Boxing Definition* are created and stored in a **Boxing** file.

The **Boxing=>Create definitions** option is used to create a new **Boxing** file (*.bf), and then the **Edit Boxing Definitions** panel is opened for the **Boxing** file to create and add new *Boxing Definitions*. The **Edit Boxing Definitions** panel is then used to write the **Boxing** file to disk.

and can be edited using the **Boxing =>Edit definitions** option, or by standard text editor.

Selecting **Create definitions** displays the **Create Boxing File** panel.

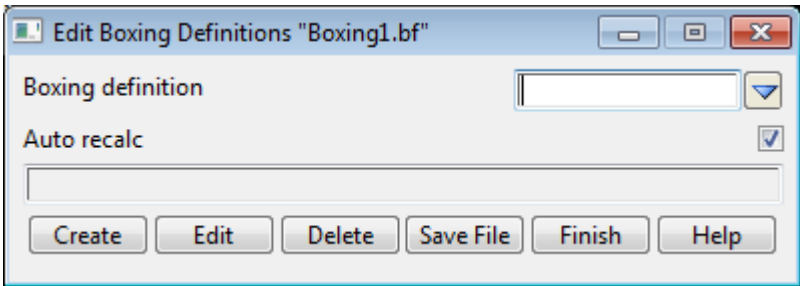

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file <i>name of the boxing file to create.</i>	file box		*.bf files

Create button
*create a boxing file with name given by the boxing file panel fields.
If the file given in the boxing file field does not exist, then the **Edit Boxing Definitions** panel is placed on the screen and is used to created and edit the boxing definitions for the boxing file.
If the file already exists, then nothing will happen on selecting **Create**.*

When **Create** is selected from the **Create Boxing File** panel, it brings up the **Edit Boxing Definitions** panel which is used to create and edit the boxing definitions, and to saved the boxing definitions to disk in the boxing file.

For information on the **Edit Boxing Definitions** panel, go to [Edit Boxing File](#) in the chapter [Advanced Design](#).

The **Edit Boxing Definitions** panel is described in the section [Edit Boxing File](#) in the chapter [Advanced Design](#).

Create Definitions Text File

Position of option on menu: **Design =>Boxing =>Create definitions file**

The **Boxing=>Create definition file** option is used to create a new **Boxing** file (*.bf) with the text editor pointed to by the EDIT_4D environment variable.

The created text file will already have a section header set up for a boxing called "1"(key word and opening and closing brackets).

Selecting **Create definitions file** brings up the **create boxing file *.bf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .bf file.</i>	folder box	current folder	
File to create <i>name of the file to create.</i>	file box		*.bf files
Create <i>create a Boxing file given by the folder and file to create panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has a section header set up.</i>	button		

For more information on boxing, see [What is Boxing ?](#) and for more information on the various scenarios for generating boxing, see [Applying Boxing](#).

The text format for the *Boxing* file is described in the section [Text Format of the Boxing File](#) the chapter [Advanced Design](#).

Edit Boxing Definitions

Position of option on menu: **Design =>Boxing =>Edit definitions**

The **Boxing =>Edit definitions** option is used to edit *Boxing* files (*.bf).

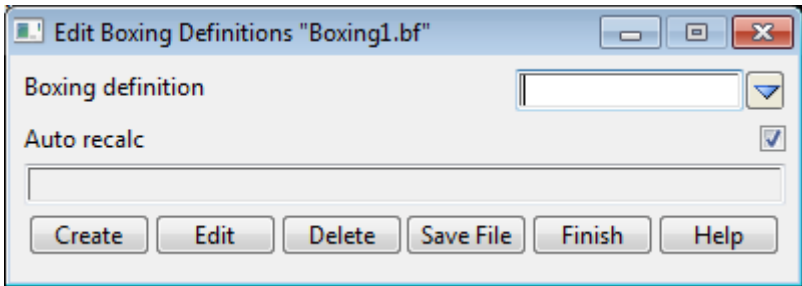

The **Boxing =>Edit definitions** option has two modes of operation - selecting the **Boxing =>Edit definitions** itself, or by activating the **Boxing =>Edit definitions** option's walk-right menu, **folder *.bf**.

Clicking on **Boxing=>Edit definitions** itself brings up the **edit boxing file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file <i>name of the boxing file to edit.</i>	input		*.bf files
Edit <i>edit the file given by boxing file panel field.</i> <i>If the file given in the boxing file field exists, then the Edit Boxing Definitions panel is brought up to create/edit the boxing definitions in the boxing file.</i>	button		

Similarly, walking right on **Boxing=>Edit** provides a list all the boxing files (files ending in .bf) in the current folder and when a file is selected from the list, the **Edit Boxing Definitions** panel is brought up for the selected boxing file.

The **Edit Boxing Definitions** panel is described in the section [Edit Boxing File](#) in the chapter [Advanced Design](#).

Edit Definitions Text File

Position of option on menu: **Design =>Boxing =>Edit definitions file**

The **Boxing=>Edit definitions file** option is used to edit boxing files (*.bf) with the text editor pointed to by the EDIT_4D environment variable.

The **Boxing=>Edit definitions file** option has two modes of operation - selecting the **Boxing=>Edit definitions file** itself, or by activating the **Boxing=>Edit definitions file** option's walk-right menu, **folder *.bf**.

Selecting **Boxing=>Edit definitions file** itself brings up the **edit boxing file *.bf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .bf file.</i>	input	current folder	
File to edit <i>name of the file, in folder, to edit.</i>	input		*.bf files
Edit <i>edit the file given by the folder and file to edit panel fields. If the file given in the file to edit field does not exist, then a new file is created which already has a section header set up.</i>	button		

The **Boxing=>Edit definitions file** walk-right menu provides a list all the boxing files (files ending in .bf) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

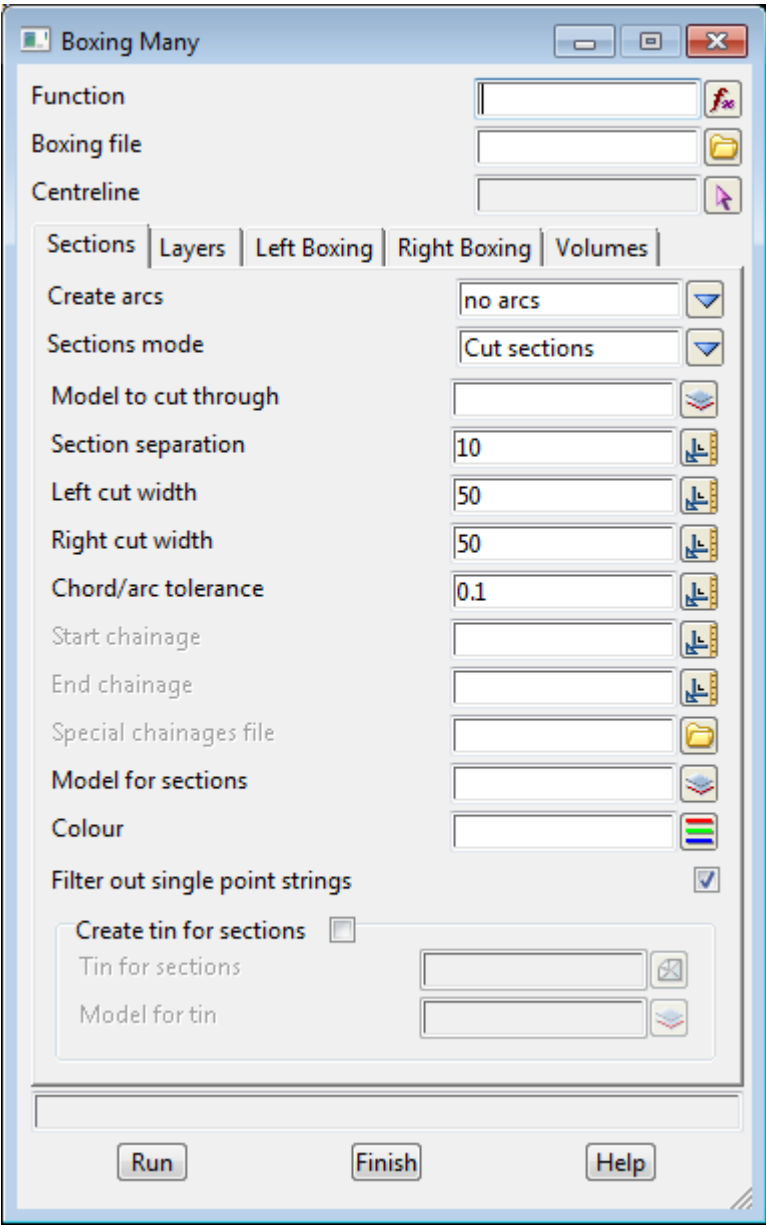

The format for the boxing file is described in the [Text Format of the Boxing File](#) section in the chapter [Advanced Design](#).

Boxing Many Function

Position of option on menu: **Design =>Boxing =>Boxing many function**

This option is used to cut strings to create sections and then apply up to eight layers of boxing to the cut sections.

Selecting **Boxing many function** displays the **Boxing Many** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function <i>name of the Boxing function</i>	function box		available boxing functions
Boxing file	file box		*.bf files

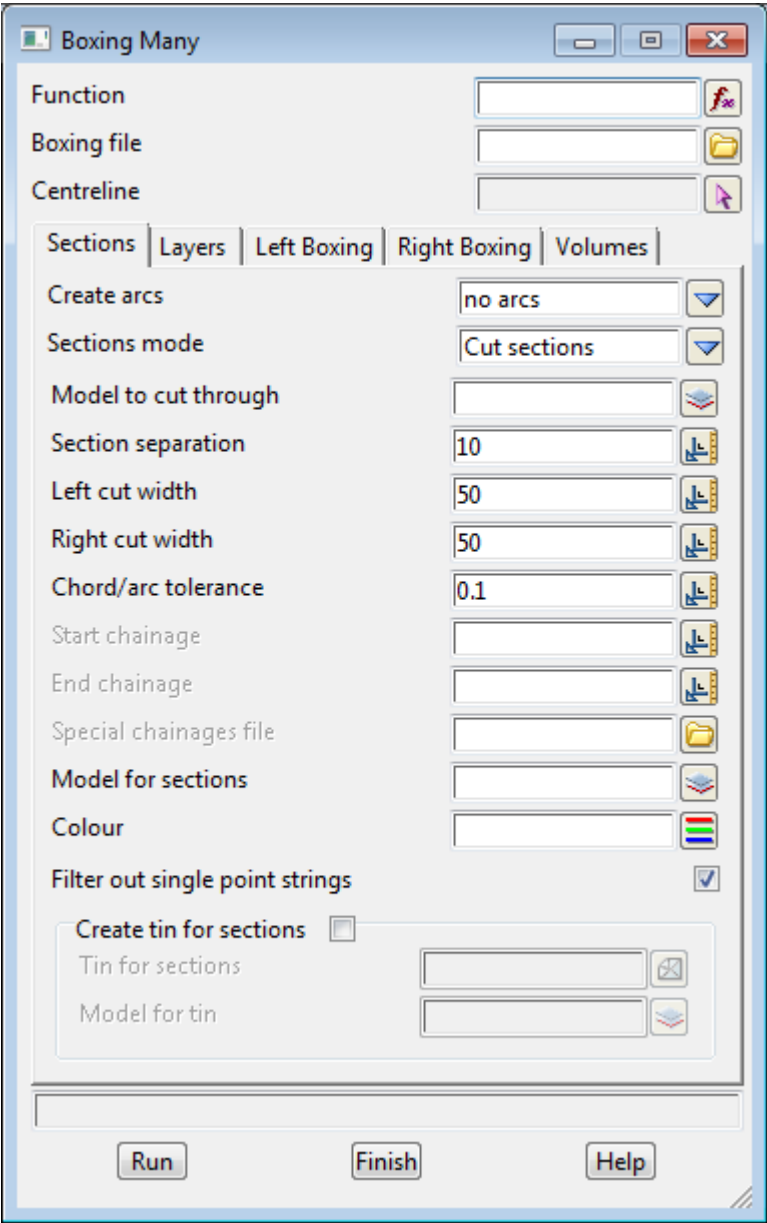

the Boxing file that contains the Boxing Definition that are be applied to the cut sections

Centreline string select
string to use for chainage, and perpendicular, for cutting cross sections to apply the boxing to

For the information on each **Boxing Many** tab, go to

- [Sections tab](#)
- [Layers tab](#)
- [Left Boxing tab](#)
- [Right Boxing tab](#)
- [Volumes tab](#)

Sections tab

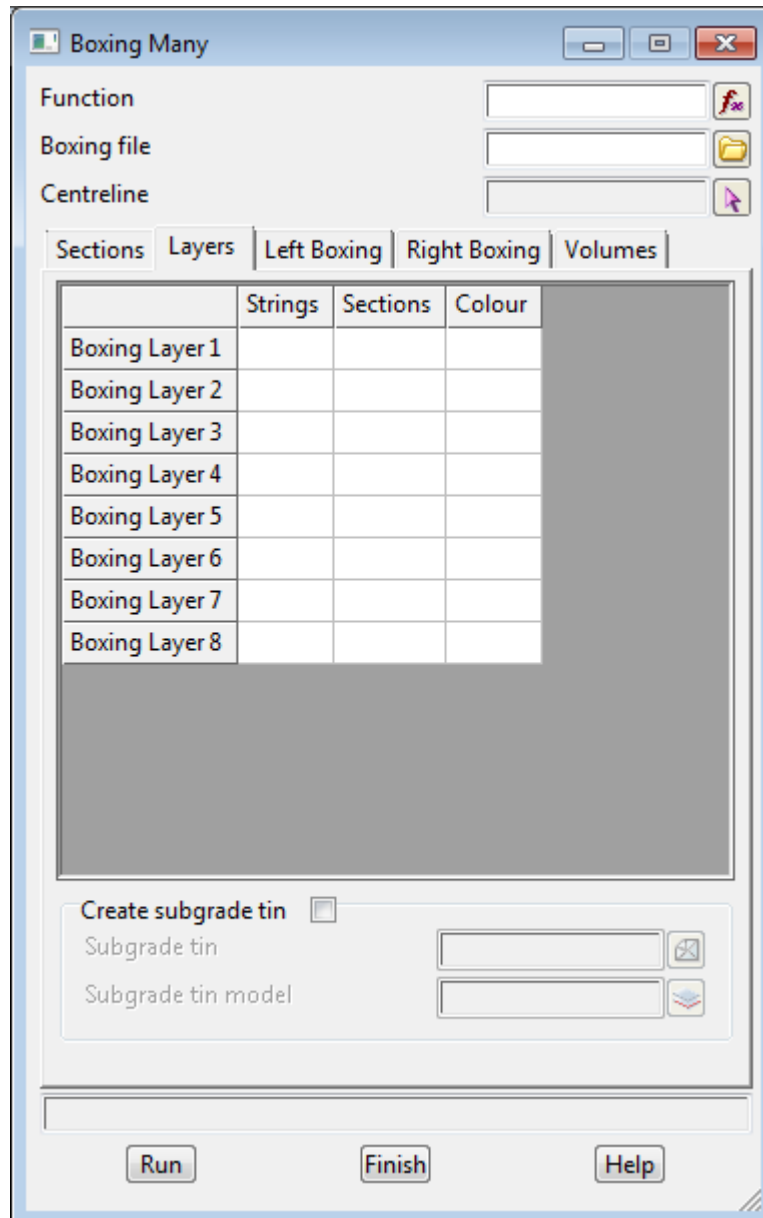

Sections mode choice box Cut sections, Use existing sections

if Cut section, sections are cut through the strings in the Model to cut through and placed in Model for sections.
If User existing sections, no sections are cut and the existing sections in Model for sections are used to apply the boxing to.

Model to cut through	model box	available models
<i>model of strings to cut sections through</i>		
Section separation	input	10
<i>the distance along the selected centre line to generate plan section lines to be used to cut through the model or view.</i>		
Left/Right cut width	input	50
<i>the left/right distance to go out from the centre line for creating a section to cut through the strings.</i>		
Chord/arc tolerance	input	default chord/arc tolerance
<i>the chord to arc tolerance to use on the selected string for determining how many plan sections are created around horizontal curves.</i>		
Start/End chainage	input	
<i>if non-blank then sections for the cuts are restricted to between the given start and end chainage of the selected centreline string</i>		
Special chainages file	file box	*.spf files
<i>a file containing chainages, one per line, that are also used as extra chainages to create cross sections at</i>		
Model for sections	model box	available models
<i>model for the cut cross sections</i>		
Colour	colour box	available colours
<i>colour for the cut cross sections</i>		
Filter out single point strings	tick box	
<i>if ticked, don't save any sections that only have a single point in them</i>		
Create tin for sections	tick box	
<i>if ticked, a tin of the cross sections in Model for sections is created</i>		
Tin for sections	tin box	available tins
<i>name of the tin of cross sections</i>		
Model for tin	model box	available models
<i>model for the cross sections tin</i>		

Layers tab

the layers tab consists of a grid for defining up to eight layers of boxing strings and sections.
*The last boxing layer is also referred to as the **subgrade** layer.*

Boxing Layer 1-8:

if the model names are non blank, boxing strings and sections will be created for that layer.

For more information on boxing, see [What is Boxing ?](#).

Strings

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing strings for this layer.*

If blank, the boxing strings will not be stored for this layer.

Sections input available models

*if non-blank, pre*post text to use with the function name to create the name of the model for the boxing sections for this layer.*

If blank, the boxing sections will not be stored for this layer.

Colour	colour box	available colours
<i>colour for the boxing sections for this layer</i>		

Create subgrade tin	tick box	
<i>if ticked, then a tin of the subgrade strings and sections is created. Note - the subgrade is the last boxing layer.</i>		

Subgrade tin	tin box	available tins

run the option

For more information on boxing, see [What is Boxing ?](#) and for more information on the various scenarios for generating boxing, see [Applying Boxing](#).

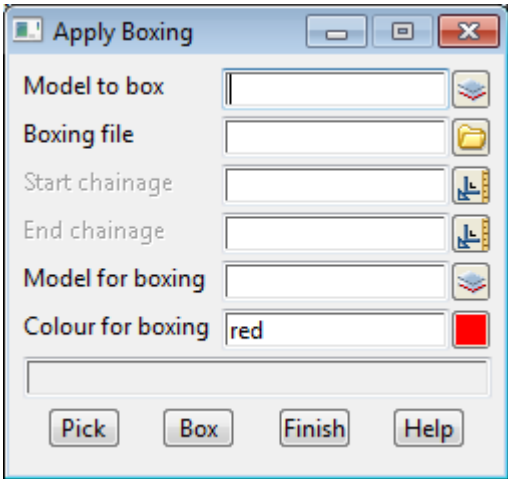

Boxing

Position of option on menu: **Design =>Boxing =>Boxing**

Selecting **boxing** displays the **apply boxing** pane.

This panel is used to create boxing sections by applying the first **Boxing Definition** in a *Boxing* file, to a selected 4d super string or model of sections created as 4d super strings. Only the one *Boxing Definition* is used for all of the sections.

The **Apply Boxing** panel is

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model to box <i>model of sections (in 4d string format) to apply the boxing definition to.</i>	model box		available models
Boxing file <i>name of the file containing the boxing definition to be applied to the sections in the model to box.</i>	file box		*.bf files
Start/End chainage <i>the start/end string chainage for applying boxing. If blank, then the start/end chainage is taken to be the chainage at the beginning/end of the picked string.</i>	input		
Model for boxing <i>model for the created boxing x-sections</i>	model box		available models
Colour for boxing <i>colour for the boxing x-sections</i>	colour box		available colours
Pick <i>after picking the Pick button, any selected strings will have the boxing applied to them.</i>	button		
Box <i>apply the first Boxing Definition given in the Boxing file to the sections in the model to box that are between the given Start chainage and End chainage.</i>	button		

For more information on boxing, see [What is Boxing ?](#) and for more information on the various scenarios for generating boxing, see [Applying Boxing](#).

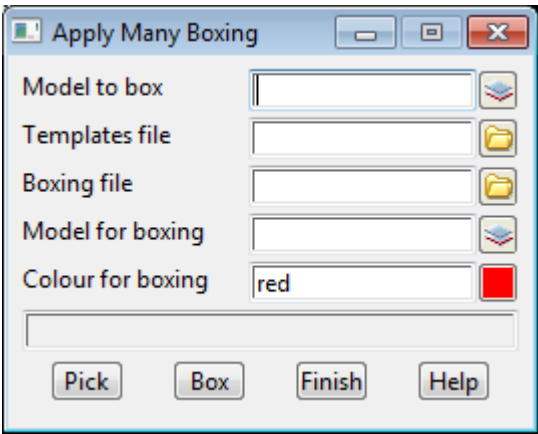

Boxing Many

Position of option on menu: **Design =>Boxing =>Boxing many**

This panel can be used to create boxing sections by applying the **Boxing Definitions** as specified in an MTF file. to a selected 4d super string or to a model of sections.

If an individual 4d super string is picked, the option uses the Boxing defined for the chainage where the section 4d string was created.

Selecting **Boxing Many** displays the **Apply Many Boxing** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model to box <i>model of sections (in 4d string format) to apply the boxing definition to.</i>	model box		available models
MTF file <i>name of the MTF file which contains the application of the Boxing Definitions to the sections given in the Model to box panel field.</i> <i>If Boxing file is blank, use the Boxing file given in the MTF file.</i> <i>If Boxing file is non-blank, then all the Boxing Definitions referred to in the MTF file are taken from the Boxing file.</i>	file box		*.mtf files
Boxing file <i>If non-blank, then all the Boxing Definitions referred to in the MTF file are taken from the Boxing file. That is, the Boxing file given in the MTF file is NOT used for the Boxing Definitions.</i> <i>If blank, use the Boxing file given in the MTF file.</i>	file box		*.bf files
Model for boxing <i>model for the created boxing x-sections</i>	model box		available models
Colour for boxing <i>colour for the generated boxing x-sections</i>	colour box		available colours
Pick	button		

*after picking the **Pick** button, any selected strings will have the boxing applied to them.*

Box button

apply the boxing as given by the MTF file, using the boxing definitions in the Boxing file, to the 4d sections in the Model for boxing field. The new boxing sections are added to the Model for boxing.

For more information on boxing, see [What is Boxing ?](#) and for more information on the various scenarios for generating boxing, see [Applying Boxing](#).

MTF

Position of menu: **Design =>MTF**

In the **Apply Many** option, a **MTF file** is used to control the application of templates, modifiers, boxing etc to the Hinge string.

The full definition for the MTF file is given in the section [MTF - Many Templates File](#) in the chapter [Advanced Design](#).

The **MTF** walk-right menu is

Each option in this menu will now be described.

For the option <i>Create</i> , go to	Create MTF
<i>Create file</i>	Create File
<i>Edit</i>	Edit
<i>Edit file</i>	Edit File
<i>Rename</i>	Rename MTF
<i>Apply many</i>	Apply Many
<i>Edit by string</i>	Edit by String
<i>Copy MTF</i>	Copy MTF
<i>Delete MTF</i>	Delete MTF

Create MTF

Position of option on menu: **Design =>MTF =>Create**

The **MTF=>Create** option is used to create a new MTF file (*.mtf).

The created MTF file is written to disk and can be edited using the **MTF=>Edit** option, or a standard file editor.

Selecting **Create** displays the **Create MTF File** panel.

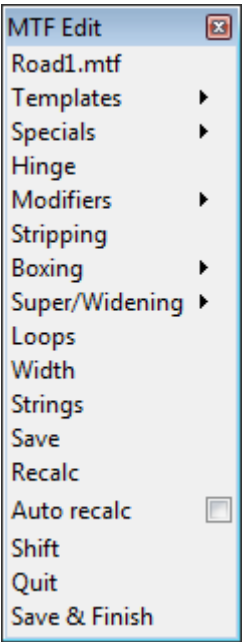

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF file <i>name of the MTF file to create.</i>	file box		*.mtf files
Seed MTF file <i>name of an MTF file to load into the new MTF file. This allows standard information to be automatically included in the new MTF file. The Seed MTF file is just a standard MTF file with the extension after the . changed to mtf_seed</i>	file box		*.mtf_seed files
Centreline <i>if a centreline string is selected, it is used for selecting chainages in the MTF</i>	string select		
Create <i>create an MTF file with name given by the MTF file panel fields. If the file given in the MTF file field does not exist, then the MTF Edit menu is placed on the screen and is used to created and edit the MTF sections in the MTF file. If the file already exists, then nothing will happen on selecting Create.</i>	button		

MTF Edit

When **Create** is selected from the **Create MTF File** panel, it brings up the **MTF Edit** menu which is used to create and edit the MTF sections to be saved in the MTF file.

	
Road1.mtf	name of mtf file being edited
Templates	create/edit template table
Specials	special chainages to use
Hinge	create/edit hinge modifiers
Modifiers	" " " modifiers table
Stripping	" " " stripping depths
Boxing	" " " boxing table
Super/Widening	strings to apply super/widening to
Loops	removed loops in strings from mtf
Width	set maximum section width
Strings	create/edit string modifiers
Save	save the mtf information to a file
Recalc	recalc the Apply many with this mtf
Auto recalc	if ticked a recalc is done when "Apply" is clicked on Modifiers panels
Shift	apply a delta chainage to the mtf
Quit	quit without saving the information
Save & Finish	finish, remove the menu

The **MTF Edit** menu is described in the section [MTF - Many Templates File](#) in the chapter [Advanced Design](#).

Create File

Position of option on menu: **Design =>MTF =>Create file**

The **MTF=>Create file** option is used to create a new many templates files (*.mtf) with the text editor pointed to by the EDIT_4D environment variable.

The created file will already have all the section headers (key words and opening and closing brackets) in it.

Selecting **Create file** brings up the **Create MTF File *.mtf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder <i>name of the folder for the .mtf file.</i>	folder box	current folder	
File to create	file box		*.mtf files

name of the file to create. The new MTF file already has each of the section headers set up.

Create button

create an MTF file given by the Folder and File to create panel fields. If the file given in the File to edit field already exists, then an error occurs.

The text format for the MTF file is described in the section [Text Format of the MTF File](#) in the chapter [Advanced Design](#).

Edit

Position of option on menu: Design =>MTF =>Edit

The MTF=>Edit option is used to edit mtf files (*.mtf).

The MTF=>Edit option has two modes of operation - selecting the MTF=>Edit itself, or by activating the MTF=>Edit option's walk-right menu, **folder *.mtf**.

Selecting MTF=>Edit itself brings up the **Edit MTF File** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF file <i>name of the MTF file to edit</i>	file box		*.mtf files
Seed MTF file <i>for a new MTF file, the name of an MTF file to load into the new MTF file. This allows standard information to be automatically included in the new MTF file. The Seed MTF file is just a standard MTF file with the extension after the . changed to mtf_seed</i>	file box		*.mtf_seed files
Centreline <i>if a centreline string is selected, it is used for selecting chainages in the MTF</i>	string select		
Edit <i>edit the file given by MTF file panel field. If the file given in the MTF file field exists, then the MTF Edit menu is brought up to create/edit the MTF sections.</i>	button		

- name of mtf file being edited
- create/edit template table
- special chainages to use
- create/edit hinge modifiers
- " " " modifiers table
- " " " stripping depths
- " " " boxing table
- strings to apply super/widening to
- removed loops in strings from mtf
- set maximum section width
- create/edit string modifiers
- save the mtf information to a file
- recalc the Apply many with this mtf
- if tick a recalc is done when "Apply" is clicked on Modifiers panels
- apply a delta chainage to the mtf
- quit without saving the information
- finish, remove the menu

Similarly the **MTF=>Edit** walk-right menu provides a list all the MTF files (files ending in .mtf) in the current folder. When a MTF file is selected from the list, the **Edit MTF File** panel is brought up to create/edit the MTF sections.

The **MTF Edit** menu is described in the section [MTF - Many Templates File](#) in the chapter [Advanced Design](#).

Edit File

Position of option on menu: **Design =>MTF =>Edit file**

The **MTF=>Edit file** option is used to edit MTF files (*.mtf) with the text editor pointed to by the EDIT_4D environment variable.

The **MTF=>Edit file** option has two modes of operation - selecting the **MTF=>Edit file** itself, or by activating the **MTF=>Edit file** option's walk-right menu, **folder *.mtf**.

Selecting **MTF=>Edit file** itself brings up the **Edit a MTF File *.mtf** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box	current folder	
<i>name of the folder for the .mtf file.</i>			

File to edit file box *.mtf files
name of the MTF file, in Folder, to edit.

Edit button
edit the MTF file given by the Folder and File to edit panel fields by the text editor pointed to by the EDIT_4D environment variable. If the file given in the File to edit field does not exist, then a new file is created which already has each of the section headers set up.

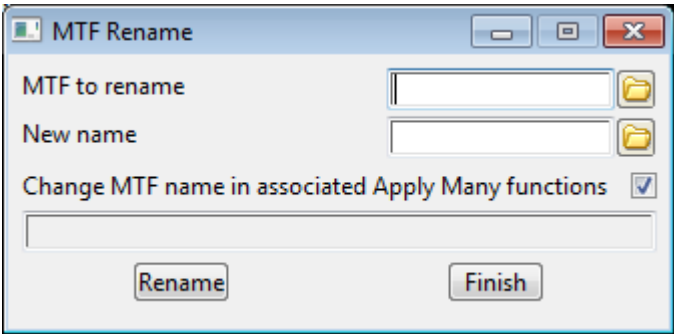

Similarly the **MTF=>Edit file** walk-right menu provides a list all the MTF files (files ending in .mtf) in the current folder. When a file is selected from the list, it is automatically loaded into the text editor.

The text format for the MTF file is described in the section [Text Format of the MTF File](#) in the chapter [Advanced Design](#).

Rename MTF

Position of option on menu: **Design =>MTF =>Rename**

Selecting **Rename** brings up the **MTF Rename** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to rename <i>name of the MTF file to rename</i>	file box		*.mtf files
New name <i>new name for the MTF file</i>	file box		*.mtf files
Change MTF name is associated Apply Many functions <i>if ticked, rename the MTF in all functions that include it</i>	tick box		
Rename <i>rename the MTF file to the new name</i>	button		

Apply Many

Position of option on menu: Design =>MTF =>Apply many

The **Apply Many** option is used to apply a MTF file to a selected hinge string.

The option has already been described under **Design=>Apply=>Apply many**.

For the description of *Apply many*, please go to the section [Apply Many](#).

Edit by String

Position of option on menu: Design =>MTF =>Edit by string

The **Edit by string** option is used to edit the **MTF** by selecting a string created by the **MTF** in an **Apply Many**.

Selecting **Edit by string** brings up the **Edit MTF/Survey Function Data** panel:

After selecting the **Pick Edit** button, a string created by MTF function is selected and the MTF editor is started for the MTF.

For information on the *MTF Editor*, go to the section [MTF Edit](#).

Copy MTF

Position of option on menu: **Design =>MTF =>Copy**
Selecting **Copy** brings up the **Copy an MTF** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to copy <i>name of the MTF file to copy</i>	file box		*.mtf files
Target MTF <i>new name for the MTF file</i>	file box		*.mtf files
Copy all backups <i>if ticked, copy all the backup files of the MTF as well</i>	tick box		
Copy <i>copy the MTF file to the new name</i>	button		

Delete MTF

Position of option on menu: **Design =>MTF =>Delete**
Selecting **Delete** brings up the **Delete an MTF** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
MTF to delete <i>name of the MTF file to delete</i>	file box		*.mtf files
Delete all backups <i>if ticked, delete all the backup files of the MTF as well</i>	tick box		
Delete <i>delete the MTF file</i>	button		

Estate Lots

Position of menu: Design => Estate/Lots

This module is currently under development.

The Estate Lots module is for creating house lots for an Estate (Subdivision).

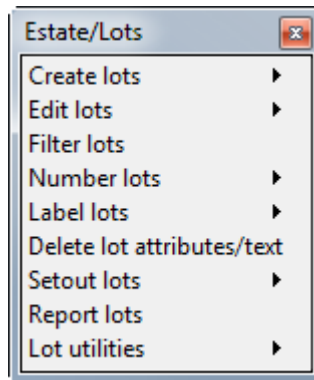

There are options to create and edit lots by a variety of methods. Once the lots are created they can be numbered, given a lot type (see [Lot types](#)) and labelled.

The labelling includes labelling the side of lots with bearing and distances, lots with areas and lot numbers.

Reports of lot areas and types can be created and lots coloured according to areas.

Finally options exist to create point numbers and reports for setting out the lots.

The **Estate/Lots** walk-right menu is:

For the option *Create lots*, go to

Edit lots

Filter lots

Number lots

Label lots

Delete lot attributes/text

Setout lots

Report lots

Lot utilities

[Create Lots](#)

[Edit Lots](#)

[Filter Lots](#)

[Number Lots](#)

[Label Lots](#)

[Delete Lot Attributes and Text](#)

[Setout Lots](#)

[Report Lots](#)

[Lot Utilities](#)

Lot types

Lots can have a **type** which is used in reports. The lot types are defined in a text file called *lottypes.4d* which is searched for in the standard library areas (see [Library](#), [User Library](#), [Customer Library](#)).

For example of *lottypes.4d* is

park

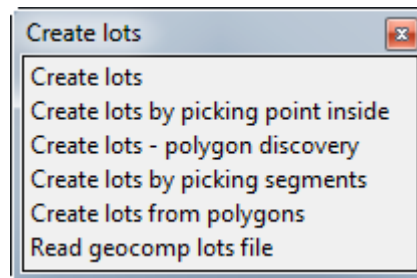

road

other

surround
McDonalds

Create Lots

Position of menu: Design => Estate/Lots => Create lots

Create Lot

Position of option on menu: Design => Estate/Lots => Create lots => Create lot

This option creates lots of a user given area using the front and back strings for a number of lots and an initial **straight line edge** of a lot. The final edge of the lot then needs to be determined.

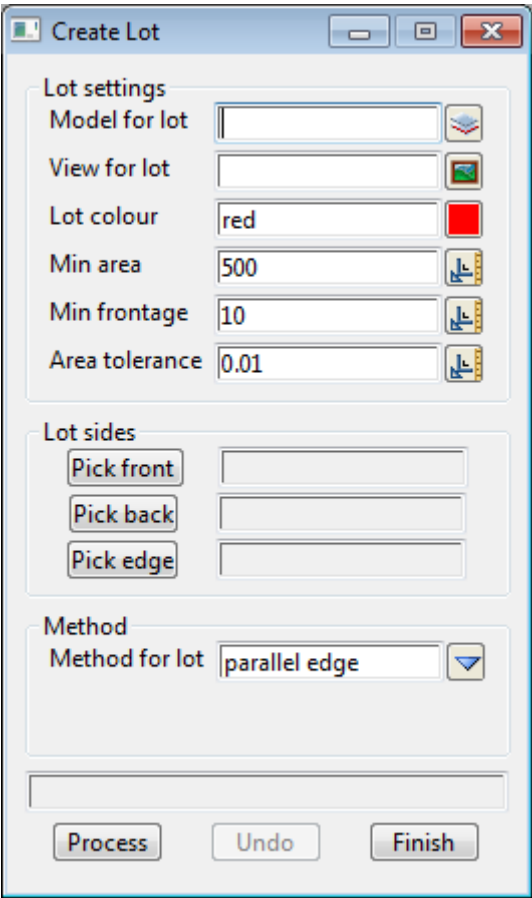

The methods of creating the final edge of lot are:

- parallel the existing side - *parallel edge*. See [Parallel Edge](#)
- having the same bearing as a selected line - *parallel pick*. See [Parallel Pick](#)
- having a given bearing - *parallel bear*. See [Parallel Bearing](#)
- perpendicular to either the front string or the back string - *perpendicular*. See [Perpendicular](#)

[and Perpendicular Pick](#)

- (e) perpendicular to either the front string or the back string but starting from a user selected point - *perpen start pt.* See [Perpendicular and Perpendicular Pick](#)See [Perpendicular and Perpendicular Pick](#)
- (f) pivoting about a selected point - *pivot pick.* See [Pivot Pick and Pivot Frontage](#)
- (g) pivoting about the point at minimum frontage - *pivot frontage.* See [Pivot Pick and Pivot Frontage](#)
- (h) closing a selected string - *close string.* See [Close String](#)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for lot <i>model for the created lot.</i>	model box		available models
View for lot <i>view to add model of created lot to.</i>	view box		available views
Lot colour <i>colour for the created lot.</i>	colour box		available colours
Min area	double box		

required area of the created lot.

Min frontage input box
required minimum frontage of the created lot.

Area tolerance double box
lot to be created can be within this tolerance of the minimum area.required area of the created lot.

Pick front string select
pick the string to form the front of the created lot.

Pick back string select
pick the string to form the back of the created lot.

Pick edge string select
*pick the **straight** line to form the edge of the created lot.*

The front, back and edge form three sides of the lot to be created.

Method choice box parallel edge parallel edge, parallel pick
parallel bear, perpendicular,
perpen start pt, pivot pick,
pivot frontage, close string

pick the string to form the back of the created lot.

Process button
use the selected front, back and edged and then create the final side of the lot by the selected method.

Continue to the next section [Creating Lots from a Front and Back String and an Edge](#) for a full description of each method of creating the lots.

Creating Lots from a Front and Back String and an Edge

Parallel Edge

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Parallel Edge*, the **final edge** is created parallel to the initial edge and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Parallel Bearing

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Parallel Bear*, the **final edge** is created with a user specified bearing and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Parallel Pick

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

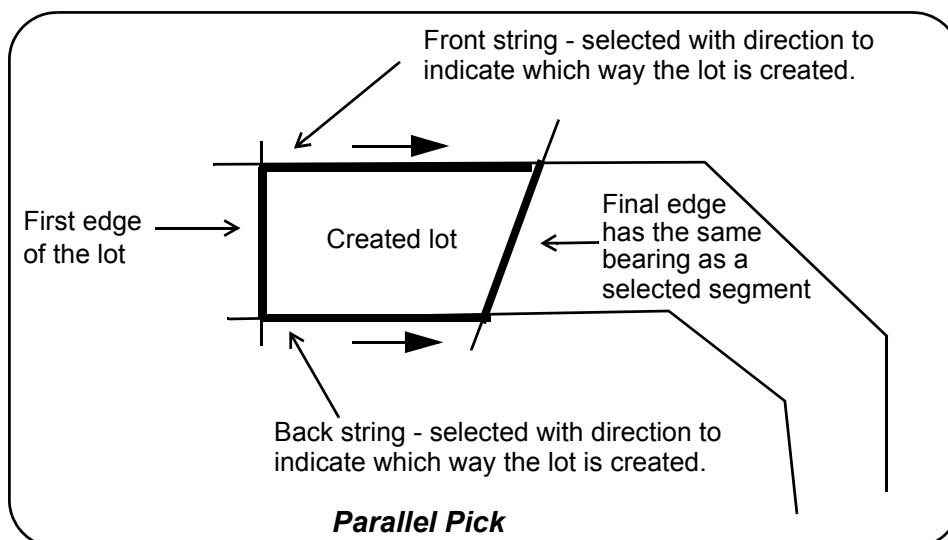

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Parallel Pick*, the **final edge** is created with the bearing of a user selected segment and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Perpendicular and Perpendicular Pick

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

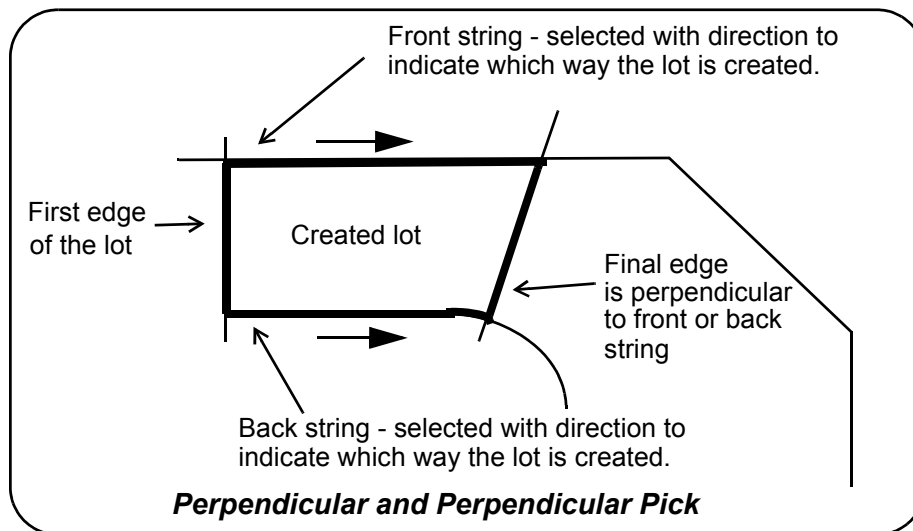

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For *Perpendicular*, the **final edge** is constrained to be perpendicular to either the front or the back string and is positioned along the front and back strings in their selected direction so that the lot has the user given area (to within the area tolerance).

For *Perpendicular Pick*, a start point is selected on the front/back string and the **final edge** is created past the start point. This option only needs to be used when *Perpendicular* has problems finding a solution due to sharp changes of bearing along the front/back string.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

Pivot Pick and Pivot Frontage

This method creates a lot of a user specified area using user selected front and back strings and a user selected initial edge. The final edge then needs to be determined to define the lot.

The front and back strings **must** be selected **with direction** to indicate which direction to move along them to form the lot. The front and back strings can not be closed strings and must be different strings. The front and back strings can have more than one segment and can have straight or arc segments.

The initial edge must cut or be very close to cutting the front and back strings. The **initial edge** must be **one straight line segment**. It can not be an arc.

For **Pivot Pick**, a position is selected on either the front or back string to be one point of the **final edge**. The other point of the final edge is determined so that the lot has the required given area (to within the area tolerance).

For **Pivot Frontage**, the pivot point is taken to be the position on the front string that is the minimum frontage distance along the front string from the initial edge.

The lot is only created if the new edge is at least the minimum frontage distance along the front string.

When the lot is created, the final edge is automatically set as the initial edge for the calculation of the next lot.

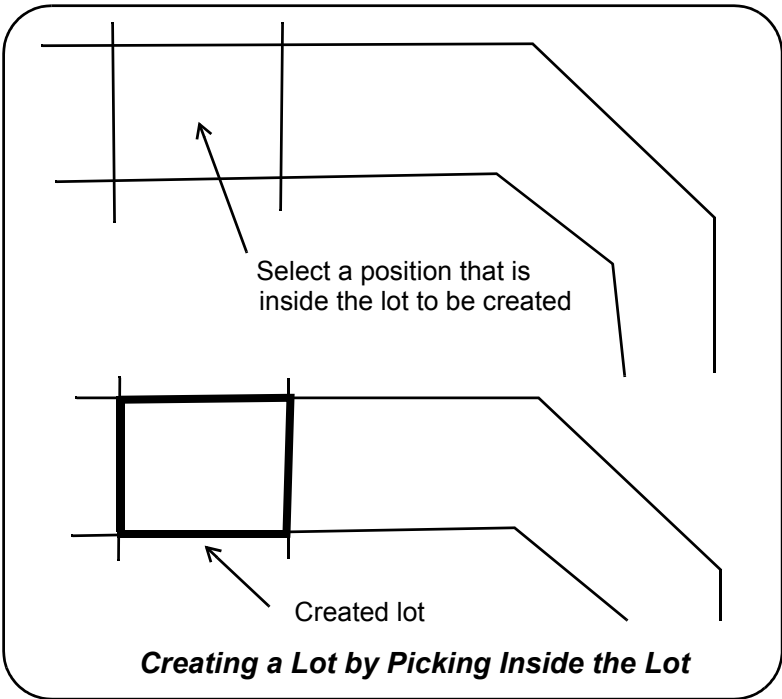

Close String

This method simply closes the string that is selected by the user.

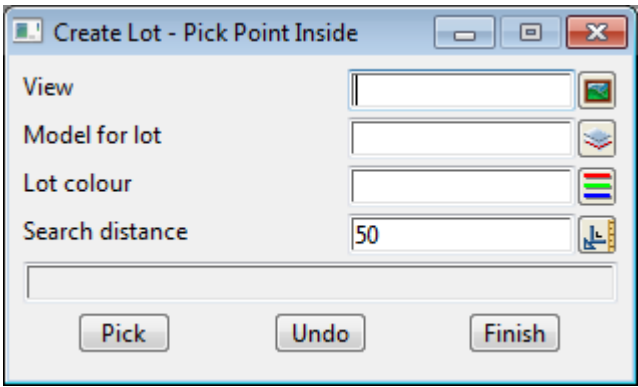

Create Lot from Picking

Position of option on menu: **Design =>Estate/Lots => Create lots =>Create lots by picking point inside**

This option creates a lot by a picking inside a collection of strings and the lot is created from the closest strings to the picked position. The picked position must be selected so that all sides of the lot can be "seen" from the picked position. That is, a straight line can be drawn from the picked position to the lot side without cutting any other segment.

On selecting the **Create lot by picking point inside** option, the **Create Lot - Pick Point Inside** panel is displayed.

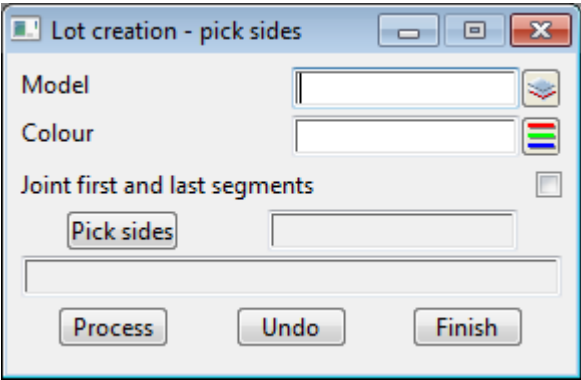

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to add model of created lot to.</i>	view box		available views
Model for lot <i>model for the created lot.</i>	model box		available models
Lot colour <i>colour for the created lot.</i>	colour box		available colours
Search distance <i>maximum distance to search from the selected point for sides of the lot</i>	double box	20	
Pick <i>pick the position to try and form a lot around.</i>	string select		

Create Lot from Picking Segments

Position of option on menu: Design =>Estate/Lots => Create lots =>by picking segments

This option creates a lot by a picking each segment in its order (and with direction) around the lot. Segments will be automatically extended or clipped to form the lot.

The fields and buttons used in this panel have the following functions.

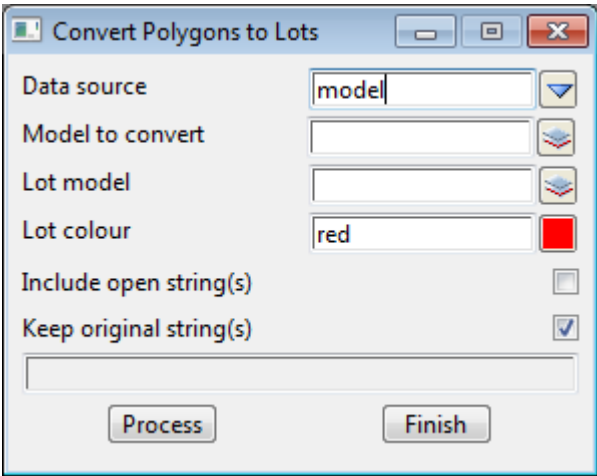

Field Description	Type	Defaults	Pop-Up
Model for lot <i>model for the created lot.</i>	model box		available models
Lot colour <i>colour for the created lot.</i>	colour box		available colours
Join first and last segment <i>if ticked, join the end of the last selected segment to the start of the first selected segment to form the final side of the lot.</i>	tick box		
Pick sides	string select		

pick, with direction, the segments to be joined together to form the sides of the lot.

Process button
create the lot from the selected segments.

Create Lot from Polygon

Position of option on menu: Design =>Estate/Lots =>Create lots =>Lots from polygons
This option converts strings to a lot. The strings can be open.

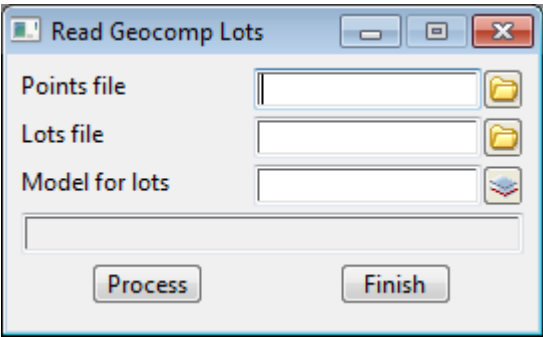

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to convert to lots.</i>			
Model for lot <i>model for the created lot.</i>	model box		available models
Lot model <i>model for the created lots.</i>	model box		available models
Lot colour <i>colour for the created lots.</i>	colour box		available colours
Include open strings <i>if ticked, open strings are used to from lots by making then closed strings. If not ticked, open strings are ignored.</i>	tick box		
Process <i>create lots from the selected strings.</i>	button		

Read Geocomp Lots File

Position of option on menu: Design =>Estate/Lots => Create lots =>Read geocomp lots file
This option reads a Geocomp lots file and creates **12d Model** lots.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Points file <i>name of the Geocomp points file.</i>			*.pts files
Lots file <i>name of the Geocomp lots file - is uses points from the given Geocomp points file.</i>			*.pts files
Model for lot <i>model for the created lot.</i>	model box		available models
Process <i>read in the given Geocomp points and lots file and created 12d Model lots.</i>	button

Adjust Lot by Pivot

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Pivot

This option adjusts the size of a lot by pivoting one side about one of its end points until the lot area has a new given area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		
<i>pick the lot to adjust by picking a side of the lot with direction. The start of the selected side will be the pivot point.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area can be larger or smaller than the existing lot area.</i>			

Process button
adjust the lot by pivoting the side.

Adjust Lot by Parallel Edge

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Parallel edge

This option adjusts the size of a lot by moving a side parallel to itself until the lot area has a new given area.

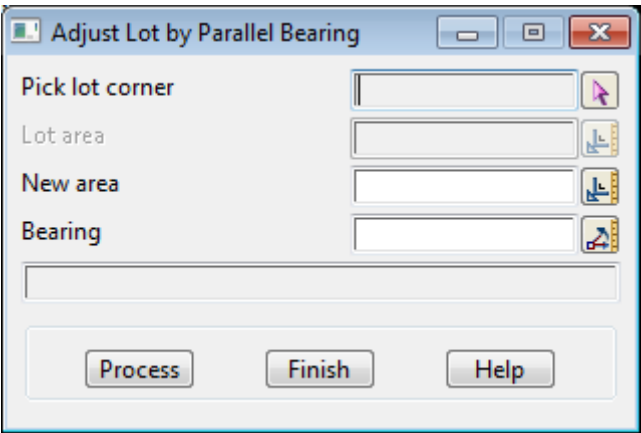

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge <i>pick the lot to adjust by picking the edge of the lot that is to be paralleled.</i>	string select		
Lot area <i>area of the selected lot.</i>	output box		
New area <i>required area of the adjusted lot. The area can be larger or smaller than the existing lot area.</i>	input box		
Process <i>adjust the lot by paralleling the selected edge.</i>	button		

Adjust Lot by Parallel Bearing

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Parallel bearing

This option adjusts the size of a lot by moving a side parallel to a given bearing until the lot area has a new given area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot corner	string select		
<i>pick the lot to adjust by picking the corner of the lot that the side goes through and has the given bearing.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area can be larger or smaller than the existing lot area.</i>			
Bearing	bearing box		

the bearing used for the selected edge.

Process button

adjust the lot by paralleling the selected edge with the given bearing.

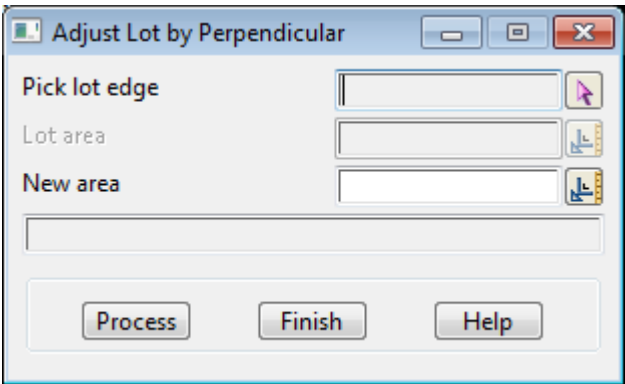

Adjust Lot by Perpendicular

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Adjust area =>Perpendicular

This option adjusts the size of a lot by creating a new side perpendicular to a selected side and then moving the new side until the created lot area has a given area.

Note -the new area must be less than the original area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		
<i>pick the side of the lot that a new side will created perpendicular to</i>			
Lot area	output box		
<i>area of the selected lot.</i>			

New area input box

required area of the adjusted lot. The area must be smaller than the existing lot area.

Process button

adjust the lot by moving the side whilst keeping it perpendicular to another side.

Subdivide Area

Position of menu: **Design =>Estate/Lots =>Edit lots =>Subdivide area**

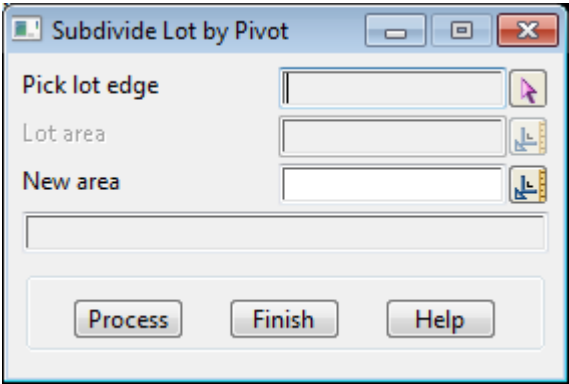

For the option *Pivot*, go to
Parallel edge
Parallel bearing
Perpendicular

[Subdivide Lot by Pivot](#)
[Subdivide Lot by Parallel Edge](#)
[Subdivide Lot by Parallel Bearing](#)
[Subdivide Lot by Perpendicular](#)

Subdivide Lot by Pivot

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Pivot

This option reduces the size of a lot by pivoting one side about one of its end points until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot	string select		
<i>pick the lot to adjust by picking a side of the lot with direction. The start of the selected side will be the pivot point.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			

New area input box

required area of the adjusted lot. The area must be smaller than the existing lot area.

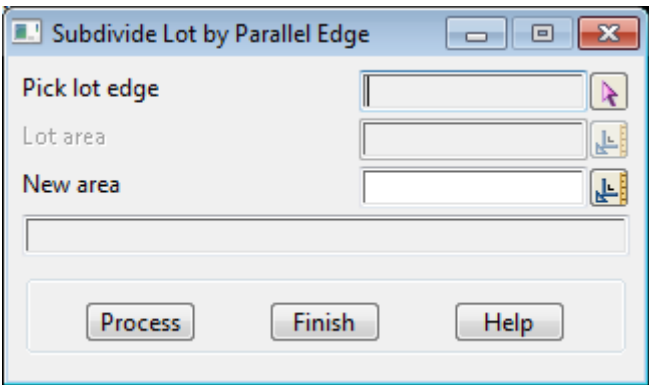

Process button

adjust the lot by pivoting the side. A second lot is created from the remainder of the original lot.

Subdivide Lot by Parallel Edge

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Parallel edge

This option adjusts the size of a lot by moving a side parallel to itself until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.

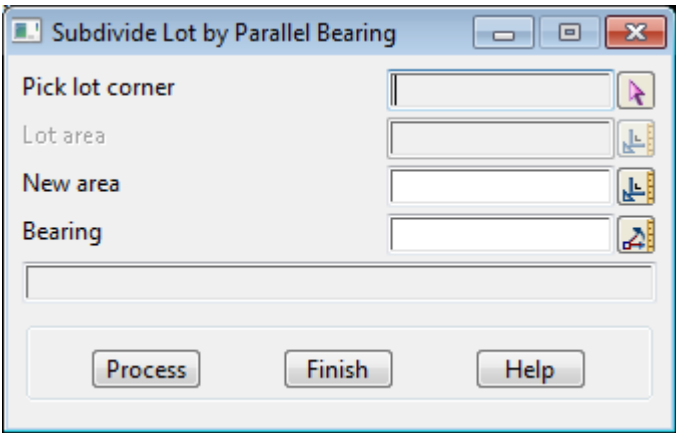

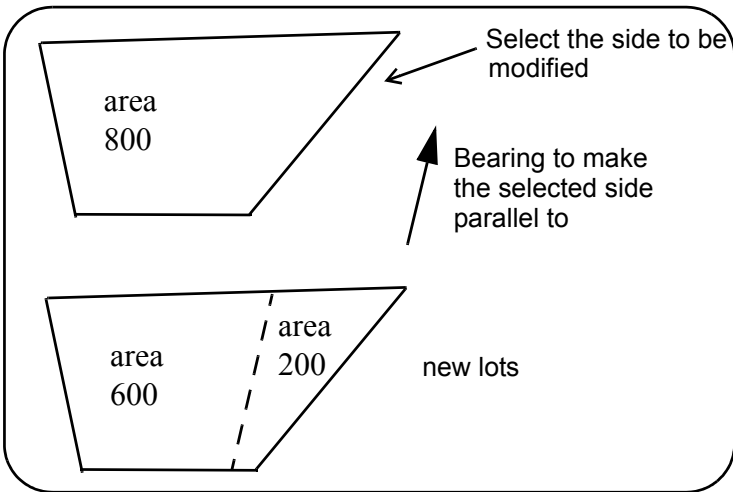

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge	string select		
<i>pick the lot to adjust by picking the edge of the lot that is to be paralleled.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area must be than the existing lot area.</i>			
Process	button		
<i>adjust the lot by paralleling the selected edge. A second lot is created from the remainder of the original lot.</i>			

Subdivide Lot by Parallel Bearing

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Parallel bearing

This option adjusts the size of a lot by moving a side parallel to a given bearing until the lot area has a new smaller area. A second lot is created from the remainder of the original lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot corner	string select		
<i>pick the lot to adjust by picking the edge of the lot that is to be paralleled.</i>			
Lot area	output box		
<i>area of the selected lot.</i>			
New area	input box		
<i>required area of the adjusted lot. The area must be smaller than the existing lot area.</i>			
Bearing	bearing box		
<i>the bearing used for the selected edge.</i>			

Process button

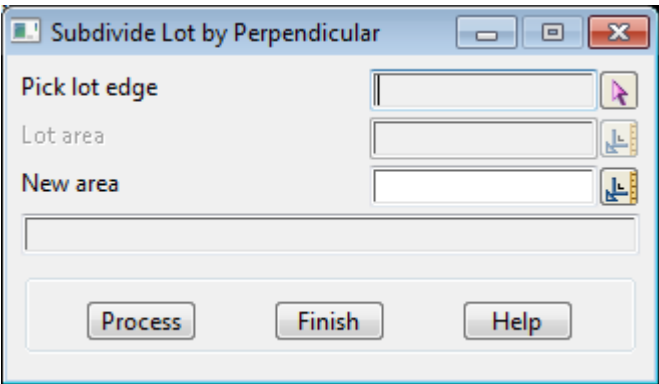

adjust the lot by paralleling the selected edge with the given bearing. A second lot is created from the remainder of the original lot.

Subdivide Lot by Perpendicular

Position of option on menu: Design =>Estate/Lots =>Edit lots =>Subdivide area =>Perpendicular

This option adjusts the size of a lot by creating a new side perpendicular to a selected side and then moving the new side until the created lot area has a given smaller area. A second lot is created from the remainder of the original lot.

Note -the new area must be less than the original area.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick lot edge <i>pick the side of the lot that a new side will created perpendicular to</i>	string select		
Lot area <i>area of the selected lot.</i>	output box		

New area input box

required area of the adjusted lot. The area must be smaller than the existing lot area.

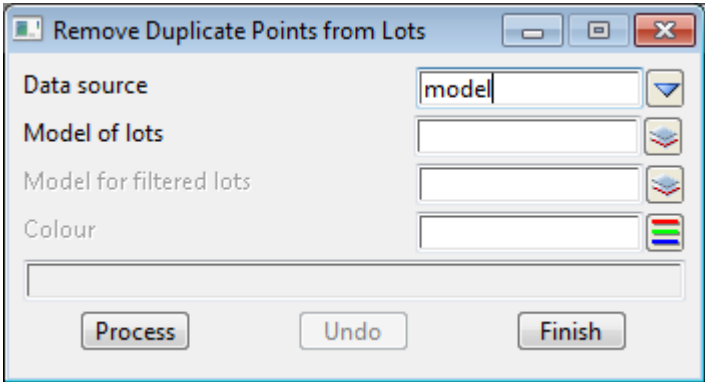

Process button

adjust the lot by moving a side whilst keeping it perpendicular to another side. A second lot is created from the remainder of the original lot.

Filter Lots

Position of option on menu: **Design =>Estate/Lots => Filter lots**

This option is used to remove adjacent duplicate points from lots.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for strings to convert to lots.</i>			
Model for filtered lots <i>model for the filtered lots.</i>	model box		available models
Colour <i>if non-blank, the filtered lots are given this colour.</i> <i>Otherwise a filtered lot has the same colour as the non-filtered lot.</i>	colour box		available colours
Process <i>filter the selected lots.</i>	button		

Number Lots

Position of menu: **Design =>Estate/Lots => Number lots**

After lots are created, they are then numbered. The lot numbers are stored with the lot

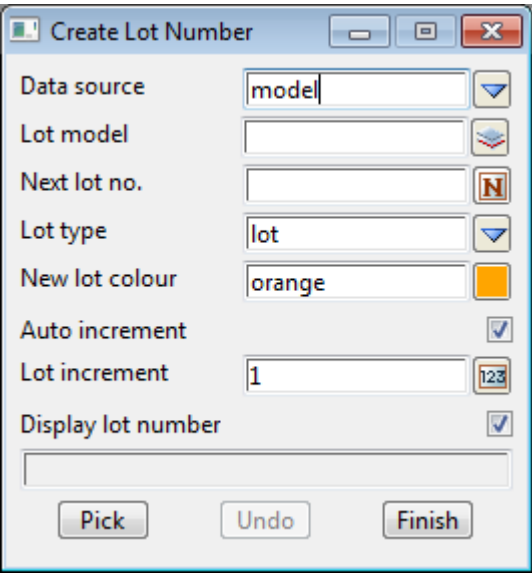

For the option *Create lot numbers*, go to [Create Lot Numbers](#).
 Change lot numbers [Change Lot Numbers](#)

Create Lot Numbers

Position of option on menu: Design =>Estate/Lots => Number lots =>Create lot numbers

This option creates lot numbers.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source

data source for lots that have been numbered. A new lot number cannot be the same as an existing one in the data source.

Next lot no.

the number to give the next lot that is numbered.

Lot type	choice box	user defined	user defined
----------	------------	--------------	--------------

type of the lot. The choices are defined by the user in the file. See [Lot types](#)

New lot colour	colour box	available colours
----------------	------------	-------------------

colour to created the numbered lot. This is done so that numbered and non-numbered lots can be easily distinguished.

Auto increment	tick box	tick
----------------	----------	------

if ticked, the Next lot no. is incremented after the lot is numbered.

Lot increment	integer box	1
---------------	-------------	---

amount to increment the Next lot no if the Auto increment flag is tick.

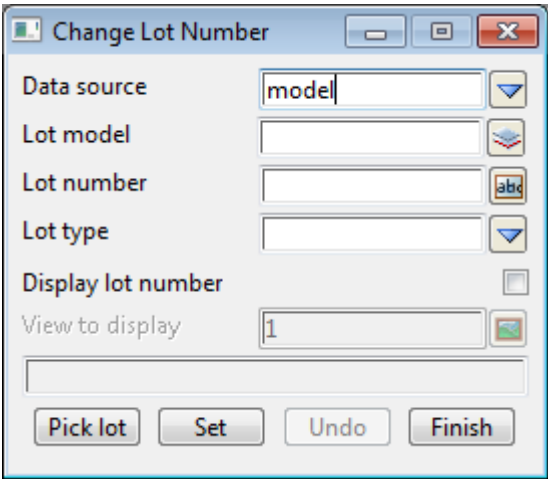

Display lot numbers	tick box	tick
---------------------	----------	------

if ticked, the lot number is temporarily displayed. Permanent lot numbers are created using the Label Lots options.

Pick string select
pick the lot the be numbered. After accepting the lot, it is given the Next lot no.

Change Lot Numbers

Position of option on menu: Design =>Estate/Lots => Number lots =>Change lot numbers
This option changes the lot numbers stored with the lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lot number <i>when a lot is selected, its lot number is displayed in this field. This can be changed and the selected lot will get the new Lot number when the Set button is selected.</i>	text box	number of selected lot	
Lot type <i>when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new Lot type when the Set button is selected. See Lot types.</i>	choice box	type of selected lot	
Display lot numbers <i>if ticked, the lot numbers are displayed for the selected lots.</i>	tick box		
View to display <i>view to temporarily display the lot numbers.</i>	view box		available views
Pick lot <i>select the lot to change either the lot number or the lot type.</i>	button		
Set <i>set the lot number and the lot type of the selected lot to the values given in the Lot number and Lot type fields.</i>	button		

Label Lots

Position of menu: Design =>Estate/Lots => Label lots

After lots are numbered, text for the lot numbers and areas can be displayed.

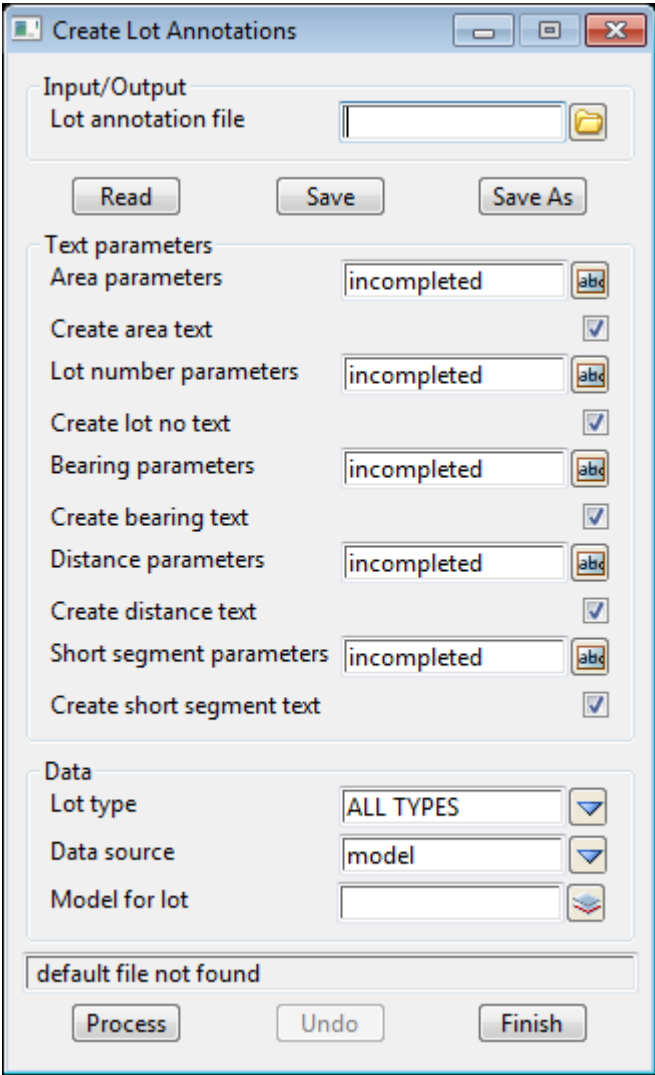

For the option *Lot labelling*, go to [Create Lot Annotation](#).
For the option *String b/d labelling*, go to [String Bearing Distance Labelling](#).

Create Lot Annotation

Position of option on menu: Design =>Estate/Lots => Number lots =>Lot labelling

This option creates annotation of the lot numbers, lot areas, bearings of the sides and lengths of the sides.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input/Output parameters			
Lot annotation file <i>file of defaults for labelling the lots.</i>			*.laf files
Read <i>read in a given lot annotation file.</i>	button		
Save <i>write out the current parameters to the given lot annotation file.</i>	button		
Save as <i>write out the current parameters to a different lot annotation file.</i>	button		
Text parameters			
Area parameters <i>parameters for labelling the area of a lot.</i>			
Create area text <i>if ticked, annotation for the areas is created using the Area parameters.</i>	tick box	tick	
Lot number parameters <i>parameters for labelling the lot numbers.</i>			
Create lot no. text <i>if ticked, annotation for the lot numbers is created using the Lot number parameters.</i>	tick box	tick	
Bearing parameters <i>parameters for labelling the bearings of the sides of the lots.</i>			
Create bearing text <i>if ticked, annotation for the lot bearings is created using the Bearing parameters.</i>	tick box	tick	
Distance parameters <i>parameters for labelling the lengths of the sides of the lots.</i>			
Create distance text <i>if ticked, annotation for the lengths of the sides is created using the Distance parameters.</i>	tick box	tick	
Short segment parameters <i>parameters for specifying what is a "short Segment" and the parameters for labelling sides of the lots that are short segments.</i>			
Create short segment text <i>if ticked, annotation for short segments is created using the Short segment parameters.</i>	tick box	tick	

Data

Data source type

data source type.

Data source

data source for lots to be annotated.

Lot type

choice box user defined user defined

of the lots selected by the data source, only lots of this type are labelled. See [Lot types](#).

Process

button

select all the lots given by the Data source and Lot type and create annotations according the Text parameters.

String Bearing Distance Labelling

Position of option on menu: Design =>Estate/Lots => Label lots =>String b/d labelling

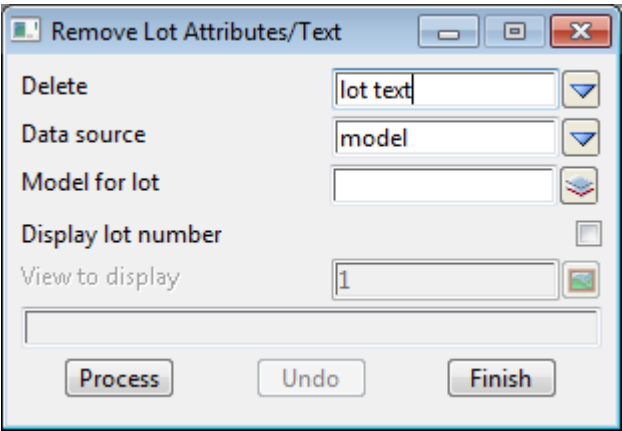

Option to label the bearing and lengths of segments of strings.

This option is described in the section [Bearing/Distance Labelling](#) in the chapter [Drafting](#)

Delete Lot Attributes and Text

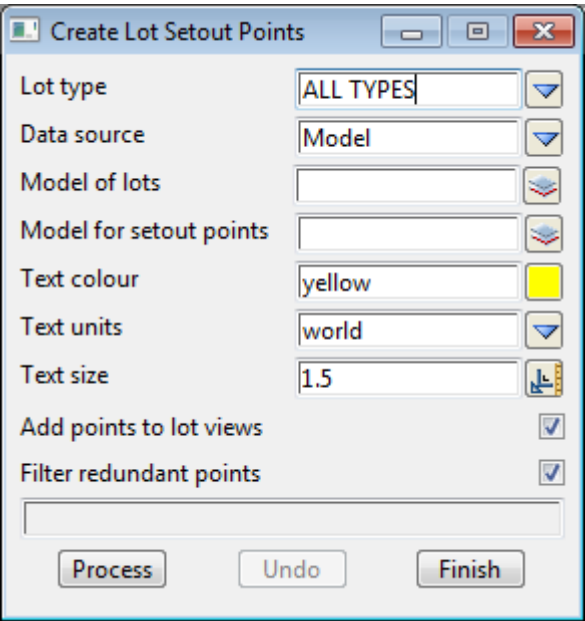

Position of option on menu: Design =>Estate/Lots => Delete lot attributes/text

This option is used to remove the attributes for a lot which store the lot number, area etc. It can also delete the annotation text that has been created for the lot.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Delete	choice box	lot text	lot text, lot attributes
<i>when a lot is selected, its lot type is displayed in this field. This can be changed and the selected lot will get the new Lot type when the Set button is selected.</i>			

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lot type <i>of the lots selected by the data source, only lots of this type have point numbers created. See Lot types</i>	choice box	user defined	user defined
Data source <i>data source for lots to have point numbers created.</i>			
Model for setout points <i>model for the set out points.</i>	model box		available models
Text colour <i>colour of the point numbers.</i>	colour box		available colours
Text units <i>units for text size.</i>	choice box	world	screen, paper, world
Text size <i>Size of the text for the point numbers.</i>	double box		
Add points to lot views <i>if ticked, add the model of point numbers to the views that the lots are displayed on.</i>	tick box	tick	
Create short segment text <i>if ticked, annotation for short segments is created using the Short segment parameters.</i>	tick box	tick	
Filter redundant points <i>if ticked, then if two adjacent line have the same bearing then the two segments are replaced by one</i>	tick box	tick	

segment. And if two adjacent arc segments could be the one arc, then they are replaced by one arc.

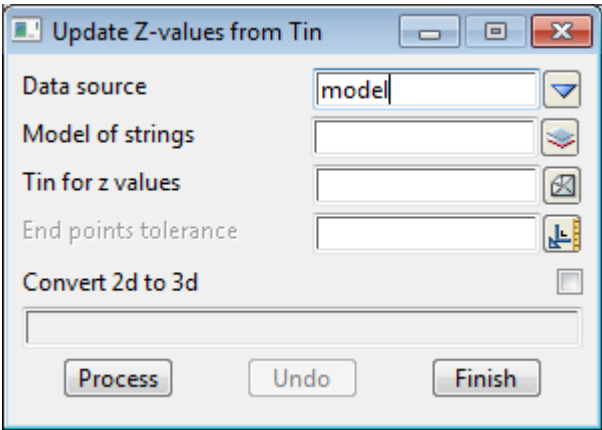

Process button

select all the lots given by the Data source and Lot type and create annotations according the Text parameters.

Drape Points

Position of option on menu: Design =>Estate/Lots => Setout lots =>Drape points

Option for setting the z-value of points to the z-value from a specified tin.

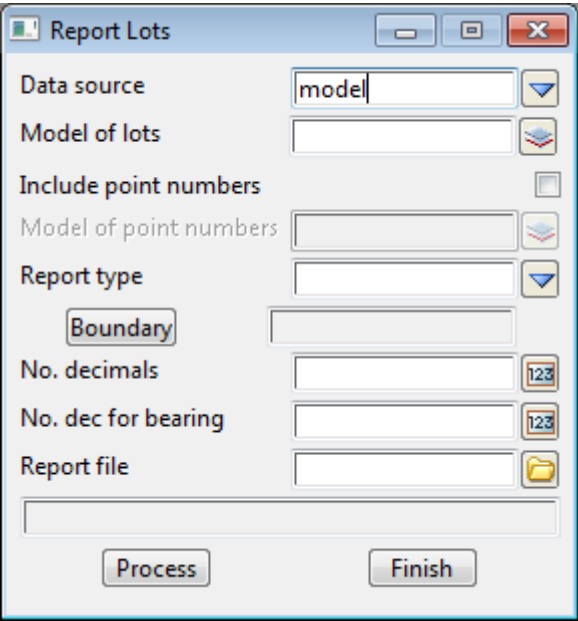

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source <i>type of the data source</i>	choice box		model, view, string
Model of strings / View of strings / Pick a String <i>source of the data</i>			
Tin for z values <i>The tin to take the z values for the vertices from</i>	tin box		
End points tolerance	input		
Convert 2d to 3d <i>if ticked, 2d strings will be converted to 3d strings which have a different z value from the tin for each vertex. if not ticked the 2d string takes its z value from the tin at the first vertex</i>	tick box		

Report Lots

Position of option on menu: Design =>Estate/Lots => Report lots

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source <i>data source for lots to be reported.</i>			
Include point numbers <i>if ticked, include the point number for each vertex around the lot.</i>	tick box		
Model of point numbers <i>model of the point numbers for the vertices of the lots.</i>	model box		available models
Report type <i>type of report for the selected lots.</i>	choice box		sort by type, sort by number sort by area, setout
Boundary <i>if selected, the boundary string for the lots. If selected then the area of the boundary string is calculated and the total area of the lots compared to the area of the boundary string.</i>	string select	optional	
No. decimals <i>Number of decimal places for co-ordinates and lengths in the report.</i>	integer box		
No. dec for bearings <i>Number of decimal places for bearings in the report.</i>	integer box		
Report file <i>Name of the file for the report.</i>	file box		

Process

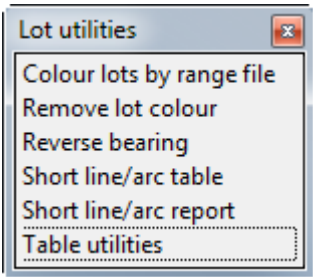

button

Create the report.

Lot Utilities

Various lot options.

Position of menu: Design =>Estate/Lots => Lot utilities

Remove lot colour
Reverse bearing
Short line/arc table
Short line/arc report
Table utilities

[Colour Lots by Range File](#)
[Remove Lot Colour](#)
[Reverse Bearing](#)
[Short Line/Arc Table](#)
[Short Line/Arc Report](#)
[Short Segment Utilities](#)

Colour Lots by Range File

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Colour lots by range file

The option colours lots by area using a lot range file (.lrf) to define the colour for each minimum and maximum area. It also creates a table of the statistics for the area ranges.

The fields and buttons used in this panel have the following functions.

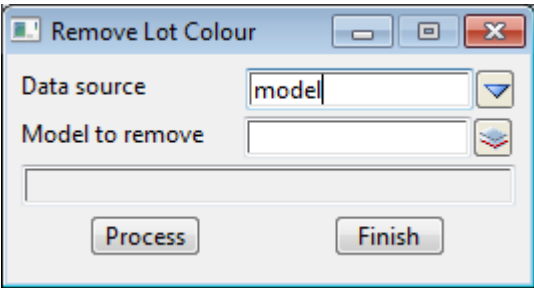

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Range file	file box	*.lrf
<i>range file for colouring lots.</i>		
Data source		
<i>data source for lots to be coloured.</i>		
Table location	position select box	
<i>position of the table.</i>		
Model for table	model box	available models
<i>model for the table of statistics on the lot areas.</i>		
Text colour	colour box	available colours
<i>colour of the text.</i>		
Text size (w)	double box	
<i>size of the text for the table.</i>		
Process	button	
<i>select all the lots given by the Data source and Lot type and colour them according to the lot range file.</i>		

Remove Lot Colour

Position of option on menu: Design ==>Estate/Lots ==> Lot utilities ==>Remove lot colour

The option removes the colour of all the selected lots.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source			
<i>data source for lots to have their colour removed.</i>			
Process	button		
<i>select all the lots given by the Data source and remove the lot colour.</i>			

Reverse Bearing

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Reverse bearing

Option to change the value of the bearing text created by the lot labelling option by adding 180 degrees to the bearing. This is then the bearing of a line in the reversed direction to that represented by the original bearing text. The rounding for the reversed bearing is done according to the lot parameters.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Zero padding	tick box	tick	
<i>if ticked, if the minutes and/or seconds are zero then two zeros are written out. If not ticked, if the minutes and/or seconds are zero then they are left out.</i>			
Pick	button		
<i>pick the bearing text that is to be modified.</i>			

Short Line/Arc Table

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Short line/arc table

Position of option on menu: Drafting =>Text and Tables =>Short segment table

Option to create a table of all the short segments and/or short arcs.

This option is described in the section [Short Segments Table](#) in the chapter [Drafting](#)

Short Line/Arc Report

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Short line/arc report

Position of option on menu: Drafting =>Text and Tables =>Short segment report

Option to create a report of all the short segments and/or short arcs.

This option is described in the section [Short Segment Report](#) in the chapter [Drafting](#)

Short Segment Utilities

Position of option on menu: Design =>Estate/Lots => Lot utilities =>Table utilities

Position of option on menu: Drafting =>Text and Tables =>Short segment table utilities

This panel is used modify an existing short segments table.

This option is described in the section [Short Segments Table Utilities](#) in the chapter [Drafting](#)

Pads

Position of menu: **Design =>Pads**

The **Pads** walk-right menu is

For the option *Balance a pad*, go to

[Dynamic Pad Interface](#)

[Allotment Pad Create](#)

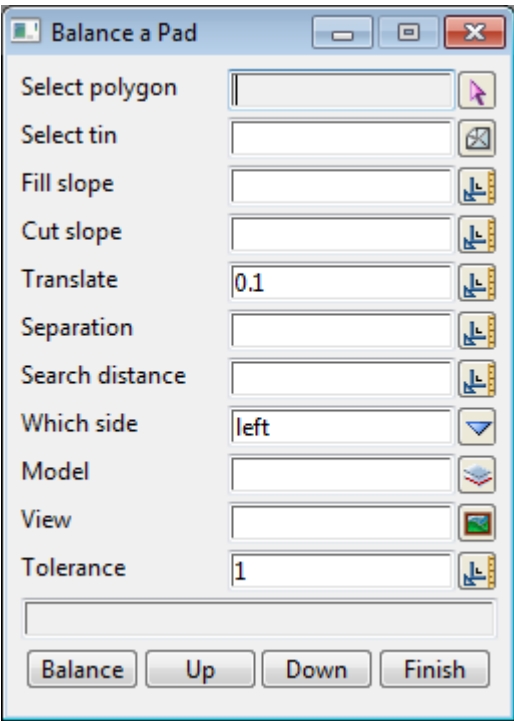

[Allotment Pad Edit](#)

[Dynamic Pad/Pond Interface](#)

Balance a Pad

Position of option on menu: Design =>Pads =>Balance a pad

This option takes a pad formed by a string and user given slopes and batters from the pad to a given tin. The pad is moved up or down until a balance is found.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Select polygon <i>The string defining the pad</i>	string select		
Select tin <i>The tin to interface the pad to</i>	tin select		
Fill slope <i>The fill slope for the pad</i>	measures box		At Point, Point to Point, String from Point, String to Point)
Cut slope <i>The cut slope for the pad</i>	measures box		At Point, Point to Point, String from Point, String to Point)
Translate	measures box	0.1	At Point, Point to Point, String from Point, String to Point)

The value for translating the pad up and down with the 'Up' and 'Down' keys.

Seperation	measures box	At Point, Point to Point, String from Point, String to Point)
-------------------	--------------	---------------------------------------------------------------

The interval along the pad string for the volume calculations.

Search distance	measures box	At Point, Point to Point, String from Point, String to Point)
------------------------	--------------	---------------------------------------------------------------

The maximum search distance for intersecting the cut/fill slopes with the pad.

Which side	choice box	left	left, right
-------------------	------------	------	-------------

Which side of the string is the outside of the pad.

Model	model box	available models
--------------	-----------	------------------

The model for the final strings and tadpoles.

View	view box	select view
-------------	----------	-------------

View to add temporary strings to.

Tolerance	
------------------	--

The tolerance for balancing the cut/fill for the pad.

Balance	button
----------------	--------

Balance the pad to within tolerance value.

Up	button
-----------	--------

Move pad up by translation value.

Down	button
-------------	--------

Move pad down by translation value.

Finish	button
---------------	--------

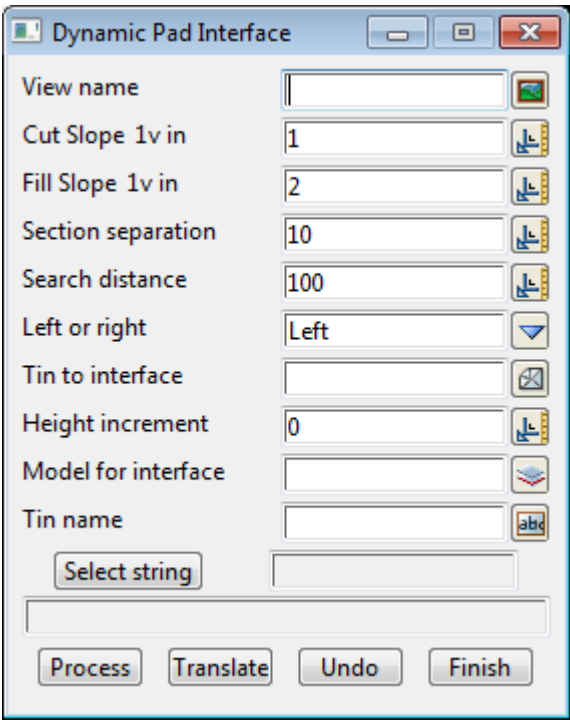

Add strings to permanent model and finish.

Dynamic Pad Interface

Position of option on menu: **Design =>Pads =>Dynamic pad**

This option is to create a pad by interfacing from a selected string and calculated the volume for the pad. The pad can be moved up or down and the new volumes are calculated.

The pad can also be moved in plan and the new interface and volumes are dynamically calculated.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View name <i>name of the view to display the pad interface strings.</i>	view box		
Cut slope 1v in <i>cut slope for interfacing.</i>		1	
Fill slope 1v in <i>fill slope for interfacing.</i>		2	
Section separation <i>interval to calculate cut and fill batters.</i>		10	
Search distance <i>distance for the batter to search to find intersection with the triangles.</i>		100	
Left or right <i>batter to the left or right of the selected string.</i>	choice box	left	left, right
Tin to interface <i>tin to batter to.</i>	tin box		
Height increment		0	

when process is selected, the pad height is adjusted by the value in this panel field and the new interface and volumes are calculated.

Select string select
select string to batter from

Process button
adjust the height of the pad by the Height increment and recalculate the new interface and volumes.

Translate
when selected the pad will move to the cursor position and dynamically calculate the interface and volumes.

Reset button
reset the pad height to its original value.

Allotment Pad Create

Position of option on menu: **Design =>Pads =>Create/grade pad**

This option and the next **Design =>Pads =>Edit/grade pad** are used to create a pad from surrounding lines, grade the created pad and edit pads already created with this option.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

General tab

Data source type	Model		
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>

Pad texture	choice box	None	None, some textures
<i>the colour of the new pad.</i>			

Use solid fill tick box
if ticked, solid fill the pad

Display button
*brings up the **Display Text Defaults** panel*

Offsets tab

Global offset input
if other offsets are not given, the distance to offset the sides of the pad from the strings used to create the pad

Offsets model model box
model for the offset lines

Offsets type choice box Segment Segment, Point to Point
*if **Segment**, define the offset line by picking a segment.
If **Point to Point**, define the offset line by picking two points.*

Select button
select an offset line

Creation tab

Pad level type choice box Typed input, Use tin level
Use bdy/ht, Use bdy/slope
*if **typed input**, all vertices of the pad are given the height in the Lot level field.
If use **tin level**, the height of each vertex of the pad is taken from the tin given in the Tin field.*

If **typed input**:

Pad level input
the height to use for all the vertices of the pad.

If **Use tin level**:

Tin tin box available tins
the tin used to give heights to the vertices of the pad.

If **Bdy/ht**:

Height
the height to be above the selected boundary string

Reference boundary
the selected boundary string for the pad to be a given height above/below

If **Use/slope**:

Slope 1 in
the slope to be above the selected boundary string

Reference boundary

the selected boundary string for the pad to be a given slope above/below

Single/ Along a string radio buttons single

*if **single**, a single pad is created from the strings surrounded the selected point.
If **along a string**, pads are created surrounding each vertex of selected string.*

Centroid/search distance string select

*if **single**, a point is selected and then a circle is rubber banded until a second point is selected. The pad is created from segments within the circle.*

Search dist input

*if **along a string**, then for each vertex, all segments within the distance are processed to create the pad.*

Select string select

*if **along a string**, select the string to use. Pads are created surrounding each vertex of this string.*

Process button

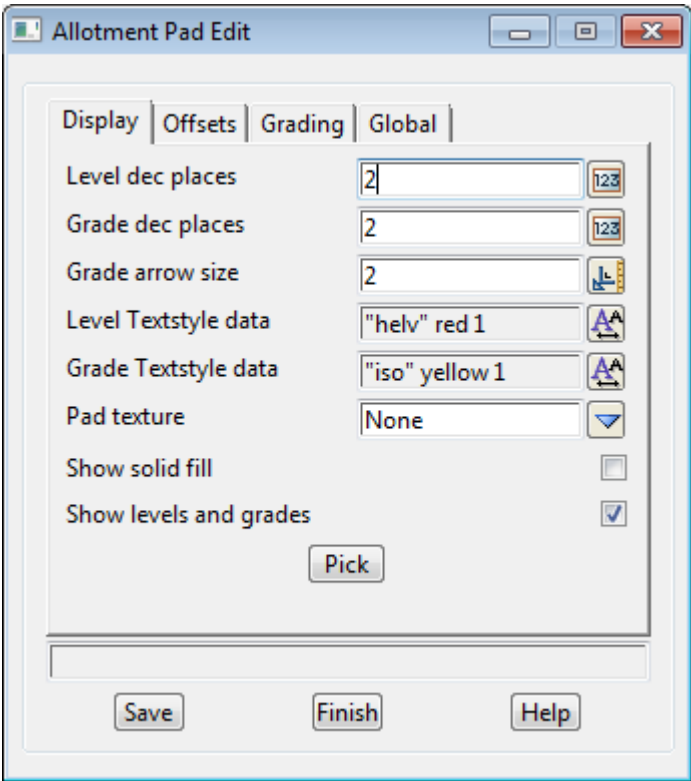

run the option

Allotment Pad Edit

Position of option on menu: **Design =>Pads =>Edit/grade pad**

This option is used to grade a pad created with the previous option, **Design =>Pads =>Create/grade pad**.

Selecting **Edit/grade pad** brings up the **Allotment Pad Edit** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Dynamic Pad/Pond Interface

Position of option on menu: Design =>Pads =>Dynamic Pad Pond Create

This option is used to interface from a string to a tin plus it can have an included pond model.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name	function box		available functions
<i>name of the pad/pond function. If the function already exists and is picked from a popup or and an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields</i>			
Cut slope 1 v in	input	1.0	
<i>the slope of the interface line if a point is in cut. A cut slope of one vertical to the given value of horizontal units is used. Positive is up for a cut slope. A value 0 is used to designate a horizontal line.</i>			
Fill slope 1 v in	input	1.0	
<i>the slope of the interface line if the point is in fill. A fill slope of one vertical to the given value of horizontal units is used. Positive is down for a fill slope. A value 0 is used for a horizontal line.</i>			
Section separation	input	10	

the distance between the points on the selected string that interface points will be calculated from.

Existing tin surface	tin box	available tins
<i>name of the tin to interface to.</i>		
Pad /Pond internal model	model box	available model
<i>if non blank, name of the model to include as part of the interface model</i>		
Model for interface strs	model box	available models
<i>name of the model to contain the calculated interface string.</i>		
Name for pad/pond tin	tin box	available tins
<i>name of the tin to create from the reference string, the interface string and the pad/pond internal model</i>		
Height increment	input	
<i>value to vertically translate the reference string by (cleared after each process unless Maintain height increment during processing is ticked)</i>		
Water level	input	
<i>if non blank, the height of the water level</i>		
Use overflow water level from cut interface	tick box	
<i>if ticked, the water level to the lowest point on the cut interface is determined and used as the water level height</i>		
View display	view box	available views
<i>if non blank, the view to display the results on</i>		
Report file name	file box	*.rpt files
<i>if non blank, the view to display the results on</i>		
Maintain height increment during processing	tick box	
<i>if ticked, the reference string will be raised by the Height increment each time the function is processed, but only while the panel is open</i>		
Calculate storage to existing tin surface only	tick box	
<i>if ticked, this will calculate the storage to the Existing tin surface from the Water level only</i>		
Reference string	string select	
<i>select the string to interface from.</i>		
Process	button	
<i>run the function</i>		

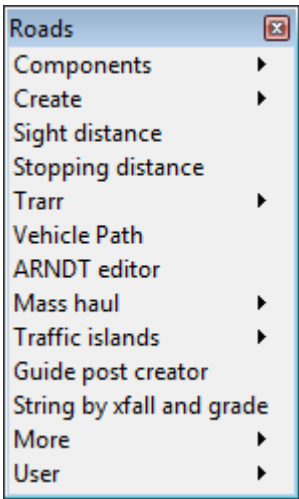

Roads

Position of menu: Design =>Roads

The road options include road network creation options and a number of other options for creating road details.

Some of the options are currently under development.

The roads walk-right menu is

	
Components	generate components
Create	setup and create road network
Sight distance	sight distance calculations
Stopping distance	stopping distance calculations
Trarr	input/output to TRARR
Vehicle Path	run TMR VPATH
ARNDT editor	editor for creating/running TMR ARNDT
Mass haul	generate data for mass haul on long section
Traffic islands	create traffic islands
Guide post creator	create guide posts to AUSTROAD standard
String by xfall and grade	lots of generating strings by Xfalls
More	more roads macros
User	

Each option in this menu will now be described.

For the option *Components*, go to

<i>Components</i>	Components
<i>Create</i>	Create Roads
<i>Design checker</i>	Design Checker
<i>Sight distance</i>	Sight Distance
<i>Stopping distance</i>	Stopping Distance
<i>Trarr</i>	Trarr

<i>Guide post creator</i>	Guide Post Placement
<i>String by xfall and grade</i>	String by Xfall and Grade
<i>More</i>	More Roads

Create Roads

Position of menu: **Design =>Roads =>Create**

The **Create roads** function allow the user to start with a model of road centrelines with vertical geometry, and unique string name.

The centrelines can then be tagged with the width of the roads, left and right turn radii for any intersections and the definitions of any culdesacs at the end of a centreline.

The **Create** option will then create the left and right edges of the roads, create kerb returns and any intersections and the appropriate culdesacs.

For example

Initial Network of Centrelines

Road Network After Running the Roads Option

Blow Up of an Intersection

The Create Roads walk-right menu is

Create Roads

Create Roads - Manager

Create Roads - Setup

Create Roads - Kret convet

construct the roads network

setups for road network

convert kerb returns

Each option in this menu will now be described.

- For the option *Create Roads - Manager*, go to

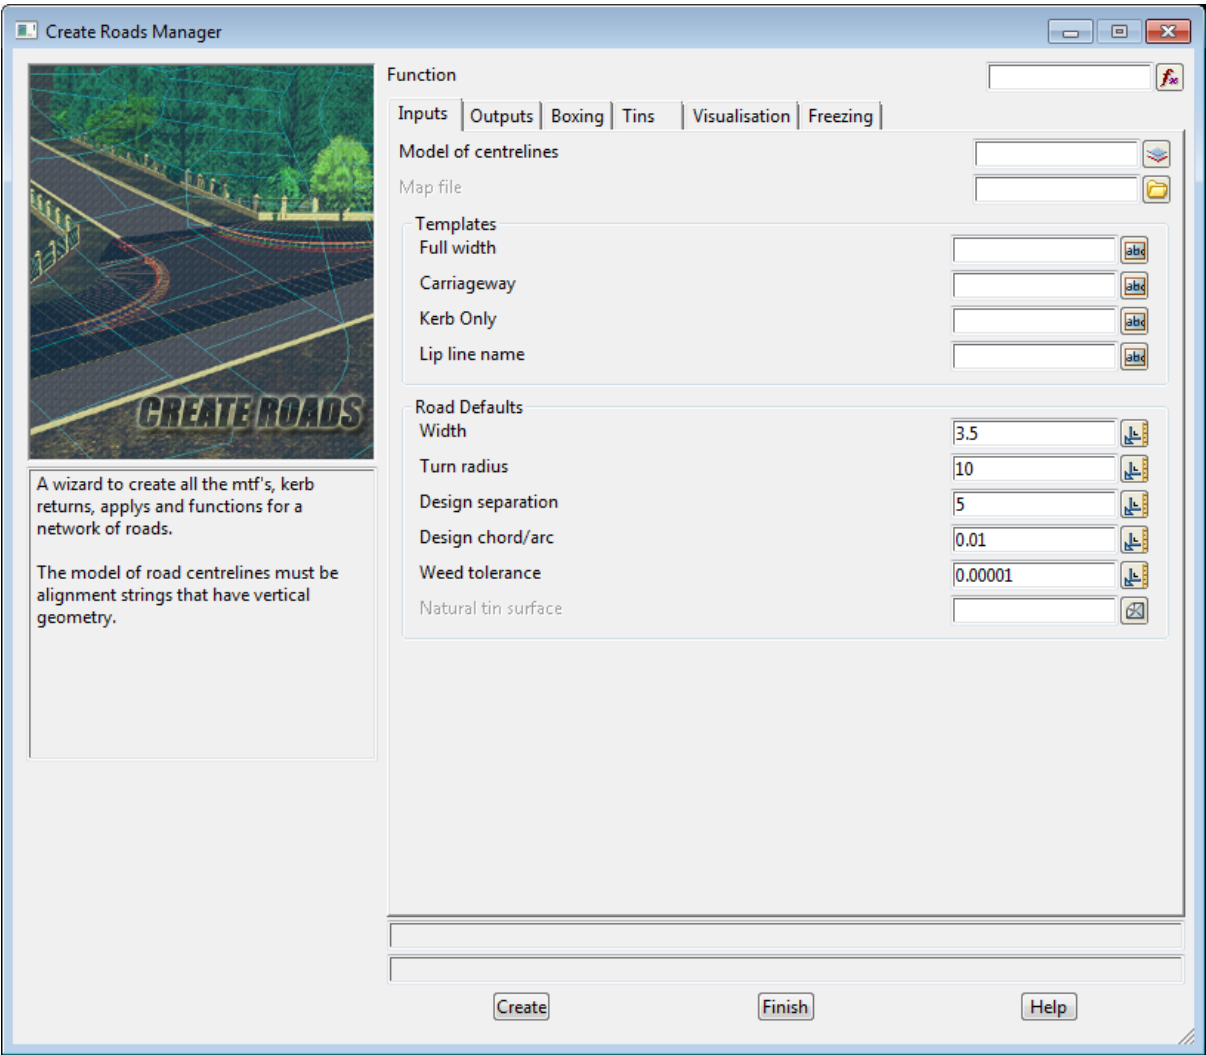

[Create Roads - Manager](#)
- Create Roads - Setup*

[Create Roads - Setup](#)
- Create Roads - Kret convert*

[Create Roads - Kreturns Convert](#)

Create Roads - Manager

This option takes all the centrelines in a model and uses road widths and left and right turn radii to form roads on each centreline.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box		available roads functions
<i>name of the create roads function</i>			

Input tab

Model of centrelines	model box		available models
<i>model of the centreline lines that are to processed to create roads, intersections and culdesac. Each centreline must have a unique name and vertical geometry</i>			

Templates

Full width	template box		available templates
<i>template with one fixed link and then cut and fill definitions to use for creating the roads. If a centreline has a road width defined, then the template is modified to use those values. The cut/fill section of the template are used to batter as normal.</i>			

Carriageway	template box		available templates
<i>a template with only a fixed part to the end of the carriageway which is applied across any intersections - going from the chainage of the start of the kerb return on one side of the intersection to the chainage at the end of kerb return on the other side of the intersection.</i>			

Kerb only	template box		available templates
<i>a template with no carriageway part. It is applied to any kerb returns</i>			

Lip line name			
<i>name of the lip line that must exist in each of the full width template and the road template. The kerb returns are created from the lip line on each road and the start height and grades are taken from the lip lines.</i>			

Road Defaults

Width			
<i>width of the road to be used if one hasn't been defined for any centrelines</i>			

Turn radius			
<i>radius to use for filleting between any centrelines that don't have a left or right radius defined</i>			

Design separation			
<i>chainage distance to use in the Applies for creating the roads along the centrelines</i>			

Default chord/arc			
<i>chord to arc tolerance to use on curves</i>			

Natural surface tin	tin box		available tins
<i>if non blank, the tin to use as the natural surface for battering in the Applies. If blank, no battering is done.</i>			

Output tab

Model stems

Road strings input

*pre*post text to use with the function name in the created Applies for the design string models for each centreline*

Road sections input

*pre*post text to use with the function name and the created Applies for the design cross section models for each centreline*

Polygons choice box One model One model, No Polygons
Model for Centreline

*if **One model**, all the polygons created by the applies are place in one model.*
*If **Model for Centreline**, different models are created for the polygons in each apply.*
*If **No Polygons**, no polygons are created by the applies.*

Model model box available models

*when **One model**, model for all the polygons created by the Applies.*

Road polygons input

*pre*post text to use with the function name in the created Applies for polygon models for each centreline*

Kerb Returns

Turn separation

chord/arc tolerance for use in the kerb return Applies

Turn chord/arc

chord to arc tolerance to use on kerb return

Model for kerb returns model box available models

model for all the kerb returns

Naming choice box Follow Road Names - LHS driving
Follow Road Names - RHS driving
Use Numbers
Use Letters

method of naming the kerb returns

Just create kerb returns tick box

if ticked, only create the kerb returns. Usually only run at the beginning to see if the kerbs look correct.

Just create kerb returns tick box

if ticked, only create the kerb returns. Usually only run at the beginning to see if the kerbs look correct.

Kerb return strings and sections in one model tick box

if ticked, then all the kerb return strings and sections are place in the one model. The model names are given in the next two fields.

Model for kerb return strings model box available models

model for all the kerb return strings

Model for kerb return sections model box available models
model for all the kerb return sections

Delete frozen apply many functions tick box
if ticked, the apply many functions are deleted for all the frozen roads. Normally not used

View for models view box available views
if non blank, view to add all the created models onto.

Error report file box *.rpt files
file for error messages

Boxing tab

boxing can be created for all the road and kerb return strings. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road/kerb return centrelines.

Create boxing tick box
if ticked, boxing is applied for all the road and kerb returns. The boxing definitions must have a common centreline name in them which will be replaced by the name of each of the road centrelines or kerb returns.

Default boxing file file box *.blf files
file of boxing file definitions

Default boxing CL delimiter input
common name in each boxing definition which will be replaced by the name of each road/kerb return centreline

Model stem for boxing strings input
*pre*post text to use with the road/kerb return function name for boxing string models*

Boxing sections input
*pre*post text to use with the road/kerb return function name for boxing section models*

Boxing kerb return sections and strings in one model tick box
if ticked, the strings for all the kerb return Applies are place in one model rather than one model for each kerb return. Similarly, the sections for all the kerb return Applies are placed in the one model. If not ticked, the model names are created in the same way as for the road centrelines. That is, the Model stem for boxing strings and sections are used with the kerb return function name and the layer stems to produce the kerb return boxing strings and sections models.

Model name for boxing kerb strings input
*when only one model (per layer) for the box kerb strings is used - the base name for the model of kerb strings created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Model name for boxing kerb sections input
*when only one model (per layer) for the box kerb sections is used - the base name for the model of kerb sections created for each boxing layer. The pre*post text in the Layer Stem is applied to this name.*

Boxing Layer 1-8 in the grid:

if non blank, boxing strings and sections will be created for that layer.

The last boxing layer is also referred to as the **subgrade** layer.

Layer stem input

*for this boxing layer, the pre*post text used when naming models for boxing sections and strings.*

Road - LHS input

for this boxing layer, the boxing definition to use on the left hand side of road centrelines

Road - RHS input

for this boxing layer, the boxing definition to use on the right hand side of road centrelines

Kerb return input

for this boxing layer, the boxing definition to use on the kerb returns

Intersection - LHS input

for this boxing layer, the boxing definition to use on the left hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Intersection - RHS input

for this boxing layer, the boxing definition to use on the right hand side of the road though an intersection. The strings and sections are place in the models for the road centreline going through the intersection.

Tins tab

Create tin ☐ tick box

if ticked, create a tin for all the roads, kerb returns and culdesacs

Road tin tin box

available tins

name for the tin created from the all the strings and sections

Road tin colour colour box

available colours

colour of the road tin

Subgrade tin tin box

available tins

if non blank, a subgrade tin of this name is created

Subgrade tin colour colour box

available colours

colour of the subgrade tin

Nulling angle

angle for nulling the triangles

Nulling length input

length for nulling the triangles

Null Seed points:

Seed X/Y input
X/Y coordinate of a nulling seed point

Seed Point button
select a seed point for nulling the tins. The X and Y coordinates are written to the Seed X/Y grid

Visualisation tab

Create visualisation tick box
if ticked, the road tin is processed for visualisation

Apply texture map to tin tick box
if ticked, the texture map is applied to the road tin

Draw road tin as solid on view tick box

Tin colour to use for cut polygons colour box available colours
colour to use for all the cut polygons

Tin colour to use for fill polygons colour box available colours
colour to use for all the fill polygons

Tin colour to use for transition polygons colour box available colours
colour to use for all the polygons in neither cut nor fill

Freezing tab

Colour for the frozen sections colour box available colours
colour to use for the sections of frozen strings. In any view, this gives a quick way of identifying frozen roads.

Road grid - list of all the centrelines

Element available colours
centreline name

Frozen tick box
if ticked, the centreline is frozen out of the automatic Create Roads process.

*For a frozen centreline, when the **Create Roads** function is run, the Apply Many for that centreline is deleted and re-created. However any existing Apply Many for that centreline will be run. Kerb returns are still calculated using the lip line create by running the existing Apply Many for the frozen centreline. Hence the mtf for a frozen centreline can be modified and the changes will **not** be deleted when the Create Roads function is recalcd.*

Note - if the two roads used to define a kerb return are both frozen, then the kerb return is automatically frozen and the kerb return is not deleted and recreated when the Create Roads function is recalcd. However the existing Apply Many for the frozen kerb return is run on each recalcd.

Buttons at bottom

Create button

run the option and create the road network.

Create Roads - Setup

In the **Create Roads - Manager** panel there are default values for the road width and road crossfall and turn radius.

If a different road width or crossfall, or a different left turn radius or right hand radius is required, the **Create Roads - Setup** option is used to define the different information for any centreline. **Create Roads - Setup** is also used to define culdesacs.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Road Setup tab			
Centreline	string select		
<i>used to set the left and right turn radii, and the width of the road. This option is used twice to set the</i>			

different radii for each end of a road by picking the centreline close to the end that is to have the left and right turn radii defined. The left and right turn radii can be different for each end of an alignment.

Road width

width of one side of the road for the selected centreline.

LHS turn radius

radius to use for filleting between any centrelines on the left.

RHS turn radius

radius to use for filleting between any centrelines on the right.

Set button

store the given values in the panel with the selected centreline.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Culdesac Setup tab

- Left fillet

input

radius of the fillet between the road and the bulb on the left hand side
- Bulb radius

input

radius of the culdesac bulb
- Bulb offset

input

offset of the culdesac bulb
- Right fillet

input

radius of the fillet between the bulb and the right had side of the road
- Left straight

input

distance between the left fillet and the bulb
- Right straight

input

distance between the right fillet and the bulb
- Set

button

store the panel values the selected centreline.

Create Roads - Kreturns Convert

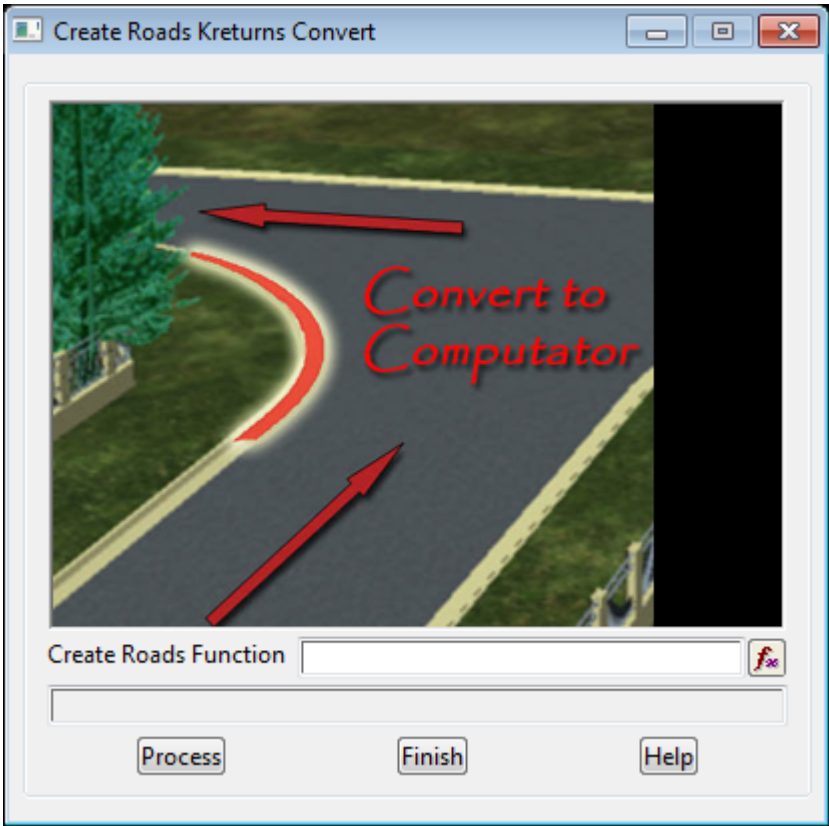

Position of menu: **Design =>Roads =>Create Roads - Kret Convert**

This macro is to be used in conjunction with the **Create Roads**.

Once **Create Roads** has been run, this macro will convert all the SA kerb returns to Element method (in both horizontal and vertical).

The horizontal parts are referenced to the appropriate road centreline, using segment computators and a free arc radius.

The vertical is a combination of a fixed grade at the start and end, with a compound parabola.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Create Roads Function <i>select function from list</i>	function		select function
Process <i>runs the option</i>	Button		

Design Checker

Position of option on menu: **Design =>Roads =>Design checker**

This option is still under development.

Selecting **Design checker** displays the **Design Checker** panel.

Sight Distance

Position of option on menu: Design =>Roads =>Sight distance

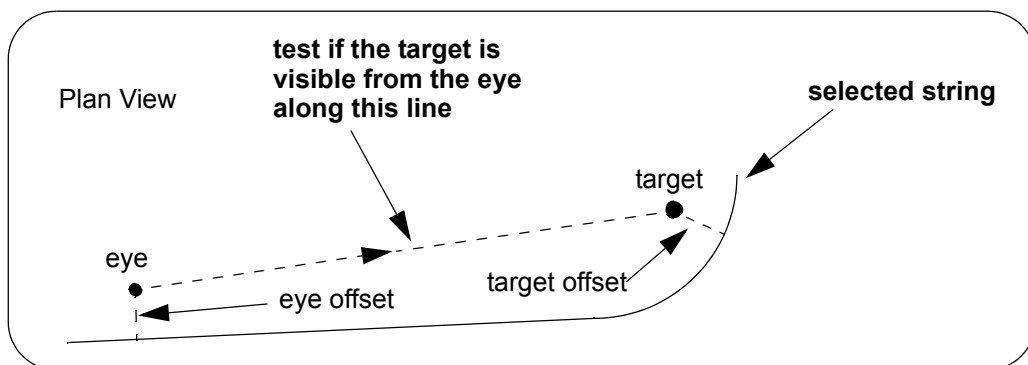

For an alignment and a given tin (or SuperTin), the **sight distance** option calculates the maximum distance that can be seen from an eye point on the tin to a target point further along the string.

In the option, a string and a tin are selected and (optionally) an eye point offset and height, and a target offset and height.

12d Model then positions the eye point at the given start chainage on the selected string, and then going out perpendicular for the given eye offset, drops that position onto the tin, and finally raises it by the given eye height.

From the eye point, a target point is placed at a chainage distance equal to the given minimum sight distance along the string. The target point is offset by the given target offset, and dropped onto the tin and finally raised by the given target height.

The **target point** is then tested for visibility from the eye point, against the given tin. That is, a test is made to see if the *target point can be seen from the eye point*, against the surface given by the tin.

If the target point is visible, it is moved the given chainage distance, trial interval, further along the string and the visibility test redone.

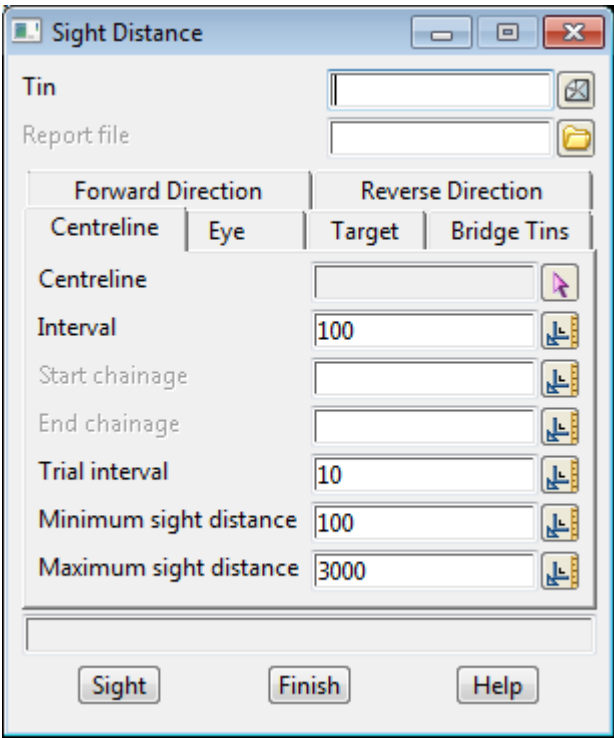

The process is repeated until either the target point is invisible, or the target point is the given maximum sight distance (in chainage) away from the eye point.

A line joining the eye and **final target point position** is created and placed in the model for sight lines. The **chainage** distance between the eye and the final target point is placed as a text string in the model for sight text, positioned at the eye point.

The eye point is then moved the given chainage distance interval along the string, and the process repeated until the eye point is past the given end chainage.

The eye point is then placed at the end chainage and the negative of the trial interval and interval values used to calculate sight distance for the reverse direction along the string.

On selecting the **sight distance** option, the **sight distance** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to use as the surface for testing visibility.</i>	input		available tins
Report file <i>if non blank, a report is produced and written out to this file name.</i>	file box		*.rpt files

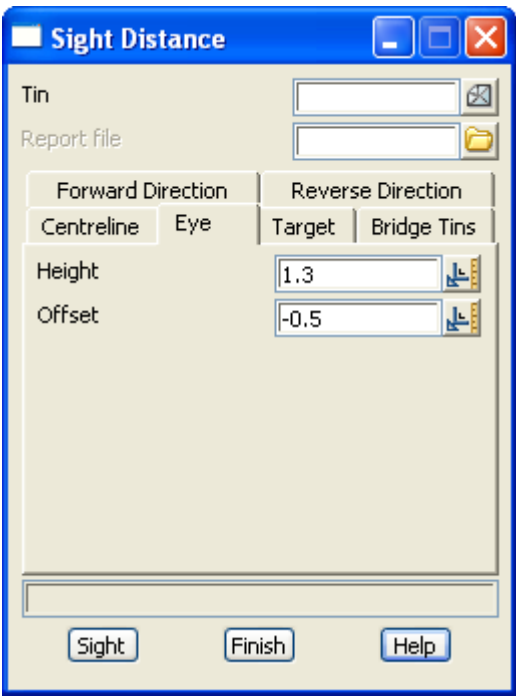

Centreline tab

Centreline <i>the string to be used for calculating the chainage position for the eye and target points, is selected from a view.</i>	string-select		
Interval <i>once the sight distance is calculated for the eye at a chainage, the eye chainage is incremented by this amount the sight distance calculation repeated.</i>	input	100	
Start/end chainage <i>the sight distance is calculated for points on the selected string covering the chainage range given by the start and end chainage fields. If the start/end chainage is blank, the star/end chainage of the selected string is used.</i>	input		
Trial interval <i>if the target point is visible, it is then moved along by this chainage increment and the sight test repeated.</i>	input	10	
Minimum sight distance	input	100	

minimum chainage distance from the eye point to place the test target point. The first test of a target is made at this minimum chainage distance from the eye chainage.

Maximum sight distance input 3000

maximum chainage distance to use for placing the test target point. The testing stops if the test target position goes over this chainage distance. In this case, the sight distance will be the maximum sight distance.

Eye tab

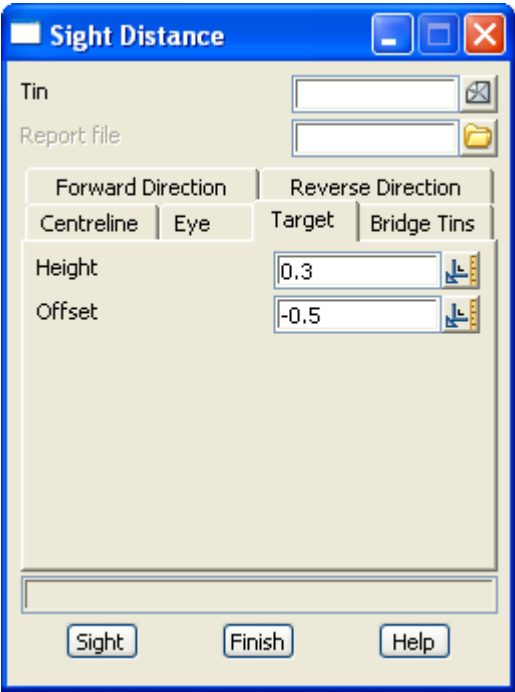

the eye position is determined by finding the chainage along the selected string, going out perpendicularly for the given eye offset (negative to the left, positive to the right), dropping that position onto the given tin, and then adding the eye height to the height on the tin. Hence the eye point is always the eye height above the tin.

Height input 1.3

height of the eye point above the given tin.

Offset input -0.5

offset of the eye point from the picked string.

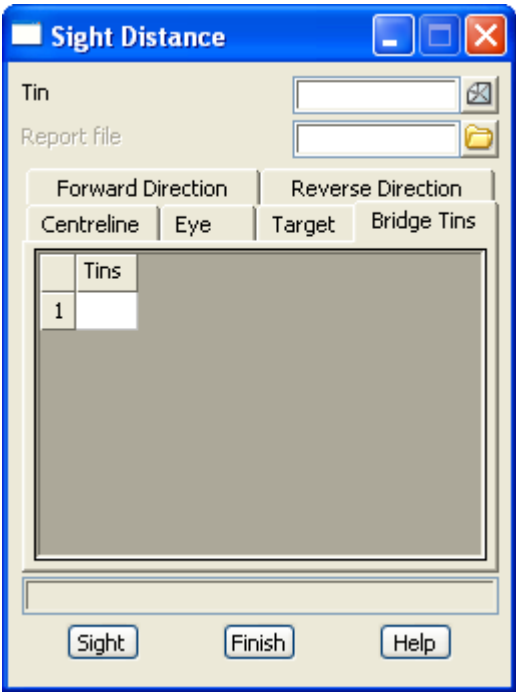

Target tab

the target position is determined by finding the chainage along the selected string, going out perpendicularly for the given target offset (negative to the left, positive to the right), dropping that position onto the given tin, and then adding the target height to the height on the tin. Hence the target point is always the target height above the tin.

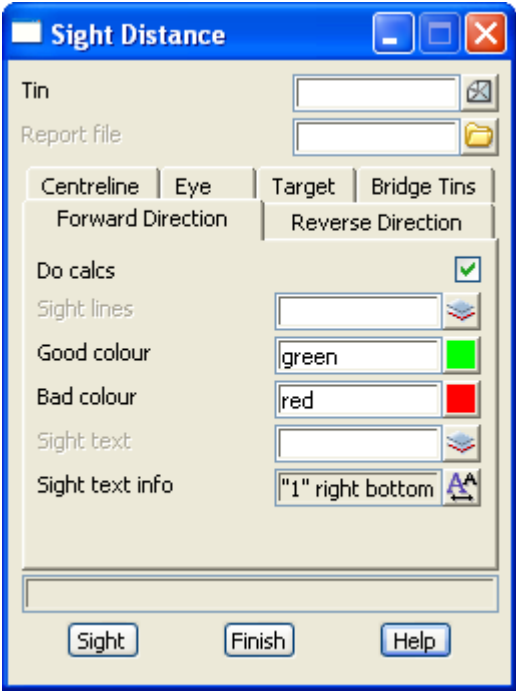

Height input 0.3
height of the target point above the given tin

Offset input -0.5
offset of the target point from the picked string.

Bridge Tins tab

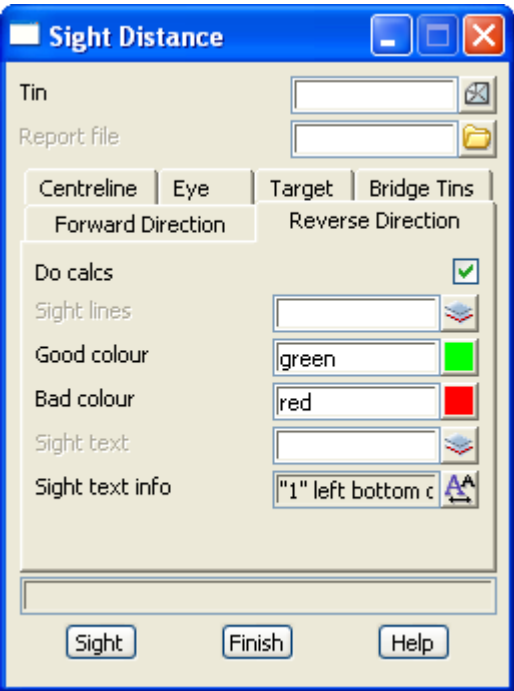

Tin grid available tins
name of the tins to use as vertical obstructions when testing visibility.

Forward Direction tab

Do calcs tick box
if ticked, do the calcs for the forward direction

Sight lines	model box	available models	
<i>if non-blank, the name of the model to contain the sight lines.</i> <i>If blank, the sight lines are not created.</i>			
Good colour	colour box	default colour	available colours
<i>when the minimum sight distance is achieved, sight lines are created in the good colour</i>			
Bad colour	colour box	default colour	available colours
<i>when the minimum sight distance is not achieved, sight lines are created in the Bad colour</i>			
Sight text	model box	available models	
<i>if non-blank, the name of the model to contain the sight distance text.</i> <i>If blank, the sight distance text is not created.</i>			
Sight text info	text info		
<i>definition of the sight text.</i>			

Reverse Direction tab

Do calcs	tick box		
<i>if ticked, do the calcs for the reverse direction</i>			
Sight lines	model box	available models	
<i>if non-blank, the name of the model to contain the sight lines when going down the string in the reverse direction Note that the eye and target offsets are then applied in the reverse direction of the string. If blank, the sight lines are not created.</i>			
Good colour	colour box	default colour	available colours
<i>when the minimum sight distance is achieved, sight lines are created in the good colour</i>			

Bad colour colour box default colour available colours

when the minimum sight distance is not achieved, sight lines are created in the Bad colour

Sight text model box available models

if non-blank, the name of the model to contain the sight distance text.
If blank, the sight distance text is not created.

Sight text info text info

definition of the sight text.

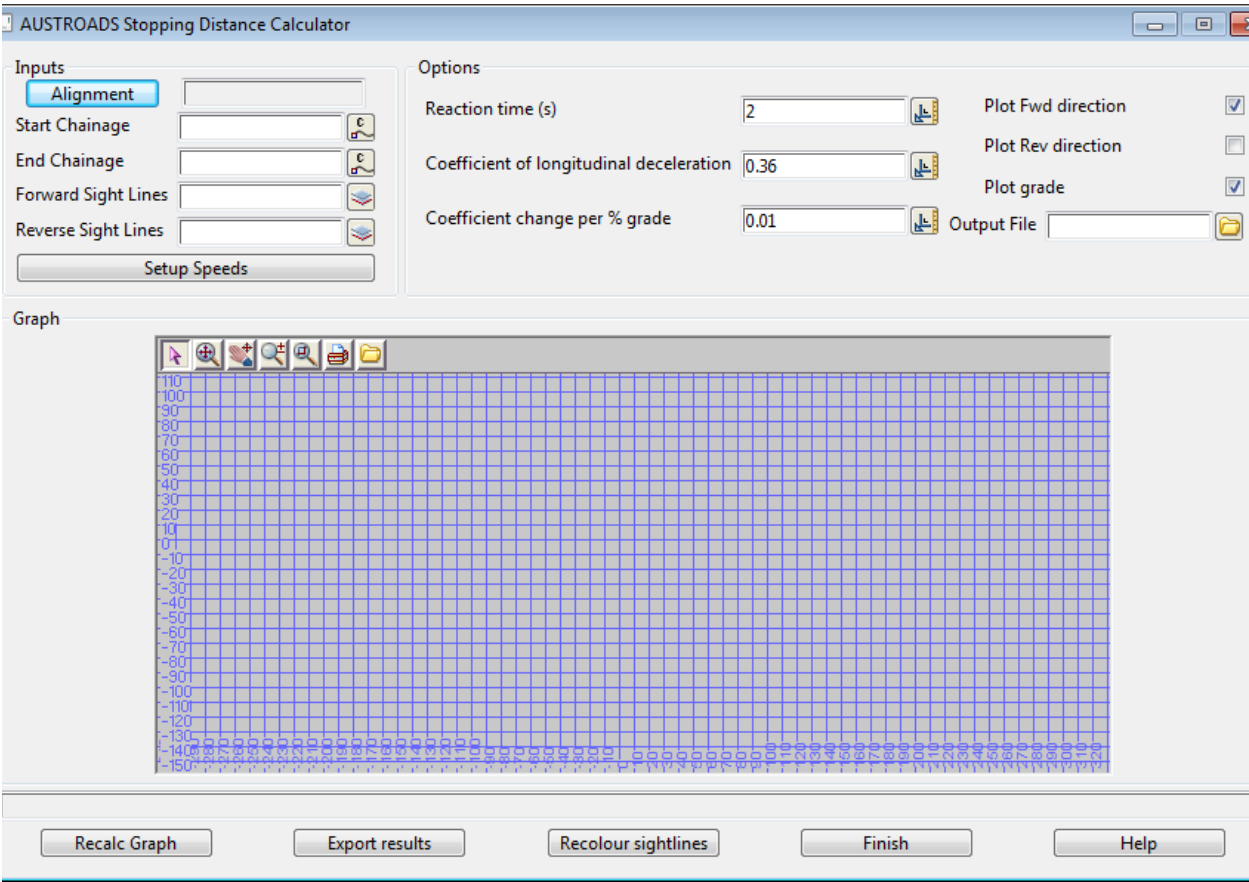

Sight button

sight lines and text will be calculated for the given string and tin, and placed in the sight line and text models.

Stopping Distance

Position of option on menu: Design =>Roads =>Stopping distance

This section of documentation is a work in progress and will be updated in subsequent releases.

Trarr

Position of menu: Design => Roads =>Trarr

The option under **Trarr** read and write Design TRARR files.

The **Trarr** walk-right menu is

write out a Trarr file
read in a Trarr file

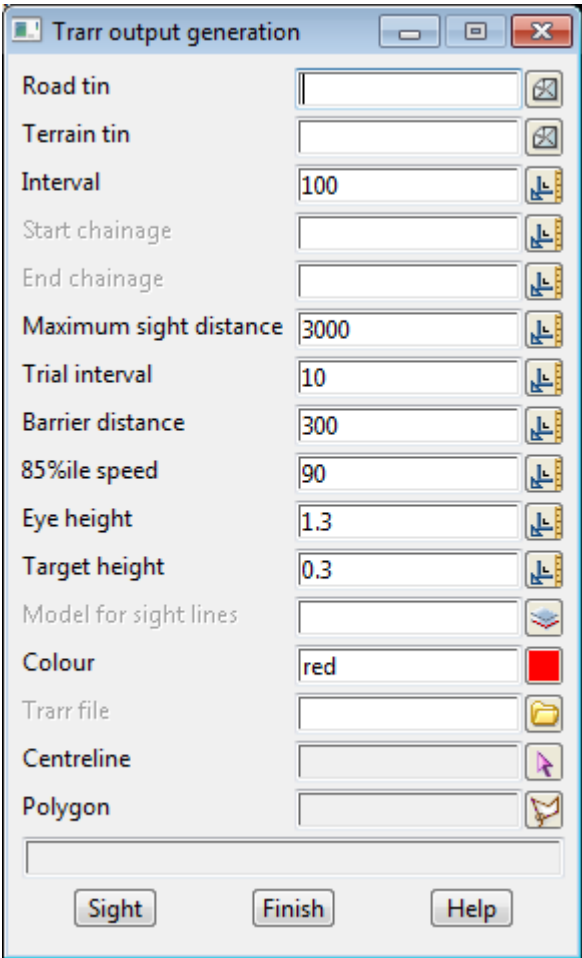

For *Trarr output*, go to [Trarr Output](#)
Trarr input [Trarr input](#)

Trarr Output

Position of option on menu: Design =>Roads =>Trarr =>Trarr output

Options to create a file for use with TRARR.

Please contact **12d** Solutions Pty Ltd if you wish to use this option.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Road tin	tin box	available tins
<i>tin of the road design</i>		
Terrain tin	tin box	available tins
<i>tin of the terrain</i>		
Interval	input	
<i>interval to calculate sight lines</i>		
Start chainage		
<i>if non blank, start chainage for producing the Trarr file.</i>		
<i>if blank, start at the beginning of the centreline string.</i>		
End chainage		
<i>if non blank, end chainage for producing the Trarr file.</i>		
<i>if blank, go to the end of the centreline string.</i>		
Maximum sight distance	input	
<i>maximum distance to try and calculate sight lines</i>		
Trial interval	input	
<i>interval to move ahead to test sight distance to</i>

Polygon	string-select	

boundary polygon for the road tin

Sight button

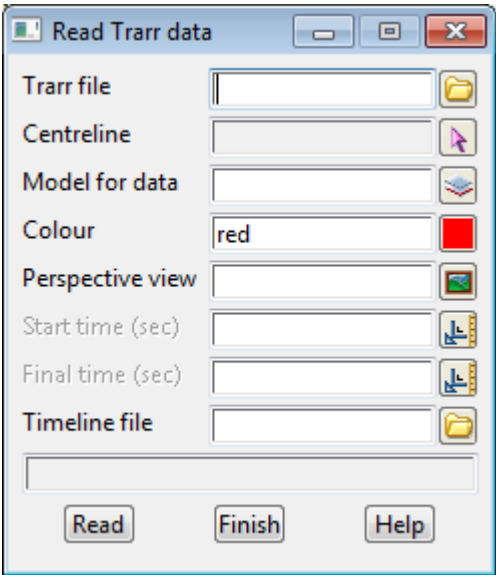

calculate sight lines and write out a Trarr file

Trarr input

Position of option on menu: **Design =>Roads =>Trarr =>Trarr input**

Option to read a TRARR file.

Please contact **12d** Solutions Pty Ltd if you wish to use this option.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Vehicle Path

Position of menu: **Design =>Roads =>Vehicle Path**

The **vehicle path** option is used to interface with the vehicle path program **Vpath**, written by the Queensland Department of Transport and Main Roads.**Vpath** can be obtained from the Queensland Department of Transport and Main Roads.

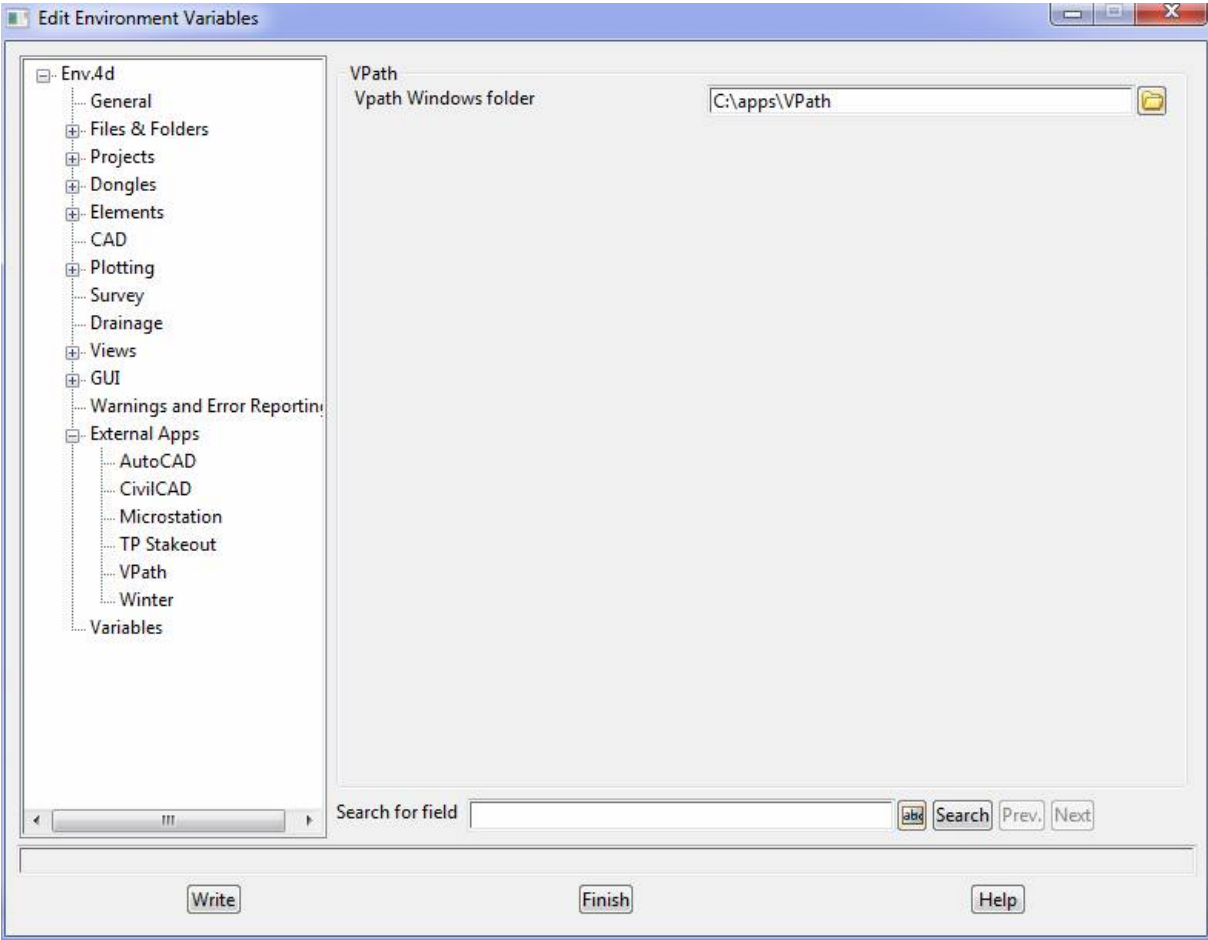

The **Vpath** program is fully described in its own Manual available from Queensland Department of Transport and Main Roads.

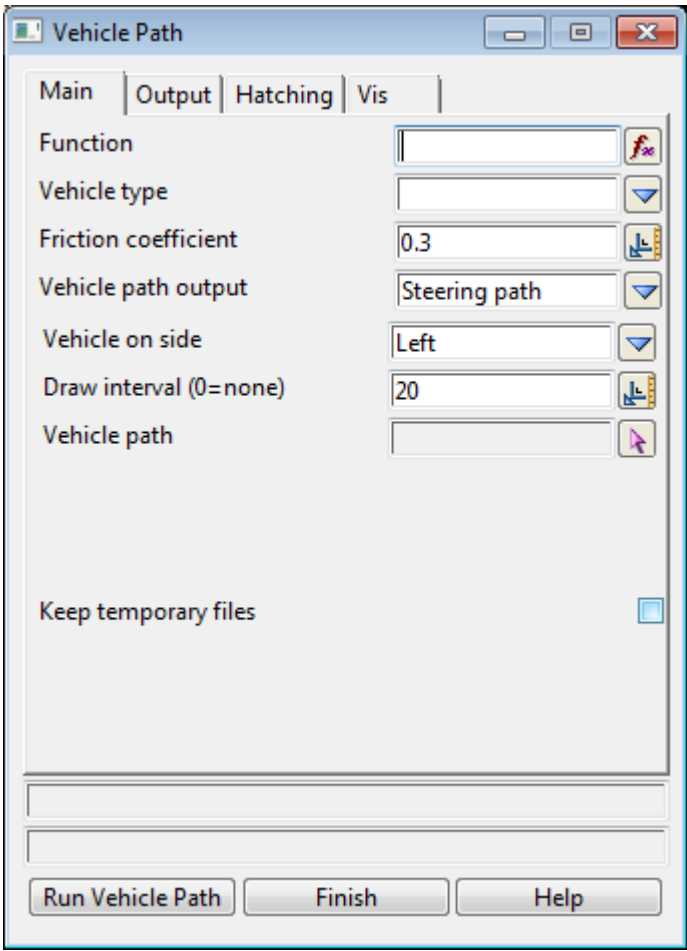

To run **Vpath** from within 12d Model the environment variable **WINDOWS_VEHICLE_PATH_4D** is set to point to the folder where the Windows **Vpath** executable is located.

This can be set manually or done through the Edit Environment Variables panel.

WINDOWS_VEHICLE_PATH_4D *folder-path*

On selecting the **Vehicle Path** option, the **Vehicle Path** panel is displayed. If the environment variable is not set the **Edit Environment Variables** panel will be displayed on the screen.

The fields and buttons used in this panel have the following functions.

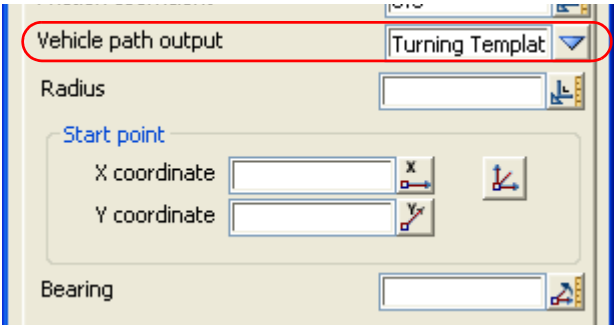

Field Description	Type	Defaults	Pop-Up
Main Tab			
Function	function box		
<i>name of the Steering Path function. If the function already exists and is picked from a pop-up or an <enter> is given at the end of the name, the information from the existing function will be placed in the appropriate panel fields</i>			
Vehicle type	choice box		
<i>the vehicle type used for generating the swept path. This is populated from first the vehicles.std and then the vehicles.cus files located in the defined vehicle path directory.</i>			
Friction coefficient	input		
<i>the coefficient of friction to be used for the vehicle.</i>			
Vehicle Path Output	choice box		Steering path, Turning Template
<i>Steering path: the swept path of the vehicle is generated along the selected super alignment/alignment string.</i>			
<i>Turning Template: the swept path of the vehicle is generated through 180° at a nominated radius</i>			

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Steering path options			
Vehicle on side <i>the side of the vehicle that the selecting steering path represents</i>	choice box		Left, Right
Draw interval (0=none) <i>if non-zero, the position of the vehicle on the steering path is, draw the position at this interval</i>	input		
Vehicle Path <i>select the string for generating the swept path. The string must be a super alignment or alignment string, consecutive straights and transitions curves are not allowed and there can be no more than 20 arcs in the string.</i>	string select		

Turning Template Options

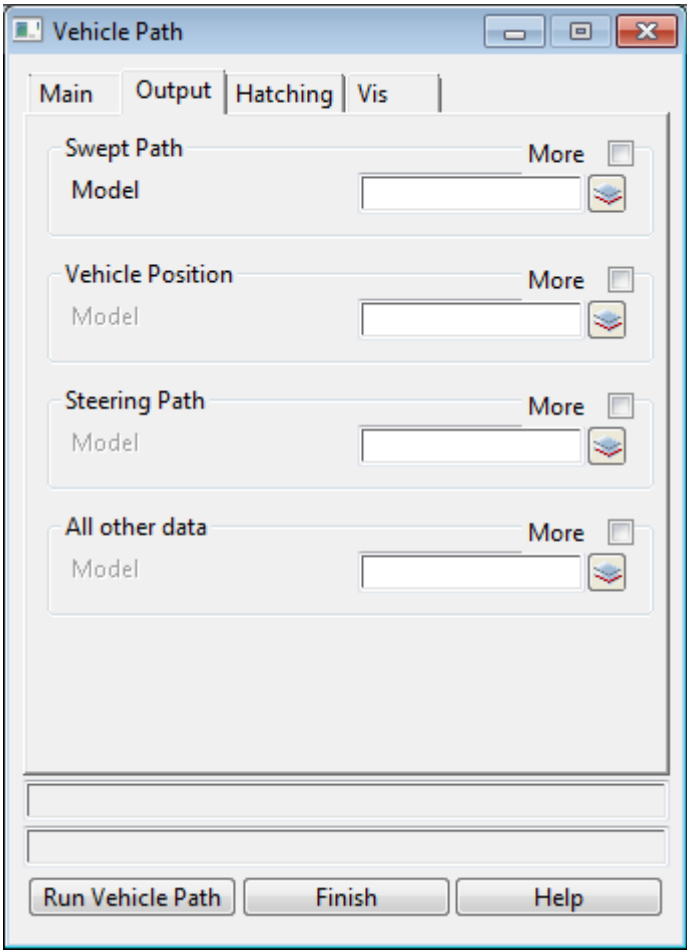

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Radius <i>enter the radius of the turning template, +ve defines a clockwise turn, -ve anti-clockwise</i>	input		
Start point <i>select the coordinates of the start point of the turning template.</i>	input		
Bearing <i>enter the bearing of the start point of the turning template.</i>	input		

Common options

Keep temporary files tick box

*if ticked the input file for **Vpath** and the **dxg** file produced by **Vpath** are kept in the **Vpath** directory.*

The fields and buttons used in this panel have the following functions.

adds a new entry curve to the selected leg

Delete curve button

deletes the selected entry curve

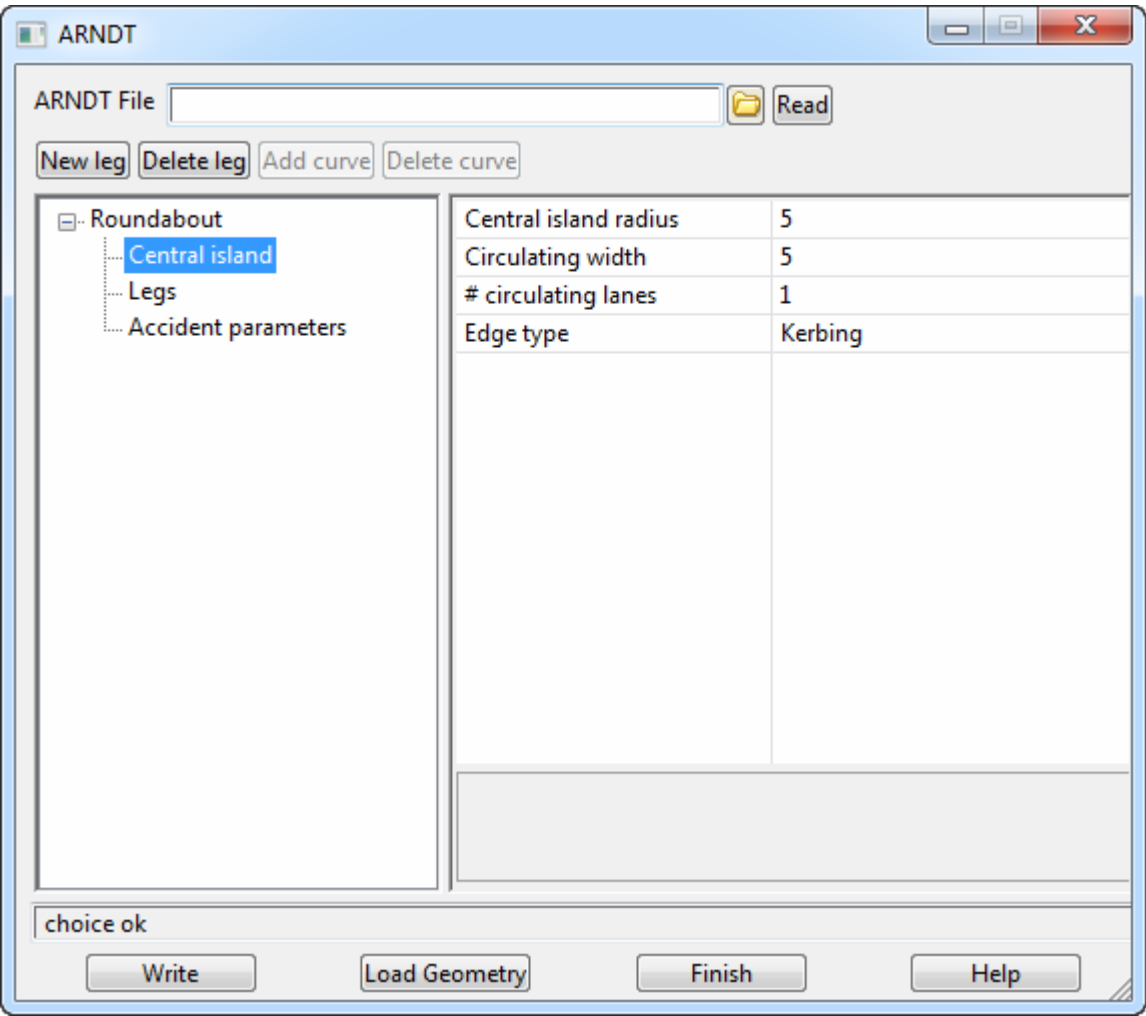

Write button

*writes the **ARNDT** file*

Load geometry button

*options for loading geometry via **ARNDT** and generating report files*

Central Island

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Central island radius

the radius of the central island

Circulating width

the offset from the radius of the circulating string

of circulating lanes

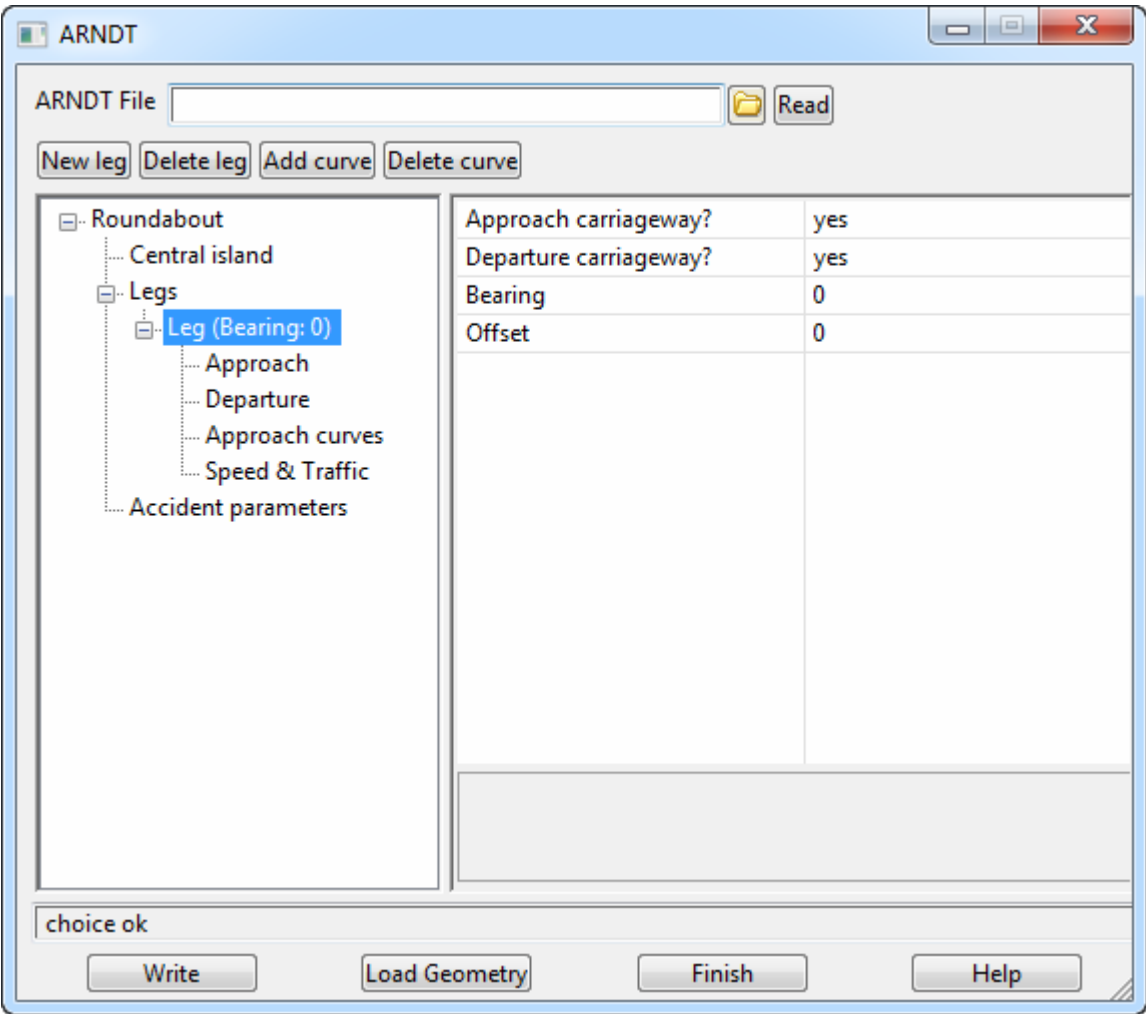

the number of lanes circulating the roundabout

Edge type

the edge type for the central island (Kerbing or Edge Line)

Legs Node

The **Leg node**, for each leg of the roundabout, allows you to modify parameters for that leg.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Approach carriageway?	choice box		yes, no

Width

the width of the approach carriageway

of lanes

the number of lanes in the approach carriageway

Offset to median edge

the offset of the approach from the median

Curve details - right edge

Radius

the radius of the right edge of the approach

Edge type

the type of edging for the right edge of the approach

Curve details - left edge

Radius

the radius of the left edge of the approach

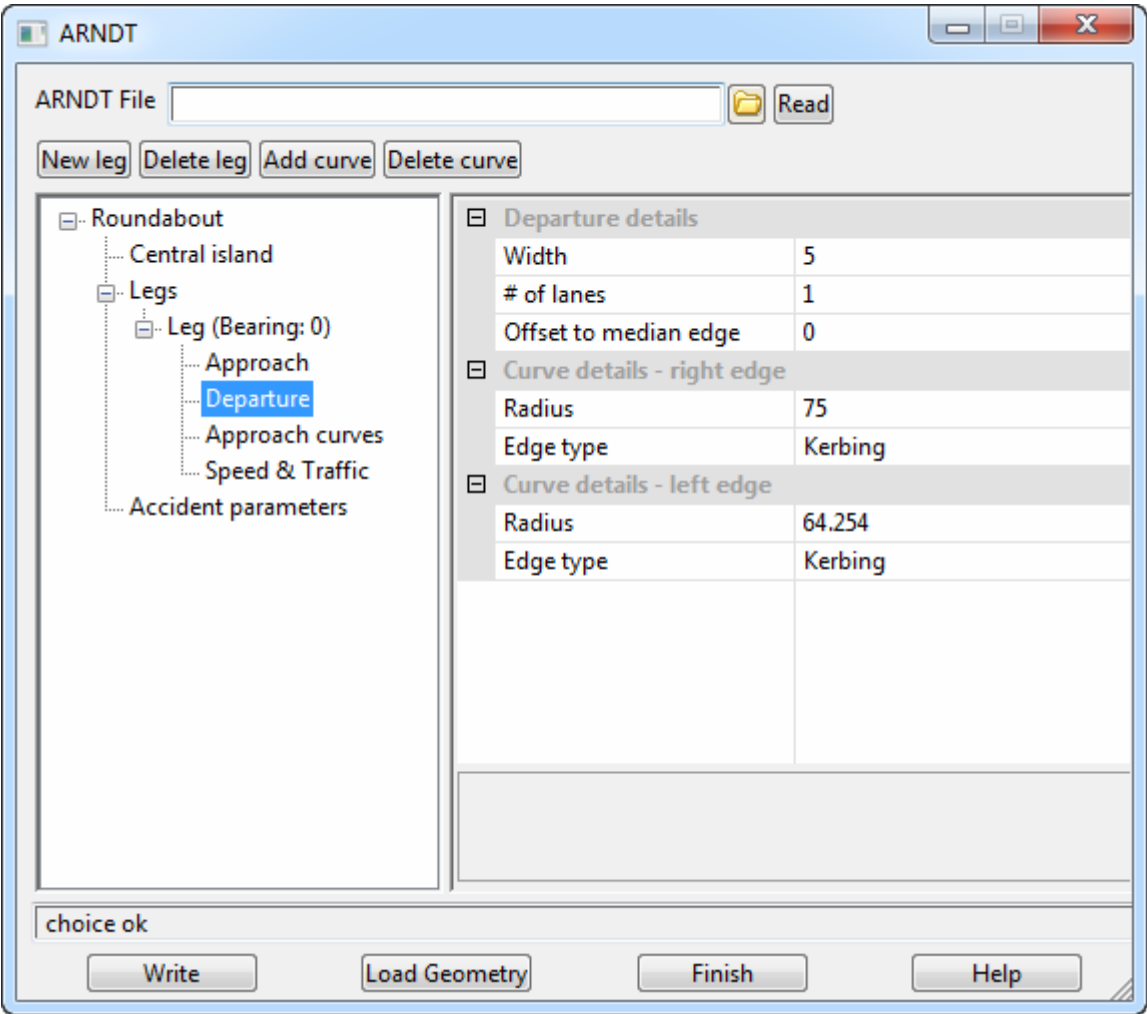

Edge type

the type of edging for the left edge of the approach

Leg Departure Node

This defines the properties for the departure carriage of the leg, if there is a departure.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Departure details

Width

the width of the departure carriageway

of lanes

the number of lanes in the departure carriageway

Offset to median edge

the offset of the departure from the median

Curve details - right edge

Radius

the radius of the right edge of the departure

Edge type

the type of edging for the right edge of the departure

Curve details - left edge

Radius

the radius of the left edge of the departure

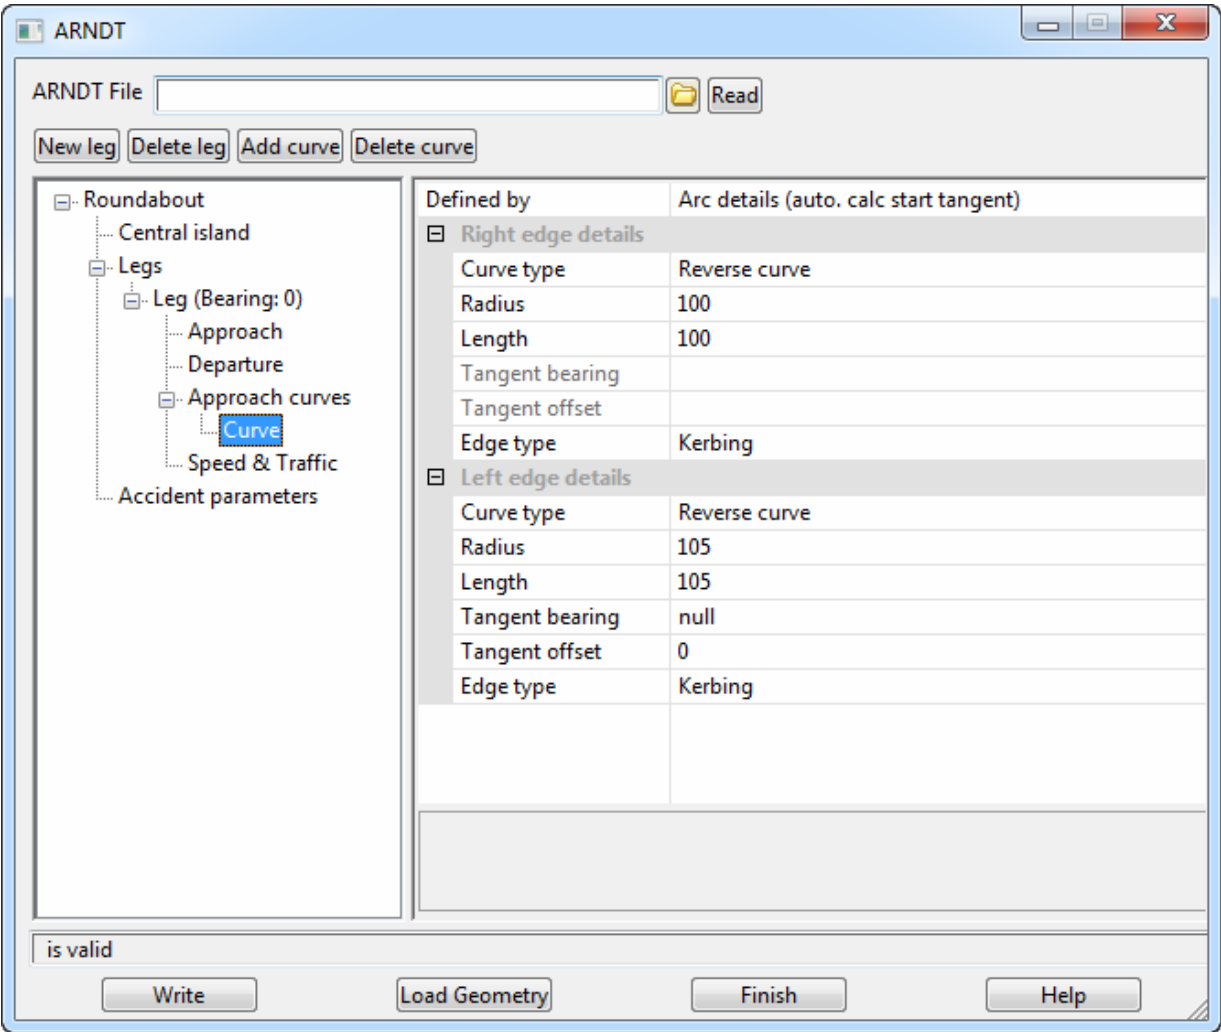

Edge type

the type of edging for the left edge of the departure

Approach Curves Node

This node defines the setting for each approach curve. New approach curves can be added to a leg by clicking the **Add curve** button. There are two methods for defining a curve - either by arc details or start tangent.

Approach curves are only defined by their right hand edge.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Right Edge Details			
Defined by	choice box		

how the curve is defined

Curve type

the type of curve (Reverse or Compound)

Radius

*the radius of the right edge - only available when defined by **Arc details***

Length

*the length of the right edge - only available when defined by **Arc details***

Tangent bearing

*the bearing of the tangent to the curve - only available when defined by **Start tangent details***

Tangent offset

*the offset of the tangent to the roundabout - only available when defined by **Start tangent details***

Edge type

the type of edging for the right edge (Kerbing or Edge Line)

Left Edge Details

Curve type

the type of curve. This field is read only.

Radius

*the radius of the curve, if using **Arc details**. This field is read only.*

Length

*the length of the curve, if using **Arc details**. This field is read only.*

Tangent bearing

*the bearing of the tangent to the curve, if using **Start tangent details**. This field is read only.*

Tangent offset

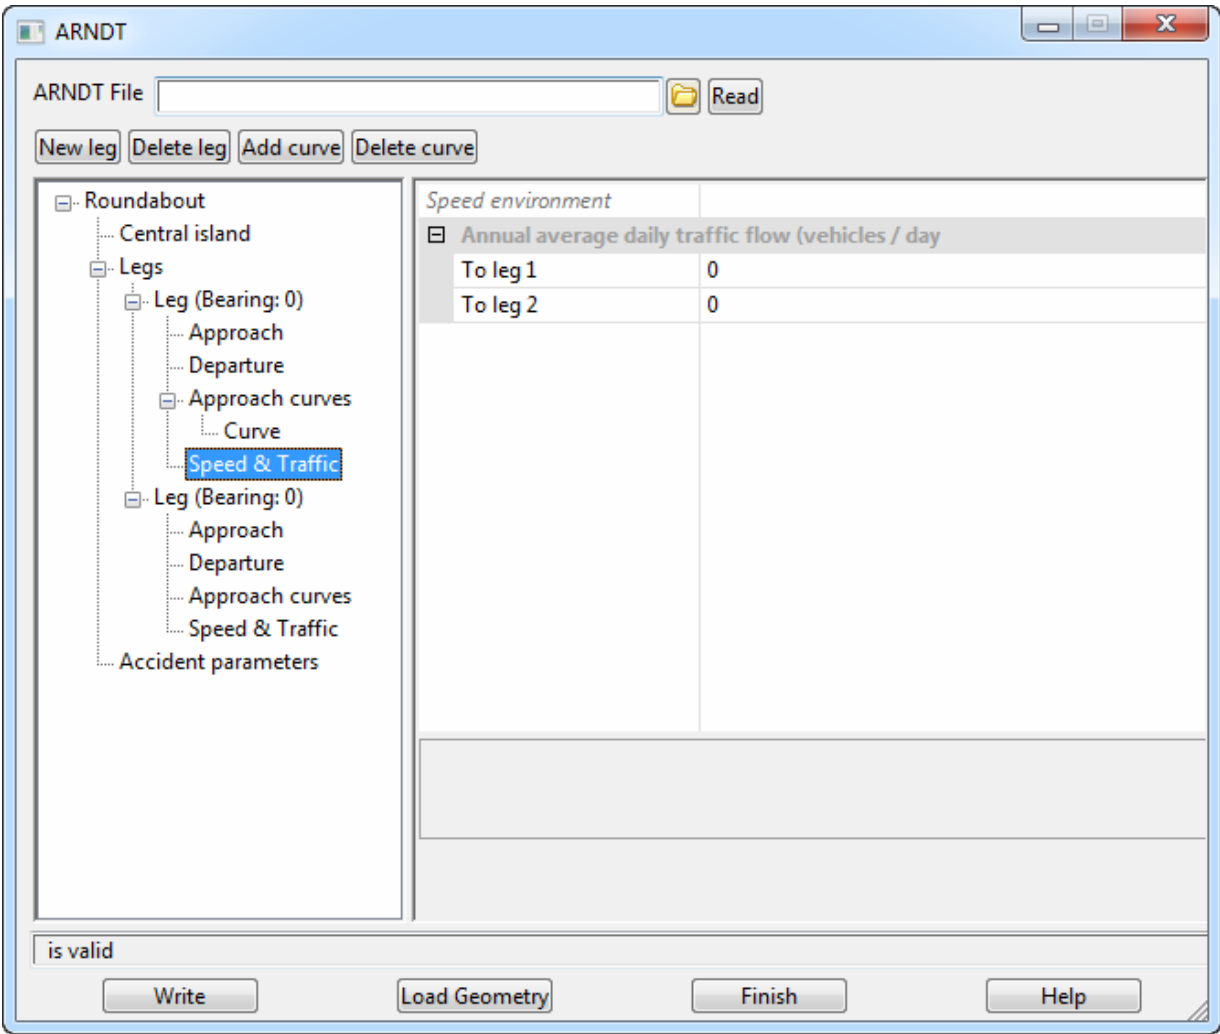

the offset of the tangent, if using *Start tangent details*. This field is read only.

Edge type

the type of edging for the right edge (Kerbing or Edge Line)

Leg Speed & Traffic Node

This node defines the speed and traffic details for each leg of the roundabout.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Speed environment

the speed environment of the carriageway

Annual average daily traffic flow

To leg 1

the average daily traffic flow (vehicles per day) leaving leg 1 and returning to leg 1

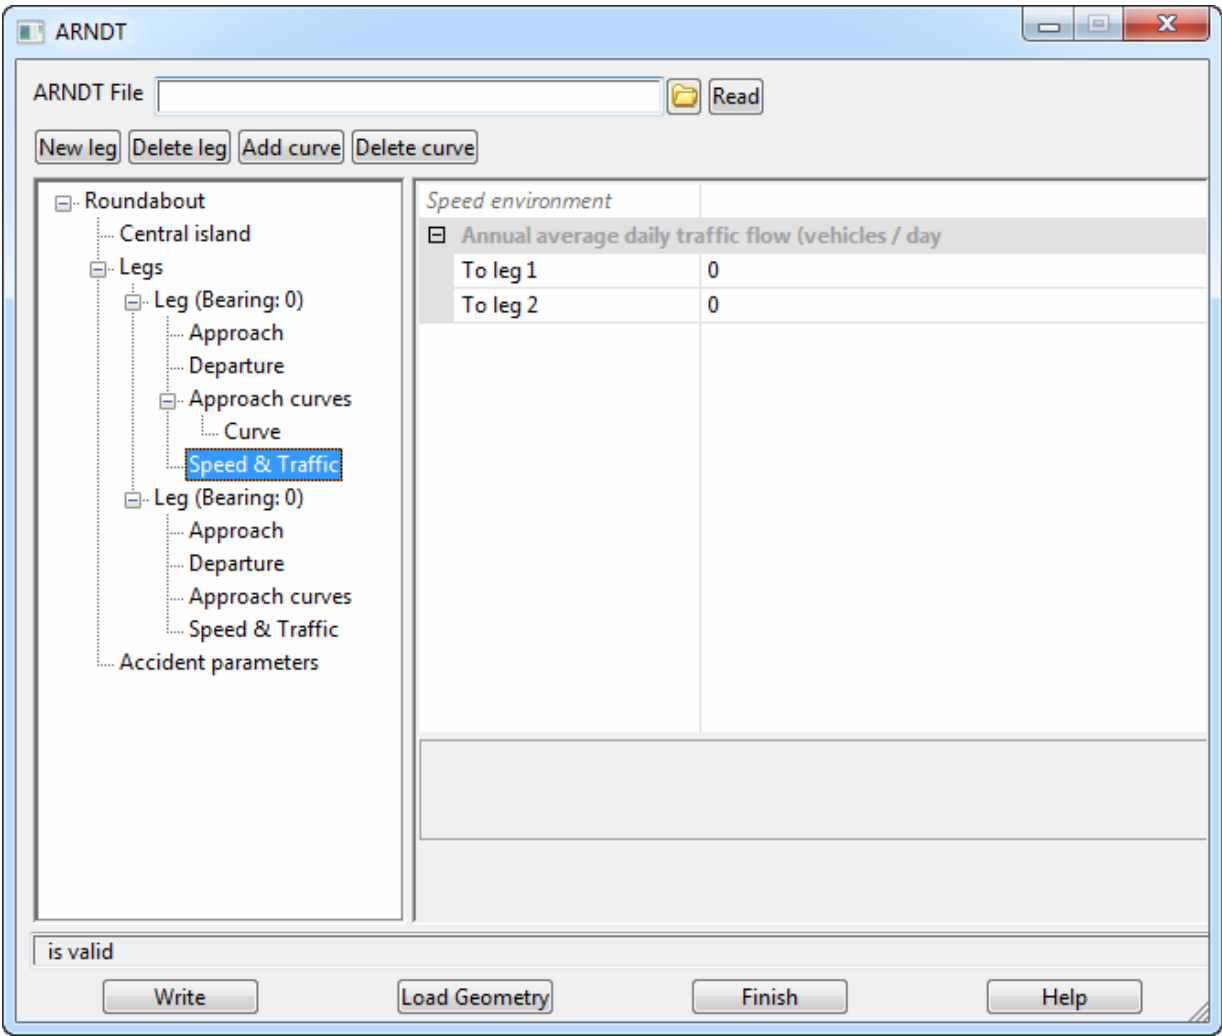

To leg 2

the average daily traffic flow (vehicles per day) leaving leg 1 and exiting via leg 2

This is repeated for each leg of the roundabout

Accident Parameters

This defines various parameters used by **ARNDT** for calculating risks and costs for the roundabout. These parameters are requested by the **ARNDT** program. Please see the **ARNDT** documentation for more details on these parameters.

Load Geometry / Export to ARNDT

Selecting **Load Geometry** Load Geometry brings up the **Export to ARNDT** panel.

This panel allows you to load geometry from **ARNDT**, based on the file you are editing, as well as optionally generating reports.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Position

the x and y co-ordinate for the roundabout

Pre*Post

*an optional pre*post applied to any strings read back from **ARNDT***

ARNDT report

*an optional report file of details generated by **ARNDT***

Export

*Exports the current roundabout details to **ARNDT**, imports the results generated by **ARNDT**. Results will include geometry at the nominated position, and a report if specified.*

Mass Haul

Position of menu: Design =>Roads =>Mass haul

The option under **Mass haul** reads a volumes report and creates Mass Haul information.

The **Mass haul** walk-right menu is

mass haul analysis from volumes report

create mass haul string and report from volumes report

For *Mass haul analyser*, go to
Mass haul

[Mass Haul Analyser](#)
[Mass Haul String and Report](#)

Mass Haul Analyser

Position of option on menu: Design =>Roads =>Mass haul =>Mass haul analyser

The **Mass Haul Analyser** option calculates the mass haul along an alignment using the volume report files from various **12d** functions.

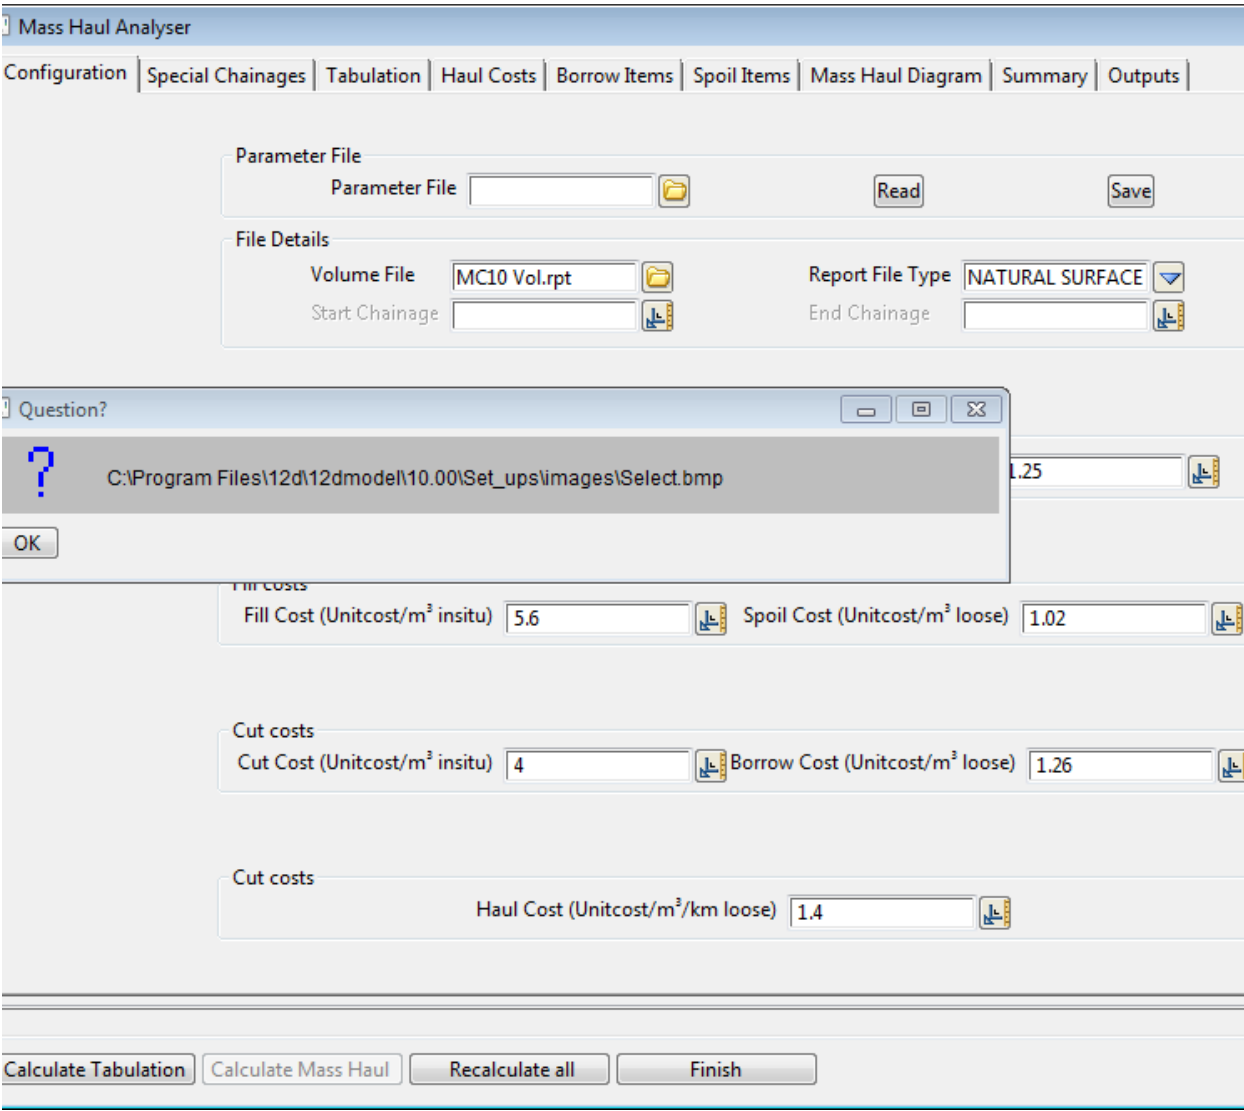

To operate the option a volume report file is selected and the report file type set to match the report type. The **Calculate tabulation** button will then calculate the bulking factors and add the special chainage items to the tabulation. After this the **Calculate Mass Haul** option will push excess fill material forwards along the alignment to a matching cut item with the same accumulated balance and push excess cut material backwards along the alignment to a matching fill item.

Where the cost of Haul cost is greater than the Borrow Plus Spoil cost the option will skip that material.

The option performs this operation several times passing back over the alignment until no more haul material can be found. It then borrows and spoils the remaining material.

The macro is intended to provide an analysis methodology to the designer to enable them to quickly review where material is available in an alignment in order to optimise the alignment with respect to potential cost savings. It is also a useful tool for training in the techniques of mass haul. The final mass haul graph should be exported for detailed analysis using the **Design=>Roads=>Mass haul =>Mass Haul** option.

Selecting the **Mass haul analyser** option brings up the **Mass Haul Analyser** panel.

Configuration Tab

This tab is used to set up the parameters to be used by the macro.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Parameter File	file		*.mhp files
name of the file containing the previously used settings for the fields in the panel.			
Read Button	button		
read the parameter file in			
Write button	button		
write the setting in the panel out to a parameter file.			
Volume File	file		*.rpt files
input file generated from another 12d option			

Report File Type choice box NATURAL SURFACE TO DESIGN VOLUMES
see [Selecting The Right Report File Type](#)
the report file type to be used as an input to the macro

Excavation bulking factor real box 1.5
*bulking factor ratio between loose excavated material and insitu compacted material.
number greater than one indicates loose material is bulkier than insitu material.
defaults are arbitrary and must be selected by the user*

Fill compaction factor real box 1.25
*compaction factor ratio between loose excavated material and insitu compacted material.
number greater than one indicates loose material is bulkier than insitu material.
defaults are arbitrary and must be selected by the user*

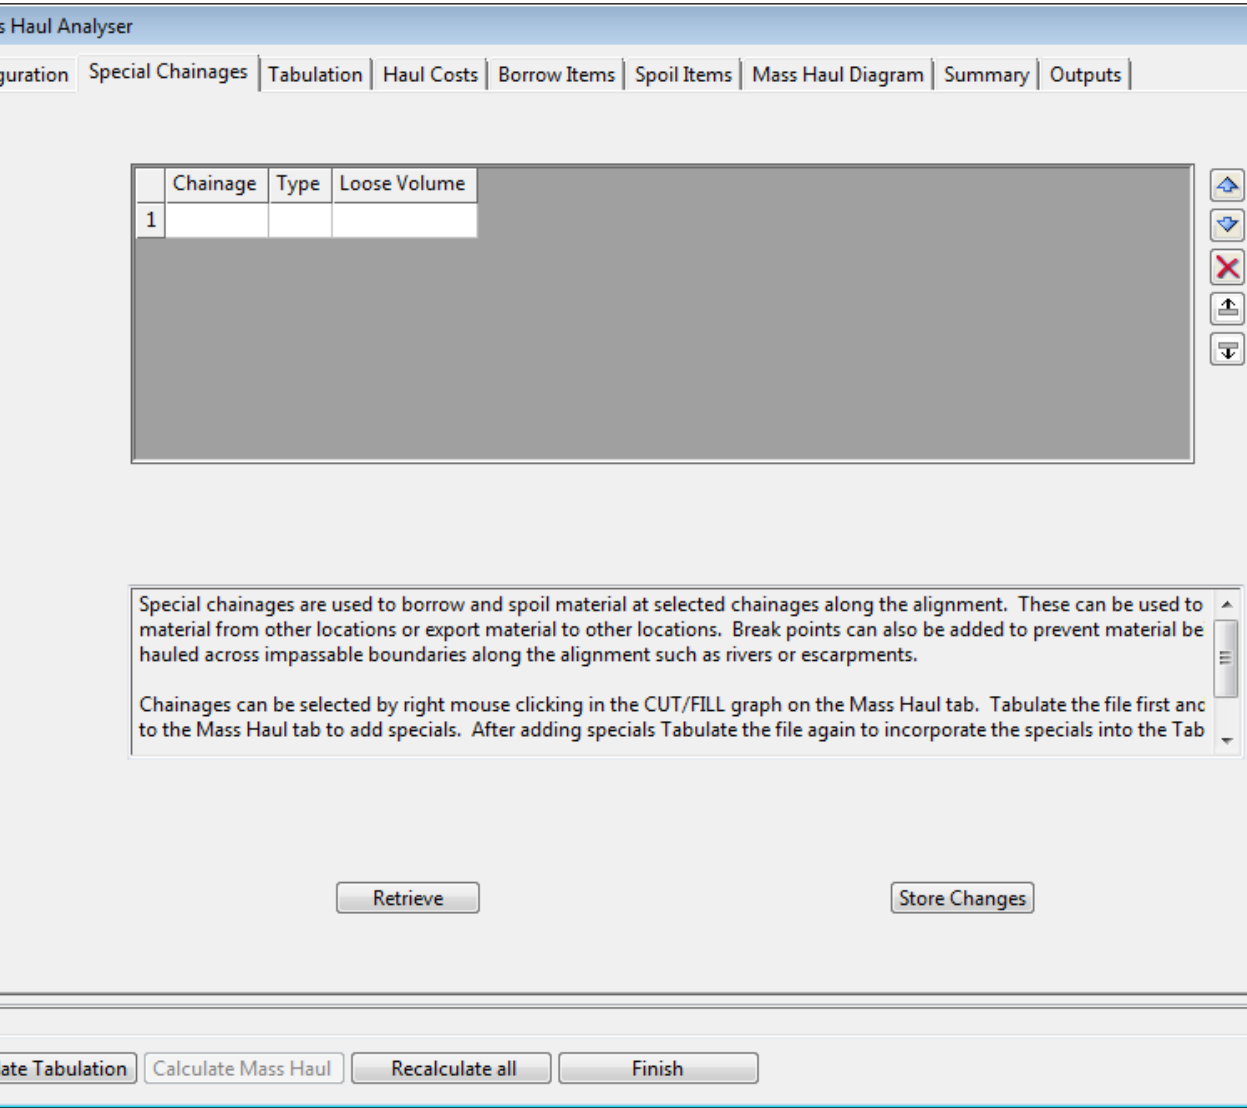

Fill Cost real box 5.6
*cost per cubic metre to place and compact material.
defaults are arbitrary and must be selected by the user*

Spoil cost real box 1.02
*cost per cubic metre to dispose of excess material (including haul costs) defaults are arbitrary and
must be selected by the user*

Cut cost real box 4
*cost per cubic metre to excavate material.
defaults are arbitrary and must be selected by the user*

Borrow cost real box 1.26
*cost per cubic metre to import additional material (including delivery costs) defaults are arbitrary and
must be selected by the user*

Haul cost real box 1.4
*cost per cubic metre to haul material one kilometre.
defaults are arbitrary and must be selected by the user*

Special Chainages Tab

This tab is used to add additional items to the tabulation.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Chainage	chainage box			
	the chainage that the special item is to be applied			
Type	choice box			borrow, spoil, break
	the type of special item to be applied			
Loose Volume				
	the volume of loose material in the special item			
Retrieve	button			
	retrieve special chainages into the grid control			

Store Chainages button
save special chainages from the grid control

Calculate TabulationCalculate Mass HaulRecalculate allFinishHelp

Haul Costs Tab

This tab displays the processed haul volumes after mass haul has been applied.

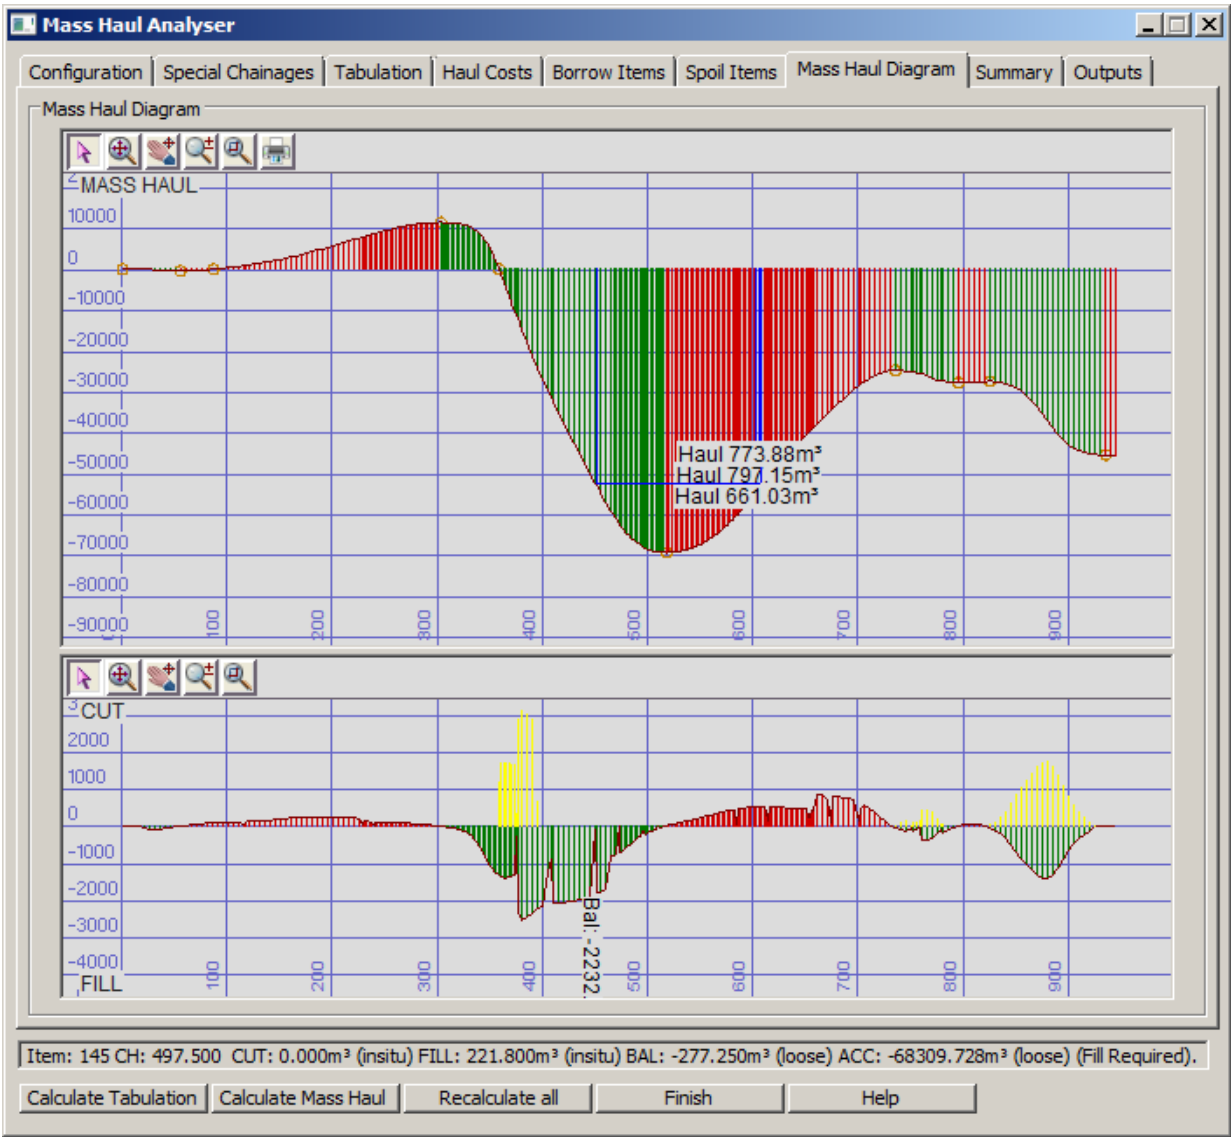

Borrow Items Tab

This tab displays the remaining borrow volumes after mass haul has been applied.

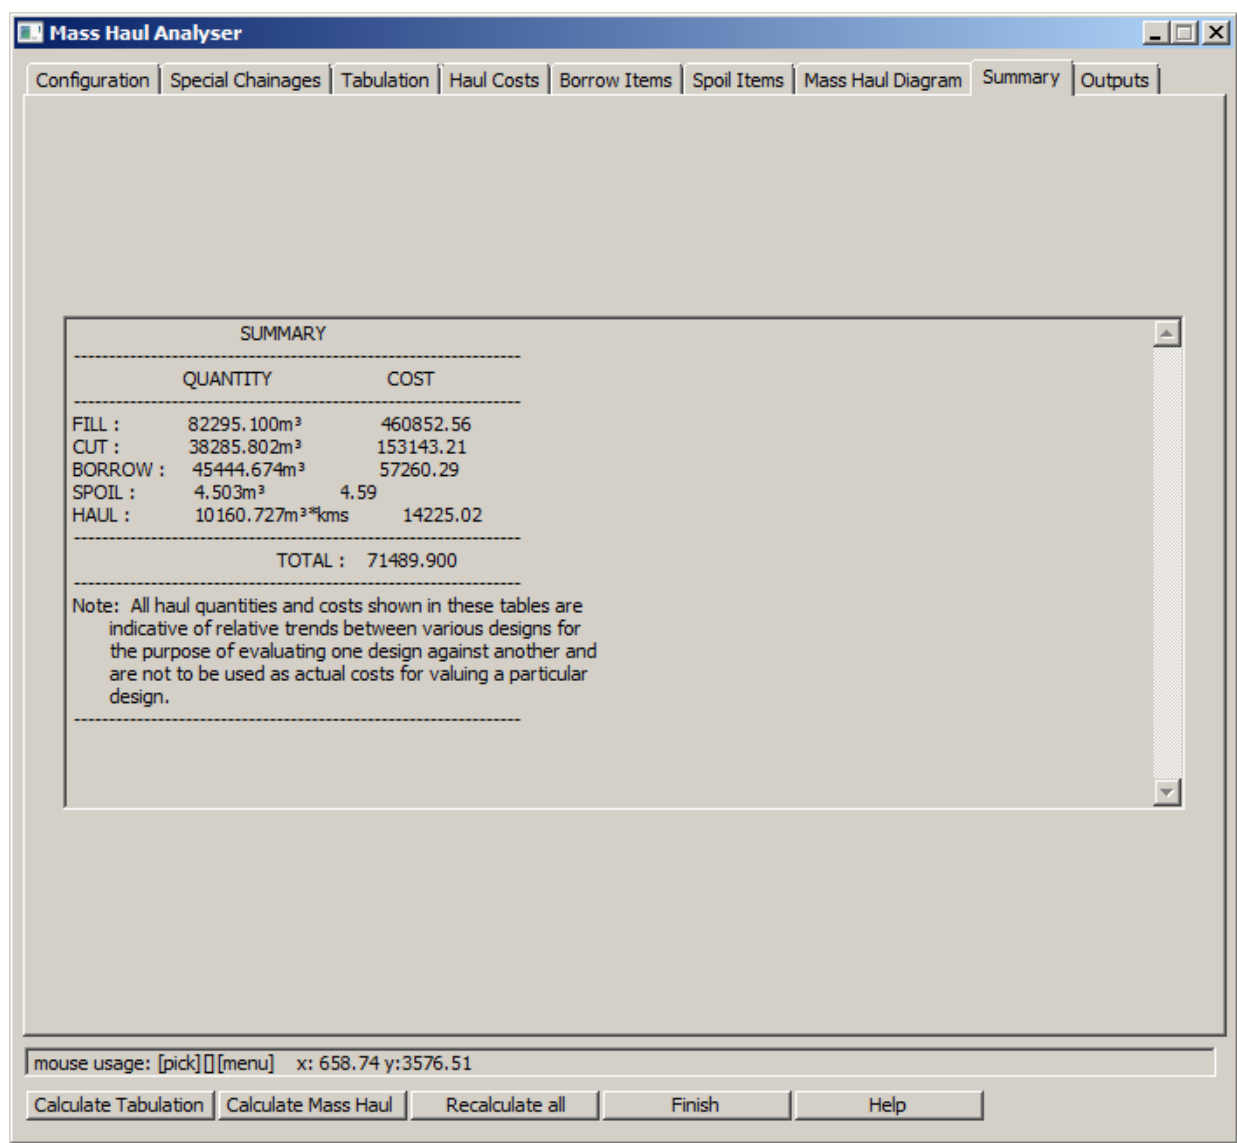

Spoil Items Tab

This tab displays the remaining spoil volumes after mass haul has been applied

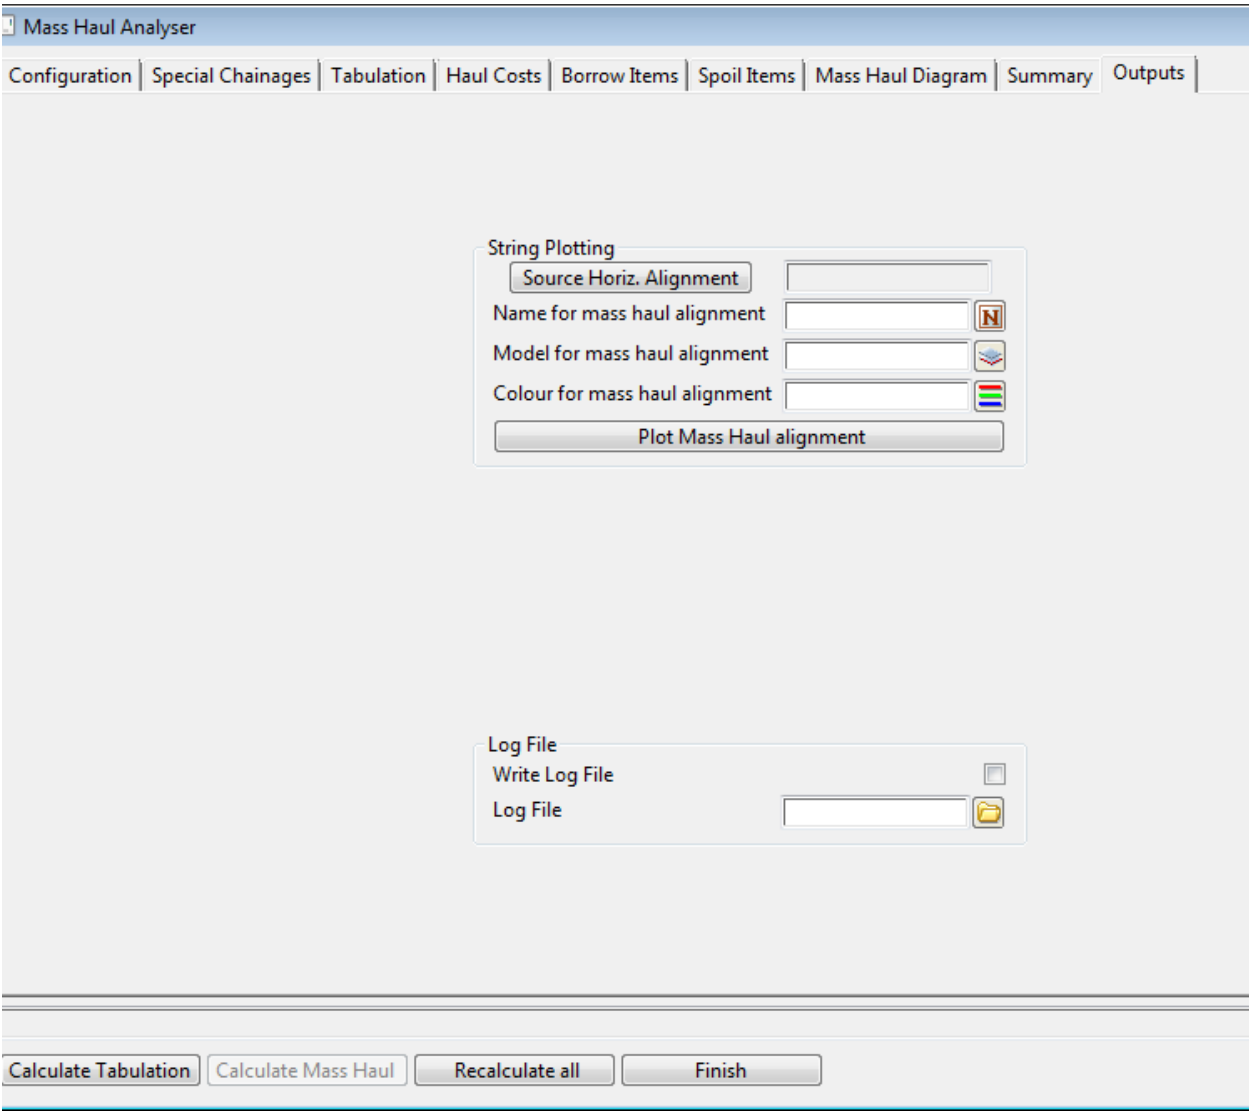

Mass Haul Diagram Tab

This tab displays a graph of the resulting mass haul diagram. For information on several features of the graph please go to [Graph Box Operation](#).

Summary Tab

This tab displays a summary of the costs calculated. These costs can be used to compare trends in the efficiency of the mass haul between different designs. The costs given are not intended to be the final cost of the mass haul as further analysis will be required however they do give an indication as to the efficiency of a design with regard to mass haul.

Outputs Tab

This tab can be used to export data from the option

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Source Horiz. Alignment	select string
<i>selects the seed alignment that will be used for the horizontal alignment of the mass haul string</i>	

Name for mass haul alignment	name box
<i>sets the name of the plotted mass haul string</i>	

Model for mass haul alignment	model box
<i>sets the model of the plotted mass haul string</i>	

Colour for mass haul alignment	colour box	red
<i>sets the colour of the plotted mass haul string</i>		

Plot Mass Haul Alignment button

duplicates the seed alignment and stores the mass haul accumulated volume balances as chainage height points in that alignment

Write log file tick box

choose this option to export a log file

Log file file box

the calculations generated by the mass haul option are stored in this log file

Common Buttons

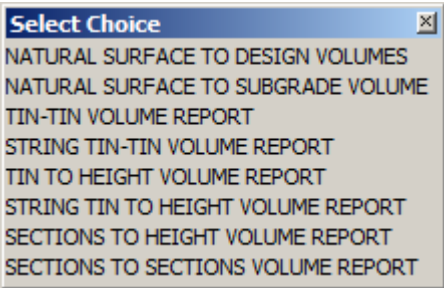

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Calculate Tabulation <i>recalculate tabulation</i>	button		
Calculate Mass Haul <i>recalculate mass haul</i>	button		
Recalculate all <i>recalculate both tabulation and mass haul</i>	button		
Finish <i>closes the panel</i>	button		
Help <i>displays this help</i>	button		

Selecting The Right Report File Type

The report file type option allows the user to use various report file types generated by 12d.

Each type is selected to cause the option to look for certain key phrases in the report file at the top of each cut/fill/balance tabulation.

Go to [NATURAL SURFACE TO DESIGN VOLUMES](#)
[NATURAL SURFACE TO SUBGRADE VOLUME](#)
[TIN-TIN VOLUME REPORT](#)
[STRING TIN-TIN VOLUME REPORT](#)
[TIN TO HEIGHT VOLUME REPORT](#)
[STRING TIN TO HEIGHT VOLUME REPORT](#)
[SECTIONS TO HEIGHT VOLUME REPORT](#)
[SECTIONS TO SECTIONS VOLUME REPORT](#)

NATURAL SURFACE TO DESIGN VOLUMES

This choice is selected to use the natural surface to design volumes table generated by the "apply many" function. This function must be run first from the **Design=>Apply=>Apply many** menu item.

NATURAL SURFACE TO SUBGRADE VOLUME

This choice is selected to use the natural surface to subgrade volumes table generated by the "apply many" function. This function must be run first from the **Design=>Apply=>Apply many** menu item. In order to use this option boxing must be calculated in the apply many function.

TIN-TIN VOLUME REPORT

This choice is selected to use the tin to tin volumes table generated by the "apply many" function. This function must be run first from the **Design=>Volumes=>End Area=>Tin to tin** menu item.

STRING TIN-TIN VOLUME REPORT

This choice is selected to use the string tin to tin volumes table generated by the "apply many" function. This function must be run first from the **Design=>Volumes=>End Area=>String tin to tin** menu item.

TIN TO HEIGHT VOLUME REPORT

This choice is selected to use the tin to height volumes table generated by the "apply many" function. This function must be run first from the **Design=>Volumes=>End Area=>Tin to height** menu item.

STRING TIN TO HEIGHT VOLUME REPORT

This choice is selected to use the string tin to height volumes table generated by the "apply many" function. This function must be run first from the **Design=>Volumes=>End Area=>String tin to height** menu item.

SECTIONS TO HEIGHT VOLUME REPORT

This choice is selected to use the sections to height volumes table generated by the "apply many" function. This function must be run first from the **Design=>Volumes=>End Area=>Sections to height** menu item.

SECTIONS TO SECTIONS VOLUME REPORT

This choice is selected to use the sections to sections volumes table generated by the "apply many" function. This function must be run first from the **Design=>Volumes=>End Area=>Sections to sections** menu item.

Graph Box Operation

Each graph box has a number of graph options available as buttons (graph buttons) at the top of the graph. To select one of the graph buttons, click LB whilst the cursor is over the button.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

This option sets the graph box to pick mode. When in this mode the graph box will show various information as the mouse hovers over a chainage in the graph.

The loose material tabulation item number, the available cut and fill within that chainage interval are shown in the message area at the bottom of the panel and the borrow, spoil and haul amounts are graphically shown in the graph highlighting the source chainage and destination chainage.

Fit	button		
------------	--------	--	--

This option sets the graph box to fit mode. This option will calculate the extents of the items plotted in the graph box and zoom out to show them. After the fit is complete the graph will return to pick mode.

Pan	button		
------------	--------	--	--

This option sets the graph box to panning mode. Click once to commence panning, then move the mouse and click a second time to stop panning.

Zoom	button		
-------------	--------	--	--

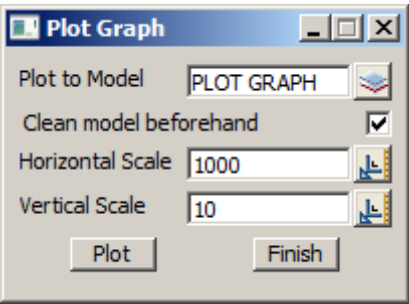

This option sets the graph box to zoom mode. Click once to commence zooming, then move the mouse and click a second time to stop zooming. Moving the mouse left and right will reduce and increase the X scale factor and moving the mouse down and up will reduce or increase the Y scale factor.

Window	button		
---------------	--------	--	--

This option sets the graph box to window mode. Click once to select the first corner of a window and click a second time to select the second corner. After the window is complete the graph will return to pick mode.

Plot	button		
-------------	--------	--	--

*This option enables the contents of the graph box to be plotted to a **12d Model**. Click on the button and the **Plot Graph** panel is displayed.*

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Plot to Model <i>the name of the model to be created/used</i>	model box	PLOT GRAPH	all available models
Clean model beforehand <i>deletes any existing data from the plot model</i>	check box	off	
Horizontal Scale <i>set the horizontal scale to be used to plot the data</i>	real box	1000	
Vertical Scale <i>set the vertical scale to be used to plot the data</i>	real box	10	
Plot <i>plot the data</i>	button		
Finish <i>closes the panel</i>	button		

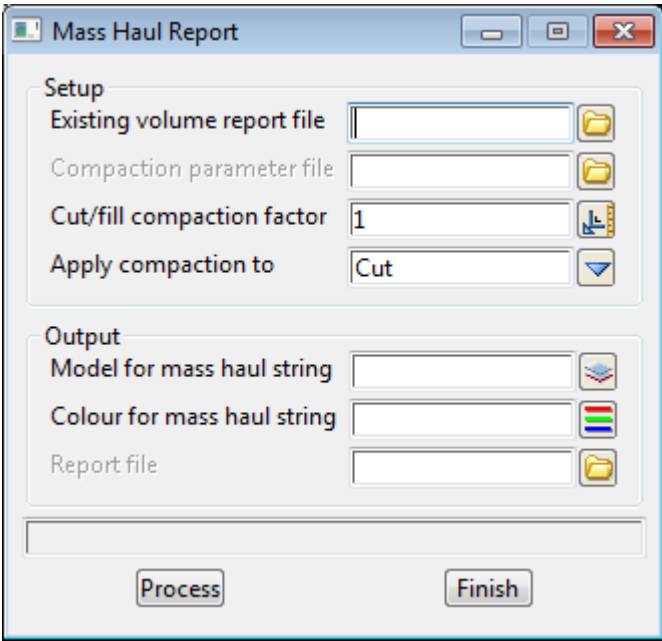

Mass Haul String and Report

Position of option on menu: Design =>Roads =>Mass haul =>Mass haul

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Existing volume report file <i>name of the existing volumes report.</i>	file box		*.rpt files
Compaction parameter file <i>file containing compaction factors to be used. See Format of the Compaction Parameter File.</i>	input		*.mhf files
Cut/fill compaction factor <i>cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.</i>	input	1	
Apply compaction factor to <i>if cut, the cut volumes are multiplied by the compaction factors. If fill, the fill volumes are divided by the compaction factors.</i>	choice box	cut	cut, fill
Model for mass haul string <i>model for the created mass haul string.</i>	model box		available models

- Colour for mass haul string

colour box

available colours

colour of the created mass haul string.
- Report file

input box

if non-blank, a mass haul volumes file is created.
- Process

button

run the option.

Format of the Compaction Parameter File

```
Format of the
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch      End_ch      Compaction_factor
           0           100           0.9
        100           500           1.0
        500          2000           1.1
```

Traffic Islands

Position of menu: **File I/O =>Roads =>Traffic islands**

The options under **Traffic islands** create a traffic island from three travel lines, offsets and nose radii, and also can apply a kerb profile around the island.

The **Traffic islands** walk-right menu is

create a traffic island
run a kerb profile around a traffic island

For *Traffic island*, go to
 Traffic island profile/tin

[Create Traffic Island](#)
[Traffic Island Profile/Tin](#)

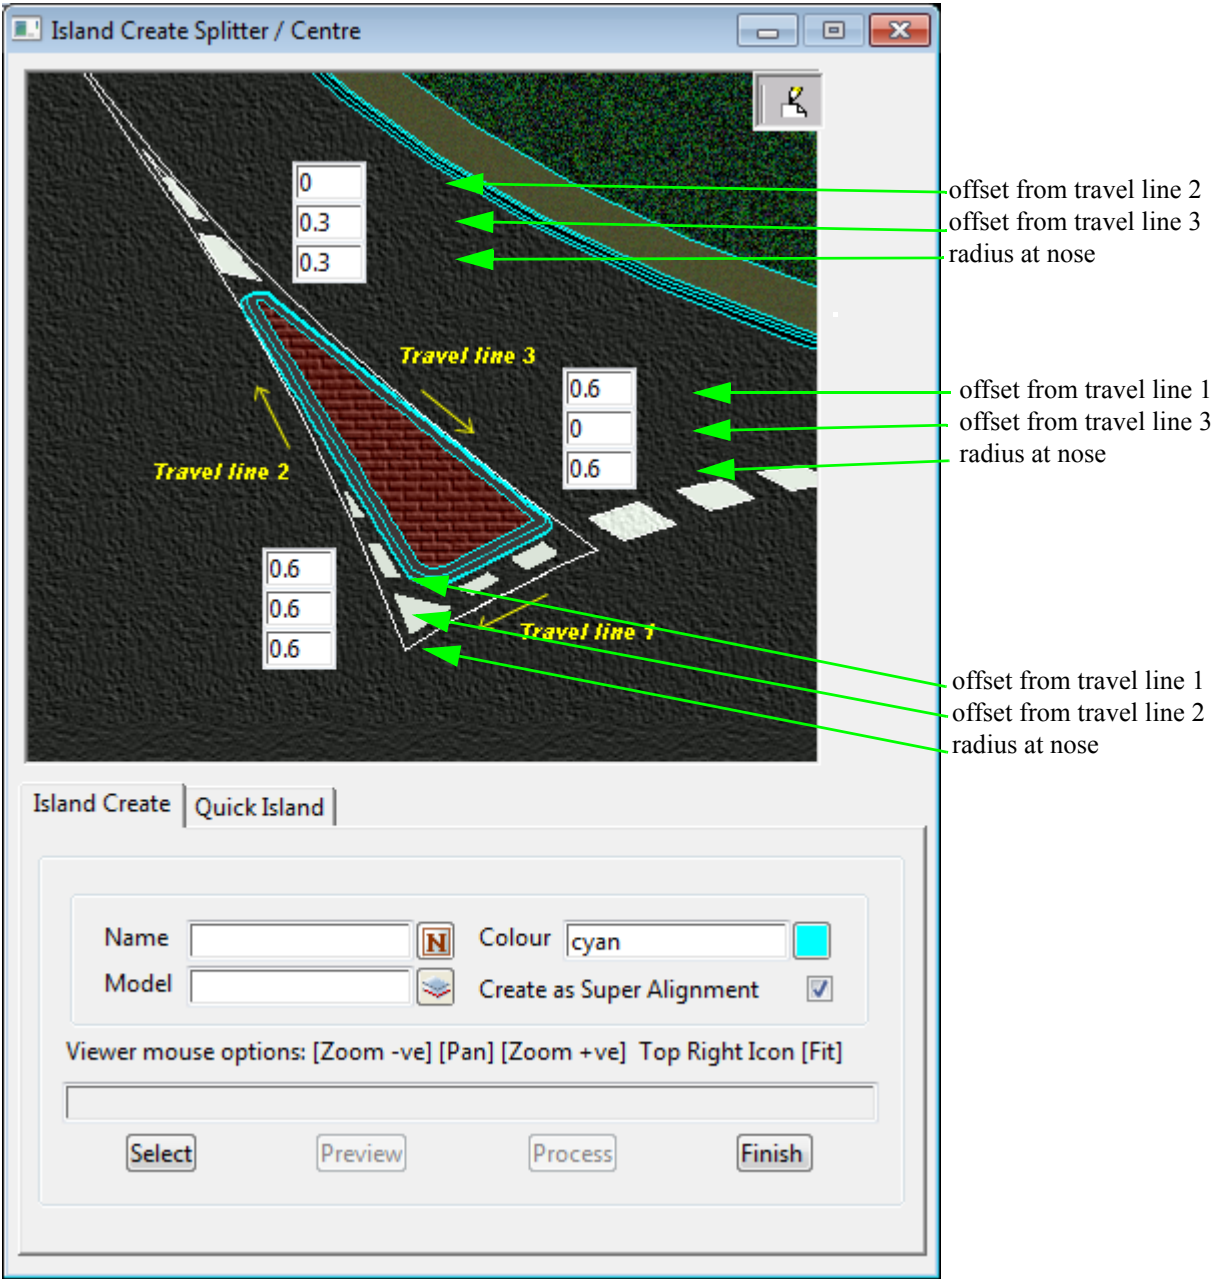

Create Traffic Island

Position of option on menu: **Design =>Roads =>Traffic islands =>Traffic Island**

Create an alignment string for a traffic island between user selected strings and with user defined offsets from the strings and nose radii. Drape the island onto a tin to give is z-values and then apply a kerb profile to complete the island.

On selecting the **traffic island** option, the **Island Create Splitter/Centre** panel is displayed.

The position of the panel fields indicate what the values are for. Tool tips appear when the cursor is passed over the panel fields.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Buttons at bottom

- | Field Description | Type | Defaults | Pop-Up |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|----------|--------|
| Select | strings select | | |
| <i>select in order and with direction, the three strings to use in creating the traffic island. Terminate by clicking RB and selecting cancel from the pick ops menu.</i> | | | |
| Preview | string select | | |
| <i>draw the traffic island with the given parameters in the panel draw box.</i> | | | |

Process button
create the alignment string

Island Create tab

Offset from travel lines input box
offset distance from the selected travel lines.

Radius at nose input box
radius of the corner of the traffic island between the selected travel lines

Name name box available names
name of the created alignment string.

Model model box available models
model for the created alignment string.

Colour colour box available colours
colour of the created alignment string.

Create as super alignment tick box
*if ticked, create the string as a super alignment.
If not ticked, create the string as an alignment.*

Quick Island tab

the quick island tab produces a traffic island of fixed sides but with the given nose radii. The traffic island can be created as a super alignment that can then be easily moved around and modified.

Radius at nose input box
radius of the corner of the traffic island

Name name box available names
name of the created alignment string

Model model box available models
model for the created alignment string

Colour colour box available colours
colour of the created alignment string

Create as super alignment tick box
*if ticked, create the string as a super alignment.
If not ticked, create the string as an alignment.*

Position xyz select box
pick two points to indicate the direction that the island will be created.

*Then click on **Process** to create the Traffic Island.*

Kerb Profile tab

Use island alignment levels instead of Tin tick box
*if ticked, use the alignments own z-value instead of draping the alignment onto the tin.
If not ticked, drape the alignment onto the tin to get z-values.*

offset for kerb face/top/back for the selected kerb type.

height for kerb face/top/back.

triangulation to drape the traffic island strings onto.

type of kerb to apply to the reference string of the traffic island. If type User is selected from the pop-up list, a file which defines the kerb profile can be selected and used.

file to read/write the user defined kerb type to.

read the given File to define a kerb type.

save the kerb parameters to the given File.

Position of option on menu: Design =>Roads =>Traffic islands =>Traffic island profile/tin

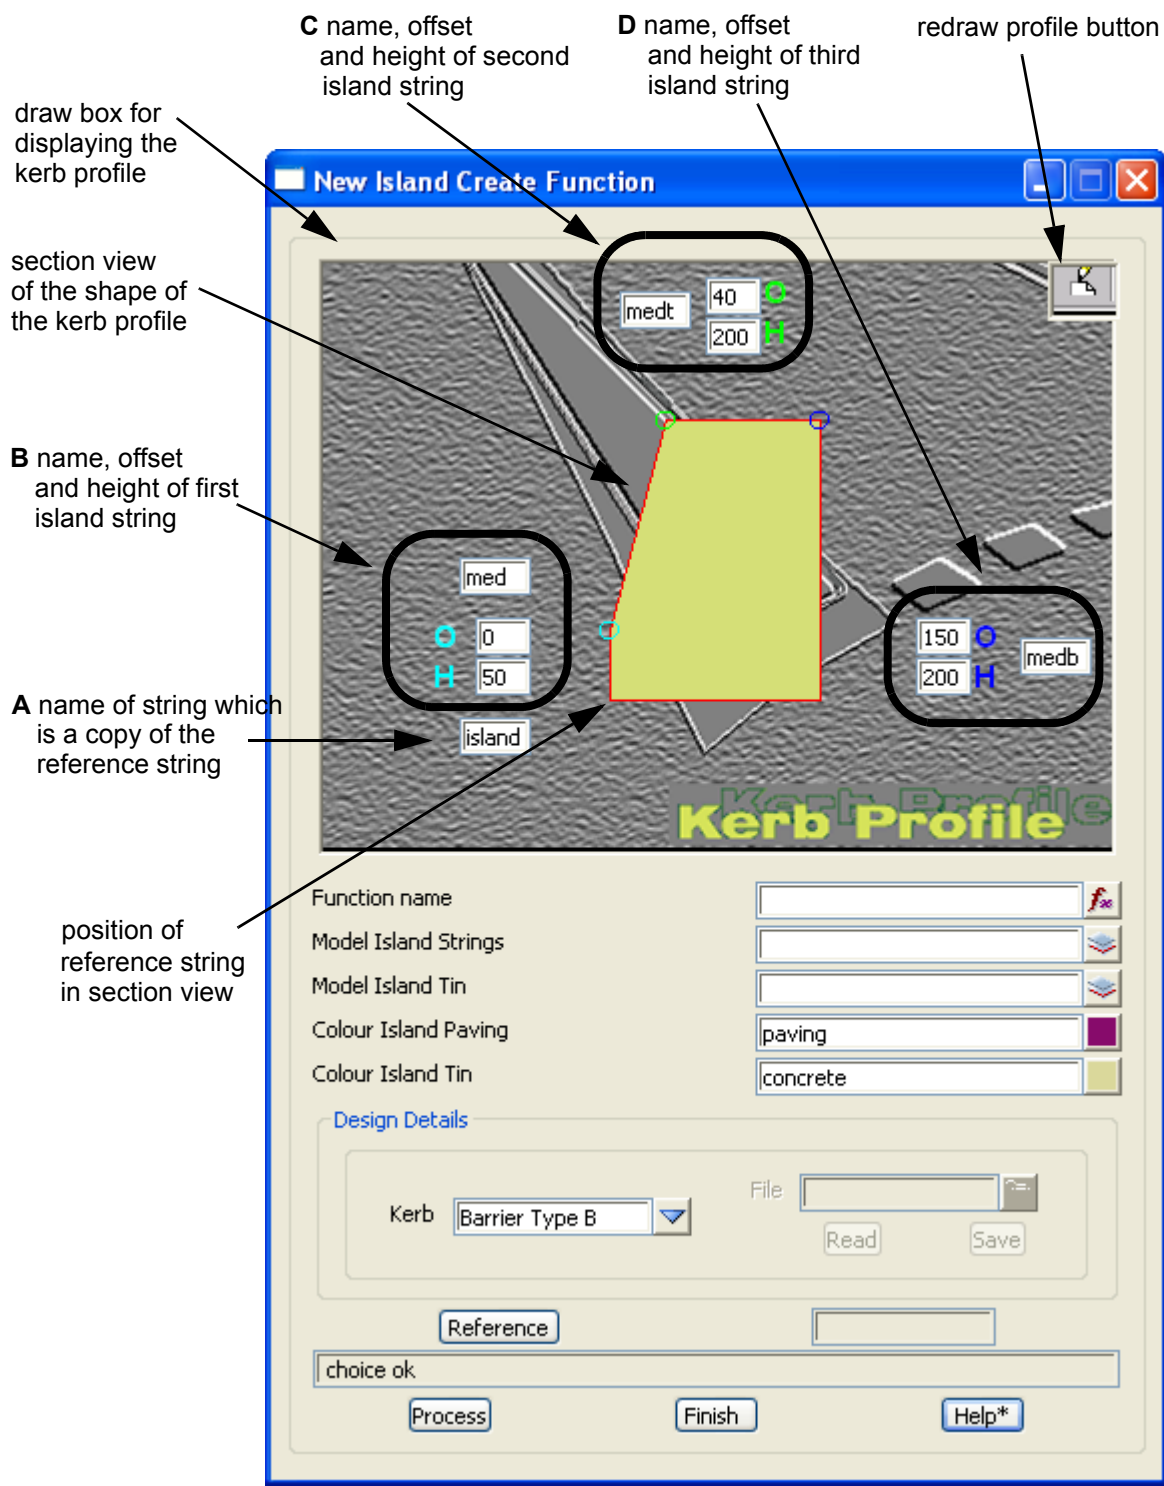

This option applies a kerb profile, either from the **12d** library or from a user defined file.

The option is saved as a function within **12d** and as a function can be re-run at any time if changes occur with the Super Alignment.

User defined kerbs are created by entering offset, height and string names in the fields in the draw box at the top of the panel, and then saved as a User Kerb Type file (*.ukt)

User Kerb Type files can then be written out, or read in as required.

On selecting the **Traffic Island** profile/tin, the **New Island Create Function** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Function name <i>name of the Island Create function</i>	function		available functions
Model Island Strings	model box		available models

model for the created island strings

Model Island Tin model box
model for the tin of the created island

Colour Island Paving input paving available colours
if non-blank, then the colour is used to colour the island triangulation within innermost kerb string (D)

Colour Island Tin input concrete available colours
if non-blank, then the colour is the colour is used to colour the island triangulation between the strings defined by A and D.

In the drawing area:

A
a string is created which is a copy of the reference string and given this name. It is added to the Model Island Strings model.

B
name, offset and height from the reference string, of the first string of the island. It is added to the Model Island Strings model. If offset and height are both zero, then the string is not created.

C
name, offset and height from the reference string, of the second string of the island. It is added to the Model Island Strings model. If offset and height are both zero, then the string is not created.

D
name, offset and height from the reference string, of the third string of the island. It is added to the Model Island Strings model. If offset and height are both zero, then the string is not created.

Design Details

Kerb choice box Barrier Type A Barrier Type A, Barrier Type B, Mountable, Semi - Mountable, User

selected kerb type is displayed in draw box above

If Kerb is User then the File field and the Read and Save buttons are made active, and are used to read in an existing user defined Kerb type, or to create a new one.

File file box files ending in.ukt

name of the user kerb type file (ukt) to read in or create

Read button

Reads in the user defined kerb definition from the ukt file given in the File field and displays the profile and Offsets and Height in the draw box at the top of the Panel

Save button

Writes out the kerb profile information (O and H values, and string names) as a user defined kerb, into the file given in the File field.

Reference select pick

Select the reference alignment which will have the kerb profile applied to it to create the island. "pick with direction" in a clockwise manner as the kerb profile is always on the RHS.

Process button

runs the option which created the island string and the coloured island tin

Note:

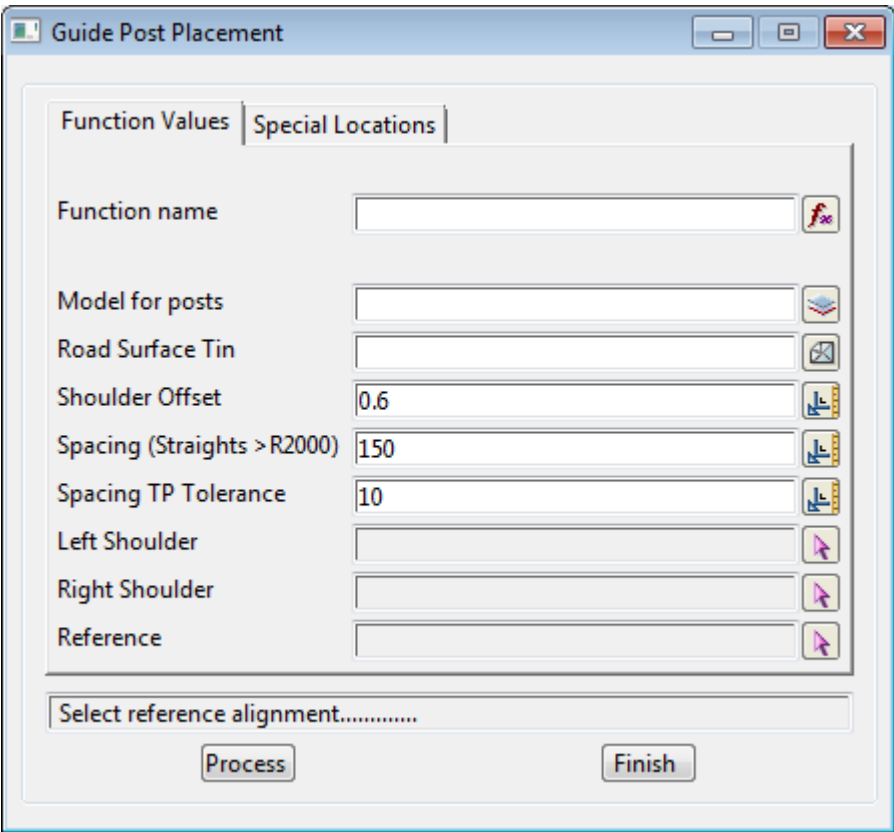

The New Island Create Function reads in the standard kerb profiles as templates and if required, creates a template from the ukt files. The function needs these templates because an apply is used (internally) to create the Island.

Guide Post Placement

Position of option on menu: Design =>Roads =>Guide post creator

This section of documentation is a work in progress and will be updated in subsequent releases.

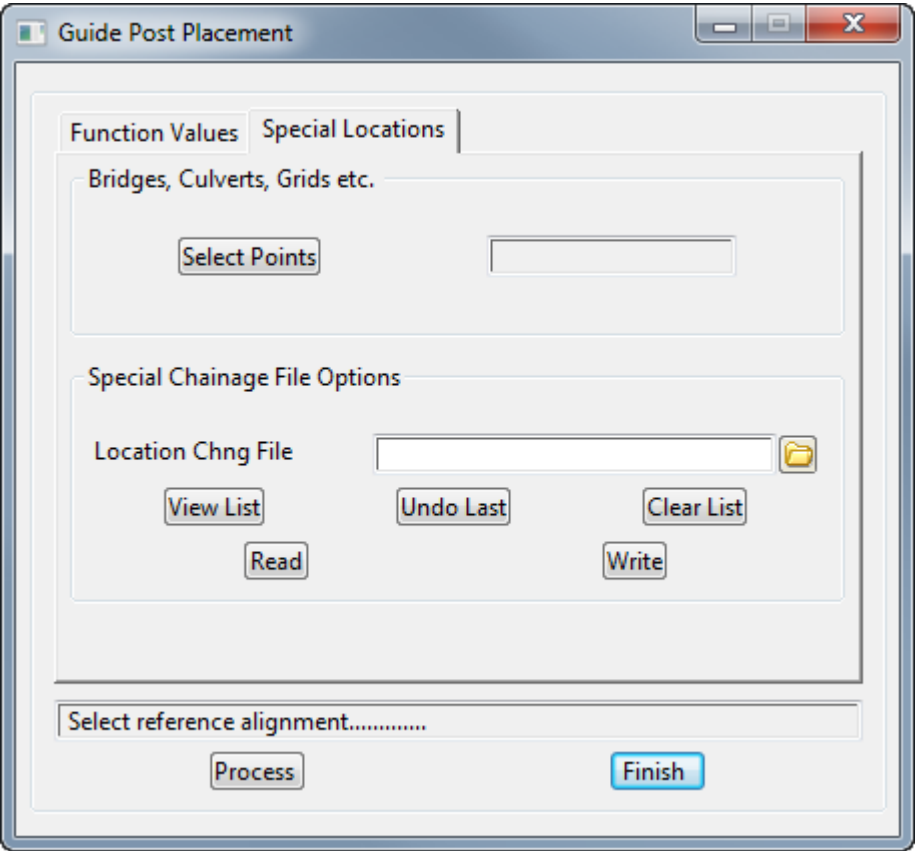

Selecting Guide post creator brings up the **Guide Post Placement** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Function Values tab			
Function name	function box		available functions
Model for posts	model box		available models
Road Surface Tin	tin box		available tins
Shoulder Offset		0.6	
Spacing (Straights >R2000)		150	
Spacing TP Tolerance		10

String by Xfall and Grade

Position of option on menu: **Design =>Roads =>String by xfall and grade**

This panel is used to create strings by a variety of methods using xfall from one string, or xfalls from two strings, either using a reference string to define where the xfall is measured, or perpendicular to selected strings. Some of the methods grade the created string.

Selecting **String by xfall and grade** brings up the **Create by Xfall and Grade** panel.

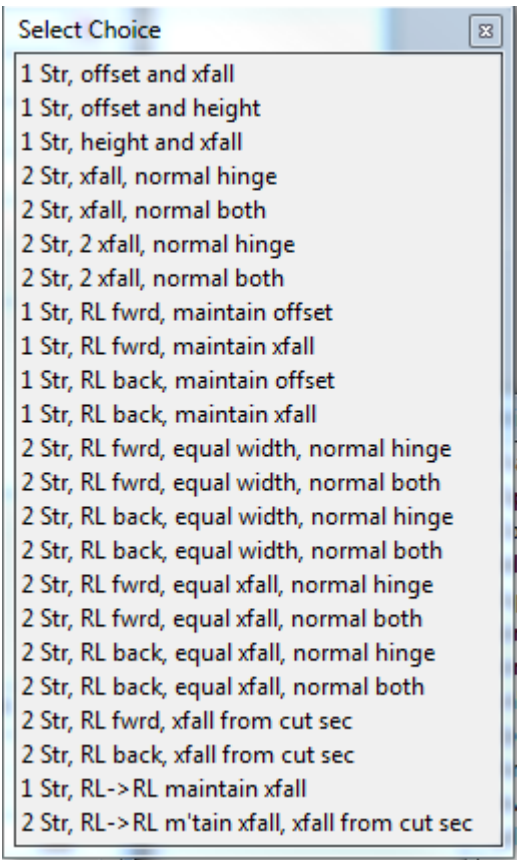

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Xfall type

choice box

methods for creating the new string. For the definition of each choice, go to [Xfall Types](#)

Reference string

Hinge string

Secondary string

Offset, Xfall, Grade etc

which of these fields are present, and what they are for depends on the Xfall type.

Start/End mode

choice box

Start (ref)/End (ref)

*defines the start/end chainages for creating the string.
The Start/End modes are the same as for the MTF modifiers. For more information on Start/End mode, see [Start and End Chainages](#) in the chapter [Advanced Design](#).*

Interval type

choice box

At vertices on the Hinge string -

Interval on Hinge/ref string -

String name

name box

1 String, Offset and Xfall

Xfall type	1 Str, offset and xfall	
Reference string		
Primary string		
Secondary string		
Offset		
Xfall		

This option requires a **Hinge** string, an **Offset** and **Xfall**, and an **optional Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Offset** and **Xfall**.

Positive Offset is defined as going to the right of the **Hinge** string when travelling in the direction of **increasing chainage on the Reference** string. Offset can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

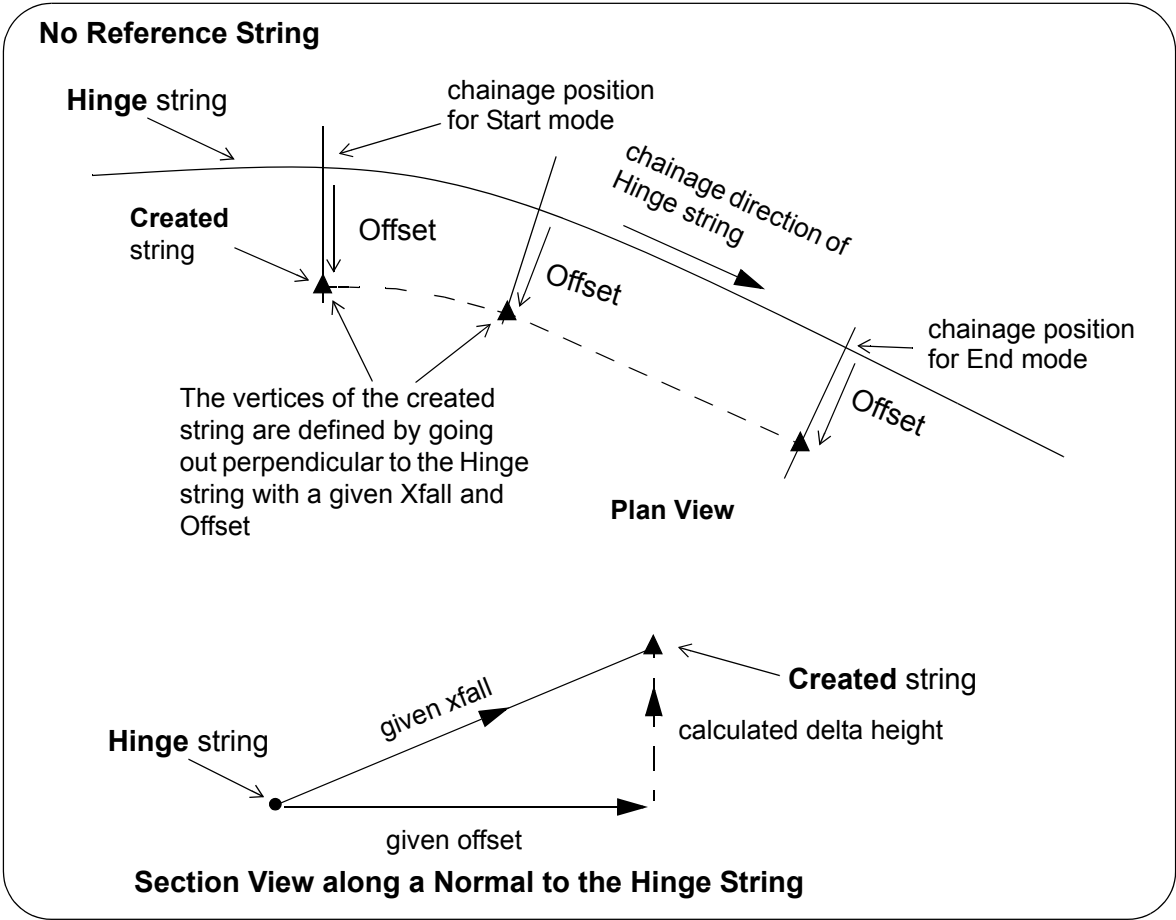

Reference String NOT Selected

If a **Reference string** is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge string** and at each chainage ch , a vertex of the new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Offset** and **Xfall**.

Positive **Offset** is defined as going to the right of the **Hinge string** when travelling in the direction of increasing chainage on the **Hinge string**. **Offset** can be positive or negative.

Positive **Xfall** is in the upward direction. **Xfall** can be positive or negative.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Continue to the next choice [1 String, Offset and Height](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

1 String, Offset and Height

Xfall type	1 Str, offset and heig	▼
Reference string		↗
Primary string		↗
Secondary string		↗
Offset		↕
Height		↕

This option requires a **Hinge** string, an **Offset** and **Height**, and an **optional Reference** string.

Reference String Selected

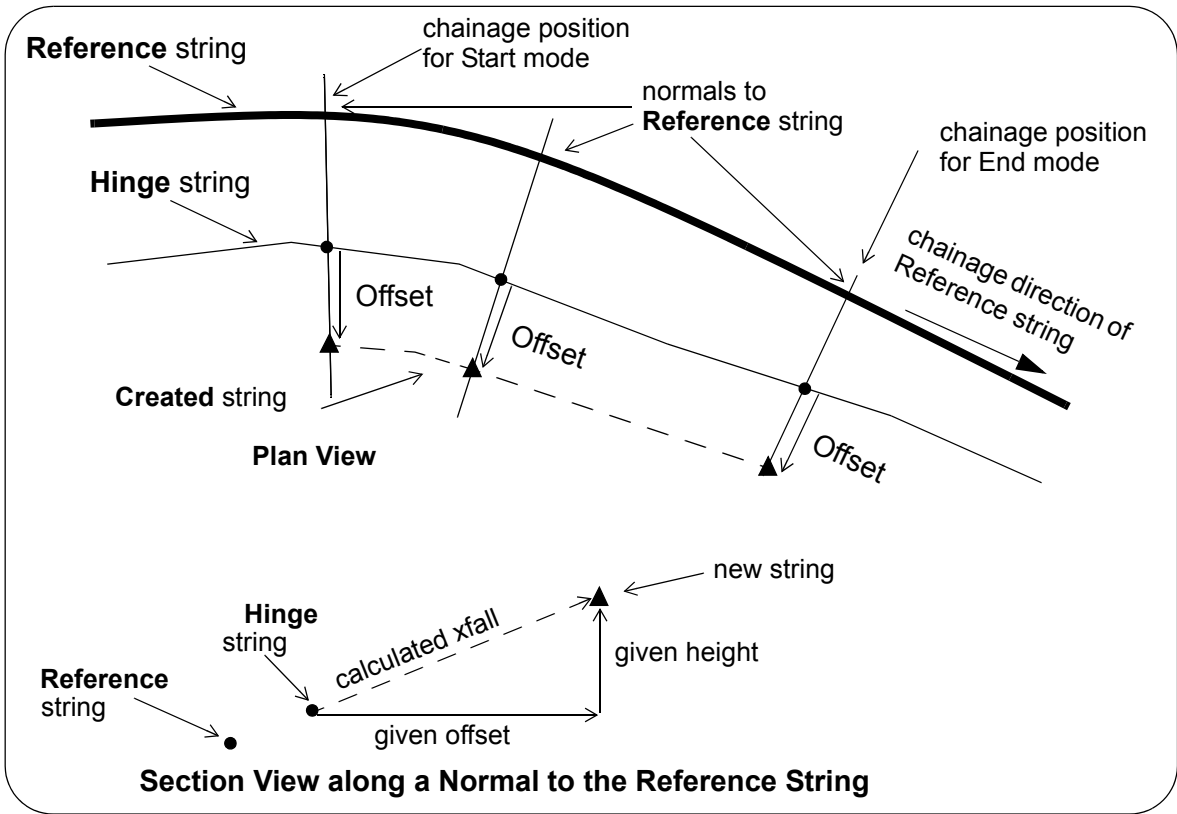

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Offset** and **Height**.

Positive Offset is defined as going to the right of the **Hinge** string when travelling in the direction of **increasing chainage on the Reference** string. Offset can be positive or negative.

Height is **added** to the height on the Hinge string. Height can be positive or negative.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

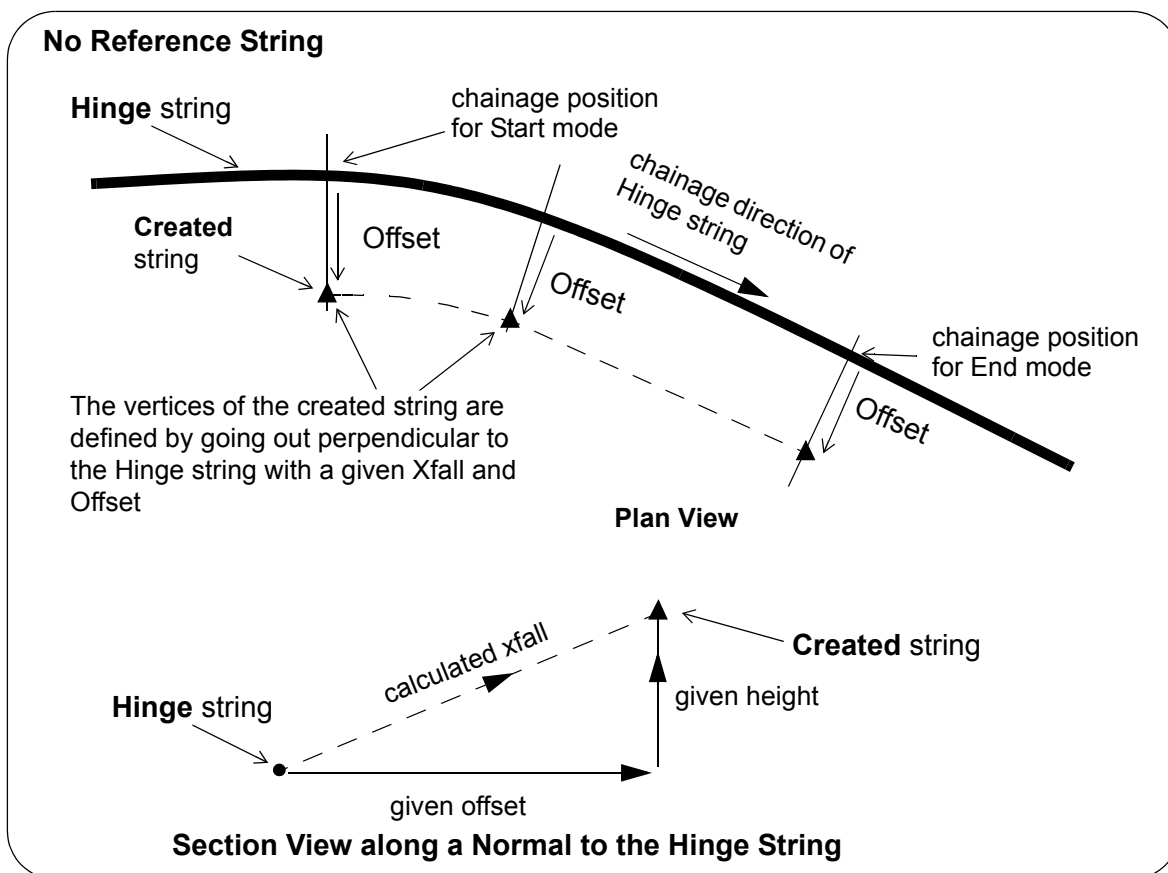

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string and at each chainage ch , a vertex of a new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Offset** and **Height**.

Positive **Offset** is defined as going to the right of the Hinge string when travelling in the direction of increasing chainage on the Hinge string. Offset can be positive or negative.

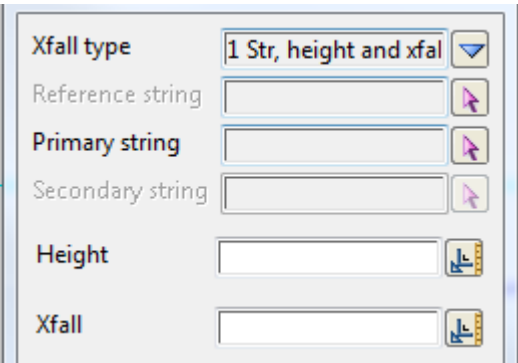

Height is **added** to the height on the Hinge string. Height can be positive or negative.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Continue to the next choice [1 String, Height and Xfall](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

1 String, Height and Xfall

This option requires a **Hinge** string, a **Height** and **Xfall**, and an **optional Reference** string.

Reference String Selected

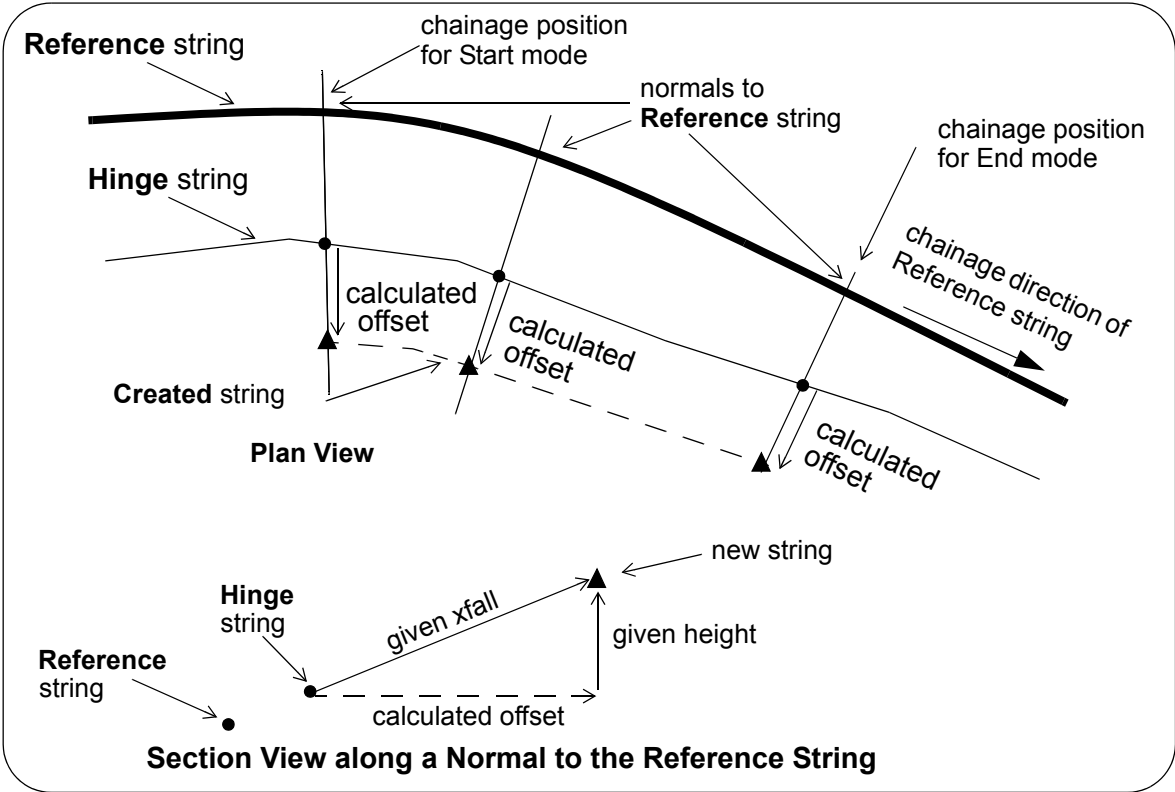

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage *ch* between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string.

A vertex of a new string is created by going out from the Hinge string along the section at the given **Height** and **Xfall**.

Height is **added** to the height on the Hinge string. Height can be positive or negative.

Positive **Xfall** is in the upward direction. **Xfall** can be positive or negative.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string and at each chainage ch , a vertex of a new string is created by going out **normal** (perpendicular) to the **Hinge string** for the given **Height** and **Xfall**.

Height is **added** to the height at that chainage on the Hinge string. Height can be positive or negative.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

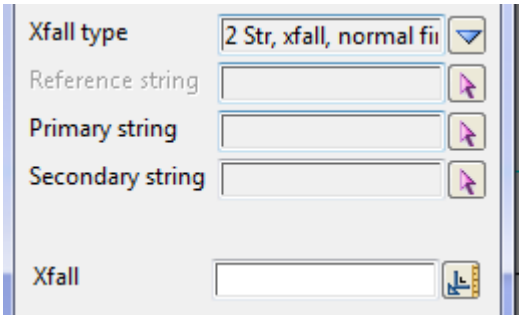

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

No Reference String

Continue to the next choice [2 Strings, Xfall and Normal to Reference String or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Xfall and Normal to Reference String or Hinge String

This option requires a **Hinge** and a **Secondary** string, a **Xfall**, and an **option Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string and the **Secondary** strings.

On this section, the **Xfall** is taken from the Hinge and Secondary strings and a vertex of a new string created where the Xfalls intersect.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

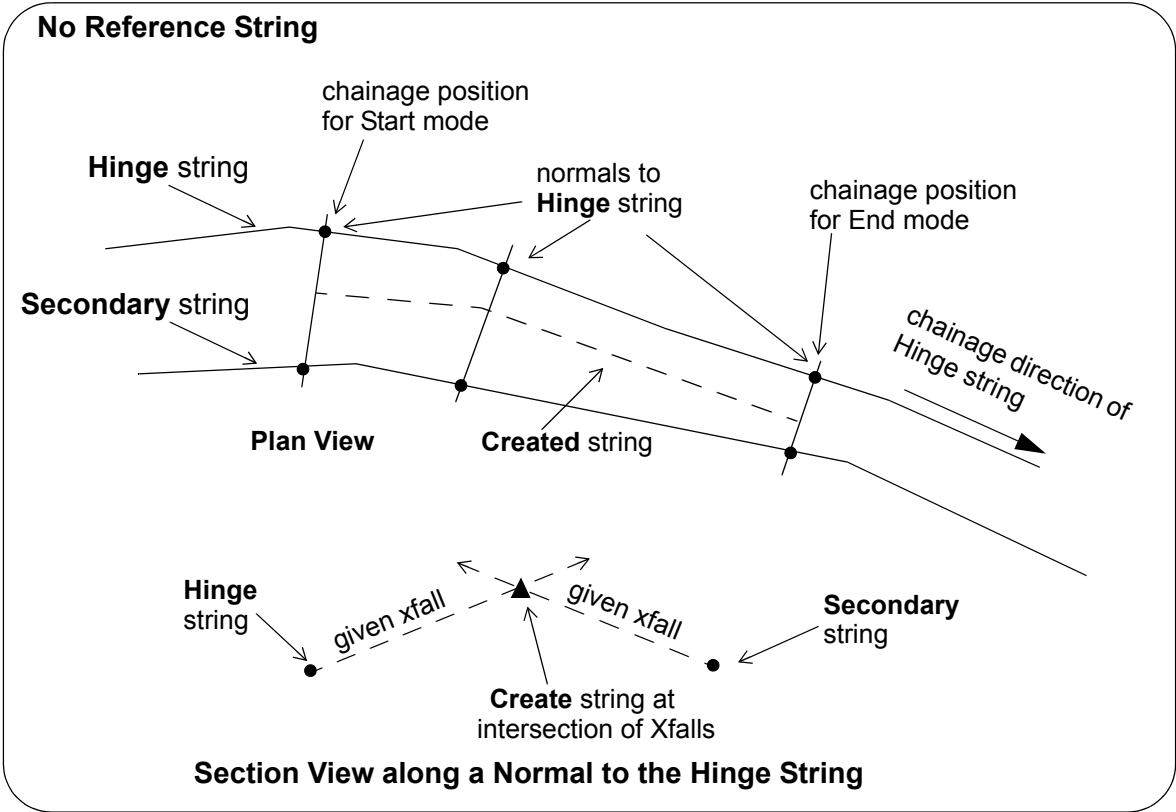

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to **Hinge** string and at each chainage (ch), a section is taken **normal** (perpendicular) to the **Hinge string** and

cutting the **Secondary** strings.

On this section, the **Xfall** is taken from the Hinge and Secondary strings and a vertex of a new string created where the Xfalls intersect.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Continue to the next choice [2 Strings, Xfall and Normal to Both](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Xfall and Normal to Both

This option requires a **Hinge** and a **Secondary** string, a **Xfall**, and an **option Reference** string.

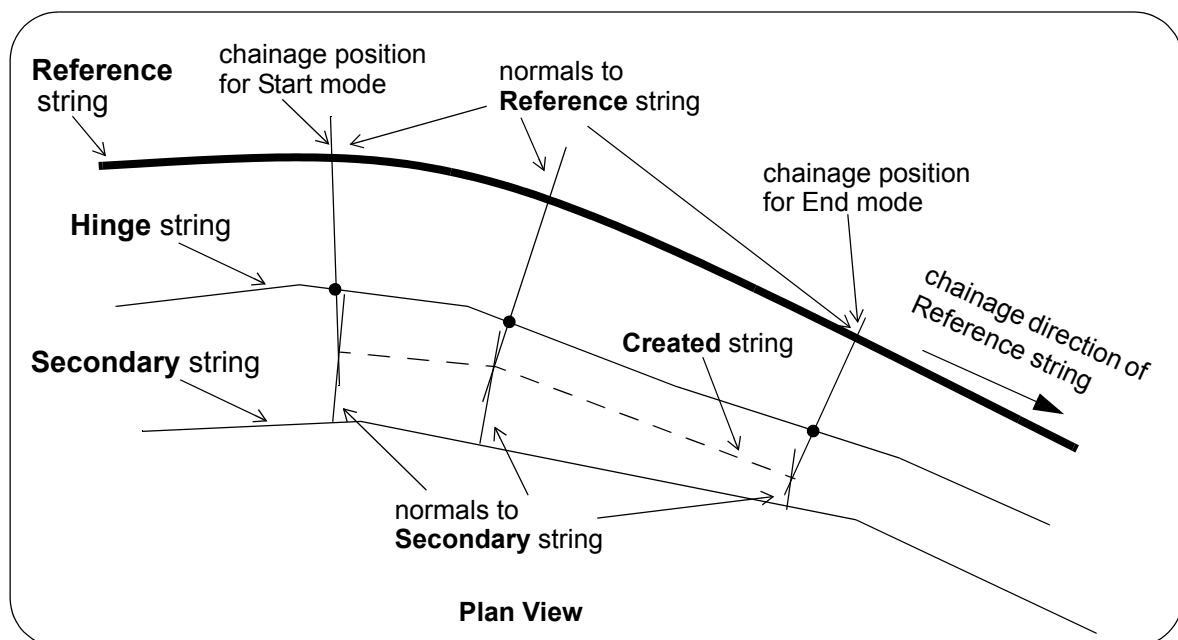

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string, and the **Xfall** is taken from the cut with the Hinge string and along the section.

This is then intersected with a section **normal** to the **Secondary** string and with the given **Xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

Reference String NOT Selected

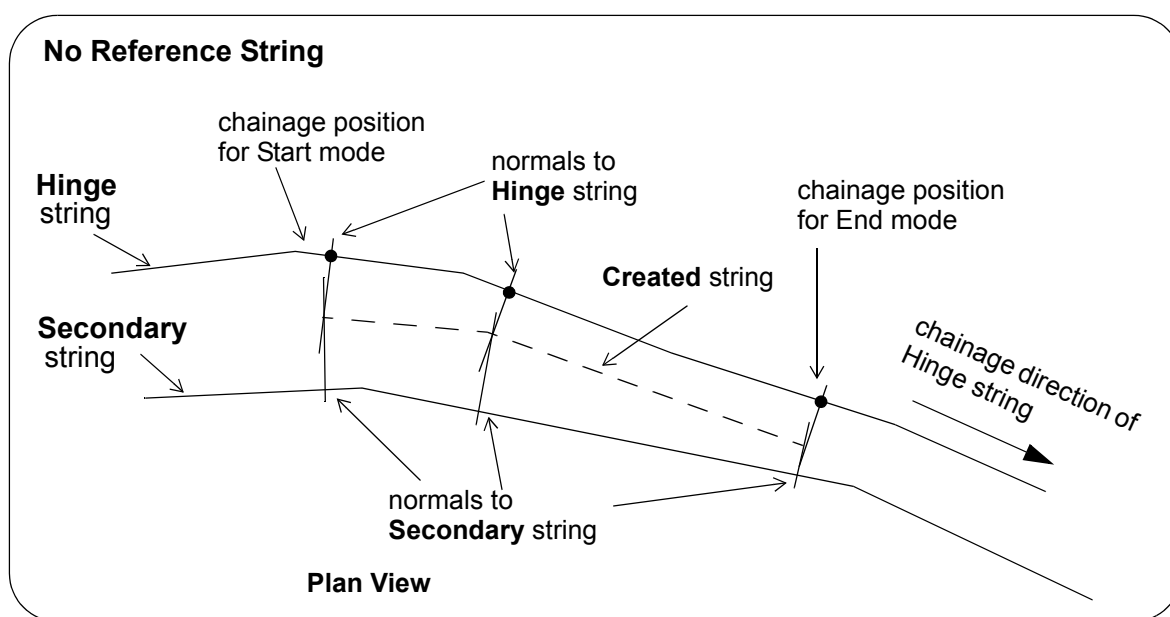

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string.

At each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Hinge string** and the **Xfall** is taken along this section.

This is then intersected with a section **normal** to the **Secondary** string and with the given **Xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice [2 Strings, 2 Xfalls and Normal to Reference String or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, 2 Xfalls and Normal to Reference String or Hinge String

Xfall type	2 Str, 2 xfall, normal	
Reference string		
Primary string		
Secondary string		
Pri xfall		
Sec xfall		

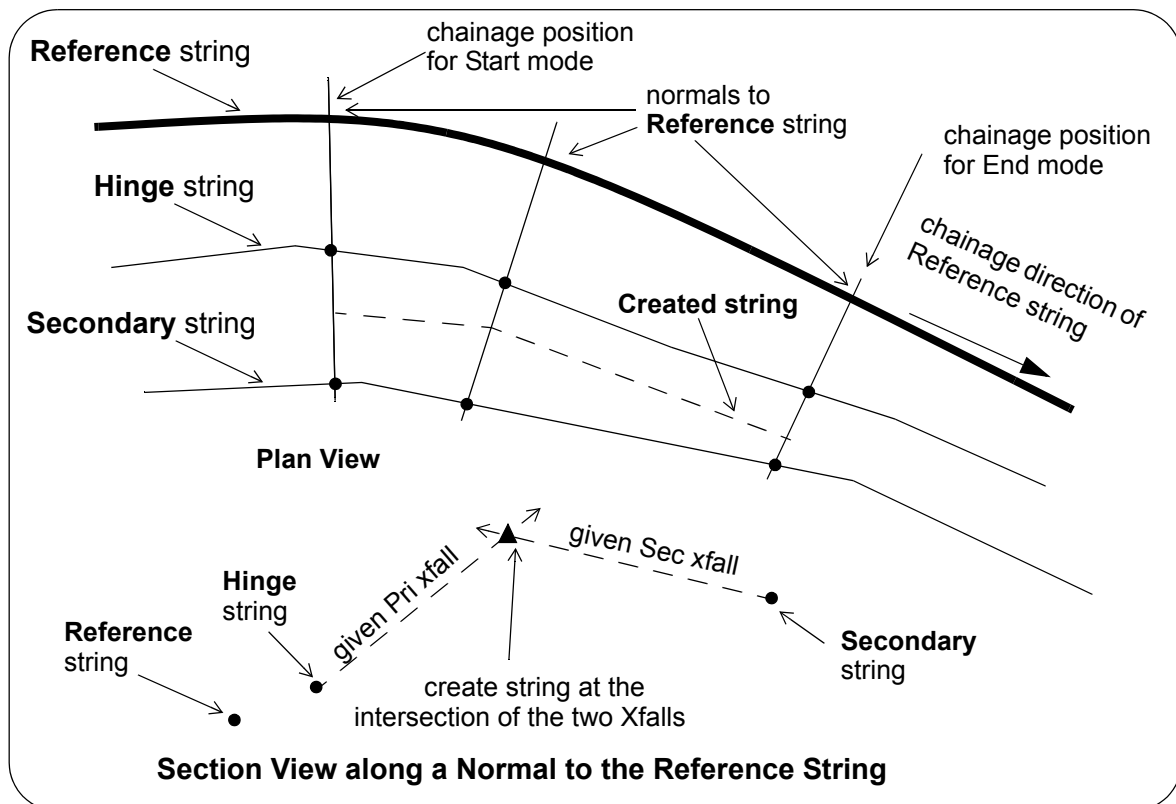

This option requires a **Hinge** and a **Secondary** string, two **Xfalls**, and an **option Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string and the **Secondary** strings.

On this section, the xfall **Pri xfall** is taken from the Hinge string, and xfall **Sec xfall** from the Secondary string, and a vertex of a new string created where the two xfalls intersect.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

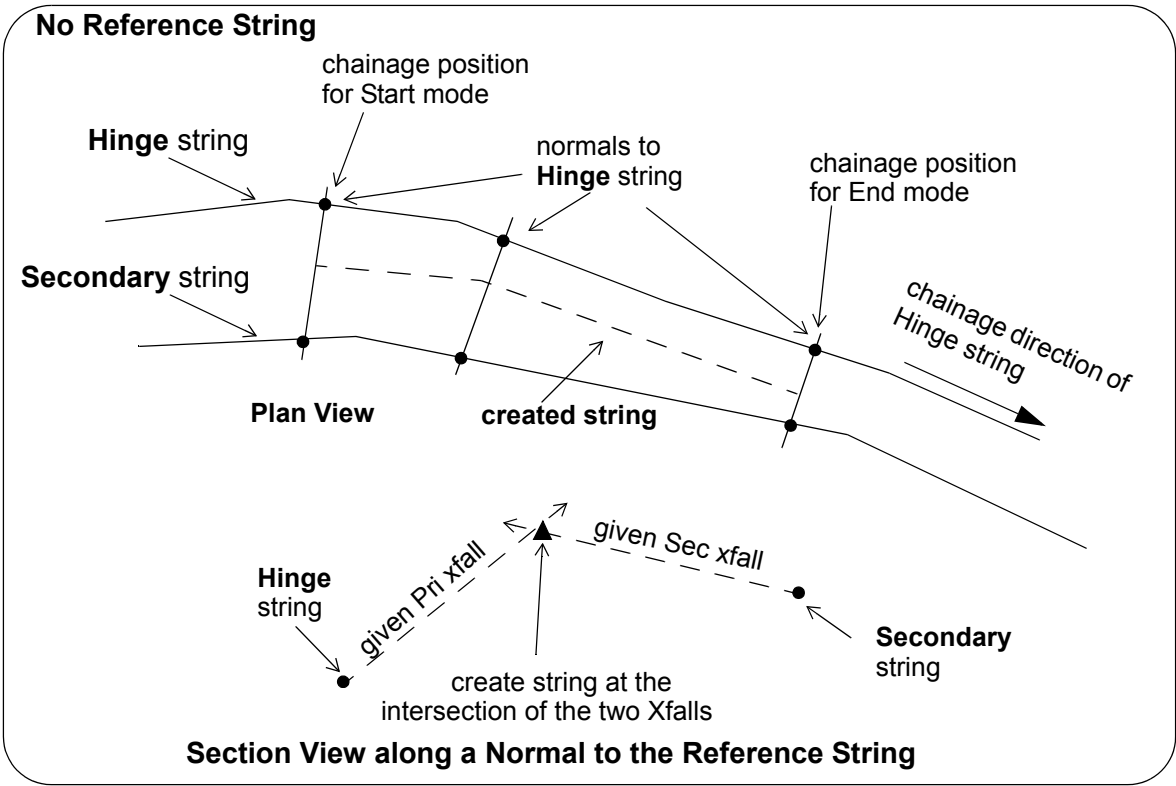

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to **Hinge** string

and at each chainage (ch), a section is taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary** strings.

On this section, the xfall **Pri xfall** is taken from the Hinge string, and xfall **Sec xfall** from the Secondary string, and a vertex of a new string created where the two xfalls intersect.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice [2 Strings, 2 Xfalls and Normal to Both](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, 2 Xfalls and Normal to Both

Xfall type	2 Str, 2 xfall, normal	
Reference string		
Primary string		
Secondary string		
Pri xfall		
Sec xfall		

This option requires a **Hinge** and a **Secondary** string, two **Xfalls**, and an **option Reference** string.

Reference String Selected

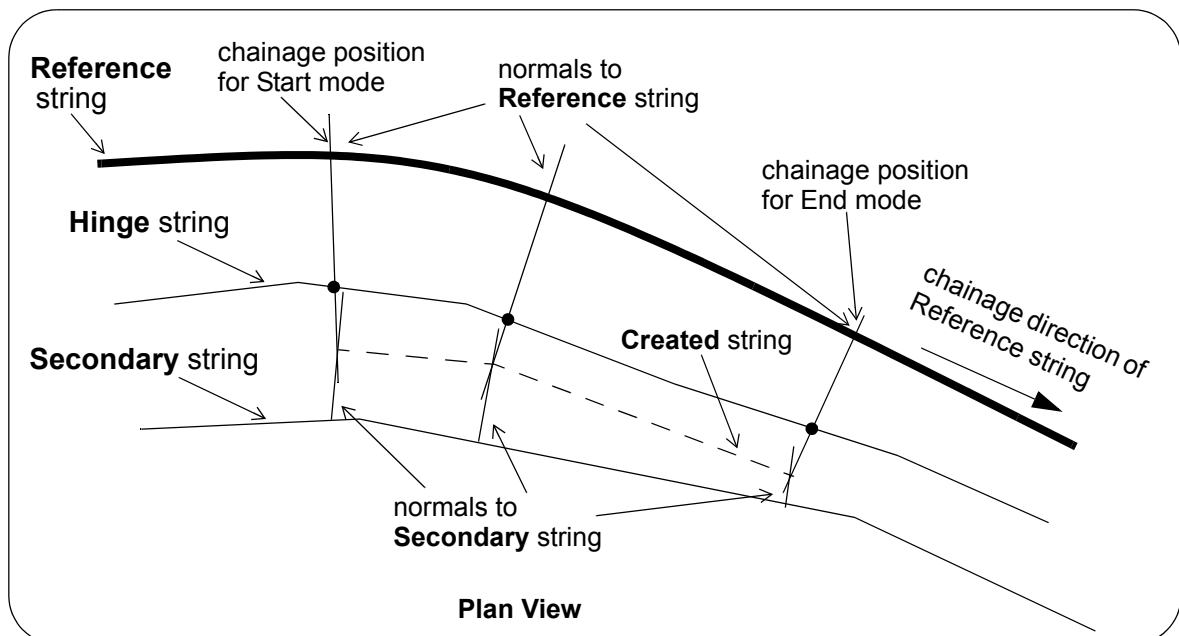

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string, and the xfall **Pri xfall** is taken from the cut with the Hinge string and along the section.

This is then intersected with a section **normal** to the **Secondary** string and with the xfall **Sec xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string.

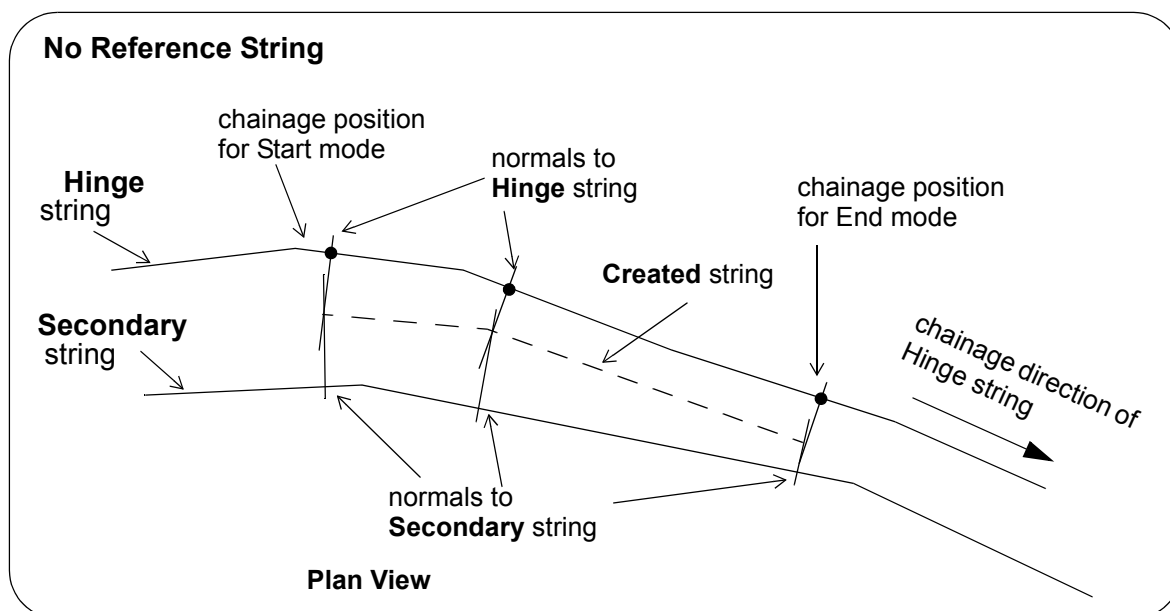

At each chainage *ch* between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Hinge string** and the xfall **Pri xfall** is taken along this section.

This is then intersected with a section **normal** to the **Secondary** string and with the xfall **Sec xfall**.

The new string is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Positive Xfall is in the upward direction. Xfall can be positive or negative.

Continue to the next choice [1 String, Start RL and Grade, Fixed Offset](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

1 String, Start RL and Grade, Fixed Offset

Xfall type	RL fwd, maintain of	
Reference string		
Primary string		
Secondary string		
Start RL		
Grade->		
Offset		

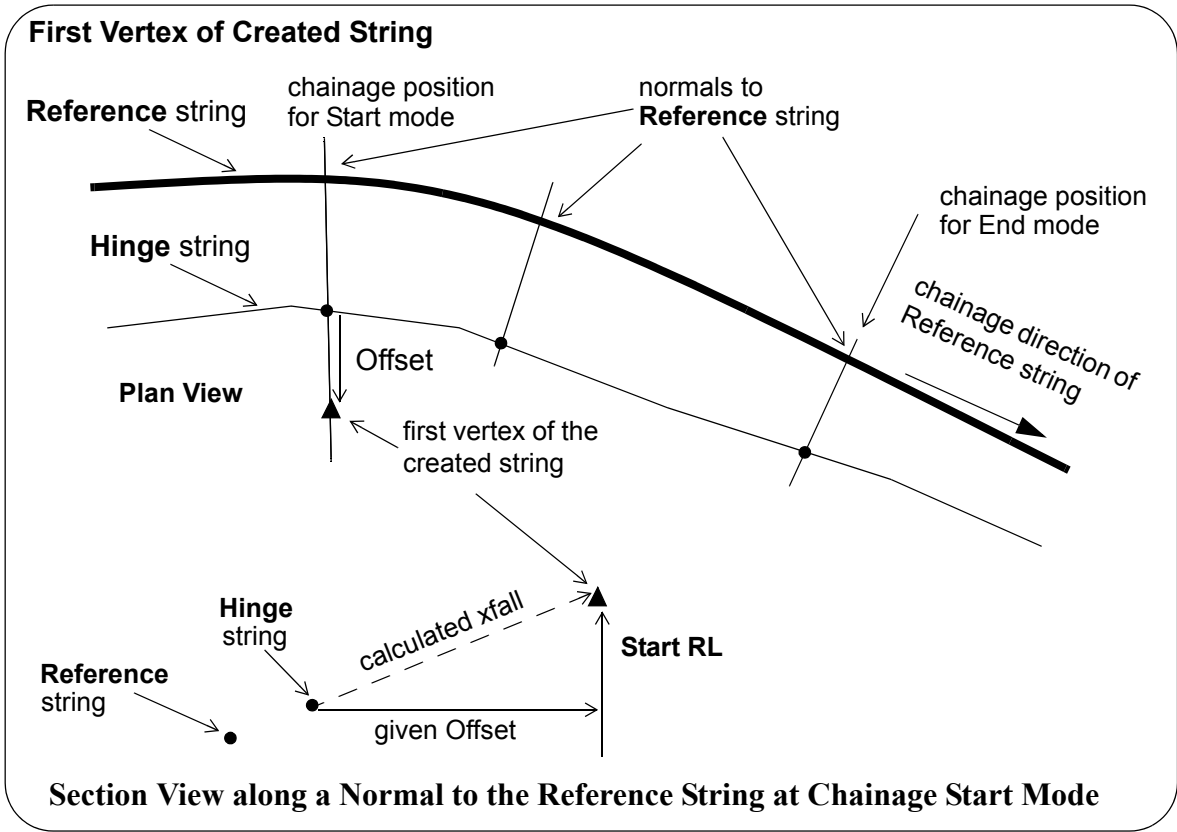

This option requires a **Hinge** string, a **Start RL** and forward **Grade**, an **Offset**, and an **optional Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

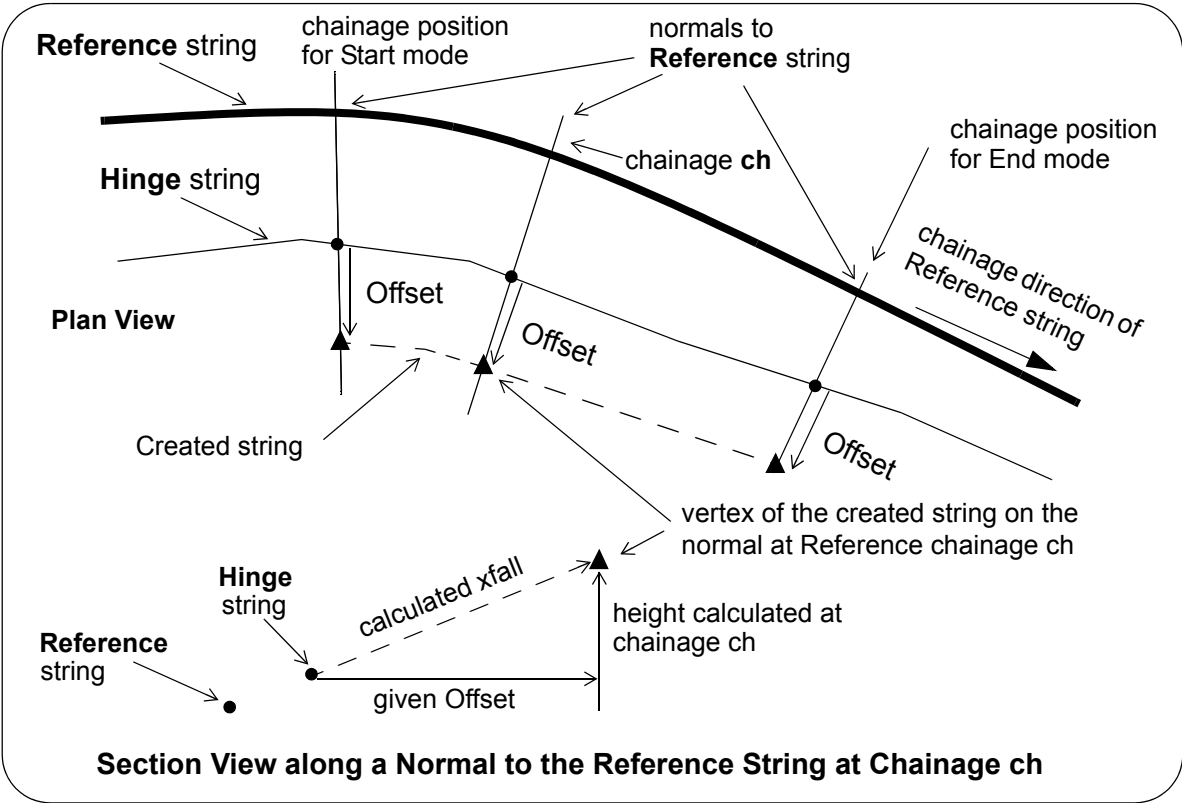

The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset**.

The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, with an offset from the **Hinge** string of **Offset** and with a **height** of **Start RL**.

The **heights** of the subsequent vertices of the created string are defined in (created string

chainage, height) space, and lie on the line with grade **Grade->** and going through the first vertex.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset**.

The **first vertex** of the created string is on the normal to the Hinge string at chainage **Start mode**, with an offset from the **Hinge** string of **Offset**, and with a **height** of **Start RL**.

First Vertex of Created String - No Reference String

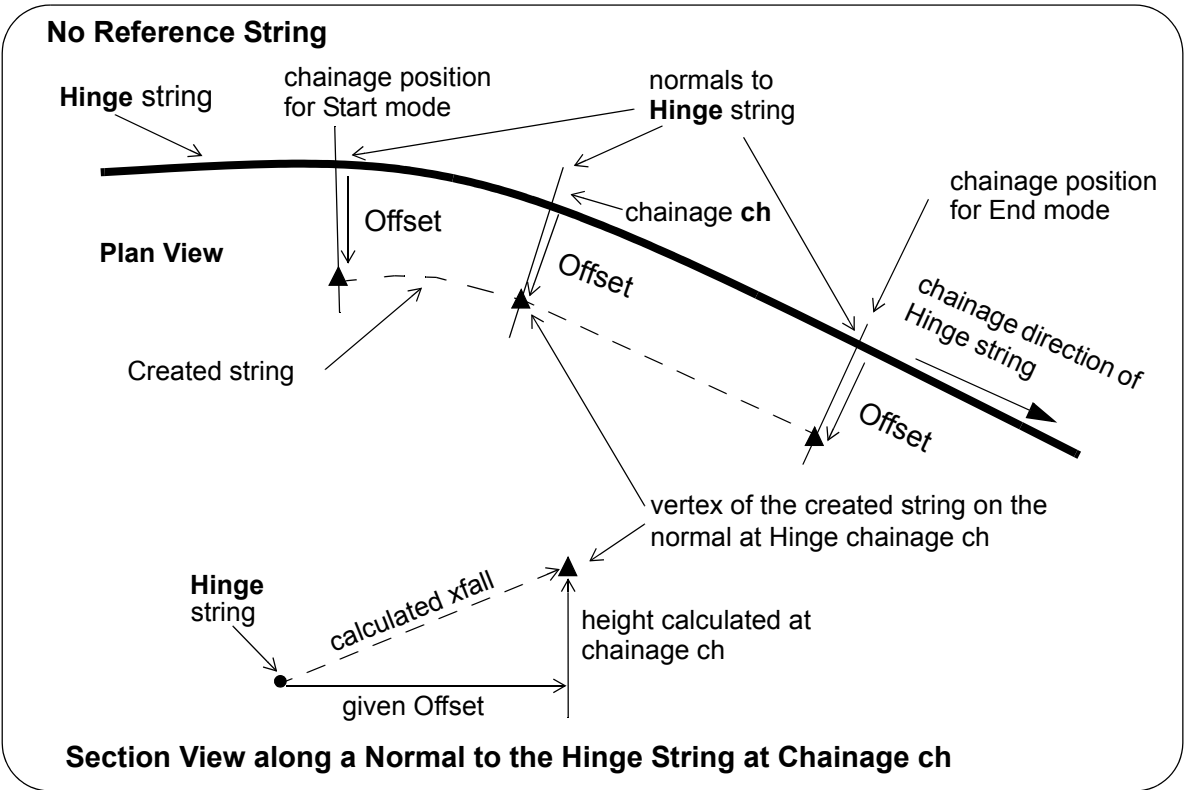

Section View along a Normal to the Hinge String at Chainage Start Mode

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade **Grade->** and going through the first vertex.

Chainage-Height Diagram for the Created String

Continue to the next choice [1 String, End RL and Grade, Fixed Offset](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

1 String, End RL and Grade, Fixed Offset

This option requires a **Hinge** string, an **End RL** and backward **Grade**, an **Offset**, and an optional **Reference** string.

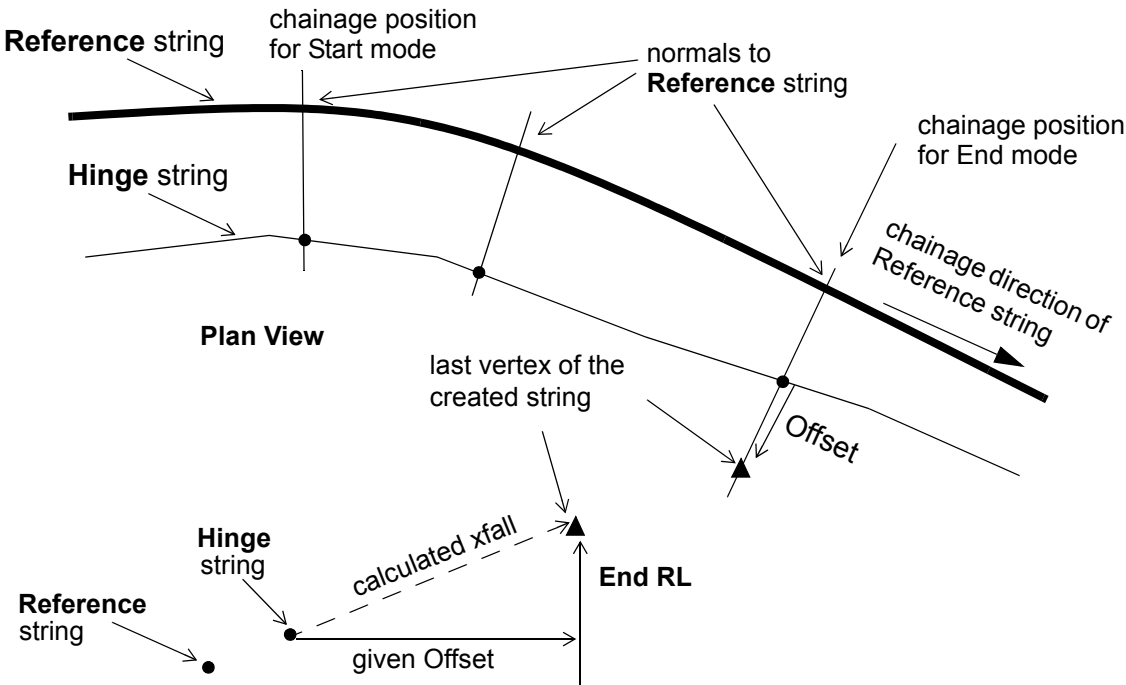

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset**.

The **last vertex** of the created string is on the normal to the Reference string at chainage **End mode**, with an offset from the **Hinge** string of **Offset** and with a **height** of **End RL**.

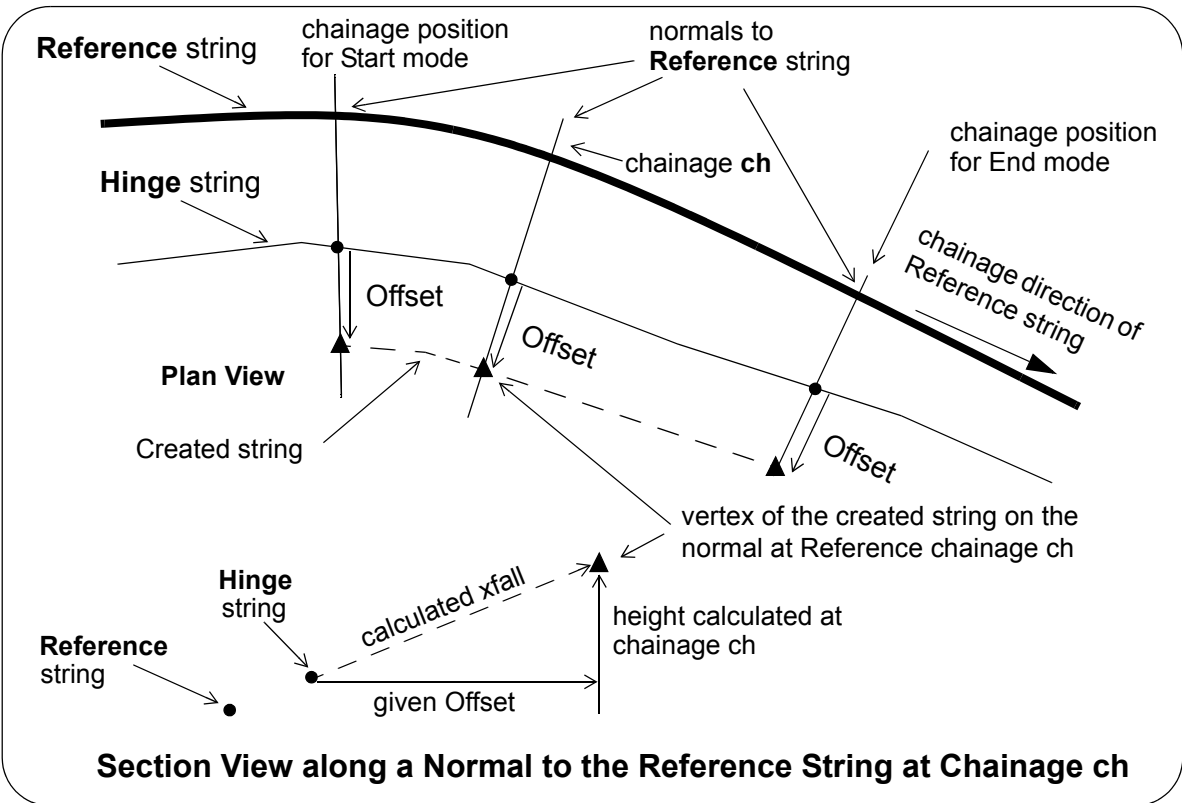

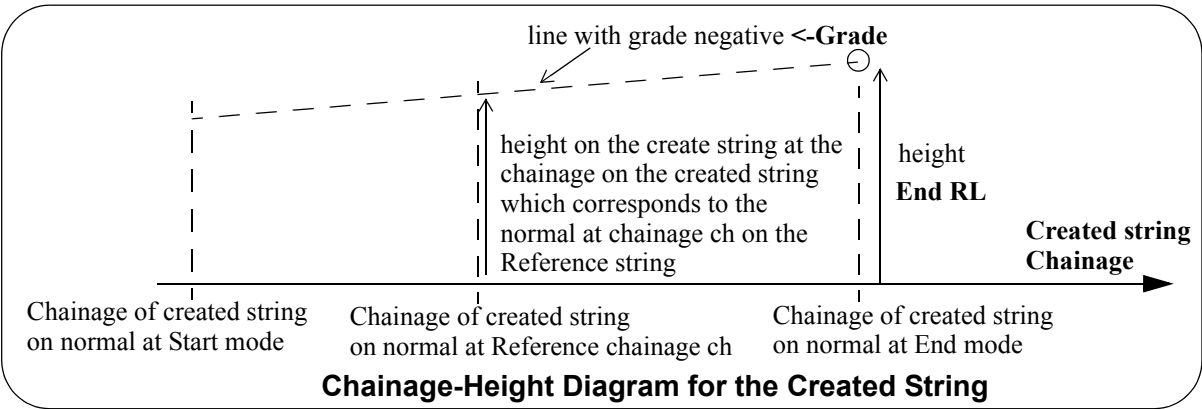

Last Vertex of Created String

Section View along a Normal to the Reference String at Chainage End Mode

The **heights** of the previous vertices of the created string are defined in (created string chainage,

height) space, and lie on the line with grade negative **<-Grade** and going through the last vertex.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

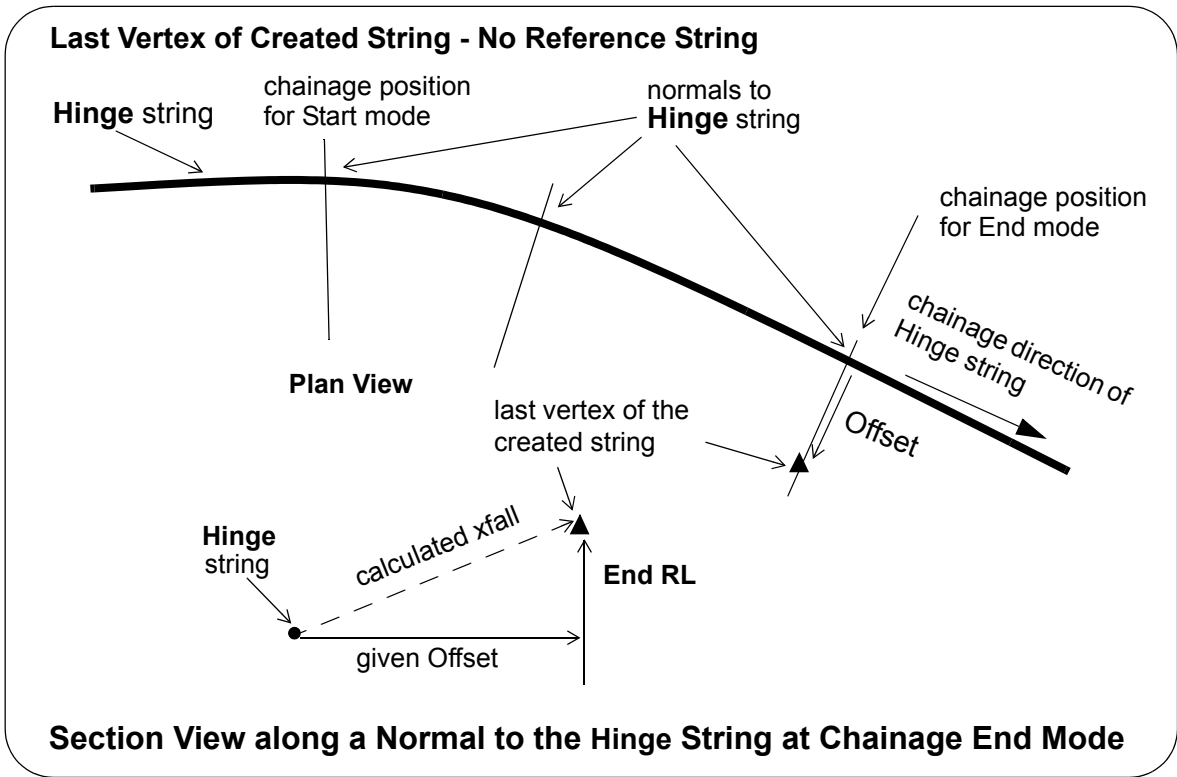

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

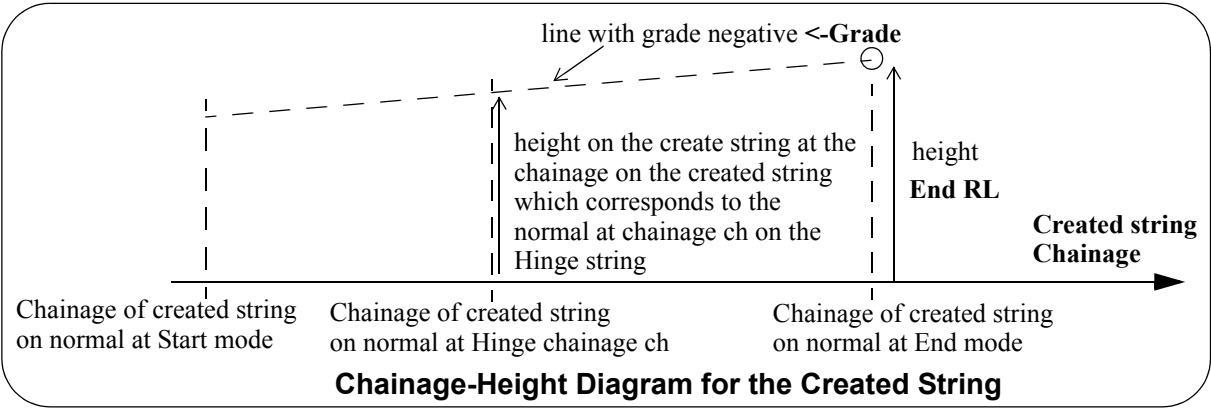

The **plan position** of the created vertices are given by going out from the Hinge string along the normal section for the given **Offset**.

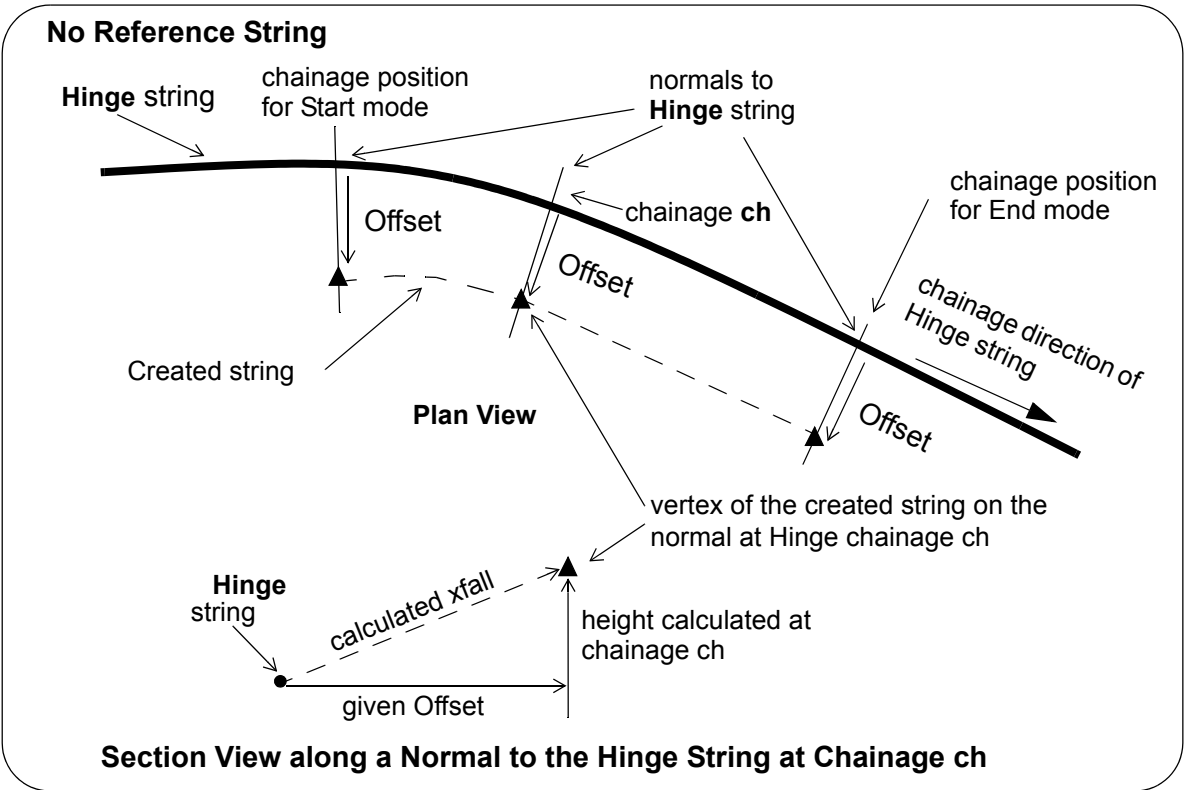

The **last vertex** of the created string is on the normal to the Hinge string at chainage **End mode**,

with an offset from the **Hinge** string of **Offset** and with a height of **End RL**.

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative **<-Grade** and going through the last vertex.

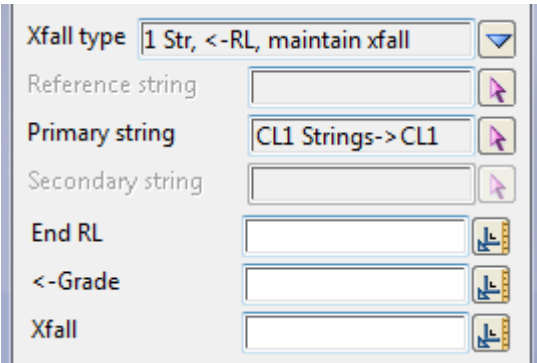

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Continue to the next choice [1 String, End RL and Grade, Fixed Xfall](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

1 String, End RL and Grade, Fixed Xfall

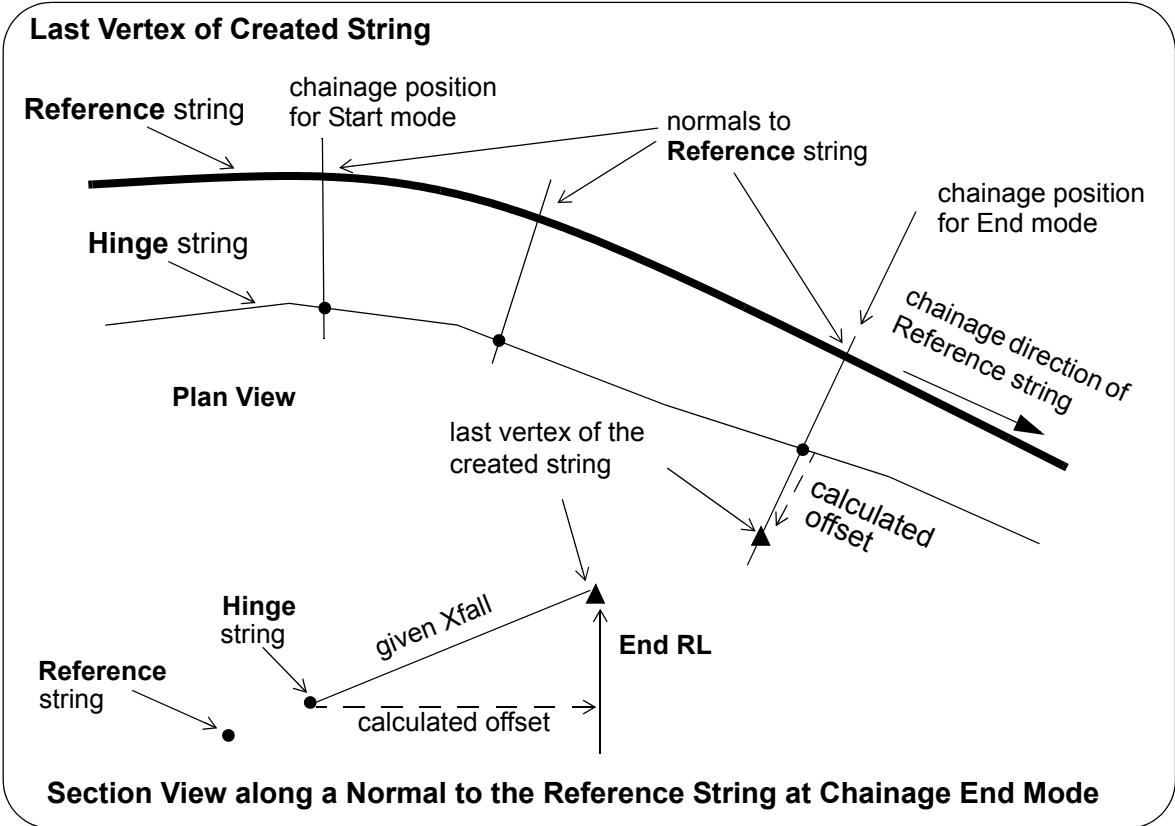

This option requires a **Hinge** string, an **End RL** and backward **Grade**, a **Xfall**, and an **optional Reference** string.

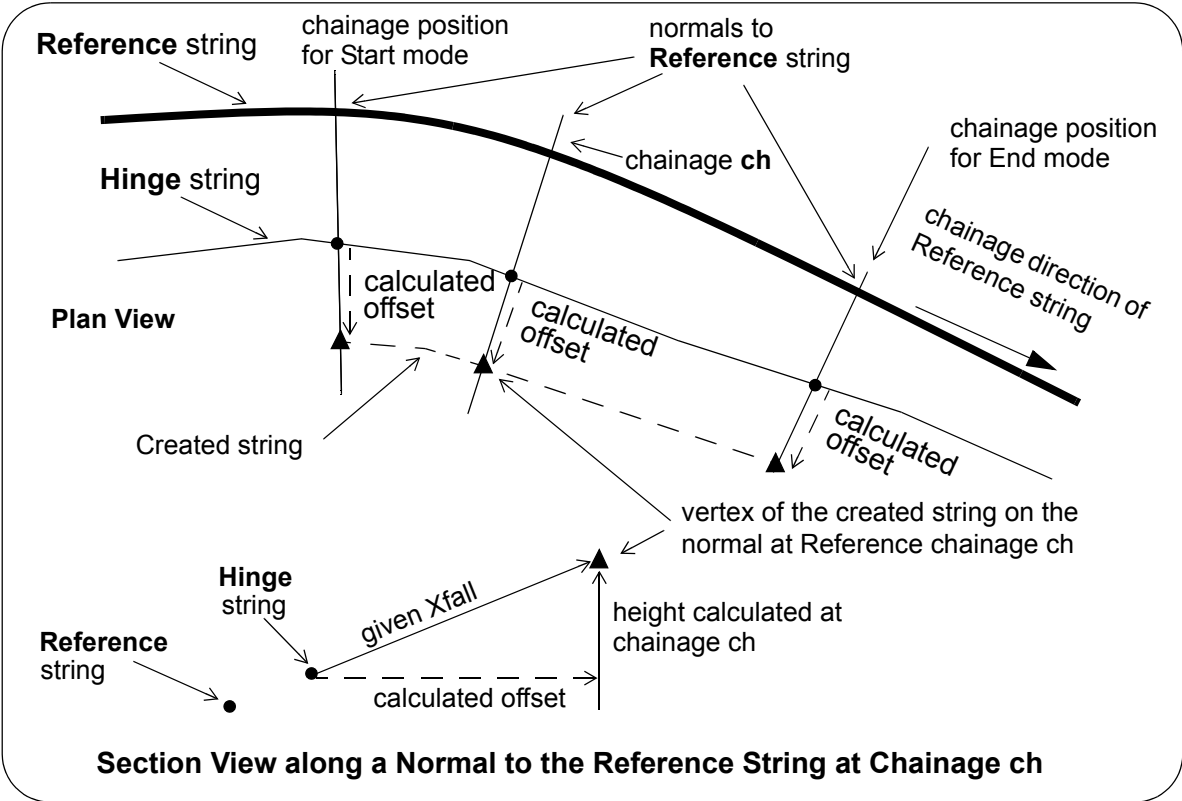

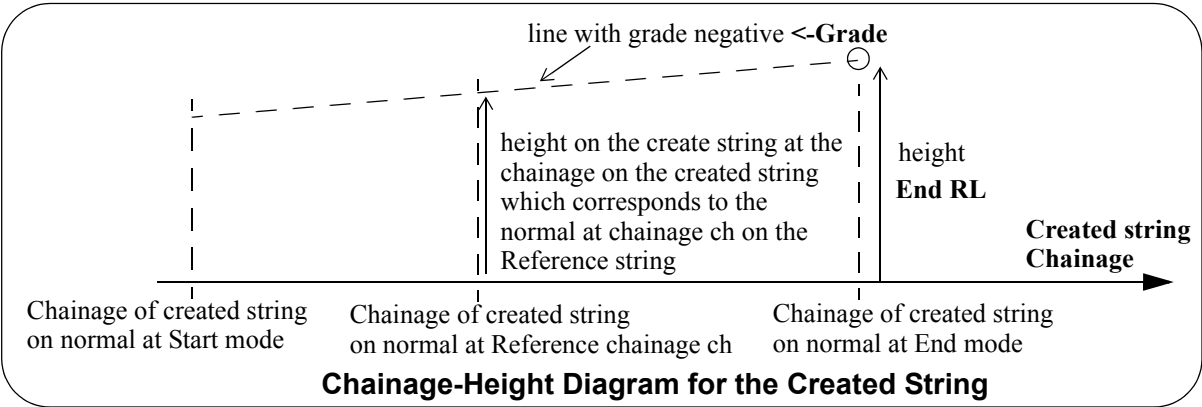

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Reference string and has a **height End RL**. The offset for the last vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **End RL**.

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative **<-Grade** and going through the last vertex.

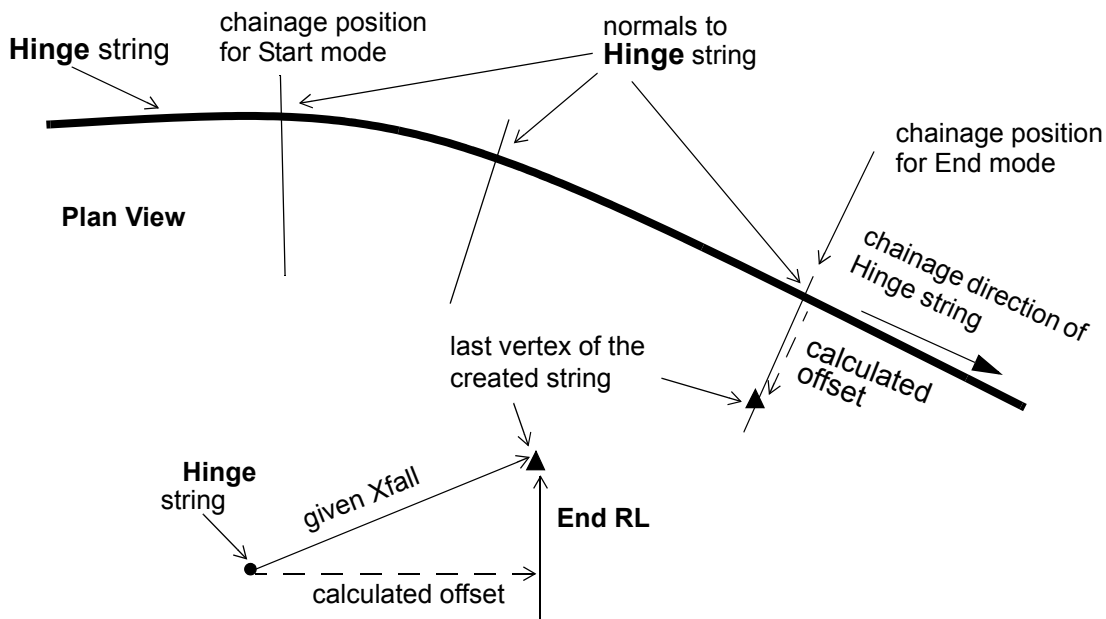

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Hinge string and has a **height End RL**. The offset for the last vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **End RL**.

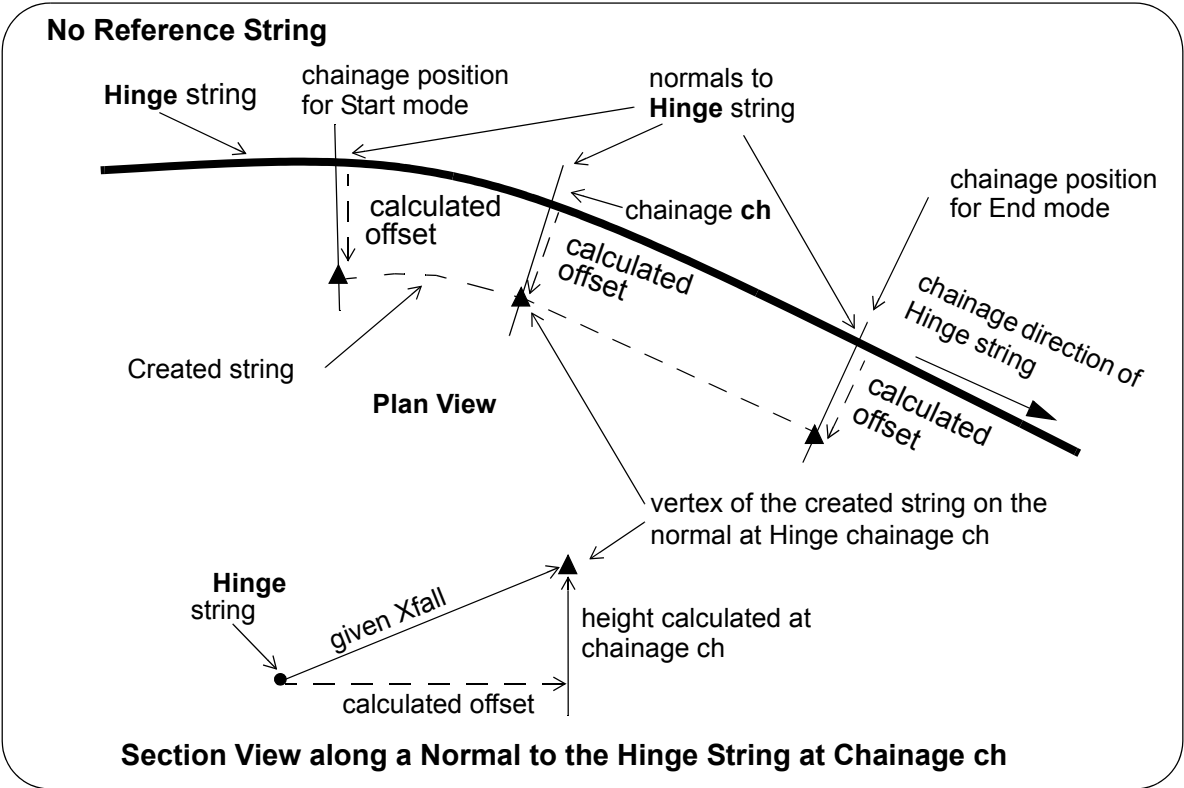

Last Vertex of Created String - No Reference String

Section View along a Normal to the Hinge String at Chainage End Mode

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative **<-Grade** and going through the last vertex.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Xfall type 2 Str, RL->, =width, norm first

Reference string

Primary string

Secondary string

Start RL

Grade->

This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

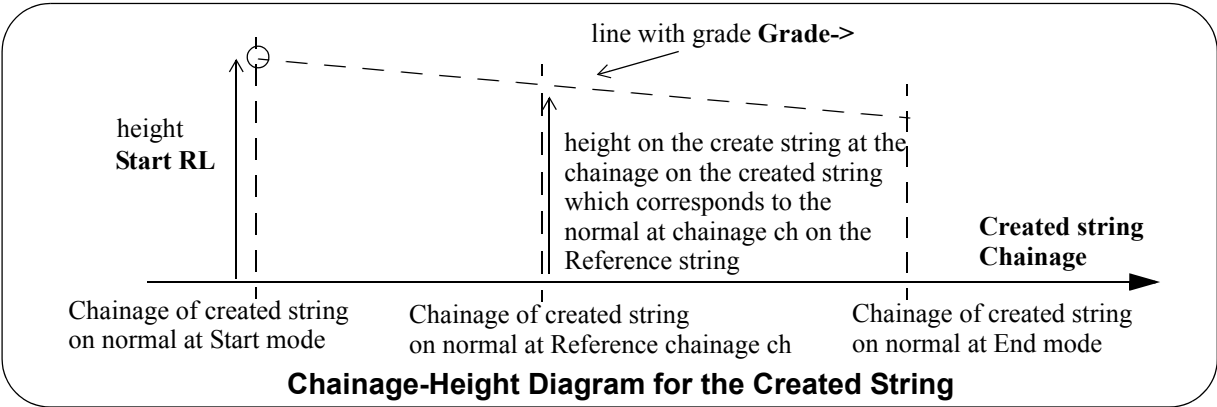

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference** string and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

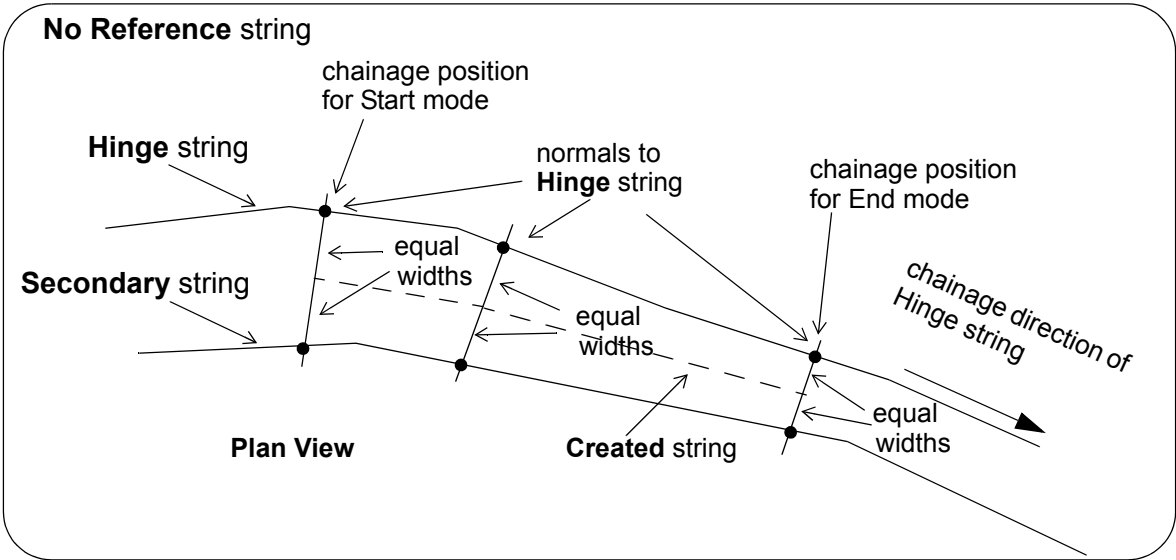

The **height** of the vertex on the section at chainage *ch*, is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal to Start mode, Start RL).

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

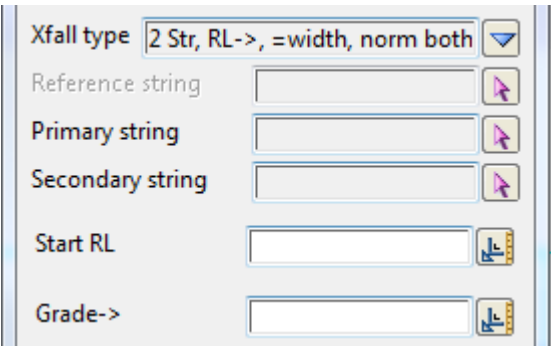

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade **Grade**-> and going through the point (normal to Start mode, Start RL).

Continue to the next choice [2 Strings, Start RL & Grade, Equal Width and Normal to Both](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Start RL & Grade, Equal Width and Normal to Both

This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an optional **Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.

The **height** of the vertex on the section at chainage *ch*, is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal to Start mode, Start RL).

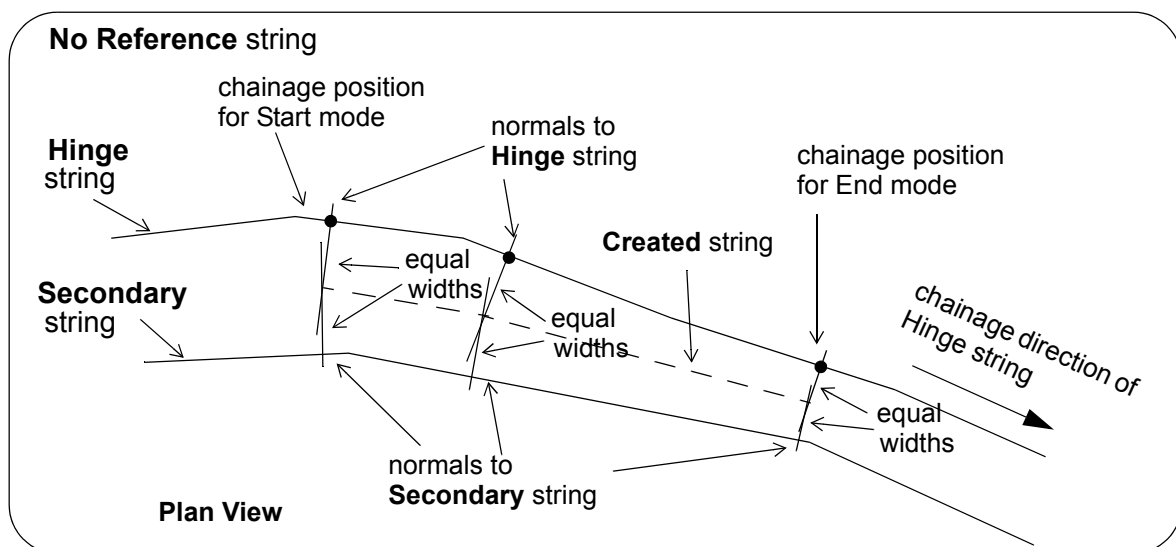

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge** string. The vertices of the created string lie on these normals.

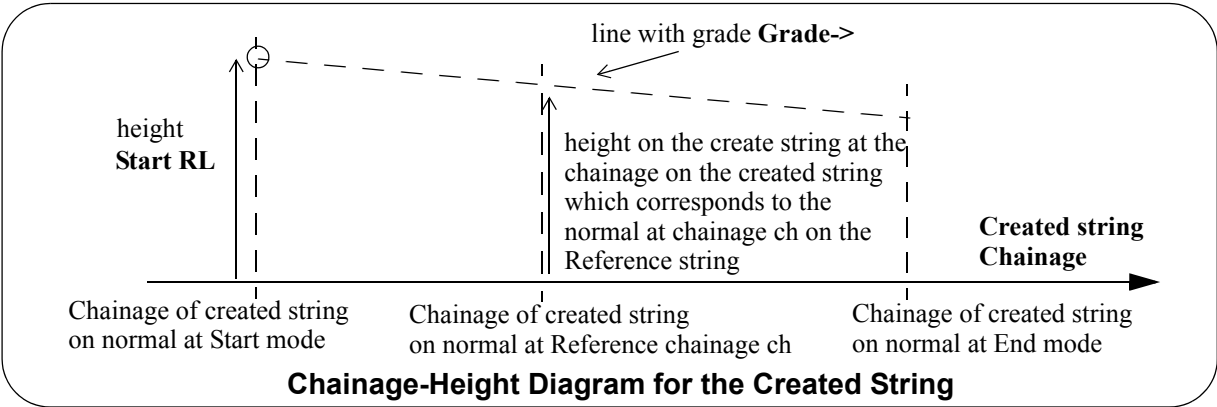

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a **normal** to the **Secondary** string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Hinge string so that the distance from the Hinge string is the same as the distance from the **Secondary** string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.

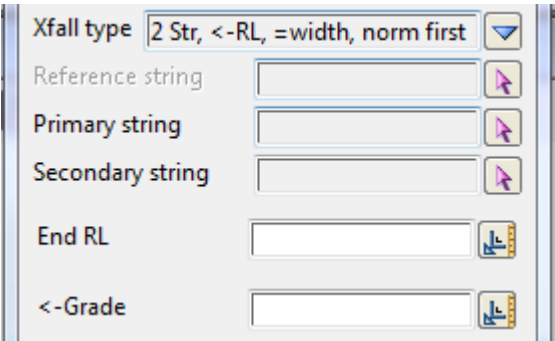

The **height** of the vertex on the section at chainage ch , is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal to Start mode, Start RL).

Continue to the next choice [2 Strings, End RL & Grade, Equal Width, Normal to Reference or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, End RL & Grade, Equal Width, Normal to Reference or Hinge String

This option requires a **Hinge** and a **Secondary** string, a **End RL** and backward **Grade**, and an **optional Reference** string.

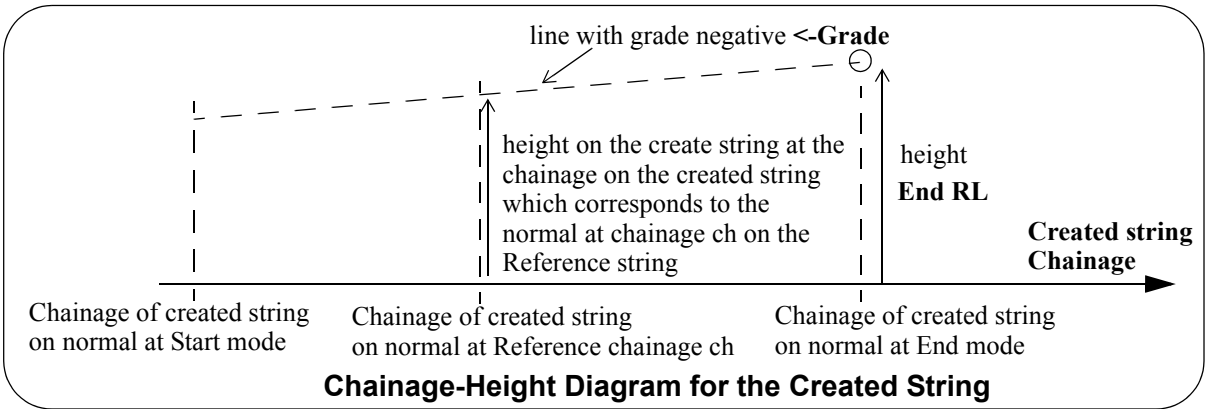

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference** string and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

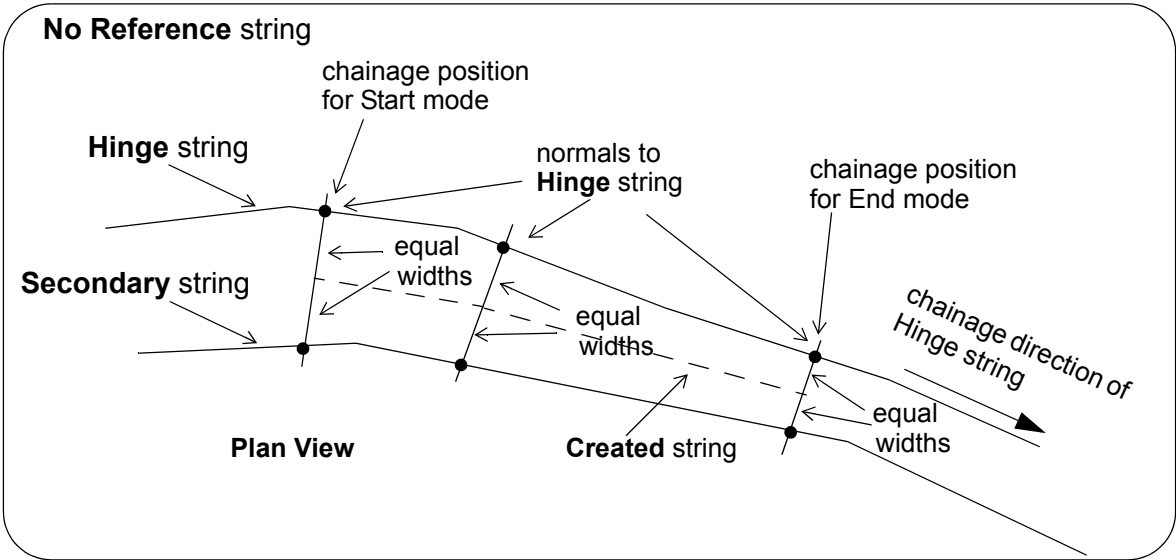

The **height** of the vertex on the section at chainage *ch*, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

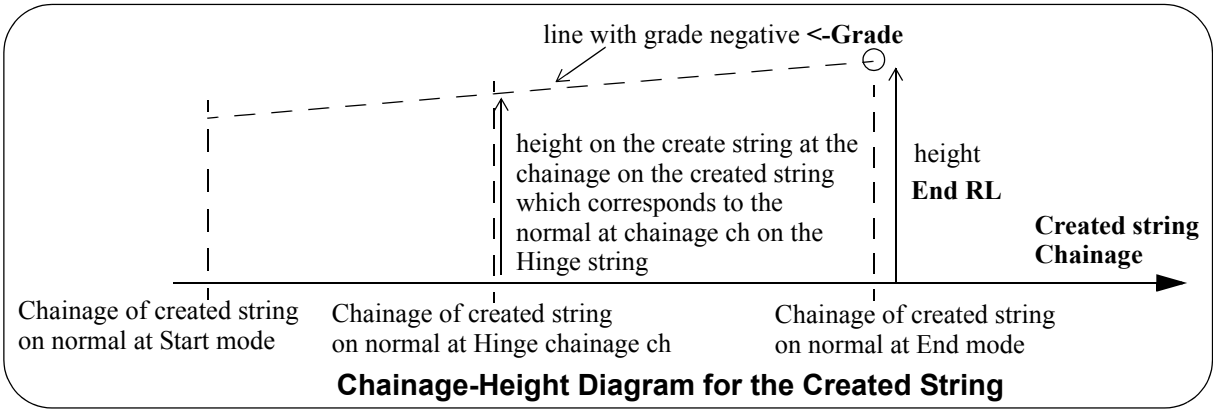

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary string**. The vertices of the created string lie on these normals.

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and the Secondary string.

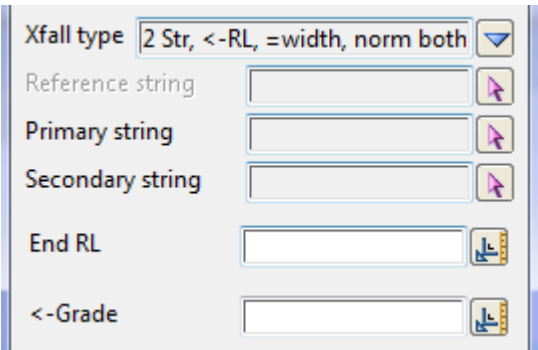

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative <-Grade and going through the point (normal to End mode, End RL).

Continue to the next choice [2 Strings, End RL & Grade, Equal Width and Normal to Both](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, End RL & Grade, Equal Width and Normal to Both

This option requires a **Hinge** and a **Secondary** string, an **End RL** and backward **Grade**, and an optional **Reference** string.

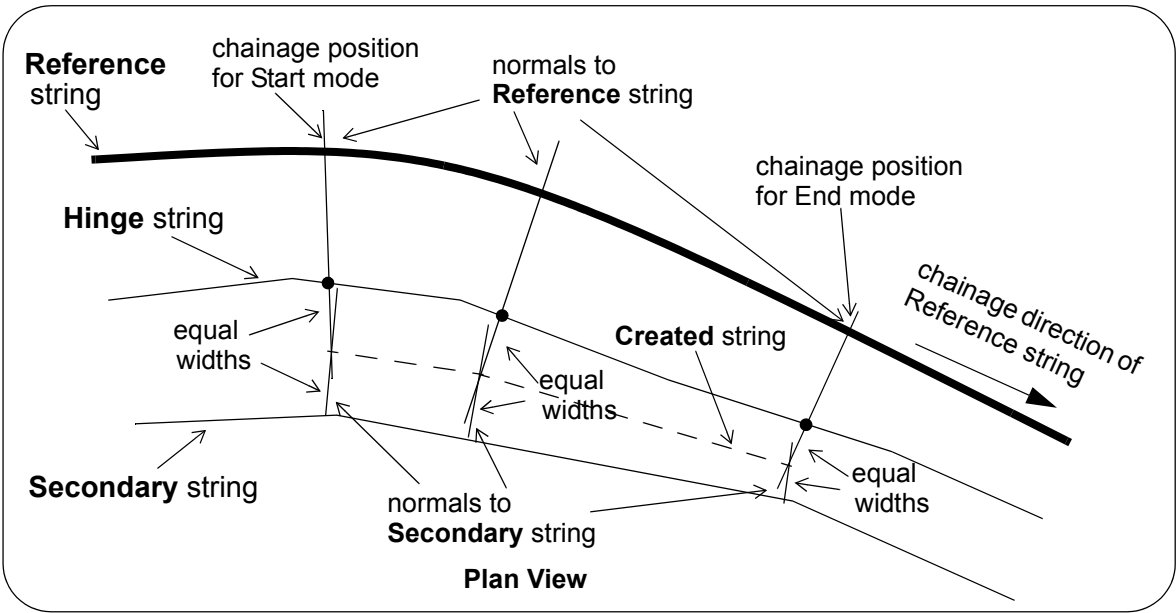

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference** string and cutting the **Hinge** string. The vertices of the created string lie on these normals.

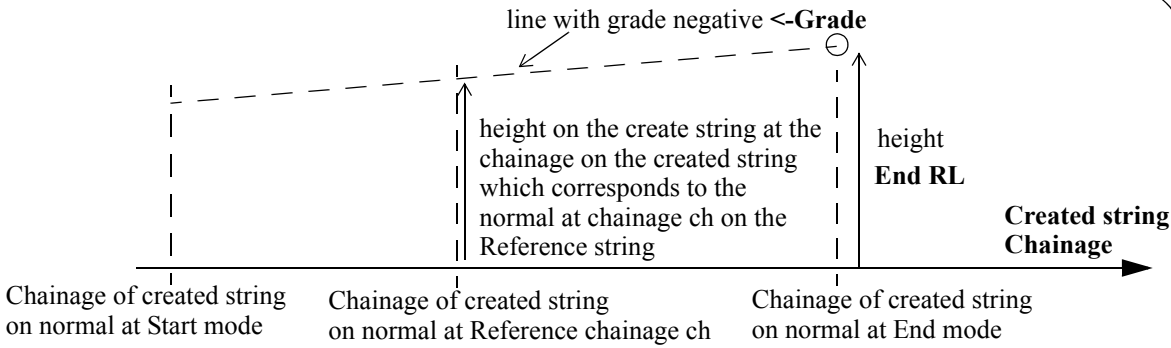

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a normal to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.

The **height** of the vertex on the section at chainage *ch*, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

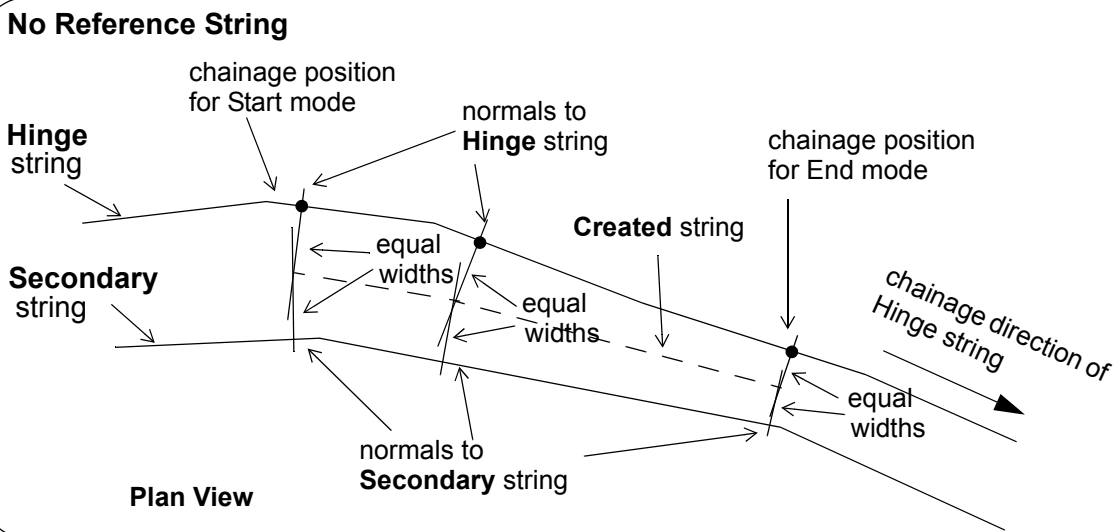

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge** string. The vertices of the created string lie on these normals.

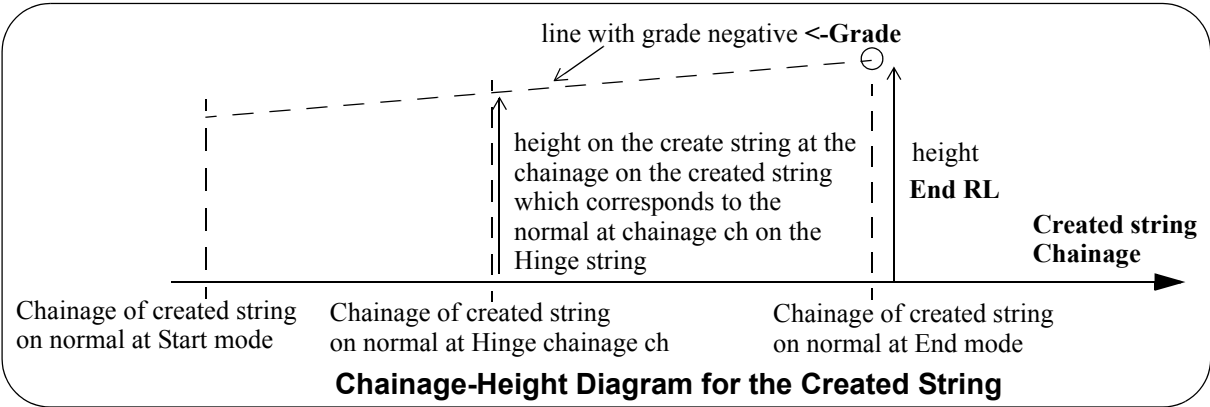

On this section, the plan position of the vertex of the new string is created so that it is halfway between the Hinge string and a **normal** to the Secondary string.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Hinge string so that the distance from the Hinge string is the same as the distance from the Secondary string. This gives the plan position of the new vertex of the new string.

Note - it may not be possible to find such an intersection point.

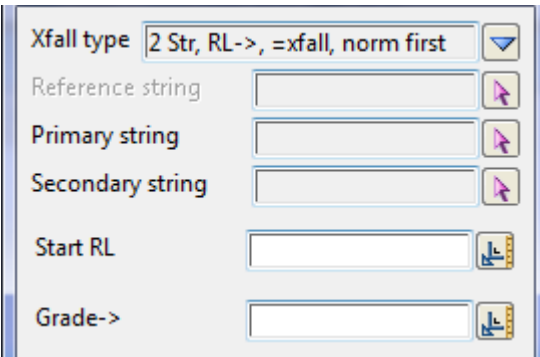

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

Continue to the next choice [2 Strings, Start RL & Grade, Equal Xfall, Normal to Reference or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Start RL & Grade, Equal Xfall, Normal to Reference or Hinge String

This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an **optional Reference** string.

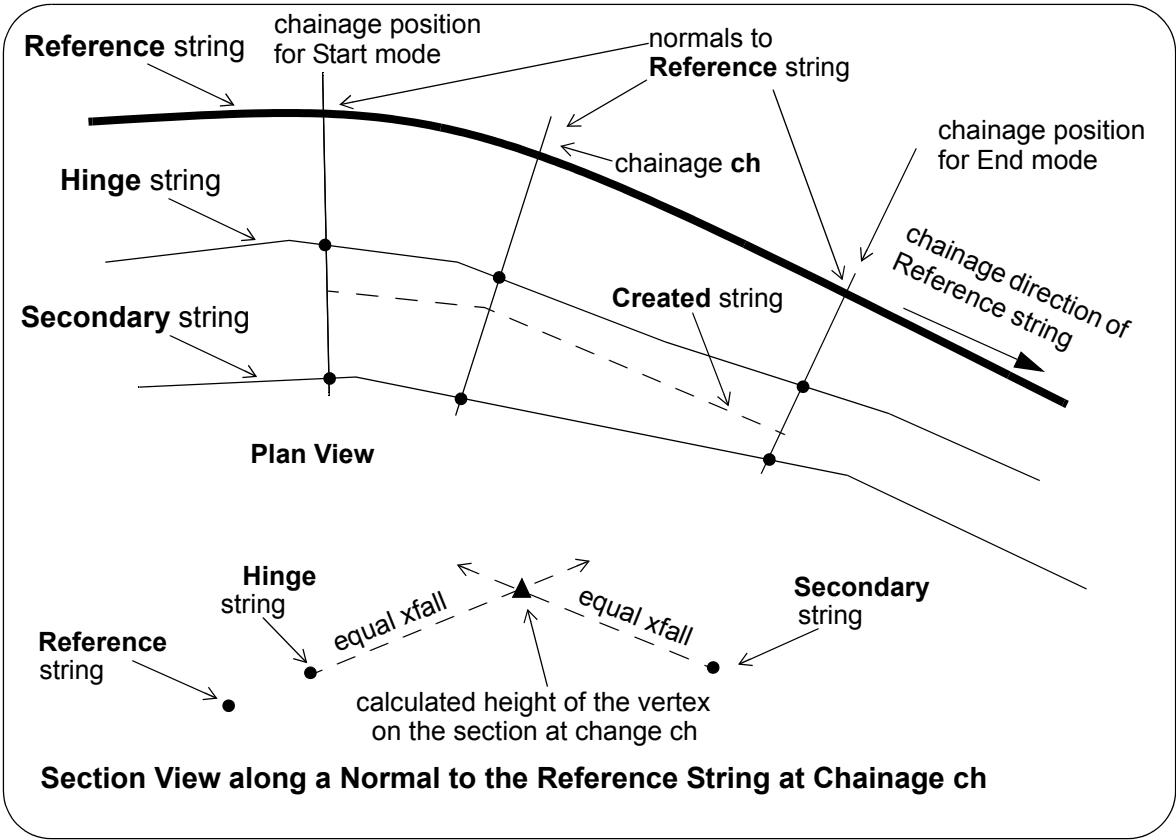

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal at Start mode, Start RL).

On the section normal to the Reference string at chainage ch, the plan position of the vertex (with the calculated height) is such that the absolute value of the xfall from the Hinge string to the vertex, and the vertex to the Secondary string, is the same. This gives the plan position of the new vertex of the new string.

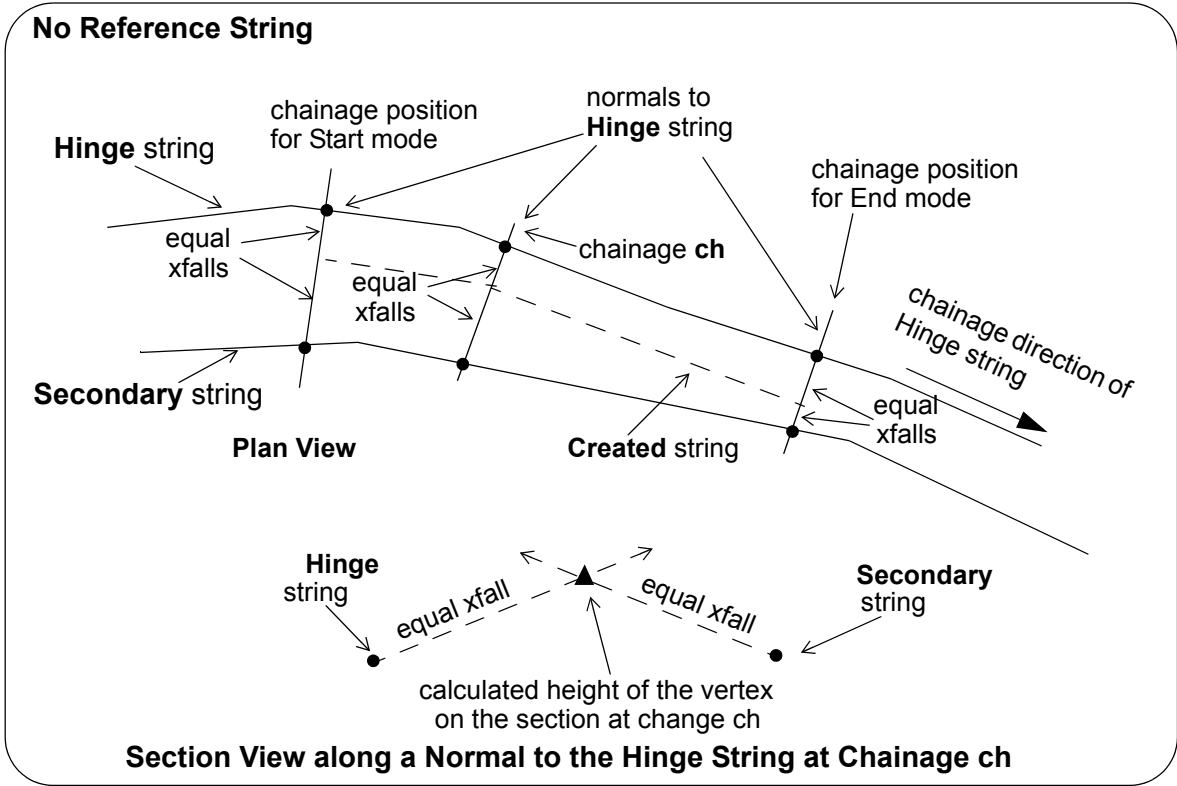

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary string**. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal at Start mode, Start RL).

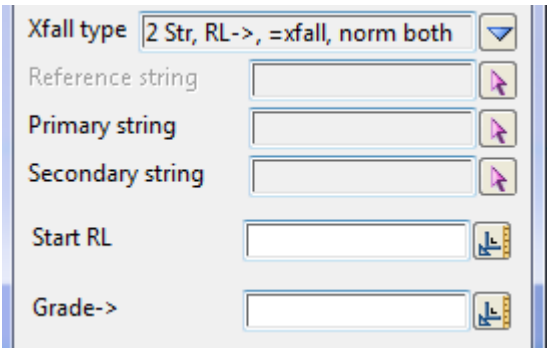

On the section normal to the Hinge string at chainage ch, the plan position of the vertex (with the calculated height) is such that the absolute value of the xfall from the Hinge string to the vertex, and the vertex to the Secondary string, is the same. This gives the plan position of the new vertex of the new string.

Continue to the next choice [2 Strings, Start RL & Grade, Equal Xfall and Normal to Both](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Start RL & Grade, Equal Xfall and Normal to Both

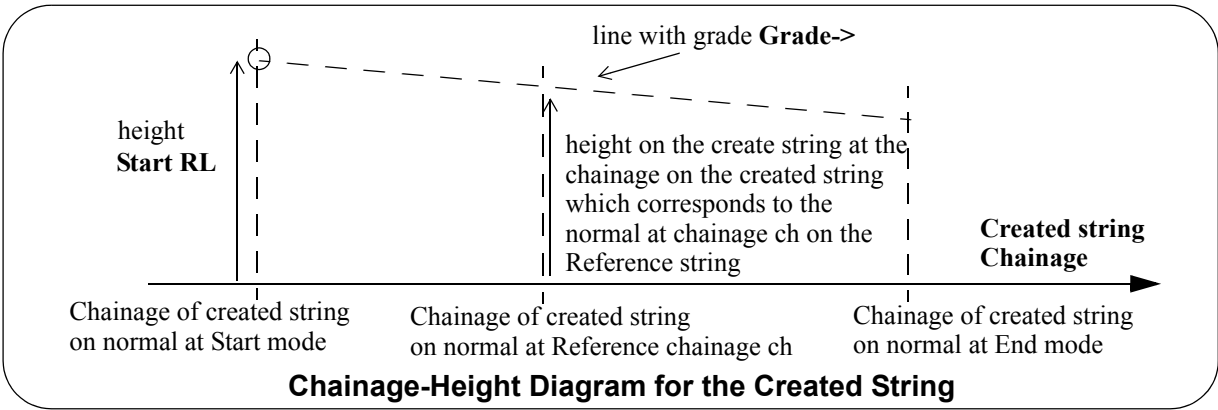

This option requires a **Hinge** and a **Secondary** string, a **Start RL** and forward **Grade**, and an optional **Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal at Start mode, Start RL).

On the section at Reference chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary** string, is the same.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.

Reference String NOT Selected

If a **Reference string** is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge string**, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The height of the vertex of the created string on the section at chainage ch , is defined in (created string chainage, height) space, and is on the line with grade **Grade->** and going through the point (normal at Start mode, Start RL).

On the section at Hinge chainage ch , the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary string**, is the same.

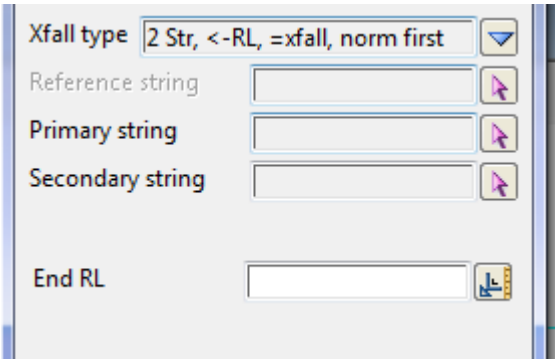

That is, a normal to the **Secondary string** is created that intersects in plan with the section from the Hinge string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.

Continue to the next choice [2 Strings, End RL & Grade, Equal Xfall, Normal to Reference or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, End RL & Grade, Equal Xfall, Normal to Reference or Hinge String

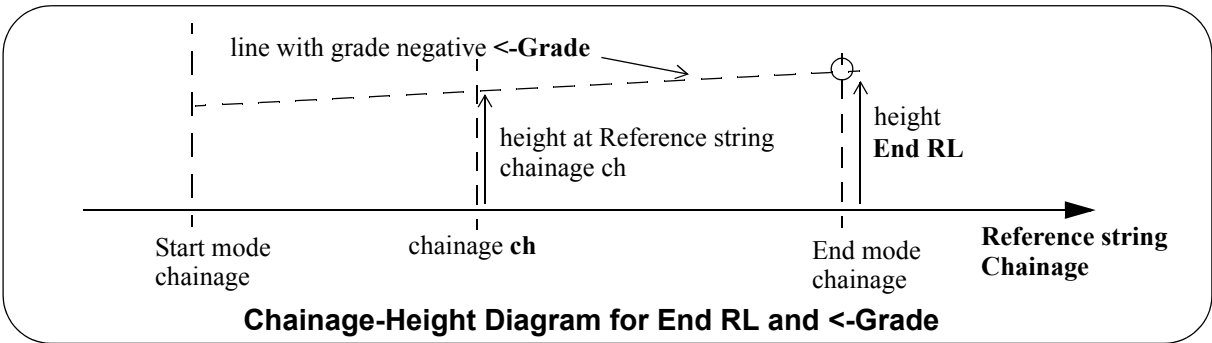

This option requires a **Hinge** and a **Secondary** string, a **End RL** and backward **Grade**, and an **optional Reference** string.

The height of the vertex (of the new string) on the section at chainage *ch*, is in (Reference string chainage, height) space, on the line with grade of negative **<-Grade** and going through the point (End mode, End RL).

That is,

the "height at *ch*" = End RL - <-Grade * (End mode - *ch*) / (End mode - Start mode) / 100

On the section normal to the Reference string at chainage *ch*, the position of the vertex with the calculated height is such that the absolute value of the xfall from the Hinge string to the vertex, and the absolute value of the xfall from the vertex to the Secondary string, are the same.

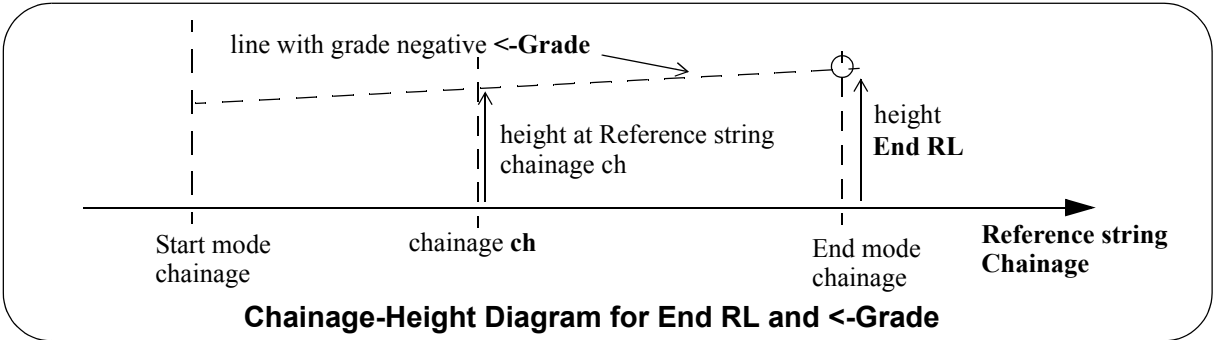

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to **Hinge** string and at each chainage (ch), a section is taken **normal** (perpendicular) to the **Hinge** string and cutting the **Secondary** strings.

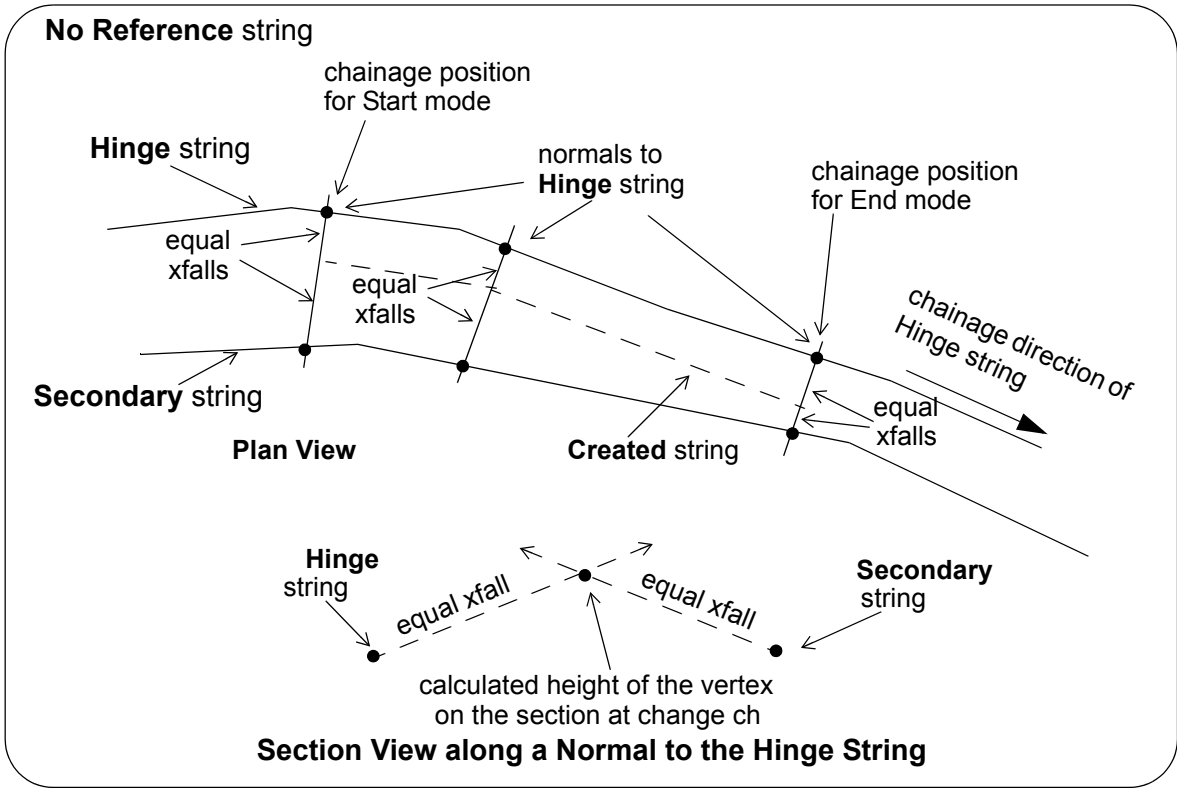

The height of the vertex (of the new string) on the section at chainage ch, is in (Hinge string chainage, height) space, on the line with grade of negative **<-Grade** and going through the point (End mode, End RL).

That is,

the "height at ch" = End RL - <-Grade *(End mode - ch)/(End mode - Start mode)/100

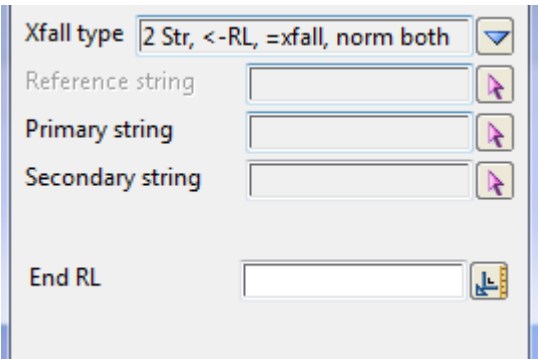

On the section normal to the Hinge string at chainage ch, the position of the vertex with the calculated height is such that the absolute value of the xfall from the Hinge string to the vertex, and the absolute value of the xfall from the vertex to the Secondary string, are the same.

Continue to the next choice [2 Strings, End RL & Grade, Equal Xfall and Normal to Both](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, End RL & Grade, Equal Xfall and Normal to Both

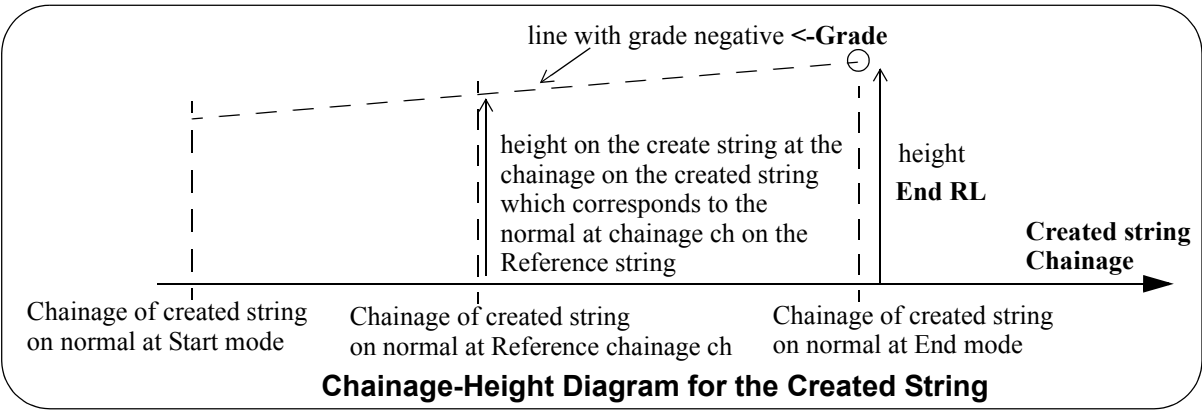

This option requires a **Hinge** and a **Secondary** string, an **End RL** and backward **Grade**, and an **optional Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** string. The vertices of the created string lie on these normals.

The **height** of the vertex on the section at chainage ch, is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

On the section at Reference chainage ch, the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary** string, is the same.

That is, a normal to the **Secondary** string is created that intersects in plan with the section from the Reference string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

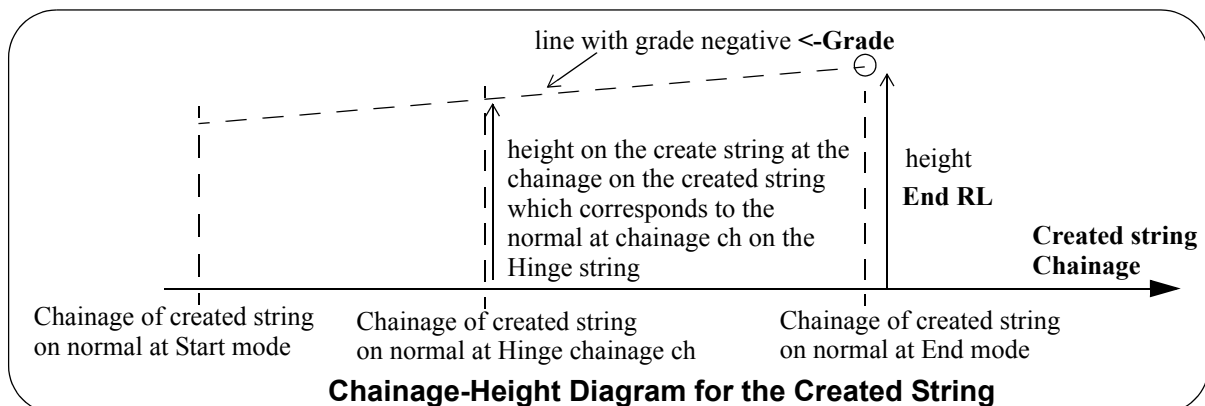

Note - it may not be possible to find such an intersection point.

Reference String NOT Selected

If a **Reference string** is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge string**, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **height** of the vertex on the section at chainage ch , is defined in (created string chainage, height) space, and is on the line with grade negative **<-Grade** and going through the point (normal to End mode, End RL).

On the section at Hinge chainage ch , the position of the vertex (with the calculated height) is such that the absolute value of the xfall from the vertex to the Hinge string, and the absolute xfall from the vertex to the **normal to the Secondary string**, is the same.

That is, a normal to the **Secondary string** is created that intersects in plan with the section from the Hinge string so that the absolute value of the xfall from the Hinge string to the vertex (with the calculated height), is the same as the absolute grade from the vertex to the Secondary string. This gives the plan position of the vertex of the created string.

Note - it may not be possible to find such an intersection point.

Continue to the next choice [2 Strings, Start Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Start Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String

Xfall type: 2 Str, RL->, xfall from cut sec

Reference string: []

Primary string: []

Secondary string: []

Start delta height: []

Grade->: []

This option requires a **Hinge** and a **Secondary** string, a **Start delta height** and forward **Grade**, and an **optional Reference** string.

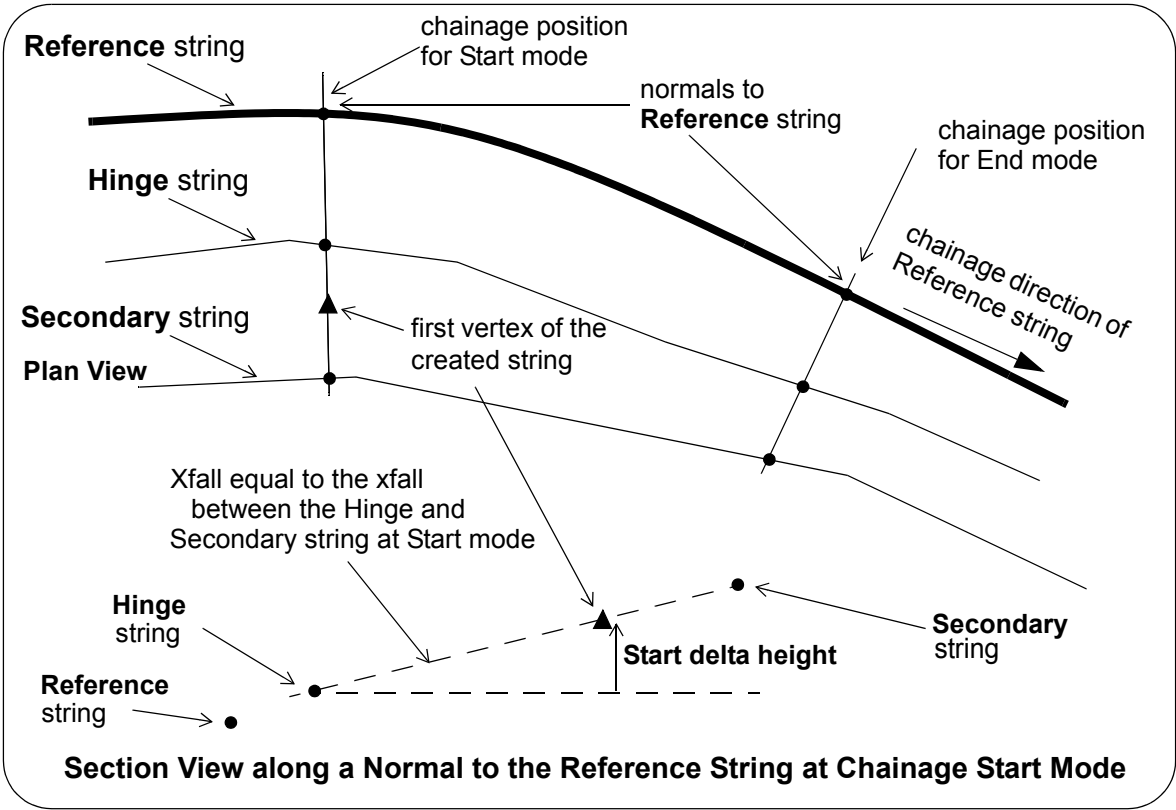

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, and its **height** is the height of the Hinge string on the Start mode normal, plus Start delta height.

height of first vertex = height of Hinge string on Start mode normal + Start delta height

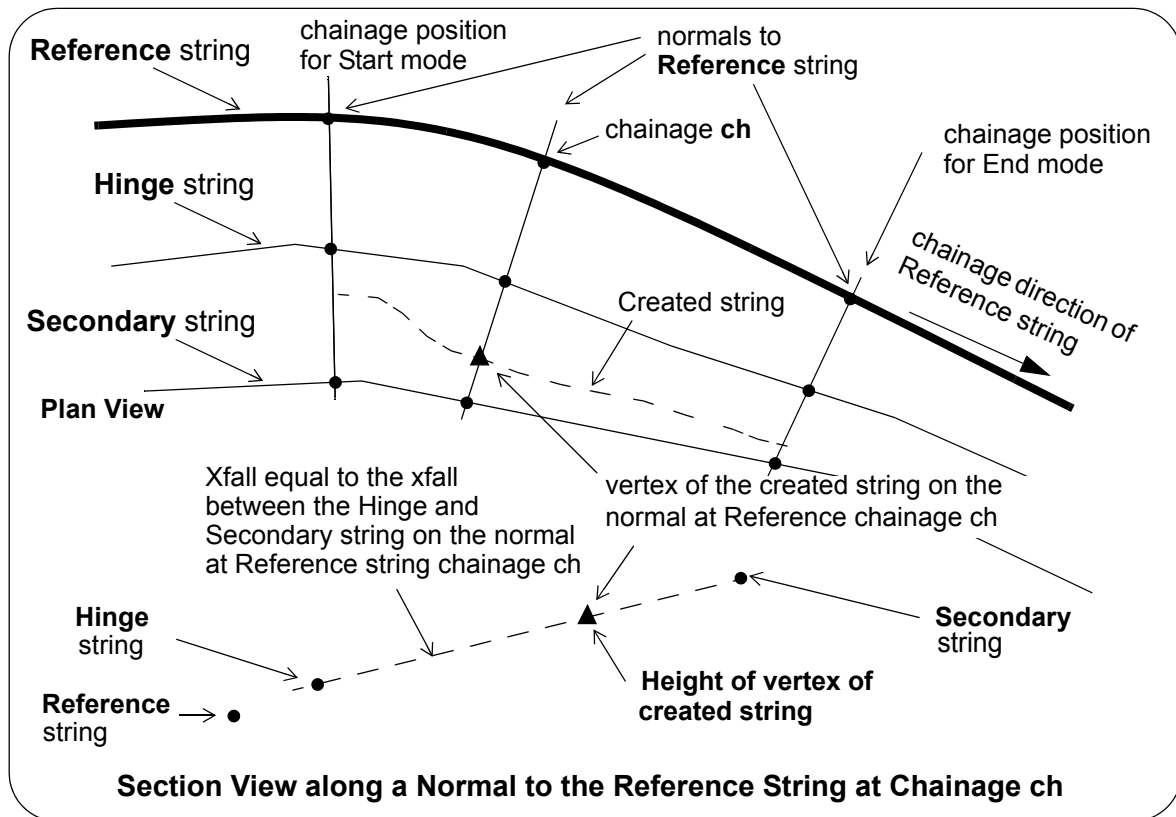

The plan position of the first vertex is on the Start mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **Start delta height**.

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade **Grade->** and going through the first vertex.

The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is such that it is on the line through the Hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge** string and cutting the **Secondary** string. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Hinge string at chainage **Start mode**, and its height is the height of the Hinge string on the Start mode normal, plus Start delta height.

height of first vertex = height of Hinge string on Start mode normal + Start delta height

The plan position of the first vertex is on the Start mode normal, and with an offset from the Hinge string such that the **Xfall** is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **Start delta height**.

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade **Grade->** and going through the first vertex.

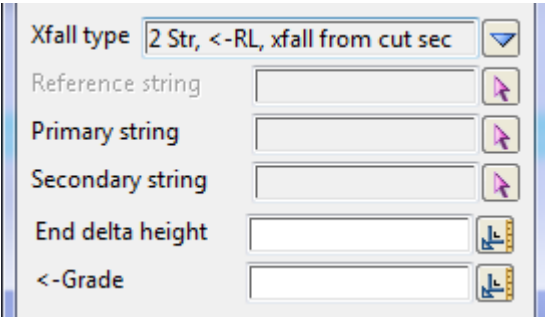

The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is such that it is on the line through the Hinge string with **xfall** equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.

Continue to the next choice [2 Strings, End Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, End Delta Height & Grade, Xfall from Secondary String, Normal to Reference or Hinge String

This option requires a **Hinge** and a **Secondary** string, an **End delta height** and backward **Grade**, and an **optional Reference** string.

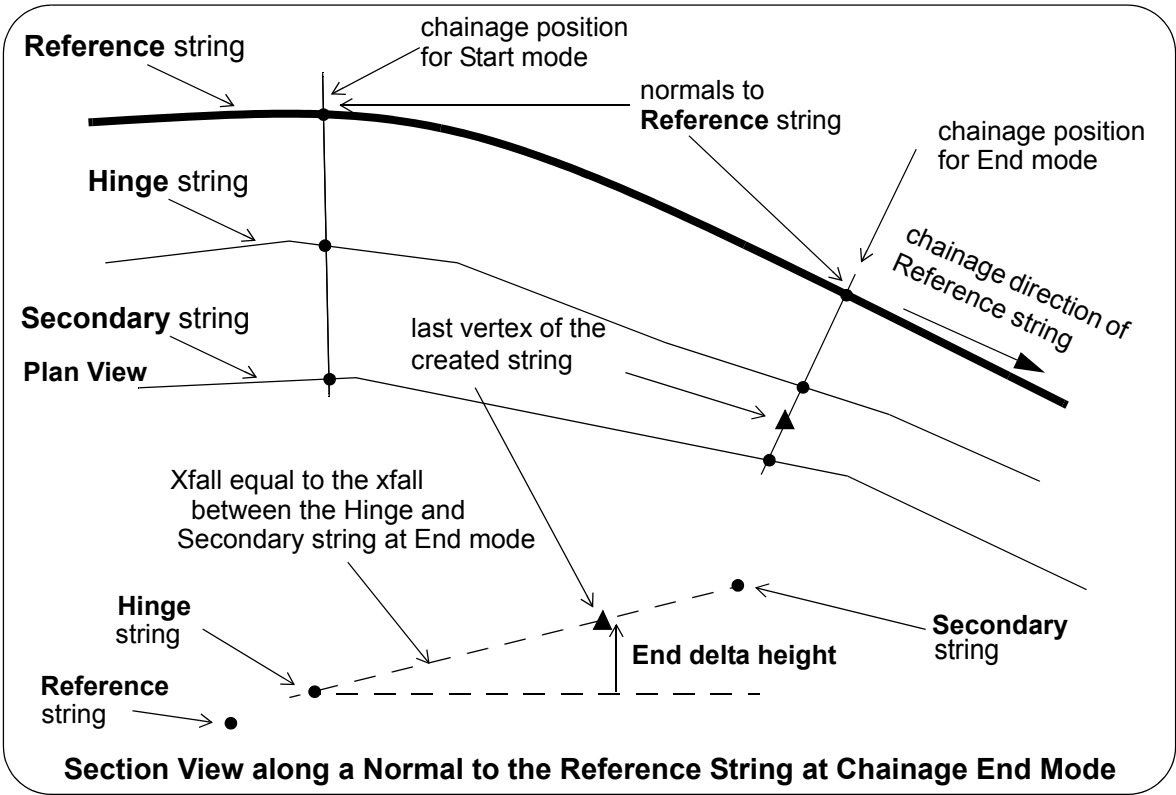

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Reference string at chainage **End mode**, and its height is the height of the Hinge string on the End mode normal, plus End delta height.

height of last vertex = height of Hinge string on End mode normal + End delta height

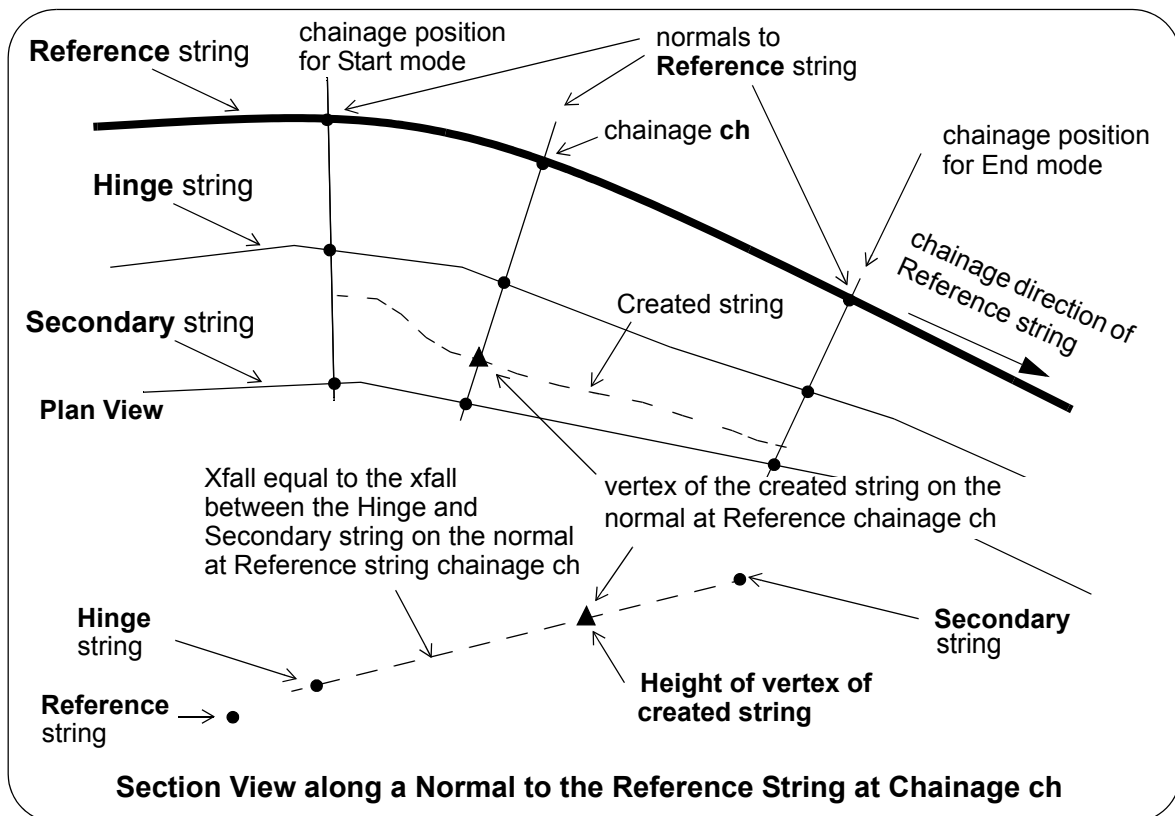

The plan position of the last vertex is on the End mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **End delta height**.

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative **<-Grade** and going through the last vertex.

The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is such that it is on the line through the Hinge string with **xfall** equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.

Reference String NOT Selected

If a **Reference string** is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge string**, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary string**. The vertices of the created string lie on these normals.

The **last vertex** of the created string is on the normal to the Hinge string at chainage **End mode**,

and its height is the height of the Hinge string on the End mode normal, plus End delta height.

height of last vertex = height of Hinge string on End mode normal + End delta height

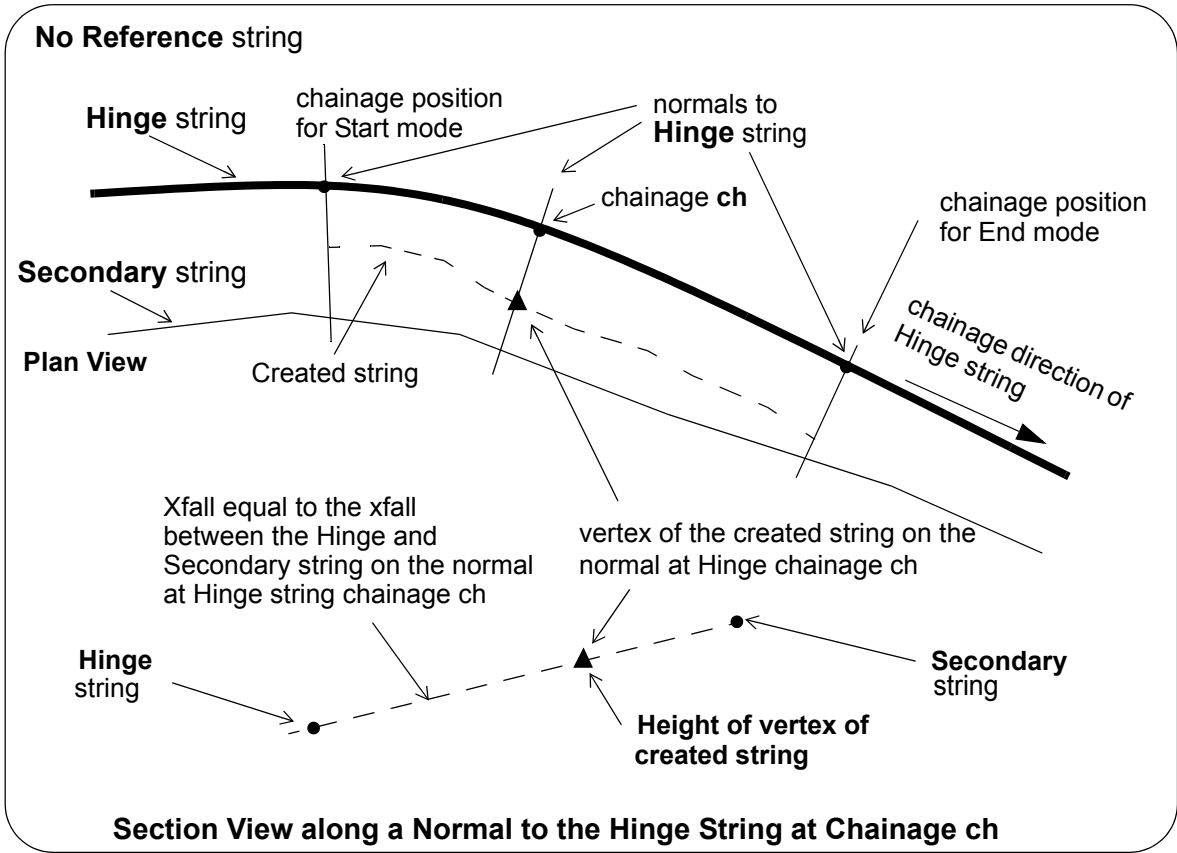

The plan position of the last vertex is on the End mode normal, and with an offset from the Hinge string such that the Xfall is equal to the **xfall between the Hinge and Secondary strings**, and the change of height from the Hinge string is **End delta height**.

The **heights** of the previous vertices of the created string are defined in (created string chainage, height) space, and lie on the line with grade negative **<-Grade** and going through the last vertex.

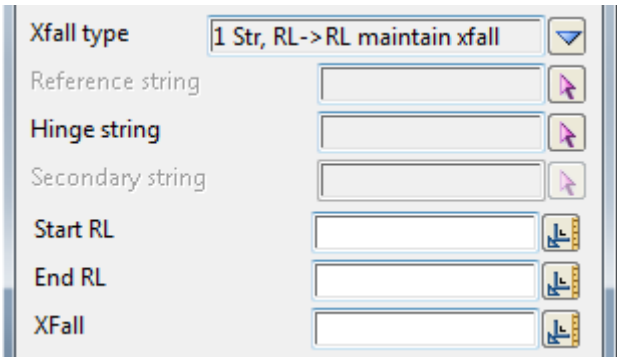

The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is such that it is on the line through the Hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and having the calculated height.

Continue to the next choice [1 String, Start RL and End RL, Fixed Xfall](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

1 String, Start RL and End RL, Fixed Xfall

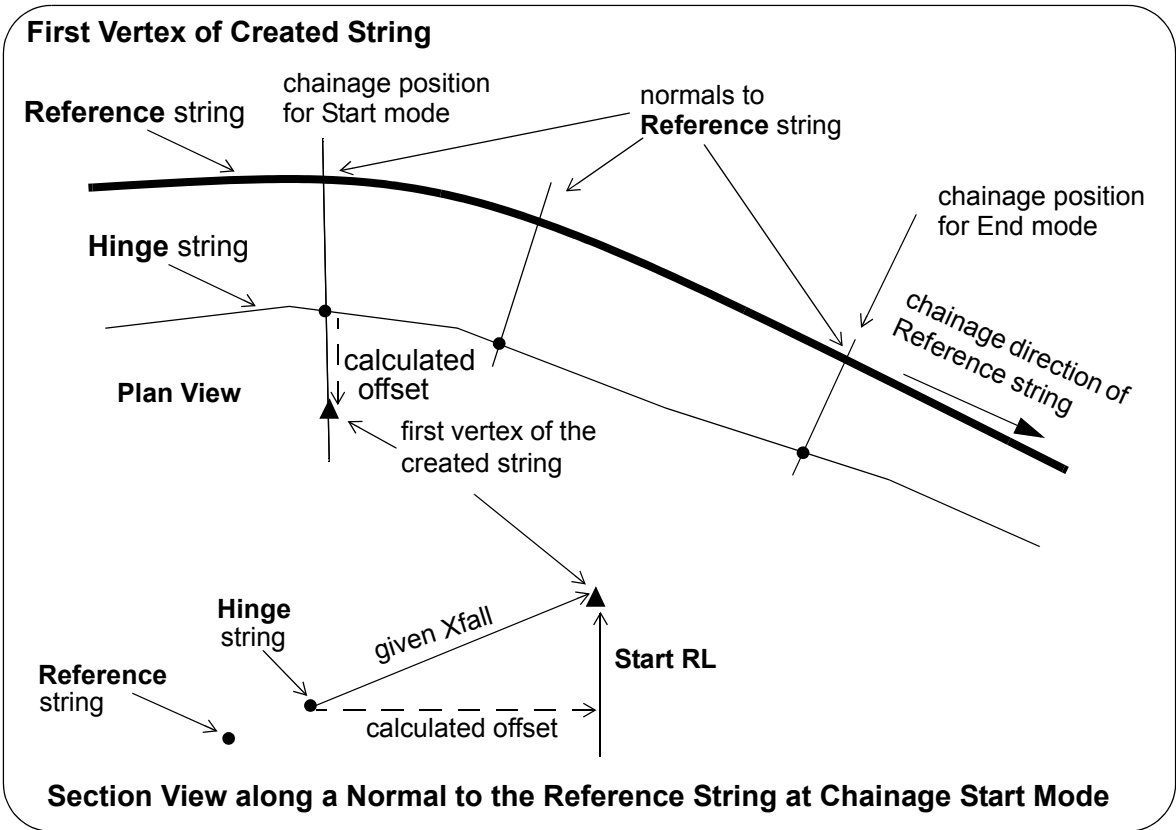

This option requires a **Hinge string**, a **Start RL** and **End RL**, a **Xfall**, and an optional **Reference string**.

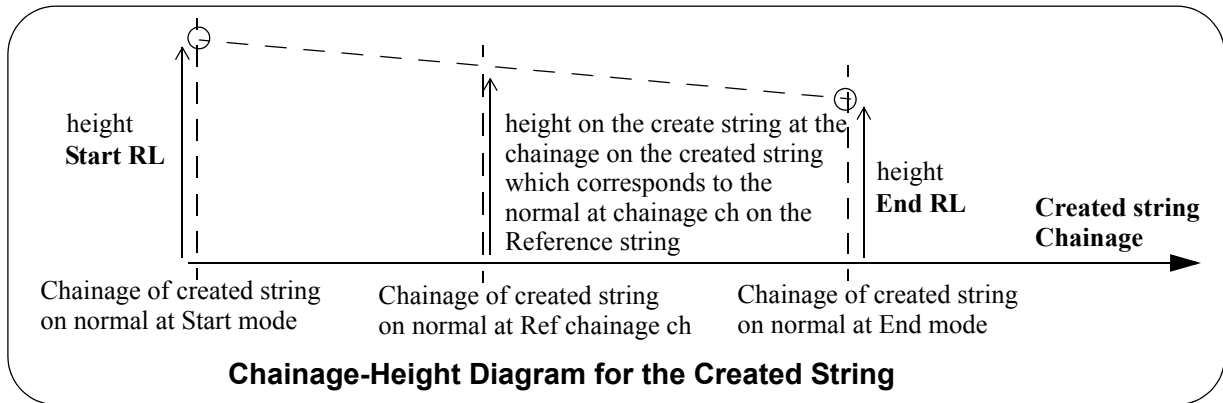

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge string**. The vertices of the created string lie on these normals.

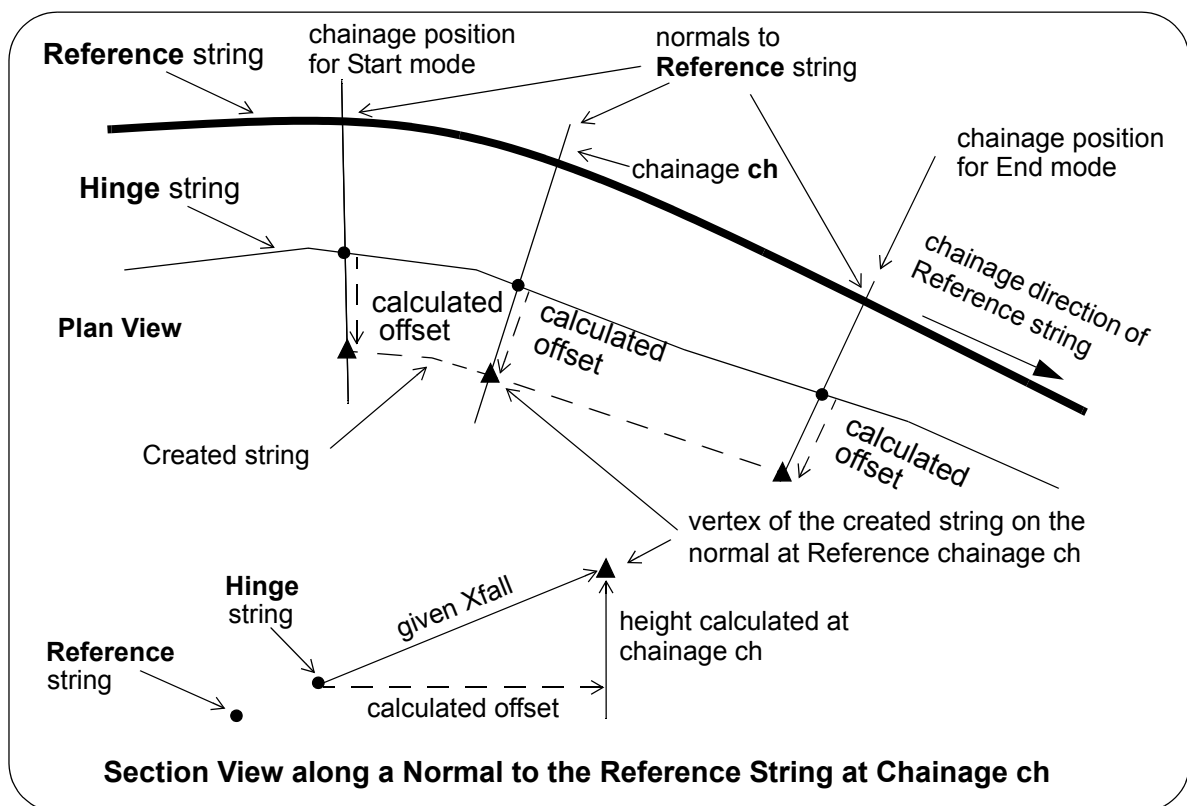

The **first vertex** of the created string is on the normal to the Reference string and has a **height Start RL**. The offset for the first vertex is calculated and is such that the given **Xfall** from Hinge string will give the vertex the height **Start RL**.

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL**, and ending with **End RL** on the normal at End mode.

The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is constructed by going out from the hinge string with **xfall** equal to the **Xfall**, and for an offset so that the height is equal to the required height at chainage **ch**.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Reference String NOT Selected

If a **Reference string** is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge string**, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string**. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Hinge string and has a **height Start RL**. The offset for the first vertex is calculated and is such that the given **Xfall** from Hinge string

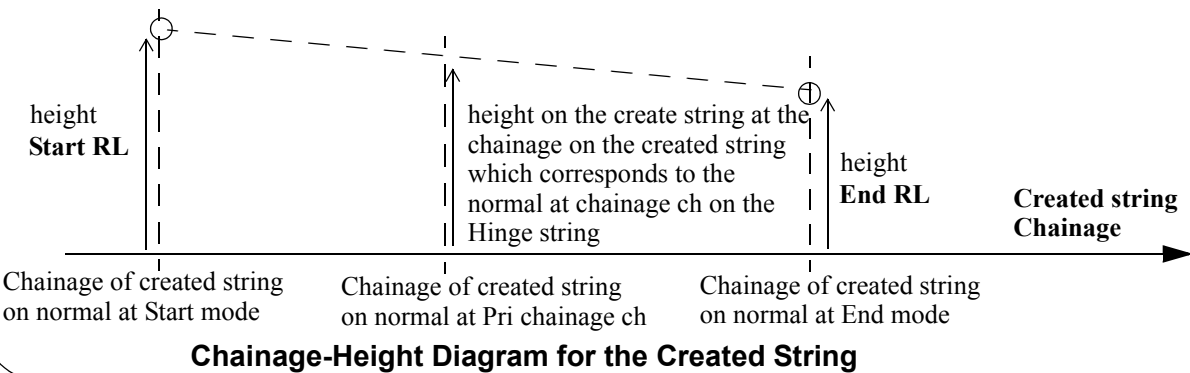

will give the vertex the height **Start RL**.

First Vertex of Created String - No Reference String

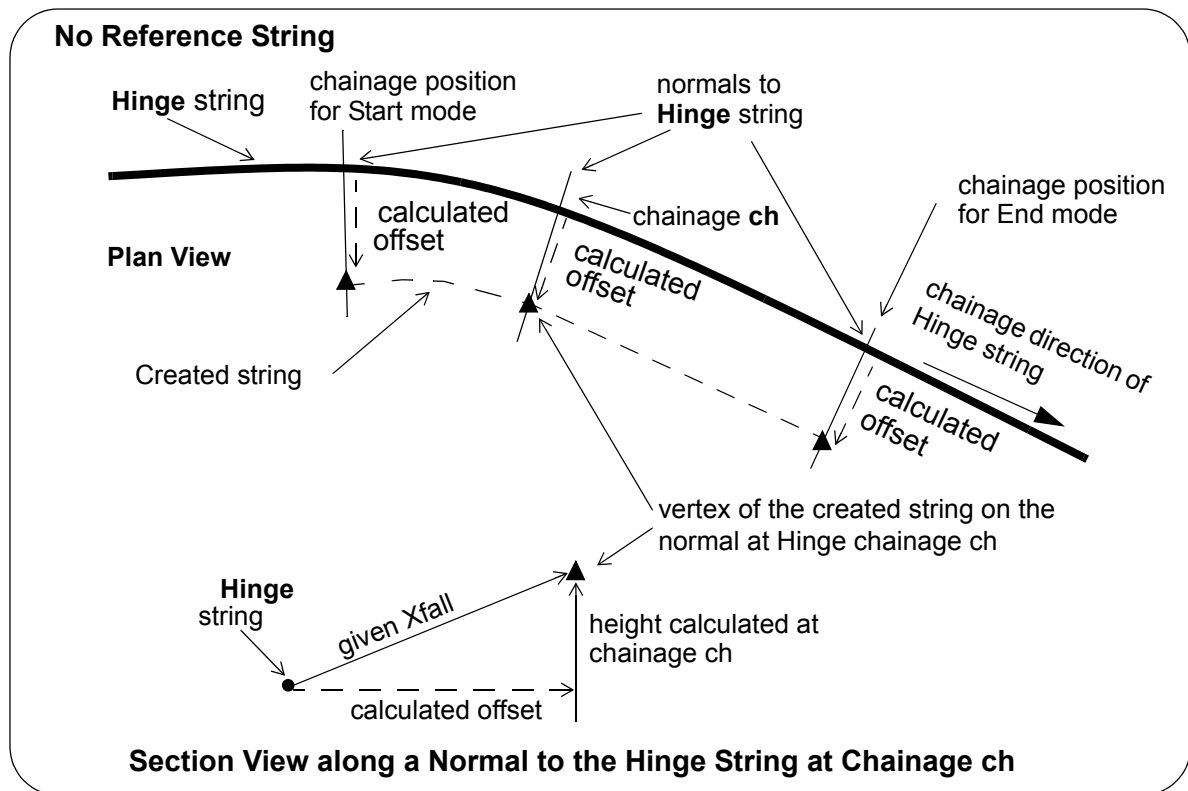

Section View along a Normal to the Hinge String at Chainage Start Mode

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL**, and ending with **End RL** on the normal at End mode.

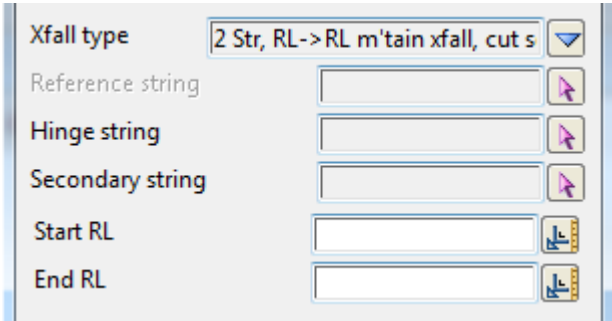

The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is constructed by going out from the hinge string with **xfall** equal to the **Xfall** and for an offset so that the height is equal to the required height at chainage **ch**.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#).

Continue to the next choice [2 Strings, Start RL and End RL, Xfall from Secondary String, Normal to Reference or Hinge String](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

2 Strings, Start RL and End RL, Xfall from Secondary String, Normal to Reference or Hinge String

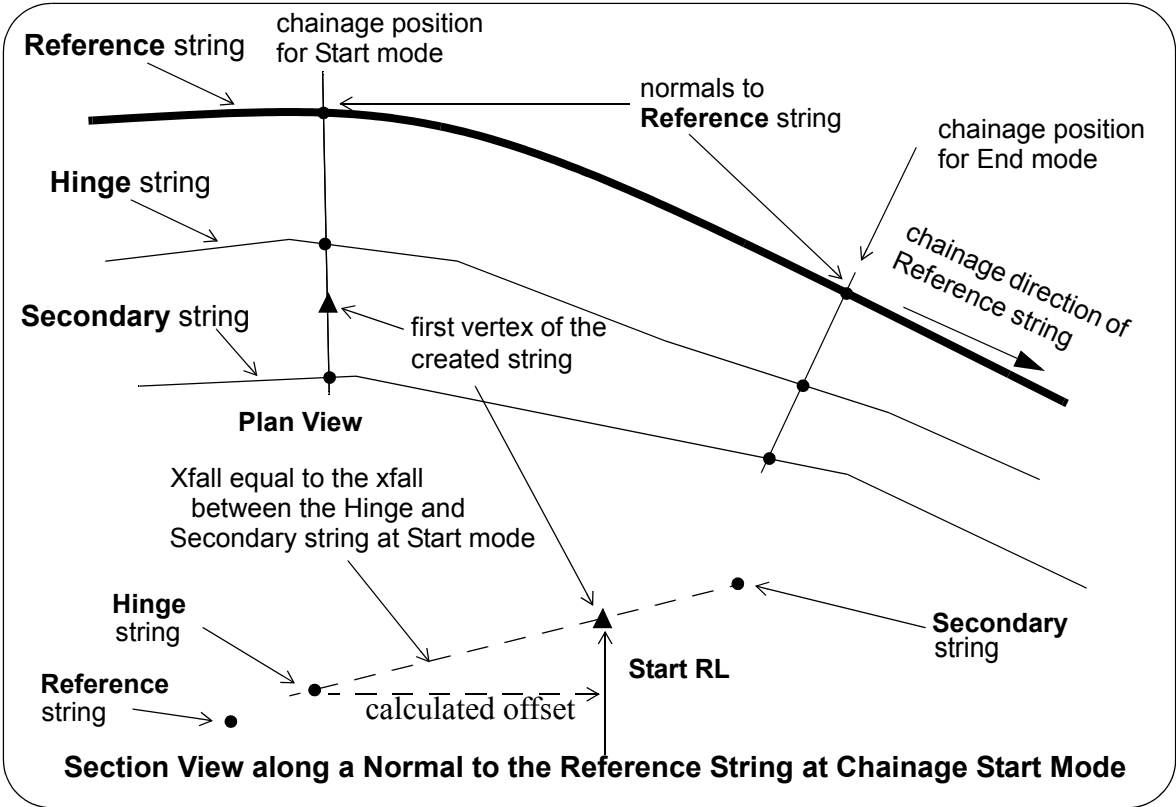

This option requires a **Hinge** and a **Secondary** string, a **Start RL** and **End RL**, and an **optional Reference** string.

Reference String Selected

If a **Reference** string is selected then the **Start mode** and **End Mode** refer to the **Reference** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Reference string** and cutting the **Hinge** and the **Secondary** strings. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Reference string at chainage **Start mode**, with height **Start RL**. The plan position of the first vertex is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and for the required offset so that the height is **Start RL**.

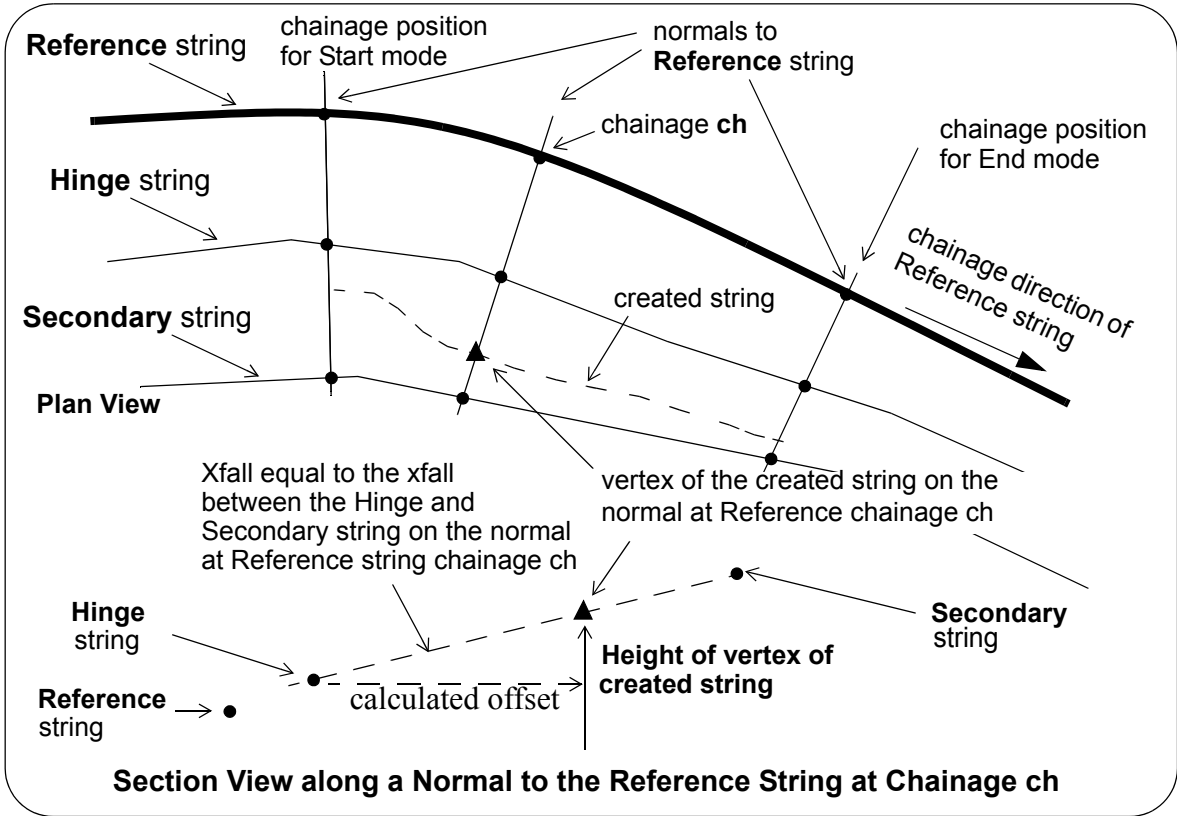

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL**, and ending with **End RL** on the normal

at End mode.

The **plan** position of the vertex of the created string on the normal at Reference chainage **ch** is constructed by going out from the hinge string with **xfall** equal to the **xfall between the Hinge and Secondary strings** at chainage **ch**, and for an offset so that the height is equal to the required height at chainage **ch**.

Reference String NOT Selected

If a **Reference** string is **NOT** selected then the **Start mode** and **End Mode** refer to the **Hinge** string, and at the given chainage interval between the Start mode and the End mode, sections are taken **normal** (perpendicular) to the **Hinge string** and cutting the **Secondary string**. The vertices of the created string lie on these normals.

The **first vertex** of the created string is on the normal to the Hinge string at chainage **Start**

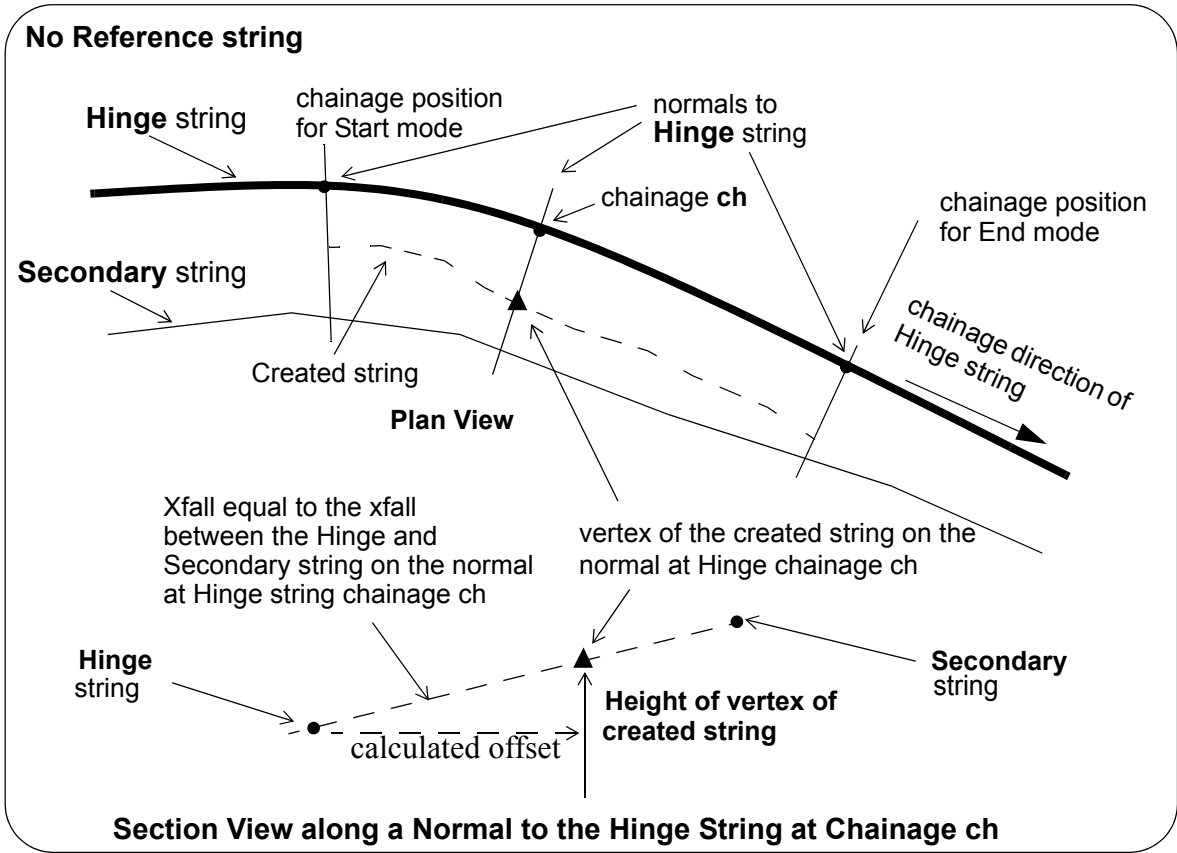

mode, with height **Start RL**. The plan position of the first vertex is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings**, and for the required offset so that the height is **Start RL**.

The **heights** of the subsequent vertices of the created string are defined in (created string chainage, height) space, and lie on the line with **Start RL**, and ending with **End RL** on the normal at End mode.

The **plan** position of the vertex of the created string on the normal at Hinge chainage **ch** is constructed by going out from the hinge string with xfall equal to the **xfall between the Hinge and Secondary strings** at chainage **ch**, and for an offset so that the height is equal to the required height at chainage **ch**.

Continue to the next section [More Roads](#) or return to [Xfall Types](#) or [String by Xfall and Grade](#).

Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade

Because of the number of different ways **Create by Xfall and Grade** can be used, there is a strict sign convention followed for heights, offsets and xfalls.

In all cases, a positive height or delta height is **up** and a negative height or delta height is **down**.

For any string, there is a definition for the left and right of a string (see [Left and Right Side of a String](#)), and there is a definition of Offset and Xfall for just that string (see [Offset and Offset Distance for a String](#).)

However, **Create by Xfall and Grade** involves not just one string, but often two or three strings, so needs a standard sign convention of Offset and Xfall.

In **Create by Xfall and Grade**, if a Reference string is selected, then the direction of the Reference string is paramount and the sign convention for Offset and Xfall for a Hinge and Secondary string refers back to the Reference string. See [Offset and Xfall - When Controlled by a Reference String](#).

In **Create by Xfall and Grade**, if a Reference string is NOT selected, then the direction of the Hinge string is paramount and the sign convention for Offset and Xfall for the Hinge and Secondary string refer back to the Hinge string. See [Offset and Xfall - No Reference String and Controlled by Hinge String](#).

See [Height](#)

See [Left and Right Side of a String](#).

See [Offset and Offset Distance for a String](#)

See [Xfall for a String](#)

See [Offset and Xfall - When Controlled by a Reference String](#)

See [Offset and Xfall - No Reference String and Controlled by Hinge String](#)

Height

For any string a positive height or delta height is up and a negative height or delta height is down.

Left and Right Side of a String

For any string:

the **right** side of the string is defined to be to the right of the string when travelling down the string in the **direction of the increasing chainage**.

the **left** side of the string is defined to be to the left of the string when travelling down the string in the **direction of the increasing chainage**.

Offset and Offset Distance for a String

Offset at chainage *ch* on a particular string is plan distance measured normal (perpendicular) to the string, starting at zero on the string and **positive** when going out to the **right** of the string, and **negative** when going out to the **left** of the string. Offset is only a (x,y) plane distance. It does not involve z values.

The **offset distance** of a point (x,y,z) from a particular string is the plan distance from the point (x,y) to the position on the string calculated by dropping the point (x,y) perpendicularly in the (x,y) plane onto the string. The offset distance is positive if the point (x,y,z) is on the right of the string, and negative if the point (x,y,z) is on the left of the string.

Xfall for a String

For **Xfall**:

a **xfall** is **positive** when it is going up when measured in the direction of increasing positive

offset. That is, it is going up when going to the **right** of the string.

a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset. That is, it is going down when going to the **right** of the string.

a **xfall** is **negative** when it is going up in the direction of increasing negative offset (decreasing positive offset). That is, it is going up when going to the **left** of the string.

a **xfall** is **positive** when it is going down in the direction of increasing negative offset (decreasing positive offset). That is, it is going down when going to the **left** of the string.

Offset and Xfall - When Controlled by a Reference String

Offset

When a Reference string is selected, the **Reference** string is used to determine the sign convention for Offset and Xfall for the Hinge and Secondary strings. Hence the direction of the Hinge and Secondary strings are not used.

When a Reference string is selected:

an **offset** is **positive** when it is going in the direction of increasing positive offset with respect to the Reference string. That is, it is moving in the direction of going to the **right** of the

Reference string.

an **offset** is **negative** when it is going in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is moving in the direction of going to the **left** of the Reference string.

Xfall

When a Reference string is selected:

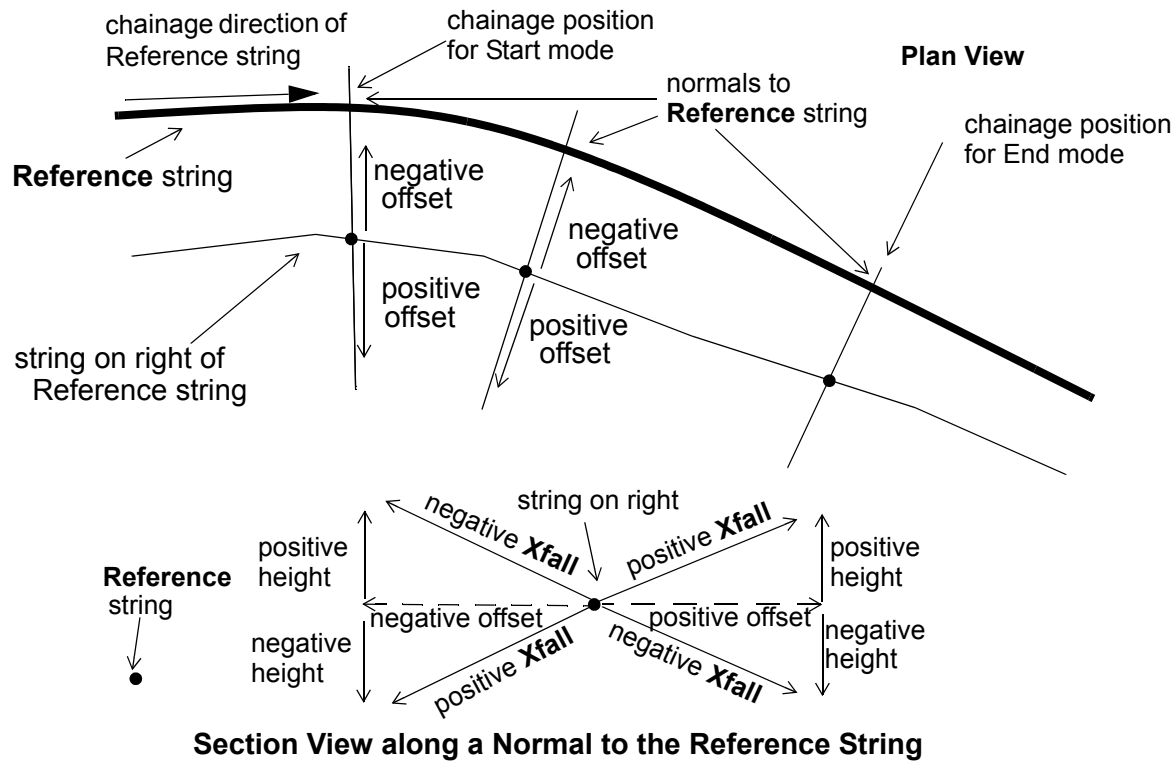

a **xfall** is **positive** when it is going up when measured in the direction of increasing positive offset with respect to the Reference string. That is, it is going up when moving in the direction of going to the **right** of the Reference string.

a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset with respect to the Reference string. That is, it is going down when moving in the direction of going to the **right** of the Reference string.

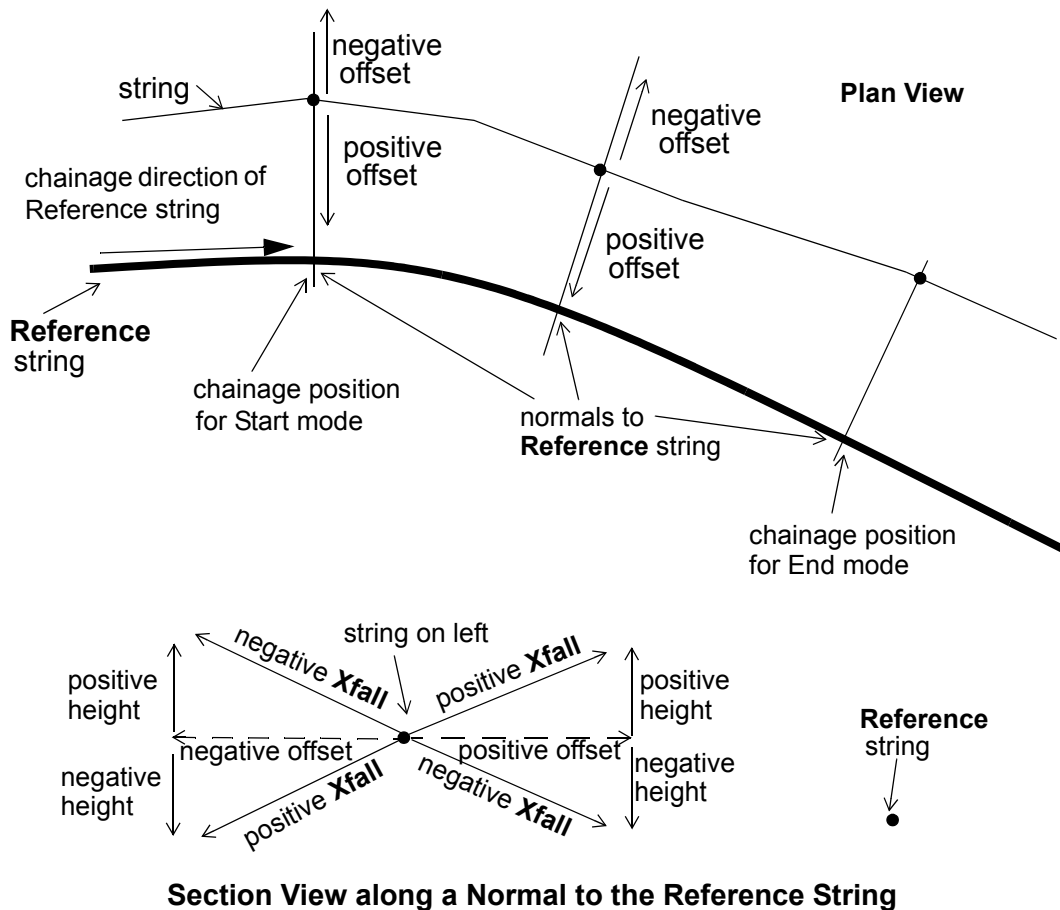

a **xfall** is **negative** when it is going up when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is going up when moving in the direction of going to the **left** of the Reference string.

a **xfall** is **positive** when it is going down in the direction of increasing negative offset (decreasing positive offset) with respect to the Reference string. That is, it is going down when moving in the direction of going to the **left** of the Reference string.

String on Right of Reference String

String on Left of Reference String

Offset and Xfall - No Reference String and Controlled by Hinge String

When no Reference string is selected, then the Hinge string is used to determine the sign convention for Offset and Xfall for the Hinge and Secondary strings. Hence the direction of the Secondary strings is not used.

Offset

When no Reference string is selected then the Hinge string is used and:

an **offset** is **positive** when it is going in the direction of increasing positive offset with respect to the Hinge string. That is, it is moving in the direction of going to the **right** of the Hinge string.

an **offset** is **negative** when it is going in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is moving in the direction of going to the **left** of the Hinge string.

Xfall

When no Reference string is selected then the Hinge string is used and:

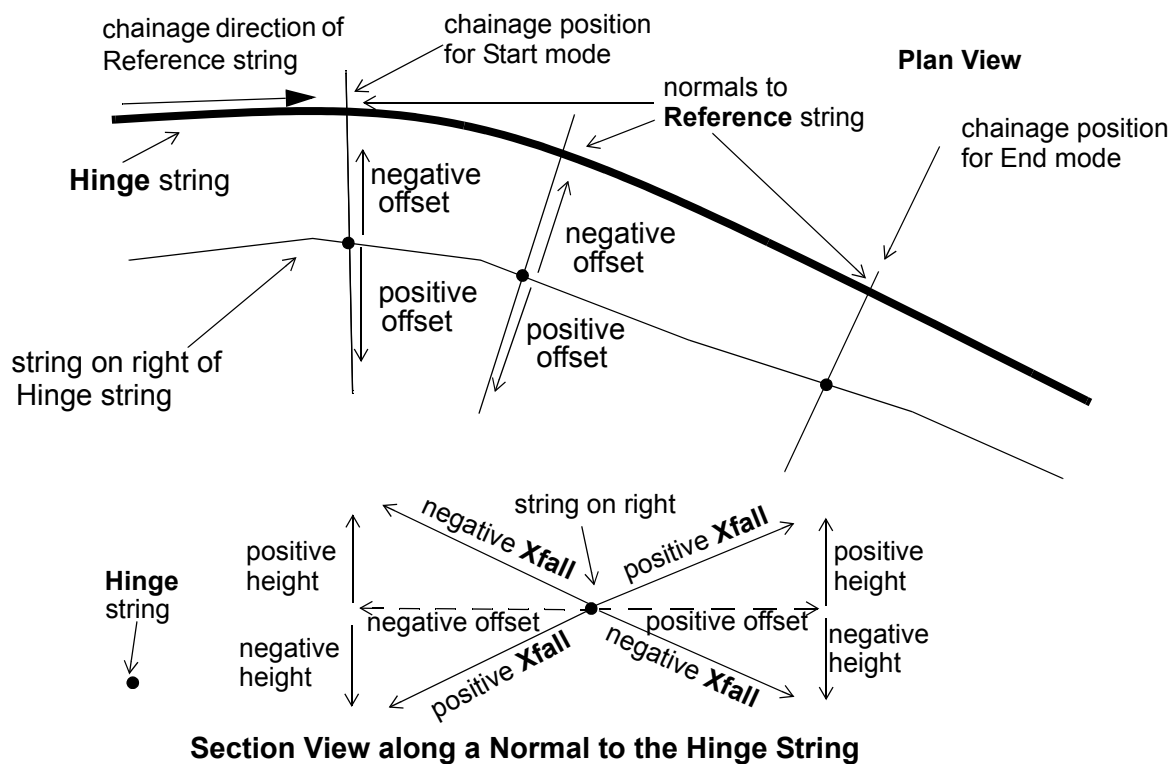

a **xfall** is **positive** when it is going up when measured in the direction of increasing positive offset with respect to the Hinge string. That is, it is going up when moving in the direction of going to the **right** of the Hinge string.

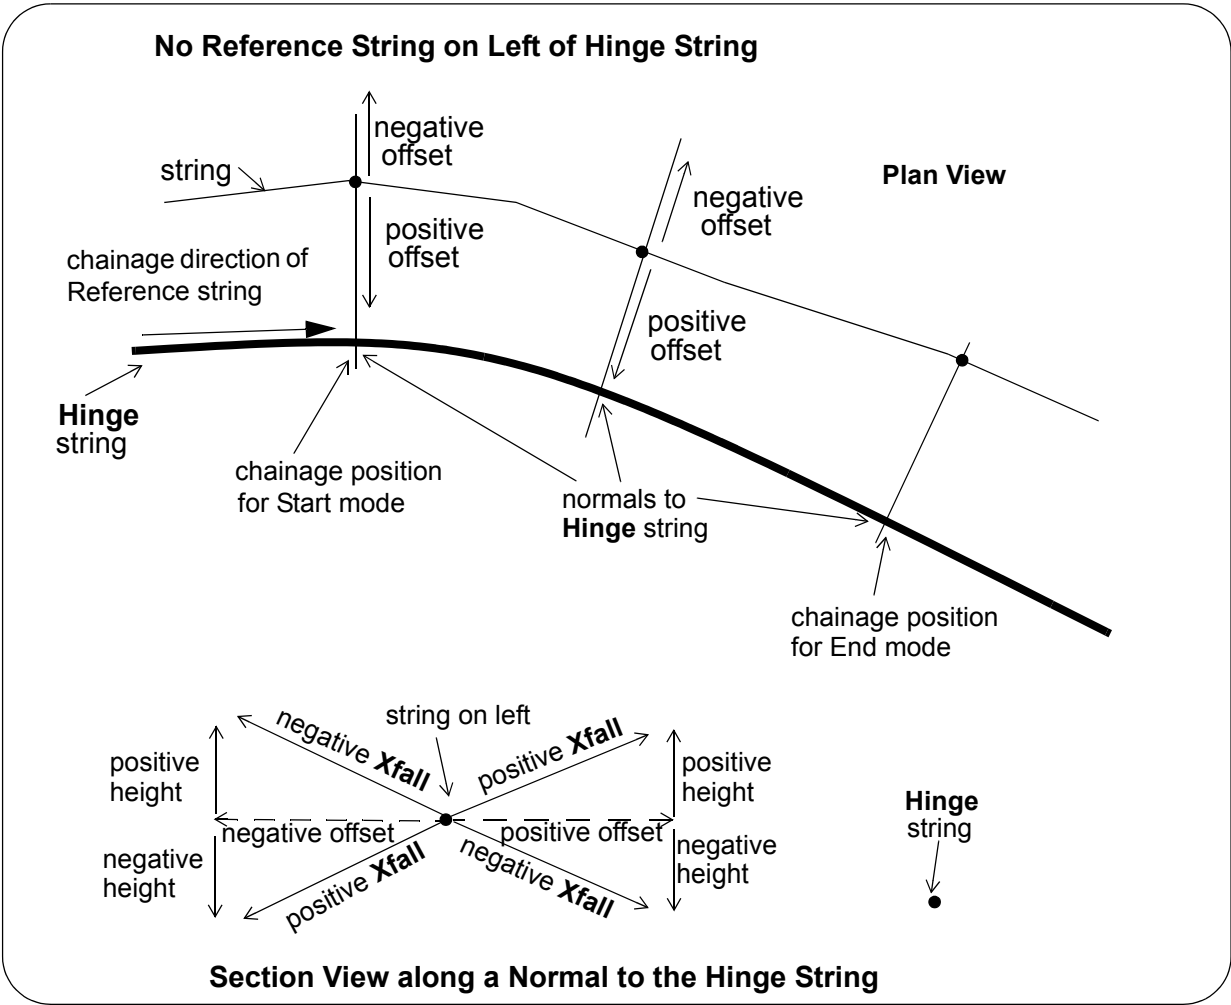

a **xfall** is **negative** when it is going down when measured in the direction of increasing positive offset with respect to the Hinge string. That is, it is going down when moving in the direction of going to the **right** of the Hinge string.

a **xfall** is **negative** when it is going up when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is going up when moving in the direction of going to the **left** of the Hinge string.

a **xfall** is **positive** when it is going down when measured in the direction of increasing negative offset (decreasing positive offset) with respect to the Hinge string. That is, it is going down when moving in the direction of going to the **left** of the Hinge string.

No Reference String - String on Right of Hinge String

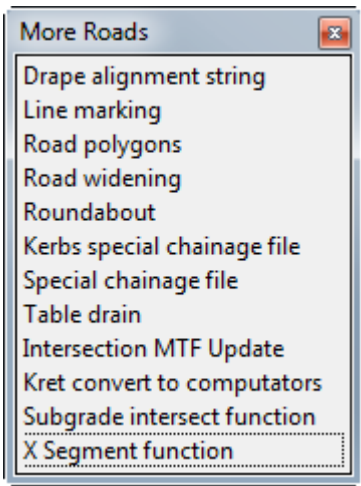

More Roads

Position of menu: **Design =>Roads =>More**

The **more roads** menu contains miscellaneous options to drape alignments, create line marking etc.

The **more roads** walk-right menu is

<i>Drape alignment string</i>	Drape Alignment (Macro) in the chapter Triangles
<i>Line marking</i>	Line Marking in the chapter Drafting
<i>Road polygons</i>	Polygons from Sections
<i>Road widening</i>	Road Widening with Minimum and Maximum Crossfall
<i>Roundabout</i>	Create Roundabout
<i>Kerbs special chainage file</i>	Kerb Special Chainage File
<i>Special chainage file</i>	Special Chainage File
<i>Table drain</i>	Table Drain - Intersection of Slopes from Two Strings
<i>Intersection MTF Update</i>	Intersection MTF Update
<i>Kret convert to computators</i>	Kret Convert to Computators
<i>Subgrade intersect function</i>	Subgrade Intersect Function
<i>X Segment function</i>	X Segment function

Drape Alignment

Position of option on menu: **Design =>Roads =>More =>Drape alignment string**

This option has already been documented in **Tins => Drape=> Drape align**.

For the option *Drape align*, please continue to the section [Drape Alignment \(Macro\)](#) in the chapter [Triangles](#).

Line Marking

Position of option on menu: **Design =>Roads =>More =>Line marking**

This option creates an alignment string for a traffic island and has already been documented as

Drafting => Line marking

For more information on the option *Line marking*, please continue to the section [Line Marking](#) in the chapter [Drafting](#).

Road Polygons

Position of option on menu: Design =>Roads =>More =>Road polygons

This option takes a model of cross-sections and create polygons between specified points on the cross-sections. This option is already documented under

Design => X-Sections =>Polygons from sections

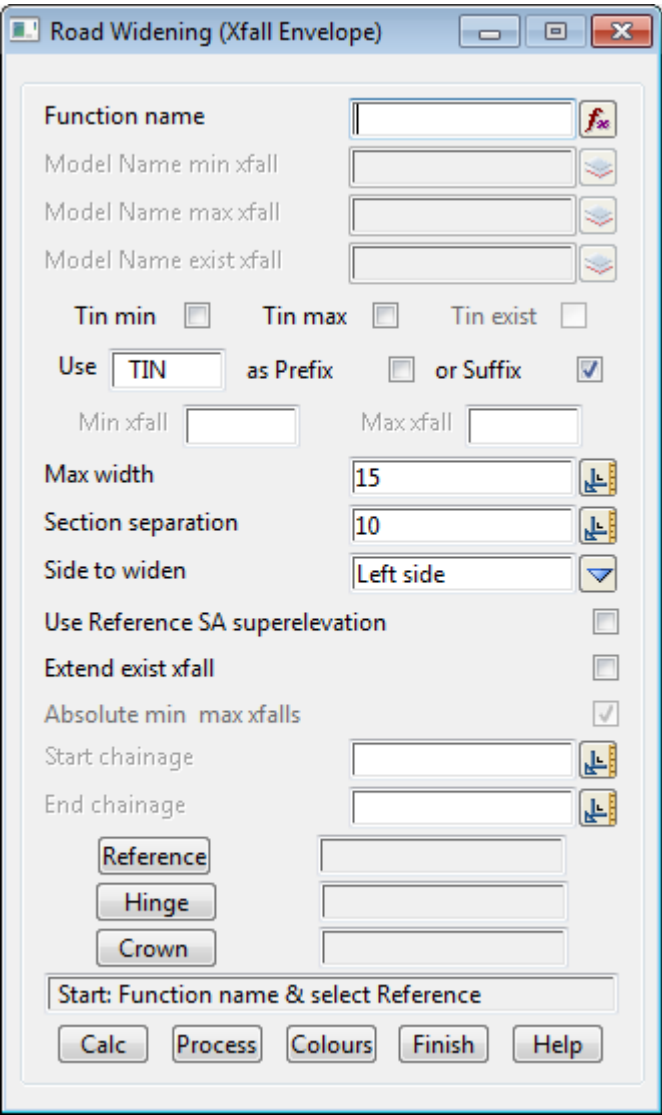

For more information on the option *Polygons from sections*, please go to the section [Polygons from Sections](#) in the this chapter

Road Widening with Minimum and Maximum Crossfall

Position of option on menu: Design =>Roads =>More =>Road widening

This option creates cross sections using the minimum and maximum cross-fall when going out from a selected reference string (usually and alignment string).

Adding these cross sections to a section view when designing the vertical geometry gives an envelope of maximum and minimum crossfall points.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model name min/max xfall	model box		
<i>model for minimum/maximum cross fall cross sections.</i>			
Min xfall	input box	-2	
<i>minimum cross-fall (in %)</i>			
Max xfall	input box	-5	
<i>maximum cross-fall (in %)</i>			
Max width	input box	10	
<i>maximum width to go out at the minimum and maximum cross falls.</i>			
Chg interval	input box	20	

chainage interval for calculating the minimum and maximum cross fall cross sections.

View to add view box
view to add the created cross sections to.

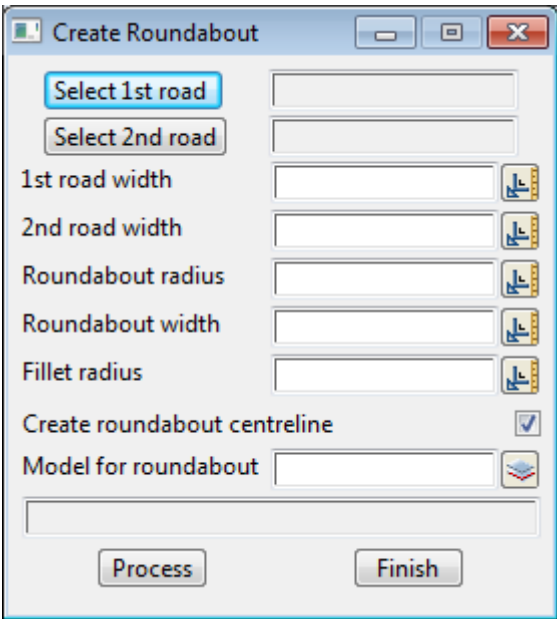

Reference string select
pick the reference string with direction for the x-sections to go out from. The cross sections are created to the right of the reference string as defined by the direction that the Reference string is picked. To get the sections on the other side, pick the reference string in the opposite direction.

Process button
create the minimum and maximum cross fall cross sections.

Create Roundabout

Position of option on menu: Design =>Roads =>More =>Roundabout

This option creates a roundabout between two alignment strings. The road widths for the two roads (the distance from the road centre line to the edge of the road) plus the roundabout radius (the distance from the centre of the roundabout to the centreline of the roundabout road), the roundabout width (added and subtracted from the roundabout width to give the inner and outer edges of the roundabout roadway - the inner and outer roundabout radii) and the fillet radius for the turning lanes.

The fields and buttons used in this panel have the following functions:

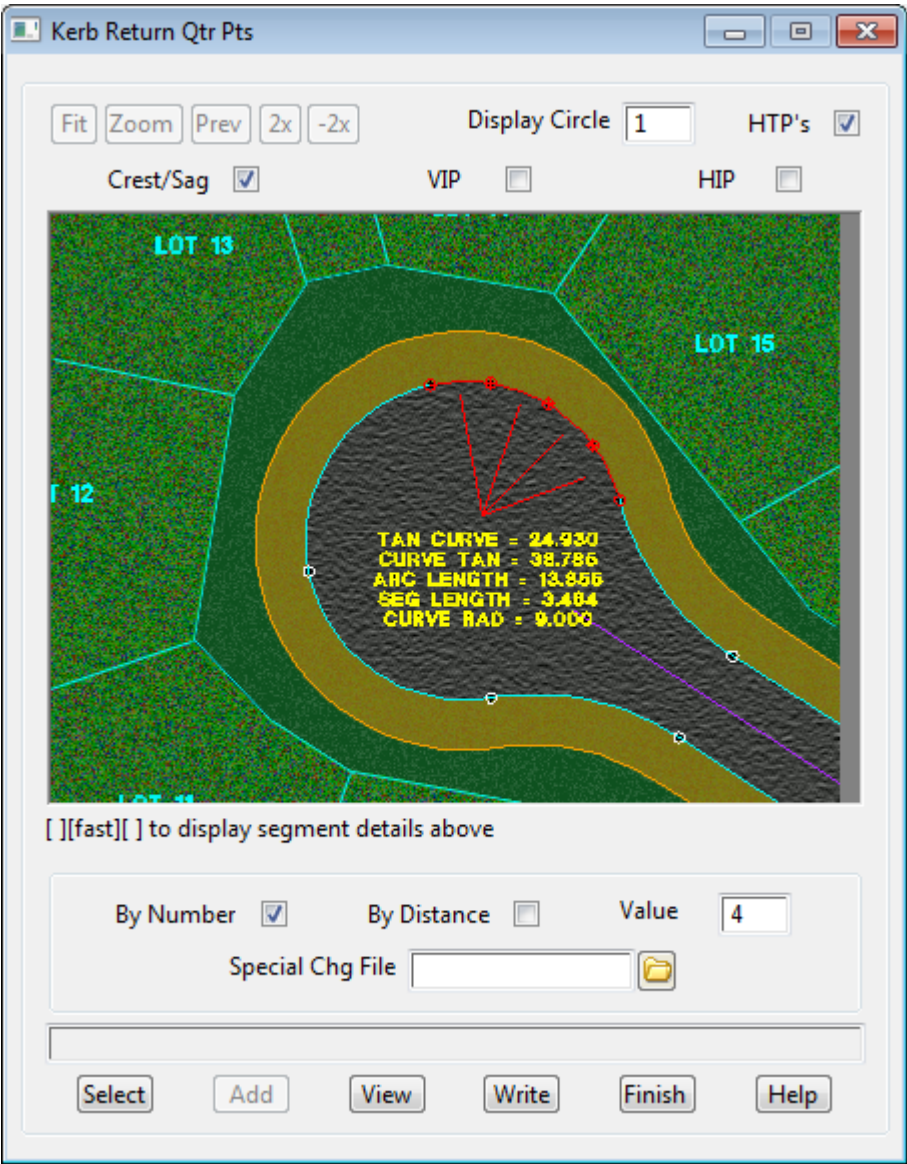

Field Description	Type	Defaults	Pop-Up
Select 1st road	string select		
<i>first alignment string for the roundabout.</i>			
Select 2nd road	string select		
<i>second alignment string for the roundabout.</i>			

1st road width	input box
<i>distance from the first alignment string to the edge of the road.</i>	
2nd road width	input box
<i>distance from the second alignment string to the edge of the road.</i>	
Roundabout radius	input box
<i>distance from the centre of the roundabout to the centreline of the roundabout road.</i>	
Roundabout width	input box
<i>distance to add and subtract from the roundabout width to give the inner and outer edges of the roundabout roadway (the roundabout radii).</i>	
Fillet radius	input box
<i>fillet radius of the turning lanes.</i>	
Create roundabout centreline	tick box
<i>if ticked, an alignment string is created for the centreline of the roundabout.</i>	
Model for roundabout	input box
<i>model for the created roundabout.</i>	
Process	button
<i>run the option.</i>	

Kerb Special Chainage File

Position of option on menu: **Design =>Roads =>More =>Kerb special chainage file**

This option is used to create a special chainage file for an alignment string. The method of creating the chainages is defined differently for each segment of the alignment string.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
By number	tick box	tick	
<i>if ticked, break the selected segment of the selected string into the number of pieces given by the Value field.</i>			
By distance	tick box		
<i>if ticked, break the selected segment of the selected string into pieces of length given by the Value field.</i>			
Value	tick box	tick	
<i>the number of pieces or the chainage length to break the selected segment into.</i>			
Special chg file	file box		

file to write chainages to

Select button

pick the alignment string to create chainages for. The alignment string is then drawn in the panel draw box. Each segment of the alignment string is selected by clicking MB over it in the panel draw box. The special chainages are then defined for that segment.

Add button

add the chainages given by number of length to the special chainages list

View button

view the special chainages list. The special chainages list can be edited

Write button

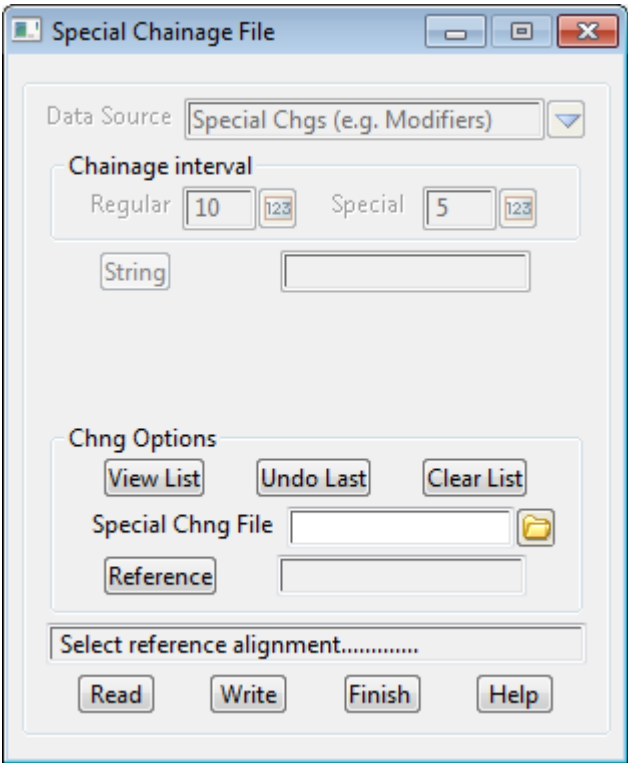

write the special chainages list to the special chainages file

Special Chainage File

Position of option on menu: Design =>Roads =>More =>Special chainage file

This option is used to create a special chainage file for an alignment string.

The chainages are created for a selected reference string but can then be defined by dropping strings and/or individual points onto the reference string.

The fields and buttons used in this panel have the following functions:

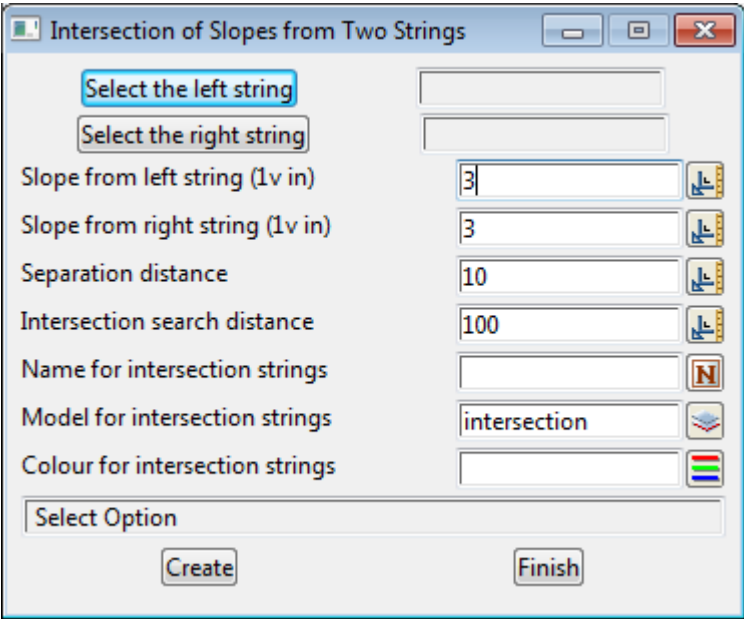

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source	choice box	Special chainages	Special chainages String Points
Regular			
Special			
String	string select		
Reference	string select		
	<i>select the string to create special chainages for.</i>		
View list	button		
	<i>view the special chainage list.</i>		
Undo last	button		
	<i>undo the last set of created chainages.</i>		
Clear list	button		
	<i>clear the chainages list.</i>		
Special chng file	file box		
	<i>file to read chainages from or write chainages to</i>		
read	button		
	<i>read in a file of special chainages.</i>		
Write	button		
	<i>write the chainages list to the special chainages file.</i>		

Table Drain - Intersection of Slopes from Two Strings

Position of option on menu: Design =>Roads =>More =>Table drain

This option is used to create a string which is the intersection of slopes from a left and right string.

The fields and buttons used in this panel have the following functions.

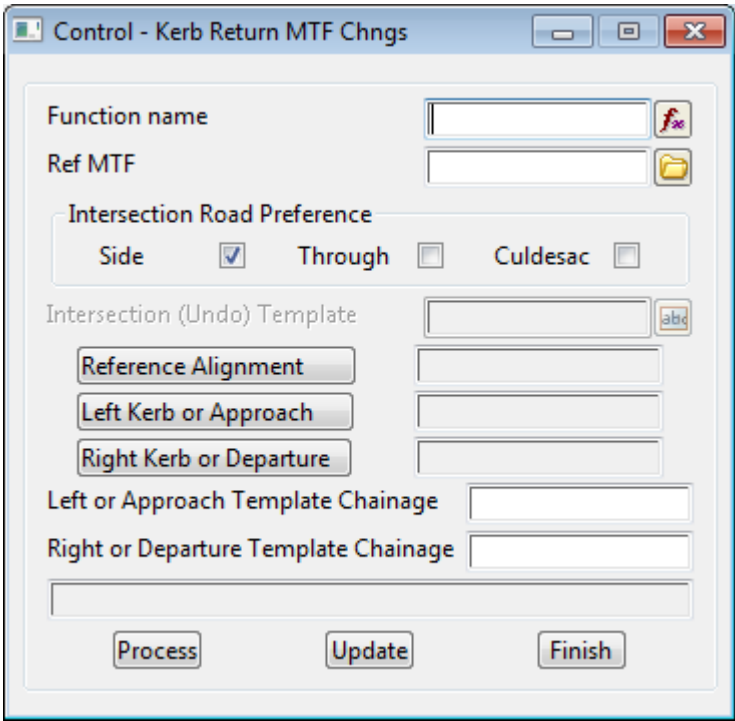

Field Description	Type	Defaults	Pop-Up
Select the left string <i>select the left hand side string</i>	string select		
Select the right string <i>select the right hand side string</i>	string select		
Cross fall (1 in...) from left/right string <i>batter slope to go from left/right string</i>	input box	3	
Separation distance <i>distance to create batter lines and find intersection</i>	input box	10	
Intersection search distance <i>distance to search to find an intersection of the batter slopes</i>	input box	100	
Name for intersection strings <i>name for the strings created by the intersection of the batters</i>	input box		
Model/Colour for intersection strings <i>model/colour for the intersection strings</i>		intersection	available models/colours

Create button

Create the intersection strings by battering of the left and right strings

Intersection MTF Update

Position of option on menu: Design =>Roads =>More =>Intersection MTF updates

The fields and buttons used in this panel have the following functions.

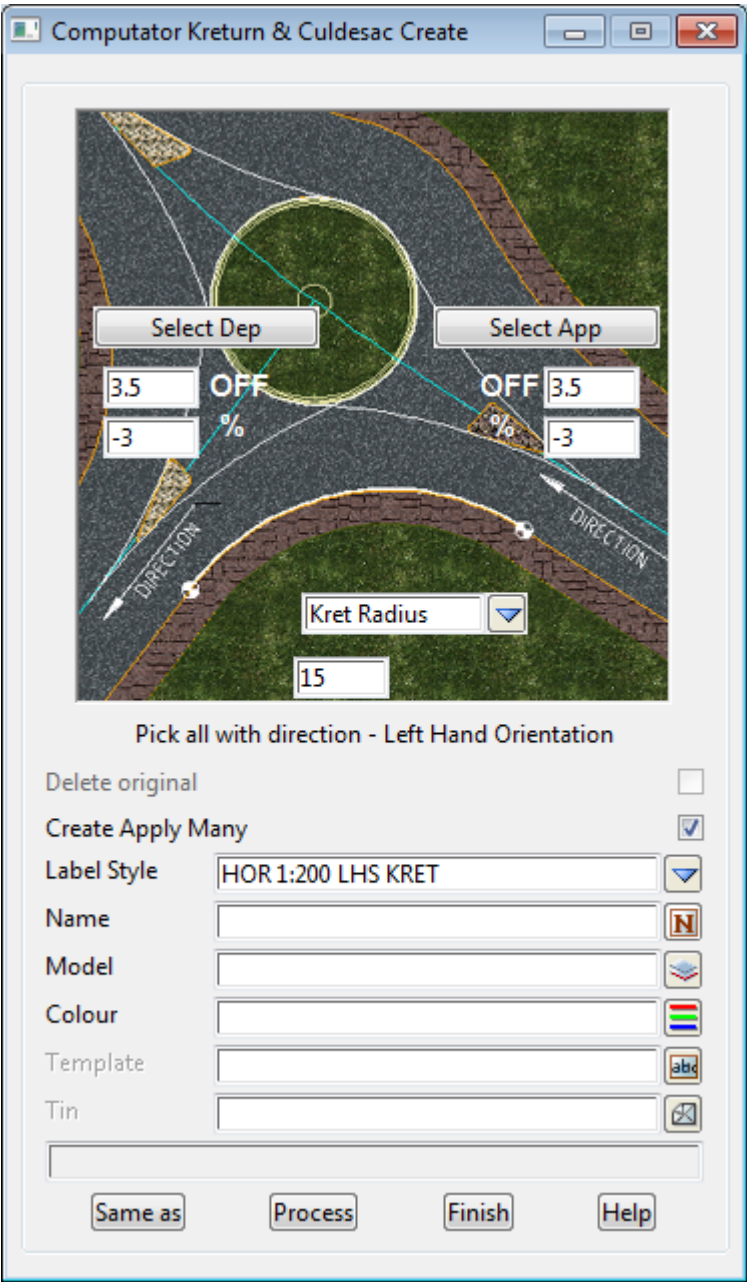

Field Description	Type	Defaults	Pop-Up
Function name <i>name for the function</i>	function box		available functions
Ref MTF	file box		*.mtf files
Reference <i>select the reference string</i>	string select		
Left kerb <i>select the left kerb string</i>	string select		
Right kerb <i>select the right kerb string</i>	string select		
Left template chainage	input		
Right template chainage	input		
Process	button		
Update	button		

Kret Convert to Computators

Position of option on menu: **Design =>Roads =>More =>Kret convert to computators**

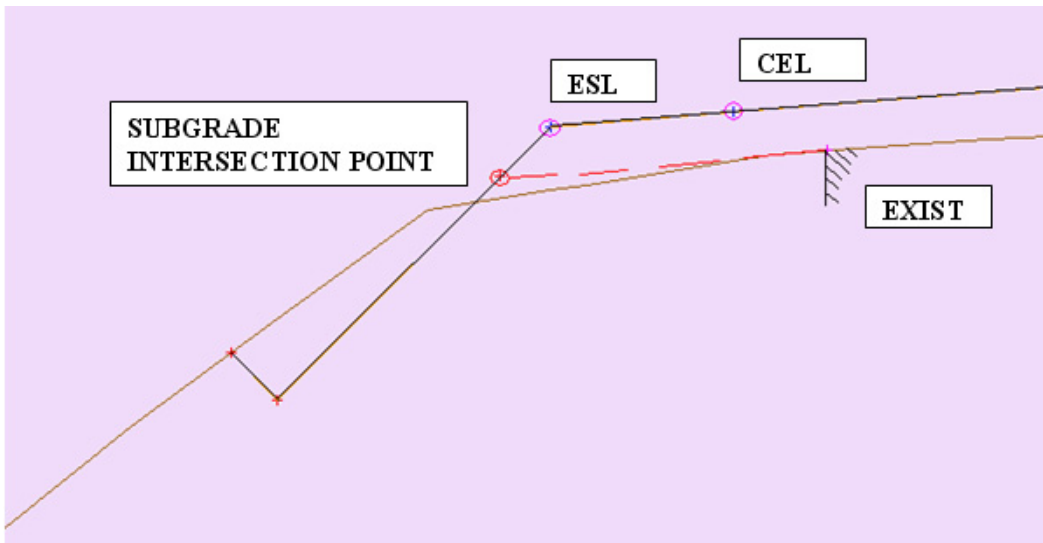

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Kret convert to computators**, displays the **Computator Kreturn & Culdesac Create** panel on the screen

Subgrade Intersect Function

Position of option on menu: **Design =>Roads =>More =>Subgrade Intersect Function**

Typical Application

1. Widening job where the intersection of the **design xfall** from the **existing road edge** and the **design batter** is required.
2. Design strings are **ESL** (shoulder edge) and **CEL** (carriageway edge)

This panel is used to create a string that could be used in the subgrade surface of a road design, in particular road widening.

The crossfall between these strings is calculated, and applied from the hinge string, offset by the subgrade depth, to intersect with the design tin specified.

The intersecting string created is placed on the selected model.

Selecting **Subgrade Intersect Function**, displays the **Subgrade Batter Intersection Create** panel.

X Segment function

Position of option on menu: **Design =>Roads =>More =>X Segment function**

This option is used for the removal of segments on design and boxing cross sections.

Typically it is used where road widening has been applied to both sides of a roadway.

Design sections in this case would be created using "Cuts through strings", where the two widenings are now joined.

The design may also have a small overlay on the existing roadway and boxing definitions have been defined for each side of the widening.

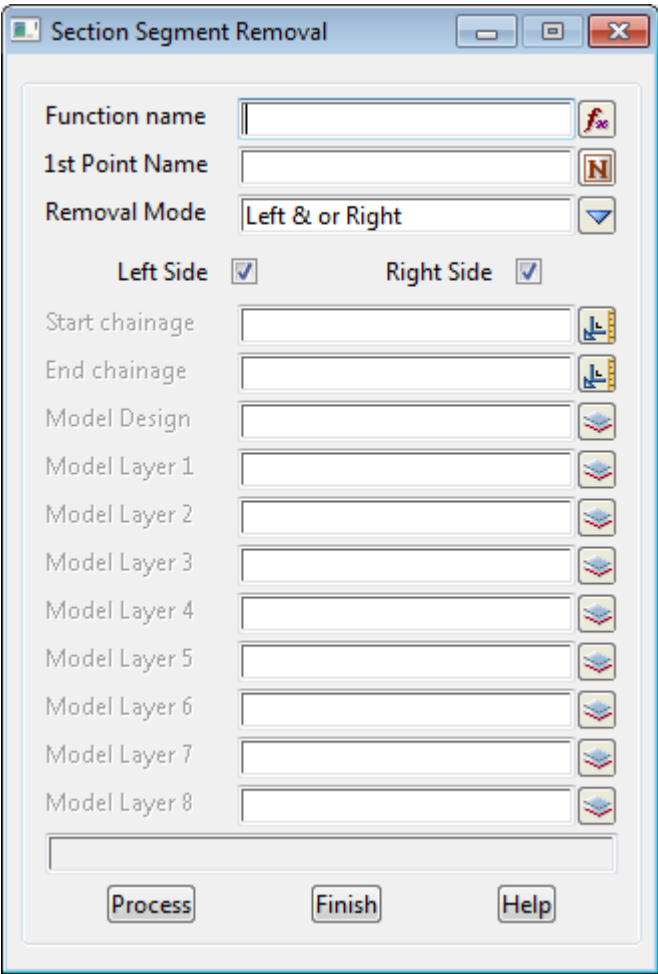

In each case again, the sections, especially the boxing subgrade, are joined.

The sections are converted to super strings and segments that need to be removed are defined at vertex points by name.

A point name is entered as the "First Point" and segments are defined as either left or right of that point or a second point along the section can be specified.

A "Design" section model can be entered along with multiple boxing models...Layer1, Layer2, Layer3 etc.

Selecting X Segment function, displays the **Section Segment Removal** panel on the screen

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Function Name	input		
<i>name for use in recalc or chains</i>			
1st point name	input		
<i>Point name on design section</i>			
Removal Mode	choice box	Left & or Right	Left & or Right, 2nd Point
<i>Removal type left or right of first point or to a second point</i>			
Left Side	tick box		
Right Side	tick box		
Start Chainage	real		
<i>if blank, then all the sections are used</i>			
End Chainage	real		
<i>if blank, then all the sections are used</i>			
Model Design	input		
<i>existing model name of design sections</i>			
Model Layer (n)	input		
<i>existing model name of boxing sections</i>			
Process	button		
<i>runs the option</i>			

Components

Position of menu: Design =>Roads =>Components

Components are parametric road objects that can be placed on existing design strings to generate complex geometry. This includes geometry for:

- Intersections
- Roundabouts
- Exit Ramps
- Entry Ramps
- Bus Bays
- Parking Bays
- CHR Intersections
- Culdesacs

Each component has a number of parameters that may be modified before and after they are placed to meet your requirements.

Components are stored in a library. Every time you place a component, you will reference the library definition. Once it is placed, if you wish to customise only that placed instance of the component, you may detach it from the library so that changes to the component will not affect the library component and vice versa.

The **Components** walk-right menu is

For the option *Component library*, go to

Place component

Edit component

Quick place

[Component Library](#)

[Place a Component](#)

[Edit a Placed Component](#)

[Component Quick Place](#)

For information on *Editing Components* go to

Specific Component Types

[Editing Components](#)

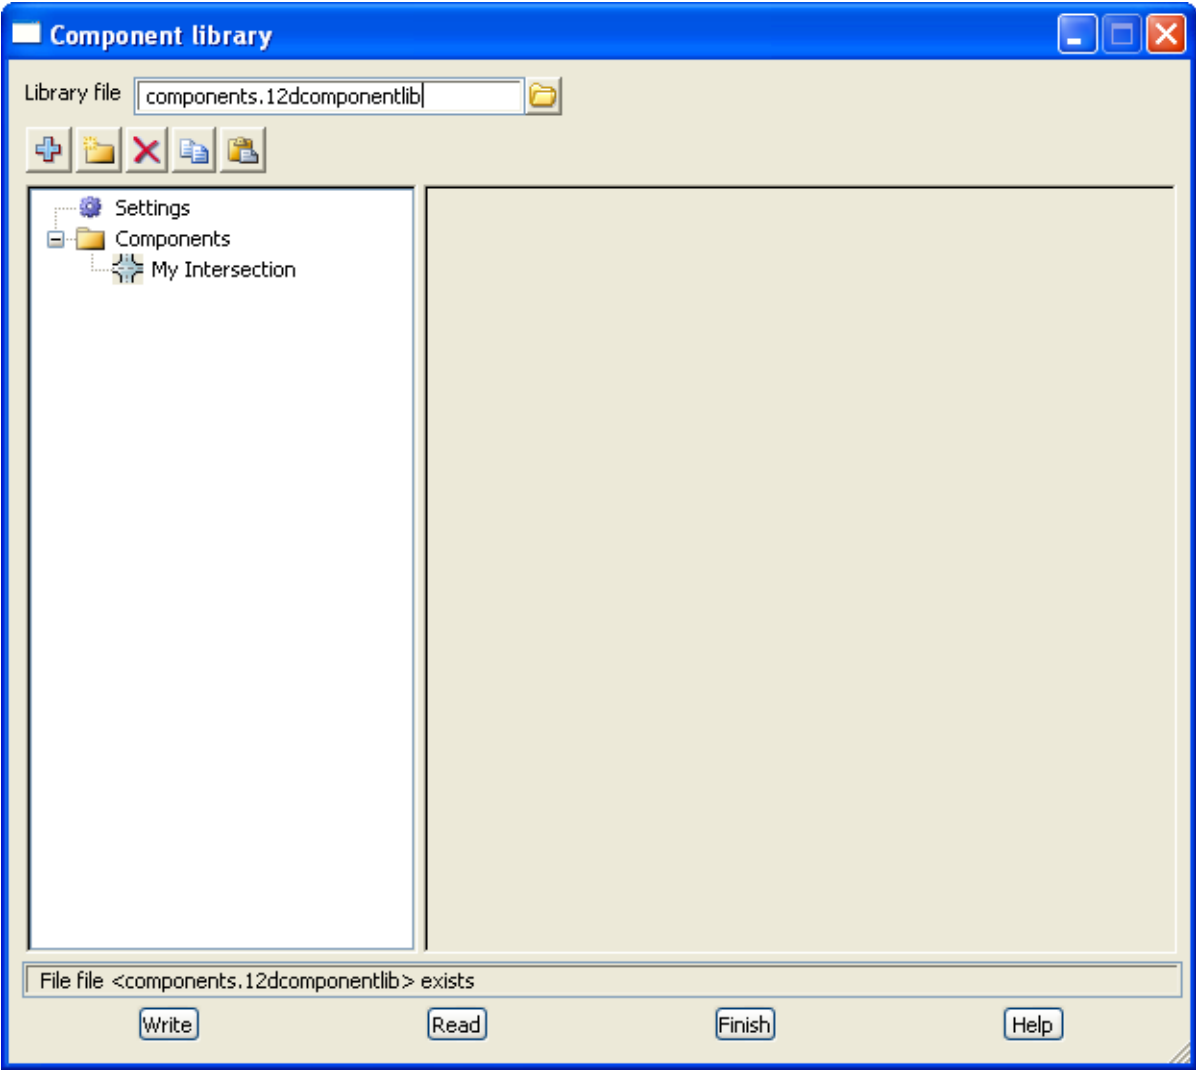

[Component Types](#)

Component Library

Position of option on menu: Design =>Roads =>Components => **Component library**

This panel is used to define the components in your current project. Components are initially based off predefined 'base' components (see [Base component](#)). Once you add a base or template component to your library, you may customise it as you require.

Selecting **Component library** brings up the **Component library** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Library file	file		
<i>the current component library you are editing</i>			

 *Inserts a new component (See [New Component](#))*

Folder
Creates a new folder, for the purposes of grouping

Delete
Deletes the selected component or folder

Copy
copies the selected component or folder

Paste

pastes the selected component or folder at the current selected level

Write

writes the library

Read

reads the library

Nodes

Settings

This node defines library wide settings. Whenever you use a component from this library, these settings will apply.

Component String Naming

Each string generated as part of the component can be named. They can either be set to something static or they can be dynamically generated using a number of variables as part of the name field.

The variables generally concern which side of the road the string is being created for, whether it was the approach or departure or the '**source**' or '**destination**'.

For example, in a left turn, the '**source**' is the string a driver is leaving from and the '**destination**' is the string entering.

\$source_name - the name of the source string after the **source string name mask** is applied (see [Source String Name Mask](#))

\$destination_name - the name of the destination string after the **source string name mask** is applied (see [Source String Name Mask](#))

\$full_source_name - the full name of the source string

\$full_destination_name - the full name of the destination string

\$source_approach_or_departure - '**approach**' if we are generating strings for the approach of the source string, otherwise '**departure**'

\$destination_approach_or_departure - '**approach**' if we are generating strings for the approach of the destination string, otherwise '**departure**'

\$source_side - the side of the road we are currently generating strings for on the source string

\$destination_side - the side of the road we are currently generating strings for on the destination string

\$count[1-9] - allows up to 9 counters, of the form **%count1**, **\$count2** ... **\$count9**

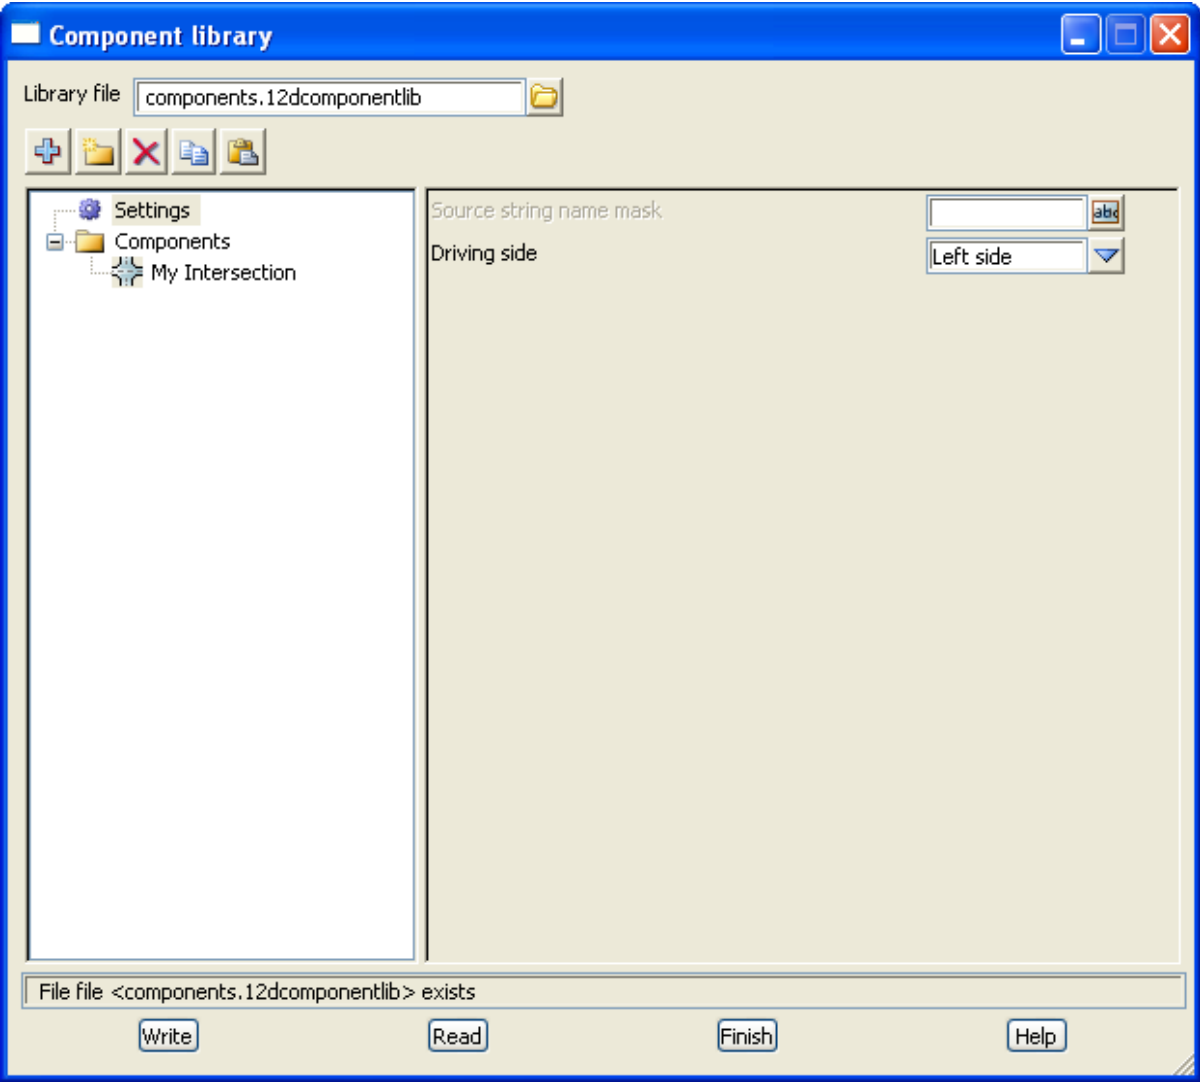

Each time this counter variable is seen, it's value is incremented by 1.

Source String Name Mask

The **source string name mask** is defined in the **Component Library**. It allows you to extract part of a centreline string name. This is quite useful to maintain your own naming conventions.

For example, if you have a centreline named **MC01** and you wish to name your left turn **MK01**, the part of the name that is common is **01**.

If you set the source string name mask to **MC***, the name used when you use the **\$source_name** or **\$destination_name** variables will be everything represented by the *****. In this case, **01**.

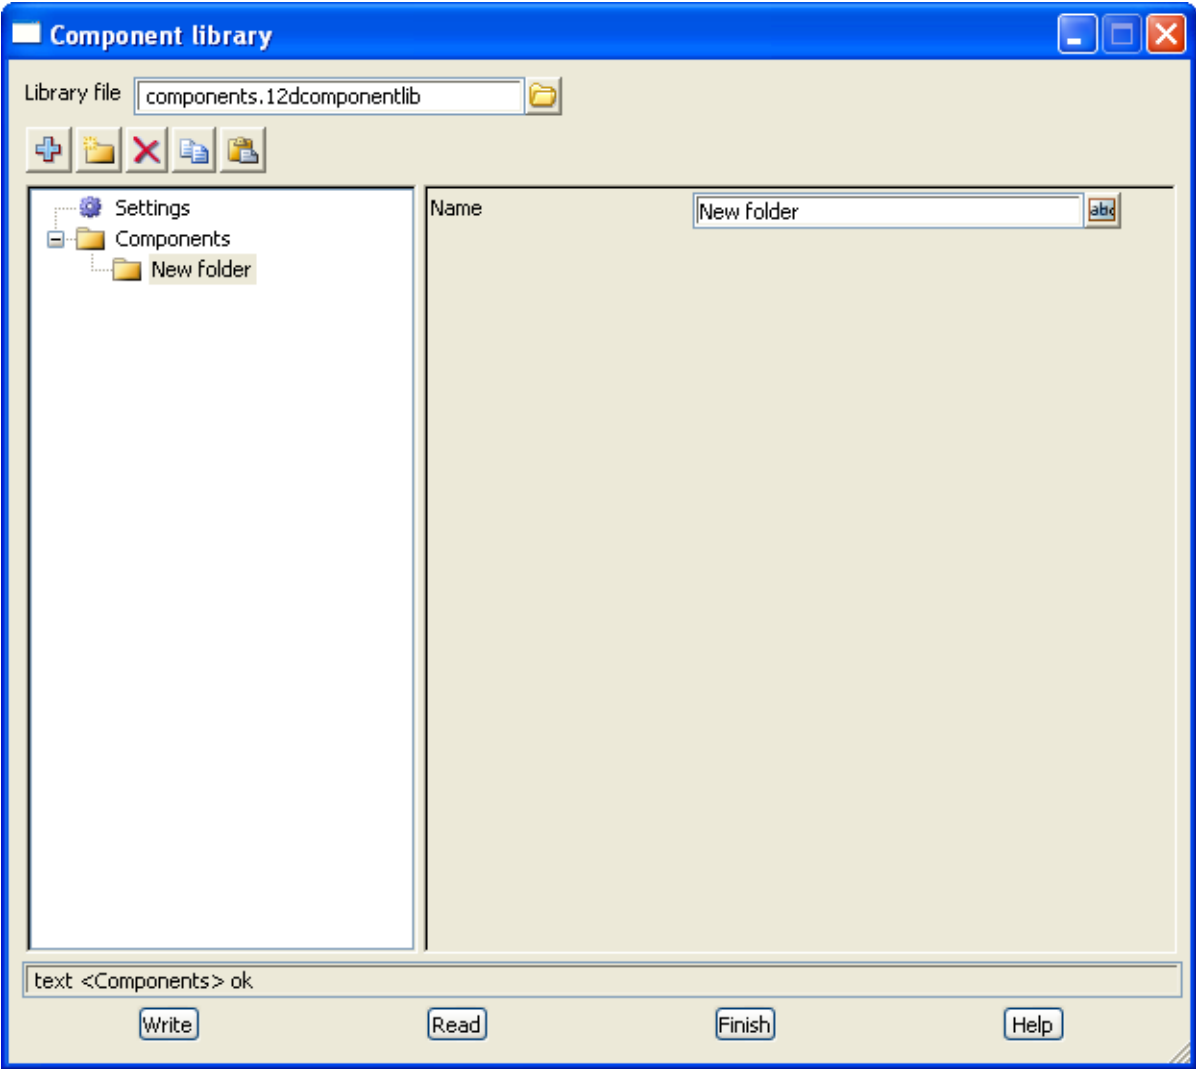

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Source string name mask			
<i>an optional field used to assist in naming individual strings created as part of a component. See Source String Name Mask for more information.</i>			
Driving side	choice box	Left side	Left side, Right side
<i>whether or not the component should be created for left or right hand side driving.</i>			

Folder Nodes

Folders can be created to group components. You can create a folder and give it whatever name you wish.

The fields and buttons used in this panel have the following functions:

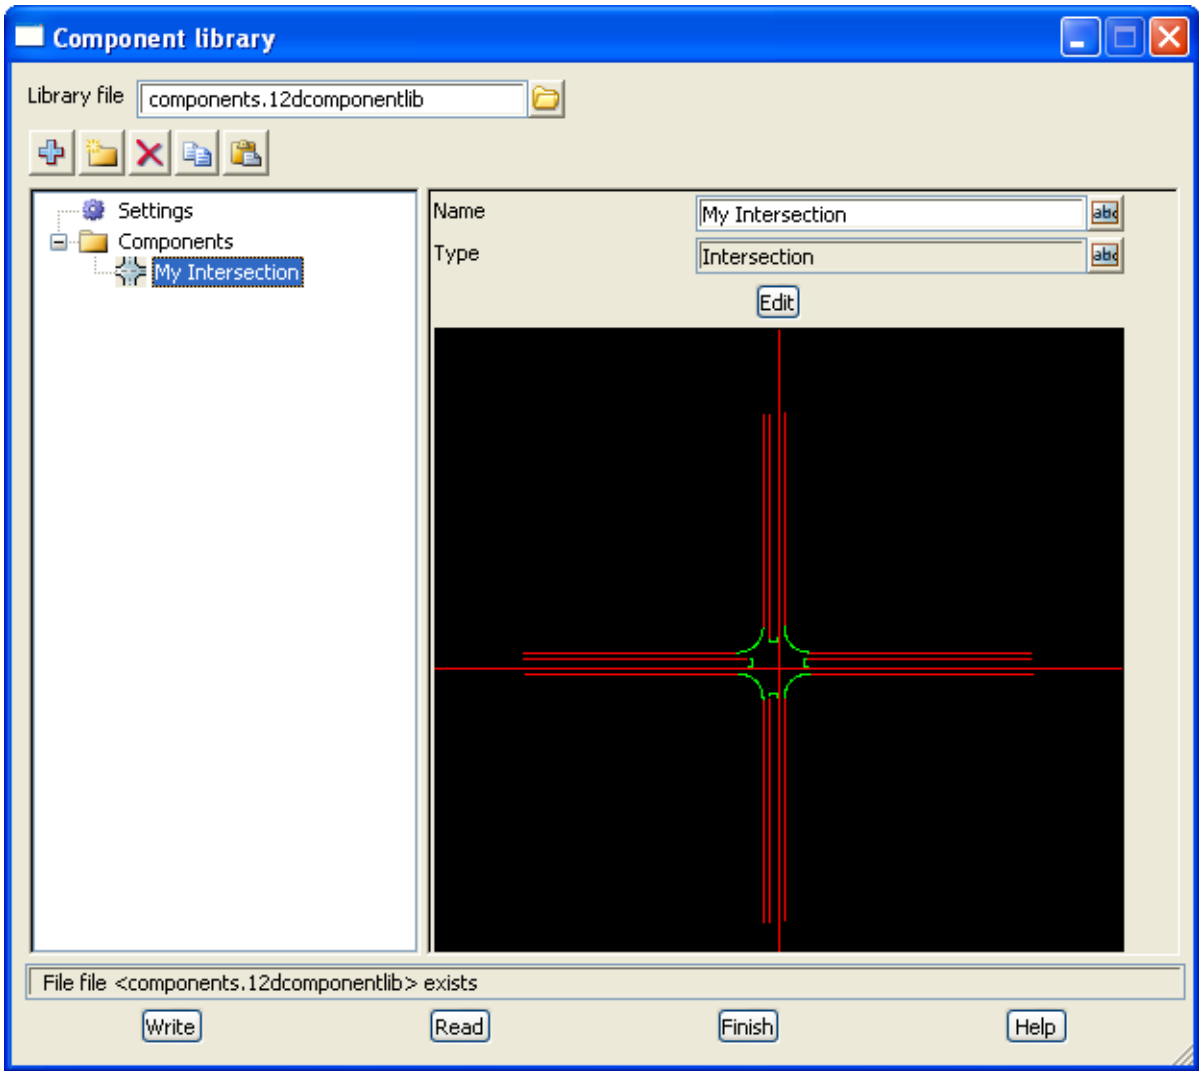

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name

the name of the folder

Components Node

Each component node displays the name and type of the component, as well as what it will look like on a theoretical set of centreline strings. The generated geometry will change when you place it depending on the selected strings but this view gives you an idea of what it may look like.

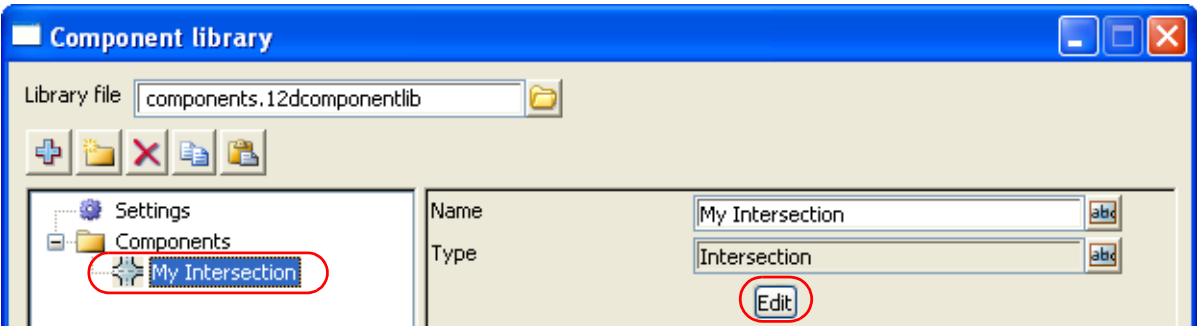

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name <i>the name of the component</i>			
-------------------------------------------------	--	--	--

Type <i>the type of the component - read only</i>			
-------------------------------------------------------------	--	--	--

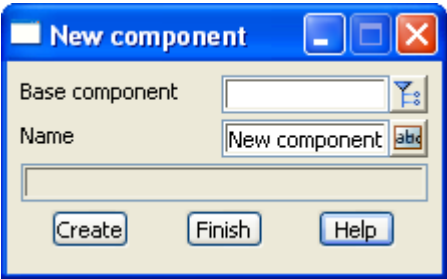

Edit button

edits the component. For more information please see [Editing in the Component library - Component Editor](#)

New Component

This panel allows you to create a new component from a base component. A base component may be from either one of your own library components, or a component shipped with **12d Model**.

Selecting  brings up the **New component** panel.

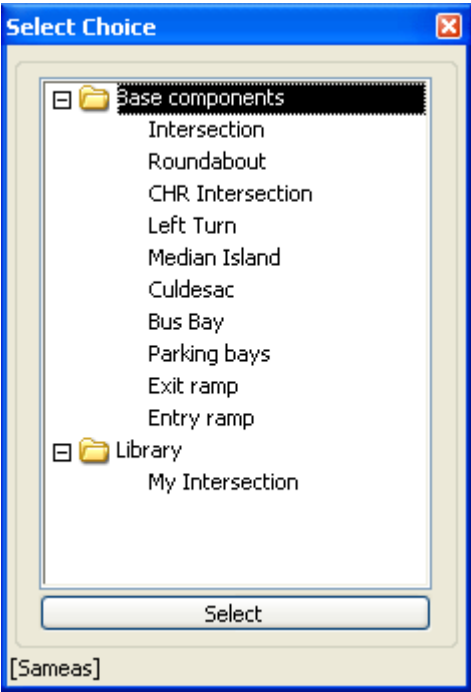

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Base component

the component you wish your component to be based on

This may be either a **Base Component**, as shipped by 12d, or one from your **Library**.

For information on **Component Types** please go to the section [Component Types](#)

Name

the name of your component, which must be unique

Create

button

creates the component and adds it to the library

Component Types

For Intersection, go to	Intersection
Roundabout	Roundabout
CHR Intersection	CHR Intersection
Left Turn	Left Turn
Median Island	Median Island
Culdesac	Culdesac
Bus Bay	Bus Bay
Parking bays	Parking Bays
Exit ramp	Exit Ramp
Entry ramp	Entry Ramp

Intersection

An intersection component can be edited via the [Component Library](#) or by editing the definition of a placed component. While an intersection is defined as a crossroad, the intersection will automatically close off any leg of the intersection that does not have valid strings.

For information on *Defining an Intersection* see
Placing Intersections

[Defining an Intersection](#)
[Placing Intersections](#)

Defining an Intersection

An intersection is broken into two roads - the **Major road** and the **Minor road**.
Each road, major or minor, may have an approach (the section of the road leading in to the intersection) and the departure (the section of the road leading away from the intersection).
The approach and departure for both the Major and Minor Road are defined by the same set of parameters.

For information on:
Placement Parameters Node see [Placement Parameters](#)
Carriageway Node [Carriageway Node](#)
Approach / Departure => Left turn Node [Approach / Departure =>Left turn](#)
Approach / Departure => Left Turn =>Kerb Return Node [Approach / Departure =>Left Turn
=>Kerb Return Node](#)
Approach / Departure => Median / Right Turn Node [Approach / Departure =>Median / Right
Turn Node](#)

Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on [Placing Intersections](#).

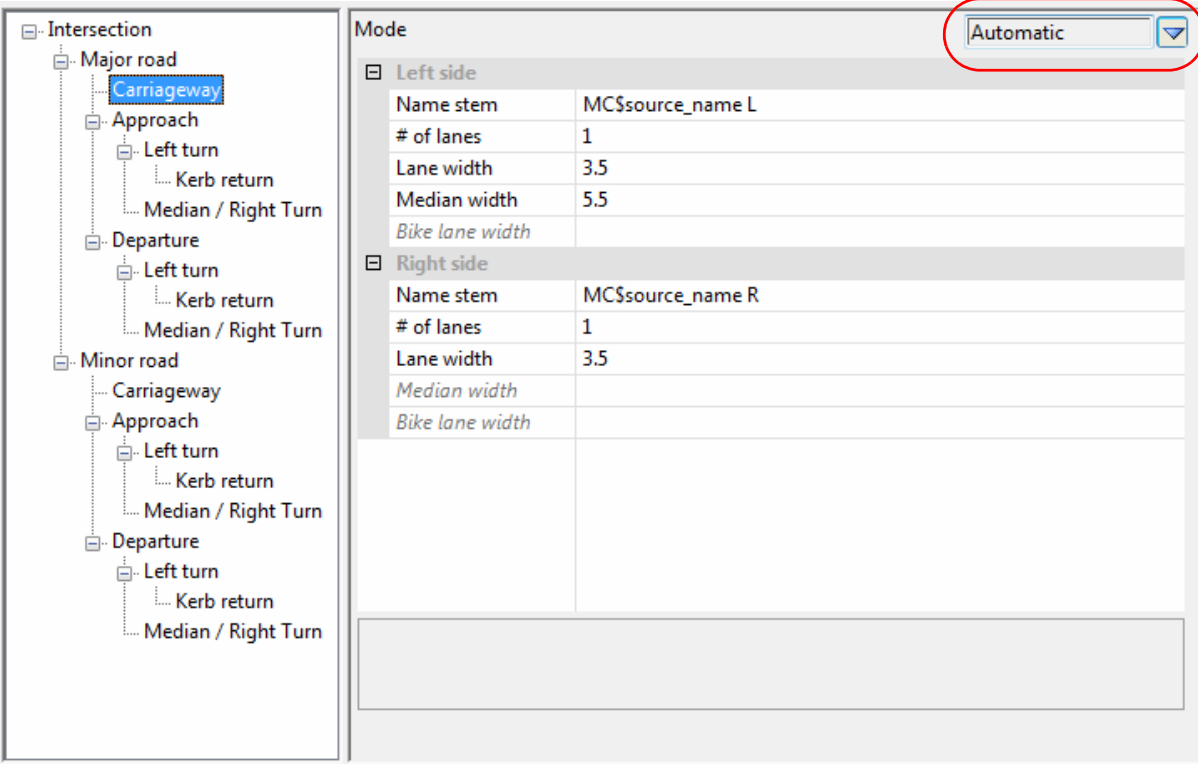

Carriageway Node

This node defines the carriageway of the road, in terms of the number of lanes and the type of lanes.
There are two modes for defining the carriageway: [Automatic Mode](#) and [Manual Mode](#).
Note that regardless of the mode, you can only define a median on one side of the carriageway.
If you place your intersection using dual carriageways, the width will be ignored.

Automatic Mode

Automatic mode does not allow you to define names for each lane of your carriageway and only allows a basic layout. It is the simplest and quickest way to define a carriageway.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Left Side

Name Stem

the name to apply to each created lane on the left side of the carriageway

of lanes

the number of lanes to create on the left side of the carriageway

Lane width

the lane width for each lane on the left side of the carriageway

Median width

the width for an optional median on the left side of the carriageway.

Bike lane width

the width for an optional bike lane on the left side of the median.

Right Side

Name Stem

the name to apply to each created lane on the right side of the carriageway

of lanes

the number of lanes to create on the right side of the carriageway

Lane width

the lane width for each lane on the right side of the carriageway

Median width

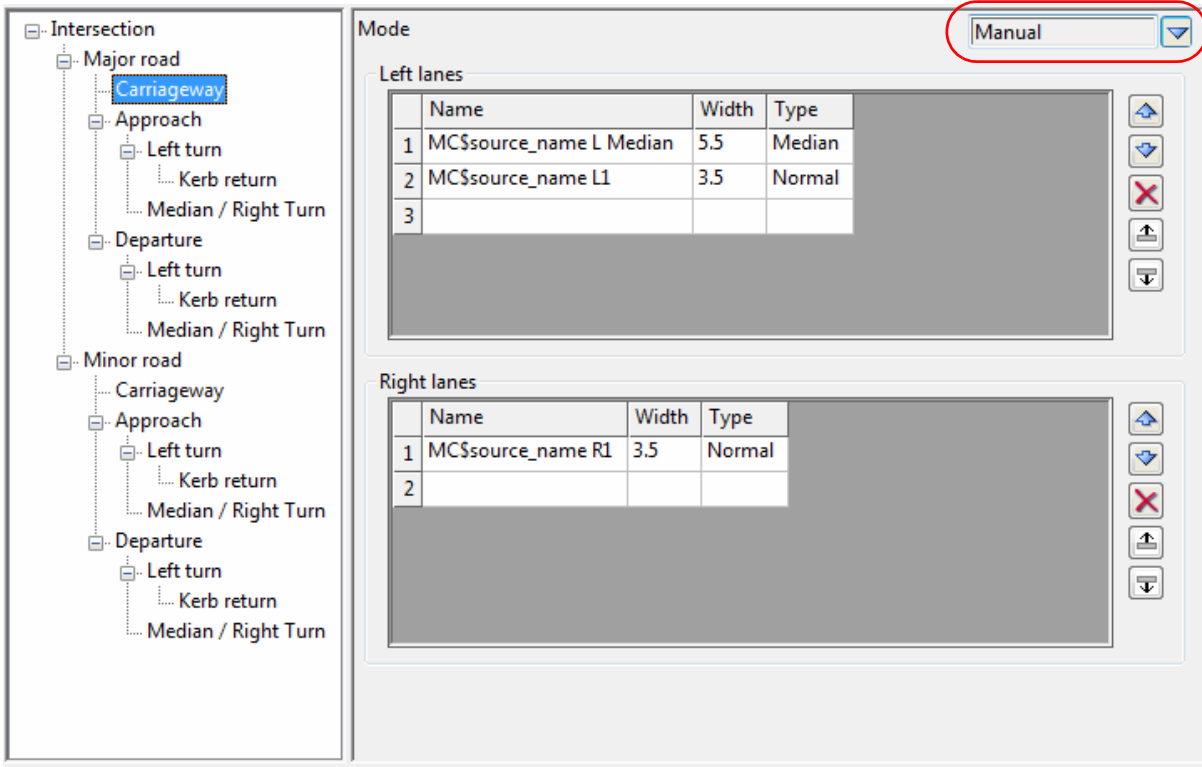

the width for an optional median on the right side of the carriageway.

Bike lane width

the width for an optional bike lane on the right side of the median

Manual Mode

Manual mode allows you to define the carriageway in more detail, by specifying each lane individually, along with its width and type.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Left Lanes Grid			
Name			
the name of the lane on the left side			
Width			

the width of the lane

Type

the type of lane (Normal, Bike or Median)

Right Lanes Grid**Name**

the name of the lane on the right side

Width

the width of the lane

Type

the type of lane (Normal, Bike or Median)

Approach / Departure =>Left turn

This node defines the **Left turn** of an intersection. If you are in Right Side driving mode, this will be called **Right Turn**.

There are three types of turns currently available:

1. Stand up - for more information go to [Stand Up Turn](#)
2. Free - for more information go to [Free Turn](#)
3. High entry - for more information go to [High Entry Turn](#)

Both **Stand up** and **Free** turns allow you to define the type of kerb return being used.

Parameters

Kerb radius 1	40
Kerb radius 2	15
Width 1	5.5
Width 2	5

Island

Island name	MT\$source_name
Offset 1	1
Offset 2	1
Offset 3	0.3
Offset 4	1
Offset 5	0.3
Offset 6	0
Radius 1	0.5
Radius 2	0.6
Radius 3	0.3

Diverging lane

Create?	yes
Name	
Lane width	3.5
Taper length	35
Taper approach radius	25
Taper departure radius	25
Parallel lane length	80
Dedicated turn lane?	no

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Turn Details

Turn name

the name to use for created geometry

Turn type

the type of turn (in this case, High entry)

Parameters

Kerb radius 1

the approach radius of the high entry kerb

Kerb radius 2

the departing radius of the high entry kerb

Width 1

the distance between the kerb return and the painted island

Width 2

the width of the painted island

Island

Island name

the name of the island string

Offset 1

the first offset of the painted island from the internal island

Offset 2

the second offset of the painted island from the internal island

Offset 3

the third offset of the painted island from the internal island

Offset 4

the fourth offset of the painted island from the internal island

Offset 5

the fifth offset of the painted island from the internal island

Offset 6

the sixth offset of the painted island from the internal island

Radius 1

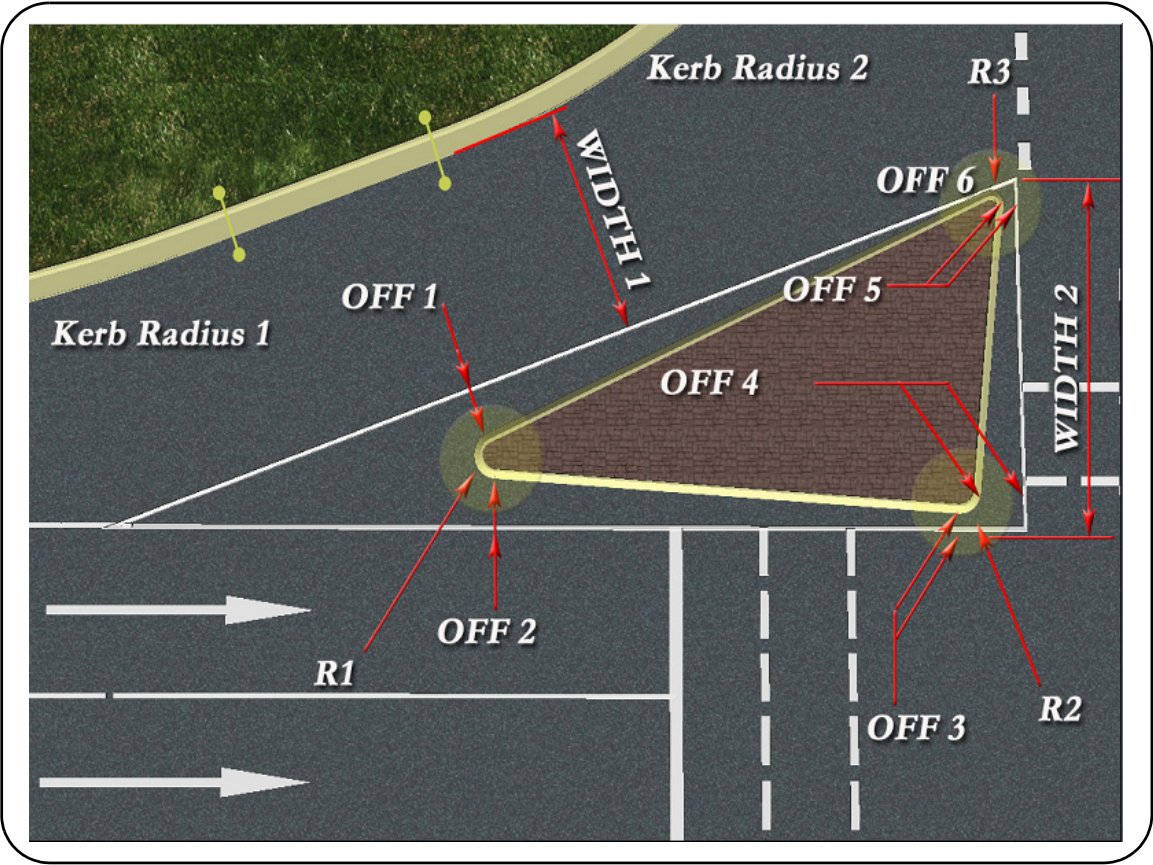

the first radius of the internal island

Radius 2

the second radius of the internal island

Radius 3

the third radius of the internal island

Approach / Departure =>Left Turn =>Kerb Return Node

The stand up and free left turn types allow you to define the kerb return to be used.

These options include [Fillet Kerb Return](#), [Two Centred Kerb Return](#) and [Three Centred Kerb Return](#)

Fillet Kerb Return

<div>Intersection</div> <div>Placement parameters</div> <div>Major road</div> <div>Carriageway</div> <div>Approach</div> <div>Left turn</div> <div>Kerb return</div>	Type	Fillet
	Radius	15

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb return to create (in this case, **Fillet**)*

Radius

the radius for the fillet kerb return

Two Centred Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb return to create (in this case, **Two Centred**)*

Approach radius

the approach radius of the two centred curve

Departure radius

the departure radius of the two centred curve

Approach tangent

the approach tangent for the two centred curve

Three Centred Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb to create (in this case, **Three Centred**)*

Approach radius

the approach radius of the three centred curve

Intermediate radius

the intermediate radius of the three centred curve

Departure radius

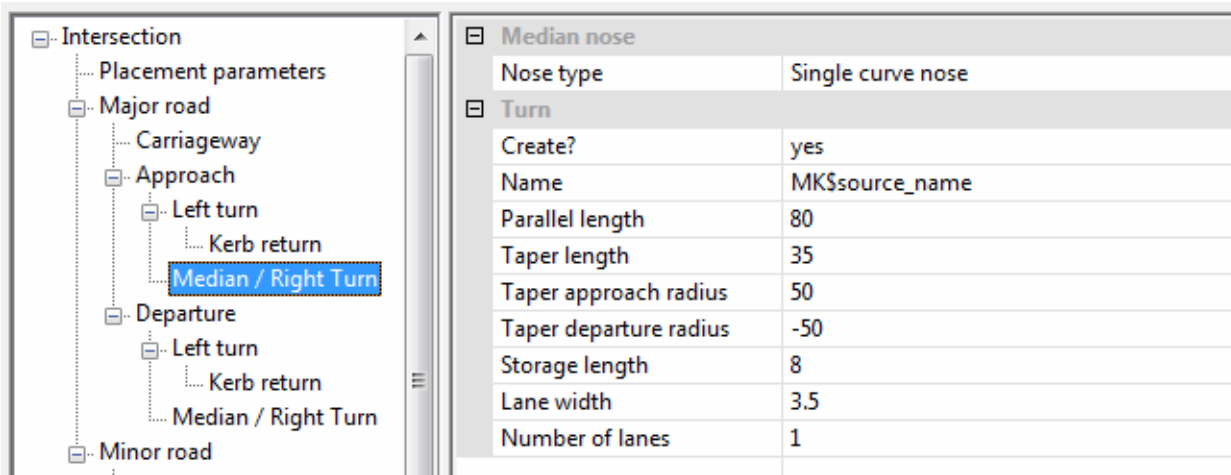

the departure radius of the three centred curve

Approach / Departure =>Median / Right Turn Node

This node is used to define the median and an optional right turn for an intersection road approach or departure.

Note that if you are using Right Side driving, then this will say Median / Left Turn.

This node is only used if a median has been defined as part of the carriageway.

The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Median Nose

Nose type

the type of nose to create for the median (see [Nose Types](#))

Turn

Create?

whether or not to create a right turn

Name

the name to apply to the turn

Parallel length

the length of the parallel lane

Taper

the length of the leading taper

Taper approach radius

the approach radius of the leading taper

Taper departure radius

the departure radius of the leading taper

Storage length

the storage length of the turn lane

Lane width

the width of the turn lane - must be less than the median width

Number of lanes

the number of turn lanes to create

Nose Types

For more information on *Single Curve Nose* see
Two Curve Nose
Three Curve Nose

[Single Curve Nose](#)
[Two Curve Nose](#)
[Three Curve Nose](#)

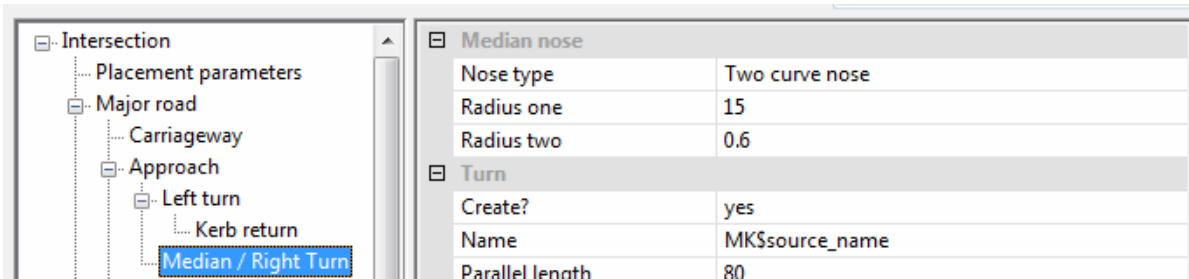

Single Curve Nose

a median nose created from a single fillet curve

Two Curve Nose

A median nose created from two curves

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Radius one

the radius of the first curve

Radius two

the radius of the second curve

Three Curve Nose

A median nose created from three curves and an optional offset

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Radius one

the radius of the first curve

Radius two

the radius of the second curve

Radius three

the radius of the third curve

Offset

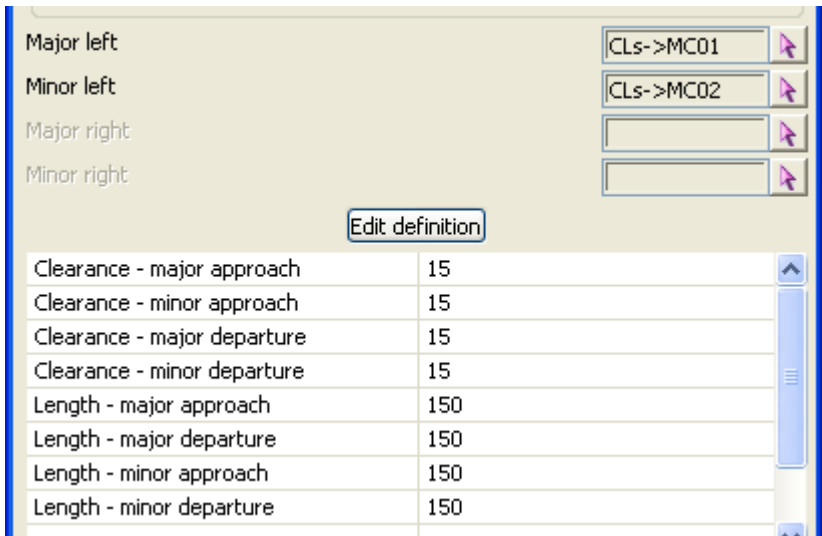

the offset of the nose from the centreline

Placing Intersections

When placing an intersection, there are several placement specific settings. This means they are separate from the definition but help define how the intersection is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#) Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Major left

the left most major road

Minor left

the left most minor road

Major right

the right most major road (optional)

Minor right

the right most minor road (optional)

Major right and minor right can be set when there is a dual carriageway.

Edit definition	button
-----------------	--------

Selecting this button displays the **Edit a Placed Component Definition** panel. For more information please see [Edit a Placed Component Definition](#)

Clearance - major approach

the clearance of geometry on the approach of the major road, from the intersection

Clearance - minor approach

the clearance of geometry on the approach of the minor road, from the intersection

Clearance - major departure

the clearance of geometry on the departure of the major road, from the intersection

Clearance - minor departure

the clearance of geometry on the departure of the minor road, from the intersection

Length - major approach

the length of the geometry created for the approach of the major road

Length - minor approach

the length of the geometry created for the approach of the minor road

Length - major departure

the length of the geometry created for the departure of the major road

Length - minor departure

the length of the geometry created for the departure of the minor road

Roundabout

A Roundabout component can be edited via the [Component Library](#) or by editing the definition of a placed component.

For information on *Defining a Roundabout* see
Placing Roundabouts

[Defining a Roundabout](#)
[Placing Roundabouts](#)

Defining a Roundabout

A Roundabout is defined around two intersecting roads - the **Major road** and the **Minor road**. Each road, major or minor, may have an approach (the section of the road leading in to the roundabout) and the departure (the section of the road leading away from the roundabout).

The approach and departure for both the Major and Minor road are defined by the same set of parameters.

- For information on:
- Placement Parameters Node see

Centre Node

Approach/ Departure Node

Approach/ Departure => Kerb Node
- [Placement Parameters](#)

[Centre Node](#)

[Approach / Departure Node](#)

[Approach / Departure => Kerb Node](#)

Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on [Placing Roundabouts](#).

Centre Node

This node defines parameters for the centre of the roundabout.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

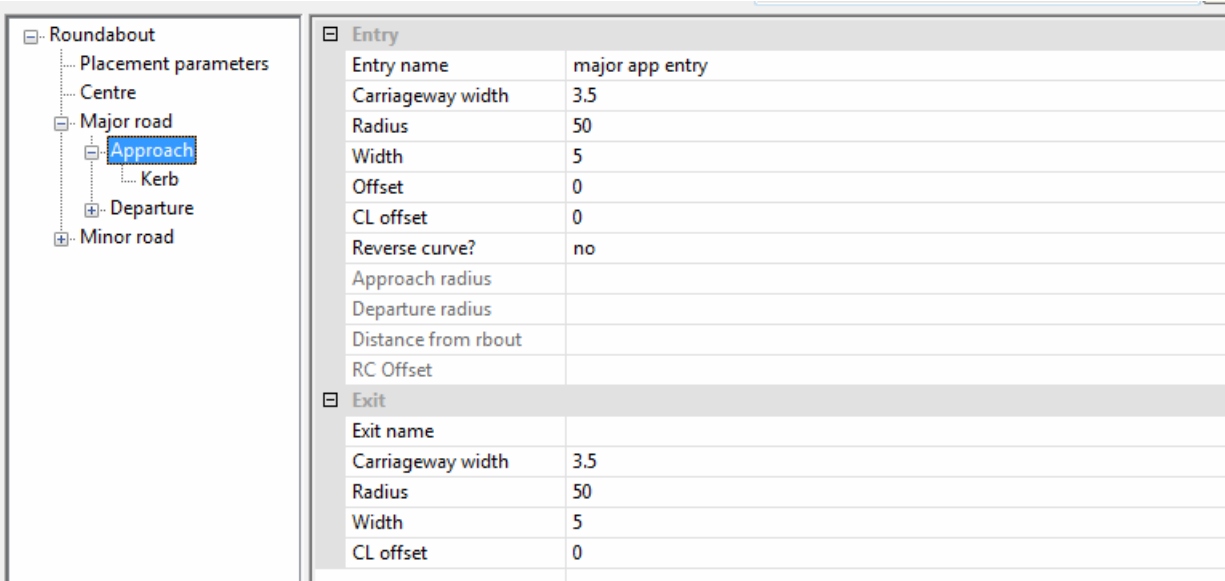

Centre radius
the radius of the centre island of the roundabout

Circulating width
the width around the centre island

Extra circulating offset
an additional offset to apply to throat and kerb return strings from the circulating width

Approach / Departure Node

This node defines parameters for the approach or departure of a specific Roundabout road. This node is made up of two sub parts - the **Entry** into the roundabout and the **Exit** from the roundabout. They can be configured independently.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Entry				
Entry name				
	<i>the name to apply to the entry string</i>			
Carriageway width				
	<i>the width of the carriageway at the entry to the roundabout</i>			
Radius				
	<i>the radius of the entry into the roundabout</i>			
Width				
	<i>the width of the entry throat into the roundabout</i>			
Offset				
	<i>an offset of the entry string from the centre of the roundabout</i>			
CL offset				
	<i>an offset of the entry from the centreline, for medians</i>			
Reverse curve?				
	<i>whether or not to create a reverse curve (yes or no)</i>			
Approach radius				
	<i>the approach radius for the reverse curve</i>			
Departure radius				
	<i>the departure radius of the reverse curve</i>			

Distance from about

the distance of the start of the reverse curve from the roundabout

RC Offset

the offset of the reverse curve from the centreline

Exit

Exit name

the name to apply to the exit string

Carriageway width

the width of the carriageway at the exit to the roundabout

Radius

the radius of the exit from the roundabout

Width

the width of the exit throat from the roundabout

CL Offset

an offset of the exit string from the centre of the roundabout

Approach / Departure => Kerb Node

This defines the kerb return between the entry at the approach / departure and the adjacent exit. There are several types of kerb returns available.

- | | |
|----------------------------------------------------|--------------------------------------------------------------|
| • Arc / Three Tangents / Arc see | Arc / Three Tangents / Arc |
| • Three Tangents / Locked Arc / Three Tangents see | Three Tangents / Locked Arc / Three Tangents |
| • Three Tangents / Arc / Three Tangents see | Three Tangents / Arc / Three Tangents |
| • Fillet see | Fillet |
| • Two Centre Curve see | Two Centre Curve |
| • Three Centre Curve see | Three Centre Curve |

Getting the geometry right for your roundabout can be complex. The geometry is not guaranteed to solve and you may need to try another kerb return type if the current one does not suit your needs.

Common Fields

Name

the name of the kerb return

Type

the type of kerb return

Arc / Three Tangents / Arc

This creates a kerb return with an approaching arc, an arc with three tangents (to the edge of the entry throat, the circulating width and the edge of the exit throat) and a departing arc.

<div><div>Roundabout</div><div>Placement parameters</div><div>Centre</div><div>Major road</div><div>Approach</div><div>Kerb</div><div>Departure</div></div>	Name	major app kerb
	Type	Arc / Three Tangents / Arc
	Approach radius	35
	Departure radius	35
	Alternate solution on approach	no
	Alternate solution on departure	no

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Approach radius

the radius of the approach arc

Departure radius

the radius of the departure arc

Alternate solution on approach

whether or not to attempt a different solution on the approach arc

Alternate solution on departure

whether or not to attempt a different solution on the departure arc

Three Tangents / Locked Arc / Three Tangents

This creates a kerb return with the following components:

- an arc tangential to the entry carriageway, the edge of the entry throat and the circulating width of the roundabout
- an arc with a radius locked to the radius of the circulating width
- an arc tangential to the circulating width of the roundabout, the edge of the exit throat and the exit carriageway

<div><div>Roundabout</div><div>Placement parameters</div><div>Centre</div><div>Major road</div><div>Approach</div><div>Kerb</div></div>	Name	major app kerb
	Type	Three Tangents / Locked Arc / Three Tangents
	Alternate solution on approach	no
	Alternate solution on departure	no

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Alternate solution on approach

whether or not to attempt a different solution on the approach arc

Alternate solution on departure

whether or not to attempt a different solution on the departure arc

Three Tangents / Arc / Three Tangents

This creates a kerb return with the following components:

- an arc tangential to the entry carriageway, the edge of the entry throat and the circulating width of the roundabout
- an arc with a user defined radius
- an arc tangential to the circulating width of the roundabout, the edge of the exit throat and the exit carriageway

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Radius

a user defined radius for the internal arc

Alternate solution on approach

whether or not to attempt a different solution on the approach arc

Alternate solution on departure

whether or not to attempt a different solution on the departure arc

Fillet

This creates a kerb return as a simple fillet between the approach / departure and the adjacent carriageway.

The fields and buttons used in this panel have the following functions:

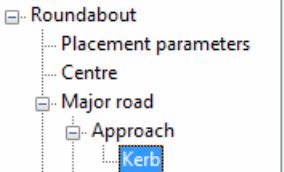

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Radius

the radius to use for the fillet

Two Centre Curve

This creates a kerb return as a two centre curve.

	Name	major app kerb
	Type	Two Centre Curve
	Approach radius	30
	Departure radius	30
	Approach tangent	15

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Approach radius

the radius for the approach of the curve

Departure radius

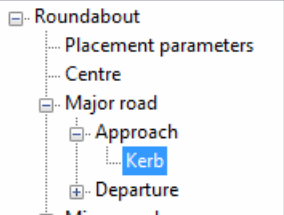

the radius for the departure of the curve

Approach tangent

the approach tangent to the curve

Three Centre Curve

This creates a kerb return as a three centre curve.

	Name	major app kerb
	Type	Three Centre Curve
	Intermediate radius	45
	Approach radius	30
	Departure radius	90
	Approach offset	0
	Departure offset	0

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Intermediate radius

the radius of the intermediate part of the curve

Approach radius

the radius of the approach part of the curve

Departure radius

the radius of the departure part of the curve

Approach offset

Departure offset

Placing Roundabouts

A roundabout is placed at the intersection of two roads - the Major and Minor road. When placing a roundabout, there are several placement specific settings. This means they are separate from the definition but help define how the roundabout is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#). Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

Alignments

Major road

CLs->MC01

Minor road

CLs->MC02

Component parameters

Length - major approach	150
Length - major departure	150
Length - minor approach	150
Length - minor departure	150

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Alignments			
Major road			
<i>the major road of the roundabout</i>			
Minor road			
<i>the minor road of the roundabout</i>			
Component parameters			
Length - major approach			
<i>the length strings to generate along the major approach</i>			
Length - major departure			
<i>the length strings to generate along the major departure</i>			
Length - minor approach			
<i>the length strings to generate along the minor approach</i>			
Length - minor departure			
<i>the length strings to generate along the minor departure</i>			

Note that setting a length to 0 will effectively close that leg of the roundabout.

Bus Bay

A **Bus Bay** component can be edited via the [Component Library](#) or by editing the definition of a placed component.

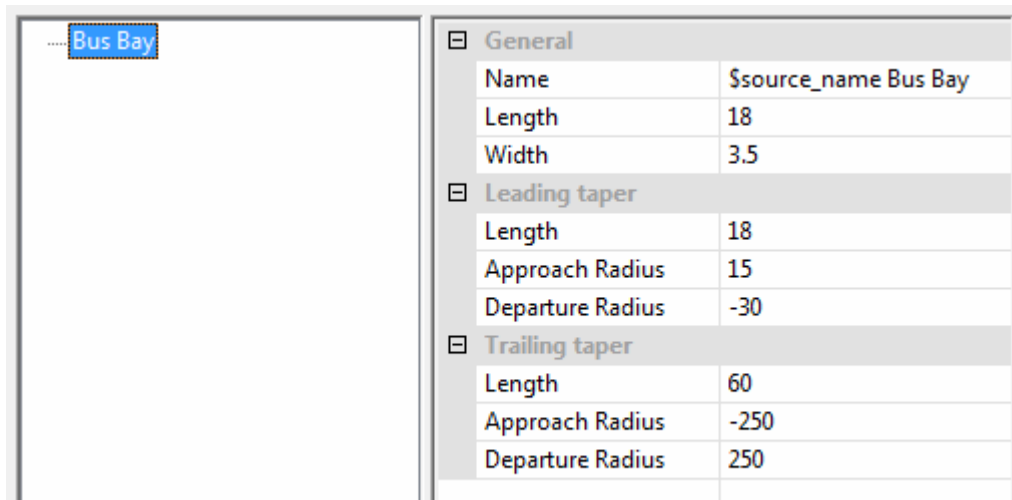

For information on *Defining a Bus Bay* see
Placing Bus Bays

[Defining a Bus Bay](#)
[Placing Bus Bays](#)

Defining a Bus Bay

A **Bus Bay** is defined as being created from a known chainage on one centreline string.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
General				
Name				
	<i>the name of the Bus Bay string</i>			
Length				
	<i>the length of the Bus Bay</i>			
Width				
	<i>the width of the widest part of the Bus Bay</i>			
Leading Taper				
Length				
	<i>the length of the leading taper into the Bus Bay</i>			
Approach radius				
	<i>the approach radius of the leading taper into the Bus Bay</i>			
Departure radius				
	<i>the departing radius of the leading taper into the Bus Bay</i>			
Trailing Taper				
Length				

the length of the trailing taper from the Bus Bay

Approach radius

the approach radius of the trailing taper from the Bus Bay

Departure radius

the departing radius of the trailing taper from the Bus Bay

Placing Bus Bays

A **Bus Bay** is placed at a known chainage along one centreline string. When placing a **Bus Bay**, there are several placement specific settings. This means they are separate from the definition but help define how the **Bus Bay** is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#) some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

Alignments

Centreline

CLs->MC02

Component parameters	
Chainage	0
Carriageway width	3.5
Side	Left

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Centreline

the centreline string on which the Bus Bay is created

Chainage

the chainage of the Bus Bay on the nominated centreline string

Carriageway width

the width of the carriageway

Side

the side of the road on which the Bus Bay is created (Left or Right). This will influence the direction of the Bus Bay, depending on your drive side settings in your library.

Culdesac

A **Culdesac** component can be edited via the [Component Library](#) or by editing the definition of a placed component.

For information on *Defining a Culdesac* see
Placing Culdesac

[Defining a Culdesac](#)
[Placing Culdesacs](#)

Defining a Culdesac

<div>.....Culdesac</div>	Name	MK\$source_name
	Bulb radius	9
	Bulb offset	
	Left fillet radius	15
	Right fillet radius	15
	Approach width	3.5
	Left tangent length	
	Right tangent length	

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name

the name of the culdesac string

Bulb radius

the radius of the bulb of the culdesac

Bulb offset

an optional offset of the bulb from the centreline

Left fillet radius

the radius of the left fillet of the culdesac

Right fillet radius

the radius of the right fillet of the culdesac

Approach width

the width of the carriageway approaching the culdesac

Left tangent length

an optional length of a tangent between the left fillet and the bulb

Right tangent length

an optional length of a tangent between the right fillet and the bulb

Placing Culdesacs

A **Culdesac** is placed either at the start or end of a road. When placing a culdesac, there are several placement specific settings. This means they are separate from the definition but help define how the culdesac is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#). Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

Parking Bays

Parking Bays can be edited via the [Component Library](#) or by editing the definition of a placed component.

For information on *Defining a Parking Bay*
Placing Parking Bay

[Defining Parking Bays](#)
[Placing Parking Bays](#)

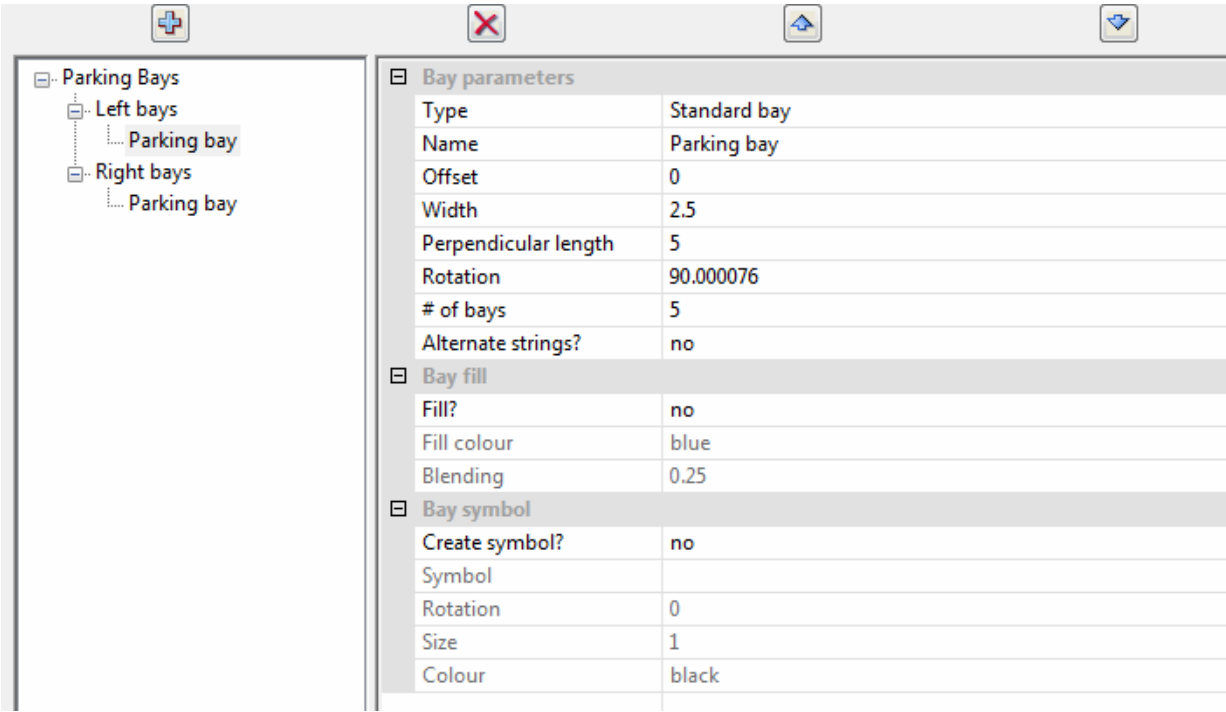

Defining Parking Bays

Parking Bays are created along a nominated centreline string. A **Parking Bays** component consists of a user defined number of 'sets of bays' on the left and right side.

A set of bays can consist of one or more actual parking bays. It is defined by a number of parameters for width, length, offset and rotation, as well as several cosmetic settings.

A set of bays can either be a [Standard Bay](#) or a [Separation](#).

Bays on the left and right side are defined in the same manner.

To add a set of bays to the left or right side, simply select either **Left Bays** or **Right Bays** and click the  button

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
 adds a bay set to the selected side			
 deletes the selected bay set			
 moves the selected bay definition up			
 moves the selected bay definition down			

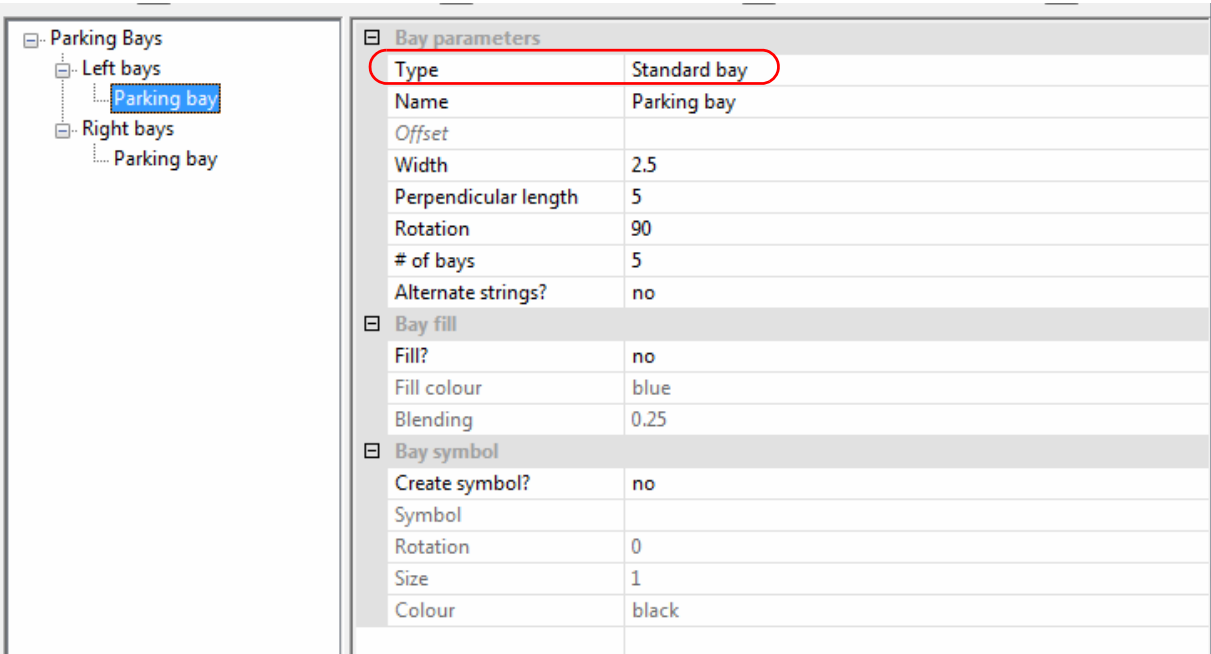

Bay Parameters

Type

the type of bay - Standard or Separation. For more information please see [Standard Bay](#) and

Separation

Standard Bay

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Bay Parameters				
Name				
	<i>the name of the bay</i>			
Offset				
	<i>an optional offset of each bay from the centreline</i>			
Width				
	<i>the width of each bay</i>			
Perpendicular length				
	<i>the perpendicular length of each bay</i>			
Rotation				
	<i>the rotation of each bay</i>			
# of bays				
	<i>the number of bays to create for this set</i>			
Alternate strings?				
	<i>whether or not to create every other string</i>			

Bay fill

Fill?

whether or not to fill each bay with a colour

Fill Colour

the colour to use when filling

Blending

an optional blend to apply, for transparency

Bay symbol

Create symbol?

whether or not to create a symbol in the centre (yes or no)

Symbol

the symbol to place

Rotation

the additional rotation of the symbol. All symbols will be rotated to match the rotation of the parking bay.

Size

the size / scale of the symbol

Colour

the colour of the symbol

Separation

A separation represents a space between parking bays.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name

the name of the separation

Width

the width of the separation

Rotation

the rotation of the separation

Placing Parking Bays

Parking Bays are placed either at the start or end of a road. When placing a Parking Bay component, there are several placement specific settings. This means they are separate from the definition but help define how the Parking Bay is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#). Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Centreline		string select		
	<i>the centreline along which the bays are created</i>			
Chainage				
	<i>the chainage at which the bays should start being created</i>			

Left Turn

A **Left Turn** is a subset of an intersection, comprising of just a **Left Turn**. A **Left Turn** can be edited via the [Component Library](#) or by editing the definition of a placed component.

For information on *Defining a Left Turn*

[Defining a Left Turn](#)

Placing Left Turns

Major right and Minor right can be set when there is a dual carriageway.

Component parameters

Width - major

the width of the carriageway of the major road

Width - minor

the width of the carriageway of the minor road

Clearance - major

the clearance of geometry on major road

Clearance - minor

the clearance of geometry on minor road

Length - major

the length of the geometry created for major road

Length - minor

the length of the geometry created minor road

From

whether or not to create the left turn leading from the approach or the departure

Median Island

A **Median Island** is a subset of an intersection, comprising of just a median and an optional right hand turn. A **Median Island** can be edited via the [Component Library](#) or by editing the definition of a placed component.

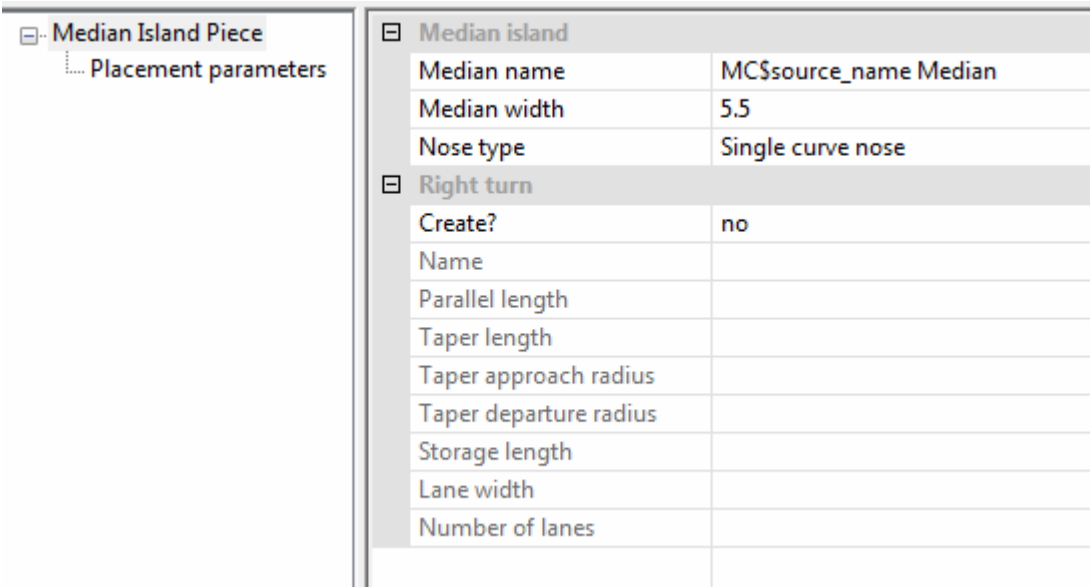

For information on *Defining a Median Island*
Placing Median Islands
Placement Parameters

[Defining a Median Island](#)
[Placing Median Islands](#)
[Placement Parameters](#)

Defining a Median Island

A median is only defined by the parameters involving the Median Island and the right hand turn.

Median Island Piece

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Median island				
Median name				
	<i>the name of the median string to create</i>			
Median width				
	<i>the width of the median</i>			
Nose type				
	<i>the type of nose to create for the median (see Nose Types)</i>			
Right Turn				
Create?				
	<i>whether or not to create a right turn</i>			
Name				
	<i>the name to apply to the turn</i>			
Parallel length				
	<i>the length of the parallel lane</i>			
Taper length				

the length of the leading taper

Taper approach radius

the approach radius of the leading taper

Taper departure radius

the departure radius of the leading taper

Storage length

the storage length of the turn lane

Lane width

the width of the turn lane - must be less than the median width

Number of lanes

the number of turn lanes to create

Entry Ramp Node

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Name
the name of the entry ramp string

Radius 1
the first radius of the entry reverse curve

Radius 2
the second radius of the entry reverse curve

Nose to taper length
The distance between the nose of the shoulder and the taper

Internal radius
the radius of the final, internal arc

Taper length
the length of the trailing taper

Taper rotation 1 in
the rotation of the trailing taper

Curved taper?

whether or not to use a curved taper (may be more suitable for curving centrelines)

Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on [Placing Entry Ramps](#).

Shoulder Node

This node defines properties for the shoulder of the **Entry Ramp**.

<div><div>Entry Ramp</div><div>Placement parameter</div><div>Shoulder</div><div>Merging lane</div><div>Connection</div></div>	Name	\$source_name island
	Nose offset from shoulder	2
	Nose offset from ramp	1
	Nose width	0.6

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Name

the name of the shoulder string

Nose offset from shoulder

the offset of the island nose from the shoulder

Nose offset from ramp

the offset of the island nose from the ramp itself

Nose width

the width of the nose

Merging Lane Node

This node defines the parameters for the **Merging lane**.

<div><div>Entry Ramp</div><div>Placement parameter</div><div>Shoulder</div><div>Merging lane</div><div>Connection</div></div>	Name	\$source_name merging lane
	Lane width	4
	Radius	394
	Curve 1 radius	
	Parallel lane length	95
	Curve 2 radius	
	Curve 2 length	
	Taper length	100

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Name

the name of the merging lane string

Lane width

the width of the merging lane

Radius

the radius used to construct the merging lane

Curve 1 radius

the radius of the first optional curve, before the parallel lane length

Parallel lane length

the length of the parallel lane

Curve 2 radius

the radius of the second optional curve, after the parallel lane

Curve 2 length

the length of the second optional curve, after the parallel lane

Taper length

the length of the taper at the end of the merging lane

Connection

This node defines the properties for an optional connection from the overpass / minor road.
At the moment, this supports either no connection strings or a roundabout.

Mode

the mode of the connection (either [Roundabout Mode](#) or [No Strings Mode](#))

Roundabout Mode

<div><div>Entry Ramp</div><div>Placement paramet</div><div>Shoulder</div><div>Merging lane</div><div>Connection</div></div>	Mode	Roundabout
	Offset	100
	Roundabout radius	25
	Circulating width	10

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Offset

the offset from the intersection, along the minor road, that the connection should be created

Roundabout radius

the radius of the roundabout

Circulating width

the circulating width of the roundabout

No Strings Mode

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Offset

the offset from the intersection, along the minor road, that the connection should be created

Width

how far away from the minor road the entry ramp should start

Placing Entry Ramps

Entry Ramps are placed at the intersection of two roads - a major freeway and a minor adjoining or overpass road. When placing an **Entry Ramp**, there are several placement specific settings. This means they are separate from the definition but help define how the **Entry Ramp** is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#). Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component

Major road

Entry road

EXAMPLE 7->MCC1

EXAMPLE 7->MCA1

Edit definition

Carriageway width	3.5
Distance from interchange	580
Approach/Departure	Approach

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Major road

the freeway or major road to enter

Entry road

the road to enter from

Edit definition	button
-----------------	--------

*Selecting this button displays the **Edit a Placed Component Definition** panel. For more information please see [Edit a Placed Component Definition](#)*

Carriageway width

the width of the freeway carriageway

Distance from interchange

the distance of the end of the entry ramp from the interchange

Approach/Departure

whether the entry ramp is bound to the approach or departure of the freeway / major road

Exit Ramp

An **Exit Ramp** component creates an **Exit Ramp** from a freeway or other major road to an overpass or other adjoining road. It can be edited via the [Component Library](#) or by editing the definition of a placed component.

For more information on Defining an Exit Ramp see
Placing an Exit Ramp

[Defining an Exit Ramp](#)
[Placing Exit Ramps](#)

Defining an Exit Ramp

An **Exit Ramp** is defined by the ramp itself, a shoulder, a diverging lane and an optional connection.

Exit Ramp Node

This node defines the ramp itself.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
Internal String				
Name	<i>the name of the string to create</i>			
Taper length	<i>the length of the ramp taper</i>			
Radius 1	<i>the first radius of a reverse curve</i>			
Length 1	<i>the first length of a reverse curve</i>			
Radius 2	<i>the second radius of a reverse curve</i>			
Length 2				

the second length of a reverse curve

Dual Lane Ramp

Dual lane

whether or not this is a dual lane exit ramp

Taper length

the taper length on the dual lane exit ramp

Placement Parameters

This node is only available when editing a placed component. For more information on the fields displayed here, see the section on [Placing Exit Ramps](#).

Shoulder Node

This node defines the shoulder part of the exit ramp.

<div><div>Exit Ramp</div><div><div>Placement paramet</div><div>Shoulder</div><div>Diverging lane</div><div>Connection</div></div></div>	<table><tr><td>Name</td><td>\$source_name shoulder</td></tr><tr><td>Shoulder length</td><td>150</td></tr><tr><td>Nose radius</td><td>1</td></tr><tr><td>Nose offset from shoulder</td><td>2</td></tr><tr><td>Nose offset from ramp</td><td>1.5</td></tr></table>	Name	\$source_name shoulder	Shoulder length	150	Nose radius	1	Nose offset from shoulder	2	Nose offset from ramp	1.5
Name	\$source_name shoulder										
Shoulder length	150										
Nose radius	1										
Nose offset from shoulder	2										
Nose offset from ramp	1.5										

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name

the name of the created shoulder string

Shoulder length

the length of the shoulder

Nose radius

the radius of the nose of the exit ramp island

Nose offset from shoulder

the offset of the island nose from the shoulder

Nose offset from ramp

the offset of the island nose from the ramp

Diverging Lane Node

This node defines the details for the diverging lane of the exit ramp.

<div><div>Exit Ramp</div><div>Placement paramet</div><div>Shoulder</div><div>Diverging lane</div><div>Connection</div></div>	Name	\$source_name diverging lane
	App. taper length	15
	Lane width	4
	Lane length	165
	Radius	1500

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Name
the name of the created string of the diverging lane

App. taper length
the length of approaching taper

Lane width
the width of the diverging lane

Lane length
the length of the diverging lane

Radius
the radius for the diverging lane

Connection Node

The connection node defines how the Exit Ramp connects to the adjoining road or overpass. There are two types of connection currently; either no visible connection or a Roundabout (see [Roundabout Connection](#)).

Component name		exit
<div><div>Exit Ramp</div><div>Placement paramet</div><div>Shoulder</div><div>Diverging lane</div><div>Connection</div></div>	Type	No connection

Roundabout Connection

<div><div>Exit Ramp</div><div>Placement paramet</div><div>Shoulder</div><div>Diverging lane</div><div>Connection</div></div>	Type	Roundabout
	Offset	100
	Roundabout radius	25
	Circulating width	6.6
	Connecting radius	55

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Offset

the offset of the roundabout from the major road

Roundabout radius

the radius of the centre of the roundabout

Circulating width

the circulating width around the roundabout

Connecting radius

the radius of an arc connecting the exit ramp to the roundabout

Placing Exit Ramps

Exit Ramps are placed at the intersection of two roads - a major freeway and a minor adjoining or overpass road. When placing an **Exit Ramp**, there are several placement specific settings. This means they are separate from the definition but help define how the **Exit Ramp** is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#). Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

Major road

ALIGNMENT MC10-

Exit road

ALIGNMENT MC60-

Edit definition

Carriageway width	3.5
Distance from interchange	400
Approach/Departure	Approach

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Major road

the freeway or major road to exit from

Exit road

the road the ramp leads to

Carriageway width

the width of the major road

Distance from interchange

the distance from the interchange that the exit ramp should start

Approach / Departure

whether the exit ramp is bound to the approach or departure of the major road

CHR Intersection

A **CHR** or **Channelised Rural Intersection** creates an intersection between two roads, typically in a T-Junction configuration. It can be edited via the [Component Library](#) or by editing the definition of a placed component.

For information on Predefined Values Node see

Major Road Node

Major Road => Kerb return Node

Major Road => Kerb Return Node

There are several different kerb return types available:

- Fillet
- Two Centred
- Three Centred
- [Fillet Kerb Return](#)
- [Two Centred Kerb Return](#)
- [Three Centred Kerb Return](#)

Fillet Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb return to create (in this case, **Fillet**)*

Radius

the radius for the fillet kerb return

Two Centred Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb return to create (in this case, **Two Centred**)*

Approach radius

the approach radius of the two centred curve

Departure radius

the departure radius of the two centred curve

Approach tangent

the approach tangent for the two centred curve

Three Centred Kerb Return

<div><div>CHR Intersection</div><div>Placement paramet</div><div>Predefined values</div><div>Major road</div><div>Kerb return</div><div>Minor road</div></div>	Type	Three Centred
	Approach radius	45
	Intermediate radius	30
	Departure radius	90

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

the type of kerb to create (in this case, **Three Centred**)

Approach radius

the approach radius of the three centred curve

Intermediate radius

the intermediate radius of the three centred curve

Departure radius

the departure radius of the three centred curve

Minor Road Node

This node defines the details for the Minor road.

<div><div>CHR Intersection</div><div>Placement paramet</div><div>Predefined values</div><div>Major road</div><div>Kerb return</div><div>Minor road</div></div>	Lane width	3.5

	Type	Fillet
	Radius	15

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Lane width

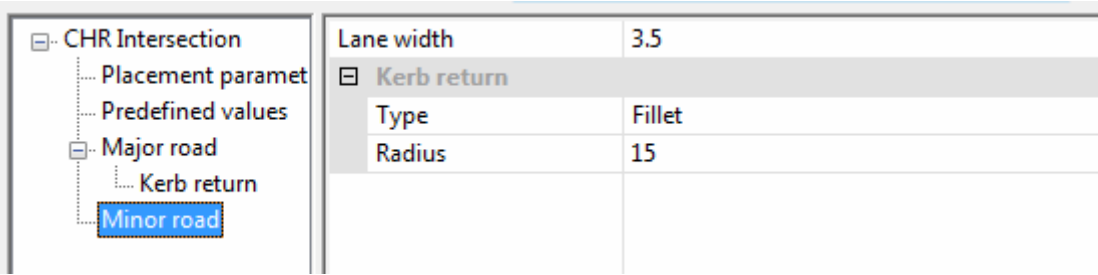

the width of the carriageway of the minor road

Kerb Return

There are several different kerb return types available:

- Fillet
- Two Centred
- Three Centred
- [Fillet Kerb Return](#)
- [Two Centred Kerb Return](#)
- [Three Centred Kerb Return](#)

Fillet Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

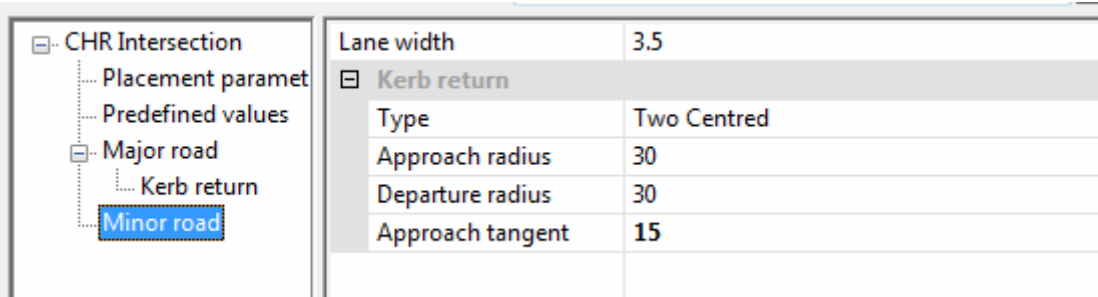

Type

*the type of kerb return to create (in this case, **Fillet**)*

Radius

the radius for the fillet kerb return

Two Centred Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb return to create (in this case, **Two Centred**)*

Approach radius

the approach radius of the two centred curve

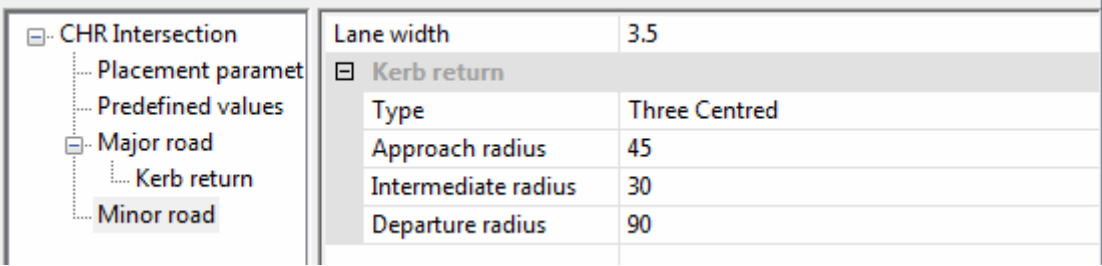

Departure radius

the departure radius of the two centred curve

Approach tangent

the approach tangent for the two centred curve

Three Centred Kerb Return

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Type

*the type of kerb to create (in this case, **Three Centred**)*

Approach radius

the approach radius of the three centred curve

Intermediate radius

the intermediate radius of the three centred curve

Departure radius

the departure radius of the three centred curve

Placing CHR Intersections

CHR Intersections are placed at the intersection of two roads - a major road and a minor road. Each road can be optionally defined with a second carriageway. When placing a CHR intersection, there are several placement specific settings. This means they are separate from the definition but help define how the CHR is placed.

These are defined when placing the component, and may be edited from the [Placed Component Editor](#) Some of these are also available from the [Edit a Placed Component Definition](#) panel.

These parameters are shown below, as they are displayed when placing the component.

Major left	12D SA EXAMPLE 7-	
Minor left	12D SA EXAMPLE 7-	
Major right		
Minor right		

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Major left <i>the left most major road</i>	string select		
Minor left <i>the left most minor road</i>	string select		
Major right <i>the right most major road (optional)</i>	string select		
Minor right <i>the right most minor road (optional)</i>	string select		

Major right and **Minor right** can be set when there is a dual carriageway.

Component parameters	
Lateral offset	0

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Lateral offset <i>an offset of the CHR intersection from the major left control line. This is useful when the control line is not the centreline.</i>			

Place a Component

Position of option on menu: **Design =>Roads =>Components => Place component**

The **Place a component** panel allows you to place a component from your library.

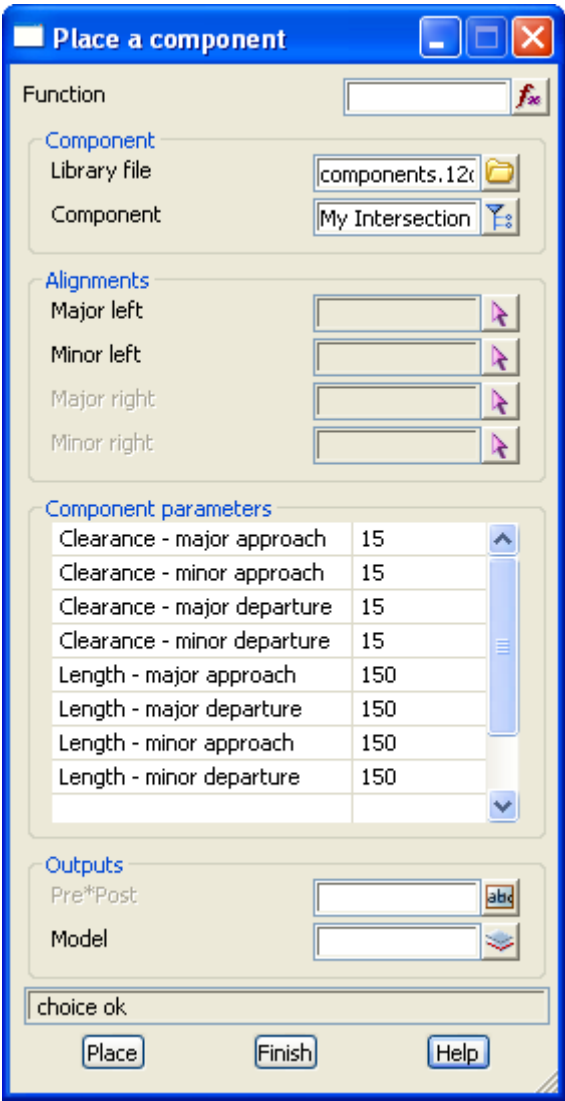

The placement specific parameters required will depend on which component you are attempting to place.

Each component is created as a function, which means you can easily recalc after you change the strings to which it is attached or make it part of a chain.

Please note that there are two types of parameters involved in defining a component:

- 1. **Component Specific** – meaning how the geometry is generated. These are edited via the library or by editing the definition of a placed component.
- 2. **Placement Specific** – how the component is placed. These are edited when placing a component on the **Place a component** panel or on **Editing a Placed Component**.

Selecting **Place component** brings up the **Place a component** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Common Fields			

Function	function
<i>the function to create</i>	
Library file	file
<i>the library file to read components from</i>	
Component	choice box
<i>the component to place</i>	
Pre*Post	
<i>an optional pre*post to apply to generated strings</i>	
Model	model box
<i>the model to create the component strings in</i>	
Place	button
<i>places the components</i>	

For more information on the placement specific parameters required for each component, see the section on the specific component type (see [Component Types](#)).

Editing Components

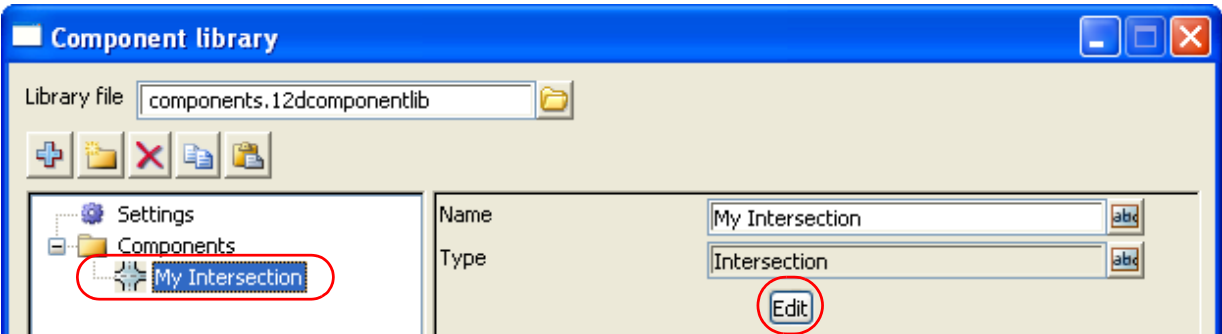

Components may be edited either in the library or directly from a placed component.

For information on **Editing in the Component library** go to [Editing in the Component library - Component Editor](#)

For information on **Editing a Placed Component** go to [Editing a Placed Component](#)

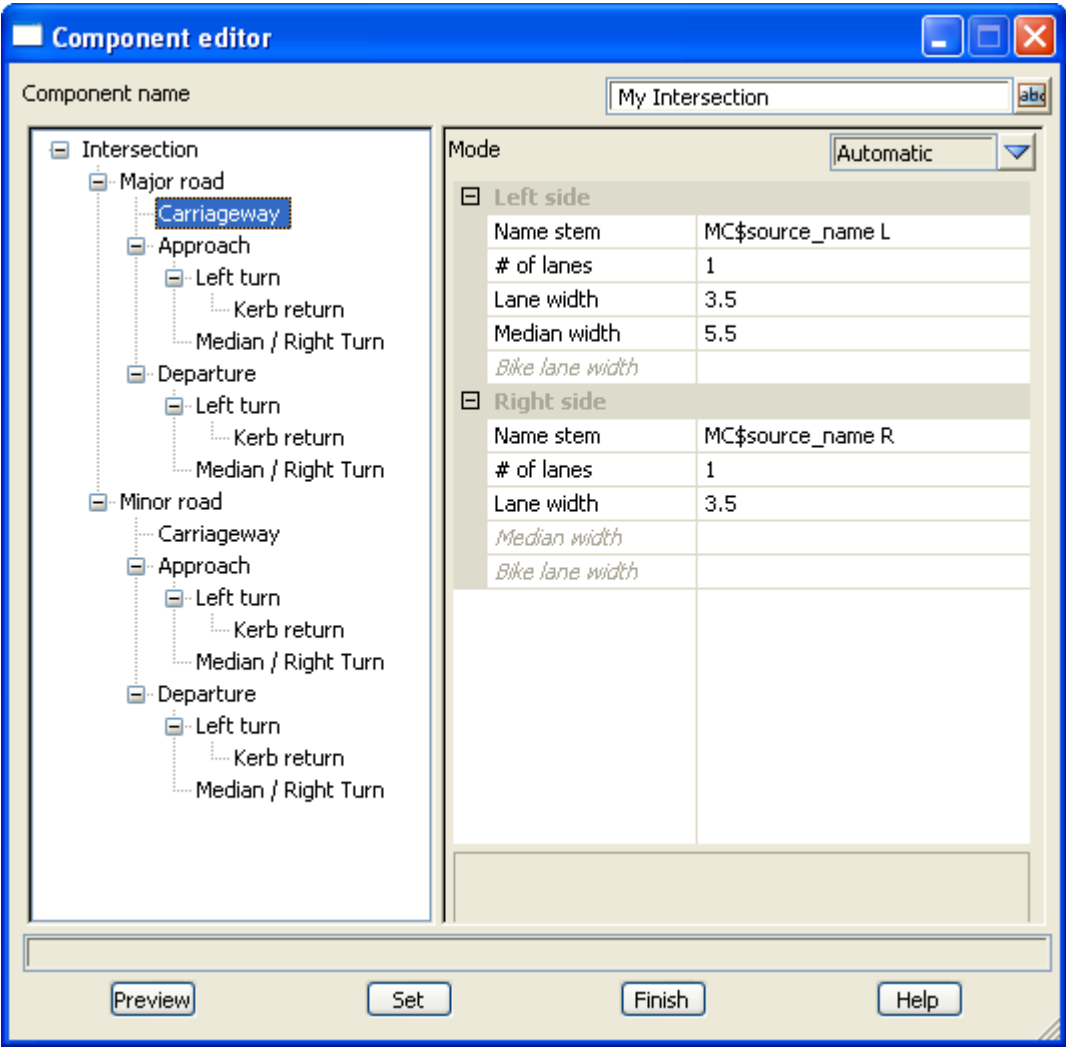

Editing in the Component library - Component Editor

Design =>Roads =>Components => Component library =>Component Node =>Edit button

To edit in the **Component Library**, select your component and then select the **edit** button, this brings up the **Component Editor** panel.

The **Component Editor** panel changes depending on the component, so for specific information on parameters, please see the section on that component type (see [Component Types](#)). The following example shows editing an intersection component.

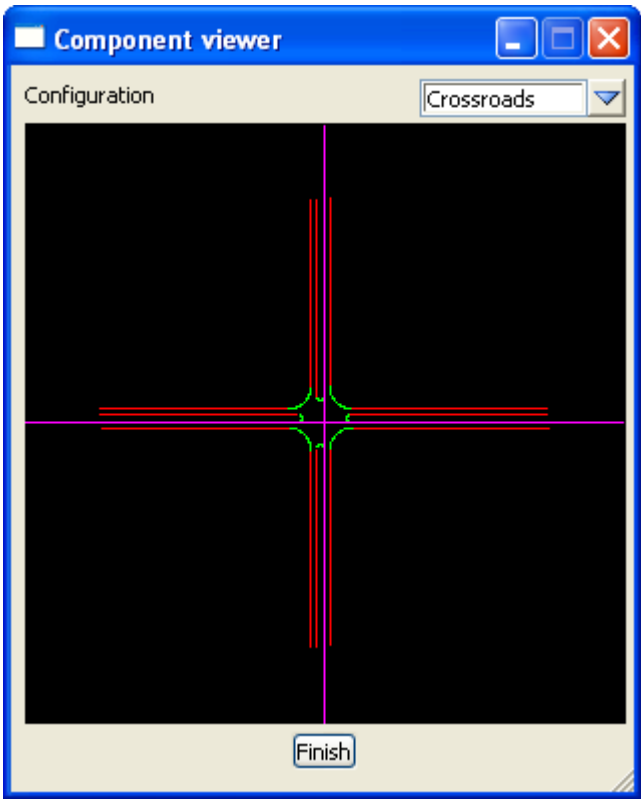

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Common fields and buttons			
Component name			
<i>the name of the component</i>			
Preview	button		
<i>shows a preview of the component with theoretical centreline strings. For more information please go to Component Viewer.</i>			
Set	button		
<i>sets the component in the library</i>			

Component Viewer

The **Component viewer**, which is updated as you make changes to your library component, gives you an idea of what your component may look like when it is placed. The following example shows a standard intersection.

Selecting the **Preview** button on the **Component Editor** panel displays the **Component viewer** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Configuration <i>this field allows you to change what strings are generated to show you how the component will change based on different centrelines.</i>	choice box		Crossroads, T Junction
<i>Options include: Crossroads and T-Junction</i>			

Note that this does not affect the component in anyway – this is only for previewing purposes.

Editing a Placed Component

You may edit a placed component, either by changing the placement specific parameters or by changing the definition itself.

A placed component may be edited by using the **Functions =>Editor (Utilities => Functions =>Editor)** or by using the **Edit Component** option on the **Components** menu (**Design =>Roads =>Components => Edit Component**).

As when placing the component, the placement specific parameters will vary based on the type of component.

For more information on **Edit a Placed Component** please see [Edit a Placed Component](#)

Edit a Placed Component

Position of menu: **Design =>Roads =>Components => Edit Component**

The **Edit a Placed Component** panel, edits an existing component by its function.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Function

the component function

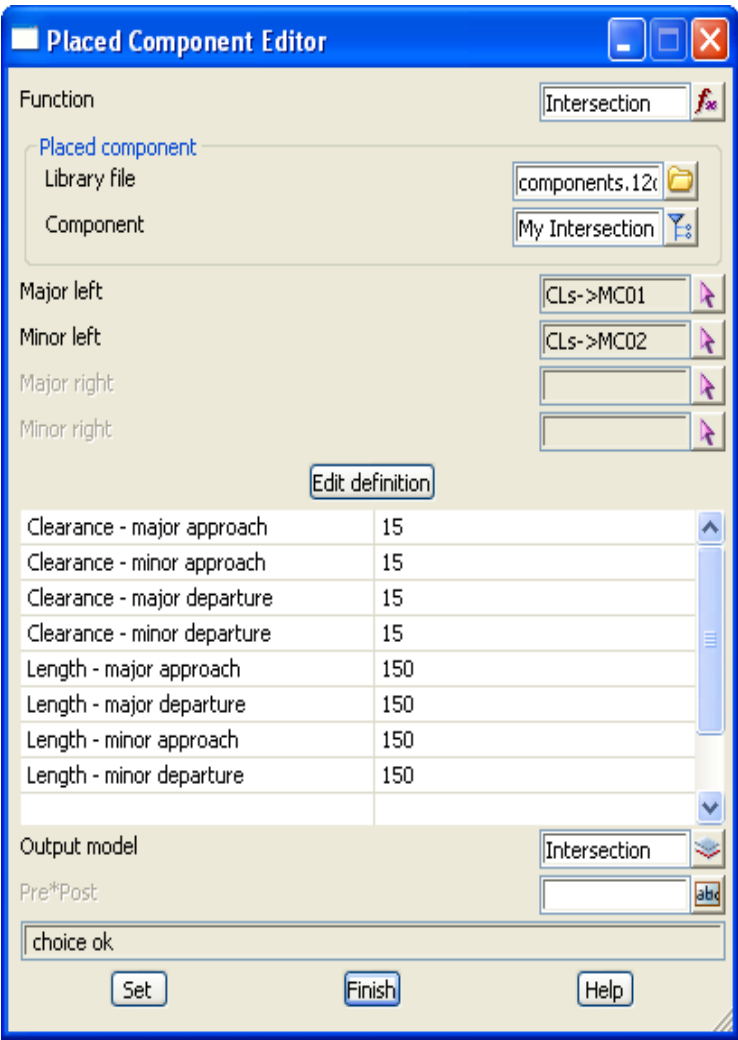

Edit

button

edits the placed component (see [Placed Component Editor](#)).

Placed Component Editor

This panel is only accessible by using the [Edit a Placed Component](#) (Design =>Roads =>Components => Edit Component) or by editing the function directly from the Utilities => Functions =>Editor.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Function	function		
<i>the function you wish to edit</i>			

Placed Component

Library	file
<i>the library your component is read from</i>	
Component	choice box
<i>the component that is being placed</i>	

Please note that Library and Component will be read only if you have opted to detach the

component from the library.

Edit Definition button

allows you to edit the definition of the placed component, which will detach it from the library. After you do this, any changes to the library component will not affect your component. For more information please see [Edit a Placed Component Definition](#)

For information on the placement specific parameters, please see the section for that component (see [Component Types](#)).

Output Model model box

the model the geometry will be generated into

Pre*Post

*an optional pre*post*

Set button

Sets the details

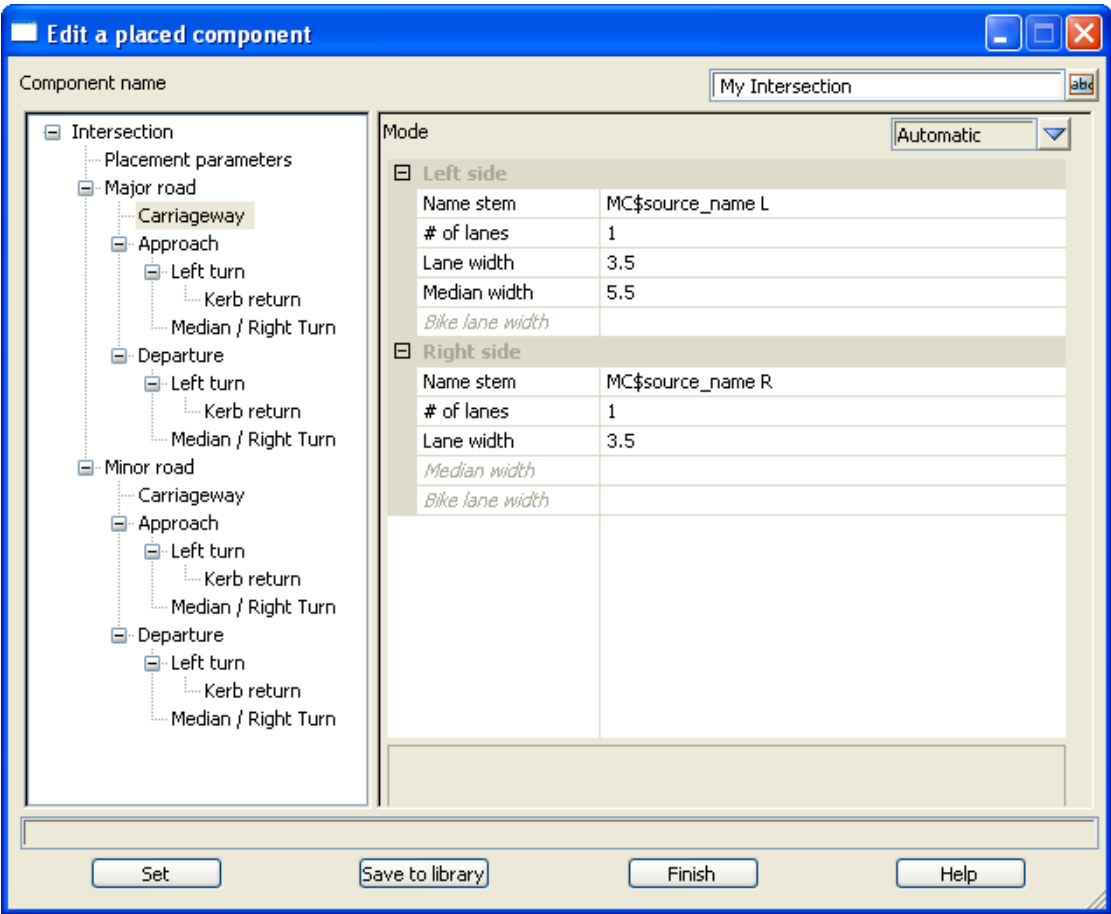

Edit a Placed Component Definition

To edit the definition of a placed component, you must edit the function (**Utilities => Functions => Editor or Design => Roads => Components => Edit Component**) and then select '**Edit Definition**' on the [Placed Component Editor](#) panel.

The following example shows the intersection editor. For details on the component specific parameters, see the section on that component type (see [Component Types](#)).

As you edit the component, your changes will be reflected on the component strings.

If you do not wish to keep the changes, simply press '**Finish**' without pressing '**Set**'.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Component name

the name of the component

Set	button
------------	--------

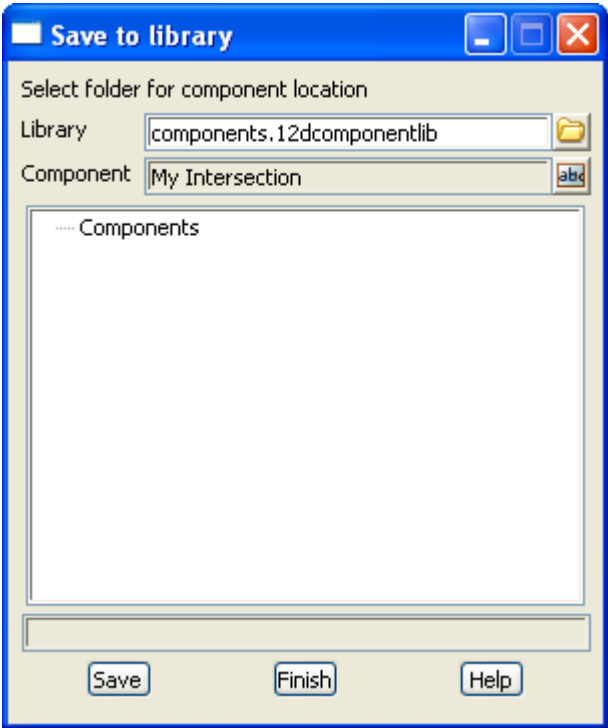

sets the component specific parameters

Save to library	button
------------------------	--------

allows you to save your component definition back into your library. This is useful after you have made changes which you wish to reuse in other components. For more information please see [Save to Library](#)

Save to Library

This panel allows you to save an edited definition back in to your library.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Library	file		
<i>the library file to save to</i>			

Component	
<i>the name of the component you are saving</i>	

The panel displays a list of all the folders in your library. Select which folder you wish to save it into.

Save	button
<i>saves the component into your library</i>	

Component Quick Place

Position of option on menu: Design =>Roads =>Components => Quick place

The **Component quick place** toolbar is an easy way to quickly drop components on to existing strings.

Simply start the toolbar, pick your component and hover your mouse over where you would like the component created. If the placement point is correct, a preview of the component will be drawn on your view.

Once you have picked the position correctly, hitting **C** on your keyboard will create the component.

You can then press **E** to edit the component.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

First field

the list of components from your local library (searched for in the working directory, or in your library)

Second field

the length on the major approach (does not apply to all components)

Third field

the length on the major departure (does not apply to all components)

Fourth field

the length on the minor approach (does not apply to all components)

Fifth field

the length on the minor departure (does not apply to all components)

Last button

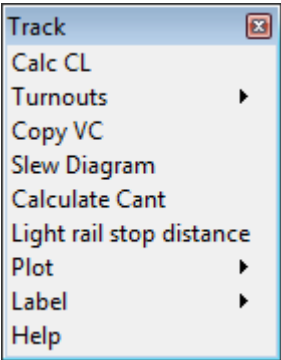

close the toolbar

Track

Position of menu: **Design =>Track**

The Track options are for working on rail design.

Super Alignment Labels

Position of option on menu: Design =>Track =>Label=>Label Alignment

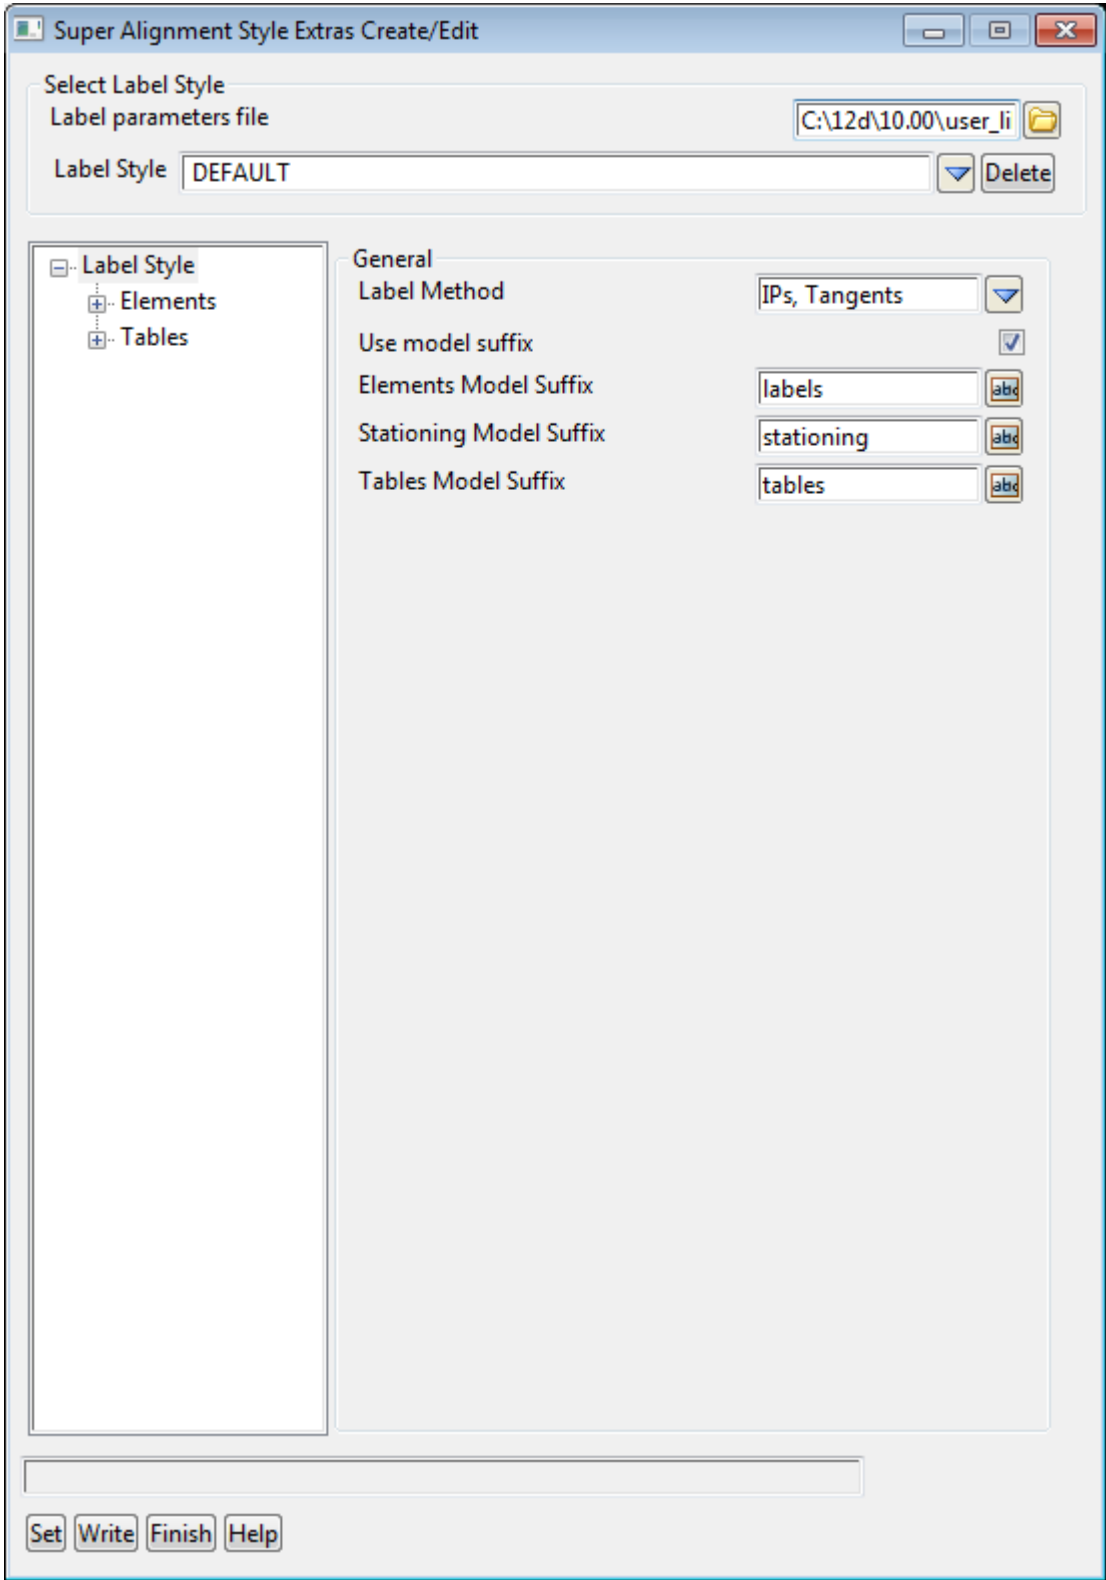

The **Track** options have their own Help system which is brought up by either clicking the **Help** button on the panel or by selecting the **Help** option on the Track menu.

Super Alignment Style Extras Create/Edit

Position of option on menu: Design =>Track =>Label=>Label Alignment Defaults

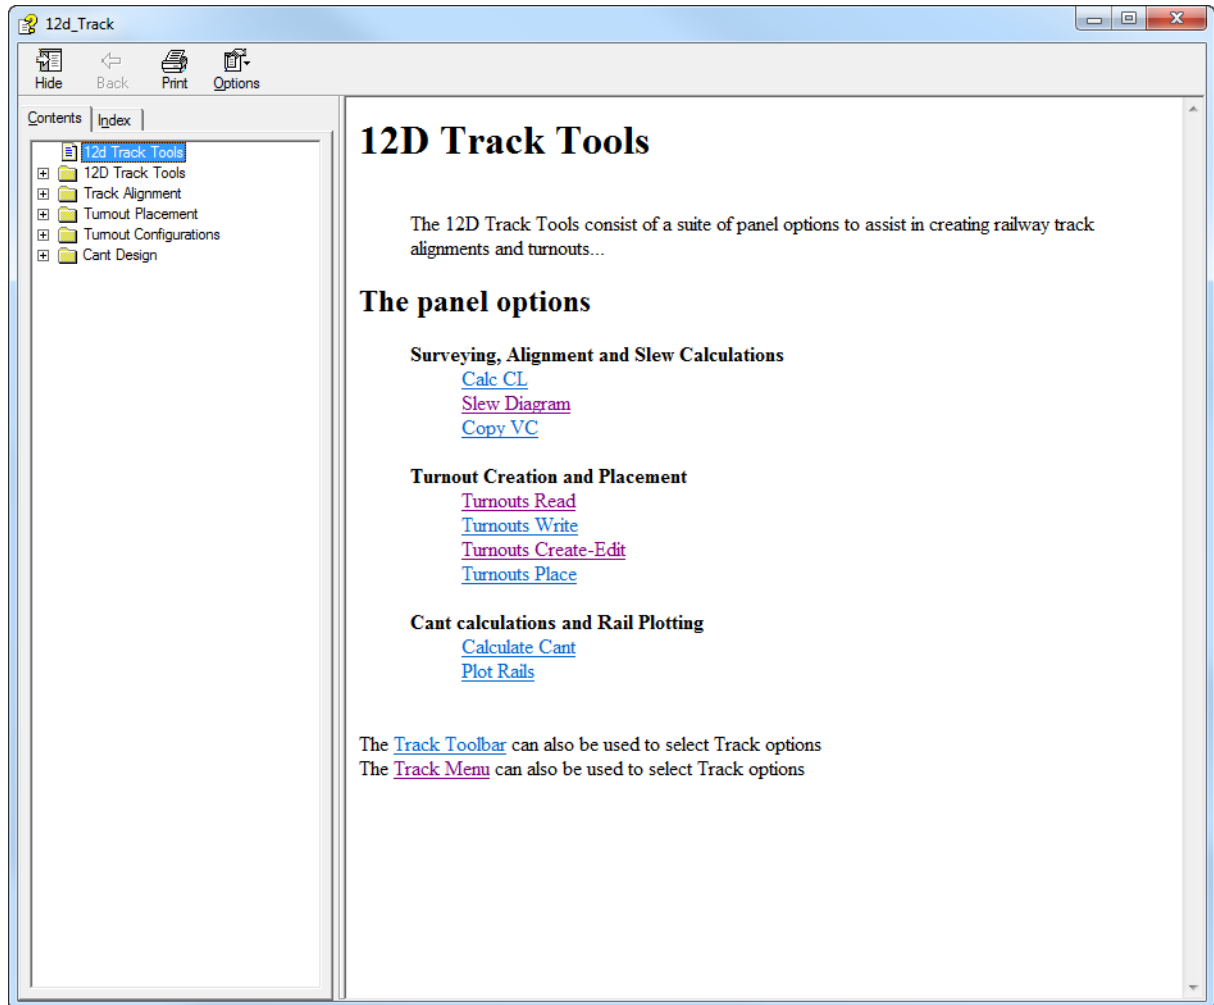

The **Track** options have their own Help system which is brought up by either clicking the **Help** button on the panel or by selecting the **Help** option on the Track menu.

Help

Position of menu: Design =>Track => Help

The **Track** options have their own Help system which is brought up by clicking on **Help** on the **Track** menu, or clicking **Help** on each of the **Track** panels.

Tunnel

Position of menu: **Design =>Tunnel**

The **Tunnel** walk-right menu is

For the option *Edit Tunnel*, go to
Create Tunnel

[Define Tunnel](#)

[Create Tunnel](#)

Define Tunnel

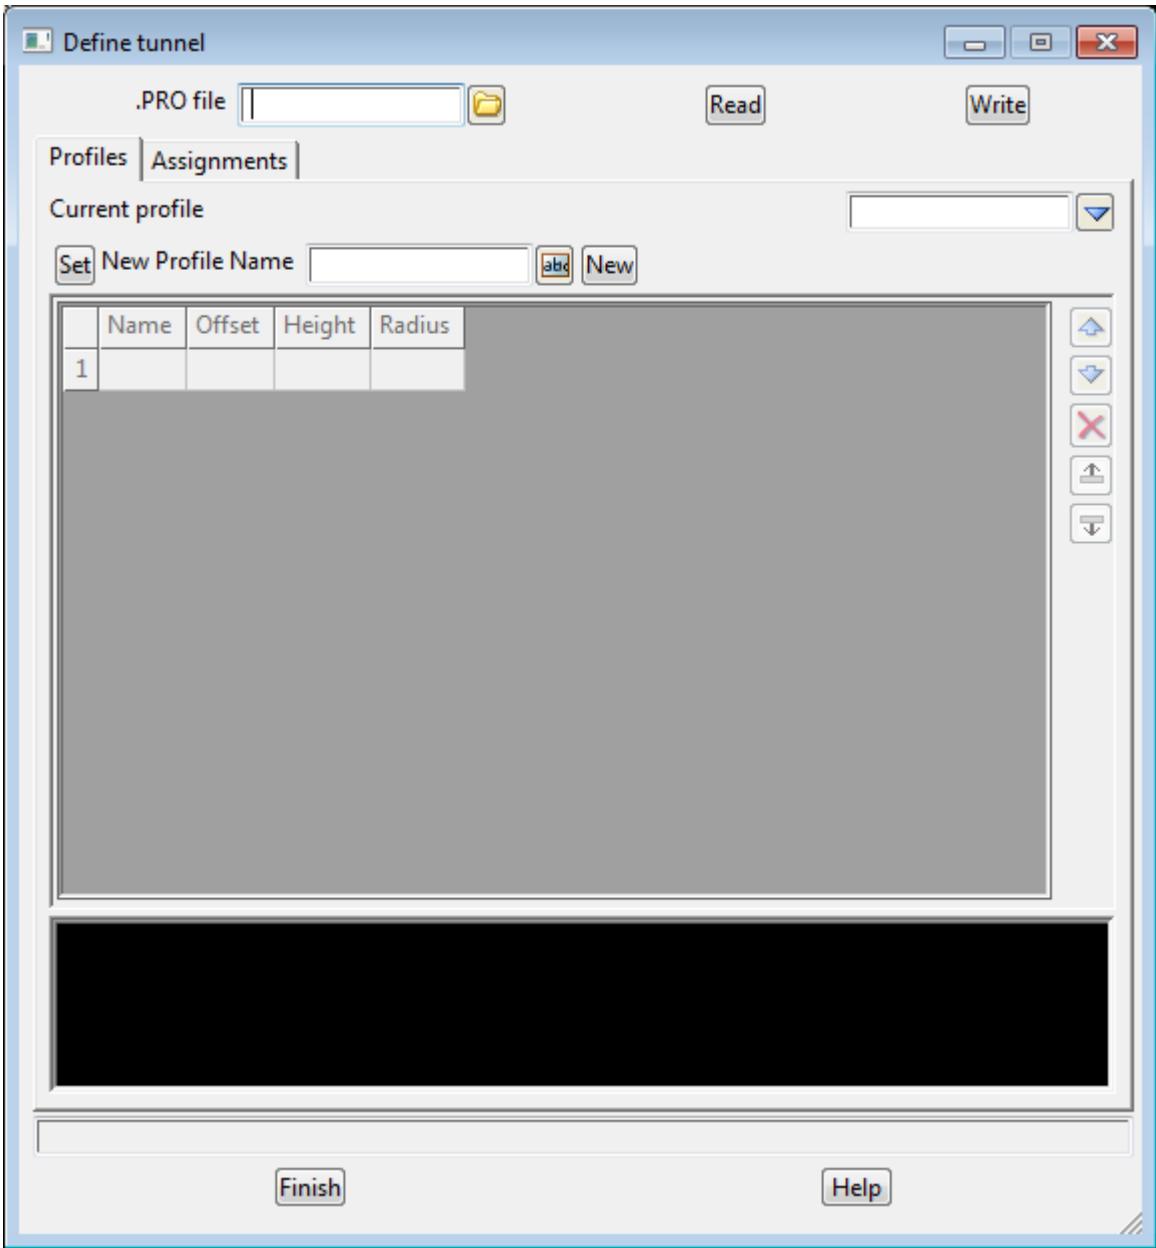

Position of option on menu: **Design =>Tunnel =>Edit Tunnel**

The **Define Tunnel** panel is used to create **PRO/PRA** tunnel definition files. These files are used by the **Create Tunnel** option and by **12dField** for tunnel setout.

Tunnels are defined by any ... n number of profiles and the chainages these profiles are assigned at, the profiles are stored in the **PRO** file and the assignments in the **PRA**.

For more information on **PRO/PRA** tunnel definition files please see [Definition of the PRO and PRA definition files](#)

Selecting **Edit Tunnel** brings up the **Define Tunnel** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
.PRO file	file		
<i>The name of the PRO/PRA files to be created/edited.</i>			
Read	button		
<i>Read in a pair of PRO/PRA files and populate the grids.</i>			
Write	button		
<i>Write the grids out to the PRO/PRA files, if an error is detected it will be displayed and the write will not occur.</i>			

The profiles tab

A tunnel can contain any number of profiles, the **profile** tab lets you create new profiles, pick existing profiles to edit and graphically display the shape of the profile for you.

Current Profile choice box list of available profiles in the current tunnel

Select the profile you wish to edit, the selected profile will be read in, the grid populated and the shape shown in the draw box.

Set button

*Sets the contents of the current grid to the overall tunnel structure, **set** must be pressed before moving to another profile or the contents of the current grid will be lost.*

New Profile Name

Enter the name of a new profile to create, this must be unique to the tunnel.

New

Create the new profile, a warning will appear if the name is not unique, if another profile already exists, the new profile will have the number of elements and their names created automatically.

Profiles grid

This grid is used to create the elements of a profile, profiles are constructed of straight and arc elements, all profiles in a tunnel must have the same number of elements with the same name.

Name

the name of the element, it must be unique to the profile.

Offset

the offset of the start of the element from the centreline, +ve is right of the centreline.

Height

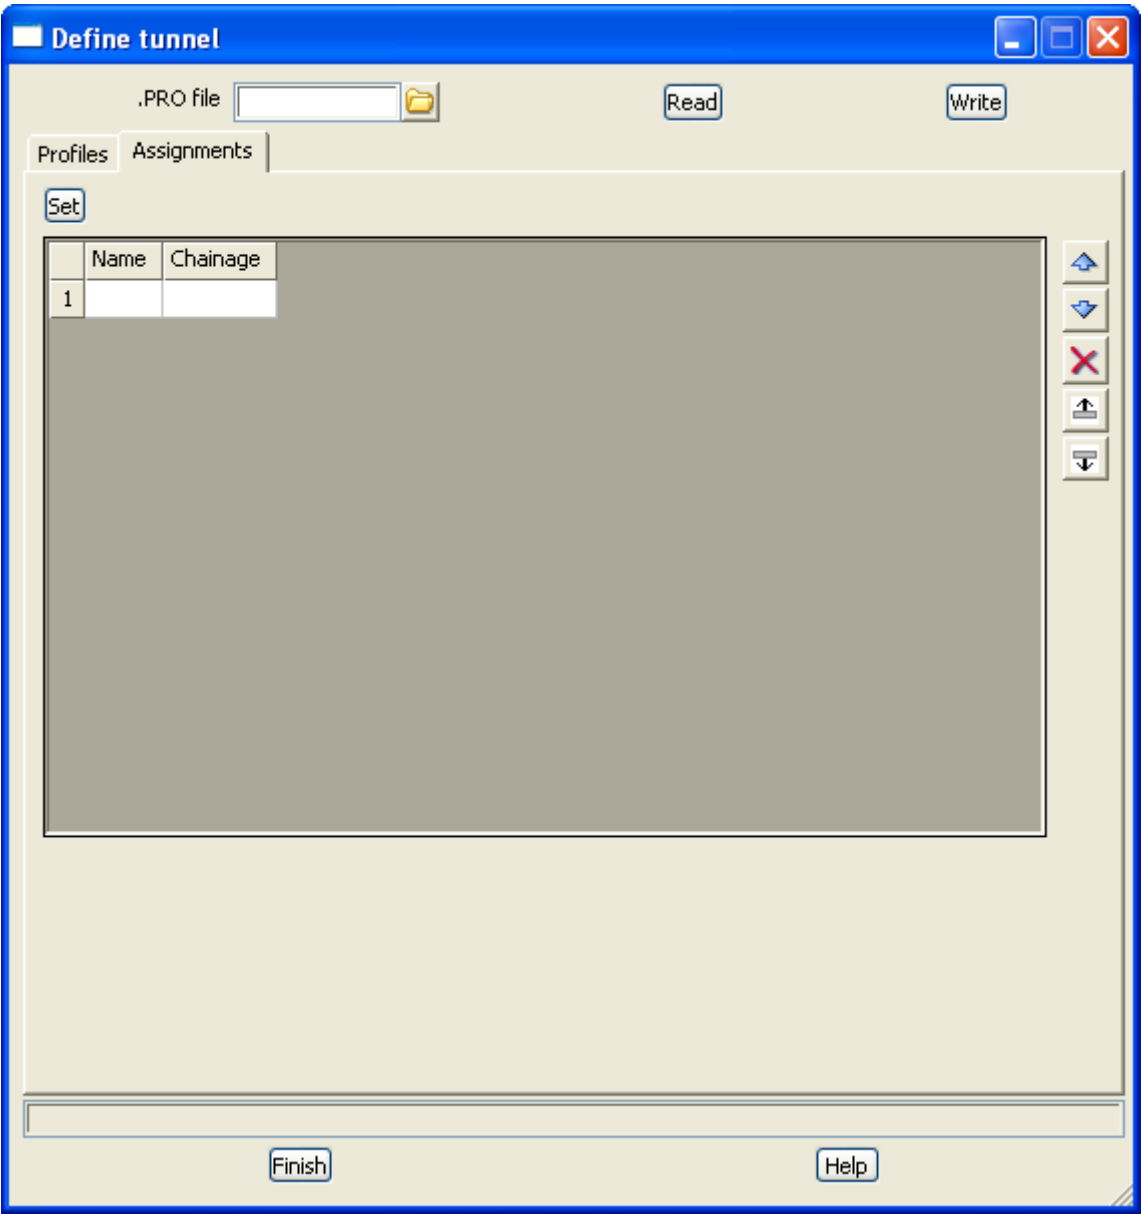

the height difference of the start of the element from the centreline, +ve is above the centreline.

Radius

the radius of the element, 0 is no radius and positive a right handed or clockwise curve.

The Assignments tab

This grid is used to define where the profiles are assigned on the centreline, the same profile can be assigned any number of times, the chainages must be in ascending order.

Set button
Write the contents of the grid to the tunnel structure.

Assignments grid

Name
The name of the profile.

Chainage
The chainage the profile is assigned at.

Finish button
Exit the panel, a warning will be displayed if the tunnel has been edited and not yet written to file.

Create Tunnel

Position of option on menu: **Design ==>Create Tunnel**

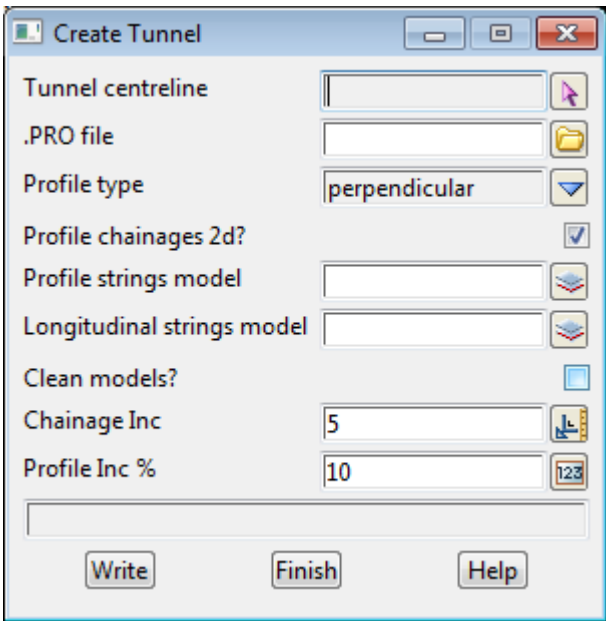

The **Create Tunnel** panel is used to create the longitudinal and profile strings defining the shape of a tunnel.

The tunnel is defined in a **PRO/PRA** file pair which can be generated using the [Define Tunnel](#) panel.

For more information on **PRO/PRA** tunnel definition files please see [Definition of the PRO and PRA definition files](#)

Tunnel strings can be generated normal/ perpendicular to the defined centreline resulting in a true 3d representation. Note a tunnel cannot be completely vertical, there must be some chainage difference in the vertical alignment, typically a difference of 0.01mm would suffice for most situations.

Selecting **Create Tunnel** brings up the **Create Tunnel** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Tunnel centreline

The centreline the tunnel definitions are applied to, the centreline must have valid vertical geometry for the chainage ranges in the PRA file.

.PRO file

*The **PRO/PRA** files containing the tunnel definition. For more information on **PRO/PRA** tunnel definition files please see [Definition of the PRO and PRA definition files](#)*

Profile type	choice box	perpendicular, vertical
---------------------	------------	-------------------------

perpendicular: the tunnel is calculated perpendicular/normal to the vertical alignment of the centreline resulting in a true 3d model.

vertical: the tunnel is calculated vertical to the vertical alignment of the centreline, this means

an effective loss of clearance on steeper grades.

Profile chainages 2d tick box

*if ticked the chainages in the **PRA** file are taken as plan chainages.*

if not ticked the chainages are interpreted as 3d, this is the plan/2d chainage of the 1st point where the horizontal and vertical geometry coincide plus the 3d length along the centreline from there.

Profile strings model model box

The model where the tunnel shape at a particular chainage is written.

Longitudinal strings model model box

The model where the strings generated on a specific point on a profile element for the entire length of the tunnel are written.

Clean models? tick box

if ticked the profile and longitudinal models will be cleaned before the new strings are created.

Chainage Inc

*The increment to create the profile and longitudinal points at, the actual range of the generated points is dependent on the assignments in the **PRA** file.*

Profile Inc%

Depending on the desired accuracy of the shape generated you can specify how many points should be created on each profile element, for example an increment of 5% would generate 20 points per element, 10% 10 points per element.

Write button

*Create the tunnel strings, if there is an error in the **PRO/PRA** files this will be displayed otherwise the strings generated.*

Finish button

Exit the panel.

Overlay

Position of menu: Design =>Overlay

The overlay options are for the design and optimisation of pavement overlay design.

The **Overlay** options is available to all users with the **Detailed Alignment Design** and **Volumes** modules.

The **Optimal Overlay** is under development and has not been released.

The **Overlay** walk-right menu is

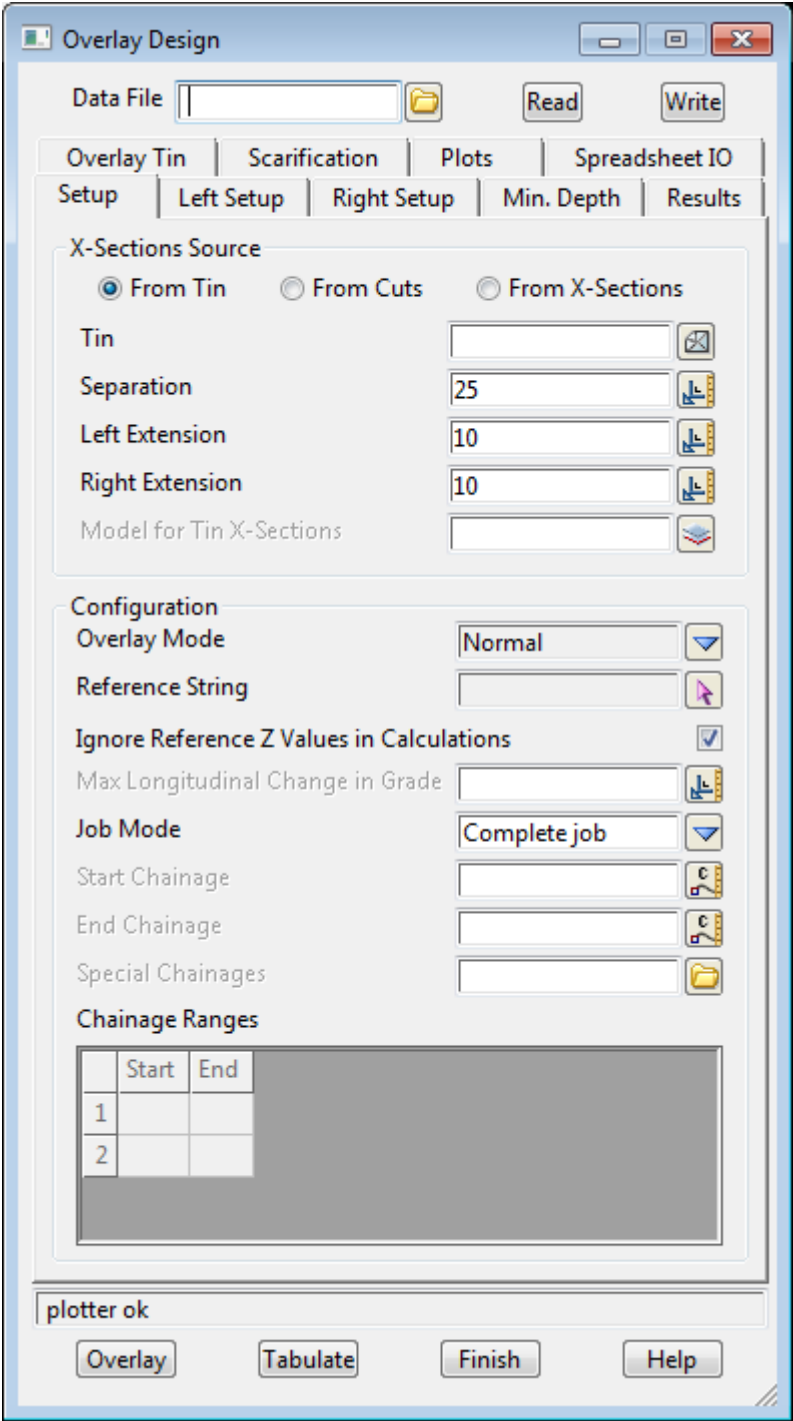

For the option *Overlay*, please continue to the section [Overlay Design](#)

Overlay Design

Position of option on menu: Design =>Overlay =>Overlay design

Selecting **Overlay** brings up the **Overlay Design** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data file	file box		*.ovd files
<i>file with all the settings used in the Overlay panel. Used for storing information between runs.</i>			
Read	button		
<i>read in a data file of settings for the panel</i>			
Write	button		

write out a data file of the settings in the panel

Buttons at bottom of panel

Overlay button

run the overlay.

Setup

Radio buttons

radio buttons to define how cross sections for existing road are produced

From Tin radio button

if **selected**, the road x-sections are created by taking sections though a tin. The following fields are displayed

Tin tin box available tins

sections are created through this tin to represent the existing road

Separation input

chainage distance between cross sections

Left/Right extension input

Left/Right distance to define the limits of the cross sections

Model for tin x-sections model box available models

model for the created cross sections

From Cuts radio button

if **selected**, the road x-sections are created by taking cuts through strings. The following fields are displayed

Strings model model box available models

sections are created by taking cuts through the strings in this model

Separation input

chainage distance between cross sections

Model for cuts model box available models

model for the created cross sections

From X-sections radio button

if **selected**, the road x-sections already exist. The following fields are displayed

X-sections model model box available models

existing model of x-sections to use for the road

Overlay mode choice box Normal Normal, Use Crossfalls Only
Use Reference Z Values and Crossfalls only

if **Normal**, at each section the left/right z-value is calculated so that the left/right crossfall and minimum overlay is obeyed. The z-value for the section is the maximum of the calculated z-values for the left and right.

If **User Crossfalls only**, the crossfalls from the Left and Right Setups tabs are used and no minimum overlay applied.

If **Reference Z values and Crossfalls only**, no overlay calculations are performed and the crossfalls in the Left and Rights Setups tabs are applied to the actual z-values on the reference string.

Reference string string select box

select the string for the centreline of the road

Ignore reference z values in calculations tick box

if not ticked, when the z-value is calculated at each section obeying just the minimum overlay criteria then use the maximum of the and the calculated z-value and the reference z-value at that section.

If ticked, use the calculated z-value at each section.

Start chainage input

chainage to start the overlay calculations

End chainage input

chainage to end the overlay calculations

Special chainages file box

special chainage file to define additional cross sections for overlay processing

Left/Right Setup tab

setup for the left/right side sections

Radio buttons

radio buttons to define how cross sections for existing road are produced

By offset radio button

*if **selected**, the width of the left/right cross sections is given in the **Offset** field*

Offset input

left/right offset distance to define the edge of the left/right section

By String radio button

*if **selected**, the width of the left/right cross section is defined by a selected **Edge** string minus the **Cut Back/Extension** value. The following fields are displayed*

Edge string string select

select the left/right edge string

Cut Back/Extension input

value to subtract from the distance to the edge string to define the left/right section

When **By String** is selected, the Chainage-Minimum X-Fall grid can also be automatically filled in by using the crossfall between the **Road Crown** and the **Edge String**.

Road crown string select
*select the road crown the use for calculating the cross fall to the **Edge string***

Only critical points tick box
*if ticked, the crossfall between the **Road crown** and the **Edge string** is only calculated at the tangent points of the Reference string.*
*If not ticked, the crossfall between the **Road crown** and the **Edge string** is calculated at the regular interval given by **Xfall Load Interval** and also at the tangent points of the Reference string.*

Xfall load interval input
regular interval to calculate crossfall

Load Xfalls from Strings button
*when selected, the **Chainage-Minimum X-Fall** grid is automatically filled in by using the crossfall between the **Road Crown** and the **Edge String***

By name radio button
*if **selected**, the width of the left/right cross section is defined by the name of a given string minus the **Cut Back/Extension** value. The following fields are displayed*

Name
name of the string to select as the left/right edge string

Cut Back/Extension input
value to subtract from the distance to the edge string to define the left/right section

Default Xfall input
*if **non blank**, the default crossfall to use for the left/right cross section.*
*If **blank**, the **Chainage-Minimum X-fall** grid is used.*

Chainage- Minimum Xfall grid
*this grid is only used if the **Default Xfall** is **blank***

Chainage input
chainage to use the Min xfall

Min X-fall input
minimum X-fall to use at that chainage

Min. Depth tab
there can be one minimum depth value for the entire job or the minimum depth can vary between chainages

Default depth input
*if **non blank**, the default minimum depth to use for the left and right cross section.*

If blank, the Chainage-Minimum Depth grid is used.

Chainage- Minimum Depth grid

*this grid is only used if the **Default depth** is blank*

Chainage input
chainage to start the minimum depth

Min Depth input

*minimum depth to start at this chainage and either go to the next chainage **or** if there is a **Min Depth 2**, interpolate to Min Depth 2 from this chainage to the next chainage*

Min Depth 2 input
minimum depth to end with at the next chainage

Results tab

Transfer Z-values to reference string ☐ tick box
if ticked, the calculated z-values are used to update the z-values on the reference string

Clean models before overlay tick box
if ticked, the models of results are cleaned before the overlay option is run

Model for overlay x-sections	model box	available models
<i>model for the created overlay x-sections</i>		

Model for overlay strings	model box	available models
<i>model for the created overlay strings</i>		

Colour	colour box	available colours
<i>colour for the created overlay strings</i>		

Model for xfall strings	model box	available models
<i>if non blank, left and right strings with z-value equal to the left/right crossfall are created and placed in this model</i>		

Model for min/max points	model box	available models
if non blank , points for the minimum and the maximum of the calculated z-values for the left and right sections are created and placed in this model		

X-sections depth range file	file box	available depth range files
<i>a depth range file used for colouring x-sections by the depth between the overlay and the road tin</i>		

Overlay report	file box	*.rpt files
<i>report on the overlay</i>		

Volumes report file box *.rpt files
volumes of overlay report

Write volumes as CSV tick box

if ticked, the volume report is written as a CSV file (for Excel)

Overlay Tin tab

the **Overlay Tin** tab controls the creation of an overlay tin and depth polygons

Create overlay tin	tick box	
if ticked, the fields in this tab are used to create an overlay tin		
Tin name	tin box	available tins
name for the tin created from the overlay strings and sections		
Tin colour	colour box	available colours
colour of the overlay tin		
Model for tin	model box	available models
model for the overlay tin		
Create depth polygons	tick box	
if ticked, depth polygons are created between the road tin and the overlay tin		
Depth range file	file box	*.drf files
depth range file used when creating polygons		
Model for depth polygons	model box	available models
model for the depth polygons		

Scarification tab

the **Scarification** tab controls any scarification to be applied to the road sections before calculating overlays

Perform scarification	tick box	
if ticked, scarification is performed on the road sections before overlay is calculated		
Model for scarified x-sections	model box	available models
if non blank , road x-sections after scarification are created and placed in this model		
Colour	colour box	available colours
colour of the scarified sections		
Clean scarification x-sections model	tick box	
if ticked, the clean the model of scarified sections before running calculations		
Default scarification depth	input	
if non blank , the default scarification depth to use for road cross section.		
If blank , the Overlay-Depth grid is used.		
Chainage- Minimum Depth grid		
this grid is only used if the Default scarification depth is blank		
Chainage	input	
chainage to start the scarification depth		

*scarification depth to start at this chainage and either go to the next chainage **or** if there is a **Depth 2**, interpolate to Min Depth 2 from this chainage to the next chainage*

scarification depth to end with at the next chainage

Plots tab

if ticked, long section plots are created

binary ppf file to use for the long section plots

type of plotter to use for the long section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

*if ticked and the **plotter type** is **model**, the plot models are cleaned before the plots are created*

if ticked, cross section plots are created

binary ppf file to use for the cross section plots

type of plotter to use for the cross section plots

Plot stem

the name to use for the plots - a number will be added when more than one page is produced

*if ticked and the **plotter type** is **model**, the plot models are cleaned before the plots are created*

X-Sections

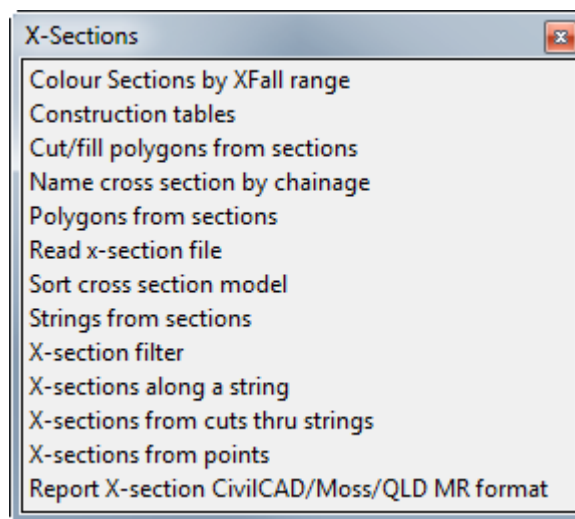

Position of menu: Design =>X-Sections

Cross sections can be created in a variety of ways including

- (a) sections through triangulations created with the options in the menu **Tins =>Sections**.
- (b) sections generated by cutting through strings with the options **Utilities =>A-G =>Cuts**.
- (c) design sections generated from options on the menu **Design =Apply**
- (d) sections generated by the end area volumes options **Design =>Volumes =>End area**

The x-sections menu contains options to read cross-sections in from a file and for working with cross sections in a variety of way.

Walking right on **X-Sections** bring up the X-Sections menu:

For Colour X-Sections by Xfall range go to

Construction tables

Cut/fill polygons from sections

Name cross sections by chainage

Polygons from sections

Read x-section file

Sort cross-section mode

Strings from sections

X-section filter

X-sections along a string

X-sections from cuts thru strings

X-sections from points

Report X-section CivilCAD/Moss/QLD MR format

Colour Sections by XFall Range

Position of option on menu: Design =>X-Sections =>Colour X-Sections by Xfall range

Utilities =>A-G =>Colour X-Sections by Xfall range

This panel will colour the segments of a set of x-sections, based on their x-fall.

Selecting **Colour X-Sections by Xfall range** displays the **Colour Sections by XFall Range** panel.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to colour

the set of x-sections to colour.

Data source type	Model
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>	
Data source	input
<i>source of data to be processed - for a full description go to Data Source in the chapter Tools and Concepts</i>	
Range type	choice box
<i>the type of range file to use</i>	
Range file	file
<i>the range file to use for colouring</i>	
Only process super stringstick box	
<i>whether or not to ignore non super strings</i>	
Target	

the target for the colour x-sections

Colour button
colours the x-sections

Construction Tables

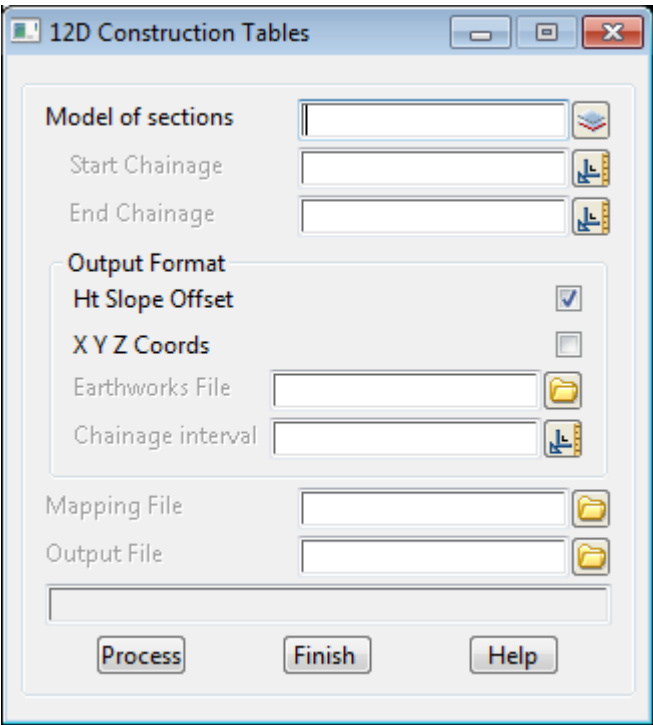

Position of option on menu: **Design =>X-Sections =>Construction tables**

This option is used to create construction tables from design cross section model.

Output can be in Ht, Slope or xfall, Offset or X,Y,Z.

A volume report file from the apply many road function can be used if Earthworks is required.

Selecting **Construction tables** brings up the **12D Construction Tables** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model of Sections	input		
<i>model name for existing sections</i>			

Start Chainage	real		
<i>if blank, means optional and the extents of the sections are used instead</i>			

End chainage	real		
<i>if blank, means optional and the extents of the sections are used instead</i>			

Output Format

Height Slope Offset	tick	true	
----------------------------	------	------	--

XYZ Coords	tick	false	
-------------------	------	-------	--

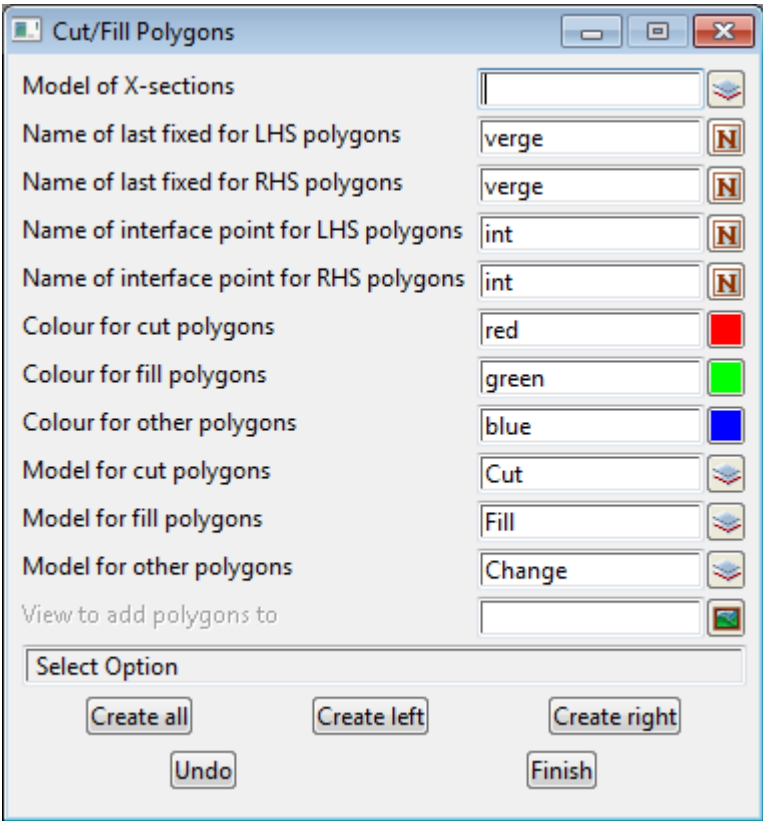

Earthworks File	file		
<i>if non-blank, file from apply many is used</i>			

Chainage Interval	real	if non-blank, value must be a multiple of chainages reported in the earthworks file
Mapping File	file	Please refer to the extra help file for details
Output File	file	Please refer to the extra help file for details
Process	button	runs the option

Cut/Fill Polygons from Sections

Position of option on menu: **Design =>X-Sections =>Cut/fill polygons from sections**

This option takes cross sections and by using the user-supplied names of points on the cross section, cut and fill polygons for the strings joining the named points in successive cross sections.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of x-sections <i>model containing the cross sections used to define the cut and fill polygons.</i>		model box	available models
Name of last fixed for LHS polygons	input		verge

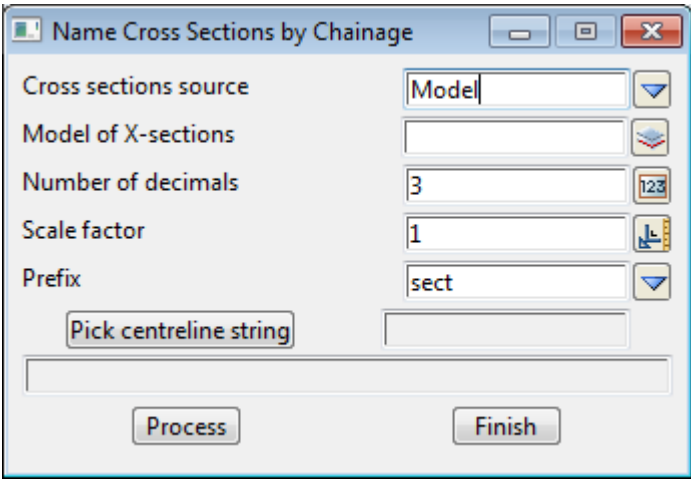

<i>Name of the cross section point to be the inner point of the left hand side polygons.</i>			
Name of last fixed for RHS polygons	input	verge	
<i>name of the cross section point to be the inner point of the right hand side polygons.</i>			
Name of interface point for LHS polygons	input	int	
<i>name of the cross section point to be the outer point of the left hand side polygons.</i>			
Name of interface point for RHS polygons	input	int	
<i>name of the cross section point to be the outer point of the right hand side polygons.</i>			
Colour for cut polygons	input	red	available colours
<i>colour for the cut polygons.</i>			
Colour for fill polygons	input	green	available colours
<i>colour for the fill polygons.</i>			
Colour for other polygons	input	blue	available colours
<i>colour for the polygons that are neither cut or fill – they are either flat or change from cut to fill.</i>			
Model for cut polygons	input	cut	available models
<i>model for the cut polygons.</i>			
Model for fill polygons	input	fill	available models
<i>model for the fill polygons.</i>			
Model for other polygons	input	other	available models
<i>model for the polygons that are neither cut or fill – they are either flat or change from cut to fill.</i>			
View to add polygons	input		available views
<i>if non-blank, the models of polygons are added to the view.</i>			
Create all	button		
<i>run the option and create left and right polygons.</i>			
Create left	button		
<i>run the option and only create the left polygons.</i>			
Create right	button		
<i>run the option and only create the right polygons.</i>			
Undo	button		
<i>undo the last set of polygons created whilst the panel has been up.</i>			
Finish	button		
<i>end the option and remove the panel. The undo capability for the polygons is terminated.</i>			

Name Cross Sections by Chainage

Position of option on menu: **Design =>X-Sections =>Name cross sections by chainage**

This option names cross-sections with the chainage from a selected string.

Note that the chainage from the string that the cross section comes from is in the name of the cross section so this option effectively gives the chainage to the cross section.

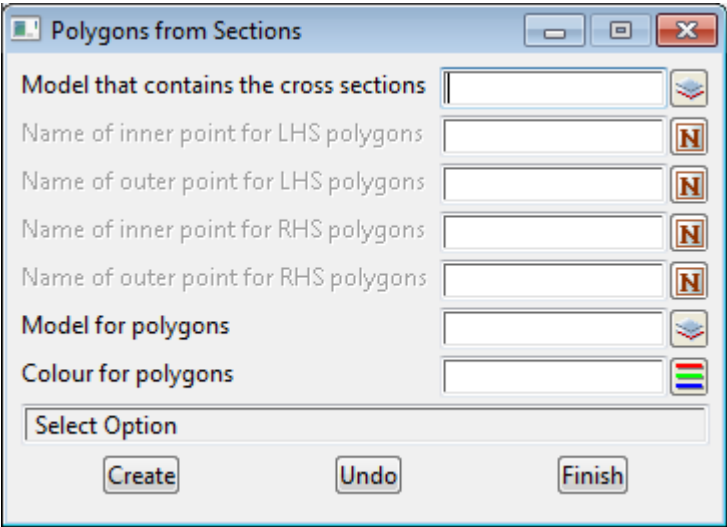

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Cross sections source <i>type of data source.</i>	choice box	model	string, model, view
Model/String/View of x-sections <i>source of the cross section data.</i>	source box		
Number of decimals <i>number of decimal places to use in the chainage label.</i>	input box	3	
Scale factor <i>factor to multiply the chainage by before creating the label.</i>	input box	1	
Prefix <i>prefix for the chainage value - for cross-section options to work, this should be sect or design.</i>	choice box	sect	sect, design, none
Pick centreline string <i>select the string that is used to find a chainage for the cross sections.</i>	output box		
Process <i>run the option.</i>	button		

Polygons from Sections

Position of option on menu: **Design =>X-Sections =>Polygons from sections**

Option to take a model of cross-sections and create polygons between specified points on the cross-sections.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model that contains the cross sections	model box		
<i>model of cross sections</i>			

Name of first/last point for lhs polygons	input box		
<i>name of the first/last point on left hand side of the cross-section to creating polygon for.</i>			

Name of first/last point for rhs polygons	input box		
<i>name of the first/last point on right hand side of the cross-section to creating polygon for.</i>			

Model/colour for polygons	input box		
<i>model/colour of the created polygons.</i>			

Create	button		
<i>create polygons between the first and last points on the left and right side of the cross-sections.</i>			

Undo	button		
<i>undo the last set of polygons created whilst the panel was up.</i>			

Read X-Section Data

Position of option on menu: **Design =>X-Sections =>Read x-section file**

This option is used to read in cross section data from a file and convert it to x-section strings (4d strings).

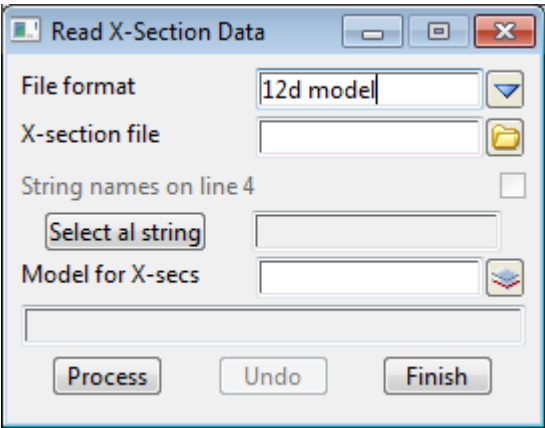

The data in the file is only centre-line chainage values, offset, heights and text (Code) so an alignment string needs to be selected to give an (x,y) position for the centre-line chainage and a direction (at right angles to the alignment string at the chainage) to convert the (offset, height) values into (x,y,z) points on a string.

NOTE - after reading in the x-section data and hence creating 4d strings, the

Design =>X-Sections =>Strings from sections

option can be run to create 3d strings by joining points with the same Code from adjacent x-sections. The created 3d strings are given the string name of the Code that they joined.

Selecting **Read x-section file** brings up the **Read X-Section Data** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File format	input box	12d Model	12d Model, Alg, Moss, Chainage/Offset/Height/ Text

format of the x-section data in the file.

12d Model Format
