The 12d Model format is a simple text file format with the text CH followed by one or more spaces and then the alignment chainage (centre line chainage) of the x-section, and then on the following lines, the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then the text (Code) for that point on the x-section. The x-section continues until the next Ch line. For example, the following defines two x-sections at chainage 10 and 20 respectively.

```
ch 10
-3 5 A
0 6 "Second label"
4 7 C
```

```
ch 20
-3.5 5.5 A
0 6 D
4.5 7.5 ""
```

Note that if the Code includes a space, then it must be enclosed in quotes. For example "Second label". Also the Code is not optional - if there is no code, put "".

Chainage/Offset/Height/Text Format

The Chainage/Offset/Height/Text format is a very simple text file format with each line containing the alignment chainage (centre line chainage) for the x-section followed by one or more spaces and then on the same line the Offset value followed by one or more spaces, the height at that offset followed by one or more spaces, and then optionally, the text (Code) for that point on the x-section. The x-section continues until the alignment chainage changes. For example, the following defines two x-sections at chainage 10 and 20 respectively.

```
10 -3 5 A
10 0 6 "Second label"
10 4 7 C
20 -3.5 5.5 A
20 0 6 D
20 4.5 7.5 E
```

Note that if the Code includes a space, then it must be enclosed in quotes. For example "Second label". Also the Code is optional (whereas it was compulsory for the **12d Model** format).

Moss (MX) Format

Please refer to Moss (MX) documentation or ask the group who supplied the data.

Alg Format

Not documented.

X-section file input box
file of x-section data.

String names on line 4 tick box
ONLY used for the ALG format which is not documented

Select al string string select
select the string that is used to define the (x,y) position of the zero offset of the x-section and also the bearing for the x-section.

Model for x-secs model box available models
model for the created x-sections

Process button
read the file and create the x-sections

Undo button
undo the last set of x-sections created since the panel has been active

Sort X-Sections in a Model

Position of option on menu: **Design =>X-Sections =>Sort cross section model**

This option is used to sort cross sections in a model so that they are in the order of the chainages embedded in the cross section name.

Selecting **Sort cross section model** brings up the **Sort X-Sections in a Model** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model of x-sections <i>model containing the cross sections to be sorted into chainage order.</i>	model box		available models
Sort <i>run the option.</i>	button		

Strings from Sections

Position of option on menu: **Design =>X-Sections =>Strings from sections**

The **strings from sections** option creates strings by joining the common named points on successive 4d strings (usually generated as sections).

Selecting **strings from sections** fires up the **strings from sections** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model of sections <i>model of the 4d strings (sections) to try and join common points from to form strings.</i>	input		available models

Model for string	input	available models
<i>model for the created strings to go to.</i>		
Process	button	
<i>try and join points with the same name from successive sections to form strings.</i>		

Sections from Points

Position of option on menu: **Design =>X-Sections =>X-sections from points**

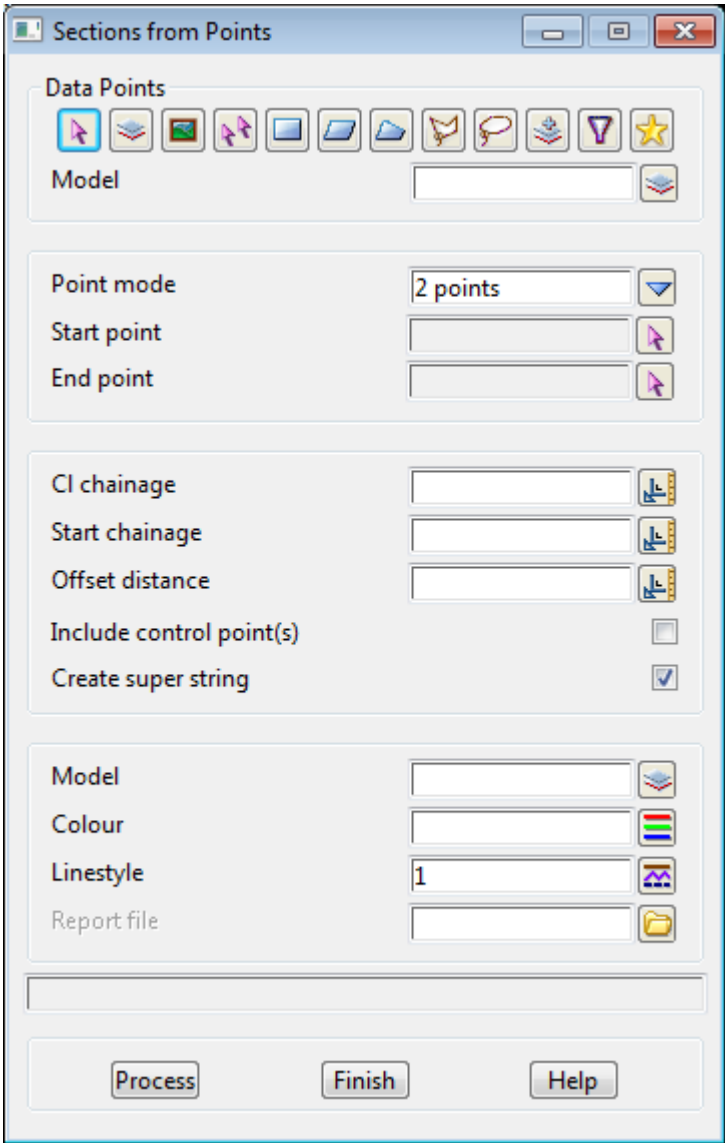

The **X-sections from points** option creates a cross section by first defining s section line and then dropping all selected points in a user defined offset distance from the section line, onto the section line.

- (a) The z-value for the dropped point is the same as for the original point.
- (b) The Point number (Vertex id) of the dropped point is the Point number (Vertex id) of the original point.
- (c) The Vertex text of the dropped is the code (string name) of the original point.

The user specifies the start chainage for the created section and the value for the "centreline chainage" of the section.

Selecting **Sections from points** fires up the **Sections from points** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up

X Section Filter (Sections at Even Chainages)

Position of option on menu: **Design =>X-Sections =>X-section filter**

This panel selects user specified cross-sections from a model of cross-sections and copies them into another model. The cross sections must already exist - no new cross-sections are created.

It is a function so can be recalcd when the cross-section model is changed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Function name			
<i>name of the function.</i>			
Model of sections	string select		
<i>model of existing cross sections to select some cross sections from.</i>			
Filter model name	model box		
<i>model for the selected cross sections</i>			
Filter section colour	colour box	cyan	
<i>colour for the filtered cross sections</i>			
Filter chainage interval	input	20	

*chainage interval to select cross sections. Sections are selected which are multiples of the **filter chainage interval**.*

Design/Existing sections radio button design sections

cross sections are 3d strings with the name

***Design** and the chainage of the cross-section (usually created by an Apply),*

*or **Sect** and the chainage of the cross-section (usually created by Tins =>Section =>X section)*

*If **Design sections** is selected, then sections starting with the name **Design** are selected.*

*If **Existing sections** is selected, then sections starting with the name **Sect** are selected.*

Include TC_CT sections tick box

if ticked, include cross sections at tangent points from the reference string.

Include start/end section tick box

include a cross section at the start/end chainage of the reference string

TC_CT tolerance +/- input box

*if **non-zero**, then regular cross sections (i.e. those selected by the filter chainage interval) are **not** included if they are closer than the given tolerance distance to a tangent point.*

Special chainage file input box

include cross sections with chainages given in the given special chainage file.

Reference output box

select reference string to use for the filter options requiring tangent points and start/end chainages.

Process button

copy the specified cross-sections to the Filtered Model.

X-Sections Along a String

Position of option on menu: Design =>X-Sections =>X-Sections along a string

This option has already been documented in **Tins => Sections=> X-Sections**

For the option **X-Sections along a string**, please continue to the section [X-Sections](#) in the Chapter [Triangles](#).

X-Sections from Cuts Through Strings

Position of option on menu: Design =>X-Sections =>X-Sections from cuts thru strings

This option has already been documented in **Utilities =>A-G =>Cuts =>by centreline**

For more information please go to the section [Cuts by Centreline](#) in the Chapter [Utilities](#).

Settlement

Position of option on menu: Design =>More =>Settlement

This option uses a tin of settlement values to adjust the z-values of strings.

The idea behind the option is that a number of string may have been surveyed as well as a number of control points. At a later date, the z-value at the control points is again measured and there is a major difference in the two z-value at each control point due to say settlement (subsidence) of the ground.

A tin of the **difference** of the z-values at each control point is called the **settlement** tin. The tin is not normally a constant value because *differential settlement* usually occurs. That is, the settlement is *different at each point over the surface*.

The Settlement option can adjust **all** the z-values of the selected data by the amount in the settlement tin.

It can be applied to just to the vertices of the strings (mode **relative points**), or to the vertices and the segments of the strings (mode **relative string**). In **relative string** mode, where ever a segment crosses a triangle of the settlement tin, a new vertex is inserted into the string (with initial z-value interpolated from the adjacent string vertices) and the settlement tin value applied to the new vertex.

The **settlement tin** values can be added to, or subtracted from, the string values.

One interesting use of the **Settlement** option is when the settlement tin is constructed from the **depths** from the surface to a rock or soil strata (as given from **bore hole** logs).

The surface of the rock could be constructed by simply calculating the height of the rock at each bore hole and triangulating the heights. The original surface would have no affect on such a rock surface.

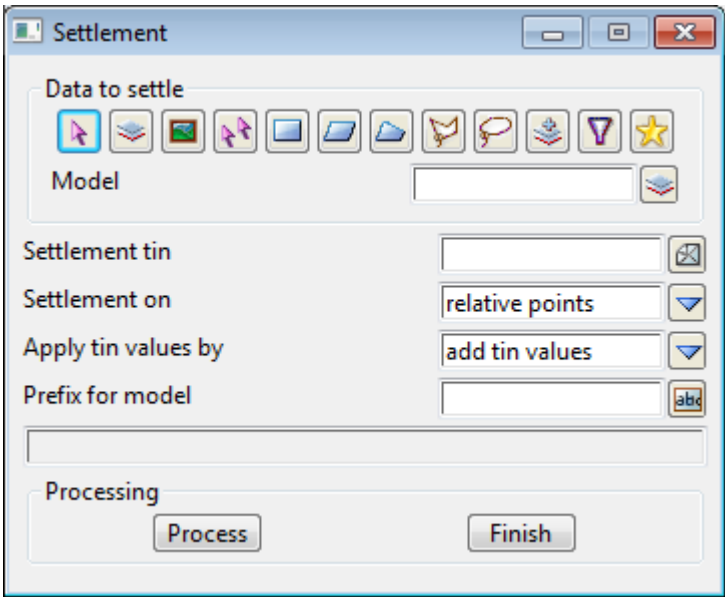

However by applying the **Settlement** option to the ground data, using the depths as the settlement tin, and then triangulating the resultant strings to give the rock surface, undulations in the ground data will also be reflected in the rock surface. This is what usually happens when the earth is folded and both surfaces fold in a similar manner.

The Settlement option can also be used **without** creating a tin of the difference of the z-values at each control point. A tin can simply be created from **the new z-values** of the control points.

In **absolute points** mode, each vertex of the strings are given the z-value from the tin. This is the same as draping just the vertices of strings onto a tin (see [Drape](#) in the chapter [Triangles](#))

In **absolute string** mode, not only do the string vertices take their z-values from the tin, but where ever a segment crosses a triangle of the tin, a new vertex is inserted into the string and the z-value for the new vertex is taken from the tin. This is the same as a draping the strings onto the tin (see [Drape](#) in the chapter [Triangles](#)).

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data to settle			Model	

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input
<i>source of data to be processed.</i>	

Settlement tin	available tins
<i>tin of values (settlement values) to be used to reduce/increase the z-values of strings by.</i>	

Settlement on	choice box	relative points	relative points relative strings absolute points absolute strings
----------------------	------------	-----------------	----------------------------------------------------------------------------

if Settlement on is:

relative points then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point.

relative string then for each point of a string, the value of the settlement string at that (x,y) position is added/subtracted from the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which then has the settlement value applied to it (the initial z-value for the inserted point is interpolated from its adjacent points in the string).

absolute points then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point.

absolute string then for each point of a string, the value of the settlement string at that (x,y) position is taken to be the z value at the point plus for each visible segment joining points of the strings then if the segment crosses any edges of triangles from the settlement tin, a new point is inserted into the string which is given the settlement value at that point.

Apply tin values by	choice box	add tin values	add tin values subtract tin values
----------------------------	------------	----------------	---------------------------------------

if "add tin values", then the tin values are added to the string values.

If "subtract tin values", then the tin values are subtracted from the string values.

Ortho12d output file <i>file to write the tin out to</i>	file box		*.T12 files
Write <i>write the tin out in the Ortho12d format</i>	button		

Moved/Reused Documentation

New Island Create (Function)

Position of option on menu: Design =>Roads =>More =>New Island Create (Function)

This option applies a kerb profile, either from the **12d** library or from a user defined file.

The template profile is applied to a Super Alignment, creating strings, and a triangulation.

The option is saved as a function within **12d** and as a function can be re-run at any time if changes occur with the Super Alignment.

Some default kerb profiles are available under **Kerb** on the panel.

User defined kerbs are created by entering offset, height and string names in the fields in the draw box at the top of the panel, and then saved as a User Kerb Type file (*.ukt)

User Kerb Type files can then be written out, or read in as required.

On selecting the **New Island Create (Function)** option, the **New Island Create (Function)** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Function name <i>name of the Island Create function</i>	function		available functions
Model Island Strings	model box		available models

model for the created island strings

Model Island Tin model box
model for the tin of the created island

Colour Island Paving input paving available colours
if non-blank, then the colour is used to colour the island triangulation within innermost kerb string (D)

Colour Island Tin input concrete available colours
if non-blank, then the colour is the colour is used to colour the island triangulation between the strings defined by A and D.

In the drawing area:

- A**
a string is created which is a copy of the reference string and given this name. It is added to the Model Island Strings model.
- B**
name, offset and height from the reference string, of the first string of the island. It is added to the Model Island Strings model. If offset and height are both zero, then the string is not created.
- C**
name, offset and height from the reference string, of the second string of the island. It is added to the Model Island Strings model. If offset and height are both zero, then the string is not created.
- D**
name, offset and height from the reference string, of the third string of the island. It is added to the Model Island Strings model. If offset and height are both zero, then the string is not created.

Design Details

Kerb choice box Barrier Type A Barrier Type A, Barrier Type B, Mountable, Semi - Mountable, User

selected kerb type is displayed in draw box above

If Kerb is User then the File field and the Read and Save buttons are made active, and are used to read in an existing user defined Kerb type, or to create a new one.

File file box files ending in.ukt

name of the user kerb type file (ukt) to read in or create

Read button

Reads in the user defined kerb definition from the ukt file given in the File field and displays the profile and Offsets and Height in the draw box at the top of the Panel

Save button

Writes out the kerb profile information (O and H values, and string names) as a user defined kerb, into the file given in the File field.

Reference select pick

Select the reference alignment which will have the kerb profile applied to it to create the island. "pick with direction" in a clockwise manner as the kerb profile is always on the RHS.

Process button

runs the option which created the island string and the coloured island tin

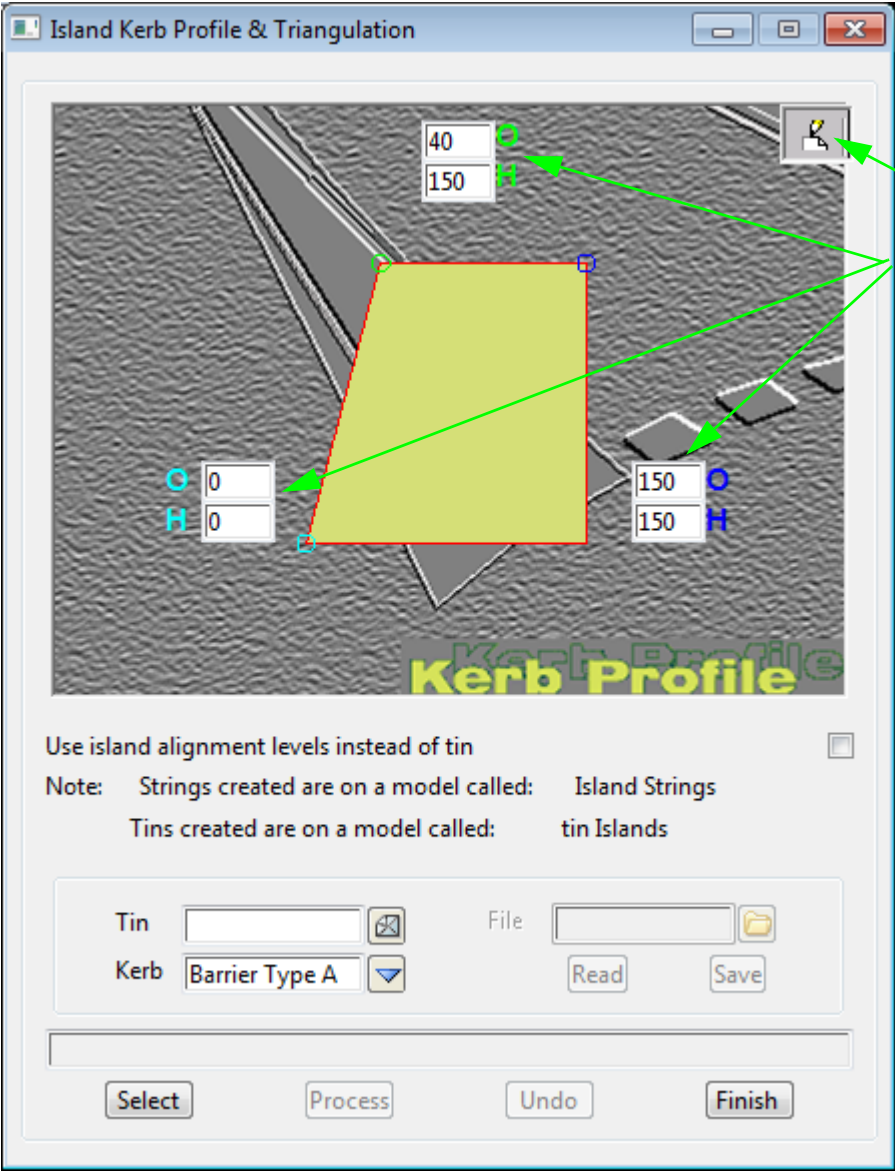

Note:

The New Island Create Function reads in the standard kerb profiles as templates and if required, creates a template from the ukt files. The function needs these templates because an apply is used (internally) to create the Island.

Traffic Island Profile and Triangulation Creation

Position of option on menu: Design =>Roads =>More =>Island profile/tin

This option creates strings by offsetting from a selected string using a kerb profile. The resultant strings are draped onto a given tin and then triangulated to form a traffic island.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Offset kerb face/top/back	input box		
<i>offset for kerb face/top/back for the selected kerb type.</i>			

Height kerb face/top/back	input box		
<i>height for kerb face/top/back.</i>			

Tin	tin box		available tins
<i>triangulation to drape the traffic island strings onto.</i>			

Kerb type	input box		
<i>type of kerb to apply to the reference string of the traffic island. If type User is selected from the pop-up list, a file which defines the kerb profile can be selected and used.</i>			

File	file box	*.ukt files
	<i>file to read/write the user defined kerb type to.</i>	
Read	button	
	<i>read the given File to define a kerb type.</i>	
Save	button	
	<i>save the kerb parameters to the given File.</i>	
Select	button	
	<i>select the string representing the traffic island.</i>	
Process	button	
	<i>create the traffic island strings and tin.</i>	
Undo	button	
	<i>undo the last traffic island created whilst the option was running.</i>	

Create Mass Haul String and Report

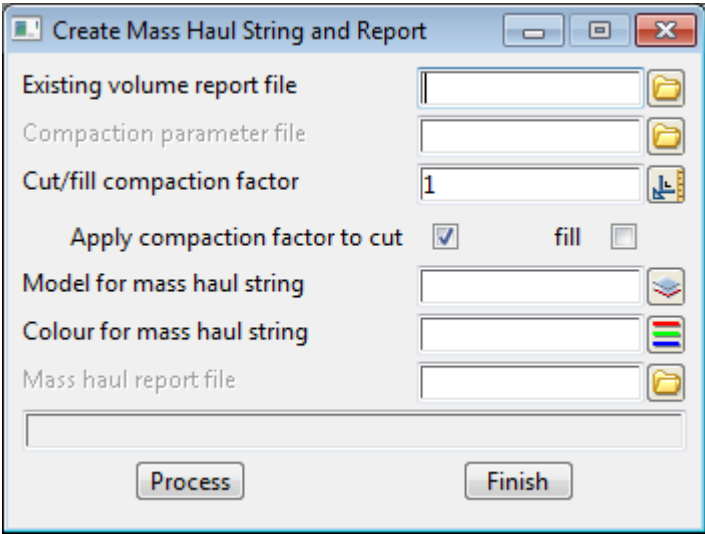

Position of option on menu: Design =>Roads =>More =>Mass haul

This option has been replaced by [Mass Haul String and Report](#).

This panel is used to read in a volumes report and optionally a cut/fill compaction parameter file and creates a mass haul string and a new volumes report with the compaction volumes.

The compaction parameter file simply contains the compaction factor for given chainage ranges. Either the cut volumes are multiplied by the compaction factor or the fill volumes are divided by the compaction factor, to give the compacted volumes in the new volumes report.

If the existing volume report contains an alignment string and that string can be found in the project then a new alignment string is created with the same horizontal geometry but with the accumulated volumes as the z-values.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Existing volume report file <i>name of the existing volumes report.</i>	file box		*.rpt files
Cut/fill compaction factor <i>cut/fill compaction factor for any chainages not in the compaction parameter file or if there is no file.</i>	input	1.0	
Compaction parameter file <i>file containing compaction factors to be used.</i>	input		*.mhf files
Apply compaction factor to <i>if cut, the cut volumes are multiplied by the compaction factors. If fill, the fill volumes are divided by the compaction factors.</i>	cut fill tick box		
Model for mass haul string <i>model for the created mass haul string.</i>	input		
Colour for mass haul string	input		

colour of the created mass haul string.

Mass haul report file input box
if non-blank, a mass haul volumes file is created.

Process button
run the option.

```
// Sample cut/fill compaction parameter file - the file ending
is .mhf
// All lines starting with // are comments and blank lines are
ignored
//
// A range is specified by a start and end chainage and a compaction
factor.
// A compaction factor of 1.0 means there is no compaction.
// A compaction factor of 0.9 means that 1.0 cubic metres of cut is
equivalent
// to 0.9 cubic metres of fill due to compaction.

// format is
// Start_ch      End_ch      Compaction_factor

          0          100          0.9
        100          500          1.0
        500         2000          1.1
```

20 Advanced Design

12d Model uses templates as a quick and easy method for defining design details along a string, and in the **Apply Many** option, modifiers are introduced to handle the most complex design details.

See [MTF - Many Templates File](#)

MTF - Many Templates File

12d Model uses templates as a quick and easy method for defining design details along a string.

The **Apply** options are used to create strings and sections using the **reference** string to define the chainage and what is perpendicular at each chainage, and a **hinge** string from where the template links are defined. The template defines a vertex (point) name and colour for each template link.

Cross sections can be created with point names corresponding to the template links, and strings formed by joining the same named vertices (points) from consecutive cross sections.

Note - the sections are stored as 4d super strings which have an (x,y,z) and a vertex text at each vertex.

For simple work, the **Design=>Apply=> Apply** option cuts a left and right template into a surface to produce a design.

For more complex work, the **Design=>Apply=> Apply many** option introduces **Modifiers** to allow more detailed control over the design process. In fact, it can be approached as string design and actually have no templates at all.

Note - the *Alignment* module is required to use the *Apply Many* option.

The **Apply Many** option uses a **file** (the **many templates file** or **MTF**) to describe

- (a) which templates are applied to the left and right side of the hinge string (with linear interpolation between templates and gaps allowed)
- (b) special chainages for creating extra cross sections
- (c) hinge modifiers for adjusting the hinge string
- (d) template modifiers for extra adjustment of the strings and sections created by the templates, or even to entirely replace the use of templates
- (e) stripping depths
- (f) up to eight layers of boxing
- (g) super elevation and widening
- (h) if removing loops from strings is required

- (i) width to define the limit of searches for strings
- (j) modifying the z-values of strings
- (k) applying a chainage shift

The **MTF** can be created and edited **interactively** from within **12d Model**, or it can be created and edited from a text editor, or any combination of the two methods.

A simple method for creating/editing an **MTF** is from the **Apply Many** option itself.

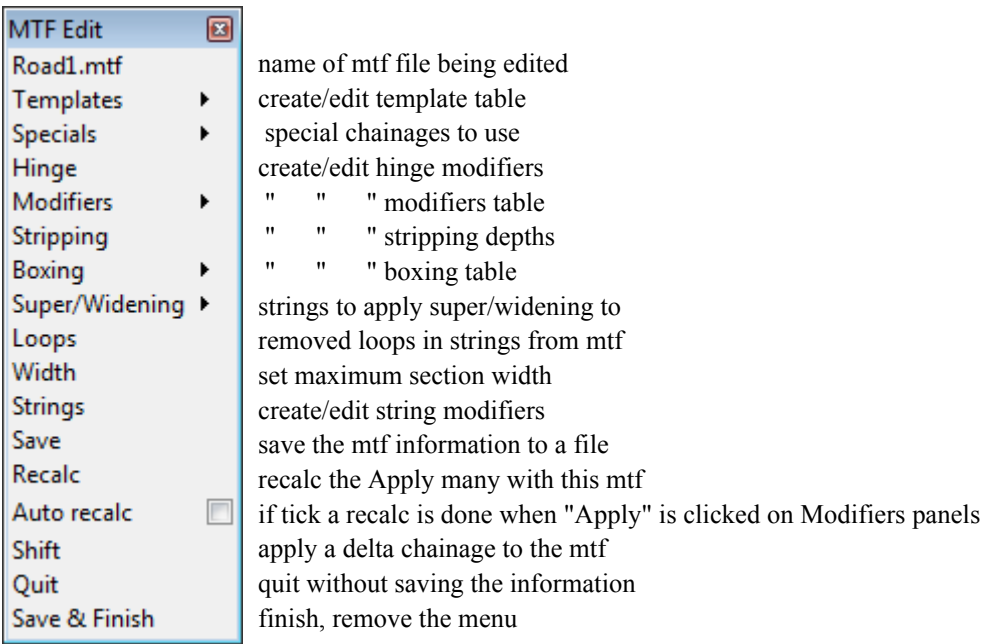

Once the **Apply Many** option has been selected and the **Apply Templates Function** panel is on the screen, simply enter the name of the mtf file into the **MTF file** field of the **Apply Templates Function** panel, click on **[+]** to bring up the pop-up menu and select **[Edit]** from the pop-up.

If the **MTF** does not exist, then the **Create MTF** panel (with the MTF file name already filled in) is placed on the screen and the user simply selects the **Create** button.

Alternatively, an **MTF** can be created inside **12d Model** using the **Create MTF** panel (Design =>MTF =>Create) and edited using the **MTF Edit** menu.

Finally, a text editor such as PFE can be used to create and/or edit an mtf.

When interactively creating the **MTF**, the **MTF Edit** menu contains all the options for (a) to (k). For example, the **MTF Edit** menu for the mtf file "Road1.mtf" is:

The documentation order will be the same as the order on the above **MTF Edit** menu.

The **interactive commands** for each of (a) to (k) will be described in the following sections.

Following the documentation of the **MTF** editor, how Boxing is applied is given in the section [What is Boxing ?](#), followed by the full definition of boxing in the section [Full Definition of Boxing](#) and the full definition of the **Decisions** button on **Template Create/Edit** panel in the section [Full Definition of Template Decisions](#).

There is a **text version** of the MTF file and it is given in the section [Text Format of the MTF File](#).

The text form of the MTF file can be edited with a text editor **supporting unicode**, and the text form does allow substitutions that can't be done via the interactive MTF Editor (see [Substitutions in the Many Templates File](#)). But most of the time, the Interactive MTF Editor is the easiest to use and covers all required situations.

For documentation on the option/menus on the MTF Edit menu:

For the option <i>Templates</i> , go to	MTF Templates
<i>Specials</i>	MTF Specials
<i>Hinge</i>	MTF Hinge Modifiers
<i>Modifiers</i>	MTF Modifiers (Template Modifiers)
<i>Stripping</i>	MTF Stripping

<i>Shift</i>	MTF Shift
<i>Quit</i>	MTF Quit
<i>Save & finish</i>	MTF Save and Finish

Please continue to the next section [Start and End Chainages](#).

Start and End Chainages

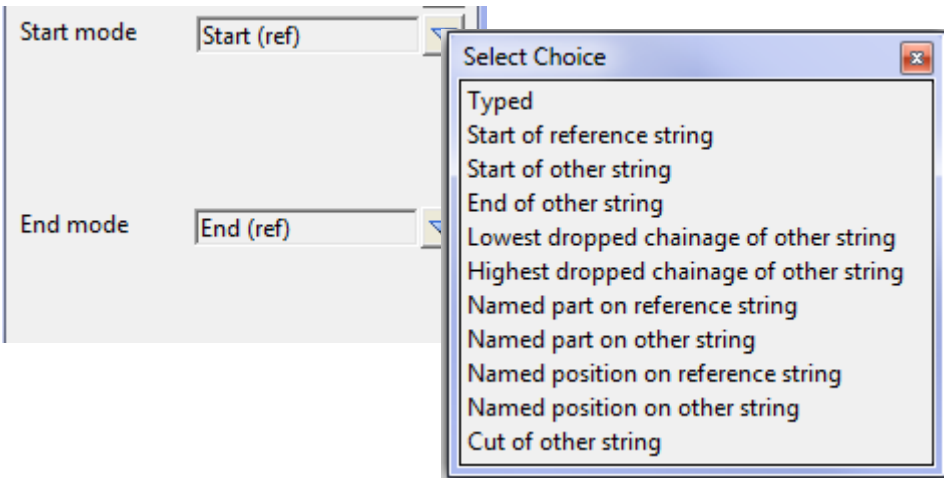

Many of the template options, particularly the left and right side modifiers, are applied from a chainage on the reference string (the **start chainage**) to a second, higher, chainage on the reference string (to **end chainage**).

There are a number of methods of defining the start and end chainages and the most common ones used on the panels use a **Start mode** and an **End mode**.

Start Mode

The **Start mode** is for defining the **start chainage**. The modes and their definitions are:

For **Typed** go to

- Start of reference string**
- Start of other string**
- End of other string**
- Lowest dropped chainage of other string**
- Highest dropped chainage of other string**
- Named part on reference string**
- Named part on other string**
- Named position on reference string**
- Named position on other string**
- Cut of other string**

[Start -Typed](#)

[Start - Start of reference string](#)

[Start - Start of other string](#)

[Start -End of other string](#)

[Start -Lowest dropped chainage of other string](#)

[Start -Highest dropped chainage of other string](#)

[Start -Named part on reference string](#)

[Start -Named part on other string](#)

[Start -Named position on reference string](#)

[Start -Named position on other string](#)

[Start -Cut of other string](#)

Start -Typed

Selecting **Typed** adds a **Start chainage** panel field where a reference string chainage can be typed in. This is used as the **start chainage**.

If the **Start chainage** is left blank then the **start chainage of the reference string** is used as the **start chainage**.

Start - Start of reference string

Selecting **Start of reference string** uses the **start chainage of the reference string** as the **start chainage**.

This is the default value for the **Start mode**.

Start - Start of other string

Selecting **Start of other string** adds a **Start string** panel field and another string is selected.

The **start** of the selected string is dropped onto the reference string and the dropped chainage from the reference string is used as the **start chainage**.

Start -End of other string

Selecting **End of other string** adds a **Start string** panel field and another string is selected.

The **end** of the selected string is dropped onto the reference string and the dropped chainage from the reference string is used as the **start chainage**.

Start -Lowest dropped chainage of other string

Selecting **Lowest dropped chainage of other string** adds a **Start string** panel field and another string is selected.

The **start** and **end** of the selected string are dropped onto the reference string and the lower of the two dropped chainages from the reference string is used as the **start chainage**.

Start -Highest dropped chainage of other string

Selecting **Highest dropped chainage of other string** adds a **Start string** panel field and another

string is selected.

Start mode

High (other)

Start string

The *start* and *end* of the selected string are dropped onto the reference string and the higher of the two dropped chainages from the reference string is used as the **start chainage**.

Start -Named part on reference string

Selecting Name part on reference string adds the two fields *Start part* and *Start extension* to the panel.

Start mode

Help

Clicking LB or RB on the + for *Start part* brings up the **Named Part Builder** for the reference string which is used to define exactly which section of a named part is required to define the chainage.

Either define the required chainage by the **Name Part Builder** and hit **Set**, or type in the syntax into the *Start part* field.

Help

The value in the **Start extension** field is added to the chainage calculated for the selected named part, and this becomes the **start chainage for the modifier**.

Start -Named part on other string

Selecting **Name part on other string** adds the three fields **Start string**, **Start part** and **Start extension** to the panel.

First click on the select button of the **Start string** panel field and select a string.

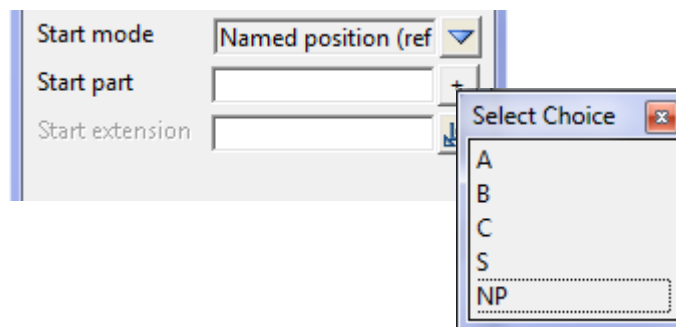

Clicking LB or RB on the **+** for **Start part** brings up the **Named Part Builder** for the selected string which is used to define exactly which section of a named part is required to define the chainage.

Either define the required chainage by the **Name Part Builder** and hit **Set**, or type in the syntax into the **Start part** field.

The value in the **Start extension** field is added to the chainage calculated for the selected named part, and this becomes the **start chainage for the modifier**.

Start -Named position on reference string

Selecting **Name position on reference string** adds the two fields **Start part** and **Start extension** to the panel.

Clicking LB or RB on the **+** for **Start position** brings up the list of *Named positions* of the reference string. Either select from the list of named positions, or type the name of a Named position for the reference string into the **Start position** field

The value in the **Start extension** field is added to the chainage calculated for the selected named position, and this becomes the **start chainage for the modifier**.

Start -Named position on other string

Selecting Name position on other string adds the three fields **Start string**, **Start position** and **Start extension** to the panel.

First click on the select button of the **Start string** panel field and select a string.

Clicking LB or RB on the **+** for **Start position** brings up the list of *Named positions* of the selected string. Either select from the list of named positions of the string, or type the name of a Named position of the string into the **Start part** field

The value in the **Start extension** field is added to the chainage calculated for the selected named position, and this becomes the **start chainage for the modifier**.

Start -Cut of other string

Selecting Cut of other string adds the two fields **Start string** and **Start extension** to the panel.

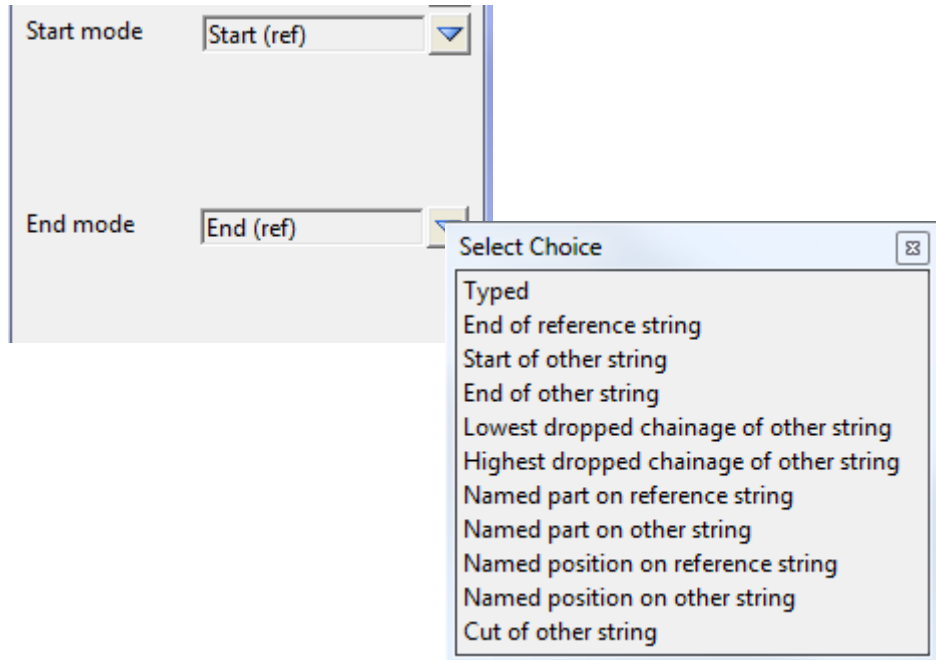

First click on the select button for the **Start string** panel field and select a string.

The value in the **Start extension** field is added to the chainage where the selected string cuts the reference string and this becomes the **start chainage for the modifier**.

Note - if the other string does not cut the reference string, or cuts it in more than one place, then the **Start mode** is invalid and an error message is generated.

End Mode

The **End mode** is for defining the **end chainage**. The modes and their definitions are:

For **Typed** go to

End of reference string

Start of other string

End of other string

Lowest dropped chainage of other string

Highest dropped chainage of other string

Named part on reference string

Named part on other string

Named position on reference string

Named position on other string

Cut of other string

[End - Typed](#)

[End - End of reference string](#)

[End - Start of other string](#)

[End - End of other string](#)

[End - Lowest dropped chainage of other string](#)

[End - Highest dropped chainage of other string](#)

[End - Named part on reference string](#)

[End - Named part on other string](#)

[End - Named position on reference string](#)

[End - Named position on other string](#)

[End - Cut of other string](#)

End - Typed

Selecting **Typed** adds a **End chainage** panel field where a reference string chainage can be typed in. This is used as the **end chainage**.

If the **End chainage** is left blank then the **end chainage of the reference string** is used as the **end chainage**.

End - End of reference string

Selecting **End of reference string** uses the **end chainage of the reference string** as the **end chainage**.

This is the default value for the **End mode**.

End - Start of other string

Selecting **Start of other string** adds a **End string** panel field and another string is selected.

.

The *start* of the selected string is dropped onto the reference string and the dropped chainage from the reference string is used as the **end chainage**.

End - End of other string

Selecting **End of other string** adds a **End string** panel field and another string is selected.

The *end* of the selected string is dropped onto the reference string and the dropped chainage from the reference string is used as the **end chainage**.

End - Lowest dropped chainage of other string

Selecting **Lowest dropped chainage of other string** adds a **End string** panel field and another string is selected.

.

The *start* and *end* of the selected string are dropped onto the reference string and the lower of the two dropped chainages from the reference string is used as the **end chainage**.

End - Highest dropped chainage of other string

Selecting **Highest dropped chainage of other string** adds a **End string** panel field and another string is selected.

.

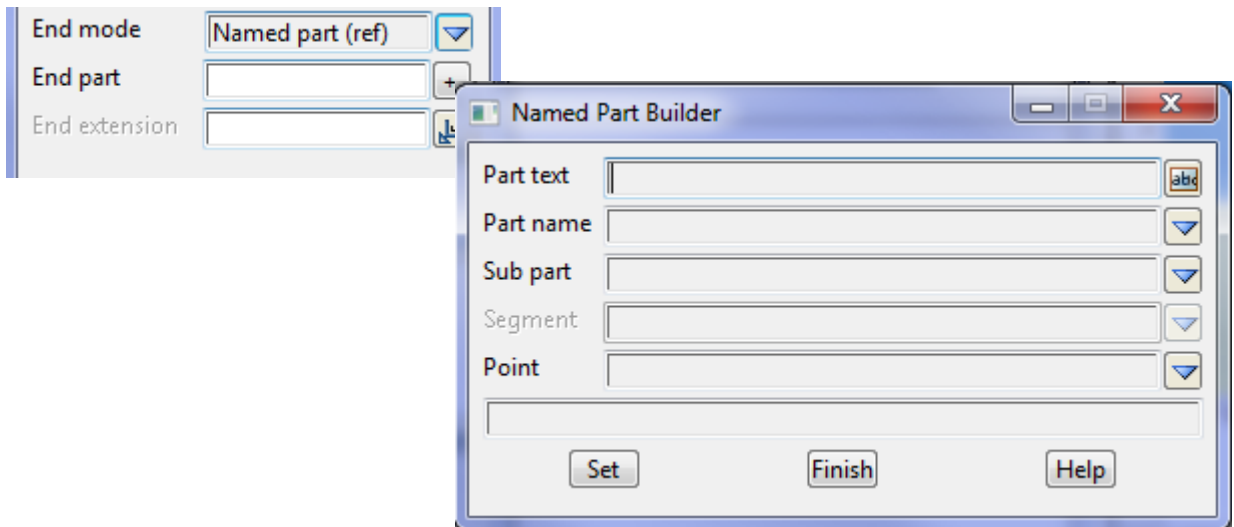

The *start* and *end* of the selected string are dropped onto the reference string and the higher of the two dropped chainages from the reference string is used as the **end chainage**.

End - Named part on reference string

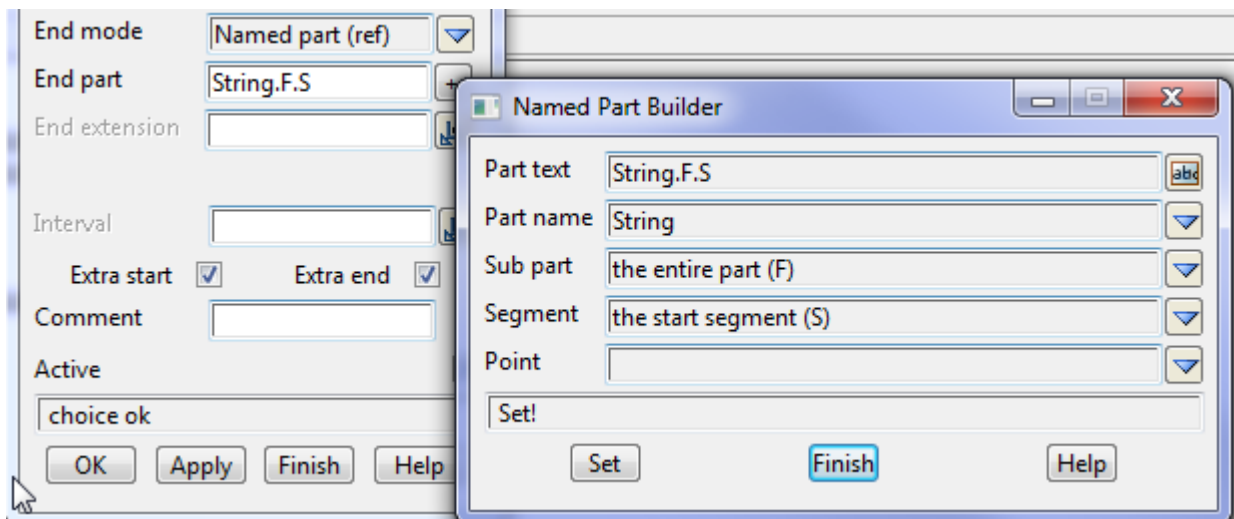

Selecting **Name part on reference string** adds the two fields **End part** and **End extension** to the panel.

Clicking LB or RB on the **+** for **End part** brings up the **Named Part Builder** for the reference string which is used to define exactly which section of a named part is required to define the chainage.

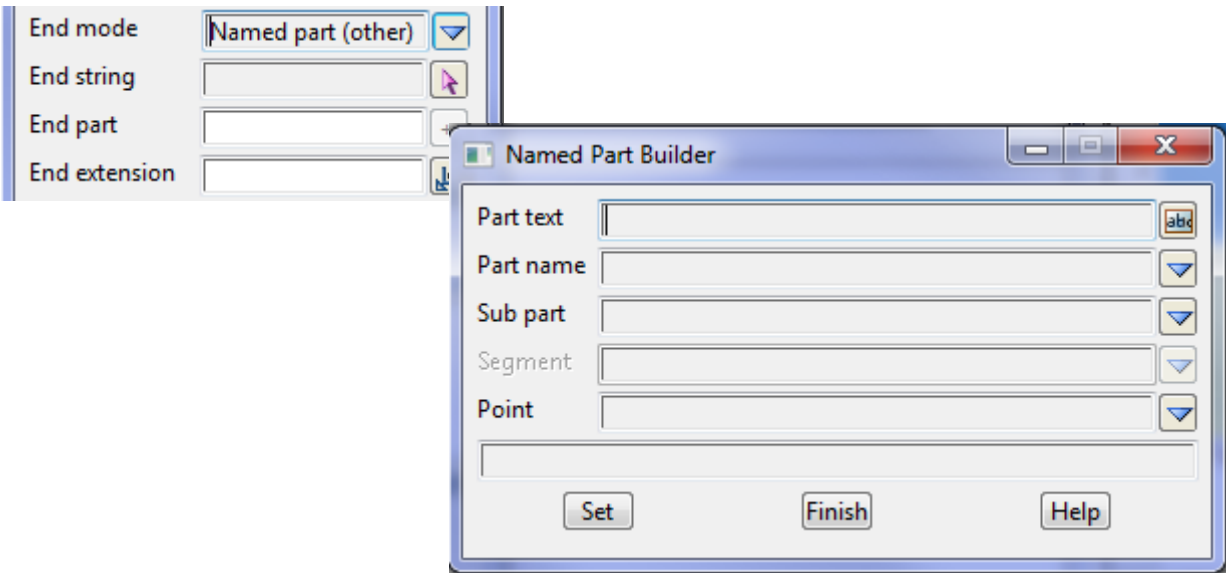

Either define the required chainage by the **Name Part Builder** and hit **Set**, or type in the syntax into the **End part** field.

The value in the **End extension** field is added to the chainage calculated for the selected named part, and this becomes the **end chainage for the modifier**.

End - Named part on other string

Selecting **Name part on other string** adds the three fields **End string**, **End part** and **End extension** to the panel.

First click on the select button of the **End string** panel field and select a string.

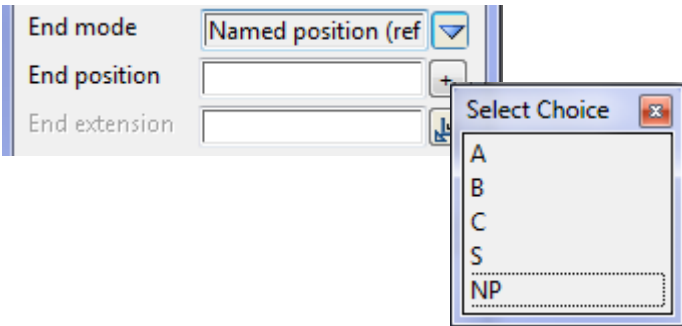

Clicking LB or RB on the **+** for **End part** brings up the **Named Part Builder** for the selected string which is used to define exactly which section of a named part is required to define the chainage.

Either define the required chainage by the **Name Part Builder** and hit **Set**, or type in the syntax into the **End part** field.

The value in the **End extension** field is added to the chainage calculated for the selected named part, and this becomes the **end chainage for the modifier**.

End - Named position on reference string

Selecting **Name position on reference string** adds the two fields **End part** and **End extension** to the panel.

Clicking LB or RB on the **+** for **End position** brings up the list of **Named positions** of the reference string. Either select from the list of named positions, or type the name of a Named position for the reference string into the **End position** field

The value in the **End extension** field is added to the chainage calculated for the selected named position, and this becomes the **end chainage for the modifier**.

End - Named position on other string

Selecting **Name position on other string** adds the three fields **End string**, **End position** and **End extension** to the panel.

First click on the select button of the **End string** panel field and select a string.

Clicking LB or RB on the **+** for **End position** brings up the list of *Named positions* of the selected string. Either select from the list of named positions of the string, or type the name of a Named position of the string into the **End part** field

The value in the **End extension** field is added to the chainage calculated for the selected named position, and this becomes the **end chainage for the modifier**.

End - Cut of other string

Selecting **Cut of other string** adds the two fields **Start string** and **Start extension** to the panel.

First click on the select button for the **End string** panel field and select a string.

The value in the **End extension** field is added to the chainage where the selected string cuts the reference string and this becomes the **end chainage for the modifier**.

Note - if the other string does not cut the reference string, or cuts it in more than one place, then the **End mode** is invalid and an error message is generated.

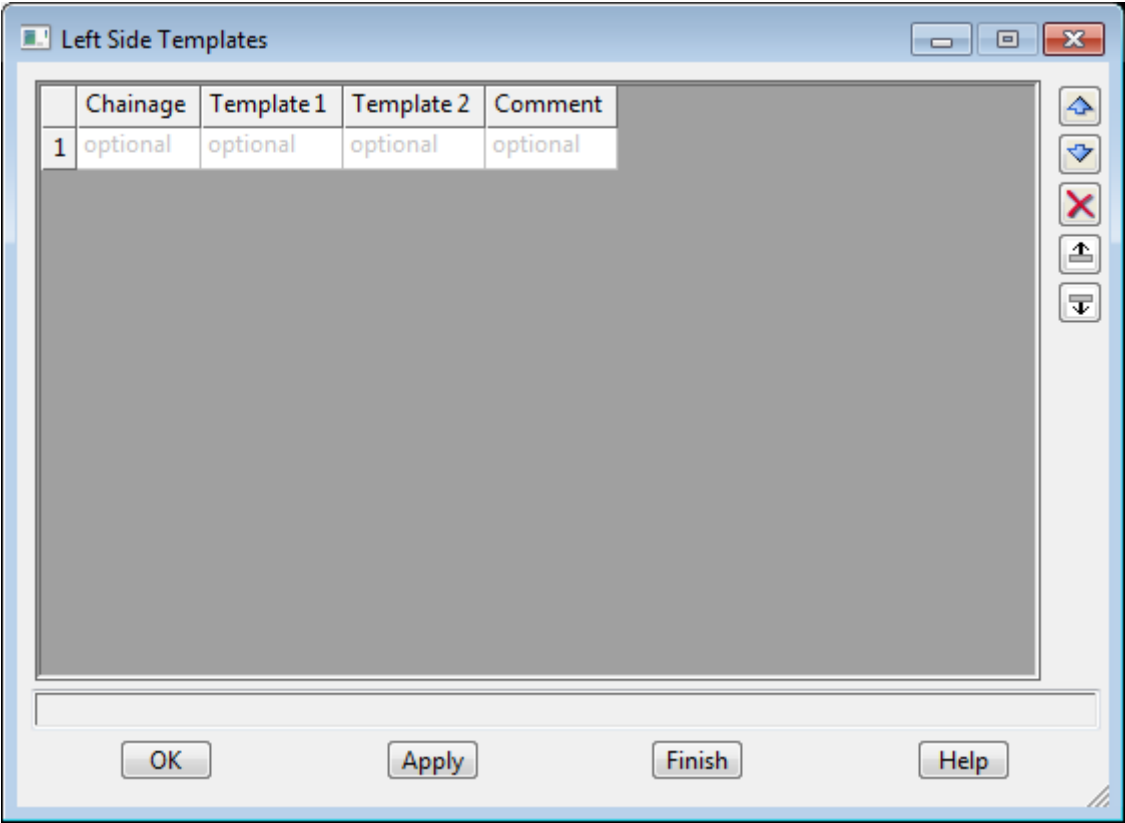

Please continue to the next section [MTF Templates](#).

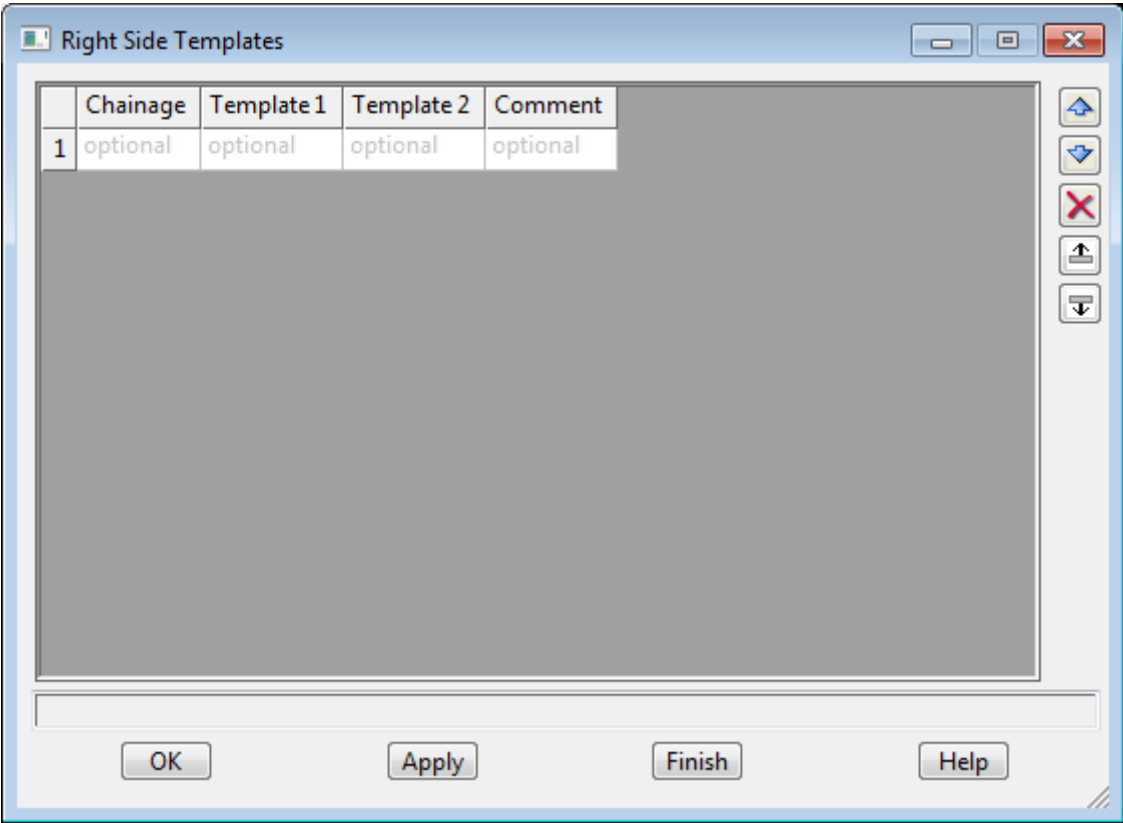

MTF Templates

The **Templates** walk-right brings up the **Templates** menu

and selecting the **Left side** or **Right side** option brings up the **Left Side Templates** or **Right Side Templates** panels respectively which are used to specify which templates are used, and over what chainage range, for the Left and Right sides.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage	column header		sort by chainage for the field - measure
<i>list of chainages for applying templates on the left/right hand side of the hinge string.</i>			
Template 1	column header		for the field - available templates
<i>template to start applying at the chainage on the same row. If template 2 is blank, then template 1 is applied until the next chainage in the chainage column.</i>			
Template 2	column header		for the field - available templates
<i>template to linearly interpolate to and finish with at the next chainage in the chainage column. In the file, the two templates will be separated by a comma.</i>			
<i>Note - template 2 must have the same number of fixed and variable links as template 1 otherwise a gap of the section separation length will be left between the end of template 1 and the start of template 2.</i>			
Comment	column header		
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>			
OK/Apply	button		
<i>OK stores the values in the fields and removes the panel.</i>			
<i>Apply stores the values and leaves the panel on the screen.</i>			
Please continue to the next section MTF Specials .			

MTF Specials

The **Apply Many** option automatically creates sections at a number of chainages including the supplied chainage interval, horizontal and vertical critical points, horizontal and vertical chord-arc tolerances, template change points and modifier change points.

However it is also possible to add extra sections at special chainages using the **Specials** option from the **MTF Edit** menu.

Walking right on the **Specials** menu brings up the **Special Chainages** walk-right menu:

Selecting **Values** brings up the **Special Chainage Values** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Chainage		column header		sort by chainage for the fields - measure
<i>list of special chainages for creating sections at.</i>				
Comment		column header		
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>				
OK/Apply		button		

OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Selecting **Files** brings up the **Special Chainage Files** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	column header		size menu for the fields - *.spc files

list of files of special chainages for creating sections at.

Comment	column header	
	<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	

Wild card	input	*.spc
	<i>the wild card used for pop-ups in the special chainage files fields.</i>	

OK/Apply	button
OK stores the values in the fields and removes the panel.	
Apply stores the values and leaves the panel on the screen.	

Please continue to the next section [MTF Hinge Modifiers](#).

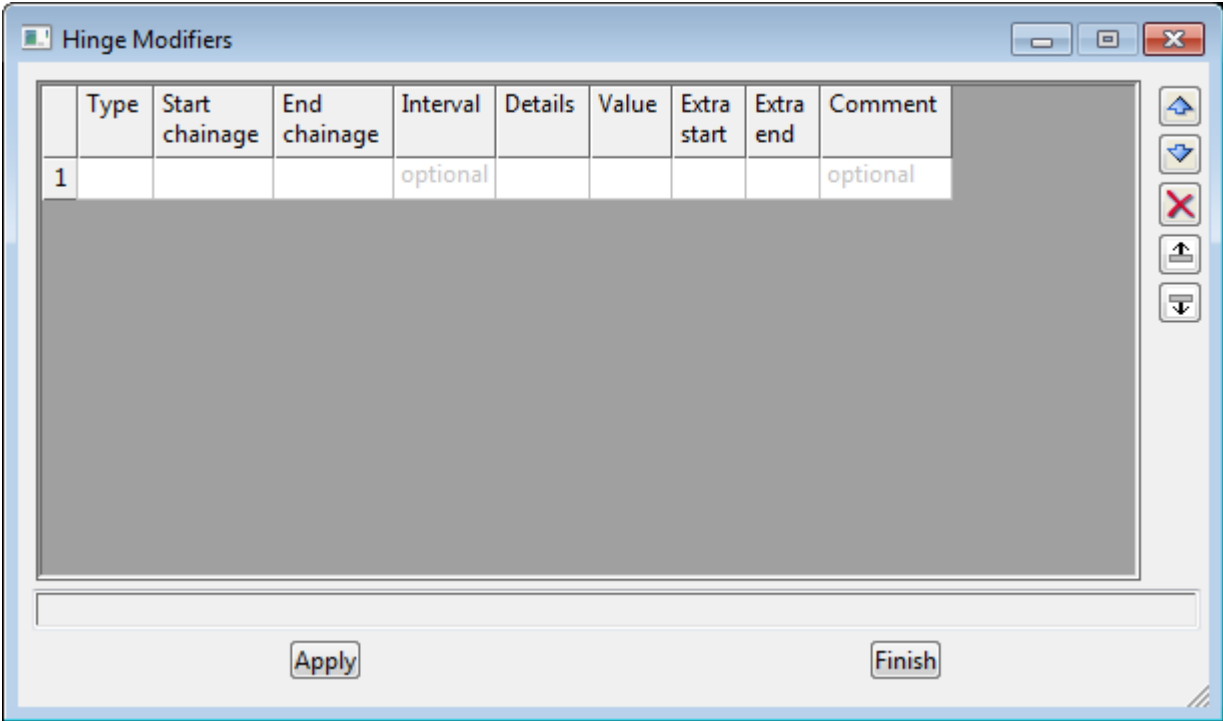

MTF Hinge Modifiers

The **hinge string** is selected using the **hinge** panel field in either the **Apply Template Function** or **Apply Templates Function** panels.

Hinge modifiers are used to **modify** the position of the point on the hinge string that templates are applied to (the **hinge point**).

Selecting **Hinge** from the **MTF Edit** menu brings up the **Hinge Modifiers** panel.

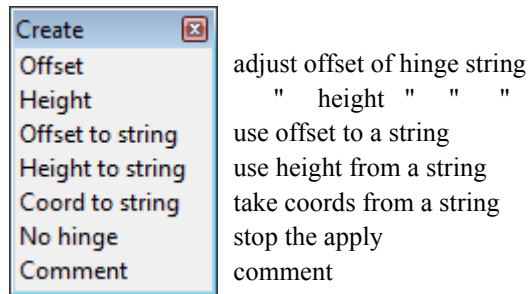

The **Hinge Modifiers** panel consists of a scrolling **command** fields and an **OK** or **Apply** button to record the results.

The **width** of the **command** area in the **Hinge Modifiers** panel is controlled by the environment variable `DEFAULT_TABLE_WIDTH_4D`.

The **commands** in the hinge modifier field can be **Offset**, **Height**, **Offset to string**, **Heights to string**, **Coord to string**, **No hinge** and **Comment**.

If the **command line** is **empty**, clicking **LB** in the **command line** will bring up the **Create** menu which contains all the available hinge commands.

Selecting a menu item will bring up an associated panel which displays the information required for the hinge command.

When the panel is filled in and **OK** or **Apply** selected, the panel information is written out to the **command line** in the correct format for that hinge command.

If the **command line** is **not empty**, clicking LB in the **command line** will bring up the associated panel for the hinge command in the **command line**.

The information in the panel can be modified and if **OK** or **Apply** is selected, the modified panel information is written out to the **command line** in the correct format for that hinge command.

Each of the panels created by selecting the command from the **Create** menu, will now be described.

For documentation on the option on the Hinge modifier **Create** menus:

For the option <i>Offset</i> , go to	Offset
<i>Height</i>	Height
<i>Offset to string</i>	Offset to String
<i>Height to string</i>	Height to String
<i>Coord to sting</i>	Coord to String
<i>No hinge</i>	No Hinge
<i>Comment</i>	Comment

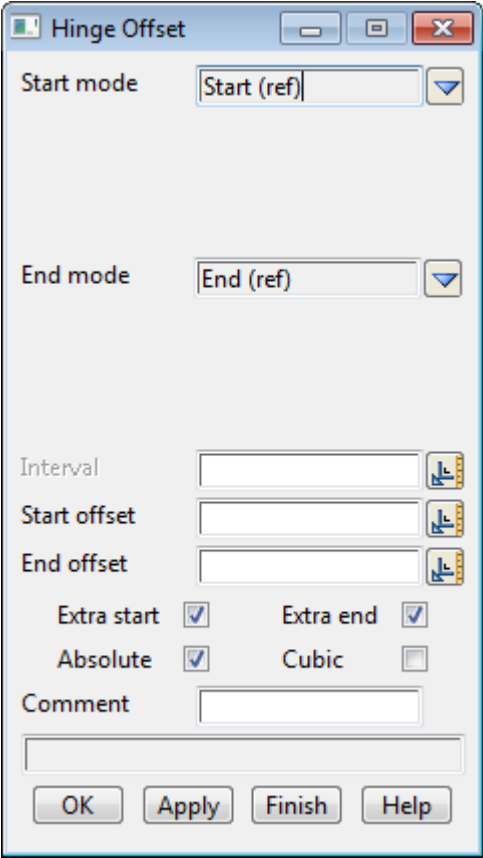

The typed form of the command will be given in the section [MTF Hinge Modifier File Format](#) and an example is given in the section [A Hinge Modifier Example](#)

Offset

The **offset** modifier will move the hinge point a given offset distance (perpendicular to the reference string) from its current plan position. A positive offset is to the right of the hinge string and a negative offset to the left.

Selecting **Offset** brings up the **Hinge Offset** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	
<i>defines the start/end chainages on the reference string for modifying the offset from the hinge string. For more information on Start/End mode, see Start and End Chainages</i>			
Interval	input		

if **non blank**, the interval to use to create cross sections and strings over the given chainage range.
If **blank**, the **Section separation** value from the **Apply Many** panel is used.

Start/End offset input measures menu
start/end offset.

Extra start/end tick box tick
*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute tick box tick
*if **ticked**, the offset is set to the values given in the **start** and **end value** fields.
if **not ticked**, the values given in the **start** and **end value** fields are added to the existing offsets.*

Cubic tick box
*if **ticked**, the offset is varied as a reverse cubic between the start and end chainages.
if **not ticked**, the offset is varied linearly between the start and end chainages.*

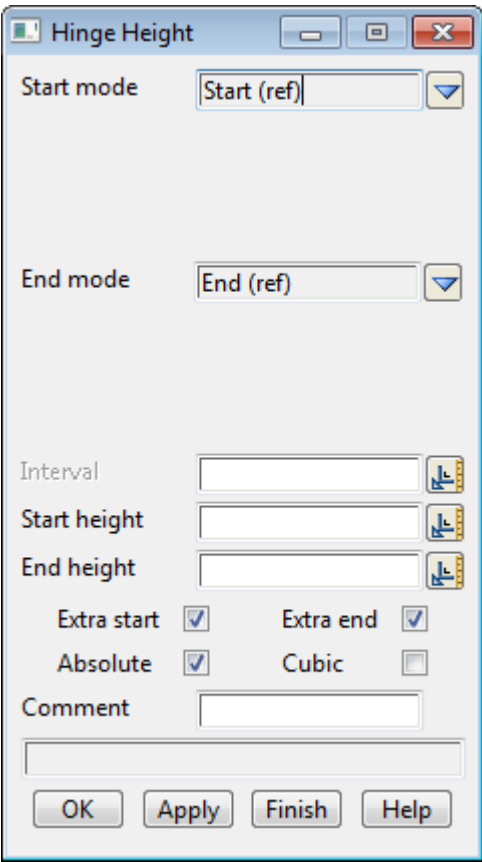

Comment input
comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Go to the next section [Height](#) or return to [MTF Hinge Modifiers](#)

Height

The **Height** modifier varies the height of the hinge point between the given chainages. Selecting **Height** brings up the **Hinge Height** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	
<i>defines the start/end chainages on the reference string for modifying the height of the hinge string. For more information on Start/End mode, see Start and End Chainages</i>			
Start/End height	input		measures menu
<i>start/end height.</i>			
Interval	input		
<i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>			
Extra start/end	tick box	tick	
<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>			
Absolute	tick box	tick	
<i>if ticked, the height is set to the values given in the start and end value fields. if not ticked, the values given in the start and end value fields are added to the existing heights.</i>			
Cubic	tick box		

if **ticked**, the height is varied as a reverse cubic between the start and end chainages.
if **not ticked**, the height is varied linearly between the start and end chainages.

Comment

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply

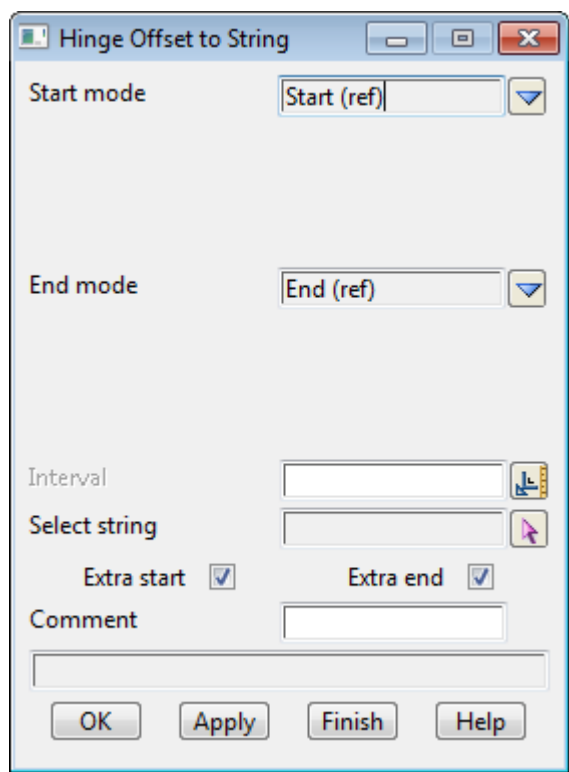

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Go to the next section [Offset to String](#) or return to [MTF Hinge Modifiers](#)

Offset to String

Selecting **Offset to string** brings up the **Hinge Offset to String** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	

*defines the start/end chainages for modifying the offset of the hinge string.
For more information on Start/End mode, see [Start and End Chainages except for this option](#):
When the **Start mode** is **Start (ref)**, or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.
When the **End mode** is **End (ref)**, or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Interval	input
<i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	

String	string-select
<i>select string to use for defining offset from hinge.</i>	

Extra start/end	tick box	tick
<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>		

Comment	input
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	

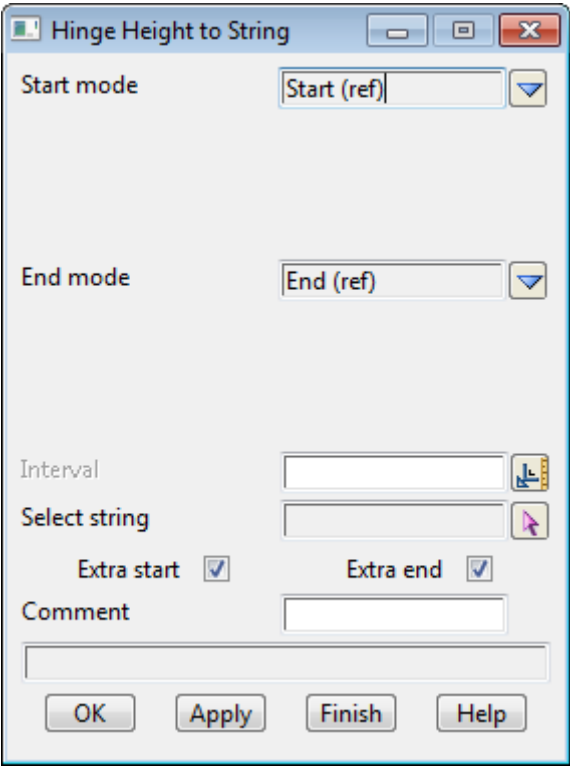

OK/Apply	button
<i>OK stores the values in the fields and removes the panel. Apply stores the values and leaves the panel on the screen.</i>	

Go to the next section [Height to String](#) or return to [MTF Hinge Modifiers](#)

Height to String

The height of the hinge point can also be specified by **taking the height from another 12d Model string**.

Selecting **Height to string** brings up the **Hinge Height to String** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start/End mode	choice box	Start (ref)/End (ref)	
-----------------------	------------	-----------------------	--

*defines the start/end chainages for modifying the height of the hinge string.
For more information on Start/End mode, see [Start and End Chainages except for this option](#):
When the **Start mode** is **Start (ref)**, or **Typed** and the chainage is **blank**, the modification begins at the low dropped chainage of the selected string.
When the **End mode** is **End (ref)**, or **Typed** and the chainage is **blank**, the modification ends at the high dropped chainage of the selected string.*

Start/End mode	choice box	Start (ref)/End (ref)	
-----------------------	------------	-----------------------	--

*defines the start/end chainages for modifying the offset of the hinge string.
For more information on Start/End mode, see [Start and End Chainages](#)*

Interval	input		
-----------------	-------	--	--

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.
If **blank**, the **Section separation** value from the **Apply Many** panel is used.*

String	string-select		
---------------	---------------	--	--

select string to use for defining height of hinge.

Extra start/end	tick box	tick	
------------------------	----------	------	--

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply button

OK stores the values in the fields and removes the panel.

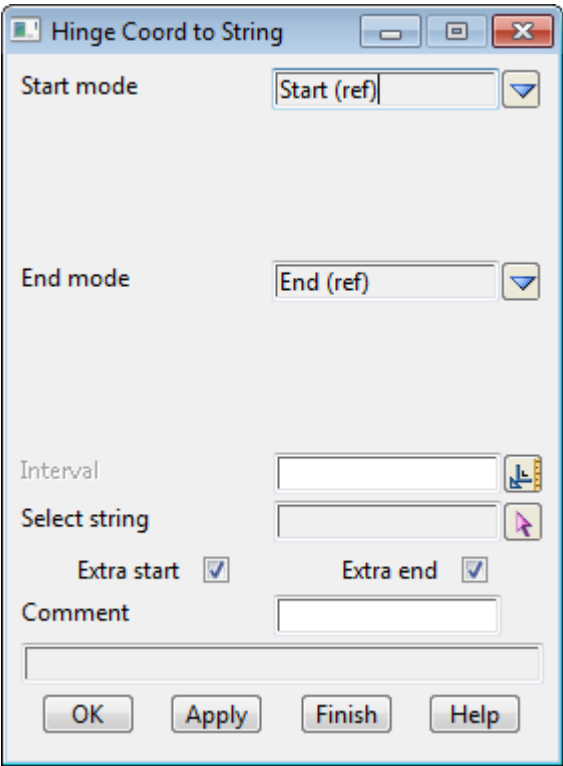

Apply stores the values and leaves the panel on the screen.

Go to the next section [Coord to String](#) or return to [MTF Hinge Modifiers](#)

Coord to String

The **Coord** modifier is used to replace the x, y and z position of the hinge point by the x, y and z position of **another 12d Model string** between given chainages. Hence **Coord** replaces the hinge string by another string between the given chainages.

Selecting **Coord to string** brings up the **Hinge Coord to String** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Start/End mode	<i>defines the start/end chainages for modifying the coordinates of the hinge string. For more information on Start/End mode, see Start and End Chainages except for this option: When the Start mode is Start (ref), or Typed and the chainage is blank, the modification begins at the low dropped chainage of the selected string. When the End mode is End (ref), or Typed and the chainage is blank, the modification ends at the high dropped chainage of the selected string.</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	input		
String	<i>select string to use for defining the coordinates of the hinge string.</i>	string-select		
Extra start/end	<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment	<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input		
OK/Apply		button		

OK stores the values in the fields and removes the panel.

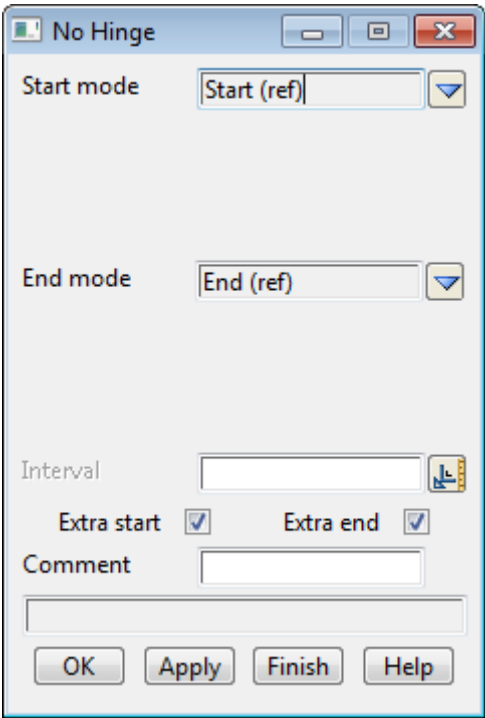

Apply stores the values and leaves the panel on the screen.

Go to the next section [No Hinge](#) or return to [MTF Hinge Modifiers](#)

No Hinge

The **Nohinge** modifier is used to **stop** the hinge string (and hence the apply) between given chainages. This will leave a gap in the strings created by the apply between the given chainages.

Selecting **No hinge** brings up the **No Hinge** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start/End mode	choice box	Start (ref)/End (ref)	
-----------------------	------------	-----------------------	--

*defines the start/end chainages to stop the apply.
For more information on Start/End mode, see [Start and End Chainages](#)*

Interval	input		
-----------------	-------	--	--

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.
If **blank**, the **Section separation** value from the **Apply Many** panel is used.*

Extra start/end	tick box		
------------------------	----------	--	--

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment	input		
----------------	-------	--	--

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply	button		
-----------------	--------	--	--

***OK** stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.*

Go to the next section [Comment](#) or return to [MTF Hinge Modifiers](#)

Comment

The **Comment** option inserts a comment line.
Selecting **Comment** brings up the **Hinge Comment** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Comment	input		
<i>comment line. In the file, the comment will be preceded by //.</i>			
OK/Apply	button		
<i>OK stores the values in the fields and removes the panel.</i>			
<i>Apply stores the values and leaves the panel on the screen.</i>			

Go to the next section [MTF Modifiers \(Template Modifiers\)](#) or return to [MTF Hinge Modifiers](#)

MTF Modifiers (Template Modifiers)

In its **simplest** form, the **MTF (Many Templates File** - so named because it was originally just for having more than one template) defines what templates are used on either side of the hinge string, where the templates stop and start with linear interpolation between two templates over a chainage range.

This simple information is given for the left side and the right side in the **Templates** section of the **MTF**.

For more complex work, **Modifiers** are used in the **MTF** to **modify** the strings defined in the templates, and even totally replace the use of templates. And just as the templates are defined on the left and the right side, the **Modifiers** are defined for the left and right side in the **Modifiers** section of the **MTF editor**.

That is, for the left side say, the application of templates is first defined for the left side in the **Left side** of the **Templates** section of the **MTF** and then can be **modified** by commands in the **Left side** of the **Modifiers** section of the **MTF**.

However, the modifiers **also include** commands to **insert** and **remove** template links, and insert templates independently of whether a template has been defined or not in the **Templates** section.

Hence the **left side modifiers** can be **self contained** without needing a **Templates** section.

Similarly for the right side.

The **Modifiers** can be used to

- insert a fixed, cut or fill link
- remove a fixed, cut or fill link
- insert the fixed, cut or fill section of a template
- insert snippets

and change the

- width/height/xfall of a fixed link
- width/height/slope of a variable cut or fill link
- width of the final link
- cut/fill slope of the final link

by a variety of methods.

Most of the modifiers have a common methodology:

- (a) an existing link from a template (referenced by its name from the template definition), or a new link that is created by an MTF Insert, can be removed or modified between a given start and end chainage on the reference string.
- (b) values being modified are given for the start chainage and the end chainage. How the values are interpreted depends on other parameters for the command.
- (c) more than one modifier may exist for a link at a given chainage and the modifiers are applied in the order that they appear in the modifiers grid.
- (d) if no modifier exists for a link at a given chainage, the link reverts back to the template definition (or the Insert link command), given by the left side or the right side.

Notes

1. When a fixed link is defined, it is given as two of the three variables width, height and xfall. For most **Modifier commands**, only the two variables used to define the link can be changed by **Modifiers**.
2. Similarly, when a variable cut or fill link is defined, it is given as two of the three variables width, height and slope. For most **Modifier commands**, only the two variables used to define the link can be changed by **Modifiers**.

Please continue to the next section [Modifiers in MTF Edit](#).

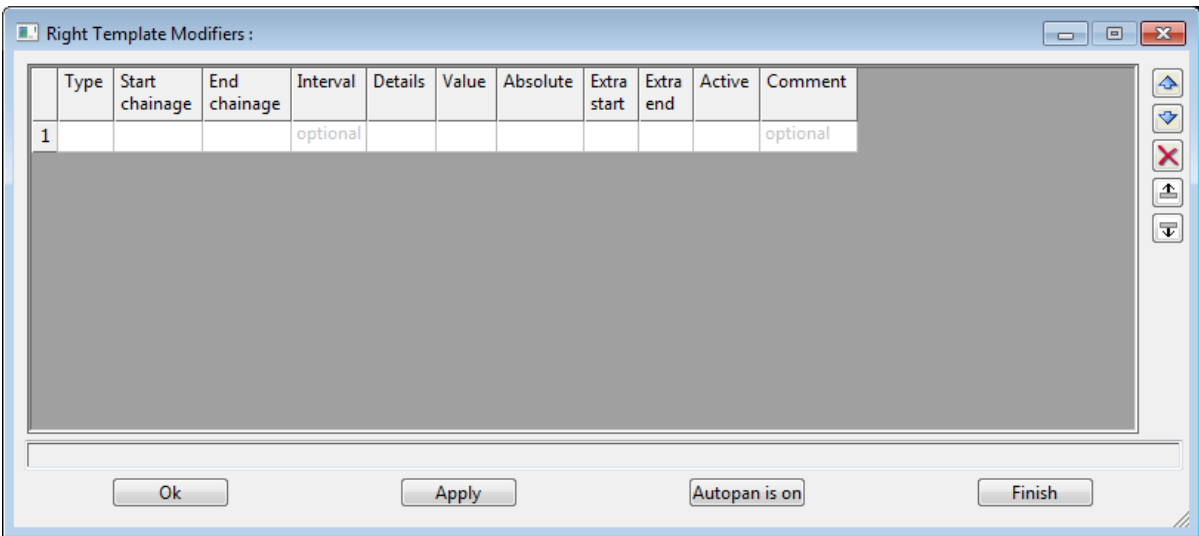

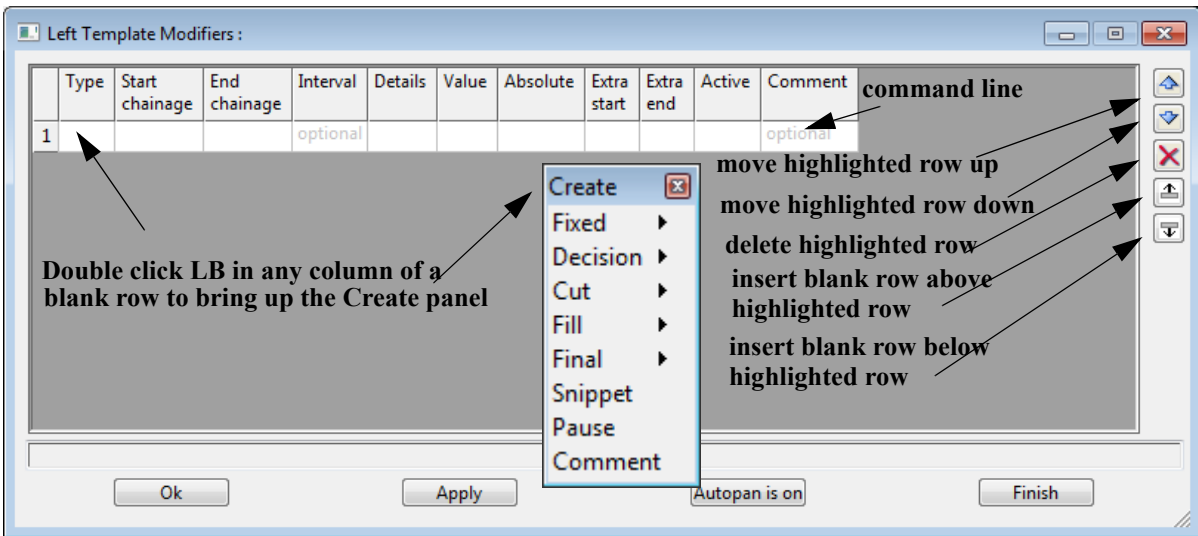

Modifiers in MTF Edit

The **Modifiers** walk-right *brings* up the **Modifiers** menu with options to modify the left side and right side sections of the MTF.

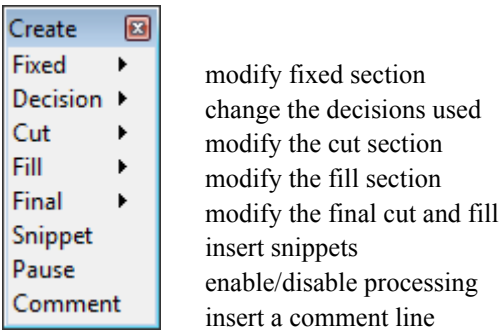

The **Left side** modifier option will be described in detail. The **right side** is exactly the same so will not be described.

Selecting **Left side** from the MT edit =>Left side menu brings up the **Left Template Modifiers** panel.

The **Left Template Modifiers** and **Right Template Modifiers** panels consists of a grid to display the command fields and an **Apply** button to record the results.

If the **command line** is **empty**, double clicking LB in any the **command line** will bring up the **Create** menu which contains all the available modifier commands.

Selecting a menu item will bring up an associated panel which displays the information required for the modifier command.

When the panel is filled in and **Apply** selected, the panel information is written out to the **command line** in the correct format for that modifier command.

If the **command line** is **not empty**, double clicking LB in the **Type** column of the **command line** will bring up the associated panel for the modifier command in the **command line**.

The information in the panel can be changed and if **Apply** is selected on the panel, the changed panel information is written out to the **command line** in the correct format for that modifier command.

For documentation on the button *Autopan*, go to [Start/End Highlighting and Autopan Button](#)

Each of the panels created by selecting a command from the **Create** menu, will now be described.

For the option <i>Fixed</i> , go to	Fixed Link Modifiers
<i>Decision</i>	Decision
<i>Cut</i>	Cut Link Modifiers
<i>Fill</i>	Fill Link Modifiers
<i>Final</i>	Final Modifiers
<i>Snippet</i>	Snippets
<i>Pause</i>	Pause
<i>Comment</i>	Comment

Please continue to the next section [Start/End Highlighting and Autopan Button](#).

Start/End Highlighting and Autopan Button

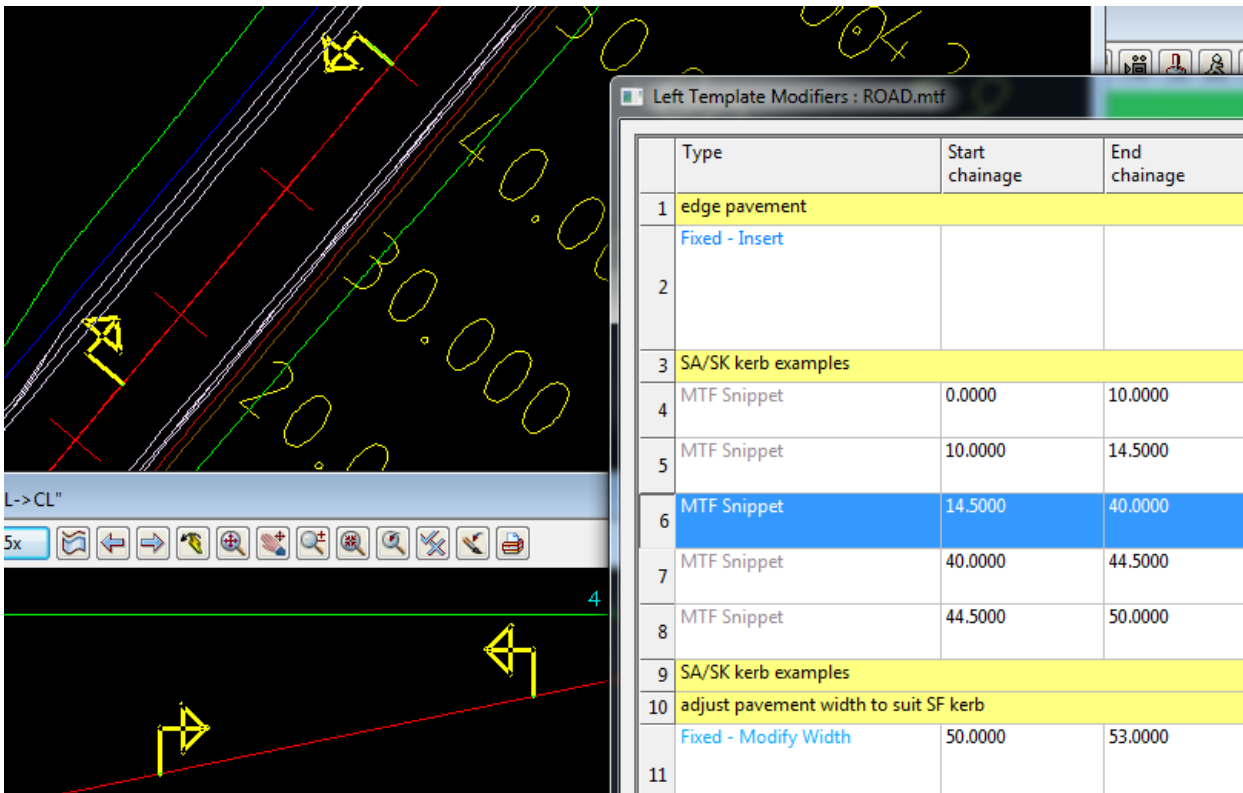

The **Autopan** button is at the button of the **Left/Right Template Modifiers** panels and clicking on the button will toggle between the **on/off** states.

The **Autopan** button is used in conjunction with clicking LB in the Type, Start chainage and End Chainage columns.

For all **plan** views that the **Reference string** for the MTF is on, and all **section views** where the **Reference string** is **profiled**., clicking in the grid on the **Left/Right Template Modifiers** panels will have the following effect:

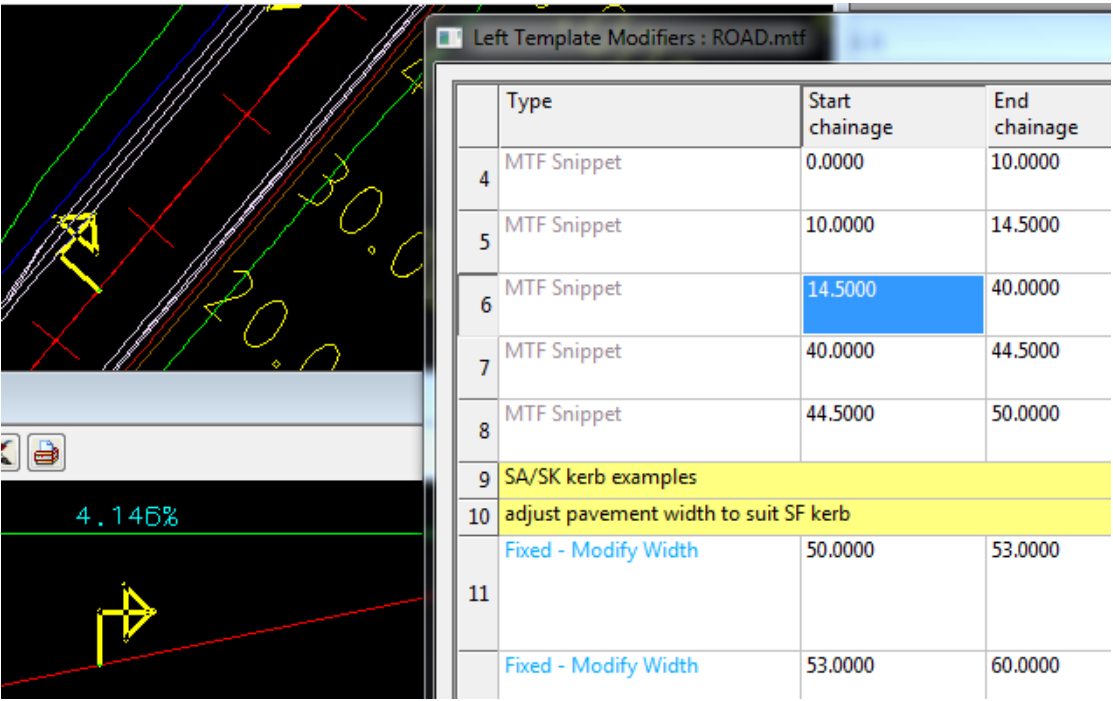

- (a) if LB is clicked on the **number** in the grid of a command then the entire line in the grid highlights, and highlight arrows are placed at the Start and End chainage of the command.

Important Note: the scale and the centre point of the views are not changed so if the Start/End chainage is not visible on the view, then the highlight arrow for the Start/End will not appear.

- (b) if LB is clicked in the **Start chainage** column of a command, then that cell of the grid highlights, and
If **Autopan is on** then the plan and/or section views will pan so that the Start chainage highlight arrow shows on the views.

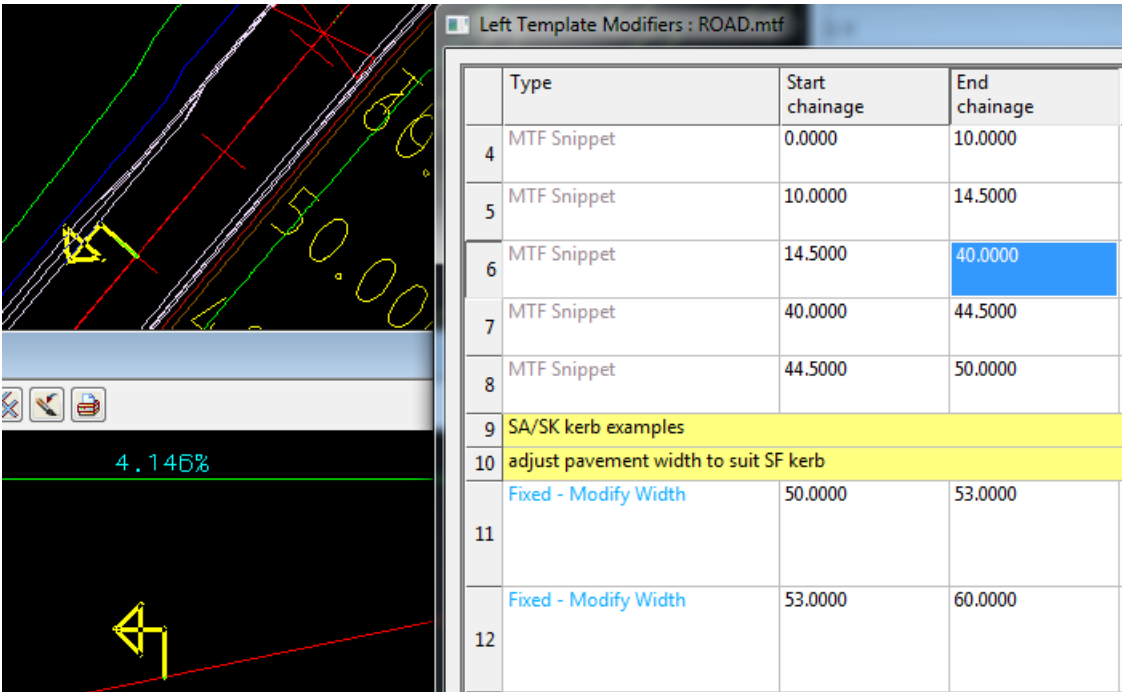

If **Autopan is off** then the Start chainage highlight arrow occurs but the view does not change. So the Start chainage highlight arrow will only show if the Start chainage is already visible on the plan and/or section views.

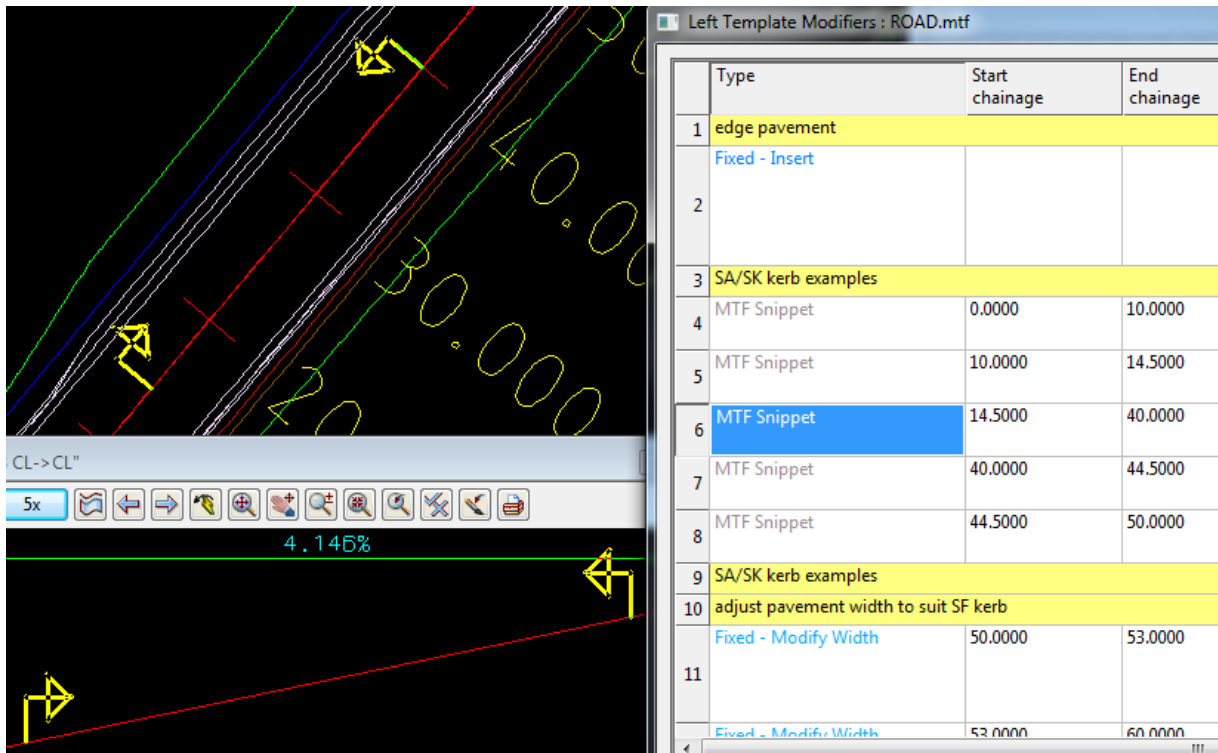

(c) if LB is clicked in the **End chainage** column of a command, then that cell of the grid highlights, and

If **Autopan is on** then the plan and/or section views will pan so that the End chainage highlight arrow shows on the views.

If **Autopan is off** then the End chainage highlight arrow occurs but the view does not change. So the End chainage highlight arrow will only show if the End chainage is already visible on the plan and/or section views.

- (d) if LB is clicked in the **Type** column of a command, then that cell of the grid highlights, and
- If **Autopan is on** then the plan and/or section views will do a fit about the Start chainage and End chainage so that both the Start chainage highlight arrow and the End chainage highlight arrow are visible in the plan and/or section views.
- If **Autopan is off** then the plan and/or section views do not change. The Start chainage highlight arrow and the End chainage highlight arrow are turned on but they will only be visible if the Start chainage and/or End chainage are already visible on the views.

LJG ??

reference string If **Autopan is on** is showing AND the **Reference string** for the MTF is on a plan view:

- (a) whenever you click on **Type** column in the grid for a command that does not involve the entire string, the scale and centre of the view is modified so that the **Start** and **End** chainage extents of the command are displayed in the plan view (with the addition of an extra percentage that is set in env.4d)
- (b) whenever you click on **Start chainage** column of a command that does not involve the entire string, the scale and centre of the view is modified so that the **Start** and **End** chainage extents of the command are displayed in the plan view (with the addition of an extra percentage that is set in env.4d)

Return to [Modifiers in MTF Edit.](#)

Fixed Link Modifiers

The **Fixed** walk-right brings up the **Fixed** menu with options to modify the fixed links of the template.

To go straight to the documentation on each of the options on the **Fixed** modifier menu:

For <i>Interval</i> , go to	Change Interval
<i>Insert</i> , go to	Fixed Link - Insert
<i>Remove</i>	Fixed Link - Remove
<i>Width/Height</i>	Fixed Link - Modify Width or Height
<i>Xfall</i>	Fixed Link - Modify Xfall
<i>Xfall CRC</i>	Fixed Link - Modify Xfall by CRC Formula
<i>Rename</i>	Fixed Link - Rename Link
<i>Parallel</i>	Fixed Link- Parallel
<i>Absolute</i>	Fixed Link - Absolute
<i>from Link</i>	Fixed Link - from Link
<i>to String</i>	Fixed Link - to String
<i>to Tin</i>	Fixed Link - to Tin
<i>to RL</i>	Fixed Link - to RL
<i>to 2 heights</i>	Fixed Link - to Two Heights
<i>to 2 Strings</i>	Fixed Link - to Two Strings

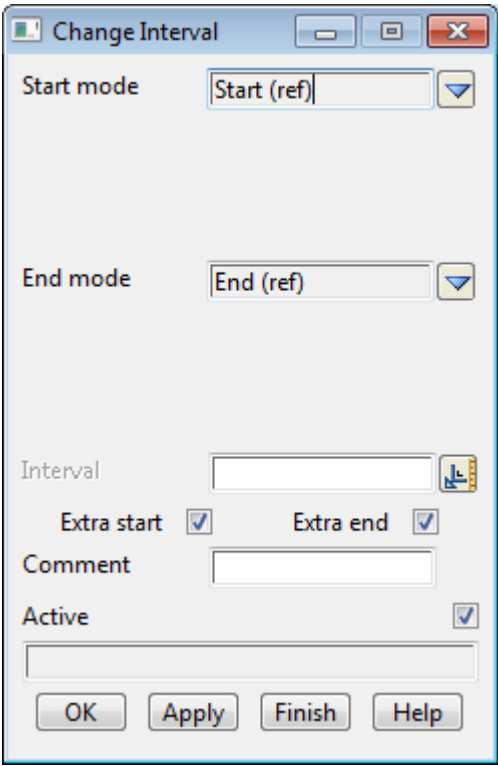

Each of the options from this menu will now described.

Change Interval

An interval can be specified to add extra cross sections and points in the create strings.

Selecting **Interval** brings up the **Change Interval** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	
<i>defines the start/end chainages for using the new Interval.</i> <i>For more information on Start/End mode, see Start and End Chainages</i>			
Interval	input		
<i>if non blank, the interval to use to create extra cross sections and strings over the given chainage range.</i>			
Extra start/end	tick box		
<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>			
Comment	input		
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>			
Active	tick box	ticked	
<i>if ticked, use this modifier.</i> <i>if not ticked, don't use this modifier.</i>			
OK	button		
<i>OK stores the values in the fields and removes the panel BUT no recalc is done.</i>			
Apply	button		
<i>Apply stores the values and leaves the panel on the screen.</i> <i>If the MTF is being used in an Apply Many MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, a recalc of the associated Apply Many for the MTF is done.</i>			
Return to Fixed Link Modifiers or Modifiers in MTF Edit .			

Fixed Link - Insert

The **fixed Insert** walk-right brings up the **fixed Insert** menu with options to insert fixed links, insert a fixed part of a template, and insert a full template.

To go straight to the documentation on each of the options on the **Fixed** modifier menu:

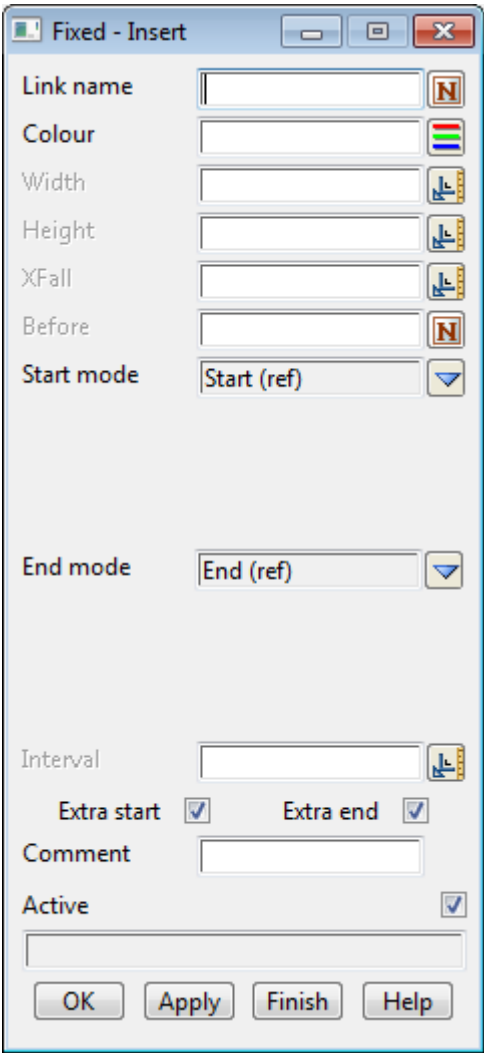

For <i>Insert</i> , go to	Insert a Fixed Link
<i>Insert absolute</i>	Insert a Fixed Link Absolute
<i>Insert fixed template</i>	Insert Fixed Links from a Template
<i>Insert full template</i>	Insert Full Template
<i>Insert xfall intersect</i>	Fixed Link - Insert Xfall Intersect

Insert a Fixed Link

Fixed links can be inserted by specifying either width and height, width and xfall, or height and xfall, where width/height/xfall are measured from the last fixed link before this link.

Note - height is not an absolute height (RL) but a delta height.

Selecting **Insert** brings up the **Fixed - Insert** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to create.</i>	names box		select name menu
Colour <i>colour of the link being created.</i>	colour box		available colours
Width /height/xfall <i>width/ height/ crossfall of the link being created - only use two of the three.</i>	input		measures menu
Before <i>if non-blank, the name of the string to insert the new string before. If blank, the link is appended to the end of the fixed part of the template.</i>	choice box		select name menu
Start/End mode <i>defines the start/end chainages for inserting the new template link. For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i>	input		

If *blank*, the **Section separation** value from the **Apply Many** panel is used.

Extra start/end tick box

if *ticked*, add an extra x-section 0.1 mm **before** the start/end chainage.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if *ticked*, use this modifier.
if *not ticked*, don't use this modifier.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.
If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

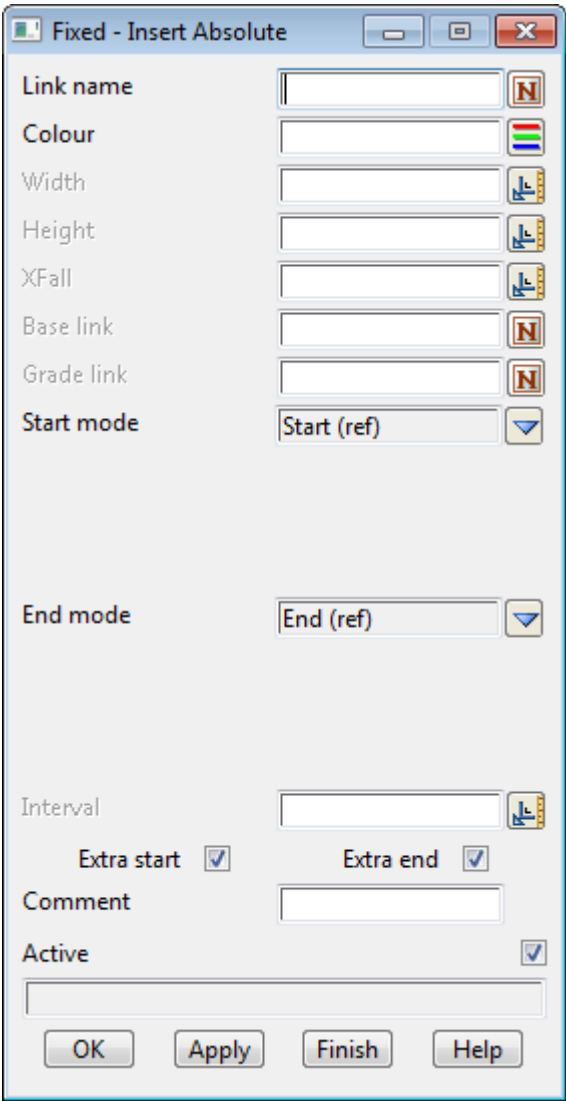

Insert a Fixed Link Absolute

Fixed links can be inserted by specifying either width and height, width and xfall, or height and xfall, where the width/height/xfall are measured from a **Base link**, or a combination of a **Base** link and a **Grade** link.

The new inserted link must end up outside any previous links.

Note - height is not an absolute height (RL) but a delta height.

Selecting **Insert absolute** brings up the **Fixed - Insert Absolute** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to create.</i> <i>Note: the new inserted link must end up outside any previous links.</i>	names box		select name menu
Colour <i>colour of the link being created.</i>	colour box		available colours
Width /height/xfall <i>width/ height/ crossfall of the link being created - only use two of the three.</i> <i>If a Grade link is given, only the combinations width and crossfall, or width and height, are allowed.</i> <i>If there is no Grade link, any two of the three can be used.</i>	input		measures menu
Base link, Grade link <i>If Grade link is blank:</i> <i>any combination of two of width, height an xfall can be used to define the new link.</i> <i>if Base link is non blank, then it is the name of the link to take the width/height/xfall from.</i> <i>If Base link is blank, then the option acts as a normal Insert and the width/height/xfall are taken</i>	names box		select name menu

from the last fixed link before this insert.

If **Grade link is not blank**:

only the combinations width and crossfall, or width and height, are allowed.

Width:

if Base link is non blank, then it is the name of the link to take the **width** from.

If Base link is blank, then the **width** is from the last fixed link before this insert.

Xfall or Height

If **xfall** is given, then the xfall is applied from the Grade link.

If **height** is given, then the height is added to the height of the Grade link.

Note: the new inserted link must end up outside any previous links.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for inserting the new template link.

For more information on Start/End mode, see [Start and End Chainages](#)

Interval input

if **non blank**, the interval to use to create cross sections and strings over the given chainage range.

If **blank**, the **Section separation** value from the **Apply Many** panel is used.

Extra start/end tick box

if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if **ticked**, use this modifier.

if **not ticked**, don't use this modifier.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

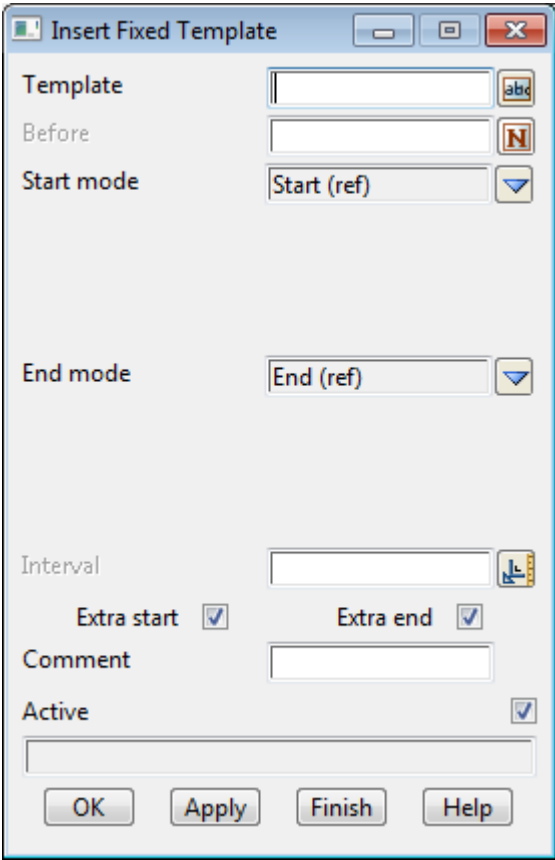

Apply stores the values and leaves the panel on the screen.

If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

Insert Fixed Links from a Template

All the fixed links from an existing template can be inserted by the **Insert fixed template** command.

Selecting **Insert fixed template** brings up the **Insert Fixed Template** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Template	<i>the name of the template to take the fixed links from.</i>	template box		select template menu
Before	<i>if non-blank, the fixed links from the selected template are inserted before the given link. If blank, the fixed links from the selected template are appended to the end of the existing fixed links.</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for inserting the new template link. For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Extra start/end	<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment		input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*

*if **not ticked**, don't use this modifier.*

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

*If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.*

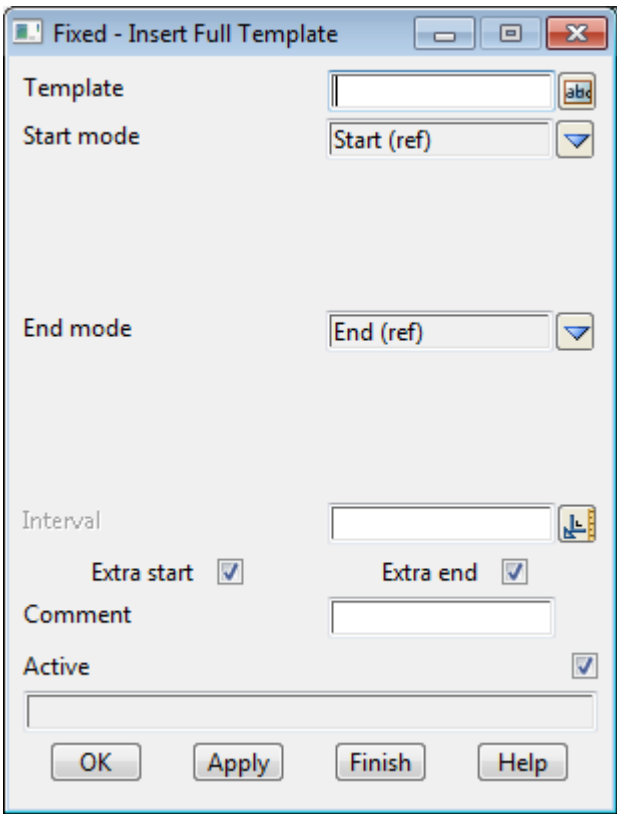

Return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Insert Full Template

The **Insert Full Template** *inserts* all the fixed links from a selected template after the existing fixed links **AND** also *replaces* the decision, cut, fill and final cut/fill links of the existing template with those from the selected template.

So the option **leaves** the existing fixed links from the template but **removes the existing** decision, cut, fill and final cut/fill links in the template.

Selecting **Insert Full Template** brings up the **Fixed - Insert Full Template** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template <i>the name of the template to take the fixed, decision, cut, fill and final cut/fill links from.</i>	template box		select template menu
Start/End mode <i>defines the start/end chainages for inserting the fixed template link.s and replacing the decision, cut, fill and final cut/fill links. For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Extra start/end <i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment <i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input		

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.
*If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.*

Continue to the next section [Fixed Link - Insert Xfall Intersect](#) or return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed Link - Insert Xfall Intersect

The **Xfall insert** option **inserts** a new link.

And the new link is created by coming off the last link of the fixed template before the **Insert Xfall Intersect** command, and going out from that last fixed link in a variety of ways and meeting a **selected string**.

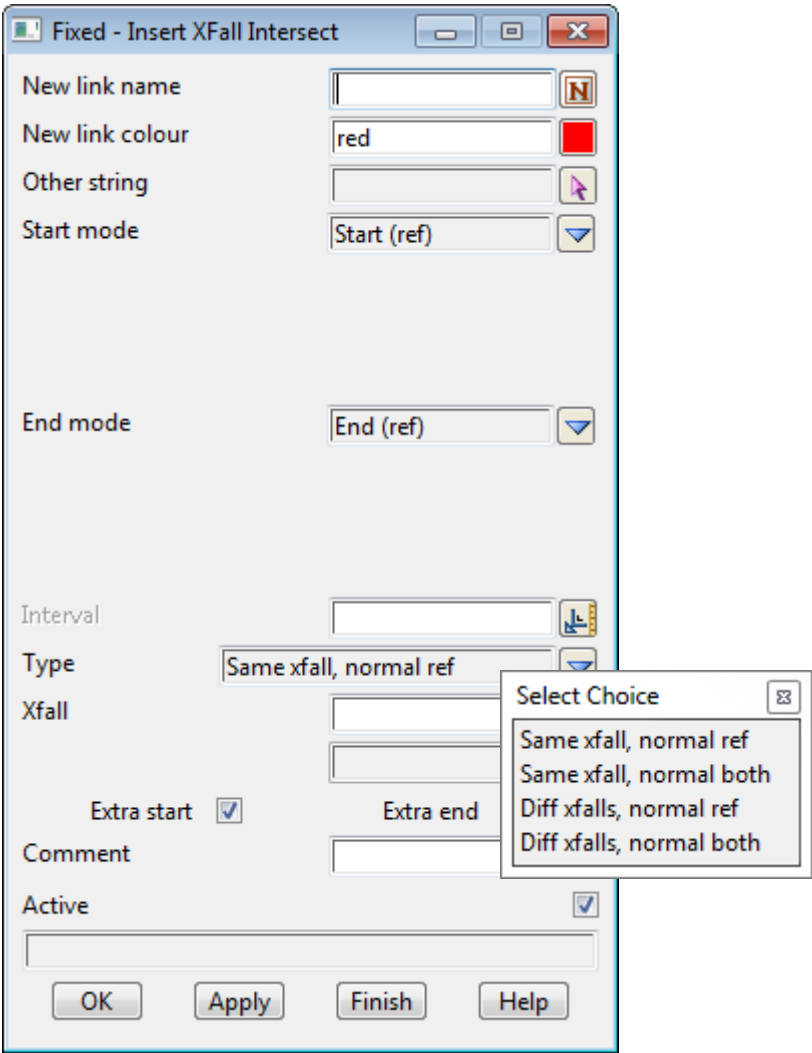

For example, over the chainage range, a given xfall is taken from the last link and the selected string, and the new link is the intersection of the two xfalls.

The different methods for creating the new link are:

and for the definitions go to [Fixed - Calculating the New Link for each Type](#).

Selecting **Insert xfall intersect** brings up the **Fixed - Xfall Intersect** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Link name	<i>name of the new link.</i>	name box		available names
Colour	<i>colour of the new link.</i>	colour box		available colours
Other String	<i>select the secondary string to use in the methods for creating the new link.</i>	string select		
Start/End mode	<i>defines the start/end chainages for creating the link. For more information on Start/End mode, see Start and End Chainages.</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	input		

Type choice box

For the types of ways to create the new link, go to [Fixed - Calculating the New Link for each Type](#)

Xfall, Xfall hinge, Xfall sec etc

which of these fields are present, and what they are for, depends on **Type**.

Extra start/end tick box

if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if **ticked**, use this modifier.
if **not ticked**, don't use this modifier.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.
If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

Fixed - Calculating the New Link for each Type

for the definitions of the calculations for each choice

go to [Same Xfall and Normal to Reference String](#)
[Same Xfall and Normal to Reference String and to Other String](#)
[Two Xfalls and Normal to Reference String](#)
[Two Xfalls and Normal to Reference String and to Other String](#)

Same Xfall and Normal to Reference String

Type	Same xfall, normal b	
Xfall		

This option requires a **Xfall**.

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the Table Drain command**, and the **Other string**.

On this section, the given xfall **Xfall** is taken from the last fixed link, and the xfall of **negative Xfall** from **Other string**, and a vertex of the new link created where the xfalls intersect.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#) in the chapter [Design](#).

Same Xfall and Normal to Reference String and to Other String

Type	Same xfall, normal r	
Xfall		

This option requires a **Xfall**.

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage ch between the

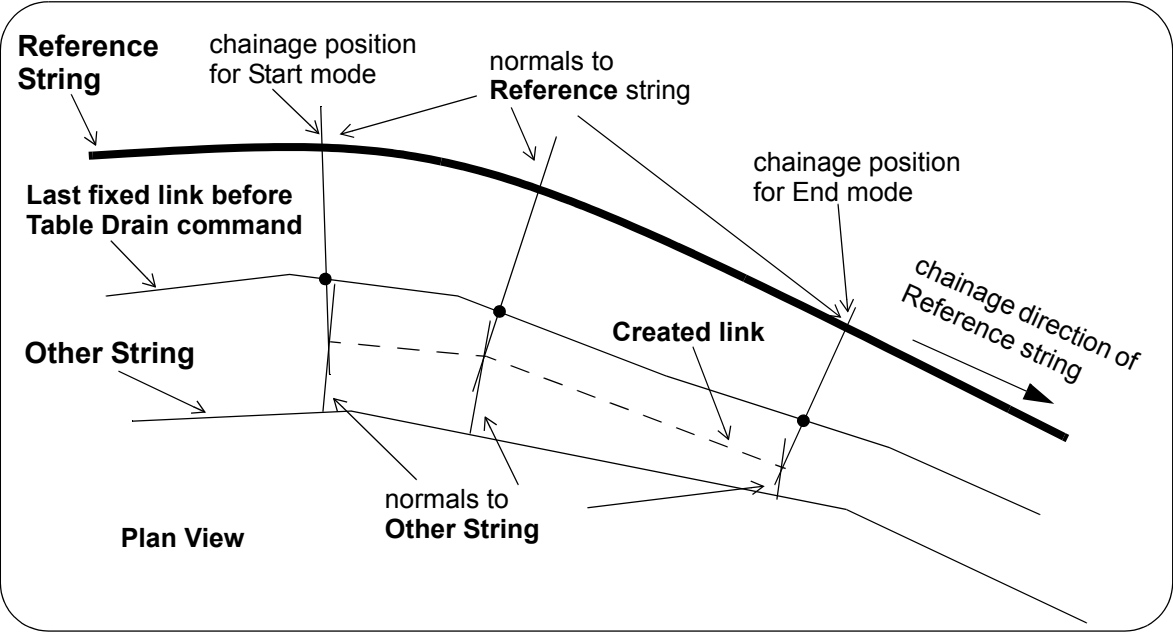

Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the Table Drain command**, and the xfall **Xfall** is taken from the cut with the last fixed link and along the section.

This is then intersected with a section **normal** to the **Other string** and with the xfall **negative Xfall**.

The new link is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#) in the chapter [Design](#).

Two Xfalls and Normal to Reference String

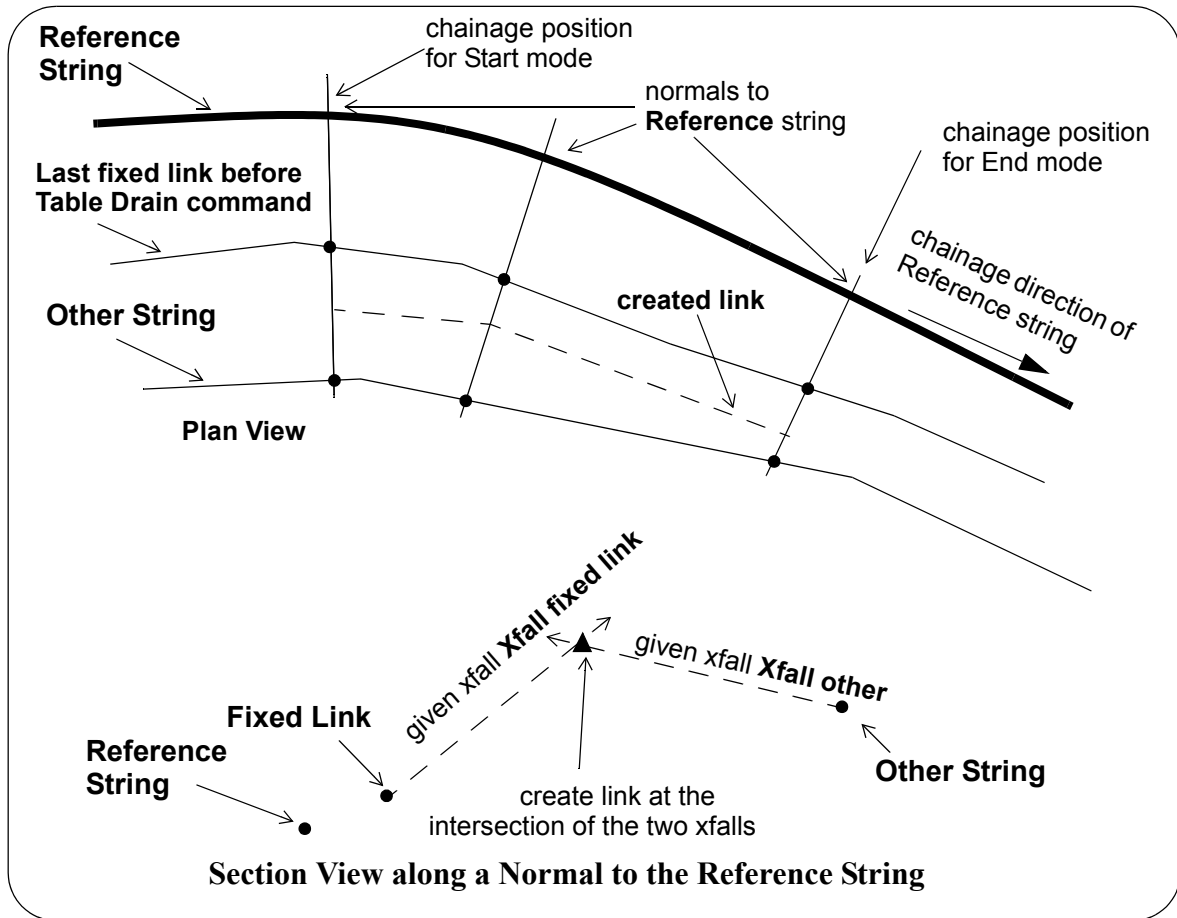

This option requires to xfalls: **Xfall fixed link** and **Xfall other**.

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage (ch) between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the Table Drain command**, and the **Other string**.

On this section, the given xfall **Xfall fixed link** is taken from the last fixed link, and the xfall of **Xfall other** from **Other string**, and a vertex of the new link created where the xfalls intersect.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#) in the chapter [Design](#).

Two Xfalls and Normal to Reference String and to Other String

This option requires to xfalls: **Xfall fixed link** and **Xfall other**.

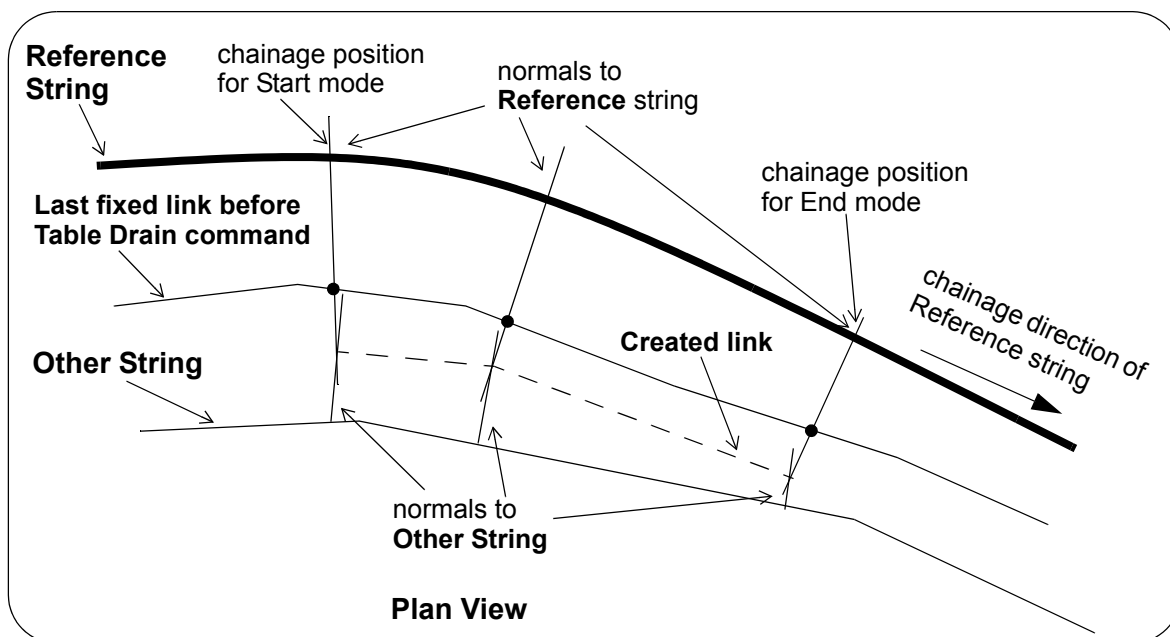

The **Start mode** and **End Mode** refer to **Reference** string and at each chainage *ch* between the Start mode and the End mode, a section is taken **normal** (perpendicular) to the **Reference string** and cutting the **last fixed link before the Table Drain command**, and the xfall **Xfall fixed link** is taken from the cut with the last fixed link and along the section.

This is then intersected with a section **normal** to the **Other string** and with the xfall **Xfall other**.

The new link is formed from the intersection points.

Note - it may not be possible to find such an intersection point.

For information about the sign convention for offset and xfalls, go to [Sign Convention for Heights, Offsets and Xfalls in Create by Xfall and Grade](#) in the chapter [Design](#).

Continue to the next section [Fixed Link - Remove](#) or return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed Link - Remove

The **fixed Remove** walk-right brings up the **fixed Remove** menu with options to insert fixed links, insert a fixed part of a template, and insert a full template.

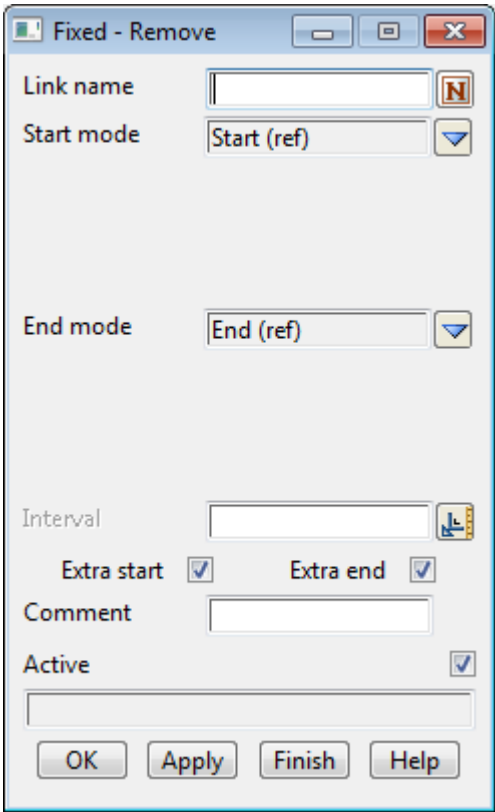

To go straight to the documentation on each of the options on the **Fixed** modifier menu:

- For *Remove* [Remove a Fixed link](#)
- Only Fixed [Fixed Link - Only Fixed Links](#)
- Only Fixed named [Fixed Link - Only Fixed Named](#)

Remove a Fixed link

Fixed links can be deleted between given chainages by using the **fixed Remove** option. Selecting **Remove** brings up the **Fixed - Remove** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to removed.</i>	input		select name menu
Start/End mode	choice box	Start (ref)/End (ref)	

For more information on Start/End mode, see [Start and End Chainages](#)

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range. If **blank**, the **Section separation** value from the **Apply Many** panel is used.*

comment to add to the end of the line. In the file, the comment will be preceded by //.

*if **ticked**, use this modifier.*

*if **not ticked**, don't use this modifier.*

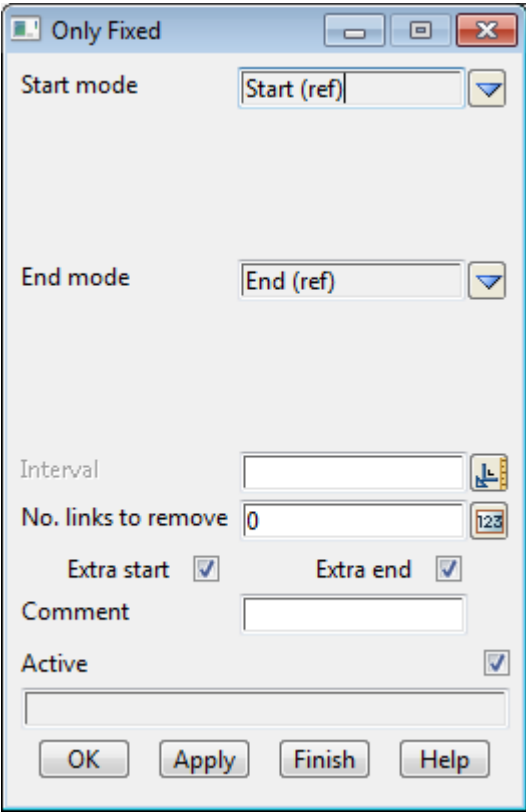

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

*If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.*

The **Only Fixed** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid. Starting from the outermost fixed link, it can also removed one or more of the remaining fixed links.

MTF Modifiers (Template Modifiers)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	
<i>defines the start/end chainages for removing the cut, fill and final cut/fill links</i> <i>For more information on Start/End mode, see Start and End Chainages</i>			
Interval	input		
<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>			
No. links to remove	integer box	0	
<i>if greater than zero, then starting from the outside link of the fixed links, this number of fixed links are removed. If the number is larger than the number of fixed links, then it removes all the fixed links.</i> <i>So a large number will remove all the links - fixed, cut, fill and final cut/fill.</i> <i>If zero then no fixed links are removed.</i> <i>If less than zero, then starting from the first link of the fixed links, this number of fixed links are kept and the outer fixed links are removed. If the number is larger than the number of fixed links, then it removes all the fixed links. So a large number will remove all the links - fixed, cut, fill and final cut/fill.</i>			
Extra start/end	tick box		
<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>			
Comment	input		
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>			
Active	tick box	tick	
<i>if ticked, use this modifier.</i> <i>if not ticked, don't use this modifier.</i>			

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

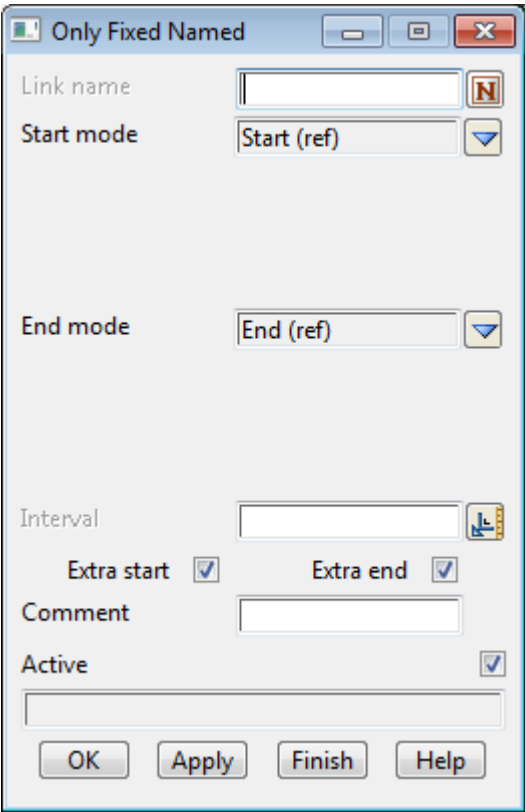

Apply stores the values and leaves the panel on the screen.

If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

Fixed Link - Only Fixed Named

The **Only Fixed Named** option removes any of the variable cut and fill, final cut/fill links and decisions that have been defined up to this point in the modifiers grid. It also removes a list of links from the remaining fixed links.

Selecting **Only Fixed Named** brings up the **Only Fixed Named** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	name box		names.4d list
<i>if non blank, one or more link names can be entered separated by spaces. If the link name contains spaces then the link name must be surrounded by the quotes ". For example " EB 1".</i>			
<i>All the links listed in the Link name field are removed from the fixed links.</i>			
<i>If blank, all but the fixed links are removed (same as Only Fixed with 0 links).</i>			
Start/End mode	choice box	Start (ref)/End (ref)	
<i>defines the start/end chainages for removing the cut, fill and final cut/fill links</i>			
<i>For more information on Start/End mode, see Start and End Chainages</i>			

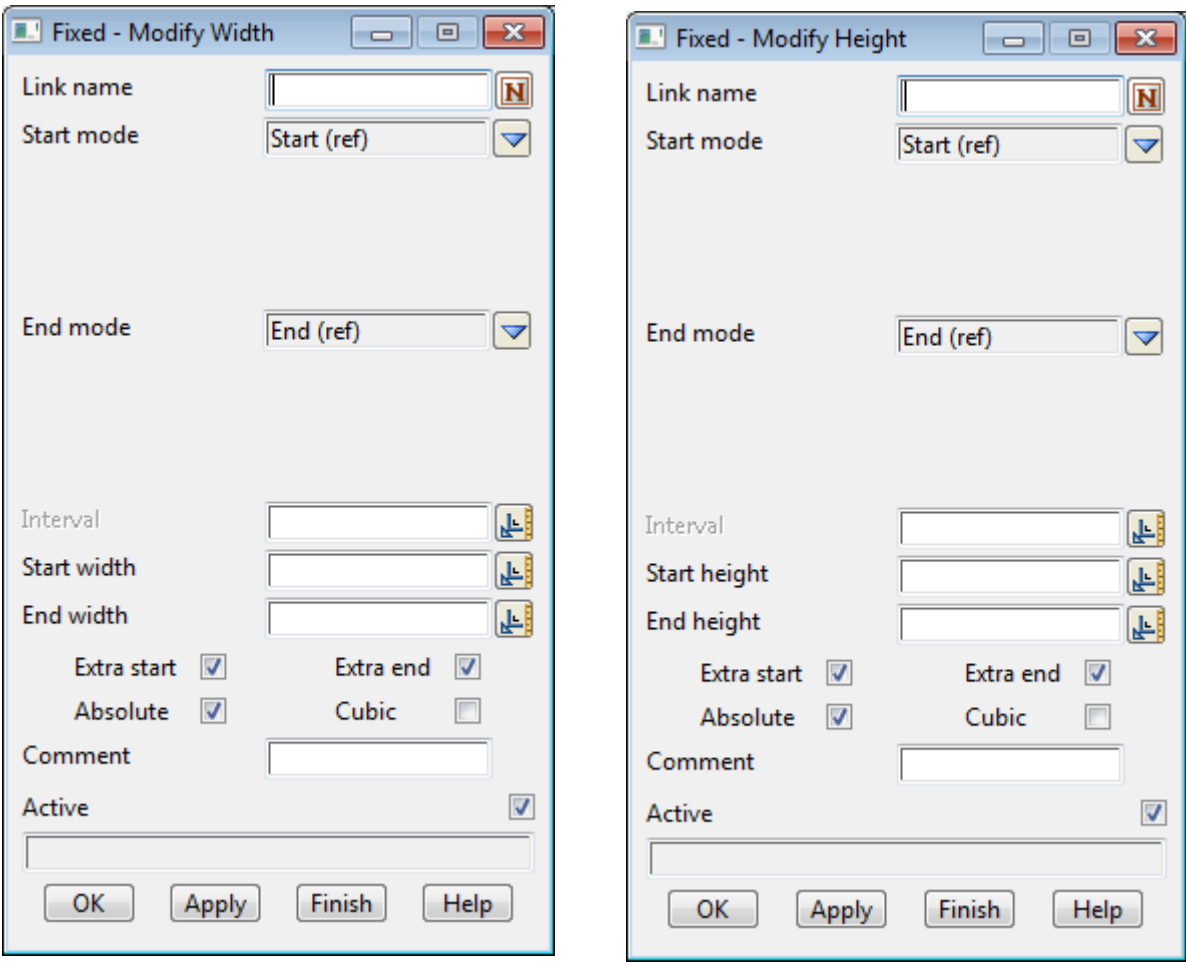

Interval	input	
<i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>		
Extra start/end	tick box	
<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>		
Comment	input	
<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>		
Active	tick box	tick
<i>if ticked, use this modifier. if not ticked, don't use this modifier.</i>		
OK	button	
<i>OK stores the values in the fields and removes the panel BUT no recalc is done.</i>		
Apply	button	
<i>Apply stores the values and leaves the panel on the screen. If the MTF is being used in an Apply Many MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, a recalc of the associated Apply Many for the MTF is done.</i>		
Continue to the next section Fixed Link - Modify Width or Height or return to Fixed Link Modifiers or Modifiers in MTF Edit .		

Fixed Link - Modify Width or Height

The **Width** modifier is used to **modify the width** of fixed links originally defined by width (*width and height* or *width and xfall*).

The **Height** modifier is used to **modify the height** of fixed links originally defined by height (*height and width* or *height and xfall*).

Selecting **width and height** brings up the **Fixed - Modify Width** and **Fixed - Modify Height** panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Start/End width/height <i>start/end width/height for modifying the template link.</i>	input		measures menu
Extra start/end <i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Absolute <i>if ticked, the width/height is set to the values given in the start and end value fields.</i> <i>if not ticked, the values given in the start and end value fields are added to the existing widths/heights.</i>	tick box	tick	
Cubic	tick box		

if **ticked**, the width/height is varied as a reverse cubic between the start and end chainages.
 if **not ticked**, the width/height is varied linearly between the start and end chainages.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if **ticked**, use this modifier.
 if **not ticked**, don't use this modifier.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

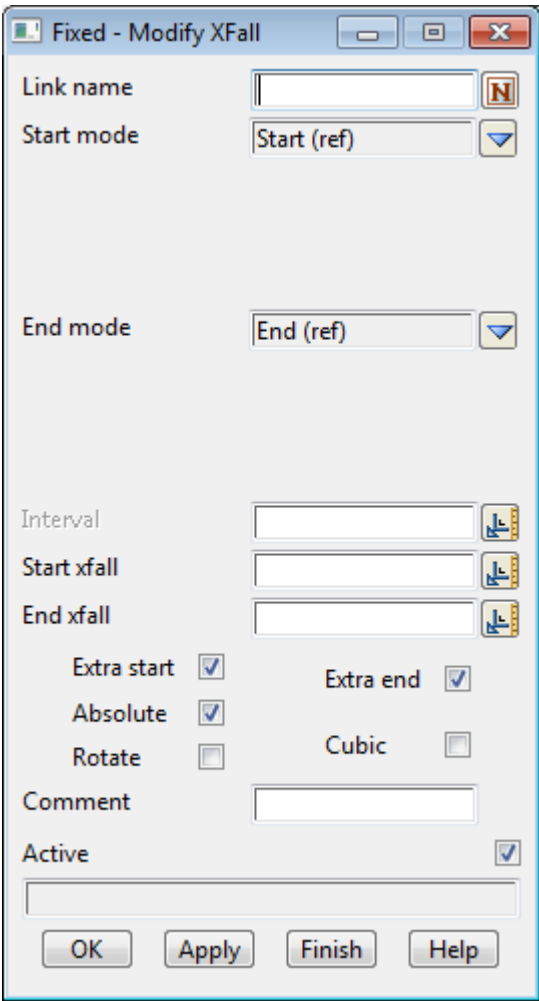

If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

Continue to the next section [Fixed Link - Modify Xfall](#) or return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed Link - Modify Xfall

The **Xfall** modifier is used to **modify the cross fall** of fixed links originally defined by cross fall (xfall and width or xfall and height).

Selecting **Xfall** brings up the **Fixed - Modify Xfall** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Link name	<i>name of the link to modify.</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Start/End xfall	<i>start/end crossfall for modifying the template link.</i>	input		measures menu
Extra start/end	<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Absolute	<i>if ticked, the xfall is set to the values given in the start and end xfall fields.</i> <i>if not ticked, the values given in the start and end xfall fields are added to the existing xfall.</i>	tick box	tick	

Only none or one of **Cubic** and **Rotate** can be set to **tick**.
The **default** is none - that is, **neither is ticked** and in the default case, the crossfall is varied **linearly with respect to crossfall** between the start and end chainages.

Rotate ☐ tick box

*if **ticked**, the x_{fall} is varied linearly **with respect to the angle**, between the start and end chainages.*

Active	tick box	tick
<i>if ticked, use this modifier:</i>		
<i>if not ticked, don't use this modifier:</i>		

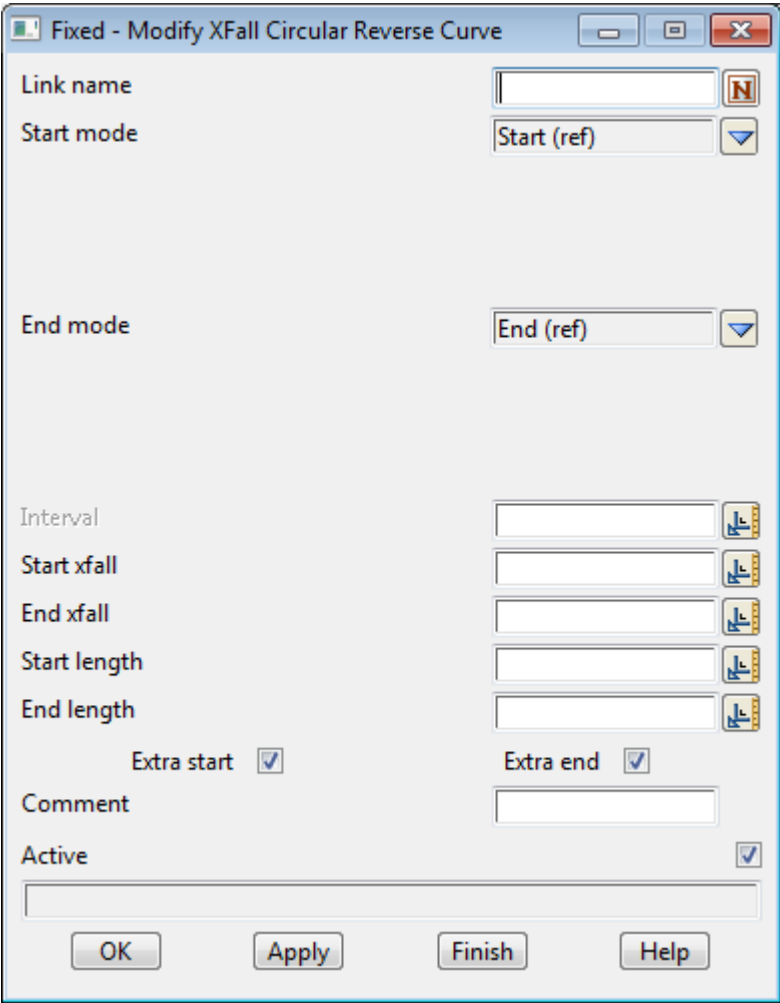

Apply button

Apply stores the values and leaves the panel on the screen.

If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

Fixed Link - Modify Xfall by CRC Formula

Selecting **Xfall CRC** brings up the **Fixed - Modify Xfall Circular Reverse Curve** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Link name	<i>name of the link to modify.</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Start/End xfall	<i>start/end crossfall for modifying the template link.</i>	input		measures menu
Start/End length	<i>start/end length for circular arcs.</i>	input		measures menu
Extra start/end	<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box

Continue to the next section [Fixed Link - from Link](#) or return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed - Maintaining Width, Xfall or Height

For the selected link, the **Absolute** command **modifies** one of width, height or xfall and another one of width, height or xfall is maintained (used) from the selected link. Together, the modified and the maintained define the new values for the selected link.

Luckily it doesn't matter which two of width, height and xfall are originally used to define the selected link, the **Absolute** option will internally convert the definition to what is required to be modified, or maintained from the selected fixed link.

For example, the fixed link may have been original defined by **xfall** and **height** and the **Absolute** option is used to **Modify Width** and **Maintain Xfall**. Although the existing fixed link is not defined by width, at each chainage the xfall and height values of the existing link **uniquely define a width** at that chainage.

So no matter how the link is originally defined, any one of width, height or xfall can be calculated and used (maintained) as the part that is maintained by the **Absolute** option.

Continue to the next section [Fixed Link - from Link](#) or return to [Fixed Link - Absolute](#), [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

For Modifier Types "Modify Width Maintain Height/Xfall"

Go to [Applying the Calculated Widths](#)

Go to [Calculating the Widths for each Type](#)

*End width can be positive or negative. See diagram after **Offset***

End width does not exist for Type Width.

S Ext/E Ext input measures menu

Start/End extension to add to the Start/end mode chainage. S Ext/E Ext can be positive or negative.

*See diagram after **Offset***

Offset input measures menu

Final offset to be added to the width calculated at each point. Offset can be positive or negative.

For a chainage **ch** between the **Start mode** and the **End mode**, a **width** is calculated at chainage **ch** and that **width** goes out from the Base Link **perpendicular** to the Centreline.

The definition for calculating the width is best described in a **Chainage-Width** diagram. That is, in a plot with **Centreline chainage** as the **x-axis**, and **Width** at that chainage as the **y-axis**. This is similar to a long section plot where centreline chainage is the x-axis and height is the y-axis.

Then for a point **A** at chainage **ch** on the centreline, the **Width** calculated at chainage **ch** in the Chainage-Width diagram is used for the Width measured from the Base link corresponding to the section *Modify Width Maintain Height*, to the Centreline at chainage **ch**.

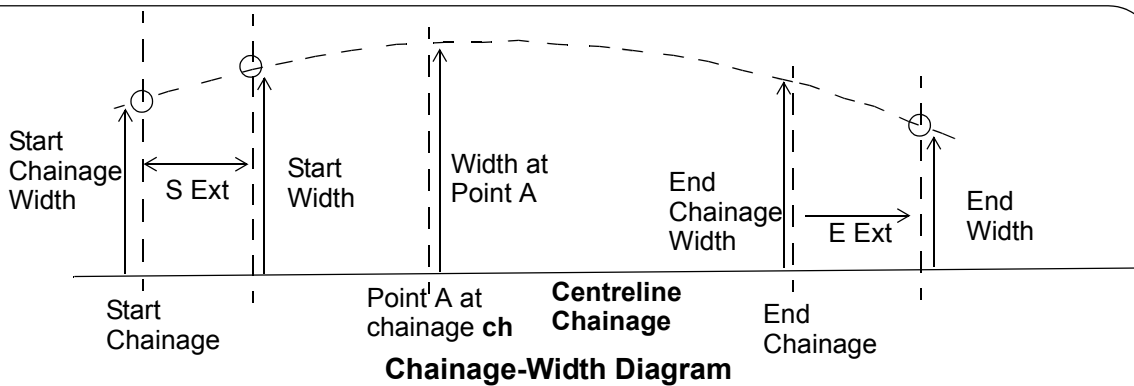

For the **Modify Width** commands, the method defining the widths may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the widths are calculated, a width Offset can be applied to all the widths.

Although the definition for calculating the widths in the chainage-width diagram may involve points outside the Start mode/End mode chainage range, the calculated widths are **only applied** to the centreline **between** the **Start mode** chainage and the End mode chainage.

Please examine the diagrams below to help understand the process.

Relationship Between Chainage-Width Diagram and Centreline

The link is modified between Start and End Chainage.
 The **S Ext** and **E Ext** are only used in the way the width is defined

Calculating the Widths for each Type

For **Type** Width, Width->Width, go to [Calculation of Width for Types Width, Width -> Width](#)

For **Type** Parabola->, go to [Calculation of Width for Type Parabola ->](#)

For **Type** Circular->, go to [Calculation of Width for Type Circular->](#)

For **Type** <-Parabola, go to [Calculation of Width for Type <- Parabola](#)

For **Type** <-Circular, go to [Calculation of Width for Type <-Circular](#)

For **Type** Cubic, go to [Calculation of Width for Type Cubic](#)

Calculation of Width for Types Width, Width -> Width

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

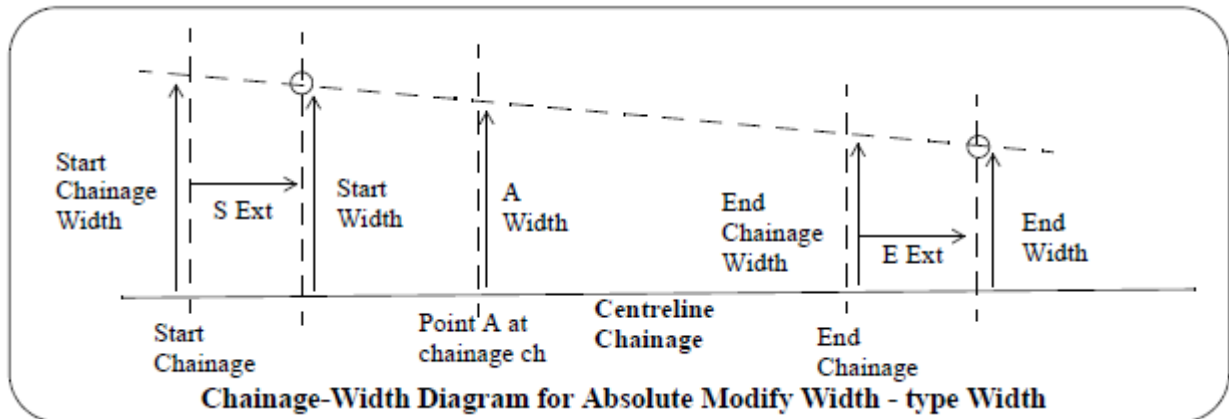

The width is **linearly** interpolated between the **Start width** and the **End width**, plus the given **Offset** in the chainage-width diagram.

That is, the rate change of width per unit chainage is

$$\text{rate of width change} = (\text{End Width} - \text{Start Width}) / (\text{End mode} + \text{E Ext} - \text{Start mode} - \text{S Ext})$$

and the width at chainage **ch** is

$$(\text{Start Width} + \text{Offset}) + (\text{ch} - \text{Start Mode chainage} - \text{S Ext}) * \text{rate of width change}$$

These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See .

The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type Parabola ->

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a **parabola** $a * X * X$ with its origin at (**Start mode + S Ext, Start width**) and going through (**End mode + E Ext, End width**).

These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type Circular->

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**. Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a **circle** with its horizontal turning point at (**Start mode + S Ext, Start width**) and going through (**End mode + E Ext, End width**).

These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type <- Parabola

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a **parabola** $a \cdot X^2$ with its origin at (**End mode + E Ext, End width**) and going through (**Start mode + S Ext, Start width**).

These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type <-Circular

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**.

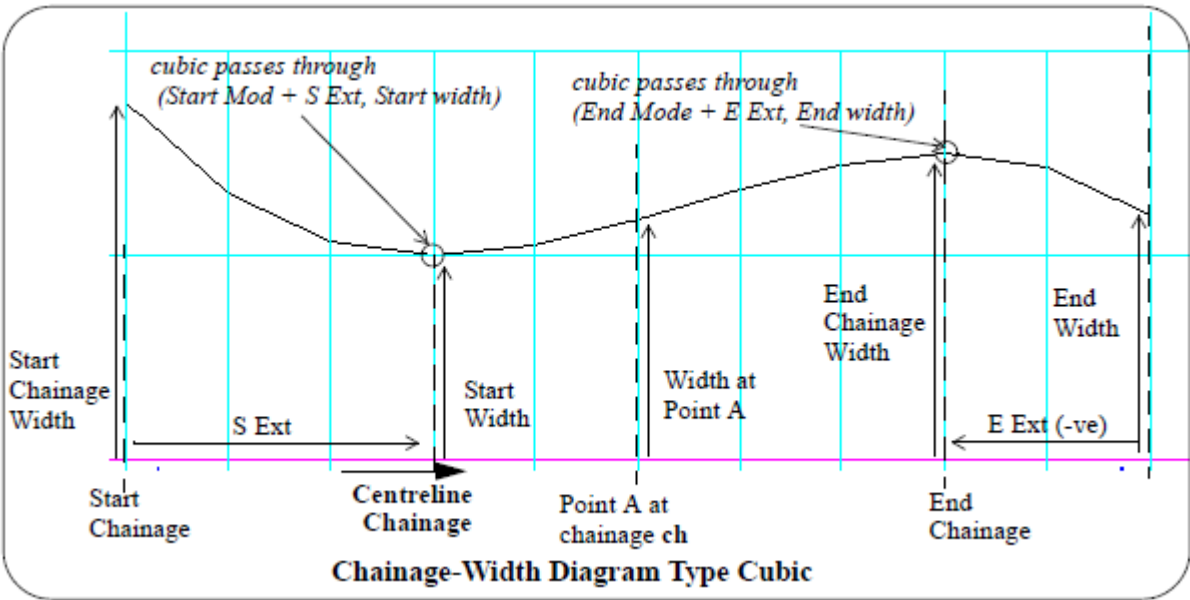

Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a **circle** with its horizontal turning point at (**End mode + E Ext, End width**) and going through (**Start mode + S Ext, Start width**).

These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See The Height/Xfall is maintained as that originally defined in the selected link.

Calculation of Width for Type Cubic

In the chainage-width diagram, the **Start width** is the width at chainage **Start mode plus S Ext**, and **End width** is the width at chainage **End mode plus E Ext**. Between the start position (**Start mode + S Ext, Start width**), and the end position (**End mode + E Ext, End width**), the width varies as a **cubic** going through (**Start mode + S Ext, Start width**) and (**End mode + E Ext, End width**).

These widths and the **Offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline. See The Height/Xfall is maintained as that originally defined in the selected link.

For a chainage **ch** between the *Start mode* and the *End mode*, a **height** is calculated for at **ch** chainage and that height is used for the link that goes out from the Base Link perpendicular to the Centreline.

The definition for calculating the height is best described in a **Chainage-Height** diagram. That is, in a plot with **Centreline chainage** as the **x-axis**, and **Height** at that chainage as the **y-axis**. This is similar to a long section plot.

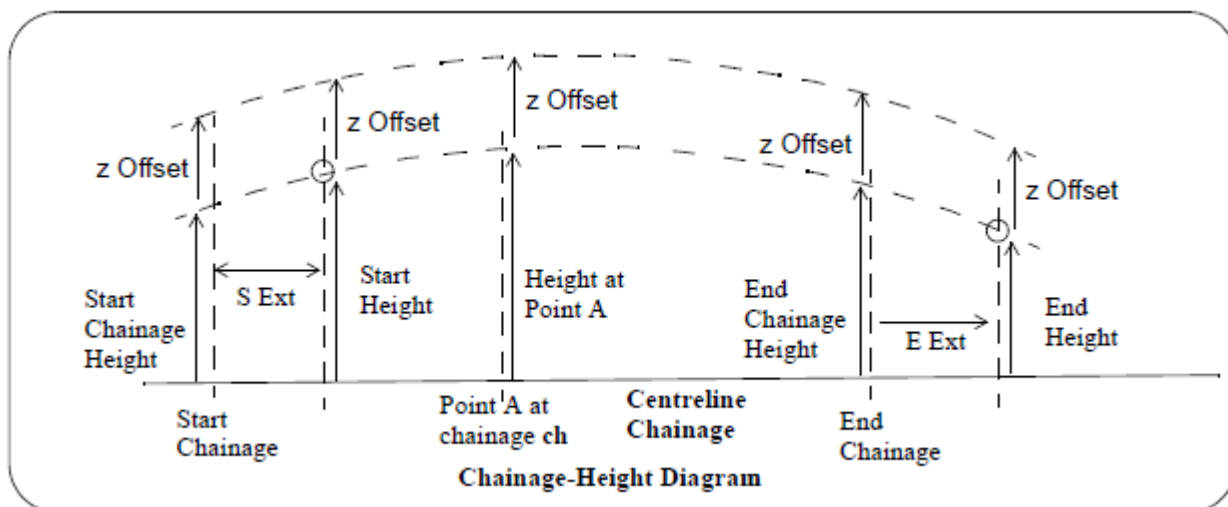

Then for a point **A** at a chainage **ch** on the centreline, the **Height** calculated at chainage **ch** in the Chainage-Height diagram is used for the Height measured from the Base link corresponding at the Centreline at chainage **ch**.

For the **Modify Height** commands, the method defining the heights may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End

mode chainages.

Finally after the heights are calculated, *Height offset* is added to all the heights.

Although the definition for calculating the heights in the chainage-height diagram may involve points outside the Start mode/End mode chainage range, the calculated heights are **only applied** to the centreline **between** the **Start mode** chainage and the **End mode** chainage.

Calculating the Heights for each Type

For **Type** Height, Height->Height, go to [Calculation of Height for Types Height, Height -> Height](#)

For **Type** Parabola->, go to [Calculations for Type Parabola ->](#)

For **Type** Circular->, go to [Calculations for Type Circular->](#)

For **Type** <-Parabola, go to [Calculations for Type <- Parabola](#)

For **Type** <-Circular, go to [Calculations for Type <-Circular](#)

For **Type** Cubic, go to [Calculations for Type Cubic](#)

Calculation of Height for Types Height, Height -> Height

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext**, and **End height** is the height at chainage **End mode plus E Ext**.

The height is **linearly** interpolated between the **Start height** and the **End height**, plus the given **Height offset** in the chainage-width diagram.

That is, the rate change of height per unit chainage is

$$\text{rate of height change} = (\text{End height} - \text{Start height}) / (\text{End mode} + \text{E Ext} - \text{Start mode} - \text{S Ext})$$

and the height at chainage ch is

$$(\text{Start height} + \text{Height offset}) + (ch - \text{Start Mode chainage} - S \text{ Ext}) * \text{rate of height change}$$

These heights and the **Height offset** are then used for the link being modified as the height that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type Parabola ->

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext**, and **End height** is the height at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start height**), and the end position (**End mode + E Ext, End height**), the height varies as a **parabola** $a*X*X$ with its origin at (**Start mode + S Ext, Start height**) and going through (**End mode + E Ext, End height**).

These heights and the **Height offset** are then used for the link being modified as the height that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type Circular->

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext**, and **End height** is the height at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start height**), and the end position (**End mode + E Ext, End height**), the height varies as a **circle** with its horizontal turning point at (**Start mode + S Ext, Start height**) and going through (**End mode + E Ext, End height**).

These heights and the **Height offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline.
The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type <- Parabola

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext**, and **End height** is the height at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start height**), and the end position (**End mode + E Ext, End height**), the height varies as a **parabola** $a \cdot X^2$ with its origin at (**End mode + E Ext, End height**) and going through (**Start mode + S Ext, Start height**).

These heights and the **Height offset** are then used for the link being modified as the width that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type <-Circular

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus $S\ Ext$** , and **End height** is the height at chainage **End mode plus $E\ Ext$** .

Between the start position (**Start mode + $S\ Ext$, Start height**), and the end position (**End mode + $E\ Ext$, End height**), the height varies as a **circle** with its horizontal turning point at (**End mode + $E\ Ext$, End height**) and going through (**Start mode + $S\ Ext$, Start height**).

These heights and the **Height offset** are then used for the link being modified as the height that the link

is **from the Base Link** when measured along the section perpendicular to the centreline.
The Width/Xfall is maintained as that originally defined in the selected link.

Calculations for Type Cubic

In the chainage-height diagram, the **Start height** is the height at chainage **Start mode plus S Ext**, and **End height** is the height at chainage **End mode plus E Ext**.
Between the start position (**Start mode + S Ext, Start height**), and the end position (**End mode + E Ext, End height**), the height varies as a **cubic** going through (**Start mode + S Ext, Start height**) and (**End mode + E Ext, End height**).

These heights and the **Height offset** are then used for the link being modified as the height that the link is **from the Base Link** when measured along the section perpendicular to the centreline.
The Width/Xfall is maintained as that originally defined in the selected link.

For a chainage **ch** between the *Start mode* and the *End mode*, a **xfall** is calculated at **ch** chainage and that xfall is used for the link that goes out from the Base Link perpendicular to the Centreline.

The definition for calculating the xfall is best described in a **Chainage-Xfall** diagram. That is, in a plot with **Centreline chainage** as the **x-axis**, and **Xfall** at that chainage as the **y-axis**. This is similar to a super elevation diagram where chainage is the x-axis and xfall is the y-axis.

Then for a point **A** at a chainage **ch** on the centreline, the **Xfall** calculated at chainage **ch** in the Chainage-Xfall diagram is used for the Xfall measured from the Base link corresponding at chainage **ch**.

For the **Modify Xfall** commands, the method defining the xfalls may not be exactly at the Start/End mode chainages but at points a S Ext/E Ext chainage distance from the Start/End mode chainages.

Finally after the xfalls and height/widths are applied to the link, a Height offset is added **to all the heights**.

Although the definition for calculating the xfalls in the chainage-xfall diagram may involve points outside the Start mode/End mode chainage range, the calculated xfalls are **only applied** to the centreline **between the Start mode** chainage and the End mode chainage.

Calculating the Xfall for each Type

For **Type** Xfall, Xfall->Xfall, go to [Calculations of Xfalls for Types Xfall, Xfall -> Xfall](#)

For **Type** Parabola->, go to [Calculations for Type Parabola ->](#)

For **Type** Circular->, go to [Calculations for Type Circular->](#)

For **Type** <-Parabola, go to [Calculations for Type <- Parabola](#)

For **Type** <-Circular, go to [Calculations for Type <-Circular](#)

For **Type** Cubic, go to [Calculations for Type Cubic](#)

Calculations of Xfalls for Types Xfall, Xfall -> Xfall

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus S Ext**, and **End xfall** is the xfall at chainage **End mode plus E Ext**.

The xfall is **linearly** interpolated between the **Start xfall** and the **End xfall**, plus the given **Xfall offset** in the chainage-width diagram.

That is, the rate change of xfall per unit chainage is

$$\text{rate of xfall change} = (\text{End xfall} - \text{Start xfall}) / (\text{End mode} + \text{E Ext} - \text{Start mode} - \text{S Ext})$$

and the xfall at chainage **ch** is

$$(\text{Start xfall} + \text{Xfall offset}) + (\text{ch} - \text{Start Mode chainage} - \text{S Ex}) * \text{rate of xfall change}$$

These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

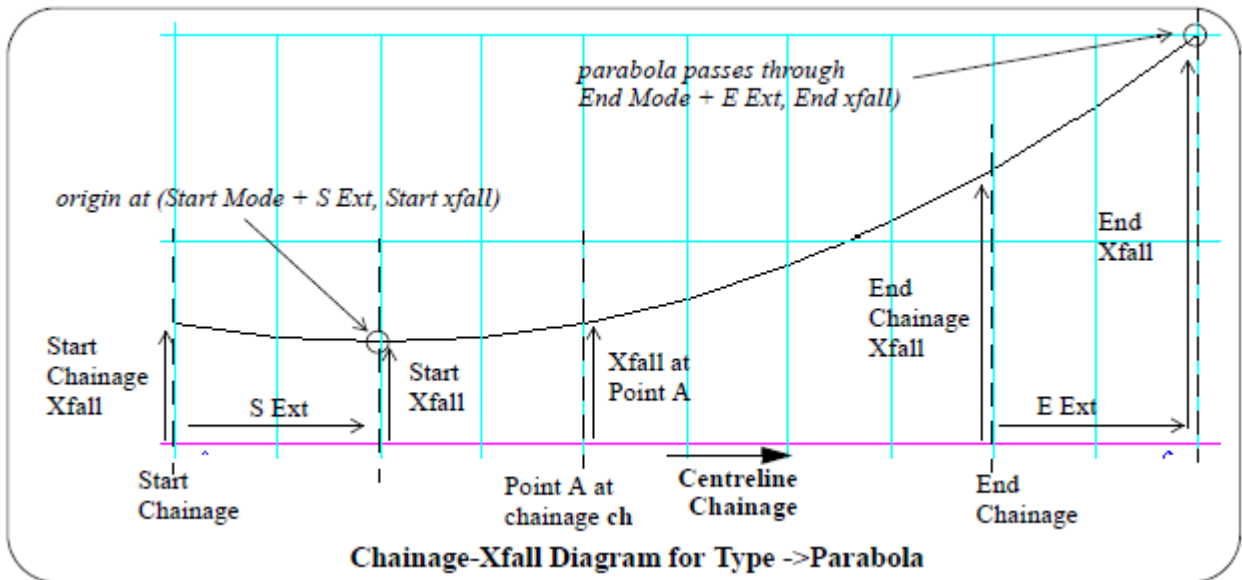

The Width/Height is maintained as that originally defined in the selected link.

Calculations for Type Parabola ->

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus S Ext**, and **End xfall** is the xfall at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start xfall**), and the end position (**End mode + E Ext,**

End xfall), the *xfall* varies as a **parabola** $a * X^2$ with its origin at (*Start mode* + *S Ext*, *Start xfall*) and going through (*End mode* + *E Ext*, *End xfall*).

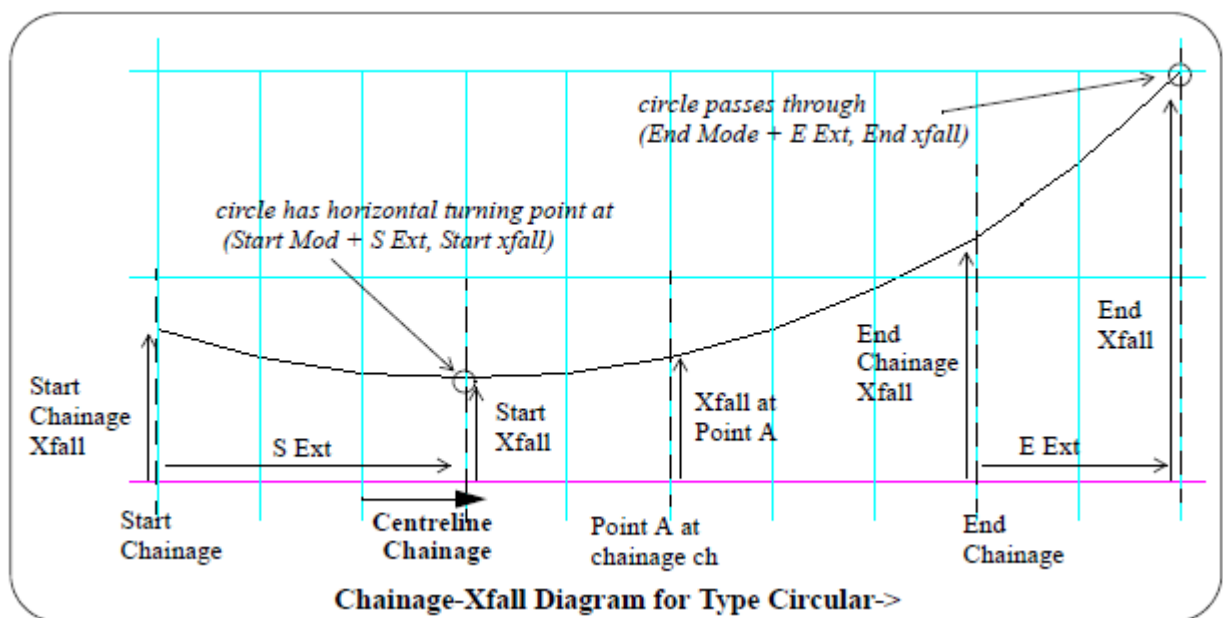

These *xfalls* and the **Height offset** are then used for the link being modified as the *xfall* that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Calculations for Type Circular->

In the chainage-xfall diagram, the **Start xfall** is the *xfall* at chainage **Start mode plus S Ext**, and **End xfall** is the *xfall* at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start xfall**), and the end position (**End mode + E Ext, End xfall**), the *xfall* varies as a **circle** with its horizontal turning point at (**Start mode + S Ext, Start xfall**) and going through (**End mode + E Ext, End xfall**).

These *xfalls* and the **Height offset** are then used for the link being modified as the *xfall* that the link is

from the **Base Link** when measured along the section perpendicular to the centreline.

Calculations for Type <- Parabola

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus S Ext**, and **End xfall** is the xfall at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start xfall**), and the end position (**End mode + E Ext, End xfall**), the xfall varies as a **parabola $a \cdot X^2$** with its origin at (**End mode + E Ext, End xfall**) and going through (**Start mode + S Ext, Start xfall**).

These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is from the **Base Link** when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Calculations for Type <-Circular

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus S Ext**, and **End xfall** is the xfall at chainage **End mode plus E Ext**.

Between the start position (**Start mode + S Ext, Start xfall**), and the end position (**End mode + E Ext, End xfall**), the xfall varies as a **circle** with its horizontal turning point at (**End mode + E Ext, End xfall**) and going through (**Start mode + S Ext, Start xfall**).

These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Calculations for Type Cubic

In the chainage-xfall diagram, the **Start xfall** is the xfall at chainage **Start mode plus $S\ Ext$** , and **End xfall** is the xfall at chainage **End mode plus $E\ Ext$** .

Between the start position (**Start mode + $S\ Ext$** , **Start xfall**), and the end position (**End mode + $E\ Ext$** , **End xfall**), the xfall varies as a **cubic** going through (**Start mode + $S\ Ext$** , **Start xfall**) and (**End mode + $E\ Ext$** , **End xfall**).

These xfalls and the **Height offset** are then used for the link being modified as the xfall that the link is **from the Base Link** when measured along the section perpendicular to the centreline.

The Width/Height is maintained as that originally defined in the selected link.

Continue to the next section [Fixed Link - from Link](#) or return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed Link - from Link

The **fixed from Link** walk-right brings up the **fixed from Link** menu with options to take the width, xfall or height from another link.

For *Width/Height/Xfall from link*, go to the next section [Fixed Link - Take Width, Height or Xfall from another Link](#)

Fixed Link - Take Width, Height or Xfall from another Link

Width from Link

The **Width from link** modifier is used to **modify the width** of fixed links originally defined by width (*width and height* or *width and xfall*) to be the same width as another link. That is, the width of the link is a **copy** of the **width** of another link.

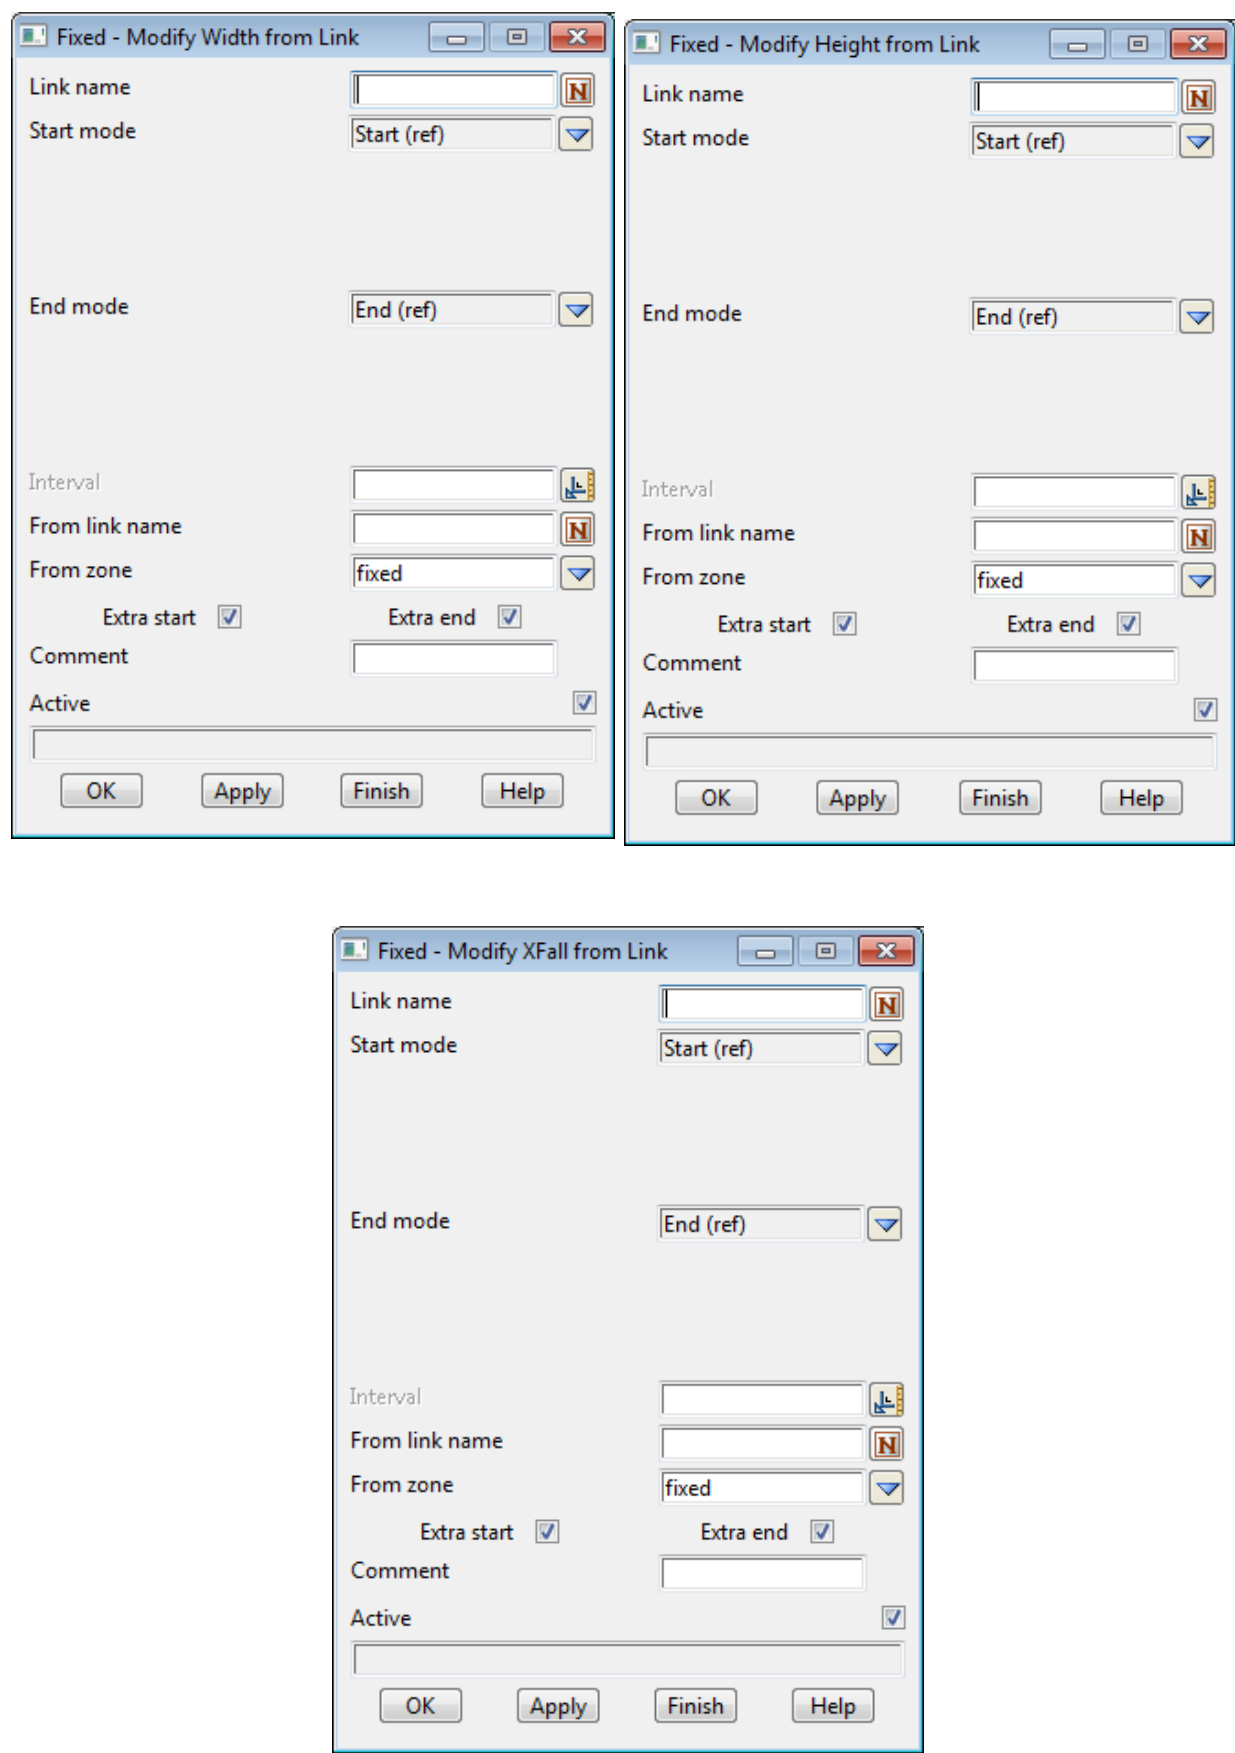

Height from Link

The **Height from link** modifier is used to **modify the height** of fixed links originally defined by height (*height and xfall* or *height and width*) to be the same height as another link. That is, the height of the link is a **copy** of the **height** of another link.

Xfall from Link

The **Xfall from link** modifier is used to **modify the cross fall** of fixed links originally defined by xfall (*xfall and height* or *xfall and width*) to be the same xfall as another link. That is, the cross fall of the link is a **copy** of the **cross fall** of another link. The link to copy cross fall from can be defined in terms of cross fall or slope. If the link to copy is defined by slope, then the cross fall is calculated to match the slope.

Selecting the **Width from link**, **Height from link** or **Xfall from link** option brings up the **Fixed - Modify Width from Link**, **Fixed- Modify Height from Link** and **Fixed- Modify Xfall from Link** panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
From link name <i>template link to take width/height/xfall from.</i>	input		select name menu
From zone <i>zone that the template link to take width/height/xfall from, comes from.</i>	input	fixed	fixed, cut, fill
Extra start/end <i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment <i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input

Fixed Link - to String

The **fixed from string** walk-right brings up the **fixed from string** menu with options to take the width, xfall or height by going to another string.

For *To string*, go to
Width/Height/Xfall to string

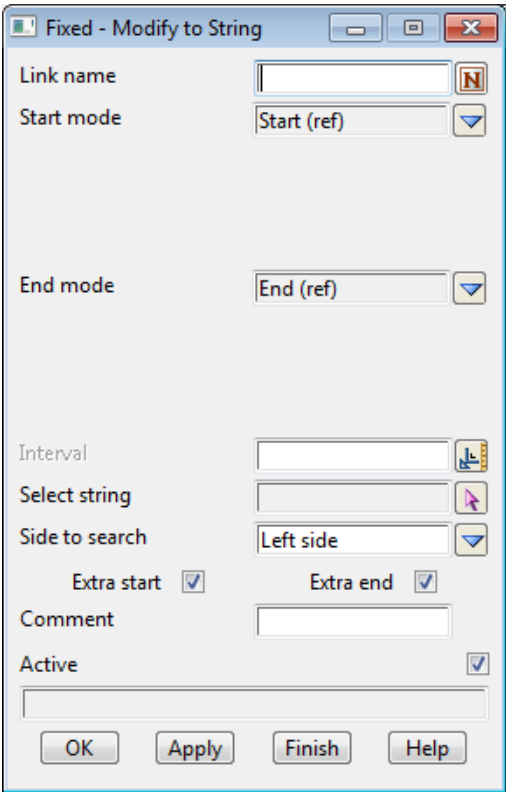

[Fixed Link - Modify To String](#)
[Fixed Link - Calculate Width, Height or Xfall to a String](#)

Fixed Link - Modify To String

For any fixed link, **To string** calculates the required width, height and/or xfall of the link needed to get from the start point of the link **to the selected string**.

Selecting **To string** bring up the **Fixed - Modify to String** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Link name	<i>names of the links to modify.</i> <i>If there is more then one link name then the names must be separated by spaces. If the link name includes a space, then the name must be enclosed in the quotes " (eg "EB 1").</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages except for this option:</i> <i>When the Start mode is Start (ref), or Typed and the chainage is blank, the modification begins at the low dropped chainage of the selected string.</i> <i>When the End mode is End (ref), or Typed and the chainage is blank, the modification ends at the high dropped chainage of the selected string.</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
String	<i>select string to use for defining width/height/crossfall for the link.</i>	string-select		
Side to search	<i>side of the hinge string to start searching to find the string to define width/height/crossfall.</i>	input	left side	left side, right side, both sides
Extra start/end	<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment		input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

*If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.*

Fixed Link - Calculate Width, Height or Xfall to a String

Width to String:

For a fixed link defined by *width* and *height* or *width* and *xfall*, **Width to string** calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The *xfall* or *height* is taken from the link. The option will give an error for a link defined by *height* and *xfall*.

Height to String:

For a fixed link defined by *height* and *width* or *height* and *xfall*, **Height to string** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**. The *xfall* or *width* is taken from the link. The option will give an error for a link defined by *width* and *xfall*.

Xfall to String:

For a fixed link defined by *xfall* and *width* or *xfall* and *height*, **Xfall to string** calculates the **xfall** of the link as the *xfall* from the start point of the link to the **selected string**. The *width* or *height* is taken from the link. The option will give an error for a link defined by *width* and *height*.

Note:

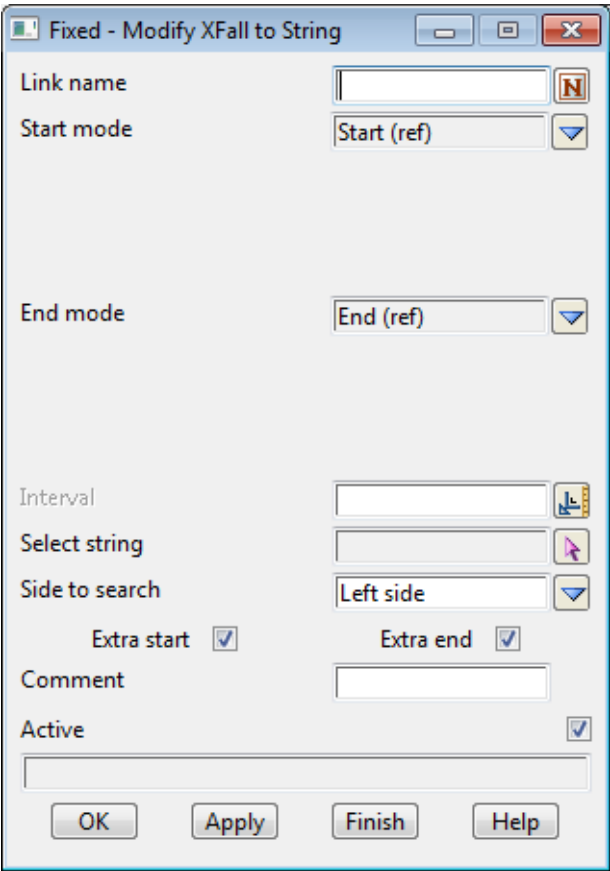

Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example for a modifier defined by *width* and *xfall*, using *width to string* and a *xfall to string* with the same string will place the end of the link on that string.

But the To string option will do the same thing in one command. See [Fixed Link - Modify To String](#).

Selecting the **width to string**, **height to string** or **xfall to string** option brings up the **Fixed - Modify Width to String**, **Fixed - Modify Height to String** and **Fixed - Modify Xfall to String** panels respectively.

The image displays two side-by-side dialog boxes, both titled "Fixed - Modify Width to String" and "Fixed - Modify Height to String". Both dialog boxes have a similar layout with the following fields and controls:

- Link name:** A text input field with a small icon to its right.
- Start mode:** A dropdown menu showing "Start (ref)".
- End mode:** A dropdown menu showing "End (ref)".
- Interval:** A text input field with a small icon to its right.
- Select string:** A text input field with a small icon to its right.
- Side to search:** A dropdown menu showing "Left side".
- Extra start:** A checked checkbox.
- Extra end:** A checked checkbox.
- Comment:** A text input field.
- Active:** A checked checkbox.
- Buttons:** "OK", "Apply", "Finish", and "Help" buttons at the bottom.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages except for this option:</i> <i>When the Start mode is Start (ref), or Typed and the chainage is blank, the modification begins at the low dropped chainage of the selected string.</i> <i>When the End mode is End (ref), or Typed and the chainage is blank, the modification ends at the high dropped chainage of the selected string.</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
String <i>select string to use for defining width/height/crossfall for the link.</i>	string-select		
Side to search <i>side of the hinge string to start searching to find the string to define width/height/crossfall.</i>	input	left side	left side, right side, both sides
Extra start/end <i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment	input		

comment to add to the end of the line. In the file, the comment will be preceded by //.

Continue to the next section Fixed Link - to RL or return to Fixed Link Modifiers or Modifiers in MTF Edit .			

Fixed Link - to RL

The **fixed to RL** walk-right brings up the **fixed to RL** menu with options to calculate the width, xfall or height to get to a given RL.

For *Width/Height/Xfall to tin*, go to the next section [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)

Fixed Link - Modify Width, Height or Xfall to Get to an RL

Width to RL

The **Modify Width to RL**, only applies to links defined by *Width and Xfall* NOT *Width and Height* or *Xfall and Height*.

For a fixed link defined by *width* and *xfall*, **Modify Width to RL** calculates the **width** required for the link to end at the given RL using the *xfall given in the link*.

The **Modify Width to RL** gives an error for a link defined by *width and height* or *xfall and height*.

Height to RL

The **Modify Height to RL**, only applies to links defined by *Width and Height* and *Height* NOT *Width and Xfall*.

For a fixed link defined by *height and width*, the **Modify Height to RL** calculates the **height** required for the link to end at the given RL using the *width given in the link*. That is, the difference in the height of the start point of the link, and the height that is required so that the link will sit on the RL at the *given width*.

For a fixed link defined by *height* and *xfall*, the **Modify Height to RL** calculates the *height* required for the link to end at the given RL using the *xfall given in the link*. That is, the difference in the height of the start point of the link, and the height that is required so that the link will sit on the RL at the *given xfall*.

The **Modify Height to RL** gives an error for a link defined by *width* and *xfall*.

Xfall to RL

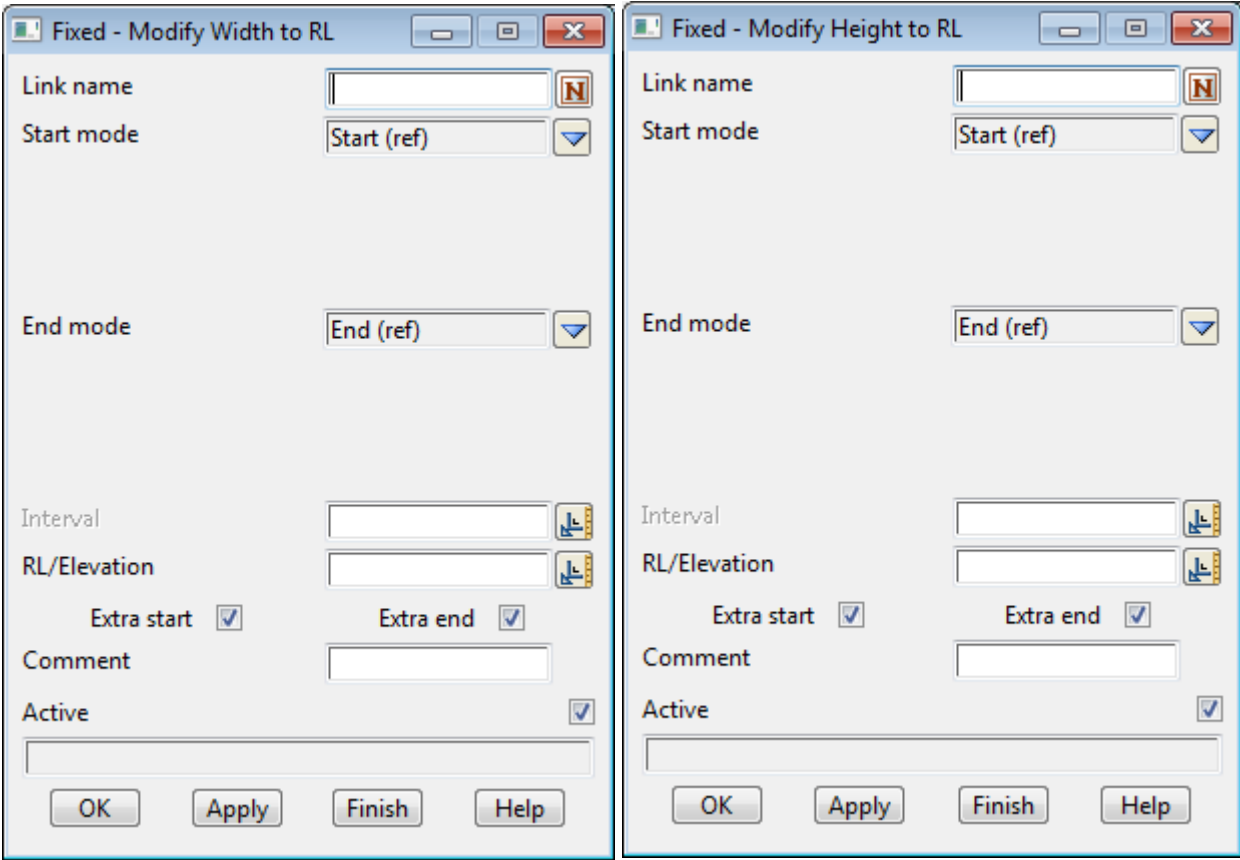

The **Modify Xfall to Get an RL**, only applies to links defined by *Xfall* and *Width*, NOT *Xfall* and *Height* or *Width* and *Height*.

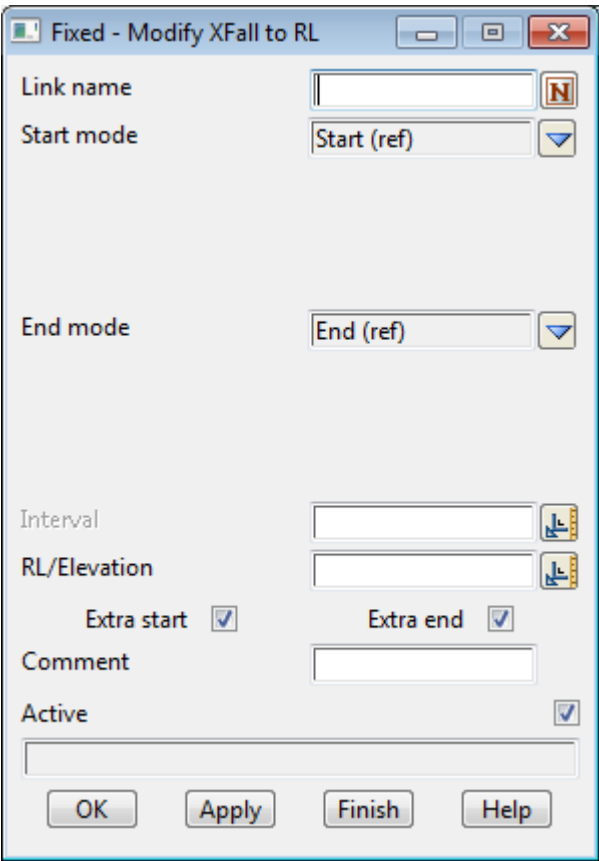

For a fixed link defined by *xfall* and *width*, **Modify Xfall to RL** calculates the *xfall* of the link required for the link to end at the given RL using the *width given in the link*.

The **Modify Xfall to RL** gives an error for a link defined by *xfall* and *height*, or *width* and *height*.

Selecting **Width to RL**, **Height to RL**, or **Xfall to RL** brings up the **Fixed - Modify Width to RL**, **Fixed - Modify Height to RL** and **Fixed - Modify Xfall to RL** panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)

OK	button		

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

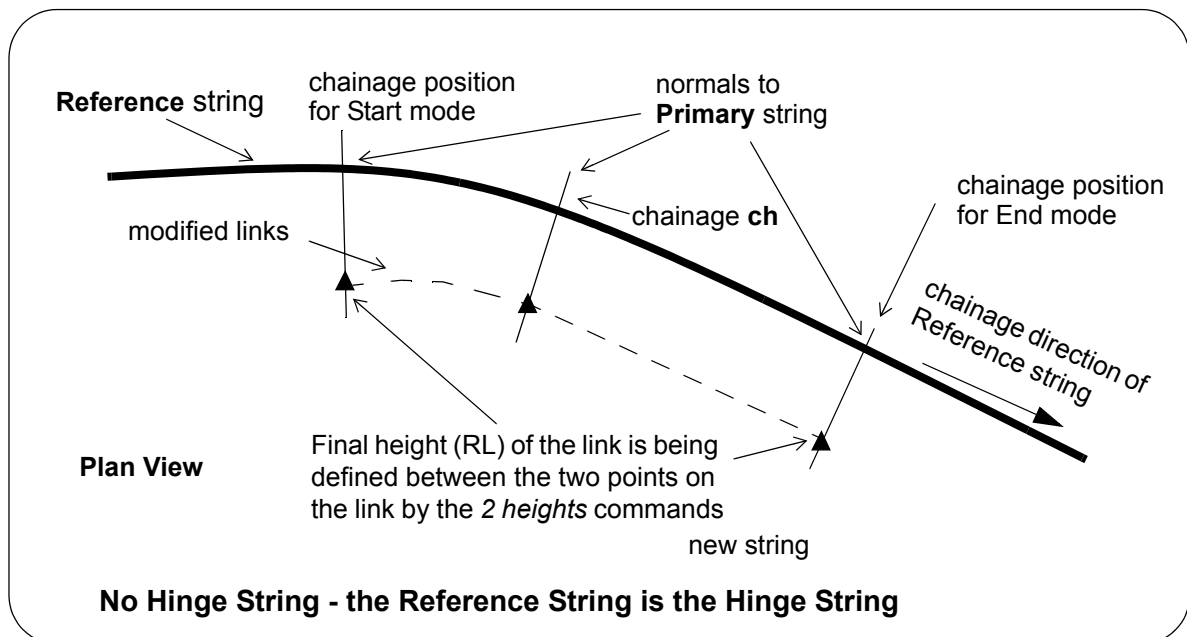

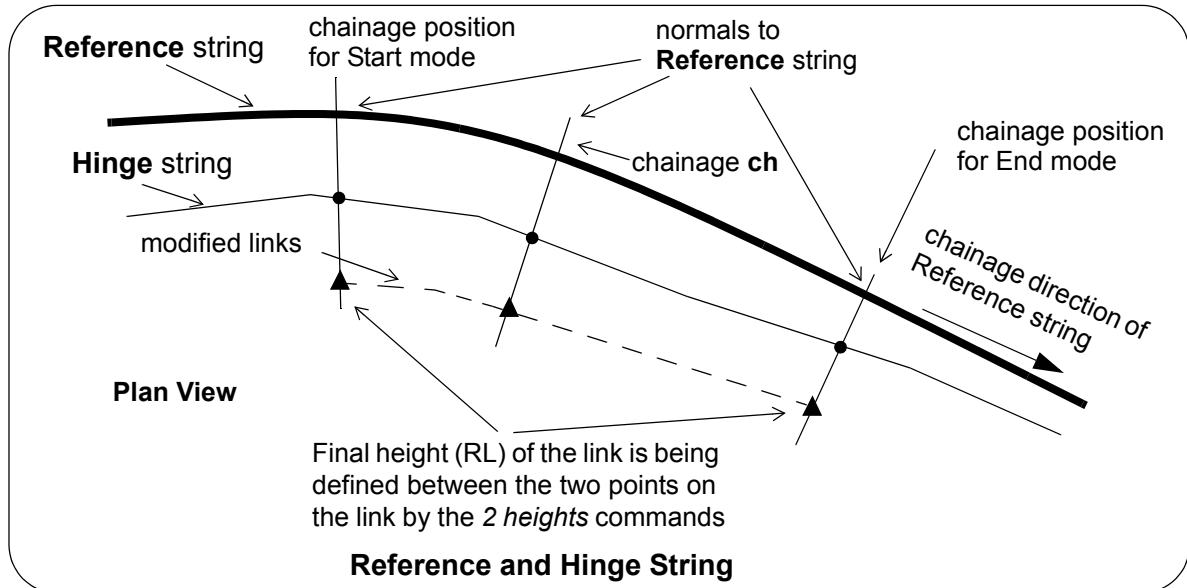

Apply stores the values and leaves the panel on the screen.

If the **MTF** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, a **recalc** of the associated **Apply Many** for the MTF is done.

Continue to the next section [Fixed Link - to Two Heights](#) or return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed Link - to Two Heights

For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL's.

The modifier is similar to the *Width/Height/Xfall to RL* modifiers except that the RL is not constant between the vertex on the normal at *Start mode* and the vertex on the normal at *End mode*, but is determined by a given formula for the normal at each chainage value between *Start mode* and *End mode*.

In the Two Heights modifiers, the formula for the height is **not** given in the chainage of the Reference string, **but in terms of the chainage along the modified string**.

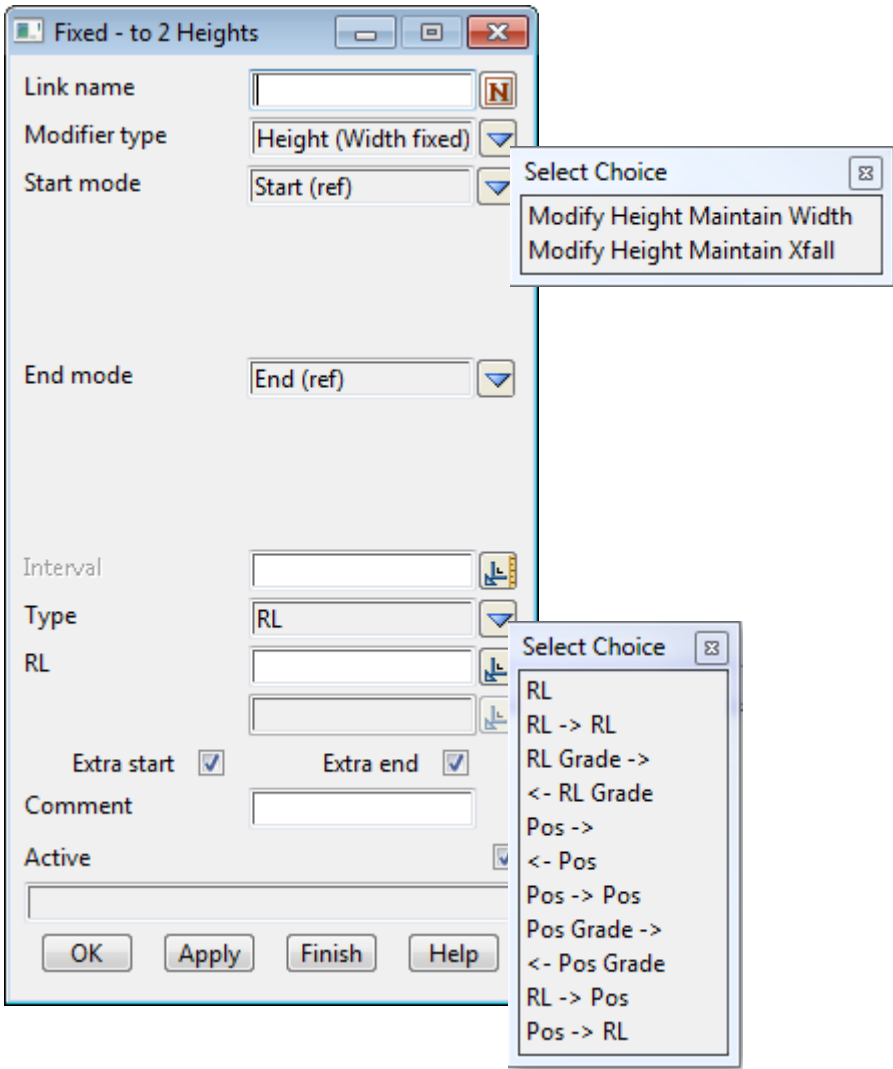

Note: the **2 Strings** modifiers work with two points in a **section**. See [Fixed Link - to Two Strings](#).

The different methods for calculating the RL at each chainage are:

and for the definitions go to [Fixed - Calculating the Heights for each Type](#).

Selecting to 2 heights brings up the **Fixed - to 2 Heights** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Modifier type	choice box		

The **Maintain** Xfall/Width is the part of the new definition of the selected link that is taken from the selected **Link name**. See [Fixed - Maintaining Width or Xfall](#).
The **Height** for the selected link is calculated by the method given by **Type**.

Start/End mode <i>defines the start/end chainages for modifying the link. For more information on Start/End mode, see Start and End Chainages.</i>	choice box	Start (ref)/End (ref)

Apply <i>Apply stores the values and leaves the panel on the screen. If the MTF is being used in an Apply Many MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, a recalc of the associated Apply Many for the MTF is done.</i>	button
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------

Fixed - Maintaining Width or Xfall

The option **to 2 heights** defines the **height** of the selected string so to completely define the link, only the width or the xfall is needed.

So from the selected link only the **width** or the **xfall** is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by **width and height**, then at any chainage a **xfall** can be calculated from the width and height at that chainage.

Section View

For links defined by width and height, the **xfall** at each chainage is uniquely defined

If the selected link is defined by **xfall and height**, then at any chainage a **width** can be calculated from the xfall and height at that chainage.

Section View

For links defined by xfall and height, the **width** at each chainage is uniquely defined

Hence it doesn't matter if the selected link is defined by **width and xfall**, **width and height**, or **xfall and height**, at each chainage a **width and xfall** are uniquely defined.

So no matter how the selected link is defined, at any chainage, a unique width or a xfall is known and it is that **Width** or **Xfall** can be maintained by the **to 2 heights** option.

So the choices for the option are:

Continue to the next section [Fixed Link - to Two Strings](#) or return to [Fixed Link - to Two Heights](#), [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed - Calculating the Heights for each Type

for the definitions of the calculations for each choice

go to if RL: keep a given RL

if RL -> RL: interpolate between two given RL's

if RL Grade ->: start with a given Start RL and continue on the line at grade Grade->

if <- RL Grade: all points are on a line with given grade and going through End RL

if Pos ->: all points have the same height as the start point

if <- Pos: all points have the same height as the end point

if Pos-> Pos: interpolate between the calculated start and end heights

if Pos Grade ->: start with the calculated height and continue at a given grade

if <- Pos Grade: all points are on a line of given grade and going through the end point

if RL -> Pos: interpolate between a given start RL & the calculated end height

if Pos -> RL: interpolate between the calculated start height and a given RL at the end

if RL: keep a given RL

At the vertex of the link on the normal at each chainage *ch* between the **Start mode** and **End Mode**, the height at *ch* is that given in the **RL** panel field.

Hence the height is the same for all modified vertices between the *Start mode* and the *End mode*.

The modifiers of *Type RL* then work the same as the modifiers "*Width/Xfall/Height to RL*" with the RL being the *given RL* (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if RL -> RL: interpolate between two given RL's

Type	RL -> RL	
Start RL		
End RL		

At each chainage ch between the **Start mode** and **End Mode**, the vertex of the modified string is on the normal to the Reference string at chainage ch.

The height at of the vertex on the normal to Reference chainage ch, is the *linear interpolation* of height with respect to the string being modified, between the given *Start RL* and the *End RL*.

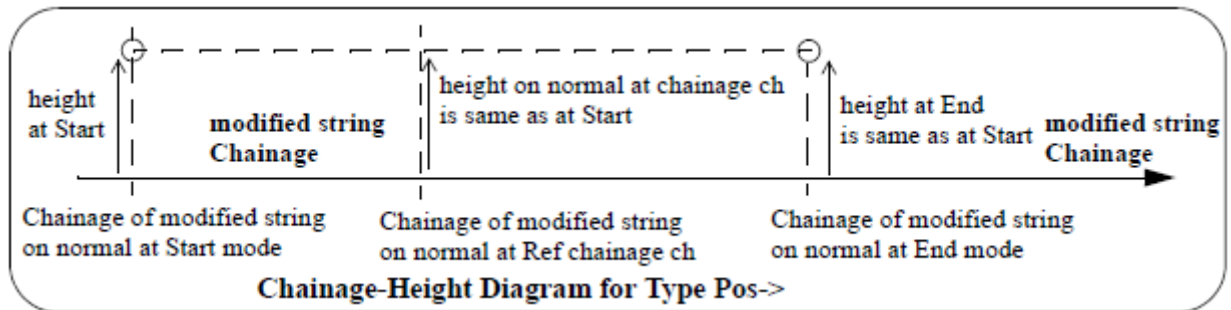

Hence for the modifiers of Type **RL->RL**, the calculations at chainage ch are the same as the modifiers "Width/Height/Xfall to RL" with the RL being the interpolated RL at chainage ch (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if Pos ->: all points have the same height as the start point

Type	Pos ->	

First let **Start RL** be the actual height calculated at the vertex of the string at the normal to **Start mode** when all the modifiers before this modifier are applied.

Then for all vertices on the normals between **Start mode** and **End Mode**, the height of the vertex equal to **Start RL**.

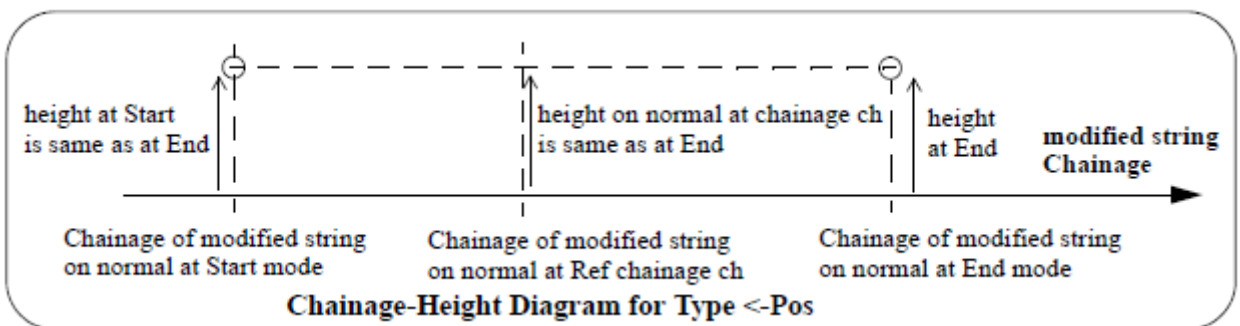

Hence the modifiers for Type **Pos->** are the same as the modifiers "Width/Xfall/Height to the RL" with RL being the Start RL (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if <- Pos: all points have the same height as the end point

First let **End RL** be the actual height calculated at the vertex of the string at the normal to **End mode** when all the modifiers before this modifier are applied.

Then for all vertices on the normals between the **Start mode** and **End Mode**, the height of the vertex is equal to **End RL**.

Hence the modifiers for Type **<-Pos** are the same as the modifiers "Width/Xfall/Height to the RL" with RL being the End RL (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if Pos-> Pos: interpolate between the calculated start and end heights

First let **Start RL** be the actual height calculated at the vertex of the string at the normal to **Start mode** when all the modifiers before this modifier are applied.

Let **End RL** be the actual height calculated at the vertex of the string at the normal to **End mode** when all the modifiers before this modifier are applied.

Then for each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the *Start RL* and the *End RL*.

Hence for the modifiers of *Type Pos -> Pos*, the calculations at chainage ch are the same as the modifiers "Width/Height/Xfall to RL" with the RL being the interpolated RL at chainage ch (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if RL -> Pos: interpolate between a given start RL & the calculated end height

Type	RL -> Pos	
Start RL	<input type="text"/>	
	<input type="text"/>	

The height at the vertex on the normal at **Start mode** is the given **Start RL**.

And **End RL** is the **actual** height calculated at the vertex on the modified string at the normal at **End mode** when all the modifiers before this modifier are applied.

Then at each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the *Start RL* and the *End RL*.

Hence for the modifiers of *Type RL -> Pos*, the calculations at chainage ch are the same as the modifiers "Width/Height/Xfall to RL" with the RL being the interpolated RL at chainage ch (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if Pos -> RL: interpolate between the calculated start height and a given RL at the end

Type	Pos -> RL	
End RL		

Start RL is the **actual** height calculated at the vertex on the normal at **Start mode** when all the modifiers before this modifier are applied.

The height at the vertex on the normal at **End mode** is the given **End RL**.

Then at each vertex on the normals between **Start mode** and **End Mode**, the height of the vertex is the linear interpolation **with respect to modified string chainage** between the *Start RL* and the *End RL*.

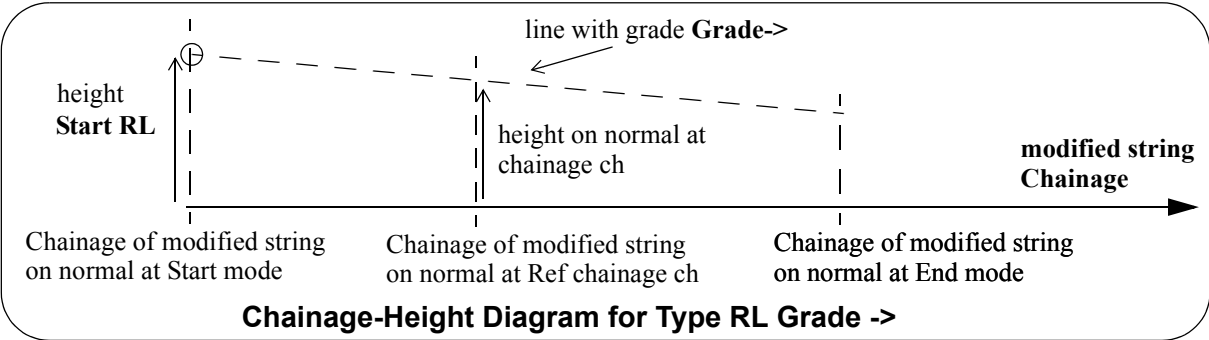

Hence for the modifiers of Type **Pos -> RL**, the calculations at chainage ch are the same as the modifiers "Width/Height/Xfall to RL" with the RL being the interpolated RL at chainage ch (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

if RL Grade ->: start with a given Start RL and continue on the line at grade Grade->

Type	RL Grade ->	
Start RL		
Grade ->		

The height at the vertex on the normal at **Start mode** is the **Start RL**.

For each normal between the *Start mode* and the *End Mode*, the height of the vertex is on the line with grade **Grade->** with respect to the modified string, and going through the point (normal at Start mode, Start RL).

Hence for the modifiers of **Type RL Grade ->**, the calculations at chainage **ch** are the same as the modifiers "Width/Height/Xfall to RL" with the RL being that calculated at **ch** using the **Start RL** and the **Grade->** (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

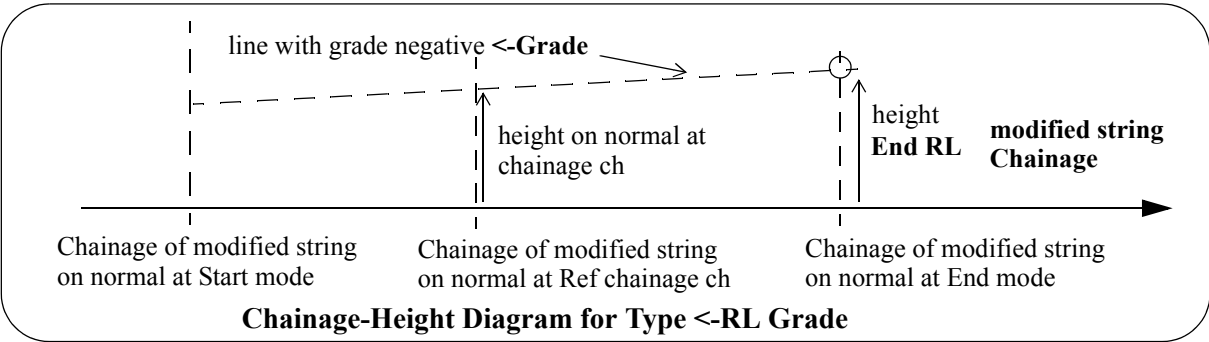

Important Note: Grade is calculated using **increasing Reference chainages**.

if <- RL Grade: all points are on a line with given grade and going through End RL

The height on the vertex at **End mode** is **End RL**.

For each normal between the **Start mode** and the **End Mode**, the height of the vertex is on the line with grade of negative **<-Grade** with respect to the modified string chainage, and going through the point (normal at End mode, End RL).

Hence for the modifiers for **Type <-RL Grade**, the calculations at chainage **ch** are the same as the modifiers "Width/Height/Xfall to RL" with the RL being that calculated at **ch** using the **End RL** and the **Grade** (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

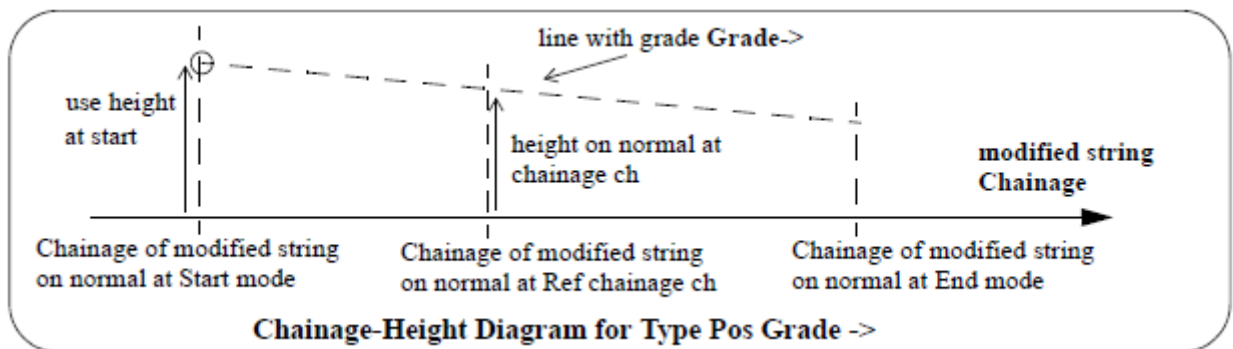

Important Note: **<-Grade** is calculated using **decreasing Alignment chainages**. So in a diagram with increasing chainage, the grade is negative **<-Grade**.

if Pos Grade ->: start with the calculated height and continue at a given grade

Type	Pos Grade ->	
Grade ->		

First let **Start RL** be the actual height calculated at the vertex on the normal at **Start mode** when all the modifiers before this modifier are applied.

Then the height of each vertex on each normal between the *Start mode* and the *End Mode* is on the line with grade **Grade->** with respect to the modified string chainage, and going through the point (normal at Start mode, Start RL).

Hence for the modifiers of Type **Pos Grade->**, the calculations at chainage ch are the same as for the modifiers "Width/Height/Xfall to RL" with the RL being calculated at ch using the **Start RL** and the **Grade** (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

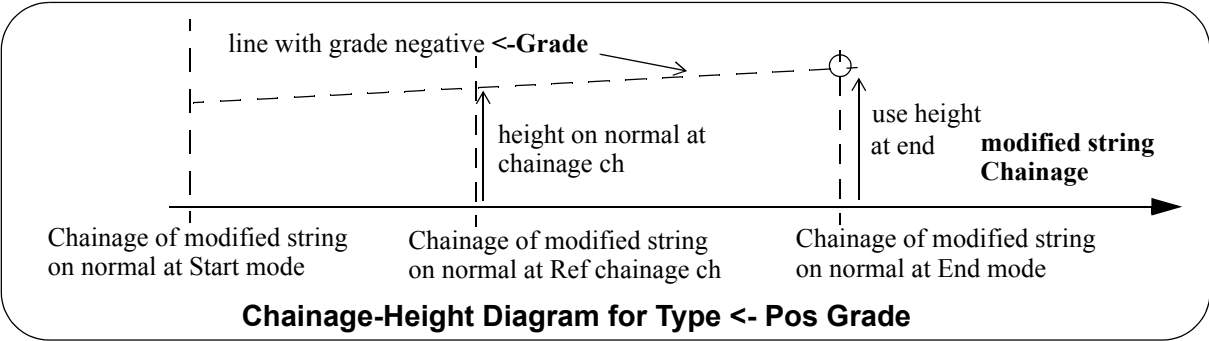

Important Note: Grade is calculated using **increasing Alignment chainages**.

if <- Pos Grade: all points are on a line of given grade and going through the end point

Type	<- Pos Grade	
<- Grade		

First let **End RL** be the actual height on the vertex on the normal at **End mode** when all the modifiers before this modifier are applied.

Then the height of each vertex on the normals between the *Start mode* and the *End Mode* is on the line with grade of negative **<-Grade** with respect to the modified string chainage, and going through the point (normal at End mode, End RL).

Hence for the modifiers of *Type <- Pos Grade*, the calculations at chainage ch are the same as the modifiers "Width/Height/Xfall to RL" with the RL being calculated at ch using the **End RL** and the **<-Grade** (see [Fixed Link - Modify Width, Height or Xfall to Get to an RL](#)).

Important Note: <-Grade is calculated using **decreasing Alignment chainages** and the **heights at the points** along the string being modified. So in a diagram with increasing chainage, the grade is negative **<-Grade**.

Continue to the next section [Fixed Link - to Two Strings](#) or return to [Fixed - Calculating the Heights for each Type](#), [Fixed Link - to Two Heights](#), [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fixed Link - to Two Strings

The **fixed to 2 strings** walk-right brings up the **fixed to 2 Strings** menu with options to calculate the width, xfall or height from two given strings.

For *Width/Height/Xfall to 2 Strings*, go to the next section [Fixed Link - Width, Height or Xfall between Two Strings](#)

Fixed Link - Width, Height or Xfall between Two Strings

Width Between Two Strings

For a fixed link defined by *width* and *height* or *width* and *xfall*, **Width to 2 strings** sets the **width** for a link to be the **width between two** existing **12d Model** strings,

The option will give an error for a link defined by *height* and *xfall*.

Height Between Two Strings

For a fixed link defined by *height* and *width* or *height* and *xfall*, **Height to 2 strings** sets the **height** for the link to be the **height between two** existing **12d Model** strings,

The option will give an error for a link defined by *width* and *xfall*.

Xfall Between Two Strings

For a fixed link defined by *xfall* and *width* or *xfall* and *height*, **Xfall to 2 strings** sets the **xfall** for the link to be the **xfall between two** existing **12d Model** strings,

The option will give an error for a link defined by *width* and *height*.

Selecting the width to 2 strings, height to 2 strings or xfall to 2 strings option brings up the **Fixed - Modify Width to 2 Strings**, **Fixed - Modify Height to 2 Strings**, and **Fixed - Modify Xfall to 2 Strings** panels respectively.

These options were never released. They should be replaced in your MTF by the appropriate to **2 heights** options.

Return to [Fixed Link Modifiers](#) or [Modifiers in MTF Edit](#).

Decision

Decision Change

Each template is made up of the sections fixed, decisions, cut, fill and final cut/fill. If a template has a decisions section then by default the decisions section it is used instead of the cut, fill and final cut/fill sections.

Hence by default, if the decisions section of a template exists then it is used but if the decisions section does not exist, the cut, fill and final cut/fill sections of the template are used.

For an Apply Many, the template specified for a chainage range in the Templates section of the MTF (see [MTF Templates](#)) is called the *original* template for that chainage range.

Using the **decision** modifier, it is possible to **override** the defaults for the original template, and for a given chainage range:

use the *decisions* section **from another** template instead of the decisions or cut/fill sections of the original template.

or

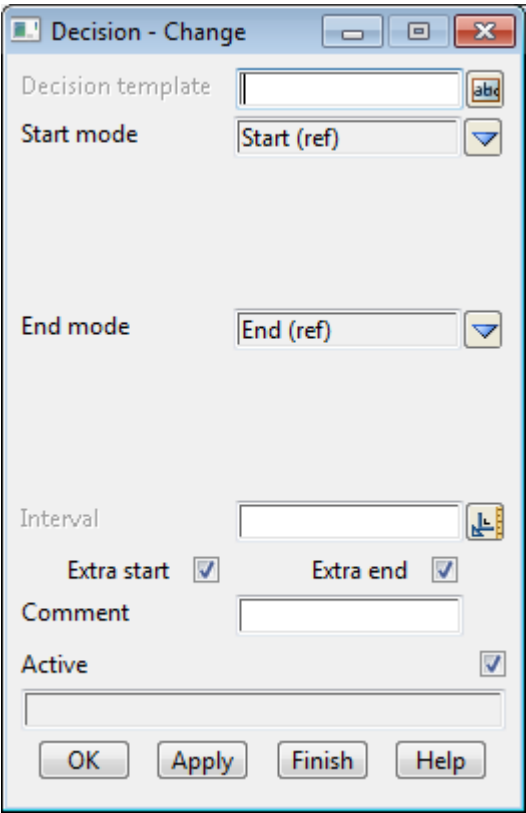

use the cut, fill and final cut/fill sections of the original template **instead** of the decisions section of the original template.

The fixed part of the *original* template is *still used* in either case.

The **Decision** walk-right brings up the **Decision** menu with the change option which nominates what decision templates are used for what chainage ranges.

Selecting **Change** brings up the **Decision Change** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Decision template	<p>if non-blank, this is the template whose decisions section is used over the given chainage range.</p> <p>If blank, the cut, fill and final cut/fill sections of the original template are used over the chainage range instead of the decision section of the original template.</p> <p>Note that if the new template has no decisions, then the cut and fill section of the original template is used instead of the decisions section of the original template. That is, it is equivalent to leaving the Decisions template field blank.</p>	input		available templates

[Cut Link - Modifier Width or Height](#)
[Cut Link - Modify Slope](#)
[Cut Link - from Link](#)
[Cut Link - to String](#)
[Cut Link - to Tin](#)
[Cut Link - to Two Heights](#)
[Cut Link - to 2 Strings](#)

Each of the options from this menu will now described.

Cut Link - Insert

Cut links can be created by the **cut Insert** command by specifying either the *width and height*, *width and slope* or *height and slope* for the link.

Selecting **Insert** brings up the **Cut - Insert** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Link name	<i>name of the link to create.</i>	input		select name menu
Colour	<i>colour of the link being created.</i>	input		available colours
Width /height/slope	<i>width/ height/slope of the link being created - only use two of the three.</i>	input		measures menu
Before	<i>if non-blank, the name of the string to insert the new string before. If blank, the link is appended to the end of the fixed part of the template.</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for inserting the new cut link. For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and vertices of the strings over the given</i>	input		

chainage range.
If **blank**, the **Section separation** value from the **Apply Many** panel is used.

Extra start/end tick box
*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input
comment to add to the end of the line. In the file, the comment will be preceded by //.

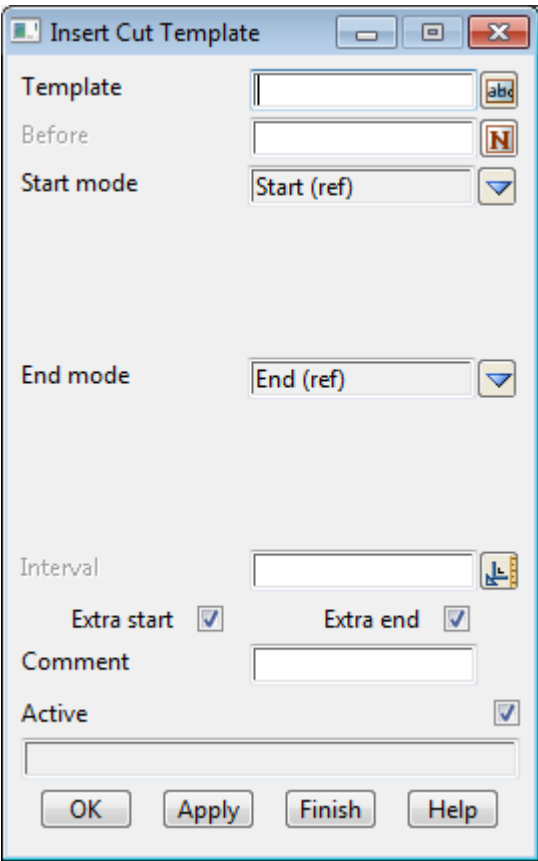

Active tick box tick
*if **ticked**, use this modifier.*
*if **not ticked**, don't use this modifier.*

OK/Apply button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Continue to the next section [Insert Cut Links from a Template](#) or return to [Cut Link Modifiers](#) or [Modifiers in MTF Edit](#).

Insert Cut Links from a Template

All the cut links from an existing template can be inserted by the **Insert cut template** command.
Selecting **Insert cut template** brings up the **Insert Cut Template** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	template box		select template menu

the name of the template to take the cut links from.

Before input select name menu

if **non-blank**, the cut links from the selected template are inserted before the given link.

If **blank**, the cut links from the selected template are appended to the end of the existing cut links.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for inserting the new template links.

For more information on Start/End mode, see [Start and End Chainages](#)

Interval input

if **non blank**, the interval to use to create cross sections and strings over the given chainage range.

If **blank**, the **Section separation** value from the **Apply Many** panel is used.

Extra start/end tick box

if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if **ticked**, use this modifier.

if **not ticked**, don't use this modifier.

OK/Apply button

OK stores the values in the fields and removes the panel.

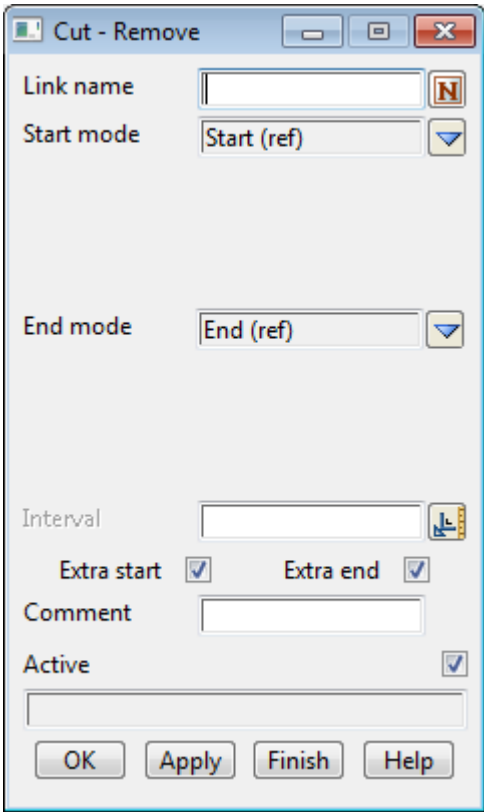

Apply stores the values and leaves the panel on the screen.

Continue to the next section [Cut Link - Remove](#) or return to [Cut Link Modifiers](#) or [Modifiers in MTF Edit](#).

Cut Link - Remove

Cut links can be deleted between given chainages by using the **Cut Remove** command.

Selecting **Remove** brings up the **Cut - Remove** panel

The fields and buttons used in this panel have the following functions.

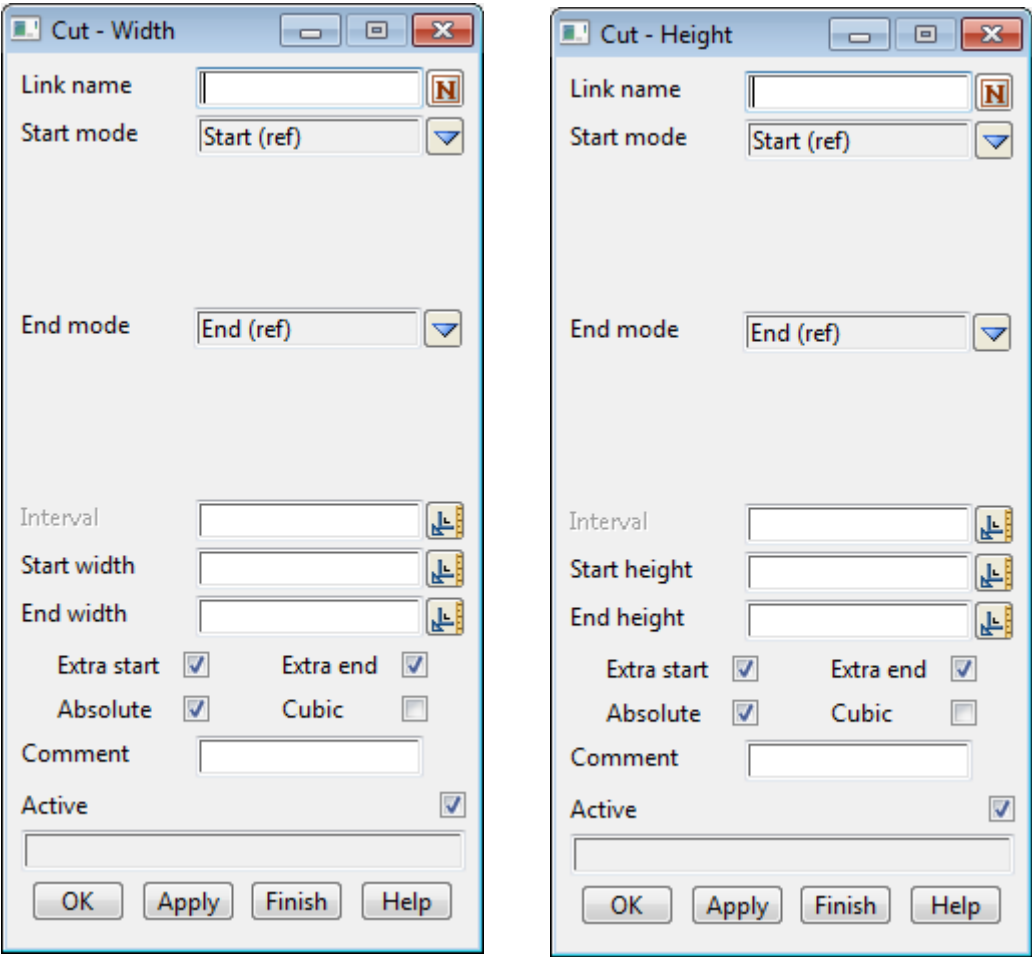

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to removed.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for removing the cut link. For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Extra start/end <i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment <i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input		
Active <i>if ticked, use this modifier. if not ticked, don't use this modifier.</i>	tick box	tick	
OK/Apply <i>OK stores the values in the fields and removes the panel. Apply stores the values and leaves the panel on the screen.</i>	button		
Continue to the next section Cut Link - Modifier Width or Height or return to Cut Link Modifiers or Modifiers in MTF Edit .			

Cut Link - Modifier Width or Height

The **cut width** modifier is used to modify the width of variable cut links originally defined by width. That is, links defined by *width and slope* or *width and height*.

Similarly the **cut height** modifier is used to modify the height of variable cut links originally defined by height. That is, links defined by *height and width* or *height and slope*.

Selecting **Width or Height** brings up the **Cut - Width** and **Cut - Height** panels respectively.

The fields and buttons used in this panel have the following functions.

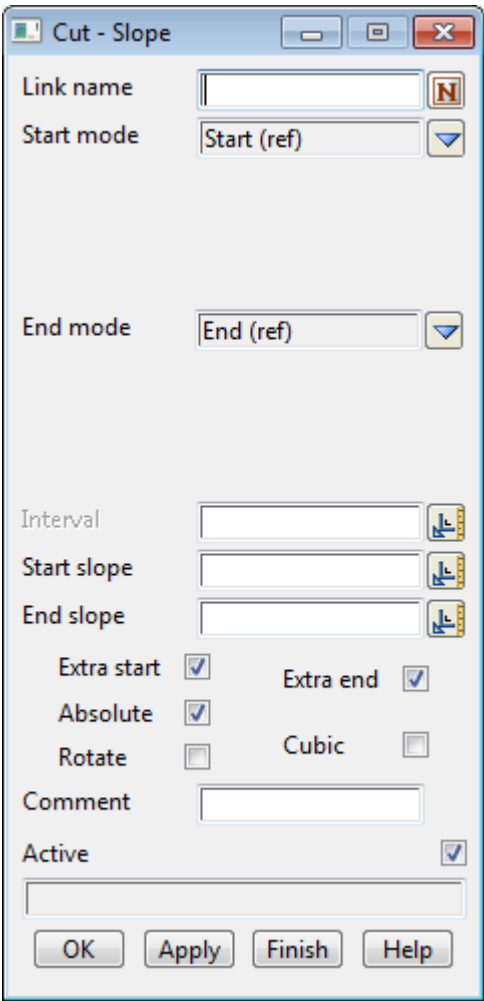

Field	Description	Type	Defaults	Pop-Up
Link name	<i>name of the link to modify.</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for modifying the links.</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Start/End width/height	<i>start/end width/height for modifying the link.</i>	input		measures menu

Extra start/end	tick box

*if **not ticked**, don't use this modifier.*

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Cut Link - Calculate Width, Height or Slope to a String

Width to String:

For a cut link defined by *width and height* or *width and slope*, **Cut Width to string** calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The *slope* or *height* is taken from the link. The option will give an error for a link defined by *height* and *slope*.

However if the tin in the Apply Many is cut before reaching the string, the **cut link stops at the Apply Many tin**.

Height to String:

For a cut link defined by *height and width* or *height and slope*, **Cut Height to string** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**. The *slope* or *width* is taken from the link. The option will give an error for a link defined by *width* and *slope*.

However if the tin in the Apply Many is cut before reaching the string, the **cut link stops at the Apply Many tin**.

Xfall to String:

For a cut link defined by *slope and width* or *slope and height*, **Cut Slope to string** calculates the **slope** of the link as the *slope* from the start point of the link to the **selected string**. The *width* or *height* is taken from the link. The option will give an error for a link defined by *width* and *height*. However if the tin in the Apply Many is cut before reaching the string, the **cut link stops at the Apply Many tin**.

**Note:**

Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example for a modifier defined by *width* and *slope*, using *width to string* and a *slope to string* with the same string will place the end of the link on that string.

But the *To string* option will do the same thing in one command. See [Cut Link - Modify To String](#).

Selecting **Width to string**, **Height to string** or **Slope to string** brings up the **Cut - Width to String**, **Cut - Height to String** and **Cut - Slope to String** panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for modifying the link. For more information on Start/End mode, see Start and End Chainages except for this option: When the Start mode is Start (ref), or Typed and the chainage is blank, the modification begins at the low dropped chainage of the selected string. When the End mode is End (ref), or Typed and the chainage is blank, the modification ends at the high dropped chainage of the selected string.</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range. If blank, the Section separation value from the Apply Many panel is used.</i>	input		
String <i>select string to use for defining width/height/slope for the link.</i>	string-select		
Side to search <i>side of the hinge string to start searching to find the string to define width/height/slope.</i>	input	left side	left side, right side, both sides
Extra start/end	tick box		

Height to Tin

For a cut link defined by *height* and *width* or *height* and *slope*, the **Height to tin** calculates the **height** of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the **width/slope given in the link**. The option gives an error for a link defined by *width* and *xfall*.

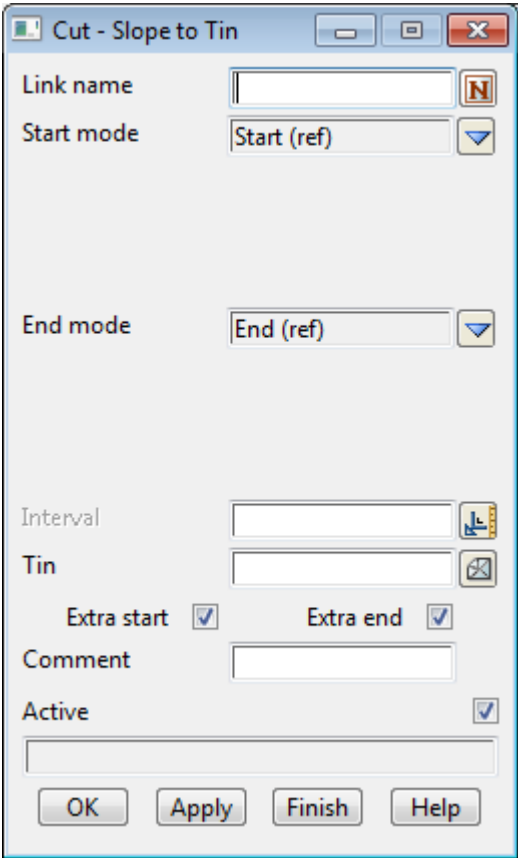

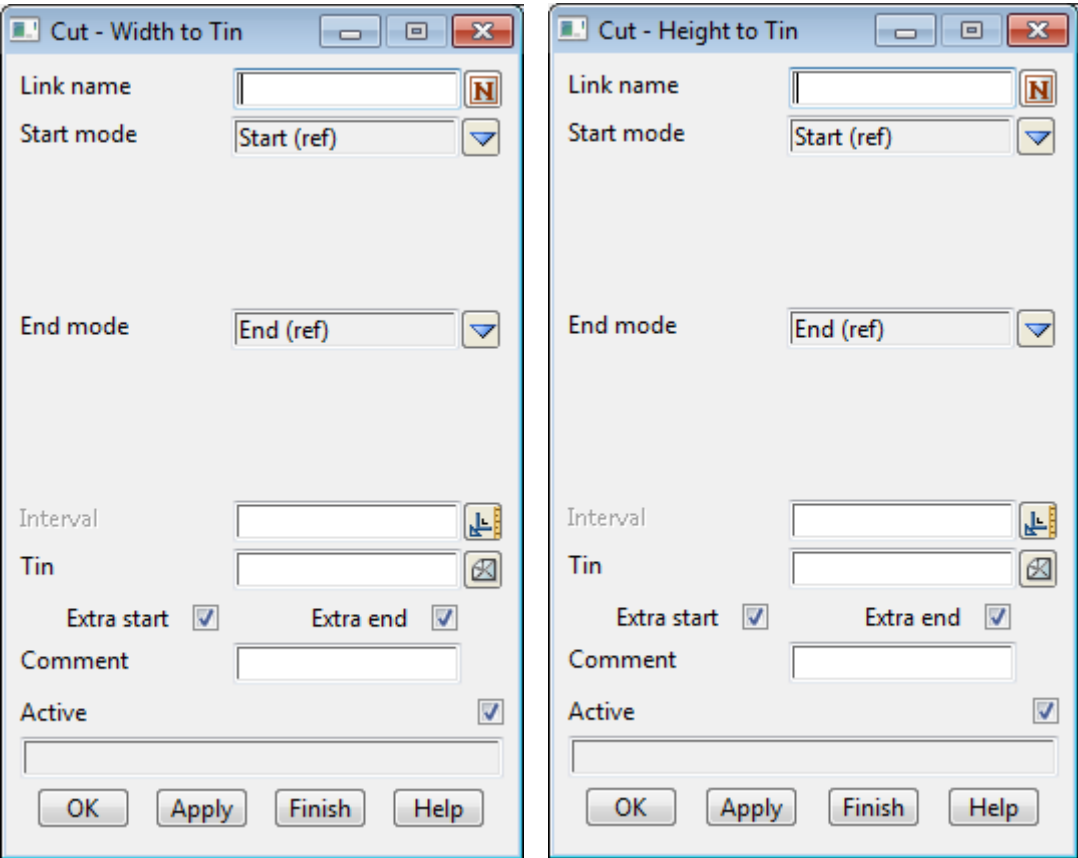

Slope to Tin

For a cut link defined by *slope* and *width* or *slope* and *height*, **Slope to tin** calculates the **slope** of the link as the *slope* required so that the link will sit on the user tin at the **width/height given in the link**. The option gives an error for a link defined by *width* and *height*.

Selecting **Width to tin**, **Height to tin**, or **Slope to tin** brings up the **Cut - Width to Tin**, **Cut - Height to Tin** and **Cut - Slope to Tin** panels respectively.

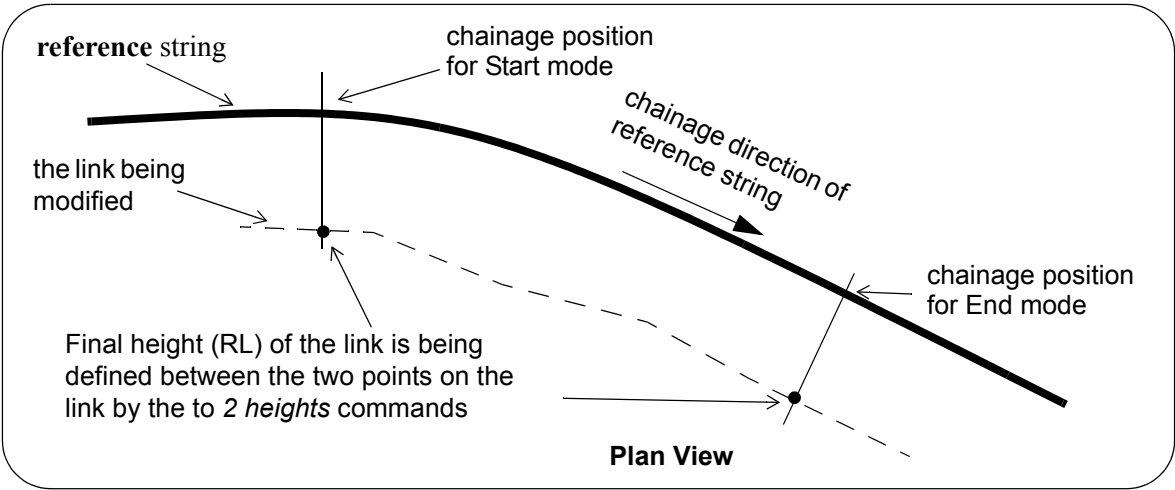

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu

Continue to the next section Cut Link - to Two Heights or return to Cut Link Modifiers or Modifiers in MTF Edit .			

Cut Link - to Two Heights

For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL's.

However if the *Apply Many* tin is cut before reaching the end of the modified link, the **cut link stops at the tin**.

Note: the **2 Strings** modifiers work with two points in a **section**. See [Cut Link - to 2 Strings](#).

Selecting o 2 heights brings up the **Cut - to 2 Heights** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu

Modifier type choice box

The **Maintain Slope/Width** is the part of the new definition of the selected link that is taken from the selected **Link name**. See [Cut - Maintaining Width or Slope](#).

The **Height** for the selected link is calculated by the method given by **Type**.

Start/End mode choice box Start (ref)/End (ref)

defines the start/end chainages for modifying the link.

For more information on Start/End mode, see [Start and End Chainages](#).

Interval input

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*

*If **blank**, the **Section separation** value from the **Apply Many** panel is used.*

Type choice box

For the calculation of height for each type, go to [Cut - Calculating the Heights for each Type](#)

Extra start/end tick box

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Comment input

*comment to add to the end of the line. In the file, the comment will be preceded by **//**.*

Active tick box tick

*if **ticked**, use this modifier.*

*if **not ticked**, don't use this modifier.*

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Cut - Maintaining Width or Slope

The option **to 2 heights** defines the **height** of the selected string so to completely define the link, only the width or the slope is needed.

So from the selected link only the **width** or the **xfall** is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by **width and height**, then at any chainage a **slope** can be calculated from the width and height at that chainage.

Section View

For links defined by width and height, the **slope** at each chainage is uniquely defined

If the selected link is defined by **slope and height**, then at any chainage a **width** can be calculated from the slope and height at that chainage.

Section View

For links defined by slope and height, the **width** at each chainage is uniquely defined

Hence it doesn't matter if the selected link is defined by **width and slope**, **width and height**, or **slope and height**, at each chainage a **width and slope** are uniquely defined.

So no matter how the selected link is defined, at any chainage, a unique width or a slope is known and it is that **Width** or **Slope** can be maintained by the **to 2 heights** option.

So the choices for the option are:

Continue to the next section [Cut Link - to 2 Strings](#) or return to [Cut Link - to Two Heights](#), [Cut Link Modifiers](#) or [Modifiers in MTF Edit](#).

Cut - Calculating the Heights for each Type

Important Note: Grade is calculated using **increasing Alignment chainages** and the **heights at the points** along the string being modifies. When going around a curve this will not be exactly the same as the grade along the string being modified.

The definitions of the calculations for each choice are the same as for the Fixed links. See [Fixed - Calculating the Heights for each Type](#).

Continue to the next section [Cut Link - to 2 Strings](#) or return to [Cut Link - to Two Heights](#), [Cut Link Modifiers](#) or [Modifiers in MTF Edit](#).

Cut Link - to 2 Strings

The *Cut to 2 strings* walk-right brings up the **Cut to 2 Strings** menu with options to calculate the width, height or slope from two given strings.

For *Width/Height/Slope to 2 Strings*, go to the next section [Cut Link - Width, Height or Slope Between Two Strings](#)

Cut Link - Width, Height or Slope Between Two Strings

Width Between Two Strings

For a cut link defined by *width* and *height* or *width* and *slope*, **Width to 2 strings** sets the **width** for a link to be the **width between two** existing **12d Model** strings,

However if the Apply Many tin is cut before reaching the string, the **cut link stops at the tin**.

The option will give an error for a link defined by *height* and *slope*.

Height Between Two Strings

For a cut link defined by *height* and *width* or *height* and *slope*, **Height to 2 strings** sets the **height** for the link to be the **height between two** existing **12d Model** strings,

However if the Apply Many tin is cut before reaching the string, the **cut link stops at the tin**.

The option will give an error for a link defined by *width* and *slope*.

Slope Between Two Strings

For a cut link defined by *slope* and *width* or *slope* and *height*, *Slope to 2 strings* sets the **slope** for the link to be the **slope between two** existing **12d Model** strings,

However if the *Apply Many* tin is cut before reaching the string, the **cut link stops at the tin**.

The option will give an error for a link defined by *width* and *height*.

Selecting the **width to 2 strings**, **height to 2 strings** or **slope to 2 strings** option brings up the **Cut - Width to 2 Strings**, **Cut - Height to 2 Strings** and **Cut - Slope to 2 String** panels respectively.

Fill Link - Modify Width or Height

The **fill width** modifier is used to modify the **width** of variable fill links originally defined by width. That is, links defined by *width and slope* or *width and height*.

Similarly the **fill height** modifier is used to modify the **height** of variable fill links originally defined by height. That is, links defined by *height and slope* or *height and width*.

Important Note - for a Fill link, a **positive** height is **down**.

Selecting the **width and height** option brings up the **Fill - Width** and **Fill - Height** panels respectively.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Link name	<i>name of the link to modify.</i>	input		select name menu
Start/End mode	<i>defines the start/end chainages for modifying the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Start/End width/height		input		measures menu

start/end width/height for modifying the template link.

Important Note - for a fill link, height **positive** is down.

Extra start/end tick box

if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.

Absolute tick box tick

if **ticked**, the width/height is set to the values given in the **start** and **end width/height** fields.

if **not ticked**, the values given in the **start** and **end height/width** fields are added to the existing widths/heights.

Cubic tick box

if **ticked**, the width/height is varied as a reverse cubic between the start and end chainages.

if **not ticked**, the width/height is varied linearly between the start and end chainages.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if **ticked**, use this modifier.

if **not ticked**, don't use this modifier.

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

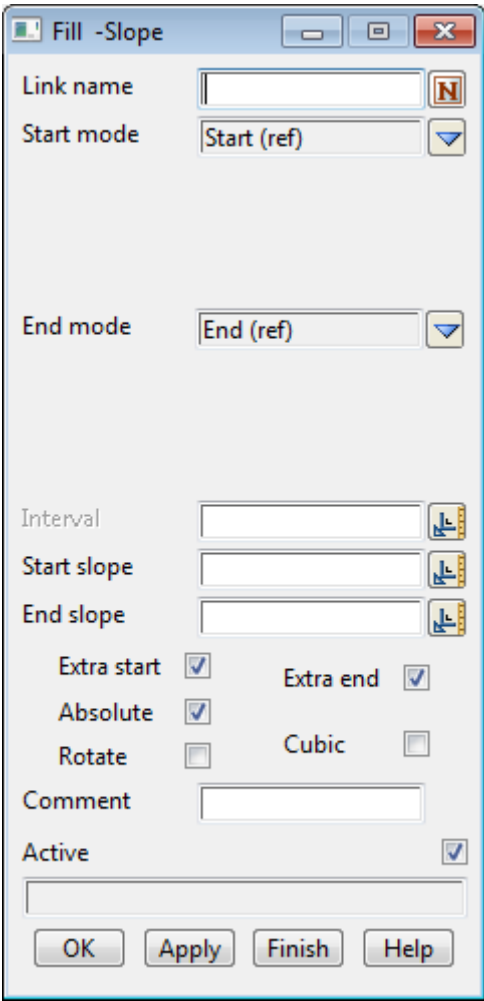

Continue to the next section [Fill Link - Modify Slope](#) or return to [Fill Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fill Link - Modify Slope

The **fill slope** modifier is used to modify the **slope** of variable fill links originally defined by slope. That is, links defined by *slope and width* or *slope and height*.

Important Note - for a Fill link, a **positive** fill slope is **down**.

Selecting **slope** brings up the **Fill - Slope** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name	input		select name menu

name of the link to modify.

Start/End mode	choice box	Start (ref)/End (ref)
-----------------------	------------	-----------------------

defines the start/end chainages for modifying the link
For more information on Start/End mode, see [Start and End Chainages](#)

Interval	input
-----------------	-------

*if **non blank**, the interval to use to create cross sections and strings over the given chainage range.*
*If **blank**, the **Section separation** value from the **Apply Many** panel is used.*

Start/End slope	input	measures menu
------------------------	-------	---------------

start/end slope for modifying the template link.
Important Note - for a fill link, a **positive** slope is down.

Extra start/end	tick box
------------------------	----------

*if **ticked**, add an extra x-section 0.1 mm **before** the start/end chainage.*

Absolute	tick box	tick
-----------------	----------	------

*if **ticked**, the slope is set to the values given in the **start** and **end slope** fields.*
*if **not ticked**, the values given in the **start** and **end slope** fields are added to the existing slopes.*

Cubic and Rotate tick boxes:

Only **none** or **one** of **Cubic** and **Rotate** can be set to **tick**.

The **default** is **none** - that is, **neither is ticked** and in the default case, the slope is varied **linearly with respect to slope** between the start and end chainages.

Cubic tick box

if **ticked**, the slope is varied as a reverse cubic between the start and end chainages.

Rotate tick box

if **ticked**, the slope is varied linearly **with respect to the angle**, between the start and end chainages.

Comment input

comment to add to the end of the line. In the file, the comment will be preceded by //.

Active tick box tick

if **ticked**, use this modifier.

if **not ticked**, don't use this modifier.

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Continue to the next section [Fill Link - from Link](#) or return to [Fill Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fill Link - from Link

The **Fill from link** walk-right brings up the **Fill from Link** menu with options to take the width, height or slope from another link.

For **Width/Height/Slope from link**, go to the next section [Fill Link - Take Width, Height or Slope from another Link](#)

Fill Link - Take Width, Height or Slope from another Link

The **Width from link** modifier is used to modify the **width** of fill links originally defined by width to be the same width as another link (**width and height** or **width and slope**). That is, the width of the link is a copy of the width of another link.

The **Height from link** modifier is used to modify the **height** of fill links originally defined by height to be the same height as another link (**height and width** or **height and slope**). That is, the height of the link is a copy of the height of another link.

The **Slope from link** modifier is used to modify the slope of fill links originally defined by slope to be the same slope as another link (**slope and width** or **slope and height**). That is, the slope of the link is a copy of the slope of another link. The link to copy slope from can be defined in terms of slope or cross fall. If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Selecting the **width from link**, **height from link** or **slope from link** option brings up the **Fill - Width from Link**, **Fill - Height from Link** and **Fill - Slope from Link** panels respectively.

OK/Apply	button	
OK <i>stores the values in the fields and removes the panel.</i>		
Apply <i>stores the values and leaves the panel on the screen.</i>		

Fill Link - Calculate Width, Height or Slope to a String

Width to String:

For a fill link defined by *width and height* or *width and slope*, **Fill Width to string** calculates the **width** of the link as the width from the start point of the link, to the **to the selected string**. The *slope* or *height* is taken from the link. The option will give an error for a link defined by *height* and *slope*.

However if the tin in the Apply Many is cut before reaching the string, the **fill link stops at the Apply Many tin**.

Height to String:

For a fill link defined by *height and width* or *height and slope*, **Fill Height to string** calculates the **height** of the link as the difference in the height at the start point of the link, and the height **at the selected string**. The *slope* or *width* is taken from the link. The option will give an error for a link defined by *width* and *slope*.

However if the tin in the Apply Many is cut before reaching the string, the **fill link stops at the Apply Many tin**.

Slope to String:

For a fill link defined by *slope and width* or *slope and height*, Fill **Slope to string** calculates the **slope** of the link as the *slope* from the start point of the link to the **selected string**. The *width* or *height* is taken from the link. The option will give an error for a link defined by *width* and *height*.

However if the tin in the Apply Many is cut before reaching the string, the **fill link stops at the Apply Many tin**.

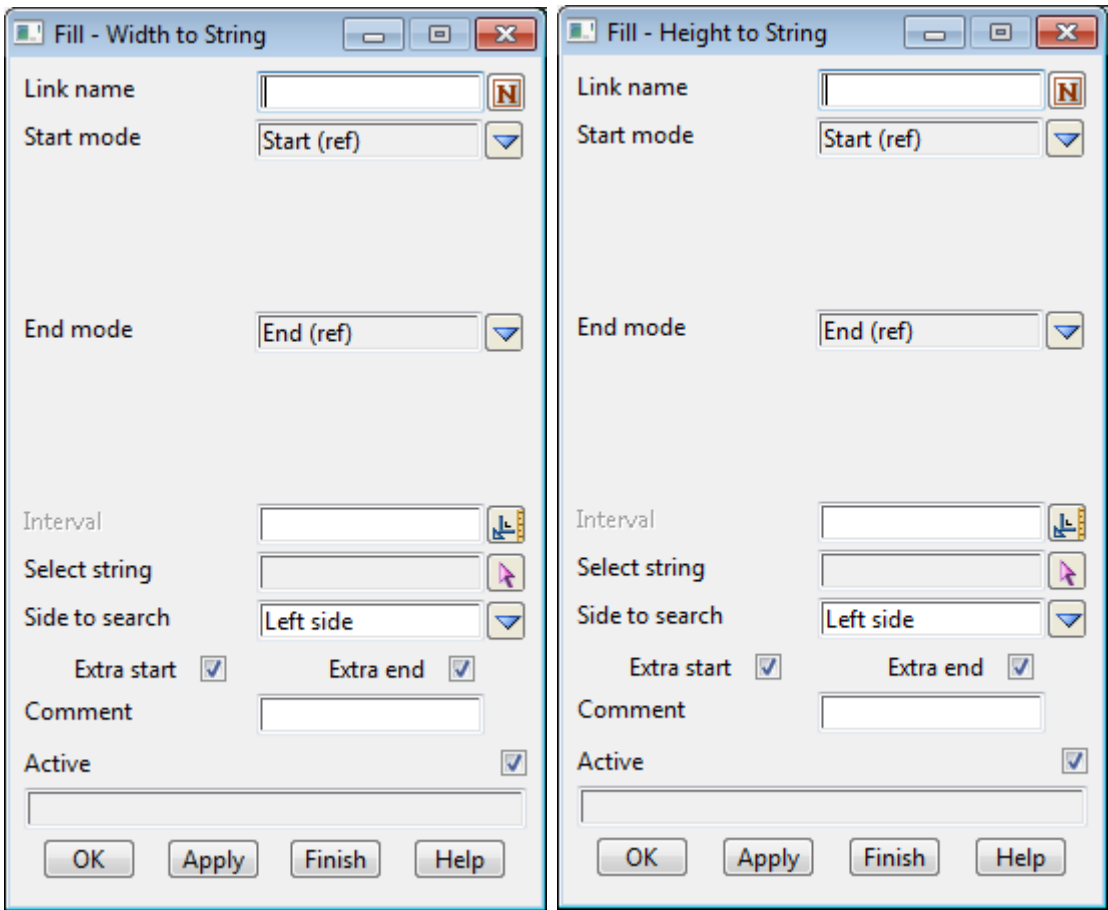

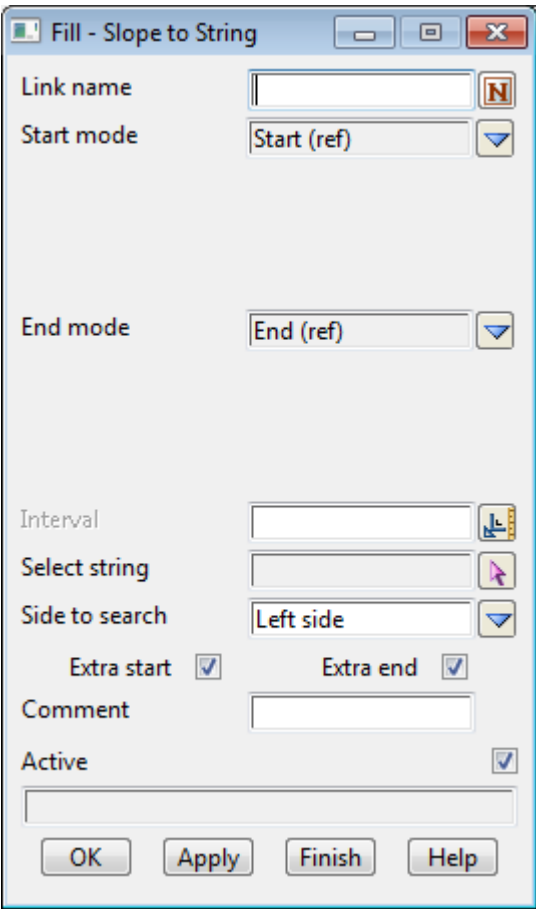

Note:

Using two of the above modifiers together and with the same string will place the end point of the link on the selected string. For example for a modifier defined by *width and slope*, using *width to string* and a *slope to string* with the same string will place the end of the link on that string.

But the To string option will do the same thing in one command. See [Cut Link - Modify To String](#).

Selecting the **width to string**, **height to string** or **slope to string** option brings up the **Fill - Width to String**, **Fill - Height to String** and **Fill - Slope to String** panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Continue to the next section Fill Link - to Tin or return to Fill Link Modifiers or Modifiers in MTF Edit .		

Fill Link - to Tin

The *Fill to tin* walk-right brings up the **Fill to Tin** menu with options to calculate the width, height or slope to get to a given tin (which doesn't have to be the Apply Many tin).

For *Width/Height/Tin to tin*, go to the next section [Fill Link - Modify Width, Height or Xfall to Sit on User Tin](#)

Fill Link - Modify Width, Height or Xfall to Sit on User Tin

Width to Tin

For a fill link defined by *width and height* or *width and slope*, **Width to tin** calculates the **width** of the link as the width required so that the link will sit on the user given tin at the **height/slope given in the link**. The option gives an error for a link defined by *height and slope*.

Height to Tin

For a fill link defined by *height* and *width* or *height* and *slope*, the **Height to tin** calculates the **height** of the link as the difference in the height of the start point of the link, and the height that is required so that the link will sit on the user tin at the **width/slope given in the link**. The option gives an error for a link defined by *width* and *xfall*.

Important Note - for a Fill link, **positive** height and slopes are **down**.

Slope to Tin

For a fill link defined by *slope and width* or *slope and height*, **Slope to tin** calculates the **slope** of the link as the *slope* required so that the link will sit on the user tin at the **width/height given in the link**. The option gives an error for a link defined by *width and height*.

Selecting **Width to tin**, **Height to tin**, or **Slope to tin** brings up the **Fill - Width to Tin**, **Fill - Height to Tin** and **Fill - Slope to Tin** panels respectively.

Continue to the next section [Fill Link - to Two Heights](#) or return to [Fill Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fill Link - to Two Heights

For an existing link, the **to 2 heights** option has a number of methods for **defining the height** from the start mode chainage to the end mode chainage. For example, over the chainage range, the height can be interpolated between two given RL's.

However if the *Apply Many* tin is cut before reaching the end of the modified link, the **fill link stops at the tin**.

Note: the **2 Strings** modifiers work with two points in a **section**. See [Fill Link - to Two Strings](#).

Selecting **o 2 heights** brings up the **Fill - to 2 Heights** panel

Fill - Maintaining Width or Slope

The option **to 2 heights** defines the **height** of the selected string so to completely define the link, only the **width** or the **slope** is needed.

So from the selected link only the **width** or the **xfall** is used (maintained) - the height is calculated by the **to 2 heights** option.

If the selected link is defined by **width and height**, then at any chainage a **slope** can be calculated from the width and height at that chainage.

Important note - for a **fill link**, for slope and heights, **positive is down**.

Section View

For links defined by width and height, the **slope** at each chainage is uniquely defined

If the selected link is defined by **slope and height**, then at any chainage a **width** can be calculated from the slope and height at that chainage.

Section View

For links defined by slope and height, the **width** at each chainage is uniquely defined

Hence it doesn't matter if the selected link is defined by **width and slope**, **width and height**, or **slope and height**, at each chainage a **width and slope** are uniquely defined.

So no matter how the selected link is defined, at any chainage, a unique width or a slope is known and it is that **Width** or **Slope** can be maintained by the **to 2 heights** option.

So the choices for the option are:

Continue to the next section [Fill Link - to Two Strings](#) or return to [Fill Link - to Two Heights](#), [Fill Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fill - Calculating the Heights for each Type

Important Note: Grade is calculated using **increasing Alignment chainages** and the **heights at the points** along the string being modifies. When going around a curve this will not be exactly the same as the grade along the string being modified.

The definitions of the calculations for each choice are the same as for the Fixed links. See [Fixed - Calculating the Heights for each Type](#).

Continue to the next section [Fill Link - to Two Strings](#) or return to [Fill Link - to Two Heights](#), [Fill Link Modifiers](#) or [Modifiers in MTF Edit](#).

Fill Link - to Two Strings

The *Fill to 2 strings* walk-right brings up the **Fill to 2 Strings** menu with options to calculate the width, height or slope from two given strings.

For *Width/Height/Slope to 2 Strings*, go to the next section [Fill Link - Width, Height or Slope Between Two Strings](#)

Fill Link - Width, Height or Slope Between Two Strings

Width Between Two Strings

For a fill link defined by *width* and *height* or *width* and *slope*, **Width to 2 strings** sets the **width** for a link to be the **width between two** existing **12d Model** strings,

However if the Apply Many tin is cut before reaching the string, the **fill link stops at the tin**.

The option will give an error for a link defined by *height* and *slope*.

Height Between Two Strings

For a fill link defined by *height* and *width* or *height* and *slope*, **Height to 2 strings** sets the **height** for the link to be the **height between two** existing **12d Model** strings,

However if the Apply Many tin is cut before reaching the string, the **fill link stops at the tin**.

The option will give an error for a link defined by *width* and *slope*.

Slope Between Two Strings

For a cut link defined by *slope* and *width* or *slope* and *height*, **Slope to 2 strings** sets the **slope** for the link to be the **slope between two** existing **12d Model** strings,

However if the Apply Many tin is cut before reaching the string, the **cut link stops at the tin**.

The option will give an error for a link defined by *width* and *height*.

Selecting the **width to 2 strings**, **height to 2 strings** or **slope to 2 strings** option brings up the **Fill - Width to 2 Strings**, **Fill - Height to 2 Strings** and **Fill - Slope to 2 String** panels respectively.

Final Link - No Cut Slope or Final No Fill Slope or Final No Cut/Fill Slope

The final link can be stopped altogether when it is in just cut or just fill or both.

The **no cut slope** modifier stops the final link when it is in *cut*, the **no fill slope** modifier stops the final link when it is in *fill* and the **no cut/fill fill slope** modifier stops the final link when it is in *cut* or *fill*.

Selecting No cut slope, No fill slope or No cut/fill slope brings up the **Final - No Cut**, **Final - No Fill** or

Final - No Cut/Fill panels respectively.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the link to modify.</i>	input		select name menu
Start/End mode <i>defines the start/end chainages for stopping the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval <i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Extra start/end <i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment <i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input		
Active <i>if ticked, use this modifier.</i> <i>if not ticked, don't use this modifier.</i>	tick box	tick	
OK/Apply <i>OK stores the values in the fields and removes the panel.</i> <i>Apply stores the values and leaves the panel on the screen.</i>	button		

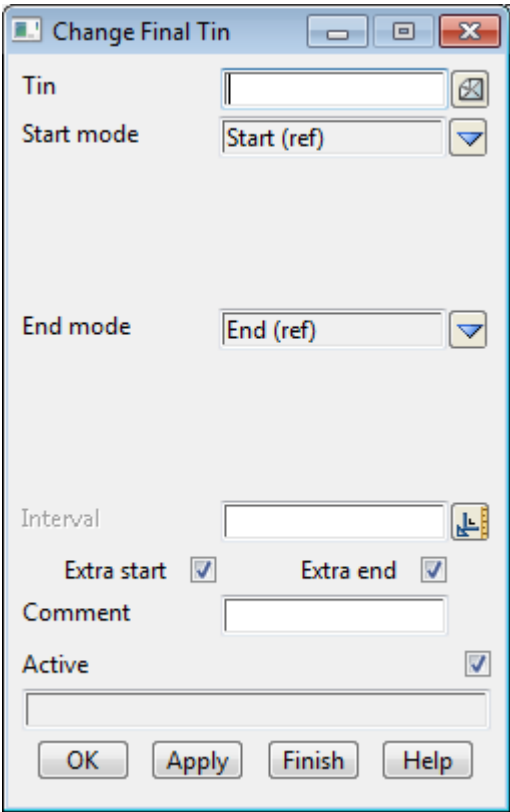

Continue to the next section [Change Final Tin](#) or return to [Final Modifiers](#) or [Modifiers in MTF Edit](#).

Change Final Tin

The tin that the final link batters to can be changed.

The **Change Final Tin** modifier changes the tin that the final cut and fill slopes batter to (the default tin is the tin from the Apply Many).

Selecting **Change tin** brings up the **Change Final Tin** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Tin	<i>name of the tin for the final cut and fill links to batter to.</i>	tin box		available tins
Start/End mode	<i>defines the start/end chainages for stopping the link</i> <i>For more information on Start/End mode, see Start and End Chainages</i>	choice box	Start (ref)/End (ref)	
Interval	<i>if non blank, the interval to use to create cross sections and strings over the given chainage range.</i> <i>If blank, the Section separation value from the Apply Many panel is used.</i>	input		
Extra start/end	<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>	tick box		
Comment	<i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input		
Active	<i>if ticked, use this modifier.</i> <i>if not ticked, don't use this modifier.</i>	tick box	tick	
OK/Apply	<i>OK stores the values in the fields and removes the panel.</i> <i>Apply stores the values and leaves the panel on the screen.</i>	button		

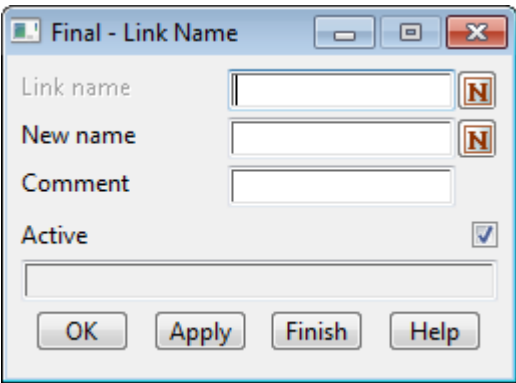

Continue to the next section [Change Final Link Name](#) or return to [Final Modifiers](#) or [Modifiers in MTF Edit](#).

Change Final Link Name

NOTE: THIS OPTION HAS NOT BEEN IMPLEMENTED.

The **Final Link Name** modifier changes the name of the interface string.

Selecting **Final link name** brings up the **Final - Link Name** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Link name <i>name of the tin for the final cut and fill links to batter to.</i>	name box		available names
New name	name box		available names
Comment <i>comment to add to the end of the line. In the file, the comment will be preceded by //.</i>	input		
Active <i>if ticked, use this modifier.</i> <i>if not ticked, don't use this modifier.</i>	tick box	tick	
OK/Apply OK stores the values in the fields and removes the panel. Apply stores the values and leaves the panel on the screen.	button		

Continue to the next section [Comment](#) or return to [Final Modifiers](#) or [Modifiers in MTF Edit](#).

Comment

Selecting **Comment** turns the line of the **Template Modifier** into a field that a comment can be typed into.

	Final - Width		optional	Link: Start: End:	"0.5" IAL 0.5000 0.5000	yes	yes	yes	i
2	The row where the Comment command was selected. A comment is typed into this area								
3									

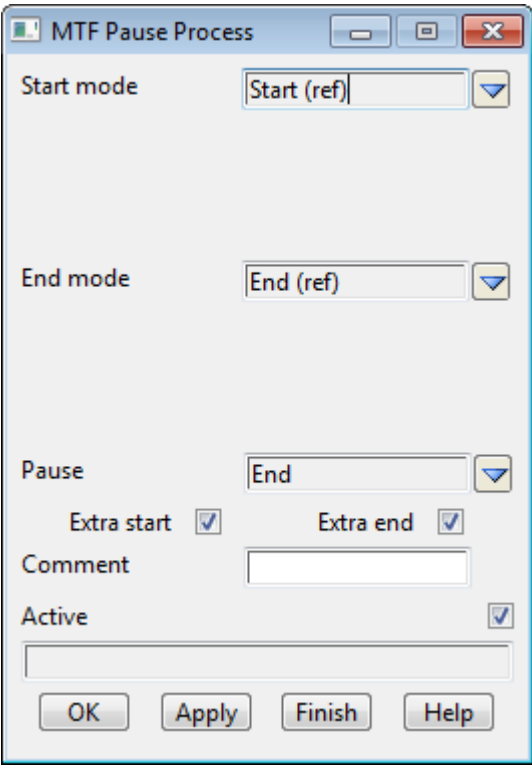

Typing will then enter a comment into this line and the entire line contains just the comment.

	Final - Width		optional	Link: Start: End:	"0.5" IAL 0.5000 0.5000	yes	yes	yes	i
2									
3	This is a comment								

Continue to the next section [Pause](#) or return to [Final Modifiers](#) or [Modifiers in MTF Edit](#).

Pause

Clicking on **Pause** brings up the **MTF Pause Process** panel which is used to enable/disable the processing of all the MTF commands in the given chainage range.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start/End mode	choice box	Start (ref)/End (ref)	
<i>defines the start/end chainages for toggling processing commands on and off</i> <i>For more information on Start/End mode, see Start and End Chainages</i>			
Process	choice box	End	Start, End
<i>if Start, then for a given chainage ch in the chainage range, all commands after this command will be processed until a MTF Pause Process panel with Process set to End (and whose chainage range includes this chainage ch), is met.</i> <i>If End, then for a given chainage ch in the chainage range, all commands after this command will NOT be processed until a MTF Pause Process panel with Process set to Start (and whose chainage range includes this chainage ch) is met.</i>			
Extra start/end	tick box		
<i>if ticked, add an extra x-section 0.1 mm before the start/end chainage.</i>

Continue to the next section [Snippets](#) or return to [Final Modifiers](#) or [Modifiers in MTF Edit](#).

Snippets

Clicking on **Snippet** brings up the **MTF Snippet** panel which is used to insert snippets.

For more information on the inserting and use of snippets, please go to the section [Defining and Using Snippets](#).

Defining and Using Snippets

The sections on snippets are:

[What are MTF Snippets?](#)
[Creating a Snippet](#)
[Creating a Snippet](#)
[An Example of a Snippet](#)
[How To Select a Snippet?](#)
[Start and End Modes for a Snippet](#)
[Snippet Parameters - Real, Text and String Types](#)
[Snippet Parameters - Choice Type](#)
[Snippet Parameters - Tick Type](#)
[Arithmetic in Snippets](#)
[#define in Snippets](#)
[Major Warning - You Will be Caught by This](#)

What are MTF Snippets?

A snippet is a collection of many single MTF modifiers that can be inserted as a group into an MTF file.

However unlike an MTF file or an insert in an MTF, values to be used inside the snippet can be passed down to the snippet via parameters whose values are specified each time the snippet is placed.

So snippets enable things such as driveway laybacks, kerb transitions, earthworks flares etc. to be a single entry in a MTF file thus educing the size of the MTF file and enhancing it's readability.

Setting up a snippet is the same complexity as creating MTF items but once a snippet is created, it can be reused over and over again.

Snippets can also be used to hide complex modifiers from novice users.

Go to the next section [Creating a Snippet](#) or back to [Defining and Using Snippets](#).

Creating a Snippet

There is currently no snippet Create/Editor in **12d Model** so for the moment snippets must be manually created as a text file. Snippet text files have the extension **MTFSNIPPET**.

Luckily the text file format for each command in a snippet is almost identical to the same modifier commands (with "named position" as the Start and End mode) as written out to the left_side_modifier or right_side_modifier section of a text MTF file.

So the easiest way to create a snippet file is to create the mtf inside **12d Model** with the modifiers to go in the snippet (with Start and End modes "named position"), and then pasting those modifiers from the left_side_modifier or right_side_modifier section of the text mtf file into the snippet file.

Thank heavens 12d left the old text definitions for the mtf file in the Help although they haven't been updated for some of the newer MTF options in V9 and V10 (e.g. named_position).

How to construct the additional information in the snippet file, and how a snippet works, will be explained in the following sections.

Go to the next section [An Example of a Snippet](#) or back to [Defining and Using Snippets](#).

An Example of a Snippet

The following is an example of a snippet called KERB_SA_DW places a layback at a driveway. It will be used as the example in describing the workings of a snippet.

```
// PARAMETER WIDTH REAL "Layback width" 0.6
// PARAMETER DEPTH REAL "Layback depth" -0.04

// drop into DW

insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

insert "SAI" "grey" 0.5 $DEPTH unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

insert "SAT" "grey" 0.03 0.15 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

insert "SAB" "grey" 0.18 0 unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

// push out links

width "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.03 $WIDTH
absolute extra_start extra_end

width "SAB" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.18 0.0 absolute
extra_start extra_end

height "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0.15 0.2 absolute
extra_start extra_end

height "SAB" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 0 0 absolute
extra_start extra_end

// DW to -0.5

insert "SKL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end

insert "SKI" "grey" 0.5 $DEPTH unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end

insert "SKB" "grey" $WIDTH 0.2 unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end

//back out -0.5 to end

insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END"
0.0 absolute extra_start extra_end

insert "SAI" "grey" 0.5 $DEPTH unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end

insert "SAT" "grey" 0.03 0.15 unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end

insert "SAB" "grey" 0.18 0 unknown named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END"
0.0 absolute extra_start extra_end
```

```
// push out links  
width "SAT" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 $WIDTH 0.03  
absolute extra_start extra_end  
width "SAB" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 0.0 0.18 absolute  
extra_start extra_end  
height "SAT" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 0.2 0.15 absolute  
extra_start extra_end  
height "SAB" named_position "MODIFIER_END" -0.5 named_position "MODIFIER_END" 0.0 0 0 absolute extra_start  
extra_end
```

Note: each line of the snippet is wrapping around because of the limited width of this document. Each line should be like:

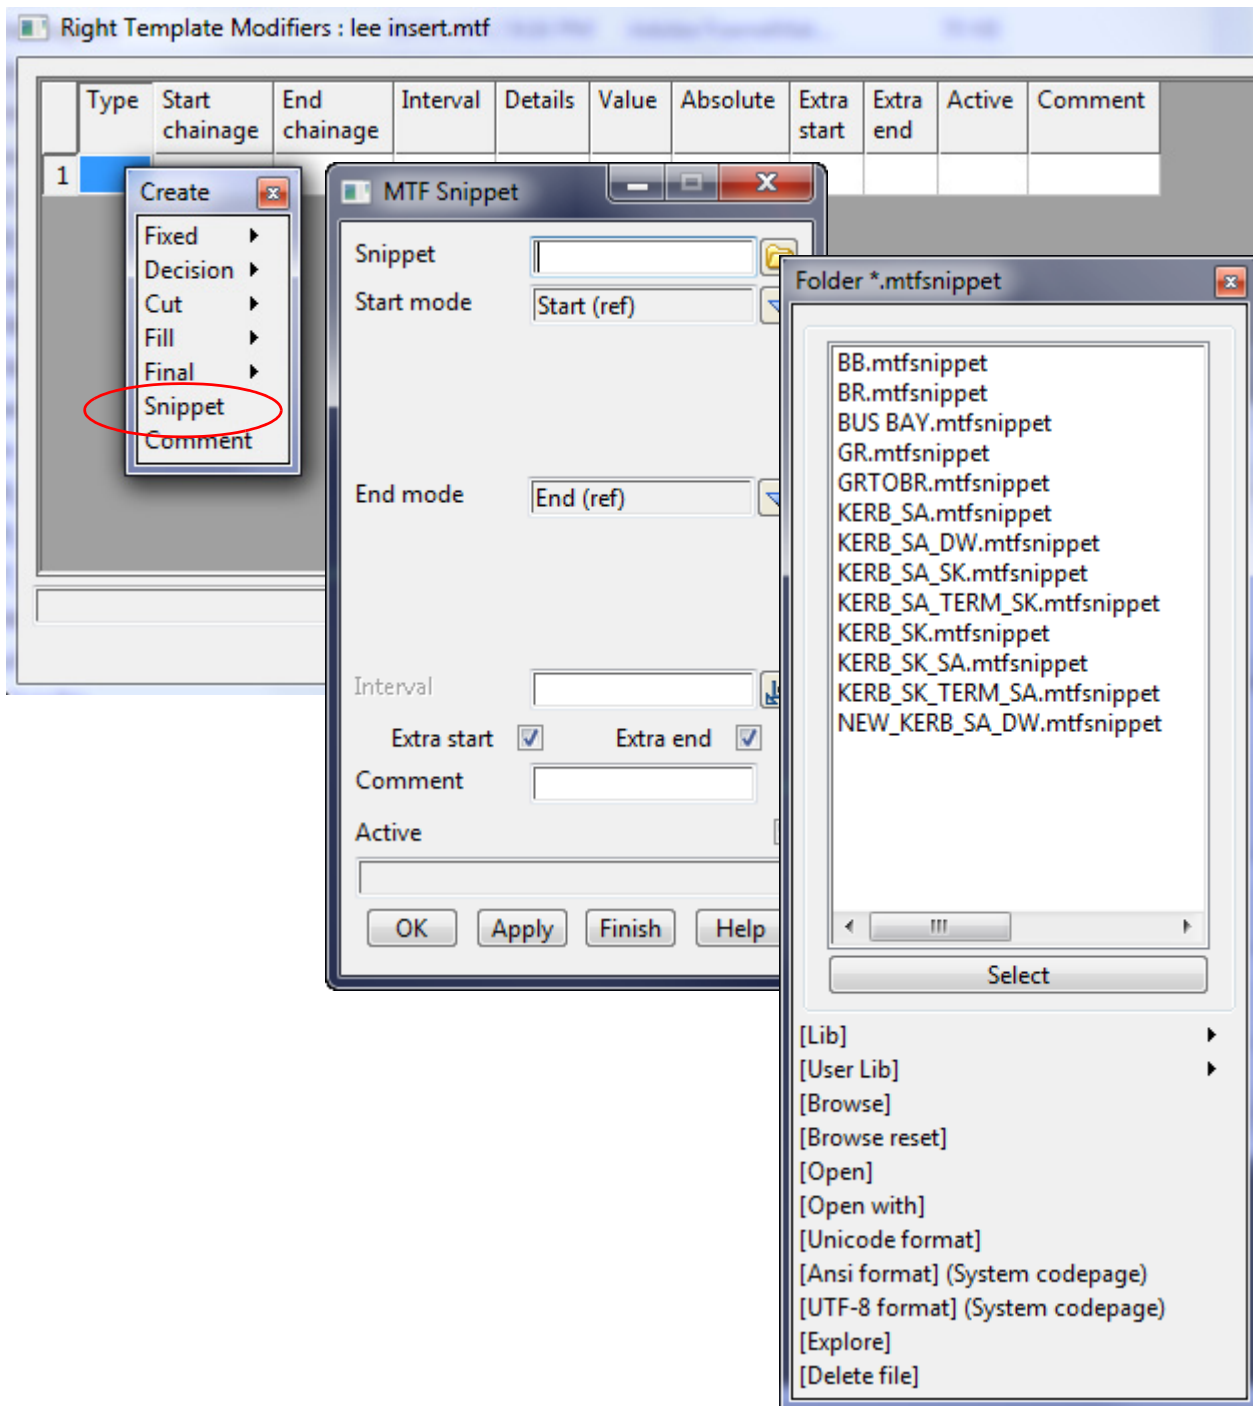

```
// drop into DW  
insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5 absolute extra_start extra_end
```

But that would be impossible to read.

Go to the next section [How To Select a Snippet?](#) or back to [Defining and Using Snippets](#).

How To Select a Snippet?

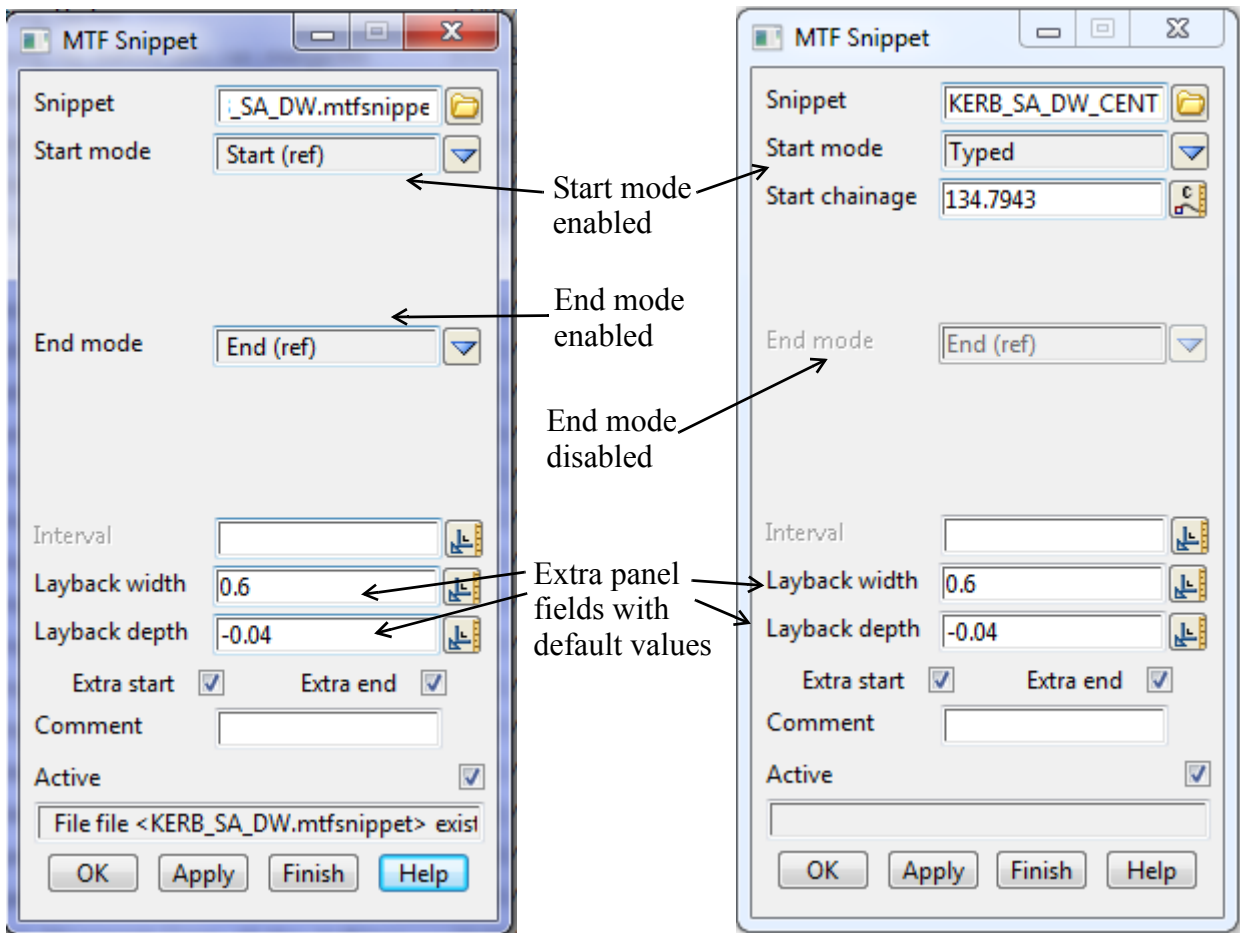

From the **Create** menu brought up from the grid in the **Right Template Modifiers** or **Left Template Modifiers** panel, select **Snippet** to bring up the **MTF Snippet** panel. And clicking on the folder icon in the *Snippet* field brings up the choice of snippets to use.

A snippet is then selected from the snippet pop-up list.

Selecting a snippet can modify the fields on the **MTF Snippet** panel. The **Start** and **End modes** may or may not be enabled, and there may be extra field on the panel, with or without values in them.

For example, selecting the *KERB_SA_DW* snippet modifies the **MTF Snippet** panel and there are two extra panel fields - **Layback width** with the value 0.6 and **Layback height** with the value - 0.4. Selecting the *KERB_SA_DW_CENT* snippet adds the extra panel fields but also disables the **End mode**.

If a Start mode or End mode is missing from the snippet, then the corresponding field will be left blank in the **Start chainage/End chainage** columns in the **Left** or **Right Templates Modifiers** panel. And the snippet name appears in the **Details** column.

Right Template Modifiers : ROAD.mtf							
	Type	Start chainage	End chainage	Interval	Details	Value	Absolut
5	MTF Snippet	Named position (ref) BB CL->CL S 104.5	Cut (other) ZZ->DW -2.5	1	Snippet:	KERB_SA_DW	yes
6	MTF Snippet	Cut (other) ZZ->DW -2.5		0.1	Snippet:	KERB_SA_DW_CENTRE	yes
7	MTF Snippet	Cut (other) ZZ->DW 2.5	Cut (other) ZZ->DW 10	1	Snippet:	KERB_SA	yes
8	Fixed Insert Full Template				Template:	BATTER	yes

is valid

Apply

Finish

A snippet with no End mode has nothing in the End chainage column.

Names of the snippets

How snippets control the **Start** and **End** modes is documented in the next section [Start and End Modes for a Snippet](#) and how the extra panel fields are created is discussed in the sections [Snippet Parameters - Real, Text and String Types](#), [Snippet Parameters - Choice Type](#) and [Snippet Parameters - Tick Type](#).

Go to the next section [Start and End Modes for a Snippet](#) or back to [Defining and Using Snippets](#).

Start and End Modes for a Snippet

The **Start** and **End** modes on the **MTF Snippet** panel calculate a position on the Alignment just like any other *MTF modifier* but how the values are specified inside the snippet file is slightly different to a standard MTF modifier.

Also unlike other MTF modifiers, some snippets only require *one* of the **Start mode** and **End mode** and if that is the case, the mode not required will be greyed out so that it can't be filled in.

The lines in the snippet file are similar to the normal MTF modifiers when "named position" has been selected for the **Start** and **End** modes. However the value of the "named position" in the text command needs to be replaced by either MODIFIER_START or MODIFIER_END followed by a real number.

So for example, the "named_postion" "name" "extension" in a MTF command is replaced by

"named_postion" MODIFIER_START snippet_extension

If a MODIFIER_START exists somewhere in the snippet then **Start mode** is enabled on the **MTF Snipped** panel.

If a MODIFIER_END exists somewhere in the snippet then **End mode** is enabled on the **MTF Snipped** panel.

Finally when a snippet runs, the chainage is calculated for the **Start mode/End mode** fields in the **MTF Snippet** panel and passed down to the snippet and where ever MODIFIER_START/MODIFIER_END appears, the passed chainage value PLUS the additional snippet_extension for each occurrence of the MODIFIER_START/MODIFIER_END is used as the chainage for that part of the snippet.

The following example for the KERB_SA_DW snippet shows how the snippet determines when a **Start mode** and/or **End mode** is needed., and how the extra snippet_extension is used.

```
// drop into DW
insert "SAL" "grey" 0.001 0   unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end

...

// DW to -0.5
insert "SKL" "grey" 0.001 0   unknown named_position "MODIFIER_START" 0.5 named_position
"MODIFIER_END" -0.5 absolute extra_start extra_end

...

// back out to -0.5 to end
insert "SAL" "grey" 0.001 0   unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
```

These lines in the KERB_SA_DW snippet a lip of kerb through a driveway layback. It starts off as an SA style kerb, the layback is an SK style and then back to the SA style.

1. Looking at the first line: - the SA->SK transition:

```
insert "SAL" "grey" 0.001 0   unknown named_position "MODIFIER_START" 0 named_position
"MODIFIER_START" 0.5 absolute extra_start extra_end
```

In this line, the **"named_position" "MODIFIER_START" 0** replaces the standard chainage command in that position in the text modifier.

"named_position" "MODIFIER_START" - this tells the snippet to have a **Start mode** on the **MTF Snippet** panel. The calculated chainage for the **Start mode** field on the **MTF Snippet** panel is then passed to the snippet to be used as the chainage (plus the snippet_extension) in that **"named_position" MODIFIER_START** position in the modifier command.

0 - the value after MODIFIER_START is an additional value to add to the chainage calculated in from the **Start mode** in the **MTF Snippet** panel and passed down to the snippet.

So **"named_position" "MODIFIER_START" 0** is replaced by the chainage defined by the **Start mode** of the **MTF Snippet** panel.

Similarly the **"named_position" "MODIFIER_START" 0.5** replaces the standard chainage command in that position in the modifier and evaluates to being chainage defined by the **Start mode** of the **MTF Snippet** panel **plus 0.5**.

So this snippet line inserts a link from the chainage value passed in from the **Start mode** on the **MTF Snippet** panel, to **0.5 after** the chainage value passed in from the **Start mode** on the **MTF Snippet** panel.

2. Looking at the second line: - SK Layback:

```
insert "SKL" "grey" 0.001 0   unknown named_position "MODIFIER_START" 0.5
named_position "MODIFIER_END" -0.5 absolute extra_start extra_end
```

The difference to the previous line is that this line has the keywords **MODIFIER_START** and **MODIFIER_END** after "named_position" commands.

"named position" "MODIFIER_END" - this tells the snippet to have a **End mode** on the **MTF Snippet** panel. The calculated chainage for the **End mode** field on the **MTF Snippet** panel is then passed to the snippet to be used as the chainage (plus the snippet_extension) in that **"named_position" MODIFIER_END** position in the modifier command.

-0.5 - the value after MODIFIER_END is an additional value to add to the chainage calculated in from the **End mode** in the **MTF Snippet** panel and passed down to the snippet.

So this snippet line inserts a link from 0.5 past the chainage value passed from **Start mode** in the **MTF Snippet** panel through to 0.5 **before** the chainage value passed in from **End mode** in the **MTF Snippet** panel.

3. Looking at the third line: - SK ->SA transition:

```
insert "SAL" "grey" 0.001 0 unknown named_position "MODIFIER_END" -0.5 named_position
"MODIFIER_END" 0.0 absolute extra_start extra_end
```

So this snippet line inserts a link from 0.5 before the chainage value passed to the snippet from the **Start mode** in the **MTF Snippet** panel, to the chainage value passed to the snippet from the **Start mode** in the **MTF Snippet** panel.

Go to the next section [Snippet Parameters - Real, Text and String Types](#) or back to [Defining and Using Snippets](#).

Snippet Parameters - Real, Text and String Types

A powerful feature of snippets is that real and text values, and strings, can be defined as parameters in the snippet file and the parameters used throughout the snippet file.

To pass values for the parameters through to the snippet, each parameter is displayed in the **MTF Snippet** panel (with descriptive text defined in the snippet) so values for the parameters can be entered in the **MTF Snippet** panel and passed through to the snippet.

For each parameter defined in the parameter file, a field is displayed in the **MTF Snippet** panel and the syntax for a parameters in the snippet file is:

```
// PARAMETER param_name param_type param_description param_default_value
```

where

// - this is needed at the beginning of the line

PARAMETER - this is needed after the "//"

param_name - this is the name to use for the parameter. Where ever the parameter is to be used in the snippet, put **\$param_name**. The characters of the parameter name can only be alphanumeric (upper and lower case) and underscores, and the name cannot contain spaces. The name doesn't have quotes around it. The parameter names are not case sensitive so two names only differing by chase are considered to be identical. The parameters names must be unique in a snippet.

param_type - the type of the parameter. this can be REAL, INTEGER TEXT or SELECT.

If REAL then the parameter is a rea/floating point number.

If TEXT then the parameter is an integer number.

If TEXT then the parameter is text.

If SELECT then a string is to be selected for the parameter.

param_description - this description is written in the **MTF Snippet** panel for the field to enter values for this parameter. The description can include spaces and if it does then the description

must be enclosed in double quotes (").

param_default_value - this value is **optional** but if it exists then this value is displayed as the value in the field for the parameter on the **MTF Snippet** panel. If the default value is text and it contains any spaces then the text must be enclosed in double quotes ("). If the default value is a string name, then it must be in the form "model_name->string_name".

The following lines from the KERB_SA_DW snippet define two REAL parameters WIDTH and DEPTH and the values for the parameters are then used inside the snippet commands by writing \$WIDTH and \$DEPTH.

```
// PARAMETER WIDTH REAL "Layback width" 0.6
// PARAMETER DEPTH REAL "Layback depth" -0.04
// drop into DW
...
// push out links
width "SAT" named_position "MODIFIER_START" 0 named_position "MODIFIER_START" 0.5
0.03 $WIDTH absolute extra_start extra_end
...
```

Extra panel fields in MTF Snippet panel because of the parameters WIDTH and DEPTH in the snippet

Description provided by the parameter definition in the snippet

Default value provided by the parameter definition in the snippet

The next example is of a SELECT parameter used in a different snippet.

```
// PARAMETER BB_STRING SELECT "Base string"
```

```
...
```

```
// parallel the selected string
```

```
fixed_parallel "SFML" "SFMB" named_position "MODIFIER_START" 0 named_position  
"MODIFIER_FINAL" 0 "$BB_STRING" interval 0.5 absolute extra_start extra_end
```

```
...
```

Extra string select panel fields in MTF Snippet panel because of the SELECT parameter BB_STRING in the snippet

Description provided by the parameter definition in the snippet

Here the parameter name is **BB_STRING**, its type is **SELECT** and so a Select box appears in the **MTF Snippet** panel with the panel field text **Base string**. The substitution point in the modifier is "**\$BB_STRING**".

Note for SELECT and TEXT type the \$parameter should be quoted in the modifier line.

WARNING - once a snippet with parameters has been saved in a MTF file, the parameters for the snippet are saved **in the MTF file**. Then when the apply many is run, the parameters and their values are read in from the MTF file and passed into the current snippet file.

Hence if the snippet file has been modified and parameter definitions added, modified or removed since the snippet was originally place in the MTF, these modifications of parameters will be **ignored** until the snippet panel is reopened in the MTF editor which forces the snippet file to be parsed again and the changes to the parameter definitions are then recognised.

Note that when the Apply Many for the MTF is run, the MTF used the **current** snippet file so if the snippet file has been modified since the snippet was placed in the MTF, the **modified** snippet file will be used (apart from any new parameter definitions and defaults)

Go to the next section [Snippet Parameters - Choice Type](#) or back to [Defining and Using Snippets](#).

Snippet Parameters - Choice Type

The Snippet Parameter of type Choice pops up a user defined list of choices for the user to select from in the **MTF Snippet** panel.

The syntax for type Choice is:

```
// PARAMETER param_name CHOICE param_description choice_1 choice_2 ... choice_n
```

where

// - this is needed at the beginning of the line

PARAMETER - this is needed after the "/"

param_name - this is the name to use for the parameter. Where ever the parameter is to be used in the snippet, put **\$param_name**. The characters of the parameter name can only be alphanumeric (upper and lower case) and underscores, and the name cannot contain spaces. The name doesn't have quotes around it. The parameter names are not case sensitive so two names only differing by chase are considered to be identical. The parameters names must be unique in a snippet.

CHOICE - the parameter type.

param_description - this description is written in the **MTF Snippet** panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes ("").

choice_1 choice_2 ... choice_n - the choices that will be displayed in the parameter pop-up in the **MTF Snippet** panel.

```
// PARAMETER KT CHOICE "Kerb type" "SA" "SK" "SM" "SC"
```

```
insert "$KT" "grey" 10 0 unknown named_position "MODIFIER_START" (0.0 - _E)
named_position "MODIFIER_END" _E absolute extra_start extra_end
```

...

Extra choice box panel field in the MTF Snippet panel because of the parameter KT

Description provided by the parameter definition in the snippet

Pop-up of choices from the parameter definition in the snippet

Go to the next section [Snippet Parameters - Tick Type](#) or back to [Defining and Using Snippets](#).

Snippet Parameters - Tick Type

The Snippet Parameter of type TICK places a tick box in the **MTF Snippet** panel.

The syntax for type Choice is:

```
// PARAMETER param_name TICK param_default
```

where

// - this is needed at the beginning of the line

PARAMETER - this is needed after the "/"

param_name - this is the name to use for the parameter. Where ever the parameter is to be used in the snippet, put **\$param_name**. The characters of the parameter name can only be alphanumeric (upper and lower case) and underscores, and the name cannot contain spaces. The name doesn't have quotes around it. The parameter names are not case sensitive so two names only differing by chase are considered to be identical. The parameters names must be unique in a snippet.

TICK - the parameter type.

param_description - this description is written in the **MTF Snippet** panel for the field to enter values for this parameter. The description can include spaces and if it does then the description must be enclose in double quotes ("").

param_default - this value is **optional** but if it exists then it must be 1 or a 0.

If 1, the tick box come up set to tick/on.

If 0, the tick box come up set to not ticked/off.

```
// PARAMETER KT CHOICE "Kerb type" "SA" "SK" "SM" "SC"
// PARAMETER TI TICK "Use extensions" 1
#if $TI
#define _E 3
#else
#define _E 0
#endif

insert "$KT" "grey" 10 0 unknown named_position "MODIFIER_START" (0.0 - _E)
named_position "MODIFIER_END" _E absolute extra_start extra_end

...
```

Extra tick box panel field in the MTF Snippet panel because of the parameter TI

Description provided by the parameter definition in the snippet

Pop-up of choices from the parameter definition in the snippet

Note that in the above example, the value of the Tick box parameter TI (\$TI), is used in a #define to set the value for **_E** (see [#define in Snippets](#)).

Go to the next section [Arithmetic in Snippets](#) or back to [Defining and Using Snippets](#).

Arithmetic in Snippets

Arithmetic expressions can be used for any of the real values in the lines of a snippet file as long as special rules are obeyed.

1. If a real value is replaced by an expression then the expression must be surrounded by round brackets. That is "(" and ")".
2. If the arithmetic operators plus **+**, minus **-**, multiplication ***** and division **/** are used then there must be a space on either side of them.

For example, **(\$TL - \$PL)** and **(0.0 - (\$DL / 2.0) - 0.5)**

Note that the negative of a number has the negative sign hard up against the number with no space in-between. For example **-0.5**

WARNING - a future interactive Snippet editor may not be able to support arithmetic in snippets. Those snippets with arithmetic will still need to be modified using a text editor.

An example of some lines from a snippet file using an arithmetic expression is:

```
// RTA Type F Half Kerb to SA transition

// PARAMETER TL REAL "Transition Length" 5.5
// PARAMETER PL REAL "Part Length" 1.340

// insert the links for the 'F' to 'short F' transition

insert "1" "grey" 0.001 0.000 unknown named_position "MODIFIER_START" 0.0 named_position
"MODIFIER_START" ($TL - $PL) absolute extra_start extra_end

insert "2" "grey" 0.499 -0.040 unknown named_position "MODIFIER_START" 0.0 named_position
"MODIFIER_START" ($TL - $PL) absolute extra_start extra_end

...
```

Go to the next section [#define in Snippets](#) or back to [Defining and Using Snippets](#).

#define in Snippets

#define can be used in a snippet file to define parameters for use inside the snippet file.

WARNING - a future interactive Snippet editor may not be able to support #define. Those snippets with #define will still need to be modified using a text editor.

The #define is placed at the beginning of a line, followed by one or more spaces and then the define_name to be used, and then one or more spaces and the expression that the define_name stands for.

```
#define define_name define_expression
```

Then the define_name can be used instead of the define_expression anywhere else in the snippet file following the #define.

Note - snippet parameters can be used in the define_expression as long as the definition of the parameter occurs before the #define.

For example

```
// PARAMETER DL REAL "Drive length" 3.0
// PARAMETER WD REAL "Layback width" 0.6
// PARAMETER DP REAL "Layback depth" -0.04

#define _DR1 (0.0 - ($DL / 2.0) - 0.5)
#define _DR2 (0.0 - ($DL / 2.0) )
#define _DR3 ( ($DL / 2.0) )
#define _DR4 ( ($DL / 2.0) + 0.5)

// drop into DW
insert "SAL" "grey" 0.001 0.000 unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAI" "grey" 0.499 $DP unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAT" "grey" 0.030 0.150 unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end
insert "SAB" "grey" 0.180 0.000 unknown named_position "MODIFIER_START" _DR1
named_position "MODIFIER_START" _DR2 absolute extra_start extra_end

...
```

and the example using a Tick parameter:

```
// PARAMETER KT CHOICE "Kerb type" "SA" "SK" "SM" "SC"
// PARAMETER TI TICK "Use extensions" 1
#if $TI
#define _E 3
#else
#define _E 0
#endif

insert "$KT" "grey" 10 0 unknown named_position "MODIFIER_START" (0.0 - _E)
named_position "MODIFIER_END" _E absolute extra_start extra_end

...
```

Go to the next section [Major Warning - You Will be Caught by This](#) or back to [Defining and Using Snippets](#).

Major Warning - You Will be Caught by This

WARNING - once a snippet with parameters has been saved in a MTF file, the parameters for the snippet are saved *in the MTF file*. Then when the apply many is run, the parameters and their values are read in from the MTF file and passed into the current snippet file.

Hence if the snippet file has been modified and parameter definitions added, modified or removed since the snippet was originally placed in the MTF, these modifications of parameters will be **ignored** until the snippet panel is reopened in the MTF editor which forces the snippet file to be parsed again and the changes to the parameter definitions are then recognised.

Note that when the Apply Many for the MTF is run, the MTF used the **current** snippet file so if the snippet file has been modified since the snippet was placed in the MTF, the **modified** snippet file will be used (apart from any new parameter definitions and defaults)

Return to the MTF Snippets section [Snippets](#) or go to the next section [MTF Stripping](#).

MTF Stripping

A fixed stripping depth can be specified in the **Apply** option whilst the **Apply many** option allows for stripping depths that can **vary along the design**.

If a **non-zero stripping depth** exists at a chainage, the **cut** and **fill** calculations are done with respect to the section through the tin **dropped in height** by the stripping depth.

However, the **design strings** are generated by battering into the **unstripped** surface, and the stripping volume is the volume between the stripped and unstripped surface for the design.

Stripping depths are defined for chainages along the reference string and can be linearly interpolated between chainages.

NOTE: Cut and fill areas and volumes are adjusted for the stripping depths. The total stripping volume is given at the end of the volumes report.

Selecting the **Stripping** option on the **MTF edit** menu brings up the **Stripping Changes** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage	column header		
<i>list of chainages for defining stripping depth.</i>			
Strip depth 1	column header		for the field - measures menu
<i>strip depth to apply at the chainage given for this row of information. If strip depth 2 is blank, then strip depth 1 is applied until the next chainage in the chainage column.</i>			
Strip depth 2	column header		for the field - measures menu

if **non-blank**, the strip depth to linearly interpolate to and finish with at the next chainage in the chainage column.

if blank, then strip depth 1 applies to the next chainage in the chainage column.

In the mtf file, the two depths will be separated by a comma.

Comment	column header

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Please continue to the next section [MTF Boxing](#).

MTF Boxing

In the **MTF**, up to eight (8) layers of boxing can be defined.

For each boxing layer, the boxing can be defined by

- (a) the Left boxing only
- (b) the Right boxing only
- (c) the Left and Right boxing.

For cases (a) and (b), the Left boxing or the Right boxing defines the boxing across the **entire** design section and then only one of Left boxing or Right boxing is needed.

For case (c) where **both** Left and Right boxing are defined for a design section, then the *last point of the left boxing* is automatically connected to the *first point of the right boxing*.

Warning for case (c), the Left boxing must end before the Right boxing begins. If there is an overlap, the Right boxing will be pushed to the **end** of the Left boxing.

Note - no interpolation or modifiers exist for boxing.

For a general discussion of Boxing, go to the section [What is Boxing ?](#), for the scenarios of applying Boxing, including but not restricted to the MTF, go to the section [Applying Boxing](#), and in particular [Scenario 1 - Design Generated by One Apply Many](#).

When boxing is used in the **Apply many**, the cut and fill areas and volumes are also calculated for all the inter-boxing layers. The **last layer** defined is also referred to as the **subgrade** layer and volumes are also given for the natural surface to the subgrade, and the design to the subgrade.

The **Boxing** walk-right in the **MTF Edit** menu brings up the **Boxing** menu with options to specify the file supplying the boxing definitions and options to apply the definitions to the Left and Right side of the design sections.

For the option *File*, go to

Left/Right side

Left/Right side for each layer

[MTF Boxing File](#)

[Left Side and Right Side Boxing](#)

[Left Side and Right Side Boxing](#)

Each of the options from this menu will now described.

MTF Boxing File

Selecting **File** from the **Boxing** menu brings up the **Boxing File** panel for defining the file of **Boxing Definitions** to be used in this **Apply Many**.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Boxing file <i>name of the Boxing file containing the Boxing Definitions to be used for the MTF.</i>	input		*.bf files
Comment <i>comment to add to the end of the line. In the text mtf file, the comment will be preceded by //.</i>	column header		
OK/Apply OK stores the values in the fields and removes the panel. Apply stores the values and leaves the panel on the screen.	button		

The full definition of all the boxing command used in a **Boxing Definition** is given in the section [Full Definition of Boxing](#).

Please continue to the next section [Left Side and Right Side Boxing](#).

Left Side and Right Side Boxing

The panels brought up by selecting **Left side** or **Right side** from the **Boxing** menu brings up the **Left Side Boxing** and **Right Side Boxing** panels respectively. By default, this is for the first layer of boxing.

The **Left Side Boxing** and **Right Side Boxing** panels define for each boxing layer, what Boxing Definitions (from the boxing file) are applied, in what chainage ranges, along the reference string.

For the definition of boxing, go to the section [Full Definition of Boxing](#)

The panels are brought up by selecting **Left side** or **Right side** for **Layer 2** to **Layer 8** from the **Boxing** menu and then selecting the *Layer number* in the **Layer** choice box. Similar panels exist for *Left* and *Right*, and for each selected layer, and so won't be documented separately.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage	column header		
<i>chainage to start applying the Boxing Definition given in the Boxing column.</i>			
Boxing	column header		for the fields - available boxing
<i>name of the Boxing Definition to apply from this chainage to the next chainage in the Chainage list.</i>			
Comment	column header		
<i>comment to add to the end of the line. In the text MTF file, the comment will be preceded by //.</i>			
OK/Apply	button		
OK stores the values in the fields and removes the panel.			
Apply stores the values and leaves the panel on the screen.			

Please continue to the next section [MTF Super/Widening](#).

MTF Super/Widening

The **Super Alignment** string can define the super elevation and widening for a design.

This super elevation and widening can be applied to the strings defined by the Apply many rather than having to use MTF crossfall and width modifiers.

This section defines which strings in the apply have super elevation/widening from the super alignment applied to them

For the option *Enable super/widening names*, go to

Left super

Left widths

Right super

Right widths

[Enable Super/Widening Names](#)

[Left Super](#)

[Left Widths](#)

[Right Super](#)

[Right Widths](#)

Each of the options from this menu will now be described.

Enable Super/Widening Names

For **12d Model** Version 8, super elevation/widening from the super alignment was applied to strings in the fixed section of the template that were defined by crossfall.

For **12d Model** 9, this method was replaced by being able to **define by string name**, which strings have super elevation and/or widening applied to them.

For backward compatibility, this option allows the user to either use string names, or to revert to the cross fall method used in version 8. The default is to use string names.

Selecting **Enable super/widening names** from the menu displays the **Auto Super/Widening** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Enable names	tick box	tick	

*if ticked, the super elevation/widening in the super string is applied to the string names as given in the **Left/Right super** and/or **Left/Right widths** options.*

If not ticked, the super elevation/widening in the super string is applied to the string from the fixed

template that are defined by crossfall.

Left Super

This table defines the strings that have the left super elevation from the super alignment applied to them.

Selecting **Left Super** from the menu displays the **Left Side Super Crossfall Strings** panel.

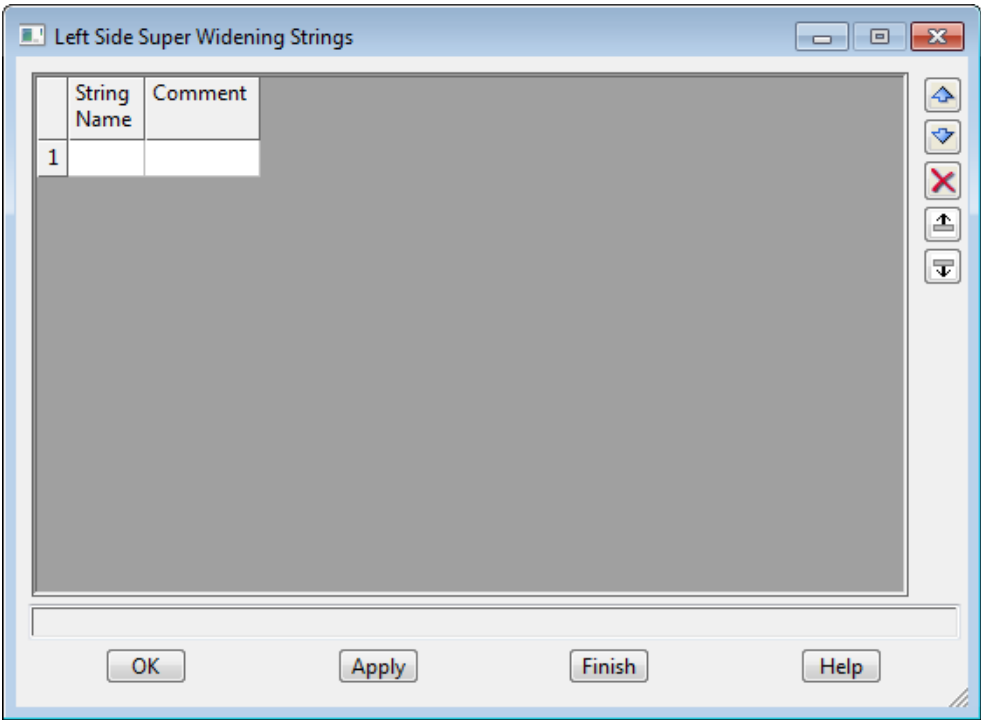

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String name	column header		
<i>names of the strings to apply the left super elevation of the super alignment to.</i>			
Comment	column header		
<i>comment to be recorded.</i>			

Left Widths

This table defines the strings that have the left widening from the super alignment applied to them.

Selecting **Left widths** from the menu displays the **Left Side Super Widening Strings** panel.

Field Description	Type	Defaults	Pop-Up
String name	column header		
<i>names of the strings to apply the left widening of the super alignment to.</i>			
Comment	column header		
<i>comment to be recorded.</i>			

Right Super

This table defines the strings that have the right super elevation from the super alignment applied to them.

Selecting **Right super** from the menu displays the **Right Side Super Crossfall Strings** panel.

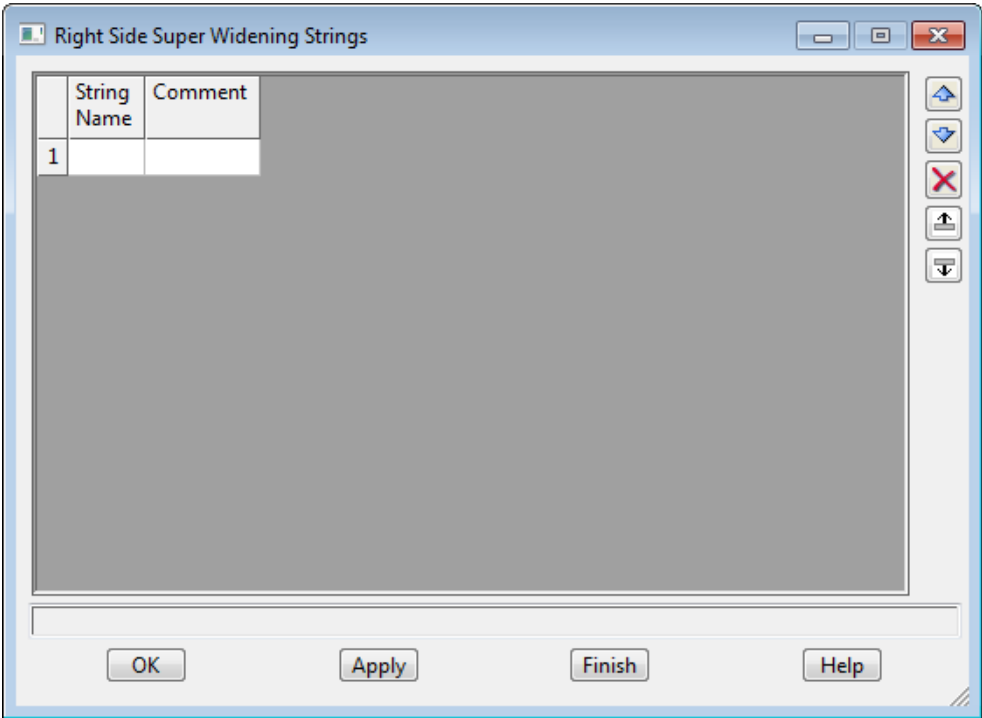

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
String name		column header		
	<i>names of the strings to apply the right super elevation of the super alignment to.</i>			
Comment		column header		
	<i>comment to be recorded.</i>			

Right Widths

This table defines the strings that have the right widening from the super alignment applied to them.

Selecting **Right widths** from the menu displays the **Right Side Super Widening Strings** panel.

- String name** column header
names of the strings to apply the right widening of the super alignment to.
- Comment** column header
comment to be recorded.

Please continue to the next section [MTF Loops](#).

MTF Loops

The Loops options tries to remove loops in nominated strings generated by the Apply Many.

Important Note - the sections generated from the Apply Many will not be modified and will still intersect each other. In that case, the sections can be generated after the **Apply Many** by cutting through strings. See [Cuts by Centreline](#).

Selecting **Loops** from the menu displays the **Remove loops** panel.

Name column header

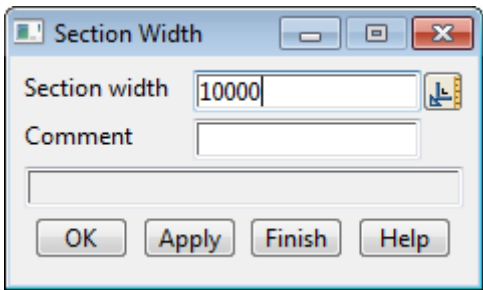

names of the strings to process to try and remove any loops from. The names can include wild cards () and wild characters (!).*

Please continue to the next section [MTF Width](#).

MTF Width

A **section width** is used to limit the distance to search along a section when trying to find strings used in any of the mtf commands.

Selecting **width** from the **mtf edit** men brings up the **section width** panel for setting the width.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Section width	input	10000	

***Section width** defines the perpendicular offset from the Hinge string. It is used to limit the search distance for strings when performing MTF modifier commands.*

Comment	column header

comment to add to the end of the line. In the file, the comment will be preceded by //.

OK/Apply	button
-----------------	--------

***OK** stores the values in the fields and removes the panel.*

***Apply** stores the values and leaves the panel on the screen.*

Please continue to the next section [MTF String Modifiers](#).

MTF String Modifiers

Unlike the other MTF options, the **string modifier** options modify the *heights* on an **existing** string called the **amend string**.

Like the apply options, a reference string is used to define chainage and what is perpendicular at each chainage. A hinge string is used to define offsets and heights. If no hinge string is selected, the reference string is also used as the hinge string.

For a given chainage on the reference string (chainage point), a line perpendicular to the reference string is constructed to cut through the hinge string and the amend string (the cut points are called the **hinge point** and the **amend point**).

Horizontal offset is defined as the offset value from the hinge point, and the height of the **amend** point is a modification of the height at the hinge point.

The string modifier options create and/or modify the heights of the **amend** points on the amend string.

The *height* of the amend point is *derived from the hinge point* by starting with the height of the hinge point and applying a crossfall to it across the offset distance from the hinge string to the amend string.

The cross fall can be defined by either:

- (a) giving the cross fall
- or
- (b) using the cross fall between two user selected strings.

For the string options, the length of string being modified is restricted by giving a start and end reference chainage. A chainage interval can also be specified to define extra reference chainage points to use between the start and end chainages.

How and where the amend string is modified depends on the *type* of string and whether the chainage interval is blank (null) or not.

What Points are Modified

For 3d, 4d, polyline and super strings:

If the chainage interval is not blank:

- (a) The start and end chainage points are projected *from the reference string* and **inserted** into the **amend** string. The *heights* of the inserted points are defined by the string modifier command.
- (b) The chainage points at the given chainage interval are also projected from the reference string and **inserted** into the **amend** string. The *heights* of the inserted points are defined by the string modifier command.
- (c) Finally, the **vertices** of the **amend** string are dropped perpendicularly *back onto* the hinge and reference string and then those points used to modify the *heights* of the same vertices of the amend string.

If the chainage interval is blank:

- (a) The start and end chainage points are projected *from the reference string* and **inserted** into the **amend** string. The *heights* of the inserted points are defined by the string modifier command.
- (b) The **vertices** of the **amend** string are dropped perpendicular *back onto* the hinge and reference string and then those points used to modify the *heights* of the same vertices of the amend string.

For Alignment strings:

If the chainage interval is not blank:

- (a) All the vertical geometry is removed between the start and end chainages. That is, the vertical intersection points (VIP's) and their associated vertical curves are removed.
- (b) The start and end chainage points are projected *from the reference string* and **vertical intersection points (VIP's) inserted** into the **amend** string. The *height* of the inserted VIP points are defined by the string modifier command.

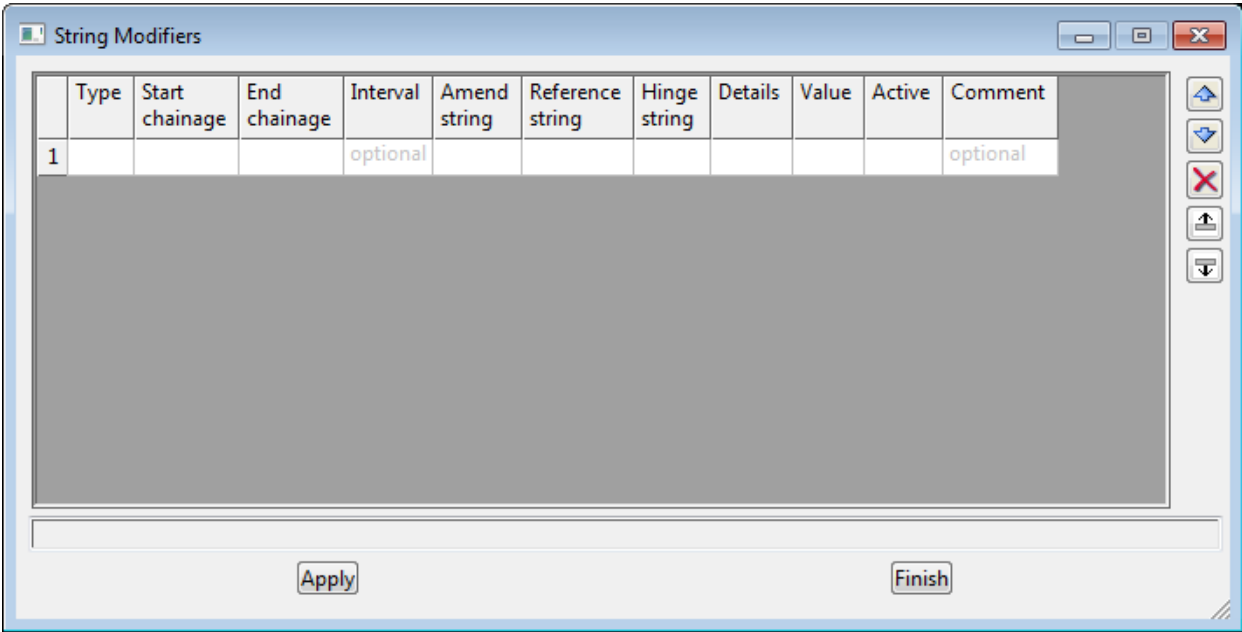

If the chainage interval is blank:

- (a) The start and end chainage points are projected *from the reference string* and **vertical intersection points (VIP's) inserted** into the **amend** string. The *heights* of the inserted VIP points are defined by the string modifier command.
- (b) The **vertical intersection points (VIP's)** of the **amend** string are dropped perpendicularly *back onto* the hinge and reference strings and then those points used to modify the *heights* of the same VIP's of the amend string. The vertical curves for the VIP's are not changed.

String Modifiers in MTF Edit

For information on how the String Modifiers in the MTF editor work, please go to the previous section [MTF String Modifiers](#).

Selecting **Strings** from the **MTF Edit** menu brings up the **String Modifiers** panel.

The **String Modifiers** panel consists of a scrolling **command** fields and an **OK** or **Apply** button to record the results.

The **width** of the **command** area in the **String Modifiers** panel is controlled by the environment variable `DEFAULT_TABLE_WIDTH_4D`.

If the **command** line is **empty**, clicking LB in the **command** line will bring up the **Create** menu which contains the available String commands.

modify by xfall and height
modify by 2-strings

Selecting a menu item will bring up an associated panel which displays the information required for the modifier command.

When the panel is filled in and **OK** or **Apply** selected, the panel information is written out to the **command** line in the correct format for that modifier command.

If the **command** line is **not empty**, clicking LB in the **command** line will bring up the associated panel for the modifier command in the **command** line.

The information in the panel can be changed and if **OK** or **Apply** is selected, the changed panel information is written out to the **command** line in the correct format for that modifier command.

Each of the panels created by selecting a command from the **Create** menu, will now be described.

Height

The *height* the **Height** string modifier calculates for the amend point is given by:

- (a) if the absolute flag is not set, the height of the hinge point, otherwise zero.
- plus
- (b) the interpolated height for the user given heights at the start and end chainages
- plus
- (c) the interpolated height for the user given cross falls at the start and end chainage.

That is, if the absolute flag is not set:

$$\text{new height} = \text{hinge height} + (\text{interpolated height}) + (\text{interpolated xfall}) \times (\text{offset distance})$$

If the absolute flag is set:

$$\text{new height} = (\text{interpolated height}) + (\text{interpolated xfall}) \times (\text{offset distance})$$

Selecting **Height** brings up the **String Modify by Xfall Height** panel

For more information on how the String Modifiers in the MTF editor work, please go to the section [MTF String Modifiers](#).

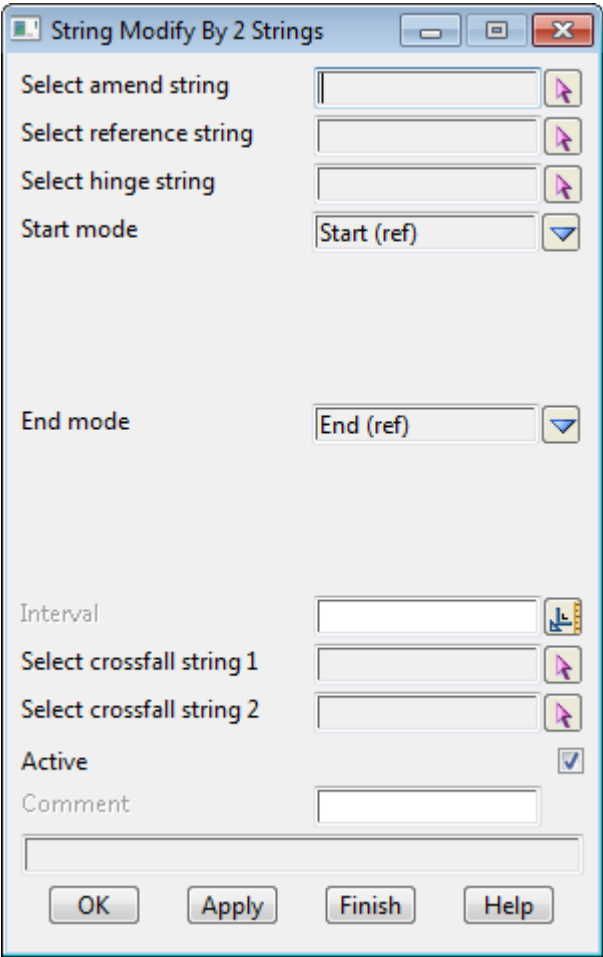

Height 2X

The *height* the **Height 2x** string modifier calculates for the amend point is given by:

- (a) the height of the hinge point
- plus
- (b) the offset distance multiplied by the cross fall between two user selected strings.

new height = hinge height + (xfall between string 1 and string 2) x (offset distance)

Selecting **Height 2x** brings up the **String Modify by 2 Strings** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Amend string <i>select string to have heights amended.</i>	string-select		
Reference string <i>select reference string.</i>	string-select

OK stores the values in the fields and removes the panel.		
Apply stores the values and leaves the panel on the screen.		

For more information on how the String Modifiers in the MTF editor work, please go to the section [MTF String Modifiers](#).

MTF Save

If **Save** is clicked, the MTF is saved to disk and the **MTF Edit** panel is left on the screen.

MTF Recalc

If **Recalc** is clicked, the **Apply Many** associated with the MTF is **recalced**.

MTF Auto Recalc

if tick a recalc is done when "Apply" is clicked on Modifiers panels

If **Auto recalc** is ticked, then whenever the **Apply** button is clicked on any of the panels for the **Modifiers - Left Side Modifiers** or **Modifiers - Right Side** or **Boxing Definitions** used in the **Boxing**, then a **recalc** of the associated **Apply Many** for the MTF is done.

MTF Shift

In an *mtf*, many modifiers are defined in terms of chainage on the reference string. For example, the width modifier is defined to apply between a given start and end chainage on the reference string.

If the horizontal geometry of the reference string is modified, many of the reference chainages in the mtf will be incorrect. **Shift** can help correct the chainages in the mtf file when modifications are made to the reference string horizontal geometry *after the mtf has been defined*.

For the *mtf* and all special chainage files referred to in the *mtf*, **Shift** adds a delta chainage (the *shift distance*) to chainages within a user specified range.

However depending on the type of modifications made to the reference string, **shift** may have to be applied a number of times over a number of different chainage ranges. And apart from a simple change of start chainage, there may be chainages that can not be corrected with **Shift**.

Before using **Shift**, it is necessary to know *how* the reference string has changed from its original position so to use shift it is advantageous to make a **copy** of the reference string **before** any changes are made.

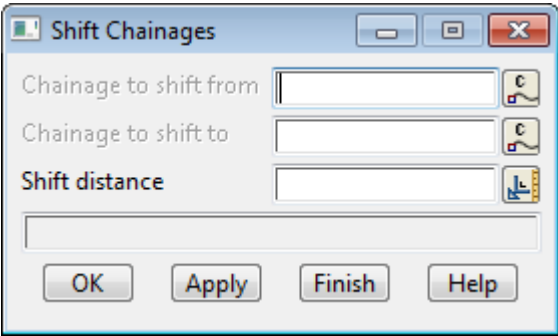

Examples Using **Shift**:

- 1. If only the start chainage of the reference string was modified, **shift** would be applied to the mtf for the entire **original** reference string and end chainages, with a *shift distance* equal to the difference between the new and the old start chainages for the reference string. For this case the horizontal geometry has not changed, just the chainages.
- 2. If the radius of a horizontal curve is changed in the middle of the reference string, all chainages from the beginning of the string up to point where the horizontal geometry starts to change would stay the same. At some point after the modified curve, the horizontal geometry of the string is unchanged and for this section of the mtf, a shift distance equal to the difference between the new and the old chainages of a non-modified point.

In all areas where the horizontal geometry has been modified, the chainages in the mtf would have to be carefully examined to see what changes are required.

Warning: **Shift** option is very powerful but is also very dangerous.

Selecting **Shift** brings up the **Shift Chainages** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage to shift from	chainage box		measure chainage
<i>chainage in the mtf to start adding the Shift distance</i>			

*Any chainages in the mtf file (and any associated special chainage files) between the **Chainage to shift from** and the **Chainage to shift to** will have **Shift distance** added to them.*

Chainage to shift to chainage box measure chainage
*chainage in the mtf to stop adding the **Shift distance***

*Any chainages in the mtf file (and any associated special chainage files) between the **Chainage to shift from** and the **Chainage to shift to** will have **Shift distance** added to them.*

Shift distance input
*delta chainage to add to all the chainages in the mtf file and any special chainages that are between the **Chainage to shift from** and the **Chainage to shift to***

OK/Apply button

OK *applies the shift and removes the panel.*
Apply *applies the shift and leaves the panel on the screen.*

MTF Quit

If **Quit** is clicked, the MTF is **not** saved to disk and the **MTF Edit** panel is closed.

MTF Save and Finish

If **Save & Finish** is clicked, the MTF **is** saved to disk and the **MTF Edit** panel then closed.

What is Boxing ?

A design is represented in 3d as a collection of strings. The design can also be approximated as a series of sections perpendicular to the centreline at various chainages. These are known as design cross section, or design sections.

Representing Cross Sections in 12d Model

In **12d Model**, cross sections, are represented as **4d super strings**.

A 4d super string has an (x,y,z) coordinate for each vertex, PLUS text at each vertex. Hence, there are four bits of information, an (x,y,z,text) value, for each vertex.

Cross sections are generated in **12d Model** by options such as

- (a) cuts through strings along a centreline (see [Cuts by Centreline](#))
- (b) the functions **Apply Many** (see [Apply Many](#)) or **Apply** (see [Apply](#))
- (c) the **Boxing Many Function** (see [Boxing Many Function](#))

For these cross sections, the **text** at each vertex of the 4d super string (vertex/point text), is the **name of the string** that the section cuts through at that vertex.

Also when the cross sections are generated by these options, the start chainage of the 4d string is set so that the chainages **along the 4d string** are the same as the **offset** of the vertices from the centreline used when generating the sections.

Named vertices (points) across a 4d super string representing a cross section through the strings

Boxing Layers

A Boxing Layer is simply another surface, usually modelling a construction material layer, under (or above) the design. The Boxing Layer is represented by strings, and also as a series of sections at the same chainages as the design sections.

Boxing Layers are normally defined in terms of the named vertices across the design section, offsets from the centreline, in terms of other boxing layers already specified, or in relationships to other strings.

When boxing is generated in the **Apply Many** or the **Boxing Many Function**, there can be up to **eight (8)** layers of boxing and the **last** layer defined is referred to as the **subgrade** layer.

In **12d Model** there are special commands called **Boxing Commands** that are be used to build a boxing layer.

A series of **12d Model** boxing commands are grouped together as a **Boxing Definition** and when a *Boxing Definition* is applied to a cross section, it generates a boxing section. That is, it generates a section that is part of a particular Boxing Layer.

Each **Boxing Definition** is given a name, and is stored in a **Boxing** file. The names of the *Boxing Definitions* must be unique within the *Boxing* file.

How the **Boxing** file and **Boxing Definitions** are applied in **12d Model** is described in the next section [Applying Boxing](#), and this is followed by the full definition of **12d Model** boxing and the **12d Model** boxing commands in the sections starting with [Full Definition of Boxing](#).

Applying Boxing

For any **12d Model** project there are a number of different data creation scenarios and the appropriate method to use to generate boxing depends on how the data has been created, or is available, inside **12d Model**.

See [Scenario 1 - Design Generated by One Apply Many](#)

See [Scenario 2 - More than One Apply Many Needed to Generate the Design](#)

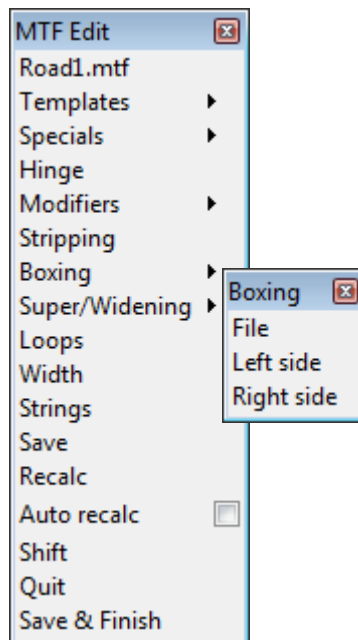

See [Scenario 3 - Design Provided as Strings Only](#)

See [Scenario 4 - Design Sections Already Exist](#)

Scenario 1 - Design Generated by One Apply Many

If a design is generated by just **one Apply Many** function, then up to eight (8) layers of boxing can also be generated at the same time by the **Apply Many** function.

In the **Apply many** option, the **MTF**, controls which **Boxing** file is used, and how the various Boxing Definitions from that file are used to create each layer of boxing.

In the **MTF Edit** menu, the **Boxing File** option specifies which **Boxing** file of **Boxing Definitions** is used.

For each boxing layer, the boxing can be defined by

(a) the Left boxing only

(b) the Right boxing only

or

(c) the Left and Right boxing.

For cases (a) and (b), the Left boxing or the Right boxing defines the boxing across the entire design section and then only Left boxing or Right boxing is needed.

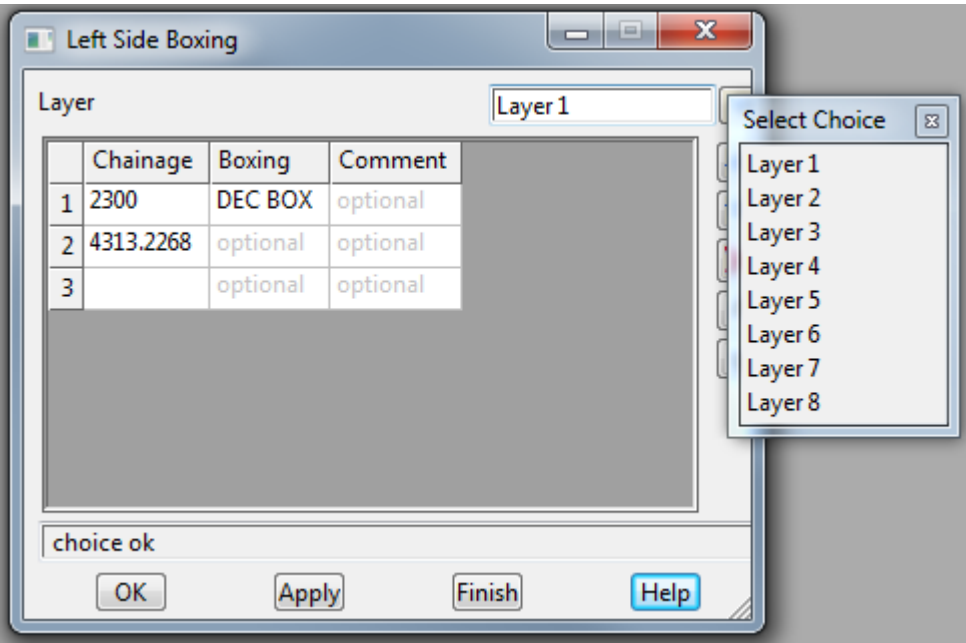

For case (c) where **both** Left and Right boxing are used to define the boxing across the design section, the **last point of the Left boxing** is automatically **connected** to the **first point of the Right boxing**.

Warning for case (c), the Left boxing must end before the Right boxing begins. If there is an

overlap, the Right boxing will be pushed to the **end** of the Left boxing.

Note - no interpolation or modifiers exist for boxing.

For each layer, the **Left side /Right side** specifies what Boxing Definition to use over what chainage range.

See [MTF - Many Templates File](#) and [MTF Boxing](#).

Go to the next section [Scenario 2 - More than One Apply Many Needed to Generate the Design](#) or back to [Applying Boxing](#).

Scenario 2 - More than One Apply Many Needed to Generate the Design

In more complex designs, a number of separate **Apply Many**'s may be needed, and even some strings hand crafted, to produce the final design. Hence the design is only fully represented by a **collection of strings**.

In this situation, design sections are produced as a **post process** using **Cuts through strings** by either

Utilities =>A-G =>Cuts =>by centreline

which can cut through a Data Source of strings (see [Cuts by Centreline](#)), or by

Design =>Boxing =>Boxing many (function)

which can only cut through one model of strings (see [Boxing Many Function](#)).

Note - the design sections produced by both options are **4d super strings** where the text at each vertex of the super string is the **name** of the string **cut** to create that vertex of the super string.

The methods described in [Scenario 4 - Design Sections Already Exist](#) are then used to generate boxing from the created design sections.

Go to the next section [Scenario 3 - Design Provided as Strings Only](#) or back to [Applying Boxing](#).

Scenario 3 - Design Provided as Strings Only

Sometimes you only have the strings defining the design (the design strings).

This case is similar to [Scenario 3 - Design Provided as Strings Only](#) and **design sections** are produced as 4d super string from the design strings using **Cuts through strings** by either

Utilities =>A-G =>Cuts =>by centreline

which can cut through a Data Source of strings (see [Cuts by Centreline](#)), or by

Design =>Boxing =>Boxing many (function)

which can only cut through one model of strings (see [Boxing Many Function](#)).

The methods described in [Scenario 4 - Design Sections Already Exist](#) are then used to generate boxing from the created design sections.

Go to the next section [Scenario 4 - Design Sections Already Exist](#) or back to [Applying Boxing](#).

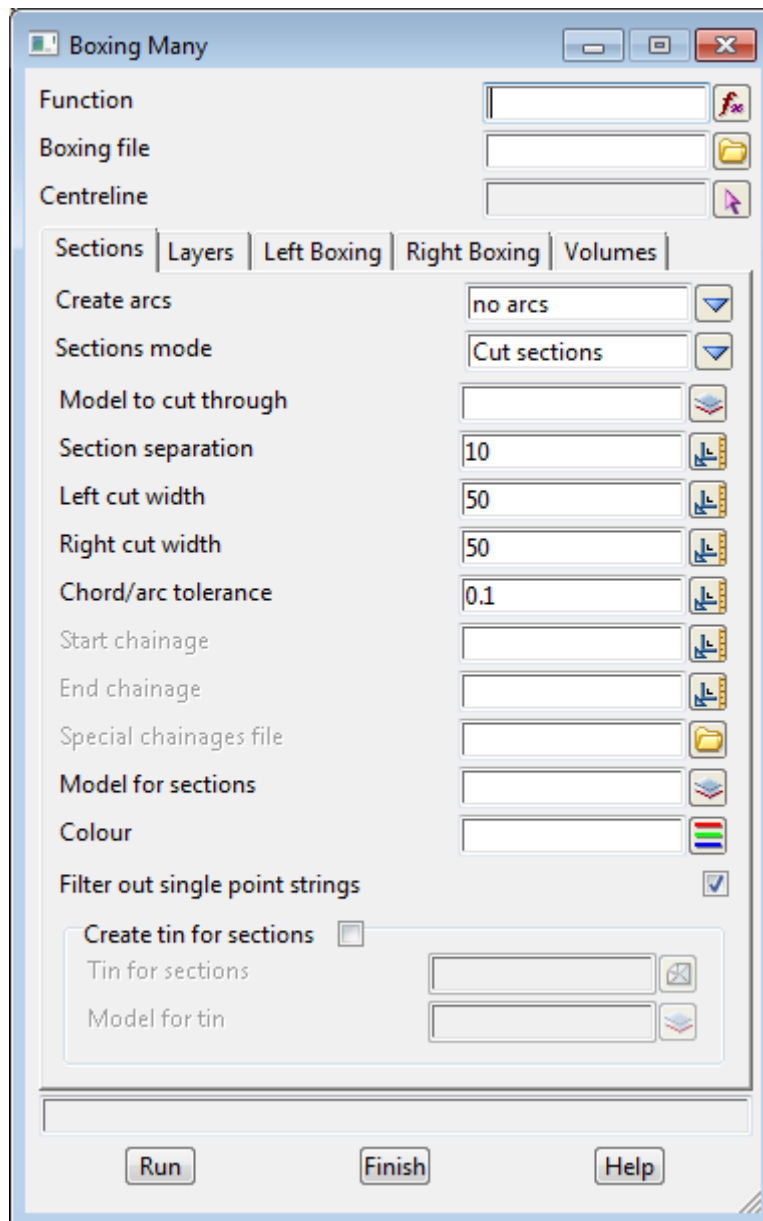

Scenario 4 - Design Sections Already Exist

There is the case where you already have the design sections as 4d super strings.

The design sections may have been created by an earlier **Apply Many** or **Apply** run, or generated by cuts through strings as in [Scenario 2 - More than One Apply Many Needed to Generate the Design](#) or [Scenario 3 - Design Provided as Strings Only](#), or simply provided.

Boxing can then be generated from the **design sections** using the options:

- (a) *Design =>Boxing =>Boxing many function*

The **Boxing Many Function** can generate up to eight layers of boxing, as well as calculating volumes. See [Boxing Many Function](#).

Note that the **Boxing Many Function** can also create the cuts through a model of strings to create the design sections and so can be used to cover [Scenario 2 - More than One Apply Many Needed to Generate the Design](#), [Scenario 3 - Design Provided as Strings Only](#) and [Scenario 4 - Design Sections Already Exist](#) in the one function.

(b) *Design =>Boxing =>Boxing many*

A simplified version of the *Boxing Many Function*.

For *Boxing Many*, an MTF is used to define the application of the Boxing Definitions, and the Boxing file containing the Boxing Definitions is either that defined in the MTF **or** a different Boxing file. See [Boxing Many](#).

The boxing can be applied to a model of sections, or just a **single selected section**.

(c) *Design =>Boxing =>Boxing*

An even more simplified version of the *Boxing Many Function*.

The **Boxing** option can only apply one Boxing Definition to all the design sections in a model. See [Boxing](#).

Note - in the case when only 4d super string are provided, the option

Design =>X-Sections =>Strings from sections

can be used to generate design strings from these sections (see [Strings from Sections](#)).

Go to the next section [Full Definition of Boxing](#) or back to [What is Boxing ?](#) or [Applying Boxing](#).

Full Definition of Boxing

In **12d Model** there are special commands called **Boxing Commands** that are be used to build up a boxing layer.

A series of **12d Model** boxing commands are grouped together as a **Boxing Definition** and when a *Boxing Definition* is applied to a cross section, it generates a boxing section. That is, it generates a section that is part of a particular Boxing Layer.

Each **Boxing Definition** (the rules for calculating a specific type of boxing) is given a name, and is stored in a **Boxing** file (with a file name ending in **.bf**).

Any number of *Boxing Definitions* can be placed in the one *Boxing* file as long as each *Boxing Definition* in the **Boxing** file has a unique name.

Note that the same name of a *Boxing Definition* can appear in more than one *Boxing* file and even through they have the same name, the *Boxing Definition* in a different *Boxing* file can be completely different.

Please continue to the next section [Terminology Used in Boxing Commands](#)

Terminology Used in Boxing Commands

The **12d Model Boxing Commands** work on a cross section, which is a 4d super string (see [Representing Cross Sections in 12d Model](#)).

A **Boxing Definition** is a group of boxing commands and the boxing commands work from **left to right** across the cross section to produce a boxing section.

Most of the **boxing commands** apply from the **offset** specified at the beginning of that command (**Start Offset** for the command) to the start offset of the **next** boxing command (like chainages and templates in the MTF). That is, the start offset of a boxing command is the **End Offset** for the **previous** boxing command.

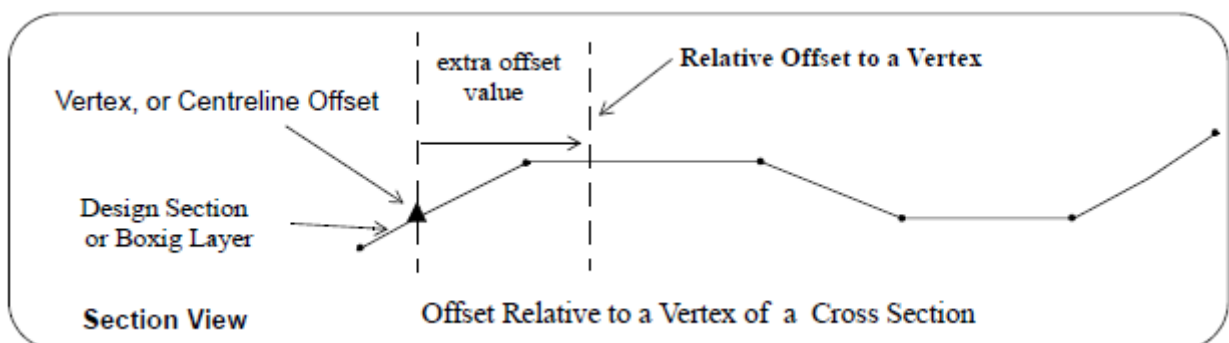

So most **boxing commands** go from the **Start Offset in the command** to the **Start Offset in the next boxing command**.

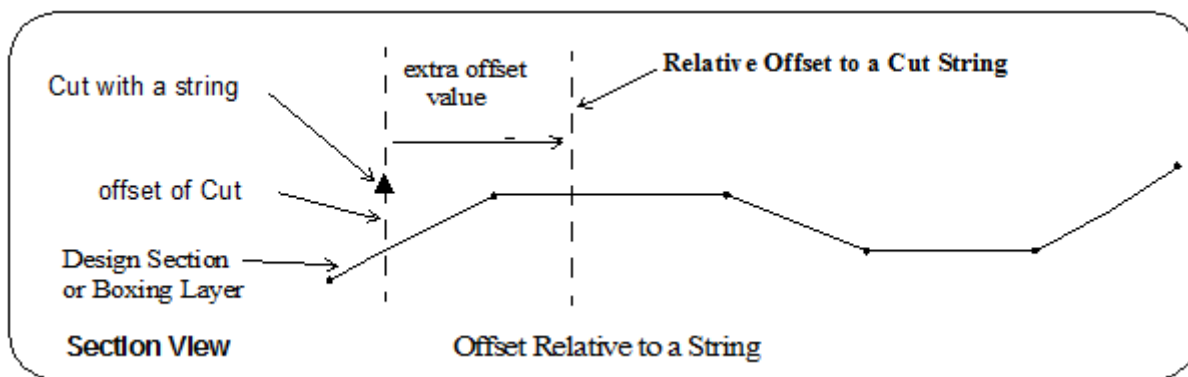

An **offset**, such as the **Start Offset**, can be defined as:

- (a) a **fixed** Centreline offset value (e.g. 10.5)
- (b) specified **relative to a vertex name** on a design cross section, or any boxing section (at the section chainage) in a Boxing Layer already created.
- (c) specified **relative to a selected string** that cuts the design cross section, or a specified Boxing Layer, in plan.

The **offset** represents a **plan** position on the cross section (a plan point on the cross section) which may or may not be the plan position of a vertex on the cross section.

The terminology used to specify such an offset is **relative offset** to a **vertex** or a **string**.

Note - if not all the vertex names and strings mentioned in a *Boxing Definition* are present in the cross section at the centreline chainage, then no boxing section is produced for that centreline chainage.

Hence

1. an **offset relative to a vertex name (relative vertex offset)** is defined to be the **offset** at a **given named vertex** on the design section, or a boxing section previously created, **plus** a **given offset value**.

That is

take the **offset at** the 4d vertex called "**vertex name**" and add "**offset value**" to it. The offset value can be positive or negative.

If the "vertex name" is blank, then the "**offset value**" is taken to be the *actual* offset on the 4d super string.

Hence the *offset* can be specified as either an actual **offset value** or given **relative to the name of a vertex** on the super string (**relative offset**).

For convenience, in both cases the offset will be denoted by **relative vertex offset**.

2. an **offset relative to string (relative string offset)** is defined to be the **offset** on the cross section where the string cuts the section in plan, **plus** a **given offset value**.

That is

take the **offset at** the plan cut of the section and the string and add "**offset value**" to it. The offset value can be positive or negative.

A major advantage of defining boxing in terms of vertex names and strings is that whenever the vertices or strings are modified using MTF modifiers, or string edits, the boxing across the section is also automatically modified on a recalc.

A *Boxing Definition* may be used in either a *Left Boxing* or *Right Boxing* in an **MTF**, or in a **Boxing Many Function** option, however unlike the case for MTF modifiers, the *Boxing Definition* is applied to the vertex names going from **left to right** regardless of whether the *Boxing Definition* is used on the left or the right. So it is possible to create the entire boxing with just the *Left Boxing* or *Right Boxing*. If both are used, the end of the *Left Boxing* is joined to the start of the *Right Boxing*.

Warning

For a *Boxing Definition* to work, any cross section vertex names referred to in the *Boxing Definition* must be **unique** for that cross section. Similarly any strings cut must have unique names.

In the *Apply Many* and *Apply*, the **LHS prefix** and **RHS prefix** panel files can be used to give vertices on cross sections different names even when the same Template is used on the left and the right side of the centreline.

Boxing **sections** are generated by the *Apply Many*, *Boxing Many Function*, *Boxing Many* and *Boxing options*, but **boxing strings** are only generated by the *Apply Many* and *Boxing Many Function*. For the other cases, the option **Strings=>Utilities=>Strings from sections** can be used to create boxing strings from the boxing sections.

Vertical Walls

If a *Boxing Definition* creates two different height values at the one offset (i.e. a wall), then an extra offset point is automatically inserted into the boxing section (at offset 0.1 mm from the first vertex) so that **no vertices in the created boxing section are on top of each other**.

So in effect a **vertical wall** is created.

And since no vertices are created that are directly above each other, the boxing sections can be triangulated.

Please continue to the next section [Edit Boxing File](#).

Edit Boxing File

The option

Design =>Boxing =>Create

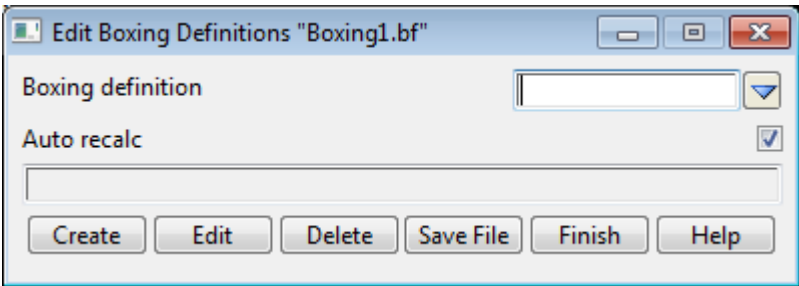

creates a **Boxing** file which contains **Boxing Definitions**, and then brings up the **Edit Boxing Definitions** panel to create the actual *Boxing Definitions* (rules) to save in the *Boxing* file.

Similarly selecting a *Boxing* file from the walk-right list of

Design =>Boxing =>Edit

also brings up the **Edit Boxing Definitions** panel to create/edit boxing definitions from the selected *Boxing* file.

The **Edit Boxing Definitions** panel is

The fields and buttons used in this panel have the following functions.

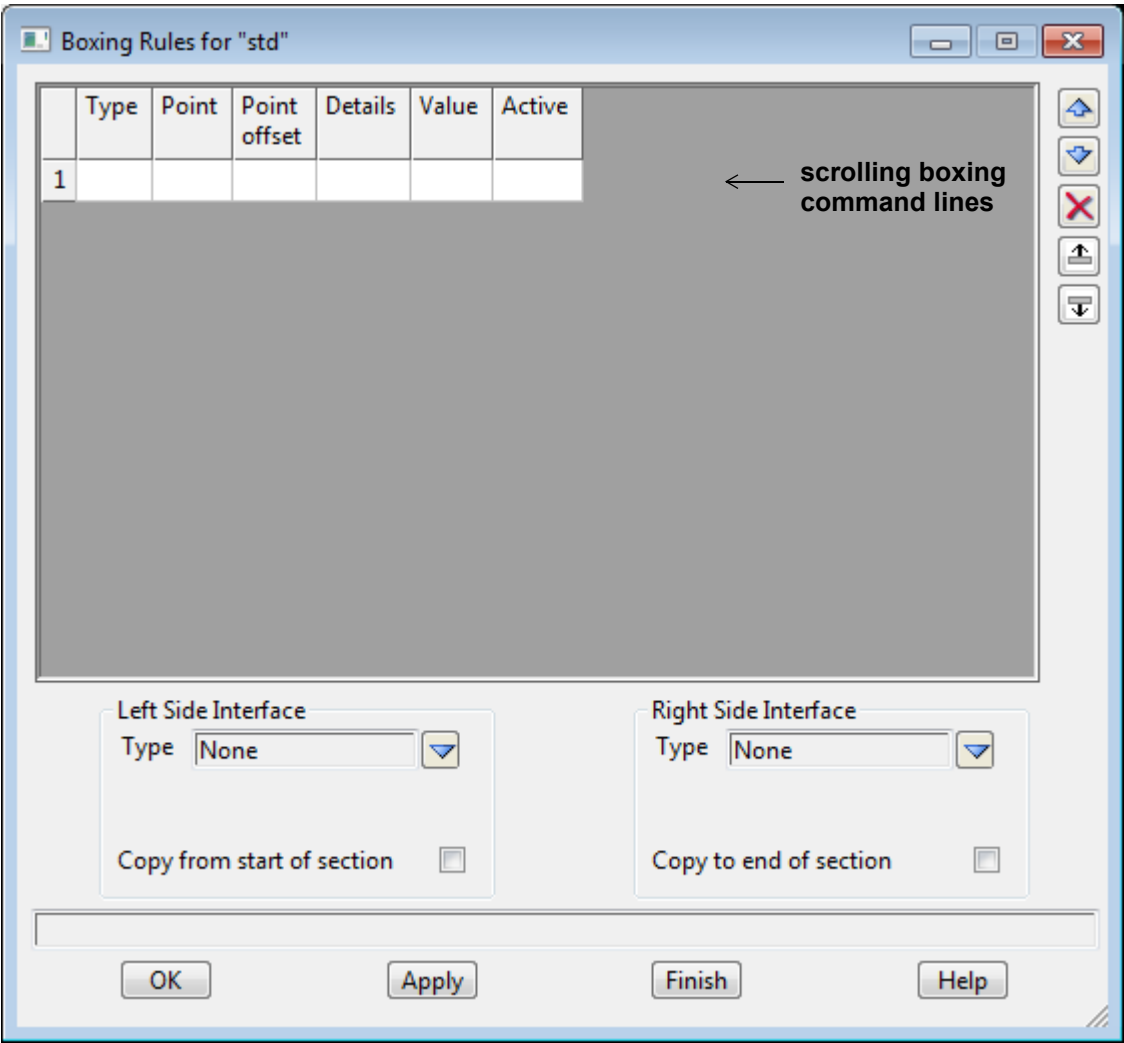

Field Description	Type	Defaults	Pop-Up
Boxing definition <i>name of the Boxing Definition (in the current boxing file) to create or edit. Each Boxing Definition must have a unique name in the Boxing file</i>	input		boxing definitions in file
Create	button		
<i>create a Boxing Definition with name given by the Boxing definition panel field</i> <i>If the Boxing Definition given in the Boxing definition field does not exist, then the Boxing Rules panel is placed on the screen and is used to created the new Boxing Definition for the Boxing file (see Boxing Rules Panel).</i> <i>If the Boxing Definition already exists, then nothing will happen when clicking on Create.</i>			
Edit	button		
<i>edit an existing Boxing Definition with name given in the Boxing definition panel field</i> <i>If the Boxing Definition given in the Boxing definition field exists, then the Boxing Rules panel is placed on the screen and is used to edit the existing Boxing Definition (see Boxing Rules Panel).</i> <i>If the Boxing Definition does not exist, then nothing happens when clicking on Edit.</i>			
Delete	button		
<i>delete the existing Boxing Definition with the name given in the Boxing definition panel field</i> <i>A Yes-No panel confirms the deletion.</i>			
Save file	button		
<i>save the Boxing file with the Boxing Definitions to disk.</i>			

For more information on how Boxing works in **12d Model**, go to the section [What is Boxing ?](#).

Boxing Rules Panel

Selecting the **Create** or **Edit** button on the **Edit Boxing Definitions** panel brings up the **Boxing Rules** panel which is used to build up/edit the nominated *Boxing Definition* from the **Boxing Commands**.

The operation of the **Boxing Rules** panel, and all the available *Boxing Commands*, will now be described.

The **Boxing Rules** panel consists of a scrolling **command** field, **Left Side Interface** and **Right Side Interface** areas, **Copy from start of section** and **Copy to end of section** tick boxes and an **OK** or **Apply** button to record the results.

The other fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Commands	Scrolling table		

commands for defining the Boxing Definition. The commands will be described in the next section [Commands for Boxing Rules Panel](#).

Left Side Interface

Type choice box

If **No interface**:
nothing is done

If **Xfall**:

Xfall real box 0

if non-zero, a batter with the given xfall is applied going to the **left** from the first point of the boxing, and goes until it intersects the design section. The intersection point is added as the first point in the boxing. If no intersection is made, nothing is added to the boxing. A positive xfall is up and negative xfall down.

If **Slope**:

Slope real box 0

if non-zero, a batter with the given slope is applied going to the **left** of the first point of the boxing, and goes until it intersects the design section. The intersection point is added as the first point in the boxing. If no intersection is made, nothing is added to the boxing. A positive slope is up and negative slope down.

If **Xfall from point**:

Set point button

clicking on **Set point** brings up the **Boxing LHS Xfall** panel which allows the battering xfall to be defined in more complex ways. This is described in the section [Boxing Left Side Interface Xfall from Point](#).

Copy from start of section tick box

if ticked, then the part of the design section from the start of the design section to the offset that is the start of the boxing section, is copied and made the beginning of the boxing section.
Hence the **Copy from start of section** tick is used to begin the boxing section with the start of the design section to make a full width left side boxing section.
If not ticked, nothing is done

Right Side Interface

Type choice box

If **No interface**:
nothing is done

If **Xfall**:

Xfall real box

if non-blank, a batter with the given xfall is applied to the last point of the boxing and goes until it intersects the design section. The intersection point is added as the last point in the boxing. If

no intersection is made, nothing is added to the boxing. A xfall slope is up and negative xfall down.

If Slope:

Slope real box

if non-blank, a batter with the given slope is applied to the last point of the boxing and goes until it intersects the design section. The intersection point is added as the last point in the boxing. If no intersection is made, nothing is added to the boxing. A positive slope is up and negative slope down.

If Xfall from point:

Set point button

*clicking on **Set point** brings up the **Boxing RHS Xfall** panel which allows the battering xfall to be defined in more complex ways. This is described in the section [Boxing Right Side Interface Xfall from Point](#).*

Copy to end of section tick box

if ticked, then the part of the design section from the offset of the last boxing vertex to the last vertex on the design section, is copied and made the end of the boxing section.

Hence the RHS copy flag is used to continue the boxing section from the last boxing point, with the design section to the end of the design section to make a full width right side boxing section.

If not ticked, nothing is done.

OK button

***OK** stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

***Apply** stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

Notes

1. When a Boxing Definition is applied on the Left side in the MTF of an **Apply Many**, or the Left side in a **Boxing Many Function**, any *Right Side Interface* and *Copy to end of section* is ignored. Similarly, when a Boxing Definition is applied on the right side the MTF of an **Apply Many**, or the Right side in a **Boxing Many Function**, any *Left Side Interface* and *Copy from start of section* is ignored.

*Hence a boxing definition can have all of *Left Side Interface*, *Copy from start of section* and *Right Side Interface*, *Copy to end of section* but which set is used depends on whether the boxing definition is used on the Left or the Right.*

*In **Apply Many**'s and **Boxing Many Functions**, if only the Left side boxing or only the Right side boxing exists, then the boxing for the entire design section can be created by just the Left/Right side boxing and then **all** of the *Left Side Interface* and the *Right Side Interface* is used.*

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#)

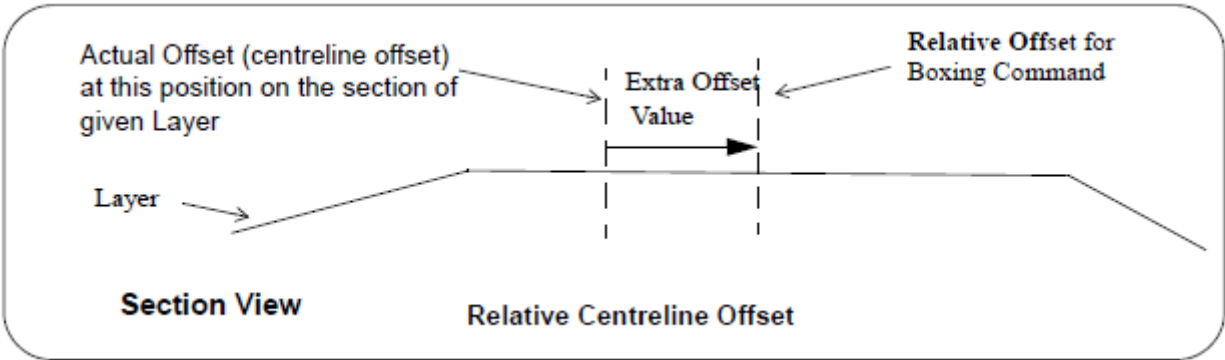

Defining Relative Offset for Boxing Commands

Most boxing commands use **Relative Offsets** to define offset positions across Design or Boxing Layers. For example, the **Start Offset** is a relative offset and is used in most boxing commands to specify where the boxing command starts.

There are a number of ways the **Relative Offset** can be defined:

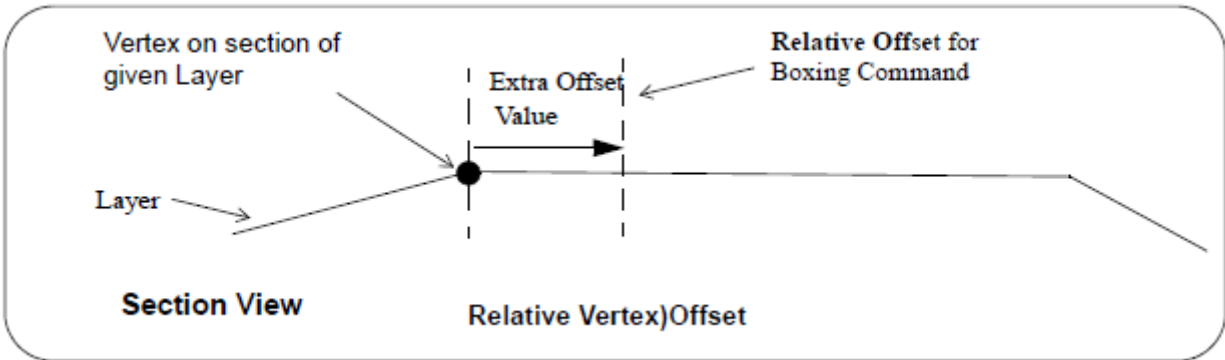

(a) **Offset from centreline**

Relative to an actual Offset for the Design or Boxing Layer - relative offset
Adding a given value to an actual Offset of the given Layer.

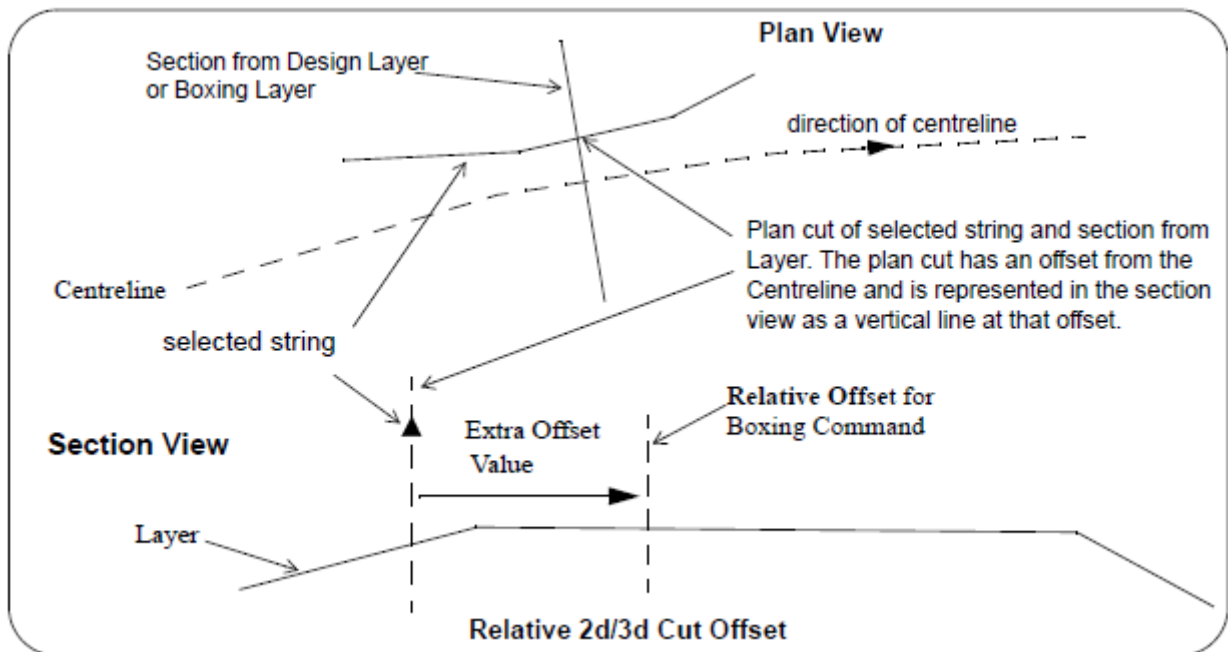

(b) **Vertex on section**

Relative to a vertex on the Design or Boxing Layer - relative vertex offset
The offset of the given vertex is calculated and then a user given value added to it to give the *relative vertex offset*.

(c) **2d cut of string**

Relative to **2d cut** of a selected string with a given Layer.
First calculate the offset on the selected Layer of the plan cut of a selected string (2d cut). A user given value is then added to it to give the *relative 2d offset*.

(d) Cut of string

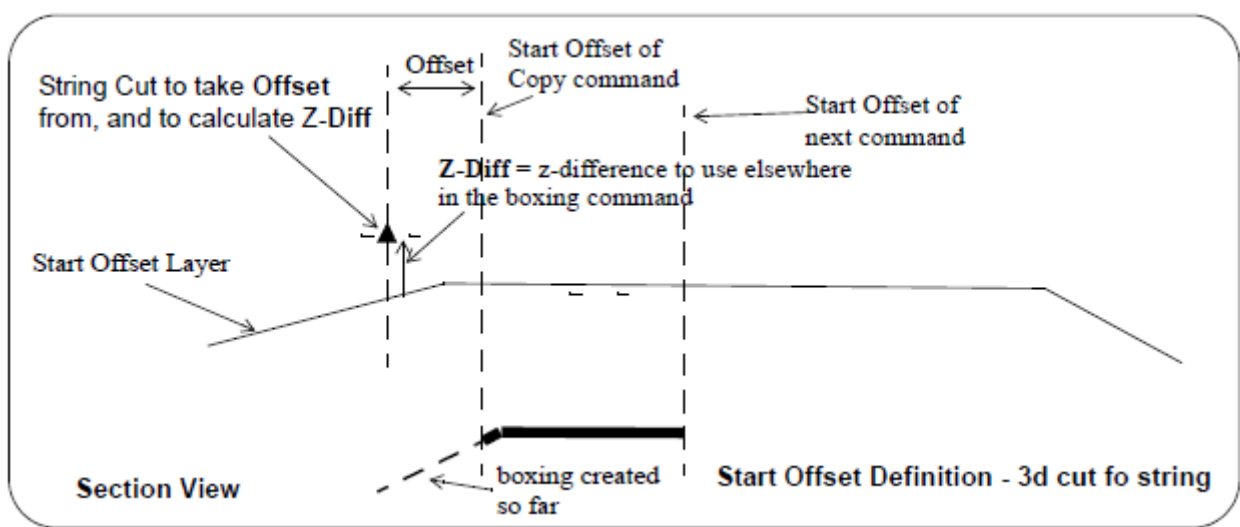

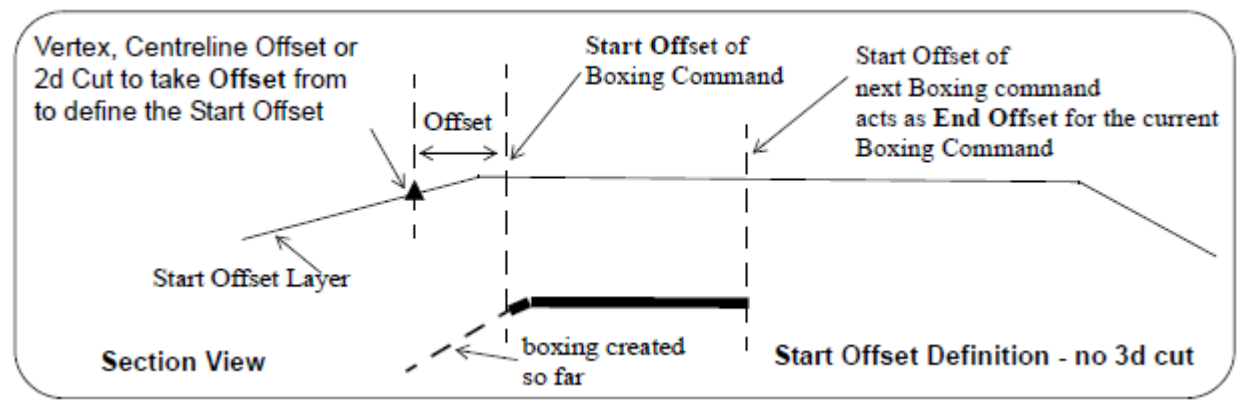

Relative to **3d cut** of a selected string

This is actually the same in **offset** value as the **2d cut** of a selected string but some boxing commands also take the **3d cut** of the selected string and use the **height difference** of the cut of the string and the height on the Layer elsewhere in the command. This is referred to as the **Z-Diff** of the 3d cut.

Note that some strings only have a horizontal (plan) definition and have no z-values at all. In that case, there is no 3d cut but there can be a 2d cut (plan cut). For example, a string with only null heights or a Super Alignment with no vertical geometry.

So for the case where Relative Offset is the **Start Offset**:

On a Boxing Command panel, the fields and buttons where a Relative Offset is required have the following functions:

Field Description	Type	Defaults	Pop-Up
Relative Offset (e.g. Start Offset, Xfall Offset etc)			
Layer - after Type	choice box		

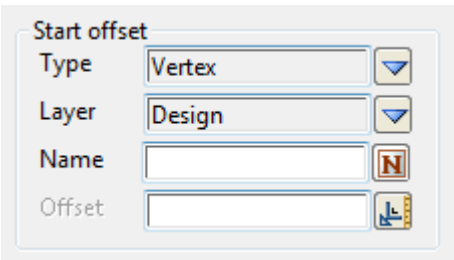

Layer to use with **Offset** to defined the Relative Offset.

Type choice box

If *Vertex on section*:
this is the Relative (Vertex) Offset

Name name box
name of the vertex on the **Layer** to use with **Offset** to define the Start Offset.

Offset real box
this value is added to the offset of the vertex given in the **Name** field to define the Relative Offset. **Offset** can be positive or negative as long as the final Start Offset is still **on Layer**.

If *Offset from centreline*:
this is the Relative (Centreline) Offset

Offset real box
an actual offset from centreline (actually just the chainage of the section). **Offset** can be positive or negative as long as it is still **on Layer**.

If *2d cut of string*:
this is the Relative (2d Cut) Offset

String string select

*the selected string needs to cut the **Layer** in plan wherever the boxing is being applied.*

Offset real box

*the Relative Offset is the offset of the plan cut of the selected string with the **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final position Relative Offset must still be on **Layer**.*

If Cut of string:

this is the Relative (3d Cut) Offset

String string select

*the selected string needs to cut the sections of the selected **Layer** in plan wherever the boxing is being applied.*

Offset real box 0

*The Relative Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on **Layer**. **Z-Diff** is the difference between the z-value of the cut string, and the z-value on the **Layer** at the same plan position as the cut with the string. The use of Z-Diff depends on the boxing command.*

Commands for Boxing Rules Panel

If the **command line** is **empty**, double clicking LB in the **command line** will bring up the **Create** menu which contains all the available boxing commands.

Selecting a menu item will bring up an associated panel which displays the information required for the boxing command.

When the panel is filled in and **OK** or **Apply** selected, the panel information is written out to the **command line** in the correct format for that boxing command.

If the **command line** is **not empty**, clicking LB in the **command line** will bring up the associated panel for the boxing command in the **command line**.

The information in the panel can be changed and if **OK** or **Apply** is selected, the changed panel information is written out to the **command line** in the correct format for that boxing command.

Each of the panels created by selecting a command from the **Create** menu, will now be described.

For documentation on the option/menus on the boxing **Create** menu:

For <i>Copy</i> , go to	Boxing Copy
<i>Vertex</i>	Boxing Vertex
<i>Vertex (Adv)</i>	Boxing Vertex Advanced
<i>X-fall</i>	Boxing Xfall - line through a point with a given crossfall
<i>X-fall 1</i>	Boxing Xfall 1 - line through a point with a crossfall taken from a point
<i>Line</i>	Boxing Line - line through two points
<i>Intersect</i>	Boxing Intersect - Intersection of Two Lines
<i>Intersect (Adv)</i>	Boxing Intersect Advanced
<i>Xfall pt</i>	Boxing Xfall Point
<i>Drop (kerb)</i>	Boxing Drop
<i>Decision</i>	Boxing Decision
<i>Label</i>	Boxing Label
<i>Goto</i>	Boxing Goto
<i>Comment</i>	Boxing Comment

<i>Extend tin</i>	Boxing Extend Tin
<i>End</i>	Boxing End

The text file format of all the Boxing Commands in the *Boxing* file is given in the section [Text Format of the Boxing File](#).

Boxing Copy

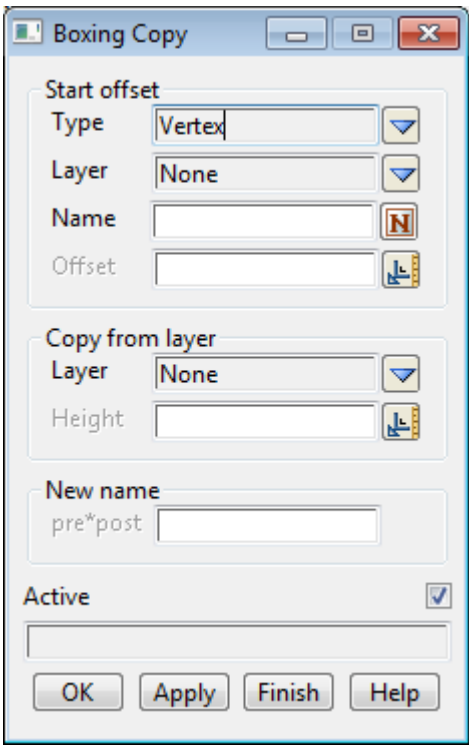

The *Copy* command copies part of the selected **Layer** from the **Start Offset** defined for the *Copy* command, to the **Start Offset of the next boxing command**.

The present slope of each segment is kept but the *height of each segment is adjusted* by a **constant** value provided by user.

Note: The height adjustment may be zero so that part of the selected **Layer** is copies as is.

Selecting **Copy** brings up the **Boxing Copy** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start Offset <i>Start Offset defines where the Copy commands starts from.</i> <i>If the 3d cut of string is used (Cut of string), the Z-Diff is used with Height in determining how far the Layer is copied.</i>			
Type	choice box		
<i>If Last created:</i> <i>the Copy command starts at the Start Offset but for the boxing commands Intersect and Intersect Adv, the offset position for the vertex is calculated by intersection and its actual value may not be known.</i> <i>So for Last created, the offset is the offset of the last vertex of the selected Layer.</i>			
Offset <i>offset to add to the offset of the last vertex. Offset can be positive or negative but the final Start Offset must still be on Layer.</i>	real box	0	

Copy from layer

Layer choice box

Height real box 0

If Start Offset Type is NOT: **Cut of string:**
Height is added to the z-values of the part of the section of the Copy from layer **Layer** being copied to give the z-values of the boxing. For example, if Height is -0.3, the part of the Copy from layer **Layer** being copied is dropped by 0.3

If Start Offset Type is: **Cut of string:**
At the plan cut of the string and the START OFFSET **Layer**, **Z-Diff** (the difference of the z-values between the string and START OFFSET **Layer**) is calculated and **Height** added to it. This combined value is added to the z-values of the part of the COPY FROM LAYER **Layer** being copied, to give the z-values of the boxing

New name

Pre*post text input

when part of a section is copied for the boxing, the vertices of the boxing are given names from either the vertices of the section, or the selected strings that are used in limiting the section, or a unique number not related to vertices or strings.

These constructed boxing vertex names are then modified by the text given in the **Pre*post** field.

The text before the * is prepended to the vertex names, and the text after the * is postpendded to the vertex names.

Active tick box

if **ticked**, use this Boxing Command.
If **not ticked**, don't use this Boxing Command.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.

If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

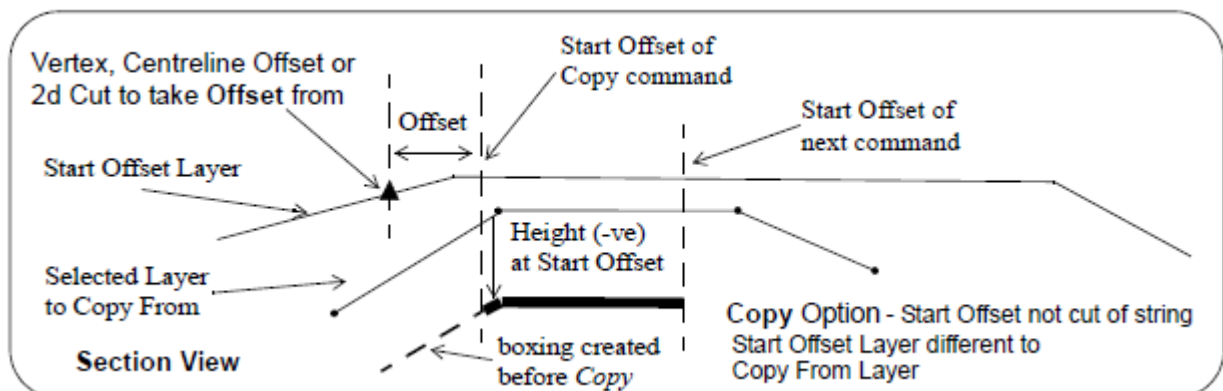

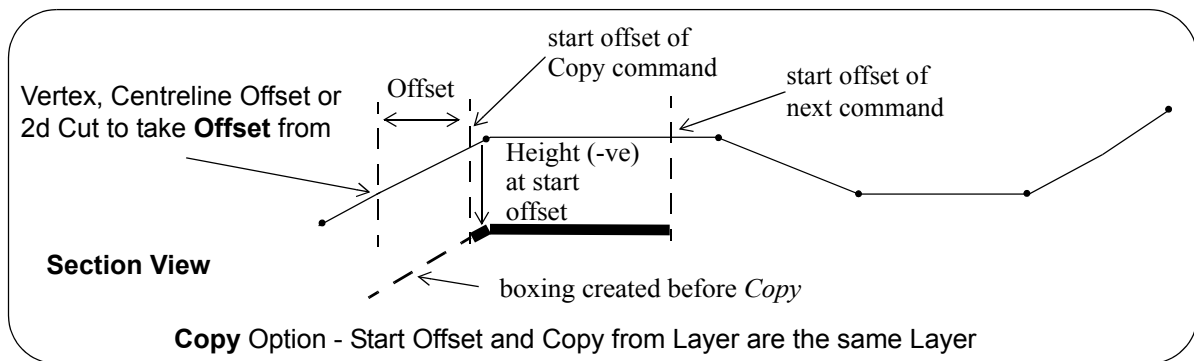

For the typed formats of the **Copy** and **Copy with height adjustment** commands created by this

panel, see [Text Format - Boxing Copy](#) and [Text Format - Boxing Copy with Height Adjustment](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Vertex](#) or back to [Edit Boxing File](#).

Copy diagrams for more methods of defining *Offsets*:

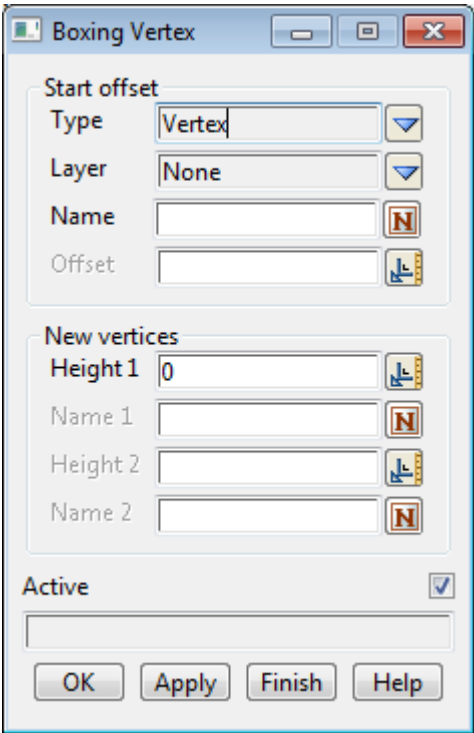

Boxing Vertex

The **Vertex** command inserts into the boxing section, one or two new vertices that are at the same *Start Offset*. So **Vertex** can be used to quickly create a vertical wall at a given *Start Offset*.

Note - to allow the boxing sections and strings to triangulate, **12d Model** increases the offset of the second vertex by ten thousandth of a unit.

Selecting **Vertex** brings up the **Boxing Vertex**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start Offset

Layer to use with **Offset** to defined the *Start Offset* where the one or two vertices are created.

Type choice box

For the documentation on the methods of defining the **Start Offset**, see [Defining Relative Offset for Boxing Commands](#)

New vertices

Height 1 real box

If Start Offset Type is NOT: **Cut of string:**

Height 1 is added to the z-value of the **Layer** at the Start Offset to give the z-values of the new boxing vertex. For example, if Height 1 is -0.3, the vertex is dropped by 0.3 from **Layer**.

If Start Offset Type is: **Cut of string:**

At the plan cut of the string and **Layer**, **Z-Diff** (the difference of the z-values between the string and the **Layer**) is calculated and **Height 1** added to it. This combined z-difference is added to z-value of the **Layer** at the **Start Offset** to give the z-value of the new boxing vertex.

Name 1 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height using Type and Height 1.

If blank, a vertex is created with a default name.

Height 2 real box

If Start Offset Type is NOT: **Cut of string:**

Height 2 is added to the z-value of the **Layer** at the Start Offset to give the z-values of the new boxing vertex. For example, if Height 2 is -0.5, the vertex is dropped by 0.5 from **Layer**.

If Start Offset Type is: **Cut of string:**

At the plan cut of the string and **Layer**, **Z-Diff** (the difference of z-values between the string and the **Layer**) is calculated and **Height 2** added to it. This combined z-difference is added to z-value of the **Layer** at the **Start Offset** to give the z-value of the new boxing vertex.

Name 2 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height using Type and Height 2.

If blank, no vertex is created.

Note - to allow the boxing sections and strings to triangulate, if two vertices are created, **12d Model** actually increases the offset of the second vertex by ten thousandth of a unit.

Active tick box

if **ticked**, use this Boxing Command.

If **not ticked**, don't use this Boxing Command.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF,

then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.

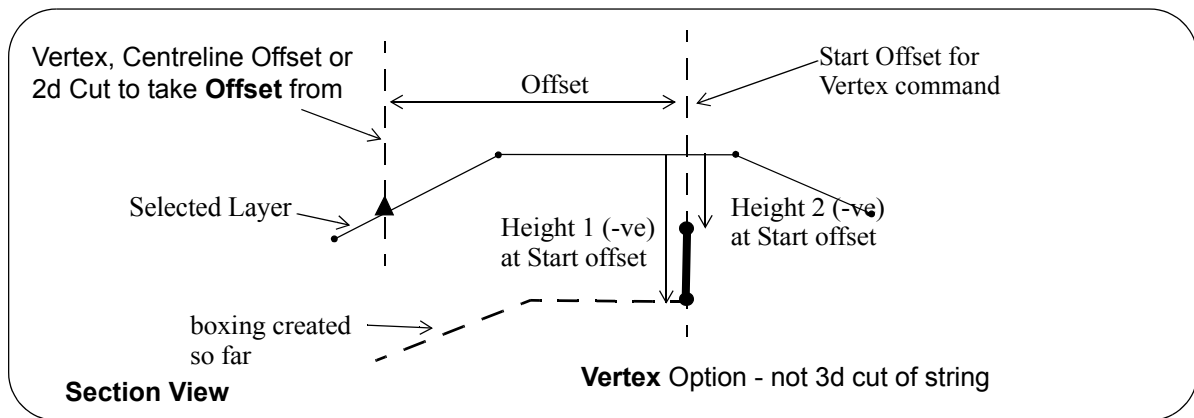

If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

For the typed format of the **Vertex** command created by this panel, see [Text Format - Boxing Vertex](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Vertex Advanced](#) or back to [Edit Boxing File](#).

Vertex diagrams for more methods of defining **Offsets**:

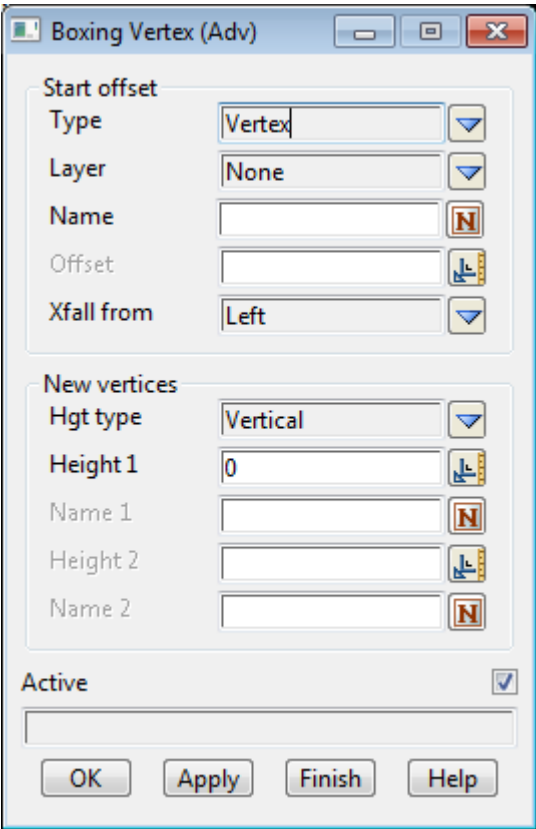

Boxing Vertex Advanced

The **Vertex Advanced** command allows a vertex to be placed where the distance is measured **NORMAL** or vertical or to a segment.

Vertex only allowed a vertical distance and not a normal distance.

Selecting **Vertex (Adv)** brings up the **Boxing Vertex (Adv)** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start Offset

Layer to use with **Offset** to defined the Start Offset where the one or two vertices are created.

Type choice box

For the documentation on the methods of defining the **Start Offset**, see [Defining Relative Offset for Boxing Commands](#)

Xfall from choice box Left, Right

When **Hgt type** is **Normal**:
if **Left**, the xfall to measure the distance **NORMAL** to is taken from the segment of the Start Offset layer that is slightly to the left of the Start Offset.
if **Right**, the xfall to measure the distance **NORMAL** to is taken from the segment of the Start Offset layer that is slightly to the right of the Start Offset.
When **Hgt type** is **Vertical**, **Xfall from** is not used.

New Vertices

Hgt type choice box Vertical, Normal

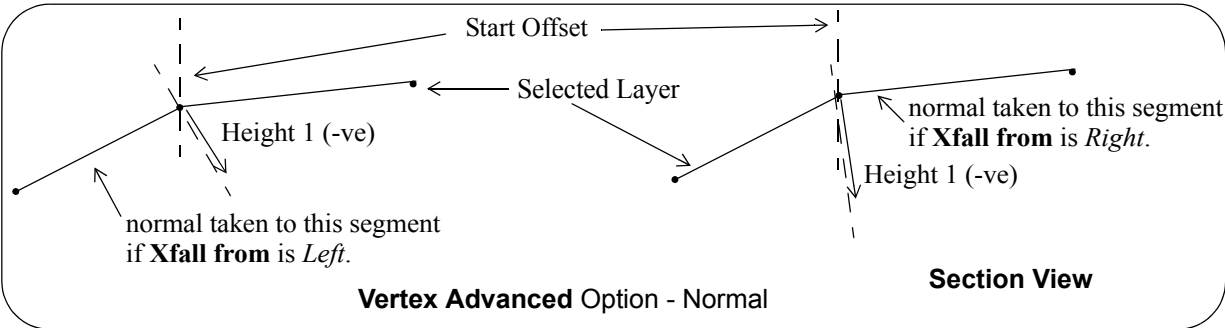

When **Hgt type** is **Normal**, the distance is measured **NORMAL** to a segment.
If **Xfall from** is **Left**, the xfall to measure the distance **NORMAL** to is taken from the segment of the Start Offset layer that is slightly to the left of the Start Offset.
If **Xfall from** is **Right**, the xfall to measure the distance **NORMAL** to is taken from the segment of the Start Offset layer that is slightly to the right of the Start Offset.
When **Hgt type** is **Vertical**, the distance is measured in the vertical plane and **Xfall from** is not used.

Name 1 name box

if non blank, a vertex is created on the boxing section with this name and the appropriate position using **Type**, **Xfall from**, **Hgt type** and **Height 1**.
If blank, a vertex is created with a default name.

Height 1 real box

If Start Offset Type is **NOT: Cut of string**:
If **Hgt type** is **Normal**, the distance **Height 1** is taken from the point on the **Layer** at the Start Offset, and going out **NORMAL** to the segment specified by Start Offset and **Xfall from**.

If **Hgt type** is **Vertical**, the distance **Height 1** is taken from the point on the **Layer** at the Start Offset, and going vertically. For example, if Height 1 is -0.5, the vertex is dropped by 0.5 from

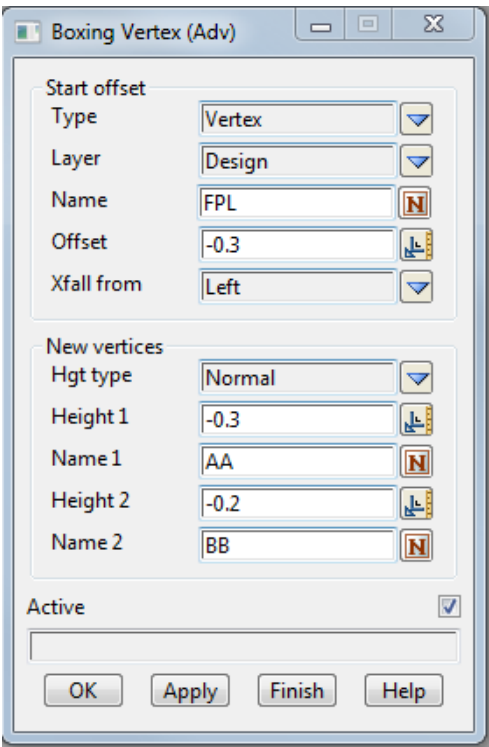

Layer.

If Start Offset Type is: **Cut of string:**
??

Name 2 name box
If blank, no vertex is created.

Height 2 real box
If Start Offset Type is NOT: **Cut of string:**

If **Hgt type** is **Normal**, the distance **Height 2** is taken from the point on the **Layer** at the Start Offset, and going out **NORMAL** to the segment specified by Start Offset and **Xfall from**.
If **Hgt type** is **Vertical**, the distance **Height 2** is taken from the point on the **Layer** at the Start Offset, and going vertically. For example, if Height 2 is -0.5, the vertex is dropped by 0.5 from **Layer**.

Vertex (Adv) - Normal to Design Layer

Active tick box
if **ticked**, use this Boxing Command.
If **not ticked**, don't use this Boxing Command.

OK button
OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button
Apply stores the values and leaves the panel on the screen.
If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.
If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

Important Notes

1. the boxing vertices must be created from left to right so be careful that vertex Name 2 is not created to the left of vertex of Name 1. If it is then it will be moved to be slightly to the right of vertex Name 1.
2. to allow the boxing sections and strings to triangulate, if two vertices are created that are on top of each other, **12d Model** actually increases the offset of the second vertex by ten thousandth of a unit.

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Xfall - line through a point with a given crossfall](#) or back to [Edit Boxing File](#).

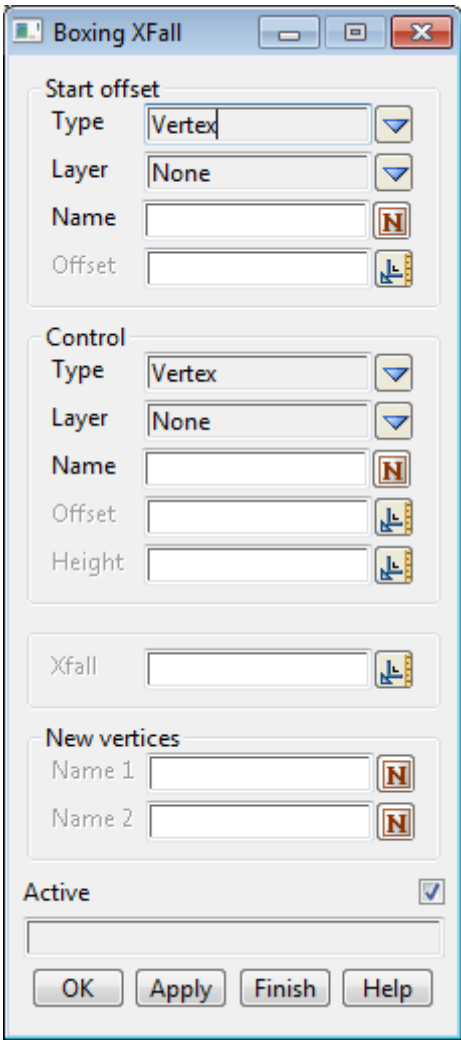

Boxing Xfall - line through a point with a given crossfall

The Xfall command creates a link from the Start Offset to the Start Offset on the *next* boxing command, with a

- (a) user given cross fall (Xfall)
- (b) start height given by projecting the line with a given xfall and going through a given control point, through to the Start Offset,

Selecting **Xfall** brings up the **Boxing Xfall** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start Offset <i>Start Offset defines the offset where the new line starts from.</i> <i>For the Xfall command, the 3d cut of string is not needed. Only 2d cut of string is required.</i>			
Type	choice box		

For the documentation on the methods of defining the Start Offset, see [Defining Relative Offset for Boxing Commands](#)

Control <i>the definition of the Control Point that the line goes through.</i>

Layer choice box

Layer to use with Control **Offset** to define the offset of the Control Point.

Type choice box

If *Vertex on section*:

Name name box

*name of the vertex on the Control **Layer** to use with **Offset** to defined the Control Offset. And used with **Height** to define the height of the Control Point*

Offset real box 0

*this value is added to the offset of the vertex given in the **Name** field to define the Control Offset. **Offset** can be positive or negative as long as the final Control Offset is still **on** the Control **Layer**.*

Height real box 0

*Height is added to the z-value of the Control **Layer** at the Control Offset to give the height of the Control Point.*

If *Offset from centreline*:

Offset real box 0

*an actual offset from centreline (actually just the chainage of the section) which is used as the Control Offset. **Offset** can be positive or negative as long as the Control Point is still on the Control **Layer**.*

Height real box 0

*Height is added to the z-value of the Control **Layer** at the Control Offset to give the height of the Control Point.*

If *2d cut of string, height from section*:

String string select

*the selected string needs to cut the Control **Layer** in plan wherever the boxing is being applied. The Control Offset is the offset of the plan cut of the selected string with the Control **Layer**, plus the **Offset** value. **Offset** can be positive or negative as long as the final Control Offset is still on the Control **Layer**.*

Offset real box 0

*offset to add to the offset of the plan cut of the Control **Layer** with the selected string to give the Start Offset. **Offset** can be positive or negative but the final Control Offset must still be on the Control **Layer**.*

Height real box 0

*Height is added to the z-value of the Control **Layer** at the Control Offset to give the height of the Control Point.*

If Cut of string:

String string select

*the selected string needs to cut the Control **Layer** in plan wherever the boxing is being applied. The Control Offset is the offset of the plan cut of the selected string with the Control **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on the Control **Layer**.*

Offset real box 0

*offset to add to the offset of the plan cut of the section with the selected string to give the Control Offset. **Offset** can be positive or negative but the final Control Offset must still be on the section.*

Height real box 0

*At the plan cut of the string and the Control **Layer**, the difference of the z-values between the string and the Control **Layer** is calculated and **Height** added to it. This combined value is added to the z-values on the Control **Layer**, to give the z-value of the Control Point.*

Xfall input 0

xfall of the line going through the Control Point.

New vertices

Name 1 name box

*if non blank, the vertex created at the Start Offset is given this name
If blank, the vertex created at the Start Offset is given a default name.*

Name 2 name box

*if non blank, the vertex created at the End Offset (the Start Offset of the next command) is given this name
If blank, the vertex created at the End Offset is given a default name.*

Active tick box

*if **ticked**, use this Boxing Command.
If **not ticked**, don't use this Boxing Command.*

OK button

***OK** stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

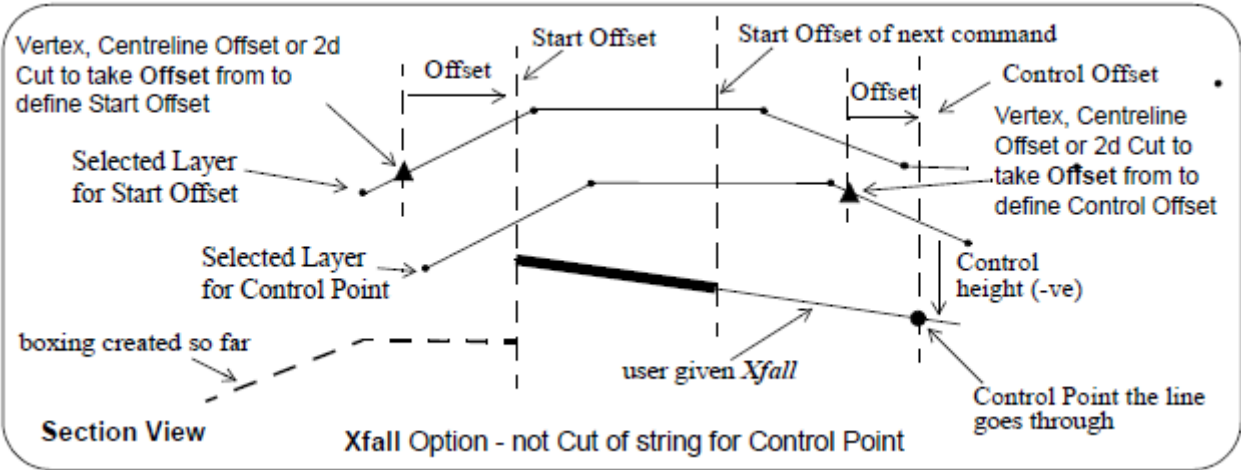

***Apply** stores the values and leaves the panel on the screen.
If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.
If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

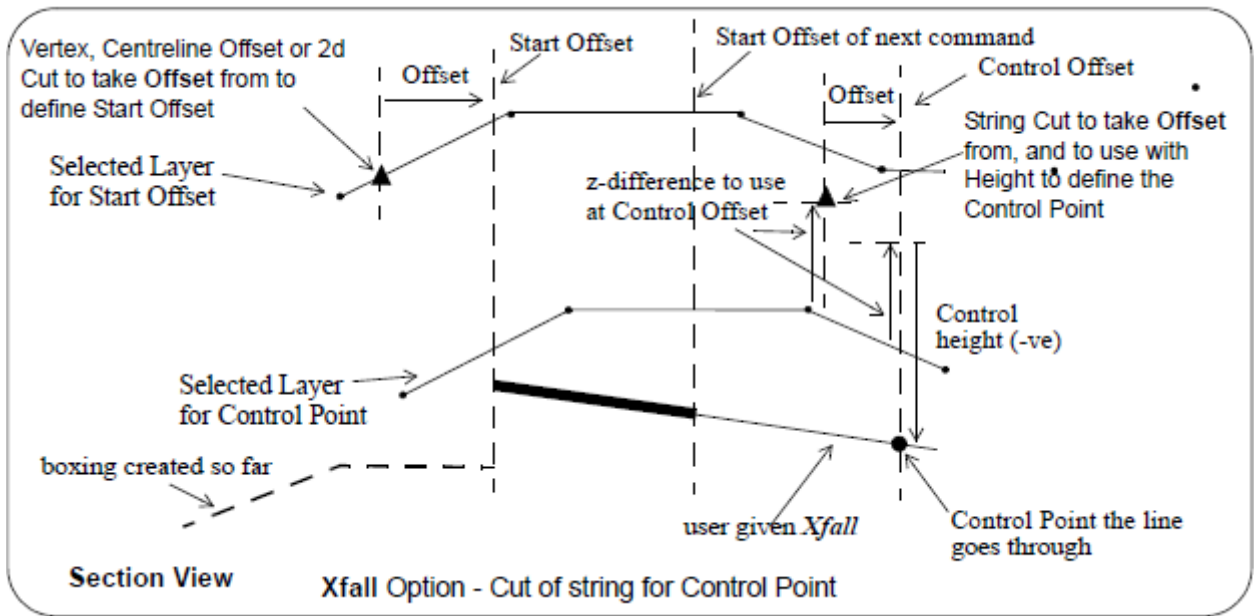

For the typed formats of the **Xfall** command created by this panel, see [Text Format - Boxing Xfall](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Xfall 1 - line through a point with a crossfall taken from a point](#) or back to [Edit Boxing File](#).

Xfall diagrams for more methods of defining **Offsets**:

Boxing Xfall 1 - line through a point with a crossfall taken from a point

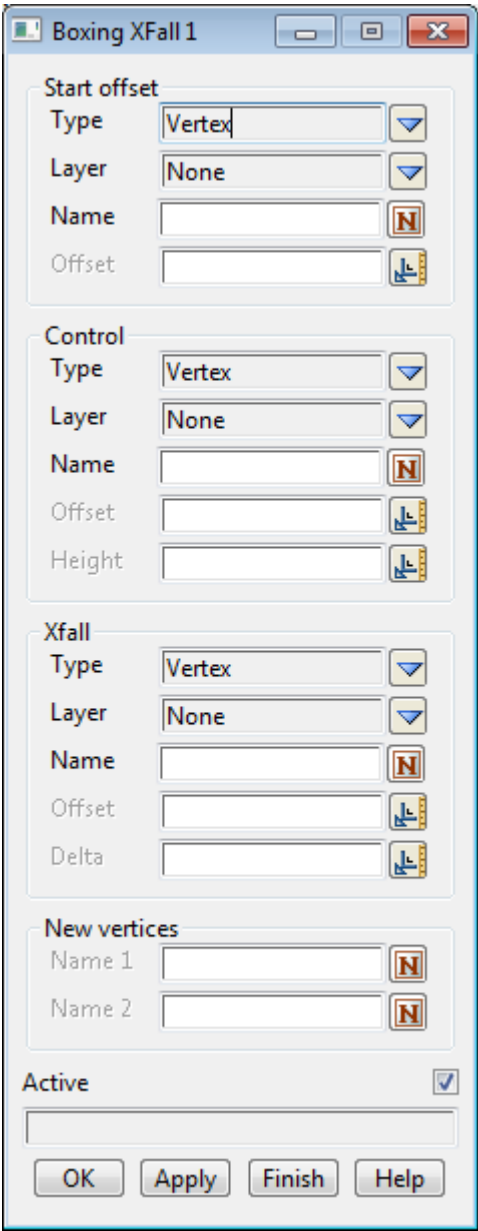

The **Xfall 1** command creates a link from the Start Offset, to the Start Offset on the *next* boxing command, with

- a Xfall which is the xfall at a given offset plus an additional xfall **Delta**
- a start height given by projecting to the Start Offset, the line with the specified Xfall and going through a given Control Point.

Note - the difference between the boxing commands **Xfall** and **Xfall 1** is that in the command **Xfall**, the user supplies the value of the xfall whereas in the command **Xfall 1**, the xfall is taken from a link on the Xfall Layer.

Selecting **Xfall 1** brings up the **Boxing Xfall 1** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start offset			
<i>Start Offset defines the offset where the new line starts from.</i>			
<i>For the Xfall 1 command, the 3d cut of string is not needed. Only 2d cut of string is required.</i>			
Type	choice box		

For the documentation on the methods of defining the Start Offset, see [Defining Relative Offset for Boxing Commands](#)

Control

the definition of the Control Point for the line to go through.

Layer

choice box

*Layer to use with Control **Offset** to define the offset of the Control Point.*

Type

choice box

*If **Vertex on section**:*

Name

name box

*name of the vertex on the Control **Layer** to use with **Offset** to defined the Control Offset. And used with **Height** to define the height of the Control Point*

Offset

real box

0

*this value is added to the offset of the vertex given in the **Name** field to define the Control Offset. **Offset** can be positive or negative as long as the final Control Offset is still **on** the Control **Layer**.*

Height

real box

0

*Height is added to the z-value of the Control **Layer** at the Control Offset to give the height of the Control Point.*

*If **Offset from centreline**:*

Offset

real box

0

*an actual offset from centreline (actually just the chainage of the section) which is used as the Control Offset. **Offset** can be positive or negative as long as the Control Point is still on the Control **Layer**.*

Height

real box

0

*Height is added to the z-value of the Control **Layer** at the Control Offset to give the height of the Control Point.*

*If **2d cut of string, height from section**:*

String

string select

*the selected string needs to cut the Control **Layer** in plan wherever the boxing is being applied.*

The Control Offset is the offset of the plan cut of the selected string with the Control **Layer**, plus the **Offset** value. **Offset** can be positive or negative as long as the final Control Offset is still on the Control **Layer**.

Offset real box 0

offset to add to the offset of the plan cut of the Control **Layer** with the selected string to give the Start Offset. **Offset** can be positive or negative but the final Control Offset must still be on the Control **Layer**.

Height real box 0

Height is added to the z-value of the Control **Layer** at the Control Offset to give the height of the Control Point.

If Cut of string:

String string select

the selected string needs to cut the Control **Layer** in plan wherever the boxing is being applied. The Control Offset is the offset of the plan cut of the selected string with the Control **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on the Control **Layer**.

Offset real box 0

offset to add to the offset of the plan cut of the section with the selected string to give the Control Offset. **Offset** can be positive or negative but the final Control Offset must still be on the section.

Height real box 0

At the plan cut of the string and the Control **Layer**, the difference of the z-values between the string and the Control **Layer** is calculated and **Height** added to it. This combined value is added to the z-values on the Control **Layer**, to give the z-value of the Control Point.

Xfall

the xfall of the line going through the Control Point is:
the xfall of the Xfall **Layer** at Xfall Offset, plus the value Delta.

Layer choice box

Layer to use with **Offset** to defined the Xfall

Type choice box

If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

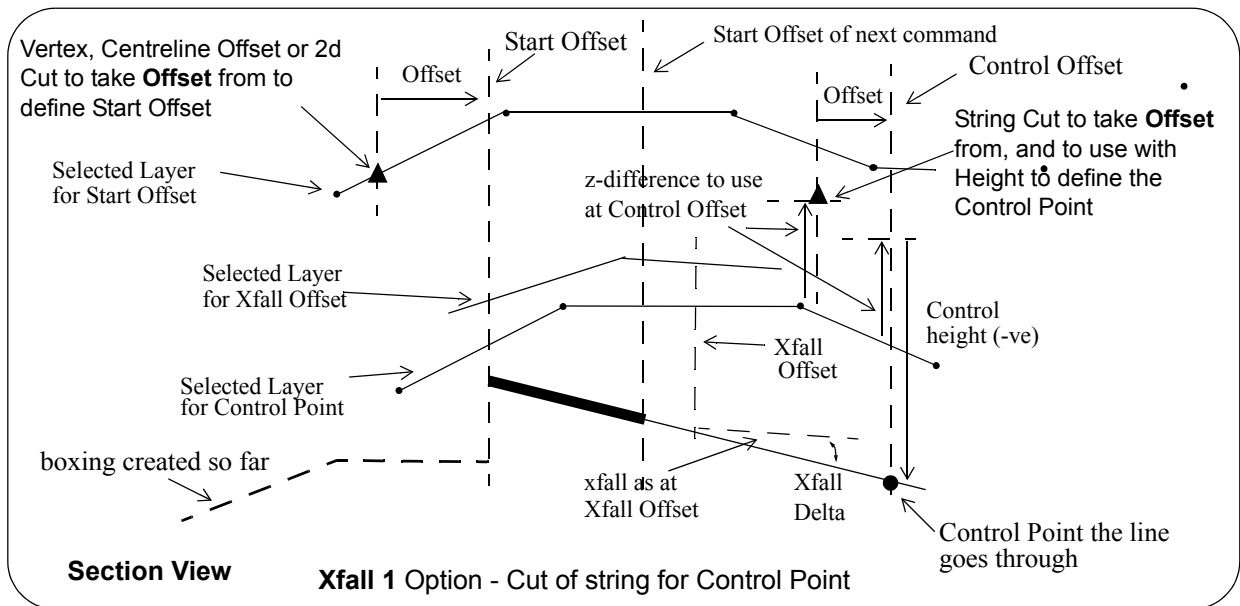

For the typed format of the **xfall1** command created by this panel, see [Text Format - Boxing Xfall1](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Line - line through two points](#) or back to [Edit Boxing File](#).

Xfall 1 diagrams for more methods of defining **Offsets**:

Boxing Line - line through two points

The Line command creates a line from the Start Offset to the Start Offset of the *next* boxing command, with a

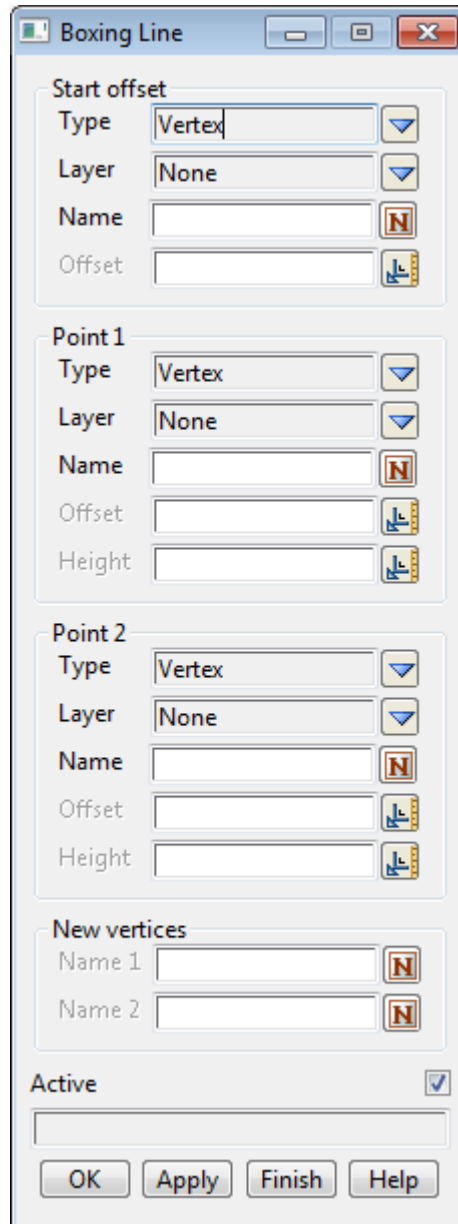

- (a) slope given by two points
- (b) start height given by projecting to the Start Offset, the line through the two points.

The first point defining the line has the offset **Point 1 Offset** which may be given in terms of a Vertex, or Cut with a string, and a height given by the height of a selected Layer, or at the Cut string, plus a given **Height**.

The second point defining the line has the offset **Point 2 Offset** which may be given in terms of a Vertex, or Cut with a string, and a height given by the height of a selected Layer, or at the Cut string, plus a given **Height**.

Selecting **Line** brings up the **Boxing Line** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Start offset

Start Offset defines the offset where the new line starts from.

For the **Line** command, the 3d cut of string is not needed. Only **2d cut of string** is required.

Type	choice box
------	------------

For the documentation on the methods of defining the Start Offset, see [Defining Relative Offset for Boxing Commands](#)

Point 1

the definition of the first point that the line goes through.

Type choice box

For the documentation on the methods of defining the Point 1 Offset, see [Defining Relative Offset for Boxing Commands](#)

If Vertex on section:

Height real box 0

Height is added to the z-value on the **Layer** at the Point 1 Offset to give the height of Point 1.

If Offset from centreline:

Height real box 0

Height is added to the z-value on the **Layer** at the Point 1 Offset to give the height of Point 1.

If 2d cut of string, height from section:

Height real box 0

Height is added to the z-value on the **Layer** at the Point 1 Offset to give the height of Point 1.

If Cut of string:

Height real box 0

Height is added to the z-value of the cut string to give the z-value of Point 1.

Point 2

the definition of the second point that the line goes through.

Type choice box

Please go to the next section [Boxing Intersect - Intersection of Two Lines](#) or back to [Edit Boxing File](#).

Line diagrams for more methods of defining **Offsets**:

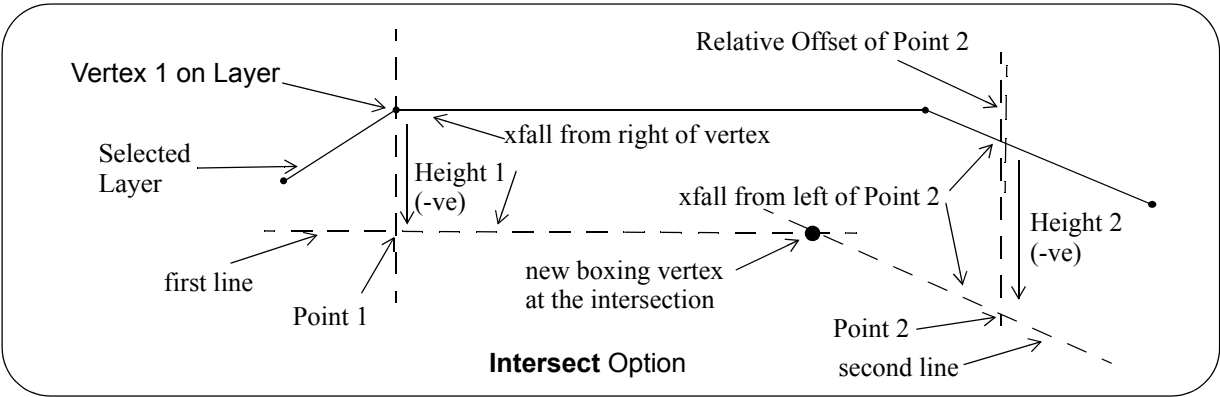

Boxing Intersect - Intersection of Two Lines

The **Intersect** command creates a vertex on the boxing section that is the **intersection** of two lines.

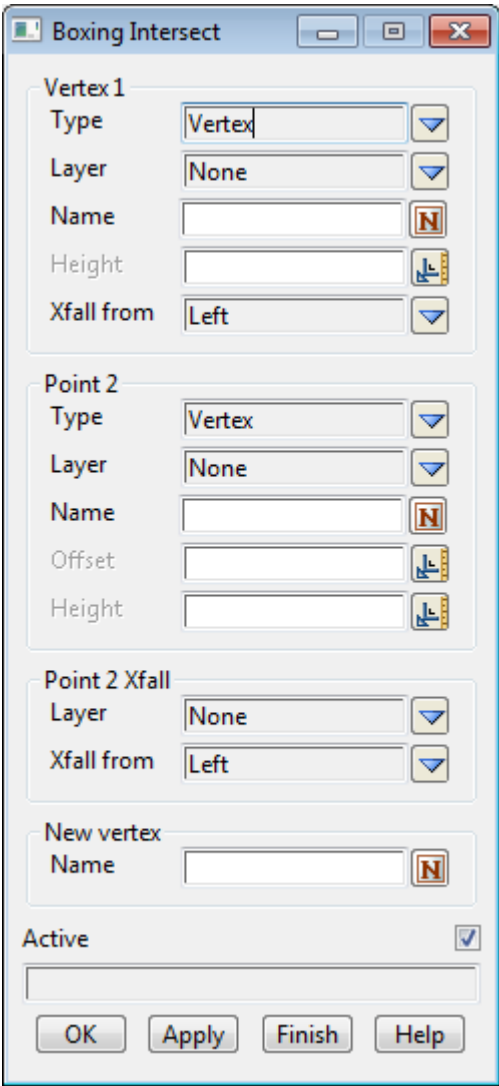

The first line goes through Point 1 where the offset for Point 1 is the offset of a vertex from a Layer, and the height at Point 1 is the height on the vertex plus of a given **Height**. The **xfall** of the line is taken from the Layer segment to either the Left or Right of the selected vertex.

The second line goes through Point 2 where the offset for Point 2 is a relative offset to a vertex or a selected string, and the height at Point 2 is either the height on the Layer section plus a given **Height**, or the height at the cut string, with the addition of a given **Height**. The **Xfall** of the line is taken from the Layer segment to either the Left or Right of the relative offset of Point 2.

A new boxing vertex is created at the intersection of the two lines.

Selecting **Intersect** brings up the **Boxing Intersect** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Vertex 1				
	<i>the definition of the point that the first line goes through. The point must be vertically over a vertex from a Layer</i>			
Layer		choice box		Design, Layer 1 ... Layer 8
	<i>Layer to select the vertex from to define the offset of the point the first line goes through.</i>			
Type		choice box		
	<i>If Vertex on section:</i>			
Name		name box		
	<i>name of the vertex on Layer to use with Height to defined the offset and height for point that the first line goes through</i>			
Height		real box		

Height is added to the z-value of the selected vertex to give the point the first line goes through.

Xfall from choice box Left, Right
if Left, the xfall for the line is taken from the segment that is a little left of the selected vertex.
If Right, the xfall for the line is taken from the segment that is a little right of the selected vertex

Point 2
the definition of the point that the second line goes through

Layer choice box Design, Layer 1 ... Layer 8
Layer to select the vertex from to define the offset of the point the second line goes through.

Type choice box

If **Vertex on section**:

Name name box
name of the vertex on the cross section to use with **Offset** to defined the Point 2 Offset. And used with **Height** to define the height of the Point 2.

Offset real box 0
this value is added to the offset of the vertex given in the **Name** field to define the Point 2 Offset. **Offset** can be positive or negative as long as the final Point 2 Offset is still **on** the section.

Height real box 0
Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If **Offset from centreline**:

Offset real box 0
an actual offset from centreline (actually just the chainage of the section) which is used as the Point 2 Offset. **Offset** can be positive or negative as long as the Point 2 Offset is still on the section.

Height real box 0
Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If **2d cut of string, height from section**:

String string select
the selected string needs to cut the sections in plan wherever the boxing is being applied. The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** value. **Offset** can be positive or negative as long as the final Point 2 Offset is still on the section.

Offset real box 0
this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** can be positive or negative but the final Point 2 Offset must still be on the section.

Height real box 0
Height is added to the z-value of the section at the Point 2 Offset to give the height of Point 2.

If Cut of string:

String	string select	
<i>the selected string needs to cut the sections in plan wherever the boxing is being applied.</i> <i>The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the</i> Offset <i>value. Offset can be positive or negative but the final position must still be on the</i> <i>section.</i>		
Offset	real box	0
<i>this value is added to the offset of the plan cut of the section with the selected string to give the</i> <i>Point 2 Offset. Offset can be positive or negative but the final Point 2 Offset must still be on the</i> <i>section.</i>		
Height	real box	0
<i>Height is added to the z-value of the cut string to give the z-value of Point 2.</i>		

Point 2 Xfall

the definition of xfall of the second line

Layer	choice box	Design, Layer 1 ... Layer 8
<i>Layer to select the vertex from to define the offset of the point the second line goes through.</i>		
Xfall from	choice box	Left, Right
<i>if Left, the xfall of the second line is taken from the segment that is a little to the left of the</i> <i>relative offset.</i> <i>If Right, the xfall of the second line is taken from the segment that is a little to the right of the</i> <i>relative offset</i>		

New vertex

a new vertex is created at the intersection of the two lines

Name	name box
<i>the vertex created at the intersection of the two lines is given this name</i>	

Active	tick box
<i>if ticked, use this Boxing Command.</i> <i>If not ticked, don't use this Boxing Command.</i>	

OK	button
OK <i>stores the values in the fields and removes the panel BUT no recalc is done.</i>	

Apply	button
Apply <i>stores the values and leaves the panel on the screen.</i> <i>If the Boxing Definition is being used in an Apply Many MTF and Auto recalc is ticked in the MTF,</i> <i>then whenever the Apply button is clicked, then a recalc of the associated Apply Many for the MTF is</i> <i>done.</i> <i>If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is</i> <i>clicked, a recalc of the Boxing Many Function is done.</i>	

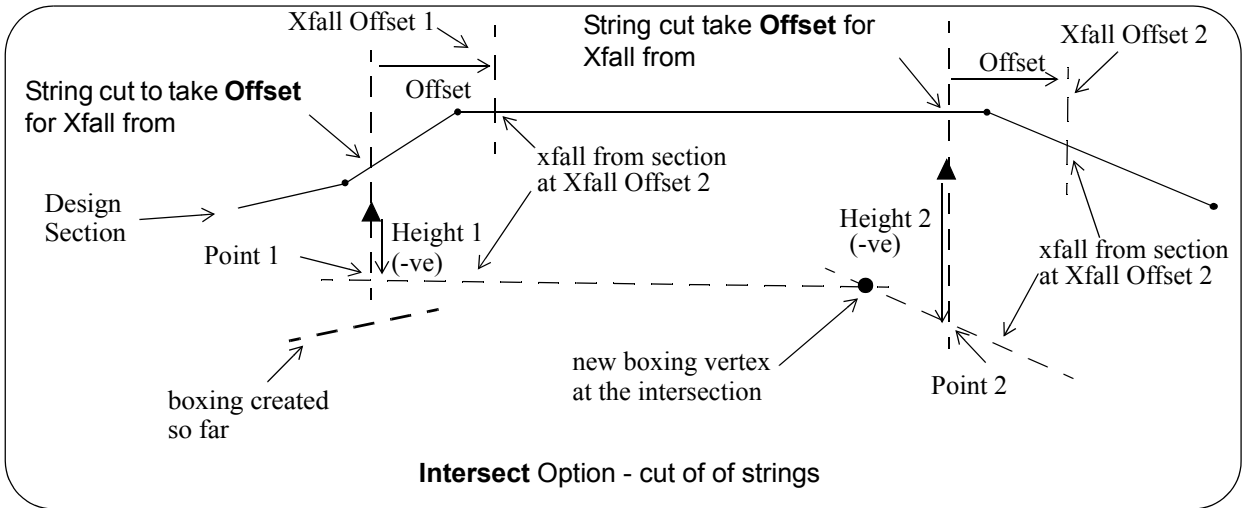

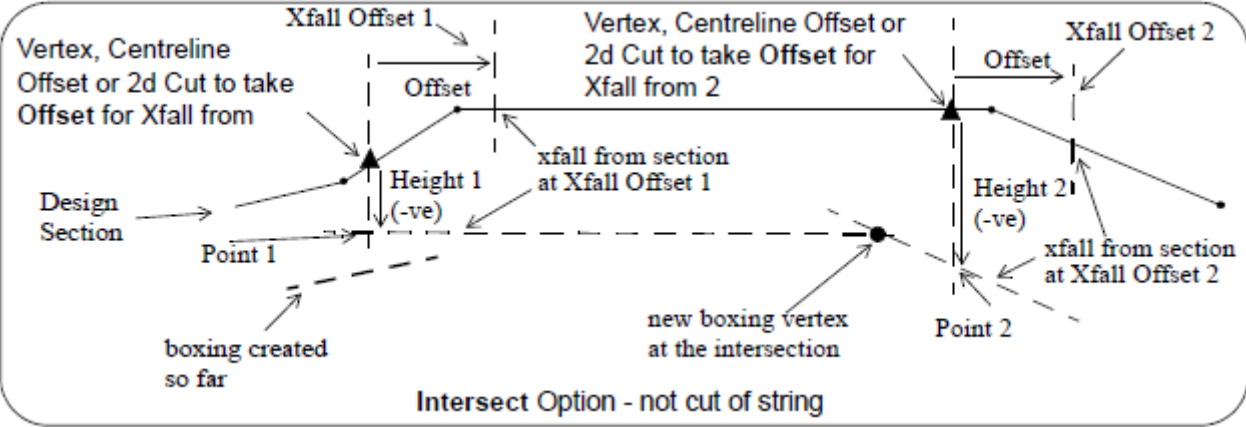

For the typed format of the **intersect** command created by this panel, see [Text Format - Boxing Intersect](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is](#)

Boxing ?.

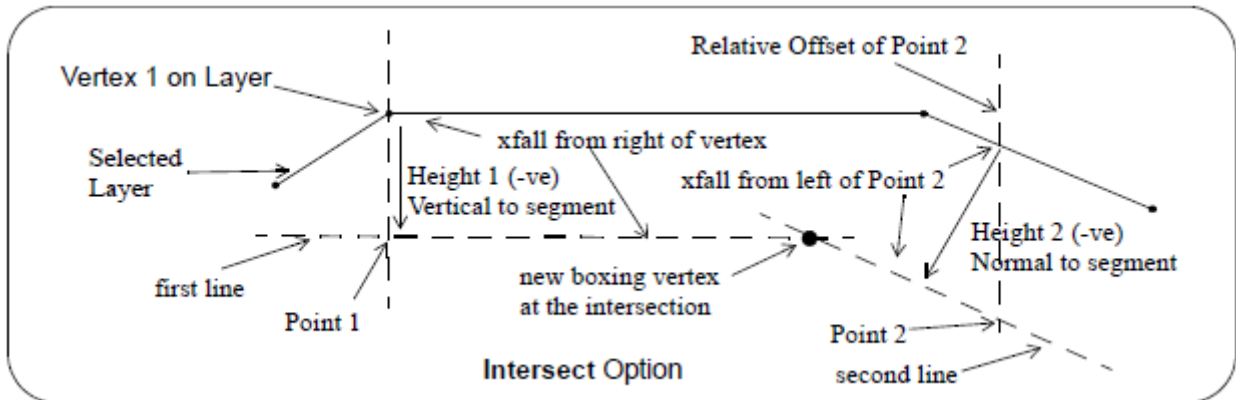

Please go to the next section [Boxing Intersect Advanced](#) or back to [Edit Boxing File](#).

Intersect diagrams for more methods of defining *Offsets*:

Boxing Intersect Advanced

The **Intersect Advanced** command is similar to the **Intersect** command where a vertex on the boxing section is the intersection of two lines. The major difference is that the distance of the lines from vertices etc can be measured NORMAL to a segment, not just a vertical distance (See [Boxing Intersect - Intersection of Two Lines](#)).

Selecting **Intersect (Adv)** brings up the **Boxing Intersect (Adv)** panel

Help

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Vertex 1	the definition of the point that the first line goes through. The point can be normal to a segment left or right of a vertex from a Layer.			
Layer - after Type		choice box		Design, Layer 1 ... Layer 8
	Layer to select the vertex from to define the offset of the point the first line goes through.			
Type		choice box		

Select Choice

Vertex on section

If Vertex on section:

- Name

name box

name of the vertex on Layer to use with Type, Xfall from, Height type and Height to define the offset and height for point that the first line goes through
- Height type

choice box

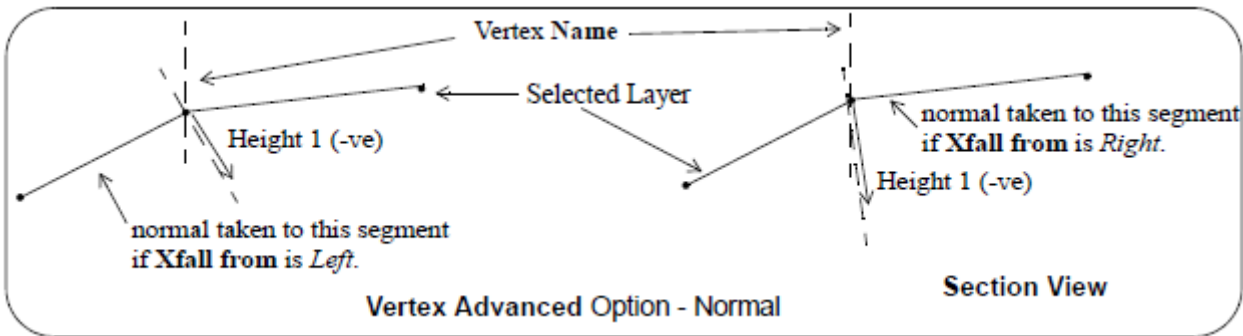

Vertical, Normal

When Height type is Normal, the distance is measured NORMAL to a segment.

If Xfall from is Left, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the left of Name.

If Xfall from is Right, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the right of Name.

When Height type is Vertical, the distance is measured in the vertical plane and Xfall from is not used. For example, if Height is -0.5, the vertex is dropped by 0.5 from Layer

- Height

real box

depending on Height type, Height is added to added vertically or normally to give the z-value of the point the first line goes through.
- Xfall from

choice box

Left, Right

if Left, the xfall for the line is taken from the segment that is a little left of the selected vertex.

If Right, the xfall for the line is taken from the segment that is a little right of the selected vertex

Point 2
the definition of the point that the second line goes through.

- Layer

choice box

Design, Layer 1 ... Layer 8

Layer to select in defining the offset of the point the second line goes through. The point can be normal to a segment left or right of the relative offset from Layer.
- Type

choice box

If Vertex on section:

- Name

name box

name of the vertex on the cross section to use with Offset to defined the Point 2 Offset. And used with Height type and Height to define the height of Point 2.

Offset real box 0

*this value is added to the offset of the vertex given in the **Name** field to define the Point 2 Offset. **Offset** can be positive or negative as long as the final Point 2 Offset is still **on** the section.*

If Offset from centreline:

Offset real box 0

*an actual offset from centreline (actually just the chainage of the section) which is used as the Point 2 Offset. **Offset** can be positive or negative as long as the Point 2 Offset is still on the section.*

If 2d cut of string, height from section:

String string select

*the selected string needs to cut the sections in plan wherever the boxing is being applied. The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** value. **Offset** can be positive or negative as long as the final Point 2 Offset is still on the section.*

Offset real box 0

*this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** can be positive or negative but the final Point 2 Offset must still be on the section.*

If Cut of string:

String string select

*the selected string needs to cut the sections in plan wherever the boxing is being applied. The Point 2 Offset is the offset of the plan cut of the selected string with the section, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on the section.*

Offset real box 0

*this value is added to the offset of the plan cut of the section with the selected string to give the Point 2 Offset. **Offset** can be positive or negative but the final Point 2 Offset must still be on the section.*

Height type choice box Vertical, Normal

*When **Height type** is Normal, the distance is measured NORMAL to a segment.
If **Xfall from** is Left, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the left of the Point 2 offset.
If **Xfall from** is Right, the xfall to measure the distance NORMAL to is taken from the segment that is slightly to the right of the Point 2 offset.
When **Height type** is Vertical, the distance is measured in the vertical plane and **Xfall from** is not used. For example, if Height is -0.5, the vertex is dropped by 0.5 from **Layer***

Height real box 0

*depending on **Height type**, **Height** is added vertically or normally to give the z-value of the point the second line goes through.*

Point 2 Xfall
the definition of xfall of the second line. The xfall comes from the segment in the elected Layer slightly to the left or right of the Point 2 offset

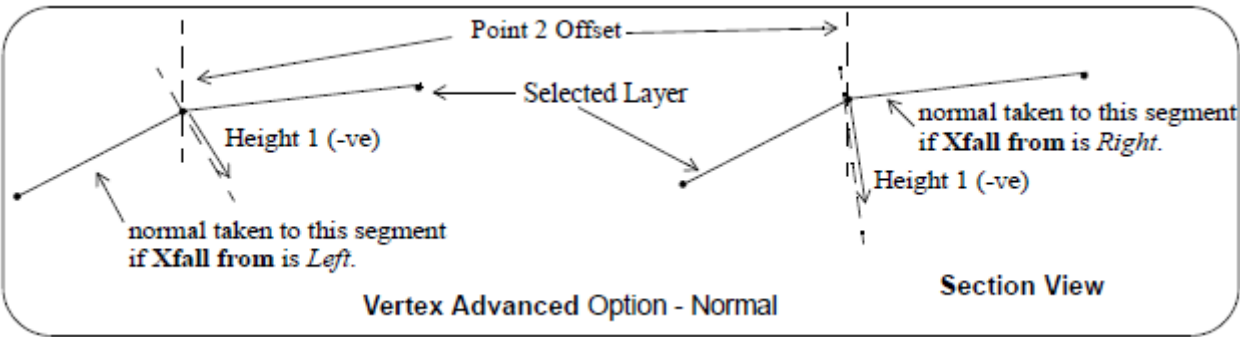

Layer choice box Design, Layer 1 ... Layer 8

Layer to select the xfall from for the second line.

Xfall from choice box

if Left, the xfall of the second line is taken from the segment that is a little to the left of Point 2 Offset.
If Right, the xfall of the second line is taken from the segment that is a little to the right of Point 2 Offset.

If Manual, the xfall is taken from the **Xfall** field.
If Left Max, the xfall on the left side of Point 2 will never exceed the value in the **Xfall** field. If the xfall is greater than the value in **Xfall** field then the xfall takes the value in the **Xfall** field.
If Right Max, the xfall on the right side of Point 2 will never exceed the value in the **Xfall** field. If the xfall is greater than the value in **Xfall** field then the xfall takes the value in the **Xfall** field.
If Left Min, the xfall on the left side of Point 2 will never be less than the value in the **Xfall** field. If the xfall is less than the value in **Xfall** field then the xfall takes the value in the **Xfall** field.
If Right Min, the xfall on the right side of Point 2 will never be less than the value in the **Xfall** field. If the xfall is less than the value in **Xfall** field then the xfall takes the value in the **Xfall** field.

For example, to force a crown in the subgrade no matter what the super elevation of the road is, you would use Left Min on the left hand side of the road and Right Max on the right side of the road.

Intersection Type

the definition of xfall of the second line. The xfall comes from the segment in the elected Layer slightly to the left or right of the Point 2 offset

Type choice box

if Intersect extended segment,
If Intersect segment stop,

New vertex

a new vertex is created at the intersection of the two lines

Name	name box
------	----------

the vertex created at the intersection of the two lines is given this name

Active ☒ tick box

*if **ticked**, use this Boxing Command.*

If not ticked, don't use this Boxing Command.

OK button

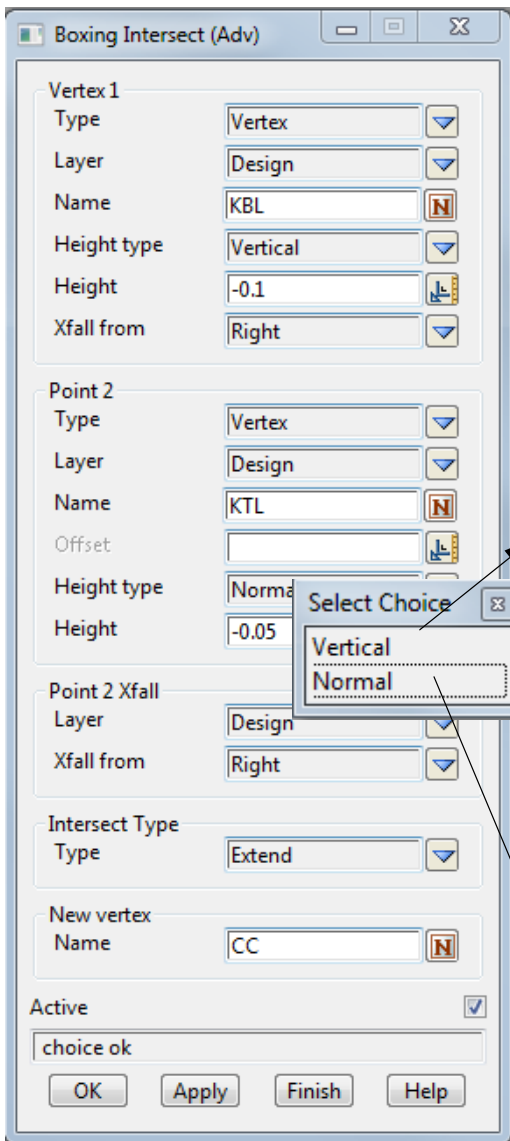

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

*If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a recalc of the **Boxing Many Function** is done.*

Intersect (Adv) - Point 2 Vertical to Design Layer

Intersect (Adv) - Point 2 Normal to Design Layer

For the typed format of the **intersect Advanced** command created by this panel, see [Text Format - Boxing Intersect](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Xfall Point](#) or back to [Edit Boxing File](#).

Intersect Adv diagrams for more methods of defining *Offsets*:

Boxing Xfall Point

The **Xfall Pt** command is similar to the **Vertex** command in that it inserts one or two new vertices at the given **Start Offset**.

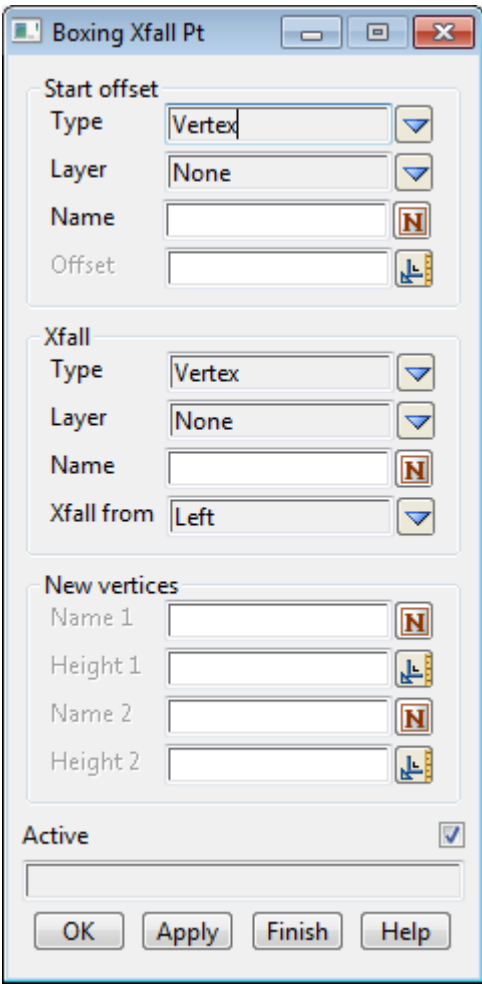

However, instead of adjusting the height from the z-value of the Layer, the **Xfall Pt** command extrapolates from the z-value of the selected Layer or 2d cut with a selected string (depending on Type) using the Xfall at the Xfall Offset given in the **Xfall Pt** command.

Like **Vertex**, **Xfall Pt** can be used to quickly create a vertical wall of two vertices.

Note - to allow the boxing sections and strings to triangulate, **12d Model** increases the offset of the second vertex by ten thousandth of a unit.

Selecting **Xfall pt** brings up the **Boxing Xfall Pt** panel

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Start offset				
<i>Start Offset defines the vertex, plan cut or cut string to define where the grade line start goes through, and then the Offset defines where the line is projected to and creates the one or two new vertices.</i>				
Layer - after Type		choice box		None, Design, Layer 1 ... Layer 8
<i>Layer to use with Type to select the point the line goes through, and for how far.</i>				
Type		choice box		

*If **Vertex on section**:*

Name name box

*name of the vertex on the given **Layer** that the line will go though. The line will have xfall given in the **Xfall** section. **Offset** is added to the offset of the vertex to defined the Start Offset, and the*

line is extended through the vertex to Start Offset.

Height 1/Height 2 are then used with the projected point to define the heights of the new boxing vertices.

Offset real box 0

this value is added to the offset of the vertex given in the **Name** field to define the Start Offset.

Offset can be positive or negative as long as the final Start Offset is still **on** the section.

Height 1/Height 2 real box 0

Height 1/Height 2 is added to the z-value of the line that is extended to Start Offset to give the z-values of the new boxing vertices.

If Offset from centreline:

Offset real box 0

an actual offset from centreline (actually just the chainage of the section) which is used as the Start Offset. **Offset** can be positive or negative as long as it is still on the section.

If Offset from centreline is used, the Xfall section is not used.

Height 1/Height 2 real box 0

Height 1/Height 2 is added to the z-value of the section at the Start Offset, to give the z-values of the new boxing vertices. For example, if Height is -0.3, the vertex is dropped by 0.3

If 2d Cut of string, height from section:

String string select

The Start Offset is the offset of the plan cut of the selected string with the section from **Layer**, plus the **Offset** value.

The **plan cut** on the section from **Layer** is used as the position to take a line through with xfall given at the Xfall Offset defined in the Xfall section. This goes through the plan cut on **Layer** and is extended through to the z-value at Start Offset.

Height 1/Height 2 are then added to the z-value at Start Offset to define the heights of the new boxing vertices.

The selected string needs to cut the sections from **Layer** in plan wherever the boxing is being applied.

Offset real box 0

offset to add to the offset of the plan cut of the section from **Layer** with the selected string to give the Start Offset. **Offset** can be positive or negative but the final Start Offset must still be on **Layer**.

Height 1/Height 2 real box 0

Height 1/Height 2 is used with the z-value of the extended line at the Start Offset to give the z-value of the new boxing vertices.

If Cut of string:

String string select

the Start Offset is the offset of the **plan** cut of the selected string with the section from **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final position must still be on the section.

The line goes through the **3d cut** with the xfall given at the Xfall Offset defined in the Xfall section. This line goes through the 3d cut point and is extended to Start Offset to give a z-value.

Height 1/Height 2 are then added to the projected point to define the heights of the new boxing vertices.

The selected string needs to cut the sections in plan wherever the boxing is being applied.

Offset real box 0

offset to add to the offset of the plan cut of the section with the selected string to give the Start Offset. **Offset** can be positive or negative but the final Start Offset must still be on the section.

Height 1/Height 2 real box 0

Height 1/Height 2 is used with the z-value of the extended line at the Start Offset to give the z-value of the new boxing vertices.

Xfall
the definition of the offset that Xfall is taken from.

Type choice box

For the documentation on the methods of defining the Xfall Offset, see [Defining Relative Offset for Boxing Commands](#).

The xfall is taken from the point on the section in **Layer** with offset Xfall Offset.

Name 1 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height.
If blank, no vertex is created.

Height 1 real box

Height 1 to used in the calculation height of the new boxing vertex

Name 2 name box

if non blank, a vertex is created on the boxing section at Start Offset with this name and the appropriate height.
If blank, no vertex is created.

Height 2 real box

Height 2 to used in the calculation height of the new boxing vertex

Note - to allow the boxing sections and strings to triangulate, if two vertices are created, **12d Model** actually increases the offset of the second vertex by ten thousandth of a unit.

Active tick box

if **ticked**, use this Boxing Command.
If **not ticked**, don't use this Boxing Command.

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.
If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.
If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.

For the typed format of the **Xfall Point** command created by this panel, see [Text Format - Boxing Xfall Point](#).

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Drop](#) or back to [Edit Boxing File](#).

Boxing Drop

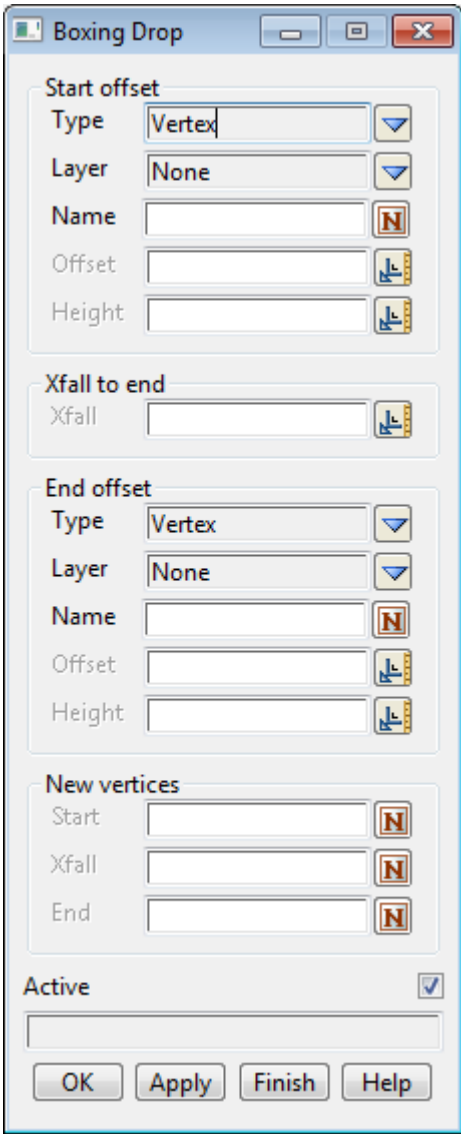

The **Drop** command is a quick way of creating three vertices, the first two on a line of given Xfall, and the third vertically above the second vertex.

If the **End Offset** is before the **Start Offset** then the **Drop** is done in reverse. That is, the line still goes through the Start vertex but it then goes to the **left**.

Selecting **Drop (kerb)** brings up the **Boxing Drop** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start offset <i>the first vertex is created with offset Start Offset and z-value determined by Start Offset Type and Height.</i>			
Type	choice box		

For the documentation on the methods of defining the **Start Offset** except for **Last created**, see [Defining Relative Offset for Boxing Commands](#)

Height	real box	0
---------------	----------	---

If Start Offset Type is NOT: **Cut of string:**
the height of the first vertex is **Height** added to the z-values of the selected **Layer** at Start Offset.
For example, if Height is -0.3, the first vertex is 0.3 below the **Layer** at Start Offset.

If Start Offset Type is: **Cut of string:**
At the plan cut of the string and the **START OFFSET Layer, Z-Diff** (the difference of the z-values between the string and **START OFFSET Layer**) is calculated and **Height** added to it. This combined value is added to the z-value of **Layer** at the Start Offset to give the z-values of the first vertex

Xfall to end

Xfall real box

a line is created going through the first vertex (the Start vertex) with the xfall given in the **Xfall** field.
Positive Xfall is up and negative Xfall is down.

End offset

the second vertex lies on the line through the first vertex when it is extrapolated to End Offset.
The third vertex is created with offset End Offset and z-value determined by End Offset Type and Height.

Type choice box

For the documentation on the methods of defining the **Start Offset** except for **Last created**, see [Defining Relative Offset for Boxing Commands](#)

Height real box 0

If End Offset Type is NOT: **Cut of string:**
the height of the last vertex is **Height** added to the z-value of the selected **Layer** at End Offset.
For example, if Height is -0.1, the third vertex is 0.1 below the **Layer** at End Offset.

If End Offset Type is: **Cut of string:**
At the plan cut of the string and the **END OFFSET Layer, Z-Diff** (the difference of the z-values between the string and **END OFFSET Layer**) is calculated and **Height** added to it. This combined value is added to the z-value of **Layer** at the End Offset to give the z-values of the third vertex

IMPORTANT NOTE: if the End Offset is **before** the Start Offset then the line from the first vertex is reversed and goes to the left rather than the right. The use of **Offset inside** the Start Offset and End Offset sections is also reversed so that a **positive offset goes to the left**.

New Vertices

Start name box

If **Start** is non blank then it is the name of the first vertex, otherwise a default name is used.

Xfall name box

If **Xfall** is non blank then it is the name of the second vertex, otherwise a default name is used.

End name box

If **End** is non blank then it is the name of the third vertex, otherwise a default name is used.

Active tick box

*if **ticked**, use this Boxing Command.*

*If **not ticked**, don't use this Boxing Command.*

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

*If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Decision](#) or back to [Edit Boxing File](#).

Boxing Decision

A Test is specified and depending on the result, processing of the boxing commands is sent to a specified **Label** in the *Boxing Definition* where processing then continues from the next command after the Label, or no jump is made and processing continues to the next boxing command in the *Boxing Definition*.

Selecting **Decision** brings up the **Boxing Decision** panel

Boxing Decision

Type:

Test offset

Type:

Layer:

Name:

Offset:

Goto label:

When test is:

Active: ☒

Type	choice box
------	------------

determines the type of test to be made.

*If **Type** is Test offset:*

Test Offset

Layer - after Type choice box

Layer to use with **Type** to defined the test.

Type choice box

If **Vertex on section**:

the test is satisfied if the Test Offset defined by **Layer**, **Name** and **Offset** is still on **Layer**.

Name name box

name of the vertex on **Layer** to use with **Offset** to defined the Test Offset. If it is not a name of a vertex then the test is not satisfied.

Offset real box 0

this value is added to the offset of the vertex given in the **Name** field to define the Test Offset. **Offset** can be positive or negative.

If **Offset from centreline**:

the test is satisfied if the Offset is on **Layer**.

Offset real box 0

an actual offset from centreline (actually just the chainage on **Layer**) which is used as the Test Offset. **Offset** can be positive or negative.

If **2d Cut of string, height from section**:

the test is satisfied if the selected string cuts **Layer** in plan and the Test Offset given by the plan cut plus **Offset** is still on **Layer**.

String string select

the selected string needs to cut the sections of **Layer** in plan wherever the boxing decision is being applied.
The Test Offset is the offset of the plan cut of the selected string with **Layer**, plus the **Offset** value.

Offset real box 0

offset to add to the offset of the plan cut of the section from **Layer** with the selected string to give the Test Offset. **Offset** can be positive or negative but the final Test Offset must still be on **Layer**.

End of definition for **Type** equal to Test offset.

If **Type** is Above Tin or Below Tin:

Above/Below Tin decision

Layer - Below Type choice box

Layer to use with **Type** to defined the height for the test.

Type choice box

If **Vertex on section**:

the test is satisfied if the **height** on the section at Test Offset defined by **Layer**, **Name** and **Offset** is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at Test Offset.

Name name box

name of the vertex on **Layer** to use with **Offset** to defined the Test Offset. If it is not a name of a vertex then the test is not satisfied.

Offset real box 0

this value is added to the offset of the vertex given in the **Name** field to define the Test Offset. **Offset** can be positive or negative.

If **Offset from centreline**:

the test is satisfied if the height of the section at Offset is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at Test Offset.

Offset real box 0

an actual offset from centreline (actually just the chainage on **Layer**) which is used as the Test Offset. **Offset** can be positive or negative.

If **2d Cut of string, height from section**:

the test is satisfied if the selected string cuts **Layer** in plan and the **height** of the section at Test Offset given by the plan cut plus **Offset** is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at Test Offset.

String string select

the selected string needs to cut the sections of **Layer** in plan wherever the boxing decision is being applied.

The Test Offset is the offset of the plan cut of the selected string with **Layer**, plus the **Offset** value.

Offset real box 0

*offset to add to the offset of the plan cut of the section from **Layer** with the selected string to give the Test Offset. **Offset** can be positive or negative but the final Test Offset must still be on **Layer**.*

If Cut of string:

the selected string can not have only null z-values.

*The test is satisfied if the selected string cuts **Layer** in plan and the **height** on the cut string at Test Offset given by the plan cut plus **Offset** is **ABOVE/BELOW** the sum of the value given in the field **Tin height offset** and the height of the tin given in the field **Tin** at Test Offset.*

String string select

*the selected string needs to cut the sections of **Layer** in plan wherever the boxing decision is being applied.*

*The Test Offset is the offset of the plan cut of the selected string with **Layer**, plus the **Offset** value.*

Offset real box 0

*offset to add to the offset of the plan cut of the section from **Layer** with the selected string to give the Test Offset. **Offset** can be positive or negative but the final Test Offset must still be on **Layer**.*

*End of definition for **Type** equal to **Above Tin** or **Below Tin**.*

Goto label text box

the name of the Label in the Boxing Definition to pass control to.

When test is choice box True, False

*if **True**, then the Goto is done if the test **is** satisfied.*

*If **False**, then the Goto is done test **is not** satisfied.*

If the Goto is not done, then control passes to the next boxing command in the Boxing Definition.

Active tick box

*if **ticked**, use this Boxing Command.*

*If **not ticked**, don't use this Boxing Command.*

OK button

***OK** stores the values in the fields and removes the panel BUT no **recalc** is done.*

Apply button

***Apply** stores the values and leaves the panel on the screen.*

*If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Label](#) or back to [Edit Boxing File](#).

Boxing Label

Selecting **Label** brings up the **Boxing Label** panel which is used to define a label for this line in the *Boxing Definition*, and control can be passed to via a **Goto** or a **Decision** boxing command.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Goto Label	input		
<i>name of the label for this line in the Boxing Definition.</i>			
Active	tick box		
<i>if ticked, use this Boxing Command.</i>			
<i>If not ticked, don't use this Boxing Command.</i>			
OK	button		
<i>OK stores the values in the fields and removes the panel BUT no recalc is done.</i>			
Apply	button		
<i>Apply stores the values and leaves the panel on the screen.</i>			
<i>If the Boxing Definition is being used in an Apply Many MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply Many for the MTF is done.</i>			
<i>If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.</i>			

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Goto](#) or back to [Edit Boxing File](#).

Boxing Goto

Selecting **Goto** brings up the **Boxing Goto** panel which is used to transfer control to the line in the *Boxing Definition* with the **Label** given in the **Goto label** field of the panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Goto label	input		
<i>name of the Label in the Boxing Definition to transfer control to.</i>			
Active	tick box		
<i>if ticked, use this Boxing Command.</i>			
<i>If not ticked, don't use this Boxing Command.</i>			
OK	button		
<i>OK stores the values in the fields and removes the panel BUT no recalc is done.</i>			
Apply	button		
<i>Apply stores the values and leaves the panel on the screen.</i>			
<i>If the Boxing Definition is being used in an Apply Many MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply Many for the MTF is done.</i>			
<i>If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.</i>			

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing Comment](#) or back to [Edit Boxing File](#).

Boxing Comment

Selecting **Comment** brings up the **Boxing Comment** panel and the panel is used to insert a comment as a line of the *Boxing Definition*. Comments are not processed when running the boxing commands.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Comment	input		
<i>user comment - for information purposes only</i>			
OK	button		
<i>OK stores the values in the fields and removes the panel BUT no recalc is done.</i>			
Apply	button		
<i>Apply stores the values and leaves the panel on the screen.</i>			
<i>If the Boxing Definition is being used in an Apply Many MTF and Auto recalc is ticked in the MTF, then whenever the Apply button is clicked, then a recalc of the associated Apply Many for the MTF is done.</i>			
<i>If the Boxing Definition is being used in a Boxing Many Function then whenever the Apply button is clicked, a recalc of the Boxing Many Function is done.</i>			

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

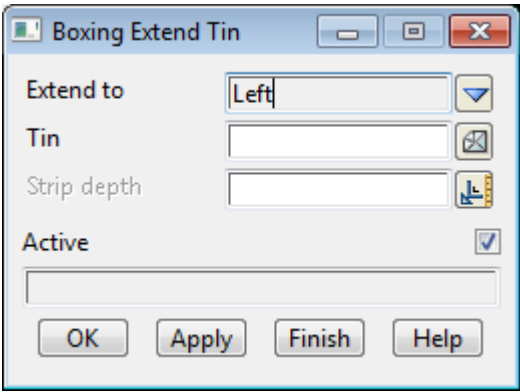

Please go to the next section [Boxing Extend Tin](#) or back to [Edit Boxing File](#).

Boxing Extend Tin

The *Extend to Tin* option is used to extend the link containing the last two vertices (or the first two vertices) already created in the boxing layer until it hits the selected **Stripped Tin**.

Selecting **Extend tin** brings up the **Boxing Extend Tin** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Default	Pop-Up
Extend to		choice box		Left, Right
<p>if Right, then the link through the last two boxing vertices is extended until intersects the stripped tin. The last vertex is then moved to the intersection point. Other boxing commands can then follow.</p> <p>If Left, then the link through the first two boxing vertices is extended until intersects the stripped tin. The first vertex is then moved to the intersection point. Note that this is moving the first vertex of the boxing defined so far. The "Copy from start of section" with the Left Side Interface will add vertices before this vertex.</p> <p>Note - there must be at least two vertices in the boxing before this command can be used.</p> <p>If the extend fails, then no vertex is moved and an error message is written to the output window and the boxing processing terminated at that chainage.</p>				
Tin		tin box		available tins
<p>the tin, dropped by the Strip depth, to batter to.</p>				

Strip depth input

distance below the tin to stop at.

Active tick box

*if **ticked**, use this Boxing Command.*

*If **not ticked**, don't use this Boxing Command.*

OK button

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply button

Apply stores the values and leaves the panel on the screen.

*If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.*

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For more information on how Boxing works in **12d Model**, please go to the section [What is Boxing ?](#).

Please go to the next section [Boxing End](#) or back to [Edit Boxing File](#).

Boxing End

Most Boxing commands go from the **Start Offset** defined with the command, to the *Start Offset* of the **next** Boxing command.

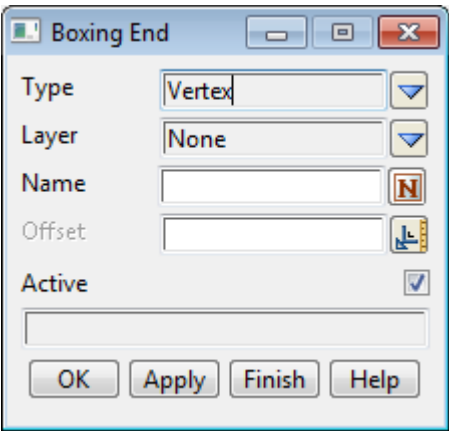

However sometimes a Boxing command needs to be stopped before the **Start Offset** of the next Boxing command.

The **End** command can be used to provide a "Start Offset" to act as the finishing position for the previous boxing command. So the **End** command simply terminates the previous Boxing command.

Apart from supplying the End Offset for the previous command, End is a "no operation" command.

Other Boxing commands can then follow the **End** command.

Selecting **End** brings up the **Boxing End** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
<i>the Relative Offset defined becomes the End Offset for the previous command.</i>			

Type	choice box
------	------------

For the documentation on the methods of defining the **Relative Offset** see [Defining Relative Offset for Boxing Commands](#)

OK	button
----	--------

OK stores the values in the fields and removes the panel BUT no **recalc** is done.

Apply	button
-------	--------

Apply stores the values and leaves the panel on the screen.

If the **Boxing Definition** is being used in an **Apply Many MTF** and **Auto recalc** is ticked in the MTF, then whenever the **Apply** button is clicked, then a **recalc** of the associated **Apply Many** for the MTF is done.

*If the **Boxing Definition** is being used in a **Boxing Many Function** then whenever the **Apply** button is clicked, a **recalc** of the **Boxing Many Function** is done.*

For the typed format of the **End** command created by this panel, see [Text Format - Boxing End](#).

For more information on how Boxing works in **12d Model**, please go to the section [MTF Boxing](#).

Boxing Left Side Interface Xfall from Point

The **Xfall from Point** command creates a line from the left hand end of the boxing already defined and then batters to the **left** at a specified xfall until it intersects the design surface. The xfall of the batter is defined as

- (a) the xfall on the section at a given section offset
- (b) the xfall on the section at a *relative vertex offset*
- (c) the xfall on the section at a *relative string offset*

plus in each case:

an additional xfall value **Delta**.

If the design surface is not intersected by the batter, then no extra line is created.

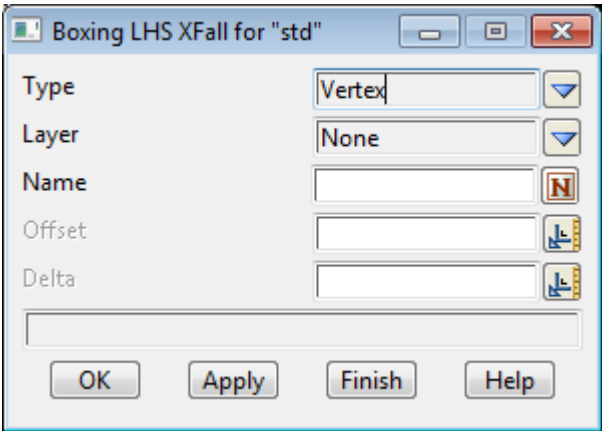

Xfall is percent cross-fall and a positive xfall is up and negative xfall is down.

Note that the **Xfall from Point** creates a line at the **beginning** of the boxing created by running all the boxing commands in the boxing grid. So it is applied **after** all the other boxing commands have been run.

If **Copy from start of section** is ticked, then the part of the design section from the start of the design section to the offset that is the start of the boxing section, is copied and made the beginning of the boxing section.

On the **Boxing Rules** panel, selecting the **Set Point** button when the *Left Side Interface Type* is **Xfall from Point** brings up the **Boxing LHS Xfall** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer - after Type	choice box		

Layer of sections to use with **Type**.

Type	choice box
------	------------

If *Vertex on section*:

Name	name box
<i>name of the vertex on Layer to use with Offset to define the section offset to take the Xfall value from</i>	
Offset	real box
<i>this value is added to the offset of the vertex given in the Name field to define the section offset to take the Xfall value from. Offset can be positive or negative as long as the final section offset is still on the section from Layer.</i>	

If *Offset from centreline*:

Offset	real box
<i>an actual offset from centreline (actually just the chainage of the section) which is used as the section from Layer offset to take the Xfall value from. Offset can be positive or negative as long as it is still on the section. from Layer.</i>	

If *2d cut of string*:

String	string select
<i>the selected string needs to cut the sections from Layer in plan wherever the boxing is being applied.</i>	
<i>The section offset to take the Xfall value from is the offset of the plan cut of the selected string with the section from Layer, plus the Offset value. Offset can be positive or negative but the final section offset must still be on the section from Layer.</i>	
Offset	real box
<i>offset to add to the offset of the plan cut of the section from Layer with the selected string to give the section offset to take the Xfall value from. Offset can be positive or negative but the final section offset must still be on the section from Layer.</i>	

Delta	input	0
-------	-------	---

*add the value **Delta** to the *xfall* taken from the section from **Layer**.*

OK/Apply button

OK *stores the values in the fields and removes the panel.*

Apply *stores the values and leaves the panel on the screen.*

For the typed format of the **left_xfall** command created by this panel, see [Text Format - Boxing Left_Xfall](#), for **left_slope** see [Text Format - Boxing Left_slope](#) and **left_copy** see [Text Format - Boxing Left_copy](#).

For more information on how Boxing works in **12d Model**, please go to the section [MTF Boxing](#).

Boxing Right Side Interface Xfall from Point

The **Xfall from Point** command creates a line from the right hand end of the boxing already defined and then batters to the **right** at a specified xfall until it intersects the design surface. The xfall of the batter is defined as

- (a) the xfall on the section at a given section offset
- (b) the xfall on the section at a *relative vertex offset*
- (c) the xfall on the section at a *relative string offset*

plus in each case:

an additional xfall value **Delta**.

If the design surface is not intersected by the batter, then no extra line is created.

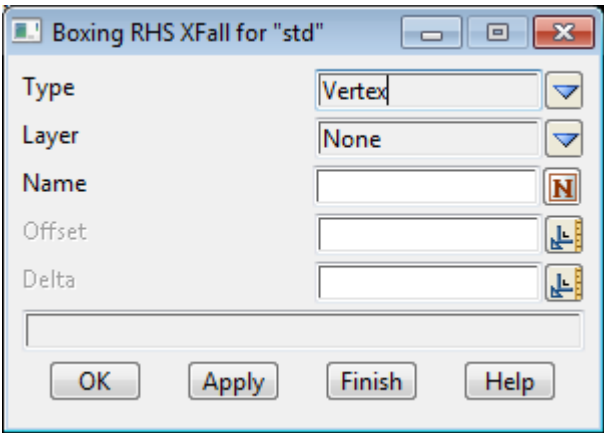

xfall is percent cross-fall and a positive xfall is up and negative xfall is down.

Note that the **Xfall from Point** creates a line at the **end** of the boxing created by running all the boxing commands in the boxing grid. So it is applied **after** all the other boxing commands have been run.

If **Copy to end of section** is ticked, then the part of the design section from the offset of the last boxing vertex to the last vertex on the design section, is copied and made the end of the boxing section.

On the **Boxing Rules** panel, selecting the **Set Point** button when the *Right Side Interface Type* is **Xfall from Point** brings up the **Boxing RHS Xfall** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layer - after Type	choice box		

*Layer of sections to use with **Type**.*

Type	choice box
-------------	------------

*If **Vertex on section**:*

Name	name box
<i>name of the vertex on the section from Layer to use with Offset to define the section offset to take the Xfall value from</i>	

Offset	real box
<i>this value is added to the offset of the vertex given in the Name field to define the section from Layer offset to take the Xfall value from. Offset can be positive or negative as long as the final section offset is still on the section from Layer.</i>	

*If **Offset from centreline**:*

Offset	real box
<i>an actual offset from centreline (actually just the chainage of the section) which is used as the section from Layer offset to take the Xfall value from. Offset can be positive or negative as long</i>	

as it is still on the section from **Layer**.

If 2d cut of string:

String string select

*the selected string needs to cut the sections from **Layer** in plan wherever the boxing is being applied.*

*The section offset to take the Xfall value from is the offset of the plan cut of the selected string with the section from **Layer**, plus the **Offset** value. **Offset** can be positive or negative but the final section offset must still be on the section from **Layer**.*

Offset real box

*offset to add to the offset of the plan cut of the section from **Layer** with the selected string to give the section offset to take the Xfall value from. **Offset** can be positive or negative but the final section offset must still be on the section from **Layer**.*

Delta input 0

*add the value **Delta** to the xfall taken from the section from **Layer**.*

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

For the typed format of the **right_xfall** command created by this panel, see [Text Format - Boxing Right_Xfall](#), for **right_slope** see [Text Format - Boxing Right_slope](#) and **right_copy** see [Text Format - Boxing Right_copy](#).

For more information on how Boxing works in **12d Model**, please go to the section [MTF Boxing](#).

Full Definition of Template Decisions

12d Model supports templates with an unlimited number of fixed links which are in the **Fixed** table of the **Temple** definition and they are processed first.

At the end of the fixed links, **12d Model** checks to see if a **Decisions** table exists.

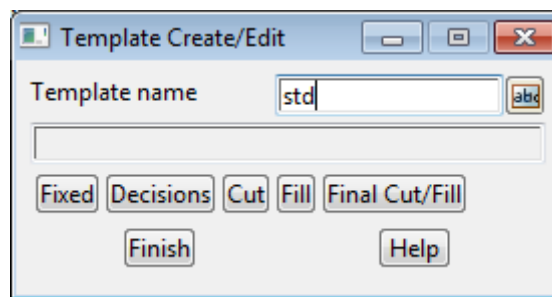

If a **Decisions** table exists, then it is used and the Decision commands processed.

If a **Continue Cut/Fill** command is reached in the decision command processing, then this stops the Decision command processing, and the processing moves onto the **Cut**, **Fill** and **Final Cut/Fill** tables.

If no **Continue Cut/Fill** command is reached in the decisions, then the processing stops after the decision commands are exhausted and the **Cut**, **Fill** and **Final Cut/Fill** tables **ARE NOT USED**.

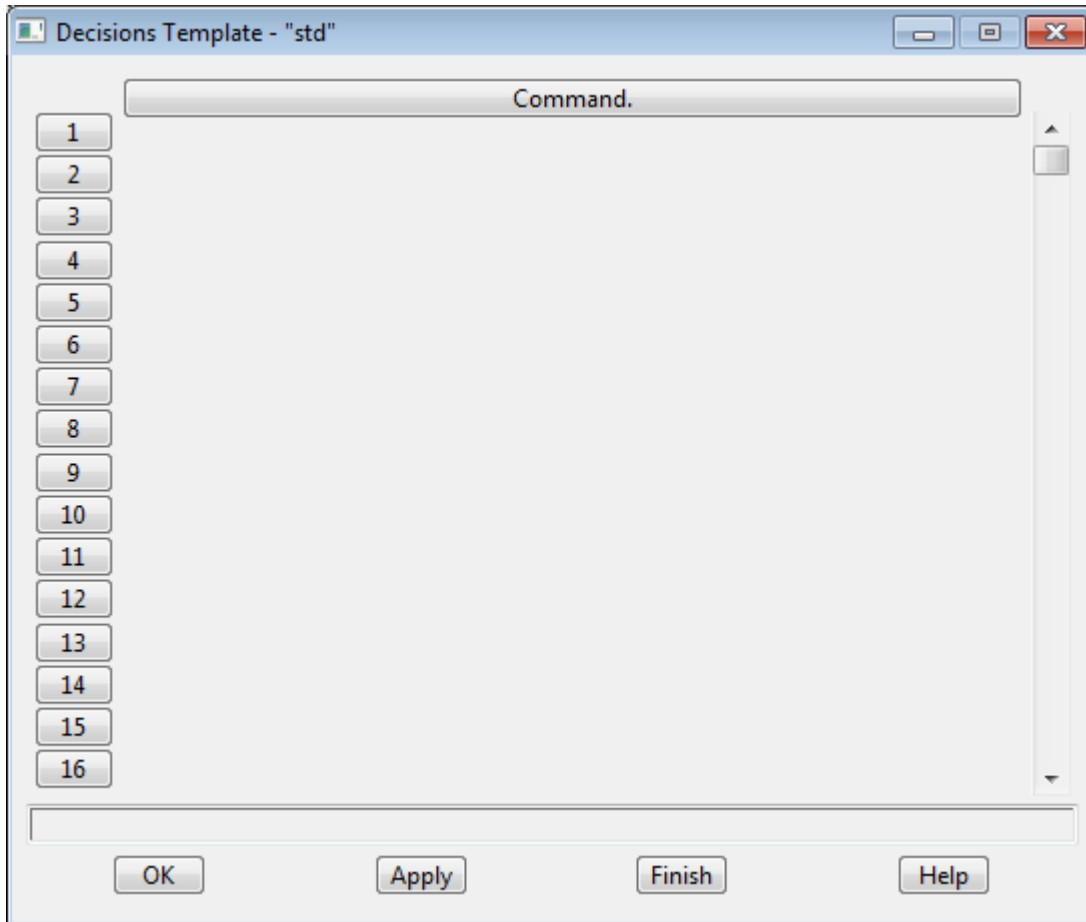

If no **Decisions** table exists, then the **Cut**, **Fill** and **Final Cut/Fill** tables are used after the **Fixed** table.

Templates are created and edited using the **Templates=>Create/edit** option which brings up the **Template Create/Edit** panel.

The description of the fields and the buttons **Fixed**, **Cut**, **Fill**, **Final Cut/Fill** in this panel were given in the chapter [Design](#).

The **Decisions** button and its associated panel, **Decisions Template**, which is created when the **Decisions** button is selected, will now be described.

The **Decisions Template** panel consists of scrolling **command** fields and a **OK** or **Apply** button to record the results.

The **width** of the **command** area in the **Decisions Template** panel is controlled by the environment variable `DEFAULT_TABLE_WIDTH_4D`.

The **commands** in the decision template form a simple language where the commands are processed sequentially unless control is passed to a labelled line from where sequential processing continues, or the processing is terminated by an **end** command.

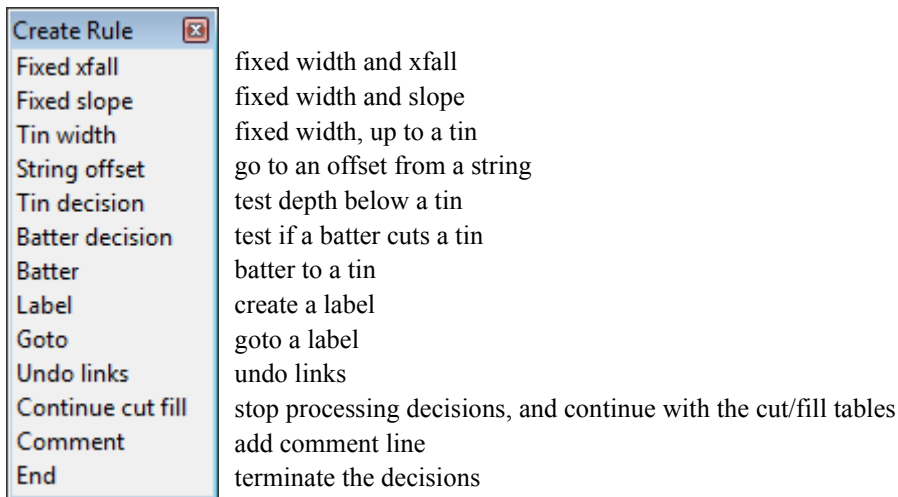

The decision template commands can:

- (a) create a fixed link - **fixed xfall** and **fixed slope**
- (b) create a link of fixed width but with a slope automatically selected so that the link reaches a given tin in the width - **tin width**
- (c) create a link that goes within an offset of a given string **string offset**
- (d) test for being between two depths below a tin, and transfer control if true - **tin decision**
- (e) test that a link would get within a given depth from a tin at a given offset, and transfer control if true - **batter decision**
- (f) create a link of set slope that batters to a depth below a tin at a given offset - **batter**
- (g) create a label which can have processing passed to - **label**
- (h) transfer processing to a given label - **goto**
- (i) end the processing of commands - **end**

The template decision commands can be typed into an text (ascii) file defining a

template (template file .tpl) or can be created and edited through panels.

If the **command line** is **empty**, clicking LB in the **command line** will bring up the **Create Rule** menu which contains all the available decisions commands.

Selecting a menu item will bring up an associated panel which displays the information required for the decisions command.

When the panel is filled in and **OK** or **Apply** selected, the panel information is written out to the **command line** in the correct format for that template decision command.

If the **command line** is **not empty**, clicking LB in the **command line** will bring up the associated panel for the template decisions command in the **command line**.

The information in the panel can be modified and if **OK** or **Apply** is selected, the modified panel information is written out to the **command line** in the correct format for that template decisions command.

If the template is written out using **File I/O=>Templates output** or **Templates=>Utilities=>Output**, the template decisions will be written out as they are displayed in the **command fields**.

Any of the commands in the templates file can be edited and the file read back into **12d Model**.

Each of the template decision commands will now be described and the associated panels created by selecting the command from the **Create Rule** menu.

The format of the decision commands that are written to the panel are given, as are the typed form of the command which is used in the templates file.

For examples of a using decisions, please go to the section [Decisions Examples](#).

For documentation on the option/menus on the **Create Rule** menu:

For <i>Fixed xfall</i> , go to	Decisions Fixed Xfall
<i>Fixed slope</i>	Decisions Fixed Slope
<i>Tin width</i>	Decisions Tin Width
<i>String offset</i>	Decisions String Offset
<i>Tin decision</i>	Decisions Tin Decision
<i>Batter decision</i>	Decisions Batter Decision
<i>Batter</i>	Decisions Batter
<i>Label</i>	Decisions Label

<i>Goto</i>	<u>Decisions Goto</u>
<i>Undo links</i>	<u>Decisions Undo</u>
<i>Continue cut fill</i>	<u>Decisions Continue Cut Fill</u>
<i>Comment</i>	<u>Decisions Comment.</u>
<i>End</i>	<u>Decisions End</u>

Please continue to the next section [Decisions Fixed Xfall.](#)

Decisions Fixed Xfall

Selecting **Fixed xfall** brings up the **Fixed Xfall** panel which is used to constructed the command for a fixed link with the possibility of using cross fall (xfall). The fixed link is defined by specifying values for two of the three fields width, height and x-fall.

Note - if defining a slope rather than a xfall is required, use **Fixed Slope** (see [Decisions Fixed Slope](#)).

The format of the Fixed Xfall command in the panel is

Fixed Xfall Width *value* Height *value* XFall *value* Name *text* Colour *colour* // *comment*

where only two of the three commands Width, Height and Xfall are used.

The format of the command typed into the template file is

Fixed_Xfall *width_value* *height_value* *xfall_value* *name* *colour* // **comment**

where one of *width_value*, *height_value* or *xfall_value* is the key word *unknown*.

The panel brought up when **Fixed xfall** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Width	input		
<i>the width for the link.</i>			

Height	input		
<i>the height for the link.</i>			
Xfall %	input		
<i>the x-fall, in percent cross-fall, of the link. Positive is up and negative down.</i>			
Name	input		
<i>the name to be used for the created point and string.</i>			
Colour	input	cyan	available colours
<i>the colour to be used for the created string</i>			
Comment	input		
<i>user comment - for information purposes only</i>			
OK/Apply	button		
OK stores the values in the fields and removes the panel.			
Apply stores the values and leaves the panel on the screen.			
Please continue to the next section Decisions Fixed Slope .			

Decisions Fixed Slope

Selecting **Fixed slope** brings up the **Fixed Slope** panel which is used to constructed a fixed link. The fixed link is defined by specifying values for two of the three fields width, height and slope.

Note - if defining a cross fall (xfall) rather than a slope is required, use **Fixed Xfall** (see [Decisions Fixed Xfall](#)).

The format of the Fixed Slope command in the panel is

Fixed Slope Width *value* Height *value* Slope *value* Name *text* Colour *colour* // *comment*

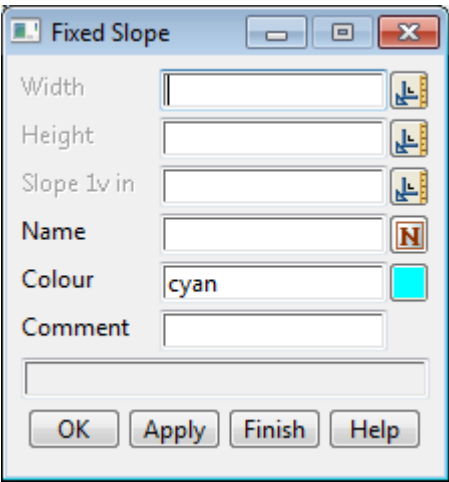

where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

Fixed_Slope *width_value* *height_value* *slope_value* *name* *colour* // *comment*

where one of *width_value*, *height_value* or *slope_value* is the key word *unknown*

The panel brought up when **Fixed slope** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Width <i>the width for the link.</i>	input		
Height	input		

the height for the link.

Slope 1v in input

the slope, in 1v in, of the link. Positive is up and negative down.

Name input

the name to be used for the created point and string.

Colour input cyan available colours

the colour to be used for the created string

Comment input

user comment - for information purposes only

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Please continue to the next section [Decisions Tin Width](#).

Decisions Tin Width

Selecting **Tin width** brings up the **Tin Width** panel which is used to construct a link which has a **given width** and stops at the depth **strip** below the tin. Control then passes to the next line of the table.

strip can be positive (end point is below the tin) or negative (end point is above the tin).

The format of the Tin Width command in the panel is

Tin Width *tin_name* Strip *value* Width *value* Name *text* Colour *colour* // *comment*

The format of the command typed into the template file is

Tin_Width *tin_name* *strip_value* *width_value* *name* *colour* // *comment*

The panel brought up when **Tin width** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin <i>tin to batter to.</i>	input		available tins
Strip <i>distance below the tin to stop at (strip depth). strip can be positive (point is below the tin) or negative</i>	input	0	

(point is above the tin).

Width input 1
width of the link

Name input
the name to be used for the created point and string.

Colour input cyan available colours
the colour to be used for the created string

Comment input
user comment - for information purposes only

OK/Apply button
OK stores the values in the fields and removes the panel.
Apply stores the values and leaves the panel on the screen.

Please continue to the next section [Decisions String Offset](#).

Decisions String Offset

Selecting **String offset** brings up the **String Offset** panel which is used to construct a link which goes to a **given offset from string** and stops at the depth **strip below the string**. Control then passes to the next line of the table.

offset and **string** can be positive or negative.

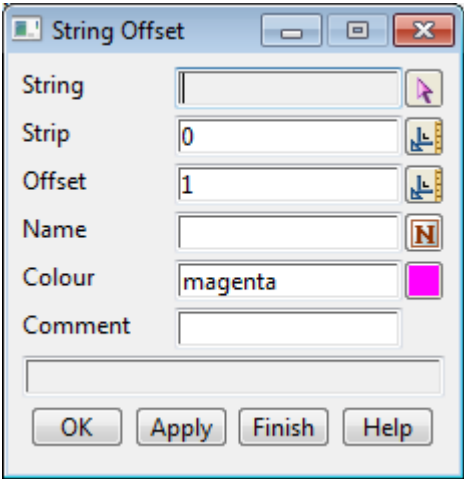

The format of the String Offset command in the panel is

String Offset *string_name* Strip *value* Offset *value* Name *text* Colour *colour* // *comment*

The format of the command typed into the template file is

String_Offset *string_name* *strip_value* *offset_value* *name* *colour* // *comment*

The panel brought up when **String offset** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
String <i>string to go to.</i>	string select		
Strip <i>distance below the string to stop at.</i>	input	0	

Offset	input	1	
<i>offset from the string to stop at.</i>			
Name	input		
<i>the name to be used for the created point and string.</i>			
Colour	input	cyan	available colours
<i>the colour to be used for the created string</i>			
Comment	input		
<i>user comment - for information purposes only</i>			
OK/Apply	button		
OK stores the values in the fields and removes the panel.			
Apply stores the values and leaves the panel on the screen.			
Please continue to the next section Decisions Tin Decision .			

Decisions Tin Decision

Selecting **Tin decision** brings up the **Tin Decision** panel which tests to see if the depth from the end of the previous link, offset by the amount given in the **offset** field, is between the two values given in the **minimum depth** and **maximum depth** fields. If the depth is between the values, then control is transferred to the line with the label given by the **goto** field. Otherwise, control passes to the next line of the table.

offset, **minimum** and **maximum** depth can be positive or negative.

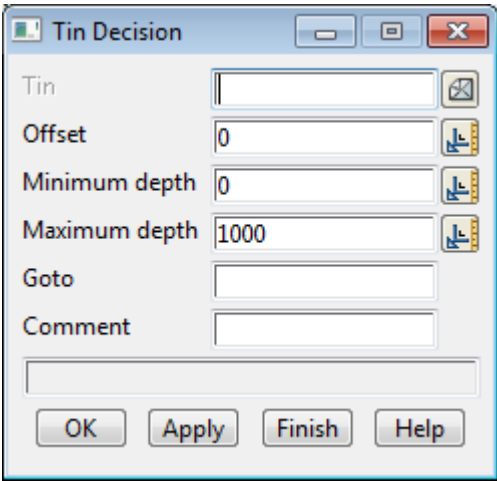

The format of the Tin Decision command in the panel is

Tin Decision *tin_name* Offset *value* Min *value* Max *value* Goto *label* // *comment*

The format of the command typed into the template file is

Tin_Decision *tin_name* *offset_value* *min_value* *max_value* *goto_label* // *comment*

The panel brought up when **Tin decision** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin <i>the tin to calculate the depth to.</i>	tin box		available tins
Offset <i>the depth is calculate at an offset distance of offset from the end of the previous link.</i>	input	0	

Minimum depth	input	0
<i>if the depth is between the minimum and maximum depth, then control is passed to the line with the label given in the goto field, otherwise control passes onto the next line of the table.</i>		
Maximum depth	input	1000
<i>see previous field.</i>		
Goto	input	
<i>label to go to if the depth is between the minimum and maximum depths.</i>		
Comment	input	
<i>user comment - for information purposes only</i>		
OK/Apply	button	
<i>OK stores the values in the fields and removes the panel.</i>		
<i>Apply stores the values and leaves the panel on the screen.</i>		

Please continue to the next section [Decisions Batter Decision](#).

Decisions Batter Decision

Selecting **Batter decision** brings up the **Batter Decision** panel which is used to test whether a given link comes within

- (a) a **strip** depth of a tin
- (b) an offset distance from a tin.
- (c) a strip depth of a tin calculated at a given offset from the link.

If the test is satisfied, then control is transferred via a goto, otherwise control continues onto the next line in the table.

The **test link** is defined by specifying values for two of the three fields width, height and slope.

Notes

1. no link is created, just the test is performed
2. cases (a) and (b) are just special cases of (c)
3. the batter decision is mainly used to test if a batter will stop without performing the batter.

Case (c)

Failure of the batter decision

The format of the Batter Decision command in the panel is

Batter Decision *tin_name* *Strip value* *Offset value* *Width value* *Height value*
Slope value *Goto label* *// comment*

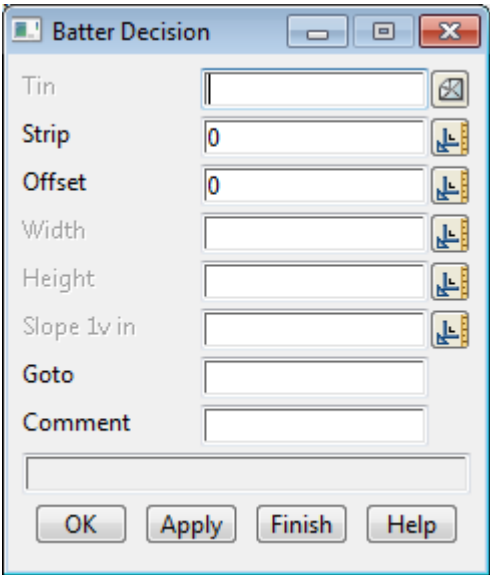

where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

Batter_Decision *tin_name* *strip_value* *offset_value* *width_value* *height_value* *slope_value*
goto_label *// comment*

where one of *width_value*, *height_value* or *slope_value* is the key word *unknown*

The panel brought up when **Batter decision** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin <i>tin to test the batter to.</i>	tin box		available tins
Strip <i>distance below the tin to stop at.</i>	input	0	
Offset <i>offset distance from the link to check strip depth</i>	input	0	
Width <i>the width for the link.</i>	input		
Height <i>the height for the link.</i>	input		
Slope 1v in <i>the slope, in 1v in, of the link. Positive is up and negative down.</i>	input		
Goto <i>label to goto if the test link comes within the strip depth of the tin at the given offset distance.</i>	input		
Comment <i>user comment - for information purposes only</i>	input		
OK/Apply <i>OK stores the values in the fields and removes the panel. Apply stores the values and leaves the panel on the screen.</i>	button		

Please continue to the next section [Decisions Batter](#).

Decisions Batter

Selecting **Batter** brings up the **Batter** panel which is used to construct a link which stops if it comes within

- (a) a **strip** depth of a tin
- (b) an offset distance from a tin.
- (c) a strip depth of a tin calculated at a given offset from the link.

If the link does stop, control is transferred via a goto, otherwise control continues onto the next line in the table.

The **batter** link is defined by specifying values for two of the three fields width, height and slope.

Notes

- 1. cases (a) and (b) are just special cases of (c)
- 2. strip and offset can be used to stop the link to allow for a fixed structure (such as a drain) to be inserted so that it ends up on the tin.

The batter link ends if the tin is cut at the **strip** depth calculated at the **offset** distance from the link.

A point is created at the cut point with **name** and **colour** given in the batter command.

The **goto** is performed.

Failure of the batter

The batter link does **not** cut at the strip depth below the tin, calculated at the offset distance from the link.

A point is created at the end of the batter link with **name** and **colour** given in the batter command.

The **goto** is **not** performed and control goes to the next line.

The format of the Batter command in the panel is

Batter *tin_name* *Strip value* *Width value* *Height value* *Slope value* *Name text*
Colour colour *Goto label* *// comment*

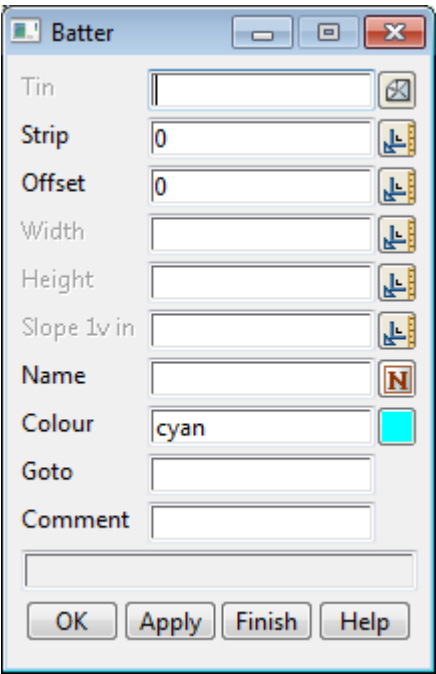

where only two of the three commands Width, Height and Slope are used.

The format of the command typed into the template file is

Batter *tin_name* *strip_value* *width_value* *height_value* *slope_value*
name colour goto_label // comment

where one of *width_value*, *height_value* or *slope_value* is the key word *unknown*

The panel brought up when **Batter** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Tin <i>tin to batter to.</i>	tin box		available tins
Strip <i>distance below the tin to stop at.</i>	input	0	
Offset <i>offset distance from the link to check strip depth</i>	input	0	
Width <i>the width for the link.</i>	input		
Height <i>the height for the link.</i>	input		
Slope 1v in <i>the slope, in 1v in, of the link. Positive is up and negative down.</i>	input		
Name <i>the name to be used for the created point and string.</i>	input		
Colour <i>the colour to be used for the created string</i>	colour box	cyan	available colours
Goto <i>label to goto if the batter link comes within the depth strip of the tin.</i>	input		
Comment <i>user comment - for information purposes only</i>	input		

OK/Apply button

OK stores the values in the fields and removes the panel.

Apply stores the values and leaves the panel on the screen.

Please continue to the next section [Decisions Label](#).

Decisions Label

Selecting **Label** brings up the **Label** panel which is used to define a label for the line for which control can be passed to via a goto.

The format of the Label command in the panel is

```
Label  label_name  // comment
```

The format of the command typed into the template file is

```
Label  label_name  // comment
```

The panel brought up when **Label** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Label <i>name of the label for the line in the table.</i>	input		
Comment <i>user comment - for information purposes only</i>	input		
OK/Apply OK stores the values in the fields and removes the panel. Apply stores the values and leaves the panel on the screen.	button		

Please continue to the next section [Decisions Goto](#).

Decisions Goto

Selecting **Goto** brings up the **Goto** panel which is used to transfer control to the line with the label given in the **goto** field of the panel.

The format of the Goto command in the panel is

```
Goto  label_name  // comment
```

The format of the command typed into the template file is

```
Goto  label_name  // comment
```

The panel brought up when **Goto** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Goto	input		
<i>name of the label to transfer control to.</i>			
Comment	input		
<i>user comment - for information purposes only</i>			
OK/Apply	button		
OK stores the values in the fields and removes the panel.			
Apply stores the values and leaves the panel on the screen.			

Please continue to the next section [Decisions Undo](#).

Decisions Undo

Selecting **undo** brings up the **Undo Decision** panel which is used to delete a given number of points (and hence links) from the template being constructed.

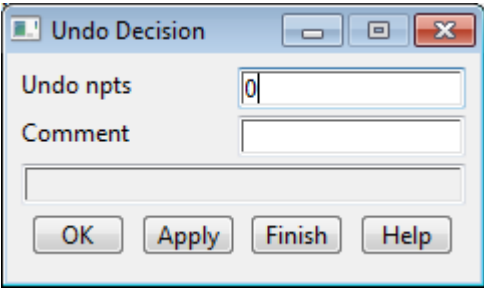

The format of the Label command in the panel is

```
Undo  number_of_points  // comment
```

The format of the command typed into the template file is

```
Undo  number_of_links  // comment
```

The panel brought up when **Undo** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Undo npts	input	0	
<i>number of points to delete from the template, if the number is larger than the number of points in the template all points in the template are removed.</i>			
Comment	input		
<i>user comment - for information purposes only</i>			
OK/Apply	button		
OK stores the values in the fields and removes the panel.			
Apply stores the values and leaves the panel on the screen.			

Please continue to the next section [Decisions Continue Cut Fill](#).

Decisions Continue Cut Fill

If the **Continue Cut Fill** statement is reached when processing the decision commands, the decision section is terminated, and the processing continues to the Cut and Fill tables.

The panel brought up when **Continue Cut Fill** is selected from the **Create Rule** menu is:

Clicking on **OK** or **Apply** inserts the **Continue Cut Fill**, and any *Comment*, into the current line of the *Command* table.

Please continue to the next section [Decisions Comment](#).

Decisions Comment

Selecting **Comment** brings up the **Comment** panel and inserts a comment into the line of the table. Comments are ignored by the decisions calculations.

The panel brought up when **Comment** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Comment	input		
<i>user comment - for information purposes only</i>			
OK/Apply	button		
<i>OK stores the values in the fields and removes the panel.</i>			
<i>Apply stores the values and leaves the panel on the screen.</i>			

Please continue to the next section [Decisions End](#).

Decisions End

Selecting **End** brings up the **End** panel and inserts an end command into the line of the table. When control reaches an **end** command, the decisions calculations are terminated.

The format of the End command in the panel is

```
End    // comment
```

The format of the command typed into the template file is

```
End    // comment
```

The panel brought up when **End** is selected from the **Create Rule** menu is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Default	Pop-Up
Comment	input		
<i>user comment - for information purposes only</i>			
OK/Apply	button		
<i>OK stores the values in the fields and removes the panel.</i>			
<i>Apply stores the values and leaves the panel on the screen.</i>			

Please continue to the next section [Decisions Examples](#).

Decisions Examples

One Tin Example

```
//From: 12D Solutions
//
//Basic Decisional Template for cut in 9m depth, 5m depth, and less
//Note the Tin Used is "SURVEY"
//
//
template "std" {
  fixed {
    link 5 unknown -3 cyan "eb"
  }
  decisional {
// if at offset 1m it is below "SURVEY" then goto drain
    Tin_Decision      "SURVEY" 1 0 1000 "drain"

    Fixed_Xfall        1 unknown -3 "edge1" cyan
    Batter              "SURVEY" 0 100 unknown -3 "fill" cyan "done"

// label drain
// create a table drain
    Label              "drain"
    Fixed_Slope         1 -0.5 unknown "invert" cyan
    Fixed_Slope         1 0.5 unknown "edge" cyan

// now at end of table drain, check depth of 5, 9
    Tin_Decision        "SURVEY" 0 0 5 "smallestcut"
    Tin_Decision        "SURVEY" 0 0 9 "smallcut"

// deeper than 9m, batter to within 9m of surface
    Batter              "SURVEY" 9 100 unknown 0.75 "cut1" cyan "bench"

// label smallcut -
    Label              "smallcut"

```

Placing Parts for Super Alignments

Placing a super alignment consists of:

- (a) defining the horizontal geometry which ultimately consisting of lines, arcs, transitions and tapers
- (b) defining the vertical geometry which ultimately consisting of lines, parabolas and arcs.

A simple way to create horizontal and vertical geometry for the super alignment is by using horizontal intersection points (HIPs) with arcs and transitions (eg spirals), and vertical intersection points (VIPs) with parabolas or arcs for placing the vertical geometry.

However the super alignment also allows for more **complex construction methods** to define the lines, arcs and transitions (the horizontal elements) that within **12d Model** are be grouped together to make up the Parts of the horizontal geometry.

For example, a horizontal line can be defined to be a given parallel offset of a selected line segment from another string. Or an arc of a known radius going through a point of another string and having a a leading and a trailing transition.

Similarly **complex construction methods** are available to define the lines, parabolas and arcs (the vertical elements) that are grouped together within **12d Model** to make up the vertical geometry.

So for a super alignment, the Horizontal Geometry is made up of **horizontal parts**, which may be as simple as a straight line between two points or an arc with a given centre and radius, or a horizontal intersection point with given leading and trailing transitions, or the **horizontal parts** can be very complicated where for example the points of a line are defined by the offset intersection of the two arcs from other strings.

Similarly for a super alignment, the Vertical Geometry is made up of **vertical parts**.

The definition of **parts** that are not fully defined are classified as being

- (a) **fixed** if the part is fully defined
- (b) **floating** if the part has one degree of freedom. That is, one unknown is still to be determined.
- (c) **free** if the part has two degrees of freedom. That is, two unknowns are still to be determined.

When the **parts** definitions have some degree of freedom, the extra restriction that the horizontal parts must be linked **tangentially** is imposed to try and fully defined the horizontal geometry.

If, with tangentiality, **12d Model** can fully determine the horizontal geometry then the horizontal geometry is said to **solve**. For more information, see [Fixed, Floating and Free, and Solving](#).

Once it solves, the horizontal geometry consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called **parts**, and if the horizontal geometry solves, it also contains the resultant **horizontal segments**.

For example, if a **Free Arc with Known Radius** (an arc with known radius and leading and trailing transitions of known lengths) is placed between two known lines then the tangentiality condition means that the position of the **Free Arc with Known Radius** (arc and two transitions) is uniquely defined as a arc and leading and trailing transitions on the intersection point of the two lines. Or just a fillet between the two lines if the two transitions have zero length.

Similarly the Vertical Geometry is made up of **parts**, which are made up of simple or complicated combinations of straight lines, arcs or a parabolas. Again the extra restriction that the vertical parts must be linked tangentially is often necessary to fully defined the vertical geometry. The vertical geometry is then said to be **solved** and the solved vertical geometry simply consists of

linked known segments of types lines, arcs and parabolas, and so can be drawn in a section view.

So the vertical geometry is made up of the constructive definitions called **parts**, and if the vertical geometry solves, it also contains the resultant **vertical segments**.

Important Note

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the segments of the solved parts are displayed and any unsolved parts are displayed as red crosses.

Fixed, Floating and Free, and Solving

The definition of fixed and floating part has to do with how many unknowns, or degrees of freedom, exist for a part.

Fixed parts, as the names suggests, are totally fixed in position, radius etc.

Floating parts have one unknown, or one degree of freedom. Solving for that one unknown will then totally determine the part.

Free parts have two unknowns, or two degree of freedom. Solving for both unknowns then totally determines the part.

The most common examples for the major parts used in the horizontal and vertical geometry are:

Horizontal Geometry:

Fixed line - its position in space is totally defined

- (a) line given by two points on the line
- (b) line given by one point on the line and a bearing

Floating lines - one unknown

- (a) line going through one known point. The bearing of the line is unknown
- (b) line of a given bearing. A point that the line goes through is needed to fix it.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free lines - a totally unconstrained line

Fixed arc - the arcs position in space and radius is totally defined

- (a) arc given by centre and radius
- (b) arc defined by three points on the arc
- (c) arc defined by centre and two points on the arc

Floating arc - one unknown

- (a) arc partially defined by one point on the arc and a radius.
- (b) two points on an arc.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free arc - two unknowns

- (a) only the radius of the arc is known
- (b) only one point on the arc is known
- (c) only the arc length is known

Vertical Geometry:

Fixed line - its position and shape in (chainage, height) is totally defined

- (a) line given by two points on the line
- (b) line given by one point on the line and a grade

Floating lines - one unknown

- (a) line going through one known point. The grade of the line is unknown
- (b) line of a given grade. A point that the line goes through is needed to fix it.

Free lines - a totally unconstrained line

Fixed parabola - the parabolas position in (chainage, height) space is totally defined

- (a) parabola given by three points on the parabola
- (b) parabola defined by its apex and effective signed radius

Floating parabola - one unknown

- (a) one point on the parabola and K value are known
- (b) two points on an parabola are known.

Free parabola - two unknowns

- (a) only the K value of the arc is known
- (b) only one point on the parabola is known
- (c) only the length of the parabola is known

Fixed arc - the arcs position in (chainage, height) and radius is totally defined

- (a) arc given by centre and radius
- (b) arc defined by three points on the arc
- (c) arc defined by centre and two points on the arc

Floating arc - one unknown

- (a) arc partially defined by one point on the arc and a radius.
- (b) two points on an arc.

This unknown as the names suggests, are totally fixed in position, radius etc.

Free arc - two unknowns

- (a) only the radius of the arc is known
- (b) only one point on the arc is known
- (c) only the arc length is known

Solving

The horizontal and vertical geometry of a super alignment is made up of a series of Horizontal and Vertical Parts where the sequencing and types of the Parts, plus the condition that, if possible, each Part is **tangential** to the adjacent elements, allows **12d Model** to calculate and solve for all the unknowns in the Part definitions and totally define the super alignment.

The order and the whether adjacent parts are *Fixed*, *Floating* or *Free* is very important as only certain combinations will satisfy the tangentiality conditions and hence solve to give a super alignment.

If, with tangentiality, **12d Model** can fully determine the horizontal or vertical geometry then the horizontal or vertical geometry is said to **solve**.

Once it solves, the horizontal geometry consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called **parts**, and if the horizontal geometry solves, it also contains the resultant **horizontal segments**.

Similarly the vertical geometry is made up of the constructive definitions called **parts**, and if the vertical geometry solves, it also contains the resultant **vertical segments**.

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the solved segments are displayed and any unsolved parts are displayed as red crosses.

Name	text box	blank	
<i>if not blank, then the Part is given this name.</i> <i>If blank then the Part has no name.</i> Note: <i>If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.</i>			
Type	choice box		types of horizontal parts
<i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>			
Geometry tab <i>the geometrical information defining the Part</i>			
X coordinate, Y coordinate <i>the (x,y) coordinates of a point on the arc can be typed in, or selected using the X, Y or XY icons.</i>			
Alternative solution	tick box	not ticked	
<i>there can be two solutions. One solution is shown first.</i>			

If ticked, the other solution is shown.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: *If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.*

Set button

*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

*after clicking the **Same As** button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.*

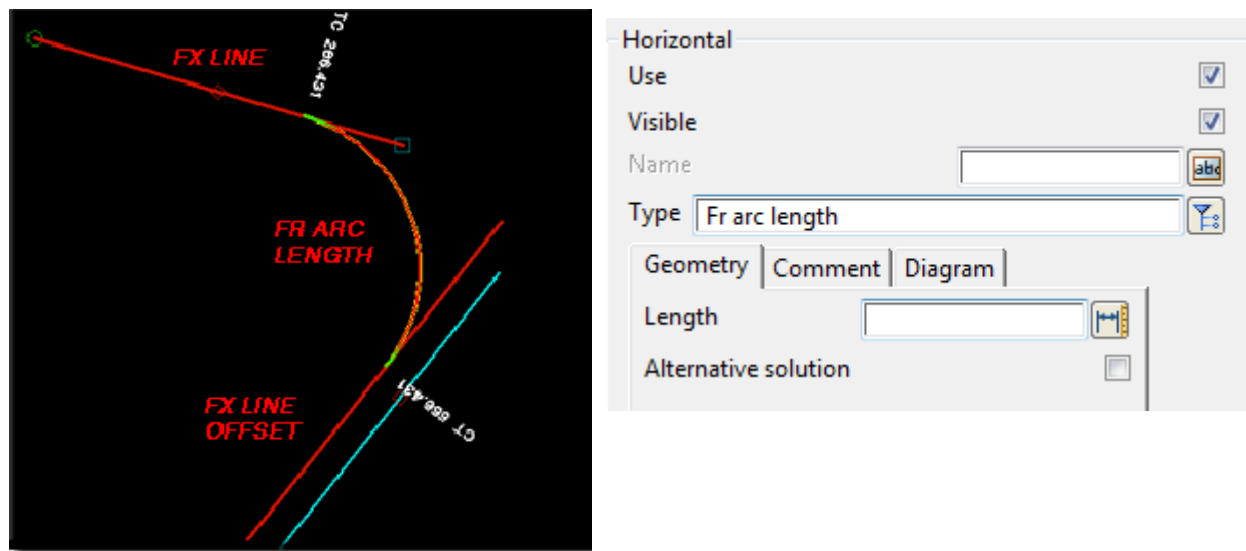

Free Arc: Arc has a Known Length

The *Free Arc* has a **known length**.

It may not always be possible for the *Free Arc* to actually solve.

For example in the case where the *Free Arc* is between two fixed lines and the two lines are on top of each other.

Example:
The *Free Arc* become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the horizontal geometry. If not ticked, the Part is not used in the horizontal geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the horizontal geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of horizontal parts
Geometry tab <i>the geometrical information defining the Part</i>			
Length <i>the length of the arc. This can be typed in or selected using the Measure Length pop-up.</i>	length box		Measure Length

Alternative solution tick box not ticked

there can be two solutions. One solution is shown first.

If ticked, the other solution is shown.

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.*

Set button

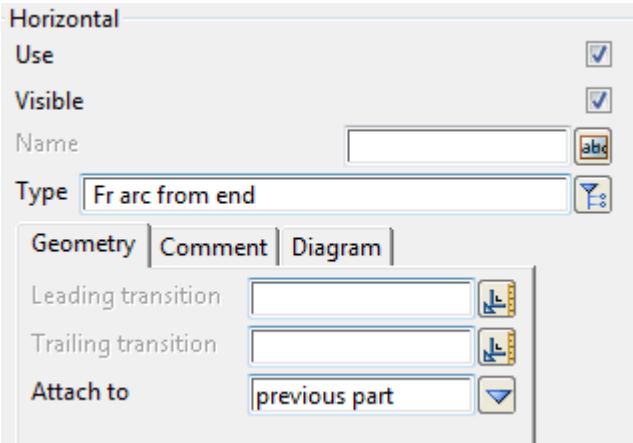

*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

*after clicking the **Same As** button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.*

Free Arc: Arc has a Known End Point

The *Floating Arc* is attached to a **known end point** of a Previous or Next **Part**.

Example:
The Free Arc become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Use		tick box	ticked	
	<i>if ticked, then the Part is used in the horizontal geometry. If not ticked, the Part is not used in the horizontal geometry.</i>			
Visible		tick box	ticked	
	<i>if ticked, then the Part is drawn in the horizontal geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>			
Name		text box	blank	
	<i>if not blank, then the Part is given this name. If blank then the Part has no name.</i>			
	<i>Note: If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.</i>			
Type		choice box		types of horizontal parts
	<i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>			

Geometry tab

the geometrical information defining the Part

Leading transition	measure box	available measures
	<i>if non zero, a leading transition curve of this length is at the start of the Free Arc. If blank or zero, no leading transition curve is used</i>	
Trailing transition	measure box	available measures
	<i>if non zero, a trailing transition curve of this length is at the end of the Free Arc. If blank or zero, no trailing transition curve is used.</i>	

Attach to choice box previous part, next part
the Part that the Free Arc is attached to.

Comment tab
the text typed into the text box is stored as a comment for the Part.
Note: If a comment exists, a # is placed after the type of the part in the Horizontal Parts list.

Set button
the **Set** button must be clicked for the information for this Part to be used.

Same As button
after clicking the **Same As** button, an existing arc can be selected from the screen and its information piped into the appropriate fields in the panel.

Floating Transition: From Arc to Arc

The *Floating Transition* consists of one or two **transition curves** going **between two arcs**.

Example:
The Floating Transition become fully defined when it is placed between two arcs

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the horizontal geometry. If not ticked, the Part is not used in the horizontal geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the horizontal geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	

Name text box blank

*if not blank, then the Part is given this name.
If blank then the Part has no name.*

***Note:** If the part has a name, then a **!** is placed after the type of the part in the Horizontal Parts list.*

Type choice box types of horizontal parts
the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab
the geometrical information defining the Part

Approaching length measure box Measure Length
*the length of the leading transition curve at the start of the Floating Transition. This must be non zero.
This will be tangential to the Previous Part.*

Tangent length length box Measure Length
*if non zero, a straight of this length is placed between the two transition curves.
This will be tangential to the Previous Part.*

Departing length measure box Measure Length
*the length of the trailing transition curve at the end of the Floating Transition. This must be non zero.
This will be tangential to the Next Part.*

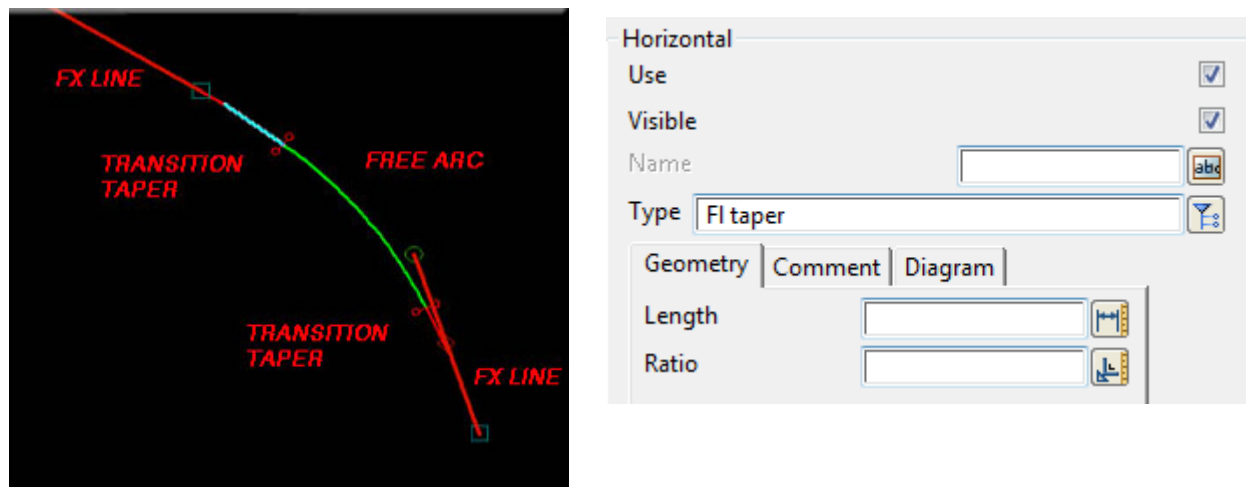

Comment tab
*the text typed into the text box is stored as a comment for the Part.
Note: If a comment exists, a **#** is placed after the type of the part in the Horizontal Parts list.*

Set button
*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

Floating Transition: Taper

The *Floating Transition* consists of.

Example:
The Floating Taper become fully defined when it is placed between two fixed lines

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	
<i>if ticked, then the Part is used in the horizontal geometry. If not ticked, the Part is not used in the horizontal geometry.</i>			
Visible	tick box	ticked	
<i>if ticked, then the Part is drawn in the horizontal geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>			
Name	text box	blank	
<i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.</i>

See [Horizontal Lines](#)

Vertical IPs

See [VIP: Speed](#)
See [VIP: K-value](#)
See [VIP: Radius](#)
See [VIP: Length:](#)
See [VIP: Asymmetric](#)

VIP: Speed

A vertical intersection point (VIP) is created and the sizes of the parabolas for the VIP come from the Design Template of the super alignment.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	
<i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>			
Visible	tick box	ticked	
<i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>			
Name	text box	blank	
<i>if not blank, then the Part is given this name. If blank then the Part has no name.</i>			
Note: <i>If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>			

Type choice box types of vertical parts
the type of this part. To change the Part type, choose another type from the pop-up list.

Geometry tab
the geometrical information defining the Part

Chainage, Height
*the (chainage,height) coordinates for the VIP can be typed in, or selected using the **C**, **Z** or **CZ** icons.*

Speed
*if **Speed** is not blank, then that is the speed used when looking up the Design Template for the VIP*
*If **Speed** is left blank, then the **Design Speed** for the super alignment is used when looking up the Design Template.*

Comment tab
the text typed into the text box is stored as a comment for the Part.
***Note:** If a comment exists, a # is placed after the type of the part in the Vertical Parts list.*

Set button
*the **Set** button must be clicked for the information for this Part to be used.*

Same As button
*after clicking the **Same As** button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: Length:

A vertical intersection point (VIP) is created and either length of the parabola on the VIP is given, or the maximum allowable parabola is used.

The fields and buttons used in the panel have the following functions.

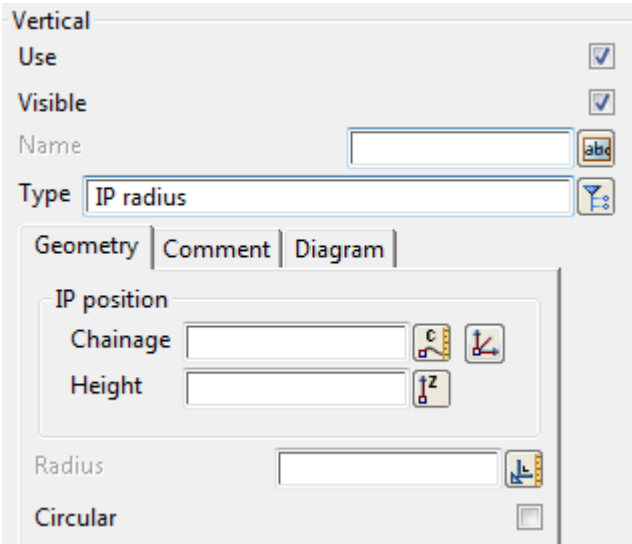

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Horizontal Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			
Chainage, Height <i>the (chainage,height) coordinates for the VIP can be typed in, or selected using the C, Z or CZ icons.</i>			
Length (blank for max length) <i>the length used for the parabola on the VIP. This field can not be left blank. If zero then a parabola of maximum length is used on the VIP.</i>			
Comment tab <i>the text typed into the text box is stored as a comment for the Part. Note: If a comment exists, a # is placed after the type of the part in the Vertical Parts list.</i>			
Set <i>the Set button must be clicked for the information for this Part to be used.</i>	button		

Same As button

*after clicking the **Same As** button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: Radius

A vertical intersection point (VIP) is created and the effective radius for the parabola on the VIP is given.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	
<i>if ticked, then the Part is used in the vertical geometry.</i>			
<i>If not ticked, the Part is not used in the vertical geometry.</i>			
Visible	tick box	ticked	
<i>if ticked, then the Part is drawn in the vertical geometry.</i>			
<i>If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>			
Name	text box	blank	
<i>if not blank, then the Part is given this name.</i>			
<i>If blank then the Part has no name.</i>			
<i>Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>			
Type	choice box		types of vertical parts
<i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>			
Geometry tab			
<i>the geometrical information defining the Part</i>			
Chainage, Height			
<i>the (chainage,height) coordinates for the VIP can be typed in, or selected using the C, Z or CZ icons.</i>			
Radius			
<i>if not blank or non zero, the radius entered is used for the parabola/arc on the VIP.</i>			
<i>If blank or zero then no parabola/arc is used on the VIP.</i>			
Circular	tick box	not ticked	
<i>if ticked, then the curve on the VIP is an arc</i>			
<i>If not ticked, then the curve on the VIP is a parabola.</i>			

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a # is placed after the type of the part in the Vertical Parts list.*

Set button

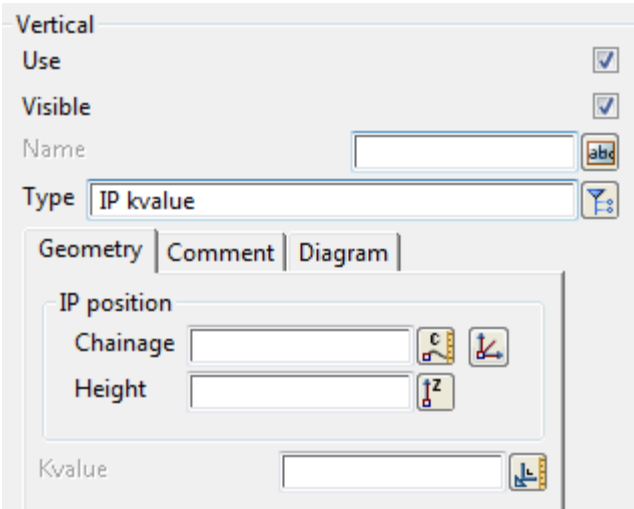

*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

*after clicking the **Same As** button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: K-value

A vertical intersection point (VIP) is created and the K value for the parabola on the VIP is given.

The fields and buttons used in the panel have the following functions.

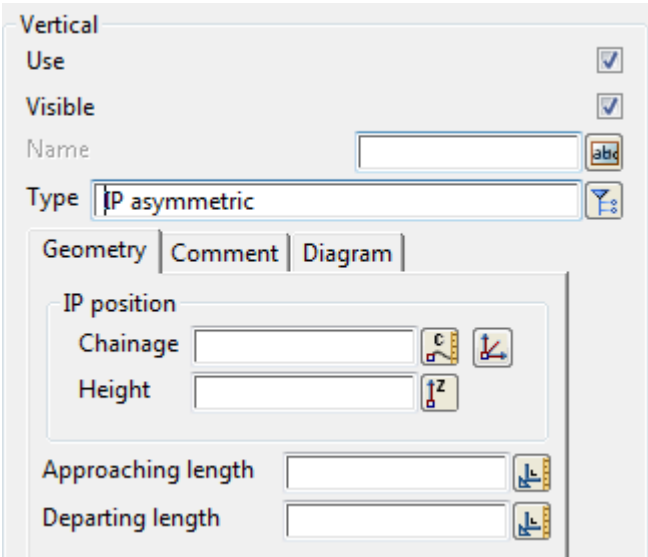

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			
Chainage, Height <i>the (chainage,height) coordinates for the VIP can be typed in, or selected using the C, Z or CZ icons.</i>			
K-value <i>the K value to use for the parabola on the VIP</i>	measure box		available measures
Comment tab <i>the text typed into the text box is stored as a comment for the Part. Note: If a comment exists, a # is placed after the type of the part in the Vertical Parts list.</i>			
Set <i>the Set button must be clicked for the information for this Part to be used.</i>	button		

Same As button

*after clicking the **Same As** button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

VIP: Asymmetric

A vertical intersection point (VIP) is created with an asymmetric parabola on the VIP. The two parabolic lengths are given for the asymmetric parabola.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			
Chainage, Height <i>the (chainage,height) coordinates for the VIP can be typed in, or selected using the C, Z or CZ icons.</i>			
Approaching length <i>the parabolic length of the first parabola of the asymmetric parabola. This parabola is tangential to the Previous Part.</i>	measure box		available measures
Departing length <i>the parabolic length of the second parabola of the asymmetric parabola. This parabola is tangential to the Next Part.</i>	measure box		available measures

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a # is placed after the type of the part in the Vertical Parts list.*

- See [Free line - No Constraints](#)

Fixed Line: Two Points

A *Fixed Line* is created by specifying two known points as the start and end points of the line.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			

Start Chainage, Height

*the coordinates in (chainage,height) of the start of the line can be typed in, or selected using the **C**, **Z** or **CZ** icons.*

End Chainage, Height

*the coordinates in (chainage,height) of the end of the line can be typed in, or selected using the **C**, **Z** or **CZ** icons.*

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a **#** is placed after the type of the part in the Vertical Parts list.*

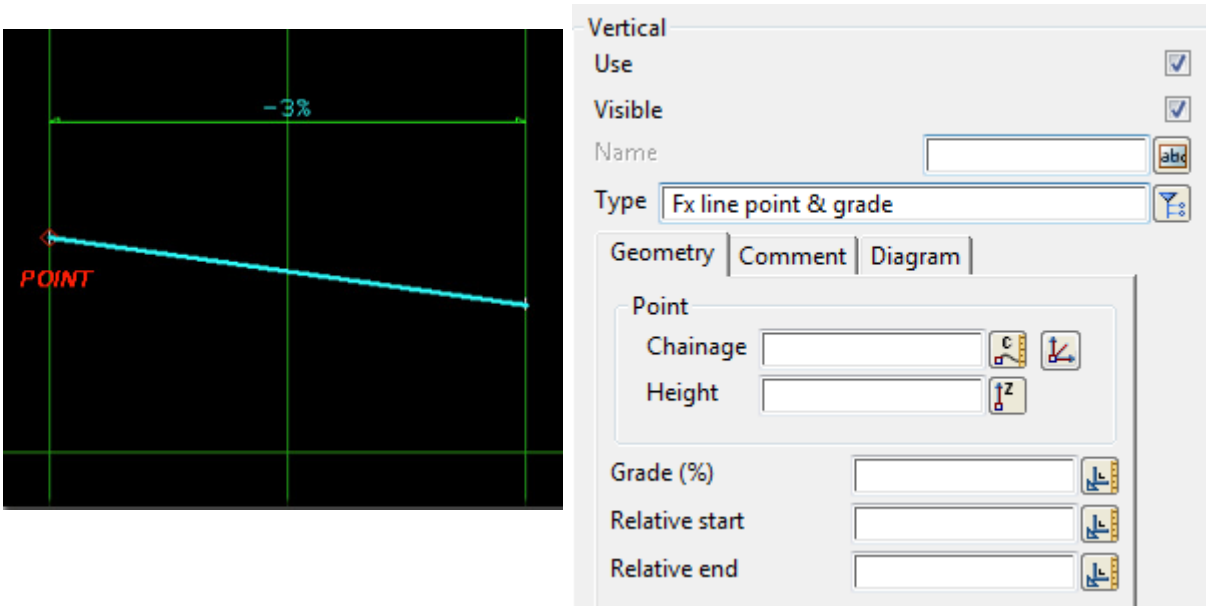

Set button

*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

Fixed Line: Known Point and Grade

A *Fixed Line* is created by specifying a known point and a grade for the line.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			
Point Chainage, Height <i>the coordinates in (chainage,height) of the point that the line goes through can be typed in, or selected using the C, Z or CZ icons.</i>			
Grade (%) <i>the grade (in percent) of the line through the point</i>	measure box		available measures
Relative start <i>the chainage distance, relative to the given point, to start the line at. A negative value is to the left of the point, and a positive value is to the right of the point.</i>	measure box		available measures

Relative end measure box available measures

the chainage distance, relative to the given point, to end the line at. A negative value is to the left of the point, and a positive value is to the right of the point.

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a # is placed after the type of the part in the Vertical Parts list.*

Set button

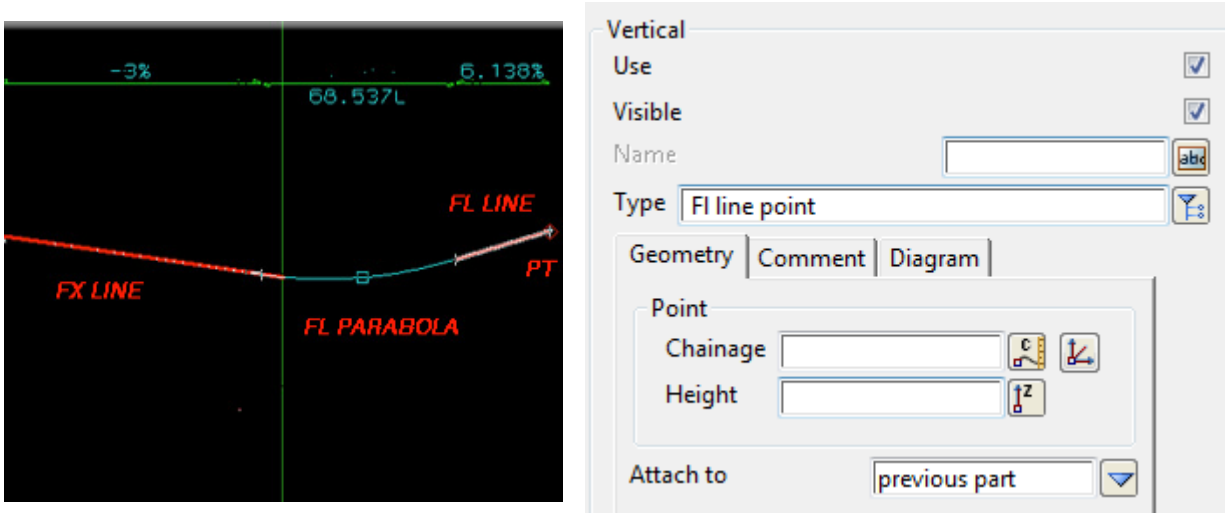

*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

Floating Line: Known Point

The *Floating Line* line passes through a **known point** but the grade is unknown.

Example
Floating Line attached to the previous parabola

The fields and buttons used in the panel have the following functions.

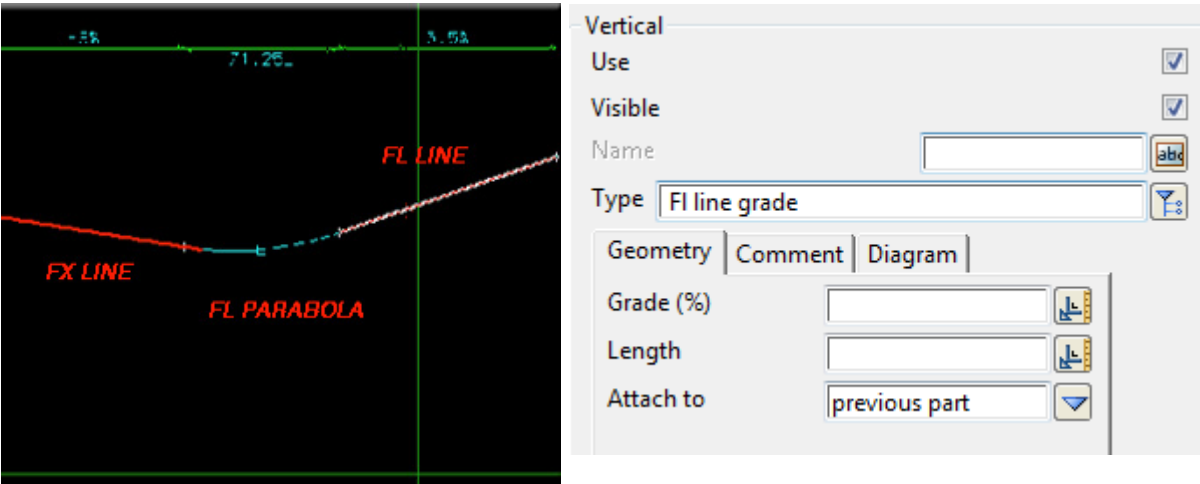

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			
Chainage, Height <i>the (chainage,height) coordinates that the line passes through can be typed in, or selected using the C, Z or CZ icons.</i>			
Attach to <i>the Part that the Floating Line is attached to and tried to make tangential to</i>	choice box	previous part	previous part, next part
Comment tab <i>the text typed into the text box is stored as a comment for the Part. Note: If a comment exists, a # is placed after the type of the part in the Vertical Parts list.</i>			

Set button
*the **Set** button must be clicked for the information for this Part to be used.*

Same As button

Floating Line: Known Grade

The *Floating Line* line has a **known grade** but no point on the line is known.

Example
Floating Line attached to the previous parabola

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	

Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box	types of vertical parts

Floating Parabola: Known Point and Grade at that Point

This *Floating Parabola* goes through a known point and has a given at the known point. It is fully determined by being tangential to either the previous part or the following part.

It may not always be possible for the Floating Parabola to solve.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	
<i>if ticked, then the Part is used in the vertical geometry.</i>			
<i>If not ticked, the Part is not used in the vertical geometry.</i>			
Visible	tick box	ticked	
<i>if ticked, then the Part is drawn in the vertical geometry.</i>			
<i>If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>			
Name	text box	blank	
<i>if not blank, then the Part is given this name.</i>			
<i>If blank then the Part has no name.</i>			
<i>Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>			
Type	choice box		types of vertical parts
<i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>			
Geometry tab			
<i>the geometrical information defining the Part</i>			
Chainage, Height			
<i>the (chainage,height) coordinates for the point on the parabola can be typed in, or selected using the C, Z or CZ icons.</i>			
Grade	measure box		available measures
<i>the grade of the parabola in units of percent grade</i>			
Attach to	choice box	previous part	previous part, next part
<i>the Part that the Floating Parabola is attached to, and made tangential to.</i>			

Comment tab

the text typed into the text box is stored as a comment for the Part.

***Note:** If a comment exists, a # is placed after the type of the part in the Vertical Parts list.*

Set button

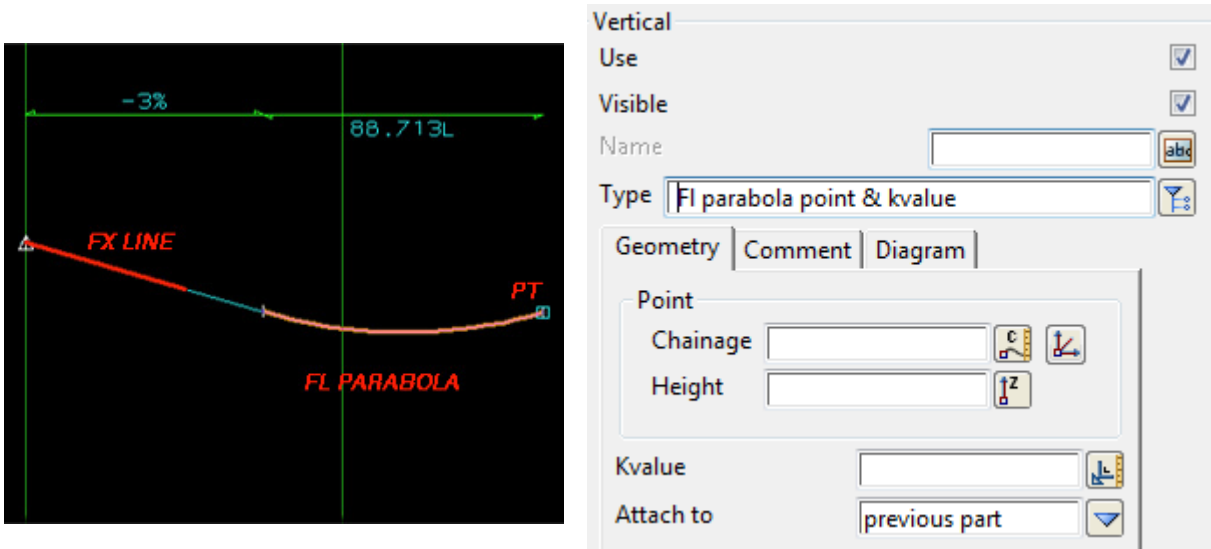

*the **Set** button must be clicked for the information for this Part to be used.*

*after clicking the **Same As** button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.*

Floating Parabola: Known Length and Grade at End

This *Floating Parabola* has a known length and a given grade at the opposite end of the parabola to the *Attached To* part. It is fully determined by being tangential to either the previous part or the following part.

It may not always be possible for the Floating Parabola to solve.

The screenshot shows the 'Vertical' panel with the following fields and buttons:

- Use:** A tick box that is checked.
- Visible:** A tick box that is checked.
- Name:** A text box with a blank field and a 'tab' button.
- Type:** A choice box with the selected option 'Fl parabola from end & grade' and a pop-up button.
- Geometry tab:** Contains three fields:
 - Length:** A measure box with a blank field and a pop-up button.
 - Grade:** A measure box with a blank field and a pop-up button.
 - Attach to:** A choice box with the selected option 'previous part' and a pop-up button.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	
<i>if ticked, then the Part is used in the vertical geometry.</i>			
<i>If not ticked, the Part is not used in the vertical geometry.</i>			
Visible	tick box	ticked	
<i>if ticked, then the Part is drawn in the vertical geometry.</i>			
<i>If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>			
Name	text box	blank	
<i>if not blank, then the Part is given this name.</i>			
<i>If blank then the Part has no name.</i>			
Note: <i>If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>

Free Parabola: Fit with Maximum Length

This Free Parabola has a maximum parabolic length which will be determined by the parts on either side. Also being tangential to the parts on either side fully determines the parabola.

It is not always possible for the Free Parabola to solve.

Example:
The Free Transition is between the line of the left and the parabola on the right

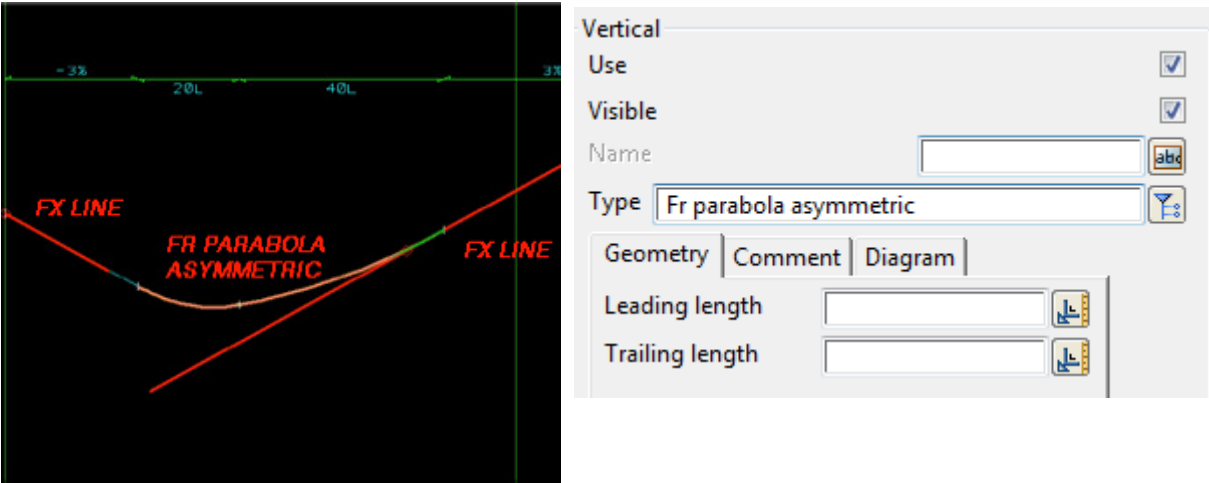

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use	tick box	ticked	
<i>if ticked, then the Part is used in the vertical geometry.</i> <i>If not ticked, the Part is not used in the vertical geometry.</i>			
Visible	tick box	ticked	
<i>if ticked, then the Part is drawn in the vertical geometry.</i> <i>If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>

Free Compound Parabola: Two Parabolas with Optional Total Parabolic Length

This Free Parabola has two parabolas with a given total length and a ratio of the division between the two parabolas. There is an option total length of the two parabolas.

With a given Total Length, a straight between the two parabolas may need to be automatically inserted to get a solution.

Being tangential to the parts on either side fully determines the two parabolas and any necessary straight. The grades on the previous and next parts also determine if the parabolas are crest or sag parabolas.

It is not always possible for the Free Parabola to solve.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use <i>if ticked, then the Part is used in the vertical geometry. If not ticked, the Part is not used in the vertical geometry.</i>	tick box	ticked	
Visible <i>if ticked, then the Part is drawn in the vertical geometry. If not ticked, then the Part is not drawn whenever all the Parts before it, or all the Parts after it, also have Visible not ticked. The effect may not be apparent until leaving the Editor and all the construction work is removed.</i>	tick box	ticked	
Name <i>if not blank, then the Part is given this name. If blank then the Part has no name. Note: If the part has a name, then a ! is placed after the type of the part in the Vertical Parts list.</i>	text box	blank	
Type <i>the type of this part. To change the Part type, choose another type from the pop-up list.</i>	choice box		types of vertical parts
Geometry tab <i>the geometrical information defining the Part</i>			
Length on leading curve (%) <i>the percentage of the total parabolic length going to the first parabola. Must be non zero.</i>	measure box		available measures
Total curves length <i>if blank, the two parabolic lengths are calculated in the given ratio to fit.</i>	measure box		available measures

If no zero, this value and the **Length on leading curve (%)** fully determines the lengths of the two parabolic curves but a straight between the two parabolas may need to be automatically inserted to get a solution.

Comment tab

the text typed into the text box is stored as a comment for the Part.

Note: If a comment exists, a # is placed after the type of the part in the Vertical Parts list.

Set button

the **Set** button must be clicked for the information for this Part to be used.

Same As button

after clicking the **Same As** button, an existing VIP can be selected from the screen and its information piped into the appropriate fields in the panel.

Vertical Computators

Not yet documented.

Text Format of Files

Go to

[Text Format of the MTF File](#)

[Text Format of the Boxing File](#)

Text Format of the MTF File

In the text version of the mtf file, most of (a) to (h) begin with a key word, following by an equals sign (=) and then special commands enclosed in { }.

```
key_word  =  {
                commands
            }
```

The key words for each case above are

- (a) left_side, right_side
- (b) specials
- (c) hinge_modifier
- (d) left_side_modifier, right_side_modifier
- (e) stripping
- (f) boxing_file, left_boxing, right_boxing, left_boxing_2, right_boxing_2 ... left_boxing_8, right_boxing_8
- (g) auto_super_tables, left_auto_super, left_auto_width, right_auto_super, right_auto_width
- (h) loops
- (i) section_width
- (j) string_modifiers

If any of the key words exist, then they must be in the following order in the **mtf** file:

```
left_side           =  { ... }
right_side          =  { ... }
specials            =  { ... }
hinge_modifier      =  { ... }
left_side_modifier  =  { ... }
right_side_modifier =  { ... }
stripping           =  { ... }
boxing_file         =  "something.bf"
left_boxing         =  { ... }
right_boxing        =  { ... }
section_width       =  value
string_modifiers    =  { ... }
auto_super_tables   =  1 or 0
left_auto_super     =  { ... }
left_auto_width     =  { ... }
right_auto_super    =  { ... }
right_auto_width    =  { ... }
loop_removals       =  { ... }
```

The format for *boxing_file* is simply

```
boxing_file  =  "something.bf"
```

where *something.bf* is the name of a file containing boxing definitions to use for the mtf.

The format for (g) is simply

```
section_width  =  value           // default is 10000
```

where *value* is the distance to search from the hinge string for strings required in some options. If *section_width* is missing, then it takes the default value of 10000.

The key words, *left_side* and *right_side* which are for initially applying templates (for part (a)), have already been described under the **Design=>Apply=>Apply many** option but will be summarised in the next section [MTF Templates](#).

The documentation for the **text file syntax** of the MTF file now follows.

See [MTF Templates File Format](#)

[MTF Specials File Format](#)

[MTF Hinge Modifier File Format](#)

[MTF Template Modifiers File Format](#)

[MTF Stripping File Format](#)

[MTF Boxing File Format](#)

[MTF Width File Format](#)

[MTF String Modifiers File Format](#)

[Substitutions in the Many Templates File](#)

MTF Templates File Format

The templates on the left and right hand sides of the centre line (or Hinge string if one is selected) are specified separately in the many templates file. Apart from a key word denoting whether the following part of the definition is for the left side or the right side, the set out for the left-side is identical to the right-side. Hence, only the left-side will be described in detail.

The left-side definition begins with the key words

```
left_side =
```

A list of chainages (in ascending order, one per line) with corresponding template names then follows. This list of chainages and templates is enclosed in curly braces { }.

Note if the template name includes spaces, then the name must be enclosed in quotes ". For example, "left 1".

The chainage-template lists are assembled as follows

- (a) To represent a template starting at a given chainage, the chainage value followed by the template name is given. The chainage and name are separated by one or more spaces. For example, the template **std** starting at chainage 150 is represented by

```
150      std
```

The template is assumed to apply until the chainage given on the next line of the left-side definition.

If the template is to go to the end of the centre-line, add a line with a chainage greater than or equal to the end chainage. For example,

```
150      std
```

```
99999
```

- (b) if no template exists from a chainage, simply include the chainage with no template name following it. For example, if there is no template from chainage 250, this is represented by

```
250
```

The non-existence of a template is assumed to apply until the chainage given on the next line of the left-side definition

- (c) the case of a linear change from one template to another template over a specified chainage range is represented by giving the start chainage of the linear change, followed on the same line by the start template, a comma, and the end template. For example, if the template is to vary linearly between the template **std** and the template **left**, beginning at the chainage 350, then the line in the file would be

```
350      std, left
```

The linear change takes place over the interval beginning at the chainage given on the defining line and ending at the chainage given on the next line of the left-side. Distances and percent cross-falls are interpolated linearly and slopes are interpolated on the radian value of the slope angles.

Combining these rules, the following lines in a template file

```
left_side = {
    100      std
    200      std , "left 1"
    250      "left 1"
    300
    350      std
    99999
}
```

describes the situation

1. the left-hand side of the centre-line has no template from the beginning of the centre-line until chainage 100.
2. at chainage 100, the template **std** begins and continues until chainage 200.

3. there is a linear change from the template **std** to the template **left 1** between chainage 200 and chainage 250.
4. the template **left 1** goes from chainage 250 to chainage 300.
5. there is a gap between chainage 300 and chainage 350.
6. the template **std** goes from chainage 350 to chainage 99999, or if the end chainage is smaller than 99999, to the end of the centre-line.

The right-side template definition begins with the key word `right_side`. The rest of the definition follows the same rules at the left hand side of the centre-line. For example,

```
right_side = {  
    100      std  
    200      std , right  
    250      right  
    300      right , std  
    350      std  
    400  
}
```

The left and right sides can vary independently.

Restrictions on the Template File Definitions

1. If one template stops at the same chainage that another template begins, then the two templates must have the same number of fixed and variable links. The templates will be varied linearly from the stopping template to the starting template over one section separation distance.
2. If there is a linear variation between two templates, the two templates must have the same number of fixed and variable links.
3. If two templates do not have the same number of links, they must be separated by a gap, that is, by a region with no template.

Summarising:

The templates on the left and right hand sides of the centre line are specified separately in the many templates file.

The left-side (right-side) definition begins with the key words

`left_side =` `right_side =`

with a list of chainages (in ascending order, one per line) with template names. This list of chainages and templates is enclosed in curly braces `{ }`.

The chainage-template lists are assembled as follows

- (a) To represent a template starting at a given chainage, the chainage value followed by the template name is given. The chainage and name are separated by one or more spaces. For example, the template **std** starting at chainage 150 is represented by

150 std

The template is assumed to apply until the chainage given on the next line of the left-side definition.

If the template is to go to the end of the centre-line, add a line with a chainage greater than or equal to the end chainage. For example,

150 std
99999

- (b) if no template exists from a chainage, simply include the chainage with no template name

following it. For example, if there is no template from chainage 250, this is represented by

250

The non-existence of a template is assumed to apply until the chainage given on the next line of the left-side definition

- (c) the case of a linear change from one template to another template over a specified chainage range is represented by giving the start chainage of the linear change, followed on the same line by the start template, a comma, and the end template. For example, if the template is to vary linearly between the template **std** and the template **left**, beginning at the chainage 350, then the line in the file would be

350 std, left

The linear change takes place over the interval beginning at the chainage given on the defining line and ending at the chainage given on the next line of the left-side. Distances and percent cross-falls are interpolated linearly and slopes are interpolated on the radian value of the slope angles.

A Left and Right Side File Example

```
left_side = {
    100      std
    200      std , "left 1"
    250      "left 1"
    300
    350      std
    99999
}
right_side = {
    100      std
    200      std , right
    250      right
    300      right , std
    350      std
    400
}
```

The **left_side** describes the situation:

1. the left-hand side of the centre-line has no template from the beginning of the centre-line until chainage 100.
2. at chainage 100, the template **std** begins and continues until chainage 200.
3. there is a linear change from the template **std** to the template **left 1** between chainage 200 and chainage 250.
4. the template **left 1** goes from chainage 250 to chainage 300.
5. there is a gap between chainage 300 and chainage 350.
6. the template **std** goes from chainage 350 to chainage 99999, or if the end chainage is smaller than 99999, to the end of the centre-line.

Go to the next section [MTF Specials File Format](#) or back to [Text Format of the MTF File](#)

MTF Specials File Format

In the many templates file, the **specials** definition begins with the key word

```
specials  =
```

This is followed by a list of

(a) chainages, in any order, one per line

and/or

(b) the names of files (enclosed in quotes “”) which include lists of chainages (The default ending for a special chainage file is *.spc)

The list of chainages and/or file names is enclosed in curly braces {}.

A Specials Example

```
specials  = {  
           125.3  
           1925.4  
           “fred”           // file of chainages to read in  
           3007  
           “joe”  
        }
```

Go to the next section [MTF Hinge Modifier File Format](#) or back to [Text Format of the MTF File](#)

MTF Hinge Modifier File Format

In the many templates file, the **hinge modifier** definition begins with the key word

```
hinge_modifier =
```

followed by one or more of the hinge modifier commands **offset**, **height**, **coord** and **nohinge** enclosing curly braces {}.

```
hinge_modifier = {
    hinge modifier commands
}
```

The definition of the hinge modifier commands will now be given.

Offset

The **offset** modifier will move the hinge point a given offset distance (perpendicular to the reference string) from its current plan position. A positive offset is to the right of the hinge string and a negative offset to the left.

The format of the modifier to vary the **offset** is

```
offset    st_ch    end_ch    st_offset    end_offset    absrel    type    extra_start    extra_end
```

where

```
st_ch      start chainage for the modifier
end_ch     end chainage for the modifier
```

```
st_offset  offset to be used at the start modifier chainage, st_ch
end_offset offset to be used at the end modifier chainage, end_ch.
```

```
absrel     relative (default) or absolute
type       linear (default) or cubic
```

```
extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end   optional - adds in an extra x-section 0.1mm before end chainage
```

If **absrel** is **relative** (the default) then

```
the st_offset is added to the current position of the hinge point at chainage st_ch.
the end_offset is added to the current position of the hinge point at chainage end_ch.
```

If **absrel** is **absolute**, then

```
the offset of the hinge point is taken with respect to the original position of the hinge
string at chainage st_ch.
the offset of the hinge point is taken with respect to the original position of the hinge
string at chainage end_ch.
```

If **type** is **linear** (the default), then the offset is varied linearly (with respect to the reference chainage) between the offsets at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the offset is varied as a reverse cubic (with respect to the reference chainage) between the offsets at chainage st_ch and chainage end_ch.

Offset to String

The offset for the hinge point can also be varied by **going out to another *12d Model* string**.

offset	st_ch	end_ch	full_string_name	extra_start	extra_end
---------------	--------------	---------------	-------------------------	--------------------	------------------

where

st_ch	start chainage for the modifier
end_ch	end chainage for the modifier

full_string_name name of a **12d Model** string to take the hinge point out to. The format of the string name is "model_name->string_name".

extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

Height

The **height** modifier varies the height of the hinge point between the given chainages.

height	st_ch	end_ch	st_height	end_height	absrel	type	extra_start	extra_end
---------------	-------	--------	-----------	------------	--------	------	-------------	-----------

where

st_ch	start chainage for the modifier
end_ch	end chainage for the modifier

<code>st_height</code>	height to be used at the start modifier chainage, <code>st_ch</code>
<code>end_height</code>	height to be used at the end modifier chainage, <code>end_ch</code> .

absrel	relative (default) or absolute
type	linear (default) or cubic

extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

If **absrel** is **relative** (the default) then

the st_height is added to the current height of the hinge point at chainage st_ch.
the end_height is added to the current height of the hinge point at chainage
end_ch.

If **absrel** is **absolute**, then

the height of the hinge point is set to `st_height` above the original hinge string at chainage `st_ch`.

the height of the hinge point is set to end_height above the original hinge string at chainage end ch.

If **type** is **linear** (the default), then the height is varied linearly (with respect to the reference

If **type** is **cubic**, then the height is varied as a reverse cubic (with respect to the reference chainage) between the height at chainage `st_ch` and chainage `end_ch`.

The height of the hinge point can also be specified by **taking the height from another 12d Model string**.

where

end_ch	end chainage for the modifier
--------	-------------------------------

extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

The **coord** modifier is used to replace the x, y and z position of the hinge point by the x, y and z position of **another 12d Model string** between given chainages. Hence **coord** replaces the hinge string by another string between the given chainages.

where

`end_ch` end chainage for the modifier

extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

The **nohinge** modifier is used to **stop** the hinge string (and hence the apply) between given chainages. This will leave a gap in the strings created by the apply between the given chainages.

where

```
end ch      end chainage for stopping the apply
```

extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage

Please continue to the next section [A Hinge Modifier Example](#).

```
hinge_modifier = {
    offset      0 250 0 3           // linearly offset the hinge by 0 to 3
```

```
                                // over the chainage range 0 to 250.
height    125  300  2    2      // add 2 to the hinge height
                                // over the chainage range 125 to 300.
coord     300  400  "mod->new_string" // use the position of the string
                                // new_string over the chainage
                                // range 300 to 400.
nohinge   400  500  2    2      // stop the apply between the chainages
                                // over the chainage range 400 to 500.
}
```

Go to the next section [MTF Template Modifiers File Format](#) or back to [Text Format of the MTF File](#)

MTF Template Modifiers File Format

In the many templates file, the **template modifier** definition begins with the key word

```
left_side_modifier  =
```

and/or

```
right_side_modifier  =
```

followed by one or more of the template modifier commands enclosing curly braces { }

- (a) fixed link modifiers - commands working on fixed links

insert

remove

**width, height, xfall, xfall_crc, copy_width, copy_height, copy_xfall,
tin_height, tin_xfall**

- (b) stop and start decisions commands

decision

- (c) variable cut and fill link modifiers - commands working on cut/fill links

insert_cut, insert_fill

remove_cut, remove_fill

**cut_width, cut_height, cut_slope, copy_cut_width, copy_cut_height,
copy_cut_slope, tin_cut_height, tin_cut_slope**

**fill_width, fill_height, fill_slope, copy_fill_width, copy_fill_height,
copy_fill_slope, tin_fill_height, tin_fill_slope**

- (d) final cut/fill link modifiers

final_width, final_cut_slope, final_no_cut_slope

final_fill_slope, final_no_fill_slope

- (e) snippets - inserting groups of modifier commands

snippet

That is,

```
left_side_modifier  = {
                        template modifier commands
                      }
```

and/or

```
right_side_modifier = {
                        template modifier commands
                      }
```

The definition of the template modifier commands and their file format will now be given.

For **Start mode and End mode**, go to the section [Start and End Chainages in the Modifier File Format](#).

For **Fixed Link** modifiers, go to the section [MTF Fixed Link Modifiers File Format](#).

For **Decision Link** modifiers, go to the section [Decision File Format](#).

For **Cut and Fill Link** modifiers, go to the section [Cut and Fill Variable Link Modifiers File Format](#).

For **Final Link** modifiers, go to the section [Final Link Modifiers File Format](#).

For **Snippets**, go to the section [Snippets File Format](#).

Please continue to the next section [Start and End Chainages in the Modifier File Format](#).

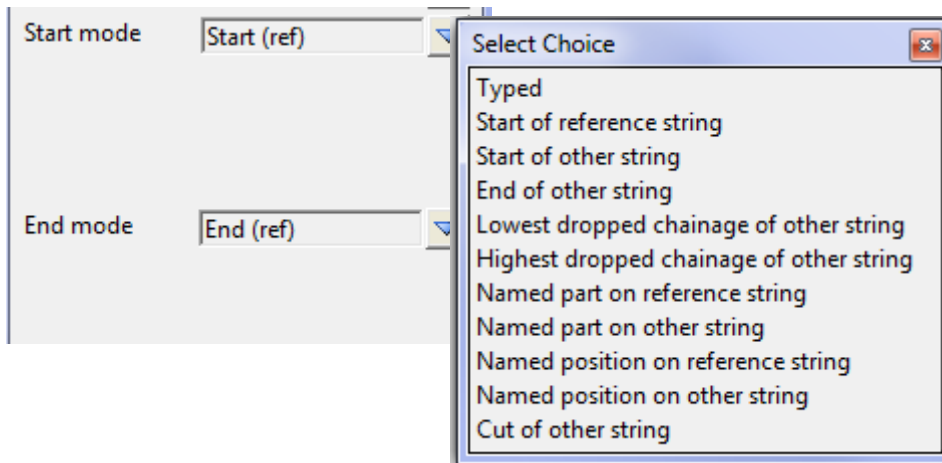

Start and End Chainages in the Modifier File Format

Modifiers work between two chainages and in each modifier command, the position of the start and end chainages for the commands are denoted by:

st_ch start chainage for the modifier
end_ch end chainage for the modifier

However there are a number of ways for defining the start and end chainages in the modifier command (called Start mode and End mode on the modifier panels).

Start Mode - st_ch

For each of the **Start modes**, the replacement for st_ch is:

- (a) Typed
the actual typed in chainage value
- (b) Start of reference string
\$null
- (c) Start of other string
chainage_start "model_of_string->string_name"
where model_of_string and string_name are the model and name of the string to take the start chainage from. The double quotes (") are needed.
- (d) End of other string
chainage_final "model_of_string->string_name"
where model_of_string and string_name are the model and name of the string to take the end chainage from. The double quotes (") are needed.
- (e) Lowest dropped chainage of other string
chainage_low "model_of_string->string_name"
where model_of_string and string_name are the model and name of the string to take the lowest dropped chainage from. The double quotes (") are needed.
- (f) Highest dropped chainage of other string
chainage_high "model_of_string->string_name"
where model_of_string and string_name are the model and name of the string to take the highest dropped chainage from. The double quotes (") are needed.
- (g) Named part of reference other string
named_part "part_specifier" start_extension_value
where part_specifier is the full specification of the part of the reference string to use. The

start_extension_value is added to the chainage. The double quotes (") are needed.

(h) Named part of other string

named_part "model_of_string->string_name" "part_specifier" start_extension_value

where model_of_string and string_name are the model and name of the string to take the name part from, and part_specifier is the full specification of the part from that string. The start_extension_value is added to the chainage. The double quotes (") are needed.

(i) Named position of reference

named_position "pos_name" start_extension_value

where pos_name is the name of the named position of the reference string to use. The start_extension_value is added to the chainage. The double quotes (") are needed.

(j) Named position on other string

named_position "model_of_string->string_name" "pos_name" start_extension_value

where model_of_string and string_name are the model and name of the string to take the name position from, and pos_name is the name of the named position from that string. The start_extension_value is added to the chainage. The double quotes (") are needed.

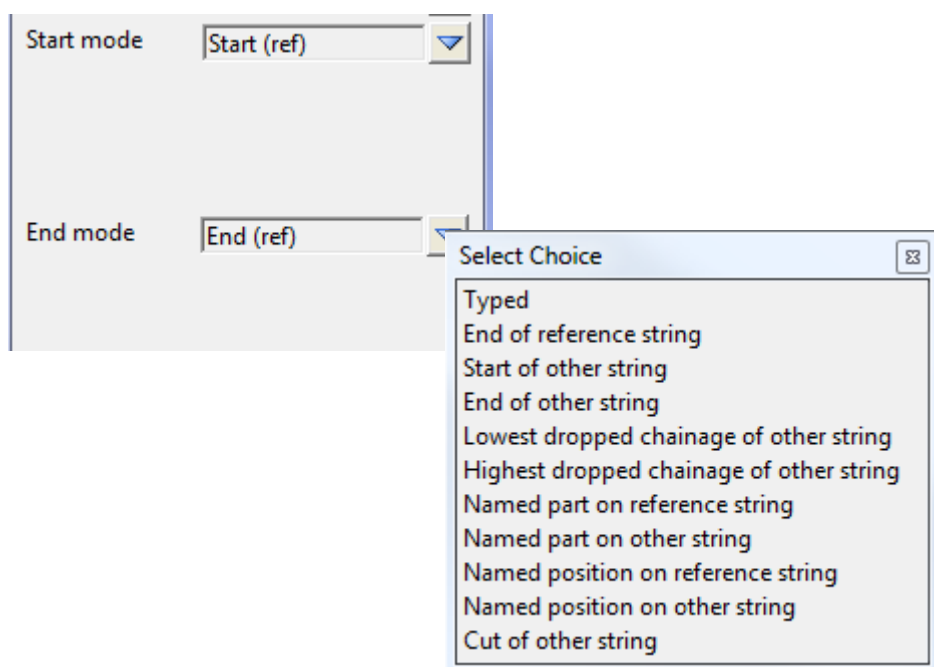

(k) Cut of other string

cut_other "model_of_string->string_name" "name" start_extension_value

where model_of_string and string_name are the model and name of the selected string. A chainage is calculated from the cut of the string with the reference string. The start_extension_value is added to the chainage. The double quotes (") are needed.

Note: If there are no cuts, or if there is more than one cut, then the command is not processed.

End Mode - end_ch

For each of the **End modes**, the replacement for end_ch is:

(a) Typed

the actual typed in chainage value

(b) End of reference string

\$null

(c) Start of other string

chainage_start "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the start chainage from. The double quotes (") are needed.

(d) End of other string

chainage_final "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the end chainage from. The double quotes (") are needed.

(e) Lowest dropped chainage of other string

chainage_low "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the lowest dropped chainage from. The double quotes (") are needed.

(f) Highest dropped chainage of other string

chainage_high "model_of_string->string_name"

where model_of_string and string_name are the model and name of the string to take the highest dropped chainage from. The double quotes (") are needed.

(g) Named part of reference other string

named_part "part_specifier" start_extension_value

where part_specifier is the full specification of the part of the reference string to use. The start_extension_value is added to the chainage. The double quotes (") are needed.

(h) Named part of other string

named_part "model_of_string->string_name" "part_specifier" end_extension_value

where model_of_string and string_name are the model and name of the string to take the name part from, and part_specifier is the full specification of the part from that string. The end_extension_value is added to the chainage. The double quotes (") are needed.

(i) Named position of reference

named_position "pos_name" end_extension_value

where pos_name is the name of the named position of the reference string to use. The end_extension_value is added to the chainage. The double quotes (") are needed.

(j) Named position on other string

named_position "model_of_string->string_name" "pos_name" end_extension_value

where model_of_string and string_name are the model and name of the string to take the name position from, and pos_name is the name of the named position from that string. The end_extension_value is added to the chainage. The double quotes (") are needed.

(k) Cut of other string

cut_other "model_of_string->string_name" "name" start_extension_value

where model_of_string and string_name are the model and name of the selected string. A chainage is calculated from the cut of the string with the reference string. The end_extension_value is added to the chainage. The double quotes (") are needed.

Note: is there is no cuts or more than one cut then the command is not processed.

Please continue to the next section [MTF Fixed Link Modifiers File Format](#).

MTF Fixed Link Modifiers File Format

Fixed - Link Insert

Fixed links can be created by one of three **insert** commands by specifying either width and height, width and xfall, or height and xfall.

insert link_name colour width height **unknown** st_ch end_ch *optional* // use width, height

insert link_name colour width **unknown** xfall st_ch end_ch *optional* // use width, xfall

insert link_name colour **unknown** height xfall st_ch end_ch *optional* // use height, xfall

where **unknown** takes the place of the one of width, height or xfall not being used, and

link_name	name of the link being created
colour	colour of the link being created
width, height, xfall	width, height or xfall of the created link
st_ch	start chainage for creating the link
end_ch	end chainage for creating the link

and *optional* can be none, one or more of the following

name	if non-blank, insert before the link name in the template if blank, then append after the last link of the fixed template table
interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1 mm before start chainage
extra_end	optional - adds in an extra x-section 0.1 mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed - Link Remove

Fixed links can be deleted by the **remove** command:

remove link_list st_ch end_ch *optional*

where

link_list	one or more names of links to be removed, in the form name1 name2 ... namei
st_ch	start chainage for removing the link
end_ch	end chainage for removing the link

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists

extra_start	optional - adds in an extra x-section 0.1 mm before start chainage
extra_end	optional - adds in an extra x-section 0.1 mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed - Width

The **width** modifier is used to modify the width of fixed links originally defined by width.

The format of the modifier to vary the **width** of the fixed links given by link_list is

width link_list st_ch end_ch st_wid end_wid absrel type optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
st_wid	width to be used at the start modifier chainage, st_ch
end_wid	width to be used at the end modifier chainage, end_ch.
absrel	relative (default) or absolute If absrel is relative (the default) then the st_wid is added to the current width of links in link_list at chainage st_ch. the end_wid is added to the current width of links in link_list at chainage end_ch. If absrel is absolute , then the width of links in link_list are set to st_wid at chainage st_ch. the width of links in link_list are set to end_wid at chainage end_ch.
type	linear (default) or cubic If type is linear (the default), then the width of links in link_list are varied linearly (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch. If type is cubic , then the width of links in link_list is varied as a reverse cubic (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The width for a link can also be varied by **going out to another 12d Model string** or by taking the **width between two 12d Model strings**.

width link_list st_ch end_ch full_string_name side optional

width link_list st_ch end_ch str_name_1 side_1 str_name_2 side_2 optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of a 12d Model string to take links in link_list out to. The format of the string name is "model_name->string_name".
side	side to search for string: -1 for left, 0 for left and right, 1 for right
str_name_1	name of the first 12d Model string. The format of the string name is "model_name->string_name".
side_1	side to search for string_1: -1 for left, 0 for left and right, 1 for right
str_name_2	name of the second 12d Model string. The format of the string name is "model_name->string_name".
side_2	side to search for string_2: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
// text	the text is a comment

The **width** of links in link_list are taken to be the distance between **str_name_1** and **str_name_2**.

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed- Width from Link

The **width from link** modifier is used to modify the width of fixed links originally defined by width to be the same as another link. That is, the width of the link is a copy of the width of another link.

The format of the modifier to vary the **width from link** of the fixed links given by link_list is

copy_width link_list st_ch end_ch from_link zone optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
from_link	name of link to take the width from

zone section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
	if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed.
	If inactive is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed - Height

The **height** modifier is used to modify the height of fixed links originally defined by height.

The format of the modifier to vary the **height** of the fixed links in the **link_list** is almost identical to varying the width and is:

height link_list st_ch end_ch st_ht end_ht absrel type optional

where

link_list one or more names of fixed links given in the template definition; with format name1 name2 ... namei

st_ch start chainage for the modifier

end_ch end chainage for the modifier

st_ht height to be used at the start modifier chainage, st_ch

end_ht height to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_ht is added to the current height of links in link_list at chainage st_ch.

the end_ht is added to the current height of links in link_list at chainage

end_ch.

If **absrel** is **absolute**, then

the height of links in link_list are set to st_ht at chainage st_ch.

the height of links in link_list are set to end_ht at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the height of links in link_list are varied linearly (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the height of links in link_list is varied as a reverse cubic (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
	if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage

extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
// text	the text is a comment

The height for a link can also be varied by **taking the height from a *12d Model* string** or by taking the **height between two *12d Model* strings**.

height link_list st_ch end_ch full_string_name side optional

height link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of a <i>12d Model</i> string to take links in link_list out to. The format of the string name is "model_name->string_name".
side	side to search for string: -1 for left, 0 for left and right, 1 for right
str_name_1	name of the first <i>12d Model</i> string. The format of the string name is "model_name->string_name".
side2	side to search for string: -1 for left, 0 for left and right, 1 for right
str_name_2	name of the second <i>12d Model</i> string. The format of the string name is "model_name->string_name".
side2	side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
// text	the text is a comment

The **height** of links in link_list are taken to be the height between **str_name_1** and **str_name_2**.

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed - Height from Link

The **height from link** modifier is used to modify the height of fixed links originally defined by height to be the same height as another link. That is, the height of the link is a copy of the height of another link.

The format of the modifier to vary the **height from link** of the fixed links given by link_list is

copy_height link_list st_ch end_ch from_link zone optional

where

link_list one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

from_link name of link to take the height from
zone section of the template that the **from_link** is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the **interval_value** for
the range of this command

interval_value if interval is missing, then the interval for the apply many is used
only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage

extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If *inactive* is not there then the command is processed

// text the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for **st_ch** and **end_ch**.

Fixed - Cross Fall

The **xfall** modifier is used to modify the cross fall of fixed links originally defined by **xfall**.

The format of the modifier to vary the cross-fall of the fixed links in the **link_list** is almost identical to varying the width and is:

xfall link_list st_ch end_ch st_xfall end_xfall absrel type optional

where

link_list one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

st_xfall xfall to be used at the start modifier chainage, **st_ch**
end_xfall xfall to be used at the end modifier chainage, **end_ch**.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the **st_xfall** is added to the current xfall of links in **link_list** at chainage **st_ch**.
the **end_xfall** is added to the current xfall of links in **link_list** at chainage **end_ch**.

If **absrel** is **absolute**, then

the xfall of links in **link_list** are set to **st_xfall** at chainage **st_ch**.
the xfall of links in **link_list** are set to **end_xfall** at chainage **end_ch**.

type linear (default) or cubic

If **type** is **linear** (the default), then the xfall of links in **link_list** are varied linearly (with respect to the reference chainage) between the xfall at chainage **st_ch** and chainage **end_ch**.

cubic, then the xfall of links in **link_list** are varied as a reverse cubic (with respect to the reference chainage) between the xfall at chainage **st_ch** and chainage **end_ch**.

rotate, then the angle of the xfall of the links in **link_list** is varied linearly (with respect to the reference chainage) between the angle of the xfall at chainage **st_ch** and

chainage end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **xfall** of a link can be defined by using the xfall from the **beginning of the link** (i.e. the end of the previous link or the hinge string if it is the first link) **to another 12d Model**, or by taking the **xfall between two 12d Model strings**.

```
xfall link_list st_ch end_ch full_string_name side optional
xfall link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional
```

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of a 12d Model string to use to calculate xfall. The format of the string name is "model_name->string_name".
side	side to search for string: -1 for left, 0 for left and right, 1 for right
str_name_1	name of the first 12d Model string. The format of the string name is "model_name->string_name".
side1	side to search for string_1: -1 for left, 0 for left and right, 1 for right
str_name_2	name of the second 12d Model string.
side2	side to search for string_2: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

The **xfall_crc** modifier is used to modify the cross fall of fixed links originally defined by **xfall** using the circular reverse curve formula.

xfall_crc link_list st_ch end_ch st_xfall end_xfall st_len end_len optional

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
-----------	---------------------------------------------------------------------------------------------------------

`end_ch` end chainage for the modifier

`end_xfall` xfall to be used at the end modifier chainage, `end_ch`.

end_len length of the end circular arc to finish at the end modifier chainage, **st_ch**.

interval value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
----------------	---------------------------------------------------------------------------------------------------------------

extra_end optional - adds in an extra x-section 0.1mm before end chainage

If inactive is not there then the command is processed

See [Start and End Chainages in the Modifier File Format](#) for the format for `st ch` and `end ch`.

The format of the modifier to vary the **xfall from link** of the fixed links given by link list is

where

end ch end chainage for the modifier

from_link	number of the link to take material from
zone	section of the template that the from link is from (i.e. fixed, cut or fill)

Page 3725

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

Important Note

The link to copy cross fall from can be defined in terms of cross fall or slope.
If the link to copy is defined by slope, then the cross fall is calculated to match the slope.
See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed - Tin Height

The **tin height** modifier is used to modify the height of the link so that the link will sit on the tin at the given width.

The tin height can only be used for a fixed link defined by width and height.

The format of the modifier to vary the **tin height** of the fixed links in the **link_list** is:

tin_height link_list st_ch end_ch tin_name optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
tin_name	name of the tin to be used in defining the height.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Fixed - Tin Xfall

The **tin xfall** modifier is used to modify the xfall of the link so that the link will sit on the tin at the given width.

The tin xfall can only be used for a fixed link defined by width and xfall.

The format of the modifier to vary the **tin xfall** of the fixed links in the **link_list** is:

tin_xfall link_list st_ch end_ch tin_name

where

link_list one or more names of fixed links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier

end_ch end chainage for the modifier

tin_name name of the tin to be used in defining the xfall.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for
the range of this command

interval_value if interval is missing, then the interval for the apply many is used
only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage

extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.

If inactive is not there then the command is processed

// text the text is a comment

Please continue to the next section [Decision File Format](#).

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Decision File Format

Each template is made up of the sections fixed, decisions, cut, fill and final cut/fill. If a template has a decisions section then by default it is used instead of the cut, fill and final cut/fill sections.

Hence by default, either the
decisions section

or

the cut, fill and final cut/fill sections

from the template being used over the chainage range.

Using the **decision** modifier, it is possible to override the default and for a given chainage range use the cut, fill and final cut/fill sections **instead** of the decisions section

or

use the decisions section **from another** template instead of the current templates sections.

The format of the decision modifier is

decision template_name st_ch end_ch *optional*

decision " " st_ch end_ch *optional*

where

template_name name of template to take the decision section from.

If the template name is given as " ", then the decision section for the template being used in the chainage range is ignored, and the cut, fill and final cut/fill tables for the template are used instead. Hence this overrides the default of using the decisions section in preference to the cut, fill and final cut/fill sections of the template.

st_ch start chainage for applying/removing the decision

end_ch end chainage for applying/removing the decision

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command

interval_value if interval is missing, then the interval for the apply many is used only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage

extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.

If inactive is not there then the command is processed

// text the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Note

The full description of the **Decisions** section of a template is given in [Full Definition of Template Decisions](#).

Please continue to the next section [Cut and Fill Variable Link Modifiers File Format](#).

Cut and Fill Variable Link Modifiers File Format

Cut and Fill Link Insert

Cut and fill links can be created by one of three **insert** commands by specifying either width and height, width and slope, or height and slope.

insert_cut link_name colour width height **unknown** st_ch end_ch *optional* // width, ht

insert_fill link_name colour width height **unknown** st_ch end_ch *optional* // width, ht

insert_cut link_name colour width **unknown** slope st_ch end_ch *optional* // width, slope

insert_fill link_name colour width **unknown** slope st_ch end_ch *optional* // width, slope

insert_cut link_name colour **unknown** height slope st_ch end_ch *optional* // ht, slope

insert_fill link_name colour **unknown** height slope st_ch end_ch *optional* // ht, slope

where **unknown** takes the place of the one of width, height or slope not being used, and

link_name	name of the link being created
colour	colour of the link being created
width, height, slope	width, height or slope of the created link
st_ch	start chainage for creating the link
end_ch	end chainage for creating the link

and *optional* can be none, one or more of the following

name	if non-blank, insert before the link name in the template if blank, then append after the last link of the fixed template table
interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Link Remove

Cut and fill links can be deleted by the **remove** commands:

remove_cut link_list st_ch end_ch *optional*

remove_fill link_list st_ch end_ch *optional*

where

link_list	one or more names of links to be removed, in the form name1 name2 ... namei
st_ch	start chainage for removing the link
end_ch	end chainage for removing the link

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Width

The **cut_width** modifier is used to modify the width of variable cut links originally defined by width. Similarly the **fill_width** modifier is used to modify the width of variable fill links originally defined by width.

The format of the modifier to vary the width of the variable cut/fill links in **link_list** is

cut_width link_list st_ch end_ch st_wid end_wid absrel type optional
fill_width link_list st_ch end_ch st_wid end_wid absrel type optional

where

link_list	one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
st_wid	width to be used at the start modifier chainage, st_ch
end_wid	width to be used at the end modifier chainage, end_ch.
absrel	relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_wid is added to the current width of links in link_list at chainage st_ch.
the end_wid is added to the current width of links in link_list at chainage end_ch.

If **absrel** is **absolute**, then

the width of links in link_list are set to st_wid at chainage st_ch.
the width of links in link_list are set to end_wid at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the width of links in link_list are varied linearly (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the width of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the width at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage

extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

The **width** for a variable link can also be varied by **going out to another 12d Model string**.

cut_width link_list st_ch end_ch full_string_name side optional
fill_width link_list st_ch end_ch full_string_name side optional

where

link_list one or more names of cut/fill links given in the template definition; with format
name1 name2 ... namei

st_ch start chainage for the modifier
end_ch end chainage for the modifier

full_string_name name of a **12d Model** string to take links in link_list out to. The
format of the string name is "model_name->string_name".

side side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for
the range of this command
if interval is missing, then the interval for the apply many is used

interval_value only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage
extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.
If inactive is not there then the command is processed

// text the text is a comment

The **width** for a link can also be varied by using the **width between two 12d Model strings str_name_1 and str_name_2**.

cut_width link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional
fill_width link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Width from Link

The cut and fill **width from link** modifiers are used to modify the width of cut and fill links originally defined by width, to be the same as another link. That is, the width of the link is a copy of the width of another link.

The format of the modifier to vary the cut and fill **width from link** of the fixed links given by link_list is

copy_cut_width link_list st_ch end_ch from_link zone optional
copy_fill_width link_list st_ch end_ch from_link zone optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
from_link	name of the link to take the width from
zone	section of the template that the from_link is from (i.e. fixed, cut or fill)
and <i>optional</i> can be none, one or more of	
interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Height

The **cut_height** modifier is used to modify the height of variable cut links originally defined by height. Similarly the **fill_height** modifier is used to modify the height of variable fill links originally defined by height.

The format of the modifier to vary the height of the variable cut/fill links in **link_list** is

cut_height link_list st_ch end_ch st_ht end_ht absrel type optional
fill_height link_list st_ch end_ch st_ht end_ht absrel type optional

where

link_list	one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
st_ht	height to be used at the start modifier chainage, st_ch
end_ht	height to be used at the end modifier chainage, end_ch.
absrel	relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_ht is added to the current height of links in link_list at chainage st_ch.
the end_ht is added to the current height of links in link_list at chainage
end_ch.

If **absrel** is **absolute**, then

the height of links in link_list are set to st_ht at chainage st_ch.
the height of links in link_list are set to end_ht at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the height of links in link_list are varied linearly (with respect to the reference chainage) between the height at chainage st_ch and chainage end_ch.

If **type** is **cubic**, then the height of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the height at chainage st_ch and chainage

end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **height** for a variable link can also be varied by **taking the height from a 12d Model string**.

cut_height link_list st_ch end_ch full_string_name side optional
fill_height link_list st_ch end_ch full_string_name side optional

where

link_list	one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of a 12d Model string to take links in link_list out to. The format of the string name is "model_name->string_name".
side	side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
interval_value	if interval is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **height** for a link can also be varied by using the **height between two 12d Model strings str_name_1 and str_name_2**.

cut_height link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional
fill_height link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Height from Link

The cut and fill **height from link** modifiers are used to modify the height of cut and fill links originally defined by height, to be the same as another link. That is, the height of the link is a copy

of the height of another link.

The format of the modifier to vary the cut and fill **height from link** of the fixed links given by `link_list` is

copy_cut_height `link_list st_ch end_ch from_link zone optional`

copy_fill_height `link_list st_ch end_ch from_link zone optional`

where

`link_list` one or more names of fixed links given in the template definition; with format
 name1 name2 ... namei

`st_ch` start chainage for the modifier

`end_ch` end chainage for the modifier

`from_link` name of the link to take the height from

`zone` section of the template that the `from_link` is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

`interval` if `interval` exists, then sections are created at the `interval_value` for
 the range of this command

 if `interval` is missing, then the interval for the apply many is used

`interval_value` only exists if *interval* exists

`extra_start` optional - adds in an extra x-section 0.1mm before start chainage

`extra_end` optional - adds in an extra x-section 0.1mm before end chainage

`inactive` if *inactive* is there then the command is not processed.

 If *inactive* is not there then the command is processed

`// text` the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for `st_ch` and `end_ch`.

Cut and Fill Slope

The **cut_slope** modifier is used to modify the slope of variable cut links originally defined by slope. Similarly the **fill_slope** modifier is used to modify the slope of variable fill links originally defined by slope.

The format of the modifier to vary the cut/fill slope of the variable links in **link_list** is

cut_slope `link_list st_ch end_ch st_slope end_slope absrel type optional`

fill_slope `link_list st_ch end_ch st_slope end_slope absrel type optional`

where

`link_list` one or more names of cut/fill links given in the template definition; with format
 name1 name2 ... namei

`st_ch` start chainage for the modifier

`end_ch` end chainage for the modifier

`st_slope` slope to be used at the start modifier chainage, `st_ch`

`end_slope` slope to be used at the end modifier chainage, `end_ch`.

`absrel` relative (default) or absolute

 If **absrel** is **relative** (the default) then

 the `st_slope` is added to the current slope of links in `link_list` at chainage `st_ch`.

 the `end_slope` is added to the current slope of links in `link_list` at chainage

`end_ch`.

 If **absrel** is **absolute**, then

 the slope of links in `link_list` is set to `st_slope` at chainage `st_ch`.

the slope of links in link_list is set to end_slope at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the slope of links in link_list is varied linearly (with respect to the reference chainage) between the slope at chainage st_ch and chainage end_ch.

cubic, then the angle of the slope of links in link_list are varied as a reverse cubic (with respect to the reference chainage) between the angle of the slope at chainage st_ch and chainage end_ch.

rotate, then the angle of the slope of the links in link_list are varied linearly (with respect to the reference chainage) between the angle of the slope at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
	if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **slope** of a link can also be defined by using the slope from the **beginning of the link** (i.e. the end of the previous link or the hinge string if its the first link) to a given **12d Model** string.

cut_slope link_list st_ch end_ch full_string_name side optional

fill_slope link_list st_ch end_ch full_string_name side optional

where

link_list	one or more names of cut/fill links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
full_string_name	name of a 12d Model string to use to calculate slope. The format of the string name is "model_name->string_name".
side	side to search for string: -1 for left, 0 for left and right, 1 for right

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command
	if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

The **slope** of a link can also be defined by using the slope **between two 12d Model strings** **str_name_1** and **str_name_2**.

cut_slope link_list st_ch end_ch str_name_1 side1 str_name_2 optional
fill_slope link_list st_ch end_ch str_name_1 side1 str_name_2 side2 optional

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Slope from Link

The cut and fill **slope from link** modifiers are used to modify the slope of cut and fill links originally defined by slope, to be the same **slope** or **xfall** as another link. That is, the slope of the link is a copy of the slope of another link.

The format of the modifier to vary the cut and fill **slope from link** of the fixed links given by link_list is

copy_cut_slope link_list st_ch end_ch from_link zone optional
copy_fill_slope link_list st_ch end_ch from_link zone optional

where

link_list	one or more names of fixed links given in the template definition; with format name1 name2 ... namei
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
from_link	name of the link to take the slope or xfall from
zone	section of the template that the from_link is from (i.e. fixed, cut or fill)

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If inactive is not there then the command is processed
// text	the text is a comment

Important Note

The link to copy slope from can be defined in terms of slope or **cross fall**.

If the link to copy is defined by cross fall, then the slope is calculated to match the cross fall.

Hence this command can be used with cut and fill slopes to match to rotation of cross fall of fixed links for super-elevation.

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Tin Height

The **cut and fill tin height** modifiers are used to modify the height of the link so that the link will sit on the tin at the given width.

The tin height can only be used for a cut or fill link defined by width and height.

The format of the modifiers to vary the **cut** and **fill tin height** of the links in the **link_list** are:

tin_cut_height link_list st_ch end_ch tin_name optional
tin_fill_height link_list st_ch end_ch tin_name optional

where

link_list one or more names of cut/fill links given in the template definition; with format
 name1 name2 ... namei
 st_ch start chainage for the modifier
 end_ch end chainage for the modifier
 tin_name name of the tin to be used in defining the height.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for
 the range of this command
 if interval is missing, then the interval for the apply many is used
 interval_value only exists if *interval* exists
 extra_start optional - adds in an extra x-section 0.1mm before start chainage
 extra_end optional - adds in an extra x-section 0.1mm before end chainage
 inactive if *inactive* is there then the command is not processed.
 If inactive is not there then the command is processed
 // text the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Cut and Fill Tin Slope

The **cut and fill tin slope** modifier is used to modify the slope of the link so that the link will sit on the tin at the given width.

The cut and fill tin slope can only be used for a cut/fill link defined by width and slope.

The format of the modifiers to vary the **cut** and **fill tin slope** of the links in the **link_list** are:

tin_cut_slope link_list st_ch end_ch tin_name optional
tin_fill_slope link_list st_ch end_ch tin_name optional

where

link_list one or more names of fixed links given in the template definition; with format
 name1 name2 ... namei
 st_ch start chainage for the modifier
 end_ch end chainage for the modifier
 tin_name name of the tin to be used in defining the slope.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for
 the range of this command
 if interval is missing, then the interval for the apply many is used
 interval_value only exists if *interval* exists
 extra_start optional - adds in an extra x-section 0.1mm before start chainage
 extra_end optional - adds in an extra x-section 0.1mm before end chainage
 inactive if *inactive* is there then the command is not processed.
 If inactive is not there then the command is processed
 // text the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.
Please continue to the next section [Final Link Modifiers File Format](#).

Final Link Modifiers File Format

Final Width

The format of the modifier to **vary the width** of the final cut and fill link `link_name` is

final_width `link_name` `st_ch` `end_ch` `st_wid` `end_wid` `absrel` `type` `optional`

where

<code>link_name</code>	name of final link given in the template definition
<code>st_ch</code>	start chainage for the modifier
<code>end_ch</code>	end chainage for the modifier
<code>st_wid</code>	width to be used at the start modifier chainage, <code>st_ch</code>
<code>end_wid</code>	width to be used at the end modifier chainage, <code>end_ch</code> .
<code>absrel</code>	relative (default) or absolute

If **absrel** is **relative** (the default) then

the `st_wid` is added to the current width of `link_name` at chainage `st_ch`.

the `end_wid` is added to the current width of `link_name` at chainage `end_ch`.

If **absrel** is **absolute**, then

the width of `link_name` is set to `st_wid` at chainage `st_ch`.

the width of `link_name` is set to `end_wid` at chainage `end_ch`.

`type` linear (default) or cubic

If **type** is **linear** (the default), then the width of `link_name` is varied linearly (with respect to the reference chainage) between the width at chainage `st_ch` and chainage `end_ch`.

If **type** is **cubic**, then the width of `link_name` is varied as a reverse cubic (with respect to the reference chainage) between the width at chainage `st_ch` and chainage `end_ch`.

and *optional* can be none, one or more of

<code>interval</code>	if <code>interval</code> exists, then sections are created at the <code>interval_value</code> for the range of this command
<code>interval_value</code>	if <code>interval</code> is missing, then the interval for the apply many is used only exists if <i>interval</i> exists
<code>extra_start</code>	optional - adds in an extra x-section 0.1mm before start chainage
<code>extra_end</code>	optional - adds in an extra x-section 0.1mm before end chainage
<code>inactive</code>	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
<code>// text</code>	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for `st_ch` and `end_ch`.

Final Cut and Fill Slope

The format of the modifier to vary the cut/fill slope of the final link **link_name** is

final_cut_slope `link_name` `st_ch` `end_ch` `st_slope` `end_slope` `absrel` `type` `optional`

final_fill_slope `link_name` `st_ch` `end_ch` `st_slope` `end_slope` `absrel` `type` `optional`

where

<code>link_name</code>	name of final link given in the template definition
<code>st_ch</code>	start chainage for the modifier
<code>end_ch</code>	end chainage for the modifier
<code>st_slope</code>	slope to be used at the start modifier chainage, <code>st_ch</code>

end_slope slope to be used at the end modifier chainage, end_ch.

absrel relative (default) or absolute

If **absrel** is **relative** (the default) then

the st_slope is added to the current slope of link_name at chainage st_ch.

the end_slope is added to the current slope of link_name at chainage end_ch.

If **absrel** is **absolute**, then

the slope of link_name is set to st_slope at chainage st_ch.

the slope of link_name is set to end_slope at chainage end_ch.

type linear (default) or cubic

If **type** is **linear** (the default), then the slope of link_name is varied linearly (with respect to the reference chainage) between the slope at chainage st_ch and chainage end_ch.

cubic, then the angle of the slope of link_name is varied as a reverse cubic (with respect to the reference chainage) between the angle of the slope at chainage st_ch and chainage end_ch.

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command

interval_value if interval is missing, then the interval for the apply many is used only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage

extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.

If inactive is not there then the command is processed

// text the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Stopping Final Cut and Fill Slope

The final link can be stopped altogether in either cut or fill.

The format of the modifier to stop the cut/fill slope of the final link link_name is

final_no_cut_slope link_name st_ch end_ch optional

final_no_fill_slope link_name st_ch end_ch optional

where

link_name name of final link given in the template definition

st_ch start chainage for the final link to stop

end_ch end chainage for the final link to stop

and *optional* can be none, one or more of

interval if interval exists, then sections are created at the interval_value for the range of this command

interval_value if interval is missing, then the interval for the apply many is used only exists if *interval* exists

extra_start optional - adds in an extra x-section 0.1mm before start chainage

extra_end optional - adds in an extra x-section 0.1mm before end chainage

inactive if *inactive* is there then the command is not processed.

If inactive is not there then the command is processed

// text the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Please continue to the next section [Snippets File Format](#).

Snippets File Format

Snippets are a method of inserting groups of modifiers at once. Snippets can have parameter but the values of the parameters are saved in the actual MTF.

snippet snippet_file st_ch end_ch param_name_1 param_value_1...
param_name_n param_value_n *optional*

where **unknown** takes the place of the one of width, height or xfall not being used, and

snippet_file	file containing the snippet definition
st_ch	start chainage for creating the link
end_ch	end chainage for creating the link
param_name_n	name of the nth parameter - must be in quotes ("")
param_value_n	value for the nth parameter - must be in quotes

and *optional* can be none, one or more of

interval	if interval exists, then sections are created at the interval_value for the range of this command if interval is missing, then the interval for the apply many is used
interval_value	only exists if <i>interval</i> exists
extra_start	optional - adds in an extra x-section 0.1mm before start chainage
extra_end	optional - adds in an extra x-section 0.1mm before end chainage
inactive	if <i>inactive</i> is there then the command is not processed. If <i>inactive</i> is not there then the command is processed
// text	the text is a comment

See [Start and End Chainages in the Modifier File Format](#) for the format for st_ch and end_ch.

Please continue to the next section [A Template Modifier File Example](#).

A Template Modifier File Example

```

left_side = {
    -99999.9    "std"
    99999.9
}

right_side = {
    -99999.9    "std"
    99999.9
}

//                                     -- assumes ---

left_side_modifier = {
    width "kerb" 103 203.0 0.0 3.0 absolute linear// widen from width 0 to width 3 - linear
    width "kerb" 203.0 303.0 3.0 3.0 absolute // keep width at 3
    width "kerb" 303.0 403.0 3.0 0.0 absolute // widen from width 3 to width 0 - linear
    width "kerb" 153.0 253.0 0.0 9.0 cubic relative
    width "kerb" 253.0 353.0 9.0 0.0 cubic // relative is default

    final_no_fill_slope "final" 190.0 310.0 extra_start extra_end
}

right_side_modifier = {

```

}

Go to the next section [MTF Stripping File Format](#) or back to [Text Format of the MTF File](#)

MTF Stripping File Format

The stripping depth is given in the many templates file (*.mtf) and is similar to the format for applying templates except there is no separate left and right side.

The stripping definition begins with the key words

stripping =

A list of chainages (in ascending order, one per line) with corresponding stripping depth then follows. The list of chainages and stripping depths is enclosed in curly braces {}.

The chainage-stripping lists are assembled as follows

- (a) to represent a stripping depth starting at a given chainage, the chainage value followed by the stripping depth is given. The chainage and stripping depth are separated by one or more spaces. For example, the stripping depth **0.03** starting at chainage 150 is represented by

150 0.03

The stripping depth is assumed to apply until the chainage given on the next line of the stripping definition.

If the stripping depth is to go to the end of the reference string, add a line with a chainage greater than or equal to the end chainage. For example

150 0.03
9999 0.0

Warning - unlike applying templates, a stripping depth **must exist** after a chainage, however the stripping depth can be zero.

- (b) linearly varying stripping depth between chainages is represented by giving the **start chainage** for the variation followed on the same line by the **start depth** and the **end depth** separated by a comma.

The linear change takes place over the interval beginning at this chainage and ending at the chainage given on the next line of the stripping definition.

For example, to linearly vary the stripping depth from 0.02 to 0.03 between the chainages 350 and 500, use

350 0.02 , 0.03
500 0.03

A Stripping Example

An example of a stripping command is

stripping = {
-999 0.03
30 0.0
70 0.03,0.05
110.5 0.05
999 0.05
}

Go to the next section [MTF Boxing File Format](#) or back to [Text Format of the MTF File](#)

MTF Boxing File Format

Apart from a key word specifying whether the following part of the definition is for the left or the right, the set out for the left boxing is identical to the right boxing. Hence only the left boxing will be described in detail.

The left boxing definition begins with the key words

left_boxing =

A list of chainages (in ascending order, one per line) with corresponding boxing names then follows. The list of chainages and boxing is enclosed in curly braces { }.

The chainage-boxing lists are assembled as follows

- (a) to represent a boxing starting at a given chainage, the chainage value followed by the boxing name is given. The chainage and boxing name are separated by one or more spaces. For example, the boxing **left** starting at chainage 150 is represented by

150 left

The boxing is assumed to apply until the chainage given on the next line of the left_boxing definition.

- (b) if no boxing exists from a chainage, simply include the chainage with no boxing name following it. For example, if there is no boxing from chainage 250, this is represented by

250

The non-existence of boxing is assumed until the chainage given on the next line of the left_side definition.

If the boxing is to go to the end of the reference string, add a line with a chainage greater than or equal to the end chainage. For example

150 left
9999

When using the **apply many** option, the name of the boxing definitions file is given by a **boxing_file** command in the **many templates file**.

boxing_file = boxing_definitions_file

When using the **boxing many** option, if a file name is given in the **boxing file** panel field, it is used for the boxing definitions file, otherwise the boxing_file command in the many templates file is used.

Note - if the boxing name includes spaces, then the name must be enclosed in quotes ". For example, "left 1".

An Applying Boxing Example

```
boxing_file = "boxing_for_client.bf"
left_boxing = {
    -999 left
    30
    70 "left narrow"
    110.5 left
    999
}
right_boxing = {
    -999 right
    30
```

	70	"right narrow"
	110.5	right
	999	
}		

Warning - no interpolation or modifiers exist for boxing.

Go to the next section [MTF Width File Format](#) or back to [Text Format of the MTF File](#)

MTF Width File Format

The format for **section width** in the mtf file is simply

```
section_width    =    value           // default is 10000
```

where *value* is the distance to search from the hinge string for strings required in some options. If section_width is missing, then it takes the default value of 10000.

For example

```
section_width    =    100.0
```

Go to the next section [MTF String Modifiers File Format](#) or back to [Text Format of the MTF File](#)

MTF String Modifiers File Format

In the many templates file, the **string modifiers** definition begins with the key word

string_modifiers =

followed by one or more occurrences of the string modifier command **height** enclosed by curly braces { }

The definition of the string modifier commands will now be given.

Height

The *height* the **Height** string modifier calculates for the amend point is given by:

- (a) if the absolute flag is not set, the height of the hinge point, otherwise zero.
- plus
- (b) the interpolated height for the user given heights at the start and end chainages
- plus
- (c) the interpolated height for the user given cross falls at the start and end chainage.

That is, if the absolute flag is not set:

$$\text{new height} = \text{hinge height} + (\text{interpolated height}) + (\text{interpolated xfall}) \times (\text{offset distance})$$

If the absolute flag is set:

$$\text{new height} = (\text{interpolated height}) + (\text{interpolated xfall}) \times (\text{offset distance})$$

The format of the **Height** string modifier is

height amend_str ref_str hinge_str st_ch end_ch ch_int st_xfall end_xfall st_ht end_ht
absolute

where

amend_str	name of a 12d Model string to take the hinge point out to. The format of the string name is "model_name->string_name".
ref_str	name of reference string. The format of the string name is "model_name->string_name".
hinge_str	name of hinge string. The format of the string name is "model_name->string_name".
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
ch_int	interval between chainage points - can be the word <i>null</i>
st_xfall	xfall to be used at the start modifier chainage, st_ch
end_xfall	xfall to be used at the end modifier chainage, end_ch.
st_ht	height to be used at the start modifier chainage, st_ch
end_ht	height to be used at the end modifier chainage, end_ch.
absolute	<i>optional</i> - if it exists, include the height of the hinge string

Height and Two Strings

The *height* the **Height 2x** string modifier calculates for the amend point is given by:

- (a) the height of the hinge point
- plus
- (b) the offset distance multiplied by the cross fall between two user selected strings.

$$\text{new height} = \text{hinge height} + (\text{xfall between string 1 and string 2}) \times (\text{offset distance})$$

The format of the **Height 2x** string modifier is

height amend_str ref_str hinge_str st_ch end_ch ch_int xfall_str1 xfall_str2
where

amend_str	name of a 12d Model string to take the hinge point out to. The format of the string name is "model_name->string_name".
ref_str	name of reference string. The format of the string name is "model_name->string_name".
hinge_str	name of hinge string. The format of the string name is "model_name->string_name".
st_ch	start chainage for the modifier
end_ch	end chainage for the modifier
ch_int	interval between chainage points - can be the word <i>null</i>
xfall_str_1	name of first string to calculate cross fall between. The format of the string name is "model_name->string_name".
xfall_str_2	name of second string to calculate cross fall between. The format of the string name is "model_name->string_name".

Go to the next section [Substitutions in the Many Templates File](#) or back to [Text Format of the MTF File](#)

Substitutions in the Many Templates File

The **many template variables** are special variables standing for information about the reference string used in the apply many operation.

The many template variables are only evaluated when the many template file is used in an **apply many** operation and provide a mechanism to generalize the many template file.

The many template file also recognizes the CCCP preprocessor rules including #include, #define, #if etc.

Many Template Variables

The list of the many template variables is:

\$tangent_curve_n	chainage of the tangent curve point for the nth HIP
\$tangent_spiral_n	tangent spiral
\$curve_spiral_n	curve spiral
\$spiral_curve_n	spiral curve
\$curve_spiral_n	curve spiral
\$spiral_tangent_n	spiral tangent
\$curve_tangent_n	curve tangent
\$start_spiral_n	length of the start spiral on the nth HIP point
\$end_spiral_n	length of the end spiral
\$radius_n	absolute radius of the curve
\$signed_radius_n	signed radius of the curve
\$vertical_tangent_curve_n	chainage of the tangent curve point for the nth VIP
\$vertical_curve_tangent_n	chainage of the curve tangent point for the nth VIP
\$vertical_sag_n	chainage of the sag point for the nth HIP
\$vertical_crest_n	crest
\$vertical_crest_sag_n	crest or sag

For example,

\$tangent_spiral_3 get the chainage for the tangent spiral on HIP 3.

The variables can be used in expressions with the arithmetic operations +, -, * and / as long as the expression is surrounded by round brackets ().

For example, in the width command:

width E (\$tangent_spiral_2 - 50) (\$tangent_spiral_2 + 50) 3 5 absolute

the expression (\$tangent_spiral_2 - 50) will yield the chainage of fifty metres before the tangent spiral point of the second HIP point.

The variables can also be used in **#define**'s and **#include**'s according to the following CCCP rules.

(a) **#define** NAME Expansion of NAME

if the `#define` is longer than one line, the backslash character `\` is added to the end of each line that has another line of the `#define` following to indicate that the `#define` continues to the next line.

- (b) **#define** can be used to define a block of things with more than one argument

For example,

```
#define SUPER(name,ip,xf1,xf2) \
\
xfall name START_TAPER(ip) xf1 xf2 absolute \
xfall name FIXED_TAPER(ip) xf2 xf2 absolute \
xfall name END_TAPER(ip) xf2 xf1 absolute
```

means that `SUPER("EB",3,-3.0,3.0)` will be expanded to the three lines:

```
xfall "EB" START_TAPER(3) -3.0 3.0 absolute
xfall "EB" FIXED_TAPER(3) 3.0 3.0 absolute
xfall "EB" END_TAPER(3) 3.0 -3.0 absolute
```

Note that `\` is used to indicate that the `#define` continues to the next line.

- (c) **(if (express) {expression1 } else {expression 2})**

is an expression *express*, which evaluates to

if *express* is true, then the value of the expression is *expression1* otherwise *expression 2*.

- (d) **word##p**

is equivalent to **wordp**

- (e) **#include file_name**

A number of `#defines` can be placed in a file and included in the mtf by using the `#include`.

As an example combining the above rules, the meaning of

```
LEADING_TAPER_START(2)
```

given by the following `$define`:

```
#define LEADING_TAPER_START(ip) ( if($radius_##ip < 75) {$tangent_spiral_##ip - 50}\
else { $tangent_spiral_##ip - 75 } )
```

is

if the radius of the second HIP is less than 75, then set `LEADING_TAPER_START(2)` to the chainage of the tangent spiral point of the second HIP point, less fifty metres, **otherwise** `LEADING_TAPER_START(2)` is set to the chainage of the tangent spiral point of the second HIP point, less seventy five metres

A more complicated example now follows which shows how `#defines` can be used to easily apply super-elevation according to rules involving leading and trailing spirals.

```
// -----
#define LEADING_TAPER_START(ip) ( if($radius_##ip < 75)\
{ $tangent_spiral_##ip - 50 } else { $tangent_spiral_##ip - 75 })

// Note: LEADING_TAPER_START evaluates to a chainage.
#define LEADING_TAPER_END(ip) ( if($radius_##ip < 75)\
{ $tangent_spiral_##ip + 10 } else { $tangent_spiral_##ip + 25 })

// Note: LEADING_TAPER_END evaluates to a chainage.
#define TRAILING_TAPER_START(ip) ( if($radius_##ip < 75)\
{ $spiral_tangent_##ip - 10 } else { $spiral_tangent_##ip - 25 })
```

```

// Note: TRAILING_TAPER_START evaluates to a chainage.
#define TRAILING_TAPER_END(ip)      ( if($radius_##ip < 75)\
  { $spiral_tangent_##ip + 50 } else { $spiral_tangent_##ip + 75 })

// Note: TRAILING_TAPER_END evaluates to a chainage.
#define START_TAPER(ip) LEADING_TAPER_START(ip)\
  LEADING_TAPER_END(ip)

// Note: START_TAPER evaluates to two chainages:      chainge1  chainage2.
#define FIXED_TAPER(ip) LEADING_TAPER_END(ip)\
  TRAILING_TAPER_START(ip)

// Note: FIXED_TAPER evaluates to two chainages:      chainge1  chainage2.
#define END_TAPER(ip)    TRAILING_TAPER_START(ip)\
  TRAILING_TAPER_END(ip)

// Note: TRAILING_TAPER evaluates to two chainages:      chainge1  chainage2.

#define SUPER(name,ip,x1,x2) \
\
  xfall name START_TAPER(ip) x1 x2 absolute \
  xfall name FIXED_TAPER(ip) x2 x2 absolute \
  xfall name END_TAPER(ip)    x2 x1 absolute

```

With the above #defines, SUPER evaluates to three lines of xfall template modifiers which rotates cross-fall, keeps it constant and then counter-rotates the cross-fall about leading and trailing spirals for an HIP point.

For example,

```
SUPER(EB,2,-3,3)
```

would give expand to the following three lines of xfall commands for link **EB** which will rotate xfall from -3 to 3, hold it at 3 and then rotate it back form 3 to -3, all about the leading and trailing spirals for horizontal intersection point number two:

```

xfall EB begin_chainage_for_start_taper end_chainage_for_start_taper -
3 3 absolute

xfall EB begin_chainage_for_fixed_taper end_chainage_for_fixed_taper_ch 3 3 absol
ute

xfall EB begin_chainage_for_end_taper end_chainage_for_end_taper 3 -
3 absolute

```

The above definitions of SUPER could be placed in a file, say

```
f:\12d\12dmodel\library\super_mtf.def
```

and then simply included into a mtf file using the a #include:

```
#include f:\12d\12dmodel\library\super_mtf.def
```

Examples of Substitutions in the Many Templates File

The following example shows how #defines can be used to easily apply super-elevation according to rules involving leading and trailing spirals.

The definition of SUPER is given in the file, f:\12d\12dmodel\library\super_mtf.def, which is simply included in the mtf file using a #include.

```
// -----  
// include the file containing the definition of SUPER  
// -----  
  
#include "f:\12d\12dmodel\library\super_mtf.def"  
  
// -----  
// apply templates left and right and then modifier them  
// -----  
  
left_side = {  
    -999999 std  
    999999  
}  
  
right_side = {  
    -999999 std  
    999999  
}  
  
specials = {  
}  
  
hinge_modifier = {  
}  
  
left_side_modifier = {  
    // linearly widen the link EB by 12 metres and bring it back  
    // in again.  
  
width EB ($tangent_spiral_2 - 50) ($tangent_spiral_2 + 50) 0 12  
width EB ($tangent_spiral_2 + 50) ($spiral_tangent_7 - 50) 12 12  
width EB ($spiral_tangent_7 - 50) ($spiral_tangent_7 + 50) 12 0  
  
    // define superelevation  
  
    SUPER(EB,2,-3,3)  
    SUPER(EB,4,-3,3)  
    SUPER(EB,5,-3,3)  
    SUPER(EB,6,-3,3)  
}  
  
right_side_modifier = {  
  
    SUPER(EB,3,-3,3)  
    SUPER(EB,7,-3,3)  
}  
stripping = {  
}  
//boxing_file = "yourfile.bf"  
left_boxing = {  
}  
right_boxing = {  
}
```

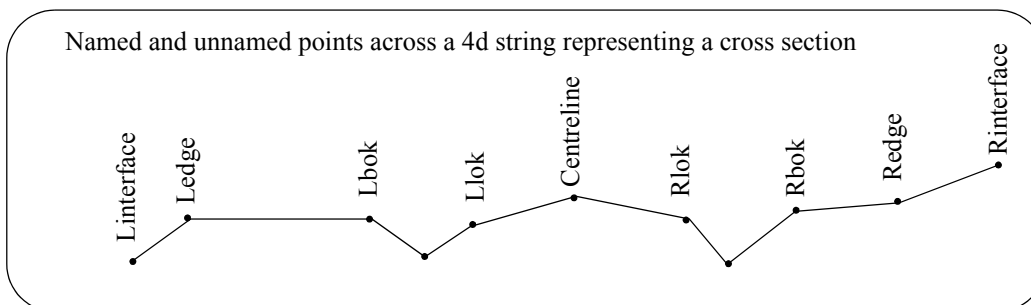

```
string_modifiers = {  
    }  
//section_width = 10000.0
```

Text Format of the Boxing File

The interactive editor for creating the *Boxing Definitions* in the *Boxing* file has been given in the previous sections [Edit Boxing File](#).

This section will describe the text layout of the text boxing file.

Boxing is defined by a series of commands going from **left to right** across the points of a cross section. (Cross sections are generated as 4d strings by options such as **apply** and **cuts**).

The definitions of boxing cross sections are set up in a file ending in **.bf** (called the boxing file) and any number of boxing definitions can be placed in the boxing file as long as each boxing definition is given a unique name.

In the boxing file, a *Boxing Definition* with name **boxing_name** is set out as

```
boxing    boxing_name {
                                boxing commands
}
```

The boxing commands apply from the offset specified at the beginning of that command (**start offset** for the command) to the start offset of the **next** command in the file (like chainages and templates in the apply many file). Hence the **end offset** for a command is the start offset of the following command in the file.

For example, in the sequence

```
offset1,    command1
offset2,    command2
```

command1 goes from offset1 (the start offset for command1) to offset2 (the end offset for command1).

The **offsets** can be **fixed** values or can be specified **relative** to a point name on the 4d string representing the x-section. One restriction is that all the points mentioned in a boxing definition, must be present in each x-section the boxing definition is applied to.

The notation used to specify an actual offset, or offset relative to a point name is

```
offset_value
or      "point_name"
or      "point_name" +/- offset_value
```

and means in the first case

take the specified **offset** value (offset_value can be positive or negative).

and for the other two relative cases

take the **offset at** the string or 4d point called **point_name** and add **offset_value** to it (offset_value can be positive or negative).

Hence the offset can be specified as either a value or given **relative to point_name** (relative

offset). For convenience, the offset will be denoted by **rel_off**.

The major advantage of defining boxing in terms of point names is that whenever the points are modified using template modifiers, the boxing across the section is also automatically modified.

Since the offset part of a command can consist of text plus or minus a number, commas are used to separate each field of the command.

A boxing definition may be used in either a `left_boxing` or `right_boxing` mtf command (see the section, creating boxing), however unlike the case for templates, the boxing definition is applied to the point names going from left to right regardless of whether the boxing definition is used on the left or the right.

In practice, the definitions for left and right boxing are usually different because of the necessity of having unique point names across the entire cross section.

Vertical Walls

If a boxing definition creates two different height values at the one offset (i.e. a wall), then extra offset points are automatically inserted into the boxing x-section (at 0.1 mm from the previous point) so that no points are on top of each other.

So in effect a vertical wall is created but since no points are created that are directly above each other, the data can be triangulated.

The commands in the boxing definition are:

- see [Text Format - Boxing Copy](#)
- see [Text Format - Boxing Copy with Height Adjustment](#)
- see [Text Format - Boxing Line](#)
- see [Text Format - Boxing Xfall](#)
- see [Text Format - Boxing Xfall1](#)
- see [Text Format - Boxing End](#)
- see [Text Format - Boxing Right_Xfall](#)
- see [Text Format - Boxing Right_slope](#)
- see [Text Format - Boxing Right_copy](#)
- see [Text Format - Boxing Left_Xfall](#)
- see [Text Format - Boxing Left_slope](#)
- see [Text Format - Boxing Left_copy](#)
- see [Text Format - Boxing Definitions Example](#)

Text Format - Boxing Copy

rel_off, copy

This copies the links (or parts of links) from the start offset **rel_off** to the offset on the next line, keeping the present crossfall and height of each link

For the boxing panel that creates this boxing command, see [Boxing Copy](#).

Text Format - Boxing Copy with Height Adjustment

`rel_off, copy, delta_height`

This copies the links (or parts of links) from the start offset **rel_off** to the offset on the next line, keeping the present slope of each link but adjusting the height of each link by **delta_height**.

For the boxing panel that creates this boxing command, see [Boxing Copy](#).

Text Format - Boxing Vertex

For the boxing panel that creates this boxing command, see [Boxing Vertex](#).

Text Format - Boxing Line

Line Through Two Given Points

`rel_off, line, rel_off_1, delta_height_1, rel_off_2, delta_height_2`

This creates a link from the start offset **rel_off** to the offset on the next line, with a

- (a) slope given by two points
- (b) start height given by projecting to the start offset, the line through the two points.

The first point defining the line has an offset **rel_off_1** and a height given by the height of the design x-section at offset **rel_off_1** adjusted by **delta_height_1**.

The second point defining the line has an offset **rel_off_2** and a height given by the height of the design x-section at offset **rel_off_2** adjusted by **delta_height_2**.

The typed format of the **line** commands created by this panel is (all on one line):

`point_name + point_offset,line, point_1_name + point_1_offset,delta_height_1,
point_2_name + point_2_offset,delta_height_2`

```
rel_off,    line, rel_off_1, delta_height_1, rel_off_2,
delta_height_2
next_off,   ...
```

For the boxing panel that creates this boxing command, see [Boxing Line - line through two points](#).

Text Format - Boxing Xfall

Line Through a Given Point with a Given Crossfall

```
rel_off,    xfall,    rel_off_1,    delta_height_1,    xfall_value
```

This creates a link from the start offset to the offset on the next line, with a

- (a) user given xfall
- (b) start height given by projecting to the start offset, the line with a given xfall and going through a given point.

The point defining the line has an offset **rel_off_1** and a height given by the height of the design x-section at offset **rel_off_1** adjusted by **delta_height_1**.

The typed formats of the **xfall** commands created by this panel is:

```
point_name + point_offset,    xfall,    control_name + control_offset,    control_height,    xfall
```

The crossfall of the line is given by **xfall_value**

```
rel_off,    xfall, rel_off_1, delta_height_1, xfall_value
next_off,   ...
```

For the boxing panel that creates this boxing command, see [Boxing Xfall - line through a point with a given crossfall](#).

Text Format - Boxing Xfall1

Line Through a Given Point with Crossfall Taken from a Point

rel_off, **xfall1**, rel_off_1, delta_height_1, rel_off_2, delta_xfall

This creates a link from the start offset **rel_off** to the offset on the next line, with a

(a) xfall which is the xfall at a given offset plus an addition given xfall

and

(b) start height given by projecting to the start offset, the line with the given xfall and going through a given point.

The point defining the line has offset **rel_off_1** and a height given by the height of the design x-section at offset **rel_off_1** adjusted by **delta_height_1**

The typed formats of the **xfall1** commands created by this panel is:

point_name + point_offset, **xfall1**, control_name + control_offset, control_height,
 xfall_name + xfall_offset, xfall_delta

The xfall of the line is **delta_xfall** added to the xfall on the design x-section at the offset **rel_off_2**

For the boxing panel that creates this boxing command, see [Boxing Xfall 1 - line through a point with a crossfall taken from a point](#).

Text Format - Boxing Intersect

For the boxing panel that creates this boxing command, see [Boxing Intersect - Intersection of Two Lines](#).

Text Format - Boxing Xfall Point

For the boxing panel that creates this boxing command, see [Boxing Xfall Point](#).

Text Format - Boxing End

rel_off, **end**

The typed format of the **line** commands created by this panel is:

point_name + point_offset, **end**

This command is used to give an end offset for any of the above commands when no command follows to use for the end offset. That is, the offset **rel_off** is used as the **end offset** for the **previous command**.

end doesn't begin another command and none of the above commands can follow an **end** command.

All of the above boxing commands are known as **standard** commands. Hence the **end** command is the **last** standard command.

For the boxing panel that creates this boxing command, see [Boxing End](#).

Text Format - Boxing Right_Xfall

Batter off Right End of Boxing with Crossfall Taken from a Point

The **right_xfall** command has two versions - providing a fixed cross fall or using the crossfall from part of the design x-section.

right_xfall rel_off, delta_xfall

right_xfall xfall_value

The typed formats of the **right_xfall** commands created by this panel is:

right_xfall, xfall_name + xfall_offset, xfall_delta

For the first case, the **right_xfall** command batters off the right end of the boxing using the xfall from the design section at a given offset **rel_off** plus an additional given xfall **delta_xfall**, until the design section is intersected. The intersection point is used as the next point in the boxing.

Hence the xfall of the batter is **delta_xfall** added to the xfall on the design x-section at the offset **rel_off**

For the second case, the **right_xfall** command batters off to the right end of the boxing at the given xfall **xfall_value** until the design section is intersected. The intersection point is used as the next point in the boxing.

In the **right_xfall** command, the xfall is percent cross-fall and a positive xfall is up and negative down.

For the boxing panel that creates this boxing command, see [Boxing Right Side Interface Xfall from Point](#).

Text Format - Boxing Right_slope

Batter Off the Right End of Boxing with a Given Slope

right_slope slope_value

The **right_slope** commands batter off to the right end of the boxing at the given slope **slope_value** until the design section is intersected. The intersection point is used as the next point in the boxing. In this command, a positive slope is up and negative down.

For the boxing panel that creates this boxing command, see [Boxing Right Side Interface Xfall from Point](#).

Text Format - Boxing Right_copy

Copy from the Last Boxing Point to the end of Design Section

right_copy value

If value is non-zero, the **right_copy** command copies from the last boxing point to the last point on the design section. Hence the **right_copy** command is used to continue the boxing section from the intersection point with the design section to the end of the design section (a full width boxing section).

Note

The **right_xfall** command **takes precedence over** the **right_slope** command. That is, if both commands exist then only the **right_xfall** command is used.

For the boxing panel that creates this boxing command, see [Boxing Right Side Interface Xfall from Point](#).

Text Format - Boxing Left_Xfall

Batter off Left End of Boxing with Crossfall Taken from a Point

left_xfall rel_off, delta_xfall

left_xfall xfall_value

The typed formats of the **left_xfall** commands created by this panel is:

left_xfall, xfall_name + xfall_offset, xfall_delta

The **left_xfall** is identical to the **right_xfall** command except that it is applied at the beginning of the boxing definition and batters off to the left rather than to the right.

In the **left_xfall** command, the xfall is percent cross-fall and a positive xfall is up and negative down.

For the boxing panel that creates this boxing command, see [Boxing Left Side Interface Xfall from Point](#).

Text Format - Boxing Left_slope

Batter Off the Left End of Boxing with a Given Slope

left_slope slope_value

The **left_slope** is identical to the **right_slope** command except that it is applied at the beginning of the boxing definition and batters off to the left rather than to the right. In this command, a positive slope is up and negative down.

The **left_slope** and **left_copy** are identical to the **right_slope** and **right_copy** except that they are applied at the beginning of the boxing definition and batter off and copy to the left rather than to the right. In this command, a positive slope is up and negative down.

The **left_copy** command must come before the **left_slope** command but they both come after all of the standard commands.

Note

The **left_xfall** command **takes precedence over** the **left_slope** command. That is, if both commands exist then only the **left_xfall** command is used.

For the boxing panel that creates this boxing command, see [Boxing Left Side Interface Xfall from Point](#).

Text Format - Boxing Left_copy

Copy from the Start of Design Section to the First Boxing Point

left_copy value

The **left_copy** is identical to the **right_copy** except that it is applied at the beginning of the boxing definition and copies to the left rather than to the right.

If *value* is non-zero, the **left_copy** command copies from the last boxing point to the last point on the design section. Hence the **left_copy** command is used to continue the boxing section from the first boxing point to the start of the design section (a full width boxing section).

Note

The **left_xfall**, **left_slope**, **left_copy**, **right_xfall**, **right_slope** and **right_copy** commands should come after all of the standard commands.

When a boxing definition is applied on the left side, any **right_xfall**, **right_slope** or **right_copy** is ignored. Similarly, when a boxing definition is applied on the right side, any **left_xfall**, **left_slope** or **left_copy** is ignored.

Hence a boxing definition can have a **left_xfall**, **left_slope**, **left_copy** and a **right_xfall**, **right_slope**, **right_copy** but which set is used depends on whether the boxing definition is used on the left or the right.

When the **boxing** panel is used to create the boxing, only one boxing definition is needed and all of the **right_xfall**, **right_slope**, **right_copy**, **left_xfall**, **left_slope** and **left_copy** commands are used.

For the boxing panel that creates this boxing command, see [Boxing Left Side Interface Xfall from Point](#).

Text Format - Boxing Definitions Example

boxing "1" {

```

    "Linterface",      copy                                // line 1
    "Lpath2",          copy,      -0.075                  // line 2
    "Lpath1",          copy                                // line 3
    "Lbok" - 0.15,     xfall,      "Llok",      -0.3,      0 // line 4
    "Llok",            copy,      -0.3                    // line 5
    "Rlok",            xfall,      "Rlok",      -0.3,      0 // line 6
    "Rbok" + 0.15,     copy                                // line 7
    "Rpath1",          copy      -0.095                   // line 8
    "Rpath2",          copy                                // line 9
    "Rinterface",      end                                // line 10
}
```

Description

- Line 1 copy from "Linterface" to "Lpath2"
- Line 2 copy and drop by 0.075 from "Lpath 2" to "Lpath 1"
- Line 3 copy from "Lpath1" to 0.15 before "Lbok"
- Line 4 go from 0.15 before "Lbok" to "Llok" at depth 0.3 below "Llok", with cross fall 0
- Line 5 copy and drop by 0.3 from "Llok" to "Rlok"
- Line 6 go from "Rlok" to 0.15 past "Rbok" at depth 0.3 below "Rlok", with cross fall 0
- Line 7 copy from 0.15 past "Rbok" to "Rpath1"
- Line 8 copy and drop by 0.095 from "Rpath1" to "Rpath2"
- Line 9 copy from "Rpath2" to "Rinterface"

```

boxing "left narrow" {                                // boxing defined from just before lkerb to m001
    "lkerb" - 0.7 ,      copy
    "m001" - 1.0,      copy ,      -0.6
    "m001",      end
}
```

boxing "left" { // boxing defined from the left start of the section to m001 (the centreline say)

```

        "lkerb",    copy,      -0.6
        "m001",    end
        left_slope  5.0
        left_copy   1
    }
    boxing "right" {           // boxing defined from m001 to the far right of the section
        "m001",    copy,      0.6
        "rkerb",   end
        right_slope 5.0
        right_copy  1
    }
    boxing "full" {           // a full width boxing - defines the entire boxing going from left to right
        "lkerb",    copy,      -0.6
        "rkerb",    end
        left_slope  5.0
        left_copy   1
        right_slope -5.0
        right_copy  1
    }
}

```

For more information on how Boxing works in **12d Model**, please go to the section [MTF Boxing](#).

21 Drainage and Sewer

Position of menu: Design =>Drainage-Sewer

The **Drainage-Sewer** option is used to place drainage and sewer networks within a subdivision, along highways and culverts for cross drainage. Pumps may also be included in the network. The network is placed in three dimensions including manholes (maintenance holes), and for sewer work, lot controls and house connections can be defined. A 12d drainage string is used for all of these options.

If used in conjunction with the services on a section view, interference with neighbouring pipe strings can be taken into consideration when placing the network.

Note that the drainage string and plots capabilities are only available with the drainage and sewer options and the sewer extensions (property control, house controls and Melbourne Water plots) are only available with the sewer option.

The **drainage string** is based on a **polyline** string so that **arcs** can exist between manholes (maintenance holes). The manholes may be placed anywhere along the polyline but generally manholes are located at the polyline indices.

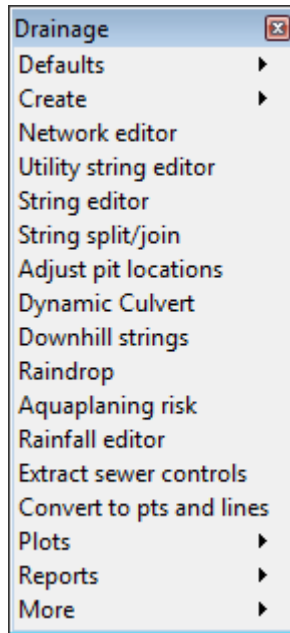

The use of the drainage string for drainage is only a subset of its use for sewer so the steps for the sewer will be given since they cover drainage as well.

The sewer process consists of a number of steps (the drainage process does not use steps 2 and 3):

1. creating the drainage or sewer network
2. Vertical alignment, pipe cover and utility clash checking using the [Drainage Network Editor](#),
3. checking that residential blocks are controlled by the sewer network
4. creating the house connections for the sewer
5. network design using custom routines, spread sheets or advanced network analysis packages via the [Drainage Network Editor](#)
6. producing [Drainage Plots](#) (plan and long section) and [Reports](#) (material quantity reports, excavation volumes and manhole construction reports)

These steps are described in the rest of this chapter.

The **Drainage** walk-right menu is laid out to reflect the standard sequence of placing drainage and wastewater pipes, *i.e.* creating, editing and plotting.

For a description of the drainage string in 12d Model, please go to the section [Drainage Strings](#)

Drainage Strings

A **drainage string** consists of a series of manholes (maintenance holes) at user selected (x,y,z) positions. The manholes can be joined by either straight or curved pipes.

Manholes may be any type of drainage structure and are represented by circles or rectangles. Drainage inlets, pump wet wells, gross pollutant traps, soak away pit, open channel changes in direction are all examples of manholes. The manholes have cover, grate and sump levels as well as wall and bottom thicknesses.

Pipes are the conduits connecting the manholes. Round pipes, box culverts, trapazoidal channels, pump rising mains, basin links, weirs and orifices are all examples of pipes.

Like all **12d** Model strings, the drainage string has an implied direction, starting at the first manhole and going in the direction towards the next manhole in the drainage string. This order is normally determined by the creation order (or string order) of the manholes.

The chainage of the drainage string starts at the **first** manhole and then increases along the direction of the drainage string.

In **12d** Model, drainage strings have a property indicating

- (a) the most upstream manhole is entered as the first point of the string and hence the water flows in the direction of ascending string chainage. The flow direction is said to be in ascending chainage.

or

- (b) the most downstream manhole is entered as the first point of the string and hence the water flows in the direction of descending chainage. The flow direction is said to be in descending chainage)

When a drainage string with flow direction in ascending order is profiled in a section view, the left hand side of a manhole is normally upstream and the right hand side of a manhole downstream.

It is recommended that drainage strings are entered with the flow direction in ascending chainage so that the minimum grade and cover can be satisfied as the drainage string is being placed.

That is, if the drainage string flow is in ascending chainage direction, then as manholes are appended, minimum *cover* and minimum *grade* can be automatically maintained. In all cases the invert levels can be recalculated using the [Drainage Network Editor](#).

Pipes

A pipe is automatically created when a second or additional manhole is added to a drainage string. The properties of the pipe follow:

Type

Size (diameter, width, top width and natural channel shapes (dynamic only)).

Inverts Levels

Wall Thickness

Minimum cover limit

Length

The pipe length by default is set to manhole centre to manhole centre. This length is displayed in the DNE and on the section view (Toggle->Grades) when the drainage string is profiled.

The pipe length maybe be also be calculated from the inside edge of the drainage manhole by using pit connections points enabled in the [Drainage Network Editor](#) on the Global Tab.

Grade

The pipe grade is calculated from the length and invert properties discussed above. This grade is displayed on the section view (Toggle->Grades) when the drainage string is profiled. It is shown as % or 1 in via

Section View Menu View => Settings =>Grade annot

Please continue to the next section [Networks and Junctions](#).

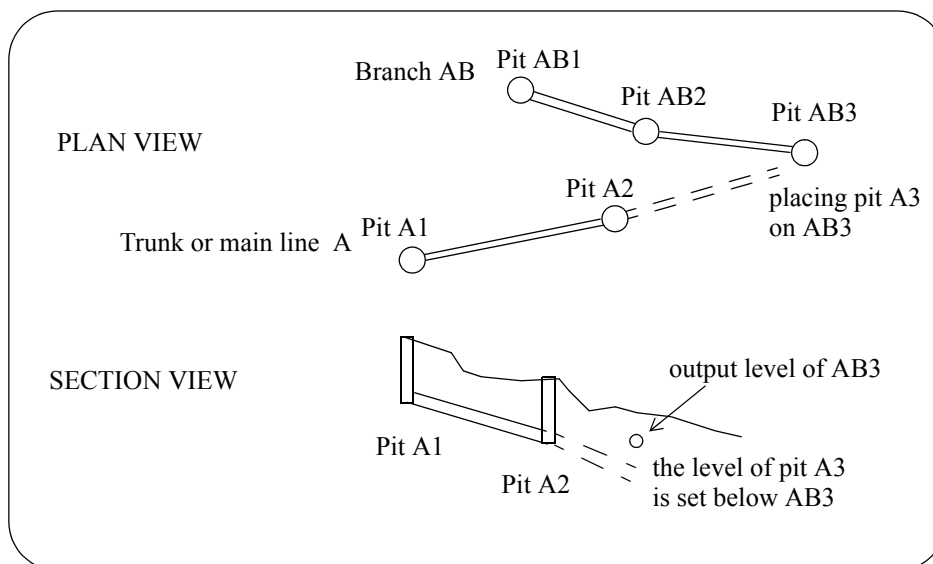

Networks and Junctions

In **12d** Model, a **drainage network** consists of one or more drainage strings in the *same* model. Consequently, all the drainage strings in the same model are considered to be part of the same drainage network. It is suggested that **all** drainage strings in a network be entered with the same flow direction.

If two drainage strings from the same model have a manhole at exactly the same (x,y) location, then **12d** Model assumes that the co-incident manholes **are** the same manhole and that the situation represents a **junction**. Most junction manholes are at the ends of the drainage strings. A junction may have a maximum of one manhole that is not at the end of the drainage string.

When water flows into a drainage string (from a branch drainage string) it is referred to as a trunk line. A trunk line may be a branch for another downstream trunk line.

Also for a network, if all the drainage strings are entered with the flow direction in ascending chainage, not only can minimum cover and minimum grade be maintained as manholes are appended, but if the branches are laid down before the trunk, then as you connect each branch to the trunk, the invert level for the trunk will be set to below the invert level of the branch line (less the default drop for the manholes). In all cases the invert levels for the entire network be recalculated using the [Drainage Network Editor](#).

Please continue to the next section [Drainage Definitions - Manholes and Pipes](#).

Drainage Definitions - Manholes and Pipes

A file of pipe and manhole (maintenance hole) definitions is used to create pipe and manhole (maintenance hole) types to allow tailoring for a particular project. The manhole or pipe type is one method to set many of the objects properties such as inlet capacity, thickness and roughness along with the objects user defined attributes.

When 12d Model starts up, it checks to see if an environment variable called DRAINAGE_4D exists and if it does, then the file it points to is used to provide the available types of manholes (maintenance holes) and pits.

If the environment variable is not set, then 12d Model searches for a file called **drainage.4d** in the standard 12d Model search sequence for set up files.

The drainage definitions file format is an ascii format and consists of one or more pipe and manhole definitions. Each definition in the file begins with the key word **Pipe** or **Manhole**, followed by the pipe or manhole type and then curly braces { }. The order that the definitions appear in the file determines the order they appear in the drop down lists inside 12d Model.

IMPORTANT: the file is only read when 12d Model starts up. When the file is changed while, 12d Model is running, you must restart 12d Model for the changes to become active. If any syntax errors have been made editing the file, the line number will be displayed in the output window. The error generally slightly above this line. The most common errors are missing curly braces { } and forgetting quotes around entries containing spaces

A minimal example of a drainage definitions file is:

```
// -----  
// drainage.4d                1/6/96  
// Used to define the types of Pipes and Manholes  
// -----  
Pipe "PVC" {  
}  
  
Pipe "VC" {  
}  
Pipe "PVC Extra Heavy" {  
}  
Pipe "Plastic" {  
}  
  
Manhole "CONC COVER" {  
}  
Manhole "Gatic" {  
}  
Manhole "Rubber" {  
}
```

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes "".
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored
4. Duplicate definitions are not allowed.

Please continue to the next section [Drainage Definitions - Manhole Types](#).

Drainage Definitions - Manhole Types

Manhole types may be used to set the following manhole properties via the DNE.

- s manhole diameter, length/width and thickness
- s manhole description, notes, group, ku/kw method, ku/kw values, rational engine design freeboard,
- s manhole level modes for cover level, grate level, survey setout level and sump levels,
- s survey setout xy modes and road chainage modes
- s user defined manhole attributes

Each definition (manhole block) in the file begins with the key word **Manhole**, followed by the manhole type and then curly braces { }. The order that the definitions appear in the file determines the order they appear in the drop down lists inside **12d Model**.

The minimum requirement for a pit type definition is

```
Manhole "type name" {
}
```

The type name must be unique and the braces {} cannot be () or [].

Optional manhole commands may be placed inside the braces. These commands include may include [Manhole Editor Commands](#), [Manhole Drainage Network Editor Commands](#) and Manhole Calculation Commands.

Manhole Editor Commands

These optional commands change the properties of the manhole objects. Changes to these commands will be used in creating new drainage strings and the [Drainage Network Editor](#) will prompt you to update the object if these settings are different to the strings current settings. A list of these commands follows

```
mhdiam x.x      set the manhole as circular (internal diameter in base units)
mhsize x.x y.y  set the manhole as rectangular (over rides mhdiam) length and width in base units
mhthickness {
  diam_thickness x.xxx a.aaa b.bbb c.ccc d.ddd
}
x.xxx          nominal diameter choices will appear in the DNE->Pipe->Diameter drop down
a.aaa          optional front thickness (base units) 0.000 if omitted
b.bbb          optional back thickness (base units) front thickness if omitted
c.ccc          optional left thickness in direction of chainage (base units) front thickness if
omitted
d.ddd          optional right thickness in direction of chainage (base units) front thickness if
omitted
```

Manhole Level Modes

There are several modes that may be used to calculate x,y, and z values for the manholes. A description of each follows.

FS tin the manhole centre x,y location is used to obtain the level from the drainage finished

	surface tin
NS tin	the manhole centre x,y location is used to obtain the level from the drainage natural surface tin
Setout string	the manhole centre x,y location is dropped perpendicular onto the setout string. The x,y or z value is then obtained from this string. If this string is missing then the pit x,y location or finished surface tin level is used instead.
Centre string	the manhole centre x,y location is dropped perpendicular onto the road centre string and the chainage value is obtained. If this string is missing an problem message will be created in the output window.
Sz + Setout string	the manhole centre x,y location is dropped perpendicular onto the setout string. The Sz value for the manhole is then added to the z value obtained from this string. If this string is missing the Sz value is added to the finished surface tin level at the pit centre x,y location.
Manual	the x,y,z or chainage value is manually entered by the user.
Cover RL	the z level is set the the Cover RL level (after it has been recalculated).
Max Obvert	The maximum obvert level from off the conduits connected to this manhole is used.
Floating sump	the manhole sump level is set to the lowest invert of all the conduits connected to this manhole + the sump offset

Manhole Drainage Network Editor Commands

These optional commands store user defined data on the manholes or change the calculation modes available in the [Drainage Network Editor](#). The set pit details button in the editor will recalculate these for all manholes in the network. A list of these commands follows

mhdesc "description"	creates a pit text attribute "pit type description" and is used in the drainage pit schedule report.
mhnotes "note"	creates a pit text attribute "pit type remarks" and is used in the drainage pit schedule report.
mhgroup "group"	routines that select manholes will select from a manhole belonging to the same group
attribute_integer "attribute name1" x	x is an integer value (no decimal, stored exactly by computers
attribute_real "attribute name2" x.xxx	x is a real value (used to store numbers with decimals or very large or very small numbers
attribute_text "attribute name3" "text"	text is a series of words or numbers not intended for calculations

Note: If a non-special attribute name is set for some, but not all manhole types, that attribute will be deleted on all manholes with types where the attribute is not defined.

The following special attribute commands create/modify an attribute as described above but these attributes also control calculations performed by the set pit details button on the [Drainage Network Editor](#). The DNE fields will be locked when these attributes are defined for the selected pit type. If these attribute are not defined for the selected pit type the DNE field will not be locked and remain unchanged.

attribute_integer	"cover rl mode" x	DNE field ->Pit=>Main=>Cover RL mode
	Mode	x
	FS tin	0
	Setout string	1
	Manual	2
	NS tin	3
	Max Obvert	4
	Sz + setout string	8
attribute_integer	"grate rl mode" x	DNE field ->Pit=>Main=>Grate RL mode
	Mode	x
	FS tin	0
	Setout string	1
	Manual	2
	NS tin	3
	Max Obvert	4
	Cover RL	7
	Sz + setout string	8
attribute_real	"sump offset" x.xx if sump RL mode is floating then this is the offset (negative down) from the lowest pipe invert <base units>	DNE field ->Pit=>Main=>Sump offset
attribute_integer	"ku method"	DNE field is Pit=>Main=>Ku method
	Mode x Description	
	Direct 0	user enters the ku value stored as pit real attribute "ku"
	Ku,Kw - Missouri/Hare Charts	
	1	ku calculated during analysis
	Ku,Kw>0 - Missouri/Hare Charts	
	2	ku calculated during analysis (ku < 0.0 changed to 0.0)
	Ku - Culvert Inlet - Generic (101 or 201)	
	3	Culvert analysis using inlet control and backwater control (entrance and exit losses automatically set)
	Remaining xxx	Culvert analysis - use numbers from DNE drop down list
attribute_real	"ku" x.xx x.xx is used to calculate pit upstream hgl when ku method is Direct	DNE field is Pit=>Main=>Ku
attribute_real	"kw" x.xx x.xx is used to calculate pit hgl when ku method is Direct	DNE field is Pit=>Main=>Kw
attribute_integer	"setout xy mode" x	DNE field is Pit=>Setout=>Setout xy mode
	Mode	x
	FS tin	0
	Setout string	1
	Manual	2
	attribute_integer "setout z mode" x	DNE field is Pit=>Setout=>Setout z mode
	Mode	x
	FS tin	0
	Setout string	1
	Manual	2
	NS tin	3
	Max Obvert	4
	Cover RL	7
	Sz + setout string	8
attribute_integer	"road chainage mode"	DNE field is Pit=>Setout=>Chainage mode
	Mode	x
	No Road	0
	Centre string	1
	Manual	2

attribute_real	"setout adjustment"	DNE field is Pit=>Setout=>Sxy
attribute_real	"setout adjustment z"	DNE field is Pit=>Setout=>Sz
attribute_real	"design freeboard" at US pit	DNE field is Pipe=>Design=>Freeboard limit

The following example of a channel ip point is given below. The setout modes are set, the cover and grate level modes are set and the ku (losses) are set. Finally, the inlet capacity is set to an on-grade pit with 200% inlet capacity so that even in a major storm with a choke factor of 0.5 it will still have 100% inlet capacity.

```
Manhole "CHNL auto" {  
  
    mhdesc "channel hip-vip"  
    attribute_text "lplot description1" "OPEN CHANNEL"  
  
    mhsize 0.0  
    mhdiam 0.0  
    attribute_integer "setout xy mode"      0 // centre of the channel  
    attribute_integer "setout z mode"      6 // sump invert is the bottom of the channel  
    attribute_integer "cover rl mode"      4 // max obvert - top of the channel  
    attribute_integer "grate rl mode"      4 // max obvert - top of the channel  
    attribute_integer "ku method"          0 // direct  
    attribute_real "ku"                    0.0 // zero unless interested in bend losses  
  
    cap_config G  
  
    cap_percent 200 // if a choke factor of 0.5 is applied then it will still have 100% inlet capacity  
}  
  
// attribute_real "design freeboard"      Pipe=>Design=>Freeboard limit at US pit
```

Manhole Drainage Analysis Inlet Capacity Commands

Manhole inlet configuration and bypass pit entries determine if these inlet capacity commands are used. Both may be set in the [Drainage Network Editor](#).

cap_config

The inlet configuration may be set via the following command

cap_config	x	x
	Mode	
	Manhole	m
	Ongrade	g
	Sag	s

Inlet Configuration = manhole - no water will enter the pit through the grate. Commands not used.

Inlet configuration = on grade or sag

Bypass pit not set - 100% of the approach flow will enter the pit. Commands not used.

Bypass pit is entered. The following commands define the stormwater inlet capacity characteristics.

Inlet Capacity Equation

The inlet capacity equation is built up with optional components (**single polynomial + curve polynomial + curve coordinates**). Generally, only one of the components is used for each manhole type but they may all be used if desired.

inlet capacity = inlet efficiency * inlet multiplier *
[**single polynomial + curve multiplier (curve polynomial + curve coordinates)**]

An inlet efficiency (choke factor) is specified in the [Drainage Network Editor](#). An inlet efficiency (choke factor) of 0 would stop all water from entering the inlet.

The inlet multiplier is specified with a cap_multi parameter.

Multipliers

cap_multi x.x inside a cap_curve_grade block or cap_curve_sag block, the curve inlet capacity is multiplied by this value
outside a cap_curve_grade or cap_curve_sag, the total inlet capacity is multiplied by this value

Single Polynomial

The inlet capacity for an inlet may be specified by a single polynomial equation based on the approach flow. This is the most simplistic method and generally used for percentage capture or fixed capture rates.

$$\begin{aligned}\text{inlet capacity} = & \text{cap_fixed} \\ & + \text{cap_percent} * 0.01 * Q_a \\ & + \text{cap_coeff} * Q_a^{\text{cap_power}}\end{aligned}$$

Example

This example creates an inlet with a fixed inlet capacity of 0.010 (cms or cfs).

```
Manhole "fixed inlet capacity" {  
    cap_fixed 0.010  
}
```

Default values

```
cap_multi  = 1.0  
cap_fixed  = 0.0  
cap_percent = 0.0  
cap_coeff  = 0.0  
cap_power  = 1.0
```

Curve Polynomial

For on-grade inlets, the polynomial parameters may change with road grade and cross fall threshold values. The formula is the same for cap_fixed, cap_percent, cap_coef and cap_power. Note that each curve may have its own curve multiplier specified with a cap_multi parameter (discussed below). Some hydraulic model tests have their on grade inlet results converted to polynomial equations.

Example

This example creates an inlet where the inlet capacity polynomials have been determined for 2 road grades (1% and 3%). Note that the road_grade 0.0 command is used for the 1% road grade. Since this is the flattest road grade curve we have calculated we will start using it at a road grade of 0%.

Note that the second curve "NJ G3" will be used when the road grade reaches 2.5. The threshold value where 12d should change to the next curve is generally slight less than the road grade from the source.

```

Manhole "On grade pit type NJ" {
    cap_config G

    cap_curve_grade "NJ 1G" {
        road_grade 0
        cap_coeff 0.215
        cap_power 0.67
    }

    cap_curve_grade "NJ 3G" {
        road_grade 2.5
        cap_coeff 0.24
        cap_power 0.673
    }
}

```

Curve Coordinates (On grade and SAG)

For on-grade and sag inlets, the inlet capacity may be determined by entering coordinates along the inlet capacity curve. These coordinates are usually obtained from hydraulic model studies or analytical methods such as HEC-22.

For on grade inlets, the coordinates are Qapproach and Qin, and the curves may change with road grade and cross fall threshold values. The inlet capacity curves are never extrapolated.

Example

```

Manhole "Ongrade coordinates" {
    cap_config G
    cap_curve_grade "0.5G" {
        road_grade 0
        coord 0.000 0.000
        coord 0.060 0.060
        coord 0.140 0.112
        coord 0.260 0.174
        coord 0.430 0.244
        coord 0.500 0.270
    }
    cap_curve_grade "1G" {
        road_grade 0.75
        coord 0.000 0.000
        coord 0.060 0.060
        coord 0.140 0.108
        coord 0.260 0.164
        coord 0.430 0.227
        coord 0.500 0.248
    }
}

```

For sag inlets, the coordinates are Depth (base units) and Qin, and there is only one curve. Each curve has a curve multiplier specified with a cap_multi parameter (discussed below).

Example

```
Manhole "SAG coordinates" {
    cap_config S
    cap_curve_sag "SAG" {
        coord 0.000 0.040
        coord 0.045 0.101
        coord 0.070 0.151
        coord 0.095 0.245
        coord 0.120 0.302
        coord 0.170 0.347
        coord 0.220 0.371
        coord 0.270 0.391
    }
}
```

Polynomial Inlet Capacity Commands

The following commands are used to set the parameters in the following polynomial equation

inlet capacity =			cap_fixed
			+ cap_percent*0.01*Qa
			+ cap_coeff*Qa^cap_power
cap_fixed	x.x	cms or cfs	
cap_percent	x.x	percentage (0 to 100)	
cap_coeff	x.x	multiplier	
cap_power	x.x	exponent	

Inlet Curve Block Commands

Inlet curve blocks may be specified for both on-grade or sag inlets. Inside the curve block you may include the [Polynomial Inlet Capacity Commands](#) and [Coordinate Inlet Capacity Commands](#).

```
cap_curve_grade "unique name for the pit type" {
    road_grade x.xx
    road_xfall x.xx
}
```

Inside the cap_curve_grade block the road grade and road crossfal threshold values (percent) may be set. The road grade and crossfall are calculated by the [Drainage Network Editor](#). When the 12d analysis engine selects the inlet curve, all curves with the same road_xfall are grouped together and then within the crossfall group the road_grade curves is selected. The inlet curve with the maximum grade threshold that is less than or equal to the road grade is selected.

- Rules for 'cap_curve_grade' entries:
- Only applicable to on-grade pits.
 - All cap_curve_grade names must be unique within a Manhole block
 - If both 'road_grade' and 'road_xfall' entries are omitted, only one cap_curve_grade entry is allowed within a pit.
 - The cap_curve_grade 'coord' entries (if used) must be in order of increasing Qa.

```
cap_curve_sag "unique name for the pit type" {
}
```

Rules for 'cap_curve_sag' entries:

Only applicable to sag pits.

Only one cap_curve_sag entry is allowed within a pit, and it must have a valid name.

Coordinate Inlet Capacity Commands

The coord command must be used inside the cap_curve_grade or cap_curve_sag grouping

coord x.xx y.yy

x.xx must be in increasing order.

For cap_curve_grade group, the coord command has the parameters Qapproach and Qin

For cap_curve_sag group, the coord command has the parameters Depth and Qin

Please continue to the next section [Drainage Definitions - Pipe Types](#).

Drainage Definitions - Pipe Types

Pipe types may be used to set the following pipe properties via the DNE.

- s pipe nominal/actual diameters and thickness
- s roughness method and value
- s rational method design mode and design percent depth
- s minimum pipe height for the rational design engine
- s user defined pipe attributes

Each definition (pipe block) in the file begins with the key word **Pipe**, followed by the pipe type and then curly braces { }. The order that the definitions appear in the file determines the order they appear in the drop down lists inside **12d Model**.

The minimum requirement for a pipe type definition is

```
Pipe "name" {
}
```

The name must be unique and the braces {} cannot be () or [].

Example:

```
Pipe "CHNL GRASS PROPOSED" { //Open Channel created below the tin. cover set in cover
file to 0.0
```

```
roughness_n 0.040
```

```
attribute_integer "design size mode" 3 // open channel mode
```

```
}
```

Pipe Drainage Network Editor Commands

Pipe Thickness

```
pipethickness {
    diam_thickness x.xxx y.yyy a.aaa b.bbb c.ccc d.ddd
}
```

x.xxx nominal diameter choices will appear in the DNE->Pipe->Diameter drop down
y.yyy internal diameter (base units) will be entered into the DNE->Pipe->Diameter
field

a.aaa optional top thickness (base units) 0.000 if omitted

b.bbb optional bottom thickness (base units) top thickness if omitted

c.ccc optional left thickness in direction of chainage (base units) top thickness if

Defaults

Position of menu: Design =>Drainage-Sewer =>Defaults

The **defaults** menu sets default tin, manhole (maintenance hole) information, drainage pipe information, property control (sewer module only) and house connection (sewer module only) defaults which are all used when defining drainage networks.

The **Defaults** walk-right menu is

For the option *Tins (fs)*, please continue to the section [Tin \(fs\)](#).

Manholes, please continue to the section [Manholes \(Maintenance Holes\)](#).

Pipes, please continue to the section [Pipes](#).

Property controls, please continue to the section [Property Controls](#).

House connections, please continue to the chapter [House Connections](#).

Tin (fs)

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Tin (fs)

On selecting the **Tin (fs)** option, the **Drainage Tin Defaults** panel is displayed.

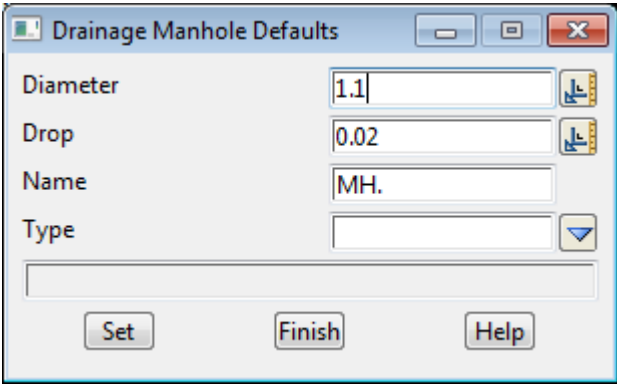

This panel is for setting the default finished surface tin in the **Create Drainage Strings** panel which is used for creating a new drainage string.

For the drainage string, the finished surface tin is used as the surface that manholes automatically sit on when z float is set on, and for defining cover when placing controls and connections.

Manholes (Maintenance Holes)

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Manholes

On selecting the **Manholes** option, the **Drainage Manhole Defaults** panel is displayed.

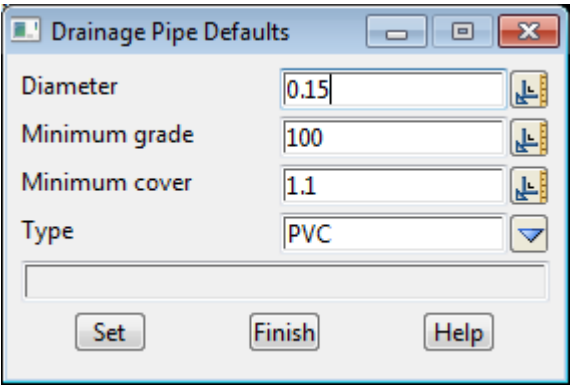

These defaults are used when creating a manhole in a drainage string. The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter <i>default diameter of a drainage manhole</i>	input	1.1	
Drop <i>drop (metres) through the manhole</i>	input	0.02	
Name <i>default name for the manhole Note that if a manhole name is EOL or eol, then the diameter of the manhole is forced to be zero.</i>	input	MH.	
Type <i>the default cover or lid type of the manholes</i>	input	CONC COVER	CONC COVER, GATIC
Set <i>set the drainage manhole defaults to the values in the above fields.</i>	button		

Pipes

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Pipes
On selecting the Pipes option, the **Drainage Pipes Defaults** panel is displayed.

This panel is for setting the default drainage pipe diameter, grade, cover and type. These defaults are used when creating a pipe in a drainage string.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter <i>default diameter of the pipe.</i>	input	0.1	
Minimum grade <i>the minimum grade (measured as 1: value) used when laying down the pipe.</i>	input	1.0	
Minimum cover <i>the minimum cover, measured in world units from the surface to the top of the pipe (obvert); used when laying down the pipe.</i>	input	1.0	
Type <i>the default type of the pipe</i>	input	PVC	PVC, VC, PVC X/HEAVY
Set <i>set the drainage pipe defaults to the values in the above fields.</i>	button		

IMPORTANT NOTE.

If the drainage string is laid down in the direction of flow (and hence the flow direction is in ascending chainage), then the minimum grade and minimum cover along the pipe are maintained as the drainage string is created. Otherwise the minimum grade and cover cannot be maintained.

Cover for the pipe segment can also be calculated and/or set afterwards by the **pipe=>cover** option in the drainage string editor.

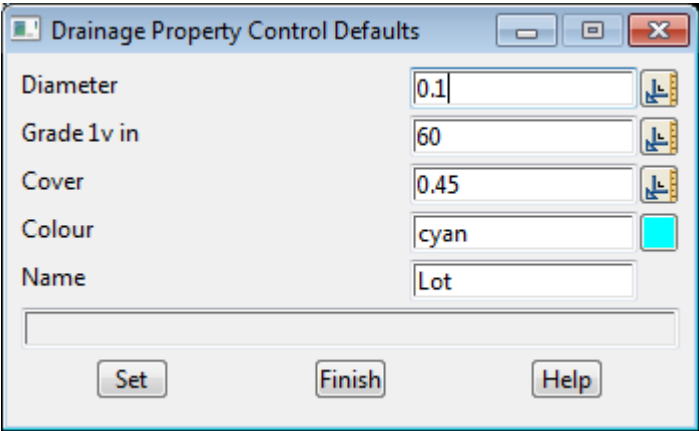

Minimum cover and minimum grade for the pipe segment to the end of the line can be set afterwards by the **pipe=>default grading** option in the drainage string editor.

Property Controls

Position of option on menu: Design =>Drainage-Sewer =>Defaults =>Property Controls

On selecting the **Property controls** option, the **Drainage Property Control Defaults** panel is displayed.

On a section view, the *Profile =>One substring* and *Profile =>Many substrings* options will profile the property control. Note that the centre (axis) of the property control is drawn on the section view, not the invert (bottom) or the obvert (top).

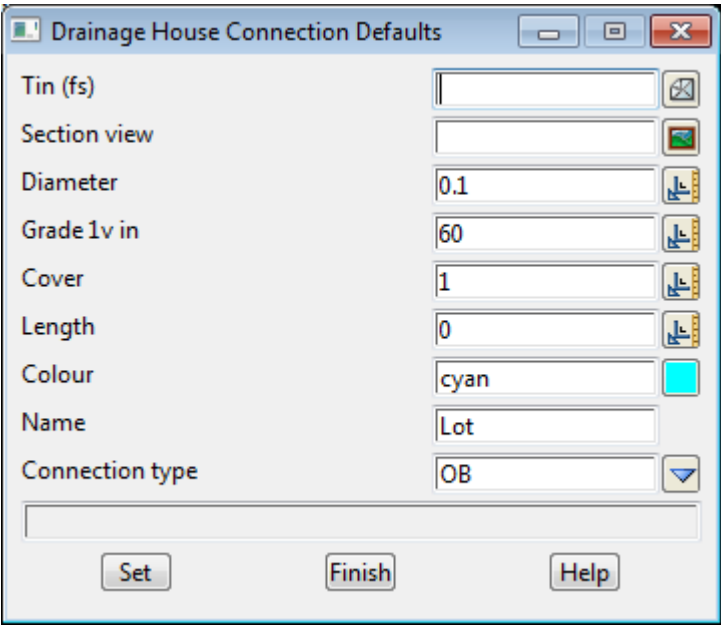

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Diameter <i>default diameter of the property control.</i>	input	0.1	
Grade 1v in <i>grade (units are "1v in" given value) to use for the property control</i>	input	60	
Cover <i>cover measured from the surface to the top of the property control (world units) to be maintained from the end of the property control in the house block to the drainage string.</i>	input	1.0	
Colour <i>colour to use to draw the property control</i>	input	cyan	available colours
Name <i>name for the property control - usually the lot number</i>	input	Lot	
Set <i>set the property control defaults to the values in the above fields.</i>	button		

House Connections

Position of option on menu: Design ==>Drainage-Sewer ==>Defaults ==>House connections

On selecting the **House connections** option, the **Drainage House Connection Defaults** panel is displayed.

This panel is for setting the default information used for connections from the drainage pipe to the house blocks.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin (fs) <i>name of the tin to automatically add to the section view used for drawing the profile along the house connection.</i>	input	drainage tin	available tins
Section view <i>the section view used to profile along the house connections as they are placed in plan view.</i>	input		
Diameter <i>default diameter of the house connection.</i>	input	0.1	
Grade 1v in <i>grade (units are "1v in") to use for the house connection</i>	input	60	
Cover <i>cover (world units) to use for the house connection</i>	input	1.0	
Length <i>length (metres) to use for some types of house connections</i>	input	2.0	
Colour <i>default colour used for the house connection</i>	input	cyan	available colours
Name <i>name for the house connection - usually the lot number</i>	input	Lot	
Connection type <i>the default type of house connection, Please continue to the section House Connection Types for a description of each connection type</i>	input	A special	A, A special, B, C, OB, Special Jump Up

Set button

set the house connection defaults to the values in the above fields.

House Connection Types

All house connection calculations do not take into account any thickness of pipe, joint sizes or actual entry points into the sewer. Hence they are **approximate only** and should only ever be used as a guide. Any quantities calculations should allow for a suitable margin of error.

House Connection -Type A

House Connection: Type A

House Connection - Type A Special

House Connection: Type A Special

House Connection - Type B

House Connection: Type B

House Connection - Type C

House Connection: Type C

House Connection - Type Special Jump Up

House Connection: Type Special Jump Up

House Connection - Type OB (Oblique)

House Connection: Type OB

Please continue to the next section [Create](#).

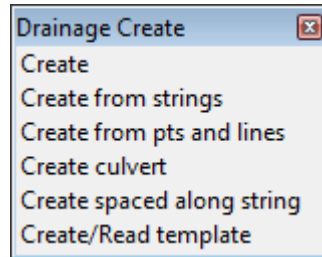

Drainage Create

Position of menu: Design =>Drainage-Sewer =>Create

The Create menu has various options for creating drainage and sewer strings.

The Drainage Create walk-right menu is

For *Create* please go to the section [Create](#)

Create from strings [Create from strings](#)

Create from pts and lines [Create from Points and Lines](#)

Create culvert

Create spaced along string [Create Drainage Spaced Along String](#)

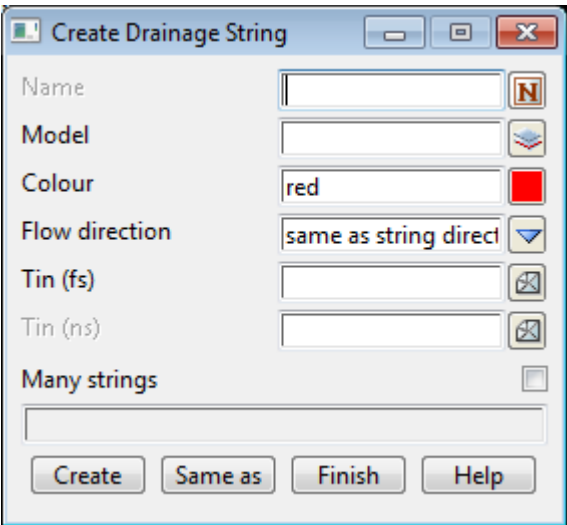

Create/Read template [Create/Read Template](#)

Create

Position of option on menu: Design =>Drainage-Sewer =>Create => Create

The **Create** option is used to produce **new** drainage strings and networks. If a drainage string already exists, the **Editor** option is used to modify it.

On selecting the **Create** option, the **Create Drainage String** panel is displayed.

To create a new drainage string, the name, colour, model and style of the new string are entered into the appropriate fields, plus the finished surface triangulation that the manholes are normally flush with, the natural surface triangulation, and the **Create** button selected.

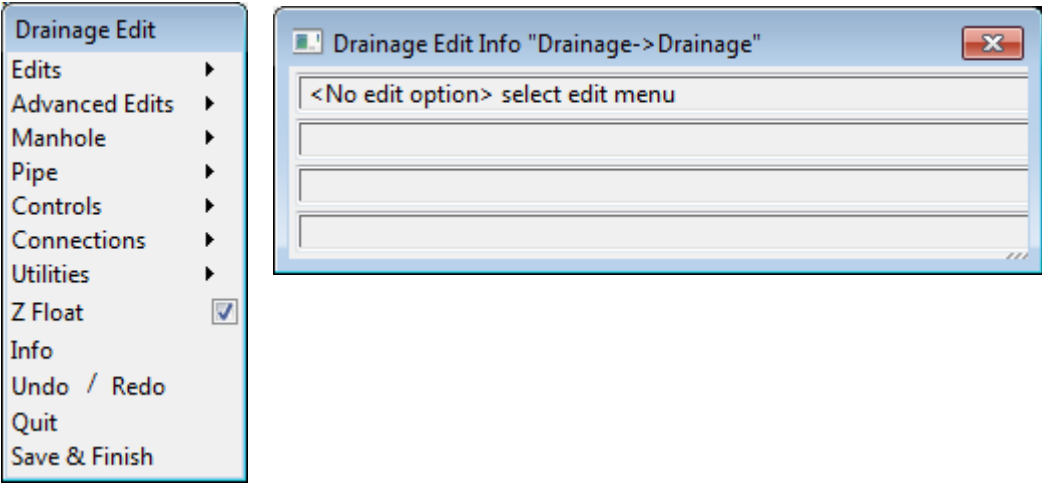

The new fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Flow direction	input	ascending chainage	ascending chainage descending chainage
<i>if ascending chainage, then the flow direction is in ascending chainage (recommended) if descending chainage, then the flow direction is in descending chainage.</i>			
Tin (fs)	input	drainage=>defaults=>tinavailable tins	
<i>the finished surface tin. If manholes are "floating", the top of the manhole is automatically place on the tin surface ("floated" on the surface).</i>			
Tin (ns)	input		available tins
<i>the natural surface tin used in longsection plots.</i>			

The **Create Drainage String** panel is then removed and the **Drainage Edit** menu and **Drainage Edit Info** panel fired up.

As for a 3d string, to create a new drainage string with some of the **same** name, colour, model and style as an existing string (not necessarily a drainage), the **Same as** button is chosen and the appropriate string selected.

The **Drainage Edit** menu contains all the available options for editing a drainage string and its associated block controls and house connections. The **Drainage Edit Info** panel contains information areas. The **Drainage Edit** menu and **Drainage Edit Info** panel are

To create a new drainage string, the user selects the **Append** option from the **Edits** walk right menu on the **Drainage Edit** menu.

Since the **Drainage Edit** menu and **Drainage Edit Info** panel are the same as those used when editing a drainage string, the options will be discussed under the drainage **Edit** option.

For documentation on editing Drainage string, please continue to the next section [String Editor](#).
For drainage utilities and import/export see [More Drainage](#)

Create from strings

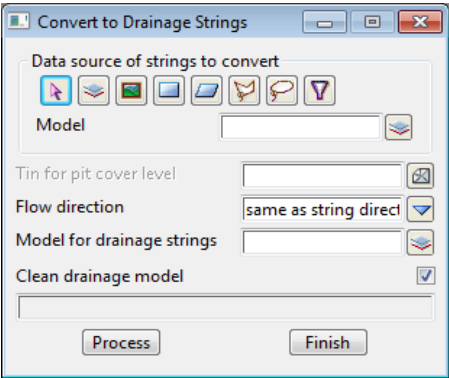

Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create from strings**

12d will convert the super strings into 12d drainage strings. The default pipe, pit and tin data will be used to set the levels for the network. Do not use the other string convert commands found on the menu system.

See Also

[Drainage overview](#)

On selecting the **Create from strings** option, the **Convert to Drainage Strings** panel is displayed.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>data source for strings to be converted</i>	source box	model	
Model for drainage strings	model box		<i>The new drainage strings will be added to this model. If it does not exist it will be created.</i>
Tin for pit cover level	tin box		<i>The new drainage manhole cover level will be set to the tin level at the manhole centre (optional)</i>
Flow direction same as string direction <i>if the strings have been drawn in the direction of water flow</i> opposite to string direction <i>if the strings are drawn opposite to the direction of flow.</i>	choice box	same as string direction	
Clean drainage model	tick box		<i>When selected, all strings in the model will be deleted before creating the new strings.</i>
Process <i>Converts the strings to the drainage strings.</i>		button	
Finish <i>Removes the panel from the screen.</i>		button	

Important notes:

The imported strings must all be drawn in the same direction. Either all in the direction the water flows or all opposite the direction of flow.

Pits are created at all vertices on the strings.

Trunk lines must have a vertex where the branch lines join.

String names can be used to control the order in when the drainage lines are numbered. These names will be transferred to the 12d drainage strings. Later, the string names can be changed in the [Drainage Network Editor](#).

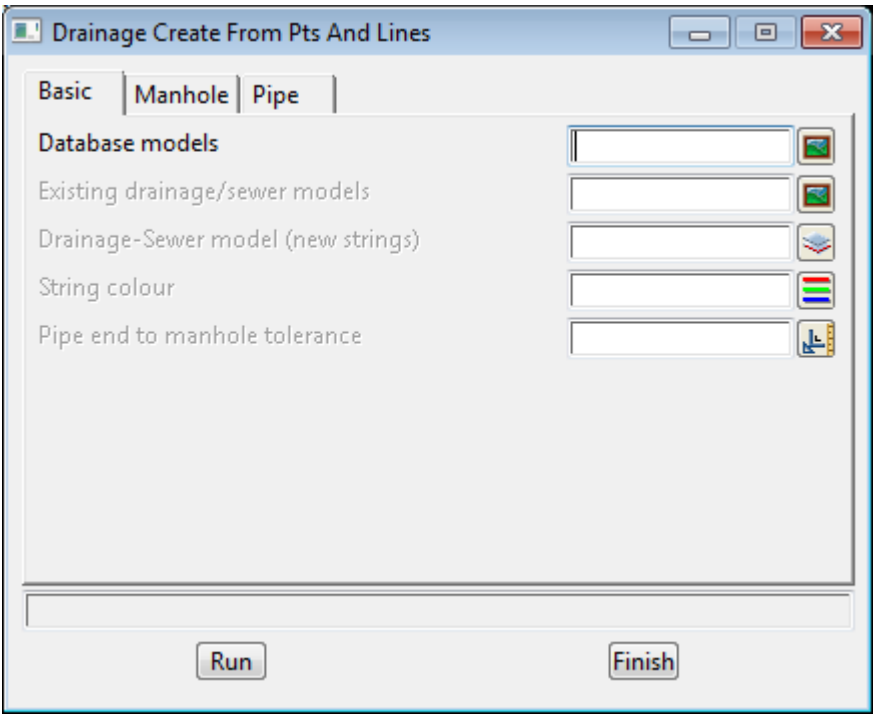

Pits can always be renamed in 12d after the import is complete.

The drainage lines must have string names to use the [Set Pit Names](#) feature on the [network editor](#).

Create from Points and Lines

Drainage_Create_From_Pts_And_Lines Position of option on menu: **Design =>Drainage-Sewer=>Create=>Create from pts and lines**

This section of documentation is a work in progress and will be updated in subsequent releases.
Selecting the **Create from pts and lines** brings up the **Drainage Create From Pts and Lines** panel:

Create Drainage Spaced Along String

Position of option on menu: **Design =>Drainage-Sewer =>Create =>Create spaced along string**

This option creates Drainage strings (pipes or channels) with “pits” variably spaced along selected design strings (which must have valid and variable z values). The user picks the design string at the downstream extent of the desired Drainage string, and the option works its way upstream (*i.e.* in increasing z direction) to a high point on the design string, at which point the full extent of the Drainage string is created automatically. The pit spacing may be controlled by the grades measured from the design string at each pit location, or from a default value. The pit cover levels and pipe invert levels are set relative to the levels on the design string.

On selecting the **Create spaced along string** menu option, the **Create Drainage Spaced Along String** panel is displayed.

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage string name	input text		
Name for created Drainage string. If unspecified, string will be created with no name.			
Drainage string colour	input text		available colours
Colour for created Drainage string. If unspecified, string will be created with a default colour.			
Flow direction	choice box	same as	same as string direction
Determines whether created Drainage string flows in, or opposite to, the direction of increasing chainage. Note that for Drainage strings, the terms upstream and downstream refer to the flow direction, not the string direction. Also note that the downstream end of the created Drainage string			
			opposite to string direction

will always be at the point selected on the graded design string.

Pit type choice-box available pit types

Pit type to apply to every created Drainage pit. If unspecified, the pit type will be adopted from the project default value set via Design=>Drainage-Sewer=>Defaults=>Manholes.

Pipe type choice-box available pipe types

Pipe type to apply to every created Drainage pipe. If unspecified, the pipe type will be adopted from the project default value set via Design=>Drainage-Sewer=>Defaults=>Pipes.

Pit cover level offset input real

Vertical distance of pit cover levels from design string (positive up, zero if unspecified). For pipes, this value should typically be zero. For channels, if the picked design string represents the channel invert, this value should be set to the height of the channel; if the picked design string represents the channel obvert, this value should be zero.

Pipe obvert depth input real 0.6

Vertical distance of pipe obverts from pit cover levels (positive down, zero if unspecified). For pipes, this value should typically be set to the required pipe cover limit. For channels, this value should typically be zero.

Diam/Height input real 0.375

Diameter of circular conduits or height of box/vee/trapezoid conduits (in base units).

Width input real

Width of box conduits or bottom width of trapezoid conduits (in base units). Leave blank for circular/vee conduits.

Top width input real

Top width of vee/trapezoid conduits (in base units). Leave blank for circular/box conduits.

Lock cover RLs tick box OFF

If ticked, sets the explicit Cover RL mode to "Manual", on each pit, for subsequent use in the Drainage Network Editor.

Lock grate RLs to cover RLs tick box OFF

If ticked, sets the explicit Grate RL mode to "Cover RL", on each pit, for subsequent use in the Drainage Network Editor.

Lock pipe inverts tick box OFF

If ticked, sets the both the Lock US Invert and Lock DS Invert tick boxes to ticked, on each pipe, for subsequent use in the Drainage Network Editor.

Lock pipe sizes tick box OFF

If ticked, sets the Lock pipe size tick box to ticked, on each pipe, for subsequent use in the Drainage Network Editor.

Default pit spacing input real 50

Pit spacing to apply between pits, if not found in the Grade vs Spacing Lookup Table.

Grade (%) more than input real column

Column of grades in percent. If not already, the Grade vs Spacing Lookup Table will be sorted (internally) in ascending grade order. The grade is measured from the design string at each new pit location, and the matching row is looked up in the table. If the design grade is greater than or equal to the row's grade, but less than the next row's grade, the matching row has been found.

Pit spacing input real column

Column of pit spacings. The pit spacings to apply between each pit and its next upstream pit, corresponding to the grade specified in the Grade vs Spacing Lookup Table.

Model for drainage strings output model box available models

Model in which to add the created Drainage string.

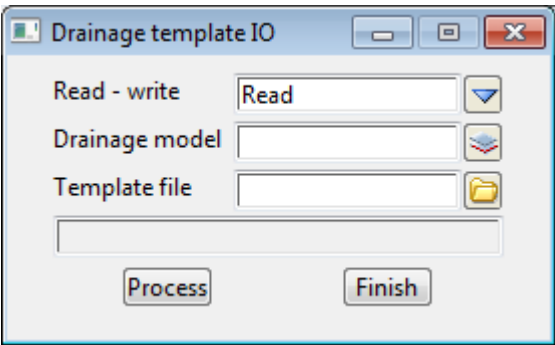

Pick pick button

Starts a string-pick process to select the design string, along which the Drainage string will be created. The coordinates of the selected point on the design string will be adopted as the downstream end of the created Drainage string. Once the point on the design string is accepted, the panel is validated and the Drainage string is created. The string-pick process is then re-started, allowing selection of another design string. Additional information is written to the Output Window, providing feedback to the user.

Create/Read Template

Drainage_template_IOPosition of option on menu: **Design =>Drainage-Sewer=>Create=>Create/Read template**

This section of documentation is a work in progress and will be updated in subsequent releases.
On selecting the **Create/Read template** option, the **Drainage template IO** panel is displayed.

String Editor

Position of option on menu: Design =>Drainage-Sewer =>String editor

This is the same option as **Editor** from the **Strings** walk-right menu on the **12d** Model menu.

The string editor is used to modify any **12d** Model strings. After selecting the **Editor** option, the **Edit String** panel is placed on the screen to record any error messages.

The option is already in the **pick** mode (the **pick & edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited.

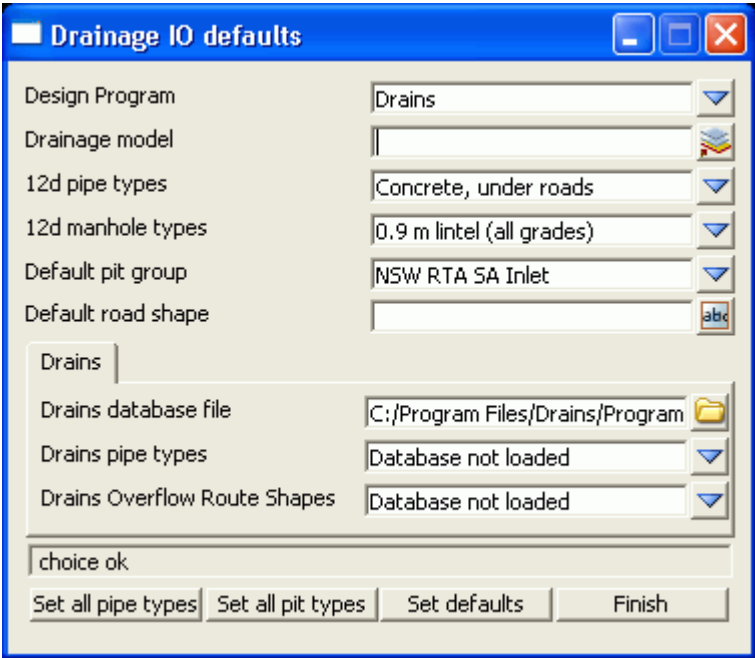

From the picked string's type, the editor is able to determine the edits that apply to the string and list them in the string's **Edit** menu.

If a drainage string is selected, the **Drainage Edit** menu and **Drainage Edit** panel (as shown in the previous section) are placed on the screen.

The individual edit operations for a drainage string will now be discussed in detail.

Please continue to the next section [Drainage Edit](#).

Drainage IO Defaults

Drainage Network Editor

Position of option on menu: Design =>Drainage-Sewer =>Drainage Network=>Drainage network editor

The drainage network editor enables the user to edit all of the drainage strings in a model (a network). The global and default settings may be stored and loaded via. There are five main tabs and plus function buttons on the bottom of the panel.

Using the Drainage [Network Editor](#)

Recommended order to use the tabs and Buttons.

(This is not required but it will lead you through the process in an systematic method.)

<u>Tab</u>	<u>Function Buttons</u>
1. Global tab	3. Set Pit Names
2. Defaults tab	4. Set Catchments
5. Pipe tab	8. Set Pit Details

[Pit Losses Ku, and Direct Flow](#)

[Outlet and Tailwater Conditions](#)

[Pipe Design Parameters](#)

[Bypass Flow Settings](#)

On selecting the Drainage network editor option, the Drainage network editor panel is displayed.

Global Tab

Design values for the hydrology and hydraulics calculations are set either globally (one value for the entire network) or via Defaults for the manholes or pipes. Defaults values may be overridden by explicit settings found on the catchment, pits or pipes tab. Explicit manhole/pipe settings need only be specified if the default value is not desired.ragg

There are 4 sub tabs. See [Main tab](#), [Utility Models tab](#), [Notes tab](#) and [Display tab](#)

Main tab

Universal data Group

Units - Metric or US. Catchment areas in ha/acres and rainfall-infiltration-storage in mm/in

Viscosity - Used with Colebrook-White energy loss calculations

TUFLOW file - with the dynamic drainage analysis and TUFLOW modules this specifies the TUFLOW tcf file to be used for the 2d storm analysis.

Att group (minor) - results from the storm analysis (minor event) may be contained within this pit/pipe attribute group

Att group (major) - results from the storm analysis (major event) may be contained within this pit/pipe attribute group

Use pit connection pts - when not selected, pipes connect at the centre of the manhole. When

selected the pipes connect at the pit connection points. See [Pit Connection Points](#) for more details.

Finished surface tin - used for determining pipe cover and surface levels for the manholes.

Natural surface tin - specified so that it can be included on the drainage longsection plots

Clear attributes - when selected all pit/pipe attributes will be deleted before the Apply/AutoApply saves the data currently in the panel.

Catchment data Group
see [Coefficients of Runoff](#)
For **Global pipe data** see [Pipe Friction Method](#).

Pit Connection Points

Pit Connection points allow the pipes connected to the pit to join at locations other than the inside perimeter of the pit wall. This feature is off by default and may be enabled on the **DNE->Global->Main** tab.

All pits have their connection point initially set to **Points**. This setting is found on the **DNE->Pits->Setout** tab.

Pit Connection Point Modes

Pit connection points may be moved via **Strings->Points Edit->Move** (except for **Centre** mode described below). The other modes constrain the movement of the connection points. If a pipe is manually moved to a new connection point, it will be locked to the connection point and will not move if the pit or neighbouring pit is moved (see exceptions below).

Centre (rectangle and circular) - This mode is the same as having the **Use connection points** turned off. The connection points will be located on the inside perimeter of the pit wall with the centre line of the pipe intersecting the centre of the pit. In this mode the connection points may not be adjusted.

Points (rectangle) - A connection point is created at the mid point of each internal side of the pit. This may be changed for a **Pit type** by using the **con_points** command in the drainage.4d file. In this mode the pipe ends will snap to the connection points. It is possible to place more than one pipe on the same connection point (the elevation of the pipes is not checked for clashes).

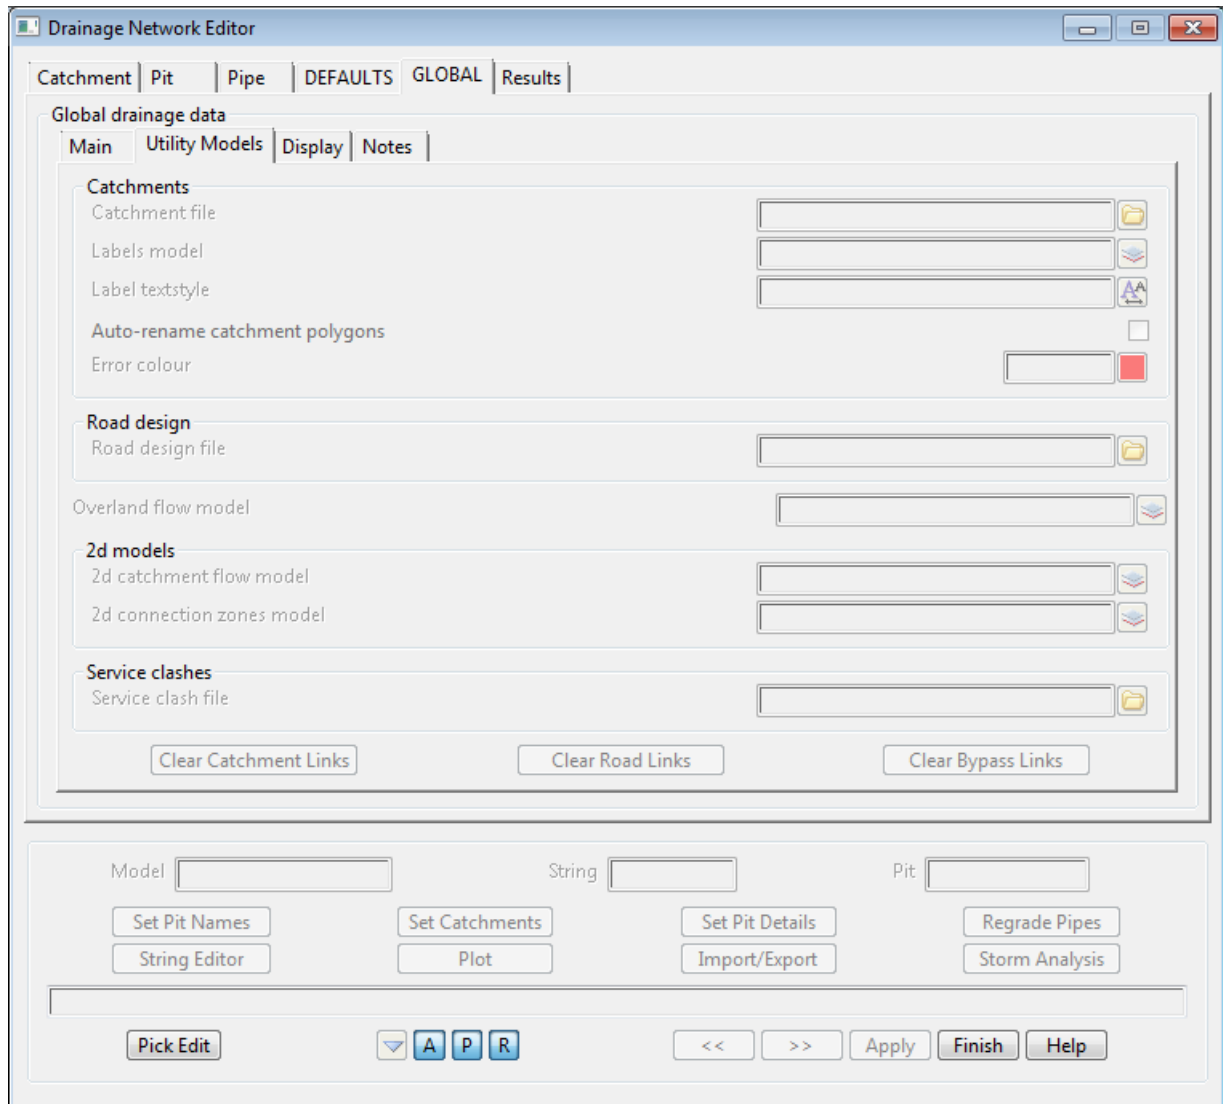

Points (circular) - The connection point may be moved anywhere around the pit internal wall as there are no connection points on the circular pits. Again, it is possible to place more than one pipe on the same connection location (the elevation of the pipes is not checked for clashes).
If the manhole centre is moved the connection point locks are removed.

Perimeter (rectangular and circular) - Same as **Points** (circular) above.

Unrestricted (rectangular and circular) - There are no constraints on the location of the pit connection points. This mode is intended for irregular shapes such as GPT structures and stormwater basins.

Utility Models tab

The utility models tab is used to specify the following data:

Catchment polygons, the catchment slope strings, catchment labelling data

Bypass flow strings

Road setout strings., road centre line strings and crossfall/grade offsets

Service/utility models and the allowable clearances

The pit tab has the explicit settings for the values entered on the Defaults catchment tab. When these fields are blank the default value is used. Three catchment sets are available. Typically the user will use one set for different types of catchment areas. For example: Set 1-Road area, Set 2-Lots, Set 3-Parks.

All 3 sets use the same default values except the percent impervious which has a separate default for each set.

Set Catchments

This selection links the catchment strings to the manholes and recalculates the areas. For SAG pits the catchments strings from all 3 sets are draped onto the design surface to locate the lowest overflow point. This level is used for the ponding depth. Information messages are written to the output window during this process.

See [Set Catchments](#)

Regrade Network

This option resets the pipe invert levels using the [pipe design parameters](#). Information, warning and problem messages will be displayed in the output window. These messages will include pipe cover warnings, service crossing data and invert alignment messages. The user may place too many restraints using the regrade options results in no feasible solutions to the grading. These messages will also be shown.

Set Pit Details

This option resets the following manhole values: cover level. If activated the following are also

set: road design string, setout x,y and z, road centre line chainage and offset, the manhole symbol rotation, the road grade and crossfall, the bypass pit,

Plot

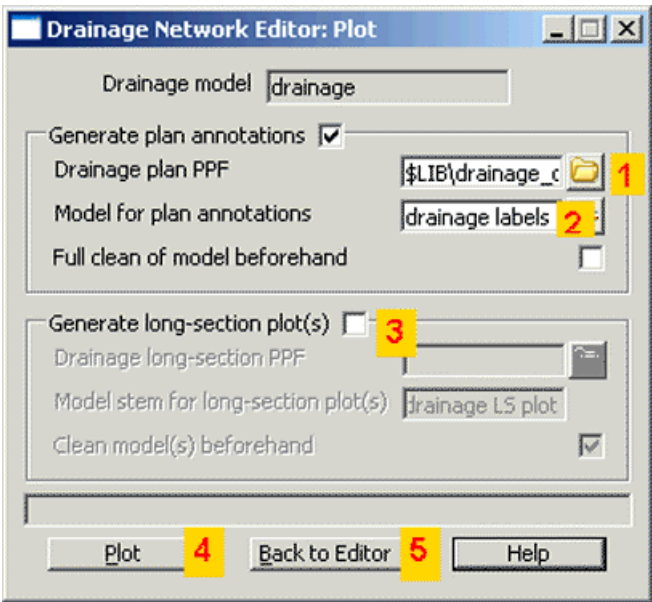

This plotting option will create a drainage plan and/or long section using the ppf files entered. The ppf editors can be launched from this panel by selecting the More Information folder icon beside the ppf field.

Set Pit Names

Tin for pit cover level tin box

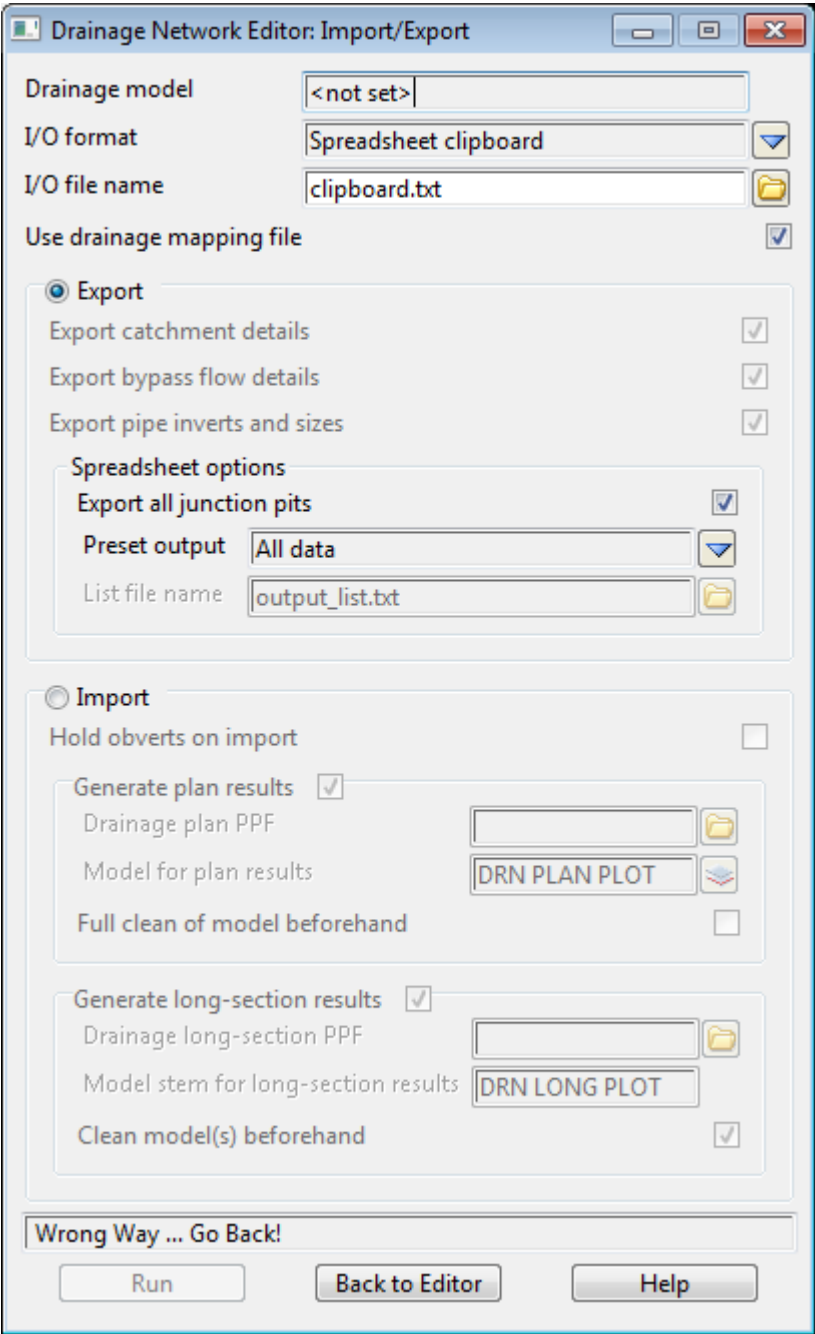

The new drainage manhole cover level will be set to the tin level at the manhole centre (optional)

Drainage Edit

On picking a drainage string when in the string **Editor** option, or by selecting **Create** in the **Create Drainage String** panel, the **Drainage Edit** menu and panel are placed on the screen.

The edit is **cancelled** by selecting the **Quit**. No changes to the string are recorded and the **Drainage Edit** option terminates.

The edit is **finished** and the changes recorded when the **Finish** is chosen. The **Drainage Edit** option then terminates.

When either button is selected, a **Yes-No-Cancel** panel is displayed and the user must confirm the selection.

The **Drainage Edit Info** panel is principally used to display information and messages during the creation and editing of the drainage string. It is toggled on and off by **Info** on the **Drainage Edit** menu.

The main message area indicates the purpose of the mouse buttons at each step.

Message area 1 displays the current Drainage Edit option and message area 4 indicate the next step in the edit option.

Message areas 2 and 3 are used to display information about the string as the cursor is moved near the drainage string and the drainage manholes.

Each of the options in the **Drainage Edit** menu will now be described.

For the option *Edits*, please continue to the section [Edits](#).

Advanced Edits, please continue to the section [Advanced Edits](#).

Manholes, please continue to the section [Manhole \(Maintenance Hole\)](#).

Pipes, please continue to the section [Pipe](#).

Controls, please continue to the section [House Connections](#).

Connections, please continue to the chapter [House Connections](#).

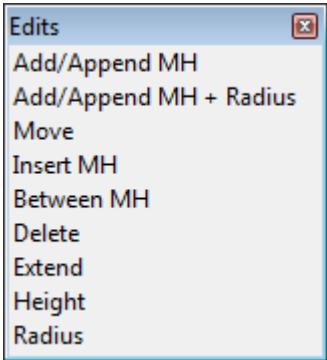

Utilities, please continue to the chapter [Utilities](#).

Z float, please continue to the chapter [Z Float](#).

Edits

The options in the **Edits** menu are used for placing the initial manholes of a new drainage string, editing a new drainage string once the initial manholes are placed or editing an existing drainage string.

The **Edits** walk-right menu is

Append, Append+Radius

The **Append**, **Append+Radius** operations for a drainage string are similar to the **Append** options for a polyline string except that manholes are also automatically placed at each added point.

Note - a manhole can be removed from the point afterwards using the **Manhole=>Remove** option. The point will still be there but without a manhole on it.

If the **Append + Radius** option selected, then before each point is appended, an enter radius typed-input box is placed on the screen.

The enter radius typed-input box looks like

The radius is entered into the typed-input box, terminated with <enter>. The entered value is taken as the radius of the arc to the next drainage string point and the arc will be drawn correctly as the cursor is moved to the next point.

A **radius** value of **0** is taken to mean no arc.

If **z Float** is set to tick, then the top of the manhole is automatically placed on the terrain given in the tin field for the drainage string.

If height snap is toggled on in the **Snaps** menu, the height will be displayed and a new height entered but the new height will only be used if **z Float** is turned off for the manhole.

Each manhole in the string is connected by a drainage pipe. The diameter, type and cover at each end of the **drainage pipe** are taken from the **Drainage Pipe Defaults** panel.

The **Append** options are terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Move

If used in a plan view, the **Move** option is used to move the (x,y) position of a manhole.

If used in a section view, the **Move** option can be used to change the height of the top of any manhole or the height of either end of the drainage pipe connecting adjacent manholes in the drainage string.

After the **Move** option is chosen, the user selects either a manhole in a plan view or the top of a manhole or

a pipe end in a section view.

If a manhole is selected from a plan view, then the plan position of the selected manhole will move with the cursor. The new position for the top of the manhole can be chosen by either cursor selection or typed input in exactly the same way as for moving a point on a 3d string.

If the top of a manhole or the end of a pipe connecting adjacent manholes is chosen in a section view, then only the height of the selected point can be modified. That is, if a point is selected in a section view, then it is constrained to move in the z-direction only.

The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Insert

The **Insert** option is designed to place a new manhole between two adjacent manholes (note that the inserted manhole does not have to be on the line joining the two adjacent manholes).

To insert a new manhole, the two adjacent manholes are chosen by selecting the line connecting the two manholes. Once the **line** is selected, the new manhole is assumed to be at the current cursor position. As the cursor is moved, the drainage string is redrawn reflecting the changing position of the inserted manhole.

The **Insert** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Between

The **Between** option is similar to the **Insert** option except that the inserted manhole **does** have to be on the line joining the two adjacent manholes. To accomplish this, the cursor position is projected onto the manhole-manhole line to give the new manhole position.

Note - once the manhole is placed, it is no longer constrained to be on the one straight or arc joining adjacent manholes. If this is required, then the manhole is placed using the **Manhole=>Add** option.

The **Between** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Delete

The **Delete** option is used to delete manholes/and or points from the drainage string.

The manhole/point to be deleted is selected with the cursor and when the selection is accepted (MB), it is **deleted**.

Once a manhole/point has been deleted, the delete option is still current and can be repeated without re-selecting the **Delete** option.

The string, minus the deleted manhole/point, is redrawn after each deletion.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Extend

The **Extend** option is used to move a manhole/point along the line joining the manhole/point to one of its adjacent manhole/point.

That is, the bearing of the manhole/point-manhole/point line is kept constant and the manhole/point moved along that line either **towards** or **away** from its neighbouring manhole/point.

Extending, like moving a manhole/point, is a two step process.

Step (a) - selecting the manhole/point-manhole/point line and the manhole/point to be moved along that line

Step (b) - selecting the final position for the manhole

Both steps are identical to extending an point in a polyline string.

Once the extend is completed, the extend option is still current and can be repeated without re-selecting the extend option.

The **Extend** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Note - Extend can be used on the end manholes of the drainage string

Height

The **Height** option is used to modify the height (z value) of the top of any manhole, or the height of the ends of the pipes connecting adjacent manholes in the drainage string.

The top of the manhole can be selected in either a plan or a section view. The pipe ends can only be selected in a section view.

After the **Height** option is chosen, the user must select the manhole top or pipe end that is going to have its height modified.

Once the manhole or pipe end has been selected, a New height typed-input box is displayed on the screen with the items current height (z value) in it.

The required height is entered into the typed-input box, terminated with <enter>. The entered value is taken as the height of the manhole or pipe and the string redrawn with the new height at that point. The typed-input box then disappears.

The **Height** option is terminated by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Radius

Selecting **Radius** brings up the **Change Radius** panel which is used to modify the radius of any arc/line joining adjacent manhole points.

After selecting the **Radius** option, the user selects the arc/straight to be modified and the current arc radius and bulge setting will be displayed in the **Change Radius** panel.

New values can then be entered and the arc modified by selecting the **Set** button.

If the radius is positive, the arc is drawn from the start point to the next point on the polyline in a clockwise direction. If the radius is negative, the arc is drawn from the start point to the next point on the polyline in a counter-clockwise direction.

For a given radius (positive or negative), there are two possible cases for the arc- one where the arc is less than a semi-circle, the other when the arc is greater than a semi-circle.

If bulge is turned on, the larger arc is used. The default is bulge turned off.

Advanced Edits

The options in the **Advanced Edits** menu are used for placing the adding manholes at locations other than a vertex and removing these manholes.

The **Advanced Edits** walk-right menu is

Insert MH (no vertex)

The **Insert MH (no vertex)** operation for a drainage adds a manhole on the existing string. When either of the 2 adjacent manholes with a vertex are moved, this manhole will move as well.

Remove MH (no vertex)

The **Remove MH (no vertex)** operation for a drainage removes a manhole on the existing string. If the manhole is on a vertex the vertex remains in the horizontal geometry but does not affect the vertical geometry.

Manhole (Maintenance Hole)

The options in the **Manhole** menu are used to modify information about individual manholes in the drainage string.

The **Manhole** walk-right menu is

Add

The **add** option is similar to the **Edits=>Between** option in that a new manhole is created that must be on the line or arc between two adjacent manholes.

However, once the manhole is placed, it is **always constrained** to be on the one straight or arc joining its adjacent manholes.

To **add** a new manhole, the two adjacent manholes are chosen by selecting the line connecting the two manholes. Once the **line** is selected, the new manhole is assumed to be at the current cursor position. As the cursor is moved, the drainage string is redrawn reflecting the changing position of the inserted manhole.

The **add** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Remove

The **Remove** option is used to remove manholes from the drainage string but unlike the **Edits=>Delete** option, the underlying point on the drainage string remains. Hence only the manhole is deleted, but not the polyline point underneath.

The manhole to be removed is selected with the cursor and when the selection is accepted (MB), it is **removed**.

Once a manhole has been removed, the **Remove** option is still current and can be repeated without re-selecting the **Remove** option.

The string, minus the deleted manhole/point, is redrawn after each removal.

The **Remove** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Name

The **Name** option is used to change a manhole's label.

After selecting the option, the mouse is used to pick the manhole to have a name change.

Once a manhole has been selected, an Enter text typed-input box is displayed on the screen containing the selected manhole's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

NOTE - if the name of the manhole is *EOL* or *eol* then the diameter of the manhole is forced to zero.

Diameter

The **Diameter** option is used to change a manhole's diameter.

After selecting the option, the mouse is used to pick the manhole to have its diameter modified.

Once a manhole has been selected, an **Enter value** typed-input box is placed on the screen displaying the selected manhole's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Type

The **Type** option is used to change the type of the cover (lid) placed on a manhole.

After selecting the option, the mouse is used to pick the manhole to have its cover type modified.

Once a manhole has been selected, a **Manhole type** typed-input box is displayed on the screen containing the selected manhole's cover type.

The list of common covers for the manhole can be obtained by clicking the **[+]** in the **Manhole type** input box and getting a menu of valid cover types.

The new cover type is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Type** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Drop

The **Drop** option is used to change the vertical distance between the bottom of the pipes on either side of a manhole, i.e., the difference in the invert levels of the pipe.

Since the drop is simply the difference in vertical distance between two pipes on either side of a manhole, the actual value of the drop can be changed by moving either of the pipes up or down the manhole.

After selecting the option, the end of the pipe to be moved is selected with the mouse.

Once the pipe end been selected, an enter value typed-input box is displayed containing the drop across the manhole that the pipe end connects into.

The new drop type is entered into the typed-input box, terminated with <enter>.

If the end of the pipe was on the upstream side of the manhole (normally the right hand side of a manhole in a section view), the end of the pipe will be moved upward until the drop across the manhole equals the entered value.

If the end of the pipe was on the downstream side of the manhole (normally the left hand side of a manhole in a section view), the end of the pipe will be moved down until the drop across the manhole equals the entered value.

The typed-input box then disappears.

The **Drop** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Z Float

A **floating manhole** takes the z-value for the top of the manhole from the tin selected for the drainage string. Hence as a floating manhole moves around in a plan view, the top of manhole will automatically change to suit the new z-value of the drainage string tin.

Selecting **Z float** brings up the **Manhole Z Float** panel which is used to change a manhole from floating to non-floating and vice-versa.

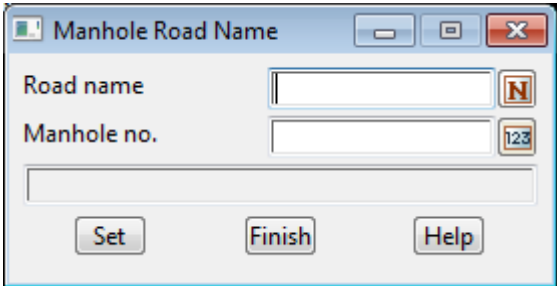

After selecting the **Z Float** option, the user selects the manhole to be modified and the current **floating z status** is displayed in the **Manhole Z Float** panel.

The tick box can then be changed and the manhole modified by then selecting the **Set** button.

Road Name

A **road name** can be set for a manhole of the line.

Selecting **Road name** brings up the **Manhole Road Name** panel which is used to give and change a road name for a manhole.

The option is running as soon as the panel is on the screen and the user is asked to selected a

manhole.

<Select manhole> [picks][Menu]

When the manhole is selected, any existing road name and the manhole number is placed in the road name and vertex no. fields respectively of the **Manhole Road Name** panel.

A new **road name** is then typed into the road name panel field and the **Set** button selected to record the road name with the manhole.

Road Chainage

A **road chainage** can be set for a manhole of the line.

Selecting **Road ch** brings up the **Manhole Road Chainage** panel which is used to give and change a road chainage for a manhole.

The option is running as soon as the panel is on the screen and the user is asked to selected a manhole.

<Select manhole> [picks][Menu]

When the manhole is selected, any existing road chainage and the manhole number is placed in the road chainage and vertex no. fields respectively of the **Manhole Road Chainage** panel.

A new **road chainage** is then typed into the road chainage panel field and the **Set** button selected to record the road chainage with the manhole.

Outfall Height

When a drainage string is created, the furthest downstream is often an outfall and the height of the outfall known.

When the furthest downstream manhole is considered to be an outfall, the **Outfall ht** option is used to set and change the outfall height. Once set, the outfall height is taken to be the height at the *bottom* of the furthest downstream manhole.

If this option is not used, the outfall height is left undefined.

After selecting the option, an enter value typed-input box is displayed on the screen containing the existing outfall height or **null** if no outfall height has been set.

The new outfall height is entered into the typed-input box, terminated with <enter>.

The height of the bottom of the furthest downstream manhole in the drainage string is then set to the given height and the typed-input box removed.

The **Outfall ht** option automatically terminates after use.

Note:

For a drainage string with flow direction in ascending chainage, the furthest downstream manhole is the *last* manhole.

For a drainage string with flow direction in descending chainage, the furthest downstream manhole is the *first* manhole.

Pipe

The options in the **Pipe** menu are used to modify information about the pipes joining adjacent manholes in the drainage string.

The **Pipe** walk-right menu is

Move

The **Move** option is used to move a pipe connecting two manholes whilst keeping the grade of the pipe constant.

After selecting the option, the mouse is used to pick the pipe to be moved.

Once a pipe has been selected, the pipe will be moved up or down so that the cursor remains on the pipe (or on the extension of the pipe if the cursor is on the other side of the manholes at either end of the pipe). The grade of the pipe is kept constant.

The manholes at either end of the pipe will also be extended if necessary so that the pipe still connects into the adjacent manholes.

The **Move** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Name

The **Name** option is used to change a pipe's label.

After selecting the option, the mouse is used to pick the pipe to have a name change.

Once a pipe has been selected, an Enter text typed-input box is displayed on the screen containing the selected pipe's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Cover

The **Cover** option is used to place the selected pipe so that minimum cover is maintained along the top of the pipe (obvert) with respect to the finished surface tin (tin (fs)).

After selecting the option, the pipe to set the cover for is selected with the mouse.

Once a pipe has been selected, an Enter value typed-input box is displayed on the screen

containing the existing cover.

The new cover is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the pipe is adjusted so that the specified cover is maintained for the full length of the pipe at the pipes existing grade.

The **Cover** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Diameter

The **Diameter** option is used to change a drainage pipe's diameter.

After selecting the option, the mouse is used to pick the pipe to be modified.

Once a drainage pipe has been selected, an Enter value typed-input box is placed on the screen displaying the selected pipe's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Type

The **Type** option is used to change the type of material that the pipe is made of.

After selecting the option, the mouse is used to pick the pipe to have its material type modified.

Once a pipe has been selected, a Pipe type typed-input box is placed on the screen displaying the selected pipes material type.

The list of common materials for the pipe can be obtained by clicking B3 in the type input box and getting a menu of valid material types.

The new material type is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Type** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Grade

The **Grade** option is used to specify an exact grade for a drainage pipe. The value for the grade is entered using typed input and is in the units "1v in".

In this option, the new grade is given to a pipe by keeping one end fixed and raising or lowering the other end by the amount required to give the pipe the new grade.

After the **Grade** option is selected, the pipe whose grade is to be modified is selected **at the end that is going to be moved**.

Once the pipe end has been selected, an enter value typed-input box is displayed on the screen

containing the current grade of the pipe. The new grade is entered into the typed-input box, terminated with <enter>.

The selected end of the drainage pipe is then moved up or down so that the pipe has the new grade.

If necessary, the manhole at the moved end of the pipe will be lengthened so that the pipe still connects into the adjacent manholes.

The **Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Grade to End

The **Grade to end** option is used to specify a **fixed** grade for all the drainage pipes from a selected pipe to the **low chainage** end (beginning) of the line. That is, it grades from *right to left* on a long section of the drainage string.

The value for the grade is entered using typed input and is in the units "1v in".

This option was originally written for pipes with flow direction in descending chainage direction which is the reason why it works from the selected pipe back towards the beginning of the line.

Hence **Grade to end** should only be run on pipes with flow in descending chainage direction. If the flow is in ascending chainage direction, use the reverse string option (**string=>strings edit=>reverse**) before using this option, and then reverse the string again after the option is run. Note that the **Default grading** option looks at maintaining minimum *grade* and minimum *cover* for flow in either ascending or descending chainage direction and supersedes **Grade to end**.

In this option, the new grade is given to a pipe by keeping the high chainage end of the selected pipe fixed and raising or lowering the low chainage end by the amount required to give the pipe the new grade. The minimum cover is over ridden during this process. If necessary, the bottom of the manhole will be lowered so that the pipe still connects into its adjacent manholes.

The next lower chainage pipe is then dropped through the default drop and given the new grade. The drop is measured from the lowest pipe invert of all pipes in the network entering the manhole.

This process is repeated until the low chainage end (beginning) of the line is reached.

After the **Grade to end** option is selected, the first pipe whose grade is to be modified is selected.

Once the pipe end has been selected, an enter value typed-input box is displayed on the screen containing the current grade of the selected pipe. The new grade is entered into the typed-input box, terminated with <enter>. The option then does the grading.

The **Grade to end** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Default Grading

The **Default grading** option starts at the given pipe and then works to the end of the line when the flow direction is in ascending chainage, or the beginning of the line when the flow direction is in descending chainage. The **Default grading** option maintains minimum grade and minimum cover.

Default grading is not designed to optimise the placement of the pipes but provides one solution preserving minimum grade and cover.

Property Controls

Property, block or lot **controls** are trial connections from a sewer line (drainage string) to a user specified plan point.

The property controls are used as checks that selected house blocks can be serviced by the sewer line. That is, they are used to test if the house block is under the control of the sewer line.

For the trial connection, once the cover (measured from the finished surface to the top of the property connection line) that the property connection must maintain and the grade are specified, the position and depth that the trial property connection must have at the sewer line can be calculated, and where the height of the *centre line* of the property control when it reaches the sewer line is displayed in any section view containing a profile of the sewer line.

If the calculated depth of the trial property connection at the sewer line (drainage string) is below the sewer pipe, then no such connection would be feasible and the house block would not be totally controlled by the sewer line.

On a section view, the *Profile =>One substring* and *Profile =>Many substrings* options will profile the property control. Note that the *centre line* (axis) of the property control is drawn on the section view, not the invert (bottom) or the obvert (top).

NOTE - property controls are only accessible by the **Sewer module**.

The options in the **Controls** menu are used to place and modify the trial connections. The **Controls** walk-right menu is

Add

The **Add** option is used to create a new trial control line going from a selected drainage pipe to a user specified plan position (the free end of the connection).

After selecting the option, the mouse is used to pick the plan position of the connection point on the drainage pipe, and then the points defining the path to the plan position of the free end of the trial connection.

After the free end has been selected, the property name typed-input box is displayed on the screen so that a label for the control can be entered (this usually consists of the lot number).

When the property name box is placed on the screen, it will already have some text in it. This text comes from the name field in the **Drainage Property Control Defaults** panel.

A z-value equal to the drainage tin value minus the default control cover depth is automatically given to the free end of the control. The default control grade is then used to define z-values along the trial path (ensuring that the default control cover depth is always observed) to give a z-

value back at the drainage pipe (the connection height of the control).

A cross at the calculated connection height is displayed whenever the drainage string is profiled on a section view.

The colour for the new control is taken from the **Drainage Property Control Defaults** panel.

The **Add** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Include

The **Include** option is used to make a control out of an existing polyline string.

The polyline string must start at the connection point on the drainage string and end at the free end (use *Strings=>Strings Edit=>Reverse* if the string's direction is incorrect).

After selecting the option, the mouse is used to pick the polyline string and its plan position is copied and used to define a new control.

A z-value equal to the default drainage tin at that point, minus the default control cover depth is automatically given to the free end of the new control. The default control grade is then used to define z-values along the trial path (ensuring that the default control cover depth is always observed) to give a z-value back at the drainage pipe.

The **Include** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Delete

The **Delete** option is used to delete a control.

After selecting the option, the mouse is used to pick the block control to be deleted.

Once a block control has been selected, it will be deleted and removed from the screen.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Name

The **Name** option is used to change the **Property name** of a control.

After selecting the option, the mouse is used to pick the control that will have a name change.

Once a control has been selected, an enter text typed- input box is displayed on the screen containing the selected control's name.

The new name is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Name** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit, Finish**, or a new option from the **Drainage Edit** menu.

Diameter

The **Diameter** option is used to change the diameter of a control.

After selecting the option, the mouse is used to pick the control that will have its diameter modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the

selected control's current diameter.

The new diameter is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Diameter** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Cover

The **Cover** option is used to change the distance that the control is below the tin (fs) for the drainage string.

After selecting the option, the cursor is used to pick the control whose cover will be modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected block control's current cover.

The new cover is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new cover calculated.

The **Cover** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Grade

The **Grade** option is used to change the grade of a control (units "1v in").

After selecting the option, the mouse is used to pick the control whose grade will be modified.

Once a control has been selected, an enter value typed- input box is placed on the screen displaying the selected control's grade.

The new grade is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new grade calculated.

The **Grade** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Boundary

The **Boundary** option is used to specify a boundary trap depth which is used as a final drop at the drainage pipe end of the control.

After selecting the option, the mouse is used to pick the control whose boundary depth will be modified.

Once a control has been selected, an Enter value typed- input box is placed on the screen displaying the selected boundary depth.

The new boundary trap depth is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears and the new connection height using the new boundary trap depth is calculated.

The **Boundary** option is terminated by selecting **Cancel** from the **Pick Ops** menu, or by selecting **Quit**, **Finish**, or a new option from the **Drainage Edit** menu.

Calc all

The **Calc all** option is used to re-calculate the connection heights for all controls of the drainage line.

The calculation uses the plan layout of the control, the control's cover, grade and boundary trap depth and the default tin for the drainage line.

The **Calc bc's** option automatically terminates after use.

Delete All

The **Delete all** option is used to remove all the controls defined for the drainage line being edited.

The **Delete all** option automatically terminates after use.

House Connections

The **Connections** option is used to create the connections from the sewer line (drainage string) to the house blocks in a subdivision.

When placing a house connection, the user indicates the two corners of the frontage of the block to allow the cross-fall of the block to be calculated and allow the frontage to be used in positioning the house connection.

When placing house connections, a section view is used to automatically display the connection to facilitate checking the type of connection used and any obstructions that may need to be avoided.

NOTES

- 1. House connections are only accessible by the *Sewer module*.
- 2. All house connection calculations do not take into account any thickness of pipe, joint sizes or actual entry points into the sewer. Hence they are *approximate only* and should only ever be used as a guide. Any quantities calculations should allow for a suitable margin of error.

The **Connections** walk-right menu is

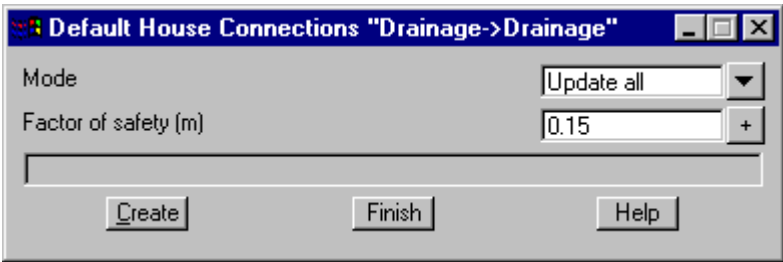

The process for creating a house connection will now be described in detail.

Create from Controls

The **Create from Controls** option is used to create a new house connection from existing controls. or modify an existing house connection.

After selecting the **Create from Controls** option, the **Default House Connections** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	input	update all	remove existing first, update new, update all
<i>if remove existing first, all the existing connections are deleted before new ones are created from the controls.</i>			
<i>if update new, connections are only created from controls with names different from any existing connection.</i>			
<i>if update all, connections are created from all controls.</i>			
Factor of safety	input	0.15	

the connection height for the control is adjust by this depth from the control connection depth.

Create button

*after selecting **Create**, the connections are created from the selected controls.*

Create/Edit

The Create/edit option is used to create a new house connection or modify an existing house connection.

After selecting the Create/edit option, the **House Connections** panel is displayed.

The process for creating a house connection will now be described in detail.

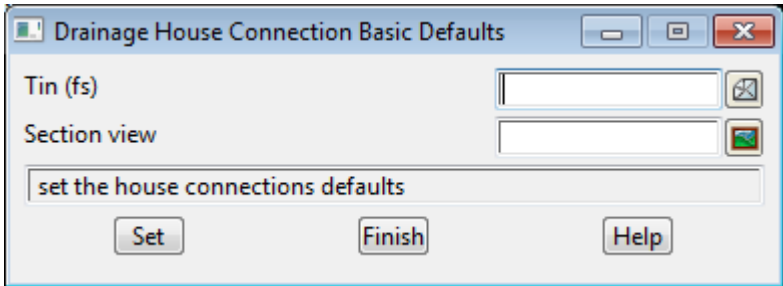

Creating A House Connection

Step 1 Select *Create*

To create a new house connection, the **Create** button is selected from the **House Connections** menu.

If either the default **drainage tin** or **section view** have not be defined, the **Drainage House Connection Basic Defaults** panel will be placed on the screen after the **Create** button is selected.

The missing values need to be filled in and the **Set** selected. This information is needed so that the house connections can be drawn up in a section view as soon as they are created.

Step 2 Selecting the Sewer (drainage) Pipe to Connect to

The user is then asked to select the sewer pipe to connect into.

Step 3 Selecting the House Lot Frontage

Next the user indicates the two frontage points for the house block.

Step 4 Positioning the House Connection on the Sewer Pipe

From the two frontage points and the default drainage tin, the program calculates the crossfall for the block frontage.

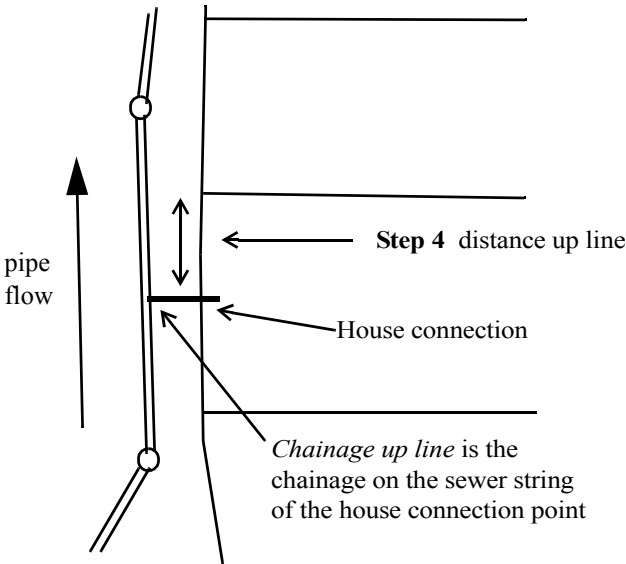

The crossfall is displayed in the name of the enter distance up line typed-input box which is now placed on the screen. The distance up line is the distance along the frontage that the house connection will be placed.

Depending on the crossfall, a default value for the distance up line is displayed. If the ground crossfall is greater than 1% the lot mid point is the suggested connection location. For crossfalls less than 1%, the connection is located 3m off the *lowest* lot boundary.

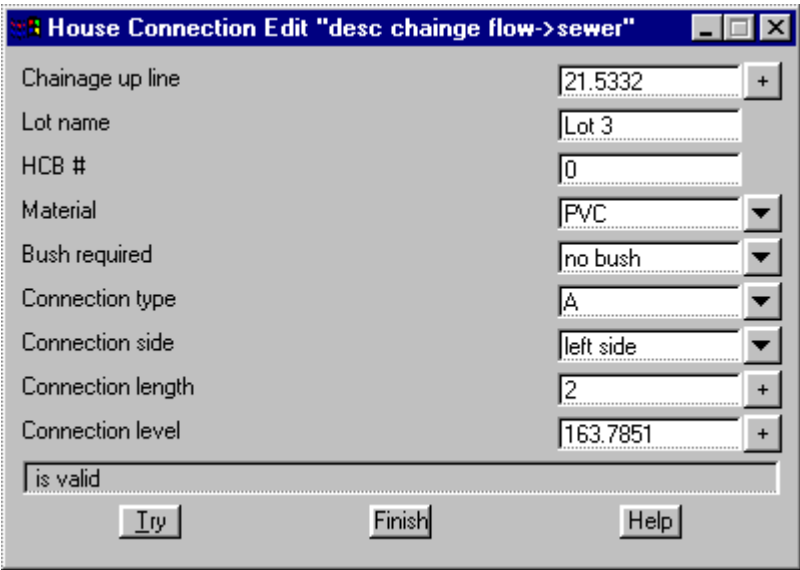

A pop-up also exists for placing the connection point at the distance 2.0, 3.0, 5.0 along the frontage, the mid point of the frontage, and the distances 2.0, 3.0 and 5.0 from the other end of the frontage.

The distance up line value is entered into the typed-input box, terminated with <enter>. The typed-input box is then removed from the screen.

Step 5 Defining the House Connection Type

Next the **House Connection Edit** panel is placed on the screen.

Most of the values in the field come from the drainage house connection defaults.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chainage up line <i>the chainage on the sewer string where the house connection is attached to the sewer line.</i>	input/output	chainage of connection	
Lot name <i>name of the house block</i>	input	from drainage defaults	
HCB # <i>a user supplied house connection branch (HCB) number</i>	input		
Material <i>the material used for the house connection.</i>	input	from drainage defaults	PVC, PVC X/HEAVY, VC
Bush required <i>the type of bush used</i>	input	no bush	no bush, PVC to VC
Connection type <i>the type of connection used. Go to the section House Connection Types for a description of each connection type</i>	input	from drainage defaults	A, A Special, B, C, OB, Special jump up
Connection side <i>the side of the line to make the connection</i>	input	right side	right side, left side
Connection length <i>length of pipe for the house connection</i>	input	from drainage defaults	
Connection level <i>height of the house connection. When this is first displayed, it is calculated using the invert level of the sewer pipe where the house connection is attached, the house connection type and connection length (if required by the house connection type), the default house connection grade, the default house connection cover and the surface level at the end of the house connection.</i>	input	calculated	
Try <i>using the parameters in the panel fields, create the house connection. Also calculate a section along the house connection and draw it in the drainage default section view.</i>	button		
Finish <i>end the option, remove the panel.</i>	button		

Step 5 Continued

After entering the appropriate values in the **House Connection Edit** panel and then selecting the **Try** button, the house connection will created.

To help check the house connection parameters, a section along the house connection will automatically be calculated and displayed in the section view given in the drainage defaults panel. Any tins or models on the section view will be included in the section.

Step 6 Modifying the Connection

If any of the fields in the **House Connection Edit** panel are changed, selecting the **Try** button will modify the house connection and redraw the section in the default drainage section view.

Editing A House Connection

To edit an existing house connection, the **Edit** button is selected from the **House Connections** menu and then the appropriate house connection selected.

The **House Connection Edit** panel will then be placed on the screen with the details of the selected house connection.

If any of the fields in the **House Connection Edit** panel are changed, the **Try** is used button to modify the house connection and redraw the section in the default drainage section view.

Delete

The **Delete** option is used to delete a connection.

After selecting the option, the mouse is used to pick the house connection to be deleted.

Once a house connection has been selected and accepted, it is deleted and removed from the screen.

The **Delete** option is terminated by selecting **Cancel** from the **Pick Ops** menu, by selecting a new option from the **Drainage Edit** menu.

Delete all

The **Delete all** option is used to delete all connections.

After selecting the option, all the connections are deleted and the option terminates.

Utilities

The options in the **Utilities** menu are used to modify default drainage tin, the name, colour, style and start chainage of the drainage string, and the size, angle, and offsets used when displaying the text for the names of all the manholes.

The **Drainage Utilities** walk-right menu is

Tin (fs)

The **Tin (fs)** option changes the default finished surface tin (tin (fs)) for the drainage string.

After selecting the option, the **FS Tin for Drainage** panel is displayed.

The existing default tin is displayed in the tin panel field. If a new tin is required, simply enter the new tin name into the tin (fs) field and select the **Set** button.

Tin (ns)

The **Tin (ns)** option changes the default natural surface tin (tin (ns)) for the drainage string.

After selecting the option, the **NS Tin for Drainage** panel is displayed.

The existing default tin is displayed in the tin (ns) panel field. If a new tin is required, simply enter the new tin name into the tin field and select the **Set** button.

Angle

The **Angle** option changes the angle of the text for manhole labels.

After selecting the option, an enter angle typed-input box is displayed on the screen containing the current text angle.

The new angle is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Angle** option then terminates.

Size

The **Size** option is used to change the size of the text for manhole labels.

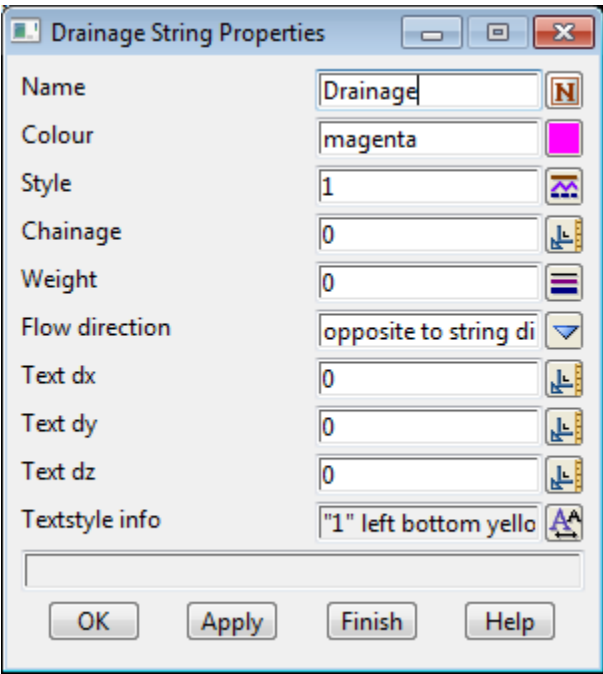

After selecting the option, an enter value typed-input box is displayed on the screen containing the current text size.

The new size is entered into the typed-input box, terminated with <enter>. The typed-input box then disappears.

The **Size** option then terminates.

Properties

The **Properties** option brings up the **Drainage String Properties** panel for the current drainage string.

Any of the data in the panel fields can be modified and then set for the drainage string by selecting the **OK** or **Apply** button.

Z Float

The status of **Z Float** is used each time a new manhole is created.

If **Z Float** is set to tick, then the top of the manhole is set to z float which means that automatically sits on the default drainage tin.

If **Z Float** is not set to tick, then the top of the manhole is given a set z value when it is created.

The z float status of the manhole can be changed after it has been created by using the **Drainage Edit=>Manhole=>Z Float** option.

Utility String Editor

Position of option on menu: **Design =>Drainage-Sewer =>Utility String Editor**

This editor is used to edit properties of the strings used by the DNE. Properties always change at an existing vertex.

Cross Section Strings (Manning’s n) - set the left and right bank n values. the centre n value is assigned by the DNE.

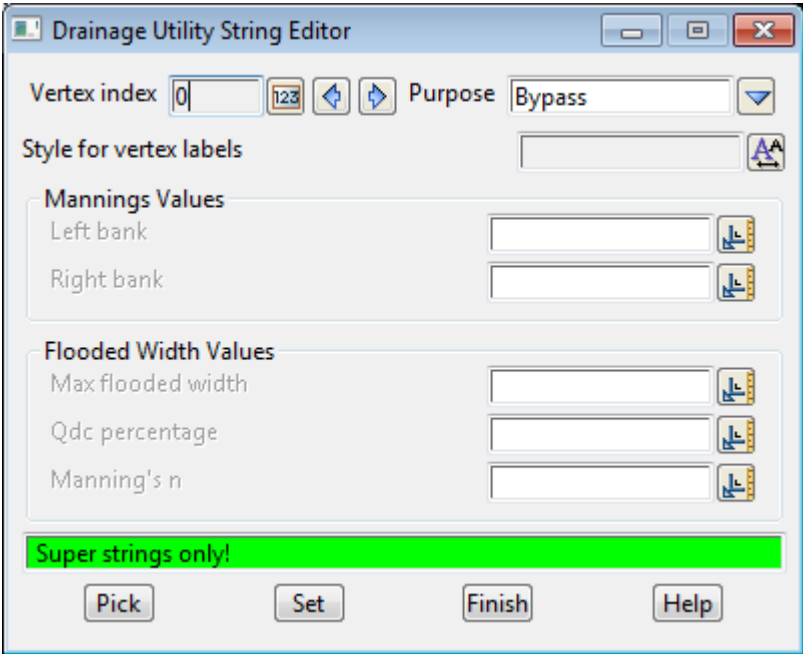

Flooded Width Values on Bypass Flow Strings - the default setting of the bypass flow strings when used to calculate flooded widths in the Drainage Analysis.Changes are in effect until the end of the string or it has been re specified at vertex at a higher chainage.

Vertex labels are created whenever properties are set (Textstyle is required).

Usage

First the string is selected at the vertex where the values are to be assigned. Next select the purpose of the string (cross section or bypass) to unlock the appropriate fields. A textstyle favourite is required as the vertex is labelled with the assigned values. Enter the values into the fields and then select Set to set the values as vertex attributes and create the label as a vertex annotation.

On selecting the Utility String Editor option, the **Drainage Utility String Editor** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	vertex	selected vertex	
<i>Once the string is selected use this to move between vertices</i>			
Style for Vertex Labels	textstyle favourite	textstyles	
<i>A label is created on the vertex using this textstyle favourite</i>			
Left bank	Input		
<i>mannings n value, to delete clear and select set</i>			
Right bank	Input		
<i>mannings n value, to delete clear and select set</i>			

Max Flooded with Input

This changes the threshold where warning bars are created during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Qdc percentage Input

This changes the percentage of the $Q_{direct} + Q_{catchment}$ that is used to interpolate the discharges during flooded width calculations. It is generally set on the first vertex past upstream pit and remains in effect till the next change or the end of the bypass flow string. The flow changes from the bypass flow at the upstream pit to this value/100($Q_{direct} + Q_{catchment}$).*

Manning's n Input

This changes the Manning's n value used for during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Pick button

Use this button to select the string. Select near the vertex you want assign the values to.

Set button

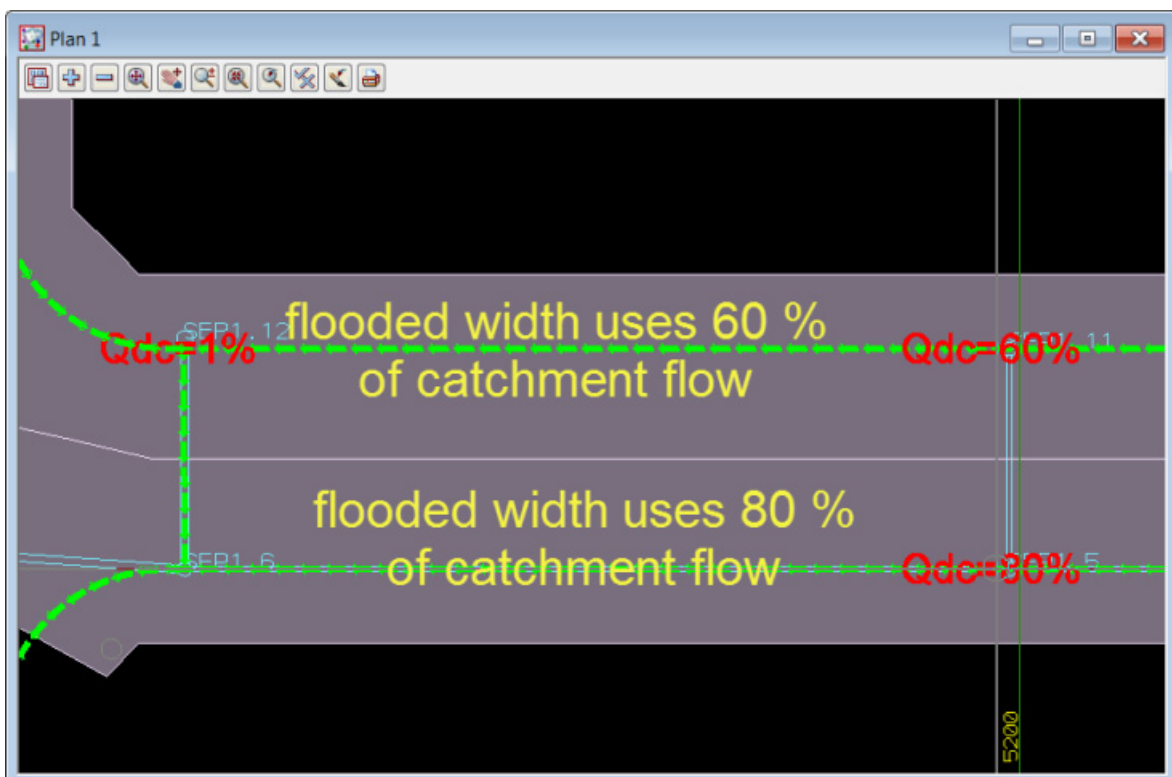

Creates the attributes and the label on the vertex.

Finish button

Removes the panel from the screen.

Help button

Launches the 12d help

In the example above, The Qdc is set to 80% at the eastern end of the catchment. The Qdc is set to 2% for the water overtopping the road. The 18% of the area is not considered large enough to do the flooded width calculation for. If desired, another bypass flow string approaching from the east could be drawn but the final bypass string to the west (direction during bypass should

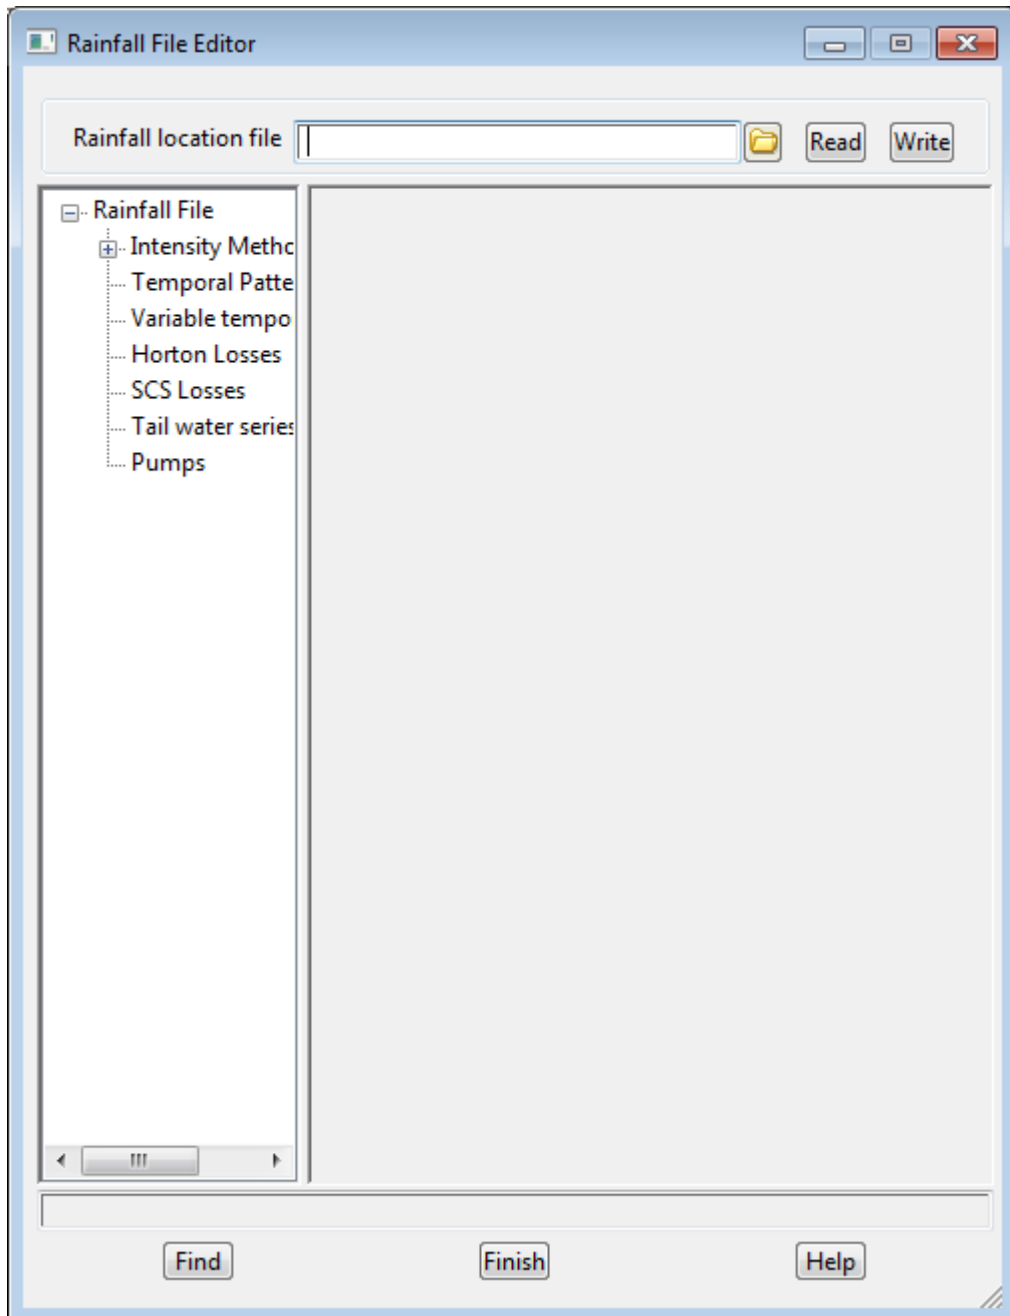

remain).

Rainfall File ppf Editor

Position of option on menu: **Design =>Drainage-Sewer =>Rainfall editor**

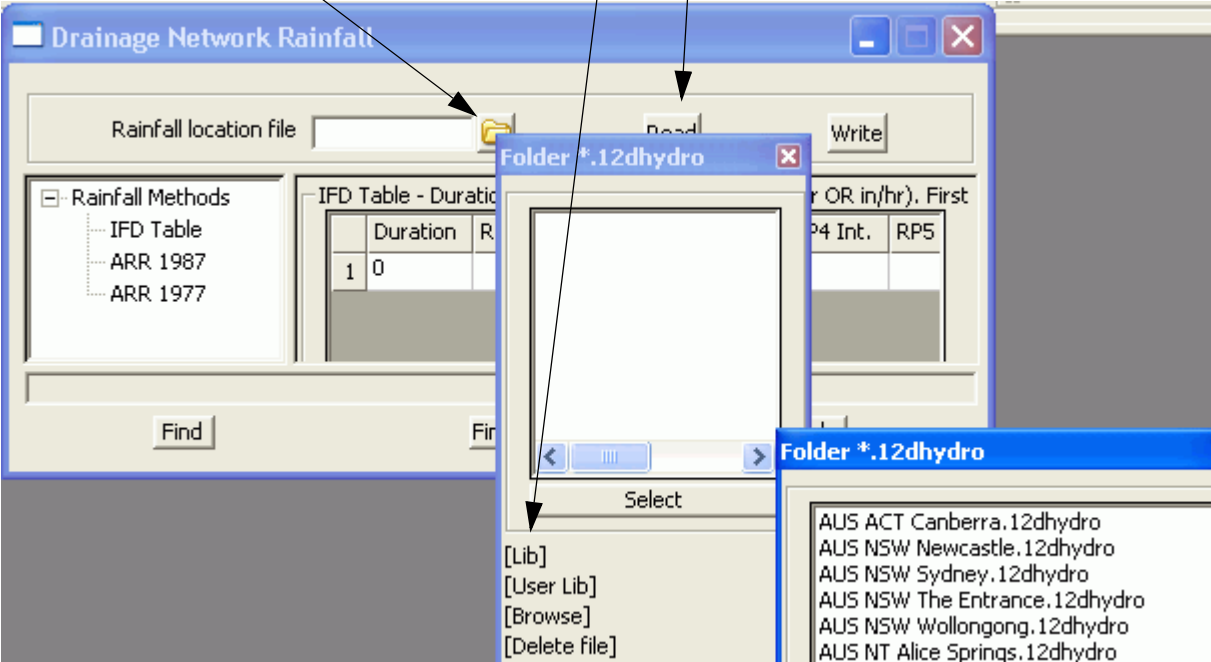

The rainfall file editor

On selecting the **Rainfall editor** option, the **Rainfall File Editor** panel is displayed.

Data is entered using one (or more if desired) input methods and then saved by entering a **Meteorology file** name and selecting **Write**. The standard 12d system file search paths are used (project folder, user library folder and then library folder).

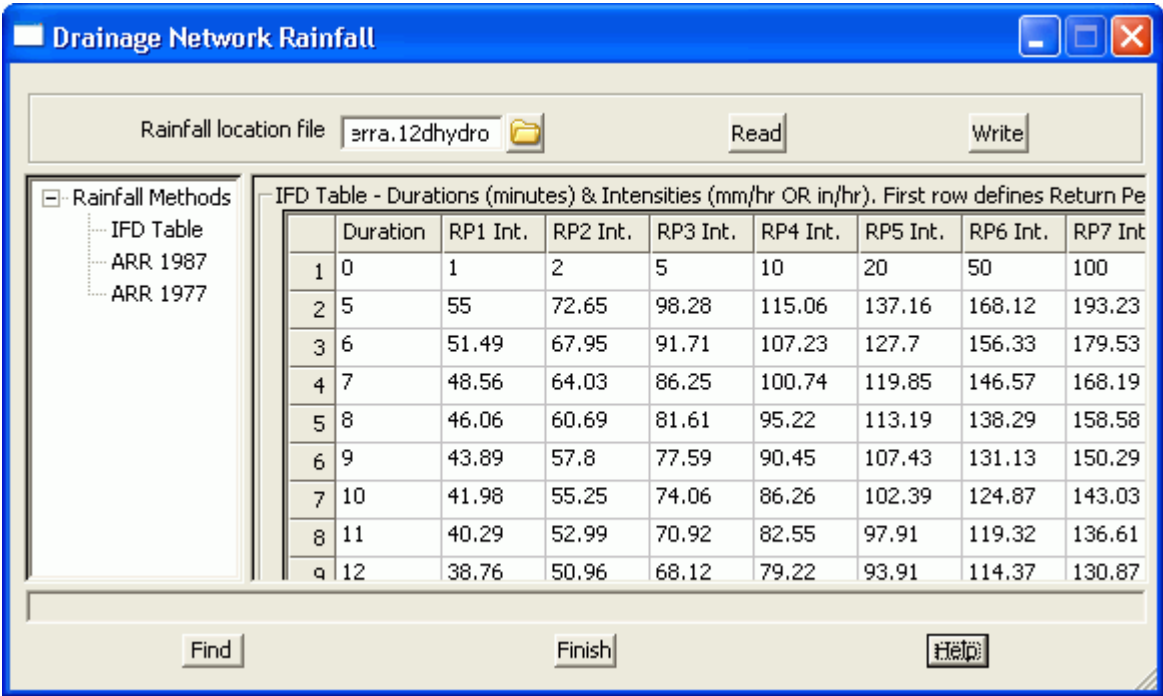

Select the folder icon and then walk right on the **Lib** item to display a list of sample files. Select a file the select **Read**. **YOU MUST SELECT THE READ BUTTON!**

IFD Tables

IFD tables are often available from meteorological services. The table input format follows. The first row is used to define up to 9 return periods and the following rows list the rainfall intensities for the duration entered in the first column.

Hint: to increase the size of the grid control select another method, ARR 1987 for example, and then select IFD table again.

Australian Rainfall and Runoff 1987 Method

The rainfall intensities and other factors from Volume 2 of ARR 1987 are entered in this table.

Australian Rainfall and Runoff 1977 Method

The seven coefficients for each return period from ARR 1977 are entered in this table.

Rainfall Temporal Patterns

Temporal patterns are referred to as storms in dynamic drainage. Several example hydro files are included in the 12d library. These examples have the temporal patterns for the minor and major storms in the 8 zones of Australia.

Temporal patterns are not required for the SCS NZ method as the standard 24 hour temporal pattern from TP108 is built into the 12d analysis engine.

The **Run storm**, **Zone filter**, **From ARI** and **To ARI** columns are used determine which storms are analysed (run). The **Run storm** column must be checked for that temporal pattern to be analysed. Many storms may be selected.

The **Zone filter** is optional. Entering a value here will allow the selected storms to be further filtered. A **Zone filter** field (accepts wild card characters) is found on the DNE Global tab that is used to determine which of the selected storms (paragraph above) are analysed.

The **ARI** field on the Run panel is used with the **From ARI** and **To ARI** columns. The value on the run panel must be within the From-To range for the storm to be analysed.

The **Duration** column determines the total length of the storm. This value divided by the **Interval** must be a whole number and this number determines the number of % values to be entered to the right of the **Interval column**. The total of the percentage must equal 100.

Horton Losses

The pervious portion of the catchments used in the **ILSAX 2** analysis will have a loss type defined describing the soil type. The loss type is defined in the DNE Default->catchment and catchment tabs.

Horton Losses Data

Name	Number	Initial Loss mm/hr(inch/hr)	Final Loss mm/hr(inch/hr)	Decay Rate	AMC 1 (mm)	AMC 2 (mm)	AMC 3 (mm)	AMC 4 (mm)
1 A-High infil-Sand gravel	1	250	25	2	0	50	100	150
2 B-Mod well drained	2	200	13	2	0	38	75	100
3 C-Slow infiltration	3	125	6	2	0	25	50	75
4 D-Very slow-clays	4	75	3	2	0	18	38	50
5 Mod to slow	2.5							
6 Slow to very slow	3.5							

Find Finish Help

These soil types use the classifications of Terstriep and Stall (1974), based on the system developed by the U.S. Department of Agriculture. The default values entered from the library represent the soil types of

- 1.Type A - low runoff potential, high infiltration rates (consists of sand and gravel)
- 2.Type B - moderate infiltration rates and moderately well-drained
- 3.Type C - slow infiltration rates (may have layers that impede downward movement of water)
- 4.Type D - high runoff potential, very slow infiltration rates (consists of clays with a permanent high water table and a high swelling potential)

Numbers are assigned to each soil type to allow interpolation between the defined soil types. When interpolated values are used they must be included in the list (2.5 and 3.5 for example). Interpolated values do not need loss data entered. If loss data is entered for the interpolated names then this data will be used rather than an interpolation occurring. If any loss data is entered then all of the values must be entered.

Four preset AMC points are defined in the rainfall file to mark AMC conditions ranging from dry (AMC1) to saturated (AMC4). The required data for each line is the **Initial loss rate**, **Final loss rate**, **decay rate** and 4 antecedent moisture conditions (**AMCs**). The AMC values are entered in depth of rainfall (mm) they represent the total rainfall prior to the start of the temporal pattern.

The AMC point numbers are set once for all catchments on the DNE Global tab. Value between 1 and 4 (decimal value are permitted) are entered for the minor and major events.

SCS NZ Losses (Initial Abstraction and Curve Numbers)

The SCS NZ method uses Initial abstraction (Ia) and the curve number (CN) to determine the losses for the catchments. Names are given to the SCS curve numbers in the rainfall file. These names and Ia (entered as storage values) and selected in the DNE catchment data.

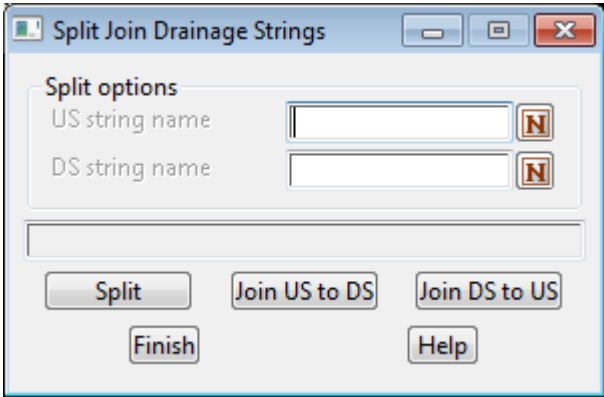

A curve number of 0 results in zero runoff while a CN=100 results in 100% runoff. TP 108 recommends the selection of the curve number by identifying 1) the soil type and 2) the land use. A CN=98 an Ia=0 are recommended for impervious areas.

String split/join

Position of option on menu: **Design =>Drainage-Sewer =>String split/join**

This option must be used on drainage strings instead of the standard split or join commands.

On selecting the **String split/join** option, the **String split/join** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
US string name	input		
<i>The upstream section of the split string is assigned this name.</i>			
DS string name	input		
<i>The downstream section of the split string is assigned this name.</i>			
Split	button		
<i>The split may only occur at a manhole. The upstream and downstream sections are renamed if names are provided above.</i>			
Join US to DS	button		
<i>The upstream segment must be selected first and then the downstream. The properties from the upstream string are used for the new string created. If there is a gap in between the joined strings, a pipe will be inserted with the default pipe properties. The attributes of the upstream pit on the downstream string will be discarded.</i>			
Join DS to US	button		
<i>The downstream segment must be selected first and then the upstream. The properties from the downstream string are used for the new string created. If there is a gap in between the joined strings, a pipe will be inserted with the default pipe properties. The attributes of the downstream pit on the upstream string will be discarded.</i>			
Finish	button		
<i>remove the panel from the screen</i>			
Help	button		
<i>displayed the help for this panel</i>			

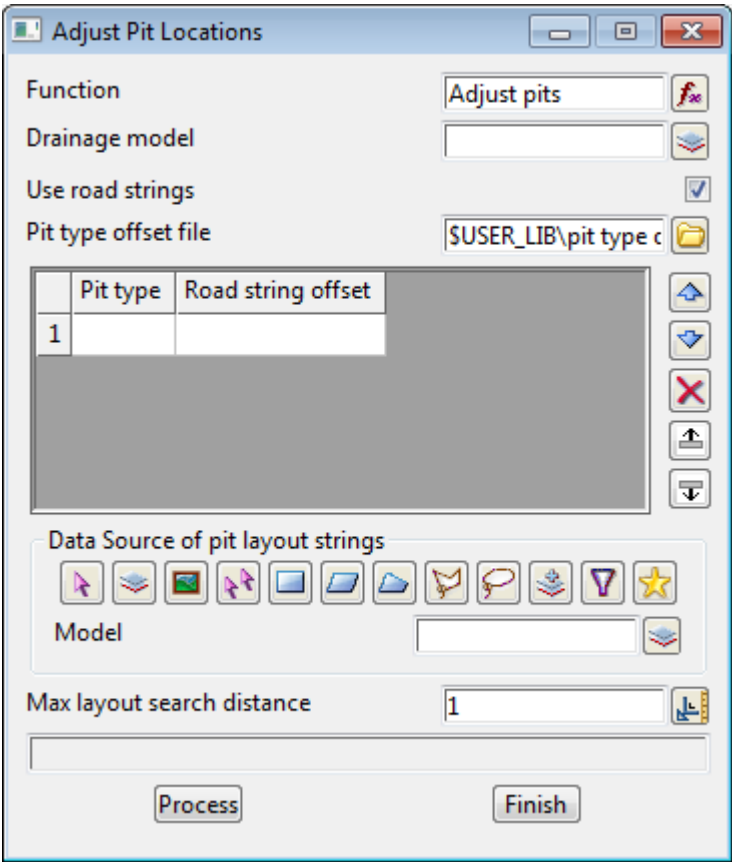

Adjust Pit Locations

Position of option on menu: Design =>Drainage-Sewer =>Adjust Pit Locations

Key Points

- 1. Pits are moved perpendicular to the road string.
- 2. The string to be moved to must be closer than the **search distance** or it will not be moved.

On selecting the **Adjust pit locations** option, the **Adjust Pit Locations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Function	function		
<i>This function will re adjust the drainage pits</i>			

Drainage model	model		
<i>The drainage model to have the pits moved.</i>			

Use road strings	tick		
<i>When selected, a DNE road string is checked for each pit. When found, the pit will be moved perpendicular to this string at the Road string offset distance. If the road string is not found, the layout string will be searched for using the Max layout search distance. If not selected the only the layout strings with an offset of zero will be used.</i>			

Pit type offset file	file		
<i>The grid data below is stored in this file when the Process button is selected.</i>			

Pit type	input	
<i>Only used when Use road strings is selected. Each pit scans for its pit type in the Pit type column. When found, the pit is placed at the Road string offset distance from the road string.</i>		
Road string offset	input	
<i>Only used when Use road strings is selected. The pit is placed at the Road string offset distance from the road string. Positive is away from the road centreline and negative is towards the centreline. When no Road string offset is set via the pit type, the offset value is zero.</i>		
Data Source of Pit Layout Strings	source model	
<i>Used when Use road strings is NOT selected or when no road string is found. As road strings are often in several models, so the filter option is usually the best. Select a view with the road string models and then use the string info tab and name field (* wild card can be used) to select the strings to move to.</i>		
Max Layout Search Distance	real	1.0
<i>Only used for layout strings. Road strings do not have a search distance. If the closest string in the pit layout strings is farther than this distance the pit will not be moved.</i>		
Run	button	
<i>This moves the pits horizontally. Undo is available</i>		
Finish	button	
<i>Removes the panel from the screen.</i>		

Extract Sewer Property Controls

Position of option on menu: **Design =>Drainage-Sewer =>Extract Sewer Property Controls**

The sewer property control strings are a sub string of the drainage string and therefore may only be profiled using a right mouse click of the profile button. To include these control strings on plots or export to other packages they need to be converted to super strings.

On selecting the **Extract Sewer Property Controls** option, the **Extract Sewer Property Controls** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	mode box		
<i>All drainage strings in this model will have their property controls strings duplicated as super strings.</i>			
Model for property controls	model box		

The super strings for the property controls are placed in this model.

Extract with diameters tick box on

The super strings will have the constant pipe dimension set to the control diameter.

Run button

Create the super strings representing the property controls.

Finish button

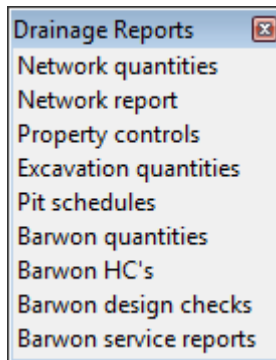

remove the panel from the screen

Reports

Position of menu: Design =>Drainage-Sewer=>Reports

Reports menu contains an option to report on the property controls for the drainage strings and an option produce network quantities.

The Reports walk-right menu is

For the option *Network quantities*, please continue to the section [Network Quantities](#).

Network report, please continue to the section [Network Report](#).

Property control, please continue to the section [Property Controls](#).

Excavation quantities, please continue to the section [Excavation Quantities](#).

Pit schedules, please continue to the section [Pit Schedules](#).

Barwon quantities, please continue to the section [Barwon Quantities](#).

Barwon HC's, please continue to the section [Barwon House Connections](#).

Barwon design checks, please continue to the section [Barwon Design Checks](#).

Barwon services reports, please continue to the section [Barwon Services Report](#)

Network Quantities

The **Network quantities** report contains information about the manholes and pipes that make up the selected drainage strings. Configuration files allow the user to specify the depth ranges and sizes of pipes to report on

On selecting **Network quantities**, the **drainage quantities** panel is displayed.

Drainage Network Quantities

Position of option on menu: **Design => Drainage => Reports=> Network Quantities**
This option creates quantity tables for manholes, pipes and house connections.
The manholes/pipes/house connections are summarised by user defined depths and types.

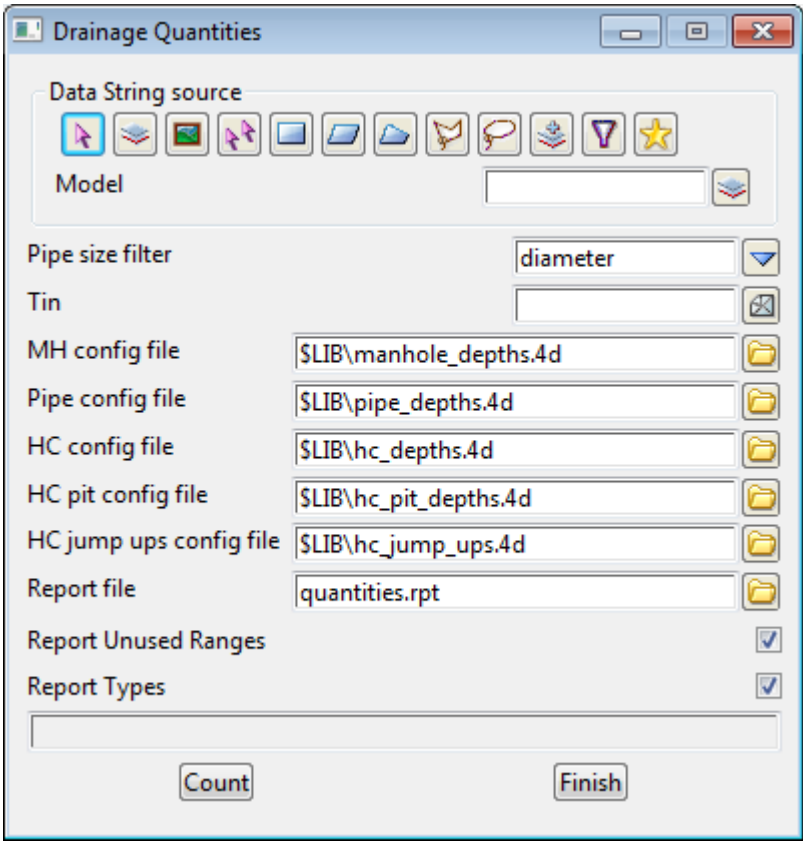

See Also

[Drainage overview](#)

Key points

- 1. Items are counted/totalled by depth and optionally type.
- 2. The routine will not "double count" items even if the ranges overlap.
- 3. Types are case sensitive, types with spaces in the name must be enclosed in quotes and the wild card * may be used.
- 4. Use vertically offset tins and "banded" depth ranges to get quantities under roads, foot paths etc. This is discussed later in detail.
- 5. Erase count file fields if the items are not to be counted.

On selecting the **Network quantities** option, the **Drainage quantities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data String Source	Choice
---------------------------	--------

usually the entire model is selected but view is also available for combining models

Pipe size filter	Choice	diameter or pipe size attribute
<i>The second item in a count line is used to filter by diameter (in meters/ft) or the pipe size attribute. The diameter can only be used when no box culverts or trapezoidal channels are used. The pipe size attribute is the label generally used in the plan plots. This is the pipe size in mm/inches (375), for box culverts width x height (750x375) and for trapezoidal channels TopwidthBottomwidthxHeight (T5000B1000x500).</i>		
Tin	tin box	
<i>This tin will be used for the pipe and pit depths.</i>		
MH config file	file box	
<i>This file specifies the types and depth ranges for the pits. Details of this file are contained below.</i>		
Pipe config file	file box	
<i>This file specifies the types and depth ranges for the pipes. Details of this file are contained below.</i>		
HC config file	file box	
<i>This file specifies the types and depth ranges for the house connections. Details of this file are contained below.</i>		
HC pit config file	file box	
<i>This file specifies the types and depth ranges for the HC pits. Details of this file are contained below.</i>		
HC jump ups file	file box	
<i>This file specifies the types and depth ranges for the house connections jump ups. Details of this file are contained below.</i>		
Report file	file box	
<i>a sample report file is given below.</i>		
Report unused ranges	tick box	
<i>the depth ranges for the pit/pipe/house connections are defined in the *.4d files. Selecting this option will cause the depth ranges in the file to be printed even if there are no pit/pipe/house connections in these depth ranges (zero quantity values will be shown).</i>		
Report types	tick box	
<i>Selecting this option will cause the pit/pipe/house connection types used in the model types to be listed (even if quantities are not requested in the *.4d files). Since this is a complete of the type used in the model, the list informs the user what types have not been included in the quantity calculation.</i>		
Count	button	
<i>executes the option.</i>		
Finish	button	
<i>removes the dialogue from the screen</i>		

The *.4d files listed above are contained in the 12d **library** directory. Each line is the file performs a count (count lines). No items are counted twice. Therefore, if an item is counted its type and then a count line is found the wild card is used for the type, the type already counted will not be included in the count.

The format for a count line is three or four values (space delimited) per line. Size is optional.

```
<type (from drainage.4d)> <size> <starting depth> <ending depth>
```

Notes:

All **types** with spaces in the name must be enclosed in quotes The wild card * may be used.

The **size** is optional and if omitted the all sizes will be counted in this group (do not use the * for a wild card).

The **starting depth** and **ending depth** are required for all count lines.

Quantities Under Roads and Footpaths

By creating super tins with vertically offset sections, quantities under roads, footpaths etc. can be determined. for example.

Offset your road design tin up by 1000m (**Tins->Utility->Translate/Copy**) and then use the depth range 1000-1999 for pipes under roads.

Create a tin from the footpaths only, null by angle length with a small length to remove the road and then offset it vertically by 2000m. the depth range 2000-2999 is not the quantities under the footpath.

Sample count lines

```
// sum concrete cover manholes is various ranges

"CONC COVER" 0.0 1.6
"CONC COVER" 1.5 3.0
"CONC COVER" 3.0 999.9 // this is expected to be zero
"CONC COVER" -999.0 0.0 // trap errors

// any that are not Concrete cover will be counted here

* 0.0 1.6
* 1.6 3.0
* 3.0 999.9
```

Manhole Quantities
=====

CONC COVER	0.00	1.60	13	16.506
CONC COVER	1.60	3.00	1	1.510
CONC COVER	3.00	999.9	0	0.000
CONC COVER	-999.0	0.0	0	0.000
*	0.00	1.60	0	0.000
*	1.60	3.00	0	0.000
*	3.00	999.9	0	0.000

total length = 18.016

Types Used

CONC COVER

Diameters Used

1.100

Since the **Report unused ranges** tick box was selected, these lines were printed even though there were no pits in the data ranges.

This data results from selecting the **Report types** tick box.

Sample count lines for pipes follow.

```
// sum class 2 pipes by diameter and for various ranges

// count 375

2 0.375 0.0 2.0
2 0.375 2.0 5.0
2 0.375 5.0 999.

// count 450

2 0.450 0.0 2.0
2 0.450 2.0 5.0
2 0.450 5.0 999.

// count 525

2 0.525 0.0 2.0
2 0.525 2.0 5.0
2 0.525 5.0 999.

// count pipe sizes that were missed

2 * 0.0 2.0
2 * 2.0 5.0
2 * 5.0 999.

// count all other missed pipes

* 0.0 999.
```

Network Report

After selecting the **Network report** option, the **Report on Selected Items** panel is displayed.

This is the same as the option **Reports =>Co-ord/ Brd-dst** on the main menu.

For the given model, it prints out the string information for each string in the model.

If a sewer network model is given, each sewer string in the network model is reported on.

For further information, go to [Coordinates or Bearing-Distance Report](#).

Excavation Quantities

Position of option on menu: **Design =>Drainage-Sewer =>Reports=>Excavation quantities**

This routine uses 12d templates to calculate the excavation volume for all of the drainage strings in a model. An option to create section for a tin on top of the pipe is also available so that the drainage long sections can include hatching between the obvert of the pipe and the design tin under roads. Templates with names set to the pipe diameters (times 1000) are used for the calculations, thus trench shapes can be customised and over excavation for bedding materials can be included. Net area calculations to exclude pipe area are not supported.

Key points

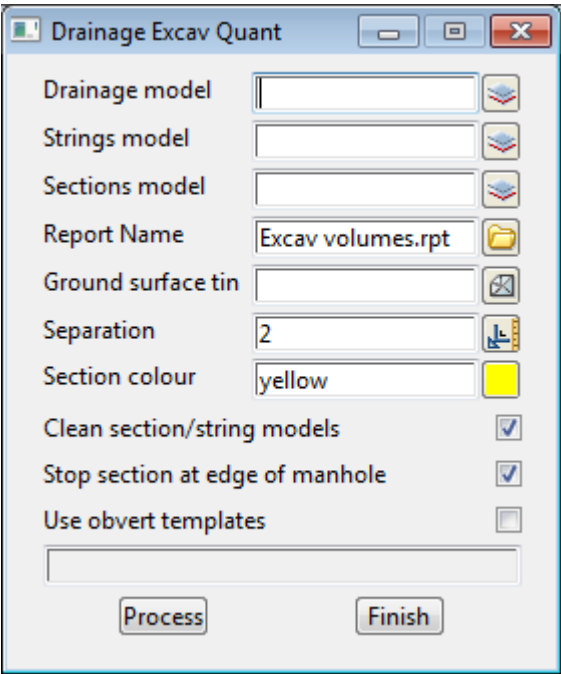

- 1. One template for each pipe size (mm)
- 2. If obvert templates are used, add the prefix “obvert “ to the pipe size
- 3. Carefully consider the tin selected.

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. A sample template library is included in the 12d library in the file **pipe_template.tpl**. The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file.

If a tin is created from these strings then volumes by depth can be determined using

Design=>Volumes=>Exact=>Tin to tin

On selecting the **Excavation quantities** option, the **Drainage Excavation Quantities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model	input box		
<i>Model to contain all of the pit and pipe network to be worked on.</i>			
Strings model	model box		
<i>Strings generated from the templates will be stored in this model</i>			

- Sections model

model box

Sections generated from the templates will be stored in this model
- Report name

input box

cut and fill volumes will ne sent to this report
- Ground Surface Tin

tin box

tins from which the volumes will be calculated
- Separation

real box

distance between the sections
- Sections colour

colour box

Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)
- Clean section/strings model

tick box

Delete the strings in these models before processing.
- Stop section at edge of pit

tick box

Template are run from pit centre to centre if this is not selected. The templates stop at the edge of the pit if selected. This is often selected with the following option **Use obvert templates**.
- Use obvert templates

tick box

Templates must be named with the prefix “obvert”. i.e. **obvert 300**. The template is still run along the invert of the pipe but the user now has a section “set” of templates that can be used to create a tin on top of the pipe as well as below.

An example report file follows.

```
----- BEGIN APPLY TEMPLATE REPORT -----

apply template to string report -

string      E
tin         design
separation  10.000

Pit Schedules

See Also

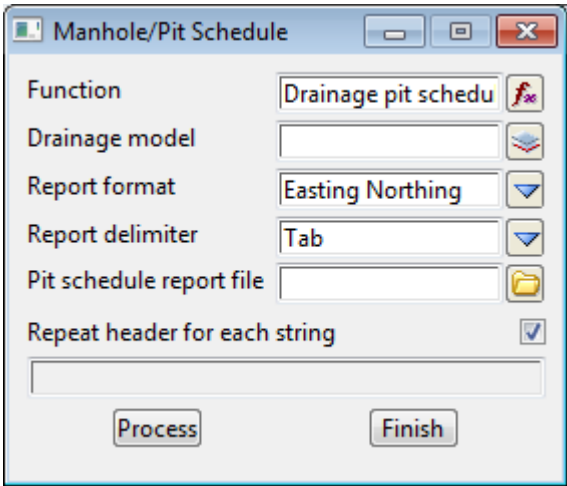

Selecting design string or tin?
Drainage overview

Usage

Position of option on menu: **Design => Drainage => Reports => Pit schedule**

This routine prints the calculations from the last time Set Pit Details was selected in the [Drainage Network Editor](#).

On selecting the Pit schedule option, the **Manhole/Pit Schedule** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model name <i>model containing the drainage strings</i>	input box	drainage network	
Pit schedule file name <i>file to be created</i>	input box	pit report	
Report Format <i>file format</i>	choice box	Road chainge.,Easting...	
Data delimiter <i>tab delimiters are best for spreadsheets and space for some text editors</i>	choice box	Tab, Space	
Repeat header for each line <i>when selected, the column headings will be printed each drainage line</i>	tick box	selected	
Process <i>Create the pit report</i>	button		
Finish <i>remove the panel from the screen</i>	button		

Notes:

The columns of data may be separated by spaces or a tab. (tab is used for spreadsheet transfers). The internal width and length data are retrieved from the **drainage.4d** file for the pit type specified. If you want a longer description for the pit then the type used inside 12d this can also be entered in the drainage.4d file. The remarks for each pit are entered as user defined pit attribute named **remarks** and may be set using the attribute editor (on the drainage menu) or via a spreadsheet.

A/7	5152.699	7322.036	29.241	d0027.450

Notes

The Set pit details must be run at least once to before printing the report. If the pits are moved or the designed strings changed then this option must re run.

The easting northing data obtained for the **road design string** option is obtained by dropping the pit centre

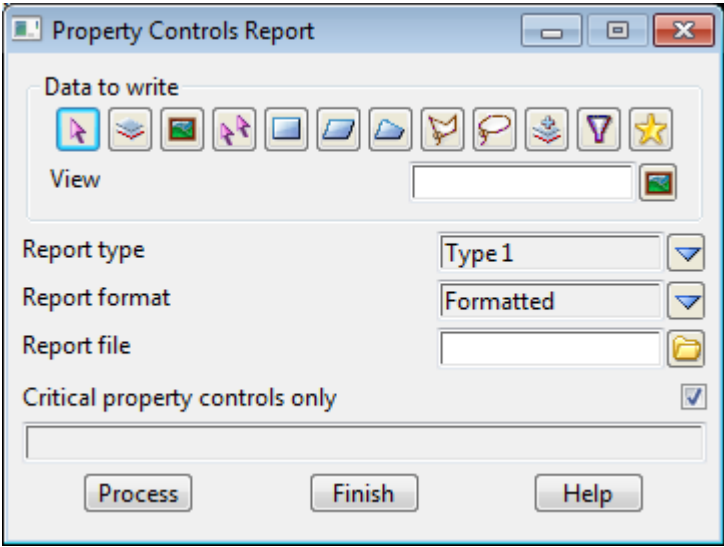

perpendicular onto the selected road design string. This data is stored as pit attributes **setout x** and **setout y**. It is calculated when the **Set Pit Detail** is selected in the [Drainage Network Editor](#).

Property Controls

Position of menu: **Design =>Drainage-Sewer=>Reports=>Property Controls**

The property controls report contains information about all the property controls for the selected drainage strings, and if required, denote the critical property control for a lot.

On selecting **Property controls**, the **Property Controls Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

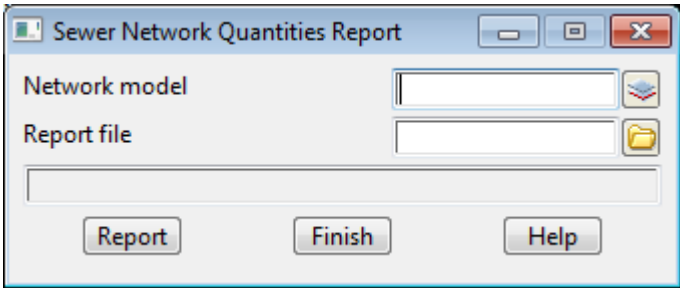

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>			
Data source <i>data source for the drainage strings to process.</i>			
Format <i>format for the property control report.</i>	choice box	ascii	ascii, excel spread sheet
Report file <i>name of the file for the report.</i>	file box		
Critical property controls only <i>if tick, only the critical property controls are reported.</i>	tick box	tick	
Process <i>run the option.</i>	button		

Barwon Quantities

The report generated from this option includes

- s the lengths of each pipe type for each line and the total length for each pipe type for all pipes in the network.
- s the quantity of concrete used for the manholes in the network.
- s the number and type of house connections in the network, including caps, bends and bushes.

After selecting the **Barwon quantities** option, the **Sewer Network Quantities Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model <i>model containing the sewer strings.</i>			available models
Report file <i>name of the file for the report.</i>	file box		
Report <i>run the option.</i>	button		

Barwon House Connections

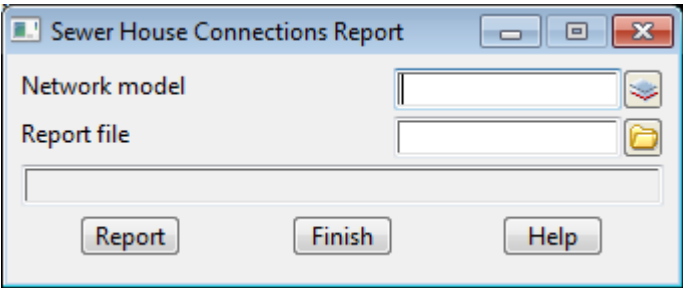

Position of menu: Design =>Drainage-Sewer=>Reports=>House connections

The house connections report contains information about all the house connections for the selected drainage (sewer) strings.

The house connection report includes for each house connection (branch) the

- s name of the sewer line
- s downstream manhole for the house connection
- s lot name
- s house connection number and type
- s chainage of the house connection
- s the invert level at the end of the house connection (IL branch)
- s the invert level of the house connection at the sewer pipe (IL sewer)
- s the drop over the house connection (branch depth)

On selecting **House connections**, the **Sewer House Connections Report** panel is displayed.

The fields and buttons used in this panel have the following functions.

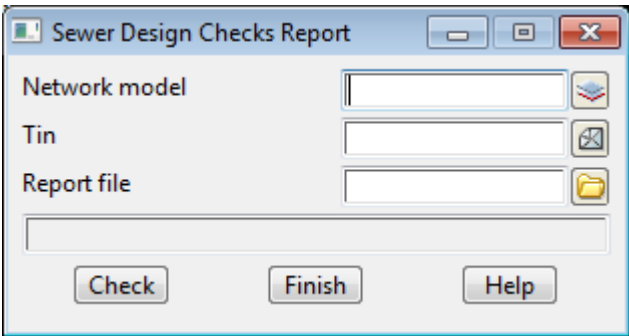

Field Description	Type	Defaults	Pop-Up
Network model <i>model containing the sewer strings.</i>			available models
Report file <i>name of the file for the report.</i>	file box		
Report <i>run the option.</i>	button		

Barwon Design Checks

The report generated from this option includes the design checks

- s network validations (checks that there are strings, no closed loops)
- s manholes don't have negative drops
- s other sewer lines connecting in don't have negative drops
- s sewers flows downhill with a minimum grade
- s manholes are not too close together (i.e. on top of each other)
- s a minimum cover for each sewer line
- s block controls are above the pipe invert level

After selecting the **Design checks** option, the **Sewer Design Checks Report** panel is displayed

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Network model <i>model containing the sewer strings.</i>			available models

Barwon Services Report

For each sewer string in the network, this option generates a report which includes the

- s section through any tins on the section view
- s name and model of any services in the corridor defined by the section view
- s co-ordinates and chainages of the parts of the service in the corridor, and the chainage and offset for each of the point of the parts projected onto the sewer centre-line.
- s clearance at the point where any service goes under or over the sewer string.

After selecting the **Services report** option, the **Sewer Services Report** panel is displayed

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Network model	<i>model containing the sewer strings.</i>			available models
Section view	<i>section view defining the corridor and service models.</i>			available section views
Report file	<i>name of the file for the report.</i>	file box		
Report	<i>run the option.</i>	button		

Drainage Plots

Position of menu: Design =>Drainage-Sewer=>Plots

Currently the **Plots** menu contains an option to produce a long section including any HGL values, flows and user defined attributes read in from other sources, and a second option to output the network to Melbourne Water's sewer format.

The **Plots** walk-right menu is

The options **Longsections** and **Melbourne Water** will now be described in more detail.

For the option *Long sections*, please continue to the section [Drainage Longsections](#).

Melbourne Water, please continue to the section [Melbourne Water](#).

Plan annotations, please continue to the section

Long plot cut labels and manholes, please continue to the section

Drainage Longsections

Position of menu: Design =>Drainage-Sewer=>Plots=>Longsections

The **Longsections** option is used to generate the longsection plots for all lines in a drainage network.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the drainage lines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

Hence the drainage lines are plotted one after another on one or more plotter sheets.

The drainage lines are plotted in string name alphabetical order.

The drainage longsection plot includes

- s the manholes, drainage pipe and any house connections
- s the height of the finished surface at the manhole
- s manhole names and cover types
- s distances between manholes
- s the invert depth of the pipe on either side of a manhole
- s the grades and types of the pipes
- s any services in the corridor - including their name, invert level and distance from the nearest downstream manhole
- s if the information exists, the velocity, flow, HGL values and diagram

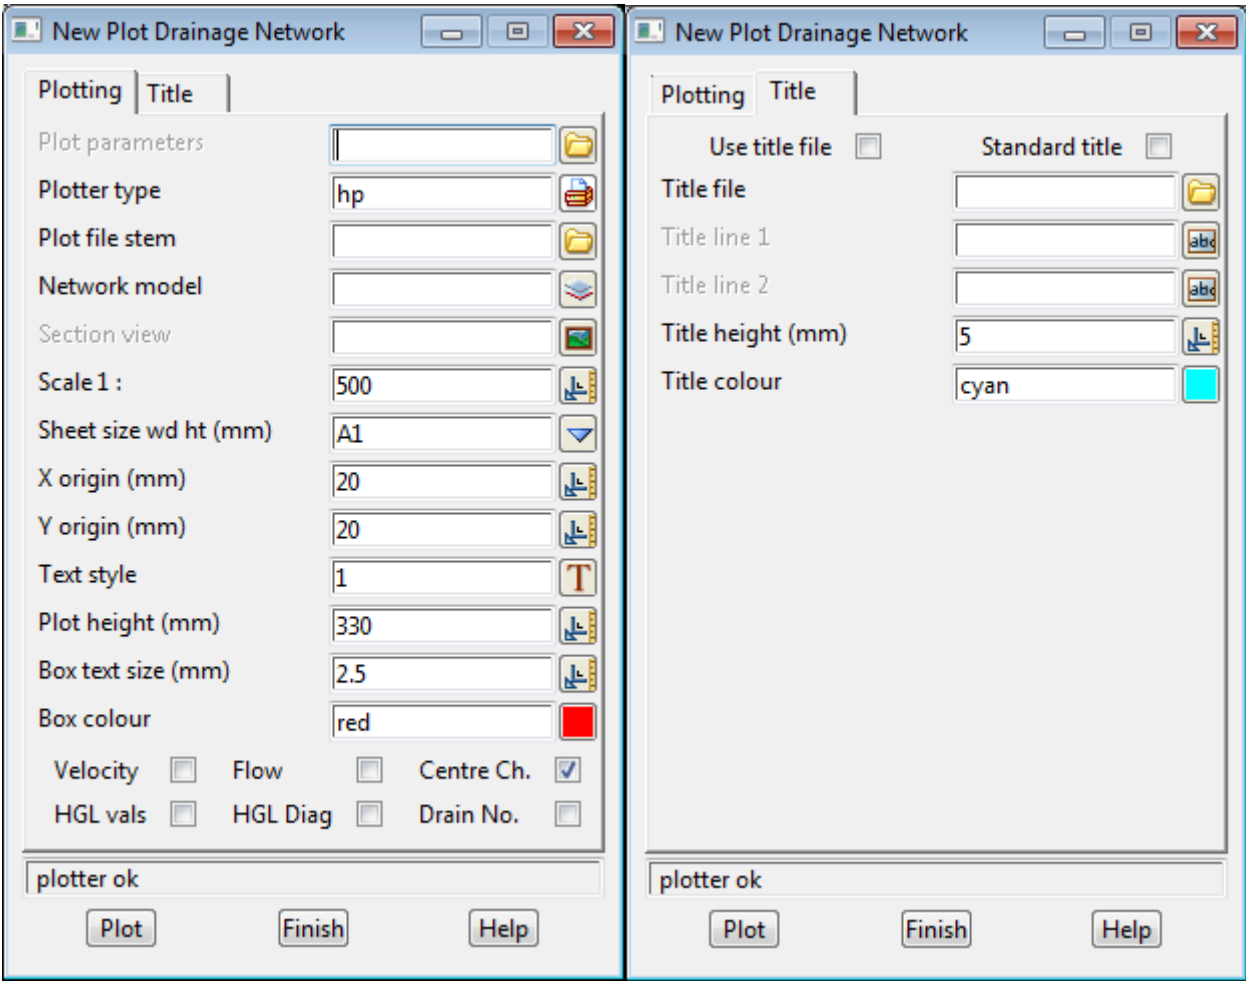

After selecting the **Longsections** option, the **New Plot Drainage Network** panel is displayed.

The drainage long section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

DRAINAGE_PPF_4D path name of default .ppf file

In the path name to the default .ppf file, \$LIB is used to stand for the library folder set by LIB_4D. For example, "\$LIB/drainage.ppf" is the file drainage.ppf in the library area.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **Title** button is selected, the **drainage plot title** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	input		*.ppf
<i>file of plot parameters used for extra control of the long section plot.</i>			
Plotter type	input	hp	model, windows, hp, dxf, postscript etc.
<i>format for the plot output.</i>			
Network model	input		
<i>the model containing all the drainage lines for the network.</i>			
Section view	input		
<i>the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.</i>			

Plot file stem	input		
<i>since more than one plot page may be produced, the plot file names are constructed from the stem plus a plot page sequence number, followed by the appropriate plotter type ending.</i>			
Scale 1:	input		
<i>horizontal scale for plotting the drainage long section. The vertical exaggeration is taken from the section view given in the section view field.</i>			
Sheet size wd ht (mm)	input		available sheet sizes
<i>the width and height values (separated by space) or the name of a user defined sheet size.</i>			
X origin (mm)	input		
<i>the x position on the plot sheet for the bottom left hand corner of the longsection plots. Same as left_margin in the plot parameter file.</i>			
Y origin (mm)	input		
<i>the y position on the plot sheet for the bottom left hand corner of the longsection plots. Same as bottom_margin in the plot parameter file.</i>			
Text style	input	1	available text styles
<i>the default text style to use in the longsection plot.</i>			
Plot ht (mm)	input		
<i>the maximum allowable height for a longsection plot for a drainage line. Datum breaks are applied to any part of the longsection that will not fit into the plot ht</i>			
Box text size (mm)	input	3	
<i>size (in millimetres) to plot the chainages, heights etc. in the boxes in the plots of the drainage longsections</i>			
Box colour	input	cyan	available colours
<i>colour used for the text and the boxes.</i>			
Velocity	tick box	tick	
<i>if tick, the velocity values for the pipes are drawn on the longsection plot.</i>			
Flow	tick box	tick	
<i>if tick, the flow values for the pipes are drawn on the longsection plot.</i>			
Centre CH.	tick box	tick	
<i>if tick, the road centre line chainages are drawn on the longsection plot.</i>			
HGL vals	tick box	tick	
<i>if tick, the HGL values for the pipes are drawn on the longsection plot.</i>			
HGL diag	tick box	tick	
<i>if tick, lines joining the HGL values for the pipes are drawn on the longsection plot.</i>			
Drain No.	tick box	tick	
<i>if tick, the drainage line names are drawn on the longsection plot.</i>			
Plot	button		
<i>plot the drainage longsections for the drainage lines in the model given in the network model field.</i>			
The fields and buttons in the <i>title</i> tab are			
Use title file	tick box		

if **tick**, a user defined title block file is used.

Standard Title	tick box	tick	
if tick , the standard 12d Model border and two lines of title are placed on the bottom of the plot			
Title file	input	*.tf	
if non-blank and use title file is set to tick , then the file given in this field is used to generate a user defined title block for the plot.			
Title line 1/2	input		
first/second line of title information			
Title height (mm)	input	5	
height (in millimetres) to draw the characters in the two lines of title information.			
Title colour	input	cyan	available colours
colour used for the border and the title information.			

Please continue to the next section [Drainage Longsection Plot Parameter File](#).

Drainage Longsection Plot Parameter File

The **Longsections plot** option is used to make special long section plots for a **network** of drainage strings.

Some of the look of the drainage long section plot can be controlled from the **plot drainage network** panel itself, however a wider selection of control parameters is available by using a drainage long plot, plot parameter file.

The drainage long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash **//** is considered to be a comment.

The set of all parameters for the drainage long section plot is enclosed within a set of curly brackets **{ }** with the header

```
drainage_long_plot "plot set name"
```

before the curly brackets.

That is,

```
drainage_long_plot "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one *drainage_long_plot* parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as *section_x_plot* in the same file. The other sets will be ignored when doing a drainage long section plot.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section [Plot Sheet Layout](#).

Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size          text          // sheet name, or
                    "mm   mm"      // sheet size: width  height
```

The sheet size name and width and heights can be specified by the user in a file named sheets.4d which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D      file          // file of plotter sheets sizes
```

The plotting area is restricted to within the plot sheet by giving the margins

```
left_margin         mm
right_margin        mm
top_margin          mm
bottom_margin       mm
```

The drainage long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

When a sheet is full, a follow on sheet is created.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, `x_origin` and `y_origin` which are the same as `left_margin` and `bottom_margin` respectively.

network_model	<i>text</i>	// model of drainage strings
x_origin	<i>mm</i>	// Position of the left hand bottom, // same as <i>left_margin</i> .
y_origin	<i>mm</i>	// corner of first plot in the bottom row, // same as <i>bottom_margin</i> .
only_one_line	<i>0</i>	// more than one row on a sheet
	<i>1</i>	// only one row of plot on a sheet
plot_height	<i>mm</i>	// total height of a plot row. // It includes the vertical_plot_gap.
horizontal_plot_gap	<i>mm</i>	// gap between plots on same row
vertical_plot_gap	<i>mm</i>	// gap between rows of plots, // also the size of the top area

drainage string name, boxes, below datum, arrow 1, bottom stagger, arrow 2, graph, arrow 3, top stagger, arrow 4, top.

The **drainage string name area** is where the name of the drainage string can be plotted.

The **boxes area** is where the chainages and various values for the drainage strings are labelled.

The **below datum area** is a region between the boxes area and the datum line.

The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.

The **graph area** is the area where the actual plots of the strings are drawn.

The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.

The **top area** is an annotation area above the arrow 4 area and is used for bubbles, manhole names (pit names), junctions, deflection angles etc.

The areas and the information in them will now be described in more detail.

Labelling the Drainage String Name on the Plot

The plot can be labelled with the name of the drainage string under the boxes area.

The name is made up of concatenation the text strings:

plot_name_pre_text drainage-string-name plot_name_post_text

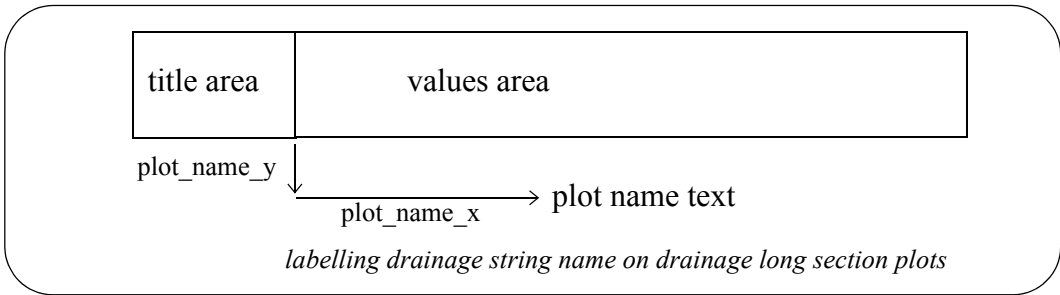

The plot name is positioned under the boxes.

plot_name_mode	0	// don't use the drainage string name
	1	// use the drainage string name in the
		// label
plot_name_pre_text	text	
plot_name_post_text	text	
plot_name_textstyle	textstyle	
plot_name_text_size	mm	
plot_name_text_colour	colour	
plot_name_x	mm	
plot_name_y	mm	

The *plot_name_x* is measured from the beginning of the height boxes.

The default for *plot_name_x* is centred on the values area.

The *plot_name_y* is measured from the bottom of the box area with positive being **down**.

Example of Labelling Drainage String Name

plot_name_pre_text	"Drainage Long Section Plot for String"
plot_name_mode	1
plot_name_post_text	""
plot_name_text_size	15
plot_name_text_colour	red
plot_name_textstyle	ISO
plot_name_y	30

Boxes Area

Many of the drainage string values (invert levels and depth, hgl values, natural and finished surface etc.) can be labelled in the boxes area at the bottom of the drainage long section plot.

Each type of information is plotted in a row made up of a title, and the actual values given at the chainage of each pit in the drainage string.

Each row of information is surrounded by lines to form a box, and the stacked boxes form the boxes area at the bottom of the drainage plot.

The **title** for the information, is drawn in the **title area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

title followed by the **values** along the drainage string.

The **titles area** for the left plot in the bottom row starts at the co-ordinate (*x_origin,y_origin*) and each row is begun by adding the distance *plot_height* to the *y_origin* (see previous section).

The width of the **title area** is given by the **box_width** parameter and the height of each box is given by **box_height**.

box_width	mm	// width of the label boxes.
box_height	mm	// height of each box

The colour of the box line work is given by:

box_colour	colour	// colour of the lines in the boxes
------------	--------	-------------------------------------

A default text size and colour can be specified for the title text and the values, or sizes, colours and text styles can be given for each individual box (given later in this section).

title_box_text_size	mm	// size of title text in boxes
title_box_text_colour	colour	// colour of title text in boxes
box_text_size	mm	// size of value text in boxes
box_text_colour	colour	// colour of values in boxes

The values text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (*box_text_left_justify*).

The values text can be on the left, right or centred on the uprights and is given by the parameter *box_text_side*.

The width of the values area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing (see next section).

box_text_left_justify	0	// top justify text in values area
	1	// bottom justify text in values area
box_text_side	0	// left (default)
	1	// right
	2	// centre

The default order of the boxes from the bottom up is

- 0. drainage string chainages
- 1. road centre line chainages - user choice
- 2. natural surface heights - user choice
- 3. finished surface heights - user choice
- 4. before pit and after pit invert levels
- 5. before pit and after pit hgl values - user choice
- 6. before pit and after pit depth to inverts - user choice

There are parameters to change the order for 1-6.

Drainage string chainages is fixed at the bottom (box 0) but what is in the boxes above box 0 is can be set by the box_n parameters:

box_n	number_from_list	// the n'th box above the drainage string
		// chainages will contain given item number
		// form the list.

For example, to have *finished surface heights* in the first box the drainage string chainages, use:

box_1	3	// the (1) will be replaced by (3)
-------	---	------------------------------------

chainage_box_size	mm	// box height for chainage box
centre_chainage_box_size	mm	// box height for centre chainage box
surface_box_size	mm)	// box height for surface box
f_surface_box_size	mm	// box height for finished surface box
invert_height_box_size	mm	// box height for invert height box
hgl_box_size	mm	// box height for hgl box
invert_depth_box_size	mm	// box height for invert depth box

The default for each box size is *box_height*

The boxes (1), (2), (3) and (5) can be suppressed by the parameters

draw_centre_chainage	0/1	// 0 = don't have centre line chainages
----------------------	-----	-----------------------------------------

		// box
draw_ns_text	0/1	// 0 = don't draw ns values from // ns tin for drainage string
draw_fs_text	0/1	// 0 = don't draw fs values from // fs tin or top of manhole // for drainage string
draw_fs_mode	0	// 0 = fs_text is from fs tin
	1	// 1 = fs_text is top of manhole
draw_hgl_value	0/1	// 0 = don't have hgl value boxes

The definition of depth to invert and whether box (6) is suppressed or not, are given by the parameter *depth_mode*:

depth_mode	0	// don't draw depth to invert values
	1	// draw depth to invert values to fs tin // for drainage string
	2	// draw depth to invert values to top of // manhole for drainage string
	3	// draw depth to invert values to ns tin // for drainage string

The default for the number of decimal places used in the values in the boxes is:

number_of_decimals	<i>integer</i>	// default number of decimal places
--------------------	----------------	-------------------------------------

The text, size, colour and textstyle for the title text and values text for each box can be set by

(0) drainage string chainages

plot_title_chainage_name	<i>text</i>	// first line of title for chainages box
plot_title_chainage_name_2	<i>text</i>	// second line of title for chainages box
chainage_title_colour	<i>colour</i>	// colour of text
chainage_title_text_size	<i>mm</i>	// size of title in chainage box
chainage_title_textstyle	<i>textstyle</i>	// textstyle for title in chainage box
chainage_text_colour	<i>colour</i>	// colour of chainage values
chainage_text_size	<i>mm</i>	// size of values
chainage_textstyle	<i>textstyle</i>	// textstyle of values
chainage_decimals	<i>integer</i>	// number of decimal places in chainage

(1) road centreline chainages

plot_title_centre_chainage_name	<i>text</i>	// title for road centre // line chainages box
plot_title_centre_chainage_name_2	<i>text</i>	// second line of title for road // centre line chainages box
chainage_title_colour_cl	<i>colour</i>	// colour of text
chainage_title_text_size_cl	<i>mm</i>	// size of title in cl box
chainage_title_textstyle_cl	<i>textstyle</i>	// textstyle for title
chainage_text_colour_cl	<i>colour</i>	// colour of cl values
chainage_text_size_cl	<i>mm</i>	// size of values
chainage_textstyle_cl	<i>textstyle</i>	// textstyle of values
chainage_cl_decimals	<i>integer</i>	// number of decimal places in chainage cl

(2) natural surface values

plot_title_surface_name	<i>text</i>	// title for the drainage ns values box
plot_title_surface_name_2	<i>text</i>	// second line of title for drainage ns values
ns_title_colour	<i>colour</i>	// colour of text
ns_title_text_size	<i>mm</i>	// size of title in ns box
ns_title_textstyle	<i>textstyle</i>	// textstyle for title
ns_text_colour	<i>colour</i>	// colour of ns values
ns_text_size	<i>mm</i>	// size of values

ns_textstyle	<i>textstyle</i>	// textstyle of values
ns_decimals	<i>integer</i>	// number of decimal places in ns

(3) finished surface values

plot_title_finished_name	<i>text</i>	// title for the drainage fs values box
plot_title_finished_name_2	<i>text</i>	// second line of title for drainage fs values
fs_title_colour	<i>colour</i>	// colour of text
fs_title_text_size	<i>mm</i>	// size of title in fs box
fs_title_textstyle	<i>textstyle</i>	// textstyle for title
fs_text_colour	<i>colour</i>	// colour of ns values
fs_text_size	<i>mm</i>	// size of values
fs_textstyle	<i>textstyle</i>	// textstyle of values
fs_decimals	<i>integer</i>	// number of decimal place in fs

(4) invert levels

plot_title_invert_name	<i>text</i>	// title for the invert levels box
plot_title_invert_name_2	<i>text</i>	// second line of title for the invert levels box
il_title_colour	<i>colour</i>	// colour of text
il_title_text_size	<i>mm</i>	// size of title in il box
il_title_textstyle	<i>textstyle</i>	// textstyle for title
il_text_colour	<i>colour</i>	// colour of il values
il_text_size	<i>mm</i>	// size of values
il_textstyle	<i>textstyle</i>	// textstyle of values
il_decimals	<i>integer</i>	// number of decimal places in il

(5) hgl values

plot_title_hgl_name	<i>text</i>	// title for hgl values box
plot_title_hgl_name_2	<i>text</i>	// second line of title for hgl values box
hgl_title_colour	<i>colour</i>	// colour of text
hgl_title_text_size	<i>mm</i>	// size of title in hgl box
hgl_title_textstyle	<i>textstyle</i>	// textstyle for title
hgl_text_colour	<i>colour</i>	// colour of hgl values
hgl_text_size	<i>mm</i>	// size of values
hgl_textstyle	<i>textstyle</i>	// textstyle of values
hgl_decimals	<i>integer</i>	// number of decimal places in hgl

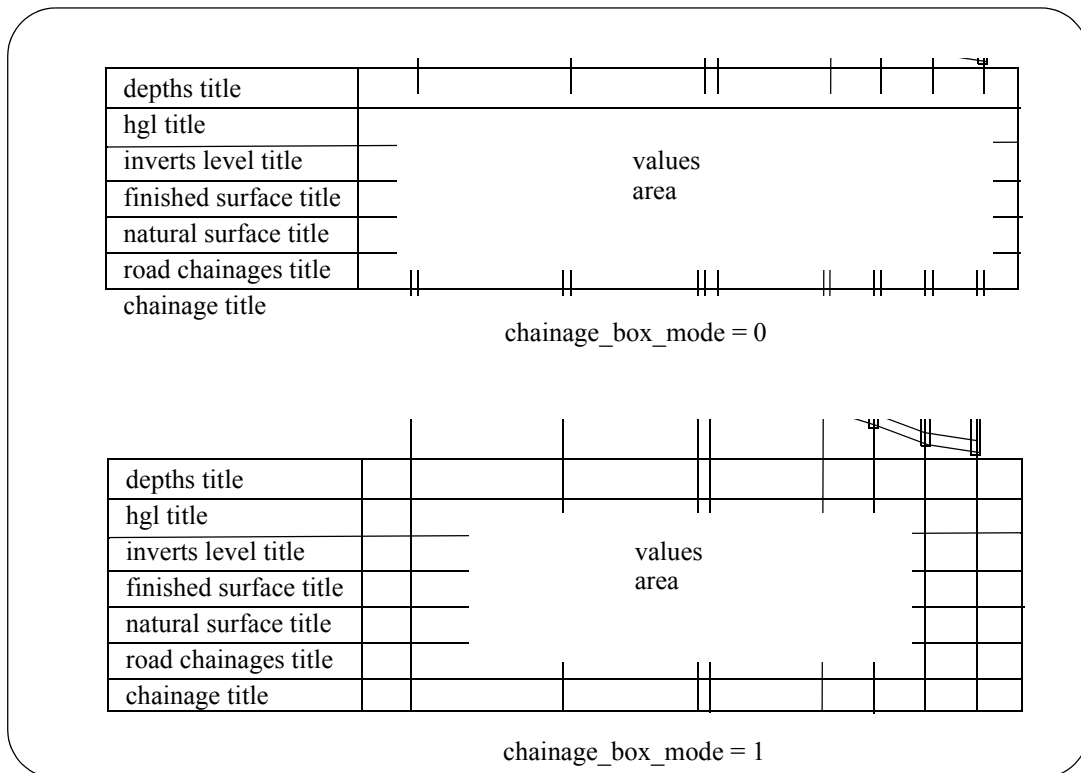

(6) depths

plot_title_depth_name	<i>text</i>	// title for depth of inverts box
plot_title_depth_name_2	<i>text</i>	// second line of title for depth of inverts box
depth_title_colour	<i>colour</i>	// colour of text
depth_title_text_size	<i>mm</i>	// size of title in depth box
depth_title_textstyle	<i>textstyle</i>	// textstyle for title
depth_text_colour	<i>colour</i>	// colour of depth values
depth_text_size	<i>mm</i>	// size of values
depth_textstyle	<i>textstyle</i>	// textstyle of values
depth_decimals	<i>integer</i>	// number of decimal places in depth

Drawing the Boxes

The bottom line from the boxes can be drawn or not drawn:

```
chainage_box_mode      0                // don't draw the bottom line
                      1                // draw all the box line work - default
```

A box can be drawn/not drawn around the title area of the boxes area.

draw_box_mode	0	// don't draw the title area box
	1	// draw the title area box, no lines - default
	2	// draw title box area with lines

Chainages and Uprights

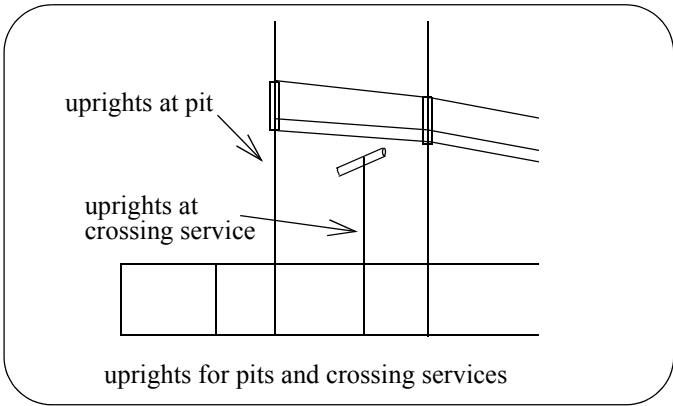

The chainage box contains drainage string chainages for

- (a) the chainages of each pit in the drainage string
- (b) the chainages on the drainage string where any strings in models on the section view are cut by the drainage string (crossing services)

For a **pit**, the invert levels, depths, finished and natural surface levels, and hgl of pipes at a pit can all labelled at the chainage of the pit.

For a **crossing service**, the level of the crossing service and the chainage on the drainage string where the crossing occurs are labelled.

Note - crossing services can also be labelled using cuts of drainage line through strings. However, this does not create a chainage in the chainage box.

Uprights, or leader lines, can be drawn from the chainage values at the bottom of the boxes to the pit in the graph area, and from the top of the pit to the top area.

Using the parameters *uprights_top_mode* and *uprights_bottom_mode*, it is possible to suppress the drawing from the top of the pit to the top area, and also from the top of the boxes to the bottom of the boxes.

<code>uprights_top_mode</code>	<code>0</code>	// stop at top of pit
	<code>1</code>	// go to top area (default)
<code>uprights_bottom_mode</code>	<code>0</code>	// stop at top of boxes
	<code>1</code>	// go to bottom of boxes (default)

Also uprights can be drawn from the chainage values bottom of the boxes to the crossing service in the graph area.

The chainage values at the uprights for the pits can be running chainage along the drainage string, pipe length chainages (i.e. the chainage starts at zero for each pipe) or both.

chainage_mode	0	//pipe length chainage
	1	// running chainage
	2	// both pipe length and running

If the *chainage_mode* includes "pipe length chainage" (modes 0 and 2), the pipe length can either be labelled with a 0.0 chainage at the start pit for the pipe and the pipe length at the end pit, or just have the length centred between the two pits.

centre_pipe_length	0	// default - 0 at start pit, length at end pit
	1	// centre pipe length

The chainage values for the crossing services can be running chainage along the drainage string, chainage length from the previous pit (i.e. the chainage starts at zero at the previous pit) or both.

service_chainage_mode	0	//pipe length chainage
	1	// running chainage
	2	// both pipe length and running

The colour of the uprights for the pits and crossing services are given by:

manhole_line_colour	<i>colour</i>	// colour of uprights to the pits
service_line_colour	<i>colour</i>	// colour of upright to the crossing
		// services

The crossing services are labelled with the drainage string chainage of the crossing point, the invert level of the service at the crossing and the name of the service which is made up of:

service diameter name of service invert level at the service at the crossing.

The service label is drawn the distance *service_name_y* below the crossing point:

service_name_y	<i>mm</i>	// def 1, distance of label below crossing point
----------------	-----------	--------------------------------------------------

The colours, text styles and sizes of the service information is specified by:

service_ch_text_colour	<i>colour</i>	// colour of services ch text
service_ch_text_size	<i>mm</i>	// size of services ch text
service_ch_textstyle	<i>mm</i>	// textstyle of services ch text
service_il_text_colour	<i>colour</i>	// colour of services il text
service_il_text_size	<i>mm</i>	// size of services il text
service_il_textstyle	<i>mm</i>	// textstyle of services il text
service_name_text_colour	<i>colour</i>	// colour of services name
service_name_text_size	<i>mm</i>	// size of services name
service_name_textstyle	<i>mm</i>	// textstyle of services name
service_name_decimals	<i>integer</i>	// number of decimal is il in name

A **finished surface** value or **top of manhole** value can also be written vertically along the uprights.

Whether the value is finished surface level or top of manhole level, the values position, size, colour etc. is controlled by the parameters:

```
draw_fs_vertical      0          // don't draw fs vertical values
                      1          // always draw values
                      2          // only draw values when different -see
                              // draw_fs_vertical_mode

draw_fs_vertical_mode 0          // the fs value is the value from the fs tin
                              // for the drainage string.
                              // When draw_fs_vertical is 1,
                              //  always draw the fs value.
                              // When draw_fs_vertical is 2,
                              //  only draw fs_value when it is
                              //  different from the top of manhole value
                      1          // the fs value is the top of manhole
                              // for the drainage string.
                              // When draw_fs_vertical is 1,
                              //  always draw the fs value.
                              // When draw_fs_vertical is 2,
                              //  only draw fs_value when it is
                              //  different from the value of the fs tin.
```

		draw_fs_vertical_mode	
		0	1
draw_fs_vertical	0	nothing	nothing
	1	fs tin	top of manhole
	2	fs tin when different from top of manhole	top of manhole when different from fs tin

```
fs_vertical_pre_text  text          // text before the vertical fs value
fs_vertical_post_text text          // text after the vertical fs value
fs_vertical_decimals  integer       // number of decimals in vertical fs
fs_vertical_colour    colour        // colour of the vertical fs text
fs_vertical_size      mm            // size of the vertical fs text
fs_vertical_textstyle textstyle     // textstyle of the vertical fs
fs_vertical_x         mm            // x adjustment to position of text
fs_vertical_y         mm            // y adjustment to position of text
```

Staggering of Chainages and Uprights

If the text values are placed at the real chainage positions at the bottom of the plot, text over writing can easily occur if the chainages are very close together.

To prevent such over writing, the text can be **staggered**.

That is, if the text is going to over write a previous text value, the next text value is actually moved along until there is no over writing.

Since the text is no longer at the correct chainage position, the uprights to the pits and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the drainage plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

And there is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

stagger_height_1	mm	// distance from the top of arrow_area_1 // to the start of the staggers
stagger_height_2	mm	// distance over which stagger occurs
stagger_gap_bottom	mm	// distance from end of staggers to the // bottom of arrow_area_2

The stagger area above the graph area is defined

stagger_gap_top	mm	// distance from the top of arrow_area_3 // to the start of the staggers
stagger_height_3	mm	// distance over which stagger occurs
stagger_height_4	mm	// distance from end of staggers to the // bottom of arrow_area_4

The distance to be left for text to avoid over writing is:

horizontal_text_gap	mm	// minimum distance to leave for text // after pit values
service_text_gap	mm	// minimum distance to leave for text // after service values

When staggering occurs, it is possible for the values area to be longer than the graph area.

Arrow Areas

Apart from information labelled in the boxes and top areas, the drainage long section plot can place arrows between pits for other information such as

- (a) pipe grade or slope
- (b) pipe diameter
- (c) velocity
- (d) flow
- (e) drainage line name
- (f) user defined pipe attributes

A specific arrow area is defined for each set of arrows.

The **arrow areas** are designed for drawing and labelling arrows between pits.

All the values refer to pipes connecting adjacent pits and the relevant pipe is indicated by drawing an arrow between the uprights from the chainage text to the pits.

Because staggering of the chainage text can occur, the position of the uprights to draw the arrows between can vary depending on whether the arrow is above or below a stagger area.

Hence, there are four arrow areas:

arrow area 1 which is below the graph and the bottom stagger area. The arrows go between the *staggered* chainage positions of the pits.

The datum line is at the bottom of arrow 1 area.

arrow area 2 which below the graph but above the bottom stagger area. Hence the arrows go between the *non-staggered* chainage positions of the pits.

arrow area 3 which is above the graph but below the top stagger area. The arrows go between the *non-staggered* chainage positions of the pits.

arrow area 4 is above the graph and the top stagger area. The arrows go between the *staggered* chainage positions of the pits.

The heights of the four areas (which can be zero) are defined by:

arrow_area_1	mm	// height of arrow_1 area
arrow_area_2	mm	// height of arrow_2 area
arrow_area_3	mm	// height of arrow_3 area
arrow_area_4	mm	// height of arrow_4 area

The parameters for controlling the arrows between manholes and associated text for the values of pipe slope, pipe diameter, flow, velocity, drainage line name and user defined pipe attributes are now given.

Each set of parameters has an arrow_mode with the following values:

..._arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line

Parameters for the Arrows for Grades of the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_grade	0	// don't draw pipe grade
	1	// draw pipe grade
pipe_grade_arrow_area	m	// the arrow area for the arrows
		// m = 1,2,3 or 4
pipe_grade_y	mm	// distance that the arrow is above the
		// bottom of the arrow area.

For the arrow, the value of the grade can be specified as either **1 in** or **percent** grade:

percentage_grade	0	// the value is a "1 in" grade
	1	// the value is a percent grade

Parameters for the title text on the left hand side of the plot:

pipe_grade_title	text	//title on the left hand side of the arrow
pipe_grade_title_textstyle	textstyle	// textstyle of the title
pipe_grade_title_text_size	mm	// size of the title
pipe_grade_title_text_colour	colour	// colour of the title
pipe_grade_title_offset	mm	//distance to raise or lower the text
		// from the arrow position
pipe_grade_title_x	mm	// distance from the left hand side of the
		// plot

Parameters for the arrow type:

pipe_grade_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_grade_arrow_colour	colour	// colour of the arrow
pipe_grade_arrow_size	mm	// height of the arrow
pipe_grade_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_grade_arrow_pre_text	text	// text before the arrows text
pipe_grade_arrow_post_text	text	// text after the arrows text
pipe_grade_arrow_decimals	integer	// The number of decimal places used
		// when writing out the pipe grade
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed after the
		//decimal point.
pipe_grade_arrow_textstyle	textstyle	// textstyle of arrow text
pipe_grade_arrow_text_size	mm	// size of the text
pipe_grade_arrow_text_colour	colour	// colour of the text
pipe_grade_arrow_text_offset	mm	// distance to raise or lower the text
		// from the arrow position

Parameters for the Arrows for Diameters of the Pipes

The diameter of the drainage pipes can be plotted between each pit.

Inside 12d Model, the pipe diameter is given a world units (usually metres), but on the diameter arrow, the diameter is multiplied by 1000 and written out as an integer value. This is normally millimetres.

For diameters entered in feet and the plot diameter to be in inches, the following parameter should be set

pipe_diameter_scale_factor 12. // default is 1000.

Parameters specifying the arrow area used and the position of the pipe diameter arrows.

draw_pipe_diameter	0	// don't draw pipe diameter
	1	// draw pipe diameter
pipe_diameter_arrow_area	m	// the arrow area for the arrows
		// m = 1,2,3 or 4
pipe_diameter_y	mm	// distance that the arrow is above the
		// bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_diameter_title	text	// title on the left hand side of the arrow
pipe_diameter_title_textstyle	textstyle	// textstyle of the title
pipe_diameter_title_text_size	mm	// size of the title
pipe_diameter_title_text_colour	colour	// colour of the title
pipe_diameter_title_offset	mm	// distance to raise or lower the text
		// from the arrow position
pipe_diameter_title_x	mm	// distance from the left hand side of the
		// plot

Parameters for the arrow type:

pipe_diameter_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_diameter_arrow_colour	colour	// colour of the arrow
pipe_diameter_arrow_size	mm	// height of the arrow
pipe_diameter_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_diameter_arrow_pre_text	text	// text before the arrows text
pipe_diameter_arrow_post_text	text	// text after the arrows text

On the arrow, the pipe type can be also plotted after the pipe_diameter_arrow_post_text:

pipe_type_mode	0	// don't include the pipe type
	1	// include the pipe type after the
		// post_text
pipe_diameter_arrow_textstyle	textstyle	// textstyle of arrow text
pipe_diameter_arrow_text_size	mm	// size of the text
pipe_diameter_arrow_text_colour	colour	// colour of the text
pipe_diameter_arrow_text_offset	mm	// distance to raise or lower the text
		// from the arrow position

Parameters for the Arrows for Velocity in the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_velocity	0	// don't draw pipe velocity
	1	// draw pipe velocity
pipe_velocity_arrow_area	m	// the arrow area for the arrows
		// m = 1,2,3 or 4
pipe_velocity_y	mm	// distance that the arrow is above the
		// bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_velocity_title	text	//title on the left hand side of the arrow
pipe_velocity_title_textstyle	textstyle	// textstyle of the title
pipe_velocity_title_text_size	mm	// size of the title
pipe_velocity_title_text_colour	colour	// colour of the title
pipe_velocity_title_offset	mm	//distance to raise or lower the text
		// from the arrow position
pipe_velocity_title_x	mm	// distance from the left hand side of
		// the plot

Parameters for the arrow type:

pipe_velocity_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_velocity_arrow_colour	colour	// colour of the arrow
pipe_velocity_arrow_size	mm	// height of the arrow
pipe_velocity_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_velocity_arrow_pre_text	text	// text before the arrows text
pipe_velocity_arrow_post_text	text	// text after the arrows text
pipe_velocity_arrow_decimals	integer	// The number of decimal places used
		// when writing out the pipe velocity
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed after the
		// decimal point.
pipe_velocity_arrow_textstyle	textstyle	// textstyle of arrow text
pipe_velocity_arrow_text_size	mm	// size of the text
pipe_velocity_arrow_text_colour	colour	// colour of the text
pipe_velocity_arrow_text_offset	mm	// distance to raise or lower the text
		// from the arrow position

Parameters for the Arrows for Flow in the Pipes

Parameters specifying the arrow area used and the position of the arrows.

draw_pipe_flow	0	// don't draw pipe flow
	1	// draw pipe flow
pipe_flow_arrow_area	m	// the arrow area for the arrows // m = 1,2,3 or 4
pipe_flow_y	mm	// distance that the arrow is above the // bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_flow_title	text	// title on the left hand side of the arrow
pipe_flow_title_textstyle	textstyle	// textstyle of the title
pipe_flow_title_text_size	mm	// size of the title
pipe_flow_title_text_colour	colour	// colour of the title
pipe_flow_title_offset	mm	// distance to raise or lower the text // from the arrow position
pipe_flow_title_x	mm	// distance from the left hand side of // the plot

Parameters for the arrow type:

pipe_flow_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_flow_arrow_colour	colour	// colour of the arrow
pipe_flow_arrow_size	mm	// height of the arrow
pipe_flow_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_flow_arrow_pre_text	text	// text before the arrows text
pipe_flow_arrow_post_text	text	// text after the arrows text
pipe_flow_arrow_decimals	integer	// The number of decimal places used // when writing out the pipe flow // If > 0, all trailing zeros after the // decimal place are removed. // If < 0, the absolute value is taken as // the number of decimal places and no // trailing zeros are removed after the // decimal point.
pipe_flow_arrow_textstyle	textstyle	// textstyle of arrow text
pipe_flow_arrow_text_size	mm	// size of the text
pipe_flow_arrow_text_colour	colour	// colour of the text
pipe_flow_arrow_text_offset	mm	// distance to raise or lower the text // from the arrow position

Parameters for the Arrows giving the Drainage Line Name

Parameters specifying the arrow area used and the position of the arrows.

draw_drainage_line	0	// don't draw drainage line arrow
	1	// draw drainage line arrow
drainage_line_arrow_area	m	// the arrow area for the arrows
		// m = 1,2,3 or 4
drainage_line_y	mm	// distance that the arrow is above the
		// bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

drainage_line_title	text	// title on the left hand side of the arrow
drainage_line_title_textstyle	textstyle	// textstyle of the title
drainage_line_title_text_size	mm	// size of the title
drainage_line_title_text_colour	colour	// colour of the title
drainage_line_title_offset	mm	// distance to raise or lower the text
		// from the arrow position
drainage_line_title_x	mm	// distance from the left hand side of
		// the plot

Parameters for the arrow type:

drainage_line_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
drainage_line_arrow_colour	colour	// colour of the arrow
drainage_line_arrow_size	mm	// height of the arrow
drainage_line_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

drainage_line_arrow_pre_text	text	// text before the arrows text
drainage_line_arrow_post_text	text	// text after the arrows text
drainage_line_arrow_textstyle	textstyle	// textstyle of arrow text
drainage_line_arrow_text_size	mm	// size of the text
drainage_line_arrow_text_colour	colour	// colour of the text
drainage_line_arrow_text_offset	mm	// distance to raise or lower the text
		// from the arrow position

Parameters for the Arrows for User Defined Pipe Attributes

There can be up to twenty sets of parameters which are used to define arrows for *user defined attributes* on the pipes.

Each *user defined attribute* is referred to by a given *user name* and it is this *user name* that is specified by a parameter and links the set of parameters to the information in the drainage string.

Note: *user defined attributes* on drainage pipes are usually set by special macros.

The parameters for the n'th set (n=1,2, ... 20) are:

Parameters specifying the pipe attribute used for this set of arrows and the arrow area used.

draw_pipe_attr_n	0	// don't draw nth set of arrows
	1	// draw the nth set of arrows
pipe_attr_n_name	text	// the name of the attribute to be labelled
		// on the n'th set of arrows
pipe_attr_n_arrow_area	m	// the arrow area for the arrows
		// m = 1,2,3 or 4
pipe_attr_n_y	mm	// distance that the arrow is above the
		// bottom of the arrow area.

Parameters for the title text on the left hand side of the plot:

pipe_attr_n_title	text	//title on the left hand side of the arrow
pipe_attr_n_title_textstyle	textstyle	// textstyle of the nth attribute's title
pipe_attr_n_title_text_size	mm	// size of the nth attribute's title
pipe_attr_n_title_text_colour	colour	// colour of the nth attribute's title
pipe_attr_n_title_offset	mm	//distance to raise or lower the text
		// from the nth arrow position
pipe_attr_n_title_x	mm	// distance from the left hand side of the
		// plot

Parameters for the arrow type:

pipe_attr_n_arrow_mode	0	// no arrow
	1	// arrow
	2	// line
	3	// line with uprights at ends
	4	// uprights, no line
	5	// line with downrights
	6	// downrights, no line
	7	// line with up and downrights at ends
	8	// up and downrights, no line
pipe_attr_n_arrow_colour	colour	// colour of the nth arrow
pipe_attr_n_arrow_size	mm	// height of the nth arrow
pipe_attr_n_arrow_gap	0	// no gap in arrow
	1	// leave gap in arrow for text

Parameters for the text on the arrow:

pipe_attr_n_arrow_pre_text	text	// text before the arrows text
pipe_attr_n_arrow_post_text	text	// text after the arrows text
pipe_attr_n_arrow_decimals	integer	// Only if the attribute is a real number.
		// The number of decimal places used
		// when writing out the value of the
		// attribute.
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed after the
		// decimal point.

pipe_attr_n_arrow_textstyle	<i>textstyle</i>	// textstyle of arrow text
pipe_attr_n_arrow_text_size	<i>mm</i>	// size of the text
pipe_attr_n_arrow_text_colour	<i>colour</i>	// colour of the text
pipe_attr_n_arrow_text_offset	<i>mm</i>	// distance to raise or lower the text
		// form the nth attribute's arrow position

Graph Area

The **graph area** is the area where the actual plots of the drainage strings are drawn.

The length of the graph area is determined by the length of the drainage string to be plotted, the horizontal scale (given by scale) of the plot and the sheet width.

```
scale          value          // 1:value - horizontal scale
                                   // The vertical scale is determined by the
                                   // horizontal scale and the vertical
                                   // exaggeration for the section view.
```

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

```
view_name      text
```

The tins to be sectioned through by the drainage strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is **calculated** by subtracting the height of the other nine boxes from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate pit and the plot continued on another row.

Datum breaks at pits are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the drainage long section plot are:

- (a) drainage string the strings from the network model
- (b) tins sections of the drainage string through any tins on the section view.
- (c) hgl hydraulic grade line values from the drainage string
- (d) services parts of strings from any models on the section view that cut the corridor for the section view.

Whether to draw the hydraulic grade line is controlled by:

```
draw_hgl_diag      0/1          // 1 = draw hydraulic grade line
```

The **colour** of the strings in the plot is the actual string colour for case (a) and (d), the colour of the tin used for the section in case (b) and user specified colour for (c).

```
hgl_colour          colour
```

Top Area

The **top area** is an annotation area above the arrow_4_area at the top of the plot.
It can be used for pit names, pit types, line names, junctions and deflection angles through pits.
The height of the top area is given by

vertical_plot_gapmm// size of the top area. If it is not large
// enough, the text will over write the
// plot in the row above.

A line can be drawn at the bottom of the top area:

draw_top_line0/1// 1= draw line at bottom of top area
// (i.e. top of arrow_4_area)

Manhole name, Manhole Types and Surrounding Bubbles

The drainage string name, the manhole name (pit number) and manhole type (pit type) can be drawn on the drainage long section plot, with or without a bubble around it.

The bubble text is made up of

line_name / pit_name pit_type

where the bits actually used are controlled by

draw_line_name	0/1	// 1 = include line name. The "/" is only // included if the line_name is drawn.
draw_pit_name	0/1	// 1 = include pit_name
draw_pit_type	0/1	// 1 = include pit type

The size, colour and text style of the bubble text is given by:

bubble_text_size	mm	// size of text in bubble def angled_text_size
bubble_text_colour	colour	// colour of text def angled_text_colour
bubble_textstyle	textstyle	// textstyle for text def angled_text_textstyle
bubble_text_x	mm	// horizontal distance from the default // position (at the pit or in top area)
bubble_text_y	mm	// vertical distance from the default // position (at the pit or in top area)
bubble_pre_text	text	// default ""
bubble_post_text	text	// default ""
bubble_text_angle	value	// default 0
bubble_text_justify	value	// the default is centre justified

A bubble is drawn of radius **bubble_radius** is drawn around the bubble text.

If **bubble_radius** is zero, then no bubble is drawn.

If the *bubble_radius* is zero, the bubble text is still drawn but without the enclosing bubble.

bubble_radius	mm	// if non-zero a bubble of this radius is // drawn around the text
bubble_colour	colour	// colour of bubbles

The "bubble" can be drawn as two semi-circles and two straight lines

bubble_length	mm	// length of the straight line in between // the semi-circles
---------------	----	------------------------------------------------------------------

The bubble text (and bubble) can be positioned at the bottom of the **top area**, or can be placed a fixed distance above the top of the corresponding manhole.

If the bubble text is drawn at the bottom of the top area, the upright is automatically drawn up to the bubble text.

If the bubble text is drawn above the pit, it is positioned by the *distance_above_pit* parameter **plus** the top stagger distances, *stagger_gap_top*, *stagger_height_3* and *stagger_height_4*.

This is necessary because the bubble text may need to be staggered.

draw_text_at_pit	0	// draw bubble and/or text in the top
------------------	---	---------------------------------------

	<i>l</i>	// area. // draw it above the pit
distance_above_pit	<i>mm</i>	// distance to add to the top stagger area // heights to draw the bubble above the // pit.
uprights_top_mode	<i>0/1</i>	// 1 = draw line from pit to bubble. Used to be // draw_line_to_text

Change of Direction Through Pits and Junctions

If there is a change of direction of the pipes of the plotted drainage string going through the pit, the deflection angle (in degrees, minutes and seconds) is drawn above the bubble text.

The deflection angle text is made up:

angled_pre_text deflection angle angled_post_text

Also any junctions at a pit in the plotted drainage string can be labelled with the name of the drainage strings coming into the pit, and the angle of the pipes at the junction.

Hence the junction text is made up of **two** lines:

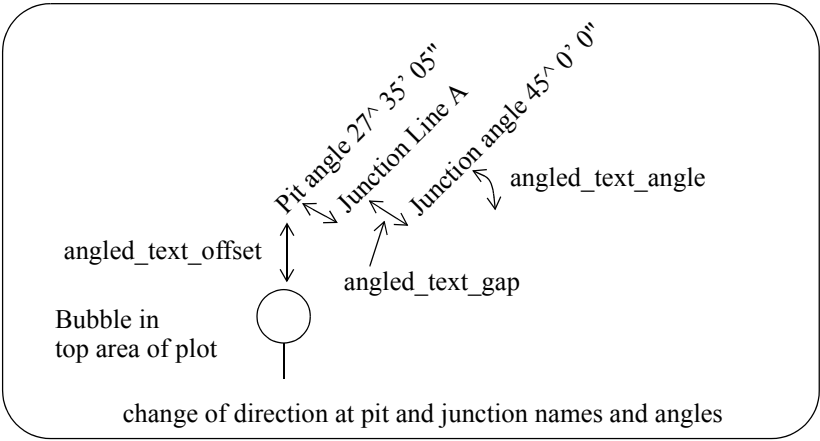

junction_pre_text line_name junction_post_text
junction_angle_pre_text junction angle junction_angle_post_text

If bubbles are drawn, the deflection angle and junction name and angle are drawn at the distance **angled_text_offset** above the bubble and with the distance **angled_text_gap** between the lines of information.

If bubbles are not drawn, the bubble text and the deflection angle and junction name and angle is placed the distance **angled_text_offset** above bottom of the top area. Each line of text is separated by the distance **angled_text_gap**.

The deflection angle and junction name and angle are drawn at an angle of **angled_text_angle**.

angled_text_offset	mm	// distance of text above bubble text // or above bottom of top area
angled_text_gap	mm	// distance between text to the right // of bubble text.
angled_text_angle	value	// angle of text

The pre and post text, colour, size and text style for the deflection angle of the drainage string pipes going through the pit are controlled by:

angled_pre_text	text	// default " "
angled_post_text	text	// default " "
angled_text_colour	colour	// colour of deflection angle text
angled_text_size	mm	// size of deflection angle text
angled_textstyle	textstyle	// textstyle of deflection angle text

The junction drainage string name can be included/not included in the first line of junction information:

junction_name_mode	0	// don't include the junction string name
	1	// default - use junction string name

The pre and post text, colour, size and text style for the junction name and the angle that the junction makes at the pit are controlled by:

junction_pre_text	text	// default "JUNCTION "
junction_post_text	text	// default " "
junction_text_colour	colour	// colour of junction name text
junction_text_size	mm	// size of junction name text
junction_textstyle	textstyle	// textstyle for junction name text
junction_angle_pre_text	text	// default " "
junction_angle_post_text	text	// default " "
junction_angle_text_colour	colour	// colour of junction angle text
junction_angle_text_size	mm	// size of junction angle text
junction_angle_textstyle	textstyle	// textstyle for junction angle text

Symbols at Manholes

Manholes can be labelled with symbols which depend on the manhole type. There can be up to twenty (20) sets of manhole symbols.

manhole_symbol_n_type	<i>mh_type</i>	// manhole type to have symbols
manhole_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for manhole_symbol_n_modes

manhole_symbol_n_position	1	// at top of manhole - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
manhole_symbol_n_size	<i>mm</i>	// size
manhole_symbol_n_x	<i>mm</i>	// x adjustment to position - default 0
manhole_symbol_n_y	<i>mm</i>	// y adjustment to position - default is 0
manhole_symbol_n_style	<i>text</i>	// the name of the linestyle (symbol)
manhole_symbol_n_angle	<i>value</i>	// default value is 0
manhole_symbol_n_colour	<i>colour</i>	//

For example:

manhole_symbol_1_type	"CONC COVER"	// manhole type to use
manhole_symbol_1_position	1	// on top of manhole
manhole_symbol_1_mode	6	// use 12d symbol
manhole_symbol_1_style	"shrub"	// name of 12d symbol
manhole_symbol_1_size	1	
manhole_symbol_1_x	0	
manhole_symbol_1_y	0	

Labelling House Connections

NOTE - house connections are only accessible by the **Sewer module**.

The house connections can be drawn from the pipe to the house connection level, with a line across the top (a T). The full width the T can be specified by the user.

draw_house_connections	yes/no
house_connection_width	value

The lot name for the house connection and the connection type can be labelled above the house connection. The house connection label is made up as:

connection_pre_text lot_name *connection_mid_text* connection_type *connection_post_text*

where lot_name and connection_type are stored with the house connection on the drainage string.

The parameters controlling the drawing of the house connection label are

house_connection_mode	0	// don't label the house connection
	1	// label the house connection with name
		// and type(default)
	2	// label the house connection with name only
connection_pre_text	text	// default " "
connection_mid_text	text	// default " "
connection_post_text	text	// default " "
connection_text_colour	colour	// colour of connection label
connection_text_size	mm	// size of connection label
connection_textstyle	textstyle	// textstyle connection label
connection_text_x	mm	// x adjustment to position of text - def 0
connection_text_y	mm	// y adjustment to position of text - def 0
connection_text_justify	text	// default is Bottom_left
connection_text_angle	value	// default vertical 90
connection_text_position	1	// above point height value
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin

Label connection type:

(this is used when the house_connection_mode is turned off, only the connection type is labelled)

house_connection_type_mode	0	// default, don't label connection type
	1	// label connection type
connection_type_text_x	mm	// x adjustment to position of text - def 0
connection_type_text_y	mm	// y adjustment to position of text - def 0
connection_type_pre_text	text	// text before type - def " "
connection_type_post_text	text	// text after type - def " "
connection_type_text_size	mm	// def box_text_size
connection_type_text_colour	colour	// def box_text_colour
connection_type_textstyle	text	//
connection_type_text_justify	text	//
connection_type_text_angle	value	// def vertical 90
connection_type_text_position	1	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin

Label the distance from the down stream pit to the house connection

house_connection_ds_pit_mode	0	// default, don't label chainage
	1	// label from down stream
	2	// label from up stream
	3	// label from left
	4	// label from right
connection_ds_pit_text_x	mm	// x adjustment to position of text
connection_ds_pit_text_y	mm	// y adjustment to position of text
connection_ds_pit_pre_text	text	// (") text before type
connection_ds_pit_post_text	text	// (") text after type
connection_ds_pit_text_size	mm	// def box_text_size
connection_ds_pit_text_colour	colour	//def (box_text_colour
connection_ds_pit_textstyle	text	//
connection_ds_pit_text_justify	text	// default Bottom_Left
connection_ds_pit_text_angle	value	// default is vertical (90)
connection_ds_pit_text_position	1	// above point height value - default

	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_ds_pit_decimals	value	// def number_of_decimals

Label the connection depth from the finished surface

house_connection_depth_mode	1	//default, label house connection depth
	0	// don't label house connection depth
connection_depth_text_x	mm	// x adjustment to position of text - def 0
connection_depth_text_y	mm	// y adjustment to position of text - def 0
connection_depth_pre_text	text	// text before type - def " "
connection_depth_post_text	text	// text after type - def " "
connection_depth_text_size	mm	// default box_text_size
connection_depth_text_colour	colour	// default box_text_colour
connection_depth_textstyle	text	//
connection_depth_text_justify	text	// default Bottom_left
connection_depth_text_angle	value	// default is vertical (90)
connection_depth_text_position	1	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_depth_decimals	value	// default number_of_decimals

Label the finished surface:

house_connection_fs_mode	1	//default, label house connection finished
		// surface
	0	// don't label house con finished surface
connection_fs_text_x	mm	// x adjustment to position of text - def 0
connection_fs_text_y	mm	// y adjustment to position of text - def 0
connection_fs_pre_text	text	// text before type -def " "
connection_fs_post_text	text	// text after type - def " "
connection_fs_text_size	mm	// default box_text_size
connection_fs_text_colour	colour	// default box_text_colour
connection_fs_textstyle	text	//
connection_fs_text_justify	text	// default Bottom_left
connection_fs_text_angle	value	// default (vertical 90)
connection_fs_text_position	1	// above point height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
connection_fs_decimals	integer	// default number_of_decimals
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed after the
		// decimal point.

The invert level of the house connection can also be plotted. The house connection invert level label is made up as:

connection_il_pre_text connection_invert_level *connection_il_post_text*

The parameters controlling the drawing of the house connection invert level label are:

2	// up and down from centre of box
3	// square
4	// triangle, base at bottom
5	// circle
6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for property_control_symbol_n_modes 0

property_control_symbol_n_position	0	// at bottom (invert) of property control
	1	// at top (obvert) of property control
	2	// at centre (axis) of property control
property_control_symbol_n_size	mm	// size
property_control_symbol_n_x	mm	// x adjustment to position - default 0
property_control_symbol_n_y	mm	// y adjustment to position - default is 0
property_control_symbol_n_style	text	// the name of the 12d symbol
property_control_symbol_n_angle	value	// default value is 0
property_control_symbol_n_colour	colour	//colour of the symbol

For example:

property_control_symbol_1_position	0	// at bottom of prop control
property_control_symbol_1_mode	6	// use 12d symbol
property_control_symbol_1_style	"shrub"	// name of 12d symbol
property_control_symbol_1_size	1	
property_control_symbol_1_x	0	
property_control_symbol_1_y	0	

Labelling Property Controls

NOTE - property controls and house connections are only accessible by the **Sewer module**.

The property control can be labelled with its name where the property control is at the drainage string. The property control name label is made up as:

property_control_pre_text *property_control_name* *property_control_pre_post_text*

where *property_control_name* is the stored with the property control on the drainage string.

The parameters controlling the labelling the property control are

property_control_mode	0	// don't label the property control with name
	1	// label the property control with name
property_control_pre_text	text	// default " "
property_control_post_text	text	// default " "
property_control_text_colour	colour	// colour of label
property_control_text_size	mm	// size of label
property_control_textstyle	textstyle	// textstyle label
property_control_text_x	mm	// x adjustment to position of text - def 0
property_control_text_y	mm	// y adjustment to position of text - def 0
property_control_text_justify	text	// default is Bottom_left
property_control_text_angle	value	// default vertical 90
property_control_text_position	1	// above pc centre height value
	3	// above top of boxes
	4	// above highest point

100 // to primary string
 101 // to first found tin

Label the distance from the down stream pit to the property control

```
property_control_ds_pit_mode    0           // default, don't label chainage
                                1           // label from down stream
                                2           // label from up stream
                                3           // label from left
                                4           // label from right
property_control_ds_pit_text_x  mm          // x adjustment to position of text
property_control_ds_pit_text_y  mm          // y adjustment to position of text
property_control_ds_pit_pre_text text       // ("" ) text before type
property_control_ds_pit_post_text text      // ("" ) text after type
property_control_ds_pit_text_size mm        // def box_text_size
property_control_ds_pit_text_colour colour  //def (box_text_colour
property_control_ds_pit_textstyle text      //
property_control_ds_pit_text_justify text   // default Bottom_Left
property_control_ds_pit_text_angle value    // default is vertical (90)
property_control_ds_pit_text_position 1     // above pc centre height value - default
                                3           // above top of boxes
                                4           // above highest point
                                100         // to primary string
                                101         // to first found tin
property_control_ds_pit_decimals value      // def number_of_decimals
```

Label the depth from the finished surface to the invert level of the property control:

```
property_control_depth_mode    1           //default, label property control depth
                                0           // don't label pc depth
property_control_depth_text_x  mm          // x adjustment to position of text - def 0
property_control_depth_text_y  mm          // y adjustment to position of text - def 0
property_control_depth_pre_text text       // text before type - def " "
property_control_depth_post_text text      // text after type - def " "
property_control_depth_text_size mm        // default box_text_size
property_control_depth_text_colour colour  // default box_text_colour
property_control_textstyle text           //
property_control_depth_text_justify text   // default Bottom_left
property_control_depth_text_angle value    // default is vertical (90)
property_control_depth_text_position 1     // above pc centre height value - default
                                3           // above top of boxes
                                4           // above highest point
                                100         // to primary string
                                101         // to first found tin
property_control_depth_decimals value      // default number_of_decimals
```

Label the finished surface:

```
property_control_fs_mode    1           //default, label pc finished surface
                                0           // don't label pc finished surface
property_control_fs_text_x  mm          // x adjustment to position of text - def 0
property_control_fs_text_y  mm          // y adjustment to position of text - def 0
property_control_fs_pre_text text       // text before type -def " "
property_control_fs_post_text text      // text after type - def " "
property_control_fs_text_size mm        // default box_text_size
property_control_fs_text_colour colour  // default box_text_colour
property_control_fs_textstyle text      //
property_control_fs_text_justify text   // default Bottom_left
property_control_fs_text_angle value    // default (vertical 90)
property_control_fs_text_position 1     // above pc centre height value - default
```

	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
property_control_fs_decimals	<i>integer</i>	// default number_of_decimals
		// If > 0, all trailing zeros after the
		// decimal place are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed after the
		// decimal point.

The invert level of the property control at the drainage string can also be plotted. The property control invert level label is made up as:

property_control_il_pre_text *property_control_invert_level* *property_control_il_post_text*

The parameters controlling the drawing of the property control invert level label are:

property_control_il_mode	1	// default, label the pc il
	0	// don't label the pc il
property_control_il_text_position	1	// above pc centre height value - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
property_control_il_text_x	<i>mm</i>	// x adjustment to position of text - def 0
property_control_il_text_y	<i>mm</i>	// y adjustment to position of text - def 0
property_control_text_gap	<i>mm</i>	// distance from pc name label and il label
property_control_il_decimals	<i>integer</i>	// def -3, number of decimal places in il value
		// >0 drop trailing zeros after decimal point
		// < 0 keep trailing zeros
property_control_il_pre_text	<i>text</i>	// default " ", text before type
property_control_il_post_text	<i>text</i>	// default " ", text after type
property_control_il_text_colour	<i>colour</i>	// colour of pc il -def box_text_colour
property_control_il_text_size	<i>mm</i>	// size of pc il - def box_text_size
property_control_il_textstyle	<i>textstyle</i>	// textstyle pc il
property_control_il_text_justify	<i>text</i>	//
property_control_il_text_angle	<i>value</i>	// (vertical 90)

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

hatch_original_tin_n	tin_name	// tin_name for original surface
hatch_new_tin_n	tin_name	// tin_name for final surface
hatch_cut_separation_n	mm	// distance between cut hatch lines
	0	// don't do cut hatching
hatch_cut_angle_n	degrees	// angle in degrees of cut hatching
hatch_cut_colour_n	colour	// colour of the cut hatching
hatch_cut_linestyle_n	linestyle	// linestyle for cut hatching
hatch_cut_draw_sides_n	1/0	// 1 = draw sides of cut regions
hatch_cut_draw_original_n	1/0	// 1 = draw original tin in cut regions
hatch_cut_draw_new_n	1/0	// 1 = draw new tin in cut regions
hatch_fill_separation_n	mm	// distance between fill hatch line
	0	// don't do fill hatching
hatch_fill_angle_n	degrees	// angle in degrees of fill hatching
hatch_fill_colour_n	colour	// colour of the fill hatching
hatch_fill_linestyle_n	linestyle	// linestyle for fill hatching
hatch_fill_draw_sides_n	1/0	// 1 = draw sides of fill regions
hatch_fill_draw_original_n	1/0	// 1 = draw original tin in fill regions
hatch_fill_draw_new_n	1/0	// 1 = draw new tin in fill regions

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.

Labelling Cuts of Drainage Through Strings in a Model

The cuts that the drainage string makes through any strings in user given models can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

“top-left”	“top-centre”	“top-right”
“middle-left”	“middle-centre”	“middle-right”
“bottom-left”	“bottom-centre”	“bottom-right”

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose name matches the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

cuts_n_model	<i>model_name</i>	// model of strings to be cut
--------------	-------------------	-------------------------------

```
cuts_n_mask      name_mask      // strings to check for cuts
                                     // and if a cut occurs,
                                     // parameters show how to
                                     // label the cut
```

For example

	cuts_1_mask	"ke"
or	cuts_1_mask	"?bank"
or, if both masks are required,		
	cuts_1_mask	"ke* ?bank"

All strings in the model *cuts_n_model* whose name satisfy the name mask *cuts_n_mask* are then checked for cuts with the drainage strings, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the n'th set.

cuts_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

[illegible]

The plot symbol of name *plotsymbol* is defined in the file given by:

- Drainage Plots* *Page 3925*

- plot_symbols filename
- or if plot_symbols is not defined**, then
- (b) in the file pointed to by the environment variable PLOT_SYMBOLS_4D
 PLOT_SYMBOLS_4D filename // default plotsym.4d
- or if PLOT_SYMBOLS_4D is not defined**, then
- (c) in the file *plotsym.4d*
 which is searched for in the standard set up file sequence
- If none of the above files are defined**, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:
- (d) either pointed to by the environment variable SYMBOLS_4D
 SYMBOLS_4D filename // default symbols.4d
 or if the environment variable SYMBOLS_4D does not exist, in the file, *symbols.4d*

The position of the symbol or plot symbol is given by:

cuts_symbol_n_position	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

cuts_symbol_n_x	mm	// offset adjustment to position
cuts_symbol_n_y	mm	// height adjustment to position
cuts_symbol_n_angle	degrees	// rotation about point
cuts_symbol_n_colour	colour	// colour of symbol

and for all values of *cuts_symbol_n_mode* **other** than 6:

cuts_symbol_n_size	mm	// size of symbol, 0 don't draw
--------------------	----	---------------------------------

The value of the **chainage** of the cut string can be labelled using the parameters

cuts_chainage_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_chainage_n_x	mm	// chainage adjustment to position
cuts_chainage_n_y	mm	// height adjustment to position
cuts_chainage_n_angle	degrees	// rotation about point
cuts_chainage_n_size	mm	// size of text, 0 don't label
cuts_chainage_n_colour	colour	// colour of text
cuts_chainage_n_textstyle	text	// textstyle of text chainage
cuts_chainage_n_pre_text	text	// text before the chainage value
cuts_chainage_n_post_text	text	// text after the chainage value
cuts_chainage_n_justification	justification	// justification of the text
cuts_chainage_n_no_decimals	integer	// number of decimals in chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of position
		// above boxes
	100	// height of primary string
cuts_height_n_position	101-500	// use height of to tin1 or tin2 etc.
	1	// at points position
	3	// above top of boxes
	100	// to primary string
cuts_height_n_x	101-500	// to tin1 or tin2 etc.
	mm	// chainage adjustment to position
	mm	// height adjustment to position
	degrees	// rotation about point
cuts_height_n_size	mm	// size of text, 0 don't label
	colour	// colour of text
	text	// textstyle of text height
	text	// text before the height value
cuts_height_n_pre_text	text	// text after the height value
	justification	// justification of the text
	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
	mm	// chainage adjustment to position
	mm	// height adjustment to position
cuts_label_n_size	degrees	// rotation about point
	mm	// size of text, 0 don't label
	colour	// colour of text
	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
	text	// text after the string name
	justification	// justification of the text

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

<i>plot_border</i>	<i>yes/no</i>	<i>// yes plots a standard title block</i> <i>// default yes</i>
<i>title_1</i>	<i>text</i>	
<i>title_2</i>	<i>text</i>	
<i>title_text_size</i>	<i>value</i>	
<i>title_colour</i>	<i>colour</i>	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the *linestyle* drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

<i>use_title_file</i>	<i>yes/no</i>	<i>// yes draws the title block given in title_file</i> <i>// default no</i>
<i>title_file</i>	<i>filename</i>	
<i>plot_border</i>	<i>no</i>	<i>// turn off standard title block</i>

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* (n = 1,2,... 1000)

<i>user_text_n</i>	<i>text</i>
--------------------	-------------

The special plot parameters are:

<i>time_format</i>	<i>text</i>	<i>// format for \$time</i>
<i>user_text_n</i>	<i>text</i>	<i>// where n = 1,2,... 1000</i> <i>// passed down to \$user_text_n</i>
<i>title_1</i>	<i>text</i>	<i>// passed down to \$title_1</i>
<i>title_2</i>	<i>text</i>	<i>// passed down to \$title_2</i>
<i>start_page_number</i>	<i>integer</i>	<i>// used as the starting value for</i> <i>// \$page_number. If missing,</i> <i>// \$page_number starts at 1.</i>
<i>start_drawing_number</i>	<i>integer</i>	<i>// added to \$drawing_number in title</i> <i>// block file. If missing,</i> <i>// \$drawing_number starts at 1.</i>
<i>drawing_number_prefix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_prefix</i>
<i>drawing_number_postfix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_postfix</i>

Parameters that Modify Fields In the Plot Drainage Network Panel

A number of parameters match those in the **plot drainage network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **plot drainage network** panel are:

network_model	text
scale	value
plotter_type	text
plot_stem	text
view_name	text
sheet_size	text or "width height"
plot_height	mm
x_origin	mm
y_origin	mm
global_textstyle	textstyle
box_text_size	mm
box_colour	colour
plot_border	yes/no
title_1	text
title_2	text
title_text_size	value
title_text_colour	colour
use_title_file	yes/no
title_file	filename

Melbourne Water

Position of menu: Design =>Drainage-Sewer=>Plots=>Melbourne Water

The **Melbourne Water** option is used to generate the longsection plots for all lines in a drainage network to the Melbourne Water sewer standards.

Given the plot sheet size and the horizontal and vertical scales, the longsections for the drainage lines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

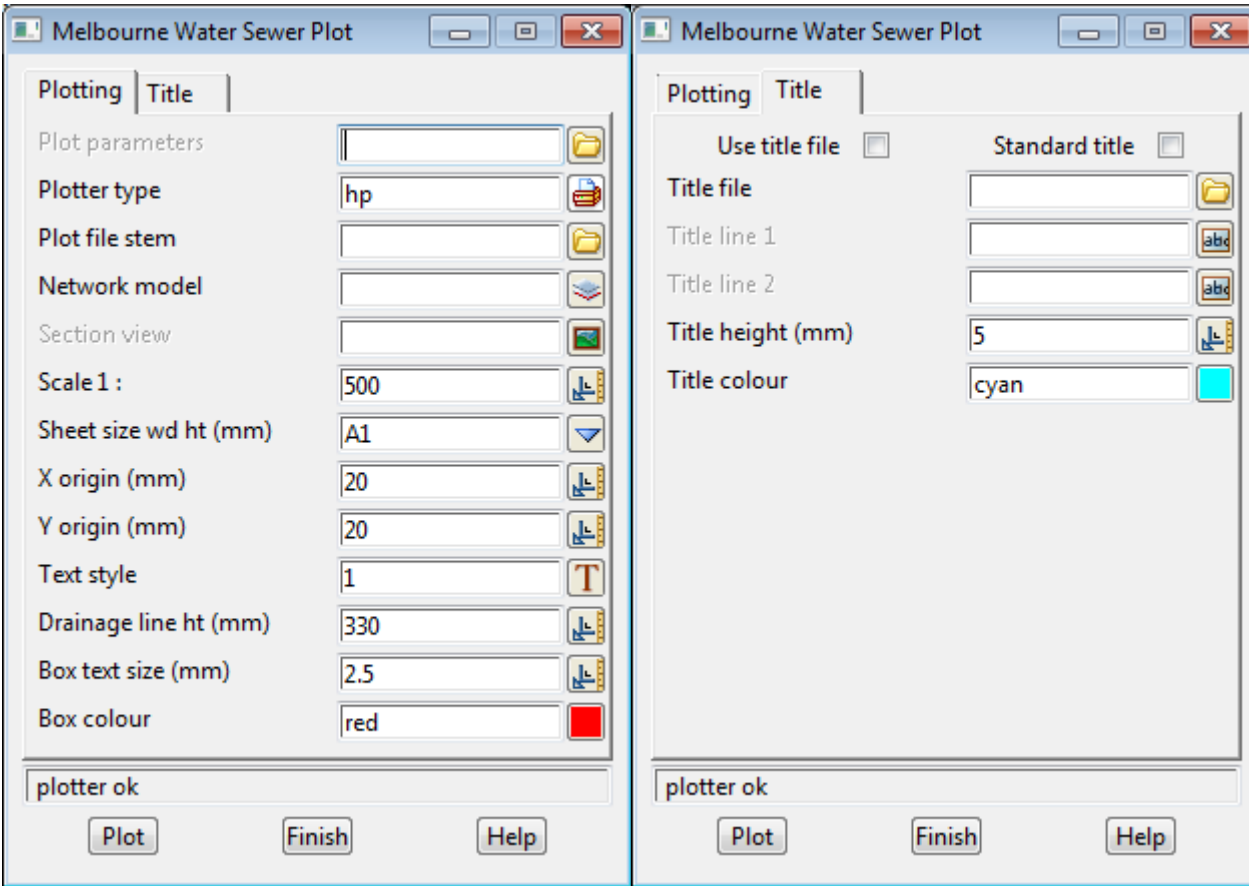

Hence the drainage lines are plotted one after another on one or more plotter sheets.

The drainage lines are plotted in string name alphabetical order.

The drainage longsection plot includes

- s the manholes, drainage pipe and any house connections
- s the height of the natural surface at the manhole
- s manhole names and cover types
- s distances between manholes
- s the invert depth of the pipe on either side of a manhole
- s the grades and types of the pipes
- s any services in the corridor - including their name, invert level and distance from the nearest downstream manhole

After selecting the **Melbourne Water** option, the **Melb plot drainage network** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters <i>file of plot parameters used for extra control of the long section plot.</i>	input		*.ppf
Plotter type <i>format for the plot output.</i>	input	hp	hp, dxf, postscript etc.
Network model <i>the model containing all the drainage lines for the network.</i>	input		
Section view <i>the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.</i>	input		
Plot file stem <i>since more than one plot page may be produced, the plot file names are constructed from the stem plus a plot page sequence number, followed by the appropriate plotter type ending.</i>	input		
Scale 1: <i>horizontal scale for plotting the drainage long section. The vertical exaggeration is taken from the section view given in the section view field.</i>	input		
Sheet size wd ht (mm) <i>the width and height values (separated by space) or the name of a user defined sheet size.</i>	input		available sheet sizes
X origin (mm)	input		

the x position on the plot sheet for the bottom left hand corner of the longsection plots.

Y origin (mm)	input		
<i>the y position on the plot sheet for the bottom left hand corner of the longsection plots.</i>			
Drainage line ht (mm)	input	boxes	boxes, centreline
<i>the maximum allowable height for a longsection plot for a drainage line. Datum breaks are applied to any part of the longsection that will not fit into the drainage line ht.</i>			
Box text size (mm)	input	3	
<i>size (in millimetres) to plot the chainages, heights etc. in the boxes in the plots of the drainage longsections</i>			
Box colour	input	cyan	available colours
<i>colour used for the text and the boxes.</i>			
Plot	button		
<i>plot the drainage longsections for the drainage lines in the model given in the network model field.</i>			
The fields and buttons in title tab are:			
Use title file	tick box		
<i>if tick, a user defined title block file is used.</i>			
Standard Title	tick box	tick	
<i>if tick, the standard 12d Model border and two lines of title are placed on the bottom of the plot</i>			
Title file	input		*.tf
<i>if non-blank and use title file is set to tick, then the file given in this field is used to generate a user defined title block for the plot.</i>			
Title line 1/2	input		
<i>first/second line of title information</i>			
Title height (mm)	input	5	
<i>height (in millimetres) to draw the characters in the two lines of title information.</i>			
Title colour	input	cyan	available colours
<i>colour used for the border and the title information.</i>			

Please continue to the next section [Melbourne Water Plot Parameter File](#).

Melbourne Water Plot Parameter File

The **Melbourne Water plot** option is used to make special long section plots for a **network** of new drainage strings to Melbourne Water sewer standards.

Some of the look of the long section plot can be controlled from the **Melb plot drainage network** panel itself, however a wider selection of control parameters is available by using a Melbourne Water long plot, plot parameter file.

Because the Melbourne Water format is so fixed, most of the parameter have sensible default values and can be left out. However, for completeness, all the parameters are given.

The Melbourne Water Sewer (MWS) long section plot parameters are placed in a file with ending **.ppf**. Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash `//` is considered to be a comment.

The set of all parameters for the Melbourne Water sewer long section plot is enclosed within a set of curly brackets `{ }` with the header

```
melb_water_sewer_long_plot    "plot set name"
```

before the curly brackets.

That is,

```
melb_water_sewer_long_plot  "plot set name" {
    plot parameters
    one per line
}
```

If there is more than one `melb_water_sewer_long_plot` parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as `section_x_plot` in the same file. The other sets will be ignored when doing a Melbourne Water long section plot.

The plot parameters are documented in following groups:

For the *Plot Sheet layout*, please continue to the section [Plot Sheet Layout](#).

Chainages, staggering and uprights, please continue to the section [Chainages, Staggering and Uprights](#).

Boxes area, please continue to the section [Boxes Area](#).

Datum area, please continue to the section [Datum Value](#).

Arrows area, please continue to the section [Arrow Areas](#).

Title block parameters, please continue to the section [Title Block Information](#).

Panel modifying parameters, please continue to the section [Parameters that Modify Fields In the Melbourne Water Network Panel](#).

Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size          text          // sheet name, or
                    "mm    mm"    // sheet size:  width  height
```

The sheet size name and width and heights can be specified by the user in a file named `sheets.4d` which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D      file          // file of plotter sheets sizes
```

The Melbourne Water long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

When a sheet is full, a follow on sheet is created.

As soon as one drainage string is completed, the next drainage string in the network model is plotted beginning on the same row as the previous drainage string and with a horizontal gap of size `horizontal_plot_gap` between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, `x_origin` and `y_origin`.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the `plot_height` to the `y_origin`.

<code>network_model</code>	text	// model of sewer strings
<code>x_origin</code>	mm	// Position of the left hand bottom
<code>y_origin</code>	mm	// corner of first plot in the bottom row.
<code>only_one_line</code>	0	// more than one row on a sheet
	1	// only one row of plot on a sheet
<code>plot_height</code>	mm	// total height of a plot row.
		// It includes the <code>vertical_plot_gap</code> .
<code>horizontal_plot_gap</code>	mm	// gap between plots on same row
<code>vertical_plot_gap</code>	mm	// gap between rows of plots

A `textstyle` can be specified which is used for all the text in the plot.

<code>global_textstyle</code>	textstyle	//used for all plot text
-------------------------------	-----------	--------------------------

The Melbourne Water long plot itself consists of nine areas. From the bottom up, they are boxes, arrow 1, bottom stagger, arrow 2, graph, arrow 3, top stagger, arrow 4, top.

The **boxes area** is where the chainages and various values for the drainage strings are labelled.

The **arrow 1 area** is for drawing arrows where the arrows go between the staggered uprights and below the graph area. The datum line is at the bottom of the arrow 1 area.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **arrow 2 area** is for drawing arrows below the graph but where the arrows go between non-staggered uprights.

The **graph area** is the area where the actual plots of the strings are drawn.

The **arrow 3 area** is for drawing arrows above the graph area and where the arrows go between non-staggered uprights.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is for drawing arrows where the arrows go between the staggered uprights and above the graph area.

The **top area** is an annotation area above the arrow 4 area and is used for manhole names, junctions, deflection angles etc.

Although the arrow areas exist, the Melbourne Water plot does not have any arrows in them.

Chainages, Staggering and Uprights

All of the labelling of the Melbourne Water sewer plot is done at the chainages of the manholes on the drainage line. For example, the invert levels, depths and natural surface of pipes at a manhole are all labelled at the chainage of the manhole.

The labels for these values are done at an angle of zero degrees rather than ninety degrees for the sewer plots.

Uprights, or leader lines, are drawn from the values at the bottom of the plot to the manhole in the graph area.

If the text values are placed at the real chainage positions at the bottom of the plot, text over writing can easily occur if the chainages are very close together.

To prevent such over writing, the text can be **staggered**. That is, if the text is going to over write a previous text value, the next text value is actually moved along until there is no over writing.

Since the text is no longer at the correct chainage position, the uprights to the manholes and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the Melbourne Water plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

And there is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

stagger_height_1	mm	// distance from the top of arrow_area_1 // to the start of the staggers
stagger_height_2	mm	// distance over which stagger occurs
stagger_gap_bottom	mm	// distance from end of staggers to the // bottom of arrow_area_2

The stagger area above the graph area is defined

stagger_gap_top	mm	// distance from the top of arrow_area_3 // to the start of the staggers
stagger_height_3	mm	// distance over which stagger occurs
stagger_height_4	mm	// distance from end of staggers to the // bottom of arrow_area_4

The distance to be left for text to avoid over writing is:

horizontal_text_gap	mm	// minimum distance to leave for text // after manhole values
services_text_gap	mm	// minimum distance to leave for text // after service values

When staggering occurs, it is possible for the values area to be longer than the graph area.

The **colour** of the uprights that are drawn from the text to the manholes is given by:

manhole_line_colour	colour	// colour of uprights to the manholes
---------------------	--------	---------------------------------------

Boxes Area

The drainage string values invert level, depth to invert and surface level can be labelled in the Melbourne Water plot with one line of title, and the actual values given at the chainage of each manhole in the drainage string.

The title or **label** for the strings, is drawn in the **labels area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

labels followed by the **values** along the string.

Thus the boxes area is built up as a series of individual boxes and the **boxes area** is made up of two areas side by side - the **labels area** and the **values area**.

The order of the boxes from the bottom up is

- (a) chainage values
- (b) upstream and downstream depth to inverts
- (c) upstream and downstream invert levels
- (d) natural surface heights

The label text size and colour are specified by

plot_title_text_size mm // size of label text in boxes
plot_title_text_colour colour // colour of label text in boxes

The width of the label box is given by the **box_width** parameter and the height of each box is given by **box_height**.

box_width mm // width of the label boxes.
box_height mm // height of each box

The label text for each box can be set by

plot_title_chainage_name text // label for chainages box
plot_title_surface_name text // label for the sewer ns values
plot_title_invert_name text // label for the invert levels
plot_title_depth_name text // label for depth of inverts

For the Melbourne Water plots, there are also additional parameters for special Melbourne Water labels. They are

plot_title_item_name text // label for item line
plot_title_d_and_g_name text // label for diameter and grade
plot_title_detail_name text // label for detail line at top of plot

The pipe type can also be included with the diameter and grade values

label_pipe_type yes/no

The **labels area** for the left plot in the bottom row starts at the co-ordinate (x_origin,y_origin) and each row is begun by adding the distance plot_height to the y_origin.

x_origin mm // x coord of bottom lh corner of bot row
y_origin mm // y coord of bottom lh corner of bot row

The **values area** starts at the end of the label area.

As for the label boxes, the height of each individual box area is given by the box_height parameter.

The width of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

box_text_size mm // size of value text
box_text_colour colour // colour of values in boxes

The colour of the box line work is given by:

box_colour colour // colour of the lines in the boxes

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of one box).

The total width of the boxes area is the width of the labels area plus the width of the values area which depends on the amount of staggering that occurs.

Datum Value

The datum value is placed above the top of the natural surface heights box.

Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size and colour are controlled by:

datum_name	<i>text</i>	// text to write before the datum value
datum_text_size	<i>mm</i>	// size of datum text and value
datum_colour	<i>colour</i>	// colour of the datum text and line
datum_value_pre_text	<i>text</i>	// text before the datum value
datum_value_post_text	<i>text</i>	// text after the datum value
		// (default " m")
datum_value_decimals	<i>integer</i>	// number of decimal places in the
		// datum value.
		// If > 0, trailing zeros are removed.
		// If < 0, the absolute value is taken as
		// the number of decimal places and no
		// trailing zeros are removed.

Arrow Areas

The **arrow areas** were designed for drawing arrows between manholes and labelling them with values such as pipe slope, pipe diameter, flow, velocity and drainage line name.

These are not required for the Melbourne Water sewer plot.

However, values can still be given to defined the sizes of the arrow areas.

There are four arrow areas:

arrow_1_area which is below the graph and the bottom stagger area. The arrows go between the staggered positions of the manhole chainages.

The datum line is at the bottom of the arrow 1 area.

arrow_2_area which below the graph but above the bottom stagger area. Hence the arrows go between the non-staggered chainage positions of the manholes.

arrow_3_area which is above the graph but below the top stagger area. The arrows go between the non-staggered chainage positions of the manholes.

arrow_4_area is above the graph and the top stagger area. The arrows go between the staggered chainage positions of the manholes.

The heights of the four areas (which can be zero) are defined by:

arrow_area_1	<i>mm</i>	// height of arrow_1 area
arrow_area_2	<i>mm</i>	// height of arrow_2 area
arrow_area_3	<i>mm</i>	// height of arrow_3 area
arrow_area_4	<i>mm</i>	// height of arrow_4 area

Graph Area

The **graph area** is the area where the actual plots of the drainage strings are drawn.

The length of the graph area is determined by the length of the drainage string to be plotted, the horizontal scale (given by scale) of the plot and the sheet width.

```
scale                value                // 1:value - horizontal scale
// The vertical scale is determined by the
// horizontal scale and the vertical
// exaggeration for the section view.
```

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

```
view_name            text
```

The tins to be sectioned through by the sewer strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is **calculated** by subtracting the height of the other nine boxes from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate manhole and the plot continued on another row.

Datum breaks at manholes are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the sewer long section plot are:

- (a) drainage string the strings from the network model
- (b) tins sections of the drainage string through any tins on the section view.
- (c) services parts of strings from any models on the section view that cut the corridor for the section view.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

Top Area

The **top area** is an annotation area above the arrow_4_area at the top of the plot.

It can be used for manhole names, manhole types, pegs, junctions and deflection angles through manholes.

The height of the top area is given by

```
vertical_plot_gap    mm                // size of the top area. If it is not large
// enough the text will over write the
// plot in the row above.
```

Manholes

The manhole name, manhole type, special manhole symbol and the change of direction of the pipes going through the manhole can all be displayed at the top of the plot.

The manhole name and type are drawn first, followed by the angle of any change of direction of the pipes going through the manhole (the angle is in degrees, minutes and seconds) and finally any junction information.

The text is drawn at the distance **angled_text_y_offset** above the top of the plot, **angled_text_x_offset** to the right of the manhole position and each piece of information is spaced horizontally by the distance **angled_text_gap** to the right of the manhole name if the **angled_text_angle** is zero, or the distance **angled_text_gap** below the previous text if **angled_text_angle** is non-zero.

The size of the manhole names and type is given by **angle_text_size** and the size of the change of direction angle is given by **manhole_angle_text_size**.

The colour of the manhole names, type and change of direction angle is given by **angle_text_colour**.

label_manhole_type		<i>yes/no</i>	// include manhole type
angled_text_size		<i>mm</i>	// size of manhole name text
manhole_angle_text_size		<i>mm</i>	// size of text for change of // angle through manhole
angled_text_x_offset	<i>mm</i>		// distance of text above top of the plot
angled_text_y_offset	<i>mm</i>		// distance of text to the right of manhole
angled_text_gap	<i>mm</i>		// distance of text to the right of previous // text
angled_text_angle	<i>value</i>		// angle of text
angled_text_colour	<i>colour</i>		// colour of text

The symbol at the manhole is controlled by the manhole name.

manhole_symbol_n_size	<i>mm</i>		
manhole_symbol_n_colour	<i>colour</i>		
manhole_symbol_n_y	<i>mm</i>		// distance above top line
manhole_symbol_n_repeats	<i>integer</i>		// draw the symbol this // many times with a // decreasing size)
manhole_line_colour	<i>colour</i>		// colour of line through // manhole

Junctions

Any junctions at the manhole are also labelled with the name of the lines coming into the manhole.

The junction text is made up of two lines:

JUNCTION LINE line_name
angle of the junction

The junction text is at the same height as the manhole and angle text and at a distance **angled_text_gap** to the right of the manhole and angle text, or a previous junction label. The size of the text is given by

junction_angle_text_size	<i>mm</i>
--------------------------	-----------

When a junction does occur, the incoming pipe is drawn at the correct position on the manhole of the main line.

Services

Any services in the corridor are drawn on the plot and if the service actually cuts the drainage string, then a line is drawn to the cut point and the line labelled with the service name. The name is drawn below the cut point and is right justified.

service_text_size	<i>mm</i>	// size of the text for the service name
service_text_x_offset	<i>mm</i>	// adjustment to the drawing position
service_text_y_offset	<i>mm</i>	// for the service name
service_text_colour	<i>colour</i>	// colour of the service name
service_line_colour	<i>colour</i>	// colour of the line to the cut point

Property Controls and House Connections

The position of the property controls can be drawn on the plot and can have a user specified diameter.

draw_property_controls	<i>yes/no</i>
property_control_diameter	<i>value</i>

The house connections can be drawn from the pipe to the house connection level, with a line across the top (a T). The full width the T can be specified by the user.

draw_house_connections	<i>yes/no</i>
house_connection_width	<i>value</i>

Symbols at Manholes

Manholes can be labelled with symbols which depend on the manhole type. There can be up to twenty (20) sets of manhole symbols.

manhole_symbol_n_type	<i>mh_type</i>	// manhole type to have symbols
manhole_symbol_n_mode	0	// cross
	1	// up from centre of box
	2	// up and down from centre of box
	3	// square
	4	// triangle, base at bottom
	5	// circle
	6	// use a 12d symbol

0 + 1 | 2 | 3 □ 4 △ 5 ○

predefined symbols for manhole_symbol_n_modes

manhole_symbol_n_position	1	// at top of manhole - default
	3	// above top of boxes
	4	// above highest point
	100	// to primary string
	101	// to first found tin
manhole_symbol_n_size	<i>mm</i>	// size
manhole_symbol_n_x	<i>mm</i>	// x adjustment to position - default 0
manhole_symbol_n_y	<i>mm</i>	// y adjustment to position - default is 0
manhole_symbol_n_style	<i>text</i>	// the name of the 12d symbol
manhole_symbol_n_angle	<i>value</i>	// default value is 0
manhole_symbol_n_colour	<i>colour</i>	//

For example:

manhole_symbol_1_type	"CONC COVER"	// manhole type to use
manhole_symbol_1_position	1	// on top of manhole
manhole_symbol_1_mode	6	// use 12d symbol
manhole_symbol_1_style	"shrub"	// name of 12d symbol
manhole_symbol_1_size	1	
manhole_symbol_1_x	0	
manhole_symbol_1_y	0	

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

hatch_original_tin_n	tin_name	// tin_name for original surface
hatch_new_tin_n	tin_name	// tin_name for final surface
hatch_cut_separation_n	mm	// distance between cut hatch lines
	0	// don't do cut hatching
hatch_cut_angle_n	degrees	// angle in degrees of cut hatching
hatch_cut_colour_n	colour	// colour of the cut hatching
hatch_cut_linestyle_n	linestyle	// linestyle for cut hatching
hatch_cut_draw_sides_n	1/0	// 1 = draw sides of cut regions
hatch_cut_draw_original_n	1/0	// 1 = draw original tin in cut regions
hatch_cut_draw_new_n	1/0	// 1 = draw new tin in cut regions
hatch_fill_separation_n	mm	// distance between fill hatch line
	0	// don't do fill hatching
hatch_fill_angle_n	degrees	// angle in degrees of fill hatching
hatch_fill_colour_n	colour	// colour of the fill hatching
hatch_fill_linestyle_n	linestyle	// linestyle for fill hatching
hatch_fill_draw_sides_n	1/0	// 1 = draw sides of fill regions
hatch_fill_draw_original_n	1/0	// 1 = draw original tin in fill regions
hatch_fill_draw_new_n	1/0	// 1 = draw new tin in fill regions

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.

Labelling Cuts of Drainage Through Strings in a Model

The cuts that the drainage string makes through any strings in user given models can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

“top-left”	“top-centre”	“top-right”
“middle-left”	“middle-centre”	“middle-right”
“bottom-left”	“bottom-centre”	“bottom-right”

A choice of six special symbols and/or or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

Up to twenty five (25) separate models of strings can be cut and labelled.

(a) the parameter *plot_symbols* in the ppf file

or if `plot_symbols` is not defined, then

PLOT_SYMBOLS_4D	<i>filename</i>	<i>// default plotsym.4d</i>
-----------------	-----------------	------------------------------

(c) in the file *plotsym.4d*

(d) either pointed to by the environment variable `SYMBOLS_4D`

or if the environment variable SYMBOLS_4D does not exist, in the file, *symbols.4d*

cuts_symbol_n_position	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

cuts_symbol_n_x	<i>mm</i>	// offset adjustment to position
cuts_symbol_n_y	<i>mm</i>	// height adjustment to position
cuts_symbol_n_angle	<i>degrees</i>	// rotation about point
cuts_symbol_n_colour	<i>colour</i>	// colour of symbol

```
cuts_symbol_n_size      mm           // size of symbol, 0 don't draw
```

cuts_chainage_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

Page 3945

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of position
		// above boxes
cuts_height_n_position	100	// height of primary string
	101-500	// use height of to tin1 or tin2 etc.
	1	// at points position
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_height_n_x	mm	// chainage adjustment to position
cuts_height_n_y	mm	// height adjustment to position
cuts_height_n_angle	degrees	// rotation about point
cuts_height_n_size	mm	// size of text, 0 don't label
cuts_height_n_colour	colour	// colour of text
cuts_height_n_textstyle	text	// textstyle of text height
cuts_height_n_pre_text	text	// text before the height value
cuts_height_n_post_text	text	// text after the height value
cuts_height_n_justification	justification	// justification of the text
cuts_height_n_no_decimals	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// chainage adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Title Block Information

The plot can have a standard 12d Model title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard 12d Model title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

<i>plot_border</i>	<i>yes/no</i>	<i>// yes plots a standard title block</i> <i>// default yes</i>
<i>title_1</i>	<i>text</i>	
<i>title_2</i>	<i>text</i>	
<i>title_text_size</i>	<i>value</i>	
<i>title_colour</i>	<i>colour</i>	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

<i>use_title_file</i>	<i>yes/no</i>	<i>// yes draws the title block given in title_file</i> <i>// default no</i>
<i>title_file</i>	<i>filename</i>	
<i>plot_border</i>	<i>no</i>	<i>// turn off standard title block</i>

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have runtime user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* (n = 1,2,... 1000)

<i>user_text_n</i>	<i>text</i>
--------------------	-------------

The special plot parameters are:

<i>time_format</i>	<i>text</i>	<i>// format for \$time</i>
<i>user_text_n</i>	<i>text</i>	<i>// where n = 1,2,... 1000</i> <i>// passed down to \$user_text_n</i>
<i>title_1</i>	<i>text</i>	<i>// passed down to \$title_1</i>
<i>title_2</i>	<i>text</i>	<i>// passed down to \$title_2</i>
<i>start_page_number</i>	<i>integer</i>	<i>// used as the starting value for</i> <i>// \$page_number. If missing,</i> <i>// \$page_number starts at 1.</i>
<i>start_drawing_number</i>	<i>integer</i>	<i>// added to \$drawing_number in title</i> <i>// block file. If missing,</i> <i>// \$drawing_number starts at 1.</i>
<i>drawing_number_prefix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_prefix</i>
<i>drawing_number_postfix</i>	<i>text</i>	<i>// passed down to</i> <i>// \$drawing_number_postfix</i>

Parameters that Modify Fields In the Melbourne Water Network Panel

A number of parameters match those in the **New Melb Plot Drainage Network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **Melb plot drainage network** panel are:

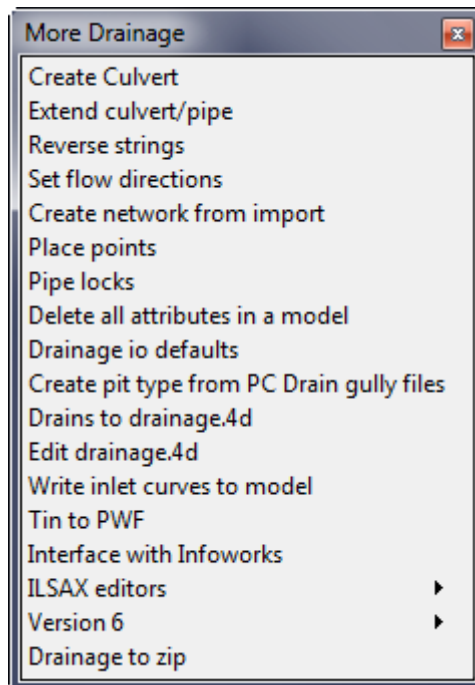

network_model	<i>text</i>
scale	<i>value</i>
plotter_type	<i>text</i>
plot_stem	<i>text</i>
view_name	<i>text</i>
sheet_size	<i>text</i> or "width height"
plot_height	<i>mm</i>
x_origin	<i>mm</i>
y_origin	<i>mm</i>
global_textstyle	<i>textstyle</i>
box_text_size	<i>mm</i>
box_colour	<i>colour</i>
plot_border	<i>yes/no</i>
title_1	<i>text</i>
title_2	<i>text</i>
title_text_size	<i>value</i>
title_text_colour	<i>colour</i>
use_title_file	<i>yes/no</i>
title_file	<i>filename</i>

More Drainage

Position of menu: Design =>Drainage-Sewer=>More

The More Drainage menu items contain the drainage import export routines and tools that enhance the basic drainage functions on the Drainage Sewer menu.

The **More Drainage** walk-right menu is:

[Frequently Asked Questions \(FAQ\)](#)

Drainage Overview

The following are the basic steps from creating a urban drainage network to producing your plan/ drainage longsection drawings and pit layout table. The optional catchment area models and bypass flow model will be discussed afterwards.

Drainage FAQ

What is **pipe capacity**?

Pipe capacity is full pipe flow with no pressurisation. The capacity figure should be used to help designers know if the friction loss in the pipe is greater or less than the pipe slope.

Case 1: Flow less than capacity....friction slope is less than pipe slope. except for maybe for pit losses, surcharging is not a problem

Case 2: Flow greater than capacity....friction slope is MORE than pipe slope. You can do this for a short length of pipe but watch out for surcharging because you cannot keep it up for too long without flooding occurring!

Why do the **obvert/invert levels not change** when I import data via the "pit/pipe interface"?

On the interface panel there is an **Options** button that displays a panel with the "**hold obverts on import**" option. The default is off but if it is selected the pipe obverts will not change even if import data has new levels. Note that the invert levels will change if the pipe diameters change.

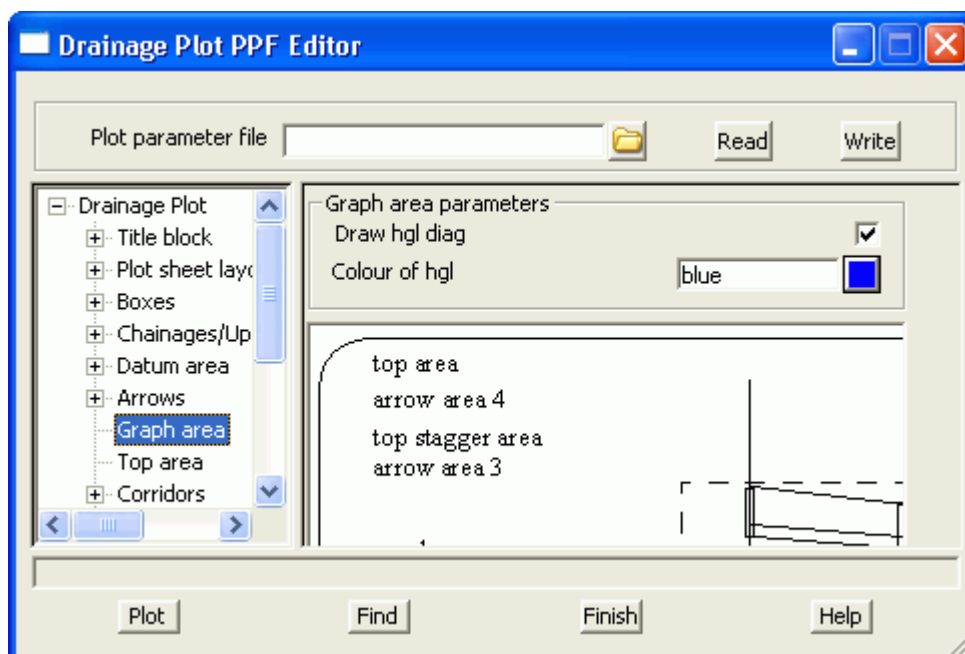

Can I **manually enter catchment areas** in the drainage design programs?

Yes. The catchment strings are optional in 12d. If no catchment string has been linked to a manhole and there has been no manhole "area" attribute a default area of 0.0001 will be sent. When results are imported back into 12d the total areas from the design package will be saved in the manhole "area" attribute.

How do I include/exclude the **hydraulic grade line** on drainage longsections..

First, there must be HGL results. These may come from the 12d rational drainage design, imported from another design package (including spreadsheets) or manually entered as manhole/pipe attributes. If HGL results exist then they may be viewed in the section view of the drainage line.

Second, the HGL results may be added to the drainage longsection drawings by editing the plot parameter file (ppf) as shown below.

Creating Drainage Strings

Drainage strings may be created in 12d in a number of ways.

1. [Import 2d strings](#) from other drawing packages and convert them to drainage string inside 12d.
2. [draw the string in 12d](#) using a design tin to the manhole cover levels and pipe inverts.
3. Enter the details in a [spreadsheet format](#) and paste the spreadsheet into 12d.

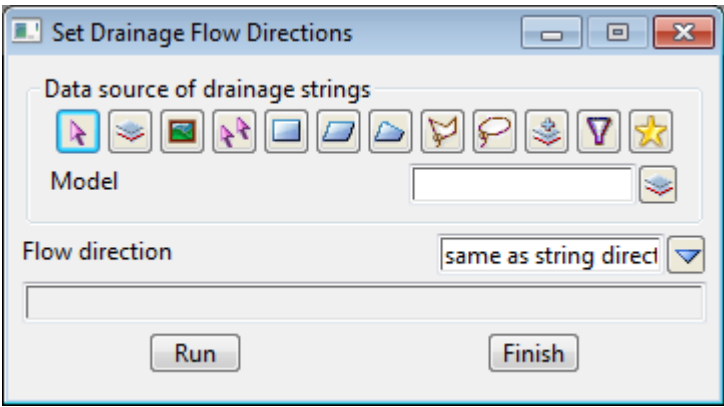

Regardless of the method, take the time to [set your defaults](#) before you start. You can always change the data later.

Set Drainage Flow Direction

Position of option on menu: **Design =>Drainage-Sewer =>More=>Set flow directions**

The routine changes the strings drainage flow direction to either **same as string direction** or **opposite to string direction**. This setting affects the pipe grading, network connectivity and hydraulic calculations.

On selecting the **Set flow directions** option, the **Set Drainage Flow Directions** panel is displayed.

The fields and buttons used in this panel have the following functions.

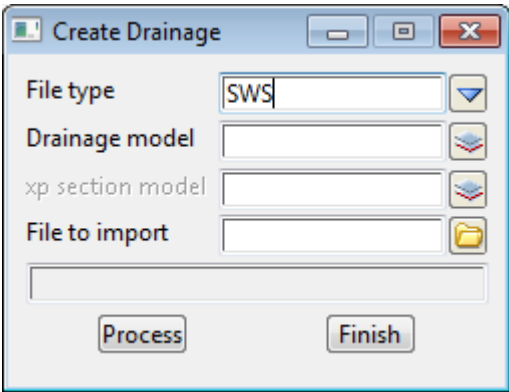

Field Description	Type	Defaults	Pop-Up
Source of drainage strings	source box		
<i>Select the desired drainage strings</i>			
Flow direction	choice box	same as string directions	same as string direction, opposite to string direction
<i>all drainage strings will have this flow direction set</i>			
Run	button		
<i>set flow directions</i>			
Finish	button		
<i>remove the panel from the screen</i>			

Create Network from Import

Position of option on menu: **Design =>Drainage-Sewer =>More=>Create network from import**

This routine creates drainage strings from existing MicroDrainage WinDes (sws and fws) and xpsoftware xpswmm (xpx) files.

On selecting the **Create network from import** option, the **Create Network from Import** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File type	choice box	SWS	SWS,xpswmm
<i>SWS (or FWS) for WinDes files, xpstorm files are the xpsoftware xpx files</i>			
Drainage model	model box		
<i>the drainage strings created will be stored in this model.</i>			
File to import	file box		
<i>select sws, fws or xpx file types</i>			
Process	button		
<i>create import file and create strings</i>			
Finish	button		
<i>remove the panel from the screen</i>			

Place Points

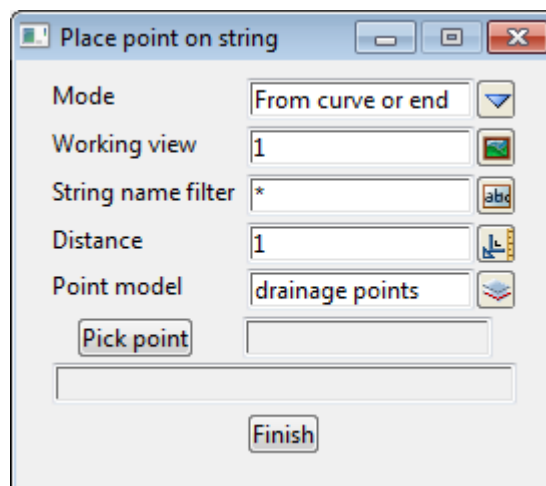

Position of option on menu: **Design =>Drainage-Sewer =>More=>Place points**

This routine creates points along a string so that drainage pits can be placed at a fixed offset from an intersection. As this is a very common task it combines several standard 12d options into one step.

The user selects a point near where the pit it to be located. The routine finds the closest string on the **working view** that matches the **String name filter** and creates a temporary point on the string.

The **Mode** determines a reference point located on the string and a marker of length, **distance**, is created from the reference point towards the temporary point.

On selecting the **Place points** option, the **Place point on string** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box	From curve or end	From curve or end, From end, Nearest point
<i>if From curve or end, the reference point is closest (by chainage) end of curve or end of string</i> <i>if From end, the reference point is the closest (by chainage) end of the string is located</i> <i>if Nearest point, the reference point is the closest vertex to the temporary point is located</i>			
Working view	view box	1	
<i>strings on this view will be searched using the string name filter. The point model will also be added to this view.</i>			
String name filter	input	*	
<i>the closest string on the working view matching this filter will be selected</i>			
Distance	input	1	
<i>the chainage distance from the reference point to the end of the marker (note that the marker is drawn as a straight line but the distance uses the chainage value).</i>			
Point Model	model box	drainage points	
<i>the marker points are placed in this model using the FLOW LINE linestyle</i>			

Pick point button

select a point near where the point marker is to be created. Only the x,y value is used from the selected point

Finish button

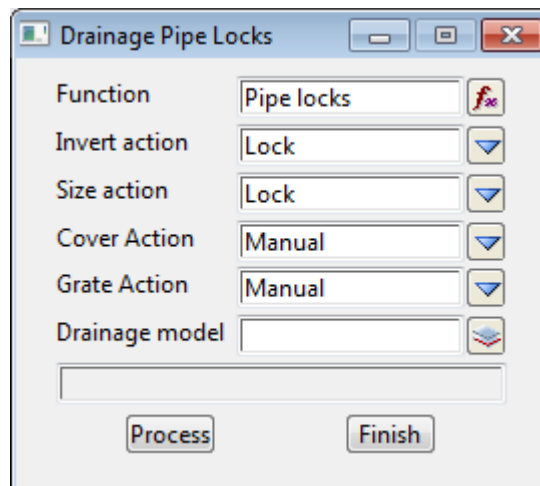

remove the panel from the screen

Drainage Pit and Pipe Locks

Position of option on menu: **Design =>Drainage-Sewer =>More=>Pipe locks**

The routine locks/unlocks (sets to manual) the pit and pipe levels in a drainage network model. A function is created so that the locks can easily be applied or removed. This is often used for existing networks or by designers wishing to set all levels manually.

On selecting the **Pipe locks** option, the **Pit and pipe locks** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function	function box	Pipe locks	
<i>A function can be created to lock and unlock the drainage string properties (via attributes)</i>			
Invert action	choice box	Lock	Lock,Unlock,None,Default
<i>Sets the pipe invert lock flags for the DNE if Lock, the flag is enabled if Unlock, the flags are cleared if None, the flags are left unchanged if Default, the flags are cleared (same as unlock)</i>			
Size action	choice box	Lock	Lock,Unlock,None,Default
<i>Sets the pipe diameter, width and top width lock flags for the DNE if Lock, the flag is enabled if Unlock, the flags are cleared if None, the flags are left unchanged if Default, the flags are cleared (same as unlock)</i>			
Cover action	choice box	Manual	Manual,None,Default
<i>Sets the mode for the cover levels (manual is the equivalent of locked) if Manual, the mode is set to manual, if None, the mode if left unchanged, if Default, the field is cleared and the default setting becomes active</i>			
Grate action	choice box	Manual	Manual,None,Default
<i>Sets the mode for the grate levels (manual is the equivalent of locked) if Manual, the mode is set to manual,</i>			

*if None, the mode if left unchanged,
if Default, the field is cleared and the default setting becomes active*

Drainage model model box
existing strings in this model are processed

Process button
Applies and removes the locks as indicated

Finish button
remove the panel from the screen

Delete All Attributes in a Model

Position of option on menu: **Design =>Drainage-Sewer =>More=> Delete All Attributes in a Model**

This routine deletes all of the model, string, pit and pipe attributes in the selected model.

On selecting the **Delete All Attributes in a Model** option, the **Delete Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

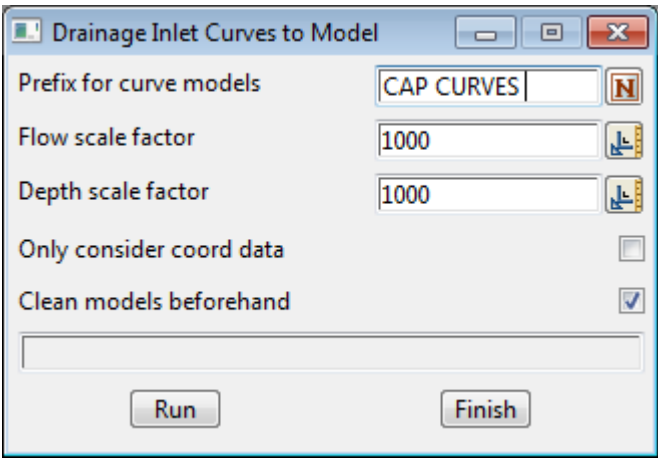

Field Description	Type	Defaults	Pop-Up
Model name <i>existing model</i>	model box		
Process <i>model, string, pit and pipe attributes will be deleted</i>	button		
Finish <i>remove the panel from the screen</i>	button		

Write Inlet Curves to Model

Position of option on menu: **Design =>Drainage-Sewer =>More=>Write inlet curves to model**

This routines reads the inlet capacity curves from the drainage.4d file and creates plot strings.
This tool is an efficient way to review the inlet capacity data in the file.

On selecting the **Write inlet curves to model**, the **Drainage Inlet Curves to Model** panel is displayed.

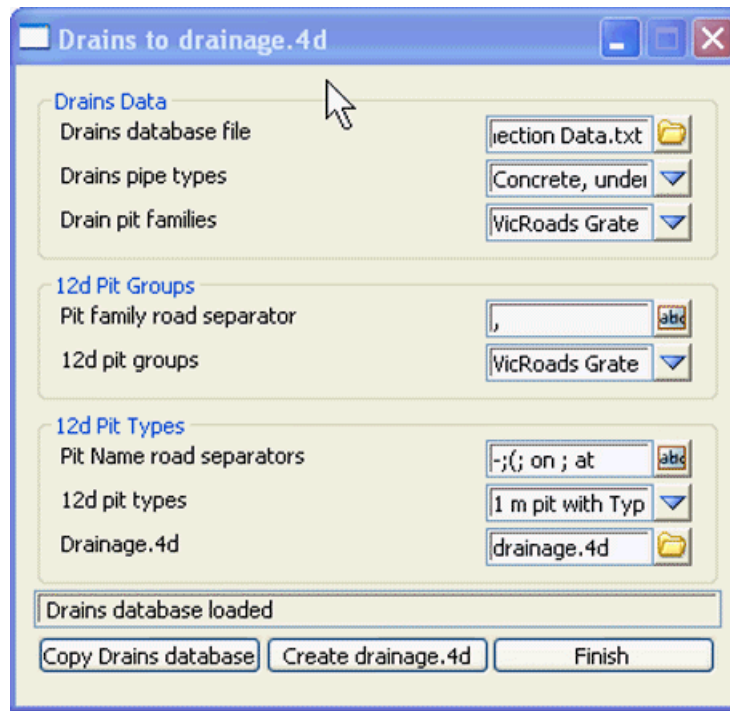

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prefix for curves models	model box	CAP CURVES	
<i>All inlet curves for a manhole type will be placed in a model named with this prefix and the manhole type.</i>			
Flow scale factor	input	1000	
<i>Inlet and bypass flow values will be multiplied by this value before creating the strings.</i>			
Depth scale factor	input	1000	
<i>Depth values for sag curves will be multiplied by this value before creating the strings.</i>			
Only consider coord data	tick box	off	
<i>Inlet capacity curves may be expressed as formulas, curve coordinate or both. Selecting this box stops curves with only formulas from being plotted as strings.</i>			
Clean models before hand	tick box	on	
<i>The curve models are cleaned before the new strings are created</i>			
Run	button		
<i>Models and strings are created from the drainage.4d file</i>			
Finish	button		
<i>remove the panel from the screen</i>			

Creating a drainage.4d file from the Drains database dump

Position of option on menu: **Design =>Drainage-Sewer =>More=>Drains to drainage.4d**

On selecting the **Drains to drainage.4d** option, the **Drains to drainage.4d** panel is displayed.

Key Points

When you are finished, open the drainage.4d file and check the road grade and crossfall values for the ongrade curves!

1. If Drains is used to selected the pit sizes then the 12d pit type must be the prefix of the Drains pit size (**Pit Name road separators** are used).

If 12d is used to select the pit sizes to export to Drains, the Drains **Pit Size** and 12d **Pit types** have to match, exactly! The pit databases supplied by Drains often have road grade and/or crossfall attached to the end of the pit size. If pit sizes are to be sent from 12d, **this must be removed!** Find **Prepare the Drains Pit Database** for more details.

2. Select **Copy Drains database** (12d will search the usual locations for the Drains database).
3. Review the **Drains pipe types** and **Drains pit families** lists to ensure you have the correct database.
4. 12d pit groups are not used in Version 8.
5. **Pit Name road separators** can only be used if **Drains** is selecting the pit types. If 12d pit types are to be exported to Drains, this field should be left blank. If you change these entries you must press the enter key to update the **12d pit types** list below.
6. Check the **12d pit types** and if they are acceptable select **Create drainage.4d**.

The Details

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Drains database file file box Drains Connection Data.txt

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file "Drains Connection Data.txt".

*Selecting **Copy Drains database** will cause the panel to search for the database dump in the folders **C:\Program Files\Drains\Program** and **C:\Program Files\Drains\Demo\Program**. If the Drains program is installed in another folder then you must browse for the file. The file will be read and the panel updated with either selection.*

Drainage.4d file box drainage.4d

The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.

Pit families choice box Drains pit families

*These are the Drains pit families that will be exported to the drainage.4d file. These will become the names on grade inlet capacity curves for all the pit sizes that belong to the family. The pit family name will be searched for words like **grade**, **slope** etc to try to determine the values for road grade and cross-fall for the 12d capacity curves.*

Pipe type choice box Drains pipe types

These are the Drains pipe types that will be exported to the drainage.4d file.

Pit group separator input box

*Pit groups are not used in Version 8. These characters will be used to remove the road grade crossfall data from the **Pit families** above. The data before this character will become the **12d pit groups**. Press **Enter** or select **Read Drains database** to create a new list of **12d pit groups**.*

12d pit groups choice box 12d pit groups

*These are created from the Pit family list above by deleting all text after the **Pit group separator**.*

Create drainage.4d button

Create a drainage.4d file.

Editing a drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

Drainage IO Defaults

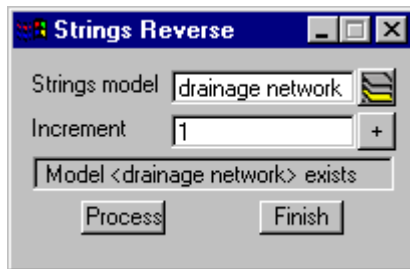

Set zero chainage to downstream end of line (Reversing the strings)

Position of options on menu: **Design =>Drainage-Sewer=>More=>Reverse all strings**

For drainage direction of flow see [Reversing the strings](#)

If desired, the reverse function may be used to move the zero chainage to the downstream end of the line. This should be done after entering all of the drainage strings and before naming the pits. From the main menu select

Design=>Drainage-sewer=>More=>Reverse all strings

This will also change the drainage flow direction attribute from **ascending chainage** to **descending chainage**.

Leave the **Increment** as 1.

Spreadsheet clipboard

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

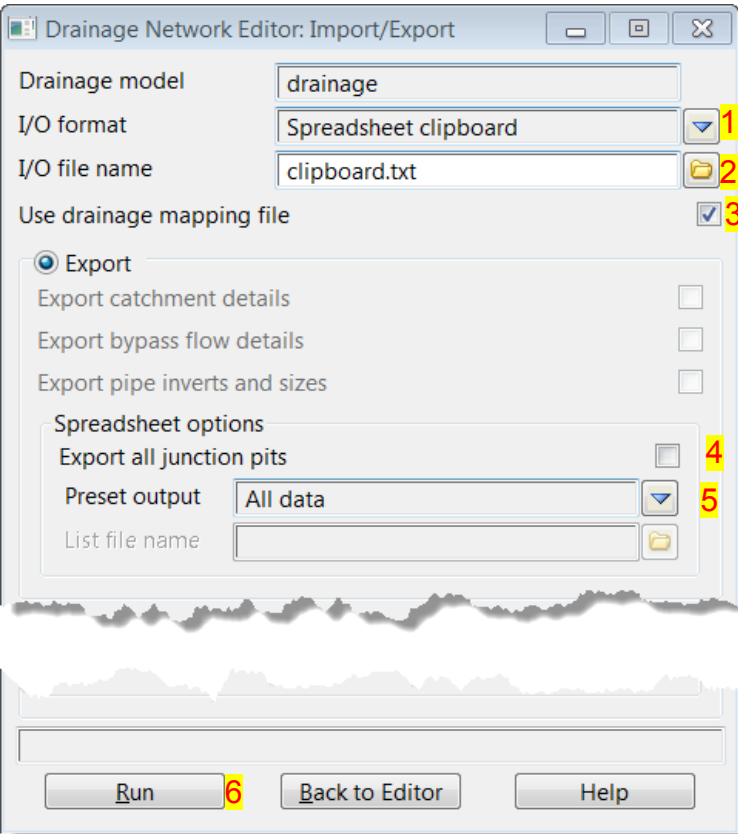

Drainage strings will be created if they do not exist in the model but pits cannot be added to existing strings.

See also

- 12d to spreadsheet transfers
- Spreadsheet to 12d update and create
- Spreadsheet options

12d to spreadsheet transfers

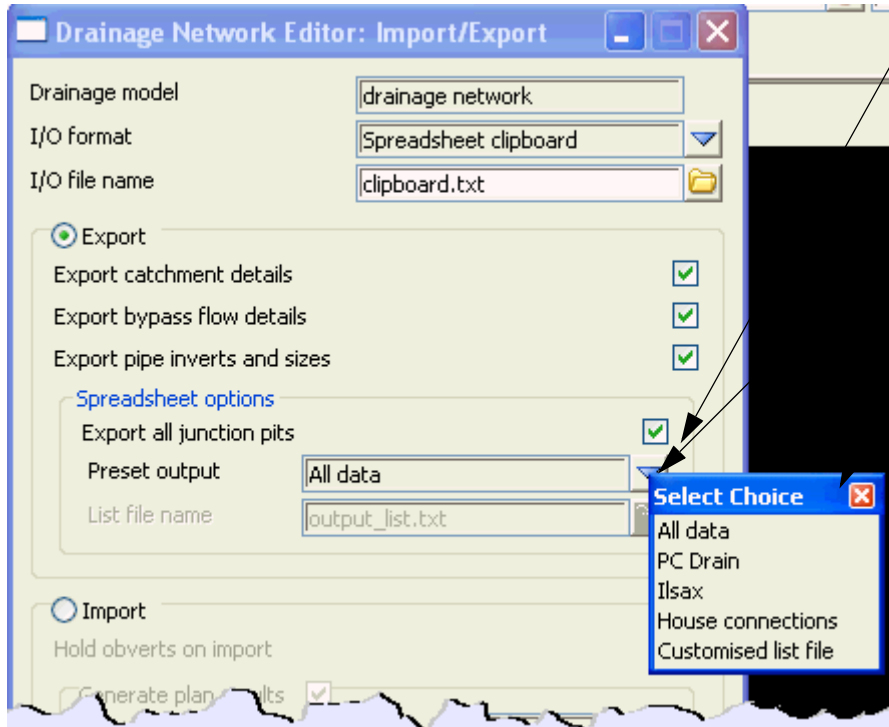

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

1. Select Spreadsheet clipboard
 2. leave as **clipboard.txt** to send the data to the windows clipboard as well as this file.
 3. Mapping files are the most current 12d technology. Leave this selected.
- These options are not used for spreadsheet export.
4. Usually leave this off! Select to export the junction pit at the end of all drainage lines (very rarely needed).
 5. You may also select to limit the output if desired. If you like using spreadsheets for data entry, the PCdrain data and ILSAX data formats are useful for adding data for the first time for either program.
 6. Select Run to place the data on the clipboard.

Options

The **Spreadsheet Options** section allows the user to define the amount of data exported.

Export all junction pits
when selected will repeat the data for the junction pit at the end of each branch line.

Preset Output
this choice box offers the following choices:

All Data: All of the 12d drainage string data and the user defined attributes will be exported to the clipboard in a tab delimited format. The 12d data names and the user defined attribute names will

appear at the top of the spreadsheets columns.

ILSAX: For the ILSAX program, the spreadsheet column headings will change depending on the pipe and catchment indicators (P2 card) and the inlet type (P3 card). Therefore, use the ILSAX pipe editor macro to set up one pit/catchment for the type of data you wish to enter. Now when you export the pipe network data the column headings will include the names of the relevant parameters.

User defined below: The **Customised list file name** is used to define the drainage values, their order and format you desire.

The **customised list file** is a text file where each line contains a drainage variable or a spreadsheet IO command (blank lines are ignored unless preceded by the header command). The spreadsheet IO commands are all lower case and listed below:

header	to define a line of text to be exported
blank	to leave a blank column in the output
pit data	the following attributes are for the pit.
downstream pit data	the following attributes are for the downstream pit.
upstream pit data	the following attributes are for the upstream pit(s).
pipe data	the following attributes are for the pit's outlet pipe
downstream pipe data	the following attributes are for the downstream pipe(s)
upstream pipe data	the following attributes are for the upstream pipe(s)
variable name	a 12d drainage variable names
factor	the following variable is multiplied by this factor
decimals	the following variable will export with these decimal places

The simplest way to create your own customised tab delimited file is to set the **Preset Output** field to **All data** and leave the **customised list file name** field blank. Selecting **Set, Finish** and then **Copy** from the main dialogue. The data will be placed on the clipboard and a **customised list file**, named **output_list.txt** will be created containing the names of all of the drainage variables in the 12d model. Use a text editor to add/or delete the variable names, change their order and/or add spreadsheet IO commands. **Save the file with a new name!** The **output_list.txt** file is overwritten on every export.

A listing of a customised list file follows. Note the words in the header file have a "tab" between them so that they will be spaces across the spreadsheet columns.

```

header
Pipe Details
  header
  Name Length  U/S IL  D/S IL  Slope(%)  Class  Dia I.D.  Rough  Pipe Is  No. Pipes

  pit data
  *pit name

  pipe data
  *length
  low ch invert
  high ch invert

  factor
  100
  *grade

  pipe type

  factor
  1000
  diameter

```

After creating your customised list file, select **Options** again and change the **Preset Output** field

to **User Defined below** and enter the new **customised list file** name that you saved above. Select **Set** then **Finish** and finally **Copy** to put the formatted data onto the clipboard.

The data can be pasted into a spreadsheet program for checking or additional formatting.

CUSTOM FORMATED DATA MIGHT NOT BE PASTED BACK INTO 12d!

The data must be in the “12d drainage spreadsheet” format to be read into 12d.

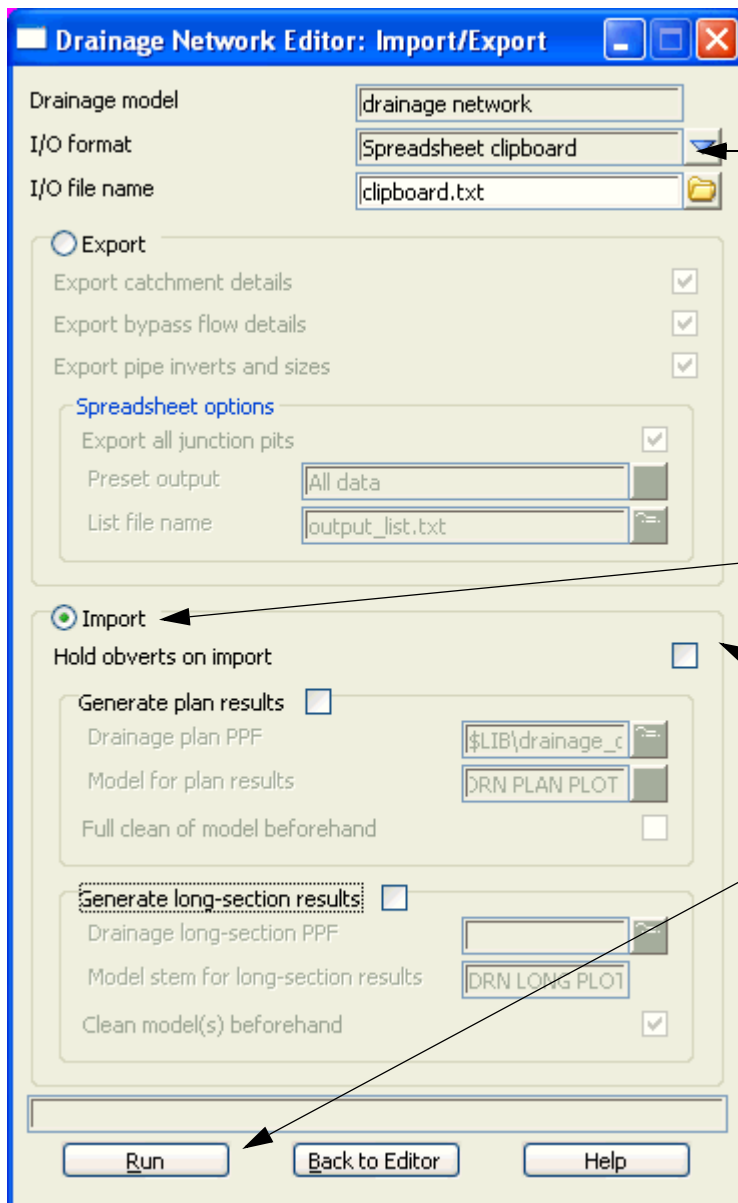

Caution with pit names in the form 1-1 or 1/1. Some spreadsheets will interpret these values as dates. If you use these formats for your pit names you will have to paste command them in once, format the columns that contain the pits names as text data and then paste the information in again.

One final word on using the copy/paste commands in the Microsoft Excel program. The Paste Special command using the “Skip Blanks” option will allow you to copy a large block of 12d data (with blanks in it) on top your data so that your data is preserved where it coincides with the blanks. To use this option paste the data into a blank spreadsheet and then select copy again. The Paste special option with “Skip Blanks” will now be available.

Spreadsheet to 12d Update and Create

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.

Select the **Spreadsheet clipboard** format.

Select **Import**

This is ignored on spreadsheet imports.

Select **Run** to update the drainage model.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clipboard in order to update a 12d drainage model or create a new model. These format are described below.

Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique pit identifier (unique to the drainage model not the 12d project). The names of the strings and pits may be changed via the spreadsheet if these columns are present at import time.

If the pit id column is not present, 12d will search the drainage model for a matching pit name. When the pit is a junction between drainage lines, only the trunk line will be the data updated.

Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, pits cannot be added to an existing string. The entire drainage string must be created at once. Two

formats are available, the “from-to pit” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not adding strings to a network, you will have to create a drainage network with one “dummy” pit. Select this one “dummy” pit to activate the editor. After importing the data and the new drainage lines are created the “dummy” pit may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, pit name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The pits must be listed from upstream to downstream order. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Pit Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name (*pit name), the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An optional column for the pit cover elev (cover elev) may be specified. Once the network has been created additional pipe and pit data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev
text	text	real	real	real
E/1	A/3	5309.458	7336.935993	29.2173
D/1	A/4	5277.189	7336.935989	28.5071

“12d drainage spreadsheet” Format

Each column of data is used for a 12d drainage variable or a user defined attribute. Each row

represents a pit and the downstream pipe (controlled by the direction of flow variable) within the drainage network. A sample is shown below.

12d	pit	pit	pit	pit	pit	pit
*string Name	*pit name	pit type	pit low ch invert	pit high ch invert	pit id	string id
text	text	text	real	real	integer	integer
E	E/1	SA2	28.108	28.108	1	67389
E	A/3	SA2	27.7559	27.7559	2	67389
D	D/1	SA2	27.3961	27.3961	3	68100
D	A/4	SA2	26.8018	26.8018	4	68100
C	C/1	SA2	30.67	30.67	5	72072
C	B/3	SA2	29.563	29.563	6	72072
A	A/1	SA2	29.1026	29.1026	7	82469
A	A/2	SA2	28.7811	28.7311	8	82469
A	A/3	SA2	27.7652	27.7059	9	82469
A	A/4	SA2	26.8127	26.7518	10	82469
A	A/5	SA2	26.0867	26.0244	11	82469
A	A/6	SA2	25.3442	25.2942	12	82469
A	A/7	SA2	24.6672	24.6672	13	82469
B	B/1	SA2	31.2759	31.2759	14	192066
B	B/2	SA2	29.351	29.301	15	192066
B	B/3	SA2	29.123	29.073	16	192066
B	B/4	SA2	28.0444	27.8951	17	192066

B	A/5	SA2	26.0744	26.0744	19	192066

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous pits on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

- 1.Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
- 2.Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
- 3.Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.

- 4.Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;
- integer
real
text
- If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.
- 5.Blank lines may be inserted as desired.
- 6.You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).
- 7.Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

12d Drainage Variable Names

Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	
pit type	low ch invert	
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

Quick Check Lists for Drainage Design Software

The drainage design software packages each have their specific requirements regarding the manhole types, names and then method they use to model pit inlet capacities. The following section details the specific requirement for each package.

See [Drains Version 2+ Requirements and Notes](#)

See [PCdrain Requirements](#)

See [Running RATHGL/RAT2000 and XP-SWMM](#)

See [Micro Drainage - WinDes Requirements](#)

Drains Version 2+ Requirements and Notes

See also [Drainage overview](#)

Basic Check List

1. All manholes must have a unique name (Manhole names cannot begin with "O ")
2. The pipe type used in 12d must exist in the Drains pipe database

Overland flow with Inlet Capacity Check List

1. Make sure you are using Drains Version 2-5 clipboard data. Inside Drains select **Project=>Pit database**. The pit family selection should be available. (CAP1 etc. is Version 1).
2. All Overflow route shapes, pit families and pit types used in 12d must exist in the Drains pit database
3. Overland flow lines must be within 1.0 metres/feet of the manhole

Running Drains - Version 2+

Key Points

The Drains database (each project has its own) and the 12d database (drainage.4d) must be synchronised (**More**).

12d Version 8 needs you to create a new drainage.4d file to include the new inlet capacity curves (pit groups are no longer used).

For pits with a bypass pit and road grade defined (non ILLUDAS), 12d selects pit families for Drains in the following way

The user selects the pit type (Drains pit size) in 12d and 12d selects the ongrade or sag curve from the drainage.4d file (see inlet capacity calculations). The names of these curves are the Drains pit families. If there are no curves for the pit type in the drainage.4d file then the Drains pit type is exported as ILLUDAS with no family or size data.

If the 12d pit type is **Headwall** then the pit will be exported as a headwall.

Catchment lengths, slopes and roughness values are NOT exported in the Drains Rational format. The default values for these parameters are NOT exported in the Drains ILSAX format but the explicit settings from the catchment panel are exported. If used, Drains requires length, slope and roughness for both impervious (paved) and pervious (grass). Supplementary values must be entered in Drains.

Data is copied from 12d to the Windows clipboard and then pasted into Drains. 12d can not delete any objects in Drains, it can only add and update.

When updating 12d from Drains, always copy the DATA to 12d before the results. 12d will update the network but will not add or delete pits.

If a new pit is added in Drains, the user will have the option to create it in 12d. If it is created only the pit will be added and not the pipes.

Why Do I get ILLUDAS pits?

The bypass pit is blank. There must be a bypass pit for the water to go to. Bypass flow strings must pass within 1 pit diameter (beware pits with zero manhole diameters) and you can enter them manually.

The pit type selected has no capacity curves in the drainage.4d file. The curve names become the pit family for the export to Drains. No pit family means ILLUDAS.

If you are intentionally using a drainage.4d file with NO inlet capacity curves, the pit families you set in Drains will be remembered by 12d when you import back into 12d. The inlet capacity curves will not be required for your next export to Drains.

Drains Interface Overview

The Drains program performs the rational or ILSAX hydrology calculations as well as hydraulic grade line calculations that determine pipe sizes and pipe invert levels.

The data sent to Drains includes

pit names and types, easting and northing data with surface levels

finished surface profile along the centre line of the pipes

Headwalls and their levels

optional - bypass inlets, road grades/crossfalls and **SAG Inlet Calculations** (ponding volumes and depths). Pit family selection using road grade and crossfall data.

optional - composite catchment area create from three 12d areas per inlet (must alter the mapping file)

catchment characteristics, k values and overland travel times

pipe sizes, type and invert levels

Data is copied from 12d to the Windows clipboard and then pasted into Drains (**Edit=>Paste data from spreadsheet**). 12d can not delete any objects in Drains, it can only add and update.

The Drains menu selection **Run=>Design** is used to design the network. Once the drainage network has been designed in Drains the updated design data (**Edit=>Copy data to spreadsheet**) and/or the hydraulic results (**Edit=>Copy results to spreadsheet**) are sent back to 12d via the clipboard.

Always copy the DATA to 12d before the results as the results are deleted inside 12d with every update of the data!

Catchment Data

Drains has one catchment per inlet and therefore only 12d's catchment set one is used in the interface. The 12d catchment is split a pervious (grass) area and an impervious (paved) area using the percent impervious fraction. The rational and ilsax spreadsheet export formats (selected in the import/export panel) are different.

The Rational format of the Drains interface does not export Drains "more detailed data". The ilsax format does support the "more detailed data" format but the user must define the length, slope and roughness in the catchment panel. No 12d DNE default data will be exported. As 12d does not have a supplementary area this data will have to be entered into Drains. Gutter lengths and slopes are calculated from the upstream section of the longest overland flow path entering the inlet.

Supplementary data entered in Drains will be remembered in 12d for the next export. The grassed percentage for the next export is calculated as the $(100 - \% \text{ impervious} - \% \text{ supplementary})$.

Synchronising the Drains database and the drainage.4d file.

The 12d pipe types are always used to interface with Drains. Ongrade or SAG pits will be created for export to Drains if the 12d pit has a bypass pit, road grade and a pit type with inlet capacity curves. If all three are not present it will be exported as an ILLUDAS pit.

Every Drains file begins with a default database and Drains uses that database for the life of the project. This database must be synchronised with the **drainage.4d** file in 12d to ensure the Drains pit families, pit sizes, pipe types and overflow route types match. Therefore it is highly recommended that copy of the drainage.4d file be kept in the 12d working folder.

The Drains and 12d data must match as follows.

Drains database	drainage.4d
Pipe type	Pipe type entries
Only if bypass flow is required	
Drains database	drainage.4d
Pit size	Pit type
Pit family	ongrade or sag curve names
Overland route database	default in mapping file

Note: If Drains is to be used to select the pit size then an exact match in pit types is not required. For this case the 12d pit type need only be the prefix of the Drains pit size.

The following 6 steps will help ensure 12d is synchronised with Drains. More details are given in the sections below.

1) Prepare the Drains Pit Database

IF 12d is to select the Drains **Pit Size**, then the Drains **Pit Size** and 12d **Pit types** have to match, exactly! If Drains is used to determine the pit size then you may skip this step.

The pit databases supplied by Drains often have road grade and/or crossfall attached to the end of the pit size. **THIS EXTRA DATA MUST BE REMOVED!**

For example, in Drains database you may find the following

Pit family	Pit size
NSW RTA SA Inlet, 3% crossfall, 1% grade and	SA1 (Type 2) - 1% longitudinal grade
NSW RTA SA Inlet, 3% crossfall, 3% grade	SA1 (Type 2) - 3% longitudinal grade

The pit size for both is the same, **SA1**, but 12d can not tell this because of all the extra data at the end. In Drains, simply remove the extra information so that they are both **SA1**. If the network already exists in Drains, then Drains will automatically change the names of the sizes you have already selected. No time lost here.

Once you have changed the Drains pit size names, you are ready to use the **Drains to drainage.4d** routine to create a drainage.4d file that is synchronised with Drains.

2)Export the Drains database from your Drains file

Inside Drains Open your drains file or begin with a blank file. Select **Project=>Overflow Route database**. Then select **OK** and then **YES**. This will cause Drains to export the database to the file "Drains Connection Data.txt" and store it in the folder with the Drains program.

3)Create a drainage.4d file from the Drains file

From the 12d menu select **Design->Drainage-Sewer->More->Drains to drainage.4d**.

Select **Copy Drains database** to copy the file to the 12d working folder.

select **Create drainage.4d**. The Drains database dump file is copied to the 12d working folder and a drainage.4d file is created in the 12d working folder.

More details below.

4)Edit the drainage.4d file

From the 12d menu select **Design->Drainage-Sewer->More->Edit drainage.4d**. Select **Find** then edit from the file **more info** button. Set the road grade and crossfalls for the 12d pit groups.**More details below.**

5)Restart 12d

From the 12d menu select **Project->Restart**.

6)Set the Overflow shape, Update Pit and Pipe types (Optional)

If the network has already been created using pit and pipe types that no longer exist in the drainage.4d file, they will have to be updated before the export to Drains can occur. You may update them using the drainage network editor (one at a time) or you may set **all** of the pit and pipes types to **one value** using this routine.Later you may change them individually using the **Drainage network editor**

This routine will also set a default overflow route shape for export (values can be modified in the Drains program if desired).

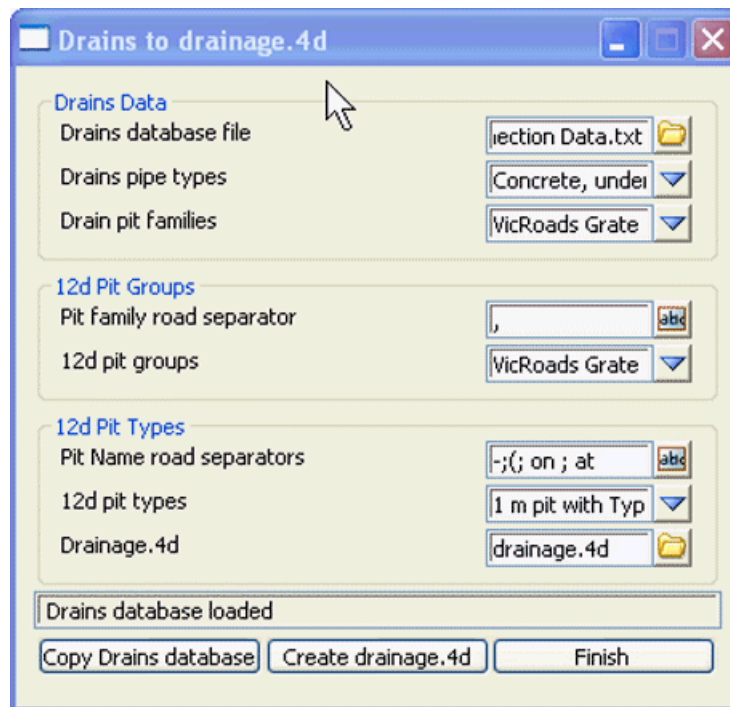

From the 12d menu select **Design->Drainage-Sewer->More->Drainage io defaults**.

More details below.

Drains to drainage.4d file

Position of option on menu: **Design =>Drainage-Sewer =>More=>Drains to drainage.4d**

On selecting the **Drains to drainage.4d** option, the **Drains to drainage.4d** panel is displayed.

Key Points

When you are finished, open the drainage.4d file and check the road grade and crossfall values for the ongrade curves!

If Drains is used to selected the pit sizes then the 12d pit type must be the prefix of the Drains pit size (**Pit Name road separators** are used).

If 12d is used to select the pit sizes to export to Drains, the Drains **Pit Size** and 12d **Pit types** have to match, exactly! The pit databases supplied by Drains often have road grade and/or crossfall attached to the end of the pit size. If pit sizes are to be sent from 12d, **this must be removed!** Find **Prepare the Drains Pit Database** for more details.

Select **Copy Drains database** (12d will search the usual locations for the Drains database).

Review the **Drains pipe types** and **Drains pit families** lists to ensure you have the correct database.

12d pit groups are not used in Version 8.

Pit Name road separators can only be used if **Drains** is selecting the pit types. If 12d pit types are to be exported to Drains, this field should be left blank. If you change these entries you must press the enter key to update the **12d pit types** list below.

Check the **12d pit types** and if they are acceptable select **Create drainage.4d**.

The Details

YOU MUST RESTART 12D FOR THE NEW DRAINAGE.4D FILE TO BECOME ACTIVE!

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Drains database file file box Drains Connection Data.txt

You must update this file from Drains before each use of this panel. Inside Drains select Project=>Overflow Route database. Then select OK and then YES. This will cause Drains to export the database to the file "Drains Connection Data.txt".

Selecting **Copy Drains database** will cause the panel to search for the database dump in the folders **C:\Program Files\Drains\Program** and **C:\Program Files\Drains\Demo\Program**. If

the Drains program is installed in another folder then you must browse for the file. The file will be read and the panel updated with either selection.

Drainage.4d file box drainage.4d

The drainage.4d will be created in the 12d working folder unless otherwise specified. It will only be used for 12d projects in this folder.

Pit families choice box Drains pit families

These are the Drains pit families that will be exported to the drainage.4d file. These will become the names on grade inlet capacity curves for all the pit sizes that belong to the family. The pit family name will be searched for words like **grade**, **slope** etc to try to determine the values for road grade and crossfall for the 12d capacity curves.

Pipe type choice box Drains pipe types

These are the Drains pipe types that will be exported to the drainage.4d file.

Pit group separator input box

Pit groups are not used in Version 8. These characters will be used to remove the road grade crossfall data from the **Pit families** above. The data before this character will become the **12d pit groups**. Press **Enter** or select **Read Drains database** to create a new list of **12d pit groups**.

12d pit groups choice box 12d pit groups

These are created from the Pit family list above by deleting all text after the **Pit group separator**.

Create drainage.4d button

Create a drainage.4d file.

Editing the Drainage.4d file

Position of option on menu: Design =>Drainage-Sewer =>More=>Edit drainage.4d

On selecting the Edit drainage.4d option, the Edit drainage.4d panel is displayed.

Select the **Find** button to search the 12d path for the current **drainage.4d** file. Select the **More info** button and then **Edit** to edit the file.

The drainage.4d file contains Manhole and Pipe commands. 12d also uses the Manhole commands to specify a pit group by using the prefix "group". Details follow.

Headwalls

The pit type "Headwall" (case sensitive for Drains) is reserved for the inlet headwall for a conduit. Drains does not use this for an outlet headwall.

If the inlet type is On Grade or there is no bypass pit, the grate level is exported as the Drains surface level. If the Inlet type is marked as a SAG pit then the surface level will be calculated from the low point on the catchment string (catchment set #1). Also see **SAG Inlet Calculations**.

Pit Families

Version 2+ of the Drains clipboard interface uses a **pit family** to describe the kerb shape and optionally, the name include the road crossfall and/or grade attached as a suffix.

An example pit group is the drainage.4d file is shown below. 12d uses the road grade and/or the road crossfall to select which pit family should be sent to Drains. In this example the road crossfall would not be used in selecting the pit family.

It is up to the user to decide the grade when the next pit family should be used. In this case the threshold value for the gutter grade is set midway between the published values of the inlet curves. For example at a gutter grade of 2% 12d starts sending the **NSW RTA Pits - 3% slope**

pit family.

The pit families listed on the right must match exactly with those in the Drains pit database.

Pit Types and Pit Sizes

Each Drains **pit family** has several **pit sizes**. The Drains **pit sizes** link to the 12d pit types and therefore all Drains **pit sizes** should exist in the 12d drainage.4d file.

The **pit size** will be read back from Drains into 12d as the **pit type** so that it can be placed on the drainage long sections and pit schedules. If no matching pit type is found in 12d then a character will be dropped off the end of the Drains pit size and 12d will be searched for the new shorter pit type. This will be repeated till a match is found (or there are no more characters in the Drains pit size).

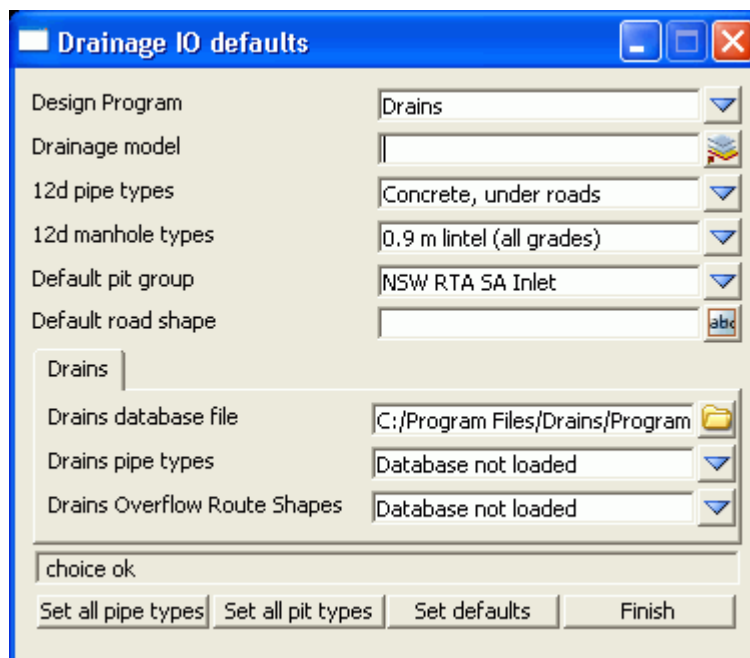

Pipe Types

The pipe type selected in 12d must exist in the pipe database inside Drains. Simple "2" for class 2 or "RCP" do not exist in Drains.

Setting the Overflow Route, the Pit and Pipe types

Position of option on menu: Design =>Drainage-Sewer =>More=>Drainage IO Defaults

On selecting the Drainage IO Defaults option, the Drainage IO Defaults panel is displayed.

The routine changes ALL of your pit and pipe types in a model to a single value. If you have changed your drainage.4d file after creating you drainage network, the pit and pipe types you originally selected may no longer be valid (i.e. in the drainage.4d file).

Field Description	Type	Defaults	Pop-Up
Design Program	choice	Drains	Drains, PCdrain

The drainage model to be updated.

Drainage model file

The drainage model to be updated.

12d pipe types choice values from drainage.4d

Set all pipe types will set all pipes in the model to this value

12d pit types choice values from drainage.4d

Set all pit types will set all pits in the model to this value

Default pit groups choice values from drainage.4d

pit definitions in the drainage.4d file that have **group** as a prefix are included.

Default road shape choice values from drainage.4d

type the desired name or if using Drains select the desired shape from the **Drains Overflow route shapes**.

Drains Tab

Drains database file file

pressing enter in this field will start a search for the Drains database dump. The search path is the specified folder, C:\Program Files\Drains\Program then C:\Program Files\Drains\Demo\Program. If the file is found the choice fields below are populated. **It is highly recommended that this file be in the 12d working folder.**

Drains pipe types choice I values from Drains file

the pipe types are retrieved from the last Drains database dump. Changing this value will update the **12 pipe types** above.

Drains Overflow Route Shapes choice values from Drains file

the overflow route shapes are retrieved from the last Drains database dump. Changing this value will update the **Default road shape** above.

Set all pipe types button

all pipe types in model are set to this value

Set all pit types button

all pit types in model are set to this value

Set defaults button

the defaults for the **Drains Overflow Route Shapes** and **12d pit group** are set

Finish button

removes the panel

Drains Version 2+ Requirements

Pit Names

The 12d pit names cannot be more than 9 characters long. 12d uses 2 additional characters to the pit name at export time create names for the pipes, overflow routes and catchments. For example pit "A-1" will have a bypass route "F A-1", a catchment "C A-1" and a downstream pipe "P A-1".

Bypass Flow (Overland Flow Routes)

There are 3 requirements for Drains bypass flow (bypass pit, pit inlet capacity curve and road grade/crossfall).

Select a **pit type** that has ongrade or sag inlet capacity curves defined in the drainage.4d file. The Drains and 12d databases must be in sync.

Bypass strings in the **Bypass route model** specified (Network editor->Global->Utility Models->Bypass flow model. For more details see **Bypass Flow**.

Road grade and crossfall calculated (Network editor->Global->Utility Models->Road design file)

The overland flow strings are not allowed to pass through the outlet pit on the network.

SAG Inlet Calculations

SAG inlets are inlets where the water ponds at the surface rather than flowing past. If a SAG inlet

has a catchment string the overflow depth and volume are calculated. The catchment string from Set #1 is draped onto the design tin and the lowest point is found on the draped string (stored as a 12d pit attribute **overflow level**). The storage volume inside the string up to this point is measured and stored as a 12d pit attribute **overflow volume from level**. and are subtracted from the to determine

The Max Ponding Depth = **overflow level- grate level**

If the **manual flag** is selected for the "sag pit pond depth", 12d will NOT calculate the value but will use the value entered by the user. 12d will check if a volume has been calculated before or imported from Drains. If the volume exists then it is exported. If it does not exist, this ponding depth will be used calculate the ponding level (depth + grate level). The ponding level will be used to calculate a ponding volume from the design tin and the catchment boundary.

If you want to manually delete this volume and force 12d to recalc to volume using the user defined level, delete the pit attribute, "overflow volume from level". To delete the attribute use Strings->Properties->Attributes, select the pit, go to the pit tab, right mouse select the row with this attribute and select delete).

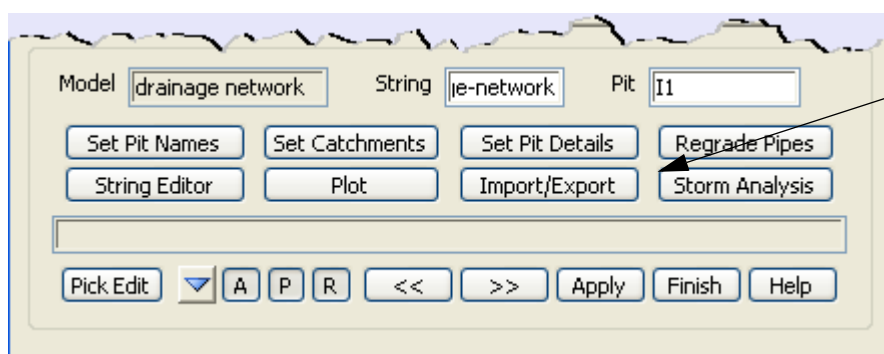

Results

Drains exports the maximum data from all of the rainfall events analysed. Therefore, ensure you analyse only the rainfall events desired before coping the results to the clipboard. To verify the data that is being sent to 12d, copy the data into a spreadsheet so you can view it there first. The pit sizes selected in Drains will be stored in 12d as the pit type. Therefore the pit sizes in Drains should exist as pit types in the drainage.4d file. If pit families are changed in Drains the pit group in 12d will be updated by search for the pit family in the drainage.4d file.

12d to Drains

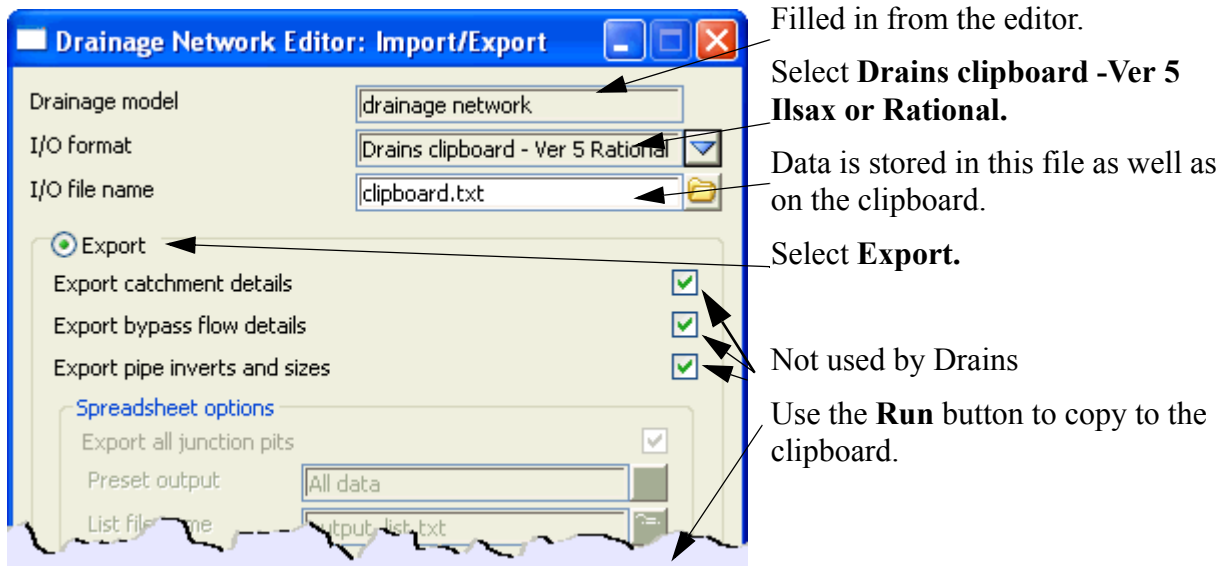

Setup your drainage network models and ensure they have been assigned pit names.

Copy the data to the clipboard

From the Drainage network editor select the **Import/Export** button.

The following interfaces dialogues will appear.

From within the Drains program select **Edit =>Paste data from spreadsheet**. If you paste the data into a Drains project that has a hydrological model and rainfall data already defined the project will be ready to run.

Use the Drains Run=>Standard design to design your pipe sizes and invert levels. The Run=>Advanced Design will select the size of the pits as well.

Drains to 12d Update

The following steps are required to update the 12d model with the Drains hydraulic results and changes to the pipe sizes and inverts.

To update the pipes and invert levels in 12d, select **Edit->Copy Data to Spreadsheet** from the Drains menu.

From within the 12d Drainage network editor select **Import/Export**.

Drainage Network Editor: Import/Export

Drainage model: drainage network

I/O format: Drains clipboard - Ver 5 Rational

I/O file name: clipboard.txt

☐ Export

Export catchment details ☒

Export bypass flow details ☒

Export pipe inverts and sizes ☒

Spreadsheet options

Export all junction pits ☒

Preset output: All data

List file name: output_list.txt

☒ Import

Hold obverts on import ☐

Generate plan results ☒

Drainage plan PPF: gn.drainplanppf

Model for plan results: DRN PLAN PLOT

Full clean of model beforehand ☐

Generate long-section results ☒

Drainage long-section PPF: ng_A1.drainppf

Model stem for long-section results: DRN LONG PLOT

Clean model(s) beforehand ☒

Run Back to Editor Help

Filled in by the editor.

Select Drains clipboard - Version 5

Leave as clipboaard.txt

Select **Import**

This will ignore the invert levels read from Drains and the current pipe obverts will remain fixed.

Plan and long section drawings may be created at the import time so that you can see the results on the drawings.

Select **Run** to update the drainage model. To see the changes in the section views you will have to select **Regen** on the section view toolbar.

To return to the network editor select **Edit**

IMPORTANT: THE DATA MUST BE PASTED BEFORE THE RESULTS!

12d erases the hydraulic and hydrology data when the physical data is updated. Therefore, always paste the data before the results.

Drains Mapping File

The rational format and the ilsax format have separate mapping files.

The Drains spreadsheet format consists of sections starting with a header, then the data area and ending with a blank line. The mapping file defines the format of the section headers and the format of the data within the sections

	A	B	C	D	E	F	G	H	I
1	PIT / NODE DETAILS			Version 9					
2	Name	Type	Family	Size	Ponding	Pressure	Surface	Max Pond	Base
3					Volume	Change	Elev (m)	Depth (m)	Inflow
4					(cu.m)	Coeff. Ku			(cu.m/s)
5	A2	Node	Sutherlan	0.85 m lin	1	1	26.451	0	
6	A3	OnGrade	Sutherlan	0.85 m lin	1	1.2	27.194	0	
7	A4	OnGrade	Sutherlan	0.85 m lin	1	1.2	27.92	0	
8	A5	OnGrade	Sutherlan	0.85 m lin	1	1.2	28.872	0	
9	D1	Sag	NSW RTA	SA1	1	2	28.492	0.068	
10									
11	DETENTION BASIN DETAILS								
12	Name	Elev	Surf. Area	Init Vol. (c	Outlet Typ	K	Dia(mm)	Centre RL	Pit Famil
13									
14	SUB-CATCHMENT DETAILS								
15	Name	Pit or	Total	Paved	Grass	Supp	Paved	Grass	Supp
16		Node	Area	Area	Area	Area	Time	Time	Time
17			(ha)	%	%	%	(min)	(min)	(min)
18	C A2	A2	0.039	80	20	0	5	10	0
19	C A3	A3	0.0408	80	20	0	5	10	
20	C A4	A4	0.0705	80	20	0	5	10	

The headers in the mapping file define the exact text to be exported in the Drains section headers. During an import the first 4 columns of the Drains header are compared to the headers in the mapping file to determine which section is being read. The data format line is then used to decode the the data.

PCdrain Requirements

See also [Drainage overview](#)

Basic Check List

1. All manholes must have a unique name
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. Pit types in used in 12d must exist in the PCdrain Inlet gully file selected.

Overland flow with Inlet Capacity Check List

1. A gutter profile named “4d” must exist in PCdrain before the interchange file is read. This gutter profile may be created in PCdrain from the menu selection **Data=>Gutter profiles** then **New**.
2. Overland flow lines must be within 1.0 metres/feet of the manhole

Data is exchanged to and from PCdrain via the interchange (*.int) file. Gutter profiles and inlet type must be specified in PCdrain before the interchange file is read into PCdrain.

The data sent to PCdrain includes

- s pit names and types, easting and northing data with surface levels
- s pipe deflection angles at pits
- s finished surface profile along the centre line of the pipes
- s optional - crossing services - level, size and location along the pipes
- s optional - bypass inlets, road grades and SAG inlet ponding depths
- s optional - up to 2 catchment areas per inlet
- s optional - default catchment characteristics, k values and overland travel times
- s optional - pipe sizes and invert levels

PCdrain Requirements

Pit names

The pit name from 12d is assigned to both the structure and catchment name in PCdrain. These names cannot exceed 7 characters.

Pit type

The 12d pit type is transferred to the structure type in PCdrain. These names must match those specified in the PCdrain Inlet charts selected (**Data=>Inlet charts**). Select the desired inlet charts BEFORE importing the interchange file.

12d pit types with an “S” in the name are treated by 12d and PCdrain as a SAG inlet pit. 12d will strip off all characters after the “S” before adding the ponding depth. If a catchment string in set #1 is available for the SAG pit then the ponding depth will be calculated. The 12d pit type will remain unchanged. A typical example would be a pit type “1TC” with the sag tick box on would become “1TC0.100” if a ponding depth of 0.1 was calculated.

Bypass Flow

When a catchment string is specified for the pit, the maximum depth before bypass flow commences is calculated. The lowest point on the catchment string is determined by draping it onto the drainage strings tin. The maximum depth before bypass is calculated pit setout level

less the setout to grate offset less the lowest point on the catchment string.

PCdrain differentiates between pits (no surface inflow) and gully pits via the 12d pit type. The bypass flow strings can only be drawn within 1 pit diameter of the gully pits. Keep the bypass flow strings away from the PCdrain pits.

Catchments

Again, since PCdrain differentiates between inlets and manholes (using the 12d pit type), ensure that catchments are only drawn for gully inlet and NOT manholes.

12d to PCdrain

1. Export the data to PCdrain selected via the Network editor

Design=>Drainage-Sewer=>Drainage Network Editor

After selecting the drainage network, select the **Import/Export** button and the following dialogue will appear.

The drainage model will be completed by the editor.

Select **PCdrain Int (Windows)** from the drop down list.

Enter the name of the int file to be created.

Select **Export**.

Select the **Run** button and the interface file will be created.

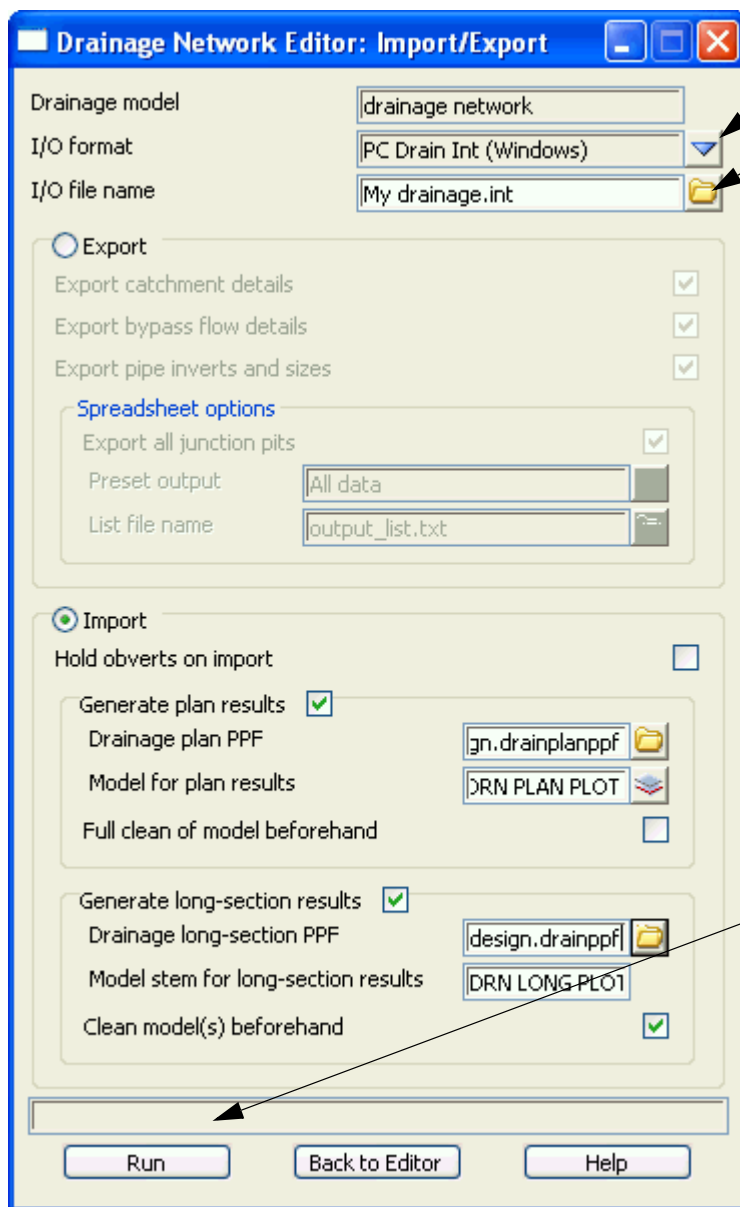

2. Launch the PCdrain for Windows program. If you have a project set up with the design parameters, rainfall data, inlet charts and gutter profiles then open it now and skip to step 8. Otherwise continue with step 5.
3. The Design Parameters can be set as desired with the menu selection **Data=>Design Parameters**.
4. Select the rainfall data using the **Data=>Rainfall** menu selection.
5. Select the inlet charts using the **Data=>Inlet Charts** menu selection. The pit types specified in 12d must be included in these settings. **More - PCdrain to 12d pit converter**
6. At least one gutter profile in PCdrain needs to be defined. These are set through the menu selection **Data=>Gutter Profiles**. The default gutter section name (**Road ID**) from 12d is **4d** and therefore it is recommended you create a profile with this name and your own description. If you have changed the profile names in 12d (through the spreadsheet interface or the Attribute editor) these new profile names will have to exist in PCdrain.
7. Save this file now so that you can retrieve it later if required. It can be used as a starting template for new jobs.
8. **File=>Import** from the menu. Select the file exported in step 1. The information from 12d may be viewed by selecting **Data=>Network** and then selecting the desired tabs.
9. The HGL level and the pipe elevation at the outlet should be set using the menu selection **Data=>Outlet**.
10. If you have not exported pipe data then the pipe size must be determined. Use the menu selection **Process=>Select Pipe Sizes**.

PCdrain to 12d

Export the results to 12d using the **File=>Export** menu selection. Note the name of the interchange file you are creating as you will need to enter it inside 12d.

Return to 12d and select **Import/Export** from the network editor and the following dialogue will

appear,

Select **PCdrain Int (Windows)** from the drop down list.

Select the output file name you created in PCdrain.

Select **Run** and the file will be read into 12d and the drainage network will be updated. To see the changes in a section view, select **Regen**.

A listing of the data imported is stored on the 12d output window.

Inlets that have been specified as SAG inlets will have the ponding depth removed from the end of the PCdrain structure type before the data is stored as the 12d pit type.

RAT2000 Requirements

See also [Drainage overview](#)

Basic Check List

1. All manholes must have a unique name (they become nodes in RAT2000)
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. First export should have “**Export pipe diameters and Inverts**” selected
5. Outlet conditions must be set in RAT2000.
6. Start-up data may be specified in the file **drainage startup.xpx** (the standard 12d system file path will

be searched).

Overland flow with Inlet Capacity Check List

1. Overland flow lines must be within 1.0 metres/feet of the manhole
2. If inlet capacity curves are to be used then the curve name must match the 12d pit type with the road grade/crossfall data added.

22.0 Running RAT2000

Data is exchanged to and from RAT2000 via the interchange (*.xpx) file. The data exported from the 12d drainage model is appended to the xpx startup data specified in the file **drainage startup.xpx** (the standard 12d system file path will be searched). This file may be edited using a text editor or you may create your own default file by exporting your RAT2000 global data this file.

RAT2000 Requirements

Manhole names

All manholes will become nodes in RAT2000 and therefore they must have a unique name inside 12d.

Manhole Types

The manhole types are used to determine the pit inlet capacities if overland flow routes are selected. Fixed inlet capacities values may be set in the drainage.4d file while inlet capacities curves must be included in the drainage_startup.xpx file. The range of available curves for 12d to choose from are set in the drainage.4d file and the curves are determined using the pit type, road grade and road crossfall.

Pipe Types

Pipe types are not transferred to RAT2000.

Overland Flow

When an overland flow model is selected the pit inlet capacities and bypass routes are calculated.

22.1 12d to RAT2000

1. Export the data to RAT2000 by selecting

Design=>Drainage-Sewer=>More=>Pit/Pipe Design Interface

The following dialogue will appear.

Select RAT2000 from the drop down list.

Enter the name of the xpx file to be created.

Optional.

Not supported in RAT2000.

See notes below on **Updating an existing RAT2000 file**

Select the **Run** button and several checks will be made on the drainage network at this time. The interface file will be created.

22.2 Updating an existing RAT2000 file

Adding new Nodes and Pipes

If new manholes and pipes have been added to 12d then these new entities will now be included in the xpx file and imported into the RAT2000 project. 12d identifies the nodes in XP by the node names. Therefore if nodes names are changed in either program then they must be manually changed in both programs.

If a manhole is to be inserted in an existing link then the existing link must be deleted in RAT2000 so that the new links and manholes may be created in the void.

WARNING! If the tick box **Export catchment/pit/overland flow default data** is selected for the update then any changes to these defaults in RAT2000 will be lost. Two options are available to the user.

Option 1 - Preferred method if updating pipe lengths, invert levels for your design.

De select the tick box and export the data. The new node and links created in RAT2000 will not have all the defaults set but the existing nodes and links will not have revisions to defaults over-written.

Option 2 - Preferred method if you have created numerous new links and nodes.

Leave the tick box selected but export the RAT2000 to a temporary xpx file first. This will save the existing setting. After RAT2000 is launched and loaded with the new data, import your temporary xpx file you just created to restore the original data.

Deleting Nodes and Pipes

If a node or link is to be deleted then delete the entity from both 12d and RAT2000.

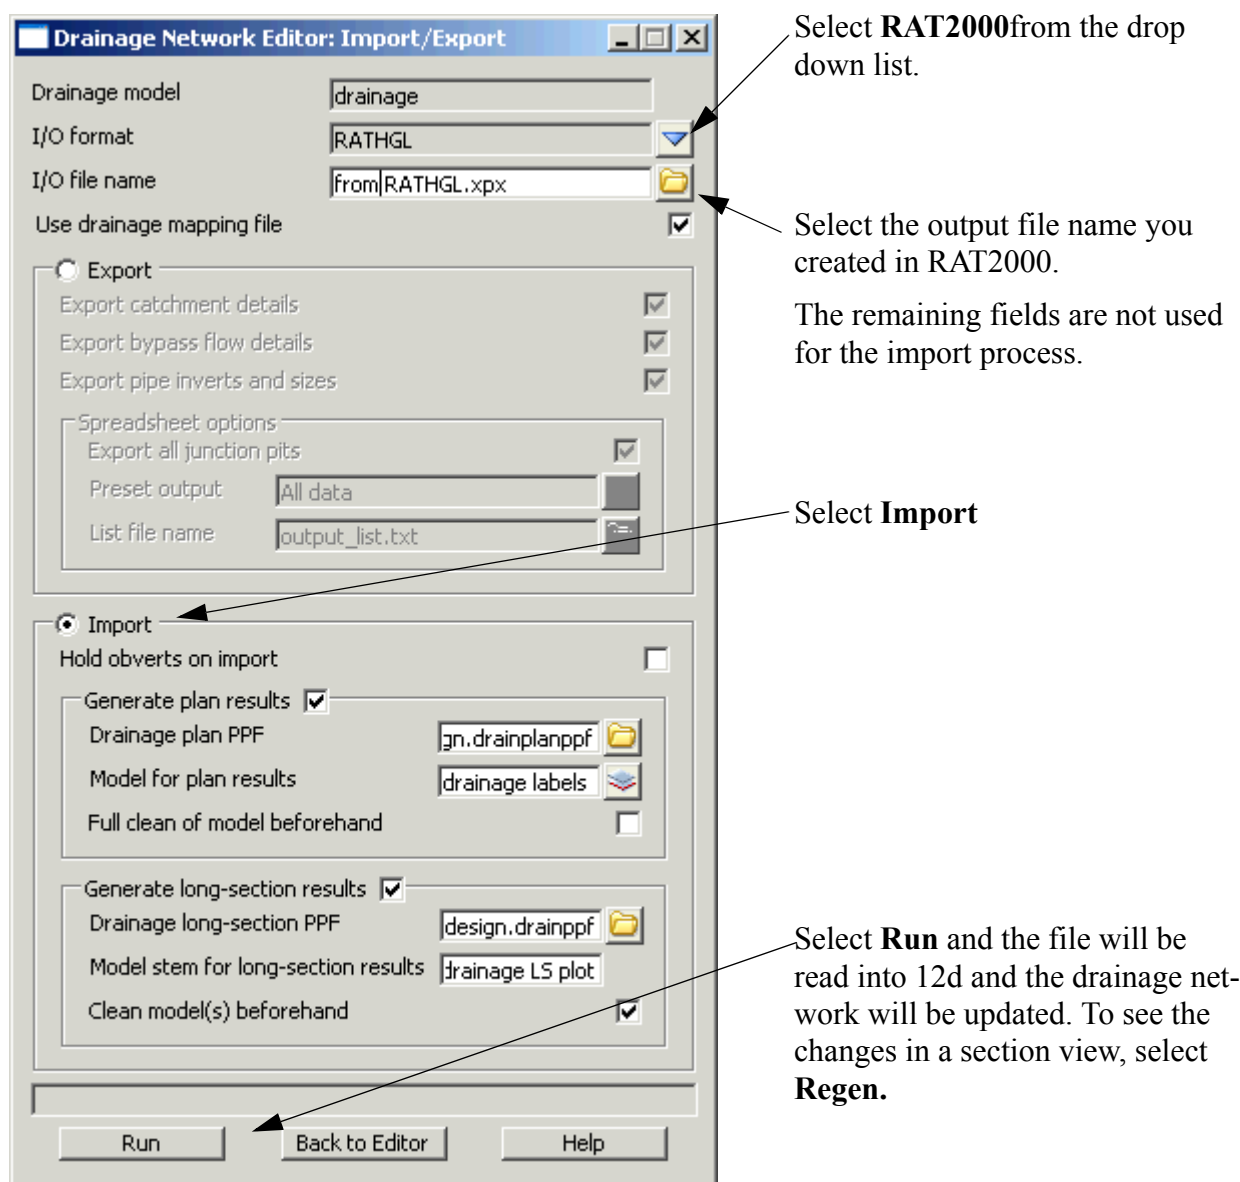

22.3 RAT2000 Results to update 12d

If RAT2000 is launched automatically using option 1 above then as soon as RAT2000 is exited an interface file is automatically created (using the same name as the import xpx file). This file will now be read back into 12d to update the pipe network and import hydraulic results for drainage longsection plots.

Return to 12d and select

Design=>Drainage-Sewer=>More=>Pit/Pipe Design Interface

The following dialogue will appear,

XP SWMM Program Requirements

See also [Drainage overview](#)

Basic Check List

1. All manholes must have a unique name (they become nodes in XP SWMM)
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. First export should have “**Export pipe diameters and Inverts**” selected
5. Outlet conditions must be set in XP SWMM.
6. Start-up data (run times and hydrology data) may be specified in the file **master_drainage.xp** (the standard 12d system file path will be searched).

Running RATHGL/RAT2000 and XP-SWMM

The drainage design with all three of the XP software programs follows the same methodology. The process is substantially automated with the XP-SWMM program so that the XPX file is automatically read by XP-SWMM and automatically created when leaving XP-SWMM.

Drainage design with XP programs includes the following steps.

1. 12d creates an XPX file that is read by the XP programs.
2. The XP program is then run in the design mode to determine the pipe sizes and invert levels.
3. If bypass and overland flows are to be modelled then the inlet capacities need to be defined and then run the XP program in the Full Analysis Model.
4. The XP program creates an XPX file for 12d to import.

22.4 xpstorm and xpswmm bypass requirements

12d will select the inlet capacity curves for the xp programs when the following bypass settings are complete

Drainage Network Editor

Kw 0

Inlet flow

1. The 12d pit type determines the inlet capacity values or curves to be selected from.

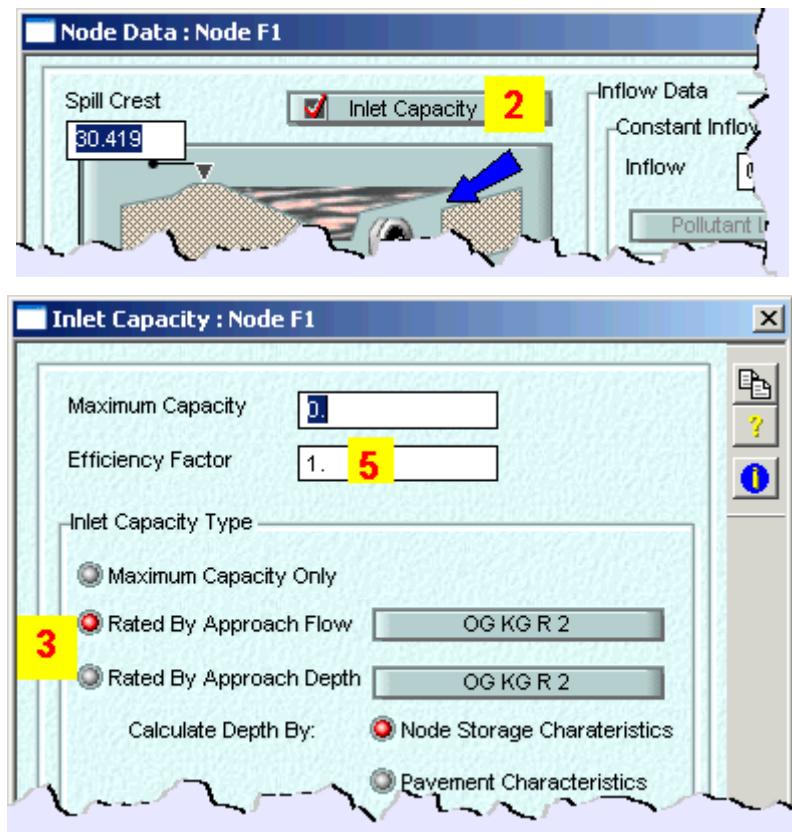

2. The bypass pit must be defined for the pit. If the bypass pit follows the pipe network a xp-multi link with a natural channel is created. Otherwise a xp single link is created. The default xp natural shape is "Road Section"

3. The Ongrade/SAG pit on the Main tab determines whether depth or approach curves are exported to (details below).

4. If ongrade is selected then the 12d inlet capacity curves may be selected by road grade, crossfall, both or neither. (details below).

5. The 12d choke factors will be exported as the xp inlet efficiency factor (1 - 12d choke)

The numbers below relate the same numbers in the 12d panels above.

- 1.
2. Inlet capacity is turned on when 12d has a bypass inlet.
3. 12d **Ongrade** inlets export as **Rated by Approach Flow** and 12d **SAG** inlets export a **Rated By Approach Depth** with depth calculated by **Node Storage Characteristics**.
- 4.
5. The minor/major selection is the 12d export panel determines the efficiency factors that are exported/
Efficiency factor = 1.0 - 12d choke.

12d Inlet Capacity Curve names

Below is an extract from the drainage.4d file for Canberra rating curves.

```

drainage.4d - Notepad
File Edit Format View Help
-----
// ACT Inlet Charts
// from Full Scale Model studies University of South Australia
//
// OG = on-grade
// LP = low point
// S = low point
//
// KG = kerb & gutter
// MLBK = modified layback kerb
// MKG = median kerb & gutter
//
// R = 'R' type kerb inlet sump
// QS = QS type inlet
//
// x = gutter slope
// Note: all the ratings are for 3 crossfall.
Manhole "OG KG R" {
cap_config G
cap curve grade "OG KG R 0.5" {
road_grade 0
coord 0 0
coord 0.005 0.005
coord 0.01 0.01
coord 0.015 0.015
coord 0.02 0.02
coord 0.025 0.025
coord 0.03 0.03
coord 0.035 0.035
coord 0.04 0.039
coord 0.045 0.0423
coord 0.05 0.0455
Ln 22, Col 1

```

1. The manhole is the inlet type selected above.
2. cap_config G forces the inlet to be used as qa 12d ongrade inlet. An S would be SAG and an M a manhole.
3. The curve name indicated here is exported as the xp inlet capacity curve.
4. The curve name will be exported starting at road grade of 0. Since one curve has a road grade value all curves must have a road grade value and the user must have a road grade calculated on the 12d bypass tab.

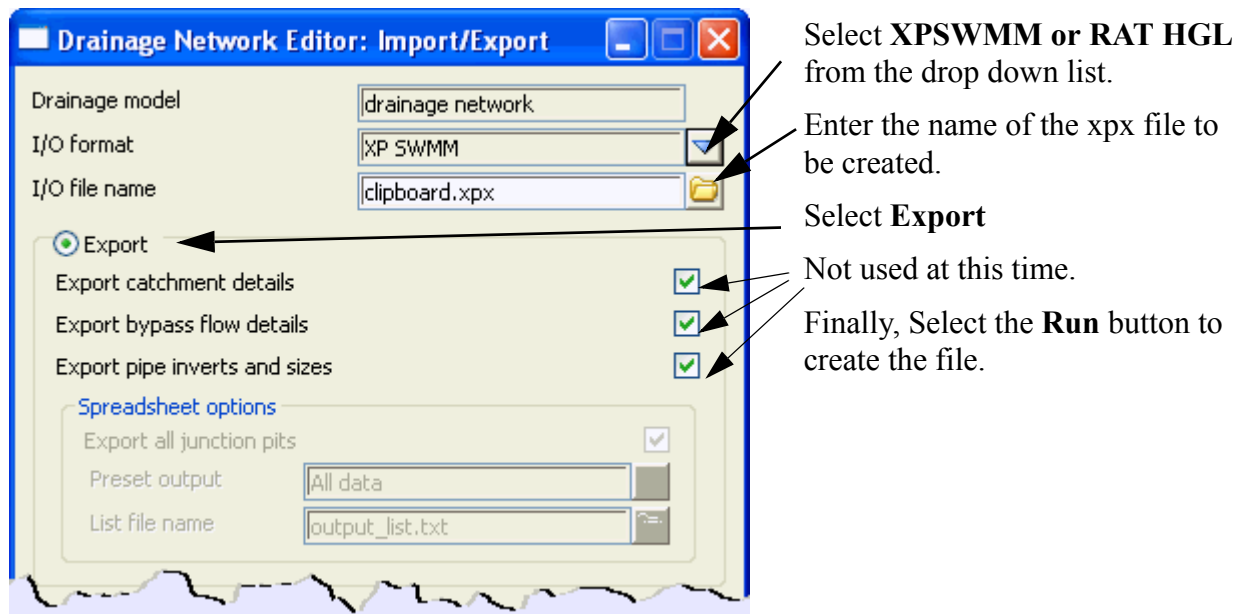

22.5 12d to the XP Programs

The x,y pit layouts and the cover/surface levels are obtained from your drainage network while the catchment and overland flow data comes from the models specified in the drainage interface dialogue.

The steps required to transfer the data to the XP programs are as follows.

1. Setup your drainage network models.
2. To create the XPX file for XP programs start the Drainage Network Editor and select **Import/Export**

The following interfaces dialogues will appear.

If exporting to RAT-HGL the following dialogue will appear.

If you are using old versions of RAT-HGL (1996 or earlier) select use **Local** otherwise select **4D units** (eastings and northings).

Select process.

3. The XP SWMM program will automatically startup and load the XPX file.

From within RAT-HGL, either select **File =>New** and follow the input prompt or load a file that contains all of the pit inlet rating curves, hydrological and design data without a pipe network. Many users have such RAT-HGL files setup so as to streamline the design process.

The xpx file for RAT2000 will have the file startup.xpx added to it so that you may include all the startup global data that you require. The

Fixed inlet capacities and rating curve names indicating road grade and crossfall may be set in the **drainage.4d** file. The format for these names is pit name-crossfall-road grade (ex SA2-3-4). These curves must exist in this file.

4. To read in the pipe file created above, select **Special =>Import Data** and select the xpx data file. Warnings will be given stating that several fields are inactive. This is expected as more data is sent to RAT-HGL than is needed at this time. Select the **Close Square** on the Help title area and the pipe network and catchments should now appear on the screen.
5. If you want RAT-HGL to redesign you network, change the analysis mode to Design mode by

selecting **Special=>Job Control** and Select Design mode. Do not do this if you want to analyse the network you layed out in 12d (used for existing systems).

6. Select the rainfall events to design/analyse and the **LB** (twice) on **OK** to return to the layout. Now select the outlet and enter the starting tailwater levels.
7. Now you can run RAT-HGL (**Special =>Solve**).

22.6 XP Programs to 12d

Once you have your design finished, the following steps are required to update your 12d model. Your design may contain several return periods in the analysis (Rp1 to Rp7) but 12d reads only the results from Rp1. The following table is taken from the RATHGL output file (*.out extension) and the results indicated are read back into 12d via the xpx file.

In addition to the results, the following input data is read back into the 12d model so that it may be exported back to RATHGL in the future (if required). 100% of your RATHGL data is not included in the XPX formats and the contents of the XPX file will depend upon your design mode. Therefore, use caution if you read an XPX file into an existing RATHGL model and check your data once inside RATHGL.

1. From within RAT-HGL, produce an XPX file for 12d to read by selecting **Special=>Export Data** and following the default prompts.
2. From within 12d, select the **Import/Export** button on the Drainage Network Editor. The fol-

lowing panel will appear.

Drainage Network Editor: Import/Export

Drainage model: drainage network

I/O format: XP SWMM

I/O file name: clipboard.xpx

☐ Export

Export catchment details ☒

Export bypass flow details ☒

Export pipe inverts and sizes ☒

Spreadsheet options

Export all junction pits ☒

Preset output: All data

List file name: output_list.txt

☒ Import

Hold inverts on import ☐

Generate plan results ☒

Drainage plan PPF: gn.drainplanppf

Model for plan results: DRN PLAN PLOT

Full clean of model beforehand ☐

Generate long-section results ☒

Drainage long-section PPF: ng_A1.drainppf

Model stem for long-section results: DRN LONG PLOT

Clean model(s) beforehand ☒

Run Back to Editor Help

Select to select **RATHGL** or **XP-SWMM**.

Select the file name specified in step 1

Select **Import**.

Select **Run** to update the drainage model and import hydraulic/hydrological results.

Running Micro Drainage - WinDes

See also [Drainage overview](#)

Basic Check List

1. All manholes must have a unique name (they become nodes)
2. Only one outlet allowed in the drainage model
3. First export should have “**Export default catchment/pit/overland parameters**” selected
4. First export should have “**Export pipe diameters and Inverts**” selected
5. Outlet conditions must be set in Win DES.

22.7 Micro Drainage - WinDes Requirements

Pit - Pipe names

The pipe names are used in the WinDes interface NOT the pit names. Therefore the pipes are often named separately to follow the WinDES required naming convention.

12d string names

The trunk line drainage string must be named “1” and then moving from upstream to down stream the branch line strings increase 2,3,4 etc. If the branch lines have sub branches then they are named in a similar upstream to downstream sequence. The sub branch string are named before moving downstream on the trunk line. If this string numbering system is not followed 12d will renumber the strings and request the user to run the drainage misc utilities to rename the pipes and pits.

12d pipe names

The trunk line pipe segments start at the upstream end at 1.000 and increase downstream (1.001, 1.002 etc). The assign pit names will automatically name the pits for you if you have followed the string naming convention discussed above. “Number of digits” must be set to 3 to ensure the leading zeros are used.

The panel below shows the naming convention.

12d pit names

The pit names may be set to any desired naming convention. Using the same names as the pipes makes the pit/pipe identification easier for the user but it is not required. As of April 2007 the maximum length is 8 characters but Windes is planning to remove this restriction.

The *.sws or *.fws files may be open directly inside WinDes.

22.8 Global /default variable mapping

The default 12d drainage mapping file maps the following Windes data

Windes	12d attribute name	pit, pipe or model	default value
Return period		model	
Time of entry		model	
UK region		model	
min grade		model	
min cover		model	
Outfall manhole name		pit	
Roughness method		model	
pipe file		model	blank. standard.pip
manhole file		model	blank. standard.mhs

22.9 Additional Notes

Pipe Resizing

Pipes are automatically resized when opened in Windes and the sizes used are from the specified *.pip file (standard.pip by default)

When locked pipe sizes are sent to Windes the pipe sizes can be increased but not made smaller.

Pit Resizing

Pit diameters are automatically updated by Windes depending on the size of the attached pipes. This resizing is determined by the Windes file, standard.mhs.

22.10 Open channel drainage design.

Win Des can (hydraulically) model any shape of conduit. The conduits are given numbers between 1 and 100. 12d selects these conduits by setting the **pipe type** to **WINDES** (case sensitive) and pipe diameter to the WinDes conduit number divided by 1000. (examples 0.032 indicates WinDes conduit 32).

12d can create the conduit shape by applying a template to the drainage string. The user must create a template with the same name as the WinDes shape number (32 for example). The templates are created from the main menu

Design->Template->Create Edit

For more information about template design please refer to the 12d training manual.

Once the template has been created it is applied to the drainage string to create the cross sections and strings to represent the conduit shape.

From the main menu **Design=>Drainage-Sewer=>User=>Drainage Volume Calculations**

For more information see **Drainage line excavation volume calculations.**

Drainage Excavation Quantities

Position of option on menu: Design => Drainage => Reports => Excavation Quantities

See Also

[Drainage overview](#)

This routine uses 12d templates to calculate the excavation volume for all of the drainage strings in a model. An option to create section for a tin on top of the pipe is also available so that the drainage long sections can include hatching between the obvert of the pipe and the design tin under roads.

Templates with names set to the pipe diameters (times 1000) are used for the calculations, thus trench shapes can be customised and over excavation for bedding materials can be included. Net area calculations to exclude pipe area are not supported.

Key points

1. One template for each pipe size (mm)
2. If obvert templates are used, add the prefix “obvert “ to the pipe size
3. Carefully consider the tin selected.

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. A sample template library is included in the 12d library in the file **pipe_template.tpl**.

The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file.

If a tin is created from these strings then volumes by depth can be determined using **Design=>Volumes=>Exact=>Tin to tin**

On selecting the **Excavation quantities** option, the **Drainage Excavation Quantities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model <i>Model to contain all of the pit and pipe network to be worked on.</i>	input box		
Strings model <i>Strings generated from the templates will be stored in this model</i>	model box		
Sections model <i>Sections generated from the templates will be stored in this model</i>	model box		
Report name <i>cut and fill volumes will ne sent to this report</i>	input box		
Ground Surface Tin <i>tins from which the volumes will be calculated</i>	tin box		
Separation <i>distance between the sections</i>	real box		
Sections colour <i>Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)</i>	colour box		
Clean section/strings model <i>Delete the strings in these models before processing.</i>	tick box		
Stop section at edge of pit <i>Template are run from pit centre to centre if this is not selected. The templates stop at the edge of the pit if selected. This is often selected with the following option Use obvert templates.</i>	tick box		
Use obvert templates <i>Templates must be named with the prefix “obvert”. i.e. obvert 300. The template is still run along the invert of the pipe but the user now has a section “set” of templates that can be used to create a tin on top of the pipe as well as below.</i>	tick box		

An example report file follows.

```

Attribute Editor

Position of option on menu: Design => Drainage => More => Top Ten attributes editor

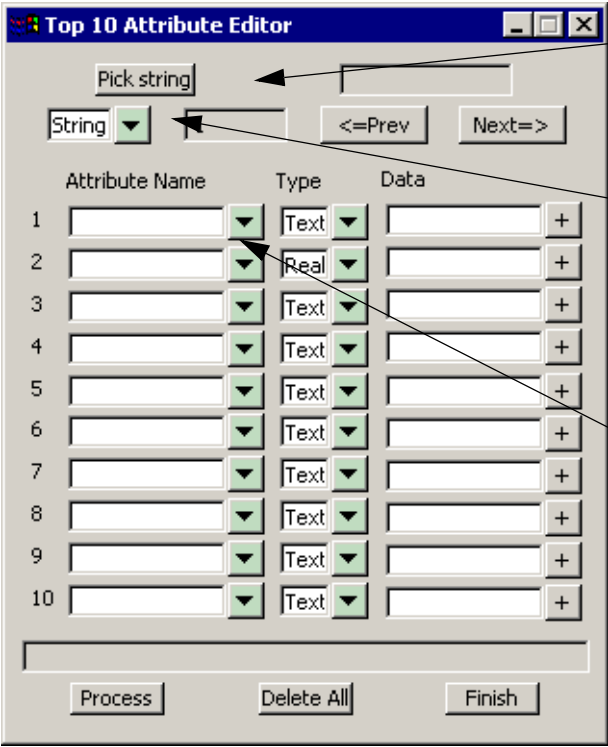

Most of the detailed catchment data is stored within 12d as user defined attributes. These attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d or edited inside 12d using this panel.

See Also

[Drainage overview](#)

Usage

From the menu select **Design => Drainage => More => Top ten attribute editor**

First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **Pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

pick string	button		
<i>used to pick the initial string in a model</i>			

string-pit-pipe	choice box	string,pit,pipe	
<i>select the type of attribute to be displayed. Pit and pipe attributes are only available for drainage strings.</i>			

attribute name	input box		
<i>3 top 10 attributes lists are maintained (pit, pipe and string). The attributes that you can select from are all of the attributes that exist on all of the strings in the model. If the attribute does not exist for the</i>			

string/pit/pipe that you are displaying the **data** field will display **Not found**.

type choice box **Text, Real, Integer**

for existing attributes this will display Text, Real or Integer.

When defining a new attribute select the type of data to be stored in the attribute

data input box

the data stored in the attribute is displayed/edited/created in this field.

<= prev button

*move to next string in the model
pit on the string
pipe on the string*

next => button

*move to next string in the model
pit on the string
pipe on the string*

process button

updates the attributes displayed in the dialogue.

Notes:

First LB select Pick to select the string that contains the user attributes. All catchment data is stored with the pits in drainage strings. The strings will be highlighted in white when they are selected.

To access the pit attributes **LB** this field then select **Pit**. A circle will be drawn around the pit selected.

LB the **Attribute Name** field and then select from the list of existing user defined attributes.

These attributes include all of the attributes in the model that the string exists in. They may not be defined for the string you are editing. If the string does not have that attribute defined **not found** will be displayed in the **Data** field.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The following message will be displayed whenever you are creating a new attribute.

Delete All Attributes in a Model

Position of option on menu: Design => Drainage => More => Delete all attributes in a model

See Also

[Drainage overview](#)

This option deletes all model, string, pit and pipe attributes in the model specified. This option allows the user to "start from scratch" while maintaining the drainage, catchment and bypass flow strings.

Usage

From the menu select **Design => Drainage => More => delete all attributes in a model**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
model name	input box		
<i>the model specified will have all of its attributes and all of the strings attributes deleted</i>			
process	button		
<i>Deletes all of the attributes</i>			

Notes: **THERE IS NO UNDO!**

Flooded Width Flow Analysis and HEC-RAS

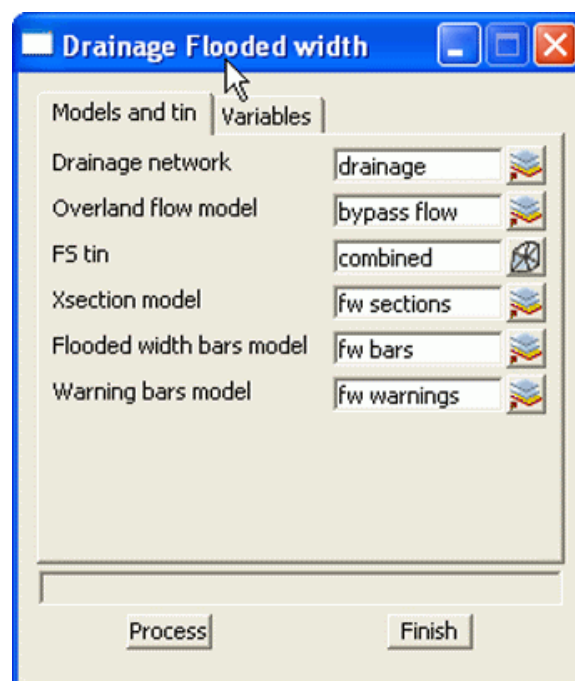

Position of option on menu: **Design =>Drainage-Sewer =>Calc flooded widths**

The Calculate Flooded width procedure creates cross sections along the **bypass flow** paths and then calculates the flooded width at each section using Manning's normal depth calculations. A HEC-RAS project (same name as the bypass flow string) is also created for each line. The flooded width is indicated on each section as a blue line if it is less than a user defined width and a red line if the flooded width exceeds the limit. Details of the calculations such as the velocity, depth, wetted perimeter and slope can be exported to a spreadsheet for further analyse (velocity times depth calculations for example). The discharges imports from the urban stormwater design packages are shown in the following table.

Design Program	Discharge Event
PCdrain	Minor ARI
Drains	Maximum flow event analysed
ILSAX	Maximum flow event analysed
RAT HGL	First return period analysed

The user defines the length of these sections and the interval at which they are to be spaced. 12d calculates the normal flow depth interpolating the pit approach and bypass flows from the hydrology models (ILSAX, Drains, PC Drains or RAT HGL). The cross sections are taken perpendicular to the flow line and the slope is for the normal depth calculations is determined using the distance along the flow line and the change in elevation between the two lowest points in the primary flow channel. The flow line need not intersect the low points on the section but the flow line does mark the primary flow channel. If the depth of the flow exceeds the banks of the primary channel, then all adjacent flow channels will be considered as active flow area.

On selecting the **Calc flooded widths**, the **Drainage flooded width** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Models and tin

Drainage network	model box	drainage	
<i>Existing drainage strings must have approach and bypass flow pit attributes. See doco below</i>			
Overland flow model	model box	bypass	
<i>Cross sections are cut perpendicular to these existing strings</i>			
FS tin	tin box	design	
<i>This tin is used to cut the cross sections and to determine the slope for normal depth calcs</i>			
Xsection model	model box	fwsections	
<i>Model is cleaned before processing. Calculated values such as velocity and slope are stored with these strings.</i>			
Flooded width bars model	model box	fw bars	
<i>Model is cleaned before processing. Blue or yellowstrings with levels indicate normal depth flooded widths.</i>			
Warning bars model	model box	fw warnings	
<i>Model is cleaned before processing. Strings created when vel x depth exceeds limit.</i>			

Variables

Max flooded width	input	2	
<i>the limit where the blue flooded width bars turn red</i>			
Manning's n	input	0.014	
<i>The n value to be used in the normal depth calculations.</i>			
Flow correction factor	input	0.8	
<i>The is the factor described in ARR 1987 for calculating depths of flow in gutter channels.</i>			
Distance between sections	input	5	
<i>The interval at which cross sections and therefore flooded width will be calculated along the flow path.</i>			
Section Length	input	5	
<i>The length of each cross section. The cross section will be centred on the overland flow path.</i>			
Trim sections at levee	tick box	off	
<i>Trims the cross section at the crest on either side of the flow channel. A levee point is the crest in the cross section found as you move away from the flow line location.</i>			
Levee tolerance	input	0.1	

The amount the cross section needs to drop as you move away from the centre line in order to identify a levee.

VxD warning limit input 0.6

The velocity times depth limit that when exceeded will cause a flooded width bar to be generated in the warning bars model.

VxD warning colour colour box orange

Colour of the velocity x depth bars

Process button

Clean output models, calculate flooded width and create HEC-RAS projects named from the string names.

Finish button

remove the panel from the screen

22.11 Limitations where overland flow lines join

Where overland flow lines converge at an inlet, 12d does not know the flow split between the 2 approaching paths. Therefore, 12d uses the total flow from all lines as the flow at the inlet for each line. This may overestimate the flooded width along the flow lines at these points.

22.12 Limitations at SAG pits

The flow width are not shown adjacent the sag inlets. The depth of flow due to ponding and the approach flow coming from several directions may overestimated flooded width in these areas. Therefore not flood depths are calculated approaching SAG inlets.

Summary Tables

The hydraulic calculations and warning messages are stored as string attributes on the flooded width bars. If these attributes are exported to a spreadsheet via the clipboard a summary table may be created. To copy these attributes to the clipboard select

File IO->User->String attributes-properties to/from clipboard

The **string model** may be either the flooded width bars or the warning bars. Both models of strings contain attributes on the strings.

The prefix selection and prefix exclusion are filters for reducing the number attributes that are exported to the clipboard.

22.13 Cross Sections, Discharges and Warnings

The analyse flooded width will proceed along each flow path and identify every pit on the line. Cross sections will be constructed in the model with the length and interval entered in the input dialogue. These cross sections may be plotted using the main menu selection

Plot=>X plot=>X plot. The **Sort Sections** must **not** be selected for these sections to be plotted.

Discharges will be determined for each cross section by linearly interpolating the discharge using distance between the pits. The bypass discharge (pit attribute - calculated bypass flow) will be taken from the upstream pit and the approach discharge (pit attribute - calculated approach flow) from the downstream pit.

The slope is calculated by subtracting the lowest points nearest to the centre line and dividing the cross section separation. The levee tolerance is NOT used for locating this point thus any rise in section moving away from the centre line marks the end of the low point search in that direction.

12d will give warning messages in the output window when it encounters the following conditions and these messages will be stored as string attributes on the flooded width strings. Descriptions of these messages follow.

Inverts do not go downhill

12d locates the lowest point (adjacent to the flow line without moving over a local crest) on each cross section to calculate the slope between the cross sections. This message indicates that the downstream minimum elevation is higher than the upstream minimum elevation.

Sometimes flow lines will go uphill. If you have specified an overflow from a SAG location then the flow line will go uphill until it crosses the overflow crest.

If the flow line is not supposed to be going uphill at this section, check to see where the flow line intersects the cross section located upstream of the one identified in the warning message. If it is in a local sag point that is not the lowest point on the section, move the flow line.

The program will use a slope of 0.5% to calculate a width at this location. This results in very wide flooded width sections to draw the user's attention to the problem area.

Vertical Walls Assumed at the Ends of the Cross Sections

If the depth of flow exceeds the ground surface elevation at the ends of the cross section a warning message the warning message shown above is shown. The cross sections causing the warning follows.

The vertical wall is placed at cross section chainage -20. Note that the flow line is always at chainage 0

Convert Drainage String to Polyline

Position of option on menu: Design => Drainage => More=> Convert drainage string to polyline

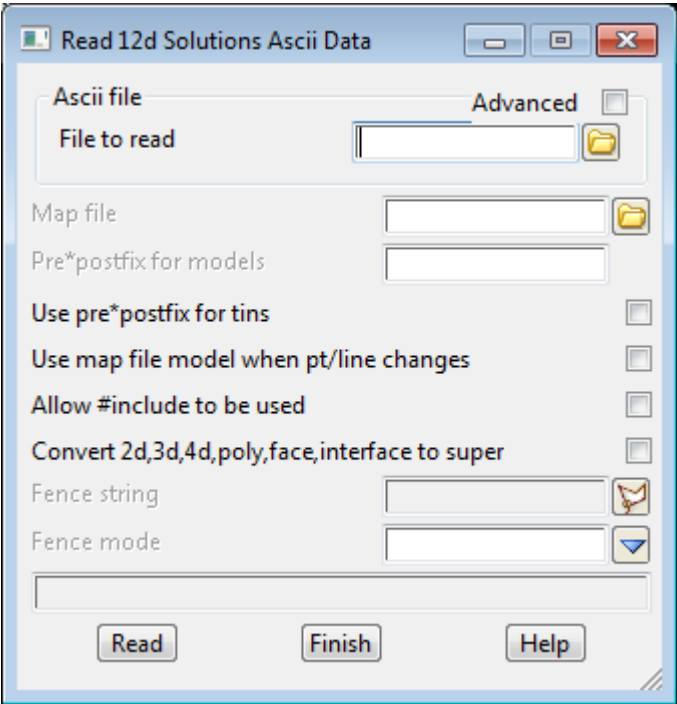

See Also

[Drainage overview](#)

All drainage strings in the specified model are exported to a 4d ascii file. When this ascii file is imported back into 12d model the strings will be converted to polylines. Import the strings using

File_io=>Data Input=>12da/4da data

Specify a prefix for the model when it is read back in. Otherwise the strings will be placed in the same model as the originals.

Usage

From the menu select **Design => Drainage => More=> Version 6=> Convert drainage string to polyline**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Drainage model name	input box	
	<i>Drainage model containing the drainage strings</i>	
4D ascii file name	input box	drainage data.4da
	<i>A temporary file that will hold the converted string data.</i>	
Process	button	
	<i>Exports the drainage strings and converts the file to polylines.</i>	

Drainage.4d file

A sample pit entry in the drainage.4d file is as follows:

Enhancements have been made if exporting to the Drains program. See [Pit Families and Pit Groups](#). The drainage.4d file controls many of the settings for the pit and pipes types inside 12d. This section details the format of the drainage.4d file. Changes to this file take effect only after 12dmodel has been restarted. If there are any errors in the drainage.4d file they will be listed in the output window at startup (just after the shp file listing). The error in the drainage.4d file is generally located just above the line indicated in the output window.

All text to the right of the // is ignored by 12d (comments). There are pit and pipe type definitions. Because of historic reasons the pit types are defined using a **Manhole** command.

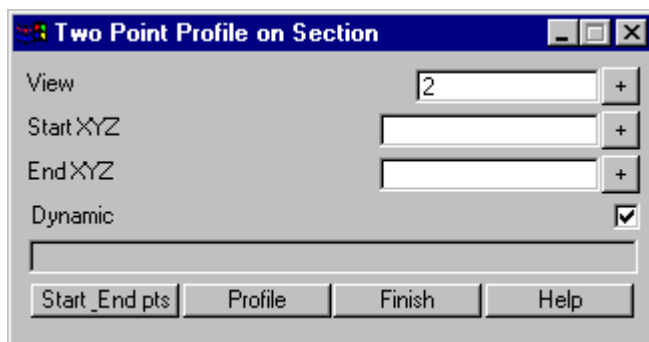

Many of the settings in the drainage network editor (DNE) can be controlled by the pit types and the pipe types defined in the drainage.4d file. The **special manhole attributes** defined below control these fields.

The original **drainage.4d** file is found in the "program files\12d\12dmodel\10.00\set_ups" directory. **Do NOT** change this file. Copy it into your user folder "\12d\10.00\User" and edit it there. Files in the user directory are used by preference and they are never over written by a 12d update.

Two Point Dynamic Profiles

If at any time you want to obtain a temporary section view, 12d has a dynamic profiling capability (2 point profile). First, add your tin design model to the section view.

Next RB on the section view title area and then LB select 2 points. The following panel will appear.

Select **Start_End pts** to begin and then pick/accept a point on a Plan View Now as you move your cursor the section view will be dynamically updated (the dynamic box should be checked on and a surface tin model added to the section view). When you obtain the cross section you want LB select then accept (MB) the second point.

LB select Finish when done.

ILSAX Editors

Position of menu: **Design => Drainage => More => ILSAX Editors**

The ILSAX editors walk-right menu is

See [ILSAX Pipe/Catchment Editor](#)

See [ILSAX Rainfall File Editor](#)

ILSAX Pipe/Catchment Editor

Position of option on menu: **Design => Drainage => More=> ILSAX editor=>ILSAX pipe editor**

See Also

[ILSAX Rainfall File Editor](#)

[Drainage overview](#)

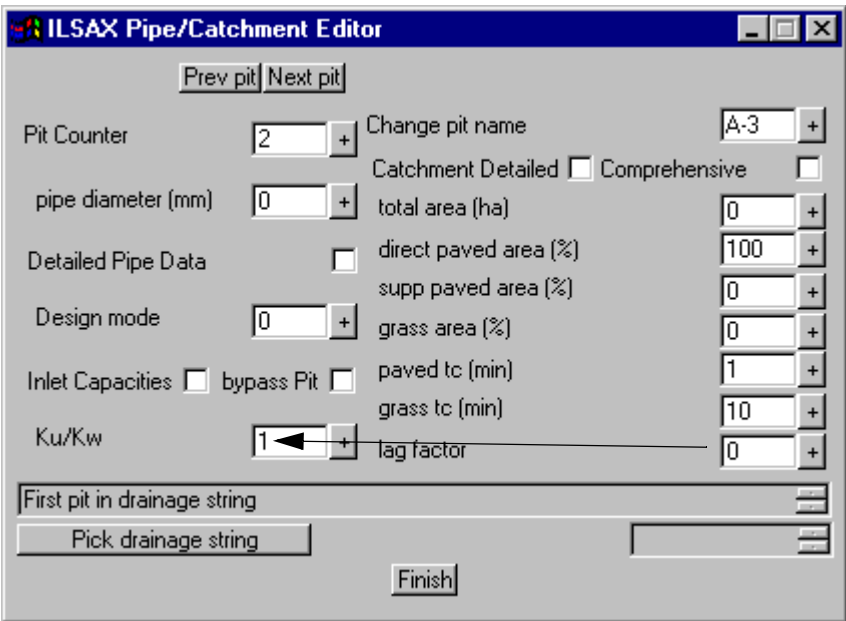

The ILSAX pipe data editor allows the user to edit pipe and catchment parameters. Most commonly used functions are supported but some of the less used functions are not included at this time. The same names have been used as those in the ILSAX drainage manual for easy reference.

Unlike the rainfall editor, all of the data in the pipe data editor is stored with the drainage string as user attributes. These user attributes can be changed using the editor (recommended for the novice user) or they may be output to a spreadsheet, changed and then read back into 12d.

CAUTION: If the drainage string is deleted then all of the attributes are deleted at the same time.

Usage

The ILSAX pipe data editor is accessed by selecting **Design=>Drainage-Sewer=>More=>ILSAX Editors=>ILSAX Pipe file editor**. The following dialogue will appear.

The panel to the left is only an example of what the editor panel may look like. This dialogue will change in size and complexity depending on the check boxes selected. The left side of the dialogue is reserved for pipe and pit data while the right side contains catchment data. The first step is to select the drainage string to be edited. Click on **Pick drainage string** and then select the drainage string from one of the views.

There are two ways to move between pits. The **Prev pit** and **Next pit** will move the user between the pits with the current pit name been shown in the **Change pit name** field. Do not use the **Change pit name**

field to move between pits. It will not work! This field is used to manually change the pit name. Entering the **pit number** and pressing **Enter** is the second method for selecting pits. This is a good way to move between pits on long drainage lines (from pit 20 to pit 1 for example).

The **pipe diameter** will change the diameter of the pipe leaving the pit in the direction of increasing chainage. Note that the invert level of the pipe will remain fixed as the obvert level changes.

The most common **Design mode** is 1 for design. This ignores the present pipe size and resizes the pipe as required.

When the **Inlet capacity** and **Bypass pit** tick boxes are checked, additional fields are added to the dialogue. These will be discussed in the section 5.0 above

The **Catchment Detailed** and **Comprehensive** tick boxes also add additional fields to the dialogue. Again, the ILSAX drainage manual contains detailed descriptions of these parameters.

ILSAX Rainfall File Editor

Position of option on menu: Design => Drainage => More => ILSAX Editor=>ILSAX rainfall file editor

The ILSAX rainfall file editor assists in the creation and editing of the ILSAX rainfall files. It is truly a file editor and no data is stored inside the 12d model. Most common features of the ILSAX rainfall file are included but some have been omitted as they have been rarely used. The files can be created using the editor and then manually edited using a word processor if required.

[Drainage overview](#)

Usage

This panel is accessed from the menu selection **Design => Drainage => More=> ILSAX editors => Ilsax rainfall file editor**

The **Rainfall file name** must be specified before the **Read** or **Write** buttons will operate. If you want to create a file, fill in the **Rainfall file name** field and then **LB** select **Write** to save the data.

Intermediate Files and **Separate Rain/pipe files** must be ticked to have ILSAX run within 12d.

The minimum value for **Num Rainfall Events** is 1.

The remaining data in the left column is the data for the ILSAX R3 and R4 cards and the data in the right column is the data for the ILSAX R2,R6, R6B and R8 cards. Please refer to the ILSAX manual for a description of these values. The fields are not in the same order as the ILSAX files but instead the fields at the top of the column are those changed most frequently between rainfall events.

The **Prev Rainfall** and **Next Rainfall** buttons select the rainfall events up to the number specified

in **Num rainfall events**. If you wish to add or decrease the number of events analysed change the **Num rainfall events** value.

CAUTION: the **Finish** button does not perform a save so make sure you click **Write** before **Finish**.

The fields and buttons used in this panel are described in the ILSAX users manual.

PCdrain to 12d pit converter

Position of option on menu: Design => Drainage Sewer => More=>Create Pit type from PC Drain gully files

This option is used to read a PCdrain gully file and create the same pit type in the 12d drainage.4d file. The sag pits in the gully file have an "S" added as a suffix as they are imported.

Important: 12d must be restarted to see the new pit types.

See Also

[Drainage overview](#)

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Create Pit type from PC Drain gully files**

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
PCdrain pit file <i>the PCdrain gully file to be imported into 12d</i>	file box		
Process <i>import the data file</i>	button		
Finish <i>removes the dialogue from the screen</i>	button		

Calc pit overflow areas

Position of option on menu: Design => Drainage Sewer => More=>Calc pit overflow areas

This option is used to graphically display the overflow storage volume at a sag pit. The following pit attributes must exist for the flood extents to be calculated.

overflow volume	value greater than zero required.
sag pit	must be equal to 1.
catchment model id	set by labelling catchments
catchment string id	set by labelling catchments

The maximum storage volume is read from the drainage pit attribute "overflow volume". This may be entered manually using the **Attribute Editor** or it will be created when data is read from the drainage design programs Drains or XP SWMM design programs.

This routine locates the lowest point on the catchment string by draping the string on the tin specified and adds the overflow limit specified to this value. This becomes the **overflow limit**.

The volume at this level is calculated and the compared to the **overflow volume** read from the user defined attribute. If the overflow volume is less than the volume in the catchment then the routine iterates to find the flood level for the overflow volume.

If the overflow volume is greater than the volume in the catchment, the results depend on the **Use overflow limit** tick box.

If the box is selected, the **overflow limit** (calculated above) is reported at the flood level in the catchment.

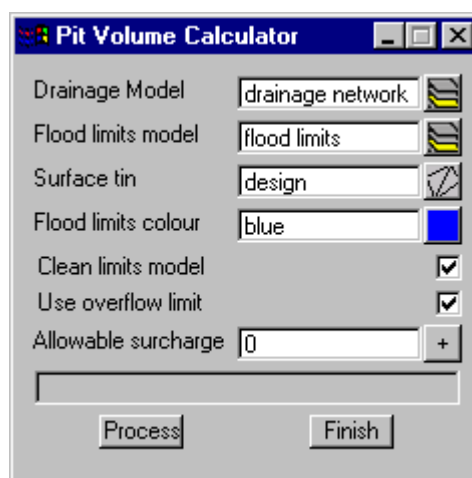

If the tick box is not selected the routine iterates to find the flood level where the storage equals the **overflow volume** read. This option allows the user to see the maximum flood level should the catchment low point become blocked.

Drainage overview

Usage

This panel is accessed from the menu selection **Design => Drainage Sewer => More=>Calc pit overflow areas**

The fields and buttons used in this panel have the following functions.

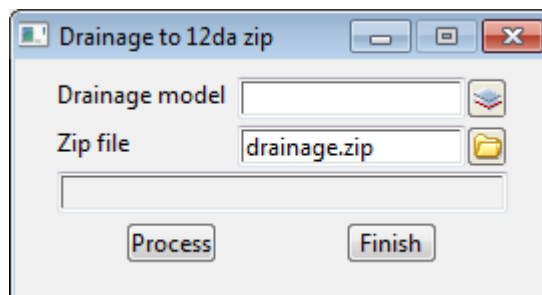

Field Description	Type	Defaults	Pop-Up
Drainage model	model box		
<i>all pits in this model that have a non zero "overflow volume" and "sag pit" set to 1 will be processed</i>			
Flood limits model	model box		
<i>flood limits strings will be created in this model</i>			
Surface Tin	tin box		
<i>ground surface tin used to calculate the volumes and flood limits</i>			
Flood limits colour	colour box		
<i>flood limits strings will be created using this colour</i>			
Clean limits model	tick box		
<i>if selected all strings in the Flood limits model will be deleted before the calculations commence.</i>			
Use overflow limit	tick box		
<i>if the elevation calculated from the storage volume is higher than the lowest point on the catchment string then the allowable surcharge value below will be added to the lowest point on the catchment string and this elevation will be used to determine the flooding limits</i>			
Allowable surcharge	real box		
<i>this value is used only if Use overflow limit is ticked. Its purpose is described in the field above.</i>			
Process	button		
<i>executes the option.</i>			
Finish	button		
<i>removes the dialogue from the screen</i>			

Drainage to Zip

Position of option on menu: **Design =>Drainage-Sewer => More=> Drainage to zip**

This zip routine is intended for support purposes only. It will save your project! This function zips up project views and only the models and files delated to the drainage model.

On selecting the **Drainage to zip** option, the **Drainage to Zip** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Drainage model	model box		
-----------------------	-----------	--	--

This model and the related models through the drainage network editor will be zipped into one file.

Zip file	file box	drainage.zip	
-----------------	----------	--------------	--

This zip file is intended to be sent to support personnel.

Process	button		
----------------	--------	--	--

Saves the project and creates the zip file

Finish	button		
---------------	--------	--	--

remove the panel from the screen

1.12d Model Drainage Modules and Work Flow

12d Model has a suite of drainage modules for stormwater design. This course covers the items listed below on this page except 24,25 and 28.

If viewing the pdf version of this manual, bookmarks on the left are hyperlinks as well as the green text. Use **Alt+left arrow** to return to where you were reading.

1.1 Drainage Module

Part A - Locate Structures and Connect the Pipe Network

1. Obtain/create [Survey data and design surfaces \(TINs\)](#) for pipe and manhole levels,
2. Identify overland flow paths and drainage inlet structure locations,
3. Set drainage default for the pits and pipes (most common settings, they may be changed later).
4. Read a drainage model template file containing you default and global settings.
5. Create the drainage strings in 12d or convert strings from CAD.
6. Assign pit names using the [DNE](#). This allows easy reference to the structures.
7. Change pit and pipe types where they are different from the default values
8. Link the drainage model to the road design models for an integrated design.
9. Check and adjust horizontal alignment of the pipes and pits.
10. Set the vertical alignment using the [DNE](#) (set pit details and regrade pipes).
11. Check for service clashes and adjust vertical as required.

Part B - Hydrology and Hydraulic Data Preparation

12. Set catchment areas, % impervious, C and tc values for hydrology,
13. Set grate levels, Ku methods (pit and culverts), pipe roughness etc for hydraulic design
14. Draw/create bypass flow paths if bypass/inlet capacity calcs are required.
15. user defined export and update interfaces with Drains, PCdrain, Micro drainage-WinDes, RAT2000 and XP SWMM/STORM.

Part C - Design Documentation

16. Print pit schedules and plan/long section drawings for construction,
17. Import and Export the network to spreadsheets,
18. Calculate network quantities (by depth ranges) for costing and system checks,
19. Calculate earthwork excavation volumes,
20. Repeat as required for design changes,
21. And of course peer review at various points of design,
22. Electronic models for survey setout.

1.2 Drainage Analysis Module

Part D - Rational Hydrology, Surface Flow Calculations and Pipe Hydraulics

23. Calculate rational hydrology peak discharges,
24. Normal depth surface flow hydraulics using channel sections cut from the ground surface. Results are shown in plan, section and 3d views (and reports) with warnings given for exceeding max widths, channel capacity and velocity x depth hazard conditions,
25. inlet capacities at sag and on grade locations determine bypass and pipe flows,

26. Hgl calculations use pipe and manhole losses (K_u/K_w) . Pipe are sized using either freeboard or flow depth methods. This includes full culvert design with backwater and inlet control calculations.
27. Review results in plan drawings, long sections and printed reports,
28. Analysis of the major flood event and checks for surface flow and hazard conditions.

1.3 Dynamic Drainage Module - Unsteady flow analysis

This module uses ILSAX and SCS hydrology together with the solution of the unsteady flow equations to analyse the network. Inlet capacity charts are used to analyse surface and subsurface hgl lines. Natural channel shapes and elevation-area curves for basin are created directly from the ground surface. User defined reports are created via the spreadsheet interface.

1.4 TUFLOW and Roadflow Modules

These modules use the TUFLOW engine (1D/2D hydrodynamic computational engine) for simulating free-surface water flow for urban waterways, rivers, floodplains, estuaries and coastlines. Using tools including 12d grid tins and the 12d TUFLOW control file editor the 12d, TUFLOW input data is created, edited and viewed all within 12d. This module may be combined with the dynamic drainage module for a coupled 1D/2D analysis to include pipes and culverts.

2.12d Model Stormwater Courses

In these documents, the generic term **pit** refers to manholes, inlets and catch basins. When the term **manhole** is used on the 12d menu system it refers to any type of pit.

2.1 Stormwater Design Part 1

These notes are for this course designed to cover creating drainage networks, rational method design and reporting.

- s create a super tin for pipe cover and pit cover levels,
- s set [Defaults](#) and layout a drainage network from CAD and in 12d,
- s use the 12d [Drainage Network Editor](#) to assign names to the pit/pipes, avoid service clashes, grade pipes, align obverts, minimise depth and many other design tools,
- s designate catchment areas and produce catchment plans,
- s run the 12d storm rational hydrology and hydraulics engine,
- s transfer data to and from electronic spreadsheets to enable the user to easily review the data and add user defined data to the 12d pipe network. This data may include such data as pipe bedding types and trench width,
- s create a drainage template containing customised default design parameters,
- s create pit setout schedules to export to spreadsheets or word processors for final formatting,
- s produce long section drainage profiles including HGL data, flows, invert levels and service crossings,
- s create plan drawings with pipe sizes, flows, pit symbols, linestyles for pipe sizes, design parameters for pit and pipes and user defined data,
- s locate pits/manholes at exact chainage and offset locations.

2.2 Stormwater Design - Part2

This course continues on with surface flow analysis, inlet capacity and bypass flow and customising the 12d drainage setup file (pit and pipe type database).

- s customising the drainage.4d file [Drainage Definitions - Manholes and Pipes](#),
- s 12d storm analysis with inlet capacity calculations and bypass flow,
- s flooded width analysis and flooding at SAG pits,
- s drainage trench excavation volume calculations,
- s pipe and pit quantity calculations/reports,
- s open channel calculations,
- s adjusting pit locations for changes in horiz road geometry
- s analysing the major flood events,
- s creating drainage symbols with grates and upstream side inlets,
- s detailed drainage plan labelling and long sections with hatching under roads.

2.3 Stormwater Basin Design Hydraulics and Hydrology

- s The course discusses unsteady flow hydraulics and their use in the design of storage basins and tanks.

3.Using the Course Notes

Areas marked in yellow (grey for black and white prints) are the exact steps required to complete the tasks. The numbers in the panels are the order to perform the tasks and they are always written to the right of the button, drop down or data field.

The additional text explains in more detail the tasks you are performing.

4. Customising 12d Model Drainage

12d Drainage has a series of files that customise your drainage components and design process. These includes

- s drainage.4d (required) manhole types and properties
pipe types and properties
- s drainage model template contains global and default settings for the drainage network. Including references to the following files.
- s cover files specify pipe cover for each pipe type
- s grade file specify pipe/channel slope by height
- s drop file specify drop across manholes by deflection angle
- s catchment file specify polygons for 3 land use types
- s road design file link manholes to strings to determine x,y z coordinates
- s services file specify clearance tolerances for models of service crossing.

The drainage.4d file has been configured for the training version. However, when you start working on your projects you may want customise the drainage module. [More - Customising the drainage module](#)

The [drainage.4d](#) file is the required drainage setup file that contains:

- s manhole and inlets with wall thickness and inlet capacity curves for ongrade and sag conditions
- s pipe types (RCP, Class 2 etc.) with nominal pipe diameters and wall thicknesses,
- s user defined attributes lists to be assigned to the network via pit and pipe types.
- s manhole and pipe type parameters are used to control settings in the [DNE](#). This allows the user to set numerous properties by selecting only the pit or pipe type. [More](#).

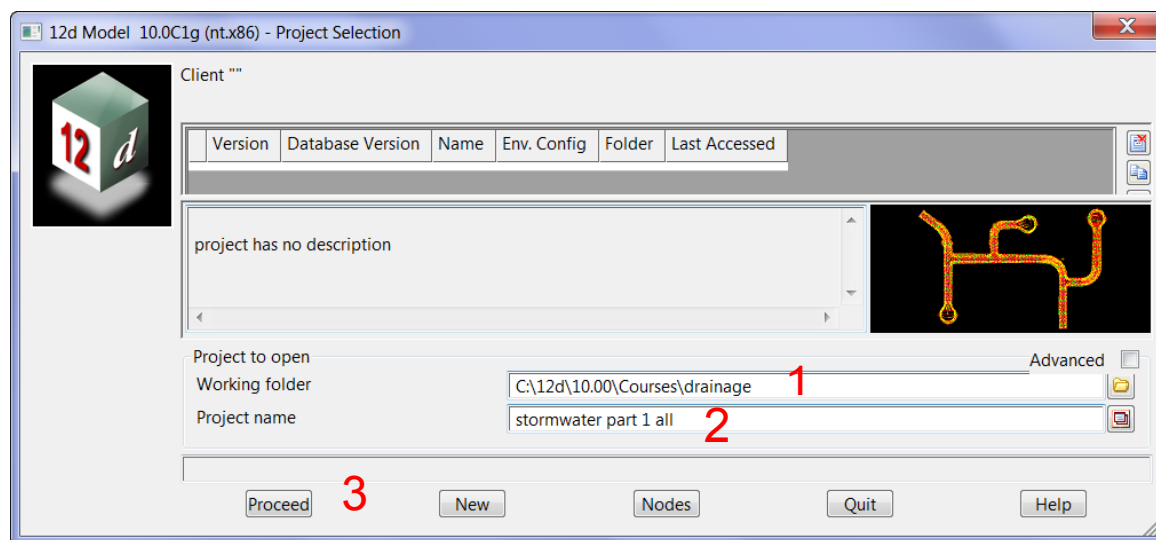

5. Survey data and design surfaces (TINs)

We will start a 12d project from the beginning by first creating the project and then reading in the survey and design data. The data can then be triangulated so that we have a final surface to measure pipe cover from and set structure cover levels to.

Start up the 12d model by selecting the 12d icon from your desktop.

The project selection panel will appear. The bottom corner of the panel is shown below

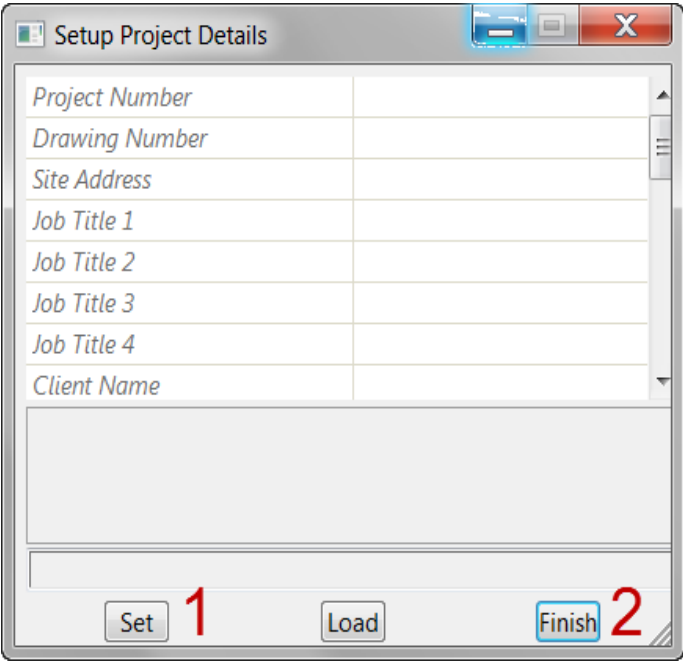

- 1) **LB** to browse to the **working folder** indicated.
- 2) Type a project name for your work **Stormwater Part 1 all** for example.
- 3) Select **Proceed**.

Alternate Step 2. If you do not want to create the tin or roadway then select the existing project Stormwater Part1 found in the courses\drainage folder. Skip to the section [Drainage Overland Flow Investigation](#) or go straight to [Read in a drainage model template](#)

12d will first look in your working folder for any input data files and output files will be created here unless you specify another folder. 12d stores it's data in a folder **not** a single file. Therefore, a folder named **Stormwater Part 1 all** will be created when you select **Proceed**.

12d model will load and you will see the following panel.

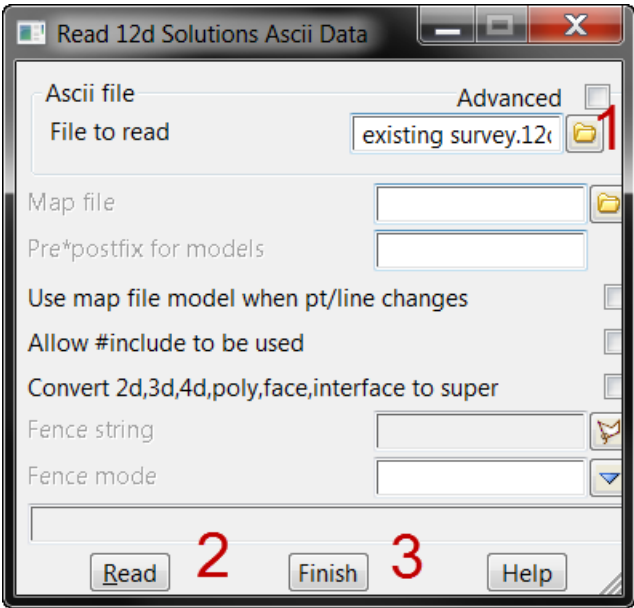

Enter data as desired. This data is both for reference and can be included on your drawings.

Later these details can be changed via Project=>Management=Details Editor

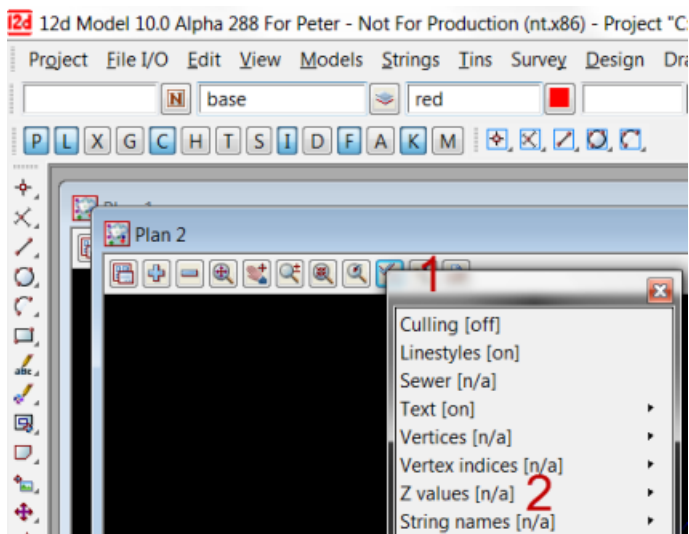

5.1 Importing the Raw Survey Data

You have created a new project into which we will import the survey data. From the main menu select.

File I/O->Data Input->12da/4da data

- 1) **LB** the folder icon to display the file list. Select the file **existing survey**.
 - 2) **LB Read** to read the data
 - 3) **LB Finish** to remove the panel
- The data will appear on a new plan view.

Now we will display the z values for the survey data.

- 1) LB the toggle button
- 2) LB **Z values**

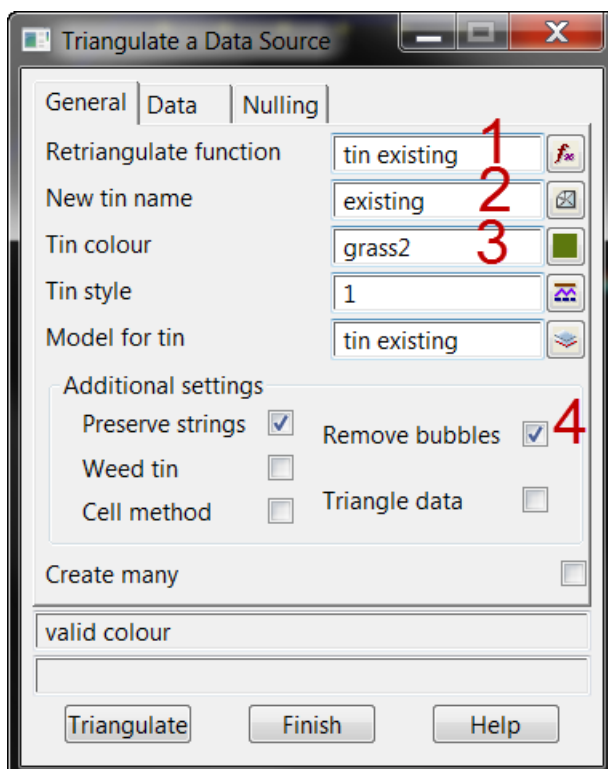

Use your mouse wheel to zoom in and read the z values.
Press Ctrl and Middle mouse drag to pan

5.2 Creating the existing Ground Surface

From the main menu select

Tins=>Create=> Triangulate data

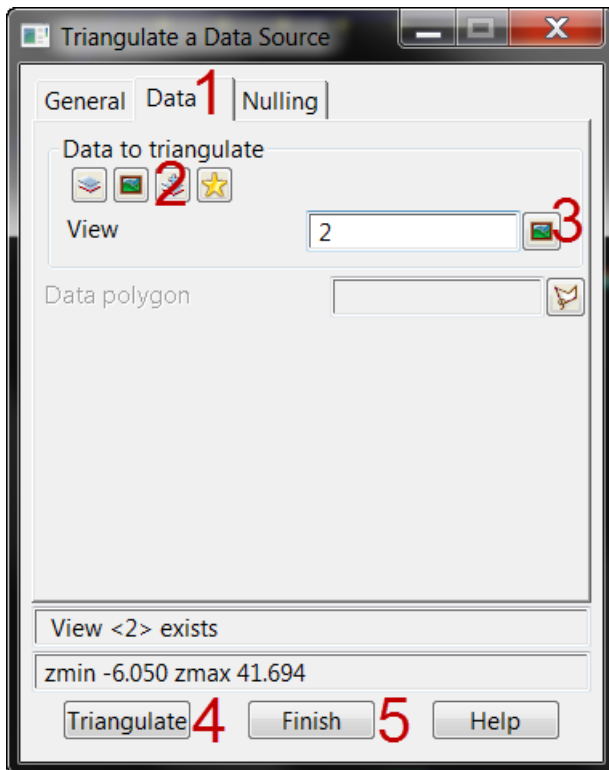

- 1) Type a name for the function to make it easy to recalculate later in new data arrives.
- 2) Type a new tin name then press **Enter**
- 3) Type grass2 instead of green. This will look better in the visualisation.
- 4) LB **Remove Bubbles** so that breaklines will attempt not to form triangles back onto themselves (if the breakline is a contour, this removes contour bubbles).

Preserve strings will make one side of a triangle follow the string thereby preserving the levels along the string.

Weed tin removes all duplicate points from the tin database.

The **Cell method** is a good speed enhancement for data that is in a grid type pattern.

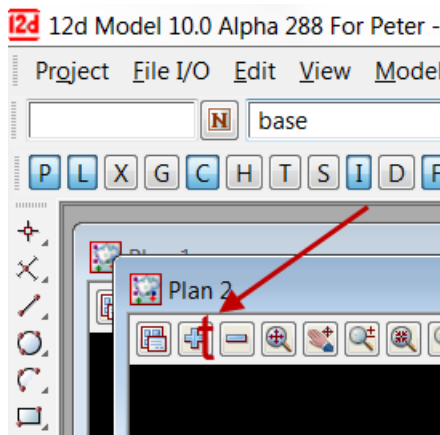

Triangle data is used for string that form triangles (tins imported from other programs).

- 1) LB the **Data** tab
- 2) LFinishB the **View** icon
- 3) Select view **2**
- 4) LB **Triangulate** to create the new tin.
- 5) **LB**

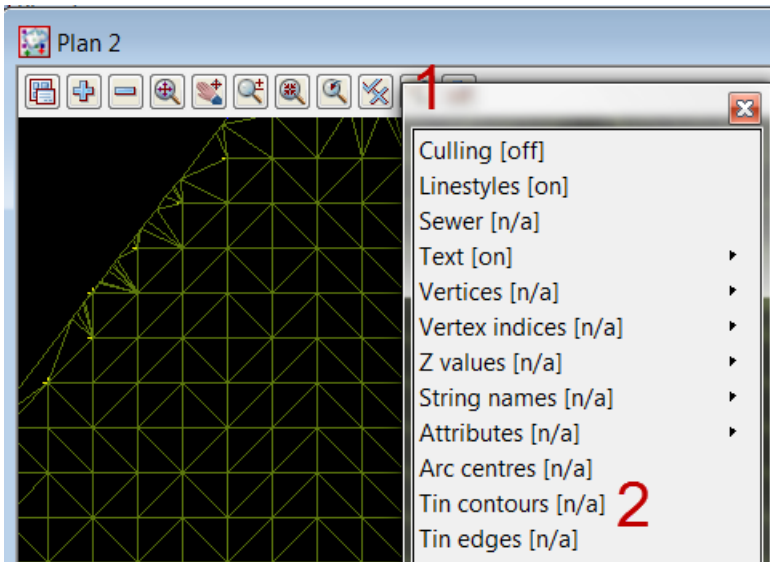

The tin will be stored in the model **tin existing**. A tin, like all 12d strings, must be stored in a model. 12d prefixes all its tins with **tin** for data management.

5.3 Viewing the Ground Surface Tin

- 1) Move your pointer over the "+" sign on the plan view 2 title toolbar
- 2) press the **t** key (all of the models beginning with lower case t will appear)
- 3) Double click on **tin existing**
- 4) **LB** Finish

The tin will be shown with the tin edges turned on. This is the default when you have all tin display modes turned off.

Display Contours

- 1) LB the toggle button
- 2) LB **Tin contours**.

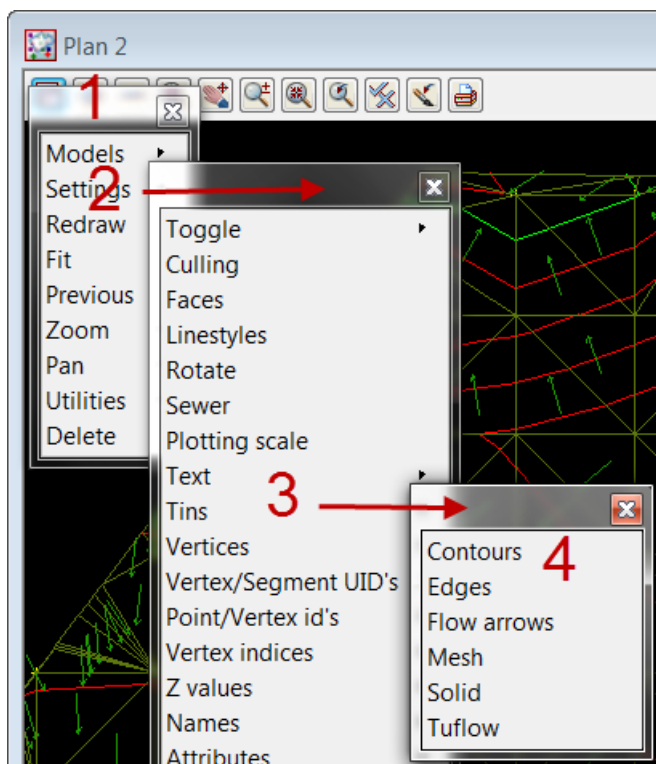

The contours are displayed with their default colours and increment (1 unit).

Display Flow

1. LB the toggle button
2. LB **Tin flow**.
Flow arrows are now visible at the centre of every triangle.

To plot flow arrows, create them in a model using **Tins->Tin analysis->Flow arrows**

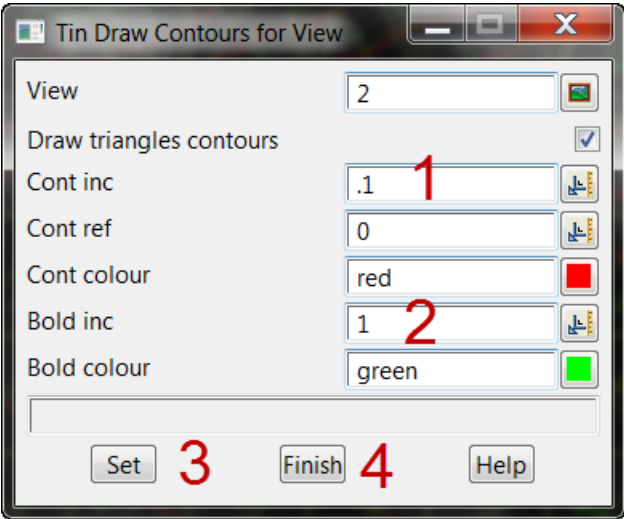

Change Contour Intervals and Colours

- 1) LB the View menu button
- 2) Walk right (do not **LB** select) on settings.
- 3) Walk right on **Tins**.
- 4) LB **Contours**

- 4) LB **Contours**

ShortCut! Press F11 to display the Menu shown in step 4

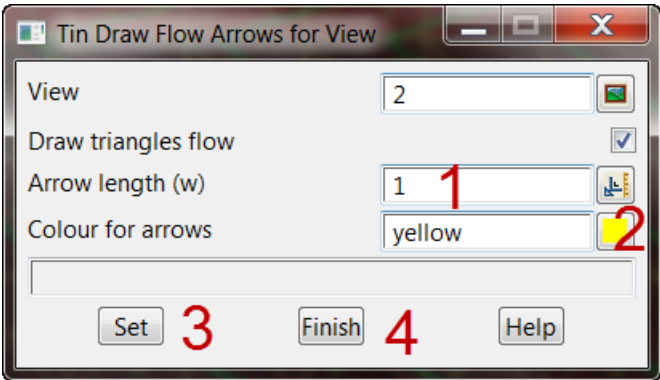

- 1) Type a new **Cont inc**
- 2) Type a new **Bold inc**.
- 3) LB **Set** to see the new contours.
- 4) LB **Finish** when done.

Change the Flow Arrow Length and Colour

Select the **Menu** button on the **plan view tool bar** and then walk right on.

Settings=>Tins=>Flow Arrows and the following dialog will appear. Remember to walk right!

- 1) Type a new **Arrow length**
- 2) LB the colour icon to select a new **Colour for arrows**.
- 3) LB **Set** to see the new flow arrows.
- 4) LB **Finish** when done.

5.4 Inquiring about Heights on the Surface

The elevation anywhere on the tin can be obtained by simply moving the pointer over the desired spot. To obtain the tin elevations select,

Tins=>Inquire=>Height

If you do not select a tin, the last tin added to the view will have its height displayed. You will see the data

in the panel change as you move the pointer around the screen. You may explicitly select a tin if another tin is desired.

Move the panel to the bottom right corner of the screen and leave it there.

5.5 Viewing the Surface Tin in a 3d Perspective

To create a 3d perspective view select

View=>New=>Perspective Open GL

- 1) Add the model **tin existing** to the view.
- 2) **Toggle** the **contours** on.
- 3) **Toggle** the **shading** on (note that the contours are no longer seen).
- 4) Use the Orbit control (planet on the toolbar) and zoom wheel to move around the view.

5.6 Reducing the number of points for the 12d Practice Version

We can delete the survey data to save space for those using the practice version of 12d. If you have a full version of 12d this is not required. From the main menu select.

Models=>Delete=>Delete a Model

and the following dialog will appear.

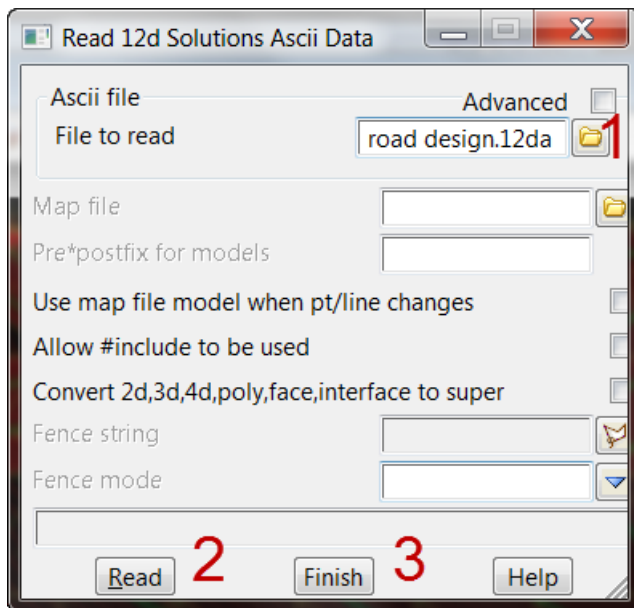

- 1) LB the model icon and select **EXISTING SURVEY**
- 2) LB **Delete** and then confirm each panel
- 3) LB **Finish**

The model is now in the 12d trash can (see bottom right corner of the 12d screen).

5.7 Importing the Road Design Centre lines

Repeat the process of importing 12da data.

File I/O->Data Input->12da/4da data

- 1) LB folder icon and select **road design**
For 12d practise users select **road design practice size use 10m spacing.12da**
- 2) LB **Read** (the data will not appear on the view yet).
- 3) LB **Finish**

5.8 Using Create Roads

We are going to create the roadways from the road centre lines (vertical grading has already been done). First we will need the road templates that we will read from a templates file.

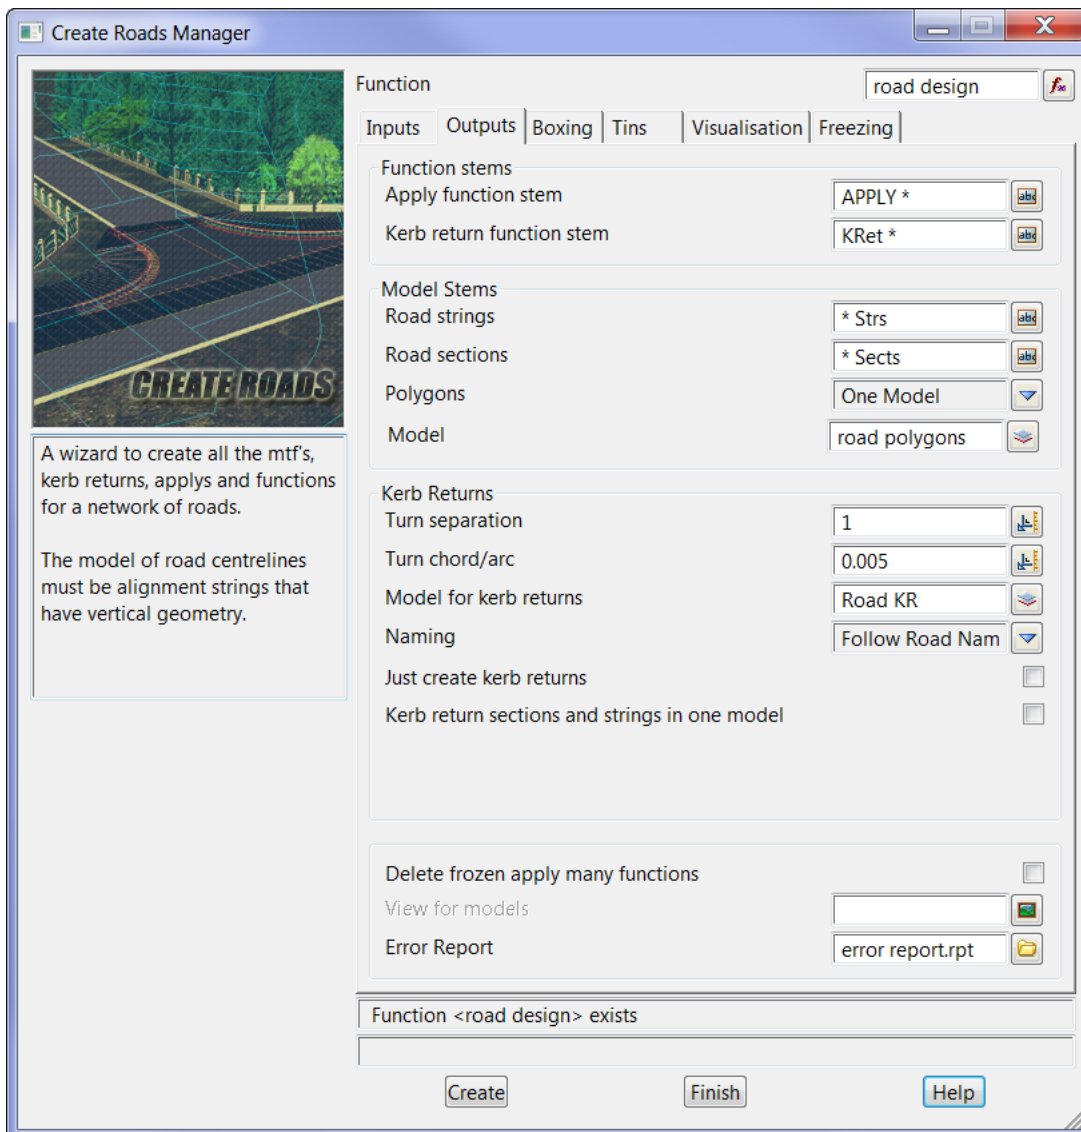

File IO=>Templates input

- 1) LB folder icon and select **lib** and select **Road templates**
- 2) LB **Read**
- 3) LB **Finish**

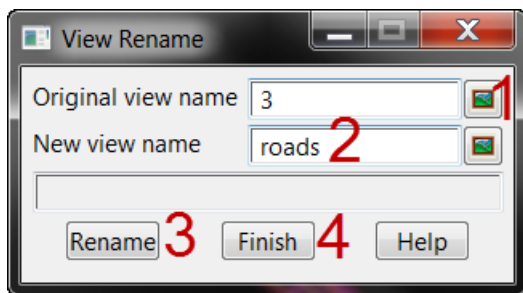

Now we are ready to create the road strings and design tin.

Design=>Roads=>Create=>Create Roads - Manager

1. LB **Function** and select the **create roads** function. This has all of the road design details included in it.
2. LB the **Create** button
3. LB the **Finish** button.
4. Add **tin design** onto the plan view.

To view the road strings, add on all of the **road *** models to view **3**. To view the tin add on the **tin design** model. You can also add the **tin design** model onto the perspective view. **Important:** On the OpenGL perspective view, 12d will show the tin data with the greatest z values (when viewed from the top side). Rename view 3 to roads to help organise your work.

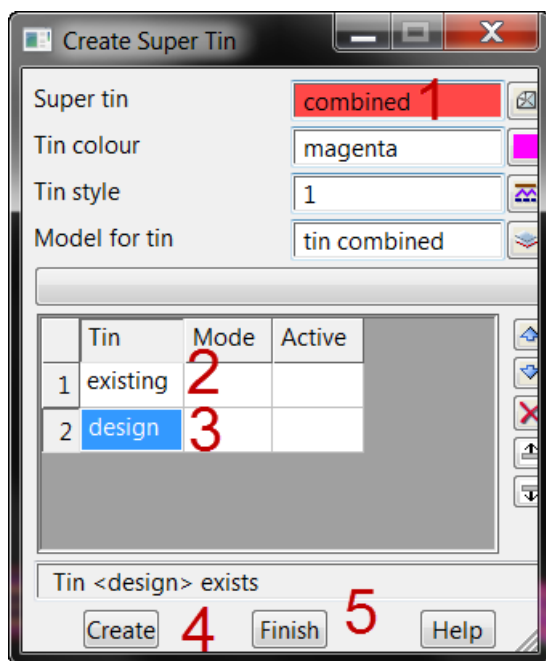

1. LB the **View** icon to select view **3**
2. Type the new name **roads**
3. LB the **Rename** button
4. LB the **Finish** button.

5.9 Creating a Super Tin from the Survey and Design Data.

The drainage fs tin may be used to set pipe inverts, pit levels, sag catchment overflow points and catchment slopes for tc strings. Therefore, the tin often needs to include several tins combined into one tin. To create a tin that is the combination of the survey data and the road design data you will need to create a 12d super tin. From the main menu

Tins=>Create=>supertin

1. Type a **New tin name** of **combined**. Press **Enter!**
2. RB in the cell and select the **existing** tin.
3. RB in the cell and select the **design** tin.
4. LB the **Create** button.
5. LB the **Finish** button.
6. Add **tin combined** onto the plan view.

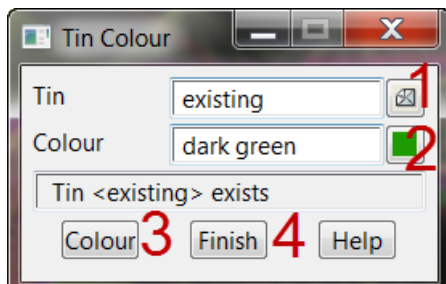

Notes about super tins:

- tin colour is only used in section views,
- the super tin is the 2 tins “glued” together,
- the super tin is Opaque so it will “cover up” other models already on the view. Use the Menu button on the View toolbar and select **Models->models to back** and select the super tin.

- **The order of the tins is very important.** Tin 1 is the first to be drawn then tin 2 is drawn. i.e. wherever tin 2 exists it will be used. If there is no tin 2 at a location then tin 1 will be used.

5.10 Changing the Colour of a Tin

To emphasise the super tin is just the tins “glued” together, we will change the colour of the **existing** tin and see how the super tin changes colour as well.

Tins=>Colour=>Colour of tin

1. LB tin icon and select the **existing** tin
2. LB colour icon and select **dark green**
3. LB **Colour**
4. LB **Finish**

Toggle the **Tin solid** on and note the colours of the super tin.

6.Drainage Overland Flow Investigation

Where a drainage designer chooses to start their design is depends a great deal on the project and the designer. Identifying overland flow routes, with the crest and sag points, is essential because it is on these routes that the inlets are to be placed. Inlet structures are then placed at the critical locations (sag points, flattening of grades, intersections, upstream of pedestrian crossings etc.). and then the spacing of additional inlets is determined by the size of the catchments. Finally, the pipe drainage system can be created linking the drainage structures.

Following is a list of 12d tools to identify surface flow routes:

[Change the Flow Arrow Length and Colour](#)

[Downhill Strings](#)

[Locating Crests and Sag Points](#)

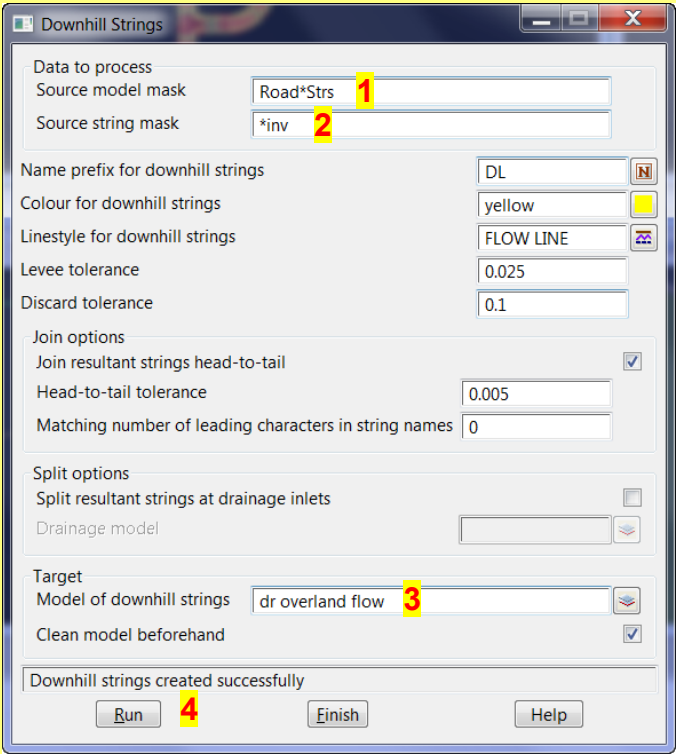

[Rain drop](#)

6.1 Downhill Strings

Roads are generally designed with a flow path in the cross section shape. In this example the roadway has a dual crossfall with kerb and gutters. We will use the downhill strings option to locate all the inverts strings, change their line style to a flow arrow, split them at their crest and sag points and ensure the chainage increases in the downhill direction.

From the main menu select

Design->Drainage-Sewer->Downhill strings

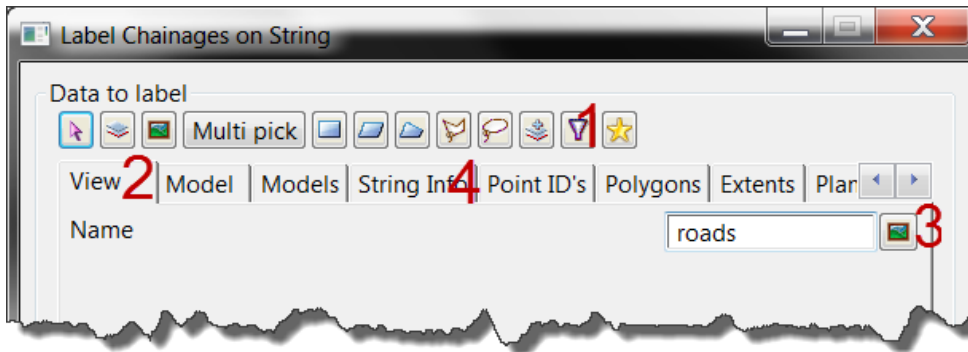

1. type **Road*Strs** (it is case sensitive). These are the models that contain all of the road strings. **Road 1 Strs** for example.
2. type ***inv**. The road string models have a **linv** and **rinv** string for the invert of the kerb and gutters.
3. type **dr overland flow** to create a model for the new strings
4. Select **Run**
5. add the model **dr overland flow** onto the **roads** view.

6.2 Locating Crests and Sag Points

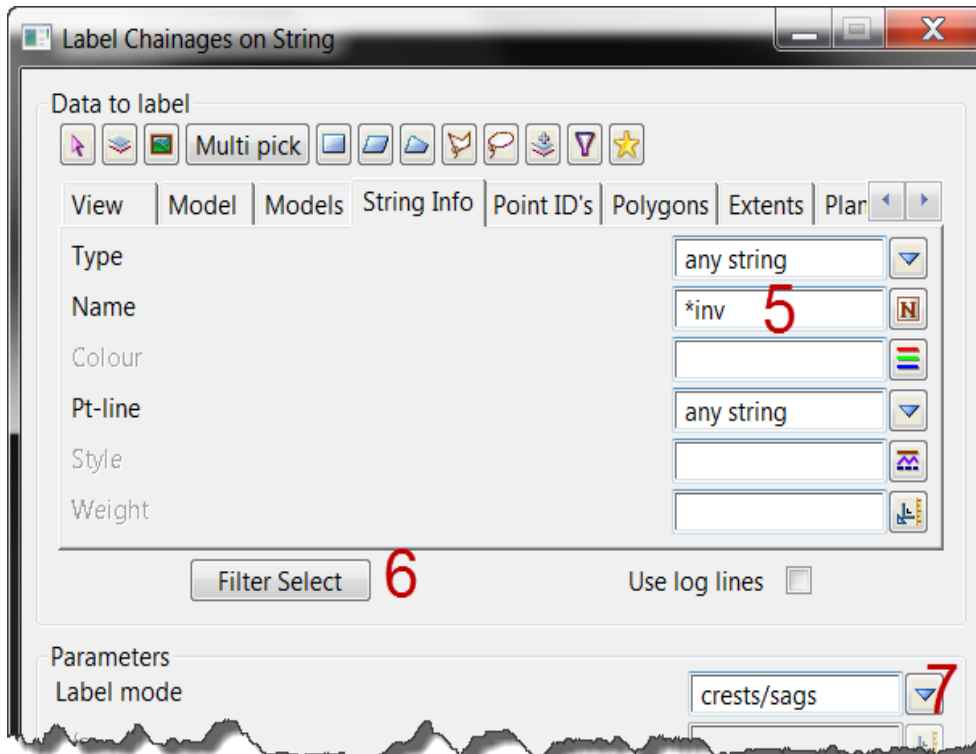

This step will place tick marks at the crest and sag points of your kerb strings and label them with the levels.

Strings =>Label => Chainages

Add all of the models beginning with Road onto plan view 1.

1. Select the filter button
2. Select the **View** tab
3. Select the **Roads** view

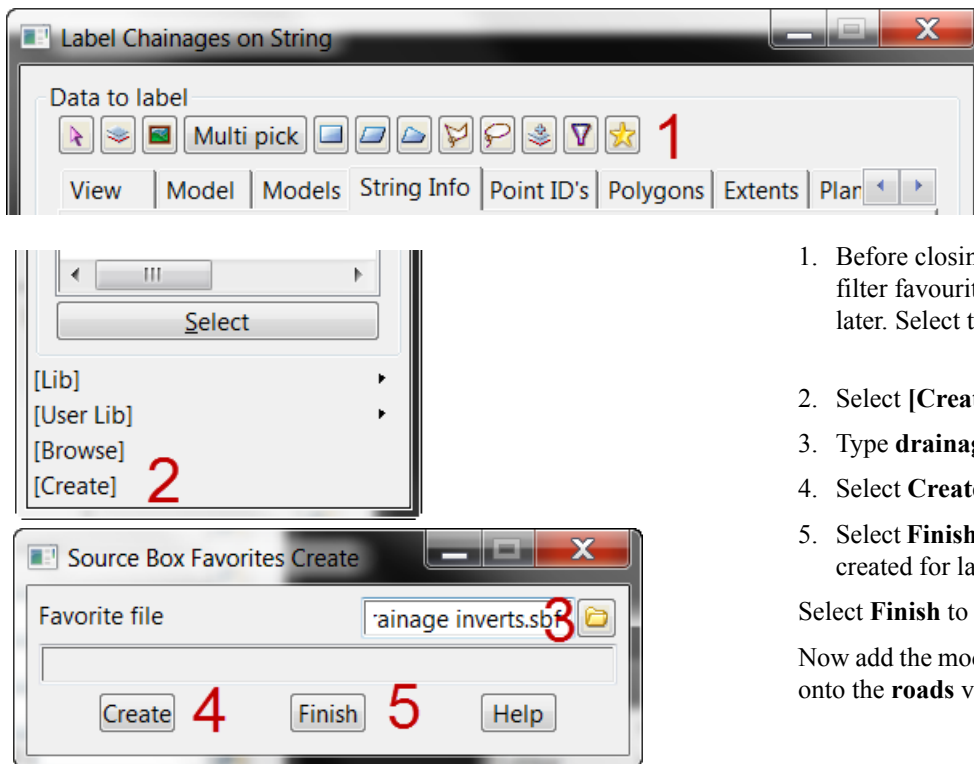

4. Select the **String Info** tab
5. Type ***inv** so that the linv and rinl strings will be selected.
6. Select **Filter Select** to select the inv strings to be labelled.
7. Select **crests/sags** from drop down list.

8. Enter a model to contain the text labels. A ,1 after the model name, requests that the model be added to view 1. This saves you adding the model to the view later to see the labels.
9. Select icon to define the text style.
10. Untick **Chainages**
11. Tick **Heights**
12. Select **Label**
13. Select **Marks** tab

14. Select the model used above for the tick marks.
15. **LB** to select **ticks centred** from the drop down list.
16. 10m marks stand out well on the screen.
17. Set colour to **yellow**
18. Select **Label** to create the labels.

6.3 Creating a Filter Favourite

1. Before closing the panels, create a filter favourite that can be used later. Select the Star button
2. Select **[Create]**
3. Type **drainage inverts**
4. Select **Create**
5. Select **Finish**. The favourite is now created for later use.

Select **Finish** to remove the panel.

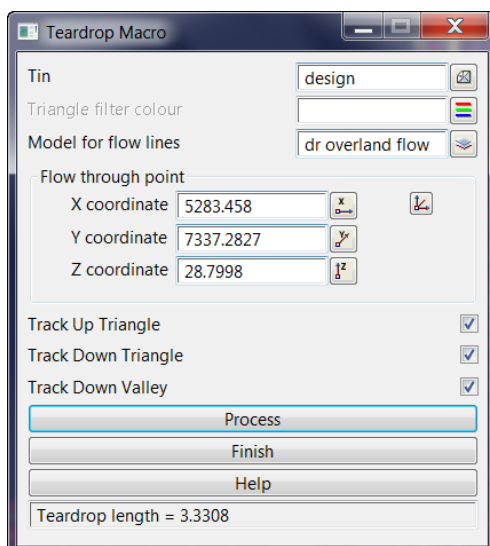

Now add the model **dr crests and sags** onto the **roads** view.

6.4 Rain drop

The raindrop routine will create a line from a selected point and follow either up or down the tin.

From the main menu select

Design->Drainage-Sewer->Rain drop

Try selecting several points on the tin to see the flow lines that are created.

7.Setting Drainage Defaults (Initial Settings)

Before creating drainage strings in 12d we should set default values for the pit and pipes. These defaults are only used as initial settings for new manholes and pipes. This ensures that most of the pit and pipes will have the desired type, size etc and then we only need to modify the pit and pipes that are different to the default values. The defaults for the drainage network are accessed through three panels; pipe defaults, manhole defaults and Tin defaults.

7.1 Tin Default

The 12d drainage module is designed so that no levels need to be manually entered into the drainage system (although they can be and locked if desired). The primary source for these levels is a design tin but levels from design strings and polygons can be used as well.

Design =>Drainage-Sewer =>Defaults=>Tin

The default TIN is used to set the initial manhole cover level and the pipe invert levels (via pipe cover or depth settings discussed later). Super tins may be used if you want to place manholes on both the existing and the design ground surface (see [Creating a Super Tin from the Survey and Design Data.](#)).

1. LB the tin icon and select the **combined** tin.
2. LB the **Set** button
3. LB the **Finish** button.

If you place a pit outside the tin boundary:

1. then no elevation will be set for the top of the pit, (it can be set later manually or by linking it to a road design string).
2. Pipe invert levels cannot be set using the default cover. Pipe invert levels must be set manually as 12d cannot automatically determine cover levels without a TIN.
3. Finally, if you are exporting to an external drainage design program that accepts surface levels along the string, then an error message will be displayed at export time. The message will say that the surface level string is shorter than the pipe length.

7.2 Manhole (Pit) Defaults

Design =>Drainage-Sewer =>Defaults=>Manholes

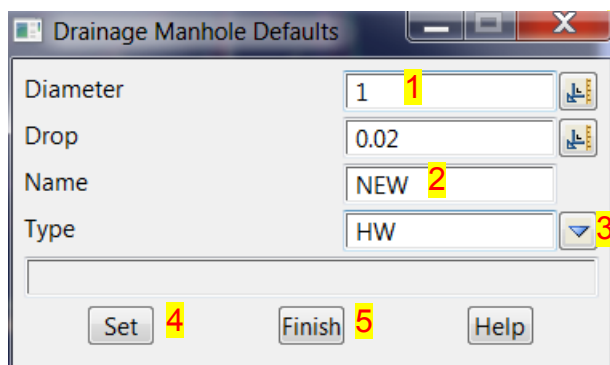

Notes on pit Diameters

The pit diameter/size is specified in metres/feet **not** mm/inches. The size of the pit is generally set in the drainage.4d file as either circular (mhdiam) or rectangular (mhsize). If both commands are specified then the mhsize command takes precedence. Plan drawings may use a symbol via the drainage plot annotations.

The **Diameter** is used for:

1. for visual service clash identification in long section drawings,

2. to clip the pipe lines drawn in the plan annotations so that symbols can be inserted in the space created,
3. maximum distance the bypass flow strings can be drawn from an inlet centre.

1. Type the desired diameter. If the manhole type below has a diameter/height defined, this setting is ignored.
2. Type the **Name** as **NEW** to remind you to assign a name latter.
3. LB the **Type** drop down and select the most common manhole type.
4. LB the **Set** button.
5. LB the **Finish** button.

The minimum **drop** will be used to set the invert level of the outlet pipe relative to the invert level of the inlet pipes. The drop should always be entered as a positive value. The DNE has many more options for aligning the pipe inverts at the pits. The drop may vary with the pipe deflection angle via the DNE->Defaults->Pipe->Drop file.

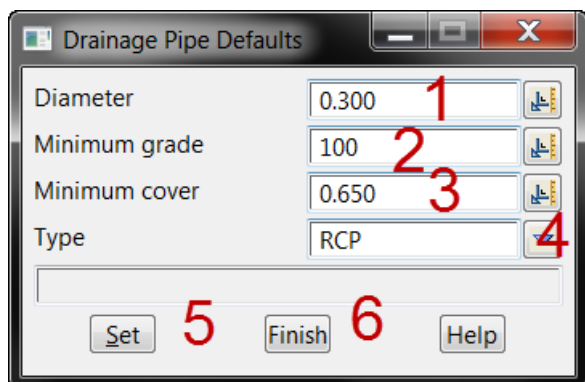

Setting the default name to **New** is a good reminder that you have not confirmed the pit type. Use the Set Pit Names function on the DNE to assign the pit names.

The **pit type** list is obtained from the drainage.4d file. Set this to the most common pit type and then later change the ones that are different using the DNE.

You **must** click the **Set** button to set the default values. Finish alone will **not** set the defaults.

7.3 Pipe Defaults

The pipe **diameter** is set in metres or feet **not** mm or inches. Set this to a common pipe diameter for your project then alter other pipes or change to box culverts in the DNE.

1. Type the common pipe diameter.
2. Type the minimum grade (1 in xxx). This value can be changed by pipe height via the **DNE->Defaults->Pipe->Grade file**
3. Type the minimum cover. This value can be changed by pipe type via the **DNE->Defaults->Pipe->Cover file**
4. LB the **Type** drop down and select the most common pipe type.
5. LB the **Set** button.
6. LB the **Finish** button.

Pipe Thickness for Pipe Cover

When 12d set the pipe inverts it checks the **minimum cover** from the top of the pipe to the finished ground surface at the ends of the pipe. Pipe thickness is changed by pipe type as defined in the drainage.4d file.

$$\text{Cover} = \text{surface level} - \text{thickness} - \text{diameter}(\text{height}) - \text{invert}$$

If the grade of the pipe is less than the **minimum** grade, the grade of the pipe is increased. The DNE has a pipe grade file where the minimum grade may be changed via the pipe diameter.

Finally, 12d checks if there is anywhere along the pipe length that has less than the **minimum cover**. If there is such a low point in the design surface, the pipe is shifted vertically downwards to achieve the cover

required. The [DNE](#) has a pipe cover file that will change the pipe cover via the pipe type. If the pipe type is not found in this file then this minimum cover will be used. Circular pipes have the cover checked along the centre line and box culverts along the centre line and edges.

When using the 12d editors to change the pipe diameters the invert levels will remain fixed and the obverts will change. The inverts may be reset using [Regrade Network](#) on the [network editor](#).

The list of available pipe types is set in the [drainage.4d](#) file.

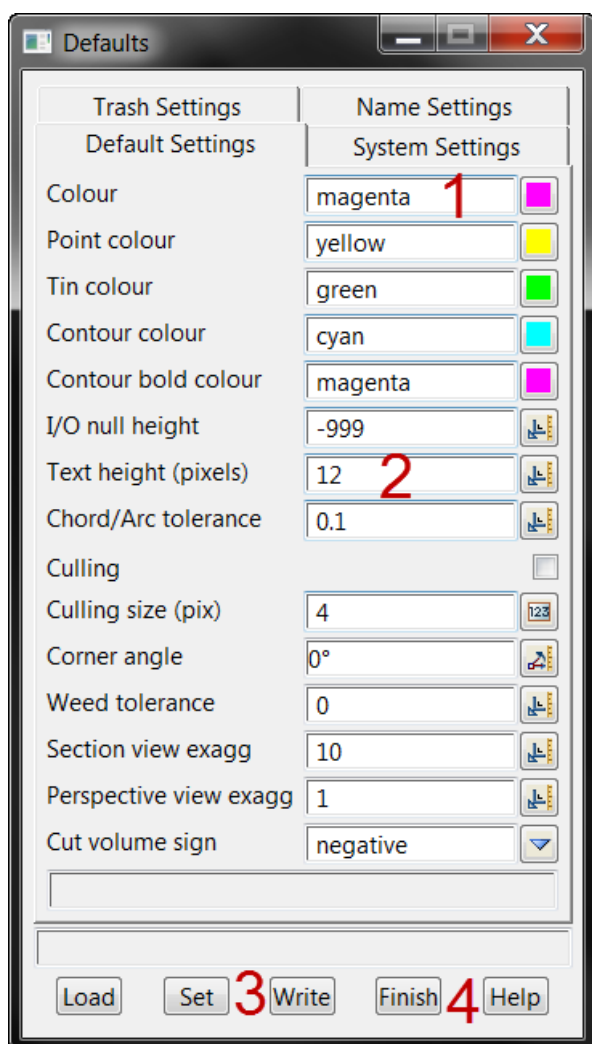

7.4 String Colour and pit Label Text Size/location (string defaults)

12d can automatically label the pits at a fixed offset from the pit using [view text](#) OR you can use the network editor [Plot](#) to create text labels that can be moved/rotated etc.

For view text, the default line colour and text size are set by selecting

Project=>Management =>Defaults

The following panel will appear.

1. LB **colour** icon to set the default colour of the drainage string and man-hole labels.
2. Type the height of the text in pixels
3. LB the **Set** button. This will set the defaults for this project only.
4. LB the **Finish** button.

The manhole label textstyle and offset may be changed via the [DNE](#)->Global->display tab

Optionally, you may LB the **Write** button to set the defaults for other projects. The following panel will appear. Selecting **Current folder** will save ALL these defaults for projects in this working folder only. The defaults set in the **user** or **setups** directories will not be used if you select this option.

Selecting **User folder** will save your defaults so that all other 12d projects will use these defaults. This is the most common option (unless your network administrator has not given you write access to this folder (check **Properties** in windows explorer).

Select **Write** then **Finish**

8. Creating Drainage Strings

We are now going to create a culvert to cross road 3.

Key Points

1. Before creating the drainage strings, read in a drainage model template (Design->Drainage-Sewer->Create->Create/Read template) so that all of **DNE** settings will set. There is a sample one in the 12d library (drainage_template_QLD.12da). If you forget, do it later but **READ A TEMPLATE FILE**. We will create one at the end of this course.
2. You will be placing centre of the culvert headwall. The headwall centre is the selection point for the pit. Pipes can be connected this pit Use setout strings for construction setout points!
3. Drawing all drainage lines in the same direction may help you keep your drainage work organised. Either draw all string uphill to downhill (flow **same as string direction**) **OR** downhill to uphill (flow **opposite to string direction**). You can mix the flow directions if desired.
4. The Drainage Network Editor **Regrade Pipes** is the key to setting pipe invert levels! Use this after modifying the drainage plan layout as it will update all initial grading described below.

However, 12d will perform an initial grading as you draw the string. If you choose **opposite to string direction** then will need to select Pipe=>Default Grading then Grade to achieve this initial estimate. If you create branch lines before the trunk lines the initial grading will ensure the trunk line inverts remain below the branch line. Regardless, the DNE regrade pipes will sort the grading for all strings in the model.

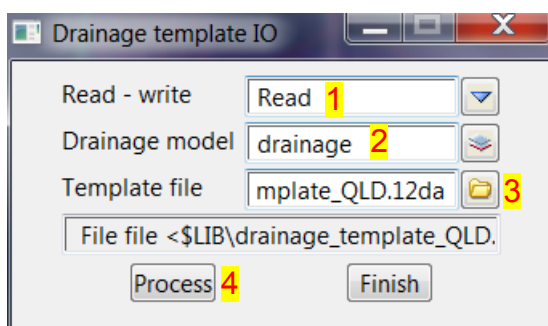

8.1 Read in a drainage model template

A drainage model template contains your favourite global and default settings for the **DNE**. These settings are stored as model attributes and the template may be read before or after the drainage strings have been created. Caution: existing default and global setting may be overridden.

You can create you own templates as well. After you have completed a drainage job and all of your global and default settings are set, create a template to save in your user library.

From the main menu select

Design =>Drainage-Sewer =>Create->Create/Read template

1. Leave as **Read**.
2. Type **drainage** to create a new model for the drainage strings
3. LB the folder icon, then lib to locate drainage_template_QLD.12da
4. LB **Process** to create tthe model and import the default and global settings.

8.2 Creating the Drainage Strings in 12d

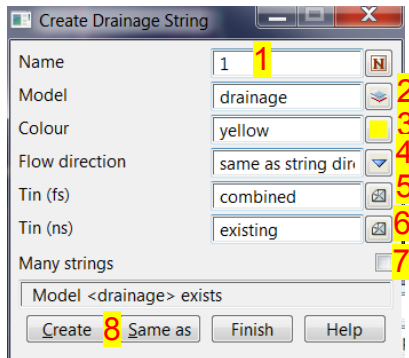

12d has a routine that creates a culvert very quickly. **Design->Drainage-Sewer->Create->Culvert**. It will also add a channel to the outlet as well! Try this, then the general method discussed below. The culvert is placed in a model **culvert** and the levels are all set to the manual mode.

A drainage string is created by selecting

Design =>Drainage-Sewer =>Create->Create

The initial manhole and pipe types will those set in [Setting Drainage Defaults \(Initial Settings\)](#).

1. Type a string name (used for pit naming later).
2. Type a new model name for the network
3. LB the **Colour** icon and select colour (optional).
4. Leave unless drawing in uphill direction.
5. From the default, leave as is.
6. Existing tin can be used for long section dwg levels
7. Select if creating more than 1 string.
8. LB the **Create** button, the menu below will appear.

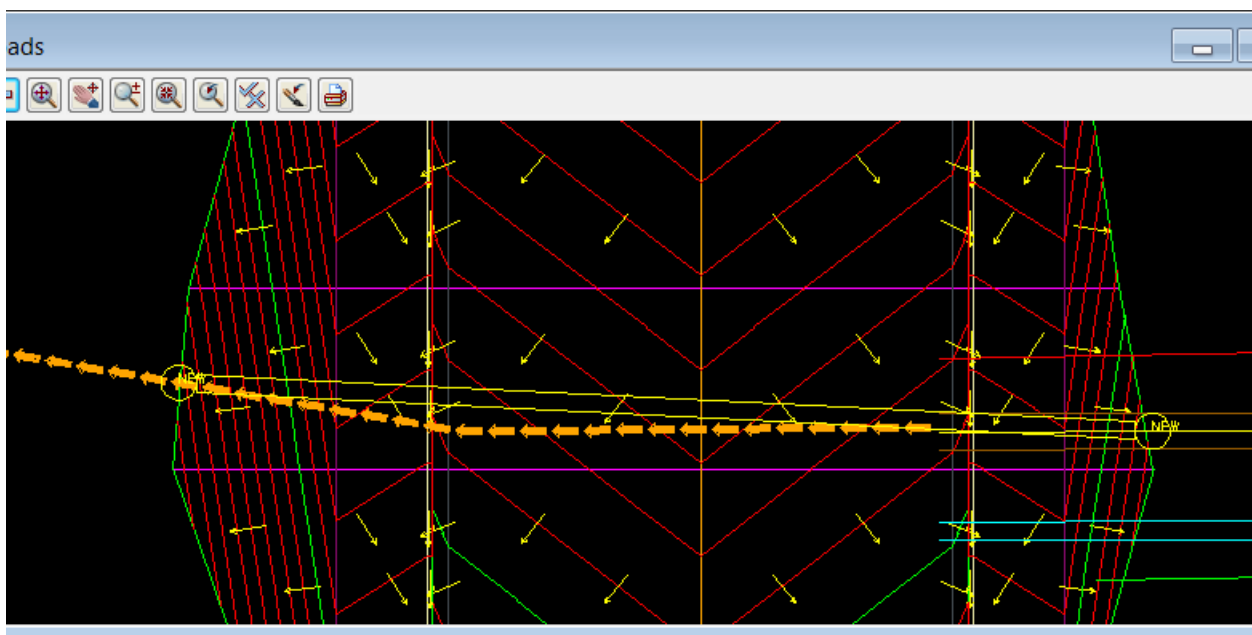

If you have already created a drainage string, click the **Same as** button and select the drainage string to obtain the panel values from that string. After selecting the string, change the string **Name**.

We are going to initially place our head walls on edge of the batters and then fine tune the location later.

To create your first manhole select

1. **Edits =>Add/Append MH**. A +MH will appear with your pointer. Refer to the plan below for the headwall locations.
2. LB and accept for the upstream (east) and downstream (west) headwalls.
3. LB the **Finish** button after the last headwall is placed.

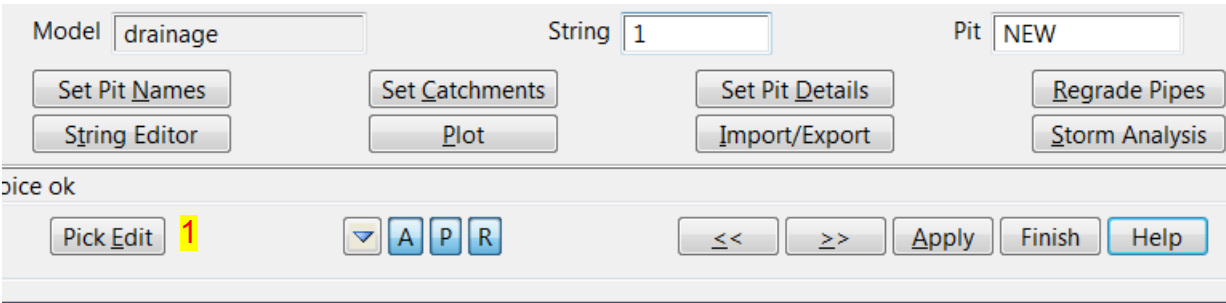

8.3 Change Pit and Pipe Types and Sizes

We will use the DNE to change the structures to inlet and outlet headwalls and the pipe to a box culvert. The drainage network editor is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Network Editor

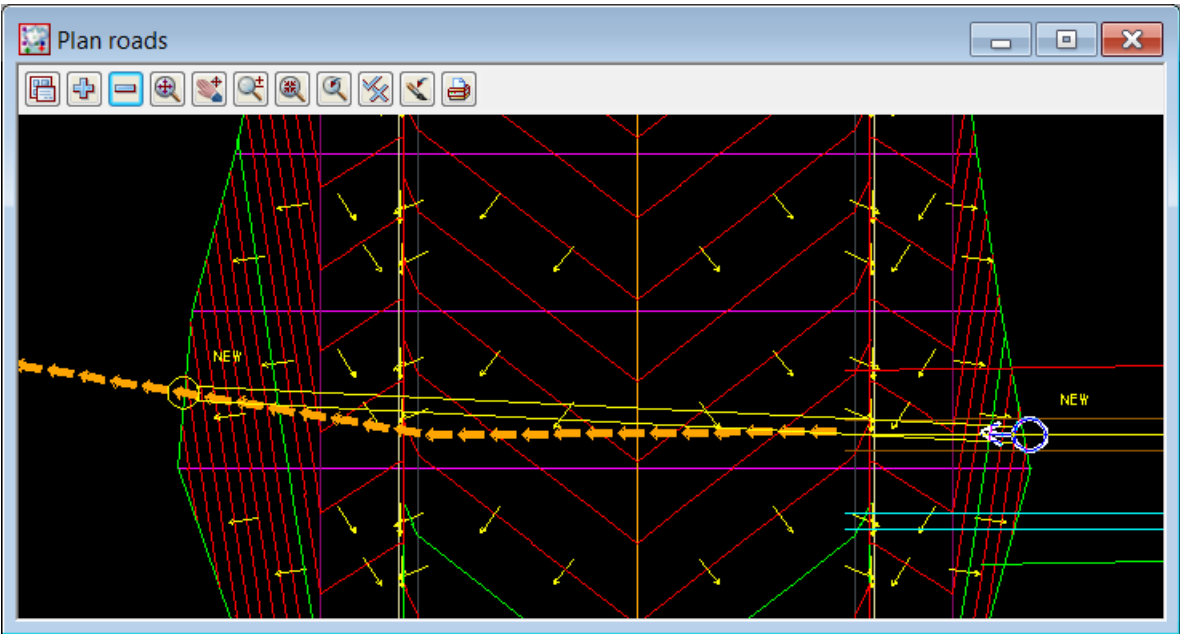

The bottom section of the network editor panel is shown below. You can change tabs but no data can be entered in the panel until a drainage pit or pipe has been selected and accepted.

1. Pick and accept the drainage string near the western headwall and the network will be loaded into the panel (only drainage strings may be picked).

The action buttons on the drainage editor now become active.

The pit closest to the point selected is highlighted with a circle and an arrow shows the direction of flow and the pipe being edited (see image below). When the outlet is selected there is no arrow. If the arrow is in the wrong direction or the outlet is at the upstream end of the string see [Flow in the Wrong Direction](#) to correct this.

The screenshot shows the 'Drainage Network Editor' window with the 'Pit' tab selected. The 'Current pit' section shows 'Pit name' as 'NEW' and 'Pit type' as 'HW'. Below this are tabs for 'Main', 'Setout', 'Bypass', 'Bypass Shape', 'Basin', 'Inflow', and 'Notes'. The 'Main' tab is active, displaying fields for 'Cover RL mode', 'Grate RL mode', and 'Sump RL mode' (set to 'floating'). It also shows 'Cover RL' and 'Grate RL' values of 29.751663, and 'Sump RL' of 28.8017. A red circle highlights the 'Diameter/length' field (1.85) and the 'Width' field (1). A yellow '3' is next to the 'Diameter/length' value.

1. Select the **Pit** Tab
2. Note the **Pit type** is already **HW** as we set this as the default. The type may be used to set pit properties. See [Drainage Definitions - Manhole Types](#) in 12d help. If you did not set this as your default ([Manhole \(Pit\) Defaults](#)) then change it now.
3. Diameter/length is in the direction of the road once it is linked otherwise it is east-west. Width is 90 degrees to this, If width is blank the pit is circular.
4. Select **Apply** to see the changes.

The screenshot shows the 'Drainage Network Editor' window with the 'Pipe' tab selected. The 'Pipe downstream of current pit' section shows 'Pipe ID' as 'NEW to NEW' and 'Pipe type' as 'BC'. Below this are tabs for 'Main', 'Design', 'Channels', and 'Notes'. The 'Main' tab is active, displaying 'Invert levels' with 'US Invert' at 28.801663 and 'DS Invert' at 28.079386. A red circle highlights the 'Diam/Height' field (0.375) and the 'Width' field (.6). A yellow '3' is next to the 'Diam/Height' value. Another red circle highlights the 'Pipe type' field 'BC' with a yellow '2' next to it.

1. Select the **Pipe** Tab
2. Change the **Pipe type** to **BC** (for box culvert). This may be used to set some of the pipe properties. See [Drainage Definitions - Pipe Types](#) in 12d help.
3. Change **Diam/height** to 0.375 and width to 0.600. If width is blank the pipe is circular.

Model	drainage	String	1	Pit	NEW
Set Pit Names		Set Catchments		Set Pit Details	
String Editor		Plot		Regrade Pipes	
		Import/Export		Storm Analysis	

choice ok

Pick Edit [v] [A] [P] [R] << >> Apply Finish Help

1. Now move to the outlet using the **Pick Edit**, << or >> buttons. << and >> are left and right in section view and NOT east west.
2. Enter the pit length and width for the outlet headwall.

A popup will appear indicating that the pipe thickness will be changed because the pipe type has a different thickness setting in the drainage.4d. Select **Stop asking for this session** and then click **Update**.

Note: A P R. The **A (auto apply)** is active by default. Changes are saved and displayed when you press any button on the DNE except **Finish** or the red **X** in the top right corner. If you turn **auto apply** off, it will be back on the next time you start the DNE.

8.4 Flow in the Wrong Direction

The direction of flow is used by 12d to determine which end of the string is the outlet and therefore the direction of decreasing invert elevations when regrading the string.

The direction of flow will be indicated with the arrow on the pit when using the **DNE**. No arrow will appear if the outlet is selected. If you find the arrow is pointing in the wrong direction there are 2 methods to access the flow directions.

Method 1: Use the **DNE** to select the string with the flow in the wrong direction and then select the **String Editor** button. From the menu select **Utility->Properties**. Change the **Flow direction** value to the other value. Select **OK** then **Save & Finish**. Now use the **Pick** button to select the drainage network again.

Method 2: Use the **Strings->Properties->String** option from the main menu. Select the string and then change the **Flow direction** value to the other value.

9.Drainage Strings Levels

The [DNE](#) quickly sets the levels for your drainage network. All the levels can be calculated by the [DNE](#) or locked with user specified values.

9.1 Pit Levels

Pits have 4 levels:

1. the cover level is used in plotting and pit depth calculations. This is also the maximum obvert level drawn for all connecting pipes.
2. the grate level is used for the freeboard measurements, the surcharge to bypass level and the reference level for pond flooding depths.
3. the setout level is used for survey setout to construct the pit.
4. the sump level (bottom of the pit) is used in plotting and for depth calculations. If set to floating mode, it is calculated from the lowest pipe invert connected to the pit plus the sump offset.

The grate level is the most important level in 12d hydraulics and will be discussed more in those sections.

9.2 Pipe Levels

Pipes have the upstream and downstream invert levels that can set by the minimum grade and cover criteria (see [Vertical Alignment - Pipes](#)). The invert drop across a pit can also be fixed or change with the deflection angle. At this time we are only concerned with the pipe cover and grade.

9.3 Section View of a Drainage String

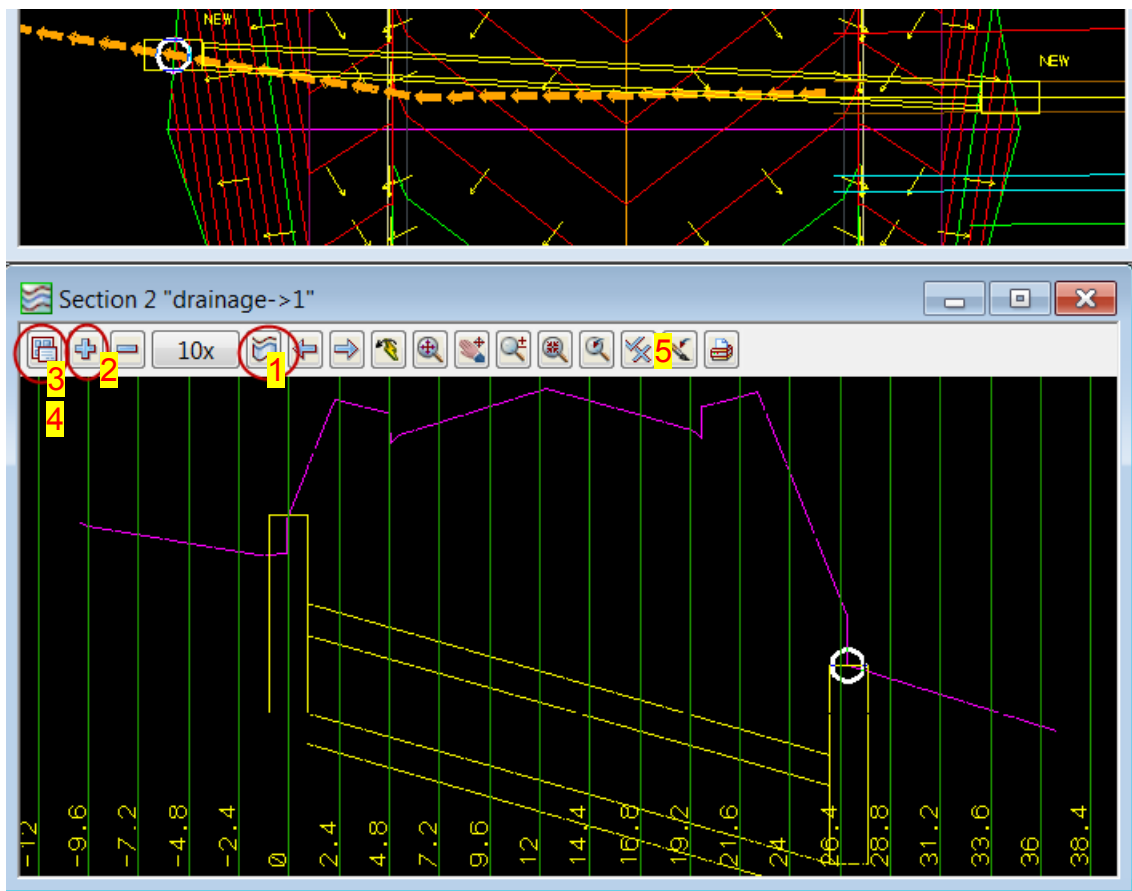

Create a section view to profile the drainage string.

From the main menu select

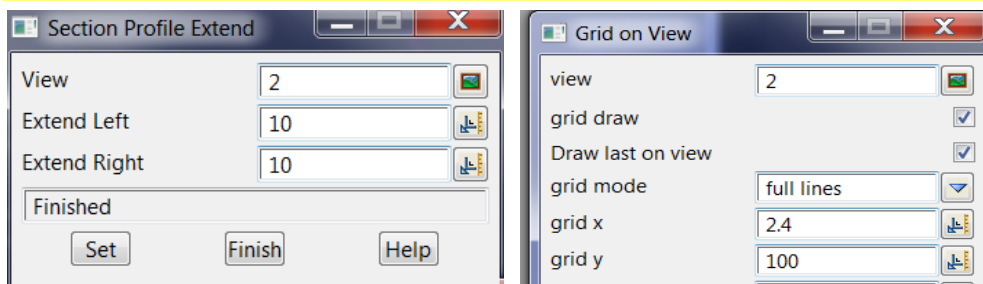

View->Create->Section view

1. Type **Drainage**
2. Select the **Create** button

1. LB the **profile** button then pick and accept the drainage string.
2. LB the + button and add the **tin combined** to the view.
3. LB the view menu button and select **Settings->Extend** to view 10m past the ends of the culvert.
4. LB the view menu button and select **Settings->Grid** to set the horizontal grid to 2.4m (a standard culvert length)
5. Toggles **Grades** on to see the pipe length and grade

LB the view menu button and select **Settings->Grade annot** to set **Draw grades as 1 in.**

9.4 Set Pit Details

Selecting **Set Pit Details** will set the pit levels and setout coordinates for all of the pits in the network using either the default settings for the model or the explicit settings for the pit (if used). Other attributes are set as well but they will be discussed later. A prompt box appears asking you to confirm. Select **Yes**.

To toggle off/on the confirm request, RB **Set Pit Details**. The same works for **Regrade pipes** and **Set Catchments**

9.5 Regrade Pipes

Selecting the **Regrade Pipes** button sets the pipe inverts for all of the pipe in the network using either the default settings for the model or the explicit settings for the pipe (if used). A prompt box appears asking you to confirm. Select **Yes**. To toggle off/on the confirm request RB **Regrade Pipes**.

Minimum grade and cover are checked and trunk lines are lowered to accept incoming branch lines. Grade is calculated using either the pit centre to centre distance or the end of pipe to end of pipe distance (**DNE->Global Use end to end pipe length**). Default pipe cover and grade are set on the **DNE Defaults-Pipe** tab and if not found there the **Drainage->Defaults-Pipe** settings are used.

Invert alignment is based on the pipe cover, the pipe minimum grade and the drop across the pit (see **Pipe Grade Modes**). The tin specified in the **Global-Main Finished Surface Tin** box is used for these calculations. Since every pipe that enters the pit may have a different drop mode, the drop mode is set on the downstream end of the pipe, NOT the pit.

If the inverts are locked on the **Pipe** tab then some the design criteria may not be able to be achieved. Messages in the output window will indicate these problems.

Now we will regrade the culvert checking the cover only under the roadway. First select the upstream (east) headwall.

Drainage Network Editor

Catchment | Pit | **Pipe 1** | DEFAULTS | GLOBAL | Results

Pipe downstream of current pit

Pipe ID: NEW to NEW Pipe type: BC

Main | **Design 2** | Channels | Notes

Invert design

Lock US Invert ☐ Lock DS Invert ☐

Grade mode Cover limit

DS vert defl Min grade (%)

DS align mode Align drop

Skip cover dist US Skip cover dist DS

1. Select the **Pipe** tab
2. Select the **Design** tab
3. Type **0.6** to over ride the default cover we set earlier (this is the minimum distance measured from the top of the pipe).
4. Type **2.5** for the Skip cover distances (US and DS). These distances are measured from the ends of the pipe. This will stop 12d from checking the cover in these areas.
5. Select **Regrade Pipe** to reset the inverts.

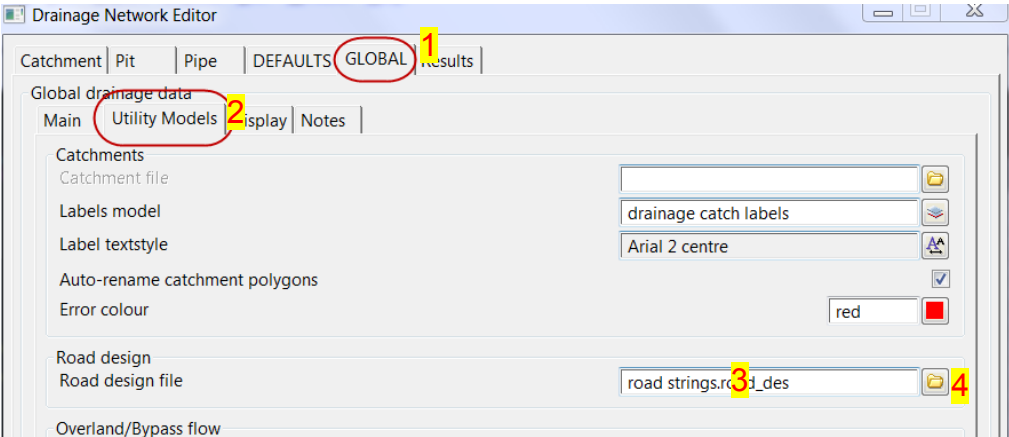

For circular pipes, the cover is checked along the centre line of the pipe. For box culverts the cover is also measured along the sides. The wall thickness is set via the pipe type and diameter from the drainage.4d file.

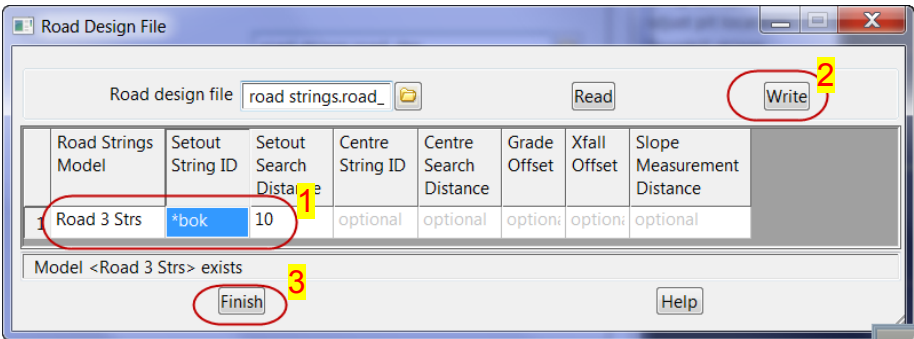

Note: The obvert of the pipe will never be drawn above the grate levels. If the cover or grate level is below the pipe invert you will get an X pipe. **Set pit details** will recalculate the pit levels and Regrade pipe to set the inverts..

9.6 Setout Strings to Align the Headwalls with the Roadway

Now link the headwalls to the roadway so they are perpendicular to the batter slope.

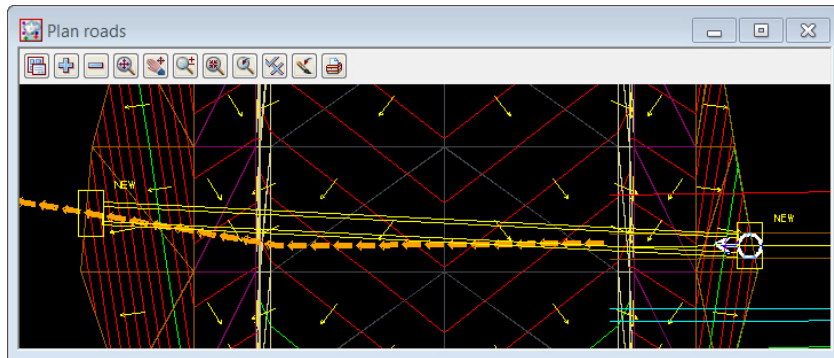

1. Select **Global**
2. Select **Utility Models**
3. Type **road strings**
4. Select the **folder icon** then **Open**

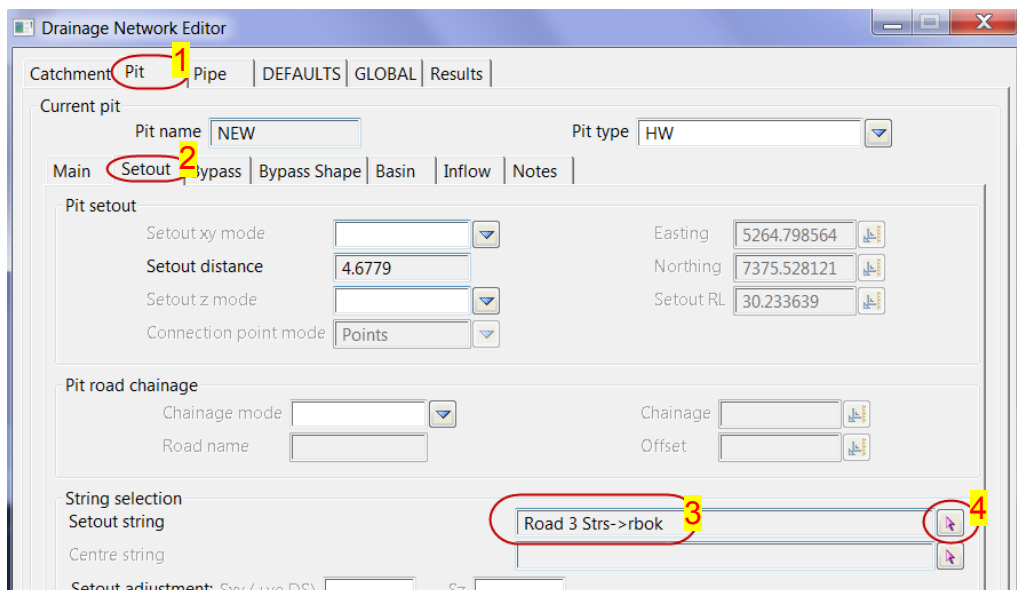

1. RB in the **Road Strings Model** cell and select **Road 3 Strs** model
type ***bok** so that the headwall will be linked to the closest lbok or rbok string.
type **10** as the max distance to search for a string
2. LB **Write** to save the file
3. Select **Finish**
4. Select **Set Pit Details** to create the links to the road strings.

The culvert headwalls now align with the roadway instead of east-west.

Now confirm the manhole link to the road strings (setout strings).

1. LB Pit
2. LB Setout
3. Note: selected string
4. Note: manual pick/clear button

DNE string links exist until you manually clear them or you delete the string.
 OR you clear the link by RB on the manual pick and select **Clear**,
 OR you clear all road string links via **Global->Utility Models->Clear Road Links**.
 We have a good link so do not do this at this time.

9.7 Adjust Pipe Length

Now adjust the culvert length to an even number of pipe lengths.

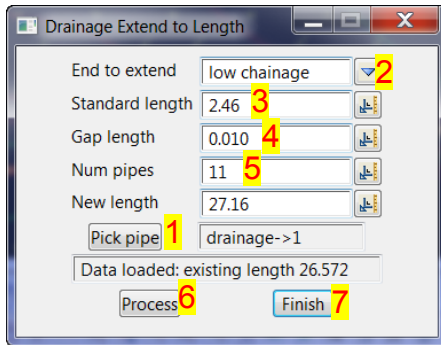

Only one editor at a time can access the strings. The DNE locks all of the strings in the model. Close the DNE now, before we start the next editor.

From the main menu select

Design->Drainage-Sewer->More->Extend pipe/culvert

As the culvert appears to be too long we will shorten it to 10 standard lengths (half on both ends).

1. Pick and accept the culvert
2. Change **End to extend** to **high chainage**
3. Change **Standard length** to 2.46
4. Change **Gap length** to 0.010
5. Change **Num pipes** to 11 and press enter. the new length is displayed
6. Select **Process**
7. Select **Finish**

After selecting process, the section view will need updating. Also the pit cover levels are set to the pipe invert level. The next time you press **Set pit details** in the DNE they will be reset using the selected method.

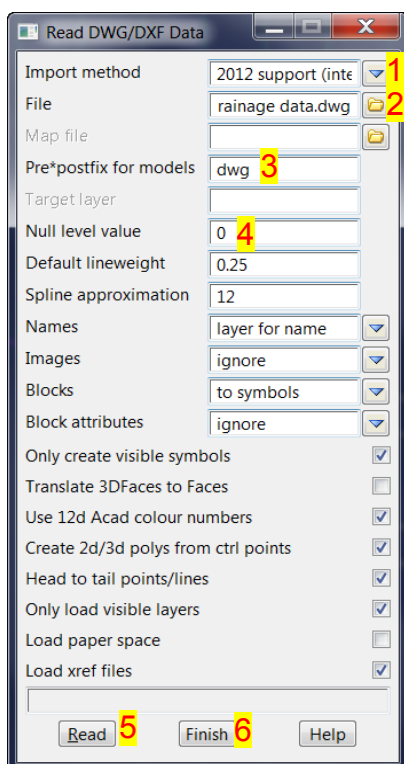

10.Importing Drainage Layouts from AutoCAD

We are now going to import a pipe layout that was drawn in CAD along with the overland flow routes and catchment areas (These could have been created in 12d as well). When these were drawn the following rules were followed:

- 1.Strings are drawn where the pipes are NOT to setout x,y locations,
- 2.Polylines are used in AutoCAD,
- 3.lines drawn from upstream to downstream (direction of flow),
- 4.a vertex was placed at every pit location.

To import the AutoCAD drawing, from the main menu select

File IO->Data Input=>DWG/DXF/DXB

1. Select 2012 support
2. LB the folder icon and select the **drainage data.dwg** file
3. Type a **prefix** for the models. It will help organise the layers from AutoCAD as every layer goes into a separate model in 12d. Specifying a prefix causes all of the layer names to be prefixed with this text and therefore kept together in the model list. The prefix used is dwg<space>.
4. Enter the null value **0** (no level in CAD value)
5. LB **Read** button. If you select the **Read** button more than once the data will be imported again and you will get duplicate, triplicate...etc data.
6. LB **Finish**

The models that have been created are,

dwg Catches Future
dwg Catch Lots
dwg Catch Reserve
dwg Catch Roads
dwg network

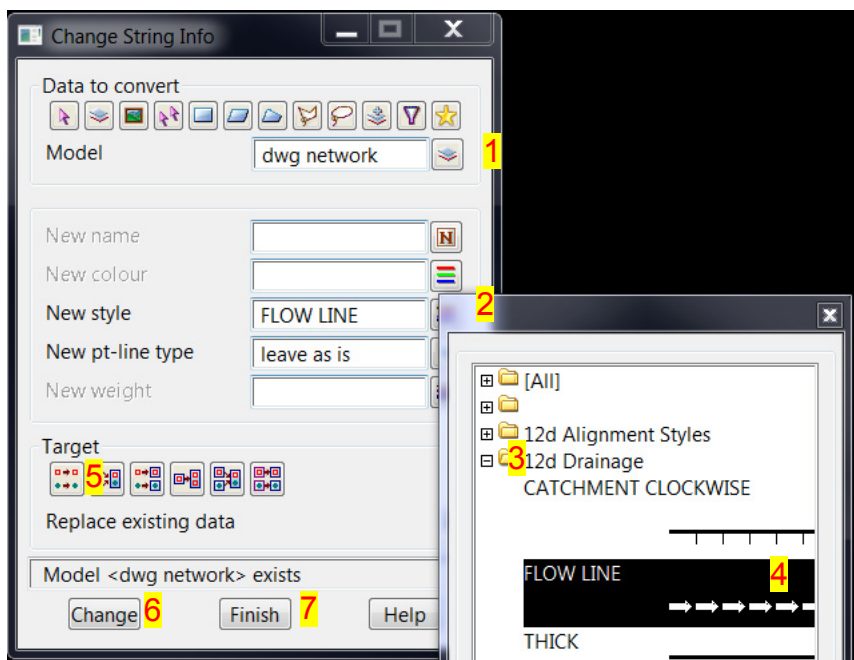

dwg network is a drainage layout that we will use to locate the pits in our drainage design.

10.1 Checking the String Direction of CAD Network Strings

A quick way to check the direction of the strings imported from CAD is to change the linestyle to a style that indicates the direction.

From the main menu select,

Utilities->A-G->Change

1. Select the dwg network model that contains the drainage network.
2. Select the **New Style** icon
3. Select + on the **Drainage 12d** group
4. Select **FLOW LINE** from the style list
5. Select the **Replace** option from the **Target** buttons
6. Select **Change**
7. Select Finish

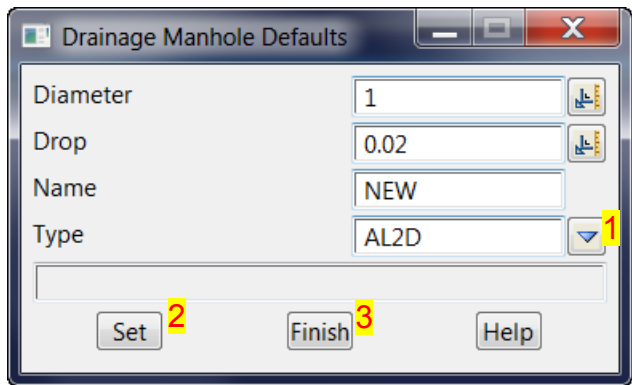

10.2 Create the drainage strings from the CAD strings

Before creating the drainage strings, [Read in a drainage model template](#) so that all of **DNE** settings will be set. If you forget, do it later but **READ A TEMPLATE FILE**. If the drainage strings are going to be added to a model that already has the global and default settings set, these strings will use those model settings.

12d will convert the import strings into 12d drainage strings. The default pipe, pit and tin data will be used to set the levels for the network. Do not use the other string convert commands found on the menu system.

Most of the pits will be grated roadway side entry pits (AL2D). Set this pit type as the default.

Design =>Drainage-Sewer =>Defaults=>Manholes

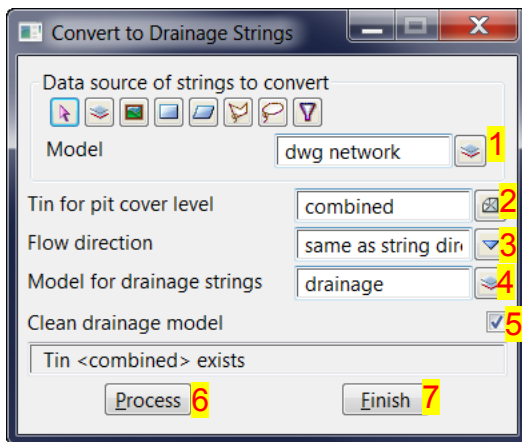

1. LB the **Type** drop down and select **AL2D**.
2. LB the **Set** button.
3. LB the **Finish** button.

Next from the menu select

Design=>Drainage-Sewer=>Create=>Create from strings

The following panel will appear.

1. Select the existing **dwg network** model
2. Select the **combined** tin. The cover level for the manholes will be obtained at the manhole centres from this tin.
3. Leave as **same as string direction**. The strings were drawn in the same direct as the flow in th CAD program.
4. Select the existing **drainage** model. If this model was not created from the read drainage model template function then you could type the name now and the model would be created.
5. **Clean drainage model** when selected will delete all strings in the model before the new drainage strings are created.
6. **Process** create the drainage strings
7. **Finish** closes the panel

The imported strings must all be drawn in the same direction. Either all in the direction the water flows or all opposite the direction of flow.

Pits are created at all vertices on the strings.

Trunk lines must have a vertex where the branch lines join.

Delete the new plan that was created and observe the new drainage strings created (road view).

11.Horizontal Alignment and Drainage String Edits

11.1 Road design strings (centre line) for Adjust Pit Locations

During the design process, roadways are often moved slightly, requiring the pit location to be adjusted. Linking the inlets to the road design strings enables 12d to quickly adjust these locations and create a report of the pit requiring adjustment.

The [Adjust Pit Locations](#) routine will move the centre of the pit perpendicularly to a **layout string** or offset from a **road setout** string.

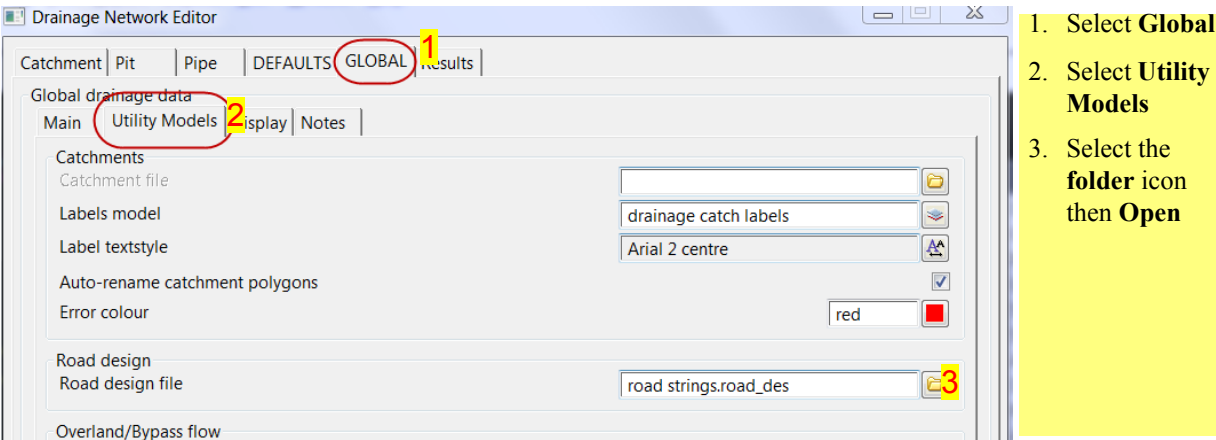

Layout strings do not need to be set up in advance but they do not allow for an offset.

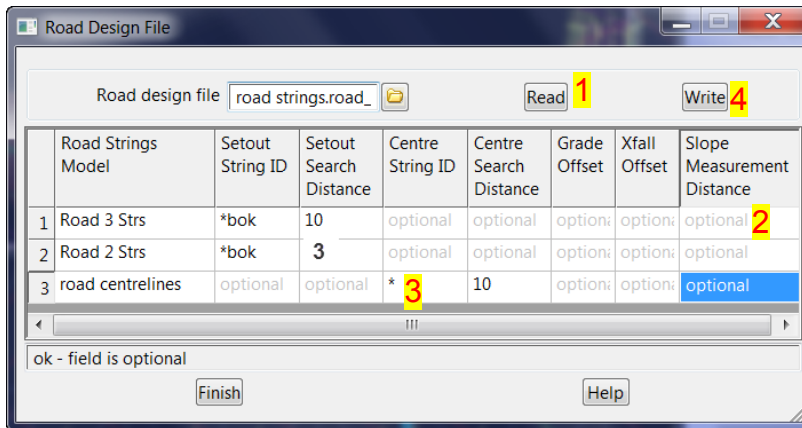

Road design strings need to be setup in the DNE but they allow an offset from the setout string that can vary with the pit type. Often large pits will be offset more into the footpath or roadway.

Road and layout strings can be used at the same time. If no road string is found, a layout string will be searched for.

In this example we are going to use the road setout strings not layout strings. We have already linked the culvert headwalls to the road design strings on Road 3. We will now do the same for the roadway inlets so they will align with the roadway and we can offset the centre of the pit a fixed distance from the setout string. This will require a link to the road centre line as well. A positive offset is away from the centre line and negative towards the centre line.

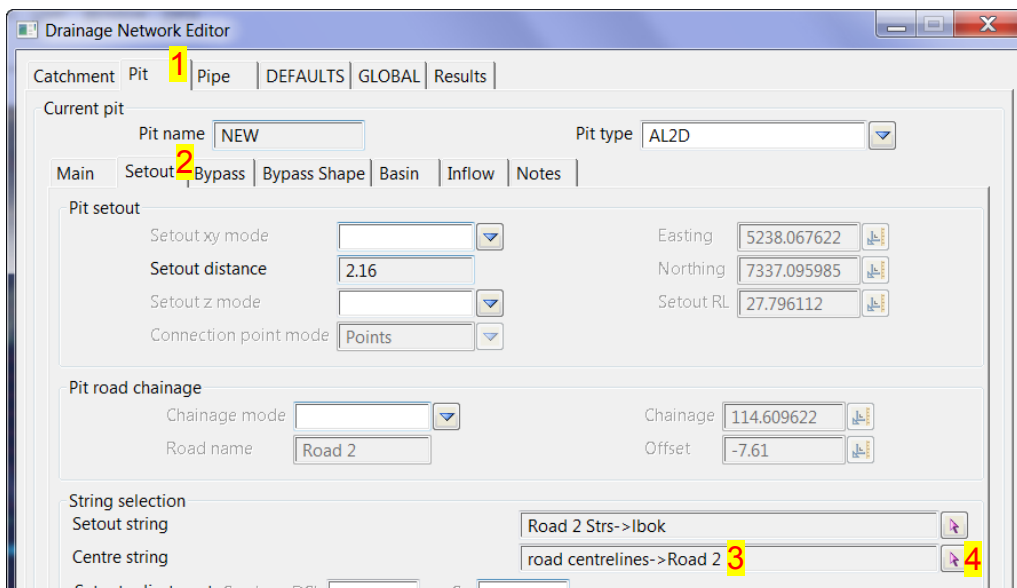

Start the DNE and select the network.

1. RB in the **Road Strings Model** cell and select **Road 2 Strs** model
type ***bok** so that the inlets will be linked to the closest lbok or rbok string.
type **3** as the max distance to search for a string
2. press enter until row 3 is added
3. type * for **Centre String ID**. This wild card will allow a string with any name (blank will not work).
type **10** as the max distance to search for a string
4. LB **Write**, then **Replace** to save the file
5. Select **Finish** then **Set Pit Details** to create the links to the road strings.
6. Regrade pipe to set the inverts.

To confirm that the inlets were linked to setout (*bok) and centre line strings,

1. LB **Pit**
2. LB **Setout**
3. Note: selected string
4. Note: manual pick/clear button

11.2 Log Lines with the Drainage Network Editor

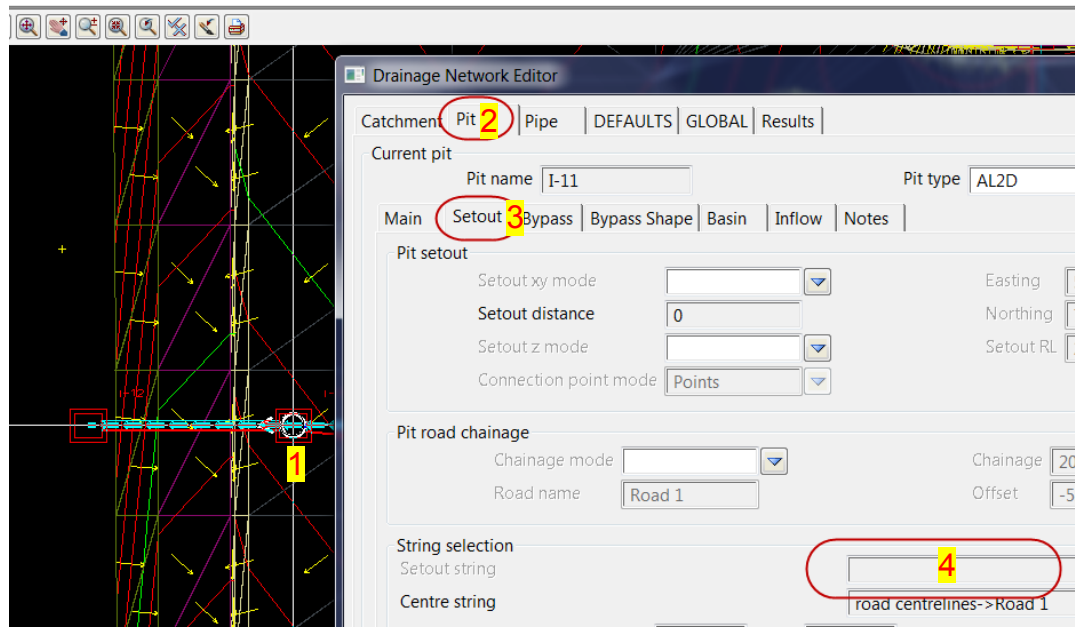

Double clicking on a log line in the Output window will take the DNE directly to the pit the message refers to!

Selecting **Set Pit Details** and messages are created in the **Output Window** for information and error checking. If the line of text begins with an exclamation mark it is a log line.

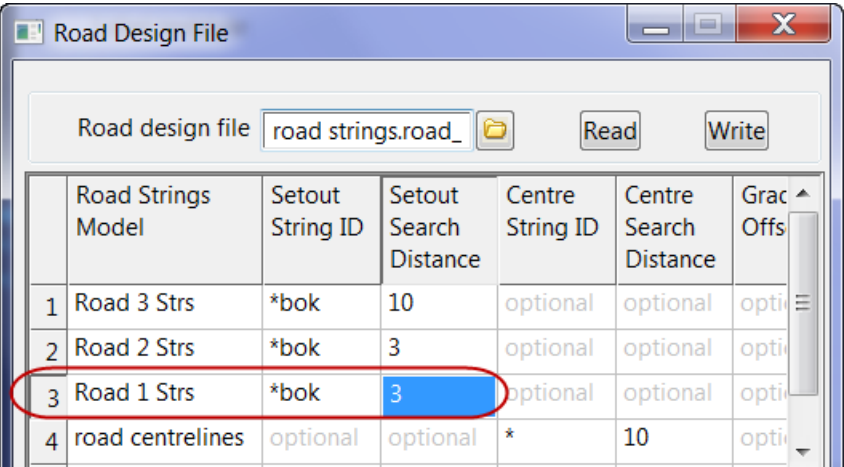

```
!INFO: Pit "NEW" Setout distance is:      0.450
!PROBLEM: Pit "NEW" Setout string not found
... needed for pit grate rl
... needed for pit z setout
... needed for pit xy setout
... needed for pit symbol angle
```

- 1. Double click on the word **PROBLEM**.

- 1. Note: the DNE (if open) moves to inlet NEW.
- 2. Select the **Pit** tab
- 3. Select the **Setout** tab.
- 4. Note that the **Setout string** field is blank

No road setout string has been found because we have not included the model **Road 1 Strs** in the **Road strings** file found on the **Global->Utility Models** tab of the DNE. The *bok strings in the **Road 2 Strs** and **Road 3 Strs** were more than the search distance away.

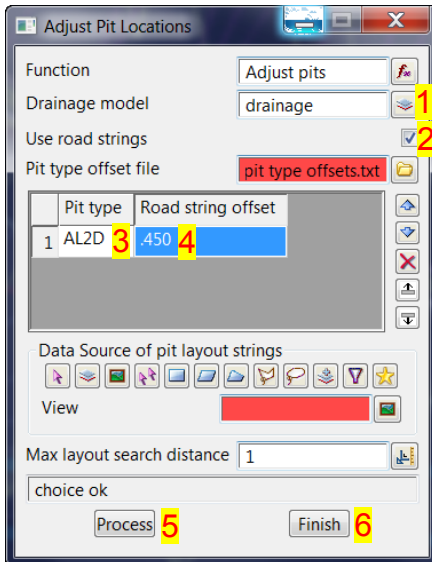

- 1. Add the new row and complete with the data as you have done before.
- 2. After **Writing** the file select **Set Pit details**.
- 3. Confirm that I-11 now has a setout string.

11.3 Adjust Pit Locations

Now we can offset the inlets from the bok setout strings.

Close the DNE and then from the main menu select,

Design->Drainage-Sewer->Adjust pit locations

1. Select the model **drainage**.
2. ensure **Use road strings** is selected.
3. RB and select **AL2D** pit type
4. type **0.450** for the offset away from the road centre line
5. Layout strings and layout search distance are not being used at this time.
6. Select **Process** and redraw the plan view to see the new pit locations.
7. Select **Finish**

The message box indicates that 13 of the 18 pits were adjusted. Check the output window for a list of the pits that were adjusted. If no road string is found then the layout string is searched for. Since we did not use layout strings we get the warning messages for 3 of the pits. Note: You will not have pit names assigned yet ([Set Pit names \(and pipes\)](#)) so your names will be just NEW.

```
WARNING: Adjust Pit Locations - pit "I-07" found no perpendicular layout string within
the specified search distance.
INFO: Adjust Pit Locations - pit "I-04" adjusted by 2.610 units.
WARNING: Adjust Pit Locations - pit "I-08" found no perpendicular layout string within
the specified search distance.
INFO: Adjust Pit Locations - pit "I-05" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-06" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-07" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-08" adjusted by 2.610 units.
WARNING: Adjust Pit Locations - pit "I-10" found no perpendicular layout string within
the specified search distance.
INFO: Adjust Pit Locations - pit "I-09" adjusted by 2.610 units.
INFO: Adjust Pit Locations - pit "I-10" adjusted by 2.610 units.
WARNING: Adjust Pit Locations - pit "I-11" found no perpendicular layout string within
the specified search distance.
WARNING: Adjust Pit Locations - pit "I-12" found no perpendicular layout string within
the specified search distance.
```

11.4 Manual Horizontal Alignment - Moving, Adding and Deleting Pits

The most common functions for adjusting the horizontal alignment of manholes and pipes are found on the Strings->Points Edit menu.

The **Append, Between, Delete, Insert and Move** commands are the most common.

The **Move** command has extra options for moving junction pits. Selecting **All points with the same coordinate** will move all points on the view that are at the same x,y coordinate. The point selected will move first and the others will follow **after** the new location has been accepted. **Restrict to selected model** will stop data from other models at the same location from being moved.

The second option

Strings->Edit

gives you all the same commands and more but requires you to select a string first and the edit commands will be restricted to the selected string.

12.Completing the Intersection Drainage Design

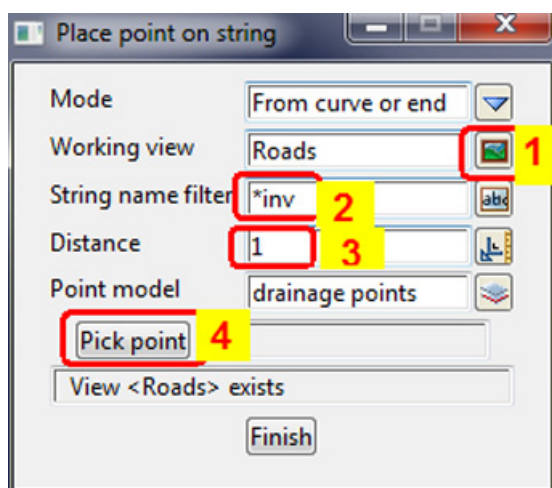

When placing inlets around an intersection, it is often required to place the centre of the inlet a specified distance from the curve so that the grate and/or the side inlet will be located on the straight section of kerb. If there is a pedestrian crossing, the inlet should be placed at a specified distance upstream to be clear of the crossing.

12.1 Placing Marker Points around the Intersection

The place points routine is a fast way to place inlet location markers at a specified location from the curved section of the kerb.

From the main menu select

Design->Drainage-Sewer->More->Place points

1. Select the **Roads** view as it contains the inv strings where we want the pipes.
2. Type ***inv** so the linv and rinv strings can be selected.
3. Type the distance from the end of the string or the start of curve where the pit is to be placed.
4. Select **Pick point** and then snap near where the pit is to be placed. The routine will find the closest *inv string and then search for the closest end or curve. It will then measure from the point towards your initial snap to create the marker (see magenta arrows below).
5. repeat for the remaining 3 ends of the kerb returns.

12.2 Option 1 (Connection at Manhole in the Road)

The option below has been selected for you to complete so that it has 2 inlets and a manhole. Use the tools you have learnt thus far to create the drainage string and assign the pit names. Special care is required when creating a junction pit (10) shown below. There must be a pit on the trunk line where the branch line connects and there branch line must point snap onto the centre of the trunk line pit (see [Junction Pits](#)).

12.3 Option 2(Connection pipe under the footpath)

Some road authorities prefer not to have a manhole in the intersection. Move the connection pit to the inlet to the west and delete the manhole.

A check list is on the following page once you have completed the layout.

12.4 Intersection Check List

1. Did you place the pipes in the correct location so that the correct cover could be measured?
2. When placing the manhole did you use the RB and **Perpendicular** to place the manhole?
3. Did you use **Strings->Points Edit->Insert** to add a pit to the trunk line at the junction location?
4. Did you assign a unique string number to the new string so that the set pit names routine would run?
5. Did you select **Set Pit Details** in the **DNE** to ensure the cover, grate and setout data was correctly calculated?
6. Did you check the output window for problem messages? Did you fix them?

7. Did you recalc the function **Adjust pits** so that the inlets are 0.450 behind the bok string.

Below are 2 other methods for placing pits that you may find useful.

12.5 Offsets from strings

As an alternative to the place points above you can use the snaps CAD to place the pits “on the fly”. Once the points move has been started use the **RB** and select

Snaps Cad=>Points=>Locate Offset. Follow the prompts given in the message area (bottom left corner of the screen). You will need experience with the 12d “directional pick” to use this capability.

12.6 Placing pits at specific Easting Northing Locations

For locating pits at specific x, y coordinates, simply start typing the x coordinate instead of clicking onto a location. An input panel will appear for you to enter the x and y coordinate separated by a space.

13.Manholes - A Closer Look

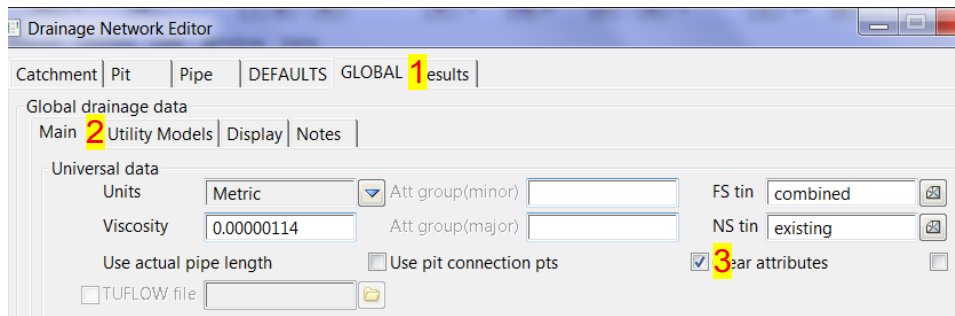

A manhole is made up of 3 points; the centre of the manhole and the pit-pipe connection points. The pipe exists as the connection between two manholes. The pipe may have a horizontal radius but not vertical.

13.1 Pit-Pipe Connection Points

The default mode has the pipes align between the centres of the manholes. The pit-pipe connection points are at the intersection of the manhole interior wall and the centre of the pipe (see below).

These connection points may be moved by enabling **Use pit connection points** on the **DNE->Global->Main** tab. All pits have their connection point initially set to **Points**. This setting is found on the **DNE->Pits->Setout** tab.

1. Select the **Global** tab.
2. Select the **Main** tab
3. tick the **Use pit connection pts** tick box
4. Select **Apply**

Pit connection points may be moved via **Strings->Points Edit->Move** (except for **Centre** mode described below). If a pipe is manually moved to a new connection point, it will be locked to the connection point and will not move if the pit or neighbouring pit is moved.

1. Close the DNE to unlock the drainage strings.
2. Use **Strings->Points Edit->Move** to move the junction pit you added to complete the intersection westward to the inlet.
3. Use **Strings->Points Edit->Move** to move the ends of the pipes as shown. Note that the pipes snap to the centre of the edges.

13.1.1 Pit Connection Point Modes

Centre (rectangle and circular) - This mode is the same as having the **Use connection points** turned off. The connection points will be located on the inside perimeter of the pit wall with the centre line of the pipe intersecting the centre of the pit. In this mode, the connection points may not be adjusted.

Points (rectangle) - A connection point is created at the mid point of each internal side of the pit. This may be changed for a **Pit type** by using the **con_points** command in the drainage.4d file. In this mode, the pipe ends will snap to the connection points. It is possible to place more than one pipe on the same connection point (the elevation of the pipes is not checked for clashes).

Points (circular) - The connection point may be moved anywhere around the pit internal wall as there are no connection points on the circular pits. Again, it is possible to place more than one pipe on the same connection location (the elevation of the pipes are not checked for clashes). If the manhole centre is moved the connection point locks are removed.

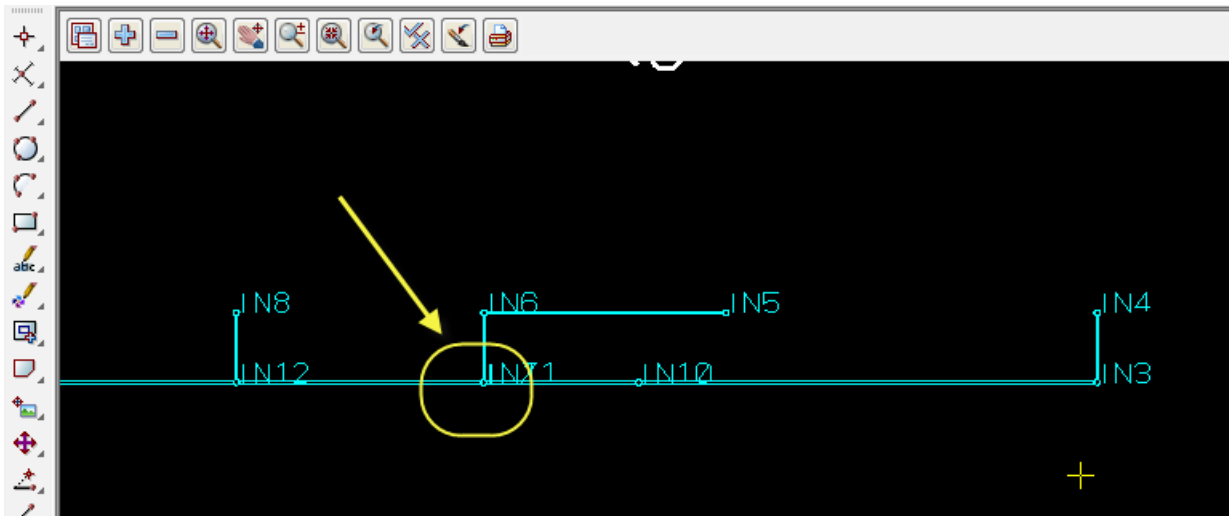

Perimeter (rectangular and circular) - Same as **Points** (circular) above.

Unrestricted (rectangular and circular) - There are no constraints on the location of the pit connection points. This mode is intended for irregular shapes such as GPT structures and stormwater basins.

13.2 Junction Pits

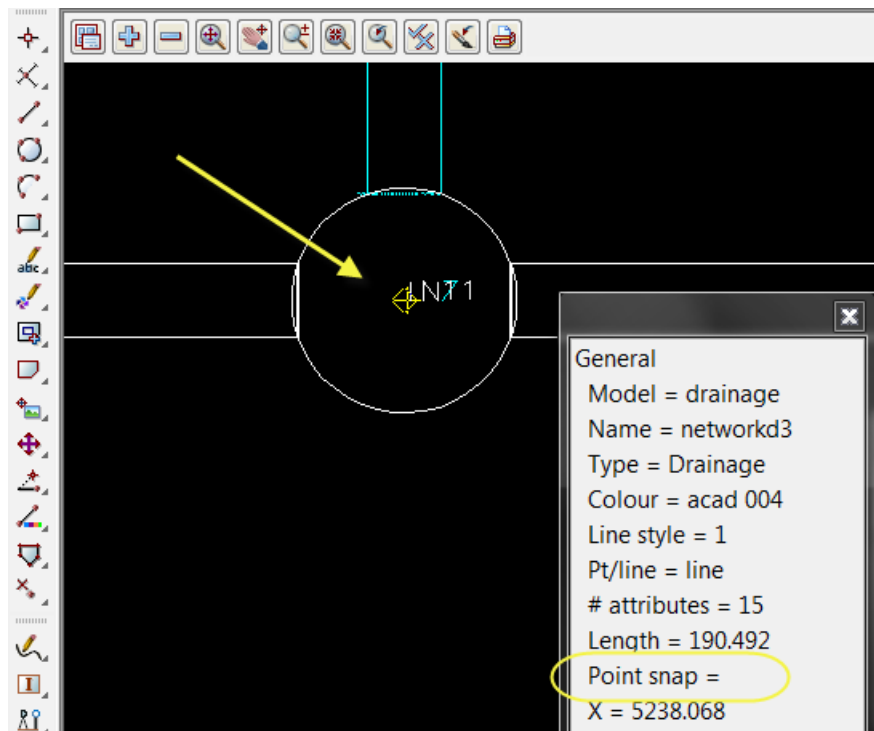

Key Points

1. The branch line must **Point Snap** onto the centre of a pit on the trunk line.
2. Both strings must be in the same model.
3. The downstream end of the string (depends on flow direction) must join onto the trunk line.

When creating a junction, pit turn the point snap on and the line snap off (the F3 and F4 keys are convenient for this). Zoom into the pit so that you can snap the being moved onto the centre of the stationary pit.

Recall a pit contains three points; one at each pit pipe connection points and one at the pit centre. You want to snap onto at the pit centre for a junction pit. In the figure below, the blue line is being placed to join the white line. Note that the diamond indicates that there is a point snap as well as the information panel.

If you cannot see your branch lines joining in the section view, check the following:

1. The centre of the pits did not align, Use **Strings=>Points Edit=>Move** to move the branch string pit the “downstream end” of the branch line must be the junction pit.
2. The branch string and the trunk string have not been created in the same drainage model. From the main menu select **Strings->Inquire (F2)** and select the strings to check their models. If this is the problem, use **Strings=>Edit=>Change** and specify the correct drainage model (enter the model BEFORE picking the string) or **Strings=>Edit=>Duplicate** to duplicate one of the strings into the correct model.

13.3 Drainage Section Views (downhill left to right OR right to left)

The long section views and the profile plots are running downhill from left to right. If you want them downhill from right to left use the **reverse** function.

To reverse only one string, from the main menu select

Strings =>Strings Edit =>Reverse

and pick the drainage strings to reverse. This will also change the drainage flow direction attribute from **same as string direction** to **opposite to string direction**.

To reverse all of the strings in a model select the Reverse all strings option,

Design =>Drainage-Sewer =>More=>Reverse all strings

13.4 Drainage Split and Join

In this example, we are going to **split** the string shown in white below at IN14 (your pit are still NEW) so that we can **join** the west end (IN14 to IN16) to the trunk line on the southern side of the road (cyan). This will allow us to produce a long section that will extend the full length of the road 2 to the headwall outlet.

Use the **String split/join** from the Drainage menu not the one on the **Strings->Strings edit**.

Split Option

- The split must be done at a pit.
1. A new name for the upstream string (optional). Leave it blank
 2. A new name for the downstream string (optional) Leave it blank.
 3. LB the **Split** button and then select the pit where the split is to occur. (IN14).

Join Option

This routine will add a new pipe between the 2 strings if required. When **Join US to DS** is selected, the properties and attributes of the upstream string and pit at the join will transfer to the new joined string.m string. **Join DS to US** will cause the properties and attributes to come from the ds string. Upstream and downstream is determined by the flow direction

1. Select the **Join US to DS** button.
2. Pick and accept the cyan drainage string, then the IN14 to IN16 string (follow the messages in the 12d message area).

14.Drainage Network Editor (DNE)

We have had a brief introduction to the DNE when we worked with the culvert. We will now look at many more of the DNE capabilities.

[Read in a drainage model template!](#) There is no need to set all of your global and default settings each time you start a new job. If we had not already read in a template we would do it now. Templates are a way to store all of your [Network Editor - Global, Default Settings and Explicit Settings](#)

The drainage network editor is used to automatically or manually change the properties of your drainage network. These abilities include:

[Vertical Alignment - Manholes](#)

[Set Pit names \(and pipes\)](#)

[Service and Utility Clashes](#)

Hydrology

[Catchment Areas](#)

[Catchment Areas and Percent Impervious](#)

[Coefficients of Runoff](#)

[Times of Concentration](#)

[Tc Path Strings](#)

Bypass flow routes

Hydraulics

[Cover RL, Grate RL, Setout RL and Sump RL modes.](#)

[Culvert Hydraulics and Tailwater](#)

[Pit Losses Ku, and Direct Flow](#)

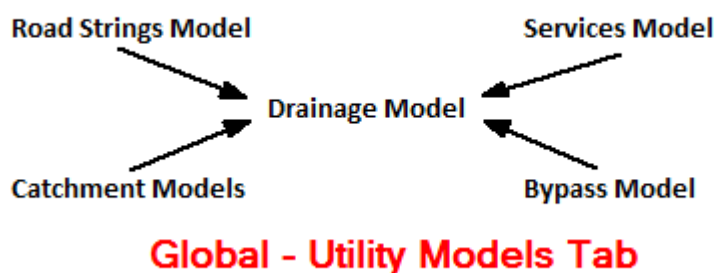

[Pipe Friction Method, Roughness Values and Direct pipe flow](#)

[Design mode, Freeboard Limit and Flow-depth limit](#)

[Pipe Size Design](#)

[Pipe Design Parameters - Sizes, Invert alignment, Min Cover, Max Height](#)

The DNE also links your drainage model to your 12d design models.

The drainage network editor is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Network Editor

There is no need to fill in all the fields. On the **Catchment**, **pit** and **pipe** tabs, blank fields will use default values from the **Defaults** tab. Check the tool tip for the default value being used.

The bottom section of the network editor panel is shown below. You can change tabs but no data can be entered in the panel until a drainage pit or pipe has been selected.

1. Pick and accept a drainage string and the network will be loaded into the panel (only drainage strings may be picked).

The pit closest to the point selected is highlighted with a circle and an arrow shows the direction of flow and the pipe being edited (see image below). When the outlet is selected there is no arrow. The option buttons on the drainage editor now become active.

14.1 Update from drainage.4d

We have set our default diameter as 1m and default manhole as AL2D. In the drainage.4d file the AL2D manhole is defined having a diameter/length of 0.93m and a width of 0.85m. When you select one of the manholes the DNE finds the difference and asks you if you want to update the manhole diameter.

1. Select **Update from drainage.4d**. The manhole diameter will now be changed to 0.93 for this manhole.
2. If you select **Stop asking for this DNE session** first, you will not be prompted before the DNE updates the manhole data.
3. Selecting **Set Pit details** will update all manhole diameters in the network.

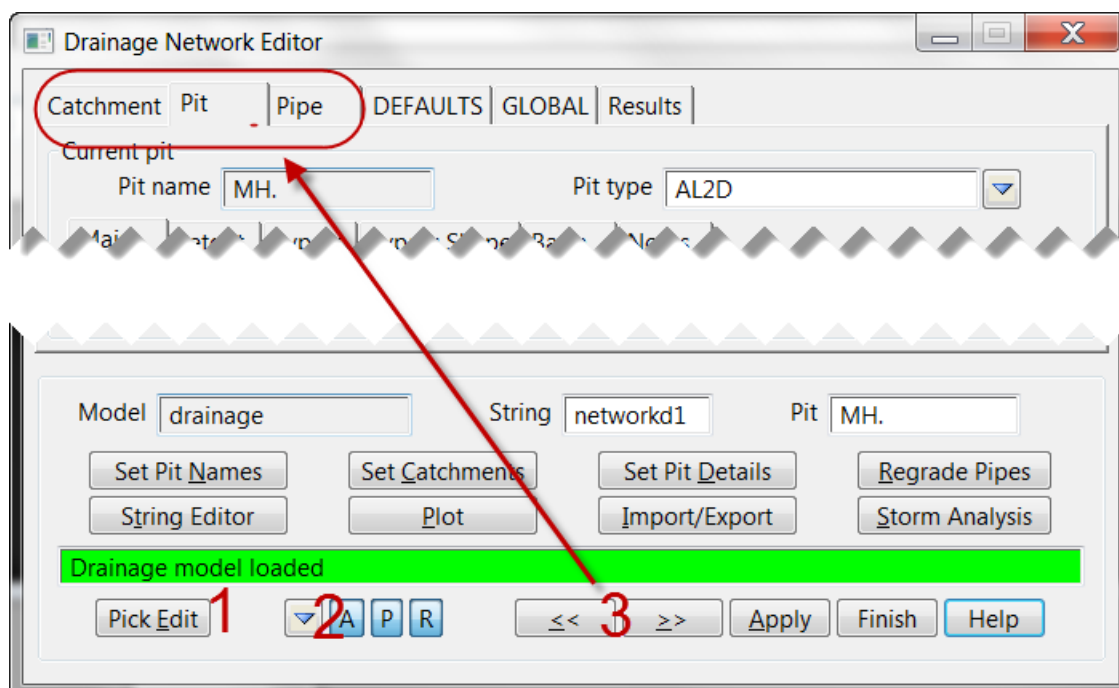

A surveyor who received a 12da file of the drainage network without the drainage.4d file would select **Keep stored data**.

14.2 Moving through the Drainage Network

There are 3 ways to change pits in the network editor. The Next-Previous (chainage NOT flow direction or east west) buttons will work if you are on the **Defaults**, **Global** or **Results** tabs. If the editor finds an error on a pit, it will take you to the error and you must correct the error before moving to the next pit.

Try all 3. The **GoTo List** will be interesting as we have not assigned pit names yet.

1. Pick Edit Button - Pick and pit or pipe in section or plan view
2. GoTo List - Select the pit from a list of pit name
3. Next and Previous (chainage) buttons - loop through all of the pits in the network

The most important button on the DNE is the **Set Pit Details** button. This button calculates the all of the manhole levels and data required for the drainage calculations.

14.3 Auto-Apply, Auto-Pan, Auto-Profile and Auto-Redraw

To tell if these buttons are on or off you need to know your computer display settings. For Windows 7, the default is Blue for on.

With **Auto-Apply (A)** enabled, data is saved when any of the 15 lower buttons are pressed **except Finish** and **Help**.

Auto-Pan is always active and any plan view showing the active drainage network selected will always auto pan if the selected pit is not in the view.

With the Auto-Profile (**P**) enabled, the same will happen for the section view.

With **Auto-Redraw (R)** enabled, the editor will regenerate the section view when changes are made in the vertical. This saves selecting **Regen** on the section views.

14.4 Set Pit names (and pipes)

Pit names are used to identify and label the pits for access. The DNE Goto drop down and outlout window loglines (warning/problem messages) become much more meaningful. **Storm analysis** requires that unique pit names be set.

Use the DNE to manually change single pit names (in the **Pit** field) or quickly change all the names using the **Set Pit Names**, button.

The **Set Pit Names** button requires unique string names. To view string names on the plan view, go to the Plan View tool bar and select **Toggle=>Names**. If they do not appear see Displaying View Text.

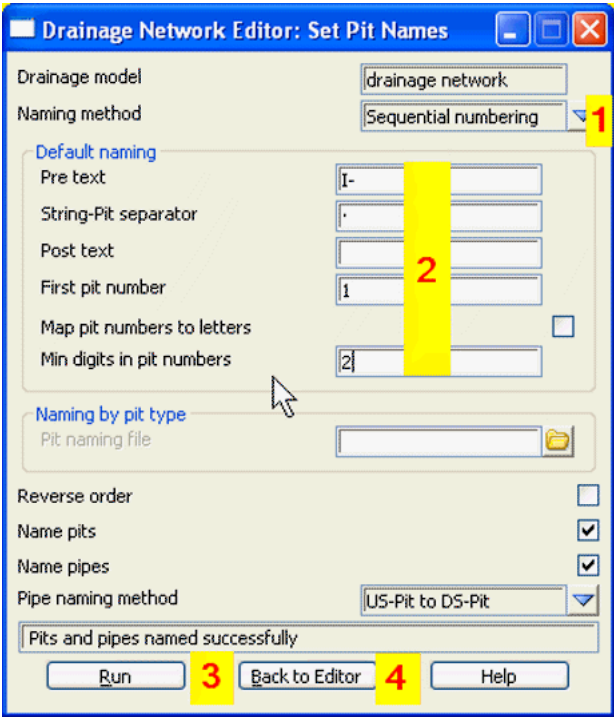

Models->String Info table is a fast way to view all the string names in the model. Double clicking on the lines will launch an editor to change the string names. The DNE also sorts the strings based on these names and this controls the plotting order.

The string names may be changed in the **String** field when the **Catchment**, **Pit** or **Pipe** tabs are selected at the top of the **DNE**. The string names must be unique.

1. Select **Set Pit Names** and the following panel will appear.

1. Select **Sequential Numbering** to number the manholes starting at First Pit Number.

2. Change the **Default naming** parameters.
Map pit numbers to letters causes the first pit to be A instead of 1.
Min digits in pit numbers set to 2 causes 1 to be 01.

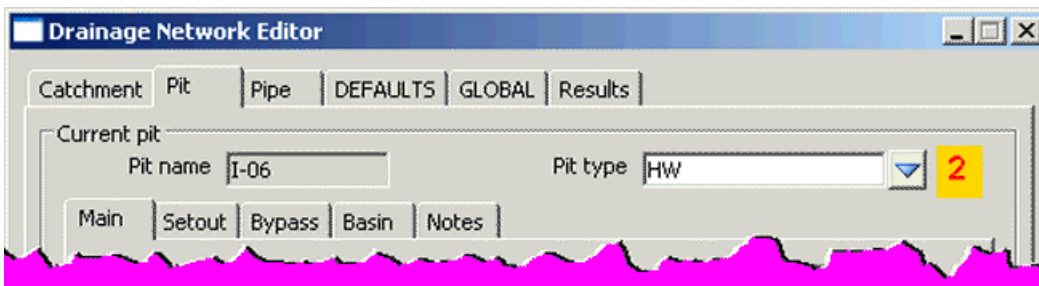

3. **Run** will update the quick text pit names on the plan view.
Try other settings!
You may find you want to change some of the string names back in the network editor.

4. **Back to the Editor** return to the main editor panel.

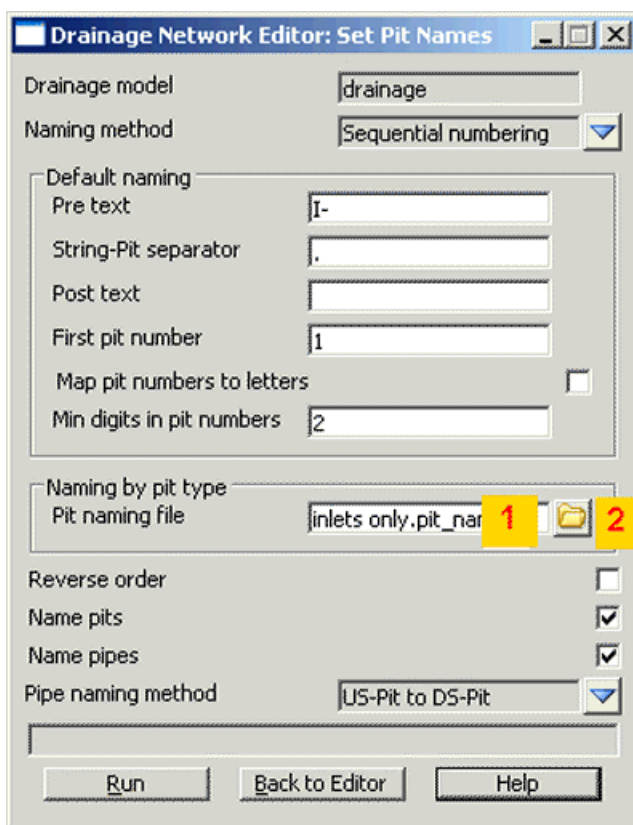

Reverse order starting numbering at the high chainage end of the string instead of the low chainage.

14.5 Set Pit Names using Pit Type

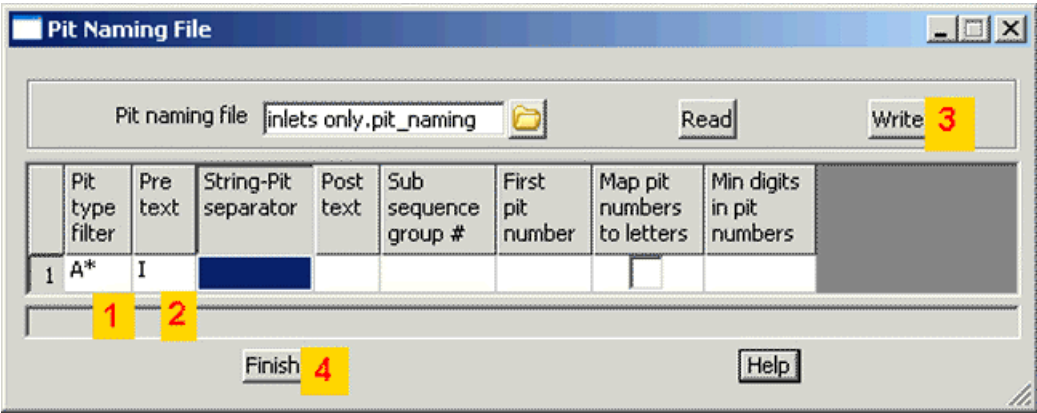

We can customise the pit name prefix, suffix, numbering sequence etc for each pit type. Currently all of the pits have the default pit type. We will now change the outlet pit type to HW and then rename the pits.

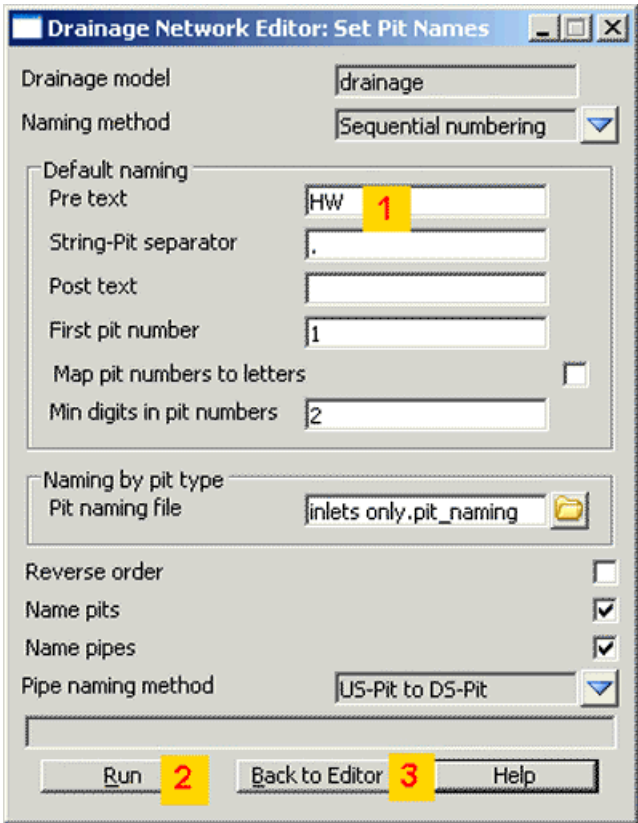

1. Move to the outlet using any of the 3 methods.
2. Change the **Pit type** to HW
3. LB Select **Pit Names**

1. Type the file name for the pit naming scheme. An example may be found in the library if desired.
2. LB the folder icon and select **Open**.

1. RB to select the **Pit type** or type text with wild card characters as shown
2. Type the **Pre text**
3. LB **Write** to save the settings to the file.
4. LB **Finish** to return to the panel.

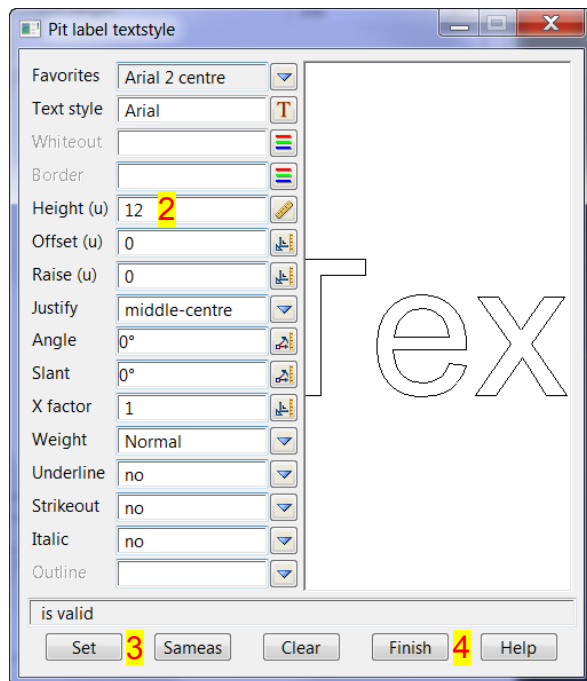

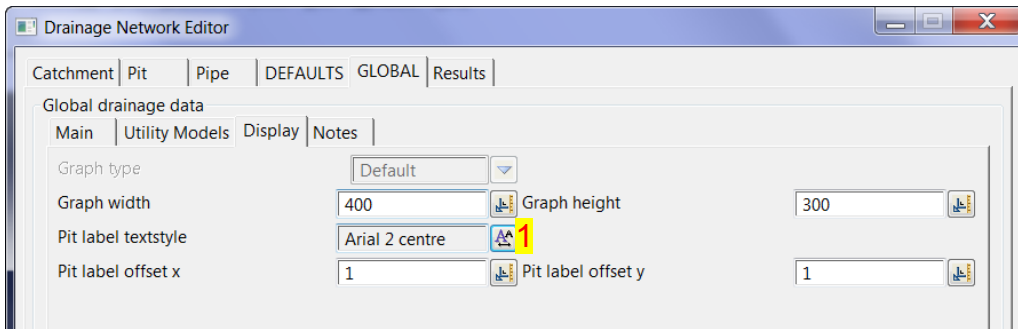

1. Type **Pre text** for those not included in the pit naming file.
2. LB **Run** to name the pits
3. LB **Back to Editor** to return to the main panel.

Note that the headwall still get the sequential numbering continued from the last numbering method. To start at a new number the **Sub sequence group number** would have to be included in the file.

14.6 Change Pit Name Textstyle and Offset

The textstyle and offset for the pit name is set on the **Global->Display** tab of the DNE. It is always shown as pixel text size and cannot be changed to world.

1. Select the **Pit label textstyle** icon and then the **Arial 2 centre** favourite.

2. Type the new **Height (u)** as 12 pixels.

3. Select **Set**.

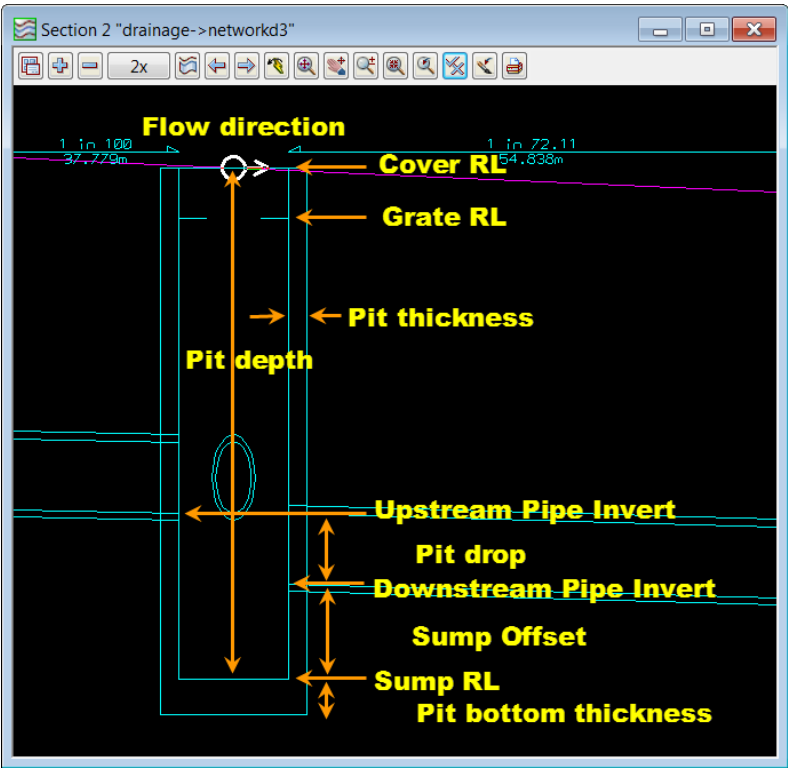

4. Select **Finish**.

5. Select **Apply** from the bottom of the DNE to see the new textstyles.

15.Vertical Alignment - Manholes

The diagram below shows the properties of a manhole. The RL levels may be set manually or calculated via the their associated mode and the **Set Pit Details** button. The **Grate RL** is used by 12d hydraulics when determining the freeboard level, bypass flows, inlet capacity values at sag inlets and depth of flooding at sag inlets.

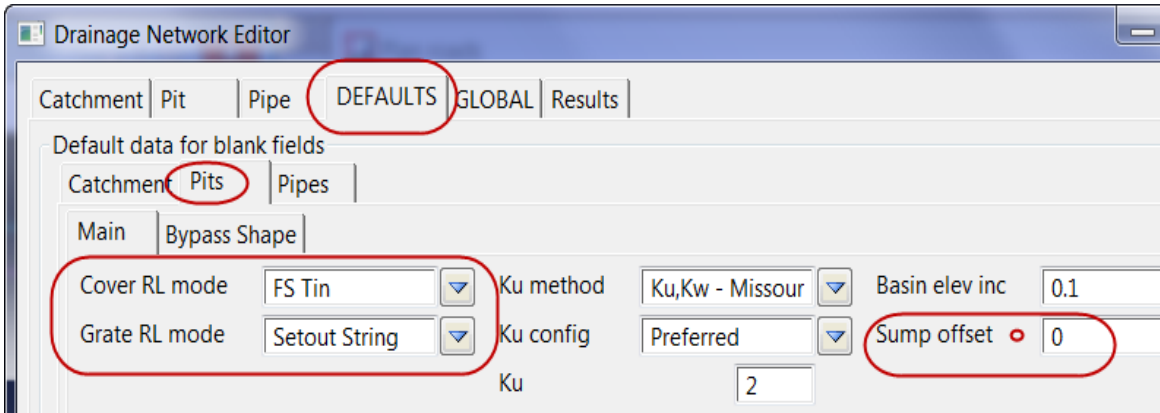

The **Setout RL** is the level used by surveyors to setout the pit.

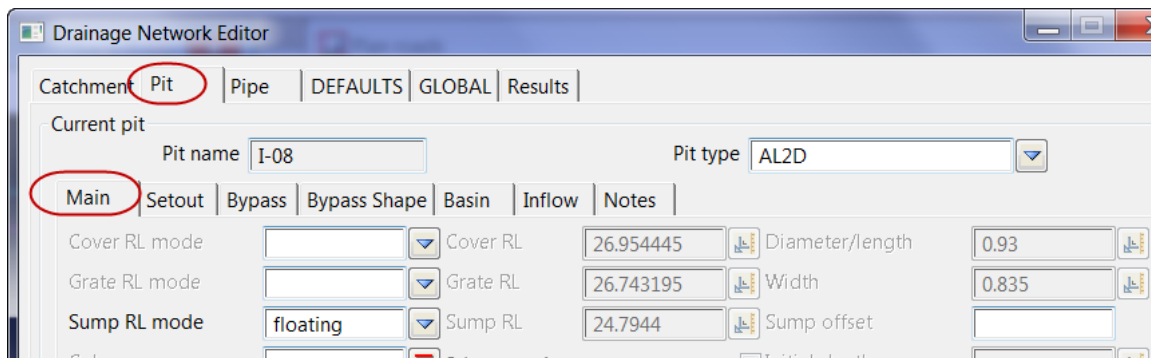

Flow direction	string property
Cover RL	DNE->Pit->Main
Grate RL	DNE->Pit->Main
Setout RL	DNE->Pit->Setout (not shown)
Pit thickness	drainage.4d via type
Pit depth	calculated value
Upstream pipe invert	DNE->pipe->design
Pit drop	Defaults(manhole) or DNE->Default->Pipes Drop file
Downstream pipe invert	DNE->pipe->design
Sump offset	DNE->Pit->Main
Sump RL	DNE->Pit->Main
Pit bottom thickness	drainge.4d via type

15.1 Cover RL, Grate RL, Setout RL and Sump RL modes

The default values for the RL modes are set on the **DNE->Defaults->Pits** tab.

These may be explicitly for an individual pit on the **DNE->Pit->Main** and Setout tabs

RL Modes

Cover RL Only available for Grade and Setout RL modes. z value will be the same as the cover RL.

FS Tin z value from the pit centre x,y location on the DNE->Global->Main->FS tin.

NS Tin z value from the pit centre x,y location on the DNE->Global->Main->NS tin.

Setout String z value from the string found by dropping the pit centre x,y location perpendicularly onto the setout string (DNE->Pit->Setout->Setout string) and then moving the distance DNE->Pit->Setout->Setout adjustment Sxy.

Sz+Setout String z value as for the **Setout String** plus the value DNE->Pit->Setout->Setout adjustment Sz.

Max Obvert z value of the maximum pipe obvert of all the connecting pipes.

DS Invert z value

Sump Invert Only available for Setout RL. z value from DNE->Global->Main->Sump RL

Manual z value is entered in the RL field to the right of the mode (field becomes active when this is selected).

floating Only available for Sump RL mode. z value is of the minimum pipe invert of all connecting pipes plus the value DNE->Pit->Main->Sump offset

RL modes for the entire model may be set via
Design->Drainage-Sewer->More->Pipe Locks

This routine has lock modes for pipes as well.

16.Vertical Alignment - Pipes

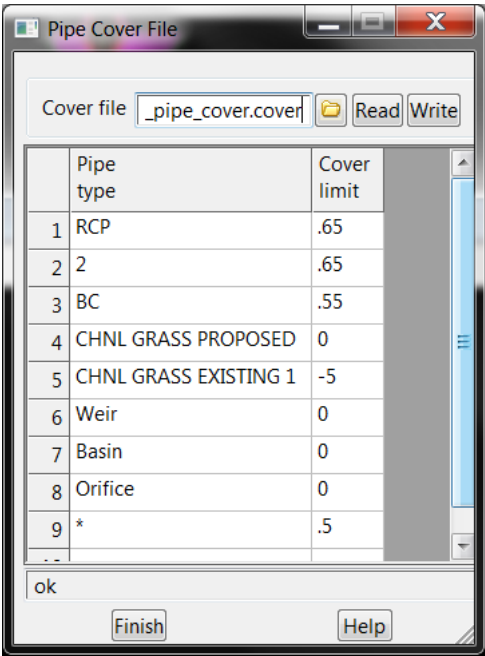

The pipe invert levels may be set manually or calculated using the DNE->Regrade Pipes button.

Pipe invert mode may be set to locked for the entire model via **Design->Drainage-Sewer->More->Pipe Locks**

There are many controls to guide 12d in the setting of the pipe inverts and the user may over constrain the network so that no solution is possible. If the minimum cover, grade or drop criteria cannot meet the criteria you have set, a problem message will be in the output window.

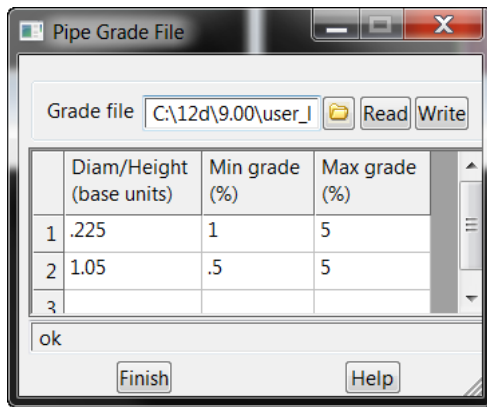

16.1 Minimum Cover

The minimum cover can be set via the pipe type and the pipe cover file (optional). If the pipe type is not found in the pipe cover file then the Defaults-Pipes-Cover for the project is used.

16.2 Minimum Grade

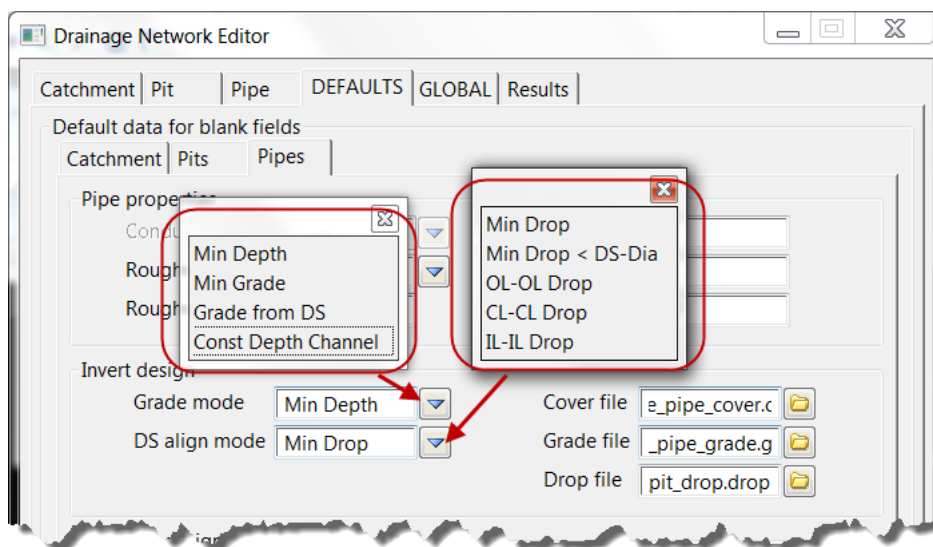

Pipe grade has been traditionally measured based on the horizontal distance from pit centre to pit centre. However, this causes issues with surveyors when they use electronic models to set out the drainage pipes. All drainage pipes lengths can now be calculated from the horizontal distance between inside pit edges (or pit connection point for the unrestricted pit connection mode). The alternate pipe length results in a different pipe grade to be calculated in 12d. This option is set one the **DNE->Global->Main Use Actual Pipe Lengths**.

The minimum grade can be set via the pipe diameter and the pipe grade file (optional). The diameter is the maximum diameter that this grade will be used for. If the diameter exceeds the greatest diameter in the grid, the last grade will be used.

If the pipe grade file is not used then the grade from the Defaults-Pipes-Min grade for the project is used.

16.3 Pipe Grade Modes

Minimum Depth The cover sets the inverts at each end of the pipe and then the downstream invert is lowered if the minimum grade is not achieved.

Minimum grade The pipe is set to the min grade and then lowered to meet the cover requirements.

Grade from DS Warning! Minimum cover may not be maintained in this mode. Each pipe has its downstream (ds) invert level set via its **DS pipe alignment** mode. If the downstream pit is the outlet then the cover is used to set the invert level. The upstream invert is set using the minimum grade.

Const Depth Channel Warning! Minimum cover, minimum grade and pit alignments are not used in this mode. The obvert of the pipe is set to the finished tin level at the pit centre.

16.4 Downstream Alignment Modes

The amount of the drop is determined first from the **Drop file** and then if required from the manhole default settings for the project. How the drop value is applied is set via the **DS align mode**.

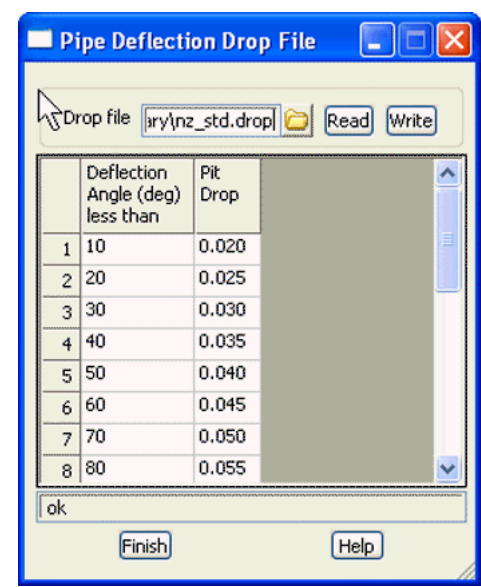

Inverts are moved down, if required, according to the setting in **DS align mode**.

Min drop ensures that the inverts drop a minimum of the drop but may be more.

Min drop<DS-Dia ensures that the inverts drop a minimum of the drop but may not be more than the downstream pipe diameter. This restricts the max drop so that the water jet will not completely impact the opposite wall of the pit.

OL-OL Drop uses the drop value for the obverts. If the downstream pipe is a smaller, then the drop will be applied to the inverts so that water will not be trapped in the pit. If the downstream pipe is larger then the obverts will be aligned as long as the min drop is maintained on the inverts.

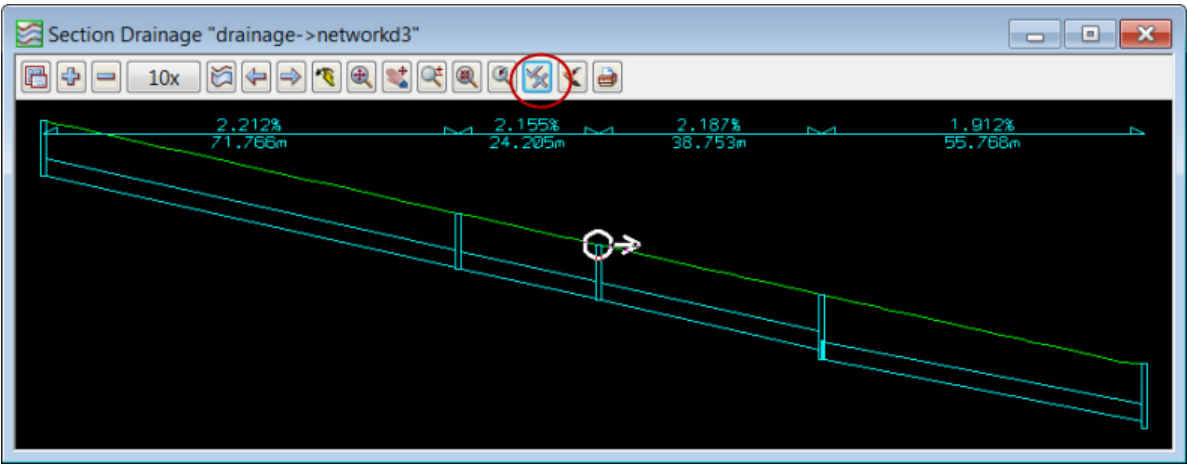

IL-IL Drop uses the drop value for the inverts.

The **Drop file** contains the drops that change with the pipe deflection angle. A sample file is included in the library.

If only one drop value is to be used set the deflection angle to 180 degrees.

After setting the pit and pipe levels, add the model **tin combined** to the **Drainage** section view. The trunk profile will be similar to the following. Select the toggle button, to toggle on the grades (and pipe lengths).

To inquire about the cover on a pipe use the following option.

Tins->Inquire->Depth from string

1. LB to select the tin
2. LB to select the string.
3. Move the pointer in plan or section to monitor the data.

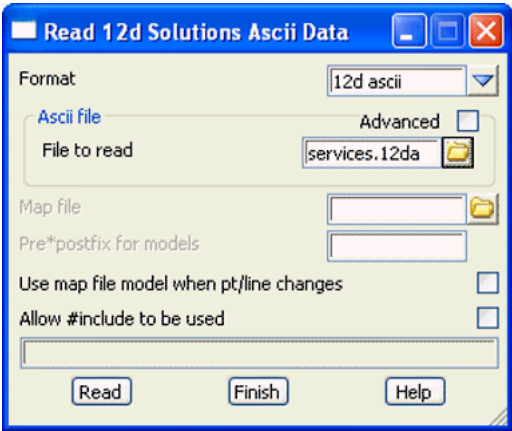

The DNE calculates cover from the top of the pipe NOT the obvert so cover may appear incorrect. Also for box culverts, cover is measured at the edges as well as the centre of the pipe. Finally for multiple pipes, each pipe is checked for cover.

17.Service and Utility Clashes

We will import some services from a 12da file. From the main menu select,

File I/O->Data Input->12da/4da data

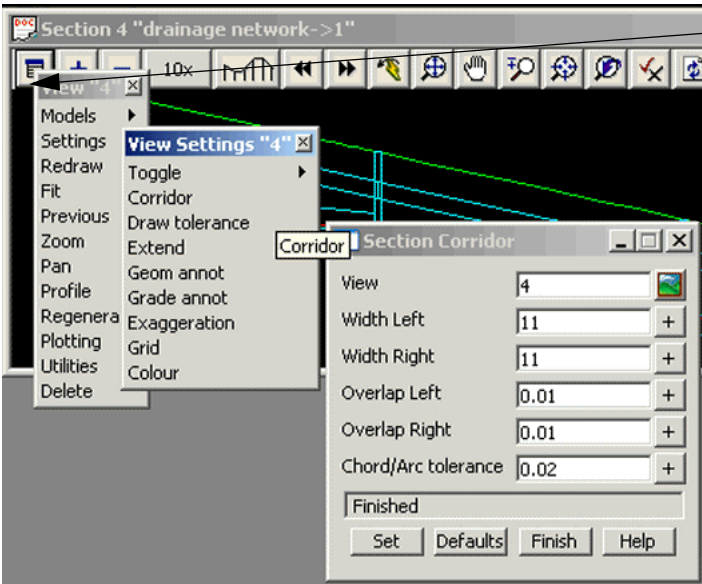

- 1. LB the **F**older icon
- 2. Select the service file
- 3. LB the **R**ead button.
- 4. LB the **F**inish button.
- 5. Add the model **s**ervices onto the plan and section views.

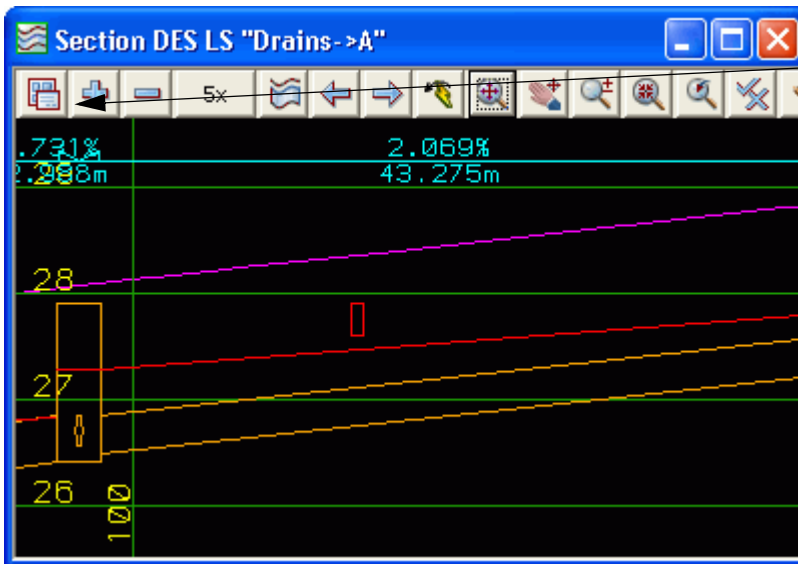

12d service clash routines notify the user of crossing services but not parallel services that are close to each other. The clearance values are vertical distances at the centre line of the drainage and service strings. The minimum clearance may be less than the vertical clearance if the drainage or services are on very steep slopes.

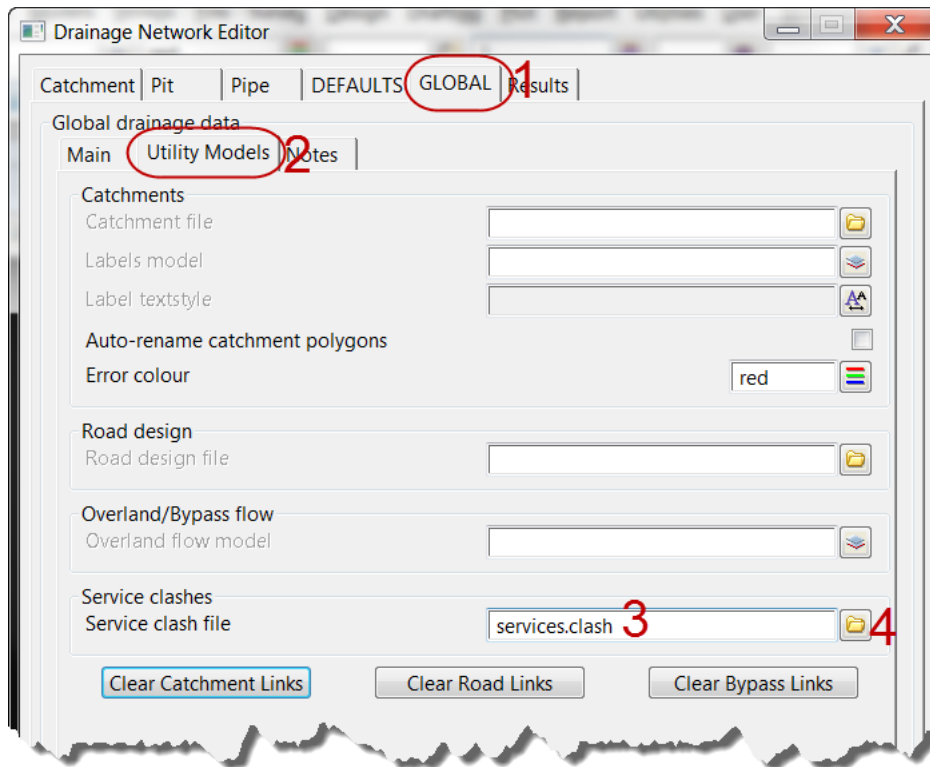

To view parallel services, add the services model onto a section view, profile a drainage string and then set the corridor value for the section view.

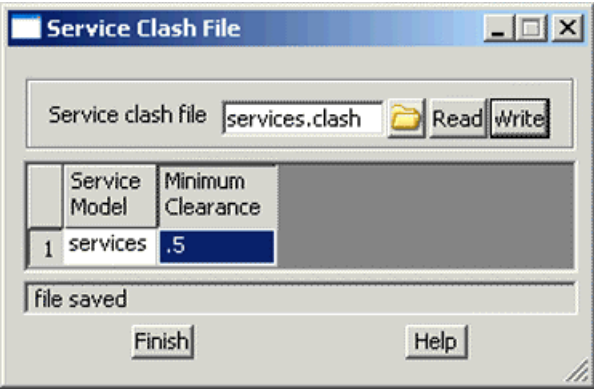

Settings->**C**orridor and then set the **W**idth **l**eft and **W**idth **R**ight to the desired clearance. If the service can be seen then it is within the tolerance. 11 is used in this example only so that you can see the service on the other side of the road.
Use the **N**ext and **P**rev button to switch drainage strings.

To obtain a report of all strings inside or crossing the drainage string profiled, select the **View menu** button then **Utilities->Report**

1. Select the **Global** tab
2. Select **Utilities Model** tab
3. Type **services** to create a new services file.
4. Select **Open** from the icon list.

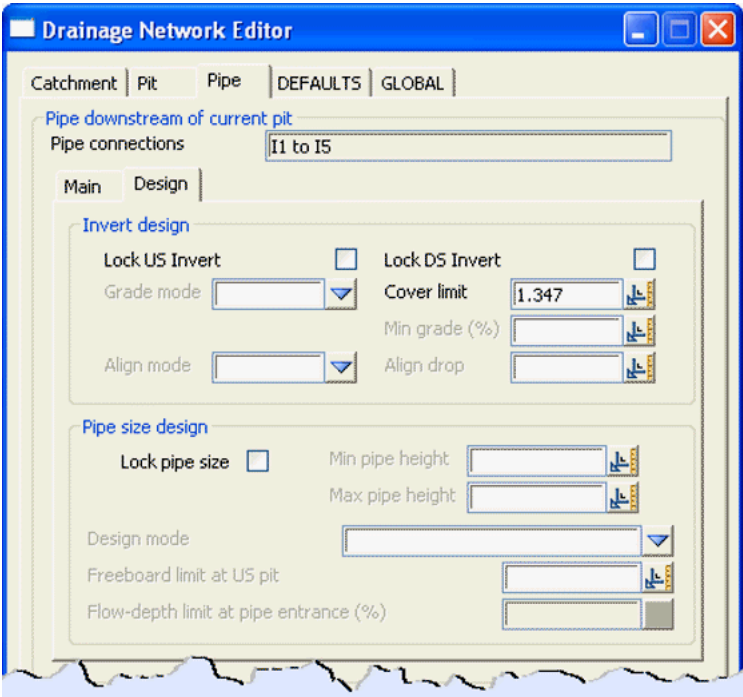

In the **Service model** column **RB** to select the model. Enter **Minimum Clearance** for the services in this model. Include an extra amount for the thickness of the drainage pipe. If the service model contains other drainage/sewer strings you must add the thickness of these pipes as well.

If different clearances are required for different services then place the services in different models. Warnings will be issued when you **Regrade Pipes**, **Set Pit details**, **Import** or **Storm Analysis**. Cover levels or fixed inverts can be used to avoid the services.

To quickly move to the section view of the string, Double click on the message in the output window (note the red! mark). The **DNE** will move to the pipe and with auto profile button enables the section view will update to this string.

The most common method to avoid the clash is to increase the **Pipe cover limit** for this pipe segment so that the pipe is pushed down.

If the clash problem is above the pipe then the **Max pipe height** may be used and multiple pipes are selected.

This method is preferred over locking the inverts as this leaves more flexibility for aligning the inverts.

Often changing the **Grade mode** to **Min grade** on a branch line will raise the downstream invert. This may allow the entire trunk line to rise and thus reduce excavation costs. This is especially true if the service clash is near the upstream end of the pipe.

Once the invert levels have been reset by selecting **Regrade pipes**, the output window will indicate the final clearance.

After a pipe design run in **Storm Analysis**, details of the service clash data will again be listed in the output window.

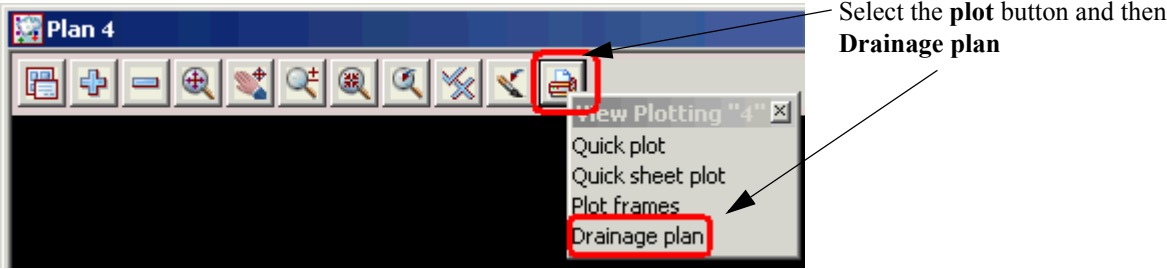

18.Drainage Plan Plots

The drainage plan plots create detailed drawings with symbols for the pits, linestyles for the pipes and string names ready to export to the desired layers in CAD. Pipes levels are 3d and setout points ready for downloading to survey total stations are prepared.

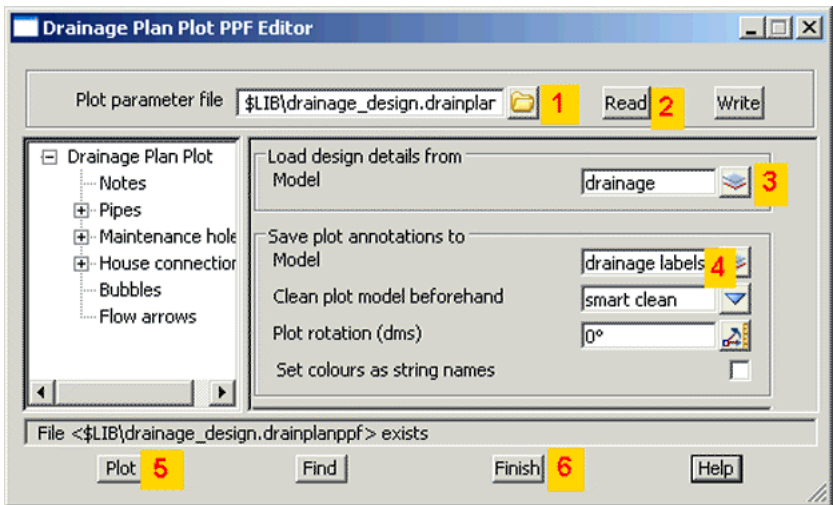

18.1 Labelling the Pits and Pipes

Plan plots are used to label the pits and the pipes. Drainage Plan Annotations may be accessed from one of three locations. The third is the most common.

Location 1: From the plan toolbar

Note (The following panel has been reduced in size).

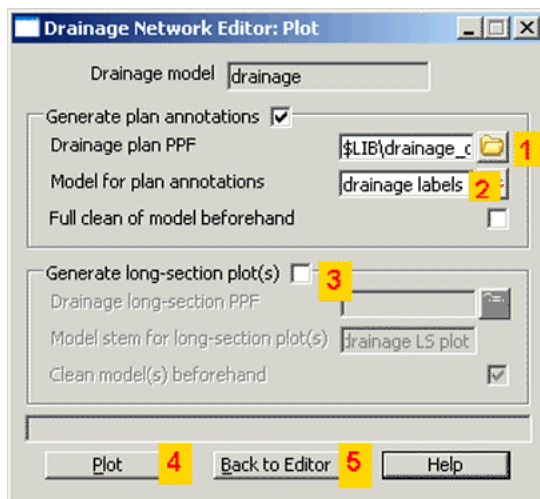

1. Select a ppf file from the library
2. LB **Read**
3. Select your drainage model
4. Type a model name for the new labels.
5. Select **Plot**
6. Select **Finish**

Now add the drainage labels model onto the plan view.

Location 2: The **Plot Button** on the **Drainage Network Editor**

The following panel will be displayed. This option can plot both the long section and plan at the same time. Select a ppf file from the library (drainage_design).

1. Enter a model for the plan annotations.
2. Select **Full clean model beforehand** if you have not manually moved any of your man-hole labels.
3. Turn off the long section plot for now.
4. Select **Plot**.
5. Select **Back to Editor**
6. Now add the **Model for plan annotations** onto the plan view.
7. Note: if you rename the manholes you will need to replot these labels!

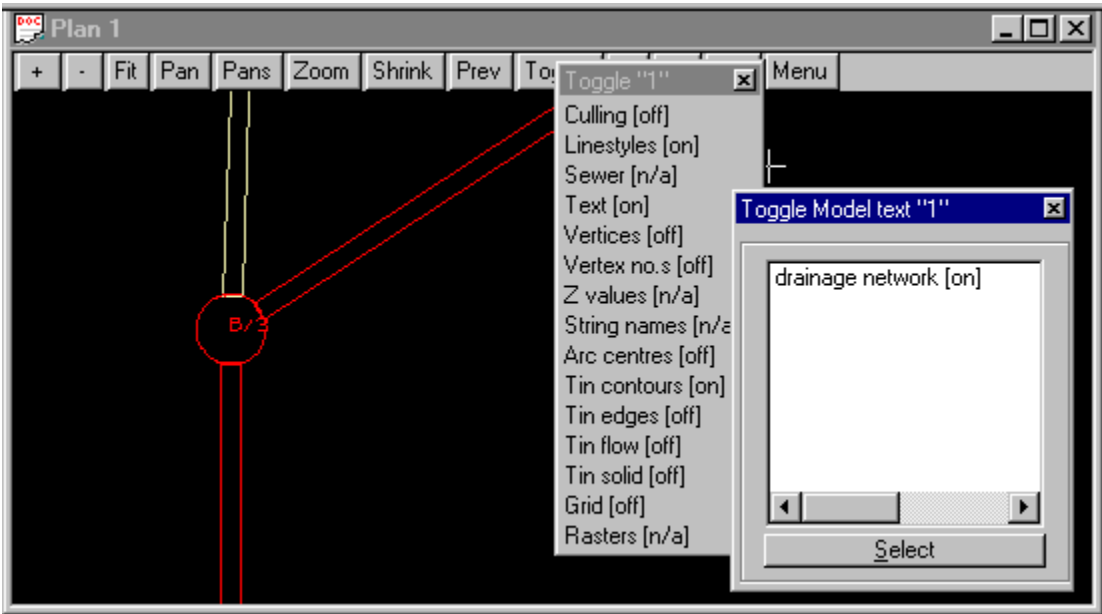

Note that **Full clean of model beforehand** was not selected. The drainage plan plot does a smart clean where it deletes and reprints text that has not been manually moved and updates text that has been moved.

The text properties can all be customised using the plot parameter file but this will be discussed later in the plotting section. These labels are **not** automatically updated when you change the names or pipe diameters. You must rerun the plot routine to update the labels.

18.1.1 Turn off View Text Pit Labels

To turn off the automatic view text pit labels for this view select Toggle=>Text and then walk right to select the drainage model. Do not click on **Text**, rather walk right. If you click **Text** you will toggle on/off all of your text on the view, not just the drainage model.

18.1.2 Moving Text

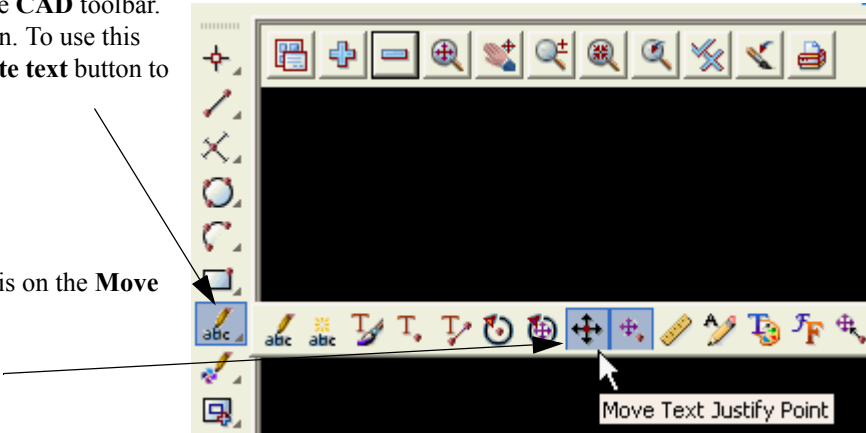

The labels created may be manually moved using the **CAD toolbar** but if the model is relabelled the text will return to its original location! Text moved via the **Drafting->Multi string translate** will remain in the moved position when **Smart Clean** is selected in the Plan Annotation panel.

Before selecting text turn on your **teXt snap**.

To move a single line a text use the **CAD toolbar**. Select the **Move text justify** button. To use this toolbar you must **DRAG** the **Create text** button to the right

and then release when the pointer is on the **Move Text Justify Point**.

To move a pre-defined **Group** of text select

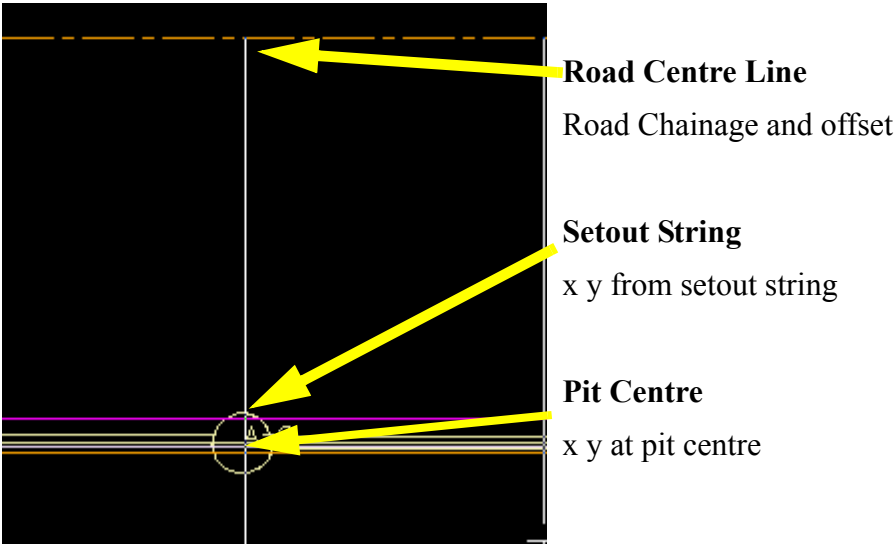

Drafting->Multi string translate

Select **Group** and then pick and accept one of the text items in the group. Move it to its new location and accept.

19.Construction Setout

Pits are setout on the construction site using a variety of techniques. The DNE creates a construction setout point (x,y,z) that can either be located at the pit centre or the pit centre can be dropped perpendicularly onto a design string for the xy location. The z value for the setout point has a number of modes as described below. Road centre line chainage may also be calculated

In the diagram below the setout point is lip of kerb. The setout x,y location level z will be obtained from the setout string and the pipe will be shown at its proper position so that the pipe cover is calculated correctly.

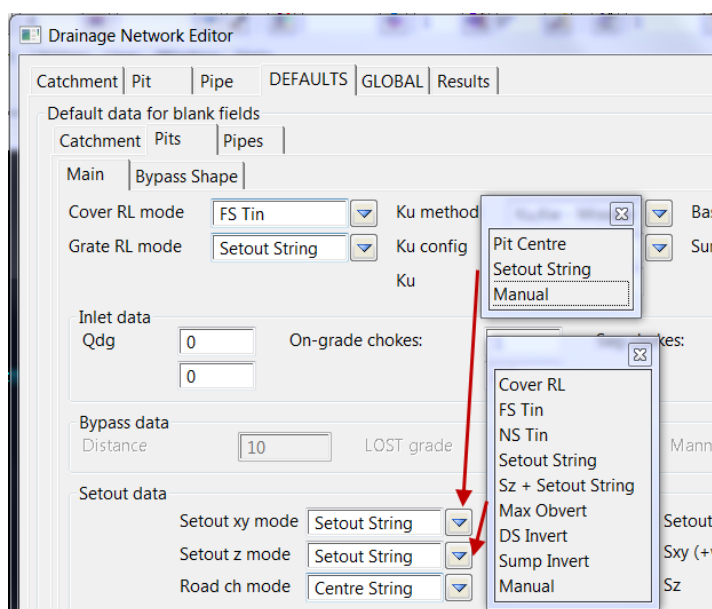

Pipes are setout using the pit connection points and the invert levels.

Design->Drainage-Sewer->Convert to Pts and Lines will create 12d super strings with the pipe attributes on them.

Setout reports can be created and the drainage plan plot generates strings for the surveyor to download to the instruments.

19.1 Pit Setout (xy)

Setout xy mode - Pit centre is the centre point of the manhole (the intersection of the joining pipes). Often the setout point for a manhole or catch basin is not the centre of the manhole but rather a point on the kerb or back on the foot path. The **setout string** option will drop the centre point of the manhole onto the closest string in the **Road design** model list specified on the **Global->Utility models** tab.

Setout z mode options are listed in the panel. This levels are used in the pit schedules.

There are currently 9 modes for determining the pit setout levels.

Cover RL - this ensures the level is the same as the Cover RL (not available for Cover level).

FS tin -The level is obtained from the finished surface tin at the pit centre.

NS tin -The level is obtained from the existing surface tin at the pit centre.

Setout String - The pit centre is dropped perpendicular onto the setout string and the level is obtained from the elevation on the string.

Sz + Setout String an offset is added to the level from Setout string described above.

Max Obvert- all connecting pipes, usually open channels, are checked for the highest obvert.

DS Invert - the invert of the outlet pipe (there is only one).

Sump Invert - the lowest pipe invert plus the **Sump offset**.

Manual - The user must manually type in the cover levels (rarely used as a default).

[Explicit settings](#) for the setout strings and the auto calculated values are found on the **Pit-Setout** tab. If the **manual** mode is selected the Easting and Northing locations may be picked in plan view or typed into the input boxes.

19.2 Pit Setout (z) Level

The setout level defines the level to be printed in the pit setout tables and in the drainage longsection plots. The **FS Tin** selection obtains the level from the FS tin, specified on the **Global-Main** tab, at the centre point of the pit. The **Setout String** location obtains the z level from the setout string as described in the section above. [Explicit settings](#) and the auto calculated value are found on the **Pit-Setout** tab.

19.3 Road Centre Line Chainage

If **Road chainage mode** is set to **Centre string**, then the **Centre String ID** in the **Road design file** (shown above) is used to select the road string to measure the chainage and offset from. The values and [explicit settings](#) for the road chainage and offset are found on the **Pit->Setout** ta

19.4 Pipe Setout

Pipe setout is along the centre line of pipes.

19.5 Plan Plots for Surveyors

Use the drainage plan plot routine to create survey setout point for each pit and strings for each pipe with the invert levels. If **drainage_setout** is not in your library, start with **drainage_inverts**.

The first screenshot shows the 'Drainage Plan Plot PPF Editor' window. Step 1: The 'Plot parameter file' is set to '\$LIB\drainage_setout.drainplanppf'. Step 2: The 'Read' button is highlighted. Step 3: The 'Drainage Plan Plot' branch is selected in the left tree. Step 4: The 'Load design details from Model' dropdown is set to 'drainage'. Step 5: The 'Set colours as string names' checkbox is checked. The second screenshot shows the 'Pipes' branch selected in the left tree (Step 6). The 'Trim mode' dropdown is set to 'trim linestyles' (Step 7). The third screenshot shows the 'MH setout points' branch selected in the left tree (Step 8). The 'Draw setout points' checkbox is checked (Step 9). The 'Plot' button is highlighted (Step 10). The final step (Step 11) is to add the 'drainage_setout' model onto a plan view.

1. Select **drainage_setout** ppf from the library
2. LB Read
3. LB **Drainage Plan Plot** branch
4. Select the existing **drainage** model
5. ensure NOT selected
6. Select **Pipes** branch and note **Trim mode**
7. Select **Maintenance holes->MH setout points** branch
8. Note:**Draw setout points** is selected.
9. String names are sent to the survey instruments so select this.
10. Select Plot
11. Add **drainage_setout** model onto a plan view

19.6 Construction Manhole/Pit Schedules

Manhole/pit schedules or construction tables are generated in tab or space delimited formats.

This routine does not recalculate the setout locations. Similar to plotting, it prints the results of the last time the calculation were done (DNE->Set Pit Details).

Position of option on menu: **Design ==> Drainage ==> Reports ==> Pit schedule**

This routine prints the calculations from the last time Set Pit Details was selected in the Drainage Network Editor.

On selecting the **Pit schedule** option, the **Manhole/Pit Schedule** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Drainage model name model containing the drainage strings	input box	drainage network	
Pit schedule file name file to be created	input box	pit report	
Report Format file format	choice box	Road chainge.,Easting...	
Data delimiter tab delimiters are best for spreadsheets and space for some text editors	choice box	Tab, Space	
Repeat header for each linetick box when selected, the column headings will be printed each drainage line	checkbox	selected	
Process Create the pit report	button		
Finish remove the panel from the screen	button		

Notes:

The columns of data may be separated by spaces or a tab. (tab is used for spreadsheet transfers). The internal width and length data are retrieved from the **drainage.4d** file for the pit type specified. If you want a longer description for the pit then the type used inside 12d this can also be entered in the drainage.4d file. The remarks for each pit are entered as user defined pit attribute named **remarks** and may be set using the attribute editor (on the drainage menu) or via a spreadsheet.

Easting Northing Sample

```

A/3	5293.458	7320.886	170.000	d0028.600	
A/4	5250.131	7320.886	126.673	d0028.600	
A/5	5217.194	7322.036	93.736	d0027.450	
A/6	5183.458	7322.036	60.000	d0027.450	
A/7	5152.699	7322.036	29.241	d0027.450	

Notes

The Set pit details must be run at least once to before printing the report. If the pits are moved or the designed strings changed then this option must re rerun.

The easting northing data obtained for the **road design string** option is obtained by dropping the pit centre perpendicular onto the selected road design string. This data is stored as pit attributes **setout x** and **setout y**. It is calculated when the **Set Pit Details** is selected in the Drainage Network editor.

20.DNE and Rational Hydrology

The rational methods uses the formula $Q = CIA/360$ where

A =	catchment area (hectares)
C =	runoff coefficient
I =	rainfall intensity (mm/hr)
360	conversion factor to m^3/s for area (ha) and rainfall (mm/hr)

The rainfall intensity requires the input/calculation of the time of concentration (t_c) for the catchment and then a return period to be used in the IFD table (see [12d Rational Method Hydrology - Drainage Rainfall Editor](#)).

The total area entered/measured may be split into impervious and pervious and analysed separately.

If you use a single composite C value for your catchments, enter a %impervious of zero and ignore the impervious settings.

Many authorities increase the C values for major storms. If you do not then enter the same C for minor and major. Similarly T_c values are sometimes reduced for major storms so you have the option to enter a minor and major C value. An example is provided below.

Total Area = 0.1	%imp=80	Cminor	Cmajor	Tc minor	Tc major
Impervious	Area*%imp	0.9	0.92	5 min	5 min
Pervious	Area-Imp area	0.3	0.31	10 min	10 min

20.1 Network Editor - Global, Default Settings and Explicit Settings

This section will discuss the **Global, Defaults** and [explicit setting](#) for the hydrology parameters. Design values for the hydrology and hydraulics calculations are set

s either globally (one value for the entire network)

s or via defaults.

Defaults values may be overridden by explicit settings found on the top level **catchment, pits** or **pipes** tabs. Explicit over ride catchment settings need only be specified if the default value is not desired. Only fill them in if you want to use a value different than the default. The tool tip will indicate the default values.

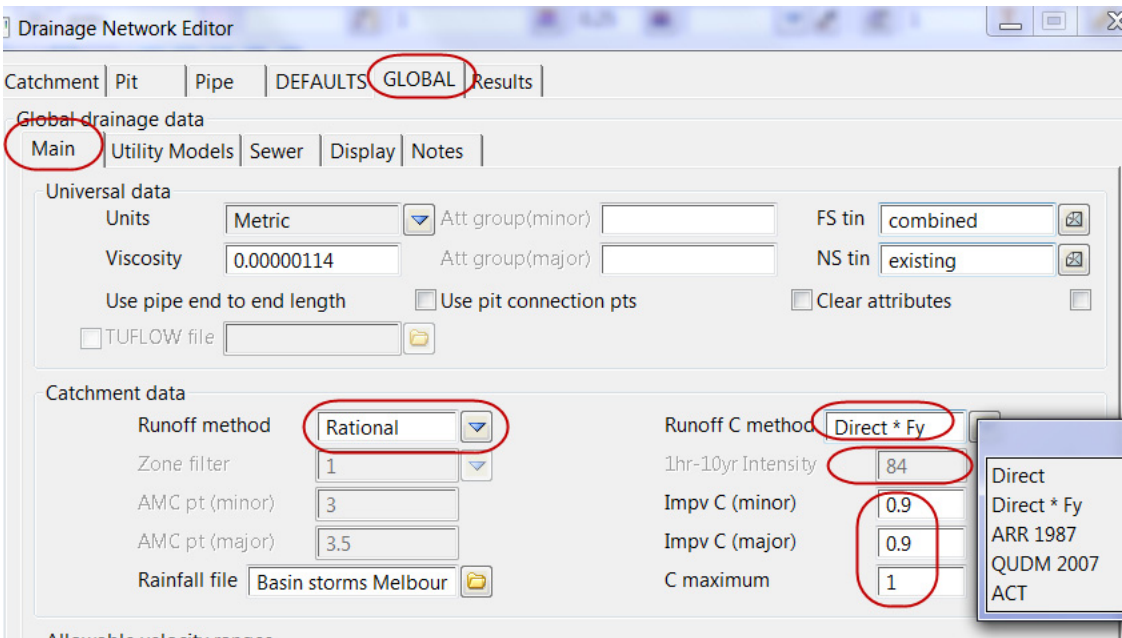

Default values must be entered for all of the fields for Set 1. Set 2 and Set 3 blank default values will use the defaults you have used in Set 1.

20.1.1 Catchment Areas and Percent Impervious

There is no default catchment area to apply to all catchments. You may type in the catchment area or create a string where 12d will measure the plan area ([Drawing Catchment Strings in 12d](#)).

The percent impervious will split the catchment area into the pervious and impervious sub catchments. Separate C and t_c values are used for the pervious and impervious areas. The default percent impervious for the various sets are entered on the **Defaults->Catchment Defaults** tab and the [explicit settings](#) are on the **Catchment** tab. The percent impervious is used also used to determine the composite C value if using the **ARR 1987** method for calculating runoff coefficients.

20.1.2 Coefficients of Runoff
Global Settings

Runoff C methods include **Direct**, **Direct * Fy**, **ARR 1987**, **QUDM 2007** and **ACT**.

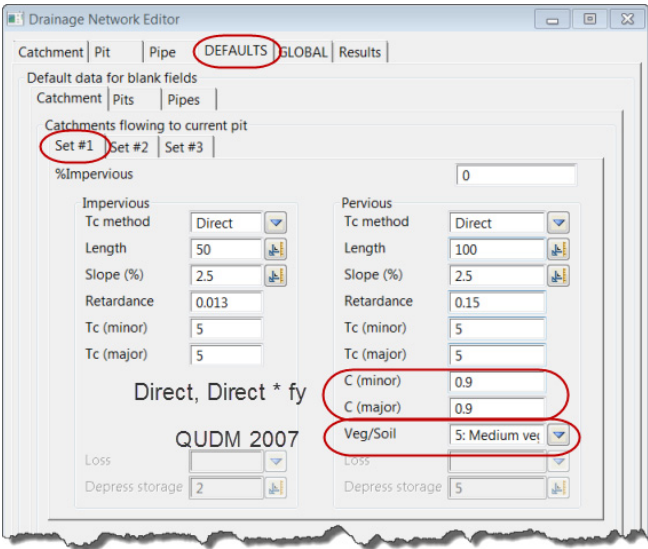

Direct: There is a global impervious C value for minor and major storms. This can only be set once. The C values for the pervious areas may be changed for every catchment in your model.

Direct * Fy: For urban areas in Australia the flood frequency factors (fy) are constant for urban hydrology. You are required to enter the f10 values, the same value for minor and major. For rural areas the direct method is required.

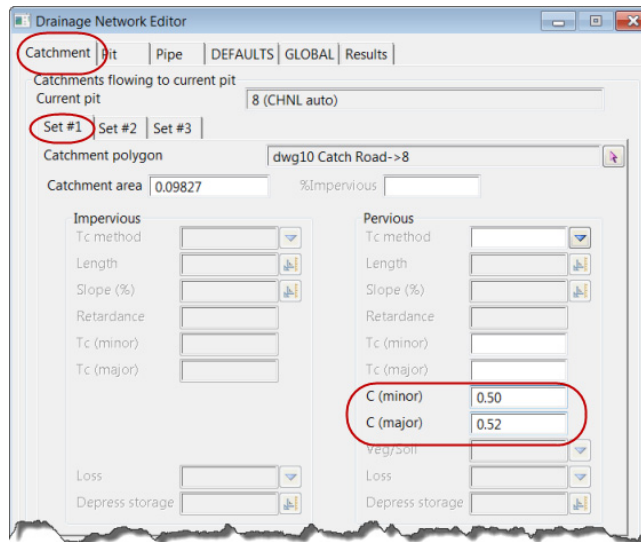

ARR 1987: The composite C value is calculated using the **1hr-10yr intensity**, the percent impervious, ARR frequency factors and the return period specified when hydrology runs are made. **You must enter the 1hr-10yr intensity value. No C values are entered if this method is used!**

QUDM 2007: Similar to the ARR 1987 method (except when the %impervious for the catchment = 0.0). The **Veg/Soil** type must be entered for the catchment via the default catchment tab.

Default Settings

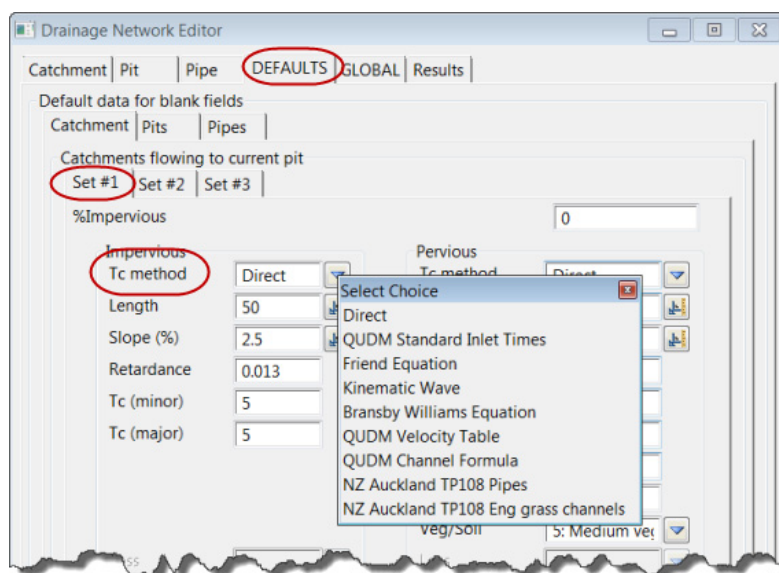

Explicit Settings

20.1.3 Times of Concentration

There are several methods for entering times of concentration for the catchment areas (see list below). Since each catchment may use a different tc method, all of the tc parameter fields on the defaults tab are active and required. They must be filled in even if you do not plan on using that value.

1. **Direct method** requires minor and major tc values.
2. **Friend, Kinematic Wave, Bransby Williams and QDUM** methods require the retardance, length and slope of the catchments to be entered. Default values must be entered but the optional [explicit settings](#) for slope and length can be entered on the catchment tabs or a catchment characteristic strings may be drawn (see [Catchment Tc path strings](#)). The length of this string is used for the length parameter and the design tin is used with the string to calculate the slope using the equal area method.
3. Data for the remaining methods is entered in a similar fashion.

20.2 Catchment Areas

Key Points

1. You do not have to draw catchment strings. You can enter the catchment areas manually (ha or acres).

2. When drawing catchment polygons, start near the inlet for auto linking.
3. 3 catchment sets are available and all catchment polygons must be in these models.
4. Specify catchment models via Network Editor->Global->Utility Models **Catchment file**.
5. Network Editor **Set Catchment** button links the polygons and calculates the areas
6. Once a string has been linked to an inlet, it will remain linked until it is deleted or the link has been cleared (**Clear Catchment Links** on the Globals->Utility Models tab).
7. Manual linking available via DNE->Catchments->Set x->Pick button (RB for a manual clear).
8. Manholes (set via cap_config in drainage.4d or **Inlet config** on the **Pit->Main** tab cannot have linked catchments.
9. Use the CAD polygon tool for drawing catchments OR close the string for sag pits
10. You can disable the auto selection of a string via Right mouse on the pick button then select **Clear**.

The catchment strings may be drawn in a CAD package and then imported into 12d or drawn inside 12d. The strings may be easily drawn in 12d with the tin contours and/or flow arrows displayed in the plan view.

When a catchment string is created to define the area for an inlet then all other data entry types will be ignored and the area from the string will be used.

There are 3 sets of catchments and it is up to the user to decide how they are to be used. Each set has its own percent impervious. The most common is to use the sets as land use types (roads, lots and park land for example). Another frequently used option is to use set 1 for all the impervious areas and set 2 the pervious and set 3 for special areas. The 3 catchment sets are drawn in three different models.

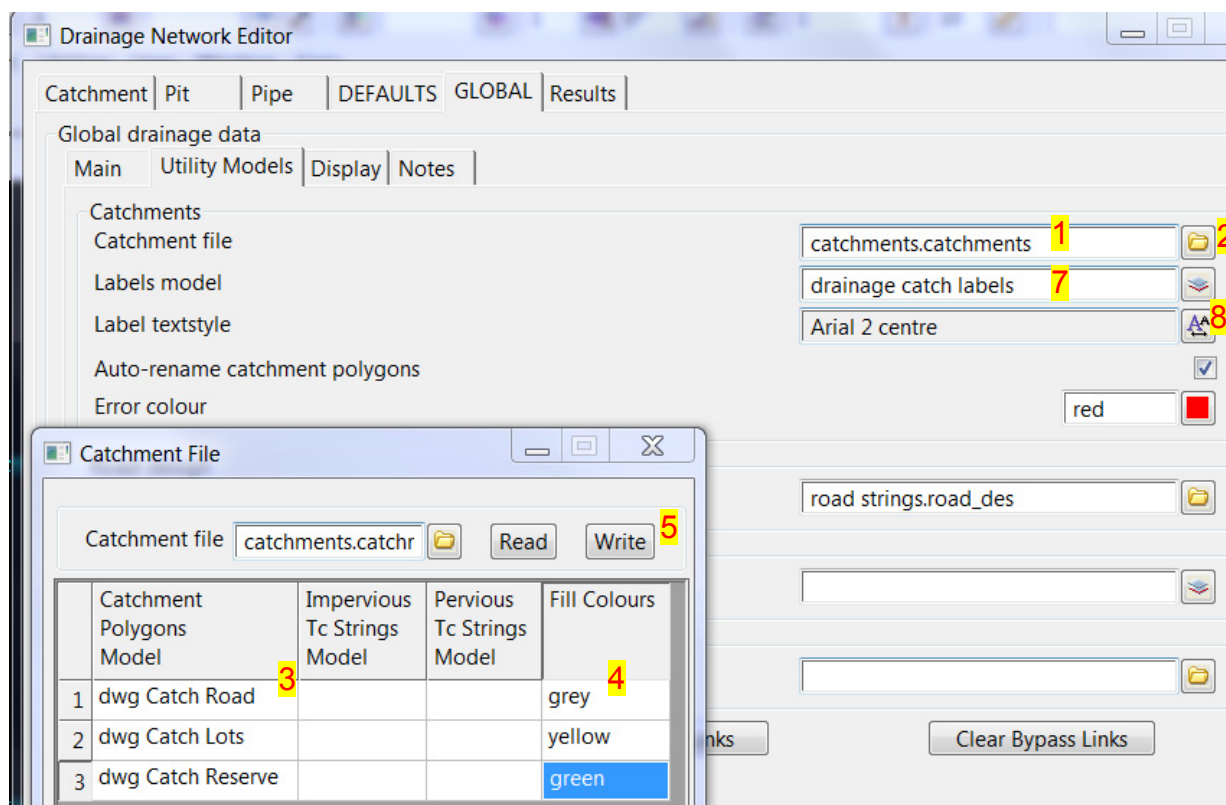

If exporting to external drainage design programs, the package may not accept all three sets so check the interface notes before defining the catchments.

Set Catchments - Auto Linking

In each set/model, 12d will automatically link the catchment string to the inlet that is closest to vertex 1 on your catchment string. This is the preferred method. If this is not possible, then an inlet may be manually linked to a catchment string using the [Catchment manual link](#). More on catchment links may be found in [Catchment string links](#).

Also see [Checking the Automatic Catchment Linking](#)

Start the **Drainage network editor** and move to the **Global** Tab and then the **Utility Models** sub tab.

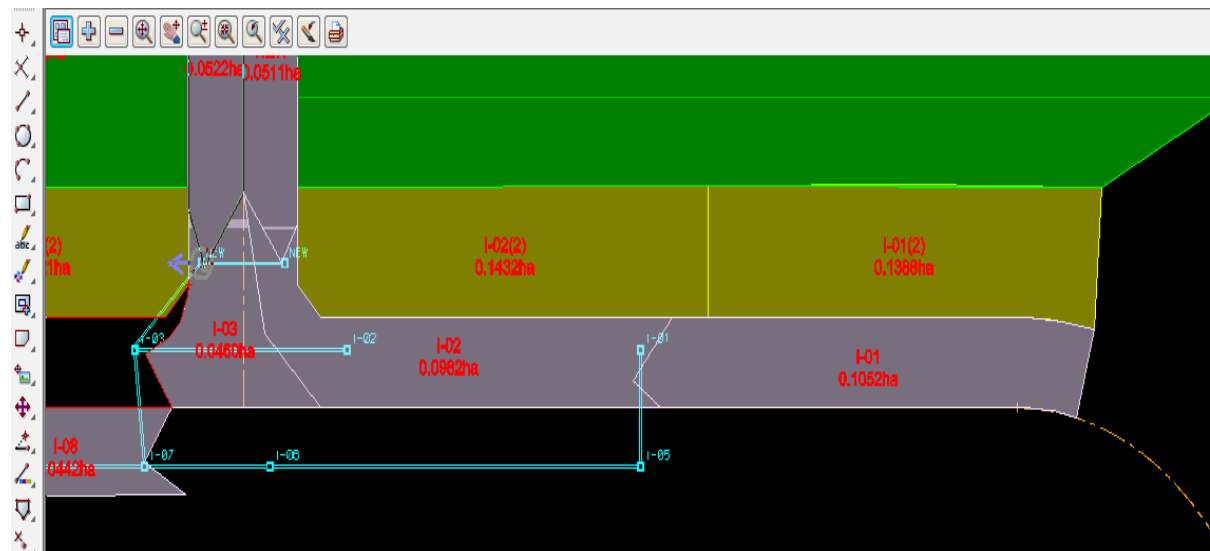

1. Type a filename for the catchment file
2. LB **More info** button and then select **Open**
3. RB to select the catchment model for set 1 (used in the **CAD control bar** above). Every inlet can have up to 3 catchments, row 1 is catchment set 1, row 2 for catchment set 2 and row 3 for catchment set 3. Often the sets are used as catchment types. for example
Set 1 - Roads, Set 2 Lots and Set 3 Parks
4. .Optional - RB to select a fill colour for the catchments
5. LB **Write** to save the file
6. LB **Finish**
7. Type a new model name for the catchment labels (optional)
8. LB **More info** button to select textstyle (required if **Labels model** is used)

The **Auto-rename catchment polygons** will set the name of the catchment string to the pit name that it is linked to. If it is not linked to any inlet it will be named "**not used**". The model can be checked for **not used** strings by selecting **Models->String Info Table**. The catchment will also be filled with the **Error colour** if a catchment string is not linked.

Label Catchments

Finally select **Set catchments**. This will link the catchments to the inlets and label the catchments. Now add the model **labels** onto the plan view.

Adding the edges to the fills

To view the edges go to the View Menu button and select **Settings->Faces**

1. LB Draw Edges
2. LB Set
3. LB Finish

There are some cases where linking the closest inlet to vertex 1 is not feasible. In these cases you may manually link the inlet to a catchment.

20.3 Drawing Catchment Strings in 12d

There are 2 catchments on the south east side of the road that have not be drawn. Use the CAD polygon tool to draw the catchments

Before creating the catchment string set the **CAD control bar** data.

Type the name of a model for the catchment strings

Now to create the catchment string use the **Create line string** button on the CAD toolbar.

DRAG the **Create line** button and release at the **Create Line String** button.

The first point should always be placed near the inlet. 12d will assume that the catchment will drain to the inlet closest to this first point.

Draw the catchment strings with the accuracy you feel appropriate. Catchment strings for sag pit or drawn along a crest lines so take extra care near the crest low points where the water may overflow and bypass. Continue selecting and accepting the points on the catchment string and the press **ESC** to finish creating this string. You are now ready to create the next catchment string.

Sag inlet catchments: DO NOT START AT THE INLET, just start nearer to this inlet than any other! If you start at the inlet then move out to the crest of the catchment, the catchment overflow level cannot be determined from the catchment string.

CAD tips

Use the CAD toolbar eye dropper to load the properties from an existing catchment polygon.

Try CAD trace instead of CAD polygon to trace around edges of existing catchment areas. It is at the end of the CAD string fly out. Follow the directions in the 12d message area (bottom left of window).

Trace begins as normal string draw,
select **t** to start the trace, pick the start point on a string then
pick the end point of the trace, (if the trace is going the wrong way select **f** or **b**).

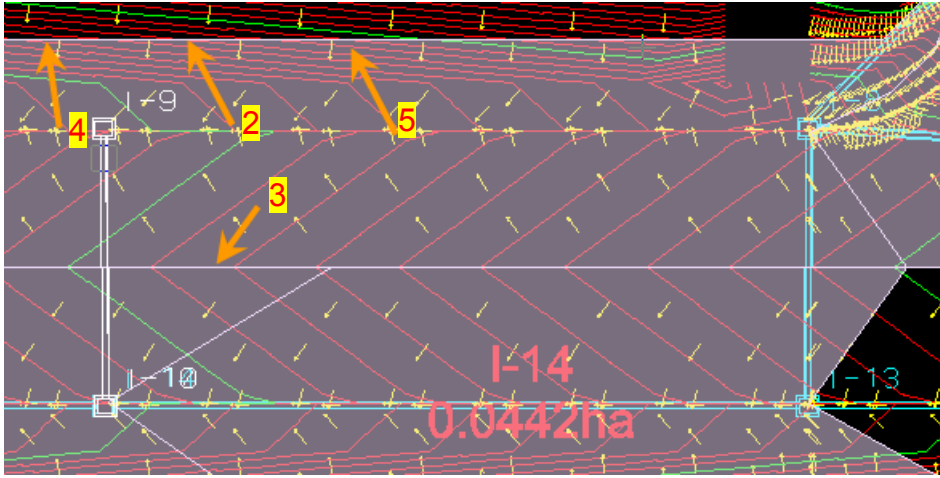

Now you can select another string to trace or
select **p** to return to pick mode.
select **c** to close and finish
and you are off creating another catchment string.

Once the catchments are drawn they become linked to the drainage network in the **Drainage network editor**. We will label the catchment with the inlet name and area at the same time.

20.4 Splitting Catchment Strings to Insert an Inlet

The catchment for the northwest sag pit needs to be split into 2 catchments for the inlet labelled I-9.

We will use mostly CAD tools except for Strings->Strings edit->Split. The trick is to roll the mouse roller ball once whenever you need to redraw the screen.

1. Cad String->Close to close the string. (roller ball!)
2. Strings->Strings Edit->Split, select string at split point (string area will go solid white - accept) roller ball!
3. repeat for south side
4. CAD vertex->Append select the string away from the split point, roller ball and draw the new catchment boundary. Single ESC to finish this string.
5. CAD vertex->Append select the string away from the split point, roller ball and trace the new catchment boundary. Double ESC to finish this string and end appending

Catchment manual link

The manual links are used when the first point on the catchment string is closest to the wrong inlet. Note that the following restrictions still apply.

1. The string selected for catchment 1 must be in the model for set 1. To check if you have selected a valid string select the **Set Catchments** button.
2. If the catchment string has already been linked to another inlet (automatic or manual) then the new link will be created and the old link erased.
3. If you change the catchment model for one of the sets on the **Network Editor->Global->Utility Models->catchments** than all of the manual links in that set will be erased.

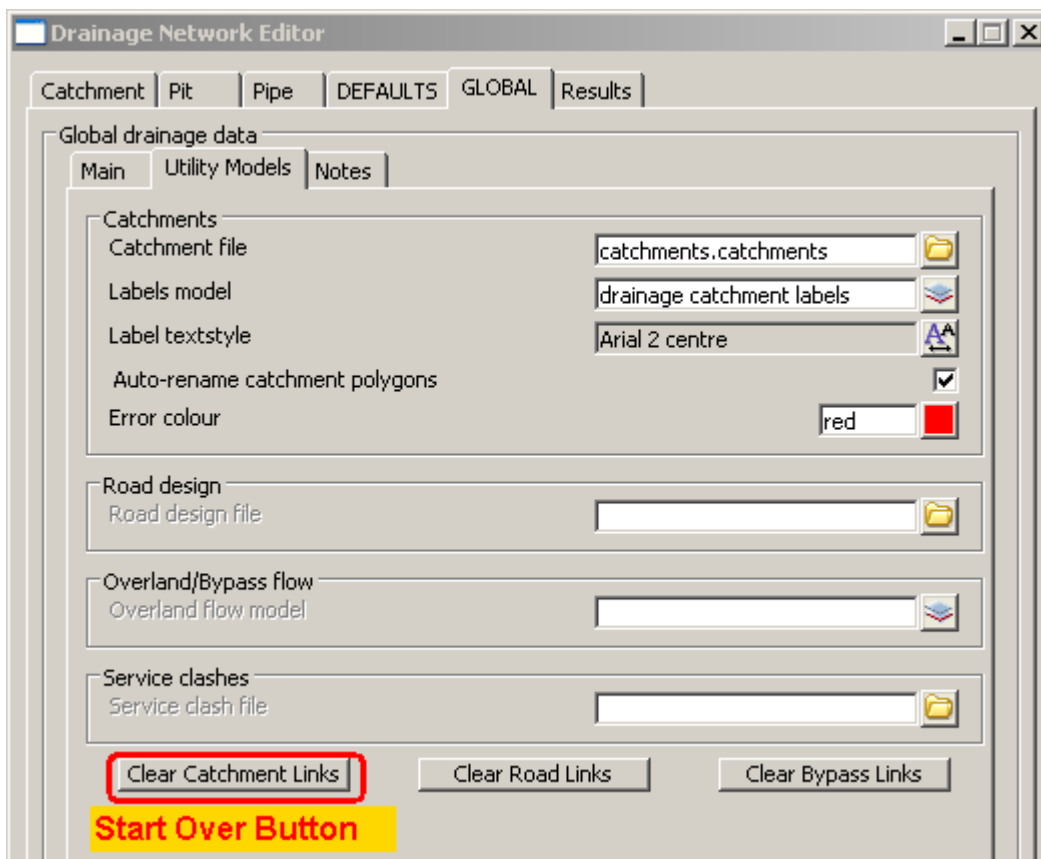

1. Change to the **Catchment** tab. Move to the desired inlet. I-9 in the plan above. The inlet will be circled in the plan view and its name shown in the **Current Pit** field.
2. LB Set 1 then LB the **Catchment polygon** button and pick the desired catchment string.
NOTE! If you decide to enter a value and NOT use the selected string **RB** on the button and select **Clear**.
If the **Auto apply** tick box is not selected then you will have to select the **Apply** button for the manual link to become active.
3. LB **Set Catchments** button. A prompt box appears asking you to confirm. Select **Yes**. To toggle off/on the confirm request **RB Set Catchments**. The measured catchment area will be shown in the **Catchment area** field using the units specified in the **Global-Utility models-Units** field.
4. Repeat these steps for the sag pit to the west.

Verifying the Automatic Catchment Linking

The automatic inlet-catchment linking is easily checked by after selecting the **Set Catchments** button on the network editor by any or all of the following:

1. Specifying a **Catchment labels model** with **Labels textstyle** on the **Global->Utility models** tab and . The catchment is indicated when the inlet is selected using the network editor. Since there may be three catchments per inlet the catchment data last viewed in the editor is the catchment that is highlighted.
2. Selecting the **Auto-rename catchment polygons** on the **Global->Utility Models** tab will set the name of the catchment string to the pit name that it is linked to. If it is not linked to any inlet, it will be named **"not used"**. The model can be checked for **not used** strings by selecting **Models->String Info Table**.
3. The unlinked catchment strings will be filled with the **Error colour** on the **Global->Utility models** tab.

Reseting All Catchment links to Start Over

There may be occasions where you will want to clear all of the catchment links and begin with a fresh start. Select **Clear Catchment Links** on Network Editor->Global->Utility Models.

20.5 Tc Path Strings

These strings are used to calculate the time of concentration for the impervious and pervious areas. For each catchment set, they are drawn in two models; one for the impervious paths and one for pervious paths. The models are specified using the **Catchment file** field on the [network editor](#) (Global->Utility model tab). The 3 rows in the **catchment file** correspond to the 3 catchments available for each inlet. Therefore it is possible to have a maximum of 6 Tc paths models!

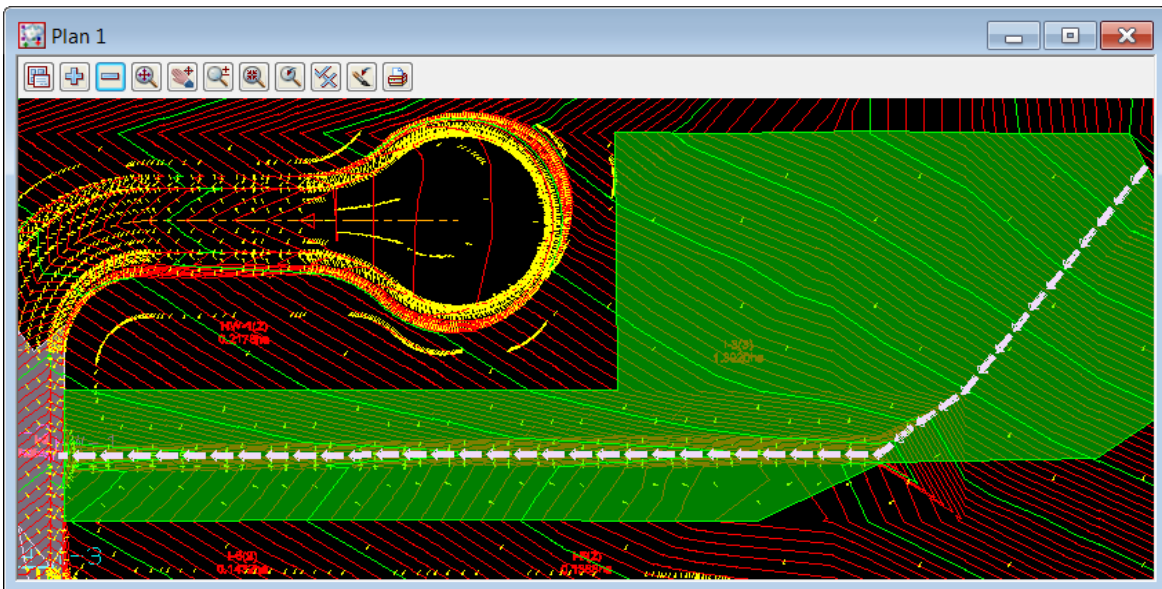

Key Points

1. Each Catchment set may have 2 Tc paths models. Pervious and impervious paths are kept in separate models.
2. End the Tc path string near the inlet that it is to be linked to.
3. Enter the paths models via **Catchment file** field on the (Global->Utility model tab)
4. You must select a Tc method (explicit or implicit) via the **Defaults->Catchments tab** or the **Catchments Tabs**. Just specifying the models is NOT enough!
5. Select **Set Catchments** to perform the calculations of length and slope.

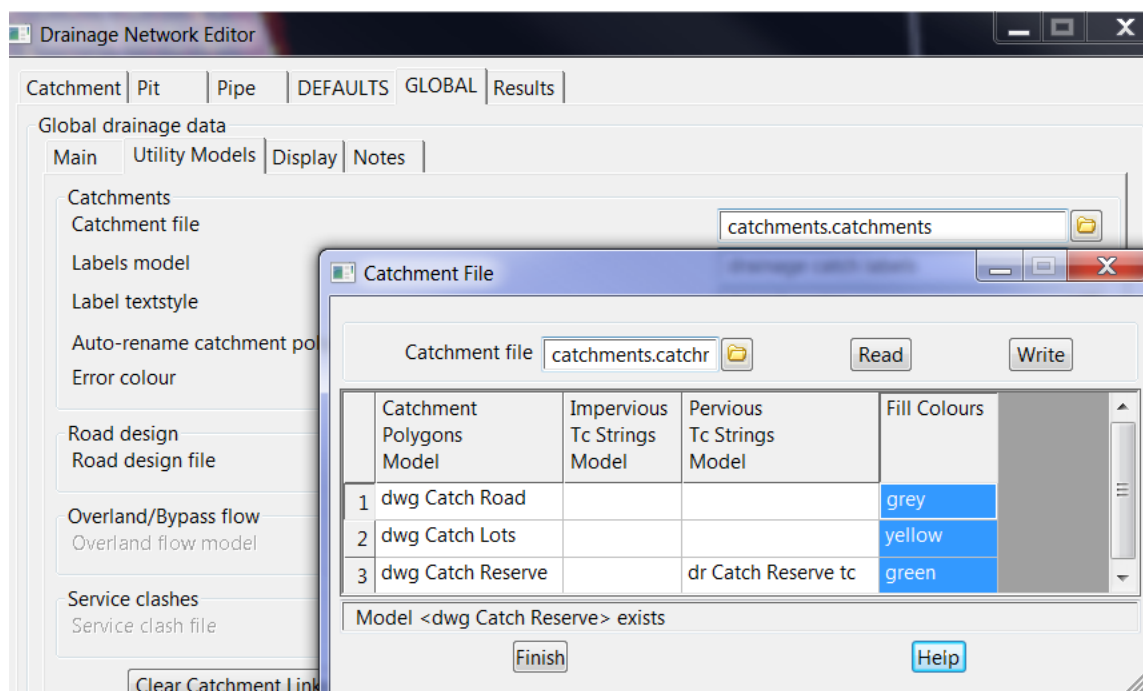

The tc strings can be drawn in the same way as the catchment strings but make sure that you change the model name first! The tc string model is then entered in either the impervious or pervious paths model columns (You could have up to 6 tc string models!).

20.5.1 Catchment slope (equal area)

The length of this string is used for the length parameter and the design tin is used with the string to calculate the slope using the equal area method. These strings are drawn from upstream to downstream, finishing nearest to the inlet they are to be linked to.

1. Change the Cad toolbar model to **dr Catch Reserve tc** and the line type to **FLOW LINE**
2. Use Cad line->Cad line to draw the flow path from the culvert inlet up to the top of the catchment.
3. Use Cad string->Reverse to that the string is in the same direction as the flow.

1. Change the Cad toolbar model to **dr Catch Reserve tc** and the line type to **FLOW LINE**
2. Use Cad line->Cad line to draw the flow path from the culvert inlet up to the top of the catchment.

The equal area slope is calculated when **Set Catchments** is selected. The slope string be profiled, with tin combined added to the view, to see the slope and the equal areas (see below) above and belong the tin.

21. Network Editor - Hydraulics

This section will discuss the hydraulic **Global**, **Defaults** and [explicit settings](#) for the hydraulic parameters. The [explicit settings](#) for the parameters described on the **defaults** tab will also be found on the **Pit** or **Pipe** tabs.

21.1 Grate Levels

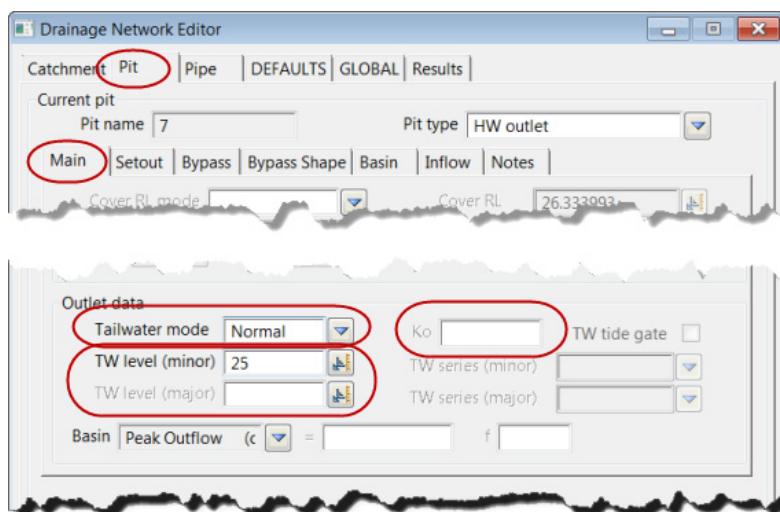

Important! Get the Grate level correct! The freeboard is measured from this level and if you do bypass cales the water will bypass if the hgl reaches this level. If the grate level is at or below the obvert of the pipe then the pit cannot surcharge and the pipe cannot flow full (it is an open channel). The grate level should not exceed the cover level except for pressurised, bolt down manholes and culvert headwalls.

Special Structures

- s **Bolt down manholes** will have the grate level above the cover level. The height above the cover will determine the hydraulic head required to "pop" the cover off and begin surcharging.
- s **Headwalls** cover levels are often the top of the headwall structure and the grate level is set to the highest point of the channel before bypass begins.

21.2 Outlet and Tailwater Conditions

The most downstream pit on each network requires tailwater conditions. Often the invert level on the downstream end of the last pipe also needs to have the invert level locked to either discharge into a waterway or join into an existing drainage system. When the most downstream pit is selected the following fields will become active on the DNE **Pit-Main** tab. If these field are not active and you think you are at the outlet see [Flow in the Wrong Direction](#).

Minimum will use the least of the **Critical** or **Normal** depths. If a fixed level is available for the minor and/or major storms, these value may be entered here.

The **Ko** is the loss coefficient for the exit losses into the downstream system. A value of 1 is typical for discharging into a pond or creek, or a Ku value for the pipe configuration in the pit the network is joining.

21.3 Culvert Hydraulics and Tailwater

To set the tailwater conditions for the culvert we created at the beginning of the course, select the outlet

1. Select **HW outlet**.
2. Select **Max Obvert** so the top of the headwall is at the obvert
3. Select **Manual** so that the grate level can be set above the max twl+ko losses.
4. Type **30.2** as the road overtopping level
5. Type **0.150** for the HW thickness.
6. Set the tailwater mode to normal and enter the expected twl.
7. Type the minor and major tailwater levels. These

In part 2 of the course we add an open channel to calculate a realistic tailwater for the culvert.

21.4 Pit Losses Ku, and Direct Flow

The **Qdg** (direct flow) (cms/cfs) is water flowing into the manhole. It is added to the approach flow and is subject to pit inlet capacity. This field will be disabled on the pit tab if the inlet type is set to a manhole.

The **Pit loss Ku** is used to model the energy losses through the pits and inlet control on culvert inlets. Three Ku methods are available, **Direct** (user entered), **Ku,Kw via charts** (may be negative), or **Ku,Kw >0 via charts** where all negative values are changed to zero. The remaining methods specify various headwall types for culverts. These will use inlet control curves and backwater energy loss coefficients.

Ku config has 4 options: **Preferred, Good, Fair** and **Poor**. The settings have no effect for 100% grate flow, straight through and 90° bends. For pipes with bends they determine the charts to use. The following are guidelines in selecting the Ku config.

Preferred	water impacts the opposite wall where it exits
Good	water impacts the side wall where it exits
Fair	water impacts the side wall and exits on the end
Poor	water impacts the opposite wall of the pit and exits on the side wall.

21.5 Introduction to 12d Ku/Kw Calculations

The following description is a very general overview of the Ku calculations in 12d. For a detailed description please see the 12d forum site <http://forums.12dmodel.com/>.

When 12d uses the Ku and Kw Charts, the values of upstream pipe angle, (Qgrate/Qoutlet), (Upstream diameter/outlet diameter) and (pit depth/outlet diameter) are calculated and used in the Ku/Kw charts. Three cases exist which determine which chart is used.

Case 1 - Pits with 100% Grate Flow

The angle between the ground approach flow and the exit pipe is measured. Charts, compiled from Sangster et al (1958) are used; G1 is used for angles less than 15 degrees (rare) and G2 for angles > 15 degrees. 12d's names G1 and G2 can be referenced to other publications in the table below.

Case 2 - Pits with More than 50% Through Flow

12d has 10 charts (T1-T10) compiled from the Hare (1981) and cross referenced to the QUDM and ACTDS Charts. In general T10 charts have greater losses than T1 charts.

Ku Config	0°	22.5°	45°	67.5°	90°
Preferred	T1	T2	T4	T8	T10
Good	T1	T2	T5	T8	T10
Fair	T1	T3	T6	T9	T10
Poor	T1	T3	T7	T9	T10

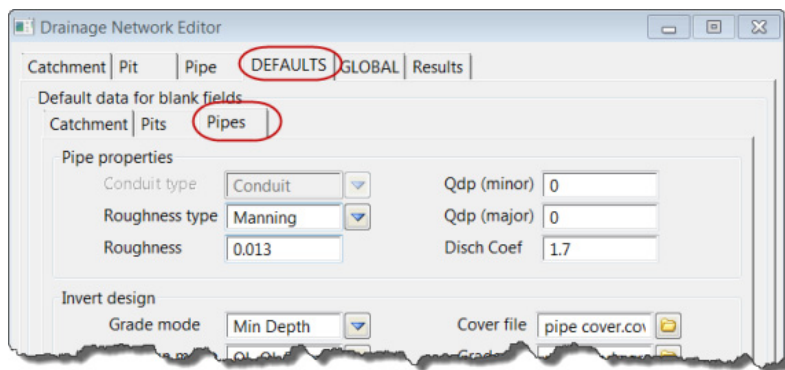

12d Chart Cross References

12d Pit Config	G1	G2	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10
QUDM Ku Chart #	32	32	33	34	35	37	37	38	40	42	44	46
QUDM Kw Chart #	32	32	33	34	36	37	37	39	41	43	45	47
ACTDS Ku Chart #	1	1	2	13	14	10	9	16	18	20	22	7
ACTDS Kw Chart #	1	1	2	13	15	10	9	17	19	21	23	8
ACTDS Pit Type #	1	2	3	11	12	8	7	13	14	15	16	6

Case 3 - Pits with between 0 and 50% Through Flow

With the flow condition between grate flow and through flow, a K value interpolation is performed based on the percentage through flow.

21.6 Pipe Friction Method, Roughness Values and Direct pipe flow

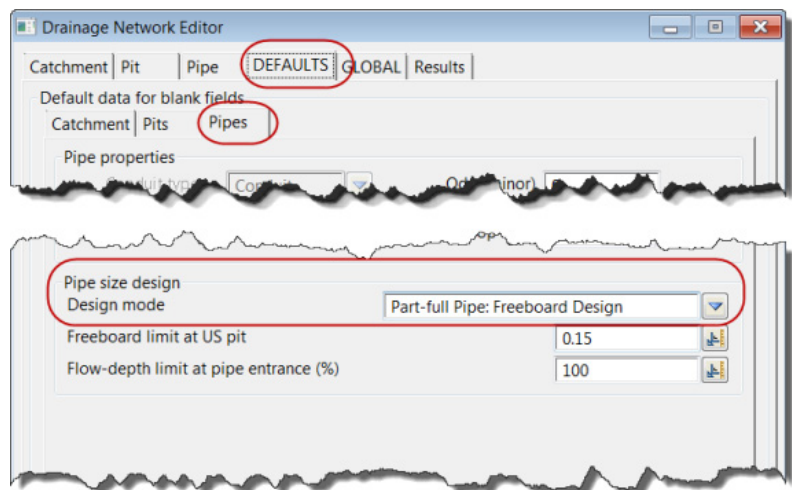

The **default** roughness and pipe roughness method are set here (**Colebrook (mm)** or **Manning**).

Qdp (direct pipe flow is flow) at the upstream end of the pipe that is included in the pipe flow calculations but is not included in the upstream pit losses nor restricted by the pits inlet capacity.

The ranges for pipe peak velocities are used for checking purposes only. If the velocities are outside this range, warning messages will be given in the output window.

21.7 Design mode, Freeboard Limit and Flow-depth limit

The **Design mode** has 4 options.

Pressurised Pipe: Freeboard Design does not use partial depths in the pipes and pipe sizes selected by checking the pit freeboard.

Part-full Pipe: Freeboard Design is similar to option 1 except gradual varied flow and hydraulic jumps are calculated in the pipes. Critical depth is the minimum depth at the upstream end of the pipe.

Part-full Pipe: Flow-depth Design is the similar to option 2 except the pipe sizes are selected by checking the normal depth in the pipe against the **Flow-depth limit**. Freeboard is also checked in this mode and if required the pipe will increase in size.

Open Channel: Freeboard Design is similar to option 2 except depths at the upstream end of the pipe may be less than critical depth for steep pipes (supercritical flow at the entrance).

The **Freeboard limit** is used for all **Design modes**. The freeboard is measured down from the grate level (**Cover RL plus Grate offset**).

The **Flow-depth limit at pipe entrance (%)** is used in **Design mode 3**. If the flow depth in the pipe is

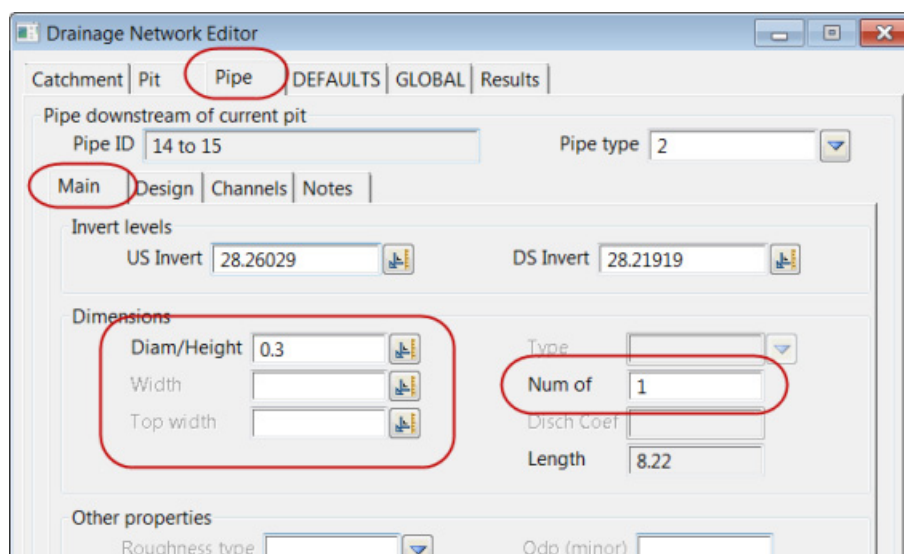

greater than this value the pipe size is increased.

21.8 Pipe Design Parameters - Sizes, Invert alignment, Min Cover, Max Height

The invert levels during design are controlled by the [pipe sizes](#), [max pipe height](#), min pipe cover and [invert alignment](#) mode.

21.9 Pipe sizes, Max pipe height and Multiple Pipes and Box Culverts

The 12d design engine will select pipe sizes from the file specified on the **Drainage Network Design** panel, **Preferred pipes file** field list. See [selecting pipe sizes](#). However, the maximum pipe height allowed before multiple pipes are used and the selection of box culverts is set on the **pipe->main** and **pipe >design** tabs respectively.

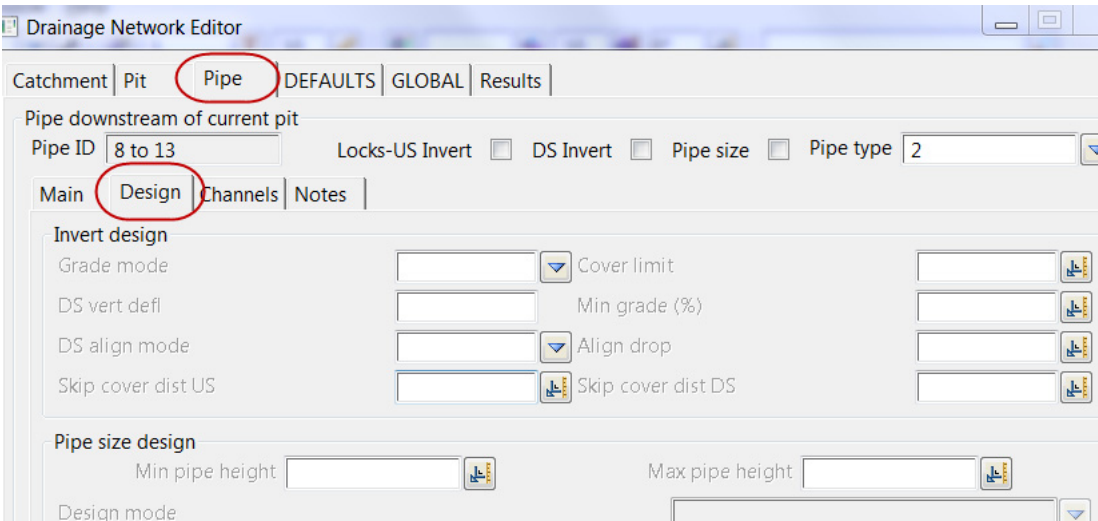

Num of specifies the number of identical pipes. The pipe flow is divided by this value when calculating losses.

To specify a box section in your network, select the pipe and enter a **width** for the pipe.

A **Top width** is used for trapezoidal channels. Note that if the hgl exceeds the top of the channel it will have friction on the soffit just as a box culvert.

For box culverts, the design engine increases the widths and maintains the height through the available sizes. Once the maximum height has been reached, the next culvert height and minimum width is checked.

21.10 Pipe Size Design

On the **Pipe** tab the **Lock Pipe size** prevents the 12d design engine from resizing the pipe.
Min pipe height can be set for each pipe segment (there is no default for this value).

Specifying a minimum pipe size may speed up 12d design. The starting value for pipe sizing will not be less than this value. That includes all downstream pipes as well. So if you know that the pipe needs to be this size or bigger, enter it here.

Max pipe height can be set for each pipe segment (there is no default for this value). If the 12d design engine requires a larger pipe, then multiple pipes will be selected.

21.11 Calculate Bypass flow routes

This option is required for pit inlet capacity calculations and is covered in the Stormwater Part 2 training.
As an introduction, the bypass strings determine the downstream bypass inlet for each inlet. Inlet capacity is determined from commands in the drainage.4d file. Road grade and crossfall measurements require the inlet to be linked to a setout string and pond depth measurements require a link to catchment string.

22.Drainage Design in 12d Drainage Design

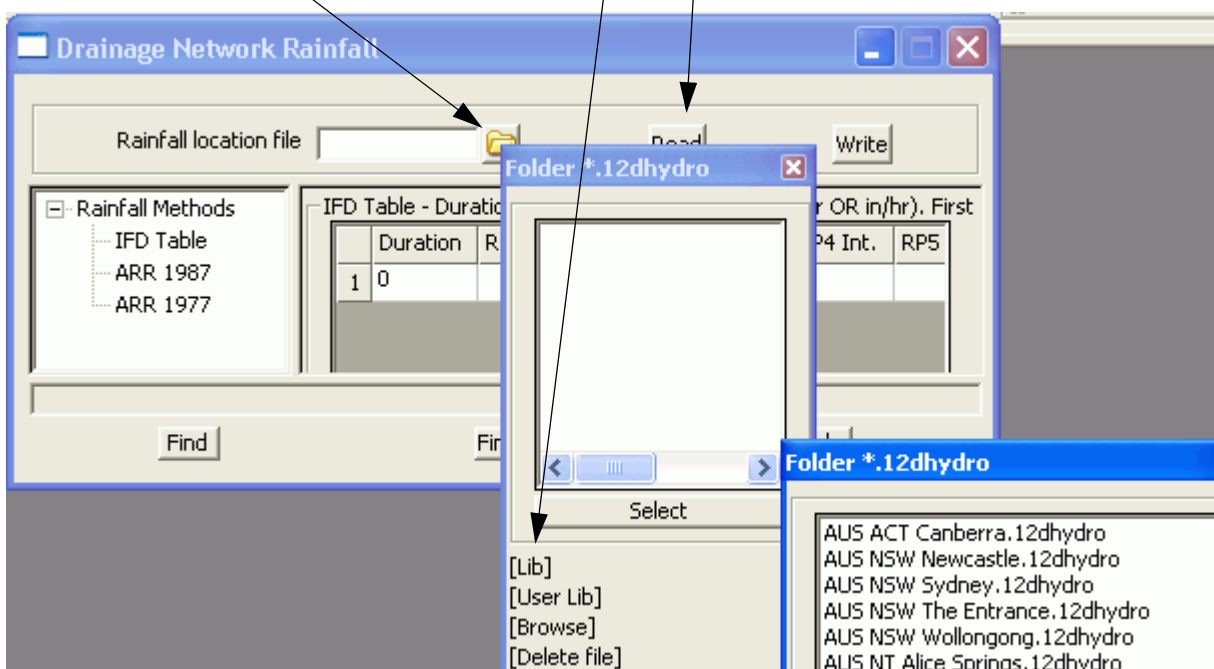

12d has a sophisticated rational method hydrology and hydraulic grade line pipe design engine. In addition it has the capability to export this data to several other popular drainage packages. Regardless of the design method selected, the drainage network in 12d is updated from the design so that drainage plans, long sections and pit schedules can be quickly produced.

22.1 12d Rational Method Hydrology - Drainage Rainfall Editor

The **Drainage Rainfall Editor** is used to input rainfall IFD data using several methods. The data is stored in hydro files (each file is for a specific location) that can be shared between 12d projects. The data is edited using an editor similar to those used for the plot parameter files (ppf). Seven methods for entering/calculating the rainfall intensities are shown in the panel below. From the main menu select,

Design->Drainage-Sewer->Rainfall Editor Data is entered using one (or more if desired) input methods and then saved by entering a **Meteorology file** name and selecting **Write**. The standard 12d system file search paths are used (project folder, user library folder and then library folder).

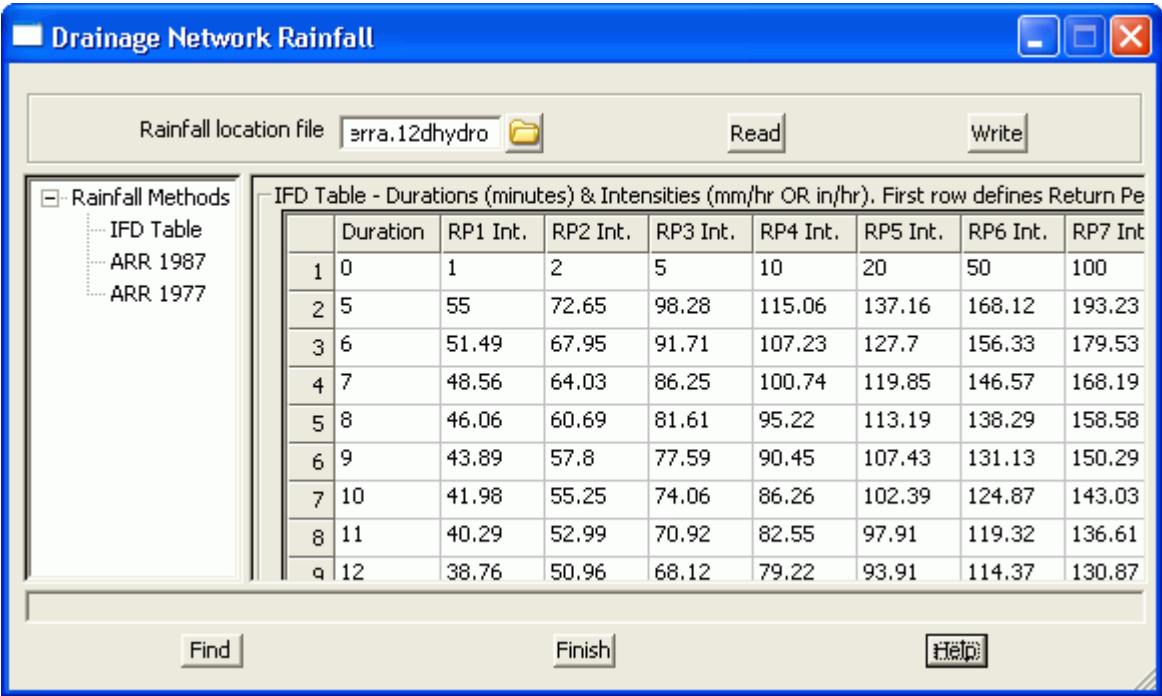

Select the folder icon and then walk right on the **Lib** item to display a list of sample files. Select a file the select **Read**. **YOU MUST SELECT THE READ BUTTON!**

22.1.1 IFD Tables

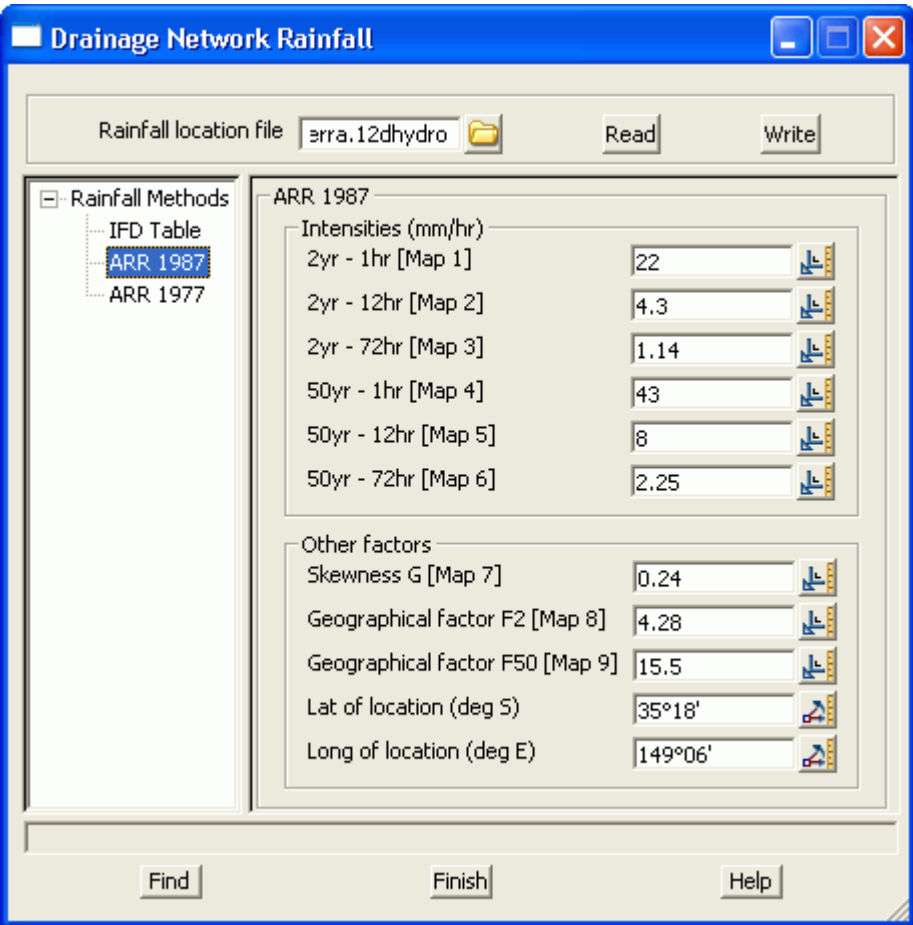

IFD tables are often available from meteorological services. The table input format follows. The first row is used to define up to 9 return periods and the following rows list the rainfall intensities for the duration entered in the first column.

Hint: to increase the size of the grid control select another method, ARR 1987 for example, and then select IFD table again.

22.1.2 Australian Rainfall and Runoff 1987 Method

The rainfall intensities and other factors from Volume 2 of ARR 1987 are entered in this table.

22.1.3 Australian Rainfall and Runoff 1977 Method

The seven coefficients for each return period from ARR 1977 are entered in this table.

Drainage Network Rainfall

22.2 Drainage Network Design

The **Storm Analysis** button on the **Network Editor** executes the 12d drainage design, plots the drainage long section and plan annotation and prepares the hydrology and hydraulic design tables.

Model: String: Pit:

Invert levels reset ... see problems in Output Window

From the **Drainage Network Editor** select **Storm Analysis**. The following design panel will appear.

Storm Analysis Factors

The valid **ARI** will depend of the method selected but you cannot extrapolate beyond your data. Select the folder icon on the **Rainfall location file** and then walk right on the **Lib** line to select one of the rainfall files in the 12d library. If the file has only one type of rainfall definition then the **Rainfall method** field will be completed. Otherwise select the **Rainfall method** desired.

Storm event type determines which set of design values (**minor or major**) will be used for this run. **Pipe travel time method** should be set to the authorities requirements.

Enable the 12d rational method engine partial area calculations by selecting the **Partial area effects** box.

Network Design Factors

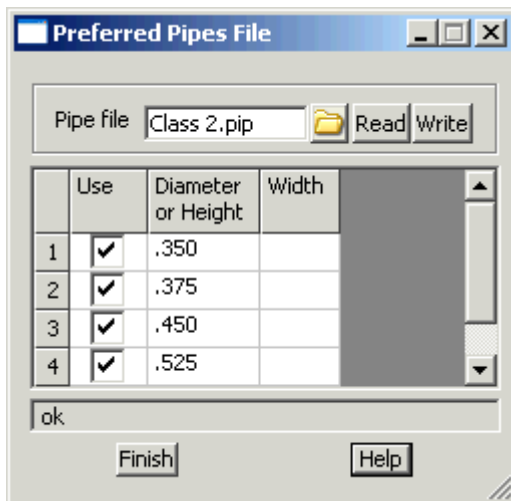

Modify Pipe Sizes

These values control the values to be designed in the run. **Consider bypass flows** causes the engine to use the bypass flow routes and inlet capacity data from the drainage.4d file.

Ensure Pipe Q < Qcap will increase the pipe size if this criteria is violated.

Modify pipe inverts will allow the design engine to shift the inverts if required (usually pipe size changes).

If **Modify pipe sizes** is selected then a files containing the available pipe sizes must be supplied. The pipe sizes in this file are in the **Units** specified in the drainage network editor. To create a new file, enter the file name and then select the folder icon followed by the **Edit** line. The following panel will appear.

The diameters/heights are required and the width is optional to specify a box culvert.

YOU MUST SELECT THE WRITE BUTTON!

The **Upsize only** selection will stop pipes in the system from being reduced in the design. Regardless of this selection, the 12d design engine will not allow a smaller pipe to be selected in the downstream direction.

22.3 Pipe Sizes too Large?

Your hydraulic settings can change you pipe sizes. Check Grate levels, freeboard, pipe design criteria and read the notes below!

A few comments on why you may have large pipes in your design.

If one pipe is sized large then 12d will not allow a smaller pipe downstream. So when pipes seem large, check the most upstream large pipe. HGL restraints will require you to look downstream of the large pipe.

Check List

1. High roughness values, accidentally setting roughness to Manning with a 0.6 roughness value (Colebrook)!
2. Grate levels not set correctly. Freeboard is measured from these levels.
3. Pipe min pipe cover set very close to freeboard.
4. Selecting **Ensure Q<Qcap** in the storm analysis dialogue. This is required by some authorities but can cause larger pipes in flat areas.
5. NOT selecting **Modify pipe sizes** in the storm analysis dialogue. 12d will not change the pipe size.
6. Selecting **Only allow pipes to upsize** in the storm analysis dialogue. 12d will not check if a smaller pipe will do.

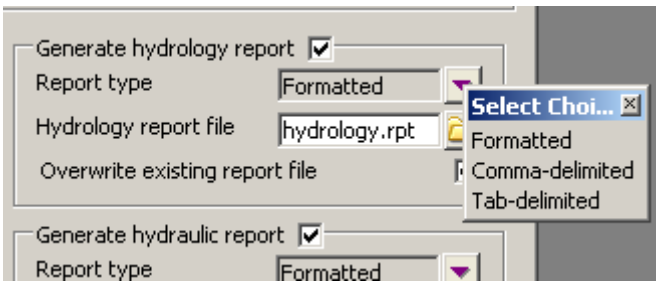

Generate Results in Plan

This selection automatically runs the drainage plot annotation function. A **Drainage plan ppf** must be entered and samples are supplied in the 12d library. A **Model for plan results** is required if this option is selected. The **Full clean model before hand** tick box forces the model to be cleaned before the labels are created. When not selected a “Smart clean” is performed.

Generate Results in Long Section

This selection automatically runs the drainage long section plotter. A **Drainage long section ppf** is required and examples are found in the 12d library. A **Model stem for long section results** is required if this option is selected. In almost all cases the **Clean model before hand** tick box should be selected.

Generate hydrology report

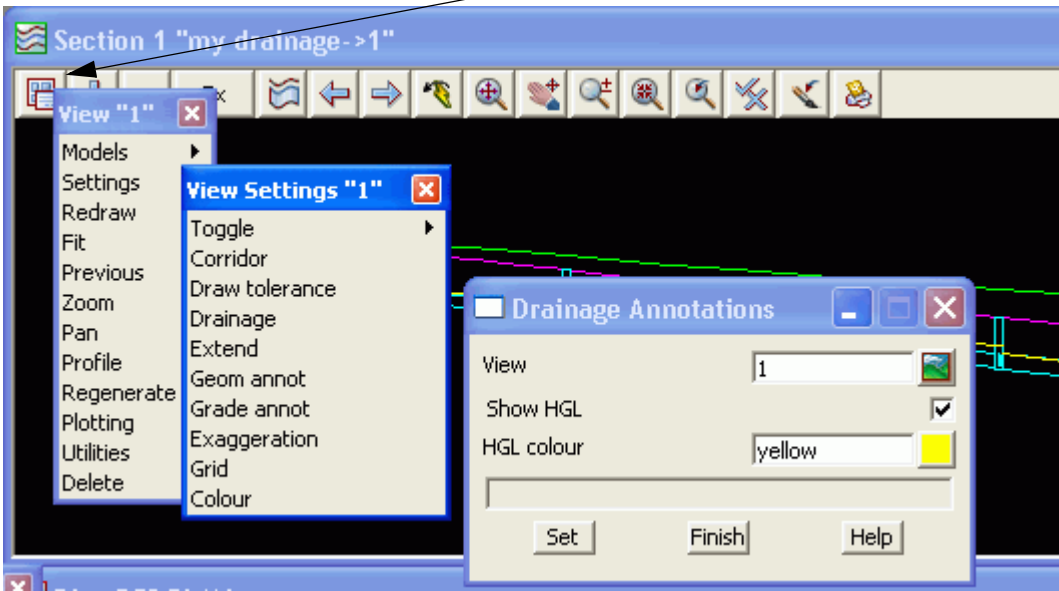

The **hydrology report** may be formatted for inserting into a 12d model/text editor (formatted) or spreadsheet (comma or tab delimited). In almost all cases **Overwrite existing report file** will be selected.

22.4 The Run Button and HGL data on the Section View

When the **Run** button is selected the discharges are calculated, the HGL check is performed and the pipes sizes and inverts are designed (if selected). The plan and long section drawings will also be updated with the new data (if selected).

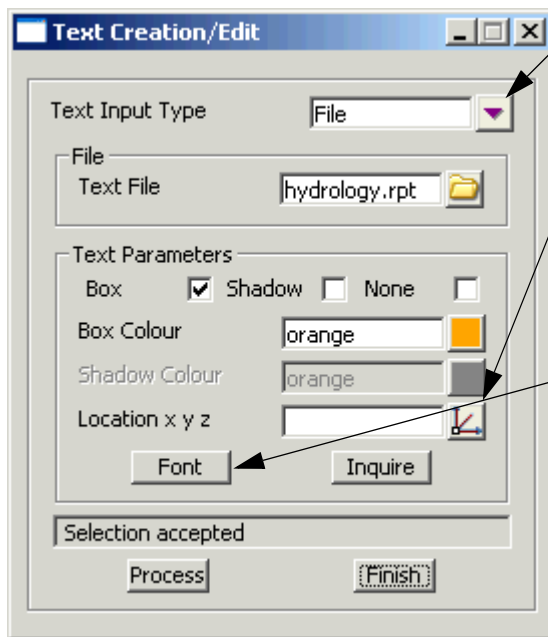

The HGL values will also be available on the 12d section views when profiling the drainage strings. The colour of the HGL line may be changed via the view's menu button then **Settings->Drainage**.

22.5 Importing Text into a 12d model

Formatted text may be inserted into a 12d model by selecting

Drafting->Text and Tables->Create edit paragraph text

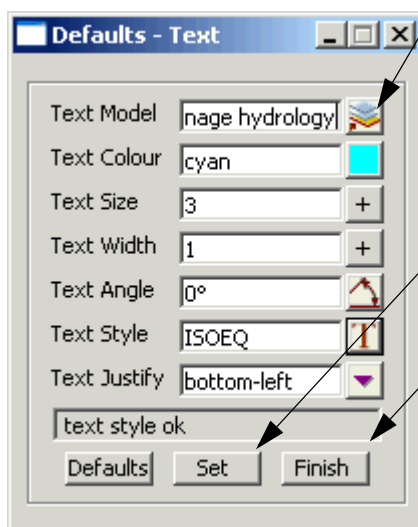

Change to **File**.

Select the folder icon and then pick the formatted text file. It will be displayed then select **Set**.

Next select the location in plan for the text.

The font selected must be a fixed space font or the data will not align properly.

Select the **Font** to display the following panel.

Enter a **Text Model** for the report.

The **Text Style** must be a fixed space font.

Select **Set** then **Finish**.

Now add the **Text Model** onto the

Generate hydraulic report

The **hydraulic report** may be formatted for inserting into a 12d model/text editor (formatted) or spreadsheet (comma or tab delimited). In almost all cases **Overwrite existing report file** will be selected.

If you want both the hydrology and hydraulic report in the same file, enter the same file name in both file fields but turn of the **Overwrite existing report file** for the hydraulic report.

22.5.1 Design Results

Results from the design runs are shown in several forms:

1. Hydrology and hydraulic reports
 2. [Drainage plan annotations](#)
 3. [Drainage long sections](#)
 4. Hydraulic Grade line on the Section view
 5. Output window data - Service/utility clashes
- Samples of the hydrology and hydraulics report are shown below.

23. Create a Drainage Model Template (Saving Defaults and Globals)

A drainage model template contains your favourite global and default settings for the **DNE**. These settings are stored as model attributes and the template may be read before or after the drainage strings have been created. Caution: existing default and global setting may be overridden.

You can create you own templates as well. Now that you have completed a drainage job and all of your global and default settings are set, create a template to save in your user library.

From the main menu select

Design =>Drainage-Sewer =>Create->Create/Read template

1. Change to **Write**.
2. Select **drainage** for you existing network
3. LB the folder icon, then user_lib, type a name for the template the select **Open**
4. LB **Process** to create the drainage model template for your next project.

24.Drainage Data Input and Output to Spreadsheets

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

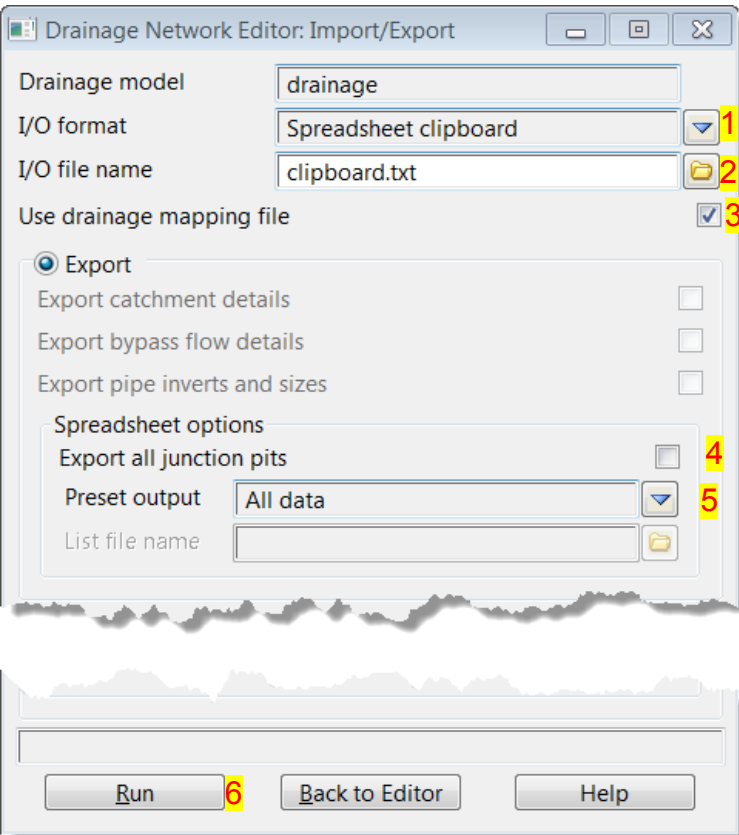

Drainage strings will be created if they do not exist in the model but pits cannot be added to existing strings.

See also

- 12d to spreadsheet transfers
- Spreadsheet to 12d update and create
- Spreadsheet options

24.1 12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

1. Select Spreadsheet clipboard
2. leave as **clipboard.txt** to send the data to the windows clipboard as well as this file.
3. Mapping files are the most current 12d technology. Leave this selected.
- These options are not used for spreadsheet export.
4. Usually leave this off! Select to export the junction pit at the end of all drainage lines (very rarely needed).
5. You may also select to limit the output if desired. If you like using spreadsheets for data entry, the PCdrain data and ILSAX data formats are useful for adding data for the first time for either program.
6. Select Run to place the data on the clipboard.

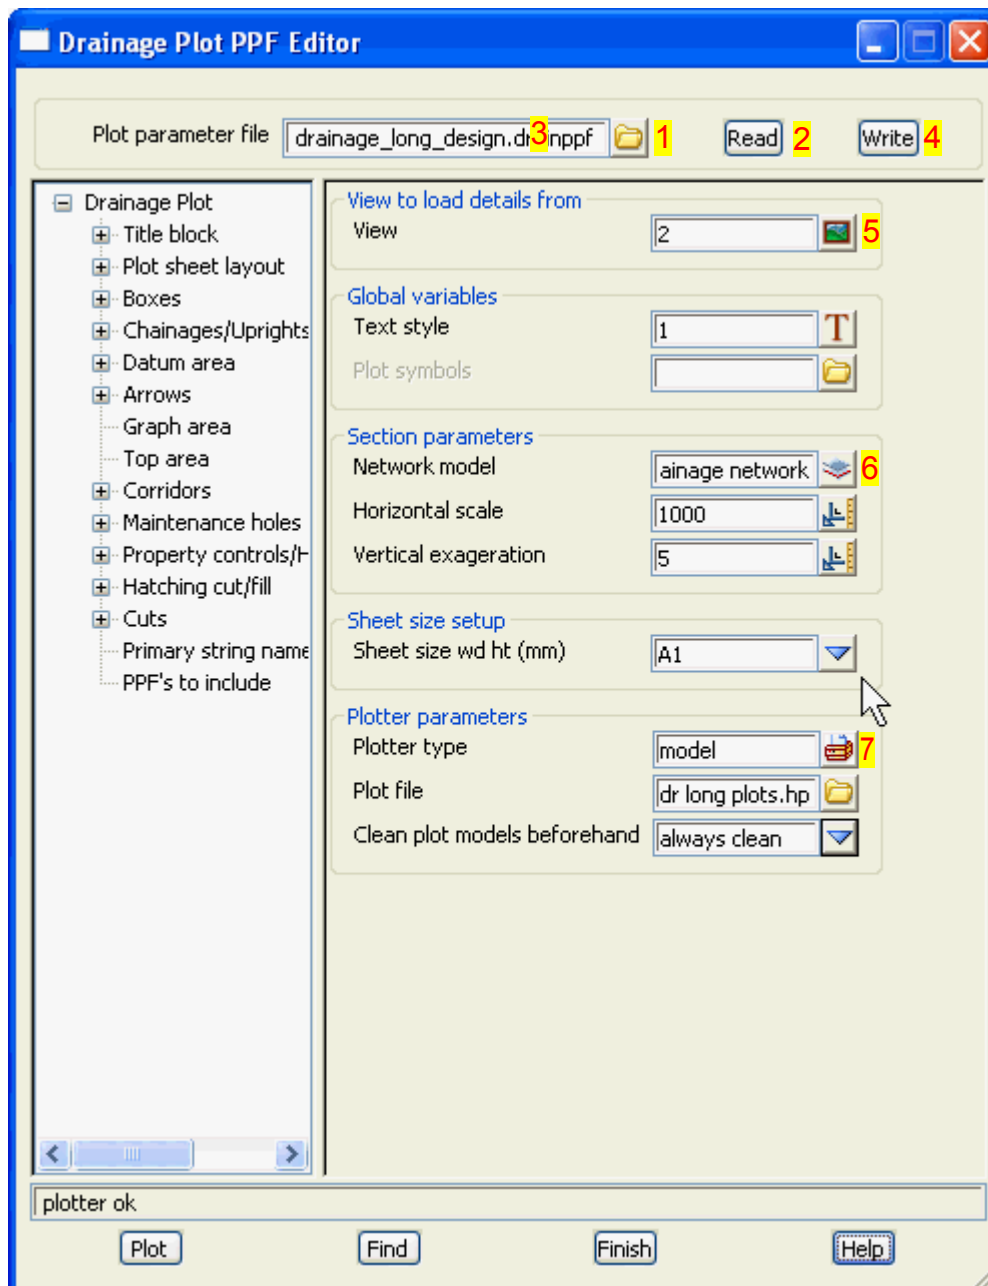

25. Long Section Plotting

Detailed description of the 12d drainage long section plotting may be found in the 12d Reference manual. The long section plots are customised using the drainage plot parameter files (drainppf). Title blocks, user defined text may be added and then plotted directly or to various file formats (dwg, dgn etc.). From the main menu

Design=>Drainage-Sewer=>Plots=>Longsections

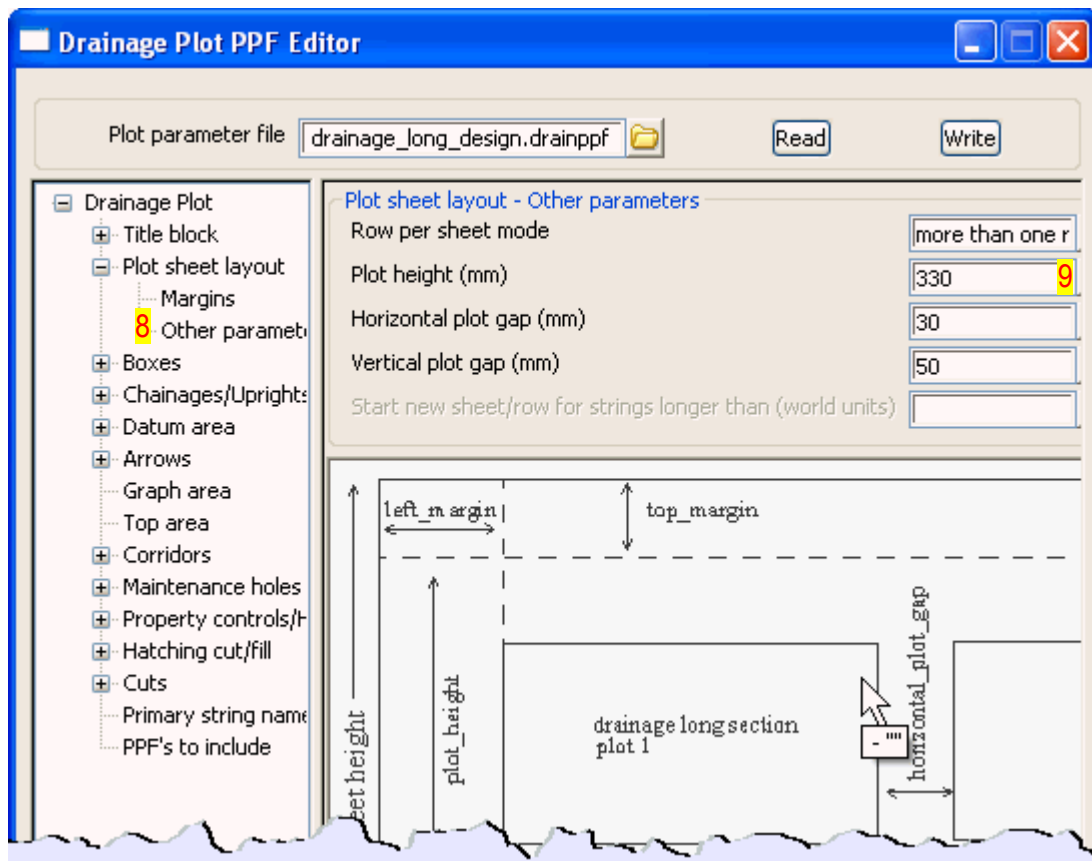

See Also

Set Pit Details to set road chainage and name data

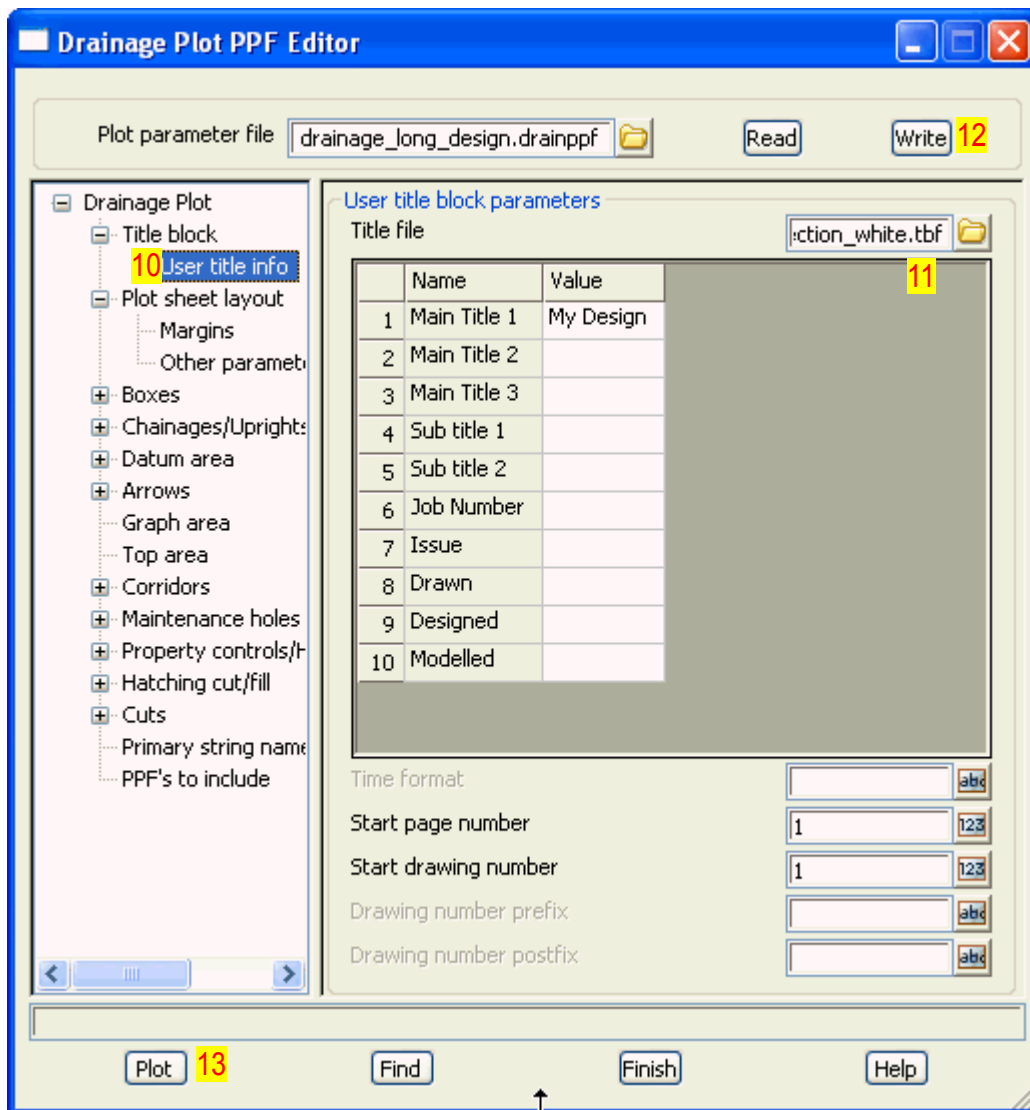

1. To access the drainppf files supplied select the icon and then walk right on **Lib** to select this drainppf file.
2. Select **Read**
3. Enter a new name for this drawing
4. select **Write**. This will save the setting we are about to make should you want to replot this long section.
5. This section view determines the additional models (such as services) to show plot. These are referred to as corridor models. The vertical exaggeration is also obtained from this view.

6. The **network model** field will be completed with the model of the string being profiled. If this is not your drainage network model then select it now.
7. When **Plotter Type** is set to model then **plot file stem** is the model name prefix for plots that will be created. The first sheet of plots will be in model **plot1**, the second in **plot2** etc.

8. Select + on the **Plot sheet layout branch** and then select **Other parameters**.
9. The **plot height** determines how much room is left vertically for the actual plot. This specifies the total height of the plot. 12d then constructs the box area and arrow area on the bottom and then arrow area on the top. The amount left over is used for the long section itself.

To stop datum breaks from occurring increase this height, increase your plot scale or decrease your vertical exaggeration. If there is too much white space in the graph area then reduce this value.

10. The **+Drainage plot+title block+User title info** allow you to enter the text for the title block.
11. The list displayed is retrieve from the **title file** selected above. Enter the data for the plot
12. Select **Write** to save the changed to the local drainppf file you entered earlier.
13. Select **Plot** and the plots will be send to the **plot file stem** entered. These models may be added (one at a time) to a plan view to inspect them before plotting to paper or exporting to other drawing packages.

26. More Information

This section provides detailed description of items introduced previously in the training notes.

26.1 Linking to Strings in General

Many pit properties may be calculated from strings linked to the pit. The following rules apply to all strings linked via the DNE.

1. The selection of strings is limited to the models specified on the DNE->Utility Model tab.
2. When no link exists for the pit, the closest string matching the selection criteria will be chosen. If a link exists, then no new string will be searched for. Even if the search criteria changes or a closer string is created. The link must be deleted before new links are searched for.
3. The link will not be broken unless
another string is manually selected
the link is manually Cleared with the RB on the manual string select
the string is deleted (manually or when a recalc is done on template applies),
the model links are reset on the DNE->Utility Model tab,
the model is removed from the DNE->Utility Model tab.
4. Once link is broken the calculated values will be kept unchanged, with the exception of bypass pits.

26.2 Catchment string links

Each catchment set has its own model of catchment strings and the sets are linked independently.

If the area (in ha) is present in the area field, no new string link be searched for.

Vertex number 1 on the catchment string determines which pit the string will link to. If vertex 1 of several catchment strings are closest to the same pit. Only the closest string will link and the remaining will not be used for any other pit.

After the catchment string link is created, the vertices are re arranged so that the vertex closest to the pit becomes vertex.

26.3 Road string links

Road strings have a name and maximum search distance criteria and there is no limit to how many pits link to a single road string. The closest string matching the string name criteria (in the road string file) and within the search distance will be selected. Note that once the string link is established, changing the criteria will NOT break the link.

26.4 Bypass string links

Pits marked with an Inlet type of Manhole on the DNE->Pit->Main tab ignore the bypass strings. Bypass strings must pass within 1 manhole diameter to be linked..

27. Training Check List

THE END

1.0

1.0 Stormwater Design Part 2- Introduction

The **Stormwater Design Course Part 1** and this manual, the **Stormwater Design Part 2**, describe the functions and processes of the 12d drainage module. In these documents, the generic term **pit** refers manholes inlets, catch basin and manholes.

The **Stormwater Design Course - Part 1 Notes** contain:

- s create a super tin for pipe cover and pit cover levels,
- s set [Defaults](#) and layout a drainage network from CAD and in 12d,
- s use the 12d [Drainage Network Editor](#) to assign names to the pit/pipes, avoid service clashes, grade pipes, align obverts, minimise depth and many other design tools,
- s designate catchment areas and produce catchment plans,
- s run the 12d storm rational hydrology and hydraulics engine,
- s transfer data to and from electronic spreadsheets to enable the user to easily review the data and add user defined data to the 12d pipe network. This data may include such data as pipe bedding types and trench width,
- s create a drainage template containing customised default design parameters,
- s create pit setout schedules to export to spreadsheets or word processors for final formatting,
- s produce long section drainage profiles including HGL data, flows, invert levels and service crossings,
- s create plan drawings with pipe sizes, flows, pit symbols, linestyles for pipe sizes, design parameters for pit and pipes and user defined data,
- s locate pits/manholes at exact chainage and offset locations.

This manual, the **Stormwater Design Course - Part 2**, is intended to describe the additional features of **12d Model** drainage and discuss the customisation of the package. This will include

- s customising the drainage.4d file [Drainage Definitions - Manholes and Pipes](#),
- s 12d storm analysis with inlet capacity calculations and bypass flow,
- s flooded width analysis and flooding at SAG pits,
- s drainage trench excavation volume calculations,
- s pipe and pit quantity calculations/reports,
- s open channel calculations,
- s adjusting pit locations for changes in horiz road geometry
- s analysing the major flood events,
- s creating drainage symbols with grates and upstream side inlets,
- s detailed drainage plan labelling and long sections with hatching under roads.
- s

2.0 Starting with a Basic Drainage Network

In this document, the generic term **pit** refers to manholes, inlets, catch basin and manholes. When the term **manhole** is used on the 12d menu system it refers to any type of pit. Pit types, dimensions and inlet capacities of the pits are set in the [Drainage.4d setup file/database](#).

These course notes assume that you have completed the Stormwater Design Course and that you have experience creating 12d Model drainage networks with catchments areas. You may continue this project or begin with a completed drainage design found in the folder

\12d\10.00\Courses\Drainage_Analysis

The project name is Local Road Complete.

3.0 Setup Files and Their Locations

The [drainage.4d](#) setup/database file contains the pit and pipe types (RCP, Class 2 etc.). The drainage.4d setup/database file can also control many of the settings in the drainage network editor (DNE). Changing the pit/pipe type in the DNE will result in your favourite settings being applied thus minimising user input errors.

The pit types may optionally include:

- s DNE field controls, including internal pit dimensions (diameter or length and width)
- s pit wall thicknesses that vary with depth,
- s pit connection points (locations where the pipes joint the pit),
- s inlet capacities for sag and on grade inlet pits.
- s detailed pit type descriptions to be inserted into your pit schedules
- s user defined attributes.

The pipe types may optionally include:

- s DNE field controls, including internal nominal and actual pipe sizes with wall thickness,
- s user defined attributes.

For PCdrain and Drains users there are routines to read your gully pit/database files and create the [Drainage.4d setup file/database](#).

The [Drainage.4d setup file/database](#) may be customised for any additional inlet capacity data you may have.**REVIEW THIS DATA CAREFULLY!**

4.0 Bypass Flow

Bypass flow strings are used to trigger the bypass calculations in the network editor and are used as a centre line for flooded width calculations.

The 12d storm analysis, and many of the design programs 12d exports to, allow for bypass flow. Bypass flow involves the calculation of pit inlet capacity for on-grade or sag inlets. These capacities are based on the pit type and may use either ponding depths (sag inlets) or on the road grade and/or crossfall upstream of the inlet (on grade inlets).

4.1 Key Points

1. Draw an bypass flow string in the direction of flow so that it passes within 1 pit diameter of an inlet. At sag locations the string should show the direction of flow during bypass conditions. When bypass flow strings join they must join within 1 pit diameter of an inlet (pits with **inlet config** set to **Manhole** are not considered inlets). If flooded with calculations are to be calculated the string should be located in the flow channel.
Enter the model name in the **Bypass flow model** field on the **Global->Utility Models** tab.

Note: if there is no bypass flow string within 1 pit diameter then 100% of the approach flow will enter into the pit.

2. Many bypass strings may join at an inlet but only one bypass string should leave each inlet.
3. Set the pit type. (**Pit Type** on the **Pit** tab). With a bypass string within 1 pit diameter of the pit centre, no water will enter the pit unless the pit type has inlet capacity data defined in the [Drainage.4d setup file/database](#).
4. Set the **Inlet config** on the **Pit->Main** tab (Manhole, On-grade or Sag pit). This selection will be disabled if cap_config parameter sets the inlet type in the [Drainage.4d setup file/database](#). Manholes have no inlet capacity and are not considered inlets, on-grade inlets capture the water as it passes the inlet while SAG inlets trap the water flowing in from all directions (until the pond depth overflows at the low point of the catchment string).
5. On grade pits may require road grade and/or crossfall data for inlet capacity. They may be entered manually or calculated using the road strings. A setout string link is required to measure road grade. If road crossfall measurement is needed then the centre string is also required. These strings are specified using the [Road design file](#) on the **Global->Utility Models** tab (see Stormwater Part 1 manual).
6. Sag inlets require a pond depth either manually entered or calculated by 12d. Pond depth calculations require a link to a catchment string to locate the overflow point and correct grate level ([Grate rl mode](#)).
7. Press the **Set Pit Details** button. Road grades, crossfalls, pond depths and bypass pits will now be found on the **Pit->Bypass** tab of the **Network Editor**. Measurement markers are created in the **construction drainage data** model.
8. Bypass pits may be cleared using **Clear Bypass Links** on the **Globals->Utility Models** tab
9. **Storm Analysis** must have **Consider Bypass Flows** selected on the **Main** tab.
10. **Calculate overland flood extents** is optional on the **Flood Extents** tab of **Storm Analysis**.

4.2 Creating Overland Flow Strings using Downhill Strings

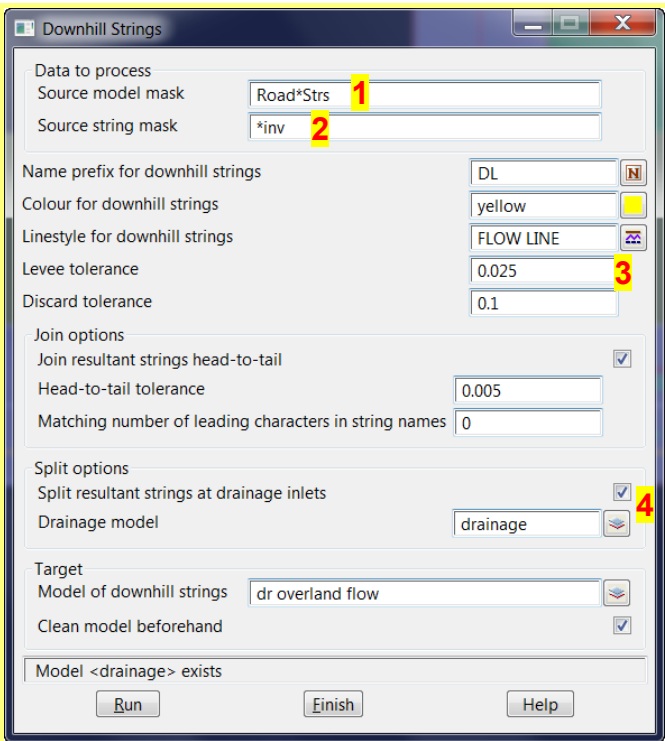

The bypass flow string must be within 1. pit diameter of the drainage pit in be considered on the bypass flow path. If the bypass flow string is to be used for flooded width calculations in the future, the string must also be drawn in the main flow area of the cross section. At sag locations the bypass flow strings indicate the direction the water flows when it overtops the overflow point. This string usually goes uphill to this overflow point.

The downhill string function quickly creates bypass flow strings from road design strings. The remaining tasks will be the bypass flow at intersections and areas off the roadways.

This routine copies strings to a single model using a string name mask to select the strings from a collection of models (using a model name mask). These strings will have their name, line style and colour changed. The line style is usually FLOW LINE so that you may see the direction of the string (downhill). The strings are split at crests (identified using a levee tolerance). They may also optionally be split at drainage string inlet location to allow easy modification using the drainage utility string editor.

From the main menu select

Design->Drainage-Sewer->Downhill strings

1. type **Road*Strs** (it is case sensitive). These are the models that contain all of the road strings. **Road 1 Strs** for example.
2. type ***inv**. The road string models have a **linv** and **rinv** string for the invert of the kerb and gutters.
3. If the crest height on one side is less than this amount it will not be split.
4. Tick the box and select the **drainage** model. This will help with the drainage utility editor later.
5. type **dr overland flow** to create a model for the new strings
6. Select **Run**
7. add the model **dr overland flow** onto the **roads** view.

4.3 Creating Overland Flow Strings at Intersection and Sag Locations

Use the **CAD toolbar** to create the overland/bypass flow paths the flow crosses the road.

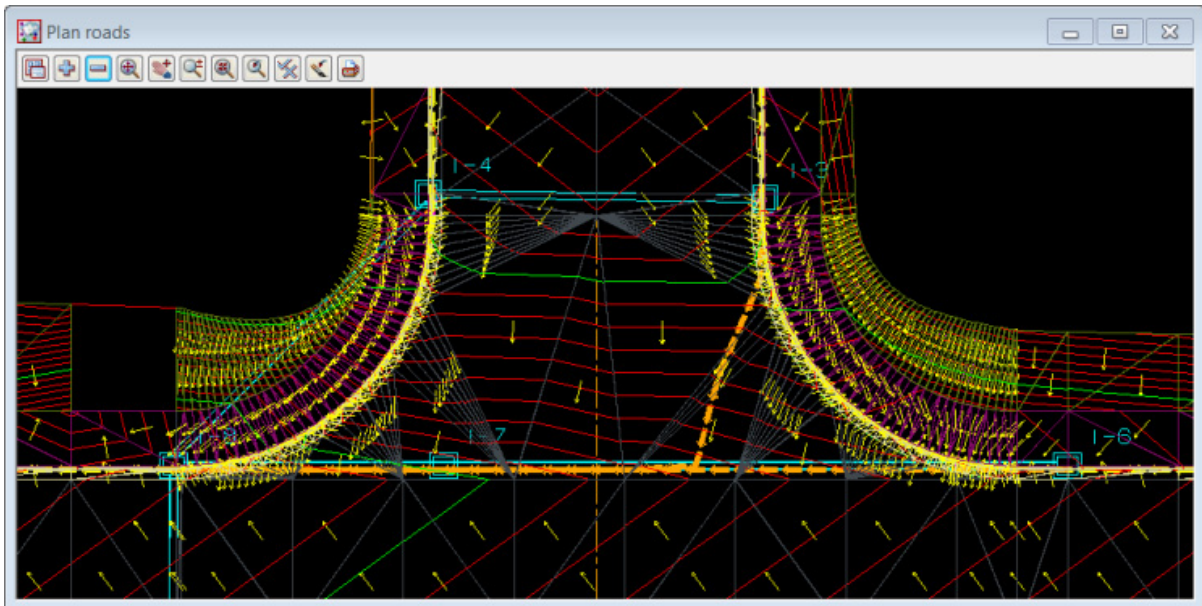

To use the **CAD toolbar** go to the **CAD data bar** and enter a string name and model name. Select the line style (optional).

Use the CAD bar eye dropper on the right (same as) and select an existing overland/bypass string. The properties of the selected string will fill the CAD bar fields.

DRAG the **Create line** button and release at the **Create Line String** button.

When finished drawing the string press **ESC**.

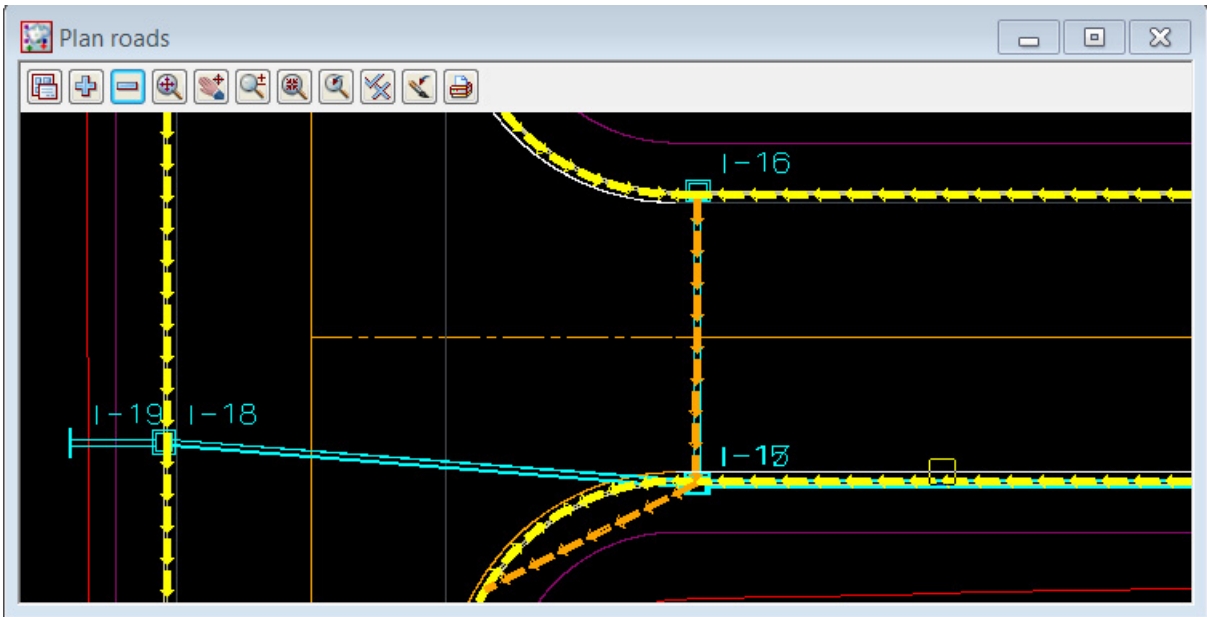

Starting at the upstream end. LB select an insertion point and MB or press return to accept the selection (the line style is shown after the point is accepted).

Do not stop drawing until you reach another sag or ongrade inlet (not a manhole). Overland flow lines often overlap as you see in the drawing above. If you stop short of the inlet, the bypass pit for the upstream inlet will be LOST.

Continue drawing until you reach the end of the flow path. Press **ESC** to finish drawing the string.

Frequently you will draw an overland flow path uphill and away from a sag inlet. It will usually go through the low point on the catchment crest and then downhill to the next inlet. No do this where road 2 intersects road 1 (see below).

4.4 Creating Overland Flow Strings for Culverts

Culverts placed at sag location in the road will generally how the overflow across the crown of the the road and the upstream headwall grate level will be set the sag low point elevation of the road crown. For headwalls, there usually is not grate so this becomes the reference elevation for bypass.

The culvert in our example is not at a sag in the roadways so the water will overflow the southern side of the channel, cross the footpath, and flow down the roadway. We need to set the grate level to the bypass level along this path.

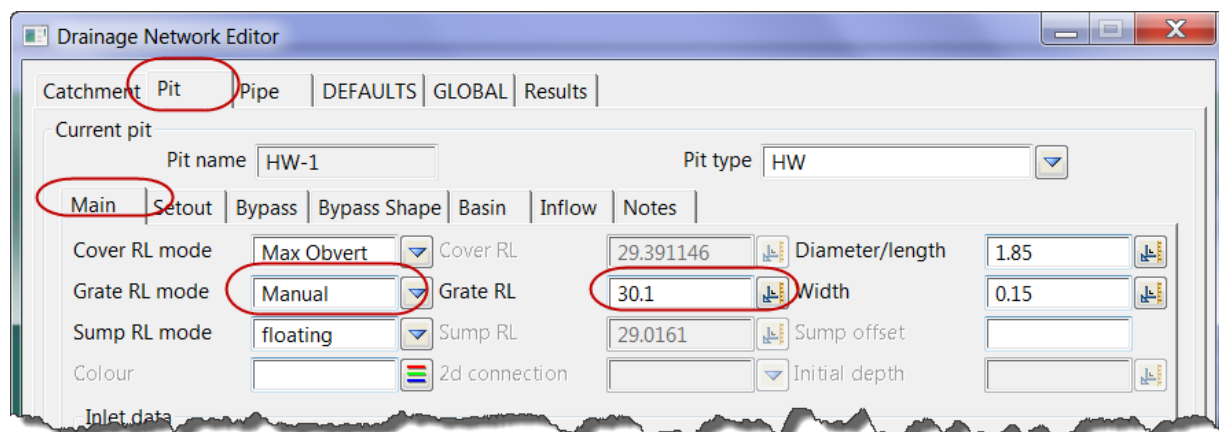

To draw the string, start at the top of the catchment so that the *flooded width calculations* in the approach channel will use the correct flows. Finish at I-3!

You could use the **CAD string->Copy** option to copy the tc string that was drawn in the model **dr Catch Reserve tc** and then **CAD vertex->Append** to add onto the downstream end of the new string and then **CAD vertex->Move** to adjust where need.

There is a low point where the south side of the channel joins the road (see red arrow). This overflow area will need to have erosion protection and detailed grading. Lets assume that the overflow area is regraded with a crest RL30.1. The grate level needs to be set to this value.

4.5 Set Inlet type to Sag or On grade

12d supports Manhole, on-grade and SAG configurations. The **inlet configuration** is set on the **Pit->Main**. This setting can be locked to the **Pit type** in the [Drainage.4d setup file/database](#) using the cap_config command. The remaining bypass data is found on the **Pit->Bypass** tab.

Pits **Inlet config** setting:

- s **Manholes** will not receive bypass flow and cannot have catchments assigned to them.
- s **On-grade** pits are pits where the water will flow past the pit if not captured (velocity and momentum are important for these inlets). Approach flow, road grade and road crossfall generally determine the inlet capacity equations/curves.
- s **Sag pits** are located at sag locations where the water will pond around the pit if there is not enough inlet capacity (generally the water will stop at these locations and flow into the inlet). There is only one inlet capacity curve/equation per inlet and the ponding depth is used to determine the inlet capacity.

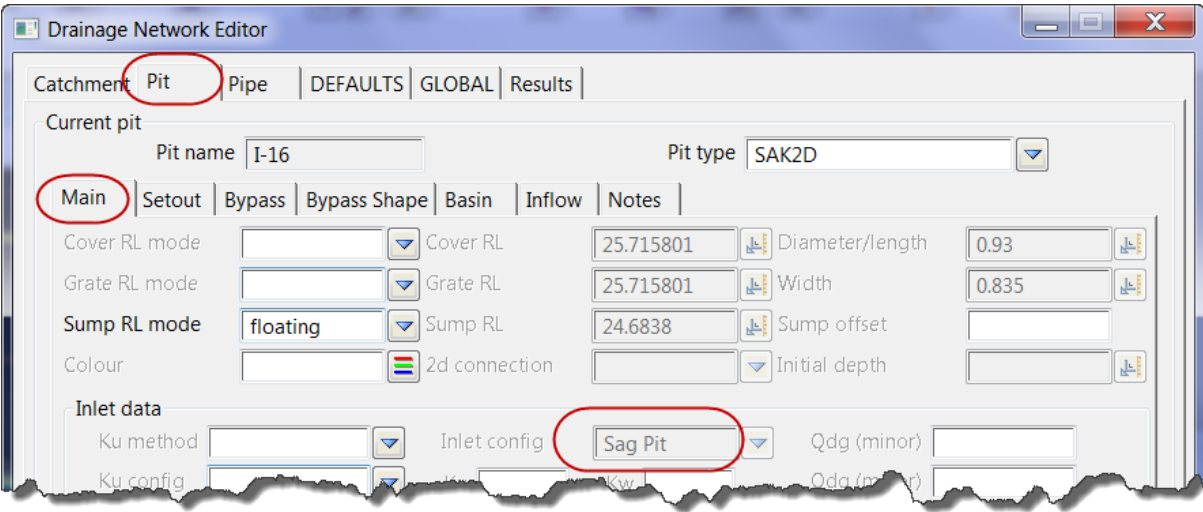

To view the inlet capacity curves used in this project, try [Viewing Inlet Capacity Curves](#).

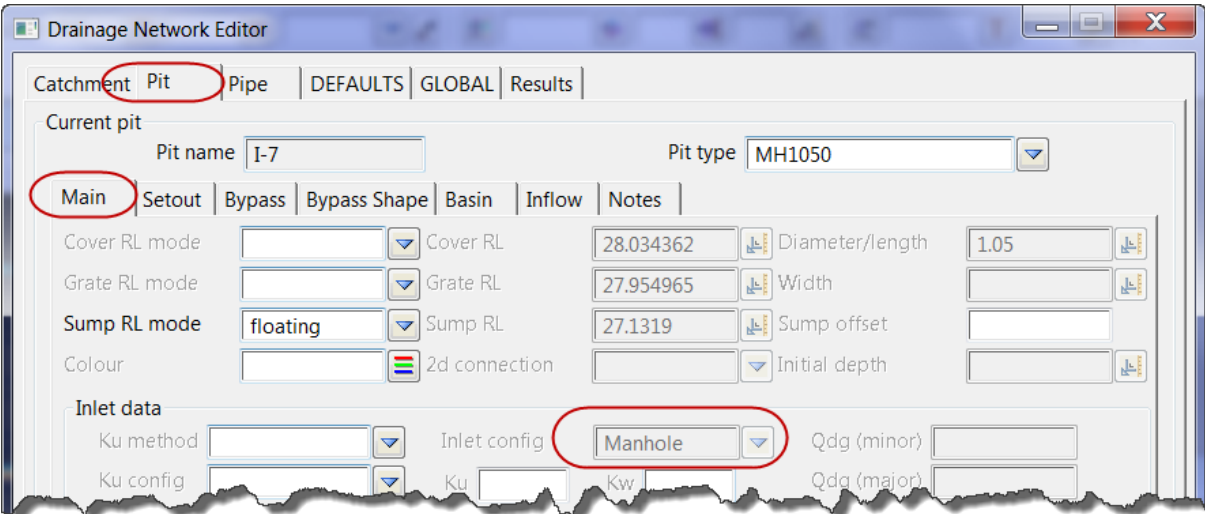

In this example the pit types have been set to an on grade grated, side entry inlet. We will now change the pit types for the manhole and the sag inlets.

Not all sag locations on a roadway behave hydraulically like a sag inlet. In general the flow should approach the inlet and not bypass over it. Sometimes the inlet acts as a sag inlet at low flows but like an on grade at design flows.

1. Move to inlet marked I-16 above and select **SAK2D** for the pit type (you may be asked to confirm the changes from the drainage.4d file).
2. Note the **Inlet config** has been changed to **Sag pit** and it cannot be changed. This has been set in the drainage.4d file.

1. Select **MH1050** for the Wipit type (you may be asked to confirm the changes from the drainage.4d file).
2. Note the **Inlet config** has been changed to **Manhole**, the **Diameter/length** to 1.05 and the **Width** has been cleared. These changes are set in the drainage.4d file.

4.6 Set Pit Details - Calculate the Bypass Flow Data

Once the first **Key Points** of bypass flow are complete, you are ready to calculate the bypass flow data. Select **Set Pit Details** and then select a pit on a bypass flow string. The bypass data is found on the **Pit Main** and **Pit->Bypass** tabs.

The downstream pit will now show in the **Bypass pit** field. If the bypass string does not go to another inlet (the network outlet is never an inlet) then the **Bypass pit** will be marked as **LOST**.

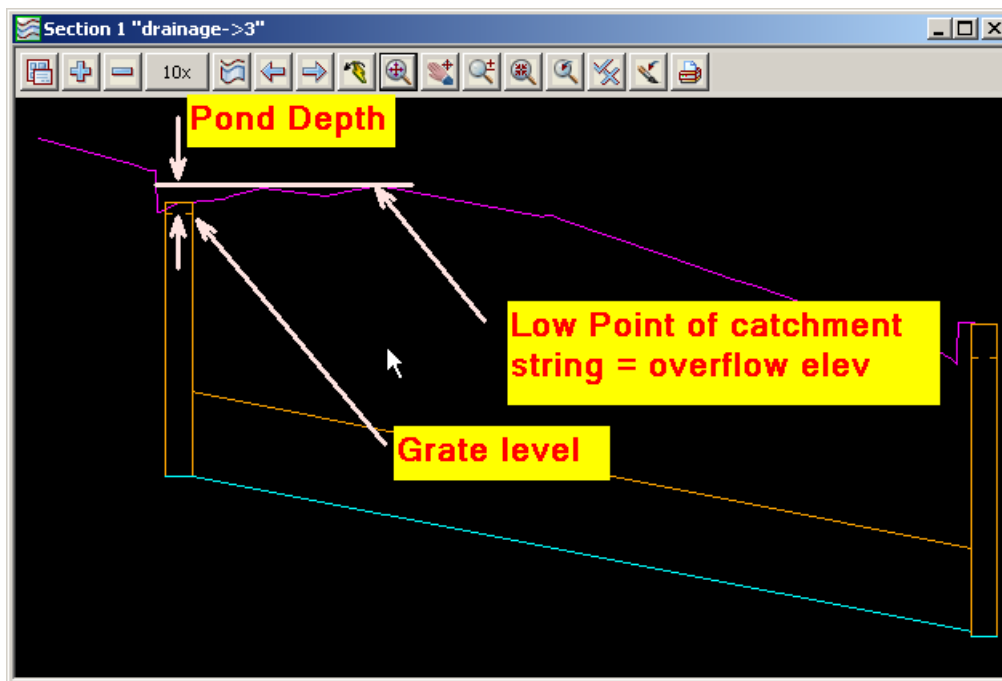

Always confirm bypass pits set to **LOST** are correct. An incorrect bypass to LOST would mean water is leaving your system when it should be included in the calculations.

If a setout string was found (see **Pit->Setout** tab), the **Road grade** will appear in grey. You may override this value by selecting the **Manual** tick box beside the value and entering your own value. If a road centre string was selected, the **Road xfall** field will also have a value.

If **Sag pit** was selected and a catchment string was selected, the **Max pond depth** will be displayed. The catchment strings from all 3 sets are draped onto the finish surface tin and the low point located. The **Max pond depth** is calculated as

Max pond depth = catchment string low point - Grate RL.

Negative Pond Depths

Negative pond depths are usually caused by one of two errors in input. The first may be that the grate level is too high. Often this happens when the Grate RL mode on the **Pit->Main** tab has not been set correctly or if **Sz + setout string** option is used the **Sz** value on the **Pit->Setout** tab has been entered correctly.

The second common error is that the catchment string has not been drawn around the crest of the catchment. The lowest section of the catchment string must be drawn carefully because it is the lowest point on the string that determines the overflow elevation. If in doubt, profile the catchment string with the design tin shown in the section view. Double check where the low point is.

4.7 Checking locations for measuring road grade, crossfall and max ponding depth

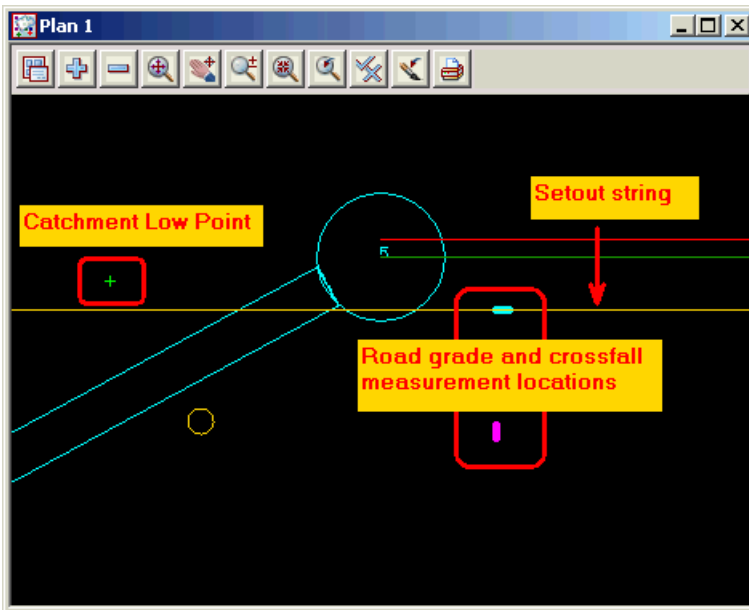

Strings indicating the location of inlet capacity parameters are generating in the **construction drainage data** model when **Set Pit Details** is selected.

The location of the low point, from all 3 catchment set polygons, is shown as a green vertex (plus sign).

Trouble finding the small green +? Select **Models->String info table** and select the sag marker line in the table. A large cross hair will show you the location in plan views.

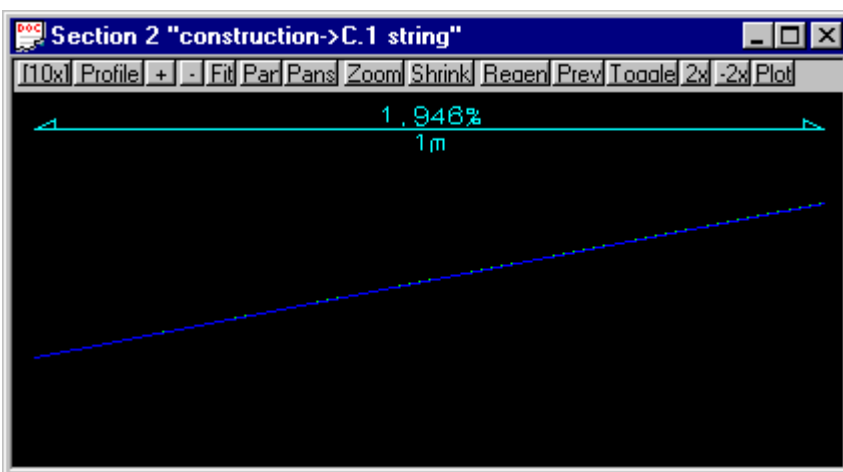

Verification strings in the same model confirm the locations where the road grade and crossfall have been measured. To check these strings add the **construction drainage data** model to the plan view. The following image shows a close up of the verification strings at a pit.

The green line indicates where road grade was measured and the magenta line indicates where the road cross fall was measured.

The default location of the road grade measurement is one pit diameter upstream of the setout point, along the setout string. The road crossfall is measure one pit diameter away from the setout point towards the road centreline. These are 3d super strings and therefore you may profile them in the section view. With the grades toggled on (check under **Toggle**) you can verify the slopes.

The location of the road grade and crossfall measurements can be changed in the **road design file**. The distance upstream to measure the road grade is controlled by the **Grade offset** column one the rows where the setout strings are defined. The road crossfall is controlled by the **Xfall offset** column on the rows where the road centre lines are defined. The distance the measurements are taken is controlled by the **Slope measurement distance**.

No flow into the pipe?

Pits with a bypass pit entered but no inlet capacity defined in the drainage.4d file will have a zero inlet capacity.

With Inlet config set to Manhole, the pit has no inlet capacity.

Important Notes

- 1. If no bypass flow string is supplied for a pit, the inlet capacity is set to 100%.
- 2. If you have a problem with the inlet capacity calculations, check the **Storm Analysis** hydrology report for details.

4.8 Viewing Inlet Capacity Curves

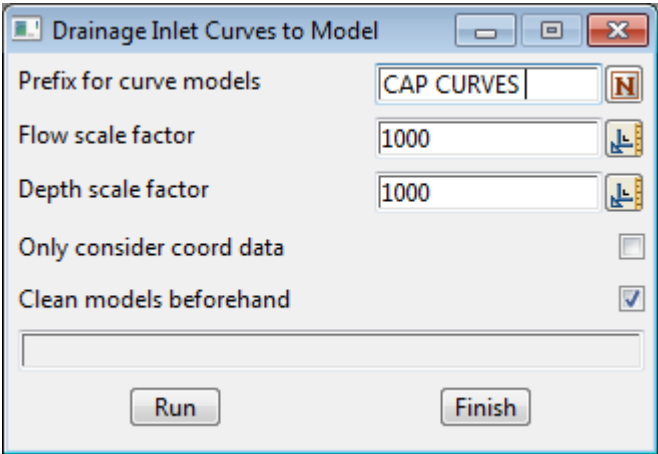

The inlet capacity information is stored in the drainage.4d file. We will now plot the inlet capacity curves in 12d. This will confirm what is in the drianage.4d but changing these plots will not change the inlet capacity calculations.

Put a **z** before **CAP CURVES** in the panel below. This will generally put these files at the end of your model list so they are not in the way when you are working.

From the main menu select

Design->Drainage-Sewer->More->Write inlet curves to model

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Prefix for curves models	model box	CAP CURVES	
<i>All inlet curves for a manhole type will be placed in a model named with this prefix and the manhole type.</i>			
Flow scale factor	input	1000	

Inlet and bypass flow values will be multiplied by this value before creating the strings.

Depth scale factor input 1000

Depth values for sag curves will be multiplied by this value before creating the strings.

Only consider coord data tick box off

Inlet capacity curves may be expressed as formulas, curve coordinate or both. Selecting this box stops curves with only formulas from being plotted as strings.

Clean models before hand tick box on

The curve models are cleaned before the new strings are created

Run button

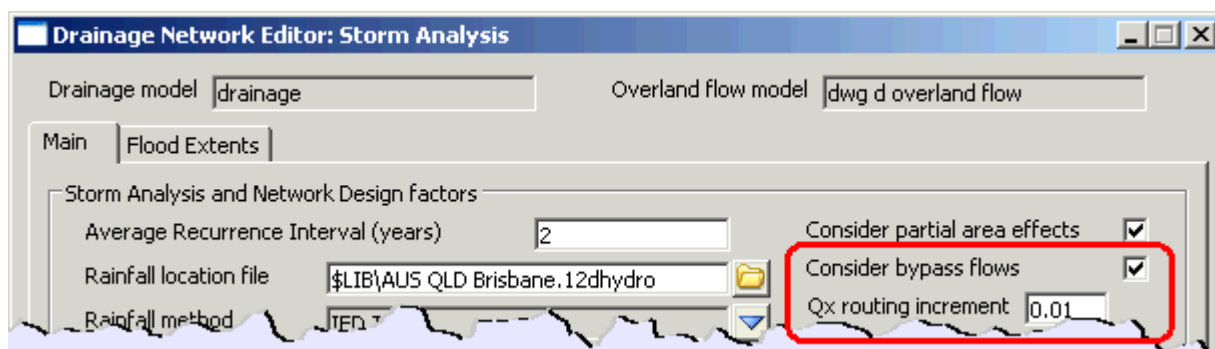

Models and strings are created from the drainage.4d file

Finish button

remove the panel from the screen

5.0 12d Storm Analysis Bypass and Flooded Width Calculations

Once the bypass pits are selected and the [Drainage.4d setup file/database](#) has been setup for bypass flow the storm analysis engine must have this feature enabled. Select **Consider bypass flow**.

Excess Flow

The **Q_x** value controls how excess flow is handled in the bypass flow calculations. If the hgl at the pit reaches the grate level then no more water can enter the pit even if there is inlet capacity. The flow that will not enter the pit is considered excess flow. When a value greater than zero is entered here, the inlet will initially have its inlet capacity restricted by this value. Upstream inlets are done first as this may reduce the hgl in the downstream system. The system is automatically rerun adjusting the flows by this amount each time.

If the inlet capacity is reduced to zero and the hgl is still above the pit then water is removed from the pit and considered as **Q_s** (surcharge flow). In the hydraulic reports this value is found as a negative **Inlet Flow Q_i**.

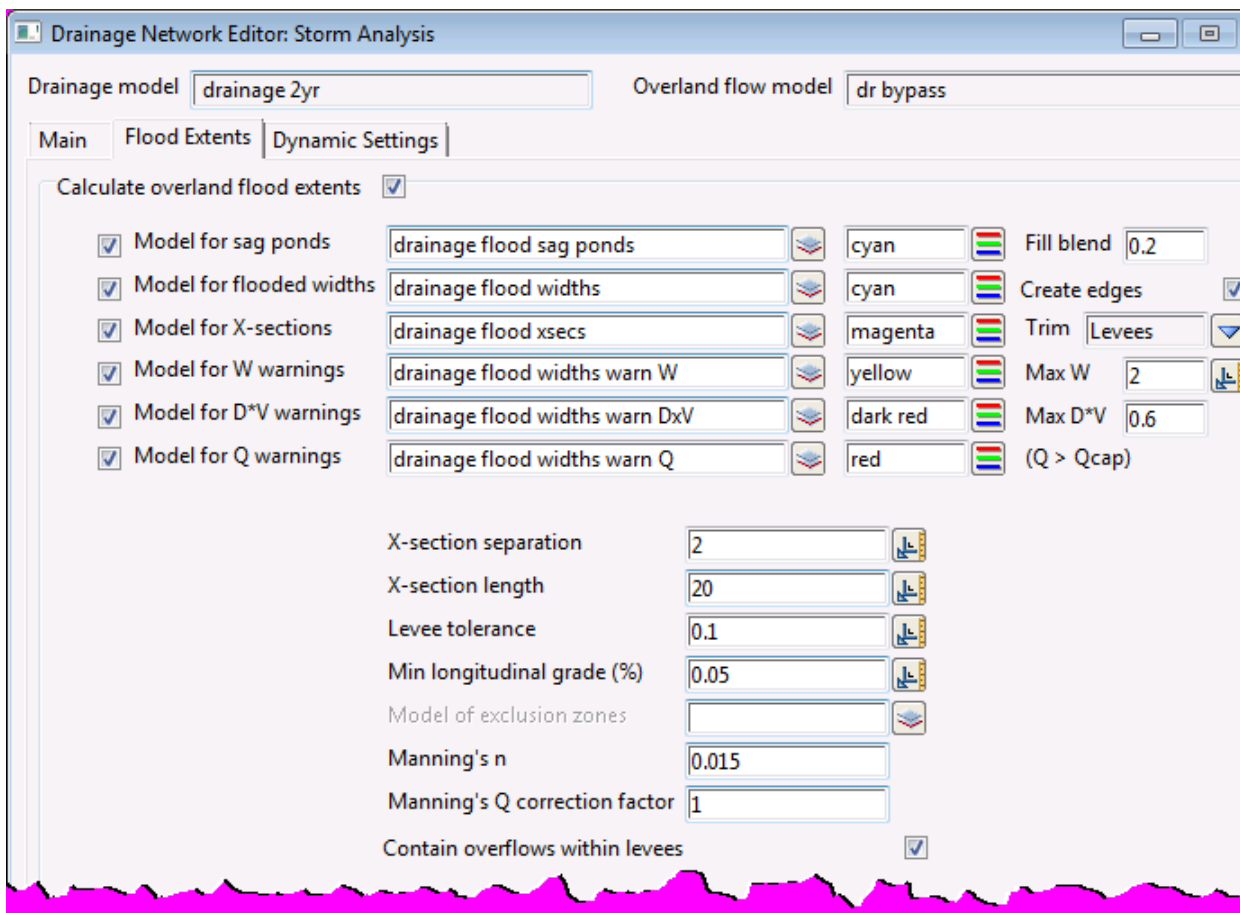

Overland Flow Calculations

The storm analysis engine will calculate flooded widths from normal depths along the flow path and ponding extents at SAG inlets. A bypass flow model (**Global-Utility Models** tab) is required for these calculations.

The **Utility String Editor** should be used where bypass flow strings combine at a pit. Without using this editor it is assumed that 100% of the catchment flow flows down each bypass flow string thereby overestimating the flooded widths.

The **Utility String Editor** could be used to change the Manning's along the string (approach channels to culvert for example) or the maximum flooded width warning limit (before a pedestrian crossing or a highway off-ramp).

The models and the default input data for these calculations are entered on the **Flood Extents** tab.

Select **Calculate overland flooded extents** to active the fields on the panel.

Model for sag ponds is used to hold strings that indicate the extent of flooding at the pits marked as SAG inlets. The total approach flow is used with the cap_curve_sag in the [Drainage.4d setup file/database](#) to determine the depth of flooding above the grate level. A closed contour at this flood elevation is then selected near the centre of the inlet. A super string is then created at this level with the colour and **fill blend** transparency selected (1.0 is solid).

Model for flooded width holds the strings indicating the normal depth - flooded width calculation results. These strings are created with a fixed elevation of the flood level. The strings will have string attributes with all of the calculations details.

Calculations

1. Cross sections are cut perpendicular to the overland flow string at the interval **X-section** sepa-

ration with a length of **X-section length**. No calculations are done for sect of the bypass flow string with in **Model of exclusion zones** polygon.

2. The x-section string is then trimmed using the **Trim** settings. The section above had a x-section length of 20 and was trimmed at the levee. The **levees** setting has the routine search for levee (high points) on either side of the low point near the bypass flow string. The levee points are found if sections drops more than the **Levee tolerance** value after the high point is found.
3. The flow for the section is calculated using the bypass flow string chainage to interpolate between the upstream bypass flow and the downstream approach flow. The percentage of catchment flow used in the calculation of the approach flow for this bypass string may be changed using the **Utility String Editor**.
4. The slope of the surface near the bypass flow line is measured for each section. If the slope is less than **Min longitudinal grade (%)** then this cross section is skipped in the calculations.
5. **Manning n** value is the default roughness used in the calculations. This value may be changed at any vertex along the bypass flow string using the **Utility String Editor**.
6. The flow's calculated at the indicated level are multiplied by the **Manning's Q correction factor**. A factor of 0.8 would cause the flooded widths to increase and the road capacity to decrease.
7. The maximum depth calculated will be at the point where water overflows the edges of the section (**Road capacity**) unless **Contain overflow within levees** is selected. This will cause frictionless vertical walls to be placed at the ends of the section so that higher water level may be calculated when the flow is greater that the road capacity.

Warning Models

Model for W warnings will contain copies of the flooded width strings with the colour selected if the flooded width is greater than the default **Max W** value.

Model for D*V warnings will contain copies of the flooded width strings with the colour selected if the depth * velocity is greater than the **Max D*V** value.

Model for Q warnings will contain copies of the flooded width strings with the colour selected if the flow is greater than the capacity of the section. The capacity is the flow where the water over tops one of the sides of the section.

6.0 Utility String Editor

Position of option on menu: **Design =>Drainage-Sewer =>Utility String Editor**

This editor is used to edit properties of the strings used by the DNE. Properties always change at an existing vertex.

Cross Section Strings (Manning's n) - set the left and right bank n values. the centre n value is assigned by the DNE.

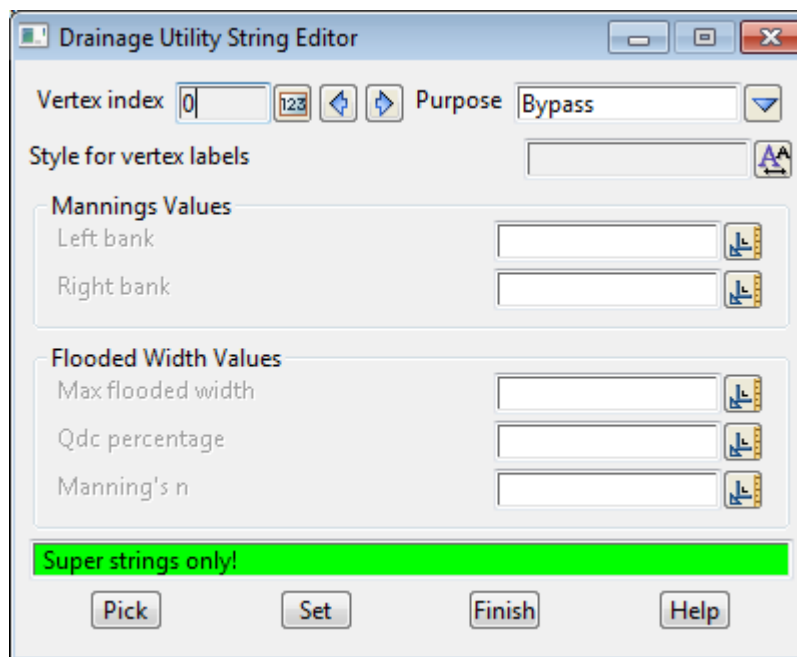

Flooded Width Values on Bypass Flow Strings - the default setting of the bypass flow strings when used to calculate flooded widths in the Drainage Analysis. Changes are in effect until the end of the string or it has been re specified at vertex at a higher chainage.

Vertex labels are created whenever properties are set (Textstyle is required).

Usage

First the string is selected at the vertex where the values are to be assigned. Next select the purpose of the string (cross section or bypass) to unlock the appropriate fields. A textstyle favourite is required as the vertex is labelled with the assigned values. Enter the values into the fields and then select Set to set the values as vertex attributes and create the label as a vertex annotation.

On selecting the **Utility String Editor** option, the **Drainage Utility String Editor** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Vertex index	vertex	selected vertex	

Once the string is selected use this to move between vertices

Style for Vertex Labels textstyle favourite textstyles

A label is created on the vertex using this textstyle favourite

Left bank Input

mannings n value, to delete clear and select set

Right bank Input

mannings n value, to delete clear and select set

Max Flooded withInput

This changes the threshold were warning bars are created during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Qdc percentage Input

This changes the percentage of the $Q_{direct}+Q_{catchment}$ that is used to interpolate the discharges during flooded width calculations. It is generally set on the first vertex past upstream pit and remains in effect till the next change or the end of the bypass flow string. The flow changes from the bypass flow at the upstream pit to this value/100($Q_{direct}+Q_{catchment}$).*

Manning's n Input

This changes the Manning's n value used for during flooded width calculations. It remains in effect till the next change or the end of the bypass flow string.

Pick button

Use this button to select the string. Select near the vertex you want assign the values to.

Set button

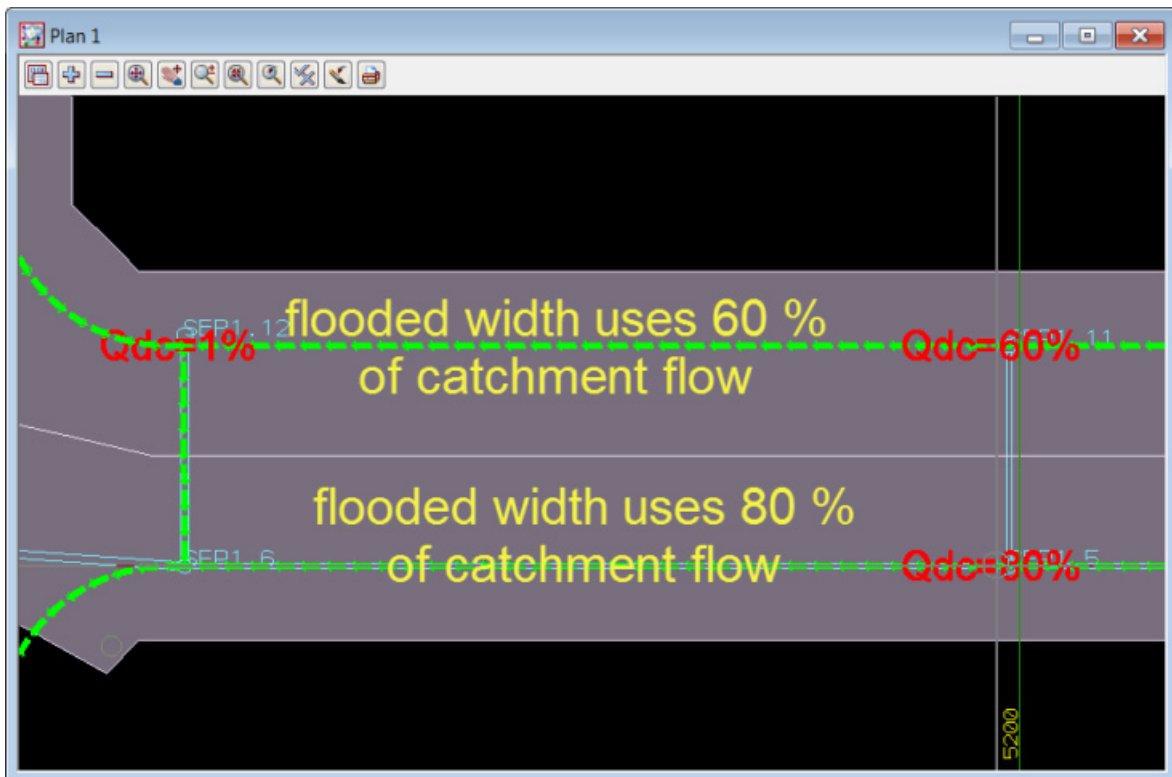

Creates the attributes and the label on the vertex.

Finish button

Removes the panel from the screen.

Help button

Launches the 12d help

In the example above, The Q_{dc} is set to 80% at the eastern end of the catchment. The Q_{dc} is set to 2% for the water overtopping the road. The 18% of the area is not considered large enough to do the flooded width calculation for. If desired, another bypass flow string approaching from the east could be drawn but the final bypass string to the west (direction during bypass should remain).

7.0 Drainage.4d setup file/database

The drainage.4d file controls many of the settings for the pit and pipes types inside 12d. This section details the format and features of the drainage.4d file. Changes to this file take effect only after 12dmodel has been restarted.

Press the **F1** button for 12d help. Select the **index** tab and type **drainage.4d** and select **drainage.4d** from the list. Full documentation of the drainage.4d file is found here.

7.1 Editing the drainage.4d file

When 12d Model starts up, it checks to see if an environment variable called DRAINAGE_4D exists and if it does, then the file it points to is used to provide the available types of manholes (maintenance holes) and pits. If the environment variable is not set, then 12d Model searches for a file called **drainage.4d** in the standard 12d Model search sequence for set up files.

12d model ships a **drainage.4d** file in the “program files\12d\12dmodel\10.00\set_ups” folder. **Do NOT** change this file. Copy it into your user folder “\12d\10.00\User” and edit it there. Files in the user folder are used by preference and they are never over written by a 12d update.

File Format

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes ”.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

Duplicate definitions are not allowed. ie. you cannot have 2 manhole types with the same name.

From the main menu select

Design->Drainage-Sewer->More->Edit drainage.4d

1. Select the **Find** button to search the 12d path for the current drainage.4d file.
2. If the file is found in the setups folder, select **Copy to working folder** and then **Find** again.
3. Now that the file is found in the working folder, select the More info button (the folder) and then **Open** to edit the file.

You must restart 12d for these changes to become active. Select Project->Restart!

At startup, refer to the output window for any error messages. 12d will print the line number where it gave up. When looking in the long list of files, the drainage.4d file is loaded after the shp files. Sometimes one error will result in many other errors to follow so fix the first one, save your changes and restart again.

7.2 Creating and Modifying Manhole Types

We will now create a new manhole type for an enlarged grated inlet. For training purposes we will do it in steps restarting 12d model between each step.

1. Create a new manhole type
2. Add manhole commands to set the size and manhole thickness
3. Add manhole commands to create pit connection points where 2 pipes may be connected on the long side.
4. Add manhole commands to set the manhole level modes
5. Add a manhole command to create a user defined attribute.

7.2.1 Create a new manhole type

The order the manhole commands appear in the file is the order they appear in the type drop down list in the DNE.

1. Go to the bottom of the file and type the following.

```
Manhole "AK2D enlarged" {
}
```
2. Save the file
3. In 12d model close the Edit drainage.4d panel.
4. From the 12d model main menu select **Project=>Restart**
5. Check the output window for errors (just below the shp files.. there are easy to find as there are so many of them. You should see the message
File found <C:\12d\10.00\Courses\drainage\drainage.4d>
6. With the DNE, change inlet I-5 to the new manhole type **AK2D enlarged**. Note that you are free to change the diameter/length, width and many of the other DNE Pit fields

Manhole must be capitalised.

Use “ (double quotes) not the single ‘ OR 2 single side by side ‘’.

Use {} NOT () or []

7.2.2 Add manhole commands to set the size and manhole thickness

The **mhsize** command sets the DNE length and width fields (rectangular manhole) and locks them from been changed.

mhdiam is used to set the diameter (circular manhole) and clear sthe width,

The **mhthickness** command block sets the mnahole wall thickness. The **diam_thickness** command has the manhole depth followed by the wall thickness. The line **diam_thickness** may be repeated if you want the pit wall thickness to change if the depth becomes greater than the specified value. Depth is measured from the cover level to the sump level.

The indenting is not required but makes the commands easier to read.

1. add a few blank lines between the braces in your new manhole definition and type the new commands shown in bold.
Manhole "AK2D enlarged" {
 mhsize 1.86 0.835
 mhthickness {
 diam_thickness 0.000 0.150
 }
}
2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.

7.2.3 Add manhole commands to create extra connection points

With connection points enables on the DNE->Global tab, a connection point is created at the mid points of the internal sides of the manhole. Additional connection points may be added with their offsets from the manhole centre.

1. add a few blank lines before the last brace in your new manhole definition and type the new commands shown in bold.
Manhole "AK2D enlarged" {
 mhsize 1.86 0.835
 mhthickness {
 diam_thickness 0.000 0.150
 }

 con_points "AL2D" {
 con_point 0.930 0.000
 con_point -.465 0.4175
 con_point .465 0.4175
 con_point -0.930 0.000
 con_point -.465 -0.4175
 con_point .465 -0.4175
 }
}
2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.
5. Use **Strings->Points Edit->Move** to move the end of the pipe that connects to I-5. You will see that it will snap to 2 points on the long side and 1 point on the short sides.

7.2.4 Add manhole commands to set the manhole level modes

We will now set the construction setout point and grate level to be obtained from the road setout string, the cover level to be 0.150 higher than the grate and a sump depth of 200mm.

1. add a few blank lines before the last brace in your new manhole definition and type the new commands shown in bold.

```
Manhole "AK2D enlarged" {
    mhsize 1.86 0.835
    mhthickness {
        diam_thickness 0.000 0.150
    }

    con_points "AL2D" {
        con_point 0.930 0.000
        con_point -.465 0.4175
        con_point .465 0.4175
        con_point -0.930 0.000
        con_point -.465 -0.4175
        con_point .465 -0.4175
    }
attribute_integer "cover rl mode"      8
attribute_real   "setout adjustment z"  0.150
attribute_integer "grate rl mode"      1
attribute_real   "sump offset"         -0.200

attribute_integer "setout xy mode"     1
attribute_integer "setout z mode"      1
}
```

2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.
5. Use the DNE to select the i-5 inlet. You will be prompted to verify that you want the design parameters to change for each attribute you have added.

7.2.5 Add manhole commands to create a user defined attribute

We will now create a manhole text attribute called “reference dwg” that we can add our drainage plan plot.

1. add a few blank lines before the last brace in your new manhole definition and type the new commands shown in bold.

```
Manhole "AK2D enlarged" {
    mhsize 1.86 0.835
    mhthickness {
        diam_thickness 0.000 0.150
    }

    con_points "AL2D" {
        con_point 0.930 0.000
        con_point -.465 0.4175
        con_point .465 0.4175
        con_point -0.930 0.000
        con_point -.465 -0.4175
        con_point .465 -0.4175
    }
    attribute_integer "cover rl mode"      8
    attribute_real    "setout adjustment z" 0.150
    attribute_integer "grate rl mode"      1
    attribute_real    "sump offset"        -0.200

    attribute_integer "setout xy mode"      1
    attribute_integer "setout z mode"       1

    attribute_text "reference dwg" "Dwg 47.1 Rev A"

}
```

2. Save the file
3. From the 12d model main menu select **Project=>Restart**
4. Check the output window for errors.
5. Use the **DNE** to select the pit. This will set the attribute for this manhole. The **Set Pit details** would do this for all manholes in the model.
6. Select **Apply** or more to another pit.
7. Use **Strings->Properties->Attributes** to select the manhole and on the pit table you will find the new attributes “reference dwg”.

7.3 Pit Inlet Capacities

The pit inlet capacity tables contained within the [Drainage.4d setup file/database](#) are used by the 12d drainage modules and exported to other design packages in different ways but with a common philosophy.

These tables may be plotted in 12d Model using [Viewing Inlet Capacity Curves](#).

7.3.1 On grade pits

The grade and crossfall values for the tables are threshold values, i.e. the next set of capacity factors/curves will not be used until the measured crossfall and grade are equal to or exceed the

threshold values for the curves. Curves with the same crossfall threshold are grouped together and the correct group is selected first. The road grade is then used to select the curve within the cross-fall group.

Each inlet selects one road grade curve from the drainage.4d file. **12d** Model does not interpolate between the curves.

Some simple sample pit definitions follow to demonstrate how the pit inlet capacities are calculated. The drainage.4d file supplied in the library has extensive curve data from model testing.

```
Manhole "SEP 25" {

    mhsize    1.200 0.900
    mhdesc    "SEP with 25 l/s"
    mhnotes   ""
    mhgroup   "SA"

    cap_multi 1.0
    cap_fixed 0.025

}

Manhole "SEP 50 percent" {

    mhsize    1.200 0.900
    mhdesc    "SEP with 50%"
    mhnotes   ""
    mhgroup   "SA"

    cap_multi 1.0
    cap_percent 50.

}

Manhole "SEP Grade x 10" {

    mhsize    1.200 0.900
    mhdesc    "SEP with 25 l/s"
    mhnotes   ""
    mhgroup   "SA"

    cap_curve_grade "curve 1" {
        road_grade 0.0
        cap_multi 1.0
        cap_fixed 0.010
    }

    cap_curve_grade "curve 2" {
        road_grade 2.0
        cap_multi 1.0
        cap_fixed 0.020
    }
}
```

```
}

cap_curve_grade "curve 3" {
    road_grade    3.0
    cap_multi     1.0
    cap_fixed     0.030
}

cap_curve_sag "curve sag" {
    cap_multi     1.0
    coord 0.0    0.000
    coord 0.1    0.010
}
}
```

7.3.2 Exporting Inlet Capacity to External Programs
Drains Version 1 and ILSAX

The cap1, cap2, cap3 and cap4 values are used to describe the inlet capacity of the pit as described in their user manuals.

Drains Version +

The 12d inlet curve names are exported to Drains as the pit family.

xpswmm, xpstorm and RAT-HGL

If cap2, cap3 and cap4 are all equal to zero then a fixed inlet capacity equal to cap1 will be exported to RAT-HGL. If the sum of these three values is greater than zero then a pit type will be created in the format of **pit_type-crossfall-roadgrade**. For example SA2-3-2 for a SA2 pit with a road crossfall of 3% and a road grade of 2%. A rating curve with this name will have to exist inside RAT-HGL. 12d has no way of transferring the rating curve itself into RAT-HGL.

PC Drain

Similar to RAT-HGL, PC Drain has it own rating curves defined internally. The road grade is sent as a separate piece of data to PC Drain so that the pit inlet capacity may be determined.

PC Drain places a suffix code in the pit type to specify that the pit is a SAG pit. For example an 9S.03 indicates that pit type 9 is a sag pit and the maximum depth before bypassing is 30mm. 12d model does this automatically when exporting.

7.3.3 Add manhole commands for inlet capacity

Manhole inlet configuration and bypass pit entries determine if these inlet capacity commands are used. Both may be set in the [Drainage Network Editor](#).

cap_config

The inlet configuration may be set via the following command

cap_config	x	
	Mode	x
	Manhole	m
	Ongrade	g
	Sag	s

Inlet Capacity Equation

The inlet capacity equation is built up with 3 optional components (**single polynomial + curve polynomial + curve coordinates**). Generally, only one of the 3 components is used for each manhole type but they may all be used if desired.

inlet capacity = inlet efficiency * inlet multiplier *
[**single polynomial** + curve multiplier (**curve polynomial** + **curve coordinates**)]

An inlet efficiency (choke factor) is specified in the [Drainage Network Editor](#). An inlet efficiency (choke factor) of 0 would stop all water from entering the inlet.

Curve Coordinates (On grade and SAG)

For on-grade and sag inlets, the inlet capacity may be determined by entering coordinates along the inlet capacity curve. These coordinates are usually obtained from hydraulic model studies or analytical methods such as HEC-22.

For on grade inlets, the coordinates are Qapproach and Qin, and the curves may change with road grade and cross fall threshold values. The inlet capacity curves are never extrapolated.

Example

```
Manhole "Ongrade Inlet A" {
    cap_config G
    cap_curve_grade "0.5G" {
        road_grade 0
        coord 0.000 0.000
        coord 0.060 0.060
        coord 0.140 0.112
        coord 0.260 0.174
        coord 0.430 0.244
        coord 0.500 0.270
    }
    cap_curve_grade "1G" {
        road_grade 0.75
        coord 0.000 0.000
        coord 0.060 0.060
        coord 0.140 0.108
        coord 0.260 0.164
        coord 0.430 0.227
        coord 0.500 0.248
    }
}
```

For sag inlets, the coordinates are Depth (base units) and Qin, and there is only one curve. Each curve has a curve multiplier specified with a cap_multi parameter (discussed below).

Example

```
Manhole "SAG Inlet A" {  
    cap_config S  
    cap_curve_sag "SAG" {  
        coord 0.000 0.040  
        coord 0.045 0.101  
        coord 0.070 0.151  
        coord 0.095 0.245  
        coord 0.120 0.302  
        coord 0.170 0.347  
        coord 0.220 0.371  
        coord 0.270 0.391  
    }  
}
```

Inlet Curve Block Commands

Inlet curve blocks may be specified for both on-grade or sag inlets. Inside the curve block you may include the [Polynomial Inlet Capacity Commands](#) and [Coordinate Inlet Capacity Commands](#).

```
cap_curve_grade "unique name for the pit type" {  
    road_grade x.xx  
    road_xfall x.xx  
}
```

Inside the cap_curve_grade block the road grade and road crossfall threshold values (percent) may be set. The road grade and crossfall are calculated by the [Drainage Network Editor](#). When the 12d analysis engine selects the inlet curve, all curves with the same road_xfall are grouped together and then within the crossfall group the road_grade curves is selected. The inlet curve with the maximum grade threshold that is less than or equal to the road grade is selected.

Rules for 'cap_curve_grade' entries:

- Only applicable to on-grade pits.
- All cap_curve_grade names must be unique within a Manhole block
- If both 'road_grade' and 'road_xfall' entries are omitted, only one cap_curve_grade entry is allowed within a pit.
- The cap_curve_grade 'coord' entries (if used) must be in order of increasing Qa.

```
cap_curve_sag "unique name for the pit type" {  
}
```

Rules for 'cap_curve_sag' entries:

- Only applicable to sag pits.
- Only one cap_curve_sag entry is allowed within a pit, and it must have a valid name.

Coordinate Inlet Capacity Commands

The coord command must be used inside the cap_curve_grade or cap_curve_sag grouping
coord x.xx y.yy

x.xx must be in increasing order.

For cap_curve_grade group, the coord command has the parameters Qapproach and Qin

For cap_curve_sag group, the coord command has the parameters Depth and Qin

Please continue to the next section [Drainage Definitions - Pipe Types](#).

7.4 Drainage Definitions - Pipe Types

Pipe types may be used to set the following pipe properties via the DNE.

- s pipe nominal/actual diameters and thickness
- s roughness method and value
- s rational method design mode and design percent depth
- s minimum pipe height for the rational design engine
- s user defined pipe attributes

Each definition (pipe block) in the file begins with the key word **Pipe**, followed by the pipe type and then curly braces { }. The order that the definitions appear in the file determines the order they appear in the drop down lists inside **12d Model**.

The minimum requirement for a pipe type definition is

```
Pipe "name" {  
}
```

7.4.1 Pipe Thickness

```
pipethickness {
    diam_thickness x.xxx y.yyy a.aaa b.bbb c.ccc d.ddd
}
```

x.xxx nominal diameter choices will appear in the DNE->Pipe->Diameter drop down
y.yyy internal diameter (base units) will be entered into the DNE->Pipe->Diameter field
a.aaa optional top thickness (base units) 0.000 if omitted
b.bbb optional bottom thickness (base units) top thickness if omitted
c.ccc optional left thickness in direction of chainage (base units) top thickness if omitted
d.ddd optional right thickness in direction of chainage (base units) top thickness if omitted

An example pipe definition follows.

```
Pipe "2" {
    // HUMES class 2 rubber ring joint pipe thicknesses
    pipethickness {
        // nominal_diam internal_diam top [bottom] [left] [right] (looking in the direction of chainage)
        diam_thickness 0.225 0.229 0.025
        diam_thickness 0.300 0.300 0.031
        diam_thickness 0.375 0.375 0.035
        diam_thickness 0.450 0.450 0.042
        diam_thickness 0.525 0.534 0.041
        diam_thickness 0.600 0.610 0.044
        diam_thickness 0.675 0.685 0.048
        diam_thickness 0.750 0.760 0.052
        diam_thickness 0.825 0.838 0.054
        diam_thickness 0.900 0.910 0.066
        diam_thickness 1.050 1.070 0.075
        diam_thickness 1.200 1.220 0.076
        diam_thickness 1.350 1.370 0.077
        diam_thickness 1.500 1.524 0.095
        diam_thickness 1.650 1.676 0.095
        diam_thickness 1.800 1.828 0.102
    }
}
```

7.4.2 Pipe Attributes

attribute_integer	"attribute name1" x	x is an integer value (no decimal, stored exactly by computers
attribute_real	"attribute name2" x.xxx very large or very small numbers	x is a real value (used to store numbers with decimals or
attribute_text	"attribute name3" "text"	text is a series of words or numbers not intended for calculations

The following special attribute commands create/modify an attribute as described above but these attributes also control calculations performed by the set pit details button on the [Drainage Network Editor](#). The DNE fields will be locked when these attributes are defined for the selected pipe type. If these attribute are not defined for the selected pipe type the DNE field will not be locked and remain unchanged.

```
roughness_n      x.xx>      DNE field ->Pipe=>Main=>Roughness
                                 DNE field ->Pipe=>Main=>Roughness type (set to Manning)
```

roughness_k	x.xx	DNE field ->Pipe=>Main=>Roughness Colebrook k roughness value in millimetres DNE field ->Pipe=>Main=>Roughness type (set to Colebrook)
attribute_real	x.xx	DNE field ->Pipe=>Design=>Min pipe height min height in base units
attribute_integer	"design size mode" x	DNE field ->Pipe=>Design=>Design mode
	Mode	x
	<u>Pressurised Pipe: Freeboard design</u>	0
	<u>Part-full Pipe: Freeboard design</u>	1
	<u>Part-full Pipe: Flow depth design</u>	2
	<u>Open Channel: Freeboard design</u>	3
attribute_real	"design percent depth" x.xx	DNE field Pipe=>Design=>Flow-depth at pipe entrance

An example of these setting follows:

```
Pipe "CHNL GRASS EXISTING 1" { //Open Channel 1
  roughness_n 0.040
  attribute_integer "design size mode"    3 // open channel mode
}
```

8.0 Open Channel Flow

12d can model flow in open channels a trapezoidal sections. Suggestions for drainage network editor settings are listed below.

Generally, simple channels leading into a pipe network are often not modelled as open channels. The flooded width calculations can perform flooded width calcs (normal depth however) along the channel and the depth at the headwall is calculated using the headwall ku method.

If gradually varied depth/backwater calculations are desired then the channel will need to be modelled as a drainage string. Also if the pipes discharge into a channel then this channel will also need to be modelled as a drainage string.

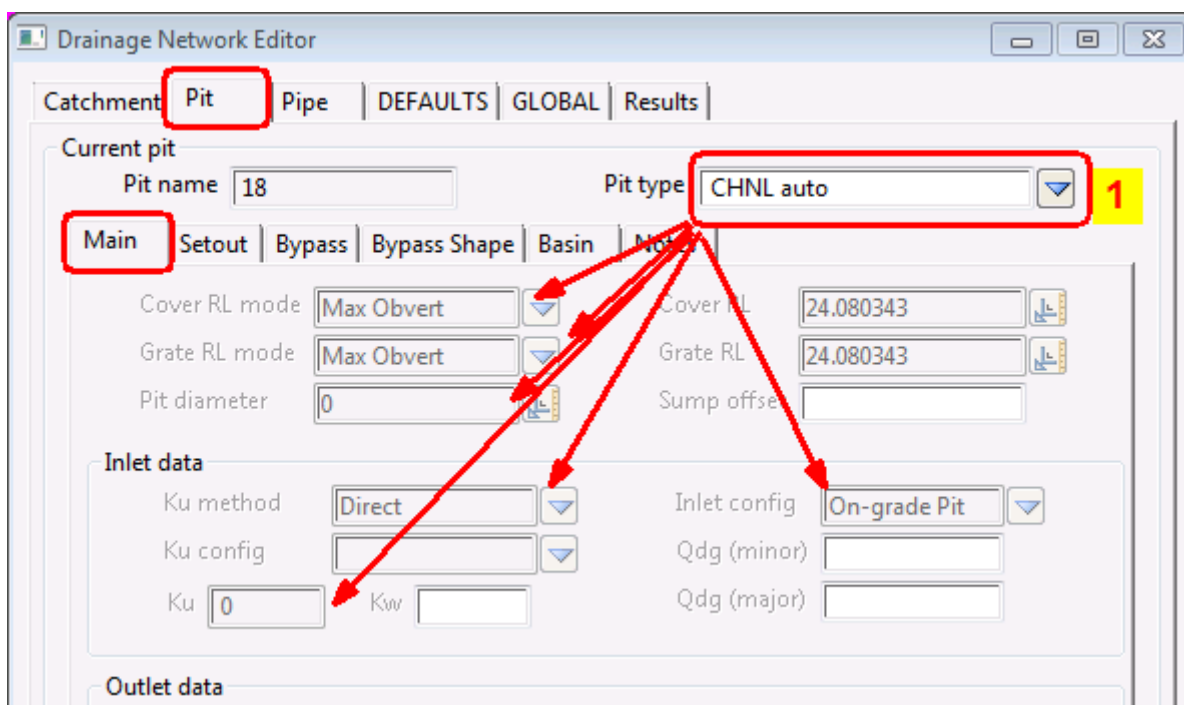

Key points

The pit grate level must always be at or above the top of the open channel conduit.

Changes in vertical grade and horizontal alignment require a pit in the drainage string. The pit diameter is usually set to zero.

Channels may exist in the tin or you may be proposing a channel to be cut into the tin. The grading and grate level modes will be different for each case. These channel type will be referred to as "Existing" or "Proposed"

Pit-Main Tab

1. Selecting the **CHNL auto** pit type changes many settings in the DNE.

Cover RL mode is changed to **Max obvert**.

Grate RL mode is changed to **Max obvert**.

Pit diameter of diameter of zero. This will result in a single line on the drainage long sections instead of a pit.

Ku method is set to **Direct** and a **Ku** of 0 for the channel change of grade points (pits).

Inlet config - On-grade pit - it has a 200% inlet capacity. The 200% inlet capacity is in case a

choke factor is accidentally applied.

2. Select the Pit Setout tab

Pit-Setout Tab

Drainage Network Editor

Catchment **Pit** Pipe DEFAULTS GLOBAL Results

Current pit
Pit name 18 Pit type CHNL auto

Main **Setout** 2 ss Bypass Shape Basin Notes

Pit setout
Setout xy mode Pit Centre
Setout distance 0
Setout z mode Sump Invert
Easting 5003.841157
Northing 7312.32155
Setout RL 23.080343

Pit road chainage
Chainage mode No Road 3
Road name
Chainage
Offset

Setout xy mode is set to **Pit centre**

Setout z mode is set to **Sump Invert** which is the lowest of the channel inverts if **Sump offset** = 0(Main tab).

3. The **Chainage mode** may be changed to **No Road** if the channel centre line is not to be used for setout.If the default was **Centre string** this will stop the Problem message saying the centreline string is not found.

Pipe-Main Tab

Drainage Network Editor

Catchment | Pit | **Pipe** | FAULTS | GLOBAL | Results

Pipe downstream of current pit

Invert levels

US Invert: 23.080343

DS Invert: 22.813673

Dimensions

Diam/Height: 0.5

Width: 1

Top width: 5

Section location:

Other properties

Roughness type: Manning

Roughness: 0.04

US defl.: -11°48'20"

Qdp (minor):

Qdp (major):

DS defl.: -45°06'25"

Length: 53.334

4. Change to the **Pipe->Main** tab
5. Change the **Pipe type** to **CHNL GRASS PROPOSED**. This changes the following:
the **Roughness type** to **Manning**
the **roughness** for the open channel to 0.040
6. Set the **Height**, **Top width** and **Bottom width** of the channel.

Note: The pipe type can now be changed back to channel if you needed to alter any of the locked settings. Selecting the **CHNL GRASS PROPOSED** first set most of the setting correctly as a good starting point.

Pipe-Design Tab

Drainage Network Editor

Catchment | Pit | **Pipe** | DEFAULTS | GLOBAL | Results

Pipe downstream of current pit

Pipe ID: 18 to 17

Min grade (%): 10 (10)

Align drop: 0 (9)

Pipe size design

Lock pipe size ☐

Min pipe height

Max pipe height

Design mode: **Open Channel: Freeboard Design**

Freeboard limit at US pit

Flow-depth limit at pipe entrance (%)

7. Change to the **Pipe->Design** tab

8. Set the **Align mode** to “IL-IL drop”

9. Set the **Align drop** value to 0 (unless you are designing drop structures for your channel).

10. **Min Grade %** for open channels is usually much less than pipes.

Note: The **Design mode** has been changed to “**Open Channel: Freeboard Design**”. This will allow supercritical flow to continue through the channel junctions. Often the Freeboard limit will be different for a channel than the pipe system.

9.0 Major Flood Events

To keep the results file from the minor event copy the drainage models using

Save your project. The following routine copies the models that are saved on disk!

Models->Utilities->Copy Project Models

	Copy	Original Model Name	New Model Name	Status
7	<input checked="" type="checkbox"/>	drainage	drainage minor	ma
8	<input checked="" type="checkbox"/>	drainage flood sag ponds	drainage minor flood sag ponds	ma
9	<input checked="" type="checkbox"/>	drainage flood widths	drainage minor flood widths	ma
10	<input checked="" type="checkbox"/>	drainage flood widths warn DxV	drainage minor flood widths warn DxV	ma
11	<input checked="" type="checkbox"/>	drainage flood widths warn Q	drainage minor flood widths warn Q	ma
12	<input checked="" type="checkbox"/>	drainage flood widths warn W	drainage minor flood widths warn W	ma
13	<input checked="" type="checkbox"/>	drainage flood xsecs	drainage minor flood xsecs	ma
14	<input type="checkbox"/>	drainage labels	drainage minor labels	ma
15	<input type="checkbox"/>	drainage points	drainage minor points	ma

1. Select your current project
2. **Type** the name of your drainage model followed by the wildcard*
3. **Type** the new name for your minor results followed by the wildcard*
4. Tick the models that you want to copy
5. Select **Copy**
6. Select **Finish**

Now that the minor results are safely stored away, edit the drainage model using the DNE.

For major flood events the user may desire to use an alternative set of values for

Catchment to,
 Catchment C,
 Pit direct inflow (Qdi),
 Pipe direct inflow (Qpi),
 Pit choke factor for ongrade inlets,
 Pit choke factor for SAG inlets,
 Outlet tailwater levels.

These controls are found on the Storm Analysis Panel, **Main** tab.

1. Ensure you have selected the **drainage** model and then go to **Storm analysis**.

2. Type the new return period.

3. Select the **major** storm setting.

4. turn off the **Modify pipe inverts** and **Modify pipe sizes**.

5. Change the name of your report files by adding **100** after drainage.

You are now ready to analyse the major event and check the surface flooding conditions.

10.0 Excavation Quantities

Sample templates are included in the 12d library (pipe template.tpl). The templates from this template library may be added to your project using

Design=>Templates=>Utilities=>Input.

Usage

Access this report from the menu selection

Design => Drainage => Reports => Excavation Quantities

This routine uses 12d templates to calculate the excavation volume for all of the drainage strings in a model. An option to create section for a tin on top of the pipe is also available so that the drainage long sections can include hatching between the obvert of the pipe and the design tin under roads.

Templates with names set to the pipe diameters (times 1000) are used for the calculations, thus trench shapes can be customised and over excavation for bedding materials can be included. Net area calculations to exclude pipe area are not supported.

Key points

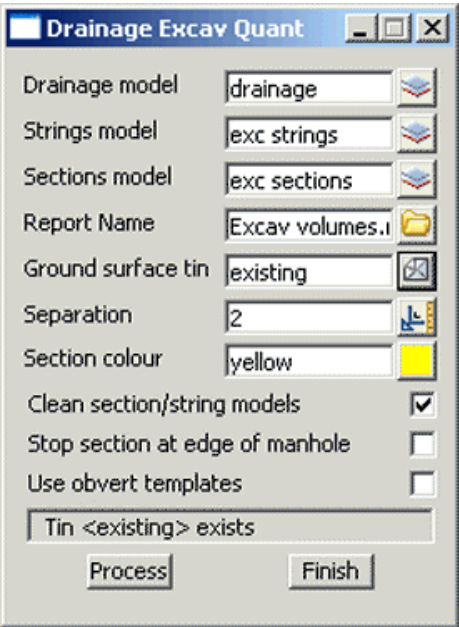

1. One template for each pipe size (mm)
2. If obvert templates are used, add the prefix “obvert “ to the pipe size
3. Carefully consider the tin selected.

A template must exist for each pipe size in the model (pipe size x 1000). For example a 0.3m pipe will require a template to exist named 300. A 0.5ft pipe would require a template named 500. A sample template library is included in the 12d library in the file **pipe_template.tpl**.

The templates are run along the strings and the total volumes are reported. Volumes for each strings are given in the report file.

If a tin is created from these strings then volumes by depth can be determined using **Design=>Volumes=>Exact=>Tin to tin**

On selecting the **Excavation quantities** option, the **Drainage Excavation Quantities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Drainage model	input box		
<i>Model to contain all of the pit and pipe network to be worked on.</i>			

Strings model	model box		
<i>Strings generated from the templates will be stored in this model</i>			

Sections model	model box		
<i>Sections generated from the templates will be stored in this model</i>			

Report name	input box		
<i>cut and fill volumes will ne sent to this report</i>			

Ground Surface Tin	tin box		
<i>tins from which the volumes will be calculated</i>			

Separation	real box		
<i>distance between the sections</i>			

Sections colour	colour box		
<i>Sections generated from the templates will be assigned this colour (strings colours are defined in the templates)</i>			

Clean section/strings model	tick box		
<i>Delete the strings in these models before processing.</i>			

Stop section at edge of pit	tick box		
------------------------------------	----------	--	--

Template are run from pit centre to centre if this is not selected. The templates stop at the edge of the pit if selected. This is often selected with the following option **Use obvert templates.**

Use obvert templates tick box

Templates must be named with the prefix “obvert”. i.e. **obvert 300**. The template is still run along the invert of the pipe but the user now has a section “set” of templates that can be used to create a tin on top of the pipe as well as below.

An example report file follows.

```
----- BEGIN APPLY TEMPLATE REPORT -----

apply template to string report -

string      E
tin         design
separation  10.000

```

11.0 Network Quantities Report

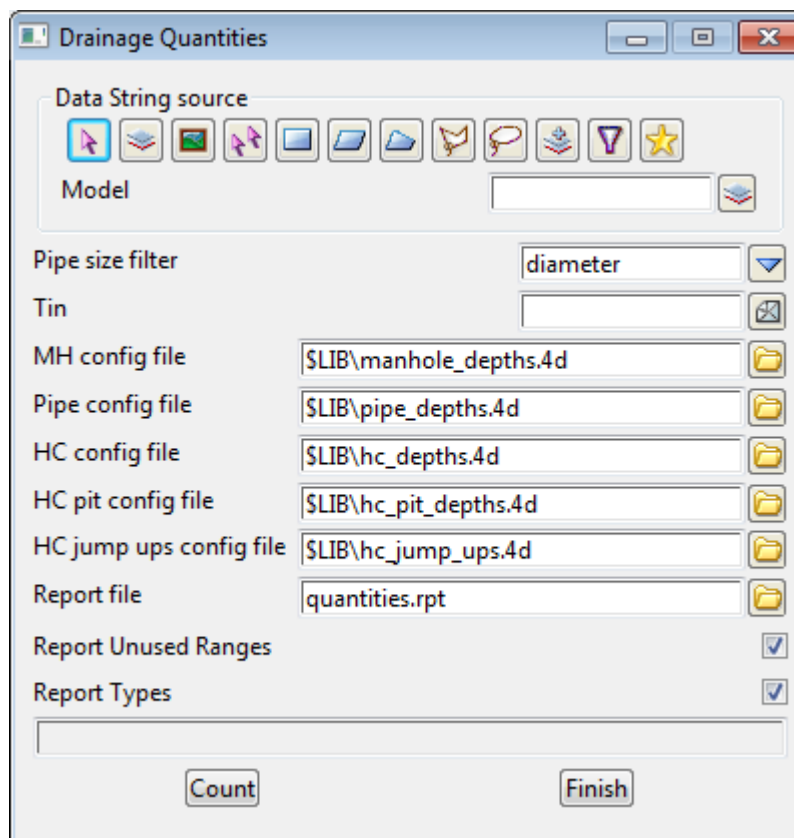

This panel is accessed from the menu selection

Design => Drainage Sewer => Reports=> Network Quantities

Key points

1. Items are counted/totalled by depth and optionally type.
2. The routine will not "double count" items even if the ranges overlap.
3. Types are case sensitive, types with spaces in the name must be enclosed in quotes and the wild card * may be used.
4. Use vertically offset tins and "banded" depth ranges to get quantities under roads, foot paths etc. This is discussed later in detail.
5. Erase count file fields if the items are not to be counted.

On selecting the **Network quantities** option, the **Drainage quantities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data String Source	Choice		
---------------------------	--------	--	--

usually the entire model is selected but view is also available for combining models

Pipe size filter	Choice		diameter or pipe size attribute
-------------------------	--------	--	---------------------------------

*The second item in a count line is used to filter by **diameter** (in meters/ft) or the **pipe size attribute**. The*

diameter can only be used when no box culverts or trapezoidal channels are used. The **pipe size attribute** is the label generally used in the plan plots. This is the pipe size in mm/inches (375), for box culverts width x height (750x375) and for trapezoidal channels TopwidthBottomwidthxHeight (T5000B1000x500).

Tin tin box
This tin will be used for the pipe and pit depths.

MH config file file box
This file specifies the types and depth ranges for the pits. Details of this file are contained below.

Pipe config file file box
This file specifies the types and depth ranges for the pipes. Details of this file are contained below.

HC config file file box
This file specifies the types and depth ranges for the house connections. Details of this file are contained below.

HC pit config file file box
This file specifies the types and depth ranges for the HC pits. Details of this file are contained below.

HC jump ups file file box
This file specifies the types and depth ranges for the house connections jump ups. Details of this file are contained below.

Report file file box
a sample report file is given below.

Report unused ranges tick box
*the depth ranges for the pit/pipe/house connections are defined in the *.4d files. Selecting this option will cause the depth ranges in the file to be printed even if there are no pit/pipe/house connections in these depth ranges (zero quantity values will be shown).*

Report types tick box
*Selecting this option will cause the pit/pipe/house connection types used in the model types to be listed (even if quantities are not requested in the *.4d files). Since this is a complete of the type used in the model, the list informs the user what types have not been included in the quantity calculation.*

Count button
executes the option.

Finish button
removes the dialogue from the screen

The *.4d files listed above are contained in the 12d **library** directory. Each line is the file performs a count (count lines). No items are counted twice. Therefore, if an item is counted its type and then a count line is found the wild card is used for the type, the type already counted will not be included in the count.

The format for a count line is three or four values (space delimited) per line. Size is optional.

```
<type (from drainage.4d)> <size> <starting depth> <ending depth>
```

Notes:

All **types** with spaces in the name must be enclosed in quotes The wild card * may be used.

The **size** is optional and if omitted the all sizes will be counted in this group (do not use the * for a wild card).

The **starting depth** and **ending depth** are required for all count lines.

Quantities Under Roads and Footpaths

By creating super tins with vertically offset sections, quantities under roads, footpaths etc. can be determined. for example.

Offset your road design tin up by 1000m (**Tins->Utility->Translate/Copy**) and then use the depth range 1000-1999 for pipes under roads.

Create a tin from the footpaths only, null by angle length with a small length to remove the road and then offset it vertically by 2000m. the depth range 2000-2999 is not the quantities under the footpath.

Sample count lines

```
// sum concrete cover manholes is various ranges

"CONC COVER" 0.0 1.6
"CONC COVER" 1.5 3.0
"CONC COVER" 3.0 999.9 // this is expected to be zero
"CONC COVER" -999.0 0.0 // trap errors

// any that are not Concrete cover will be counted here

* 0.0 1.6
* 1.6 3.0
* 3.0 999.9
```

Manhole Quantities
=====

CONC COVER	0.00	1.60	13	16.506
CONC COVER	1.60	3.00	1	1.510
CONC COVER	3.00	999.9	0	0.000

*	0.00	1.60	0	0.000
*	1.60	3.00	0	0.000
*	3.00	999.9	0	0.000

total length = 18.016

Types Used

CONC COVER

Diameters Used

1.100

Since the **Report unused ranges** tick box was selected, these lines were printed even though there were no pits in the data ranges.

This data results from selecting the **Report types** tick box.

Sample count lines for pipes follow.

```
// sum class 2 pipes by diameter and for various ranges

// count 375

2 0.375 0.0 2.0
2 0.375 2.0 5.0
2 0.375 5.0 999.

// count 450

2 0.450 0.0 2.0
2 0.450 2.0 5.0
2 0.450 5.0 999.

// count 525

2 0.525 0.0 2.0
2 0.525 2.0 5.0
2 0.525 5.0 999.

// count pipe sizes that were missed

2 * 0.0 2.0
2 * 2.0 5.0
2 * 5.0 999.

// count all other missed pipes

* 0.0 999.
```

12.0 Exporting to Drainage Design Software Packages

12d contains most of the data required for your drainage design packages. However, each package has specific design variables that 12d does not have access too. The design process is intended to export your data from 12d to the design package, design the drainage system and then read the results back into 12d for your long sections.

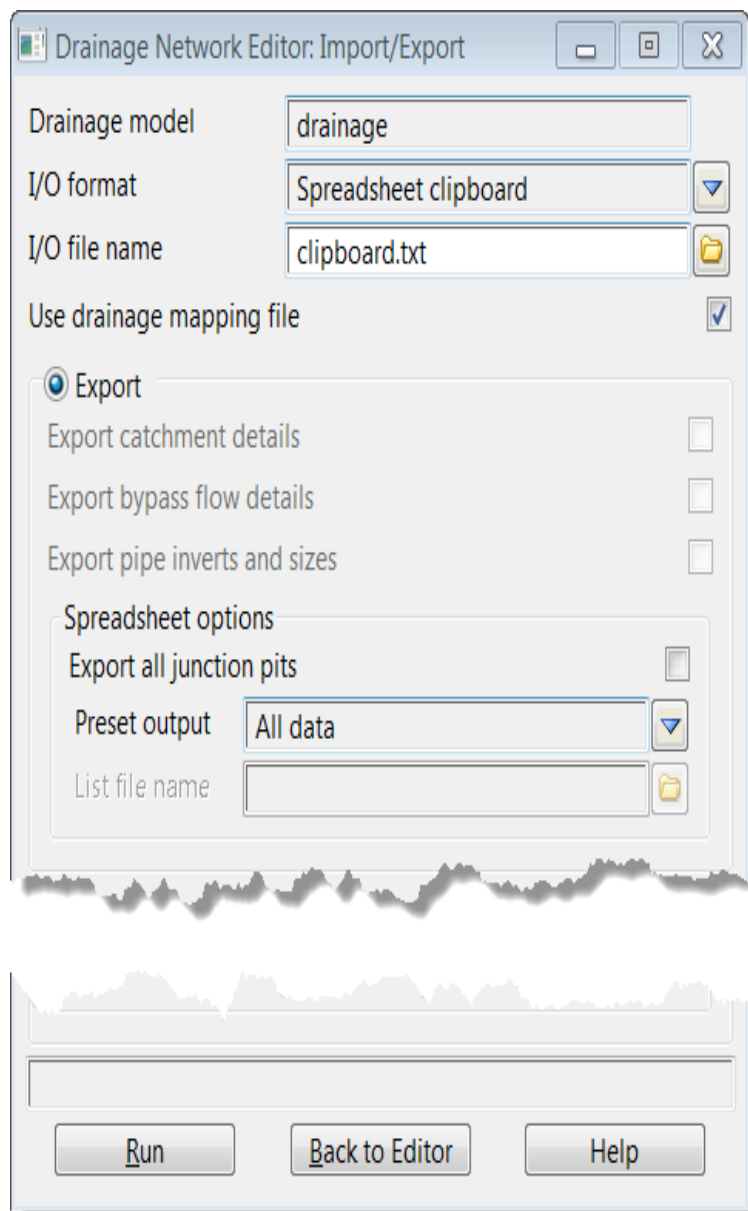

If pits/pipes are to be added/deleted from your network during the design process you are safest to add/delete the pit/pipe to 12d and to your design package separately.

Not recommended and as a poor alternative, you have the option of reading the results back into 12d, adding/deleting the pits/pipes and then exporting the data to a new drainage project in your drainage design software. **As 12d does not have access to all of the data in the design packages this method is not recommended!**

Some of the drainage design programs offer a third option that allows you to import data “on top of” an existing project thereby merging and over writing the existing data. Be sure to contact the drainage software supplier to obtain exact details of how the merging process is performed.

The interface is run by selecting **Import/Export** from the **Drainage [Network Editor](#)**

Design->Drainage-Sewer->Network Editor

The **Drainage model** is the model currently being edited.

The **I/O format** selects which external program the 12d is interfacing with. Some programs use the windows clipboard and others use files. If the clipboard is used the data will also be written to a file by 12d in case you need to take the data to another computer.

Export enables the export fields below and exports when **Run** is selected.

The **Export options** have slightly different effects depending on the **I/O format** (program) selected above. Therefore they will be discussed later with the various formats.

Export pipe diameters and inverts is generally select for existing systems only. If your design program will set invert levels and pipe sizes then turn this tick box off for new systems. Some design programs will require initial inverts and pipe sizes. In this case this box should be selected on the first export.

Export default catchment/pit parameters is generally selected for the first export. For subsequent exports turn this selection off and then only the catchment areas (if the model is supplied above) will be exported.

13.0 Drainage Data Input and Output to Spreadsheets

Spreadsheets are an effective method to manage the numerous variables urban drainage designers create in the modelling process. Spreadsheet data can be transferred to and from 12d in tab delimited files and stored within 12d as “user definable attributes”. These attributes are linked to the pit and pipes within a network. Drainage long section plots can display the pipe attributes in the “arrows” data area and pit attributes in the bubbles area. Drainage plan drawing can also show these pit and pipe attributes.

Drainage strings will be created if they do not exist in the model but pits cannot be added to existing strings.

12d to spreadsheet transfers

Spreadsheet to 12d update and create

Spreadsheet options

13.1 12d to spreadsheet transfers

This interface is accessed the **Import/Export** button on the Drainage **Network Editor**.

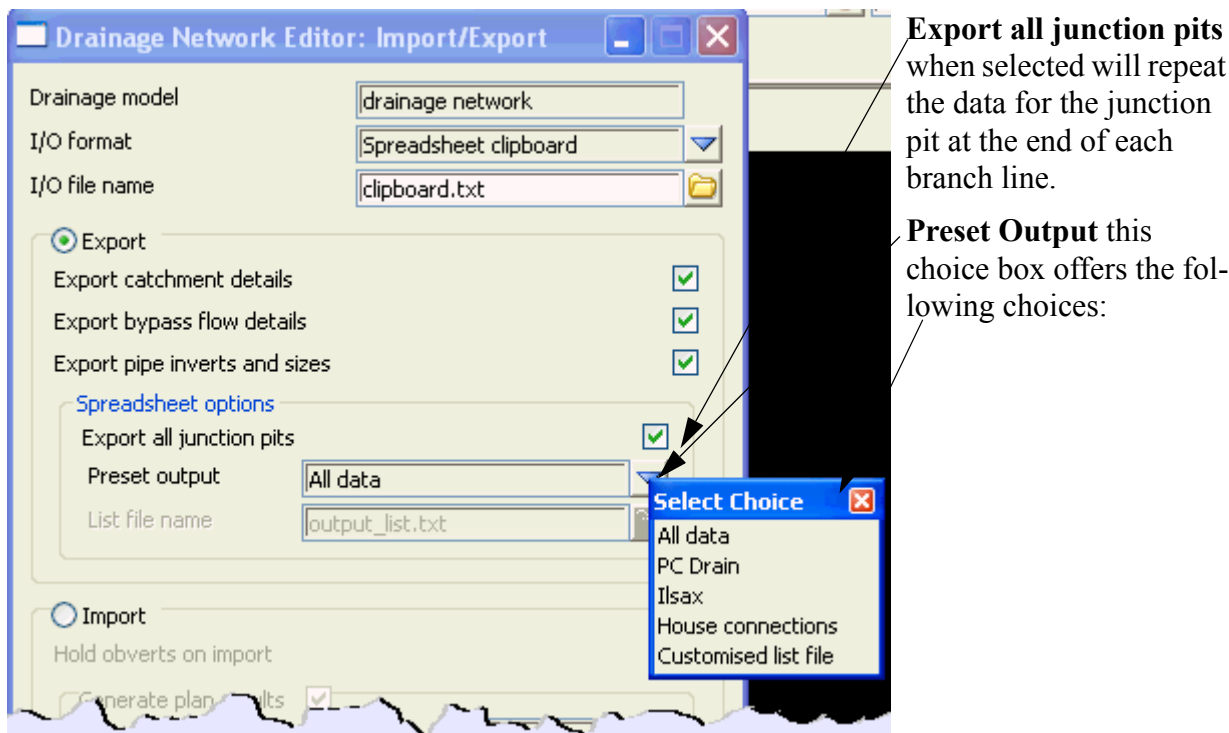

1. Select Spreadsheet clipboard
2. leave as **clipboard.txt** to send the data to the windows clipboard as well as this file.
3. Mapping files are the most current 12d technology. Leave this selected.

These options are not used for spreadsheet export.

4. Usually leave this off! Select to export the junction pit at the end of all drainage lines (very rarely needed).
5. You may also select to limit the output if desired. If you like using spreadsheets for data entry, the PCdrain data and ILSAX data formats are useful for adding data for the first time for either program.
6. Select Run to place the data on the clipboard.

13.1.1 Options

The **Spreadsheet Options** section allows the user to define the amount of data exported.

All Data: All of the 12d drainage string data and the user defined attributes will be exported to the clipboard in a tab delimited format. The 12d data names and the user defined attribute names will appear at the top of the spreadsheets columns.

ILSAX: For the ILSAX program, the spreadsheet column headings will change depending on the pipe and catchment indicators (P2 card) and the inlet type (P3 card). Therefore, use the ILSAX pipe editor macro to set up one pit/catchment for the type of data you wish to enter. Now when you export the pipe network data the column headings will include the names of the relevant parameters.

User defined below: The **Customised list file name** is used to define the drainage values, their order and format you desire.

The **customised list file** is a text file where each line contains a drainage variable or a spreadsheet IO command (blank lines are ignored unless preceded by the header command). The spreadsheet IO commands are all lower case and listed below:

header	to define a line of text to be exported
blank	to leave a blank column in the output
pit data	the following attributes are for the pit.
downstream pit data	the following attributes are for the downstream pit.
upstream pit data	the following attributes are for the upstream pit(s).
pipe data	the following attributes are for the pit's outlet pipe
downstream pipe data	the following attributes are for the downstream pipe(s)
upstream pipe data	the following attributes are for the upstream pipe(s)
variable name	a 12d drainage variable names
factor	the following variable is multiplied by this factor
decimals	the following variable will export with these decimal places

The simplest way to create your own customised tab delimited file is to set the **Preset Output**

field to **All data** and leave the **customised list file name** field blank. Selecting **Set**, **Finish** and then **Copy** from the main dialogue. The data will be placed on the clipboard and a **customised list file**, named **output_list.txt** will be created containing the names of all of the drainage variables in the 12d model. Use a text editor to add/or delete the variable names, change their order and/or add spreadsheet IO commands. **Save the file with a new name!** The **output_list.txt** file is overwritten on every export.

A listing of a customised list file follows. Note the words in the header file have a “tab” between them so that they will be spaces across the spreadsheet columns.

```

header
Pipe Details
    header
    Name Length  U/S IL  D/S IL  Slope(%)  Class  Dia I.D.  Rough  Pipe Is  No. Pipes

    pit data
    *pit name

    pipe data
    *length
    low ch invert
    high ch invert

    factor
    100
    *grade

    pipe type

    factor
    1000
    diameter
  
```

After creating your customised list file, select **Options** again and change the **Preset Output** field to **User Defined below** and enter the new **customised list file** name that you saved above. Select **Set** then **Finish** and finally **Copy** to put the formatted data onto the clipboard.

The data can be pasted into a spreadsheet program for checking or additional formatting.

CUSTOM FORMATED DATA MIGHT NOT BE PASTED BACK INTO 12d!

The data must be in the “12d drainage spreadsheet” format to be read into 12d.

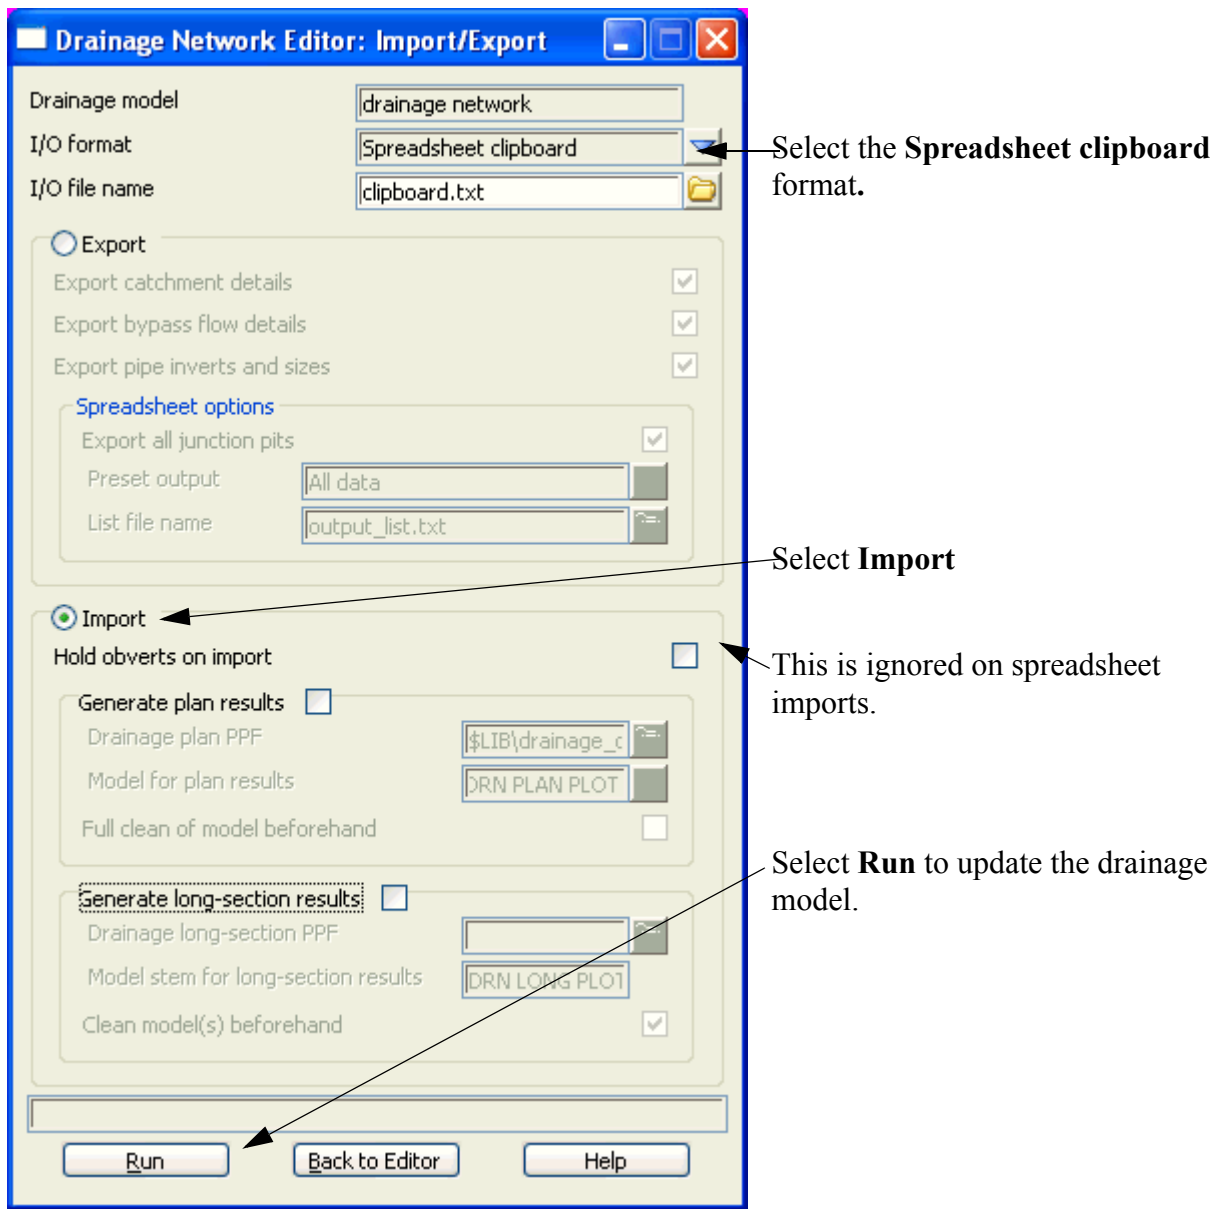

Caution with pit names in the form 1-1 or 1/1. Some spreadsheets will interpret these values as dates. If you use these formats for your pit names you will have to paste command them in once, format the columns that contain the pits names as text data and then paste the information in again.

One final word on using the copy/paste commands in the Microsoft Excel program. The Paste Special command using the “Skip Blanks” option will allow you to copy a large block of 12d data (with blanks in it) on top your data so that your data is preserved where it coincides with the blanks. To use this option paste the data into a blank spreadsheet and then select copy again. The Paste special option with “Skip Blanks” will now be available.

13.1.2 Spreadsheet to 12d transfers

This item is accessed from the **Import/Export** button on the **Drainage Network Editor**.

The following panel will appear.

Tab delimited, “12d drainage spreadsheet” format or “from to” format data must be on the clipboard in order to update a 12d drainage model or create a new model. These format are described below.

13.1.3 Updating an Existing Model

The data usually is generated by 12d using the **Export** option, pasted into a spreadsheet and then copied back to the clipboard so that 12d can be updated.

When 12d exports the drainage model to a spreadsheet it includes a column for the unique string identifier and a unique pit identifier (unique to the drainage model not the 12d project). The names of the strings and pits may be changed via the spreadsheet if these columns are present at import time.

If the pit id column is not present, 12d will search the drainage model for a matching pit name. When the pit is a junction between drainage lines, only the trunk line will be the data updated.

13.1.4 Creating a New Model

It is possible to create a new string or an entire drainage network using this format. However, pits cannot be added to an existing string. The entire drainage string must be created at once. Two formats are available, the “from-to pit” format and the “12d drainage spreadsheet” format.

At present the network editor must select a drainage string to become active. Therefore, if you are not adding strings to a network, you will have to create a drainage network with one “dummy” pit. Select this one “dummy” pit to activate the editor. After importing the data and the new drainage lines are created the “dummy” pit may be deleted.

12d drainage spreadsheet Format

The top left cell in the clipboard data must be the text “12d” to specify this format. The minimum amount of data required to create a new string is the string name, pit name, x and y coordinates. You can add as much additional data as you have available. This would include pipe diameters inverts etc. The pits must be listed from upstream to downstream order. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An example file exists called **new_network.txt** is supplied in the library. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Set the **I/O Action** to **Import** and select **Run**. The new drainage lines will exist in the model currently being edited.

From-to Pit Format

The top left cell in the clipboard data must be the text “from to” to specify this format. The minimum amount of data required to create a new string is the upstream pit name (*pit name), the downstream pit name (*ds pit name) and the x(x location) and y(y location) coordinates of the upstream pit. If the string is to join a trunk line, the junction pit must be included for both the tributary and the trunk line.

An optional column for the pit cover elev (cover elev) may be specified. Once the network has been created additional pipe and pit data may be added using the “12d drainage spreadsheet” format described above.

An example file exists called **new_from_to_network.txt** is supplied in the library. It is shown below. Open this file in a spreadsheet or a text editor and copy it to the clipboard. Enter a new model name in the **Drainage model** field and select paste. The new drainage model will now exist.

from to	pit	pit	pit	pit
*pit name	*ds pit name	x location	y location	cover elev
text	text	real	real	real
E/1	A/3	5309.458	7336.935993	29.2173

13.2 “12d drainage spreadsheet” Format

Each column of data is used for a 12d drainage variable or a user defined attribute. Each row represents a pit and the downstream pipe (controlled by the direction of flow variable) within the drainage network. A sample is shown below.

12d	pit	pit	pit	pit	pit	pit
*string Name	*pit name	pit type	pit low ch invert	pit high ch invert	pit id	string id
text	text	text	real	real	integer	integer
E	E/1	SA2	28.108	28.108	1	67389

B	A/5	SA2	26.0744	26.0744	19	192066

Duplicate Definitions

Strings Variables such as “direction” are may be defined for numerous pits on the same string. Searching in a top down direction through the file, the last definition found for the string will be set.

Invert levels may be set via pipe data or pit data or combined. It is recommended that the user only use one method and not combine them. Both are exported so delete the ones you are not going to use. The variables are processed from left to right, so if duplicate definitions of an invert level or found the right most data will be set.

The format definition

1. Row1, column 1 must contain either “12d”, or “from to”. Therefore, the first column must be a 12d drainage variable (cannot be a user defined attribute).
2. Row 1. The text <pit> at the top of the column indicates the column contains a user defined pit attribute and similarly <pipe> indicates a user defined pipe attribute.
3. Row 2. This row contains the names of the 12d drainage variable names and the pit/pipe attributes. All names are case sensitive so be careful where you use capital letters. A list of 12d drainage variables is found below.

Names beginning with an asterix (*) will not be processed (except pit/string names when unique identifiers are present in the data). 12d drainage variables names beginning with an asterix indicate that this data was calculated at export time and cannot be read back into 12d (for example, pipe length, pipe grade and deflection angle).

Prefixing an user defined attribute name with “DELETE ” (no quotes, note the space after the DELETE) will cause the attribute to be deleted from all pits/pipes within the model.

4. Row 3. The text in this row define the type of attribute to be stored within 12d. The only valid choices are;

integer
real
text

If you want to change an attribute type you must delete the attribute and create it again. If you simply change the attribute type in the third row then that attribute will not be updated.

5. Blank lines may be inserted as desired.
6. You are not required to fill in all of the cells in the spreadsheets. Blank cells are ignored (you must use a space to remove all data from text attributes (the space will not be stored).
7. Pipe names are included in the data so that they can be changed but they are **not** used to identify the pipe. Pipe data will always be assigned to the pipe following the pit in the direction of **ascending** chainage. If flow directions is ascending then the pipe data will be for the downstream pipe. If the flow direction is descending then the pipe data will apply to the upstream pipe.

13.3 12d Drainage Variable Names

Manhole Variables	Pipe Variables	String Variables
*string Name	pipe name	direction
*pit name	pipe type	<div></div>
pit type	low ch invert	<div></div>
pit diameter	high ch invert	string id
pit low ch invert	diameter	
pit high ch invert	*length	
pit road chainage	*grade	
pit road name	low hgl	
*pit angle	high hgl	
*pit drop	pit hgl	
*pit depth	flow	
*pit chainage	velocity	
x location		
y location		
cover elev		
*fs elev		
*ns elev		
pit id		

14.0 Detailed Drainage Plan Drawing - Creating MH Symbols

There are many methods to create the drainage symbols and one is presented here. The pit symbol is drawn so that the symbol “sits on” the road string that it aligns with (the road string is the y reference). For drawing lintels and grates, assume the road is downhill to the right. See diagram below.

Two symbols are required, one for the left side of the road and one for the right side (referred to as the mirror symbol in the plan ppf). 12d checks the downhill direction of the road strings when using these symbols to determine which is the left and right side of the road.

Either draw your own symbol or import the symbols using **File IO->Data Input->4ds/12da data** and selecting the file **inlet symbols.12da**

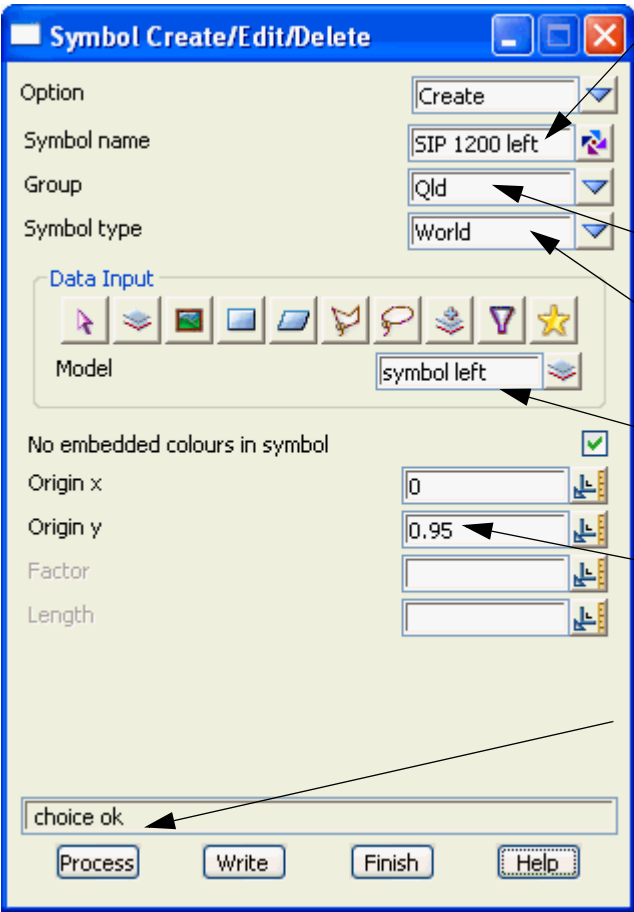

To create the symbol in 12d draw the left pit symbol in a model by itself. The pit should “sit on” the zero “y” grid line. A 900 wide by 600 long inlet with a 1.2m lintel is shown above.

From the main menu, select

Project->Tree

Expand **Project** then expand **Symbols** and finally select **Create Symbol**.

Enter the **Symbol Name**. Usually the name includes the size.

Select the **Group** the symbol is to appear in the symbol drop down menu and select **World** as the symbol type.

Select the **model** that contains the manhole drawing.

Enter the x,y location of the manhole centre in your drawing (0 is different then blank!).

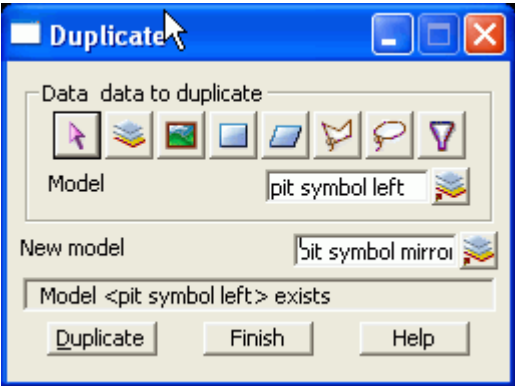

Process will create the symbol in the project.

Change the **symbol name**, **origin y** and press **Process** for each offset required.

Write will add the new symbols to the symbols.4d file so that they will be available to other projects.

Leave this panel open as we will need it after we create the mirror image of the pit.

To create the mirror image of the symbol about the x axis use the CAD mirror about X axis command. 12d will require you do this one string at a time. Version 7 does not mirror into a new model so you will want to duplicate the pit symbol model first using **Utilities->A-G->Duplicate**.

Now repeat the process of creating the right side mirrored symbol. Note that the location of the pit centre is now **negative** and add the suffix **mirrored** to the symbol name.

Do not forget to select **Write** again to save the symbols to the symbols.4d file.

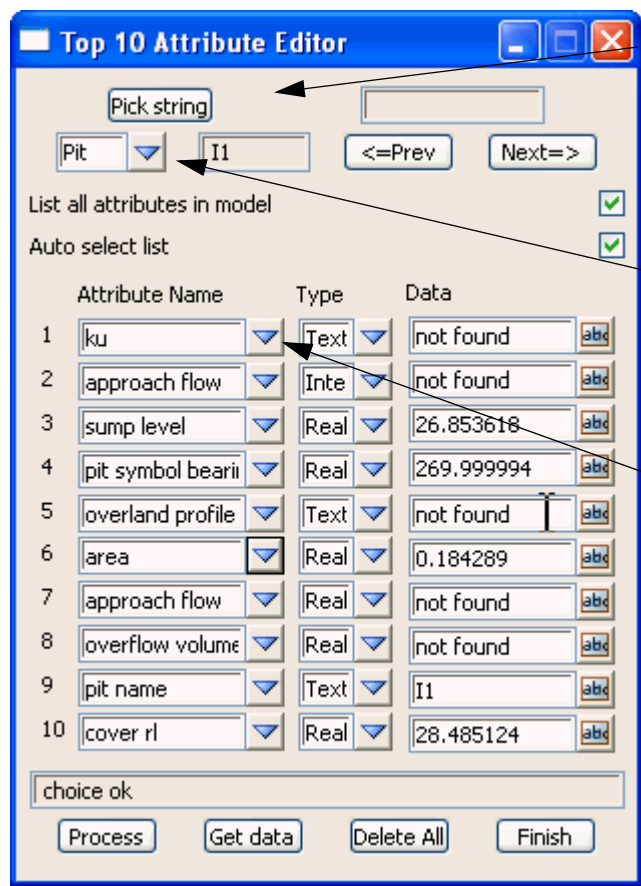

These symbols can now be used in the **Maintenance hole** tab of the Drainage Plan Plot ppf editor. If your version of 12d supports, **native-size symbol**, in the ppf editor then use this mode. If not, select scalable symbol and enter the size equal to the full width of the symbol (height if it is greater).

15.0 User Defined Attributes

These drainage attributes are automatically created by 12d when required but you are free to change them or add more as desired. The attributes may be exported to a spreadsheet and edited and then imported back into 12d. To edit/add the user defined attributes within 12d select either

Strings=>Properties=>Attributes or

Strings=>User=>Attribute Editor. This second editor is described below.

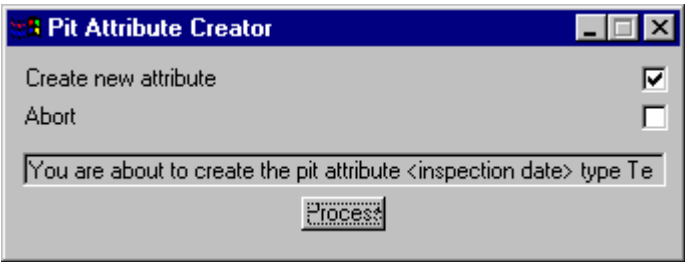

First Select **Pick** to select the string that contains the user attributes (the drainage string). The strings will be highlighted in white when they are selected.

All catchment data is store with the pits in drainage strings. To access the pit attributes, select the drop down icon and then select **pit**. A circle will be drawn around the pit selected. **Next** and **Prev** will now move you from pit to pit.

Select the drop down icon and then select the **Attribute Name** from the list of existing user defined attributes. These attributes include all of the attributes in the model that the string exists in.

They may not be defined for the pit you are editing. **Not found** will be displayed in the **Data** field if the pit does not have that attribute defined.

To change the value for the attribute enter the new value in the **data** field. If the attribute does not exist, deleting the **not found** text and adding data will create it. The message on the right will be displayed whenever you are creating a new attribute.

15.1 Drainage Pit attributes2010

Pit attributes are created and/or updated when the user selects **Set Pit Details**.

pit length	real	0	mhsiz (first value) from drainage.4d file
pit width	real	0	mhsiz (second value) from drainage.4d file
pit group	text		mhgroup from drainage.4d file
cover rl	real	446.685248	
grate level	real	446.685248	
setout z	real	446.685248	
setout x	real	299643.648	
setout y	real	6563620.716	
setout distance	real	0	
pit name	text	1-3	
pit type	text	SA2	
pit diameter	real	1.1	
pit chainage	real	118.61441375

16.0 Detailed Drainage Plan Drawing

12d drainage has the capability to create detailed drainage plan drawings with the following features:

- create symbols at the inlets and the type of symbol is controlled by the inlet type (given when you create the inlet).
- create text labels for inlet types and user defined pit attributes
- draw lines with line styles and colours to represent pipe sizes
- create text labels for pipe diameters, inverts and user defined pipe attributes
- create text labels for house connection types, invert levels and chainages
- indicate direction of flow on pipes.

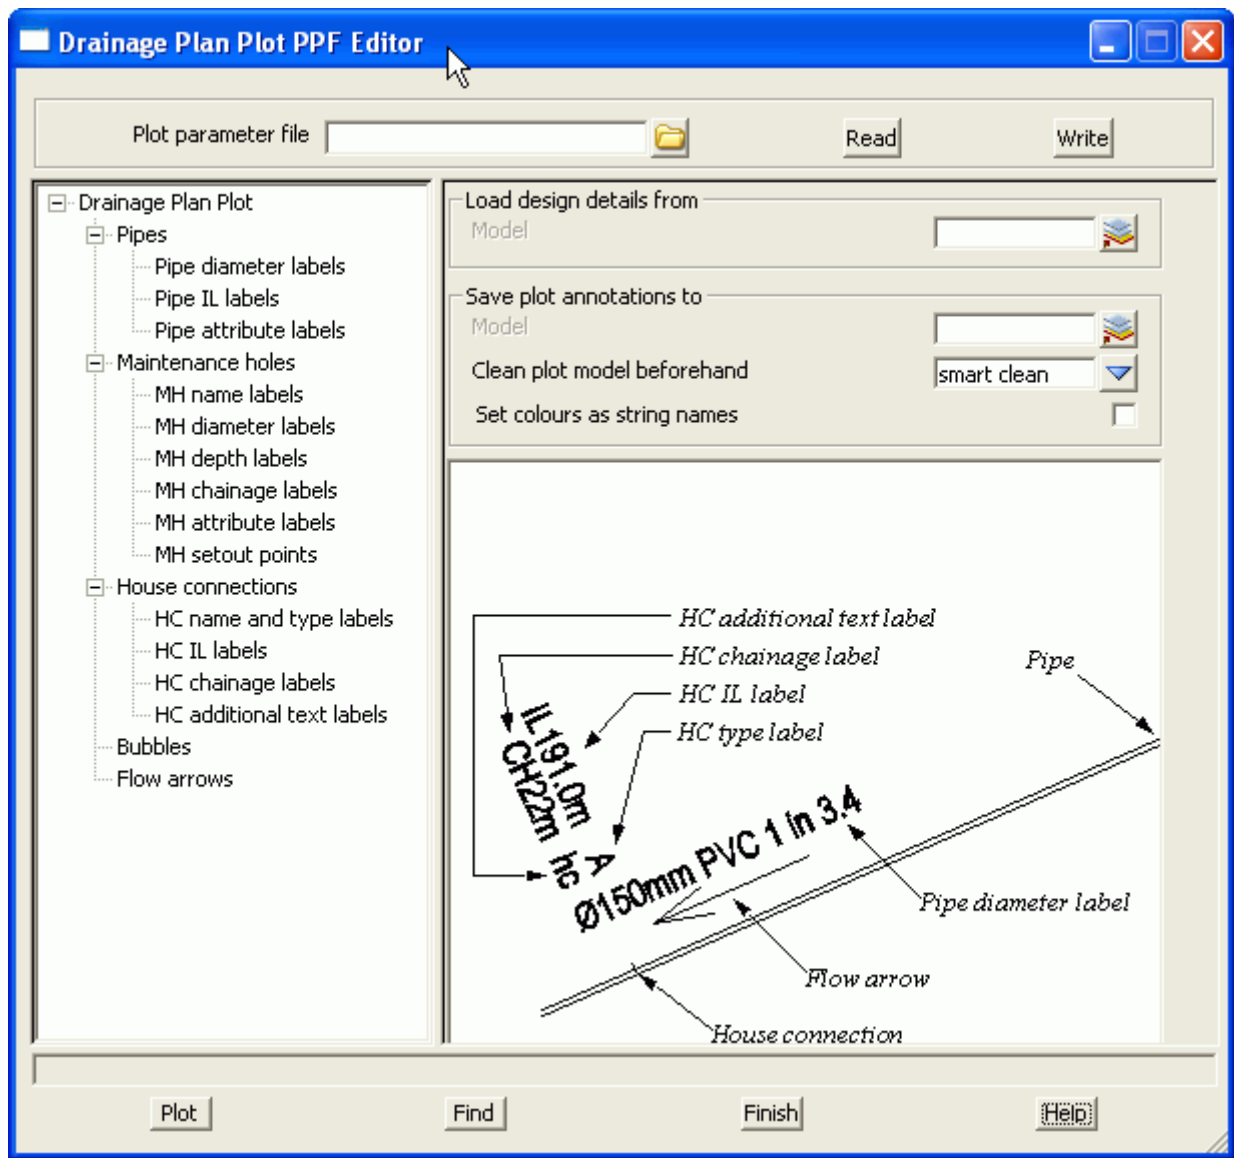

An example is shown below

Usage

This option is accessed from the menu selection

Design => Drainage-Sewer => Plots => Plan Annotations

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Plot parameter file	file box		
----------------------------	----------	--	--

Optional - no dpf is required. The default settings will create a schematic drainage drawing. A custom dpf may be selected if desired.

Load design details from	model box		
---------------------------------	-----------	--	--

data source for drainage strings to be labelled

Save plot annotations to model	model box		
---------------------------------------	-----------	--	--

labels to be created are stored here, Undo will remove the labels created

Clean plot model before hand	choice box		
-------------------------------------	------------	--	--

smart clean will update text that has been moved and clean the rest. Full clean will all text from the plan annotations model.

Set colour as string name tick box

when selected the string colour will be used for the string name (to be used for DWG/DXF export using map files)

Plot button

Creates the labels in the model specified

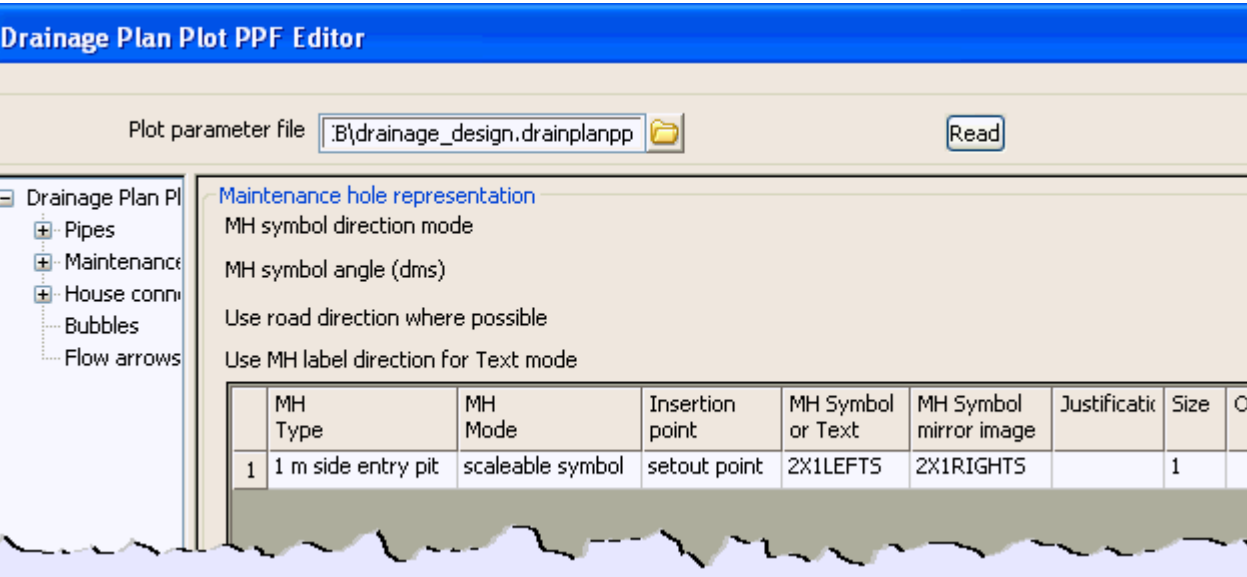

Find button

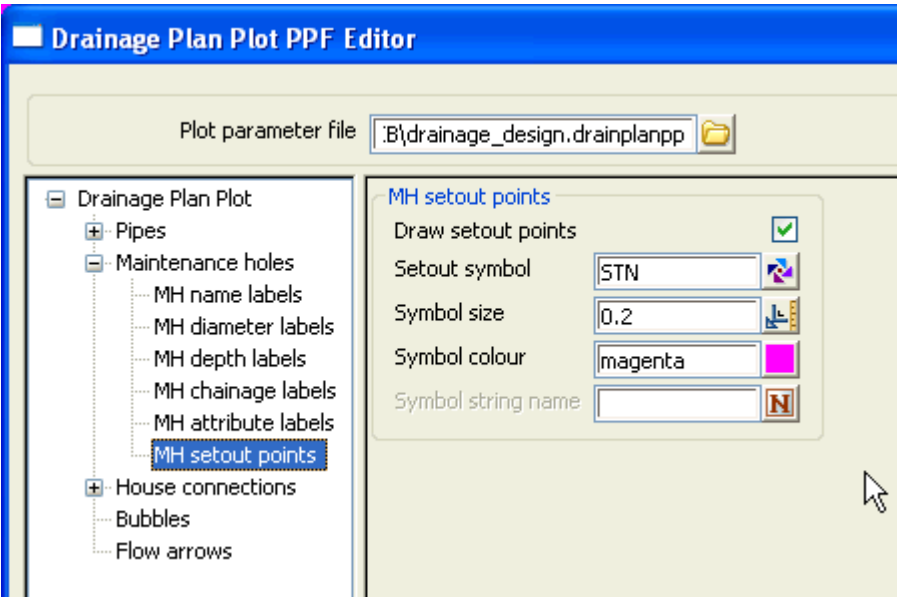

used to locate plot parameter input boxes using Version 5 plot parameter names

IMPORTANT! to turn off any data change the text height to zero.

Select **Maintenance holes** from the tree to set the symbols to be used for the various pit types.

Select the MH type as desired and use **scalable symbol** and **setout point**. For the symbols enter the names that you used when you created the symbols.

Plotting a symbol at the pit setout point is a good confirmation of the data printed in the setout reports. The settings to create this symbol are shown on the left.

17.0 Drainage Long Section Plotting - Hatching Under Roads

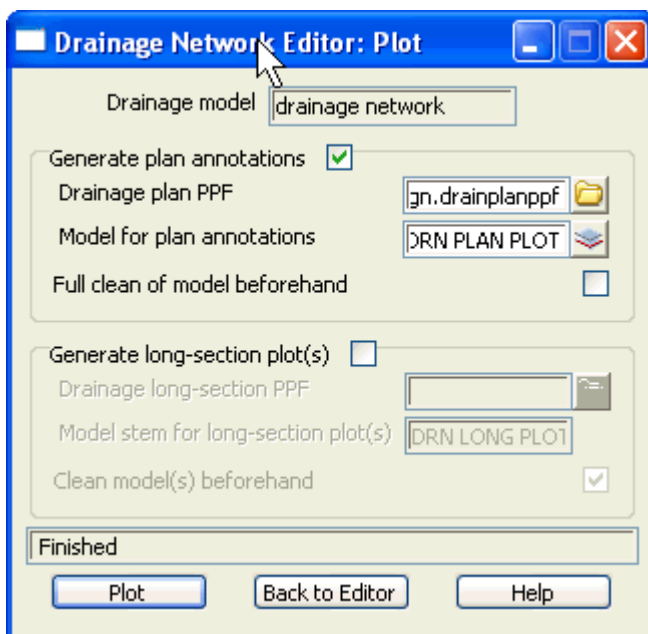

The drainage long section plotting has been discussed in the Intro Drainage Course. Here we will discuss the technique for hatching under roads and/or footpaths.

The following steps are required.

1. Run the Excavation volumes routine using the obvert templates to create sections and strings for a tin on top of the pipe (obvert tin). Select **Stop section at end of manhole** to prevent the pits from being hatched
2. Create the obvert tin from the strings and sections then and null by angle length with a small length value so that the tin is nulled near the pits.
3. Create a design tin that extends to the limit of the roads.
4. Use the hatching section of the drainage long section plot to select the hatching style.

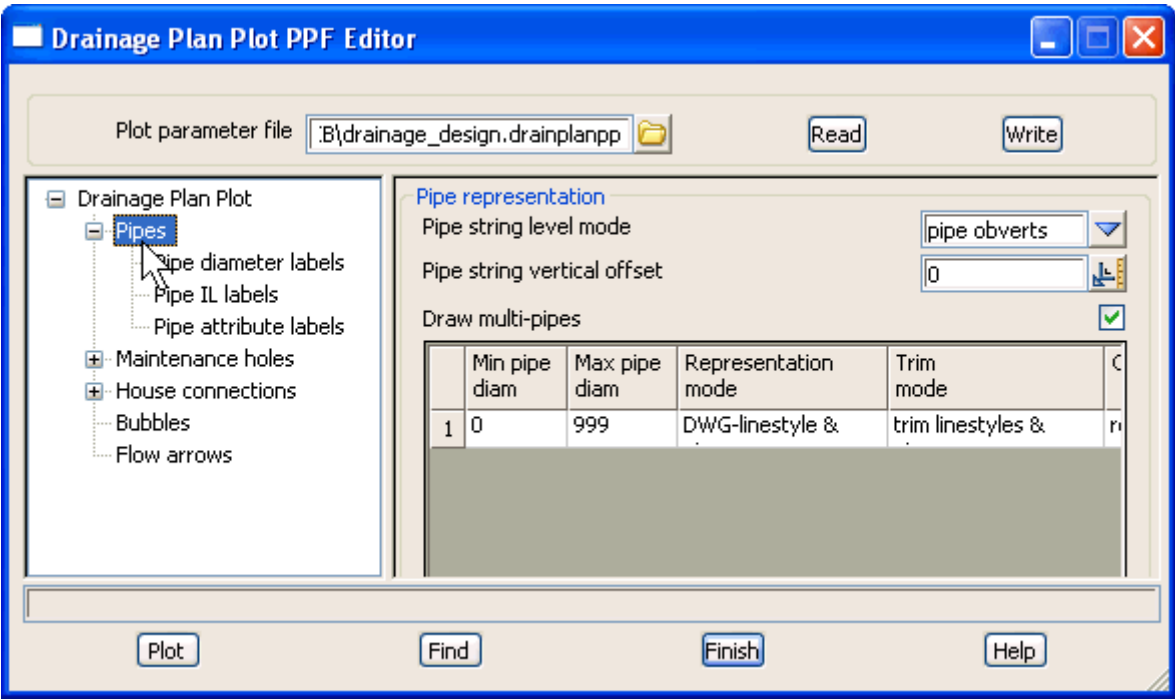

17.1 Creating the Obvert strings.

Run the Drainage Plan Plot by selecting Plot from the Drainage Network Editor.

Select the drainage_design ppf file from the library.

Select the folder icon then **Open** the ppf.

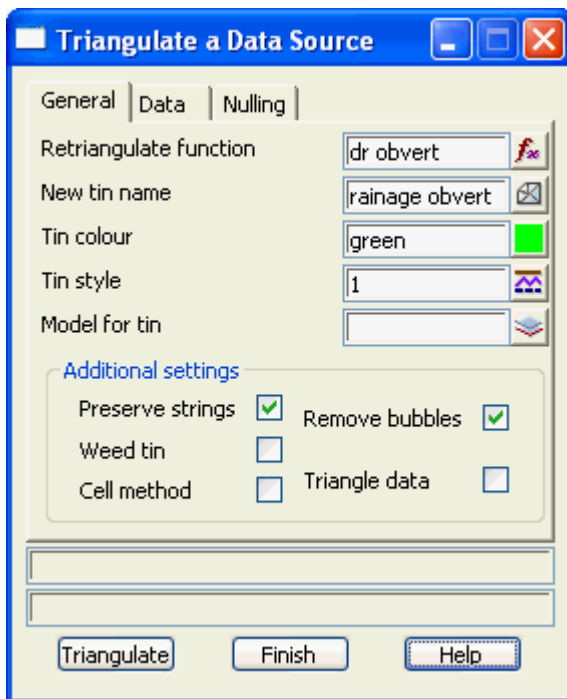

Confirm that the **Pipe string level mode** is set to **pipe obverts** and that all symbols with elevations are not used. This include:

- s MH setout points,
- s Flow arrows,
- s pit symbols

Now plot the drawing and we will use the pipe strings at the obvert level to create a tin.

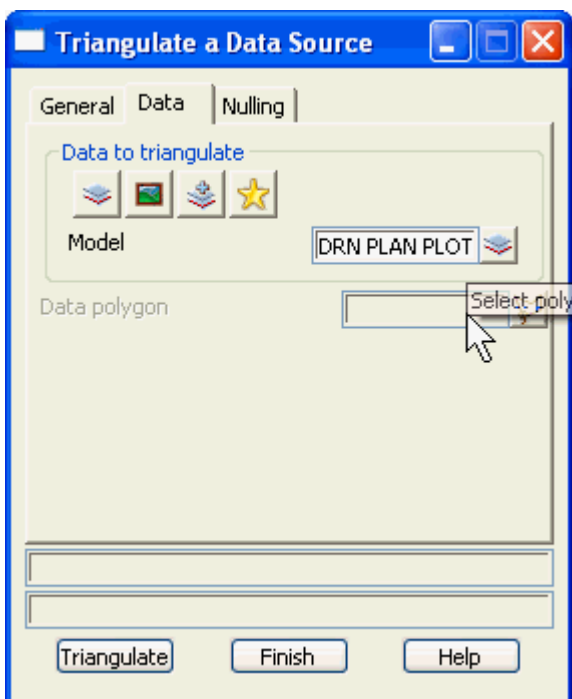

17.2 Create and Null the Obvert tin

To create the obvert tin select.

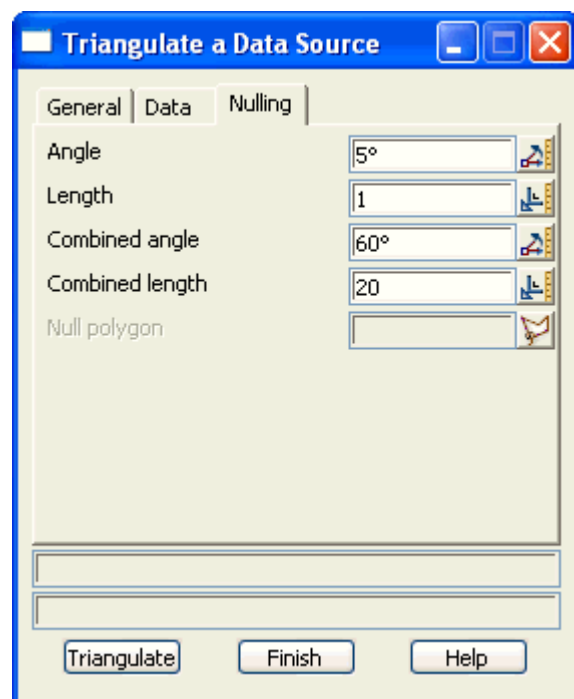

Tins->Create->Triangulate Data

Enter a **New tin name** as desired.

Select the **Data** tab.

Select the plot model created above.

Select the Nulling tab

Enter a **Length** that is less than the pit diameter and greater than the largest pipe.

Select **Triangulate**

The tin will now only exist on top of the pipe and it is ready to use for hatching.

17.3 Create a Roads Only Tin

The design tin is already nulled to remove the long triangles. If the footpaths were to be excluded from the tin then they should be removed from the road design strings. You could run a template that did not include the footpath and has a **Final Maximum slope width** of zero or just copy the desired road strings to one model and remove unwanted strings. We will use the later techniques.

Add all of the road string and kerb return models onto one view and then select

Utilities->A-G->Change

View select the view that contains all of the road strings

Copy to model type the name of a model for all of the road strings.

Select **Change** copy the strings.

Select the **Filter** icon at the end of the selection strip. Now select the **Model** tab and select the **Name** of the model that holds all of your road and kerb strings **road strings only** (tab not shown here).

Select the **String Info** tab and enter the name of the strings that you want to remove from the road only model. In this case it is **path**.

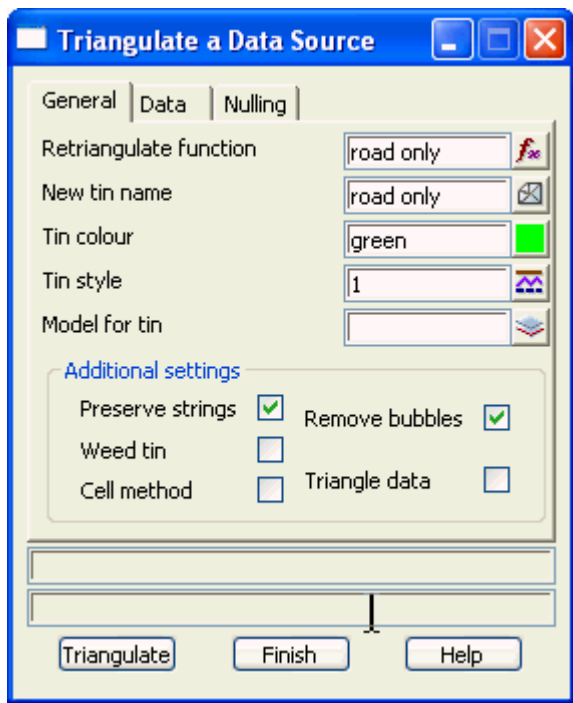

Select **Filter Select** to select these strings.

Select the second **Target** button **Move to model** and select the model **trash** and then select **Change**.

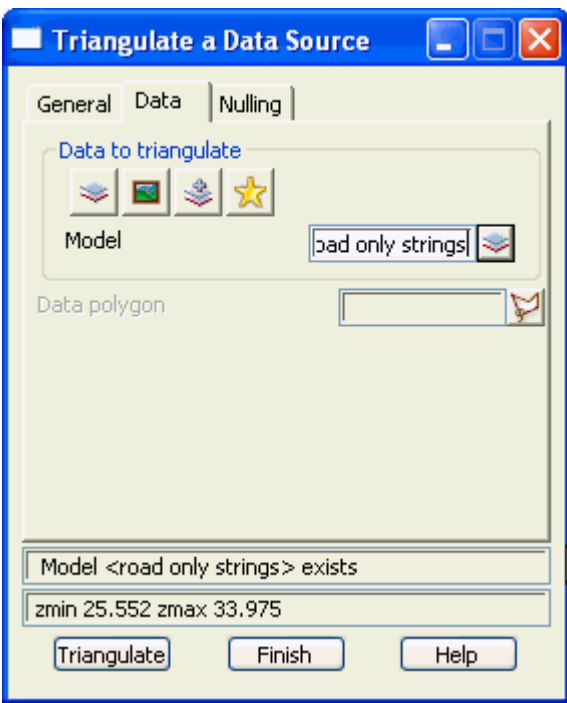

Repeat this for string names **int**.

We are now ready to triangulate the road only tin.

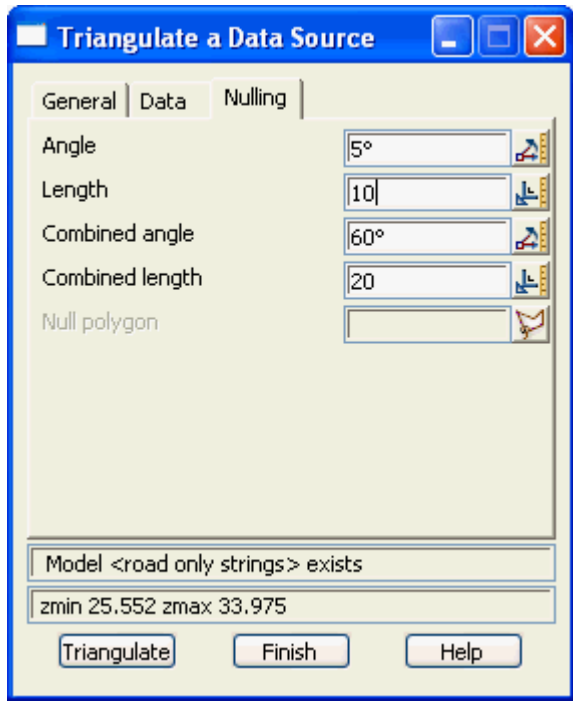

Now to create the tin select **Tins->Create->Triangulate data**

Enter a function name (optional) and **New tin name** and then select the **Data** tab.

Model - Select the model containing the road only strings.

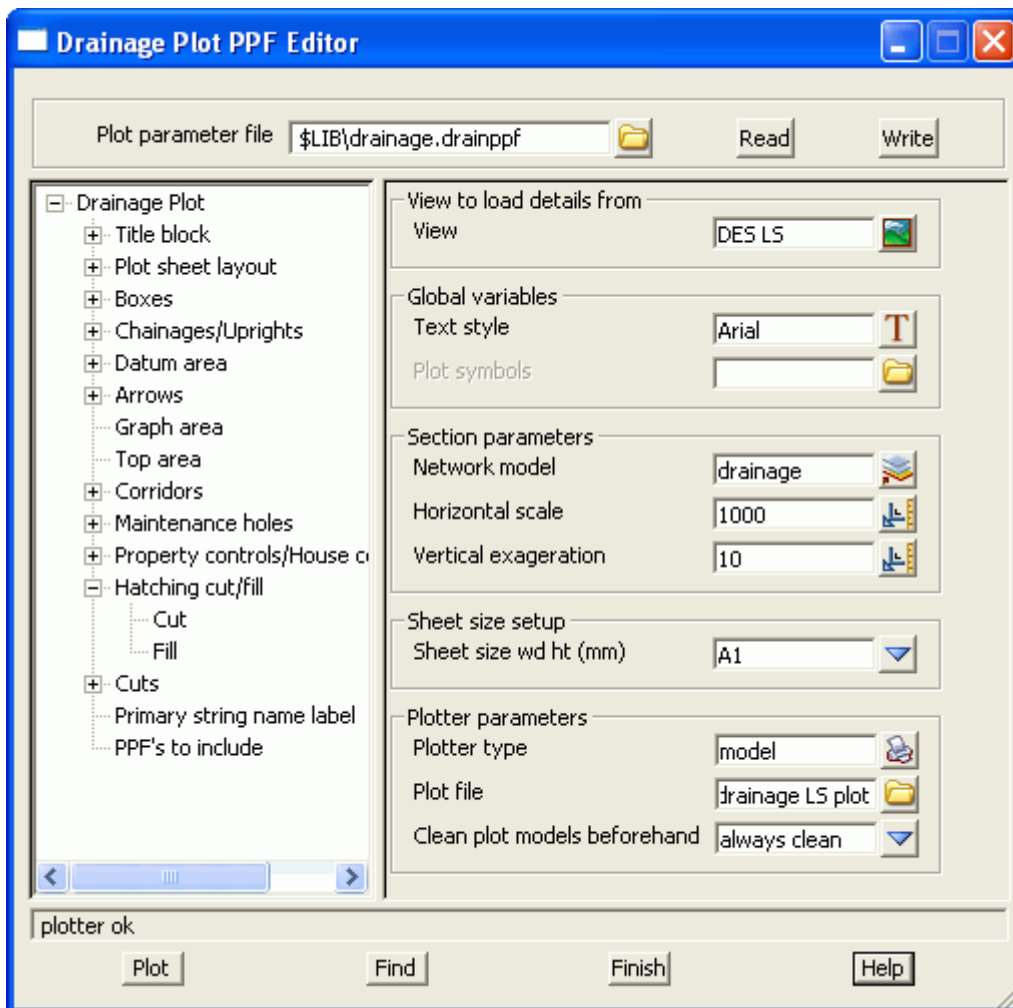

Length - Select a length just greater than the width of half the road so that the tin will not be nulled from the end of the roads.

Select **Triangulate**..

17.4 Use the Hatching Feature in Drainage Longsections

We are now ready to create the drainage longsection plots. Set up a section view with the a string in the drainage model profiled, the vertical exaggeration set, the desired tins displayed and the service models added. From the main menu select,

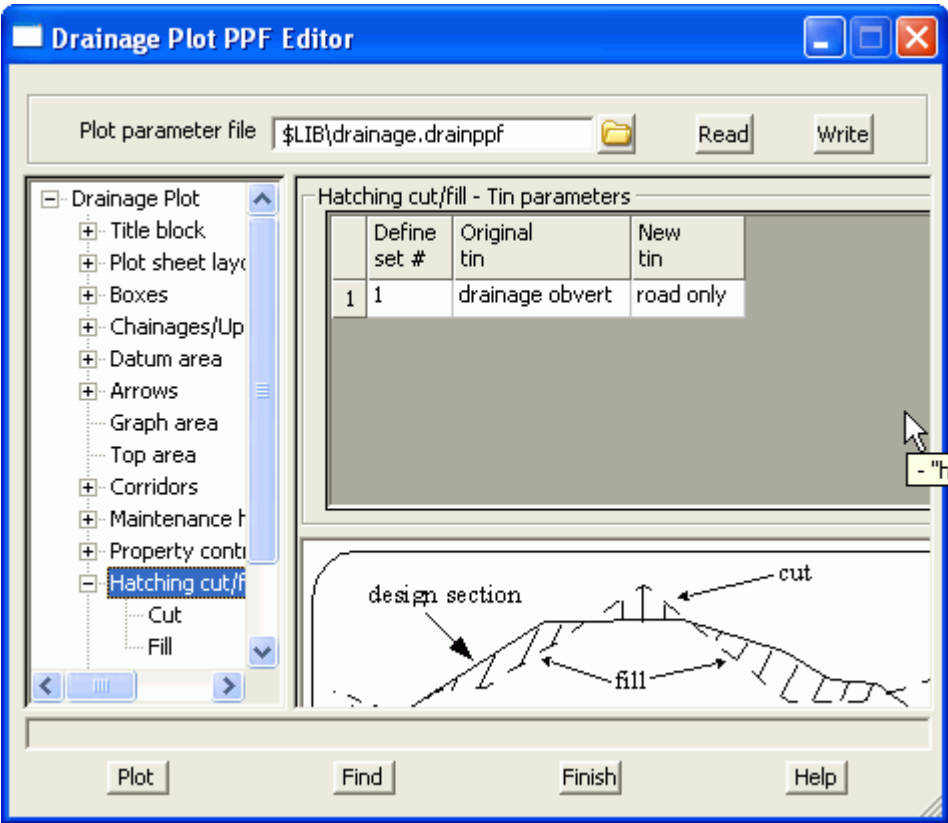

Design->Drainage-Sewer->Plots->Longsections

From the **Plot parameter file** field select a drainage longsection ppf from the library and then select **Read**.

In the **View to load details from** field select the section view you have setup for the drainage long section.

Now select **Hatching cut/fill**

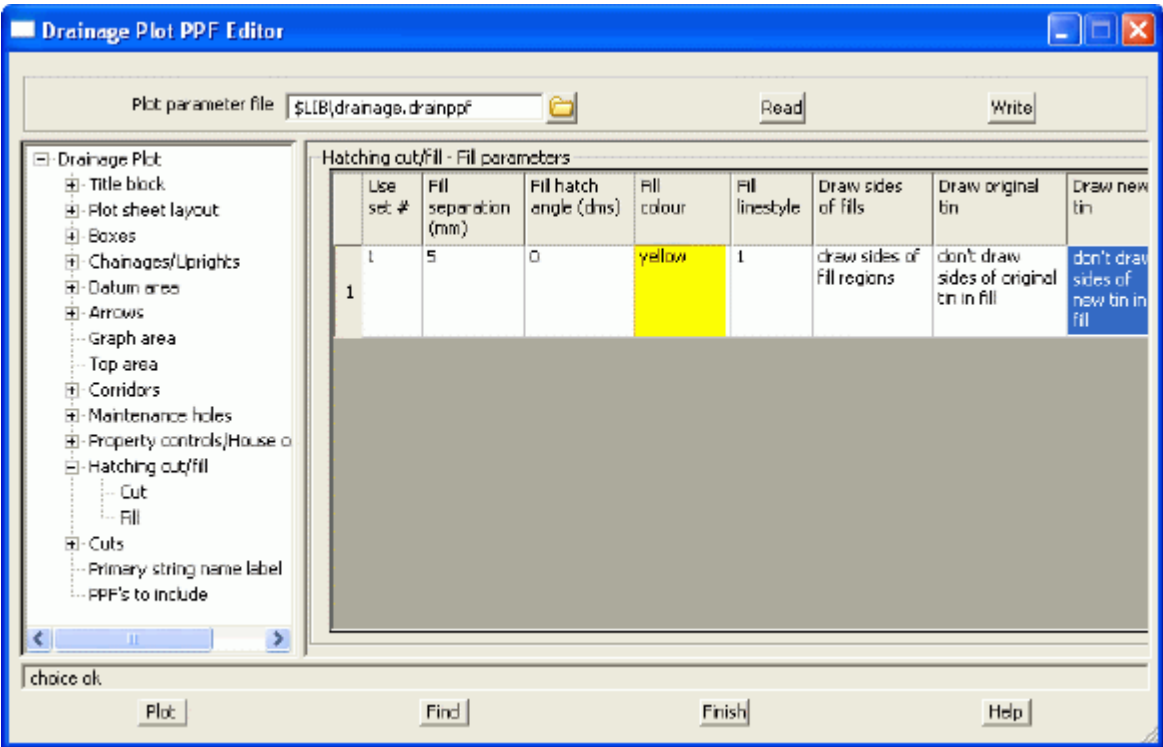

Define set is set to 1.

Original tin is set to the obvert tin.

New tin is set to the road only tin.

Now select the + beside the **Hatching cut/fill** and then select **fill**.

Use set # is entered as 1. Fill separation, hatch angle, colour and linestyle selected as desired. Draw sides of tin, Draw original tin and Draw new tin are not required unless you want these

extra line in the drawing.

Select **Plot** and add the plot model **drainage LS plot1** onto a PLAN view to preview the drawing.

The hatching is shown to the left at a 2mm spacing with the tins and sides not drawn.

18.0 Flooded Width Analysis and HEC RAS

There are 2 flooded width methods in the drainage module. The first can be used with any of the external drainage packages and the second is part of the 12d storm analysis. The first is found on the main menu

Design->Drainage-Sewer->Calc flooded widths

The name of the overland flow string becomes the name of the HECRAS project.

1.0

1.0 Dynamic Stormwater Design

This manual, the **Dynamic Stormwater Design**, describes how to use 12d model to calculate catchment hydrographs and perform unsteady flow hydraulic computations on drainage networks.

The rainfall runoff and loss methods supported include the time area unit hydrograph (ILSAX) with Horton infiltration (from runoff), and the New Zealand SCS hydrology method.

The starting point for this manual is a 12d drainage network already constructed with catchment areas assigned, inlet and manhole properties set and vertical grading applied. These tasks are described in detail in the **Stormwater Part 1 Design Course**. The network will have open channels, bypass flow routes and pits with inlet capacity settings as described in **Stormwater Part 2 Design Course**

This manual, **Dynamic Stormwater Design Course** contains:

- s review and modifying the 12d hydro file with respect to IFD data, rainfall temporal patterns, infiltration loss methods (horton and SCS curve numbers),
- s selecting the hydrological runoff method (Ilsax2 or NZ SCS) and the infiltration loss method,
- s using cross section shapes cut from the tin for bypass flow paths and open channels
- s running the analysis and reviewing the graphical output, plan and long section plots and the custom spreadsheet reports.
- s create parallel pipes with different sizes and invert levels,
- s adding and initial sizing of storage basin with fixed discharge,
- s discuss graphical basin links,
- s create outlet structures including, culverts, weir spillways, orifice controls, bubble up pits,
- s underground storage tanks,
- s bypass over road crown
- s

2.0 Starting with a Basic Drainage Network

In this document, the generic terms **pit** or **manhole** refer to inlets, catch basins and manholes. The exception to this is when referring to inlet types in the Drainage Network Editor (DNE). The term **manhole** specifically refers to an inlet with zero inlet capacity. Pit types, dimensions and inlet capacities are set in the drainage.4d file.

These course notes assume that you have completed the Stormwater Design Course and that you have experience creating 12d model drainage networks with catchments areas. This course will begin with a completed drainage design found in the directory

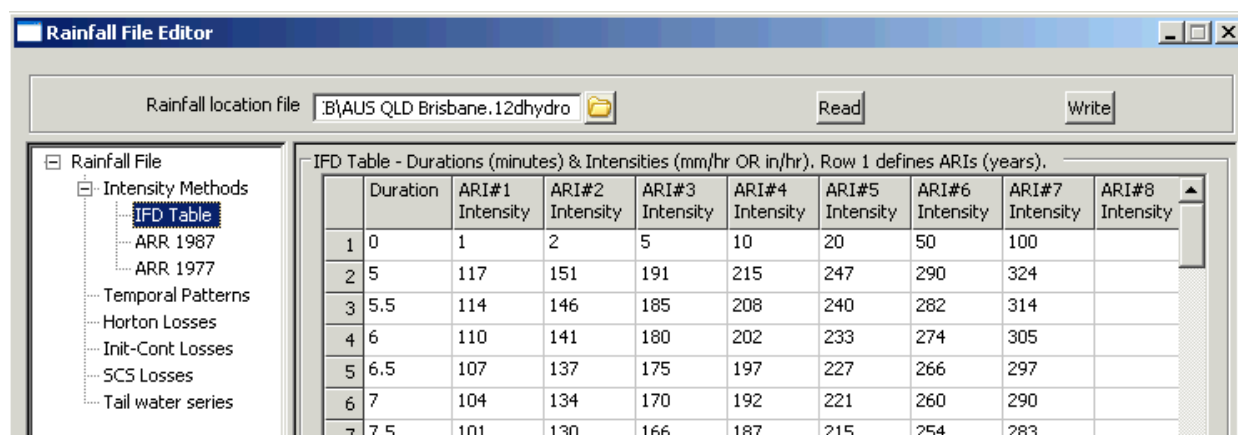

\12d\9.00\Courses\drainage\basins

The project name is basins.

3.0 Hydro-Rainfall File with Infiltration

Access the rainfall editor from the main menu

Design->Drainage-Sewer->Rainfall Editor

Key Points

1. Several rainfall files are shipped in the 12d library as examples.
2. One of the 3 Intensity method **MUST** be entered. Do not leave blank rows in the IFD Table.
3. All dynamic drainage runs require temporal patterns.
4. Dynamic drainage (ILSAX 2) requires Horton losses
5. Dynamic drainage (NZ SCS) requires SCS losses
6. Rainfall data is in mm/hr NOT mm (important for NZ)
7. Tailwater series are time versus elevation data for outlets.
8. Initial and continuing losses are not supported in release V9c1e

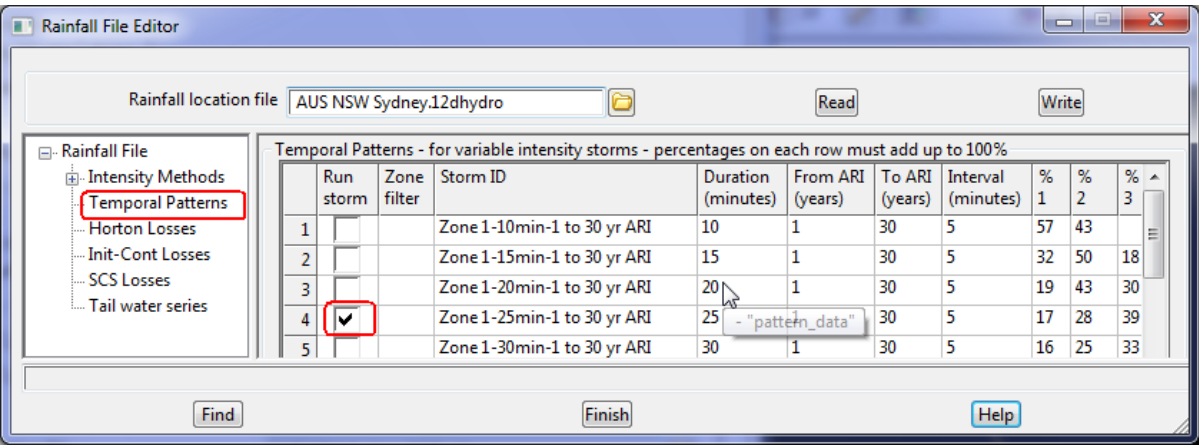

3.1 Intensity Frequency Duration (IFD) Data

The **IFD table** method is the most common (refer to figure above). The rainfall intensity is entered in mm/hr for metric data and in/hr for US units. The top row is the return period in years and the first column is the rainfall duration in minutes. The top left corner cell is always zero.

When using the TP 108 method for the Auckland region, the 24hr rainfall depth is extracted from the Appendix A and then converted to mm/hr before entering it into the IFD table. Thus only 2 lines may exist in the 12d grid.

Note that areal reduction factors must be accounted for by the user as they are not included in the 12d rational hydrology engine.

3.2 Rainfall Temporal Patterns

Temporal patterns are referred to as storms in dynamic drainage. Several example hydro files are included in the 12d library. These examples have the temporal patterns for the minor and major storms in the 8 zones of Australia.

Temporal patterns are not required for the SCS NZ method as the standard 24 hour temporal pattern from TP108 is built into the 12d analysis engine.

The **Run storm**, **Zone filter**, **From ARI** and **To ARI** columns are used determine which storms are analysed (run). The **Run storm** column must be checked for that temporal pattern to be analysed. Many storms may be selected.

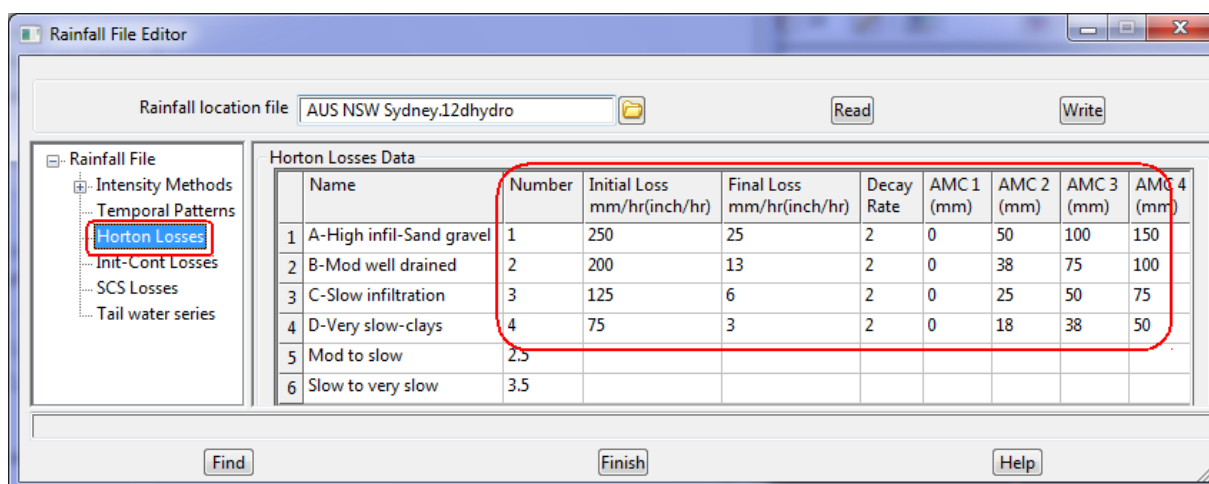

The **Zone filter** is optional. Entering a value here will allow the selected storms to be further filtered. A **Zone filter** field (accepts wild card characters) is found on the DNE Global tab that is used to determine which of the selected storms (paragraph above) are analysed.

The **ARI** field on the Run panel is used with the **From ARI** and **To ARI** columns. The value on the run panel must be within the From-To range for the storm to be analysed.

The **Duration** column determines the total length of the storm. This value divided by the **Interval** must be a whole number and this number determines the number of **%** values to be entered to the right of the **Interval column**. The total of the percentage must equal 100.

3.3 Horton Losses

The pervious portion of the catchments used in the **ILSAX 2** analysis will have a loss type defined describing the soil type. The loss type is defined in the DNE Default->catchment and catchment tabs.

These soil types use the classifications of Terstriep and Stall (1974), based on the system developed by the U.S. Department of Agriculture. The default values entered from the library represent the soil types of

- 1.Type A - low runoff potential, high infiltration rates (consists of sand and gravel)
- 2.Type B - moderate infiltration rates and moderately well-drained
- 3.Type C - slow infiltration rates (may have layers that impede downward movement of water)
- 4.Type D - high runoff potential, very slow infiltration rates (consists of clays with a permanent high water table and a high swelling potential)

Numbers are assigned to each soil type to allow interpolation between the defined soil types. When interpolated values are used they must be included in the list (2.5 and 3.5 for example). Interpolated values do not need loss data entered. If loss data is entered for the interpolated names then this data will be used rather than an interpolation occurring. If any loss data is entered then all of the values must be entered.

Four preset AMC points are defined in the rainfall file to mark AMC conditions ranging from dry (AMC1) to saturated (AMC4). The required data for each line is the **Initial loss rate, Final loss rate, decay rate** and 4 antecedent moisture conditions (AMCs). The AMC values are entered in depth of rainfall (mm) they represent the total rainfall prior to the start of the temporal pattern.

The AMC point numbers are set once for all catchments on the DNE Global tab. Value between 1 and 4 (decimal value are permitted) are entered for the minor and major events.

3.4 SCS NZ Losses (Initial Abstraction and Curve Numbers)

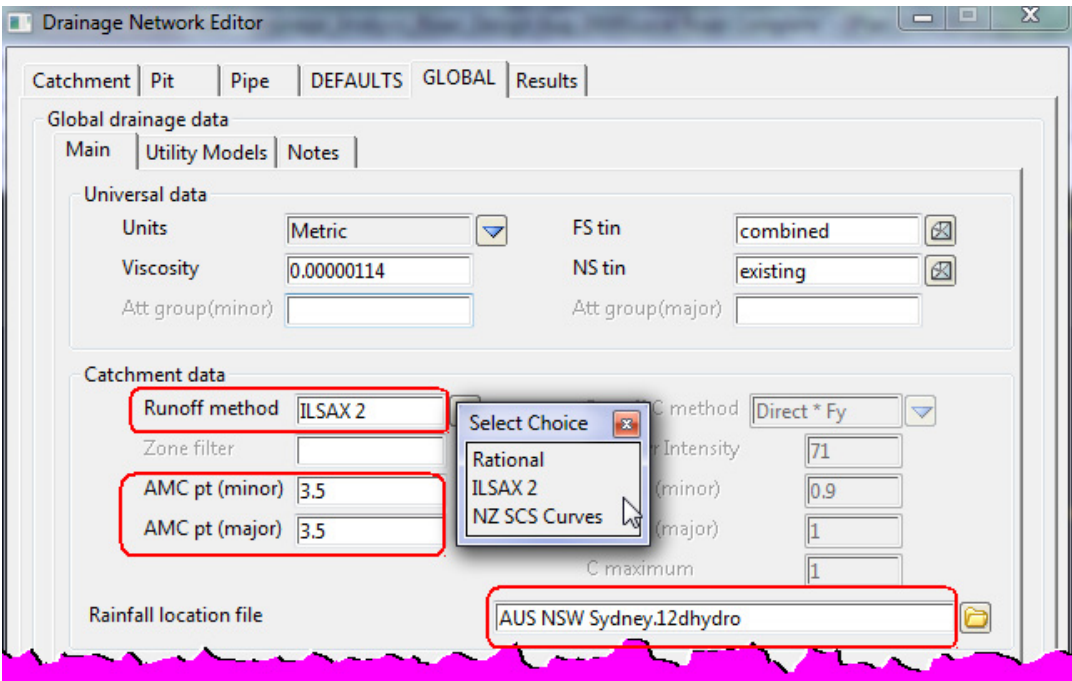

The SCS NZ method uses Initial abstraction (Ia) and the curve number (CN) to determine the losses for the catchments. Names are given to the SCS curve numbers in the rainfall file. These names and Ia (entered as storage values) and selected in the DNE catchment data.

A curve number of 0 results in zero runoff while a CN=100 results in 100% runoff. TP 108 recommends the selection of the curve number by identifying 1) the soil type and 2) the land use. A CN=98 an Ia=0 are recommended for impervious areas.

4.0 Rational to Dynamic ILSAX2 in the DNE

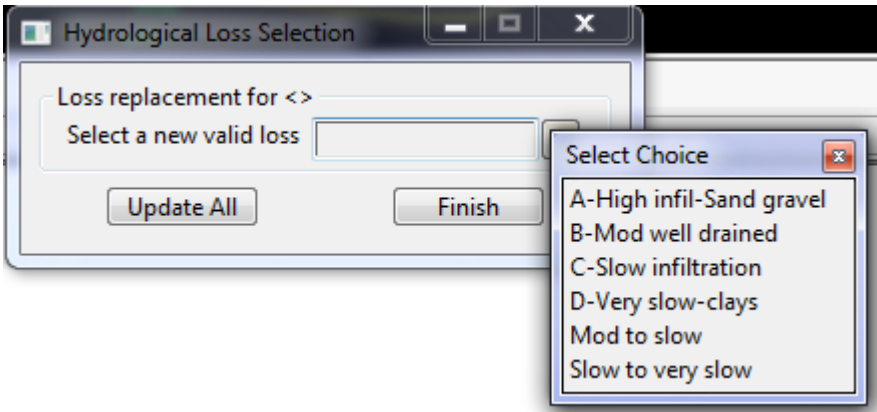

The user does not have to start with the rational hydrology method but since this method has a pipe sizing algorithm it is often run first. The following steps will prepare a drainage network for dynamic hydrology.

Changing to ILSAX 2 is done on the DNE Global->Main tab.

4.1 Infiltration Losses

If this is the first time in this project you have switched to ILSAX2 you will be prompted for the default infiltration loss. These loss types are retrieved from the rainfall location file (Horton losses) specified above. Select one of these and then select **Update All**. These losses are only applied to the previous percentage of the catchment.

4.2 Storage Losses

Both the impervious and pervious portions of the catchments have storage losses. This amount of rainfall depth (in mm) is removed from the start of the rainfall pattern. The default values are entered on the **Defaults Catchments** Tab.

Catchment | Pit | Pipe | **DEFAULTS** | GLOBAL | Results

Depress storage	0	Depress storage	10

5.0 Rainfall Runoff Calculations

12d currently supports 2 rainfall runoff methods.

See [ILSAX 2](#)

See [SCS NZ](#)

5.1 ILSAX 2

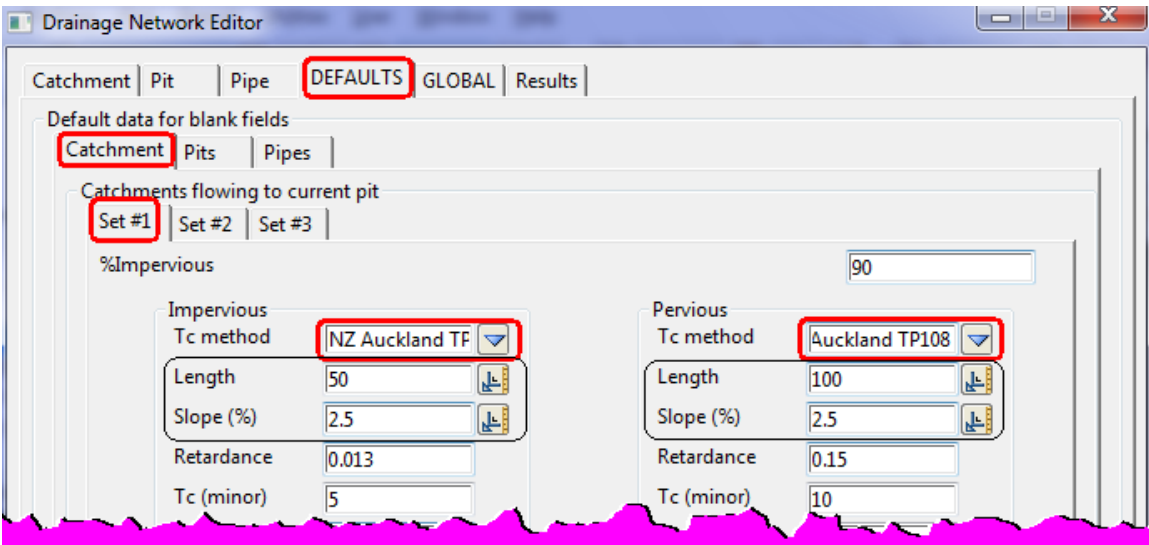

The ILSAX mode 2 uses a triangular shaped unit hydrograph with the time to peak equal to the recession time. The time to peak equals the tc value throughout the 12d DNE.

5.2 SCS NZ

The SCS NZ uses a unit hydrograph as described in TP 108 Table 4.1 (hydrograph number of 3/4). 12d calculates the time to peak value (tp) = 2/3 the time of concentration (tc).

The %impervious value is used to create a composite CN and a composite initial abstraction Ia

One of the optional tc methods uses the equation derived from a regression analysis of Auckland catchments (BCHF, 1999c). On the **Defaults->Catchments->Set 1** tab set the Impervious and Pervious Tc methods to **NZ Auckland TP108**. The default length and slope values will be used unless they are specified for each catchment.

6.0 Dynamic Hydraulics

As with the rational method hgl calculations it is essential that the pit grate levels are entered correctly. With no bypass specified, water is lost from the analysis when the hgl exceeds the grate level. When bypass is specified the water will not be lost until the level exceeds the highest bank of the bypass section shape (see below).

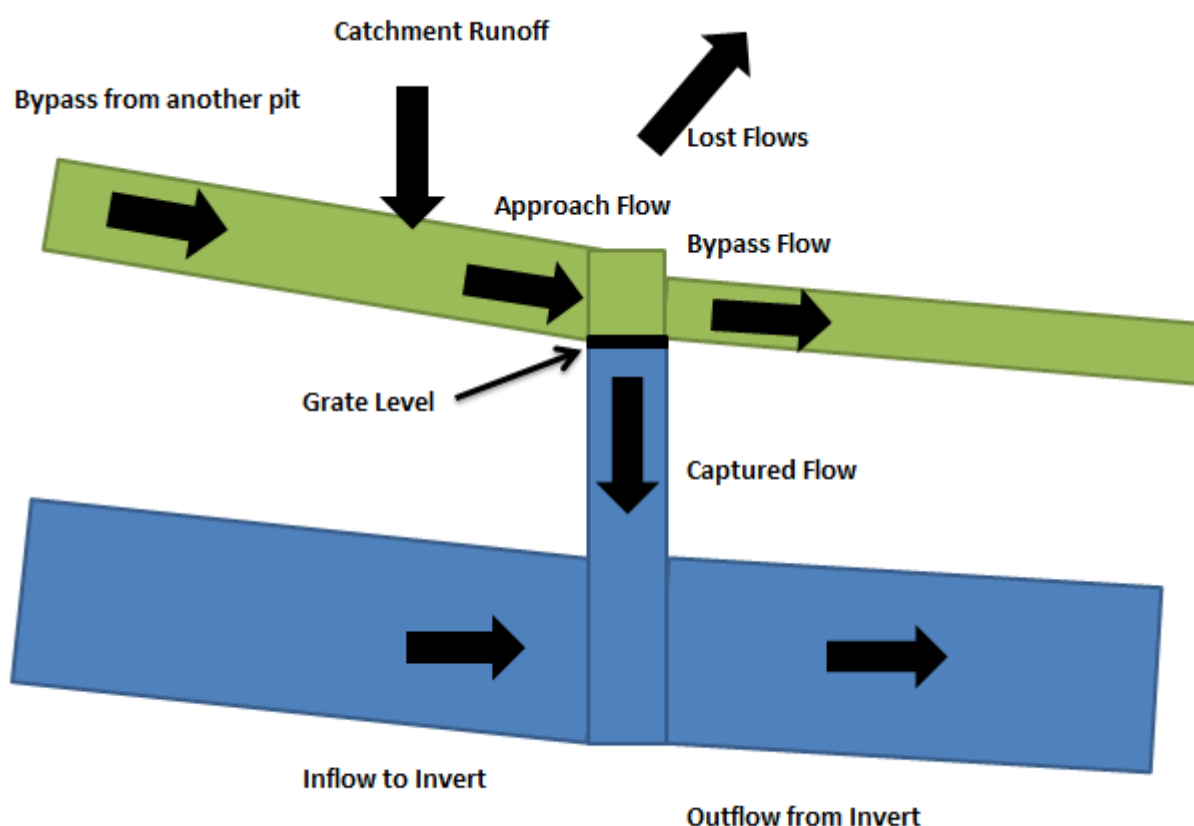

12d uses the St Venant unsteady flow and continuity equations to solve for the flows in the pipe network. With these equations it is the water level in the pits that determines how much flow travels through the conduits. The hgl is not calculated from the flows. Viewing the results from this perspective will help immensely.

6.1 Flows in and out of the Pits

The diagram below shows the possible flows through a pit. When bypass is used, there are 2 hgl levels; one level for all of the conduits with inverts at or above the grate level and another for conduits with inverts below the grate level.

The pit inlet capacity and choke factors determine the amount of approach flow that is captured. If the HGL of the subsurface reaches the grate level, the captured flow becomes zero and only the surface hgl is used to determine the flows in all conduits. When the hgl drops below the grate level again, 2 hgl levels will again be used.

The continuity balance is monitored during analysis and the results of this check are stored as a model attribute “dynamic/xx/calculated hydraulic continuity error percent” where xx is the duration of the storm. A detailed output file is also created for each storm analysed. The file name begins with the name of the drainage model and ends with the storm duration (plus the extension rpt).

6.2 Default Bypass Section Shapes and Slopes

In the rational method, bypass flows (water that could not enter the inlet because of either inlet constrictions or hgl levels) were bypassed to the **Bypass pit**. With the dynamic analysis, a channel

shape is required so that the hgl levels and the storage effects can be modelled. If all of the bypass routes have the same shape then you need only cut one default shape and it will be used for all routes. However you can enter a shape string for every bypass route if desired.

The bypass **distance** is determined from the length of the bypass flow string and the channel has a constant grade. If a changing grade or channel shape is required then the bypass should be to a drainage line modelled as a natural channel (see section further in the notes).

The invert elevations of the bypass channel are set by the grate elevation of the upstream and downstream pits. However, when the bypass is to the pit LOST then there is no downstream grate level so the slope of the bypass channel will be defined. The **Lost grade** value is specified here as 1%. 12d needs this to determine the water forces try to hold the water into the bypass channel.

The **Manning's n** value is the default for the entire section. If left and right bank n values are desired they are entered on the **Bypass Shape** tab.

Drainage Network Editor

Setout data

6.3 Create and Editing Channel Shapes

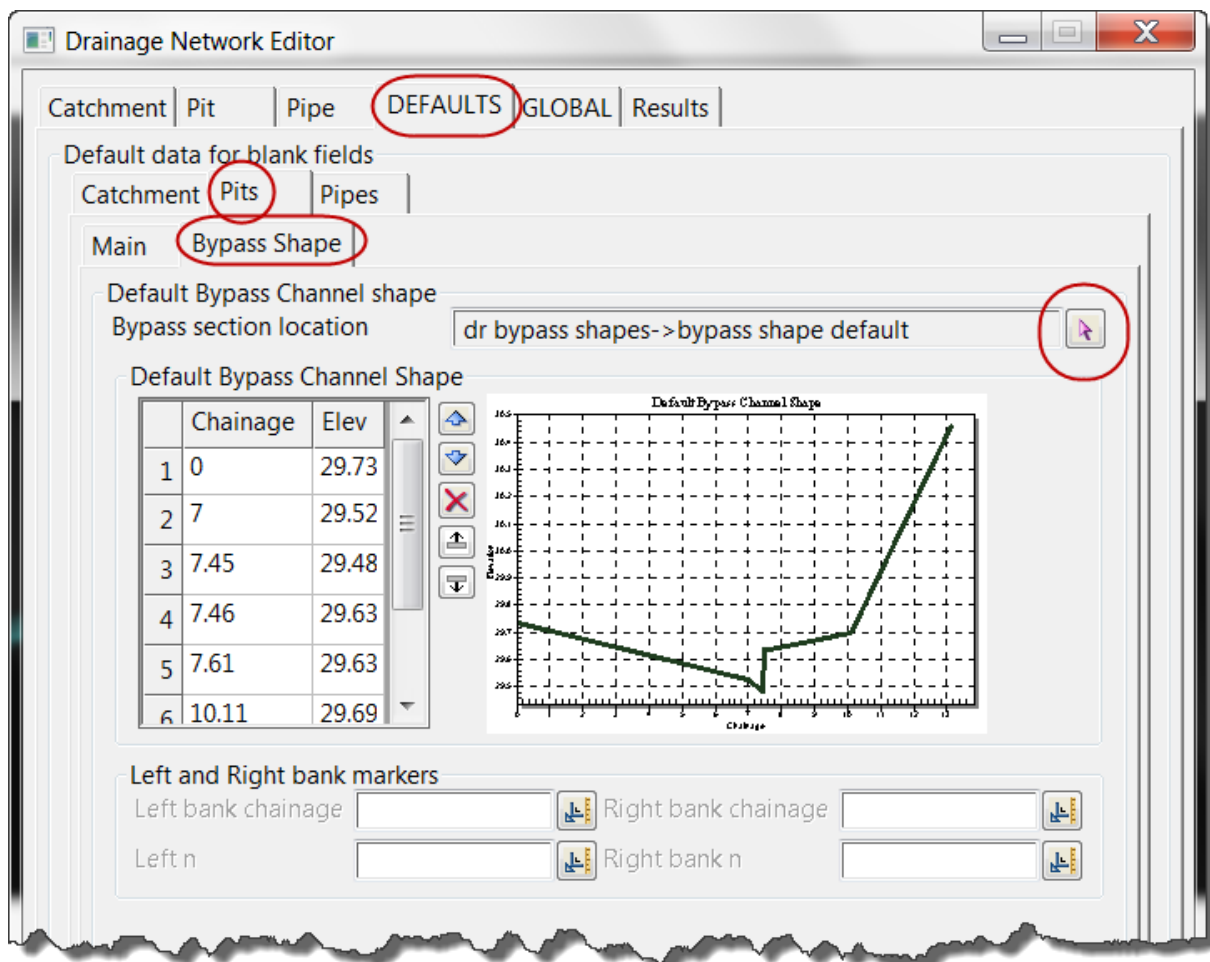

The channel shape may be entered manually or created by drawing a string perpendicular to the flow path and 12d will cut section from the finished surface tin. It is recommended that you keep you section shape strings in one model for data management purposes. The strings are drawn from left to right looking in the direction the bypass string (the direction of flow). To create this string enter the new **model name** in the **CAD Control Bar**. Entering a name for the string is optional. If only 2 points are to be used for the shape string then use the **Create Line** button from the **CAD** tool bar.

After drawing the string it needs to be selected via the **Bypass section location** pick button (see below). Once picked and accepted, select **Set Pit Details** to have the bypass shape cut from the finished surface tin specified on the Global tab. This shape may be seen on the **Bypass Shape** tab and the chainage elevation data displayed.

The elevations on this graph are not used. The data is relative to the lowest elevation on the section. This becomes level 0.0 for the shape and the channel inverts added to determine the final elevation.

Left and right bank n values may also be entered if desired. They **Left n** is used to the left of the **Left bank chainage** and the **Right n** is used to the right of the **Right bank chainage**. The centre chainage is entered on the **Default->Pits->Main** tab.

If you manually change any of the chainages and elevations they will be lost the next time you select **Set Pit Details**. To prevent this RB select the **Bypass section location** and select **Clear**. Now there is no string so the data cannot be recalculated.

6.4 Explicit Bypass Section Shapes and Slopes

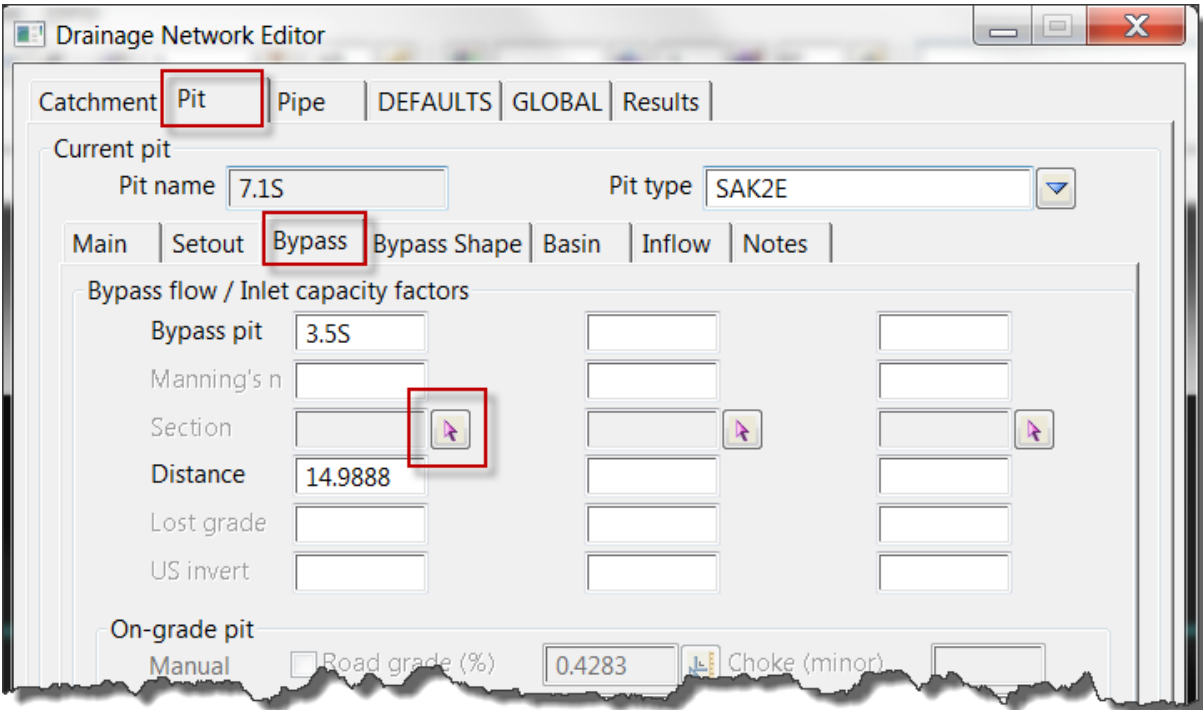

We will now explicitly define a bypass flow shape for bypass link. Water flow across the crown of the road should not use a kerb and gutter shape. Instead we need the shape and invert elevation for the road crown that the water will overtop.

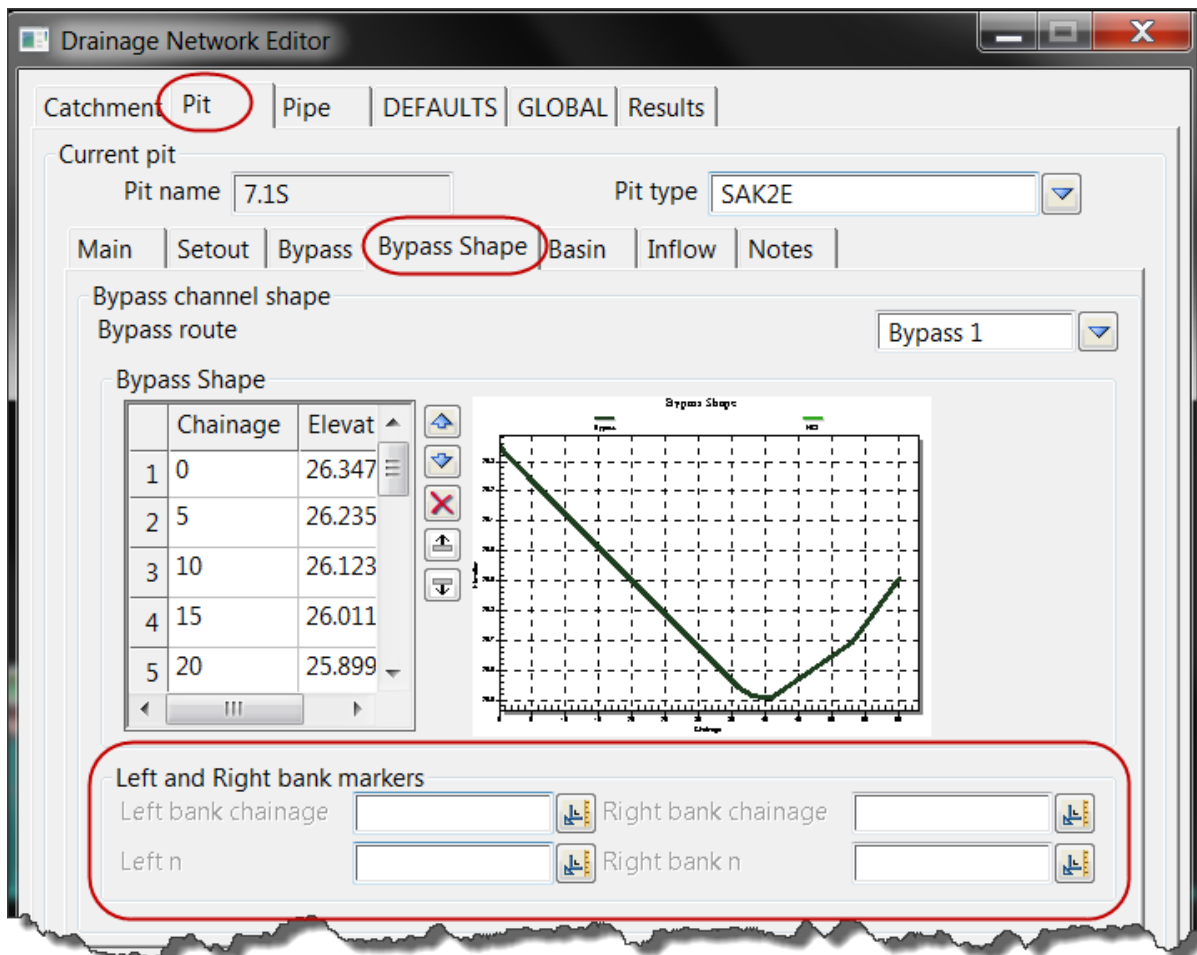

To create a shape string for the bypass across road 2, draw the string from east to west (left to right looking in the direction of flow).

Now select the bypass shape for crossing the crown of the road. Select the **Set Pit Details** button to have 12d calculate the bypass shape from the finished surface tin. Change to the Bypass Shape tab to see the shape. Note the **bypass pit** and **Distance** fields will already be completed from the bypass flow string calculations. Entering a manning's n value is optional.

You will also note that there are 2 other bypass flow routes that can be used. To use these the bypass pit and distances will need to be manually set. The hgl above the grate determines the head that will drive the water down the various channels.

The enlarge the plot RB select inside the graph area and select **Maximise** from the menu. Note the lowest level on the section shape is approximately 25.5. This is the grate level of the pit. Press **Esc** or select the title area to close the graph. Left and right channel n values with their chainages may be entered in the fields below the graph. If these values are left blank the n value from the centre of the channel will be used, NOT the n values from the default bypass channel shape.

If this bypass shapes was to be used in the model now, the bypass channel would go from one grate level to the other without any reference to the crown of the road level. To model the flow path from the crown of the road to the pit 3.5S we will raise the upstream invert level to the road crest level (25.790).

Drainage Network Editor

Catchment **Pit** Pipe DEFAULTS GLOBAL Results

Current pit

Pit name 7.1S Pit type SAK2E

Main Setout **Bypass** Bypass Shape Basin Inflow Notes

Bypass flow / Inlet capacity factors

Bypass pit	3.5S		
Manning's n			
Section	1S to 3.5S		
Distance	14.9888		
Lost grade			
US invert	25.79		

Select the **Apply** button to store the changes and note that the lowest point of the bypass shape graph is now raise the 25.79.

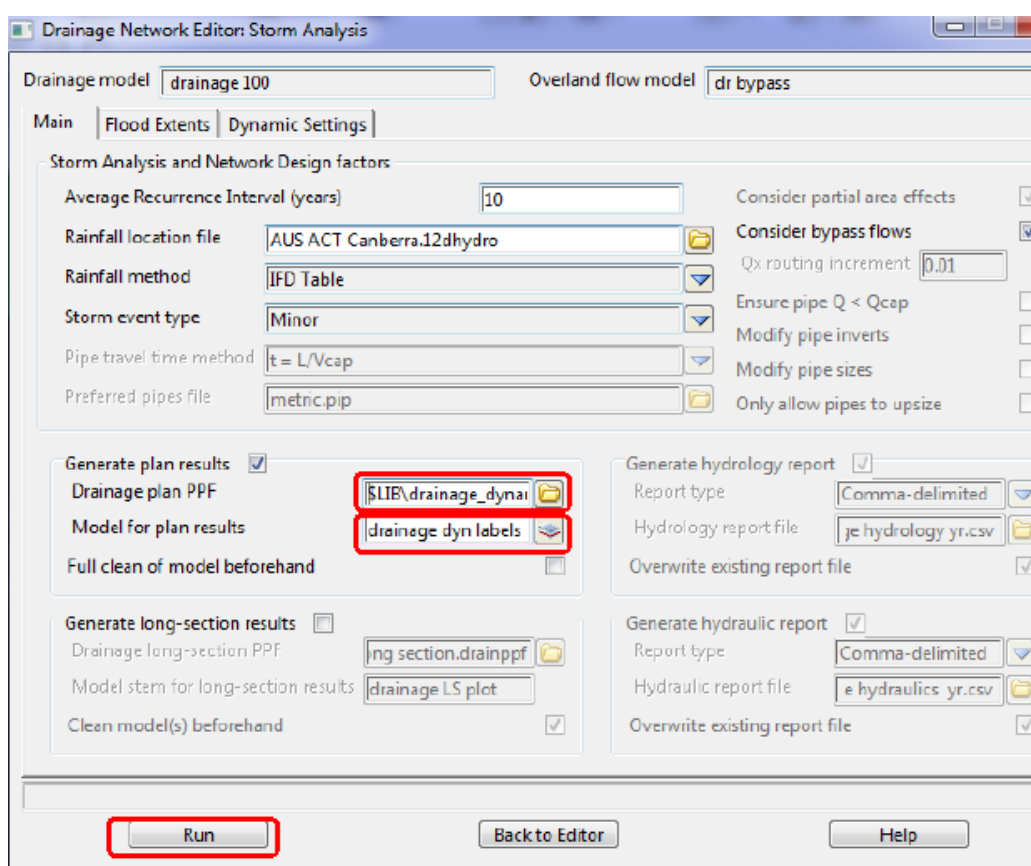

See [Create and Editing Channel Shapes](#) for details about manually entering data or changing the shape.

7.0 Running Dynamic Drainage

The dynamic engine analyses the network but does not design the components. Multiple storm patterns may be run simultaneously and the results from individual storms as well as the worst case from all currently analysed storms is saved. The results may be viewed graphically or in user defined reports. If your computer has a multiple core processor each storm will be processed by different processors and 12d will accumulate the results as the storms finish analysing.

7.1 Storm Analysis

Select the **Storm Analysis** button. To generate plan labels for the worst case dynamic results select the **drainage_dynamic_design** ppf file from the library. Also change the name of the **Model for plan results** so that you can keep the results from previous rational hydrology runs. Select the **Run** button.

A process window will be launched for each storm analysed and the status will be printed in the output window. **Always watch this window for messages.** Below are message from a sample run,

```
==> Checking Storm: 1
==> Storm: 1   OK
==> Updating Catchment Attributes
==> Updating Node Attributes
==> Updating Link Attributes
```

==> Updating Model Attributes
Elapsed Time: 6.67 secs
Run finished normally.

A run with errors would have a message like the following:

Dynamic Drainage Analysis (Build 5.1.026)
Dynamic Runoff Method: ILSAX 2
ari0.0
zone: 0
1 TP_Durations: 25.00
==> Solving Storm: 1
ERROR: Bypass section not defined for conduit: 7/A-SEP_to_6/A-SEP(S)
Model failed to solve.

7.2 Reviewing Results - Plan Labels

As with the rational method, the plan plots indicate the peak values. If multiple storms are run then this ppf file will print the max from all storms run.

So that the dynamic results are not mixed with the rational results, the worst case results are stored with the prefix **dynamic**. Results from individual storms have the prefix dynamic/xx where xx is the max time of the rainfall event.

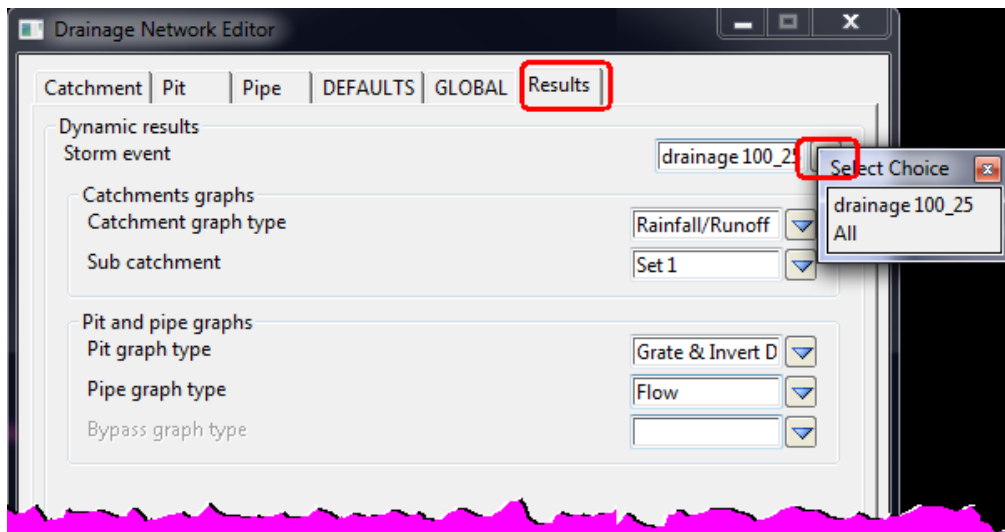

For example the pipe attribute for the maximum pipe flow

calculated pipe max flow	rational hydrology result
dynamic/calculated pipe max flow	worst case dynamic result
dynamic/calculated pipe max flow critical storm	storm where above results occurred
dynamic/25/calculated pipe max flow	25 min storm dynamic result
dynamic/calculated pipe max flow	worst case dynamic result

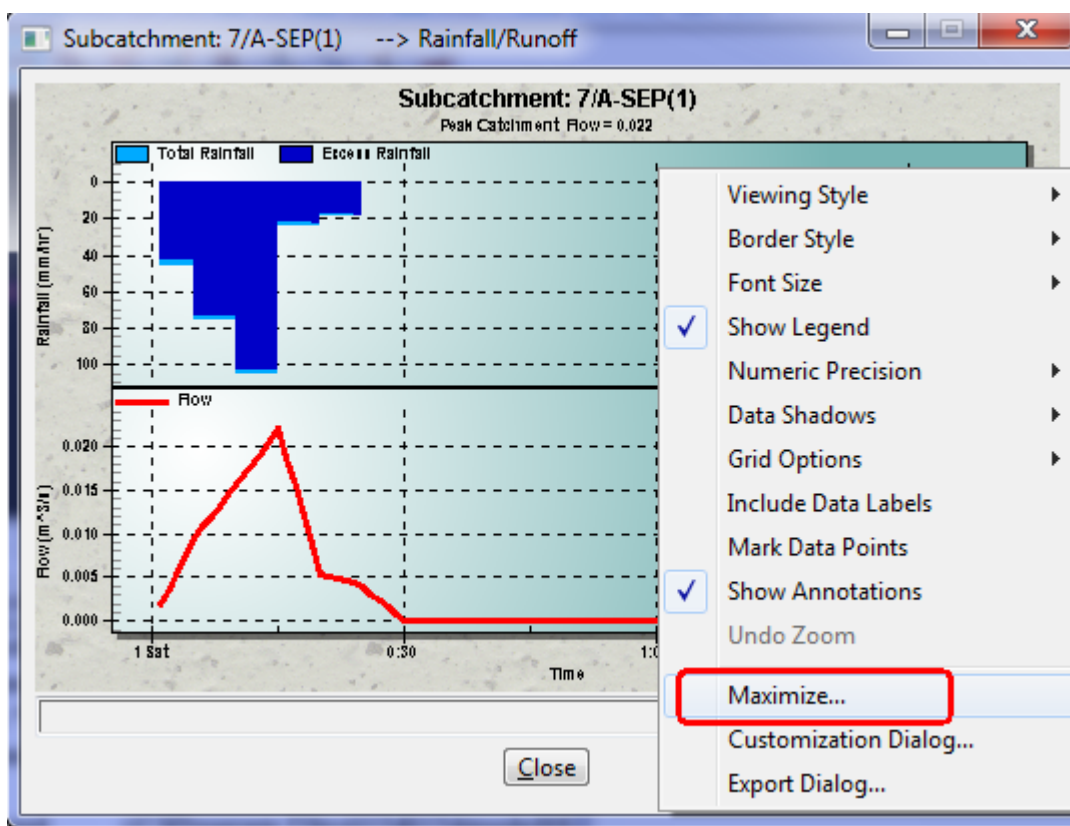

7.3 Reviewing Results - Graphs

Graphs indicating the results are created on the **Graphs** tab of the **DNE**. These graphs are a sampling of the time step results and usually does not include all time steps. Therefore, if the peak indicated in the attributes occurs between 2 plot points the peak may not be on the graph.

Select the **Storm event** to view. Nothing is displayed yet. When **All** is selected, the results from all the storms analysed in the last run are displayed. Graphs types that display more than one line will not be displayed when all is selected. There will be far too many lines on the plot to properly identify them.

Now select the data to view using the drop down boxes or by selecting the below and pressing enter. For example the **Rainfall/Runoff**.

The panel cannot be resized but it can be maximised via the right mouse menu. ESC returns to smaller view. The peak from the plot data (not the attribute) is indicated at the top of the graph.

You can zoom into the graph areas by dragging a rectangle inside the graph area. You must right mouse select and choose **Undo Zoom** to return to the full plot.

The available graphs are:

Catchment graph types (used in conjunction with **Sub catchment** selection)

Rainfall/runoff

The **Total rainfall** is the rainfall intensity calculated from the IFD data, the return period and the temporal patterns.

Excess rainfall (ILSAX 2) is the water that is left over after the rainfall losses infiltrate into the soil.

For the impervious area, excess rainfall = total rainfall - storage

For the pervious area, excess rainfall = total rainfall - storage - infiltration

Runoff starts when the excess rainfall depth exceeds the storage depth and the intensity is greater than the infiltration. Most frequently runoff starts from the impervious area first, (no infiltration, small storage and short tc) and then from the pervious area.

Runoff The runoff component of the **Rainfall/runoff** graph (good for all storms).

Rainfall The rainfall component of the **Rainfall/runoff** graph (good for all storms).

Losses These are the horton infiltration losses that are subtracted from the pervious component of the catchment (good for all storms).

Pit graph types

12d analysis has 2 systems for conveying flow. The **surface system** created with bypass flow strings (open channels with their inverts at the pit grate levels) and the **link system** created with the 12d drainage strings.

Grate & Invert Depths:

The top is the **Grate depth** showing the depth of flow in the surface channel measured from the grate level. The bottom is the **Invert depth** showing the depth in the link system above the pit invert.

Grate & Invert Elevations:

Shows both the bypass and link system water elevations. Good to see when the link elevation reaches the grate level to stop the inflow of water through the grate.

All Inflows & Outflows: (Inflows are + and outflows are - (S means surface))

Flows for each link and bypass are listed separately.

Local is the total **Catchment** flow from all 3 catchment sets plus direct flow,

In: Links and surfaces flows entering the pit.

Out: Links and surfaces flows leaving the pit.

Total Inflows and Outflows:

Local: the total **Catchment** flow from all 3 catchment sets plus direct flow,

Inflow to Invert: the sum of **In:** (links) + **Captured flow** This is the total inflow into the pit for the link system.

Outflow from Invert: the sum of **Out:** (links) This is the total outflow from the pit for the link system.

Approach Flow: the sum of the **Local** + **In:** (surface)

Captured Flow: determined from the **Approach Flow** (on grade pits) or **Grate Depth** (sag pits)

Bypass Flow: Approach flow - Captured Flow

Depth above Invert see invert depth above

Depth above Grate see grate depth above

Elevation - see Invert elevation above

Elevation Bypass Flow - see Grate elevation above

Basin volume - only available on pits with basin curve data.

Catchment Flow - Total of **Runoff** for Sets 1, 2 and 3.

Link Inflow and Captured Inflow: surface and link pit elevations, **Link Inflow** (see **Inflow to invert** above) and **Captured Inflow** (see **Captured Flow** above)

Link Outflow: see **Outflow from Invert** above

Approach Flow: see above

Bypass flow: see above

Inflow: see **Link Inflow** above

Overflow - the flow that is lost from the drainage system when the hgl exceeds the maximum level at the pit.

The maximum level at the pit is largest of

1) the cover level,

- 2) the grate level + depth of bypass channel
- 3) the maximum storage level in the basin storage data.

Ku - the link flow, upstream velocity, Ku and head loss of the primary outgoing link.

Pipe graph types (link system)

Dynamic Section: a section view of the entire string showing the hgl in the links and surface channels. The lower dashed line connect the grate levels and the upper shows the top of the surface channels. If the hgl goes above the top of the surface channel water will be lost from the system.

All Link Results 3 charts: The colour of the right axis label is the same as the graph line it represents.

HGL US, HGL DS (left axis)

Depth (right axis) depth at the mid point of the link

Capacity (left axis) the ratio of the current pipe flow / (pipe full, HGL at grade capacity)

Froude Number (right axis) - Froude number at the mid point of the link

Flow (left axis) flow in the link

Velocity (right axis) - velocity at the mid point of the link

Bypass graph types (bypass system)

same results graphs as for the **pipe graph types** above

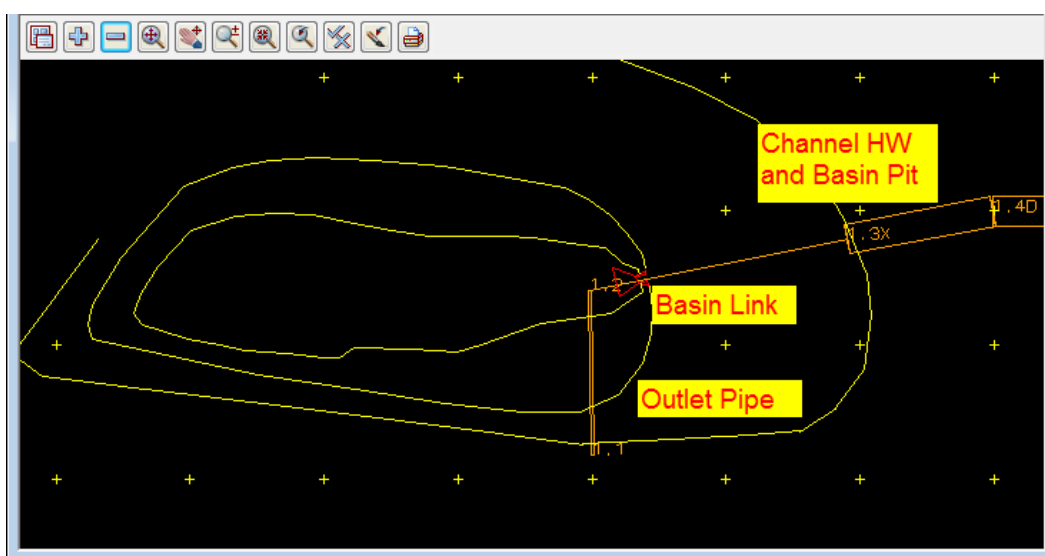

8.0 Adding Storage Basins

Storage basins are created by adding an elevation versus area curve at a pit. Without the area curve the default area of a pit is defined by the diameter or the length, width settings in the drainage.4d file.

The elevation area curve may be entered manually for initial estimates or measured from the finished surface tin (inside a string defining the extent of the basin).

The outlet structure is the link exiting the basin pit. This is often a weir, orifice or discharge limiting pipe.

An optional basin link may be used to separate the outflow structure from the basin pit. This allows the user to place the outlet structures in their correct position. The basin link is only a graphical link and often has its diameter set to zero to help indicate that it is not a hydraulic component of the system.

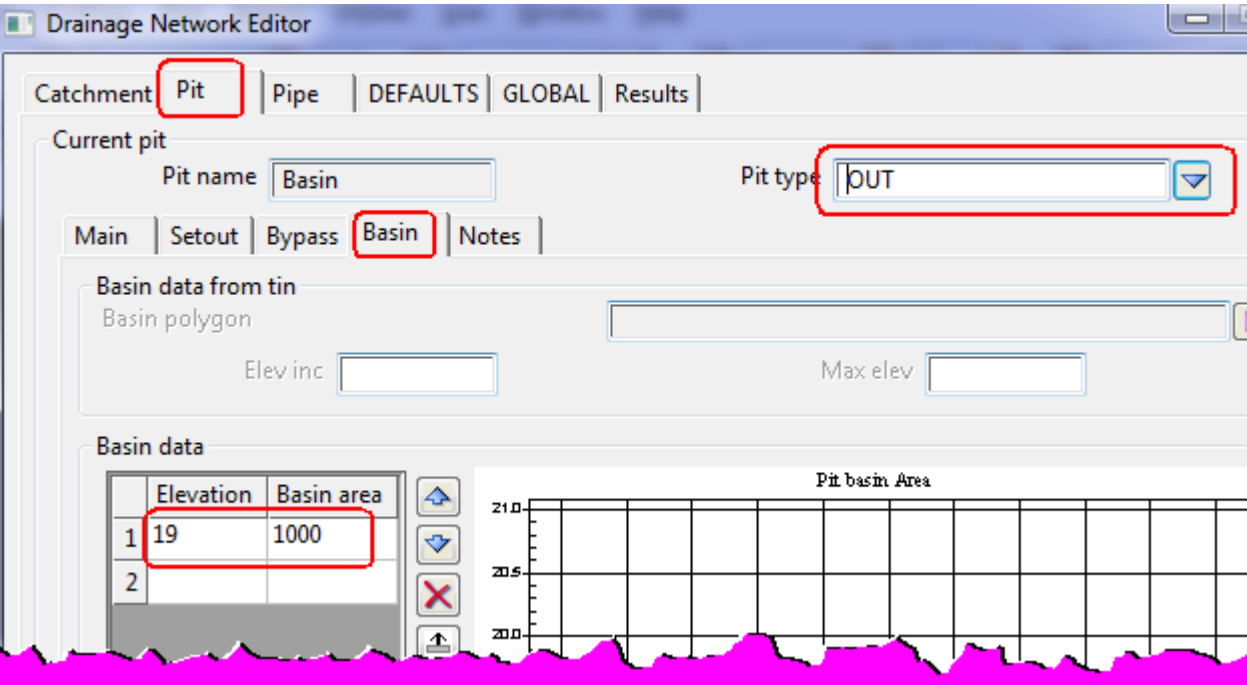

8.1 Selecting the Basin Location

The node modelling the basin is the outlet of the pipe or channel discharging into the basin. The pit becomes a basin when the user enters elevation versus area curve for the basin or selects a polygon around the top of the basin. With the polygon method, 12d will create the elevation versus area curve from the finished surface tin. We will use an existing string from the survey data but you may easily create your own polygon around the top of the basin.

For an initial sizing you only need to enter the basin invert elevation and area into the grid.

If the outlet pipe has an upstream invert level below the lowest basin curve entry, this lower section of the pit will use the default pit area.

8.2 The Outlet Structure and the Basin Link

The basin outlet generally includes more than one structure. Typical arrangements include a low flow pipe that restricts the outflow from the basin and a high flow spillway used in larger events. Every outlet structure is linked to the basin pit with a basin link. Often the outlet structure is a fair distance from the basin pit and we want the outlet structures drawn in their correct location. IF the diameter of the basin link is set to zero it joins the basin pit to the outlet structure but preforms no hydraulic function in the model.

The minimum elevation in the elevation data becomes bottom of the basin and the outlet inverts cannot be below this level. If there is a drop pit for the outlet then ensure that the base of the drop pit is first elevation in the basin data. The area will be the area of the pit. The second entry will be the top of pit level with the same pit area.

8.3 Creating the Basin link

The pipe downstream of a basin pit is a basin link. When the diameter is set to zero, the data set on this link is for graphical presentation and has no hydraulic function.

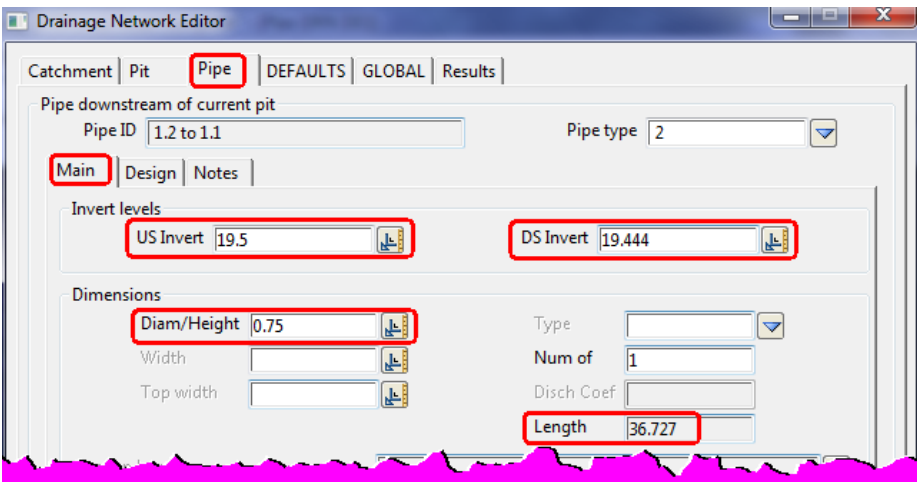

The screenshot shows the 'Pipe' tab in the Drainage Network Editor. The 'Pipe ID' is '1.3X to 1.2' and the 'Pipe type' is 'CHNL'. The 'Main' sub-tab is selected. Under 'Invert levels', 'US Invert' is '19.5' and 'DS Invert' is '19.5'. The 'Dimensions' section is highlighted with a red box and includes: 'Diam/Height' (0), 'Type' (Basin), 'Width', 'Top width', 'Num of' (1), 'Disch Coef', 'Length' (58.729), and 'Section location'. The 'Other properties' section includes 'Roughness type' (Manning), 'Roughness' (0.04), 'US defl.' (0°29'45"), and 'DS defl.' (79°35'49").

For clarity in the section view we will set the levels to the bottom elevation of the basin and set a zero pipe diameter to make the link as unobtrusive as possible.

The screenshot shows the 'Pipe' tab in the Drainage Network Editor, with the 'Design' sub-tab selected. Under 'Invert design', 'Lock US Invert' and 'Lock DS Invert' are both checked. 'Grade mode' is set to 'IL-IL Drop'. 'Cover limit' is '0'. 'DS vert defl' and 'Align drop' are both '0'. The 'Pipe size design' section includes 'Lock pipe size' (unchecked), 'Min pipe height', 'Max pipe height', 'Design mode' (Open Channel: Freeboard Design), 'Freeboard limit at US pit', and 'Flow-depth limit at pipe entrance (%)'.

Locking the link inverts will ensure the invert elevations are not changed with a regrade pipe selection. Remember this is a graphical link and the values do not affect the hydraulic calculations.

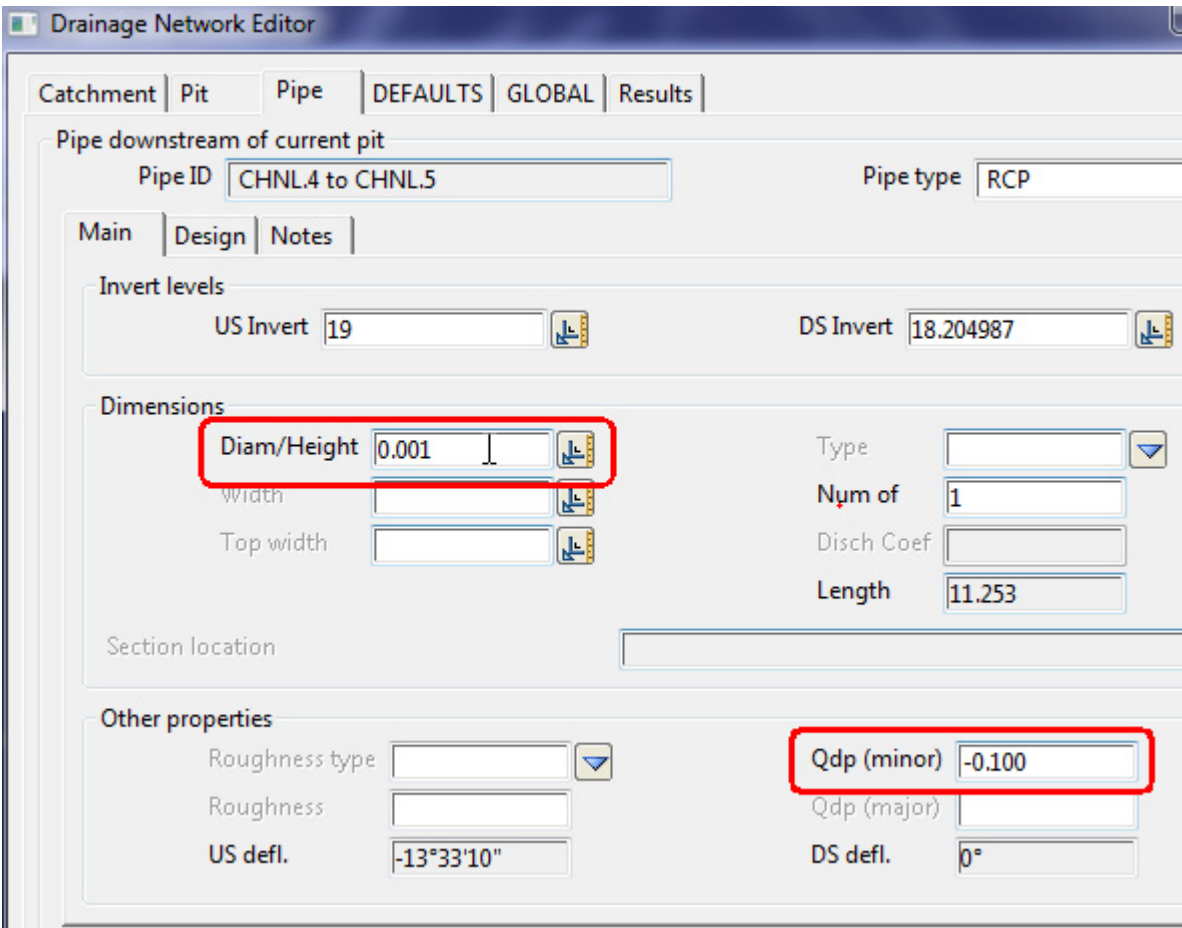

8.4 Data for the Outlet Control Pipe

The upstream invert is being set to the bottom of the basin and then we will lock this invert. We will leave the engine to set the DS invert level.

The length will depend of your drawing.

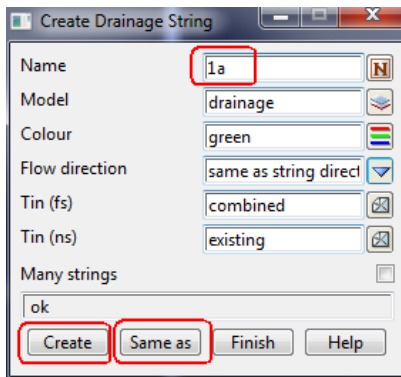

For initial sizing of the basin you can set the diameter of the pipe to 0.001m so that no flow goes through it. Now enter a negative pipe direct flow and this will become the constant outflow from the basin (usually set to your pre-development peak discharge). Once you size the basin, return here, remove the negative flow and select a pipe size to yield similar results.

8.5 Adding a Second Outlet Structure (Spillway Weir)

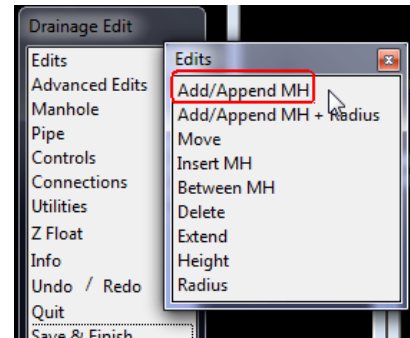

A second drainage string will be needed for the spillway. Again it will start with a basin link and then have a weir section. From the main menu select

Design->Drainage-Sewer->Create

Select the Same as button and pick a drainage string in the model. This will fill in all of fields. Name must be unique so change this data. Finally select Create.

Then select Add/Append MH from the menu.

The plan view below shows the basin link and the spillway weir location. Draw the string in the

direction of flow and ensure you start with a point snap on end of the channel.

Once the string has been created the pit data at the upstream side of the weir need to be set.

US Invert DS Invert

Dimensions
Diam/Height Type
Width Num of
Top width Disch Coef
Length

Section location

On the pipe-main tab we will see the **US invert** level to weir crest level (20.0). The **DS Invert** is set the same but will have no affect on the calculations. The **Diam/Height** determines when the weir will start acting as an orifice. Generally used in underground storage tanks. In this case we will set it to a value higher than the expect flow depth (1.0 m). The **Width** is the dimension of the weir perpendicular to the flow. The Disch Coef is optional as the default will be used if it is blank.

The tailwater levels are now set to the expected levels for the minor and major events.

Enter a name for the outlet.

9.0 Natural Section Shapes

The channel shape may be cut from the design tin by drawing a string at the desired location. It is a standard convention to draw it from left to right looking in the direction of flow.

In this example we are going to connect the end of the culvert to a channel down to the spillway and then eastward to the end of the project. Set the Defaults, **Pit Type** to **chnl auto** and **Pipe Type** to **CHNL GRASS EXISTING 1** with a **height** of 4.0. This height will not affect the calculations but will show the approximate channel top in the section view. This will mean you no not have to change them later.

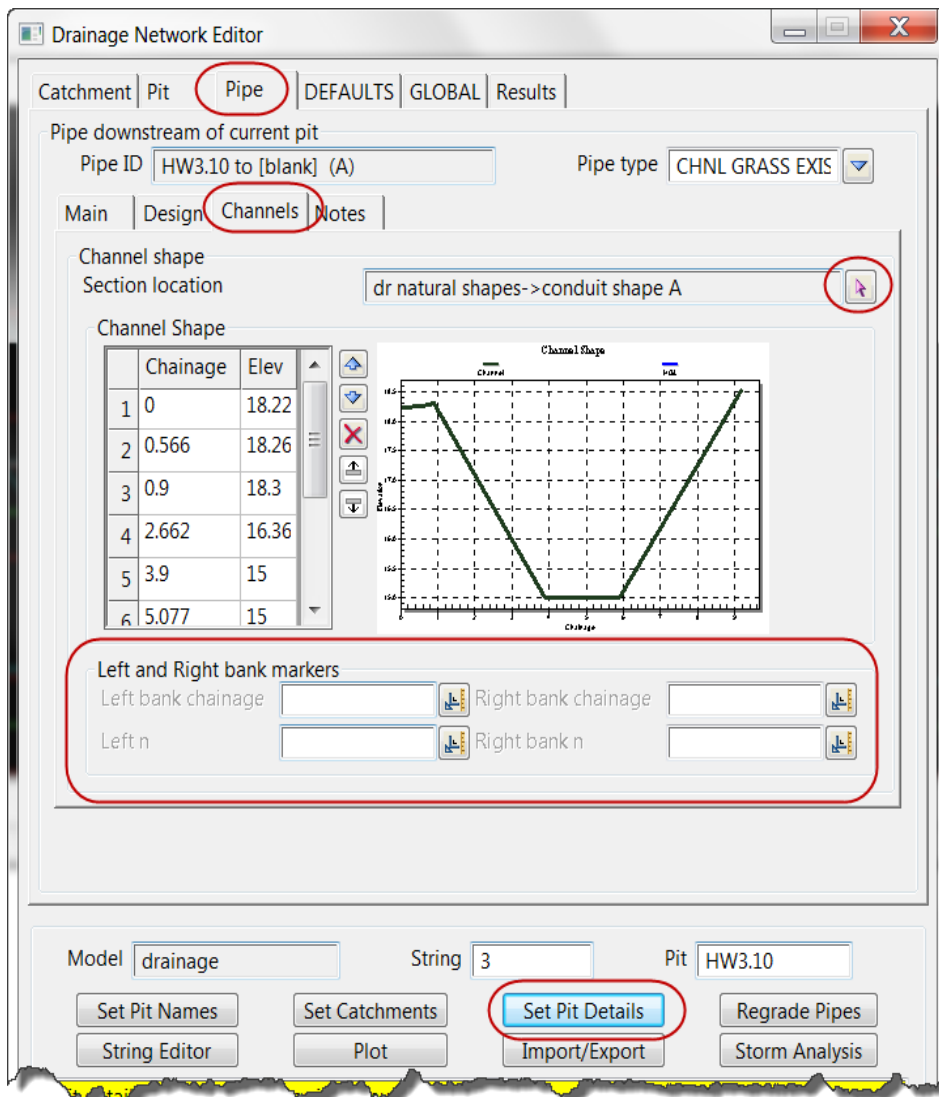

Use the **Points Edit->Append** to add the extra links as shown below. Ensure that the centre of the drainage string is in the lowest part of the channel. Finally, extent the spillway to the channel.

Enter the model name **dr natural shapes** into the CAD toolbar model field before drawing this string.

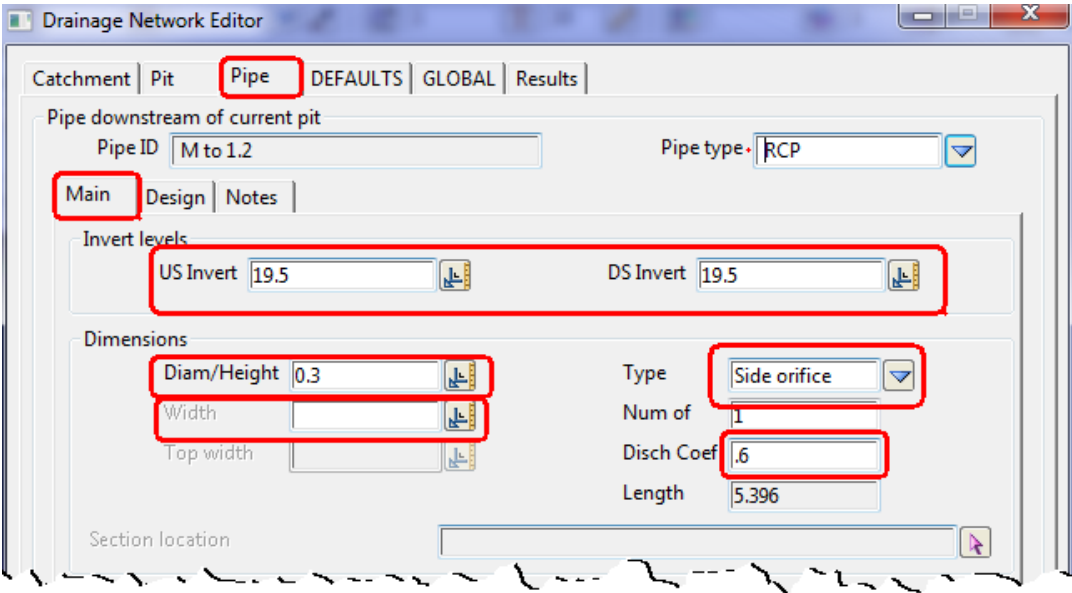

Once you have drawn the string you can select it from the **Pipe->Channels** tab. Selecting **Set Pit Details** will have the shape cut from the design tin and displayed in the grid and graph area. If you do not want the shape cut from the tin you can just enter the shape in the grid area. Once again the shape obtains its elevation by setting the lowest point onto the invert elevations.

Left and **right bank chainages** and n values may be entered if desired. If blank the link's n value will be used. There is no default left and right bank n values.

10.0 Orifice Control on a Pipe

Use the Strings->Points Edit->Insert command to add a pit upstream of the outlet pipe. This new pipe will be set to an orifice to control the flow entering the pipe.

Lock the invert levels so that the orifice will not move in elevation,

11.0 Storage Tanks as Basin or Pipe

A storage tank may be modelled as a box culvert or as a basin but do not do both as this will double count the storage. To model the tank using basin areas Set conduit type to a Basin link and set the pipe diameter to a value that is meaningful for the long section appearance. Once it is marked as a basin link it will not affect the calculations.

Drainage Utility Program

Position of option on menu: Design => Drainage-Sewer =>More => Misc. utilities

The Drainage utility program contains functions to significantly reduce the time required to perform drainage tasks. These tasks include

Assign Pit names

To use the export routines, every pit in 12d must have a pit name. This selection automatically creates the pit names for the entire model or selected strings. Examples of pit names are 1,2,3... A1,A2,A3....Pit 3-A, Pit 3-B.

Reset pit cover levels

This selection sets the cover levels for the manholes to the design tin or design strings. The user will be prompted for each manhole to select a tin level, a string level (if a design string model is supplied) or keep a manually set level. The tin/string/manual selection will be stored and the levels reset now and whenever the pit/pipe interfaces exports the data (unless this last option has been manually turned off).

Regrade pipe levels

The selection applies the default grading rules (cover level) to reset the pipe invert levels for the entire network. Manhole cover levels are not changed during this function

Label Catchments and Label drainage network

This selection quickly creates labels for a drainage and catchment plan. The pits are labelled with their name, the pipes with their diameters and the catchments with their area and the pit they drain to. These labels must be updated using this selection whenever the catchment or network is changed. To turn off the automatically drawn pit names in the current view select

Menu=>Settings=>Text=>Toggle and select the drainage model.

Analyse Flooded Width

This is the only hydraulic calculation that takes place in 12d. The normal depth along the bypass flow paths is calculated using discharges imported from hydrology/hydraulic packages including spreadsheets. This flooded width is drawn to scale at intervals along the bypass flow path and colour coded (blue if less than a specified limit and red if greater than the limit).

Drainage overview

Usage

This panel is accessed from the menu selection

Design => Drainage-Sewer => More => Misc. utilities

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

drainage model	input box		
-----------------------	-----------	--	--

Model to contain all of the pit and pipe network to be worked on.

catchment area model	input box		
-----------------------------	-----------	--	--

*Model to contain the catchments strings for the **Drainage Model** above*

<u>Assign pit names</u>	button		
-------------------------	--------	--	--

This button launches a dialogue for setting the names for the pit and pipes in the network model.

design tin	tin box		
-------------------	---------	--	--

*This optional field allows the user to specify a new tin for the surface levels of the pits. If you are using road grade and cross fall for pit inlet capacity it is preferable leave this blank and to link the pits to a string using the **design model** field below. If some or all of the pits are linked to strings in the design model below, they will still use the strings selected. [more about design strings](#)*

design model	model box		
---------------------	-----------	--	--

This model contains the strings for the pit cover levels (the string directions are also used for road grade and cross fall). If this model is changed you will be prompted to select new strings to link the pits to. [more about design strings](#)

Reset pit cover levels

button

*This button will reset the pit levels to the design strings in **design model** or to the tin specified in **design tin** above. The first time this is selected you will be prompted to choose whether to set the pit cover level to the design tin or the a string in the design model. [more about design strings](#)*

Regrade pipe levels

button

The selection applies the default grading rules (cover level) to reset the pipe invert levels.

network labels model

model box

drainage labels network

*Model to contain the network labels for the **Drainage Model** above. This model is cleaned out each time **Label drainage network** is selected.*

catchment labels model

model box

drainage labels catchment

*Model to contain the catchment labels for the **Catchment Area Model** above. This model is cleaned out each time **Label catchments** is selected*

catchment units

choice box

ha, acres

Conversion factors of 10,000 will be used for ha and 43560 for acres. Not that not all design packages support both units.

text parameters

input box

*Select the + to access the text parameters (colour, size, alignment etc.) for the text created with **Label Catchment** or **Label drainage network***

label catchments

button

This selection creates labels indicating the catchment name and area in the units specified above.

CAUTION: *If you change you catchment strings or rename you pits you must run this routine to update the labels.*

label drainage network

button

This selection creates labels indicating the pipe size and pit name for the network model.

CAUTION: *If you change you change the pipe sizes or rename you pits you must run this routine to update the labels.*

analyse flooded width

button

This selection launches the dialogue for analysing the flood along bypass flow paths. The bypass flows must be imported from your design package/spreadsheet before running this selection.

Set Pit Names

The **Set pit name** selection names the pits and pipes for the drainage model (both pits and pipes can be named). Three numbering schemes are available:

- 1) drainage strings names are used as the prefix followed by the pit number (ex A-
- A) drainage strings names are used as the suffix followed by the pit number (ex 1/
- the pits are sequentially numbered. (ex 1,2,3....)

The names can have pre-text added to the beginning of the pit name and a separator between the string name and the pit number (/ etc.) if desired.

Design Program Notes:

PCdrain users: Since catchments contain only 3 characters do not use separators. Using the letters A-Z for strings and numbers 1-99 will give you 26 strings and up to 99 pits on each string. Using the numbered stem works very well in PC Drain.

Micro Drainage users: Pits and pipes are numbered separately in Micro drainage. The pipes must use the numbered sequence with the most upstream pipes numbered with the smallest numbers. Number of digits must be set to 3.

ILSAX users: You must use alphabetic characters for your string names and no more than 3 characters

 Drainage overview

Usage

The selection is found on the drainage **network editor** and is accessed through the main menu by selecting

Design=>Drainage-Sewer=>Drainage Network=>Drainage=>Network editor

Select the **Set Pit Names** button and the following panel will appear.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Model	Model box		drainage model from main dialogue
Naming Method	Choice box		
		<i>Pit num - String name</i> for string A pit 1 the name is 1A <i>String name - Pit num</i> for string A pit 1 the name is A1 <i>Sequential numbering</i> the strings names are sorted alpha-numerically and the pits are numbered starting at First pit number	
Pre text	input box		
		this text will precede the pit name (ex Pit A01)	
String/pit separator	input box		
		the character that separates the string name from the pit number. For example if <u>pit names</u> A/01, A/02 etc. where desired a "/" would be entered. You may omit the separator if none is desired.	
First Pit Number	integer box		
		the starting pit number on the drainage lines. For drainage strings with the flow direction set as descending chainage the first pit is the junction pit.	
Min digits in pit numbers	integer box		
		a non zero value will pad the pit numbers with leading zeros. (ex if 2 is entered, pit 1 is not A/1 but rather A/01)	
Reverse numbering order	tick box		
		Unselected, pit First pit number is at the low chainage end of the line. Selected, pit First pit number is the second pit from the high chainage end of the line.	
Number pits	tick box		
		the pits are assigned names. This allows the pit and pipes to be names differently.	
Number pipes	tick box		
		the pipes are assigned names. This allows the pit and pipes to be names differently.	
Run	button		
		name the pits/pipes. The pit at the high chainage of the string is not labelled. The only time you will need to name this pit is when it is the outlet from the system.	
Back to Editor	button		
		return to the network editor.	
Help	button		
		display this page.

River Interface Models

The River interface strings are split into different models depending on the strings function. Also the string names are used to define names of entities such as cross sections and reservoirs when they are exported. Following is a list of the river interface string types:

[River strings](#)

[Source strings](#)

[Reservoir Strings](#)

[Spill Strings](#)

River Strings

The river centre line and bank are defined by the strings in the **River strings** model.

The centre line string is used to

- s measure the centre line distance between the sections,
- s mark to zero chainage (or starting chainage) on the cross section, and
- s if automatic source strings are created they will be perpendicular to this string
- s **define culvert locations** and sizes (XP SWMM only)

The left and right bank strings are used to

- s measure the bank distances between the sections and
- s mark the cross section chainage where the conveyance (usually roughness) changes

The names of the strings must be **left bank**, **right bank** and **centre line** *river name, reach name* (centre may be spelled center).

The left bank is on the left side of the river looking downstream and the right bank is on the right (looking down stream). These strings need not touch each other and may extend from one river reach to another.

HEC RAS and UNET

The centre line string must begin at the downstream end of the river. The modelling convention for these programs is to have the low chainage at the downstream end. You may use super, 2D,3D or alignment strings in this model. If you put other strings in this model you will receive warning messages saying that these strings will not be used.

Each reach of the river **MUST** have its own centre line string and they must "touch" each other to create a river confluence.

A sample of a river strings model for **HEC RAS** with one confluence is shown below. The line style for the centre line is not required. It is used only to show the direction of the centre line string.

Notes:

left bank strings are shown in red, right bank in blue and centre line strings in yellow and green. The line style for the centre line strings is *Drainage_4D->Flow line*. This is not required but shows the direction of the string. The string labels were created with Strings->Label->User->Label strings with names.

Centre line string direction is very important!

HEC RAS, UNET, XP SWMM

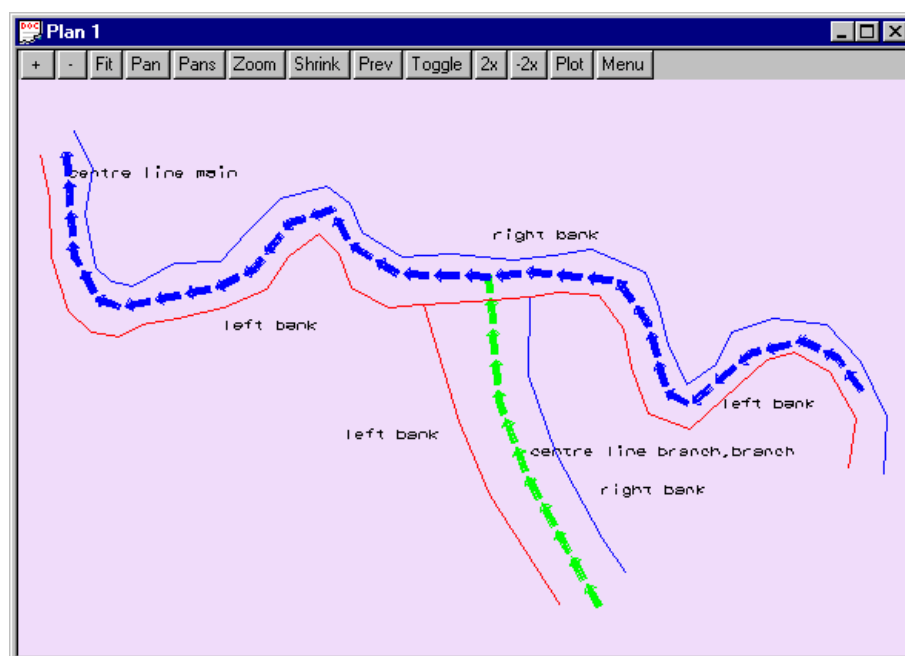

start at the **DOWN**stream end of the river

ISIS and Mike 11

start at the **UP**stream end of the river

ISIS and MIKE11

The centre line strings are drawn starting **upstream** for the ISIS and Mike 11 programs.

Source Strings

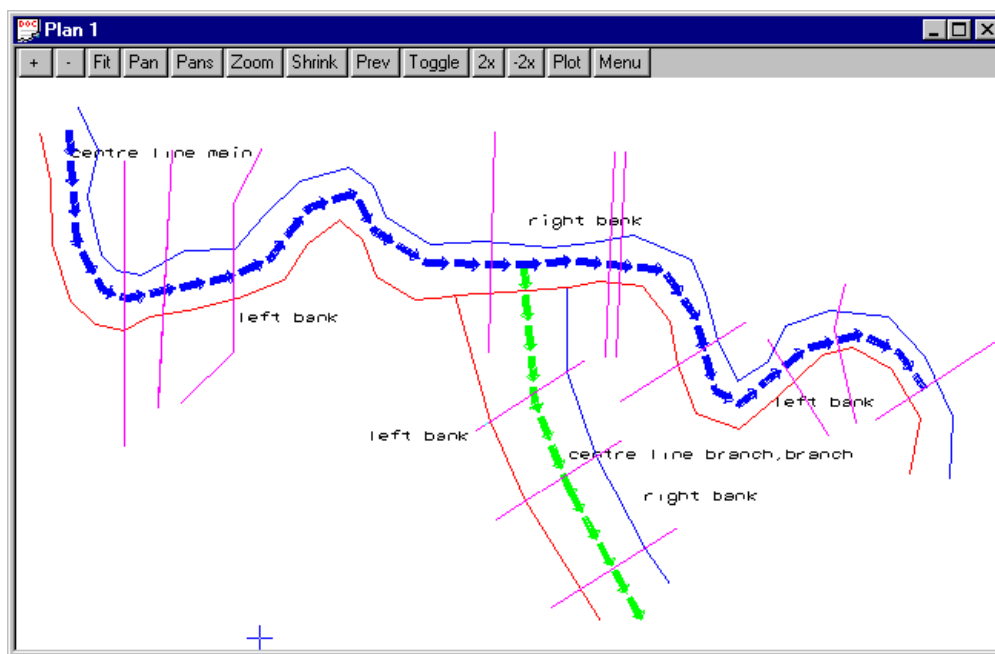

Cross sections are created at the location of the **source strings**. These source strings are initially created at a user defined spacing and section length using any one of the river interfaces writers. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

A quick way to manually create 2 point string is via the CAD tool bar.

A sample of source strings (shown in magenta) is presented below. The source strings may run in any direction except for Mike11. In Mike11, the cross sections will be created in the same direction as the source strings. For all other interfaces the low chainage will be used for the left bank (section viewed looking downstream).

Reservoir Strings

The **reservoir strings** may define inline reservoirs or offline storage. The elevation of the first point on the string sets the maximum level to be used in the stage storage curve. 12d will determine the minimum level inside the reservoir string and then calculate the volumes at a 1m (2 foot for imperial units) increment. The default increment may be changed by creating a string attribute "stage increment" (see **stage increment**).

Inline reservoirs are "touched" by centre line strings both upstream and downstream. Offline storage areas

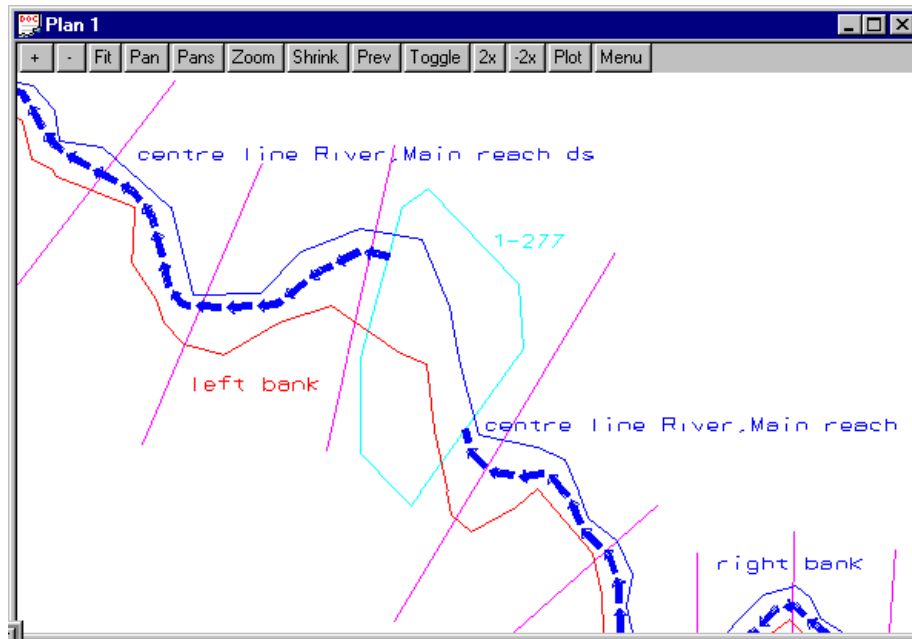

are linked to the cross sections via **Spill strings**.

Other features of the reservoir strings are

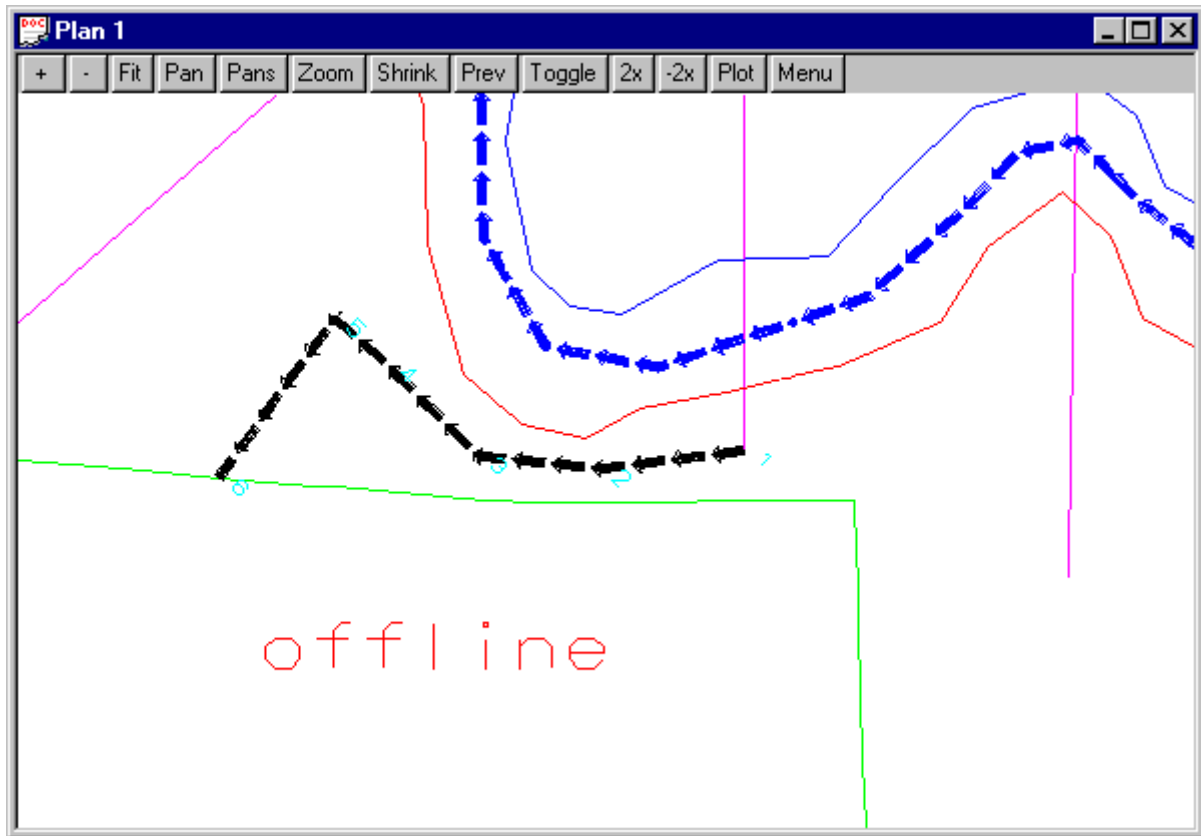

Auto height

XP SWMM catchment parameters

A sample drawing showing an inline reservoir in cyan (1-277) follows. Note that the river centre line touches the reservoir string both upstream and downstream. The left and right bank strings may continue straight through the reservoir.

A sample drawing of an offline reservoir follows (the reservoir string is shown in green). Note that the spill string (black) starts at the source string (point 1), then follows the section line to be cut and exported (points 2 to 5) and ends by touching the off line reservoir string at point 6. The rivers strings do not touch the offline storage strings.

Spill strings

Spill strings are strings that link offline storage areas to a cross section (see drawing above). The string must begin by "touching" the source string and then proceed to the first point on the spill section. During the export the first point will NOT be exported as part of the spill section. After defining the end of the spill section the last point on the string must "touch" the reservoir string. Again this last point will NOT be exported as part of the spill section.

The default roughness for the spill section is the "left n" from the main export panel, the default slope is 0.5% and the default length is 100. See the manual setting table for **manual override settings**.

XPSWMM Only. 2 point culvert strings (6 max) may be drawn across the spill string to create a multi conduit. The culvert strings should be drawn in the same direction as the spill string so that the upstream and downstream inverts follow in the same direction.

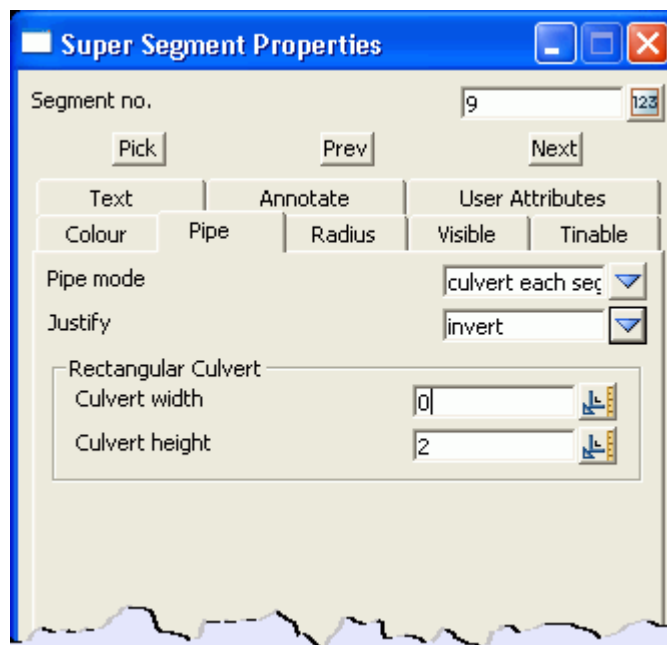

Define Culvert Locations

12d allows culverts to be included as a segment of a super string. The **XP SWMM** rivers interface allows culverts in 2 models. In the spill string model, multiple two point superstring may cross a spill string to indicate a culvert through the embankment. In the river string model a segment of the river centre line may be marked as a culvert. For parallel culverts, segment attributes must be used. If a source string crosses the same segment than a multi-link with both the culvert and the natural section will be exported.

Important note: Version 10.0 of xpswmm (at the time of writing) will only use inlet control curves on culverts with positive slopes.

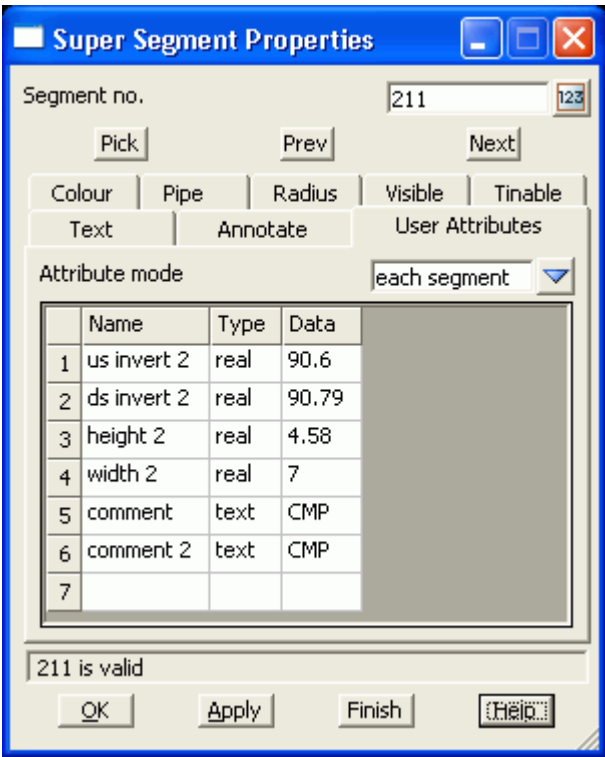

Adding a Culvert to a super string

1. **Super strings only!**
Convert string to a super string (if required)
Strings->Convert
2. **Mark the ends of the culvert.**
Add a vertex at the upstream and downstream end of the culvert (Toggle vertices on if desired)
String->Points Edit->Insert
3. **Mark the segment as a culvert or pipe**
Use the super string segment editor to set the culvert data.
Strings->Properties->Segments (all) and change Segment properties to use **culvert each segment** (box) or **pipe each segment** (round). Note that if there is one box culvert on the centre line then all must be box culverts. If you need pipes and box culverts combined, set the width to zero for pipes. Also set the Justify mode to indicate the type culvert levels you wish to specify.

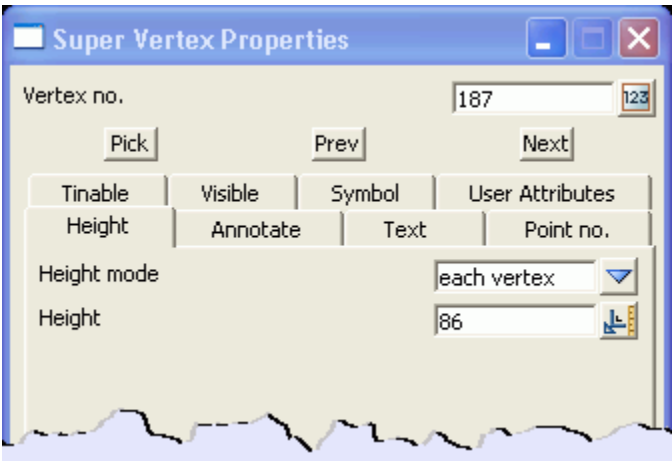

If there are two (max is 7) culverts at this location that have different inverts or sizes add the following user defined attributes to the segment. The comment attributes are printed by the Culvert Table routine and are used to label the culvert as well. If there are a number of identical culverts, the attributes "number of pipes" (integer) can be set to a value greater than 0. Additional attributes to customise the culvert are listed at the end of this section. Default manning's n are 0.024 for pipes (corrugated metal) and 0.012 for box (concrete).

4. Conduit Factors are automatically set. Circular pipes are set to "Headwall (circular corrugated metal)" and box culverts are set to "45 deg Wingwall Flares (Rect, Conc)". Expansion and contraction energy loss coefficients have default values of 1.0 and 0.5 respectively but these may be changed using the attributes indicated below.

5. **Set the upstream and downstream levels**
 Select a vertex at the end of segment, ensure the **height mode** is **each vertex** and set the height. Use the **Next** or **Prev** button to move to the other end of the culvert and set its height as well.

Additional Culvert Segment Attributes (Spill and River strings)

Purpose	Attribute Name	Type	Typical Data Value
Culvert entrance loss	entrance loss	Real	0.5
Culvert exit loss	exit loss	Real	1.0

Purpose	Attribute Name	Type	Typical Data Value
Mannings n	roughness	Real	0.014
Multiple identical culverts	number of pipes	Integer	2

Centre Line Culvert Segment Attributes (River strings)

The attribute name has the culvert number as a suffix. i.e. (height 2)

Purpose	Attribute Name	Type	Typical Data Value
Diameter/height	height n	Real	0.5
Box culvert width	width n	Real	1.0
Upstream invert	us invert n	Real	20.2
Downstream invert	ds invert n	Real	20.1
Culvert length	length n	Real	10.2

Culvert Table

Position of option on menu: **Design=>Rivers=>XP SWMM interface=>Culvert table**

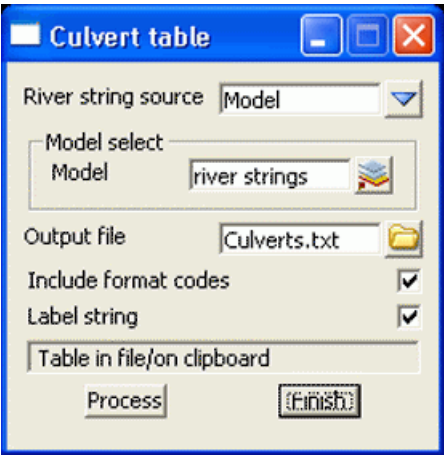

This option is used to create a table of the culverts created along the centre line of the river and to label the invert levels and comment for the first culvert on each segment (some segments may include attributes for more than on culvert). A sample is shown below.

Culvert Listing										
chainage	Number	US Invert	DS Invert	Height	Width	Quantity	X location	Y location	Comment	Segment

[Presenting Water Level Results](#)

[Import cross sections \(GIS file\)](#)

[Read HECRAS Interp sections](#)

[Read HEC2 Data](#)

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Exporting to HEC-RAS

The HEC-RAS project is created from a surface tin (representing the river bed and overbanks) and a model containing strings identified by their names "left bank", "right bank and the name prefix, "centre line". Any additional strings in the specified model will be ignored (warning messages will be given when you run the macro that any additional strings are being ignored). The low chainage (often zero) of the centre line strings must be at the downstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the HEC-RAS option at a user defined spacing and section length. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

Presenting HEC-RAS Results in 12d

After the HEC-RAS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the HEC-RAS results. These strings are then triangulated to create a water surface tin from which the water level boundaries are determined. These results can then be shown in plan, long section, cross section and in 3D perspectives.

[More details](#)

HEC-RAS Write Panel

Position of option on menu: Design=> Rivers=>HEC-RAS interface=>Create HEC-RAS project

The HEC-RAS interface creates the HEC-RAS project files ready to open and run. This includes the project, plan, flow and geometry files. Water levels are read back into 12d where they may be viewed in a three dimension perspective view to easily identify extents of flooding.

[Presenting Water Level Results](#)

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

The HEC-RAS panel for creating the HEC-RAS project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

INPUT MODELS

River strings model

Model box

Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.

Confluences are modelled by using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

The distance from the start of the upstream strings to the first cross section is used to model the confluence length.

The left and right bank strings need not be separate strings (see figure below).

Source string model

Model box

New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.

Rename Source Strings

Tick box

not selected

If selected the source strings will be a name using the chainage along the river centre line. The **number of decimals** and the **Centre line chainage factor** (ft to miles or m to km) are specified below.

Centre Line Chainage Factor

Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals

Real box

When **Rename source strings** is selected, the source strings name will have the specified number of decimals.

CREATE SOURCE STRNGS OPTIONS**Create Source Strings**

Tick box

not selected

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).

Distance between sections

Real box

The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.

Section Length

Real box

The length of the cross section with zero chainage at the mid point.

CROSS SECTION DATA**Cross section model**

Model box

The cross sections created and exported are stored in this model.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Levee Tolerance

Real box

If the surface level drops more than this amount while moving away from the channel centre line then the crest is marked as a levee. A value of zero means that no levees are marked.

Delta Y tolerance

Real box

*This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. **The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***

STARTUP DATA**Manning's n**

Real box

Manning's n values for the left, right and centre channel sections.

Discharge

Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside HEC-RAS or inside 12d. This can be changed at each section [See manual settings](#)

Units

Choice box

This selection will set the default units for the project being created.

Project file name

Input box

The HEC-RAS project name. Remember HEC-RAS (2.0 or earlier) is limited to 8 characters only. If the total path name is too long HEC-RAS will not analyse the project.

HEC-RAS Read Panel

Position of option on menu: Design=>Rivers=>HEC-RAS interface=>Read HEC-RAS reports

After the HEC-RAS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the HEC-RAS results. These strings are then triangulated to create a water surface tin.

See also

[HEC-RAS Interface overview](#)

[Create HEC-RAS files](#)

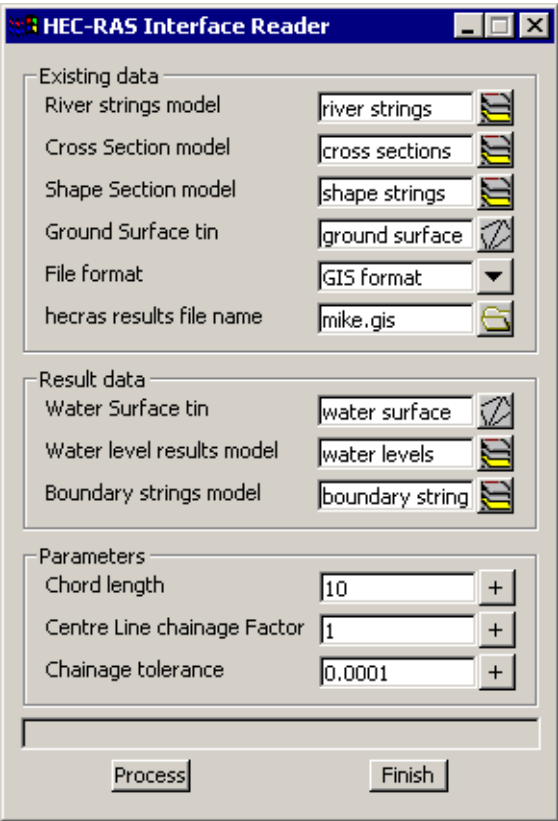

[Presenting Water Level Results](#)

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

The HEC-RAS read panel follows.

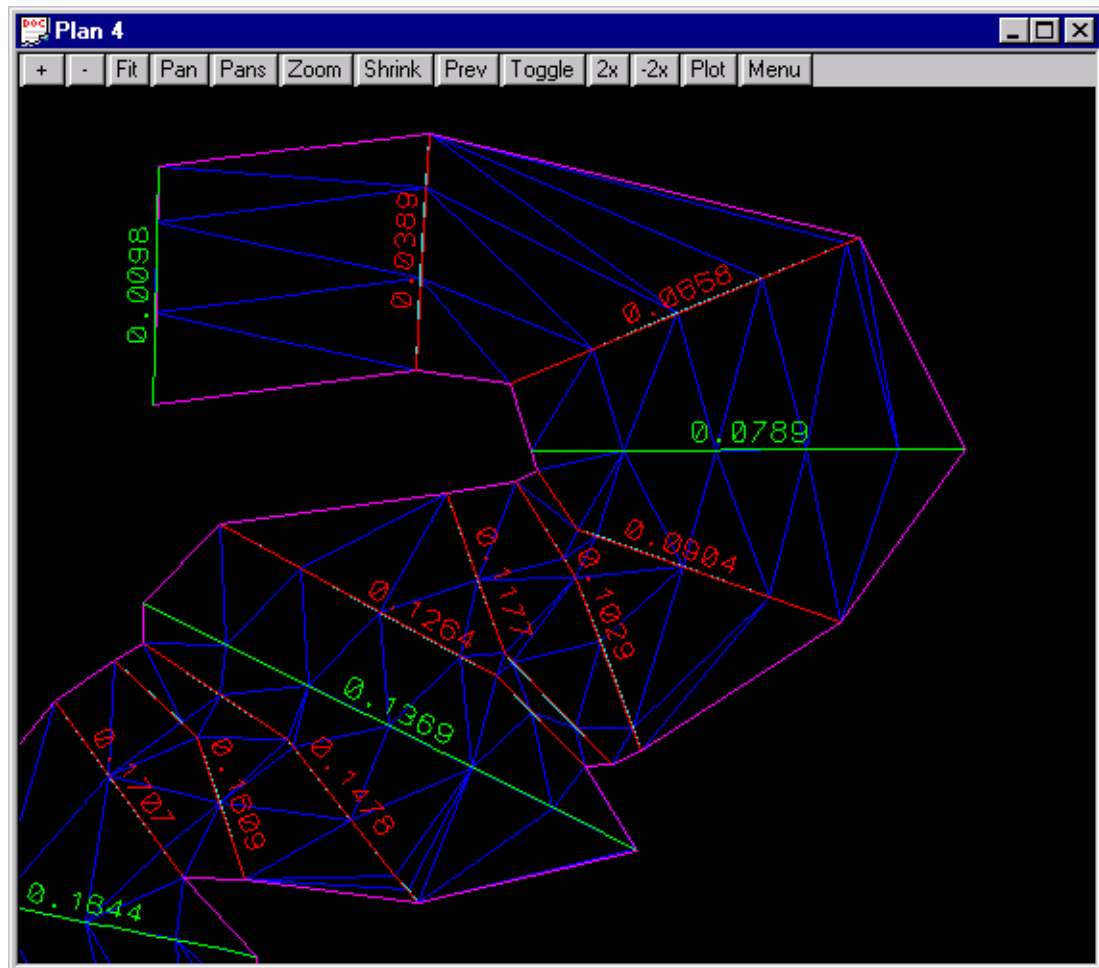

EXISTNG DATA

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. This must be specified but is only used when reading the *.rep file types (see **File format** below). The interface will search the string names in this model for the cross sections specified in the HEC-RAS report. A match is successful if the HEC-RAS cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

**Shape string model**

Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Ground surface tin

Tin box

If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.

File format

Choice box

The GIS format should be used in most cases. The rep format is used for reading the HECRAS report files with the "Standard Table 1" selected in HECRAS.

HEC-RAS report file name File box

The HEC-RAS report file (GIS format) is created using the HEC-RAS menu selection

File=>Export GIS data

The HEC-RAS report file (REP format) created using the HEC-RAS menu selection

File=>Generate Report

The report must include the Standard Table 1.

RESULTS DATA

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

PARAMETERS

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Centre line chainage factor Model box

*This data is only required if the **Shape string model** is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.*

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the HEC-RAS report is compared with the cross section string names. A value of 0.00001 is excellent if you have not altered the cross section names in 12d or HEC-RAS.

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the HEC-RAS report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor

(Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

Import cross sections (GIS file)

Position of option on menu: Design=>Rivers=>HEC-RAS interface=>Import cross sections (gis file)

This option is used to import HEC RAS cross sections, interpolated cross sections, source strings (Cut lines), river centre lines and storage area boundaries into 12d. Note that the imported data will be given the X,Y coordinates used in the HECRAS project.

- [Presenting Water Level Results](#)
- [How to for Rivers](#)
- [Frequently Asked Questions \(Rivers\)](#)

The source strings define the location where cross sections are cut from the ground surface TIN. A node is created in XP-SWMM at this location and the cross section shape is used to the next downstream node (no cross section is created at the most downstream source string).

The centre line and overbank channel lengths are measured in the downstream direction. XP SWMM link and node input panels are displayed below with the relationship to the 12d model described.

XP SWMM Link Data

- cross section chainage at intersection of left and right bank strings
- max elev - min elev at upstream cross section

- n values from 12d panel
- channel lengths measured along river strings
- Minimum cross section elev from upstream node.
- Minimum cross section elev from downstream node

XP SWMM Conduit Data

The slope of the conduit/link is calculated by assuming that its invert matches vertically with the invert of the downstream link. The overflow levels at the nodes are calculated by determining the lowest of the bank levels for the upstream and downstream links. The least of the overflow depths at the nodes is then used as the link diameter.

Usage

The XP-SWMM panel for creating the XP-SWMM project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

River strings model	Model box		
----------------------------	-----------	--	--

*Model containing the centre line, left bank and right bank strings. **The centre line strings must begin downstream and proceed upstream.** The name of the river may follow the words "Centre line " (note the ending space). For example the centre line string may be named "Centre line Parramatta River, downstream reach". The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.*

The left and right bank strings need not be separate strings (see figure below).

Source string model	Model box		
----------------------------	-----------	--	--

*New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.*

Create Source Strings	Tick box	not selected	
------------------------------	----------	--------------	--

*When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).*

Distance between sections	Real box		
----------------------------------	----------	--	--

The distance between the cross sections. At present no check is made for overlapping cross sections

around river bends.

Section Length

Real box

The length of the cross section with zero chainage at the mid point.

Cross section model

Model box

The cross sections created and exported are stored in this model.

Centre Line Chainage Factor

Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Number of decimals

Integer box

The cross section names are created with this many decimals. CAUTION XP SWMM only allows 10 characters for the names and each link name begins with "Lx-" That leaves 7 characters for the chainages.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Levee Tolerance

Real box

Not implemented in XP-SWMM.

Manning's n

Real box

Manning's n values for the left, right and centre channel sections.

Delta Y tolerance

Real box

*This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. **The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.***

Discharge

Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside XP-SWMM or inside 12d. This can be changed at each section [See manual settings](#)

Units

Choice box

This selection will set the default units for the project being created.

Project file name

Input box

*The XP-SWMM *.xp name to be created or updated. An xpx file will also be created using this name to transfer the data.*

After selecting the **Process** button the cross section strings will be created and exported to a xpx file (using the project file name as the stem. **Never included ".xpx" in the project file name**) The xpx file will be over written without any warning. This is only used as a temporary transfer file.

12d needs to know where XPSWMM program and the XP SWMM working directory are. The system file that contains these locations is called XPSWMM.4d. (See [System file path](#) for its location). The file contents are as follows:

Line 1 the XP SWMM working directory
 Line 2 the full path to the XP SWMM program
 Line 3 the destination of the hydro.ini file when it is created

IMPORTANT: include the final "\" on lines 1 and 3.

The **XPSWMM.4d** file as supplied follows;

```
c:\xps\xp-swmm\work\  

c:\xps\xp-swmm\xpswmp32.exe  

c:\xps\xp-swmm\
```

Next 12d will check for an XP project in your XP SWMM work directory (project file name + ".xp"). If it does not exist the file **Master_rivers.xp** will be copied from the [System file path](#) to your XP SWMM working directory. If a wp file already exists in your working directory you will see the following options dialogue.

The default is to update the wp file. Nodes and links in the file with the same names as in the export will be updated. If they do not exist they will be added. The import will NOT delete any nodes or links inside XP SWMM. This option is often used to merge rivers data with urban drainage data.

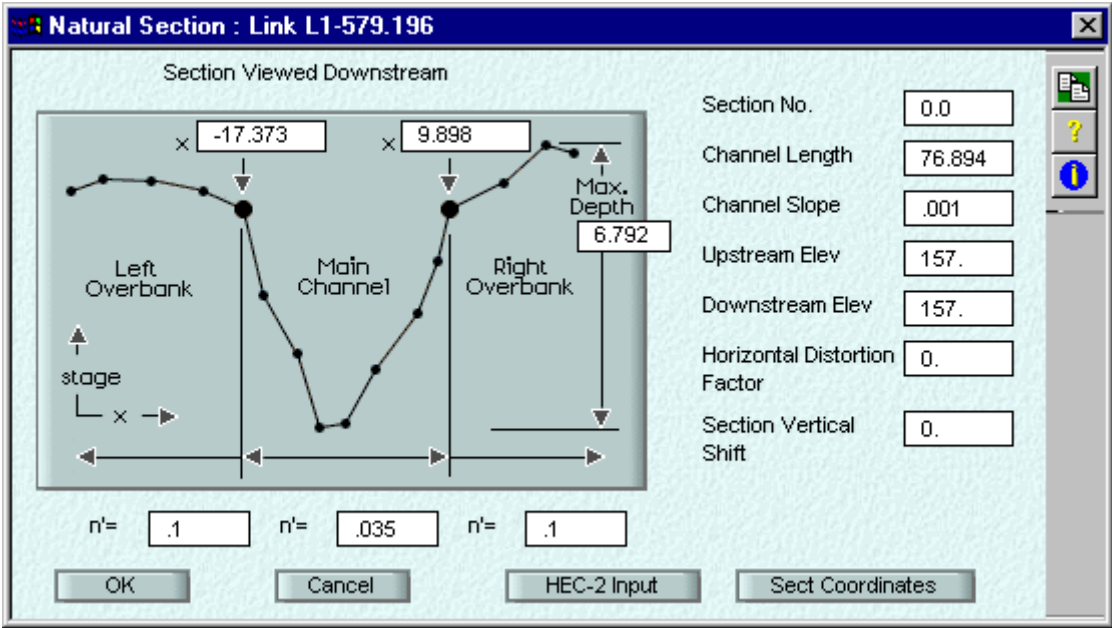

The over write option will copy the Master_river.xp file into the working directory and over write the existing file.

In either of the two cases the xpx file will be imported after XP SWMM has started. When you exit your XP SWMM session regardless of whether or not you save the XP file the XPX file will be exported over writing the original export file from 12d.

Your third option is not to run XP-SWMM at all and work with the XPX file as you see fit.

Export Details

The following diagram displays how the values from 12d are exported to XP-SWMM

At every source string location a node is created in XP-SWMM. The cross section geometry is then used for the downstream reach and is exported looking in the downstream direction.

The node name is [set manually](#) or calculated inside 12d by obtaining the centre line chainage at the intersection with section string. This value is divided by the **Centre line chainage factor** and rounded to the **Number of decimals** specified in the 12d export dialogue box. This value is then prefixed with the reach index followed by a dash. The downstream link name is set to the node name prefixed with "L". If you are planning to merge the river file with an XP SWMM drainage network then you will want to manually set the node names to the drainage pit names for the most upstream and most downstream source strings.

When selecting the **Number of decimals** in the 12d export dialogue, ensure that the total link name generated does not exceed the XP limit of 10 characters.

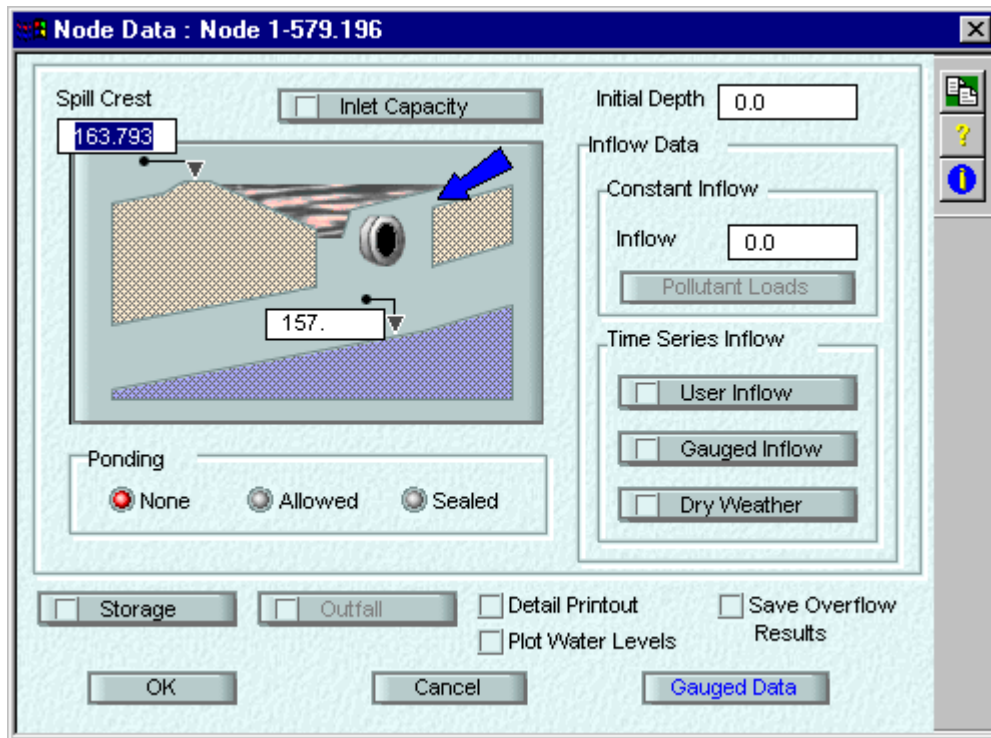

The section number variable is not exported to XP-SWMM.

Where the centre line cross the section in 12d is marked as zero chainage in XP-SWMM. The left overbank (-17.373) and the right overbank (9.898) are determined by the intersection of the left and right bank strings with the section. The n values are the values that are entered in the 12d export dialogue box. The maximum depth is calculated by subtracting the lowest elevation from the greatest elevation for both this cross section and the downstream cross section. The minimum of the two values is used.

The channel length is determined by subtracting the downstream section's centre line chainage from the current section centre line chainage. The **Centre line chainage factor** is **NOT** used in this calculation.

Upstream elevation is obtained by calculating the minimum elevation at the current section and the downstream elevation is the same value for the downstream cross section. The channel slope is calculated using these elevations and the channel length above.

The horizontal distortion factor and section vertical shift are set to zero. A section coordinate point is generated every time the source string crosses a 12d triangle edge, at the centre line and the left/right bank locations.

The spill crest level at the node is set to the maximum level on the cross section. Constant inflow is zero unless the node is the most upstream section on the reach or the flow value for the source string has been set manually [see manual settings](#).

Hydrology Data

Hydrology data may be exported to the runoff layer of XP SWMM for both the reservoir strings and the source strings. There are 2 requirements to enable the hydrology.

Key Points

1. If you plan to use storage areas, you need to draw reservoir strings (all in one model) and each should have a name (to become the XP SWMM node name).
2. You must create a file named "hydrology.txt" and store it in the project working folder. This file will contain the default xpx variable names. These defaults may be overridden using the same xpx variable name as a string attribute on the source/reservoir string (see format below).
3. The reservoir or source string must have an integer string attribute named "xpx r rfcmnt" with a value greater than 0 (max of 5). Use the Strings->Properties->Attributes or Strings->User->Attribute Editor to create/change this attribute.
4. Total area for the reservoir strings is calculated at each export time.

Hydrology.txt file format

The file is tab delimited and each line consists of three pieces of data: the XPSWMM variable name, the default value, and the type of data (integer, real or text).

You enter the xpx variable name

Any of these default values may be specified using a string attribute on the reservoir or source string. The attribute name must be of the same type as defined in the hydrology.txt file. If data for a second XP SWMM catchment is desired add a " 2" to the end of the attribute name. Up to 5 catchments are allowed in XP SWMM.

A sample hydrology.txt file follows:

```
// SCS hydrology screen

R_CN      85      real
R_TC      60      real
R_SHF     256     integer
R_SHAPE   0       integer

R_IADEPTH 0.04    real
R_IAFRACT 0.2     real
R_IA      1       integer
CNTLS     5       integer
R_FSCS    1       integer

// sub catchment screen

R_RAINSEL "SCS Type II FL Mod."text
R_INFILSEL      ""text
R_GWTAG  0      integer

// runoff node screen

R_WAREA  1.      real
R_WIMP   1.      real
R_WIDTH  1.      real
R_WSLOPE 1.      real
```

Attribute name format for string attributes.

The attribute name is the XP variable name prefixed by "xpx " with the underscore character in the xpx variable replaced by a space. For example the xpx variable "R_RAINSEL" would be set using the attribute name "xpx R RAINSEL".

Exporting River Junctions

River junctions are defined by the intersection of the centre line strings in 12d. The cross section immediately downstream of the intersection becomes the junction node. It is used as the downstream cross section for all upstream branches. The channel length for the last link on the tributary is set to the distance the centre line string extends beyond the cross section. The distance downstream along the main branch is **NOT INCLUDED!**

XP-SWMM Read Panel

Position of option on menu: **Design=>Rivers=>XP SWMM interface=>Read XP SWMM xpx results file**

After the XP-SWMM analysis is complete and the XP-SWMM program is closed the water level data is written to an xpx file that 12d will read. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the XP-SWMM results. These strings are then triangulated to create a water surface tin.

Chainage tolerance	0.0001	+

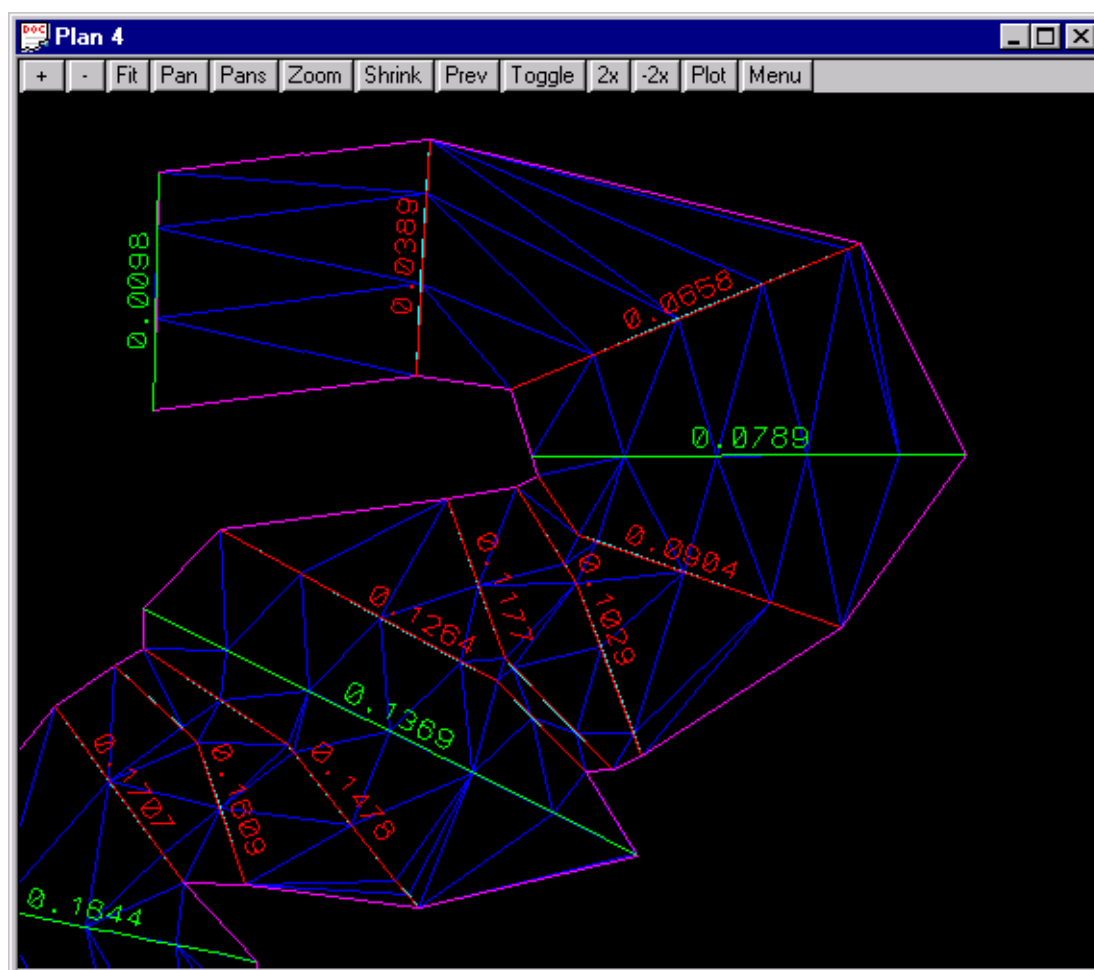

Process **Finish**

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the XP-SWMM report. A match is successful if the XP-SWMM cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

**Shape string model**

Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor

Model box

This data is only required if the **Shape string model** is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Ground surface tin

Tin box

If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.

XP-SWMM report file name

File box

The XP-SWMM *xpx* file created automatically created when closing XP-SWMM or via the XP-SWMM menu selection

File=>Export Data

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Chainage Tolerance Real box

This is the tolerance used when the cross section chainage from the XP-SWMM report is compared with the cross section string names. A value of 0.00001 is excellent if you have not altered the cross section names in 12d or XP-SWMM.

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the XP-SWMM report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor

(Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

MIKE11 Interface

Position of menu: **Design=>Rivers=>Mike11 interface**

The MIKE 11 interface creates the MIKE 11 project files including *.bnd11, *.hd11, *.nwk11, sim11 and the cross section data text file (to be imported into *.xns11). Water levels are read back into 12d where they may be viewed in a 3D perspective view, on cross sections and on river profiles. Plan drawings easily identify extents of flooding and all data can be plotted onto engineering drawings.

The Mike11 walk right panel is,

[MIKE 11 Write Panel](#)

[MIKE 11 Read Panel](#)

[Presenting Water Level Results](#)

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Exporting to MIKE 11

The MIKE 11 project is created from a surface tin (representing the river bed and overbanks) and a model containing river centre line strings (identified by the name prefix, “centre line”). The low chainage (often zero) of the centre line strings must be at the upstream end of the reaches.

Cross sections are created at the location of the **source strings**. These source strings are initially created using the MIKE 11 option at a user defined spacing and section length, imported from drawing packages or manually created in 12d. The user may alter these sections as desired. They may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The Create source strings tick box on the interface panel must NOT be selected to use the customised strings.

Presenting MIKE 11 Results in 12D

After the MIKE 11 analysis is complete the maximum water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the MIKE 11 results. These strings are then triangulated to create a water surface tin.

[How the water level boundaries are determined](#)

MIKE 11 Write Panel

Position of option on menu: **Design=>Rivers=>Mike11 interface=>Create Mike11 files**

The MIKE 11 interface creates the MIKE 11 project files including *.bnd11, *.hd11, *.nwk11, *.sim11 and the cross section data text file (to be imported into *.xns11). Water levels are read back into 12d where they may be viewed in a 3D perspective view to easily identify extents of flooding.

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

12d creates most of the files necessary to run MIKE11. The exception to these are the time series files (both water level and discharge data). The simulation file created assumes that these files will have the same name as the centre line strings used in 12d. For example, if you name your centre line string *centre line Major River* then your time series files will be named *Major River-H.DFS0* for the tail water conditions and *Major River-q.dfs0* for your discharges.

The *.bnd11, *.hd11, *.nwk11 and *.sim11 files are created by appending 12d data to default data found in the following files.

cross_sections.4d

hd11-end.4d

hd11-header.4d

nwk11-header.4d

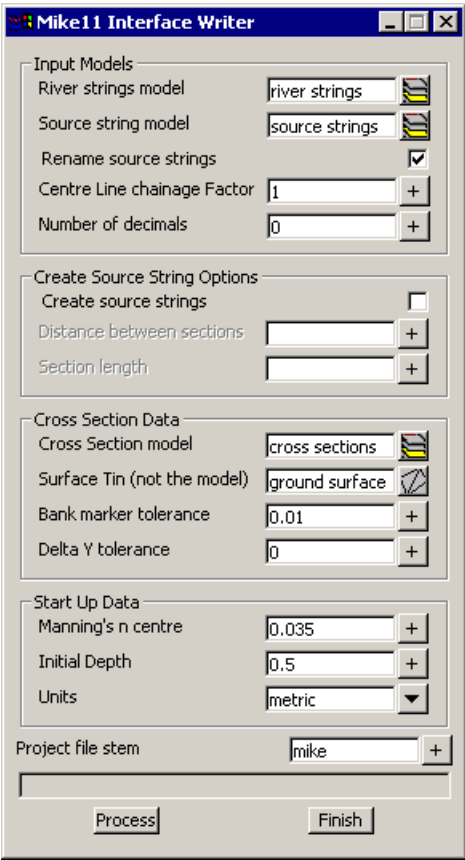

nwk11-options.4d

sim11-header.4d

sim11-period.4d

The user need not modify these files unless they would like to change the default values used when first creating the MIKE11 project. If you plan to modify these files, they are found in the 12d *setups* directory. Before modifying they should be copied to the 12d *user* directory (global defaults) or into the current project directory if they are project specific.

The MIKE 11 panel for creating the MIKE 11 project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

River strings model	Model box		
----------------------------	-----------	--	--

Model containing the river centre line strings. **The centre line strings must begin upstream and proceed downstream.** The name of the river must follow the words “centre line “ (note the ending space). The name of the river may follow the words “Centre line “ (note the ending space). For example the centre line string may be named “Centre line Parramatta River, downstream reach”. The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.

Confluences are modelled by a using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.

Source string model	Model box		
----------------------------	-----------	--	--

New source strings will be created in this model or existing source strings are contained in the model. See **Create source strings** tick box below.

Create Source Strings	Tick box	not selected	
------------------------------	----------	--------------	--

When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the sources strings they can be easily modified. On the **Strings->Points Edit** menu you will find the selections **Move** (to move the end points), **Insert** (to insert additional points).

Distance between sections	Real box
<i>The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.</i>	
Section Length	Real box
<i>The length of the cross section with zero chainage at the mid point.</i>	
Cross section model	Model box
<i>The cross sections created and exported are stored in this model.</i>	
Centre Line Chainage Factor	Real box
<i>The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.</i>	
Surface Tin (not the model)	Tin box
<i>Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).</i>	
Bank Marker Tolerance	Real box
<i>If the surface level drops more than this amount while moving away from the channel centre line then the crest is used as a Bank Marker. A value of zero means that no bank marks are created.</i>	
Delta Y tolerance	Real box
<i>This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.</i>	
Manning's n	Real box
<i>Manning's n values for the channel sections.</i>	
Initial depth	Real box
<i>This depth is added to the minimum elevation on the cross section and is used as the starting water level for the cross section.</i>	
Units	Choice box
<i>This selection will set the default units for the project being created.</i>	
Project file name	Input box
<i>The MIKE11 project name. All of the MIKE11 files will begin with this name and the appropriate extensions added.</i>	

Running MIKE11

Three steps are required to run MIKE11 with the files 12d creates.

1. Create you time series files.
2. Inside MIKE11, create a new cross sections file and import the cross sections.

3. Open the simulation file, and load the network file to have the grid points calculated.

Creating Time Series Files

Your time series files must be named with the prefix of the river string name. For example if your centre line string in 12d was named *centre line Major River* your time series files need to be named *Major River-H.DFS0* for the tail water conditions and *Major River-q.dfs0* for your discharges.

The standard time series dates are from 12:00 to 12:30 on 01 January 2000 with a one minute time step. If other periods are desired, you can either change the file *sim11-period.4d* in the 12d library before running the interface or change the dates inside MIKE11 after you read in the data. **DO NOT USE THE ORIGINAL FILES! Copy the file you are changing into the 12d user directory and modify it there. 12d will look for the file here first.**

Importing Cross Sections

From the MIKE11 main menu select **File->new** and then under Mike11 select **cross sections** from the dialogue box.

From the main menu select **File->Import->Import Raw data & Recompute**. Select the *.txt file with the **Project file stem** you specified in the 12d-Mike11 Write Panel. Now save this file with the same **Project file stem** (MIKE11 adds the .xns11 extension).

Calculating Grid Points

From the main menu select **File->Open** and select the *.sim11 file with the **Project file stem** you have specified in 12d. On the **Input** tab property sheet select **Edit** beside the **Network** file. Press **Ctrl+T** to take you into the table editing mode and then select the **Grid Points** tab property sheet. On the sheet select **Generate Grid Points** and then save the file.

You should now get the “Green lights” on the **Start** property sheet of the simulation file editor.

MIKE 11 Read Panel

Position of option on menu: **Design=>Rivers=>Mike11 interface=>Read Mike11 results (max)**

After the MIKE 11 analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the MIKE 11 results (maximum water level).

Water levels are interpolated to create water level strings at the shape string locations. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach. These strings are then triangulated to create a water surface tin.

The MIKE11 executable file, *res11read.exe* must be found in the directory *c:/mikezero/bin* so that 12d can read the Mike11 binary data files.

Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor

Model box

This data is only required if the **Shape string model** is used. The shape string names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Ground surface tin

Tin box

If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field. Super tins cannot be used for this function. A composite tin is required for the tin-tin intersect.

MIKE 11 report file name

Input box

This is the binary data file that will be converted to an ASCII text file and read by 12d. The maximum water levels at each cross section will be extracted from the file.

Water surface tin

Tin box

The name of the water surface tin to be created.

Water surface tin model Model box

The model to contain the new water surface tin.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Centre Line Chainage Factor Real box

The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.

Chainage Tolerance Real box

*This is the tolerance used when the cross section chainage from the MIKE 11 results file is compared with the cross section string names. If a **Centre line chainage factor** of 1 is used a value of 0.1 is appropriate. If a **Centre line chainage factor** of 1000 or 5280 is used a **Chainage** tolerance of 0.00001 is more appropriate.*

However, if you have altered chainage names then you may have to increase the value of the tolerance. Suppose the tolerance is set to 0.001 and the water level for section 0.056 is read from the MIKE 11 report file. The interface will search for the first string with a name between 0.055 and 0.057. If you chose to great of a tolerance then more than one water level result will match a 12d cross section and a warning message will be given.

If you have one specific cross section that you would like to have a different tolerance set for (maybe only one section is giving you troubles), use the Attribute Editor (Strings->User->Attribute Editor), select the cross section string and create a real type attribute named tolerance set to the tolerance desired.

[Frequently Asked Questions \(Rivers\)](#)

How the water level boundaries are determined

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above). Note that water levels are extended when the shape strings are in a junction area or past the end of a reach. can be created to

create a water surface (shown in blue above) to follow the river.

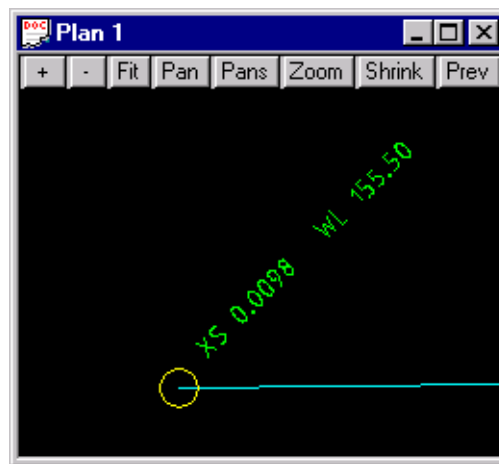

The water surface is draped over the ground surface and the boundary strings (strings defining the edges of the water surface – shown in yellow above) are created. They may be used to trim the water surface or shade your ground surface tin for flood inundation mapping. Boundary strings also include islands! Shading the river bed blue, in a 3D perspective view, is an effective way to show the water level extents and still view the shape of the river bottom (it has the effect of very clean water that you can see through!).

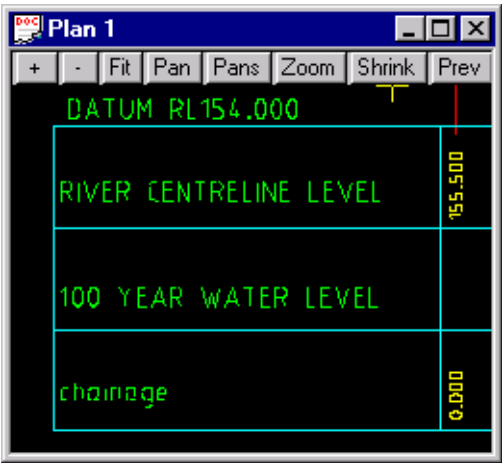

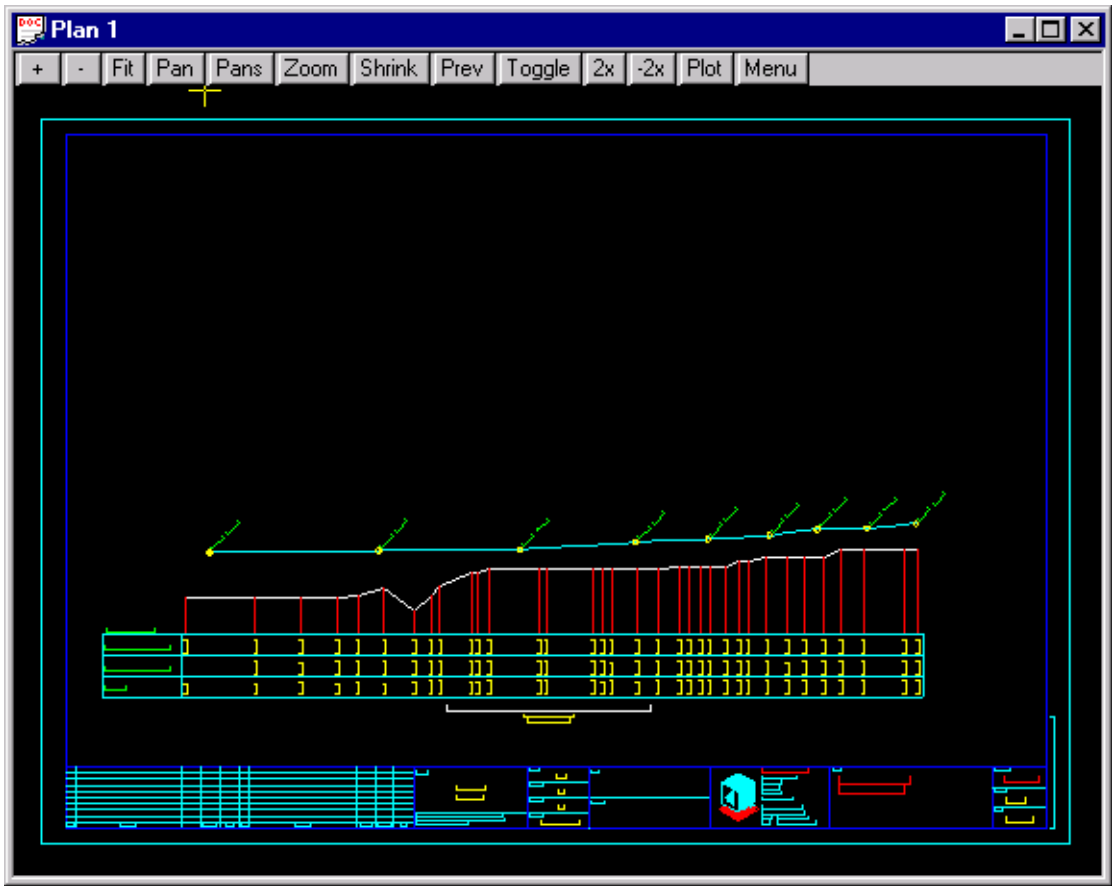

Sample Presentations and Drawings

The water surface may be

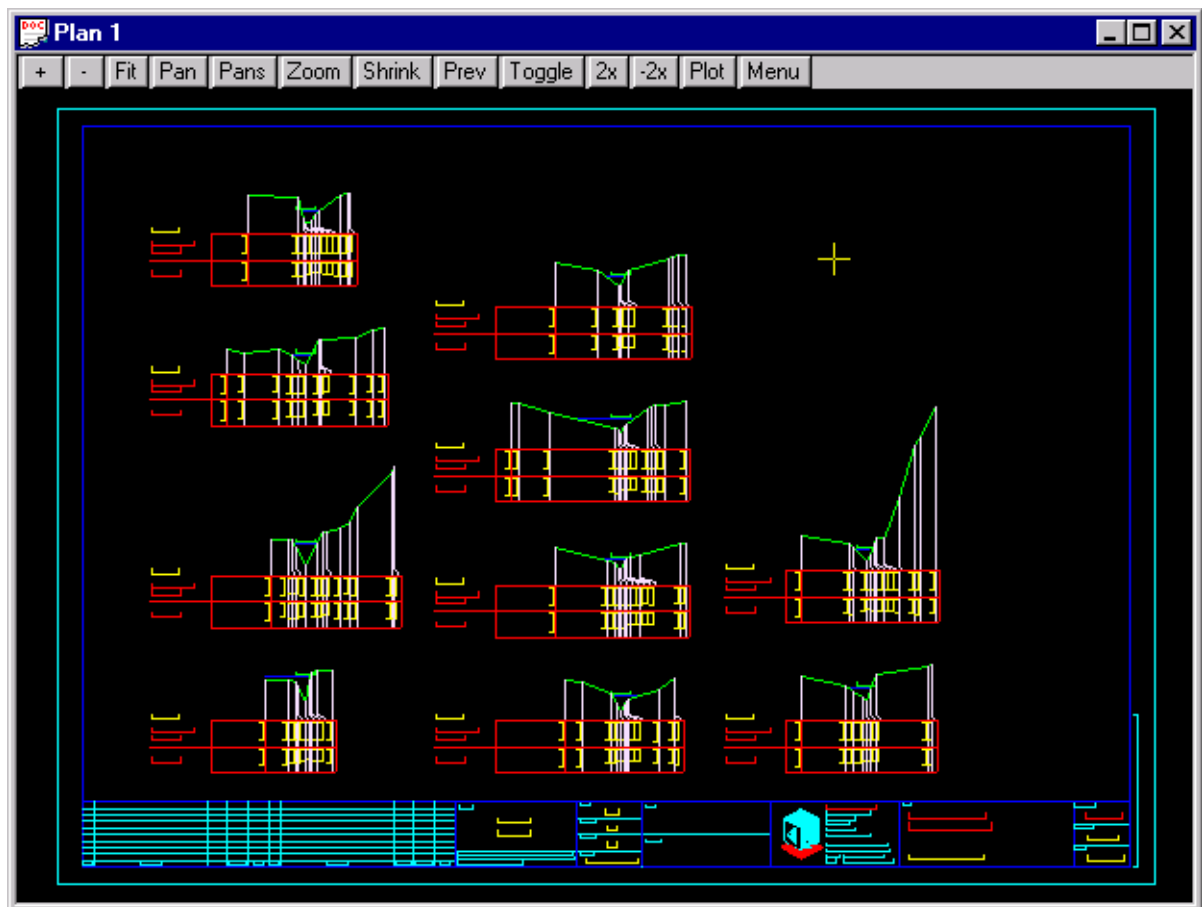

- s •contoured (elevation),
- s • depth contours created,
- s • water surface coloured by depth (shown above),
- s • cross sections plotted
- s • and longitudinal profiles drawn (shown below).
- s •All of these results can be plotted complete with your customised drawing sheets.
- s •Finally, you may walk down the water course in the perspective view (and record this to an Windows AVI file).

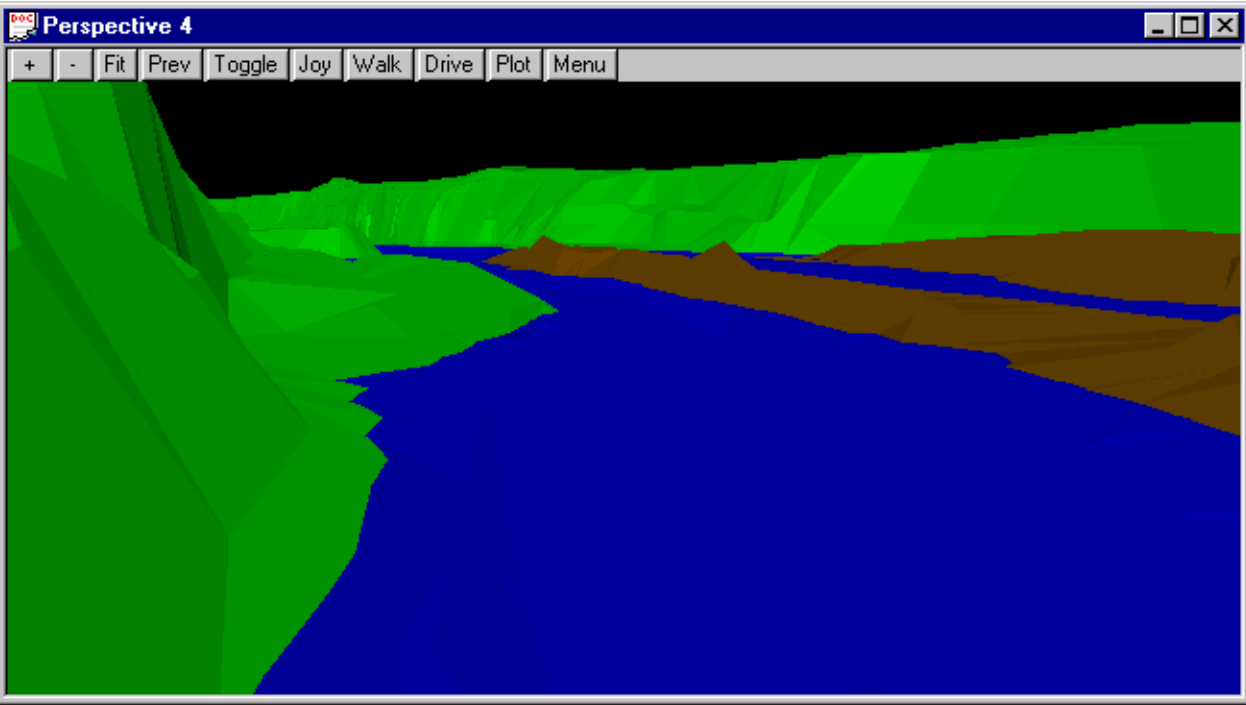

Close up view of cross section labels with water levels

Close up of text (user chooses wording, size, colour, text style etc.)

The tin created can be viewed in a perspective view and sections taken where desired. A sample perspective view follows.

Example of cross sections long sections and depth colouring see the HEC-RAS Interface topic.

Defining the Water Surface Boundaries

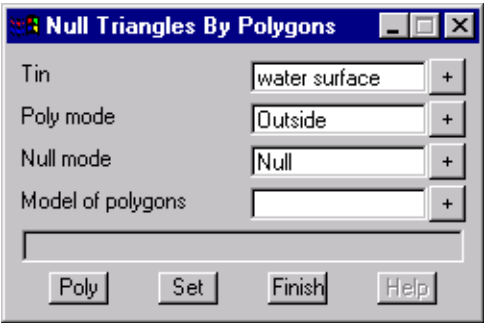

The water surface and its boundary is created by 12d. The first step is to trim the water surface back to the boundary strings. Since the water boundary does not generally form a closed polygon (the left and right river boundaries will need to be joined at one end of the river) use the **Strings=>Strings Edit=>Join** to connected strings.

If the water surface reached the edges of you cross sections then there will be numerous breaks in the boundary string. The best solution is to extend the cross sections and/or add additional shape strings. If it is not a major error in modelling then the break in the boundary can be joined using the **Strings=>Strings Edit=>Join**.

If boundary strings are created outside that water level boundaries they should not be used in this area. Boundary strings should only be used inside the area defined by your water level results.

Trimming the Water Surface Tin and Islands

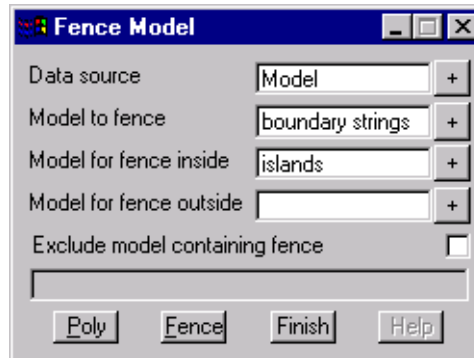

Use the **Triangle=>Null=>by polygons** selection to null triangles inside the polygon you have created above.

Select your water surface tin and change the **Poly mode** to **Outside**. Now select the **Poly** button and pick the boundary string. The triangles outside the polygon will now be nulled.

If you have some islands in the model then change the **Poly mode** to **Inside** and select the islands.

If you have numerous islands, say more than 10 it may be easier to copy all of the islands into one model using the fence command (Utilities->Fence->Fence).

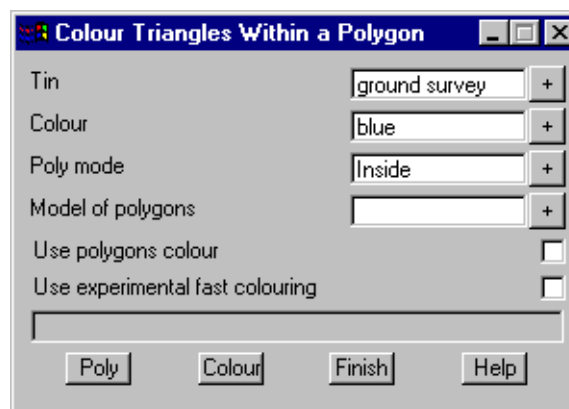

The **Model to fence** is the boundary strings model and the **Model for fence inside** is the new model to contain the islands. The **Exclude model containing fence** should not be ticked. Select **Poly** and then pick the boundary string. All of the islands inside the boundary string will not be copied to the islands model.

Colouring the Ground Surface with Flood Zones

The boundary strings can also be used to colour the ground surface. Colouring the river bed blue is an effective way to show the water level extents and still view the shape of the river bottom (the effect of very clean water that you can see through!).

First, define the water surface boundaries (see above). Next re-triangulate the ground tin so that it includes the boundary string model (**Triangles=>Edit=>Tin**). Next select **Triangles=>Colour=>Colour within polygon**. The following panel will appear.

Select your ground tin and the desired colour. Next select the **Poly** button and pick the boundary string to be coloured inside. If islands exist change, change the colour (to a ground colour) and then select the island string.

Colour by Depth

The water surface can be coloured by depth. This function calculates the depth between the water surface and the ground surface and creates “faces” of different colours. The colours to be used are specified in a depth range file. This option requires the purchase of the Volumes Option

From the main menu select Options->Volumes->Exact->Tin to tin.

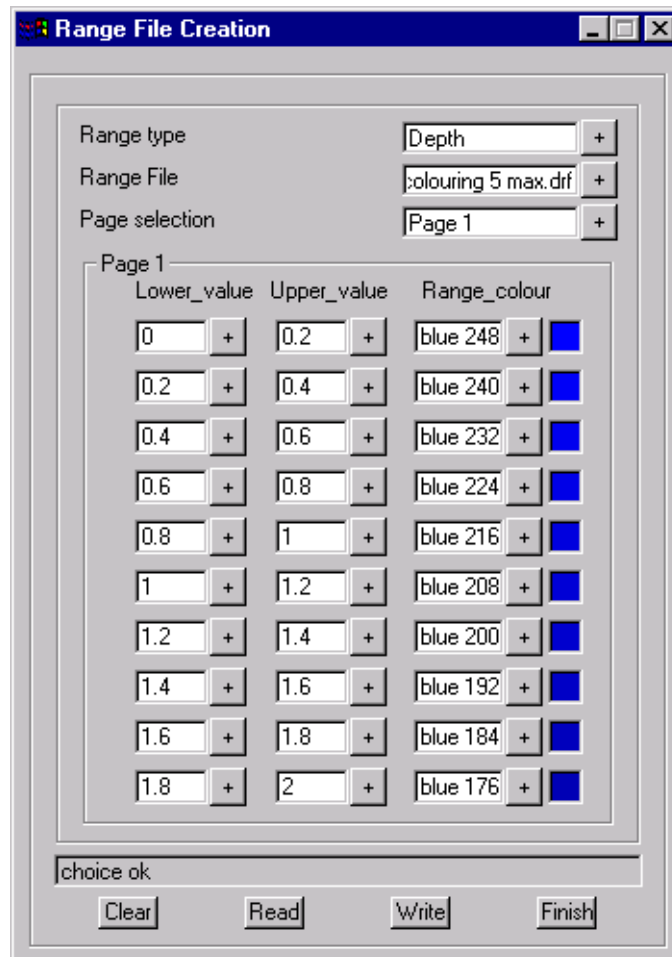

- Original tin

this is your ground survey tin
- New tin

this is your water surface tin
- Range file

two range files are supplied. One with a range from 0 to 5 and another from 0 to 50. The library contains a spreadsheet the can quickly create other range files or you may edit the using the built in range editor.

To use the built in range file editor select + beside you range file then **edit**.

You may change the range value and the colours as desired. Be sure to select **Write** to save the changes before selecting **Finish**.

See also Range File Creation

Plan View to paint you can paint a current view without saving the face data. This is a good option if you wish to take a quick look at the depth colours in one area.

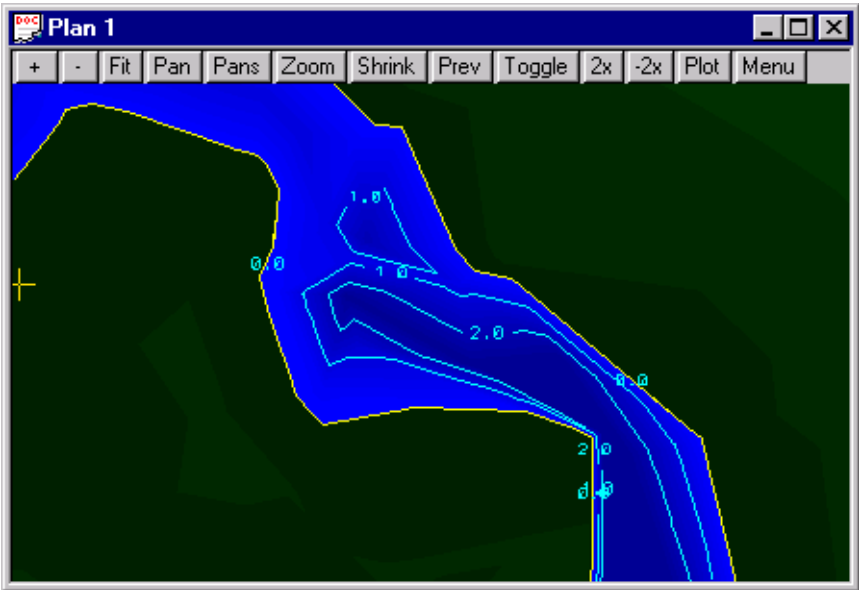

Model for faces the faces can be stored in a model. Note that faces consume a great deal of hard disk space. Therefore you may consider colouring one area at a time using the **Poly** option.

Poly If your water surface tin is very large than you may want to only colour a portion of the tin. You must create a polygon (Strings->Create->2d) and then pick this polygon. When your select **Volume** only the area inside the polygon will be coloured.

Volume select this button to colour the surface.

Depth Contours

Once you have the tin coloured by depth you might want to add depth contours. From the main menu select **Options->Tin->Analysis->Depth Contours**. This option requires the purchase of the tin Analysis module.

enter a zero for this value
- End level

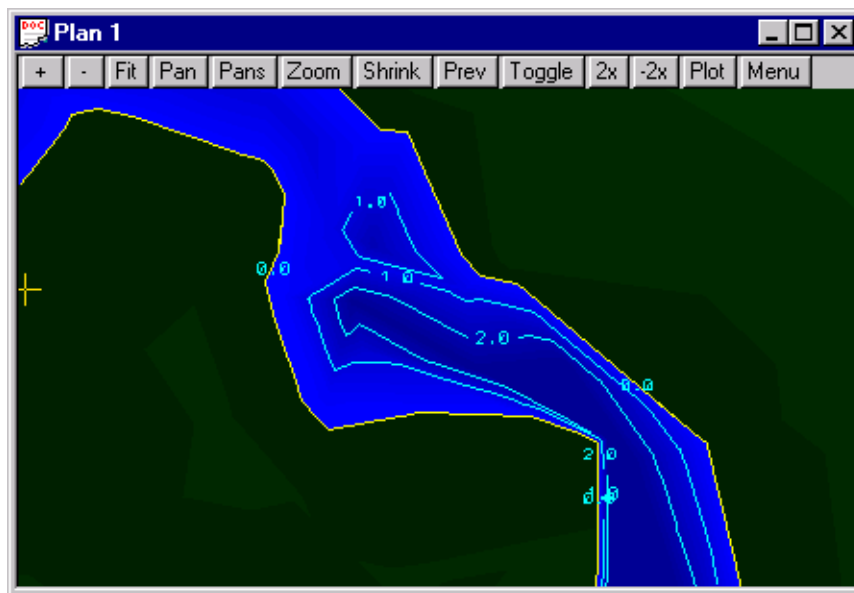

enter a level grater than the greatest depth
- Interval

enter the contour interval as desired
- 2d/3d strings

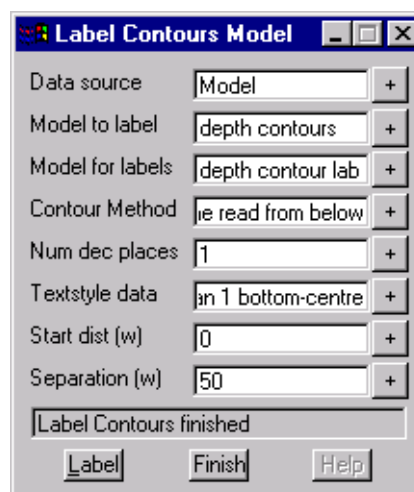

2d strings
- Calculate

this will create you contour strings

Adding Values to the Contours

Since there are numerous ways to label the contours it is performed as a separate step. From the main menu select **Strings->Label->Contours**.

Contour method the example above uses *Line removal and Centred line read from below*. This copies the contour lines themselves and inserts a break in the line.

Start distance this is usually left as zero. It changes the start point for the first label on each contour.

Separation this determines the spacing of the contour labels.

Colour the ground surface by elevation

With the water surface coloured by depth, you may want to colour the ground surface by elevation.

This colouring may be done from either From the main menu select **Options->Volumes->Exact->Tin to height** or **Triangles->Colour->Tin height colour**.

Options->Volumes->Exact->Tin to height

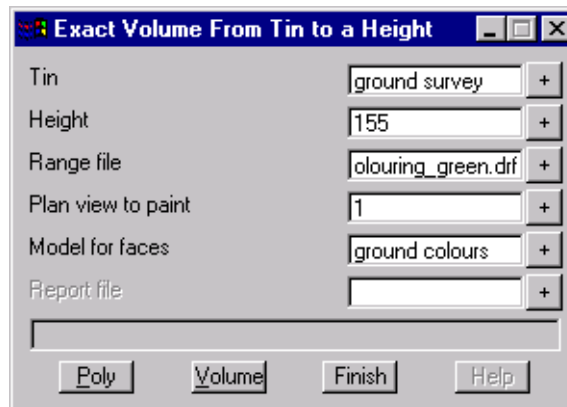

Options->Volumes->Exact->Tin to height requires the purchase of the Volumes module. First select **Triangles->Tin info** from the main menu and then select you ground surface tin. You will want to copy the minimum z level from this pane.

Tin	ground survey	+	
x min	42407.034	x max	43076.368
y min	36815.276	y max	37563.525
z min	155	z max	234.074
Points	2459	Tris	4912

information retrieved

Info Calc Extent Finish Help

Now from the main menu select **Options->Volumes->Exact->Tin to height**

Select your ground surface to colour and enter the minimum elevation (from above) into the **Height** field. The **Range file** “\$LIB/ground_colouring_green.drf” is found in the library.

Plan View to paint you can paint a current view without saving the face data. This is rarely used in this case

Model for faces the faces can be stored in a model. Note that faces consume a great deal of hard disk space. Therefore you may consider colouring one area at a time using the **Poly** option.

Poly If your ground surface tin is very large than you may want to only colour a portion of the tin. You must create a polygon (Strings->Create->2d) and then pick this polygon. When your select **Volume** only the area inside the polygon will be coloured.

Volume select this button to colour the surface.

UNET Interface

Position of menu: **Design=>Rivers=>UNET interface**

[Create ISIS files](#)

[Read ISIS results](#)

[Presenting Water Level Results](#)

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Exporting to ISIS

The ISIS project is created from a surface tin (representing the river bed and overbanks) and a model containing [river strings](#) identified by their names “left bank”, “right bank and the name prefix, “centre line”. Any additional strings in the specified model will be ignored (warning messages will be given when you run the macro that any additional strings are being ignored). The low chainage (often zero) of the centre line strings must be at the upstream end of the reaches.

Cross sections are created at the location of the [source strings](#). These source strings are initially created using the ISIS option at a user defined spacing and section length. The user may alter these sections as desired. These may be shortened if they intersect at sharp bends in the river; they may be extended at extremely wide river sections or extra points may be added so that the section is no longer a straight line.

Source strings can be deleted and additional sections can be added by creating new source strings. The **Create source strings** tick box on the interface panel must **NOT** be selected to use the customised strings.

[Reservoir Strings](#) are 2d strings that define the extents of the reservoir. The volume is calculated in increments of 1 or the value set in the attribute [stage increment](#) for this string. The volumes start from a level with zero volume to the level set for the 2d reservoir string.

The **reservoir strings** may define inline reservoirs or offside storage. Inline reservoirs are "touched" by centre line strings both upstream and downstream. Offline storage areas are linked to the cross sections via **spill strings**.

[Spill strings](#) are 2d strings that link offline storage areas to a cross section. The string must begin by "touching" the source string and then proceed to the first point on the spill section. During the export the first point will NOT be exported as part of the spill section. After defining the end of the spill section the last point on the string must "touch" the reservoir string. Again this last point will NOT be exported as part of the spill section.

Presenting ISIS Results in 12d

After the ISIS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the ISIS *.zzr file. These strings are then triangulated to create a water surface tin from which the water level boundaries are

determined. These results can then be shown in plan, long section, cross section and in 3D perspectives.

[More details](#)

ISIS Write Panel

Position of option on menu: **Design=>Rivers=>ISIS interface=>Create ISIS file**

The ISIS interface creates the ISIS project files ready to open and run. This includes the project, plan, flow and geometry files. Water levels are read back into 12d where they may be viewed in a three dimension perspective view to easily identify extents of flooding.

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

The ISIS panel for creating the ISIS project follows.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
River strings model	Model box		
<p><i>Model containing the centre line, left bank and right bank strings. The centre line strings must begin downstream and proceed upstream. The name of the river may follow the words “Centre line “ (note the ending space). For example the centre line string may be named “Centre line Parramatta River; downstream reach”. The comma separates the river name from the reach name. If no comma is included then the river name is repeated for the reach name.</i></p> <p><i>Confluences are modelled by using a separate string for all reaches. Thus a system with a branch is modelled with three strings. The branch will be one string and the main reach will have a downstream string and an upstream string. The reaches must touch at the confluence.</i></p> <p><i>The distance from the start of the upstream strings to the first cross section is used to model the confluence length.</i></p> <p><i>The left and right bank strings need not be separate strings (see figure below).</i></p>			
Source string model	Model box		
<p><i>New source strings will be created in this model or existing source strings are contained in the model. See Create source strings tick box below.</i></p>			
Create Source Strings	Tick box	not selected	
<p><i>When selected existing source strings are deleted and new ones created perpendicular to the centre line at the specified spacing and length. Once you have created the source strings they can be easily modified. On the Strings->Points Edit menu you will find the selections Move (to move the end points), Insert (to insert additional points).</i></p>			
Distance between sections		Real box	
<p><i>The distance between the cross sections. At present no check is made for overlapping cross sections around river bends.</i></p>			
Section Length		Real box	
<p><i>The length of the cross section with zero chainage at the mid point.</i></p>			
Storage strings		Real box	
<p><i>These 2d strings define the extents of the storage area. For more details see Reservoir strings.</i></p>			
Spill strings		Real box	
<p><i>These 2d strings define the location to cut the spill section and start end points define the cross section and reservoir, respectively. For more details see Spill strings</i></p>			
Cross section model		Model box	
<p><i>The cross sections created and exported are stored in this model.</i></p>			
Centre Line Chainage Factor		Real box	
<p><i>The cross section names are created by dividing the chainage on the centre line by this factor. Typically 1000 is used to convert metres to kilometres and 5280 to convert feet to miles.</i></p>			
Number of decimals		Integer box	

The cross section names are created with this many decimals. CAUTION XP SWMM only allows 10 characters for the names and each link name begins with "Lx-" That leaves 7 characters for the chainages.

Surface Tin (not the model) Tin box

Tin or super tin to create the cross sections from (remember a tin is like a string. It is placed in a model.).

Bank Marker

Real box

Not currently implemented in ISIS

Delta Y tolerance

Real box

This value filters out points on the cross section. Imagine a tube of this diameter passing over the cross section. The tube is elongated until one point lies outside the tube. The tube is shortened to the previous point and then all points inside the tube are deleted from the cross section. The tube then moves on to the next point. The filtered (smoothed) and original sections are kept for comparison. **The final water tin is created from the ground tin and therefore the boundary string is located using the unfiltered section.**

Manning's n

Real box

Manning's n values for the left, right and centre channel sections.

Initial depth

Real box

Not currently implemented in ISIS.

Discharge

Real box

This discharge is used at the upstream end of all reaches. If you have multiple river branches, you can set the flow for each branch inside ISIS or inside 12d. This can be changed at each section [See manual settings](#)

Units

Choice box

This selection will set the default units for the project being created.

Project file name

Input box

The ISIS project name. The extension ".dat" will automatically be added for you.

ISIS Read Panel

Position of option on menu: **Design=>Rivers=>ISIS interface=>Read ISIS results**

After the ISIS analysis is complete the water level results are read back into 12d. Water level strings are created with the plan shape of the cross sections at the elevation retrieved from the ISIS results. These strings are then triangulated to create a water surface tin.

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

The ISIS read panel follows.

ISIS Interface Reader

Existing data

River strings model: river strings

Cross Section model: cross sections

Shape Section model: shape strings

Reservoir: reservoir strings

Centre Line chainage Factor: 1

Ground Surface tin: ground survey

isis results file name: isis.zzi

Result data

Water Surface tin: water surface

Water Surface tin model: tin water surface

Water level results model: water levels

Boundary strings model: boundary strings

Parameters

Chord length: 10

Chainage tolerance: 0.0001

Model <shape strings> exists

Process Finish

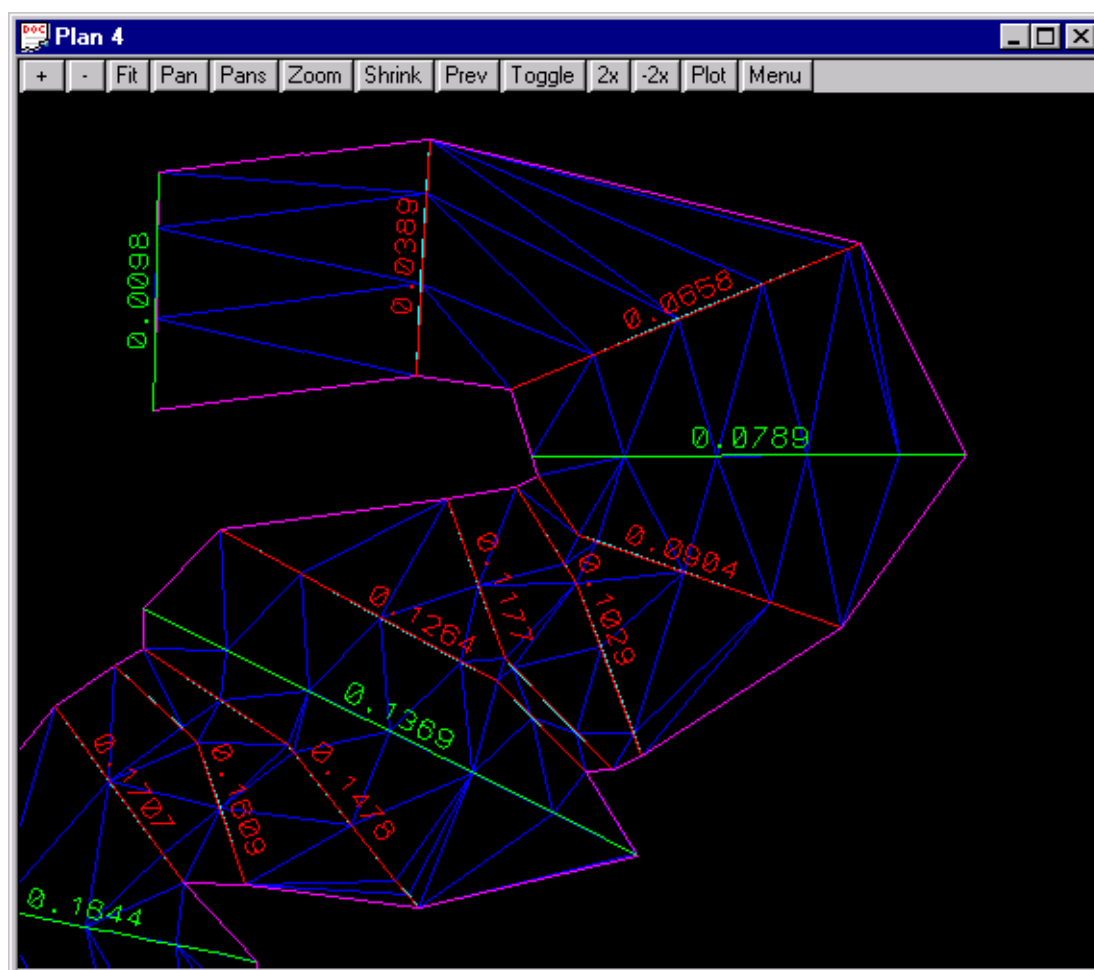

River strings model Model box

The same river strings model specified in the write panel. The river strings are used to sort the cross section and the shape strings. The left and right bank strings are used to check the direction of the strings.

Cross Section model Model box

The same cross section model specified in the write panel. The interface will match the ISIS label and the string name (without the "SECT "). If the ISIS labels were created by 12d then an exact match should result.

However, if the ISIS file was not created by 12d, the file can still be mapped by manually creating cross section strings (2d or 3d strings). See [Mapping non 12d and historical water level data](#).

**Shape string model**

Model box

For meandering rivers, the cross sections (shown in green above) may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings (shown in red above) can be created to create a water surface (shown in blue above) to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Reservoir

Model box

Reservoir strings are assigned elevations from the ISIS zsr file. This model is the same as the **storage area stings** specified in the write panel.

Centre line chainage factor

Model box

This data is only required if the Cross sections have been manually created and have no names yet. See [Mapping non 12d and historical water level data.](#)

ISIS results file name

File box

The ISIS zsr file is automatically generated by ISIS.

Ground surface tin

Tin box

If a **boundary string model** is specified below, the intersection of this ground surface and the water surface will be determined. The strings will be stored in the model from the **boundary string model** field.

Water surface tin model Model box

The model to contain the new water surface tin.

Water surface tin Tin box

The name of the water surface tin to be created.

Water level results model Model box

The model where the water surface strings will be created at each cross section and shape string.

Boundary string model Model box

The model to contain the intersection strings between the water and ground surfaces specified above. If left blank no intersection strings will be calculated.

Chord Length Model box

This value set the spacing for the points on the water level strings (both cross section and shape strings). It is recommended that you use a length of no more than half of your average cross section and shape string lengths. A large value in this field may result in unexpected water level profiles for meandering rivers.

Chainage Tolerance Real box

This tolerance is not used for the standard 12d cross section names. However, if the cross section names have been created manually and they can be converted to a real number then this is the tolerance used to match the cross section label from the ISIS report to the cross section string names. A value of 1.0 to 10. is common. See [Mapping non 12d and historical water level data](#) for more details.

A sample of the *.zzr file that is read by 12d follows.

A sample of the zzr file that is read follows.

Maxima and minima of all variables from

time 0.000 hours to time 30.000 hours

maxima of all variables

Label12	Flow	Stage	Froude no	Velocity	Umode	Ustate

How to for Rivers

This section lists specific tasks for the rivers interface. Worked examples are contained in the courses directory of 12jobs and training manuals are found in the documentation directory on the 12d model distribution CD.

[Change manual override settings for river strings via attributes](#)

[Manually set a cross section name](#)

[Specify a local inflow at a cross section](#)

[Change the stage increment for reservoir strings](#)

[Boundary Strings are broken. How do I stop this?](#)

[Plot river xsections with the river sections names?](#)

Manual Override settings

Many of the automatic settings can be overridden using string attributes via the [String Attribute Editor](#). To use the editor

1. Select the river or source string to add/edit the attribute for
2. In the **Attribute Name** column use the selection list to find the attribute to change. If it is not listed then type the attribute name into one of the boxes.
3. Change the attribute **Type** to Integer/Real/Text as required
4. Type the attribute value into the **Data** field (erase the **not found** if required).
5. Select **Process**, **Next**, **Previous** or **Pick string**. Selecting **Finish** will NOT save the attribute.

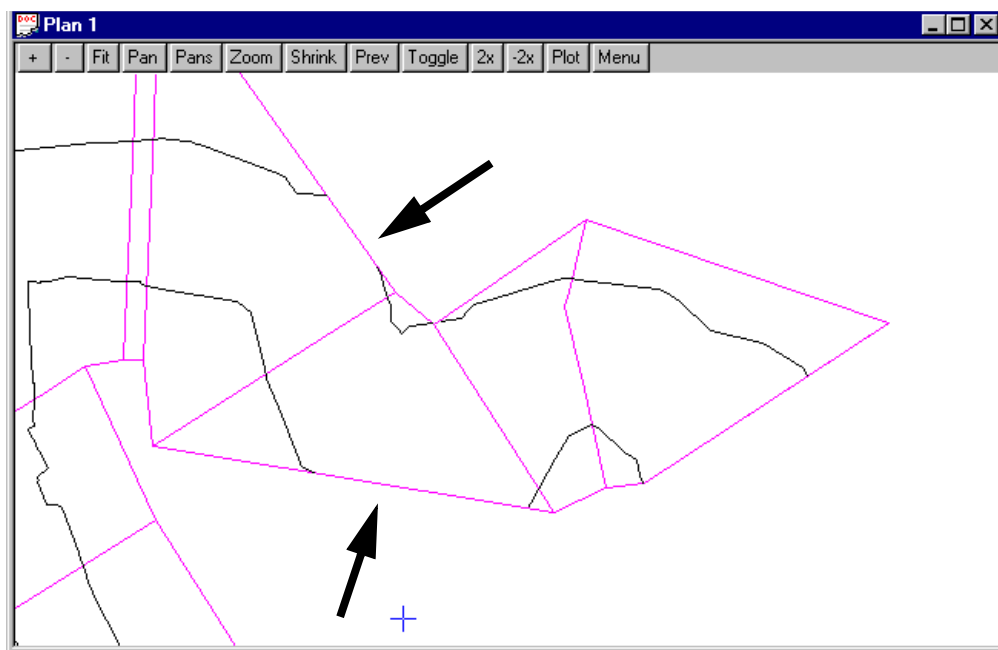

You will be prompted that you will create a new attribute if you have typed in a new attribute for that string

Purpose	String Type	Attribute Name	Type	Typical Data Value
Node/cross section name	source strings	node name	Text	A1
Set a local inflow for this section	source string	flow	Real	10.2
Storage curve increment	storage area strings	stage increment	Real	1.0
Water level string tolerance when comparing numeric string names to data file names	cross sections before importing	tolerance	Real	0.01
Custom n values	source strings	left n, right n, centre n	Real	0.03
Culvert n value	centre line and culverts in spill	roughness	Real	.013
Culvert entrance loss	centre line and culverts in spill	entrance loss	Real	0.5
Culvert exit loss	centre line and culverts in spill	exit loss	Real	1.0

Purpose	String Type	Attribute Name	Type	Typical Data Value
Culvert length	centre line and culverts in spill	length	Real	8.0
Multiple identical culverts	centre line and culverts in spill	number of pipes	Integer	2
Chanel length of a spill string	spill strings	length	Real	30
Channel roughness	spill strings	roughness	Real	0.02
Channel slope %	spill strings	slope	Real	0.5

Boundary Strings are broken. How do I stop this?

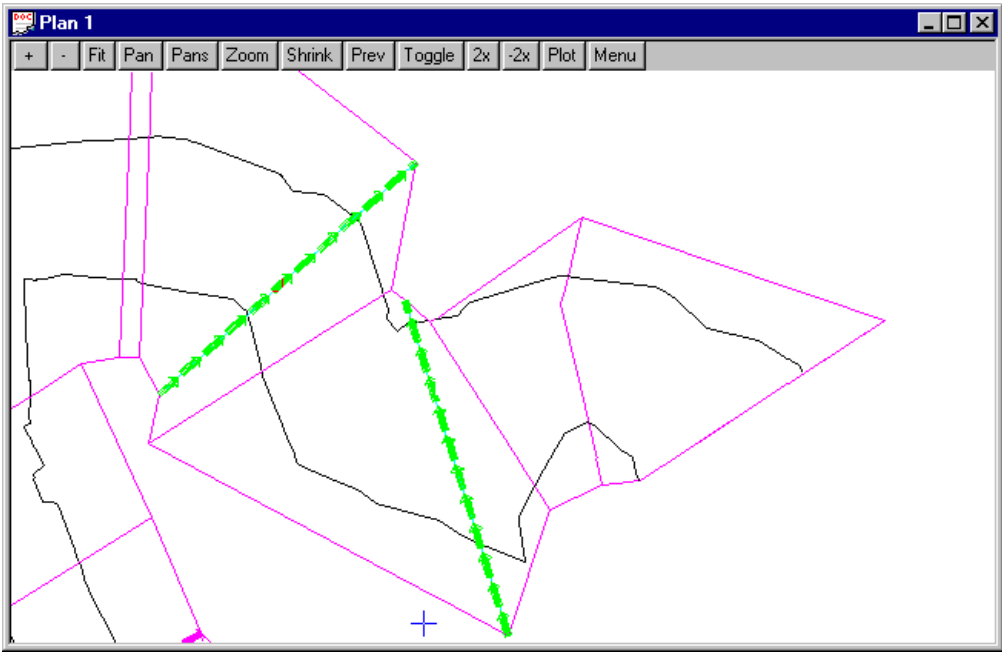

The boundary strings will be broken into sections when the boundary string goes outside the area defined by the cross sections. See below

In these two cases the water level has not exceeded the extents of the cross sections but the boundary strings (black) has gone outside the limits of the water level strings (magenta). **Shape strings** are used to expand the area of the water levels between the sections. The water level assigned to the shape string is a linear interpolation between the upstream and downstream cross section water levels. The interpolation is prorated using the distance along the centre line of the river.

Important! water levels are extended when the shape strings are in a junction area or past the end of a reach.

Shape strings are 2d strings. The direction is not important except for Mike11 models. For Mike11 they must be in the same direction as the cross section strings (usually left bank to right bank). The following drawing shows the boundary string when 2 shape strings have been added (green).

Mapping non 12d and historical water level data

12d can map water levels from river engineering models that were not created by 12d. If the water level results are in the standard HECRAS GIS, HECRAS report, ISIS zsr, UNET, XP SWMM xpx or Mikel1 binary file then the standard 12d readers can be used. If the data is historical or not in any of the standard format the **River Mapper** feature can be used.

River Mapper

Position of option on menu: **Design=>Rivers=>River Mapper**

River cross section water level data in a text file may be mapped and displayed using the 12d River Mapper interface. 2d strings are created by the user with the plan shape of the cross sections. 12d assigns water levels from a text file to these strings. These strings are then triangulated to create a water surface tin.

See also

[Presenting Water Level Results](#)

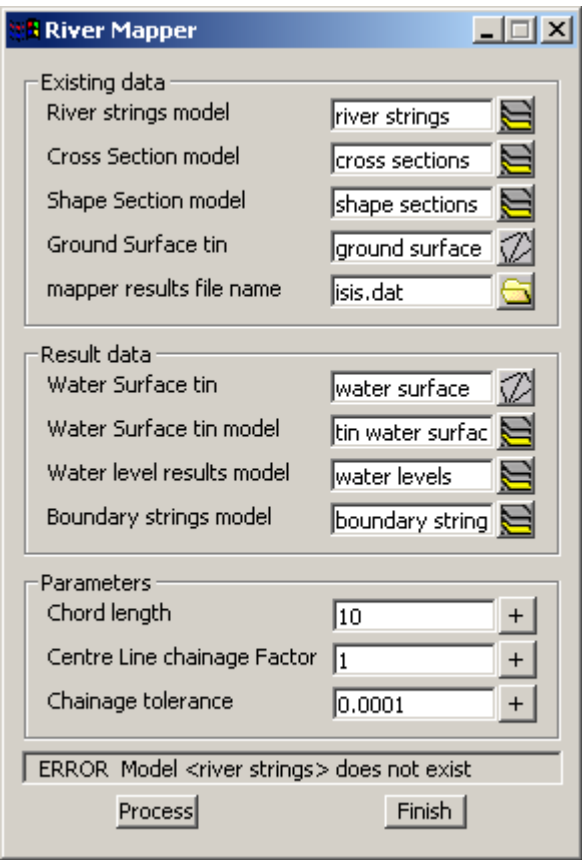

[How to for Rivers](#)

[Frequently Asked Questions \(Rivers\)](#)

Usage

The steps are as follows:

1. Create the [river strings](#) (centre line, left bank and right bank).
2. Create 2d [source strings](#). Use your name for the cross section as the string name. 12d will match the water levels in the file to this string using the name as the key. If you do not assign a name the interface will assign names to strings according to the chainage along the centreline and the value of **.Centre line chainage factor**.
3. From the **Design->Rivers** menu select **River Mapper**.
4. Fill in the fields in the dialogue for the rivers strings (step 1 above) and the cross sections (step 2 above).

River strings model Model box

The river strings model specified in the write panel.

Cross Section model Model box

*The cross section model specified in the write panel. The interface will search the string names in this model for the cross sections specified in the HEC-RAS report. A match is successful if the HEC-RAS cross section chainage and the string name are within the tolerance specified below in **Chainage tolerance**.*

Shape string model Model box

For meandering rivers, the cross sections may not be at a close enough spacing to create a water surface that follows the river. 2D shape strings can be created (automatically or manually) to create a water surface to follow the river. Note that water levels are extended when the shape strings are in a junction area or past the end of a reach.

Centre line chainage factor Model box

If you assigned the source/cross section string a name in Step 2 this field is not used. Otherwise, the centre line chainage and the Centre line chainage factor are used to name your source string/cross sections in 12d. The cross sections will be named in the same units as the 12d data if a Centre line chainage factor of 1 is specified. If your existing data uses cross section names in your data file are in kilometres and your 12d data in meters, you will want to use a Centre line chainage factor of 1000. If your existing data cross section names are in miles and your 12d data is in feet then a Centre line chainage factor of 5280 would be used.

Mapper results file name File box

The report is a tab (or space) delimited text file (usually created by a text editor or spreadsheet). The format is

cross section name <tab> water level elevation

each section name with its water level must be on a separate line. For example.

<i>Section A</i>	<i>2.31</i>
<i>Section B</i>	<i>2.32</i>

If the names contain letters (abc..) then the section name must match the 12d string names exactly (case sensitive). If the names are real numbers than a tolerance for the matching (global and string specific) can be set (see parameters).

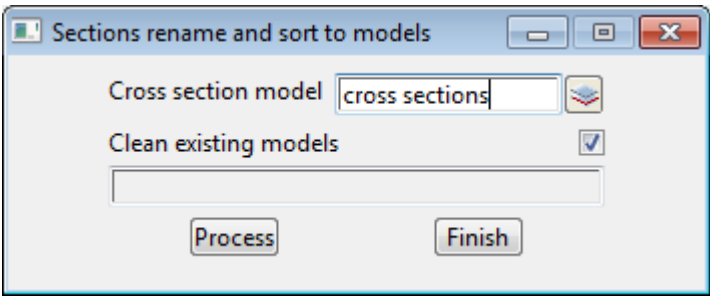

1.0 Rivers Rename and Move Cross Sections

Position of option on menu: **Design =>Rivers=>Xsections rename and move**

River cross section names begin with the river reach number followed by the cross section chainage. To plot these x sections they need to be renamed to the 12d chainage standard.

This routine gets the cross section model name moves the cross section to a model with the name as a prefix followed by the reach number. The reach number is removed from all of the cross section name.

On selecting the **Xsections rename and move** option, the panel is displayed.

These defaults are used when creating a manhole in a drainage string. The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Cross section model	model box		
<i>this model holds the cross sections created by one of the river interface routines. The name of this model will used as the prefix for the new models to hold the renamed cross sections.</i>			
Clean existing models	tick box		
<i>when selected the models that the cross sections are to be moved to will be cleaned before the supplied cross sections are moved into them.</i>			
Process	button		
<i>moves and renames the cross sections</i>			

12d System Path

When looking for system files 12d first checks your local project directory (the directory that hold the *.project folder), and then the system folders. Unless you have changed these folders in your env.4d file the path is first "program files\12d\12dmodel\5.00\user" and then "program files\12d\12dmodel\5.00\set_ups". In summary:

1. local project directory (the directory that hold the *.project folder)
2. program files\12d\12dmodel\5.00\user
3. program files\12d\12dmodel\5.00\set_ups

Never modify the files in set_ups. Copy them to the user directory and make your changes there. Here they are safe from being changed during future 12d updates. The only time you will want files in the local project directory is when you have some project specific data. Master_drainage.xp and Master_rivers.xp are good examples of such cases.

[More on System files
Attribute Editor](#)

FAQ Rivers

[XP SWMM does not start or gives errors when starting from 12d](#)

21 Pipeline

Position of menu: Design =>Pipeline

The **Pipeline** option is used to place large diameter pipelines.

The pipeline is very similar to an alignment string in that it is defined by separate horizontal and vertical geometries.

The major differences between a pipeline and an alignment is that a pipeline has a diameter and normally uses circular curves in the vertical geometry rather than the parabolic curves used for alignments.

The pipeline is entered by placing the invert (bottom) of the pipe. Hence in a plan view, the horizontal geometry places the centre of the pipeline. The vertical geometry of the pipeline is for the invert (bottom) of the pipeline.

Note

A **pipeline** string is not the same as a **pipe** string. A **pipe** string is only a 3d string with a diameter.

The **Pipeline** walk-right menu is

For the option *Create*, go to

Editor

Defaults

Plots

Reports

[Create](#)

[Editor](#)

[Defaults](#)

[Plots](#)

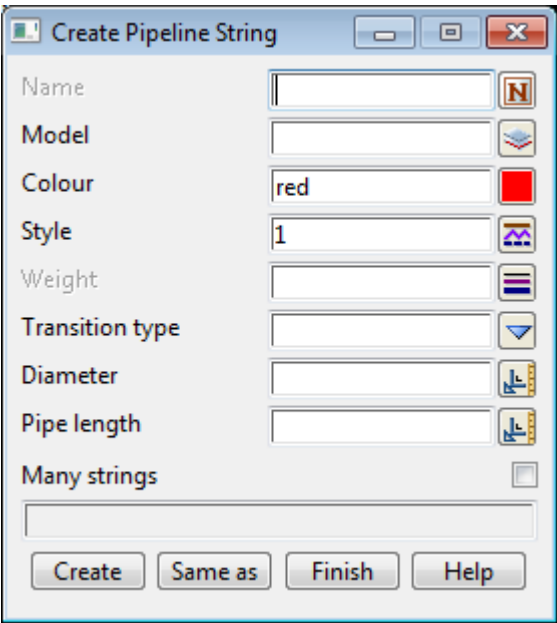

[Reports](#)

Create

Position of option on menu: Design =>Pipeline =>Create

The **Create** option is used to produce **new** pipelines. If a pipeline string already exists, the **Edit** option is used to modify it.

On selecting the **Create** option, the **Create Pipeline String** panel is displayed.

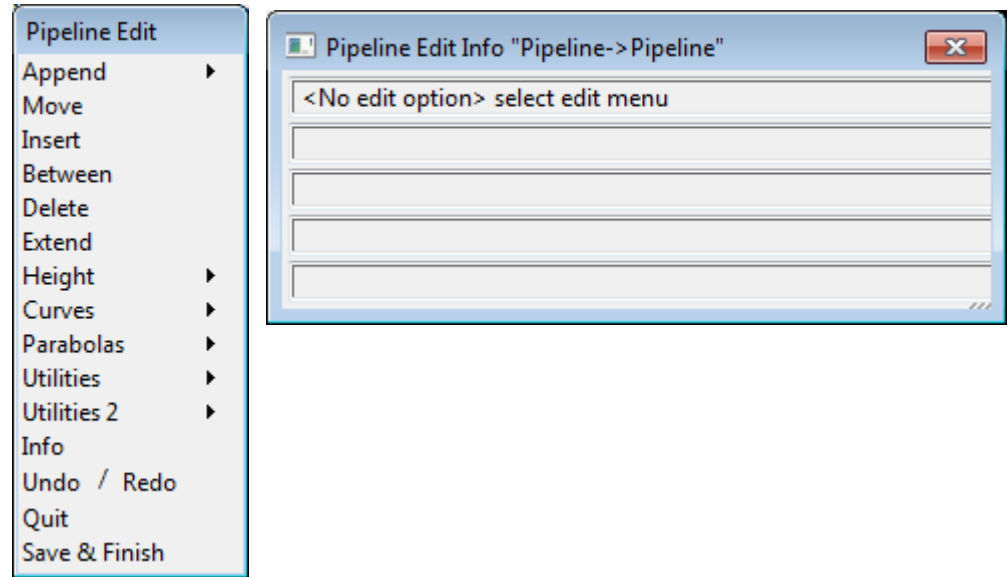

To create a new pipeline string, the pipeline's name, model, colour, style, spiral type and pipe diameter, plus the standard length of pipes used to make up the pipeline are entered into the appropriate fields and the **Create** button selected.

As for a 3d string, to create a new pipeline string with some of the **same** name, colour, model, style etc. **as** an existing string (not necessarily a pipeline), the **same as** button is chosen and the appropriate string selected.

The **Create Pipeline String** panel is then removed and the **Pipeline Edit** menu and **Pipeline Edit Info** panel fired up.

The **Pipeline Edit** menu contains all the options for creating/editing a pipeline string. The **Pipeline Edit Info** panel contains information areas.

The **Pipeline Edit** menu and **Pipeline Edit Info** panel are

As for an alignment string, to create a new pipeline string the user selects the **Append=>HIP's** option from the **Pipeline Edit** menu and start placing points in a plan view.

Since the **Pipeline Edit** menu and **Pipeline Edit Info** panel are the same as those used when editing

a pipeline string, the options will be discussed in the following sections under the pipeline **Edit** option.

For information on pipeline editing, please continue to the section [Pipeline Editor](#).

Editor

Position of option on menu: Design =>Pipeline =>Editor

This is the same option as **Editor** from the **Strings** walk-right menu on the **12d Model** menu.

The string editor is used to modify any **12d Model** strings. After selecting the **Editor** option, the **Edit String** panel is placed on the screen to record any error messages.

The option is already in the **Pick** mode (the **Pick & Edit** button only needs to be selected if the pick was cancelled) and the user simply picks and accepts the string to be edited.

From the picked string's type, the editor is able to determine the edits that apply to the string and list them in the string's **Edit** menu.

If a pipeline string is selected, the **Pipeline Edit** menu and **Pipeline Edit Info** panel (as shown in the previous section) are placed on the screen.

The individual edit operations for a pipeline string will now be discussed in detail.

Please continue to the next section [Pipeline Editor](#).

Pipeline Editor

Position of option on menu: Design =>Pipeline =>Editor

A pipeline string is defined by specifying both the horizontal and vertical geometry of the invert (bottom of the pipeline) as separate operations.

The horizontal geometry consists of a series of (x,y) points (called horizontal intersection points) and circular curves applied to the intersection points.

Vertical geometry also consists of a series of points but they are defined with respect to the plan length of the string (chainage) and height. Hence, the vertical geometry is defined by a series of (chainage,height) points (called vertical intersection points) and circular curves applied to the vertical intersection points.

The horizontal geometry is usually defined in a plan view and the vertical geometry in a section view. Hence the pipeline string editor can edit information for the string on both plan and section views.

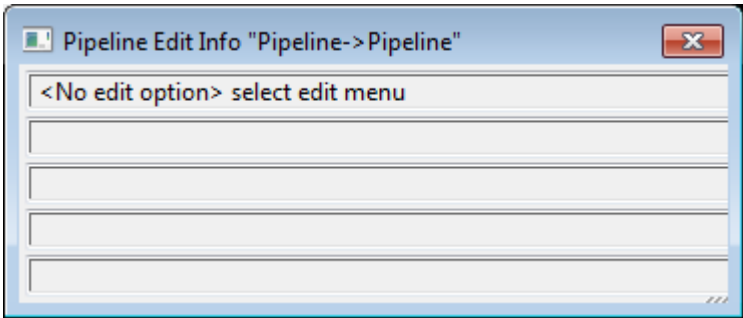

Note: the string can only be edited on a section view if the string is also profiled on the section view.

On selecting a pipeline string the **Pipeline Edit** menu and **Pipeline Edit Info** panel are placed on the screen.

The **Pipeline Edit** menu is

Pipeline Edit	
Append	▶ append or prepend an IP
Move	move an IP or TP
Insert	insert an IP
Between	insert on IP-IP line
Delete	delete an IP
Extend	extend an IP
Height	▶ modify the strings z-value
Curves	▶ circular curves, spirals
Parabolas	▶ VG only, radius or length
Utilities	▶ interval, start chainage, validate, clear etc.
Utilities 2	▶ set diameter and pipe length
Info	toggle edit info panel
Undo / Redo	undo and redo
Quit	quit the edit session
Save & Finish	finish the create

and the **pipeline edit info** panel is

To edit the selected pipeline string, simply select the required edit option from the list of all possible edits in the **pipeline edit** menu.

The edit is **cancelled** by selecting the **cancel** option. The edited string is restored to its pre-edit state and the option terminated.

The edit is **finished** and the new string placed in the given model when the **finish** option is chosen. The edit option then terminates.

When either **quit** or **finish** is selected, a **yes-no-cancel** panel is displayed and the user must confirm the selection.

The **pipeline edit info** panel is used to display information and messages during editing of the pipeline string.

The main message area indicates the purpose of the mouse buttons at each step.

Message area 1 displays the current pipeline edit option and message area 5 indicate the next step in the edit option.

Message areas 2 and 3 are used to display information about the string as the cursor is moved near the string and the string points. For example, for the closest IP, the (x,y,z) position and radius of the IP is displayed in area 2, and in area 3 the bearing-in, bearing-out and deflection angle for the adjacent IPs.

Message area 4 displays the cover above the pipeline and the vertical, horizontal and combined joint deflection.

Most of the options are identical to the edit options for an alignment string and will not be discussed in detail again. The options that are only applicable to a pipeline string will be fully described.

Append

HIPs

In a plan view, the **append=>HIPs** option is used to create the first horizontal point in a new pipeline string, to append a new horizontal intersect point to the end of the string or to prepend a new horizontal intersection point to the beginning of the string. The horizontal geometry is for the centre of the pipe in plan.

VIPs

In a section view, the **append=>VIPs** option can be used to create and edit the vertical geometry of the picked string if the string is a primary string on any section view. This can be achieved by using either the **VG edit** or the **profile** option from the section view **View ops** menu. The vertical geometry is for the invert (bottom) of the pipe.

The **append** option is the same as **append** for an alignment string and will not be described further.

Move

The **move** option can be used for moving individual horizontal and vertical intersection and tangent points.

The option acts on the horizontal geometry if the point to move is selected in a plan view, or the vertical geometry if the point to move is selected in a section view.

The **move** option is the same as **move** for an alignment string and will not be described again.

Insert

The **insert** option is designed to place a new intersection point in a string between two adjacent horizontal or vertical intersection points (note that the inserted point does not have to be on the line joining the two intersection points).

The **insert** option is the same as **insert** for an alignment string and will not be described again.

Between

The **between** option is similar to the **insert** option except the inserted point **does** have to be on the line joining the two intersection points. To accomplish this, the cursor position is automatically projected onto the IP-IP line to give the new IP point position.

The **between** option is the same as **between** for an alignment string and will not be described again.

Delete

The **delete** option is used to delete horizontal or vertical intersection points from the string.

The **delete** option is the same as **delete** for an alignment string and will not be described again.

Extend

The **extend** option is used to move an intersection point along the line joining the intersection point to its neighbouring intersection point.

The **extend** option is the same as **extend** for an alignment string and will not be described again.

Height

The height option is used to modify the height of a vertical intersection point in the string.

The **height** option is the same as **height** for an alignment string and will not be described again.

Curves

The **curves** option allows the user to add circular curves of a given radius to a either horizontal or vertical intersection points.

The **curve** option is the same as **curve** for an alignment string and will not be described again.

Parabolas

The **parabolas** option is for adding parabolic curves to the **vertical geometry**.

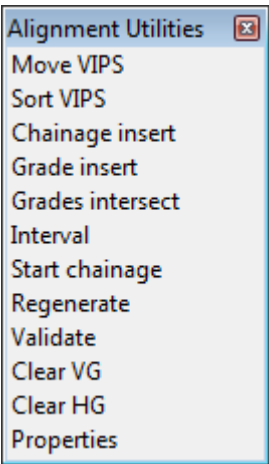

For pipelines, circular curves are normally used on vertical curves.

The **parabolas** option is the same as **parabolas** for an alignment string and will not be described again.

Utilities

The **Alignment Utilities** walk-right menu contains a number of useful miscellaneous options for the pipeline string. The menu is

Each of these options is the same as for an alignment string and will not be discussed again.

Utilities 2

The **utilities 2** walk-right menu contains options to modify the diameter of the pipeline and to set the standard length of the pipes used to construct the pipeline.

The **utilities 2** walk-right brings up the **Pipeline Utilities** menu:

Diameter

The **Diameter** option is used to change the diameter of the pipeline string.

After selecting the option, an enter value typed-input box is displayed on the screen containing the pipeline's current diameter.

The new diameter is entered into the typed-input box, terminated with <return>.

The typed-input box then disappears and the option terminates.

Length

The **Length** option is used to change the length of the standard pipe used to construct the pipeline string.

The length of the pipes used in constructing the pipeline string is used for calculating joint deflections along the pipeline.

After selecting the option, an enter value typed-input box is displayed the pipeline's current standard pipe length.

The new length is entered into the typed-input box, terminated with <return>.

The typed-input box then disappears and the option terminates.

Info

The **pipeline edit info** panel is toggled **on/off** by the **info** option in the **pipeline edit** menu.

Quit and Finish

Even after points are created for the new string, the create process can be **aborted** by selecting the **quit** option from the **pipeline edit** menu. The option then terminates and **no** string is created.

The create process is completed and the new string created and placed in the given model when the **finish** option is chosen from the **pipeline edit** menu.

When either the **finish** or **quit** option is selected, a **yes-no-cancel** panel is displayed and the user must confirm the selection.

Defaults

Position of menu: Design =>Pipeline =>Defaults

The **defaults** menu sets default depth to tin and joint deflection angle.

The **default** walk-right menu is

For the option Depth to tin, go to [Depth to Tin Joints](#)

Depth to Tin

Position of option on menu: Design =>Pipeline =>Defaults =>Depth to tin
On selecting the tin option, the pipeline tin defaults panel is displayed.

This panel is for setting the default terrain tin which is used to calculated the cover above the pipeline.

Joints

Position of option on menu: Design =>Pipeline =>Defaults =>Joints
On selecting the joints option, the pipeline joint defaults panel is displayed.

This panel is for setting the maximum joint deflection for the individual pipes that make up the pipeline.

Plots

Position of menu: Design =>Pipeline =>Plots
Currently the plots menu contains only one option and it is used for producing longsection plots of major pipelines.
The plots walk-right brings up the pipeline plots menu:

This option will now be described in more detail.

Please continue to the next section [Longsections](#).

Longsections

Position of option on menu: Design =>Pipeline =>Plots

Position of option on menu: Plot =>Pipeline Plot PPF Editor

For more information please go to the section [Pipeline Plot PPF Editor](#) in the Chapter [PPF Editors](#)

For a description of the pipeline plot parameters, please go to the section [Pipeline Plot Parameters](#).

Pipeline Plot Parameters

The **pipeline plot** option is used to make special long section plots for a **network** of pipeline strings.

Some of the look of the pipeline long section plot can be controlled from the **plot pipeline network** panel itself, however a wider selection of control parameters is available by using a pipeline long plot, plot parameter file.

The pipeline long section plot parameters are placed in a file with ending **.ppf**.

Each parameter consists of a parameter name followed by one or more spaces and then the parameter value. There is only one parameter per line.

Anything on a line after a double forward slash **//** is considered to be a comment.

The set of all parameters for the pipeline long section plot is enclosed within a set of curly brackets **{ }** with the header

```
pipeline_long_plot    "plot set name"
```

before the curly brackets.

That is,

```
pipeline_long_plot    "plot set name"  {  
                                plot parameters  
                                one per line  
                                }
```

If there is more than one `pipeline_long_plot` parameter set in the file, only the first set is used.

There may also be parameter sets for other plot types such as `section_x_plot` in the same file.

The other sets will be ignored when doing a pipeline long section plot.

Plot Sheet Layout

The plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

The overall size of the plot sheet is given by either a defined sheet size, or by the width and height of the plot given in millimetres and separated by one or more spaces.

```
sheet_size            text            // sheet name, or  
                      "mm    mm"      // sheet size: width  height
```

The sheet size name and width and heights can be specified by the user in a file named `sheet_sizes_definitions` which is in the normal set up areas, or is pointed to by the environment variable

```
SHEET_SIZES_4D        file            // file of plotter sheets sizes
```

The long plot is then positioned within the plot sheet by giving the margins

```
left_margin           mm  
right_margin          mm  
top_margin            mm  
bottom_margin         mm
```

The (left_margin,bottom_margin) defines the left hand corner position of the long plot on the plot sheet.

The right_margin and top_margin need not be set and if missing, will be calculated from the other plot parameters defining the plot layout.

The pipeline long section plot will break an individual plot up if it doesn't fit across the sheet. There can be one or more rows of plot on the same sheet.

The top row is done first, followed by the second top row, then the third and so on until the bottom row. If there is only one row, it is considered to be the bottom row.

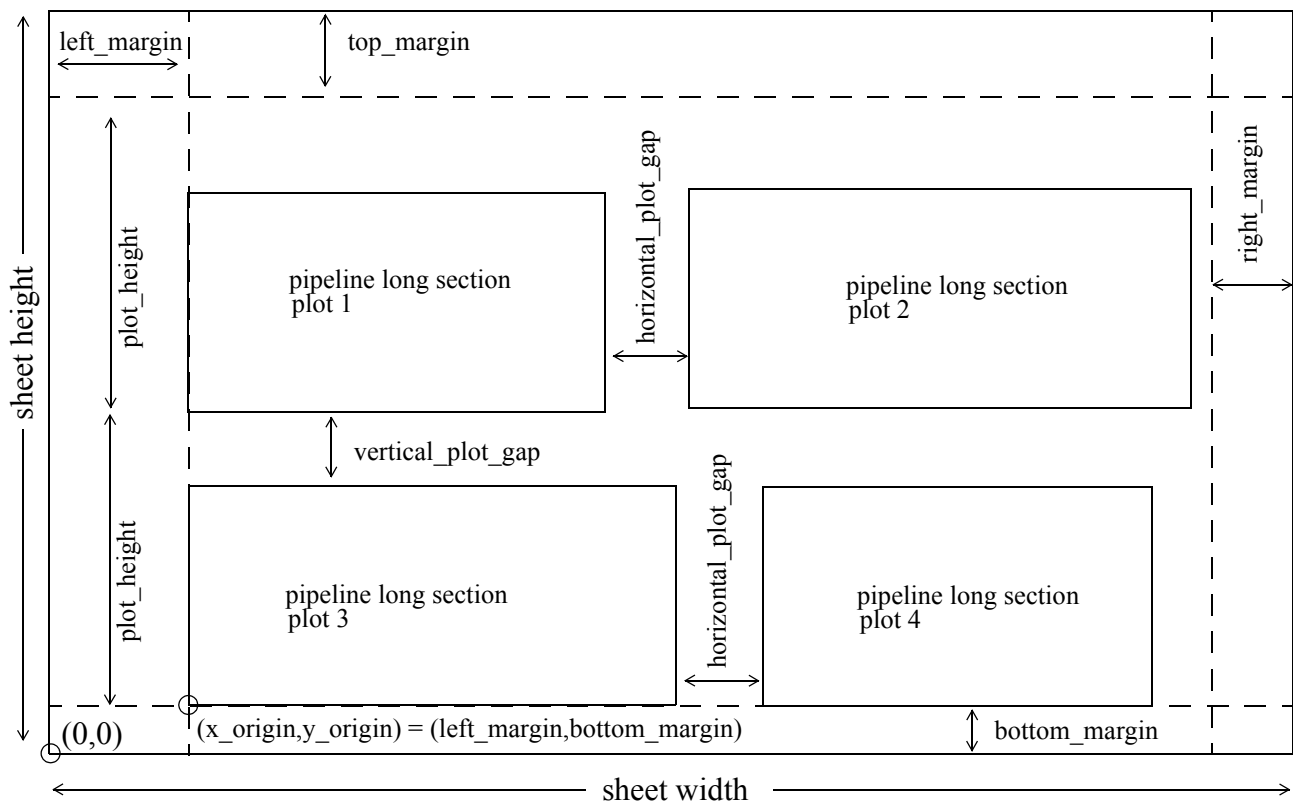

When a sheet is full, a follow on sheet is created.

As soon as one pipeline string is completed, the next pipeline string in the network model is plotted beginning on the same row as the previous pipeline string and with a horizontal gap of size horizontal_plot_gap between the plots. If there is not enough room on the row to start the next plot, it will begin on a new row.

The position of the left hand bottom corner of the first plot in the bottom row is given by the parameters, left_margin and bottom_margin.

If there are two or more rows of plots, the position of the first plot in each row is given by adding multiples of the (plot_height+vertical_plot_gap) to the bottom_margin.

network_model	text	// model of pipeline strings
left_margin	mm	// Position of the left hand bottom
bottom_margin	mm	// corner of first plot in the bottom row.
only_one_line	0	// more than one row on a sheet
	1	// only one row of plot on a sheet
plot_height	mm	// total height of a plot row. It doesn't
		// includes the vertical_plot_gap.
horizontal_plot_gap	mm	// gap between plots on same row
vertical_plot_gap	mm	// gap between rows of plots

The pipeline long plot itself consists of seven areas. From the bottom up, they are boxes, below datum, bottom stagger, graph, top stagger, arrow 4 area and top.

The **boxes area** is where the chainages and various values for the pipeline strings are labelled.

The **below datum area** is a region between the boxes area and the datum line.

The **bottom stagger area** is where the upright line staggers occur before going up from the boxes area to the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

The **top stagger area** is where the upright line staggers occur above the graph area.

The **arrow 4 area** is an extension of the uprights above the top stagger area to allow for the drawing of arrows where the arrows go between the staggered uprights above the graph area.

The **top area** is an annotation area above the arrow 4 area (the top of the plot) and is used for pegs and deflection angles.

Apart from information labelled in the boxes and top areas, the pipeline long section plot can place arrows between ips for other information such as

- (a) pipe grade
- (b) vertical geometry
- (c) horizontal geometry

Also the chainages where services cross the pipeline line are automatically labelled.

Chainages, Staggering and Uprights

For the pipeline plot, the labelling of pipe invert levels, pipe invert, depth to invert, pipe grade and natural surface level are done at the chainages:

- (a) pegs given by the peg_interval
- (b) horizontal and vertical deflection points
- (c) points in the specials model
- (d) crossing services

The points in the specials model are projected onto the pipeline string and the chainages used for labelling. If the point is a 4d string, then the text at the point is used as a text label at the top of the plot.

The peg interval and specials model are given by the parameters

peg_interval	<i>world-units</i>	// distance between pegs
specials_model	<i>text</i>	// model name

Uprights, or leader lines, are drawn from the values at the bottom of the plot to the top of the plot for cases (a), (b) and (c), or to the crossing service in the graph area for case (d).

If the text values are placed at the real chainage positions at the bottom of the plot, text overwriting can easily occur if the chainages are very close together.

To prevent such overwriting, the text can be **staggered**.

That is, if the text is going to overwrite a previous text value, the next text value is actually moved along until there is no overwriting.

Since the text is no longer at the correct chainage position, the uprights to the pegs and services start at the text position and then bend back to the correct chainage position on the plot. The region where the bending occurs is called the stagger area.

For the pipeline plot, there is an area below the graph where the uprights bend backwards from the staggered text position to the real chainage position (bottom stagger area).

There is a second area above the graph where the uprights bend forwards from the real chainage position to the staggered text position (top stagger area).

Hence annotation above the top stagger area will line up with the staggered values below the bottom stagger area.

The stagger area below the graph area is defined by

stagger_height_1	<i>mm</i>	// distance from the top of datum to the // start of the staggers
stagger_height_2	<i>mm</i>	// distance over which stagger occurs
stagger_gap_bottom	<i>mm</i>	// distance from end of staggers to the // bottom of the graph area

The stagger area above the graph area is defined

stagger_gap_top	<i>mm</i>	// distance from top of the graph area to // the start of the staggers
stagger_height_3	<i>mm</i>	// distance over which stagger occurs
stagger_height_4	<i>mm</i>	// distance from end of staggers to the // bottom of above upper staggers area

The distance to be left for text to avoid overwriting is:

horizontal_text_gap	<i>mm</i>	// minimum distance to leave for text // after peg values
services_text_gap	<i>mm</i>	// minimum distance to leave for text // after service values

When staggering occurs, it is possible for the values area to be longer than the graph area.

For the uprights that are drawn from the text to the pegs, specials and services:

line_colour	<i>colour</i>	// colour of uprights to the pegs and // specials
service_line_colour	<i>colour</i>	// colour of upright to the crossing // services
service_text_colour	<i>colour</i>	// colour of the name of the service.
service_text_size	<i>mm</i>	// size of the service text.

service_il_text_size	<i>mm</i>	// size of the service invert level text.
----------------------	-----------	-------------------------------------------

service_il_textstyle *text* // textstyle of the service il text
service_il_text_colour *colour* // colour of the service il text

Label vertical geometry:

v_g_text_size *mm* // size of the vertical geometry text
v_g_textstyle *text* // text style of the vertical geometry text
v_g_text_colour *colour* // colour of the vertical geometry text

Label horizontal geometry:

h_g_text_size *mm* // size of the horizontal geometry text
h_g_textstyle *text* // textstyle of the horizontal geometry text
h_g_text_colour *colour* // colour of the horizontal geometry text

Label pegs:

peg_text_size *mm* // size of the peg label
peg_textstyle *text* // text style of the peg label
peg_text_colour *colour* // colour of the peg label

Label special chainage:

chainage_special_text_size *mm* // size of the special chainage text
chainage_special_textstyle *text* //textstyle of the special chainage text
chainage_special_text_colour *colour* // colour of the special chainage text

Boxes Area

The pipeline string values of chainage, invert level, depth to pipe invert or depth to top of pipe, grade and natural surface level can be labelled in the pipeline long section plot with one line of title, and the actual values given at the chainage of each peg in the pipeline string.

The **titles** for the string values, are drawn in the **titles area** of the **boxes area** and the values are drawn in the **values area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

title followed by the **values** along the string.

Each row is surrounded by lines to form a box.

The **titles area** for the left plot in the bottom row starts at the co-ordinate (left_margin, bottom_margin) and each row is begun by adding the distance (plot_height + vertical_plot_gap) to the bottom_margin.

The width of the title box is given by the **plot_title_width** parameter and the height of each box is given by **plot_title_height**.

plot_title_width	mm	// width of the label boxes.
plot_title_height	mm	// height of each box
box_titles_x	mm	// the distance between the left of the // title box and the title

The **values area** starts at the end of the label area and the values text is written at right angles to the bottom of the boxes.

The colour of the box line work is given by:

plot_title_line_colour	colour	// colour of the lines in the boxes
------------------------	--------	-------------------------------------

A default text size and colour can be specified for the title text, and the size and colour of the values. These can be overridden by parameters (given later in this section).

plot_title_text_size	mm	// size of label text in boxes
plot_title_text_colour	colour	// colour of label text in boxes
text_size	mm	// size of value text
text_colour	colour	// colour of values in boxes

The width of the **values** area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

The total width of the boxes area is the width of the labels area plus the width of the values area which depends on the amount of staggering that occurs.

The order of drawing and labelling the boxes from the bottom up is

- (a) chainage values
- (b) natural surface heights
- (c) pipe invert levels
- (d) depth to invert or depth to top of pipe
- (e) grade of pipeline

The text, size, textstyle and colour for the title text and values text for each box can be set by:

(a) pipeline string chainages

plot_title_chainage_name	text	// label for chainages box
chainage_title_text_size	mm	// size of chainage title text in boxes
chainage_title_textstyle	text	// the textstyle of chainage title text in boxes
chainage_title_text_colour	colour	// colour of chainage title text in boxes
chainage_text_colour	colour	// colour of chainage text in boxes
chainage_text_size	mm	// size of chainage text in boxes
chainage_textstyle	text	// the textstyle of chainage text in boxes
chainage_decimals	integer	// number of decimal places
		// If > 0, trailing zeros are removed after
		// the decimal point.
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed

(b) natural surface values

plot_title_surface_name	text	// label for the pipeline ns value
ns_title_text_size	mm	// size of ns title text in boxes
ns_title_textstyle	text	// the textstyle of ns title text in boxes
ns_title_text_colour	colour	// colour of ns title text in boxes
ns_text_colour	colour	// colour of ns text in boxes
ns_text_size	mm	// size of ns text in boxes
ns_textstyle	text	// the textstyle of ns text in boxes
ns_decimals	integer	// number of decimal places
		// If > 0, trailing zeros are removed after
		// the decimal point.
		// If < 0, the absolute value is taken as the

// number of decimal places to report
 // i.e. no trailing zeros are removed

(c) pipe invert values

plot_title_invert_name	<i>text</i>	// label for the invert level
il_title_text_size	<i>mm</i>	// size of il title text in boxes
il_title_textstyle	<i>text</i>	// the textstyle of il title text in boxes
il_title_text_colour	<i>colour</i>	// colour of il title text in boxes
il_text_colour	<i>colour</i>	// colour of il text in boxes
il_text_size	<i>mm</i>	// size of il text in boxes
il_textstyle	<i>text</i>	// the textstyle of il text in boxes
il_decimals	<i>integer</i>	// number of decimal places
		// If > 0, trailing zeros are removed after
		// the decimal point.
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed

(c) depth to invert or depth to top of pipe

depth_mode	0	// if 0, depth to invert of pipe - default 0
	1	// if 1, depth to top of pipe (cover)
plot_title_depth_name	<i>text</i>	// label for depth of invert
depth_title_text_size	<i>mm</i>	// size of depth title text in boxes
depth_title_textstyle	<i>text</i>	// the textstyle of depth title text in boxes
depth_title_text_colour	<i>colour</i>	// colour of depth title text in boxes
depth_text_colour	<i>colour</i>	// colour of depth text in boxes
depth_text_size	<i>mm</i>	// size of depth text in boxes
depth_textstyle	<i>text</i>	// the textstyle of depth text in boxes
depth_decimals	<i>integer</i>	// number of decimal places
		// If > 0, trailing zeros are removed after
		// the decimal point.
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed

(d) grade of pipeline

plot_title_grade_name	<i>text</i>	// grade of pipe at the peg
grade_title_text_size	<i>mm</i>	// size of grade title text in boxes
grade_title_textstyle	<i>text</i>	// the textstyle of grade title text in boxes
grade_title_text_colour	<i>colour</i>	// colour of grade title text in boxes
grade_text_colour	<i>colour</i>	// colour of grade text in boxes
grade_text_size	<i>mm</i>	// size of grade text in boxes
grade_textstyle	<i>text</i>	// the textstyle of grade text in boxes
grade_decimals	<i>integer</i>	// number of decimal places
		// If > 0, trailing zeros are removed after
		// the decimal point.
		// If < 0, the absolute value is taken as the
		// number of decimal places to report
		// i.e. no trailing zeros are removed

Below Datum Area

The **below datum area** is the region between the boxes area and the arrow_1 area. The datum line is drawn at the top of the below datum area.

datum_title_text_size	<i>mm</i>	// size of datum title text and value
datum_title_textstyle	<i>text</i>	// textstyle of datum title text and value
datum_title_text_colour	<i>colour</i>	// colour of the datum title text and line

The size of the below datum area is

datum_gap	<i>mm</i>	// height of the below datum area
-----------	-----------	-----------------------------------

The datum value is placed above the datum line.

Since the datum value is automatically calculated to try and fit the plot vertically into the graph area, the datum value can change along the plot. When a datum change occurs, the new datum value is written on the datum line at the relevant chainage position.

The datum name, text size and colour are controlled by:

datum_text_size	<i>mm</i>	// size of datum title text and value
datum_textstyle	<i>text</i>	// textstyle of datum title text and value
datum_text_colour	<i>colour</i>	// colour of the datum title text and line

datum_name	<i>text</i>	// text to write before the datum value
datum_text_size	<i>mm</i>	// size of datum text and value
datum_colour	<i>colour</i>	// colour of the datum text and line

Graph Area

The **graph area** is the area where the actual plots of the pipeline strings are drawn.

The length of the graph area is determined by the length of the pipelines string to be plotted (given by the start and end chainages) and the horizontal scale (given by scale) of the plot.

scale	<i>value</i>	// 1:value - horizontal scale // The vertical scale is determined by the // horizontal scale and the vertical // exaggeration for the section view.
start_chainage	<i>value</i>	// “ ” means use start of pipeline strings
end_chainage	<i>value</i>	// “ ” means use end of pipeline strings

The vertical exaggeration is taken from the section view specified for the plot by the parameter:

view_name	<i>text</i>
-----------	-------------

The tins to be sectioned through by the pipeline strings and any service models and corridor settings for the graph area are also taken from the specified section view.

The height of the graph is calculated by subtracting the height of the first five areas (i.e. don't include the top area) from the plot height.

If the plot will not fit horizontally into a row on the sheet, then the plot will be broken at an appropriate peg and the plot continued on another row.

Datum breaks at pegs are used to try and fit the plot vertically into the graph area but if the plot still cannot fit, then it will be truncated at the bottom.

The types of strings that can be drawn in the graph area of the pipeline long section plot are:

- (a) pipeline string the strings from the network model
- (b) tins sections of the pipeline string through any tins on the section view.
- (c) services parts of strings from any models on the section view that cut the

corridor for the section view.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), the colour of the tin used for the section in case (b).

Arrow 4 Area

This is just an extension of the stagger lines before the top of the plot. It leaves an area that can be used for extra annotation after the plot is produced.

The height of the area is

plot_title_top_height mm // height of the arrow 4 area

Top Area

The **top area** is an annotation area at the top of the plot (above the arrow 4d area).

It can be used for peg names and horizontal and vertical deflection angles in the pipeline.

The height of the top area is given by

vertical_plot_gap mm // size of the top area. If it is not large
// enough, the text will overwrite the
// plot in the row above.

Change of Direction At Intersection Points

If there is a horizontal or vertical intersection point without a curve on it, the deflection angle at the intersection point is drawn in the top area.

The text is drawn at the distance **angle_text_offset** above the top of the plot and if there is more than one angle, they are spaced horizontally by the distance **angled_text_gap** to the right.

The size and colour of the deflections is given by text_size and text_colour.

angled_text_offset mm // distance of direction text above
// top of the plot
angled_text_gap mm // distance of direction text to the right
// of previous text.
angled_text_angle value // angle of direction text

Hatching Cut and Fill Areas

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins be hatched.

The parameters for labelling cuts and/or fill regions between tins are given by:

hatch_original_tin_n	tin_name	// tin_name for original surface
hatch_new_tin_n	tin_name	// tin_name for final surface
hatch_cut_separation_n	mm	// distance between cut hatch lines
	0	// don't do cut hatching
hatch_cut_angle_n	degrees	// angle in degrees of cut hatching
hatch_cut_colour_n	colour	// colour of the cut hatching
hatch_cut_linestyle_n	linestyle	// linestyle for cut hatching
hatch_cut_draw_sides_n	1/0	// 1 = draw sides of cut regions
hatch_cut_draw_original_n	1/0	// 1 = draw original tin in cut regions
hatch_cut_draw_new_n	1/0	// 1 = draw new tin in cut regions
hatch_fill_separation_n	mm	// distance between fill hatch line
	0	// don't do fill hatching
hatch_fill_angle_n	degrees	// angle in degrees of fill hatching
hatch_fill_colour_n	colour	// colour of the fill hatching
hatch_fill_linestyle_n	linestyle	// linestyle for fill hatching
hatch_fill_draw_sides_n	1/0	// 1 = draw sides of fill regions
hatch_fill_draw_original_n	1/0	// 1 = draw original tin in fill regions
hatch_fill_draw_new_n	1/0	// 1 = draw new tin in fill regions

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.

Labelling Cuts of Pipeline Through Strings in a Model

The cuts that the pipeline string makes through any strings in user given models can be automatically labelled on the long section plots.

The **height**, **chainage** and **name** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The chainage position for the labelling is the chainage of the cut string.

The height position for the labelling can be specified as the

- (a) top of the boxes on the long section
- (b) height value of the cut string
- (c) height of the primary string
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the cut string. For all other cases, only the chainage of the cut string is used. Hence for all cases except (b), the string does need to have a sensible height to be used for cuts through strings.

For example, a boundary string may have null heights but only the chainage is required and the height of the tin at that chainage can be used as the height (case (d)).

Text justification refers to the actual position and is given by

“top-left”	“top-centre”	“top-right”
“middle-left”	“middle-centre”	“middle-right”
“bottom-left”	“bottom-centre”	“bottom-right”

A choice of six special symbols and/or any 12d symbols can be drawn at the cut point.

The special 12d Model symbols of size one millimetre are drawn in a square box centred on (0,0) with sides of length two millimetres. That is, the box co-ordinates are (-1,-1), (1,1), (1,-1), (-1,-1).

The six special shapes are

The plot symbol of name *plotsymbol* is defined in the file given by:

- (a) the parameter *plot_symbols* in the ppf file

plot_symbols *filename*

or if *plot_symbols* is not defined, then

- (b) in the file pointed to by the environment variable `PLOT_SYMBOLS_4D`

`PLOT_SYMBOLS_4D` *filename* // default *plotsym.4d*

or if `PLOT_SYMBOLS_4D` is not defined, then

- (c) in the file *plotsym.4d*

which is searched for in the standard set up file sequence

If none of the above files are defined, or if the symbol does not exist in the above files, then it will be searched for in the standard 12d symbols file which is:

- (d) either pointed to by the environment variable `SYMBOLS_4D`

`SYMBOLS_4D` *filename* // default *symbols.4d*

or if the environment variable `SYMBOLS_4D` does not exist, in the file, *symbols.4d*

The position of the symbol is given by:

<code>cuts_symbol_n_position</code>	1	// above point height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.

The symbol can be adjusted by the parameters:

<code>cuts_symbol_n_x</code>	<i>mm</i>	// offset adjustment to position
<code>cuts_symbol_n_y</code>	<i>mm</i>	// height adjustment to position
<code>cuts_symbol_n_angle</code>	<i>degrees</i>	// rotation about point
<code>cuts_symbol_n_colour</code>	<i>colour</i>	// colour of symbol

and for all values of *cuts_symbol_n_mode* **other** than 6:

<code>cuts_symbol_n_size</code>	<i>mm</i>	// size of symbol, 0 don't draw
---------------------------------	-----------	---------------------------------

The value of the **chainage** of the cut string can be labelled using the parameters

<code>cuts_chainage_n_position1</code>		// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
<code>cuts_chainage_n_x</code>	<i>mm</i>	// chainage adjustment to position
<code>cuts_chainage_n_y</code>	<i>mm</i>	// height adjustment to position
<code>cuts_chainage_n_angle</code>	<i>degrees</i>	// rotation about point
<code>cuts_chainage_n_size</code>	<i>mm</i>	// size of text, 0 don't label
<code>cuts_chainage_n_colour</code>	<i>colour</i>	// colour of text
<code>cuts_chainage_n_textstyle</code>	<i>text</i>	// textstyle of text chainage
<code>cuts_chainage_n_pre_text</code>	<i>text</i>	// text before the chainage value
<code>cuts_chainage_n_post_text</code>	<i>text</i>	// text after the chainage value
<code>cuts_chainage_n_justification</code>	<i>justification</i>	// justification of the text
<code>cuts_chainage_n_no_decimals</code>	<i>integer</i>	// number of decimals in

chainage

The value of a **height** at the chainage of the point can be calculated and labelled using the parameters

cuts_height_n_mode	1	// use height of cut point itself
	3	// use real world height of position
		// above boxes
	100	// height of primary string
cuts_height_n_position	101-500	// use height of to tin1 or tin2 etc.
	1	// at points position
	3	// above top of boxes
	100	// to primary string
cuts_height_n_x	101-500	// to tin1 or tin2 etc.
cuts_height_n_y	mm	// chainage adjustment to position
cuts_height_n_angle	mm	// height adjustment to position
cuts_height_n_size	degrees	// rotation about point
cuts_height_n_colour	mm	// size of text, 0 don't label
cuts_height_n_textstyle	colour	// colour of text
cuts_height_n_pre_text	text	// textstyle of text height
cuts_height_n_post_text	text	// text before the height value
cuts_height_n_justification		// text after the height value
cuts_height_n_no_decimals	justification	// justification of the text
	integer	// number of decimals in height

A **label** which can include the **name** of the cut string is drawn by using the parameters

cuts_label_n_position	1	// above cut strings height value
	3	// above top of boxes
	100	// to primary string
	101-500	// to tin1 or tin2 etc.
cuts_label_n_mode	0	// don't include cut string name
	1	// include cut string name in label
cuts_label_n_x	mm	// chainage adjustment to position
cuts_label_n_y	mm	// height adjustment to position
cuts_label_n_angle	degrees	// rotation about point
cuts_label_n_size	mm	// size of text, 0 don't label
cuts_label_n_colour	colour	// colour of text
cuts_label_n_textstyle	text	// textstyle of text label
cuts_label_n_pre_text	text	// text before the string name
cuts_label_n_post_text	text	// text after the string name
cuts_label_n_justification	justification	// justification of the text

Title Block Information

The plot can have a standard **12d Model** title block or a user defined title block.

The standard title block consists of a simple border around the plot and two lines of text in a box underneath the plot. For a user defined title block, all the line work and text is defined by the user.

Standard Title Block

For the standard **12d Model** title block, there are extra parameters for two lines of text and text size and colour. The standard title block is turned on or off by the parameter *plot_border*.

plot_border	yes/no	// yes plots a standard title block // default yes
title_1	text	
title_2	text	
title_text_size	value	
title_colour	colour	

User Title Block

For the user defined title block, the title block drawing commands are kept in a file whose name is supplied by the user. The title block drawing commands are almost identical to the linestyle drawing commands and is given at the beginning of chapter Advanced Plotting.

Hence for a user defined title block, there are just two parameters - one to say a title block file is being used and the other to give the name of the title block file. The *plot_border* parameter should also be set to *no* so that the standard title block is not also drawn.

use_title_file	yes/no	// yes draws the title block given in title_file // default no
title_file	filename	
plot_border	no	// turn off standard title block

Some special plot parameters are used to pass information down to variables in a user defined title block

For example, inside the title block file it is possible to have run time user defined text variables. The actual text values for these text variables are passed down to the title block file from the plot parameter file via the parameters *user_text_n* (n = 1,2,... 1000)

user_text_n	text
-------------	------

The special plot parameters are:

time_format	text	// format for \$time
user_text_n	text	// where n = 1,2,... 1000 // passed down to \$user_text_n
title_1	text	// passed down to \$title_1
title_2	text	// passed down to \$title_2
start_page_number	integer	// used as the starting value for // \$page_number. If missing, // \$page_number starts at 1.
start_drawing_number	integer	// added to \$drawing_number in title // block file. If missing, // \$drawing_number starts at 1.
drawing_number_prefix	text	// passed down to // \$drawing_number_prefix
drawing_number_postfix	text	// passed down to // \$drawing_number_postfix

Parameters that Modify Fields In the Plot Pipeline Network Panel

A number of parameters match those in the **plot pipeline network** panel.

When the plot parameter file is first read, any parameters in the panel will be replaced by the values of any corresponding parameters from the parameter file.

However, if the parameter is subsequently modified in the panel, the panel value will be the value used for the parameter.

The plot parameters that also occur in the **plot pipeline network** panel are:

network_model	text	
plotter_type	text	
plot_stem	text	
view_name	text	// name of section view for tins, services, // vertical exaggeration etc.
specials_model	text	
peg_interval	world-units	
scale	value	
sheet_size	text	or "width height"
plot_height	mm	
start_chainage	world-units	
end_chainage	world-units	
left_margin	mm	
right_margin	mm	
top_margin	mm	
bottom_margin	mm	
plot_border	yes/no	
title_1	text	
title_2	text	
title_text_size	value	
title_text_colour	colour	
use_title_file	yes/no	
title_file	filename	

Reports

Position of menu: Design =>Pipeline =>Reports

The **Reports** walk-right menu contains reports for joint deflections along the pipeline and crest and sag points.

Fo the option Deflection, go to [Deflection](#)

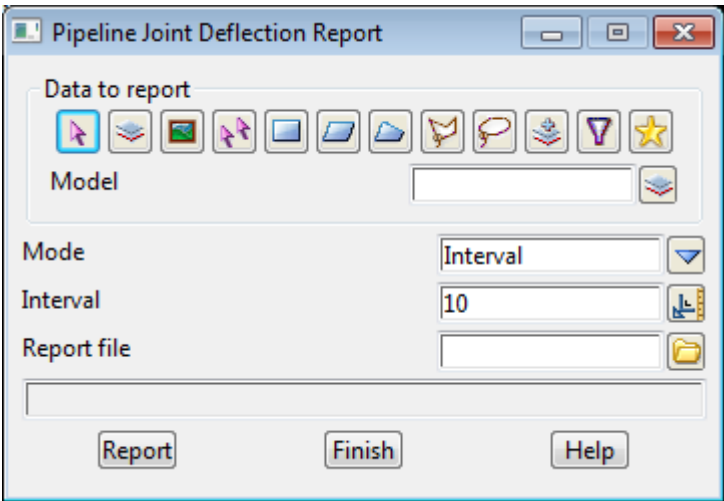

Crest/ sag points [Crest/Sag Points](#)

Deflection

Position of option on menu: Design =>Pipeline =>Reports=>Deflection

The deflection report gives the horizontal, vertical and combined joint deflections along the pipeline.

After selecting the **Deflection** option, the **Pipeline Joint Deflection Report** panel is displayed.

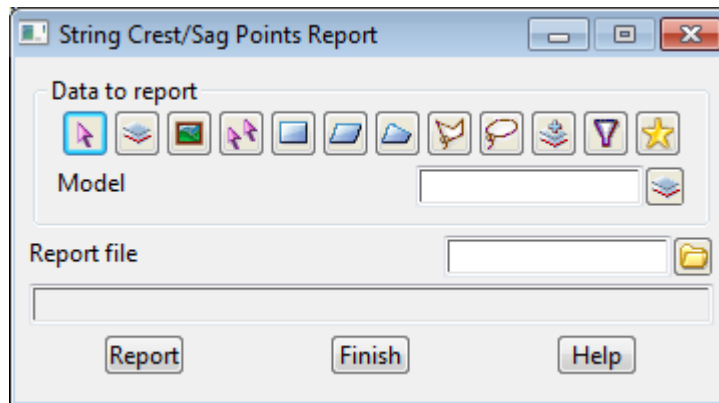

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Report file <i>name of the file for the report</i>	input		
Mode <i>if interval - reports the joint deflection at the interval given plus any horizontal or vertical intersection points without curves on them</i> <i>If critical - only reports points where the deflection is greater than the value given in the pipeline joint defaults panel.</i> <i>If summary - gives the maximum joint deflections</i>	input	interval	interval, critical, summary
Interval <i>the chainage distance between points along the pipeline where joint deflections are to be reported</i>	input	10	
Pick & Report <i>pick the pipeline string to report on.</i>	button		

Crest/Sag Points

Position of option on menu: **Design ==>Pipeline ==>Reports==>Crest/Sag Points**

After selecting the **Crest/sag points** option, the **String Crest/Sag Points Report** panel is displayed.

This is the same option as the **Reports=>Strings=>Crest/sag points**.

For more information please go to [Crest/Sag Points](#) in the chapter [Reports](#).

For each selected string, the string's crest/sag points are written to the report file given in the report file field of the panel.

22 Volumes

12d Model provides two distinct methodologies for calculating volumes; end area and exact.

In all cases the volumes are broken up into cut and fill volumes.

Definition of Cut and Fill

Cut is defined to be where ever the new surface or given height is **below** the original surface. That is, you have to **cut** to get from the original surface to the new surface. The sign of cut quantities is set via the **Cut volume sign** field from the **Default settings** tab of the Defaults panel (Utilities=>Defaults) and the default for *cut volume sign* is positive.

Fill is defined to be where ever the new surface or given height is **above** the original surface. That is, you have to **fill** to get from the original surface to the new surface. The sign of fill quantities is the opposite to the value for cut and cut is set via the **Cut volumes sign** field from the **Default settings** tab of the Defaults panel (Utilities=>Defaults). The default for fill is *negative*.

End Area and Exact Volumes

In the **end area** method, sections are *automatically* created through tins. From the sections, cut and fill areas for the sections and the cut and fill volumes between the sections are calculated. For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#)

For **exact** volumes, the volume between a tin and a plane or between two tin is determined by working out the exact geometrical shapes between the tins and summing their volumes. For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

It is often stated that exact volumes are more accurate than end area volumes. However, when the distance between sections is small in the end area volume calculations, the results are the same to any reasonable degree of accuracy.

The reason for having both methods available in **12d Model** is

- (a) to provide an independent check on the volumes produced
- (b) each method produces a different breakup of the volumes.

In the end area method, cut and fill volumes are produced on a section by section basis. This is needed for applications such as mass-haul calculations.

For the exact method, cut and fill volumes are easily calculated between different **depth** values.

This is useful for applications such as depth (isopach) analysis.

For both the end area and the exact method, 12d Model provides options to calculate the volume

(a) between a surface (tin) and a fixed height (z-value)

and

(b) the volume between two surfaces (tins) - an original surface (tin) and a new surface (tin).

NOTE: For the **end area volumes**, sections are automatically generated and used for the calculations. You do **not** need to generate the sections separately.

For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

For information on the end area options, please go to the section [End Area](#).

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#).

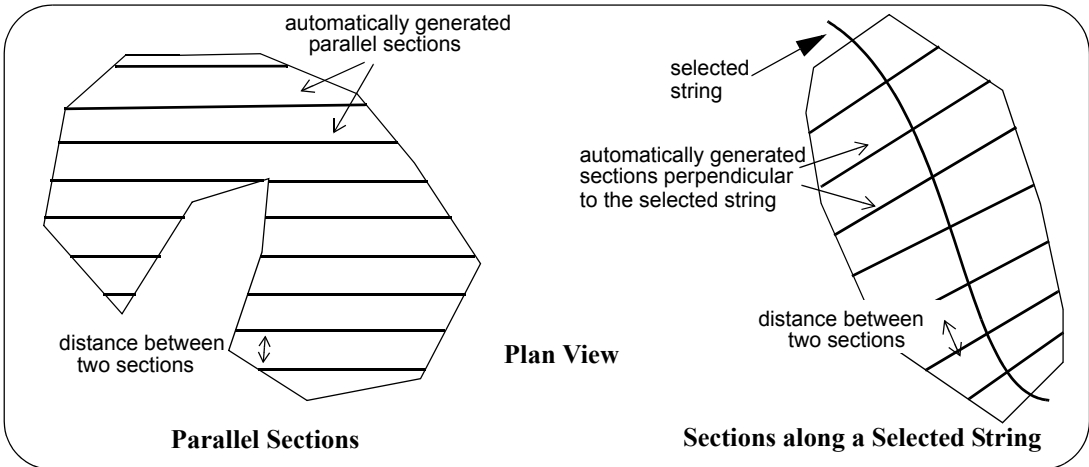

For information on the exact volume options, please go to the section [Exact](#).

Theory of End Area Volumes

In the **end area** method of calculating volumes, sections are automatically generated through the tins. For each section, cut and fill areas are calculated and then cut and fill volumes are calculated from the cut and fill areas. For the definition of cut and fill, please go to the section [Definition of Cut and Fill](#).

For the end area method, **12d** Model provides options to calculate the volume between a surface (tin) and a fixed height (z-value) and the volume between two surfaces (tins).

In the **end area** methods of calculating volumes, sections can be generated through a tin or tins at either a *given angle* or at right angles to a **selected** string.

When using the **sections along a string** options, it is possible for a generated section to be broken into more than one part and a parameter exists to only use those sections that contain the selected string.

For each generated section, the *cut* and *fill* areas are calculated and then the volumes between the two sections using either the **average end** (see [Average End Area Formula](#)) or the **two section prismatic** methods (see [Two Section Prismatic Formula](#)).

NOTE: For the **end area volumes**, sections are automatically generated and used for the calculations. You do **not** need to generate the sections separately.

Average End Area Formula

Using the *Average End Area* method the *volume* between two *consecutive* sections is calculated by the formula

$$\text{Volume of cut between the two sections} = D \times (C1 + C2) / 2$$

where

D = distance between the two sections

C1 = area of cut for the first section

C2 = area of cut for the second section

The **Total cut volume** is the sum of the cut volumes between each pair of sections.

Similarly

$$\text{Volume of fill between the two sections} = D \times (F1 + F2) / 2$$

where

D = distance between the two sections

F1 = area of fill for the first section

F2 = area of fill for the second section

The **Total fill volume** is the sum of the fill volumes between each pair of sections.

Two Section Prismoidal Formula

The *two section prismoidal* method, as its name suggests, is a modification of the standard prismoidal method but it uses only two sections rather than the three sections required by the standard prismoidal method.

Using the *Two Section Prismoidal* method the *volume* between two *consecutive* sections is calculated by the formula

$$\text{Volume of cut between the two sections} = D \times (C1 + C2 + \text{Sqrt}(C1 \times C2)) / 3$$

where

D = distance between the two sections

C1 = area of cut for the first section

C2 = area of cut for the second section

The **Total cut volume** is the sum of the cut volumes between each pair of sections.

Similarly

$$\text{Volume of fill between the two sections} = D \times (F1 + F2 + \text{Sqrt}(F1 \times F2)) / 3$$

where

D = distance between the two sections

F1 = area of fill for the first section

F2 = area of fill for the second section

The **Total fill volume** is the sum of the fill volumes between each pair of sections.

For the definition of cut and fill, please go to the section [Definition of Cut and Fill](#).

For information on the end area options, please go to the section [End Area](#).

For information on the theory for exact volumes, please continue to the section [Theory of Exact Volumes](#).

Theory of Exact Volumes

This method calculates the exact volume between two triangulated surfaces (tins), or between one triangulated surface and a plane of constant height.

The volumes are calculated by mathematically subdividing the triangles from both tins into areas that contain only one triangle from each tin.

In three dimensions, these areas represent well defined polygons with the plane of the triangle from one tin as its top and the plane of the triangle from the other tin as its bottom.

For each small area, the cut and fill volume between the two tins can be calculated exactly.

The total *cut* and *fill* volume between the two tin is simply the sum of the cut and fill volumes for each small area.

For the definition of cut and fill, please go to the section [Definition of Cut and Fill](#).

For information on the exact volume options, please go to the section [Exact](#).

The calculated volumes by the exact method can be produced and reported on over *user supplied depth ranges*. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If

the depth ranges **does not cover** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins.

For information on the theory for end area volumes, please go to the section [Theory of End Area Volumes](#).

Volumes Menu

Position of menu: Design => Volumes

12d Model provides two distinct methodologies for calculating volumes; end area and exact.

For information and the theory on both these methods go to the section [Volumes](#)

The Volumes walk-right menu is

and each option in this menu will now be discussed.

For the option <i>End area</i> , go to	End Area
<i>Exact</i>	Exact
<i>Grid cell</i>	Grid Cell
<i>Stockpile</i>	Stockpile
<i>Tin to tin ht range</i>	Tin to Tin by Height Range
<i>Cut/fill text in poly</i>	Create Cut/Fill Text Within Polygon

End Area

Position of menu: Design =>Volumes =>End area

These volumes are calculated using the end area method. For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

The options **tin to height** and **tin to tin** use parallel sections defined at a user supplied angle and separation distance, to calculate the end areas.

The options **string tin to height** and **string tin to tin** use sections defined at right angles to a user selected string, for their end area volume calculations. The distance between sections is supplied by the user.

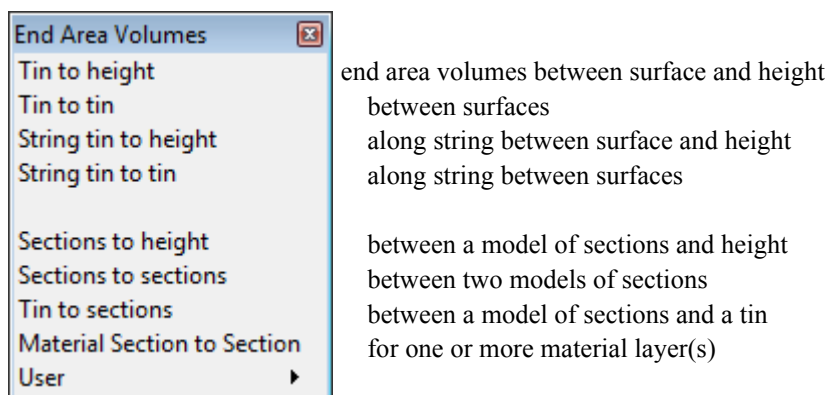

The options **sections to height** and **sections to sections** use sections already created to calculate volumes using end areas.

In all the volume options, the sections are restricted to a user defined polygon.

12d Model reports on the cut, fill and balance for each of the sections used in the calculations and also the total cut, fill and balance.

In the report, the sign for cut (negative or positive) is given by the cut volume sign from the **Defaults** panel (fill will have the opposite sign).

The **End area** walk-right menu is

Each option in this menu will now be described.

For the option <i>Tin to height</i> , go to	Tin to Height
<i>Tin to tin</i>	Tin to Tin
<i>String tin to height</i>	String Tin to Height
<i>String tin to tin</i>	String Tin to Tin
<i>Section to height</i>	Sections to Height
<i>Section to sections</i>	Sections to Sections
<i>Tin to sections</i>	Tin to Sections
<i>Material Section to Section</i>	Material Section to Section

For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

Tin to Height

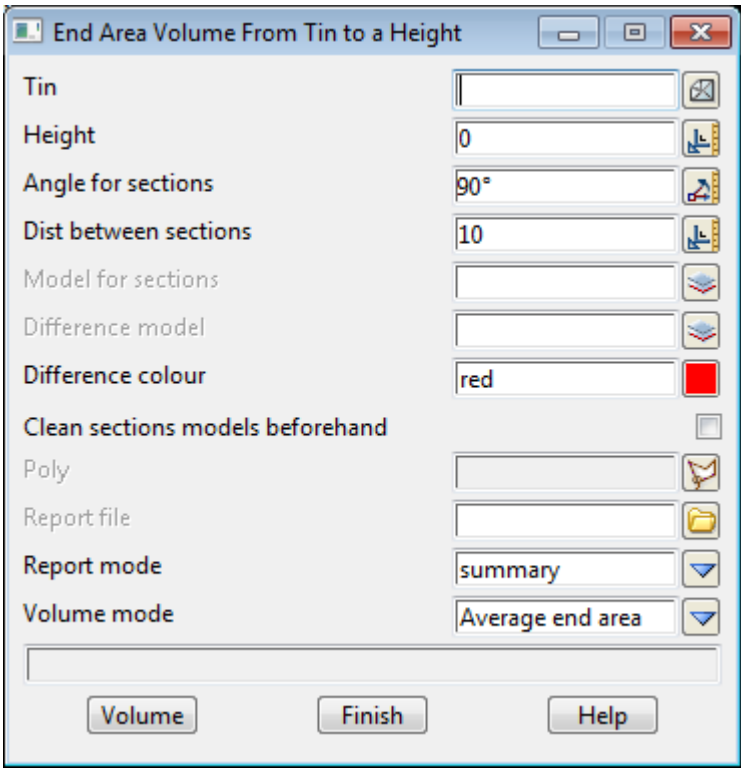

Position of option on menu: Design =>Volumes =>End Area =>Tin to height

The **Tin to height** option is used to find volumes between an existing surface and a user supplied height. The volumes can only be calculated within a user supplied polygon.

For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

On selecting the **Tin to height** option, the **End Area Volume From Tin to a Height** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	input		available tins
Height <i>the volume is calculated between the tin and the value in this field.</i>	input		

Angle for sections	input	90.0	0,45,90
<i>angle (in degrees) of the lines to section along.</i>			
Dist between sections	input	10.0	1,10,100
<i>distance between the lines to section along</i>			
Model for sections	input		available models
<i>if non-blank, the sections though the tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the tin. If blank, the sections are not kept.</i>			
Difference model	input		available models
<i>if non-blank, the sections which are the difference between the tin sections and the height are retained and placed in the model given in this field. If blank, the sections are not kept.</i>			
Difference colour	input		available colours
<i>colour for the difference sections strings</i>			
Clean sections models beforehand	tick box		
<i>if tick, the model of sections and difference sections are cleaned out before the option runs.</i>			
Poly	poly string-select		
<i>if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.</i>			
Report file	input		*.rpt
<i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>

Volume	button	
<i>The volume between the new and the original tins within the selected polygon string is calculated by the end area method. The sections through the polygon selected by poly will be calculated along straight lines at the angle given by the angle field and at a separation given by the dist field. The sections are made against the tins given by the original and the new tin fields.</i>		

How to Use the Panel and Panel Messages

- (a) Select the bounding polygon string by choosing **Poly** and picking the required string.
 - (b) Volume processing begins on selecting the **volume** button.
 - Progress messages - sent to the panel message area
calculating volumes
 - Completion message - sent to the panel message area
c cut volume f fill volume bal total (balance) volume
- <Esc> can be used to terminate the option during volume calculations.

String Tin to Height

Position of option on menu: Design =>Volumes =>End Area =>String tin to height

The volume options already described calculate the volumes by forming parallel sections through the tin and then using the end area method between adjacent sections.

In many situations, the sections to be used are defined to be at right angles to a user selected string. This method is commonly used in road calculations.

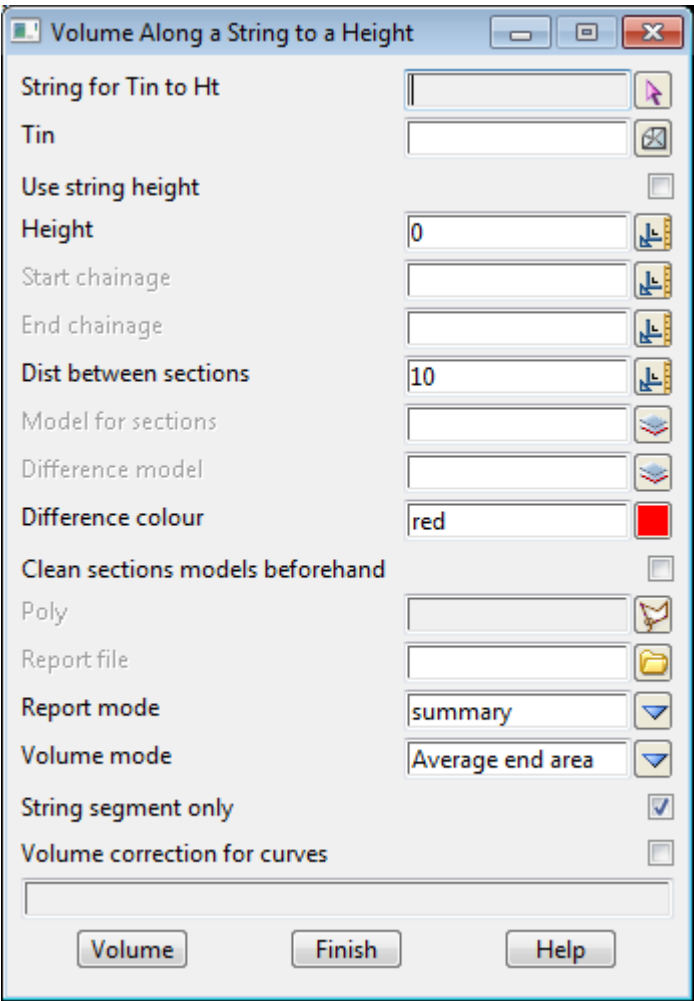

The options **String tin to height** and **String tin to tin** both use sections defined at right angles to a user selected string for the end area volume calculations. For both options, the volumes can only be calculated within a user supplied polygon.

It optionally uses the whole section within the polygon or only the part of the section that contains the string.

For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

On selecting the **String tin to height** option, the **Volume Along a String to a Height** panel is displayed.

The fields and buttons in this panel are used as follows.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

String for Tin to Ht	string select		
<i>a string is selected to be used to define the sections used in the end area calculations. The sections are taken at right angles to this string.</i>			

Tin	input		available tins
<i>name of the tin for which the volume between it and a height (z-value) will be calculated.</i>			

Use string height	tick box		
<i>if tick, the height used for the area calculations is taken at each section from the user selected string. If not tick, the height given in the height panel field is used in the area calculations.</i>			

Height	input	0	
<i>if Use string height is set to no tick, the volume is calculated between the tin and the value in this field.</i>			

Start chainage	input		
<i>if non blank, the chainage of the first section to use for volume calculations. If blank, start with the section with the lowest chainage.</i>			

End chainage	input		
<i>if non blank, the chainage of the last section to use for volume calculations.</i>			

If blank, end with the section with the highest chainage.

Dist between sections input 10 1,10,100

distance between the sections taken at right angles down the user selected string.

Model for sections input available models

if non-blank, the sections though the tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the tin.

If blank, the sections are not kept.

Difference model input available models

if non-blank, the sections which are the difference between the tin sections and the height are retained and placed in the model given in this field.

If blank, the sections are not kept.

Difference colour input available colours

colour for the difference sections strings

Clean sections models beforehand tick box

if tick, the model of sections and difference sections are cleaned out before the option runs.

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Report mode input summary summary, full

*if **full**, the cut and fill details for every section are included.*

*If **summary**, just the cut and fill totals are given.*

Volume mode choice box Average end area average end area,
prismoidal - 2 sections

the two methods in [12d](#) for calculating volumes using areas of sections. For more information on each method, go to [Average End Area Formula](#)

String segment only tick box tick

*if **tick**, only the part of the section within the polygon that contains the selected string is used.*

*If **not tick**, the whole section within the polygon is used (see [Theory of End Area Volumes](#)).*

Volume correction for curves tick box

if tick, volume corrections are made when going around curves.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Volume button

The volume between the tin and the height (z-value) within the selected polygon is calculated by the end area method. The sections through the tin are calculated at right angles to the selected string at a separation given by the dist field. The section strings are placed in the model given in the model field.

How to Use the Panel and Panel Messages

- (a) Select the bounding polygon string by choosing **Poly** and picking the required string.
- (b) Select a string to define the sections string by choosing **String** button
- (c) Volume processing begins on selecting the **volume** button.

Progress messages - sent to the panel message area

calculating volumes

Completion message - sent to the panel message area

c cut volume f fill volume bal total (balance) volume

<Esc> can be used to terminate the option during volume calculations.

String Tin to Tin

Position of option on menu: Design =>Volumes =>End Area =>String tin to tin

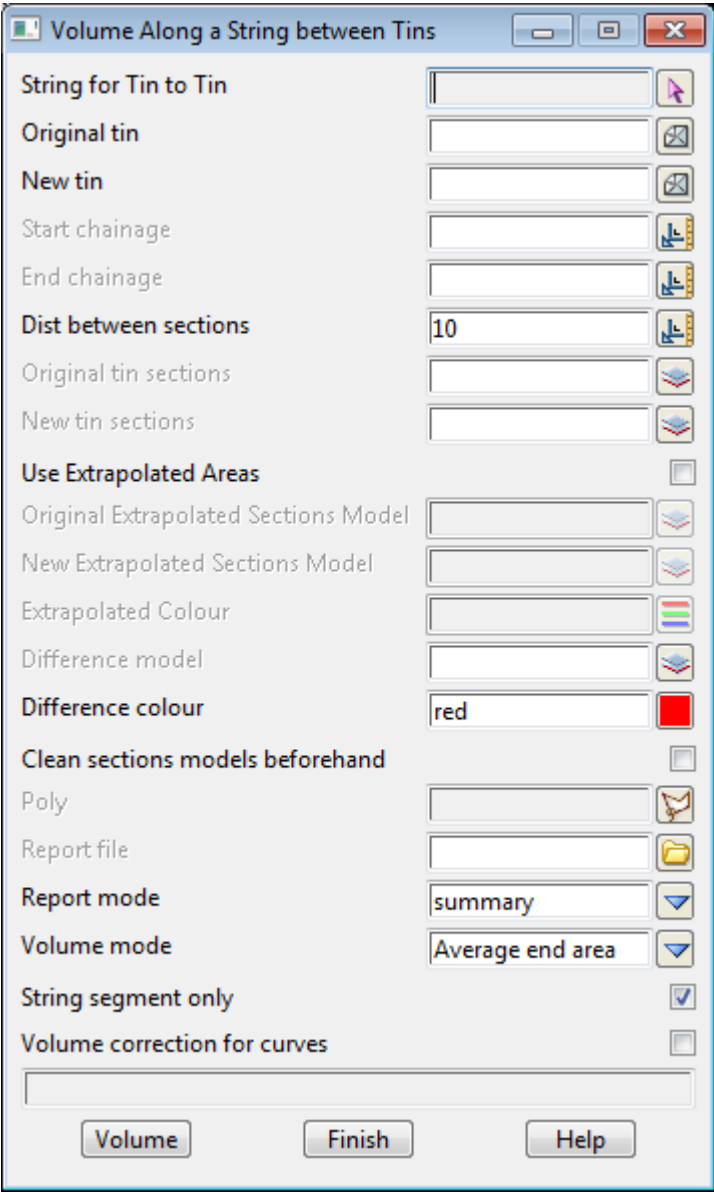

In this option, the sections generated for collating areas and volumes are defined to be at right angles to a *user selected string*. This method is commonly used in road calculations.

It optionally uses the *entire* section within the polygon or only the sections or part of sections that contain the user selected string.

For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

On selecting the String Tin to Tin option, the **Volume Along a String Between Tins** panel is displayed.

The fields and buttons in this panel are used as follows.

Field Description	Type	Defaults	Pop-Up
String for tin to tin	string select		
<i>the string for defining the sections used in the end area calculations. The sections are taken at right angles to this string.</i>			
Original tin	input		available tins
<i>name of the original tin for determining volumes.</i>			
New tin	input		available tins
<i>name of the new tin for determining volumes.</i>			
Start chainage	input		
<i>if non blank, the chainage of the first section to use for volume calculations. If blank, start with the section with the lowest chainage.</i>			
End chainage	input		

*if non blank, the chainage of the last section to use for volume calculations.
If blank, end with the section with the highest chainage.*

Dist between sections input 10.0 1,10,100
distance between the lines to section along

Original tin sections input available models
*if non-blank, the sections though the original tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour at the original tin.
If blank, the sections are not kept.*

New tin sections input available models
*if non-blank, the sections though the new tin used for the end area calculations are retained and placed in the model given in this field. The sections are given the same colour as the new tin.
If blank, the sections are not kept.*

Use extrapolated areas tick box not ticked
*if **not ticked**, areas (and hence volumes) are only calculated where **both** sections exist. Hence the sections are limited to where both occur.

If **tick**, when the sections are not the same length, the end points of the above and below sections are connected thereby extrapolating the smaller section. This method is not recommended since data does not exist.*

Original extrapolated sections model model box available models

the two methods in 12d for calculating volumes using areas of sections. For more information on each method, go to [Average End Area Formula](#)

String segment only tick box ticked

*if **ticked**, only the part of the section within the polygon that contains the selected string is used.
If **not ticked**, the whole section within the polygon is used (see [Theory of End Area Volumes](#)).*

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Poly poly string-select

if selected, the string, rectangle or lasso used as the bounding polygon for the volume calculations.

Volume button

The volume between the original and new tins within the selected bounding polygon is calculated by the end area method. The sections through the tins are calculated at right angles to the selected string at a separation given by the dist field.

How to Use the Panel and Panel Messages

- (a) Select the bounding polygon string by choosing **Poly** and pick the required string.
- (b) Select the string to define the sections string by choosing **String for tin to tin**
- (c) Volume processing begins on selecting the **Volume** button.

Progress messages - sent to the panel message area

<Esc> can be used to terminate the option during volume calculations.

Sections to Height

Position of option on menu: Design =>Volumes =>End Area =>Sections to height

The Sections to height option is used to find volumes between sections that already exist (in a given model) and a user supplied height. The volumes can be restricted to be within a user supplied polygon.

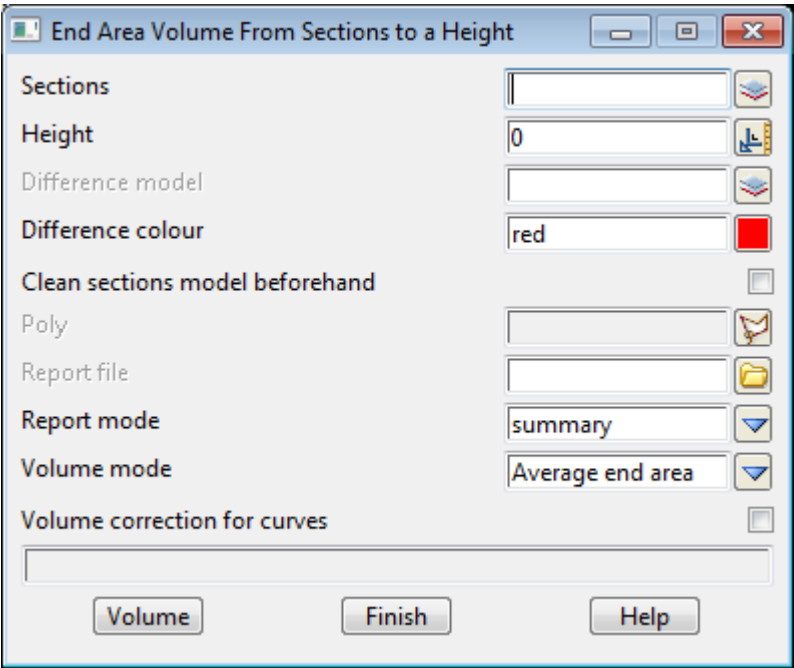

Normally the **Sections to Height** method is not used since if the tin exists, the option **Design =>Volumes =>End Area =>Tin to height** automatically generates sections through the tin at the required interval.

WARNING: The **Sections to Height** method can **not** be used when there are cases of two sections being on the same line.

For more information on the end area volume calculations, go to the section [Theory of End Area Volumes](#).

On selecting the Sections to height option, the **End Area Volume from Tin to a Height** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Sections	<i>name of the model containing the sections for which the volume between them and a height (z value) will be calculated.</i>	input		available models
Height	<i>the volume is calculated between the sections and the value in this field.</i>	input		
Difference model	<i>if non-blank, the sections which are the difference between the given sections and the height are retained and placed in the model given in this field. If blank, the sections are not kept.</i>	input		available models
Difference colour	<i>colour for the difference sections strings</i>	input		available colours

the two methods in **12d** for calculating volumes using areas of sections. For more information on each method, go to [Average End Area Formula](#)

Volume correction for curves tick box

if ticked, volume corrections are made when going around curves.

Volume button

The volume between the original model of sections and the new model of sections within the selected bounding polygon is calculated by the end area method.

<Esc> can be used to terminate the option during volume calculations.

Material Section to Section

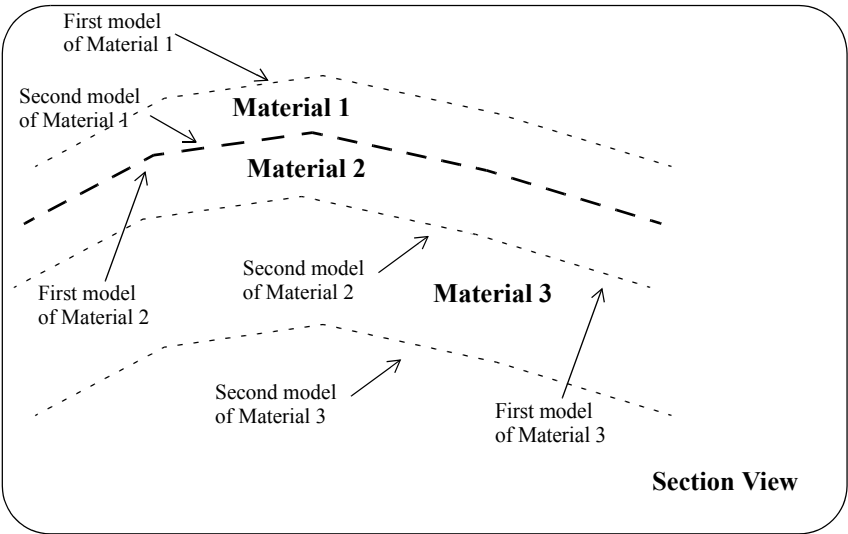

Position of option on menu: **Design =>Volumes =>End Area =>Material section to section**

The **Material section to section** option calculates the volumes for one or more material layers where a material layer is given by two models of sections representing the top (First model) and the bottom (Second model) of the material layer.

The cut and fill volumes for each material layer is written to a table on the panel, and optionally to a report.

This option uses models of sections already created by other options such as *Apply Many* or *Tins =>Sections =>X sections*

The cut and fill volumes are calculated using the **End Area** method (see [Theory of End Area Volumes](#)).

Selecting **Material section to section** brings up the **Material Volume Report (Section to Section)** panel

Material Volume Report (Section to Section)

Function name

Help

Volumes are End Area and a comparison is made by using the distance between ALL the sections specified.

The chainage limits for the volume calculations are defined by the smallest chainages on the sections in the **First** and **Second Models**, or by the **Optional Section Start Chainage** and **Optional Section End Chainage** ranges given in the panel.

The **First** and **Second Models** used over these limits, must have matching sections, and no large gaps in either model.

If the chainage limit in the smaller model falls within the limits of the chainages in the larger model and no optional chainages are used, then the chainage limit of the smaller model is used.

In this case no interpolation is done up to the start or after the end of the smaller model chainage limits, in relation to the larger model.

However, if there is a large chainage gap in the smaller model then some interpolation will be done between the first and last section in this area, in relation to the larger model.

The latter is not desirable and the optional chainage ranges should be used to take into account the chainage gap in the smaller model

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function Name	function box		
<i>if non-blank entry used as the name of a function that can be used in chains etc</i>			
Report File	file box		available *.csv files

if non-blank entry used as the report file in a csv format

Report Description input

if non-blank entry used a descriptive heading in the report

if non-blank entry used as the start chainage in the report

Section End Chainage real

if non-blank entry used as the end chainage in the report

Report Options Grid

Material Description input

if non-blank entry used as a description for a material, such as "Asphalt Surface" in the report

First Model model

if non-blank entry this section model is used in the volume calculations

Second Model model

if non-blank entry this section model is used in the volume calculations

Cut m³

field for display of results only, after the "Write" button is used.

If more than one <Optional Chainage Grids> are used, then the values displayed represents the accumulative cut for that material

Fill m³

field for display of results only, after the "Write" button is used.

If more than one <Optional Chainage Grids> are used, then the values displayed represents the accumulative fill for that material

Write button

the end area volumes is run for each of the Optional Chainage ranges or for the extents of the smaller model, if no optional chainages are specified

The volumes are calculated for each material using a chain from the Library. This can be verified in the output window.

Starting chain: Vol Sect to Sect.chain

Exact

Position of menu: Design => Volumes => Exact

These volumes are calculated by dividing the tins up into small prisms whose volumes can be calculated exactly. For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

In the exact volume options, the volumes calculations can be restricted to a user defined polygon or if no polygon is provided, the volumes will be only be calculated for the regions where both the triangulations exist.

With the exact method, volumes can easily be calculated for depth bands from

(a) the given height to the tin for "tin to height" volumes

or

(b) the new tin to the original tin for "tin to tin" volumes.

Hence for the calculations, a range file can be supplied giving depth pairs and **12d** Model will report the cut, fill and balance for each of the depth pairs and also the total of the cut, fill and balance for all the pairs.

In the report, the sign for cut (negative or positive) is given by the cut volume sign from the **default settings** panel (fill will have the opposite sign).

The range file consists of a list of depth ranges and colours, one set per line, in the format

```
lower_depth    upper_depth    depth_colour
```

This line represents all depths satisfying

```
lower_depth <= depth < upper_depth.
```

For **each range** in the file, the total cut and fill volumes for the depth range will be reported on, and the depth_colour can be used to colour all areas on a plan view satisfying the range.

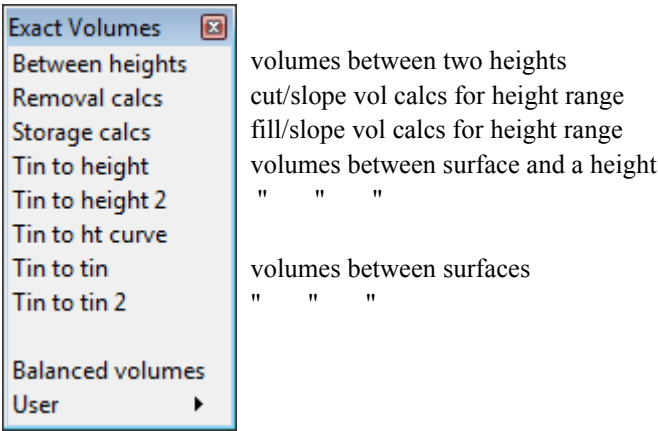

IMPORTANT NOTE - when are depth file is used, the *volume totals* are *only* calculated for the *depths in the range file*. If the depth ranges *does not cover* the entire depth difference between the tins then the totals which are the sum of the different depth ranges will *not* be the same as the volumes between the two tins or the volumes from a tin to a height.

Example of a Depth Range File

```
// depth range file
// format:  lower_depth    upper_depth    colour_for_depth_range
// depth is measured positive down and negative up.

-20  -10  red           // colour red where the depth is greater or equal to -20 and less than -10
-10   0  magenta       // colour magenta where the depth is greater or equal to -10 and less than
0
0   10  green          // colour green where the depth is greater or equal to 0 and less than 10
10   20  "dark green"   // colour dark green where depth is >=10 and less than 20
```

The Exact walk-right menu is

The options in this menu will now be described.

Between Heights

Position of option on menu: Design =>Volumes =>Exact =>Between heights

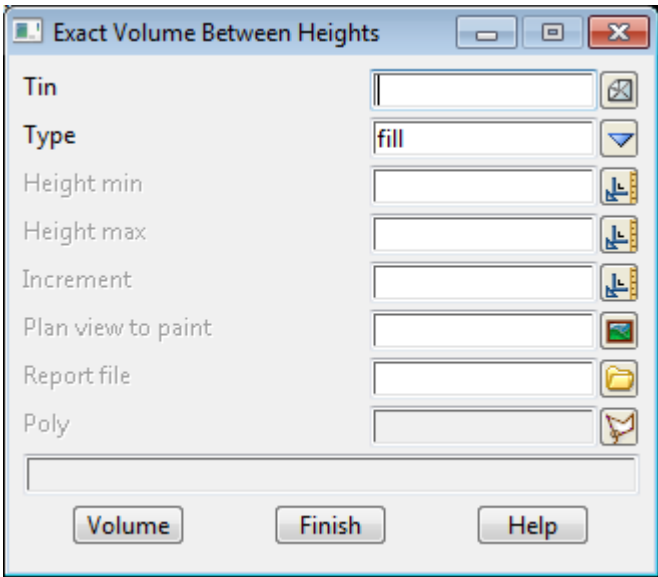

This panel is used to calculate the volume between two heights on a given tin.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the **Between heights** option, the **Exact Volume Between Heights** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between two heights will be calculated.</i>	input		available tins
Type <i>if fill, the fill volume between the two heights is calculated.</i> <i>If cut, the cut volume between the two heights is calculated.</i>	input	fill	cut, fill
Height min/max <i>volume is calculated between the height min and the height max values.</i>	input		
Increment	input		

the volumes between the height min and height max are reported on and is broken up into intervals given by the increment value.

Plan view to paint input available views

*if non-blank, the region used for calculations will be painted in the given plan view. The colour will be green if type is **fill**, or red if type is **cut**.*

Report file input *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly poly string-select

if selected, this string is used as the bounding polygon for the volume calculations.

Volume button

The volume between the height min and height max for the tin within the selected bounding polygon is calculated by the exact method.

<Esc> can be used to terminate the option during volume calculations.

Removal Calcs

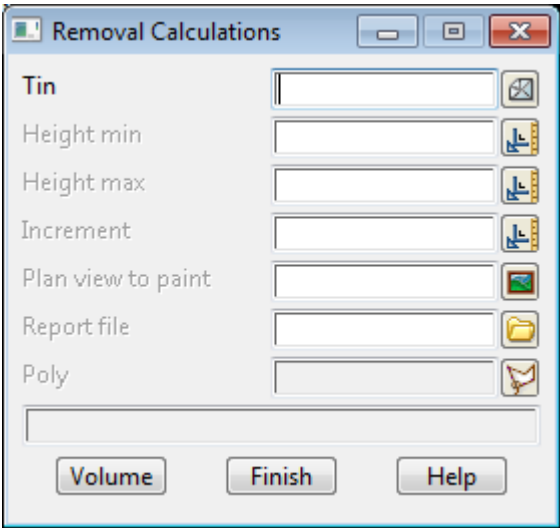

Position of option on menu: Design =>Volumes =>Exact =>Removal calcs

For a user specified range of heights, this option will calculate the cut volume from each height to a given tin, plus the plan and slope areas for the region of the tin exposed by cutting to the height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the Removal calcs option, the **Removal Calculations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin used in the volume calculations.</i>	input		available tins
Height min/max <i>if non-blank, the minimum/maximum value of the height range to calculate volumes to. if blank, the tin's minimum/maximum z-value is used.</i>	input		
Increment <i>increment between the heights to calculate the volumes to.</i>	input		
Plan view to paint <i>if non-blank, the region used for calculations will be painted red in the given plan view.</i>	input		available views
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. if no name is given, no report is produced.</i>	input		*.rpt

Volume <i>calculate the cut volumes from the tin to the height for the required heights in the height min and height</i>	button		

max *range*.

<Esc> can be used to terminate the option during volume calculations.

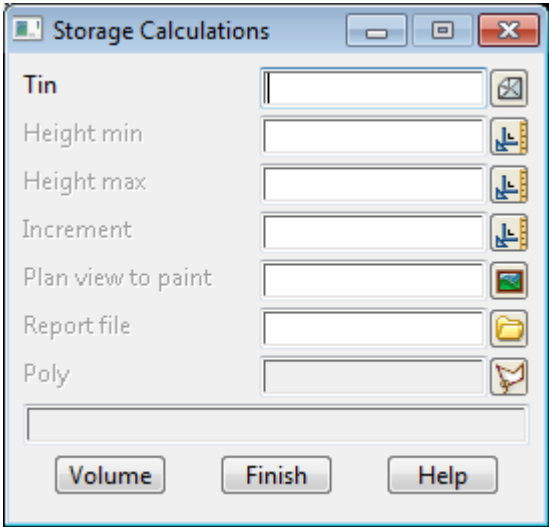

Storage Calcs

Position of option on menu: Design =>Volumes =>Exact =>Storage calcs

For a user specified range of heights, this option will calculate the fill volume from each height to a given tin, plus the plan and slope areas for the region of the tin covered by filling to the height. The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the Storage calcs option, the **Storage Calculations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin used in the volume calculations.</i>	tin box		available tins
Height min/max <i>if non-blank, the minimum/maximum value of the height range to calculate volumes to. if blank, the tin's minimum/maximum z-value is used.</i>	input		
Increment <i>increment between the heights to calculate the volumes to.</i>	input	1	
Plan view to paint <i>if non-blank, the region used for calculations will be painted green in the given plan view.</i>	view box		available views
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	file box		*.rpt
Poly <i>if selected, this string is used as the bounding polygon for the volume calculations.</i>	poly string-select		
Volume <i>calculate the fill volumes from the tin to the height for the required heights in the height min and height max range.</i>	button		

<Esc> can be used to terminate the option during volume calculations.

Tin to Height

Position of option on menu: Design =>Volumes =>Exact =>Tin to height

This panel is used to calculate the volume between a tin and a given height.

The calculations can be restricted to within a polygon, or if no polygon is selected, the entire tin is used.

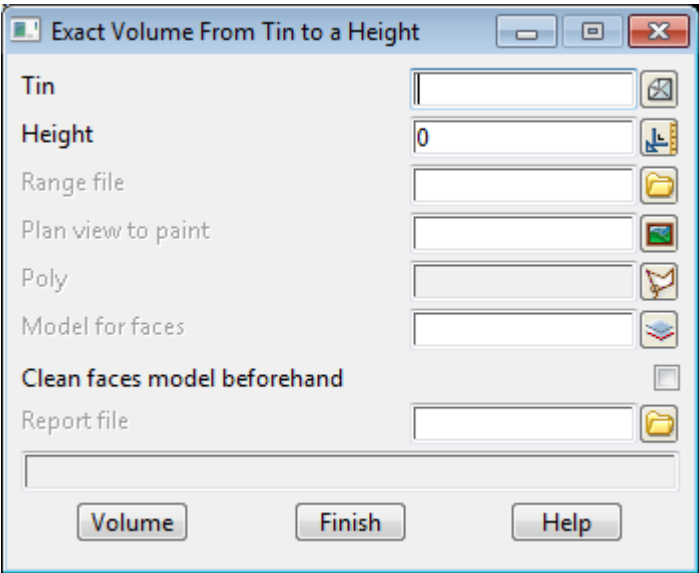

The calculated volumes can be produced and reported over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tin and the height then the totals which are the sum of the different depth ranges will **not** be the same as the volume between the tin and the height.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the **Tin to height** option, the **Exact Volume From Tin to a Height** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	input		available tins
Height <i>the volume is calculated between the tin and the value in this field.</i>	input		
Range file <i>if non-blank, the user supplied depth range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	input		available views
Poly <i>if selected, this string is used as the bounding polygon for the volume calculations.</i>	poly string-select		
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces models beforehand <i>if ticked, the model of faces is cleaned out before the option runs.</i>	tick box		
Report file <i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	input		*.rpt
Volume <i>The volume between the tin and the height (z-value) for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the tin and the height is calculated.</i>	button		

<Esc> can be used to terminate the option during volume calculations.

Tin to Height 2

Position of option on menu: Design =>Volumes =>Exact =>Tin to height 2

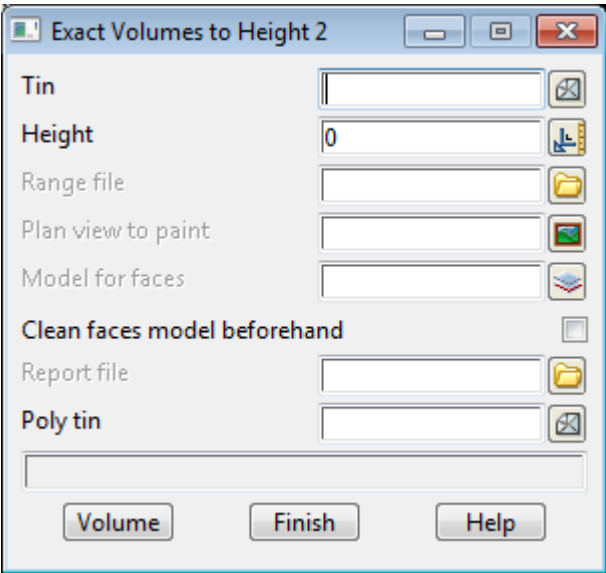

This panel is used to calculate the volume between a tin and a given height but the calculations are restricted to only the regions defined by another tin rather than to a polygon.

The calculated volumes can be produced and reported over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tin and the height then the totals which are the sum of the different depth ranges will **not** be the same as the volume between the tin and the height.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the **Tin to height 2** option, the **Exact Volumes to Height 2** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	tin box		available tins
Height <i>the volume is calculated between the tin and the value in this field.</i>	input		
Range file <i>if non-blank, the user supplied depth range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	view box		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	model box		available models
Clean faces models beforehand	tick box		

if ticked, the model of faces is cleaned out before the option runs.

Report file file box *.rpt

name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly tin tin box available tins

name of the tin to define the regions that the volume calculations are restricted to.

Volume button

The volume between the tin and the height (z-value) for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the tin and the height is calculated.

<Esc> can be used to terminate the option during volume calculations.

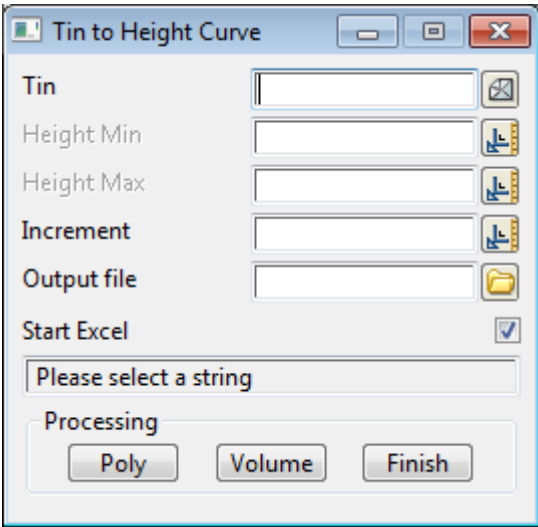

Tin to Height Curve

Position of option on menu: Design =>Volumes =>Exact =>Tin to ht curve

This panel is used to calculate the volume between a tin between heights and writes out a report on the volumes.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the Tin to ht curve option, the **Tin to Height Curve** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin for which the volume between it and a height (z value) will be calculated.</i>	tin box		available tins
Height min <i>the start height for calculation volumes.</i>	input		
Height max <i>the end height for calculation volumes.</i>	input		
increment <i>the height increment.</i>	input		
Output file <i>the file for the volumes report.</i>	file box		
Start Excel <i>if ticked, start Excel up with the report loaded into it.</i>	tick box	tick	
Poly <i>select the polygon which is used in plan only to restrict the area for calculating volumes over.</i>	select		
Volume <i>calculate the volume between heights differing by the given increment, and write out a report.</i>	button		

Tin to Tin

Position of option on menu: Design =>Volumes =>Exact =>Tin to tin

This panel is used to calculate the volume between two tins using the exact method.

The calculations can be restricted to within a polygon, or if no polygon is selected, the overlapping sections of the two tins is used.

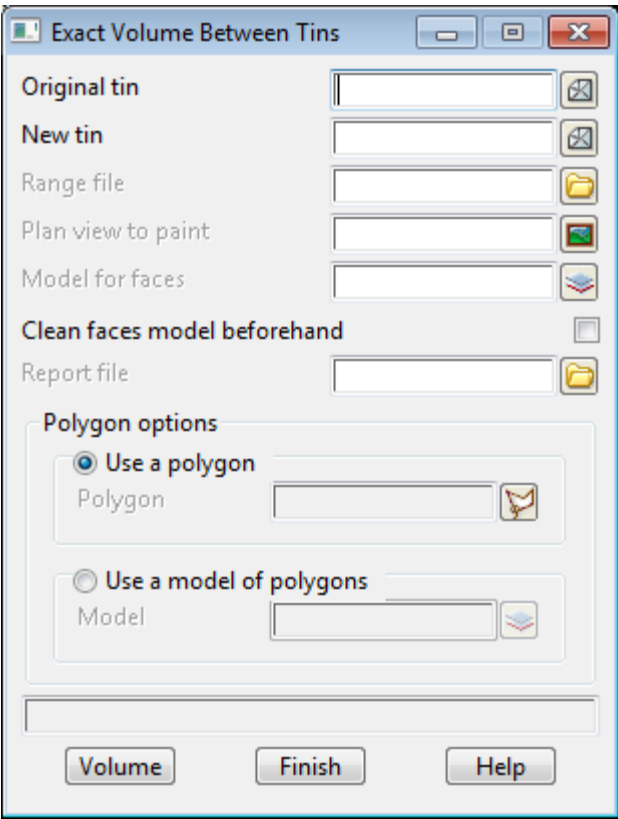

The calculated volumes can be produced and reported on over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the **Tin to tin** option, the **Exact Volume Between Tins** panel is displayed.

Cut is defined to be where ever the new tin is **below** the original tin. Fill is defined to be where ever the new tin is **above** the original tin.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin	tin box		available tins
<i>name of the original/new tin for determining volumes.</i>			
Range file	input		*.drf
<i>if non-blank, the user supplied range file is used to split up the volumes report and define the depth colours used for painting a view.</i>			
Plan view to paint	input		available views
<i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>			
Model for faces	input		available models
<i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>			
Clean faces model beforehand	tick box		
<i>if ticked, the model of faces is cleaned out before the option runs.</i>			
Report file	input		*.rpt
<i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>

button

The volume between the two tins for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the two tins is calculated.

<Esc> can be used to terminate the option during volume calculations.

Tin to Tin 2

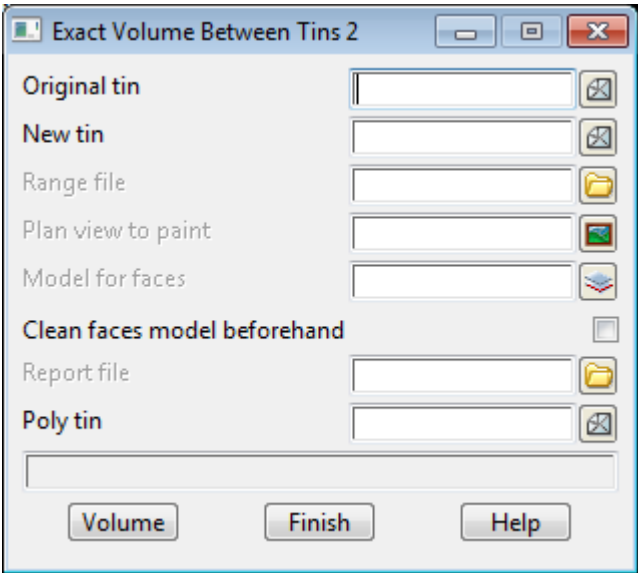

Position of option on menu: Design =>Volumes =>Exact =>Tin to tin 2

This panel is used to calculate the volume between two tins using the exact method but the calculations are restricted to only the regions defined by another tin rather than to a polygon. The calculated volumes can be produced and reported on over user supplied depth ranges. Similarly, a view can be coloured on a depth basis using the same **range** file.

IMPORTANT NOTE - the **volume totals** are **only** calculated for the **depths in the range file**. If the depth ranges **does not cover** the entire depth difference between the tins then the totals which are the sum of the different depth ranges will **not** be the same as the volumes between the two tins.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the **Tin to tin** option, the **Exact Volume Between Tins 2** panel is displayed.

Cut is defined to be where ever the new tin is **below** the original tin. Fill is defined to be where ever the new tin is **above** the original tin.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Original/New Tin <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Range file <i>if non-blank, the user supplied range file is used to split up the volumes report and define the depth colours used for painting a view.</i>	input		*.drf
Plan view to paint <i>if non-blank, the given plan view will be painted according to the depth colours given in the range file.</i>	input		available views
Model for faces <i>if non-blank, faces will be created with colours according to the range colours given in the range file.</i>	input		available models
Clean faces model beforehand	tick box		

if ticked, the model of faces is cleaned out before the option runs.

Report file file box *.rpt
name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.

Poly tin tin box available tins
name of the tin to define the regions that the volume calculations are restricted to.

Volume button
The volume between the two tins for the given range file within the selected bounding polygon is calculated by the exact method. If a range file does not exist, the volumes between the two tins is calculated.

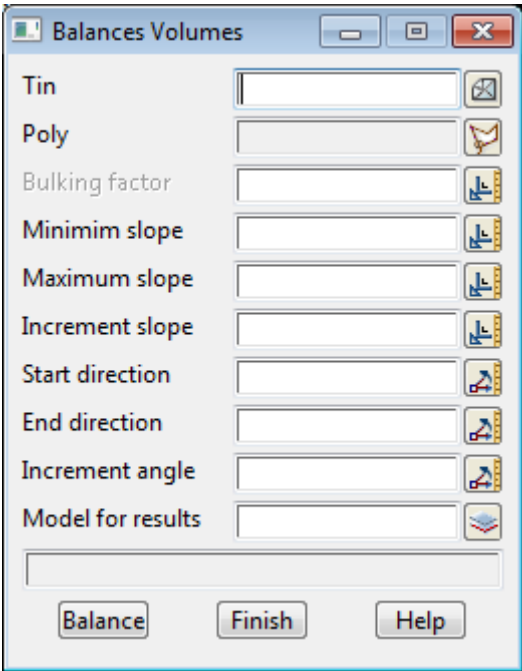

<Esc> can be used to terminate the option during volume calculations.

Balanced Volumes

Position of option on menu: Design =>Volumes =>Exact =>Balanced volumes

This option is currently under development.

On selecting the **Balanced volumes** option, the **Balances Volumes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins
Poly	polygon box		
Bulking factor	measure box		available measures
Minimum slope	measure box		available measures
Maximum slope	measure box		available measures
Increment slope	measure box		available measures
Start direction	measure box		available measures
End direction	measure box		available measures
Increment angle	measure box		available measures
Model for results	model box		available models
Balance	button		

Grid Cell

Position of option on menu: Design =>Volumes =>Grid cell

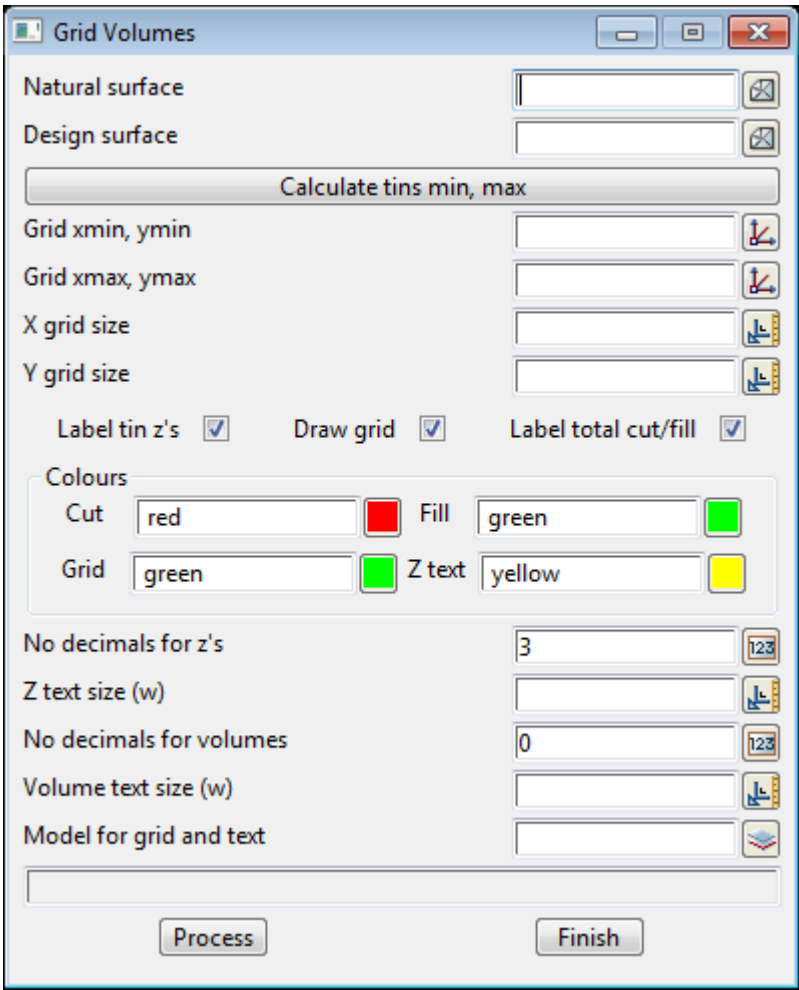

This panel is used to calculate the cut and fill volume between two tins using the exact method and then creating text for each rectangular cells of user defined sides covering the tins.

The rectangular cells (grid) can be drawn and the text of the cut and fill values for each grid cell and z-values at the cell corners. The total cut and fill can also be created at the bottom of the grid.

Cut is defined to be where ever the *design* tin is **below** the *natural surface* tin. **Fill** is defined to be where ever the *design* tin is **above** the *natural surface* tin.

For more information on the exact volume calculations, go to the section [Theory of Exact Volumes](#)

On selecting the Grid cell option, the **Grid Volumes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Natural surface/Design surface <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Calculate tins min, max	button		

when selected, the minimum and maximum x and y values to define the grid cells are calculated and written to the grid x and y minimum and maximum panel fields.

Grid xmin xmax input

the minimum and maximum x values to define the grid cells. The two values are separated by one or more spaces.

Grid ymin ymax input

the minimum and maximum y values to define the grid cells. The two values are separated by one or more spaces.

X/Y grid size input

the X/Y size of the grid cell.

Label tin z's tick box ticked

if ticked, create text values for the z-values from the tins for each of the grid cell corners. The natural surface z value is followed by a **N** and is placed above and to the right of the corner point. The design surface z value is followed by a **D** and is placed below and to the right of the corner point.

Draw grid tick box ticked

if ticked, the grid is drawn.

Label total cut/fill tick box ticked

if ticked, label the total cut, fill and balance at the left hand bottom corner of the grid.

Cut/Fill/Grid/Z text colours colour box

colours to use for the cut, fill and z-values and the grid lines.

Num decimals for z's input 3

number of decimal places in the z values.

Z text size (w) input

size in world units for the text of the z values.

Num decimals for volumes input 0

number of decimal places in the cut and fill volumes.

Volume text size (w) input

size in world units for the text of the volumes.

Model for grid and text model box available models

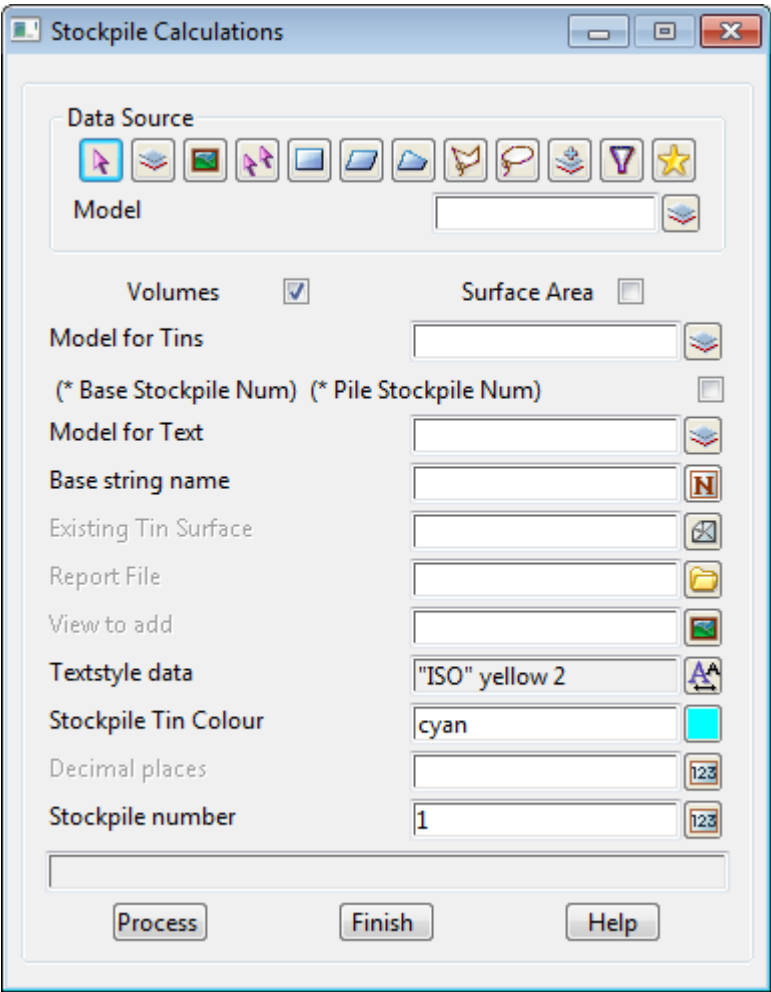

model to place all the text and grid lines in.

Report file	input	*.rpt
	<i>name of the file to contain the volume report. If the file already exists, the report will be appended to the file. If no name is given, no report is produced.</i>	
Process	button	
	<i>calculate the grid volumes and grid lines.</i>	
Undo	button	
	<i>undo the last set of text and grid lines created whilst the panel was up.</i>	

Stockpile

Position of option on menu: Design =>Volumes =>Stockpile

On selecting the Stockpile option, the **Stockpile Calculations** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source			
<i>data source for strings to create the stockpile.</i>			
Volumes	tick box	ticked	
<i>if ticked, calculate and report the volumes of the stockpiles.</i>			
Surface area	tick box		
<i>if ticked, calculate and report the surface area of the stockpiles</i>			
Model for tins	model box		available models
<i>name of the model to place the stockpile tins in.</i>			

Model for text	model box	available models
<i>name of the model to place the text in.</i>		
Base string name	name box	available names
<i>Name of the string to use as the base of the stockpile.</i>		
Report file	file box	*.rpt
<i>name of the file to contain the volume report.</i>		
View to add	view box	available views
<i>view to add the model of text to.</i>		
Textstyle data	textstyle data box	text favourites
<i>text setup - for a full description go to Textstyle Data and Textstyle Info in the chapter Tools and Concepts.</i>		
Decimal places	number box	
<i>number of decimal places for the volumes in the report.</i>		
Stockpile number	number box	
<i>number of stockpile to use in the report.</i>		
Process	button	
<i>calculate the volume and/or surface area of the stockpile.</i>		

Tin to Tin by Height Range

Position of option on menu: Design =>Volumes =>Tin to tin ht range

This option is used to calculate the cut and fill volume between two tins breaking the *cut* and *fill* volumes up by height ranges.

An approximate method is used which uses the z-value of the tin at a point as the representative of the height for a cell of user specified size "delta x" by "delta y" centred on the point. By making delta x and delta y small, the volumes become more accurate but the computation time increases.

Please note that the volume totals are **only** for the heights in the range file. If the height ranges don't cover the entire height difference, then the totals will not be the volumes between the two tins.

Cut is defined to be where ever the new tin is **below** the original tin. **Fill** is defined to be where ever the new tin is **above** the original tin.

In the volumes report, the sign for cut (negative or positive) is given by the cut volume sign from the **default settings** panel (fill will have the opposite sign).

The *height range file* consists of a list of height ranges and colours, one set per line, in the format

lower_height upper_height height_colour

This line represents all heights satisfying

$\text{lower_height} \leq \text{height} < \text{upper_height}$.

For each range in the file, the total cut and fill volumes for the height range will be reported on. The colour is ignored in this option.

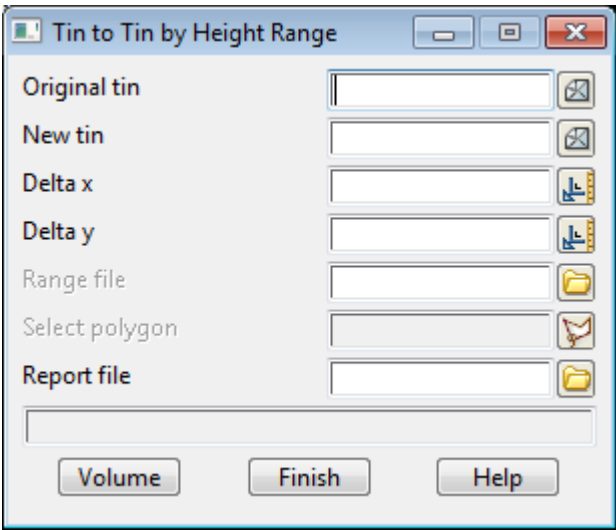

Example of a Height Range File

```
// height range file
// format:  lower_height    upper_height    colour_for_height_range

110    120    green    // colour green where the height is greater or equal to 110 and less than
120
120    220    "dark green"    // colour dark green where height is >= 120 and less than 220
```

On selecting the tin to tin ht range option, the tin to tin by height range panel is displayed.

The fields and buttons used in this panel have the following functions.

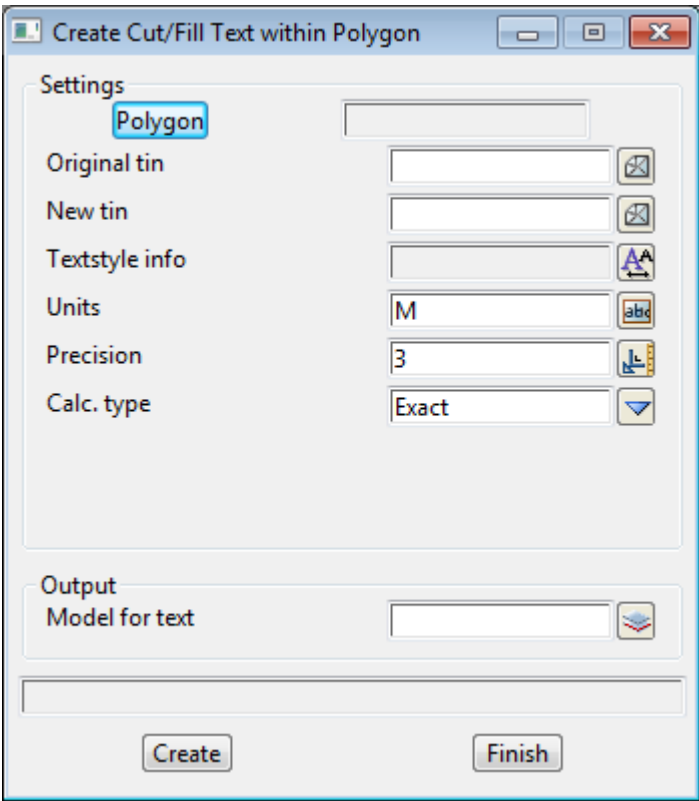

Field	Description	Type	Defaults	Pop-Up
Original/New tin	<i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Delta x/Delta y	<i>x/y size of the cell to consider to be of the height.</i>	input	1	
Select polygon	<i>optional. If selected, the volumes are restricted to being inside this polygon.</i>	string select		
Range file	<i>if non-blank, the user supplied height range file is used to split up the volumes report. Note that the volume totals are only for the heights in the range file.</i>	input		*.drf
Report file	<i>if non-blank, the name of the file to contain the volume report. Note that the volume totals are only for the heights in the range file</i>	report file		*.rpt
Volume	<i>calculate the volumes.</i>	button		

Create Cut/Fill Text Within Polygon

Position of option on menu: Design =>Volumes =>Cut/fill text in poly

This option is used to calculate the cut and fill volume between two tins within a polygon and writing the cut and fill values to a model. The Exact or End Area method can be used for the volume calculations.

Selecting Cut/fill text in poly brings up the **Create Cut/Fill Text within Polygon** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Polygon <i>the volumes are restricted to being inside this polygon.</i>	poly string select		
Original/New tin <i>name of the original/new tin for determining volumes.</i>	tin box		available tins
Textstyle info <i>textstyle info to use for the cut and fill text</i>	textstyle info box		
Units <i>text to place after the cut/fill values</i>	input		
Precision <i>number of decimal places to use for the cut/fill values</i>	input	3	
Calc. type <i>use either Exact or End Area for the volume calculations</i>	choice box	Exact	Exact, End Area

Angle

angle for sections when End Area is used

Separation input

distance between sections when End Area is used

Model for text model box

available models

model to place to cut and fill text in.

Create button

calculate the volumes and text.

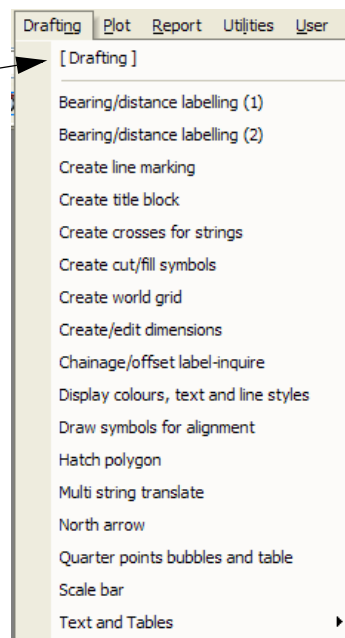

23 Drafting

The **Drafting** menu contains options to create data for plots.

Bearing/Distance Labelling

Position of option on menu: Drafting =>Bearing/distance labelling

This option is used to label a selected line or arc segment with bearing, distance information and arc length information. If the line or arc length is below a given value, the label information is added to a short segment table.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
bd annotation file <i>file containing values for the text parameters.</i>	file box		*.bdf files
Read <i>read the file given in the “bd annotation file” field.</i>	button		
Save <i>save the current text parameter settings to the file given in the “bd annotation file” field.</i>	button		
Save as <i>save the current text parameter settings in a file.</i>	button		
Bearing parameters	input box	none/complete	bearing parameters

incomplete

*if none, don't label bearings.
If complete, all the bearing parameters have been set.
If incomplete, not all the bearing parameters have been set so the labels can't be created.*

Create bearing text tick box tick
if tick, bearings are labelled.

Distance parameters input box none/complete bearing parameters

incomplete

*if none, don't label distances.
If complete, all the distance parameters have been set.
If incomplete, not all the distance parameters have been set so the labels can't be created.*

Create distance text tick box tick
if tick, distances are labelled.

Label all segments tick box
*if tick, all segments of the selected element are labelled.
If not-tic, only the selected segment is labelled.*

label style input box b/d, d/b, /bd b/d
 /db, bd, db
defines how to label the bearing and distances. For example, d/b means distance above the line and bearing below the line. Bearing or distance is only labelled if the appropriate flags are set.

Add text models to view tick box tick
if tick, all models containing text are added to the view containing the selected segment.

Minimum length input box 0
if non-zero, then if the length of the segment is less than this value, then it is given a short segment number and added to the short segment table.

Next short segment no. input box 1
the next number to use for short segments.

Pick button
select the segment to be labelled.

Undo button
undo the last set of created labels.

Line Marking

Position of option on menu: Drafting =>Create line marking

This option creates a title block file from a model of data. It has already been documented as

View => Visualisation => Line marking

in the section [Line Marking](#) in the chapter [View](#).

Create Titleblock

Position of option on menu: Drafting =>Create title block

This option creates a title block file from a model of data. It has already been documented as

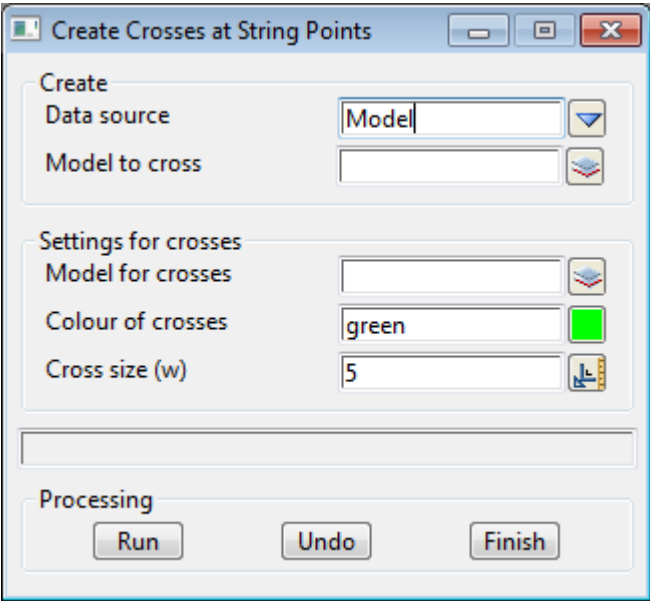

Plot => Create title block file

in the section [Create/Edit Title Block File](#) in the chapter [Plots](#).

Create Crosses at String Points

Position of option on menu: Drafting =>Create crosses for strings

This panel is used to create crosses at the points of strings. The cross is made up of two 2d strings with the intersection of the two strings being the (x,y) position of the point in the string. The option is mainly used to created crosses to send to packages that don't support a cross at a point.

The fields and buttons used in this panel have the following functions:

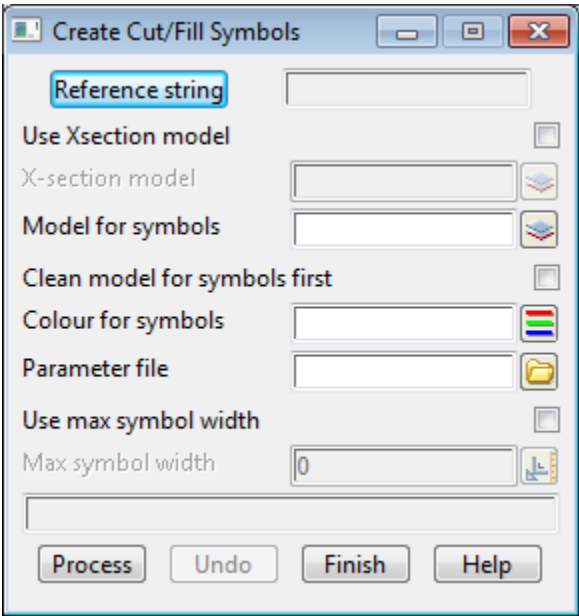

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data source.</i>	data source	Model	String, Model, View
Model/View/String <i>data source to create crosses for.</i>	data source		
Model for crosses <i>model for the created crosses</i>	model box		available models
Colour for crosses <i>colour for the crosses</i>	colour box		available colours
Cross size (w) <i>size of the cross in world units.</i>	input box		5
Run <i>run the option</i>	button		
Undo	button		

undo the last set of crosses created whilst the panel has been up.

Create Cut/Fill Symbols

Position of option on menu: Drafting =>Create cut/fill symbols

This option is used to create cut and fill symbols (tadpoles) between strings or the names of the points across x-sections. The choice of symbols and the points they go between is controlled by a parameter file.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Reference string	string select		
<i>string used to define chainage and perpendicular</i>			
Use X-section model	tick box	not ticked	
<i>if ticked, the points on the cross-sections in the model are used as the names to create symbols between.</i>			
X-section model	model box		available models
<i>model of cross sections used if “Use X-section model” is ticked.</i>			
Model for symbols	input		available models
<i>model for the created cut-fill symbols</i>			
Clean model for symbols first	tick box	not ticked	
<i>if ticked, the Model for symbols will be cleaned before the new symbols are created and added.</i>			
Colour for symbols	input		available colours

colour for the created cut-fill symbols

Parameter file input

file specifying what symbols are drawn between what strings (or points on x-sections).

Use max symbol width tick box

if tick, the symbols are only stretched to the maximum size given in the "Max symbol width" field.

Max symbol width input

maximum distance in world units to stretch the symbol.

Process button

Run the option.

Undo button

undo the last set of cut-fill symbols created by running the panel. The "Undo" function is lost once the option is finished.

Notes:

```
// Sample file for plotting symbols to denote cut/fill slopes
// All lines starting with // are comments. Blank lines are ignored
//
// The file layout is:

// ch_start ch_end ch_inc side str1   str2 symbol1 %1 symbol2   %2
//
// eg 110 150 10 L "trial1->c1" "trial->c2" tadpole 100 tadpole 50
//
// ch_start defines the start chainage
// ch_end defines the end chainage
// ch_inc defines the chainage increment
// side is one of L, R or LR (left, right, both)
// str1 is the name of the string (or point on x-section) to start tadpole
// str2 is the name of the string (or point on x-section) to end tadpole

// If strings are used, the string model name must be contained in the
// string definition i.e. in the format "model->string_name"
//
// The symbols drawn between the strings (or points) alternate between
// symbol1 and symbol2 and the symbols are drawn as the
// given percentages %1 and %2 respective of the distance
// between the strings (points).

// The symbol can be one of "
// tadpole      - predefined tadpole shape
// line         - predefined batter tick
// "model=xxxxx" - where model "xxxxx" contains 3d strings
//                defining the symbol shape. This is as per
//                user-defined batter symbols in 4D.
//                NB. only 3d strings are supported in the macro

// Example

0 700 10 LR "road str->c2" "road str->c3" tadpole 100 tadpole 50
0 700 10 LR "road str->c4" "road str->c5" line 90 line 50
```

```
0 700 10 LR "road str->f2" "road str->f3" "model=symbol" 100 tadpole 50
0 700 10 LR "road str->f4" "road str->f5" line 90 line 50
```

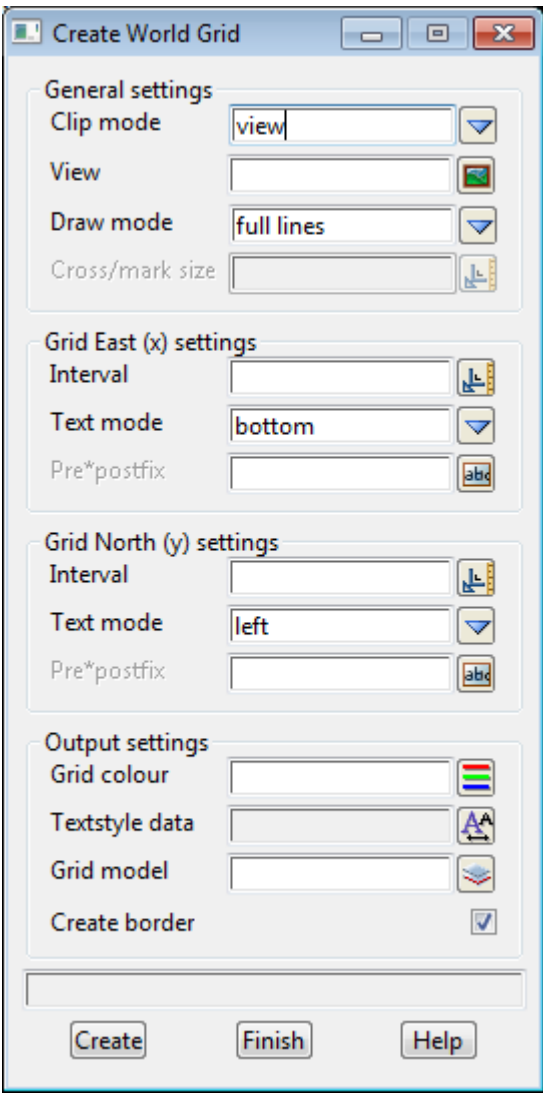

Create World Grid

Position of option on menu: Drafting =>Create world grid

This option is used to create a grid, identical to the one drawn on a plan view, but in world units. This can then be output to CAD systems that do not allow grids to be easily created.

Selecting the Create world grid option, brings up the **Create World Grid** panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Clip mode	choice box		rectangle, view
<i>if rectangle, icons appear for drawing a rectangle, a rotated rectangle or selecting a plot frame. selecting the rectangle and rotated rectangle icons require the user to draw the rectangle to define the area to produce the grid for. selecting the plot frame icon requires the user to select a plot frame and the view area from the plot frame defines the area to produce the grid for.</i>			
<i>If view, a View Box appears and a view is selected to define the area to produce the grid for.</i>			

Draw mode	choice box	full lines	full lines, crosses, marks
<i>the type of the grid being drawn - full lines, crosses or marks.</i> <i>If full lines, then solid lines are drawn at the grid x and y spacing.</i> <i>If crosses, then crosses of size cross/mark size are drawn at the intersection of the grid x and y spacing.</i> <i>If marks, then solid lines size cross/mark size are drawn at the beginning/end of the grid at the x and y spacing.</i>			
Cross/mark size	input		
<i>size in world units of the grid crosses/marks.</i>			
Grid East (x)			
Interval	input		
<i>the distance between the East (x) grid lines. If this value is zero, the x grid lines will not be drawn.</i>			
Text mode	input	bottom	off, top, bottom, top and bottom
<i>the x (East) grid lines can be labelled with their x value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the x-grid lines.</i> <i>if off, no text is created for the x-grid lines.</i> <i>If bottom, text is created only at the bottom of the x-grid lines.</i> <i>If top, text is created only at the top of the x-grid lines.</i> <i>If top & bottom, text is created at the top and bottom of the x-grid lines.</i>			
Pre*postfix	input		
<i>if non blank, pre*post text to use for the labels on the x-grid lines.</i> <i>prefix/postfix (pre*post) to be applied to the value of x (East). If pretext only, just give the text. If post text is required, precede it by a *. For example E*m will place E before the x value and m after the number.</i>			
Grid North (y)			
Interval	input		
<i>the distance between the North (y) grid lines. If this value is zero, the y grid lines will not be drawn.</i>			
Text mode	input	bottom	off, top, bottom, top and bottom
<i>the y (North) grid lines can be labelled with their y value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the y-grid lines.</i> <i>if off, no text is created for the y-grid lines.</i> <i>If left, text is created only at the left of the y-grid lines.</i> <i>If right, text is created only at the right of the y-grid lines.</i> <i>If left & right, text is created at the left and right of the y-grid lines.</i>			
Pre*postfix	input		
<i>if non blank, pre*post text to use for the labels on the y-grid lines.</i> <i>prefix/postfix (pre*post) to be applied to the value of y (North). If pretext only, just give the text. If post text is required, precede it by a *.</i>			
Output settings			
Grid colour	colour box		available colours
<i>colour for the grid lines.</i>			
Textstyle data	textstyle box		
<i>textstyle data (height, angle etc) for the text for the grid labels.</i>			

Grid model model box available models
model for the grid lines and text.

Create border tick box tick
if tick, a rectangle around the area to create the grid for, is created.

Create button
create the grid according to the values given in the panel.

Create/Edit Dimensions

Position of option on menu: Drafting =>Create/edit dimensions

This option is used to create and edit dimensions.

This option is currently under development.

The fields and buttons used in this panel have the following functions:

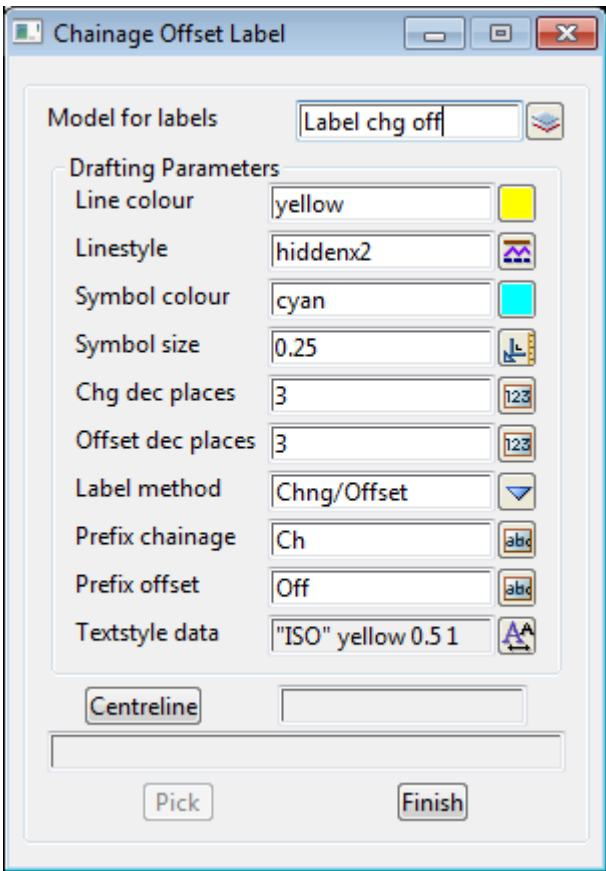

Field Description	Type	Defaults	Pop-Up
<i>read in an existing range file.</i>			

Write	button
<i>write out the data in the pages to the given range file.</i>	

Chainage/Offset Label Inquire

Position of option on menu: Drafting =>Chainage/offset label inquire

This option is used to calculate and label the perpendicular distance from a selected point to a selected centreline, and the chainage of the point dropped perpendicularly onto the centreline.

The fields and buttons used in this panel have the following functions.

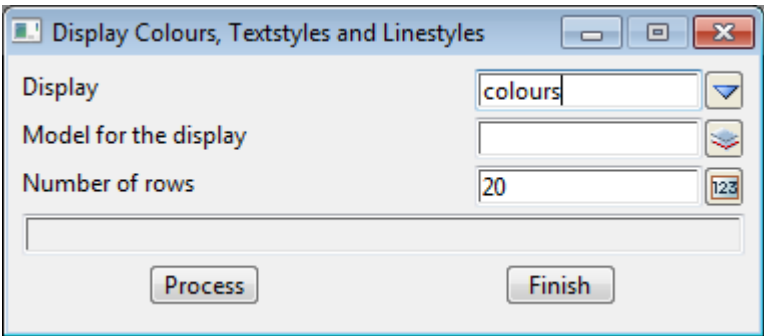

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model for labels <i>if non-blank, create text for the calculated offset and chainage values and place it in this model.</i>	model box	Label chg off	available models
Line colour <i>colour of the line drawn.</i>		yellow	available colours
Linestyle <i>text style for the text.</i>	linestyle box	hidden2	available linestyles
Symbol colour <i>colour of the symbol drawn at the point. text style for the text.</i>		cyan	available colours
Symbol size <i>size (in world units) of the symbol drawn at the point.</i>		0.5	
Label method <i>method of labelling the line from a selected point to the dropped point.</i>	choice box	Chng/Offset	Chng/Offset, Offset/Chng
Prefix chainage <i>prefix for the chainage value.</i>		Ch	
Prefix offset <i>prefix for the offset value.</i>		Off	
Textstyle data <i>textstyle, size, colour etc. for the text.</i>	textstyle data box		available text data
Centreline <i>select the string to use for the calculation of chainage and offset.</i>	string select		
Pick <i>pick a position and the offset from the position to the position dropped perpendicularly onto the selected Centreline is calculated, plus the chainage on the Centreline of the dropped point. The values are reported in the panel's message area and if Model for labels is non-blank, text of the values is created and place in the model.</i>	button		

Display Colours, Textstyles and Linestyles

Position of option on menu: Drafting =>Display colours, text and line styles

This option creates a model to display either all the colours, linestyles or textstyles defined for a project.

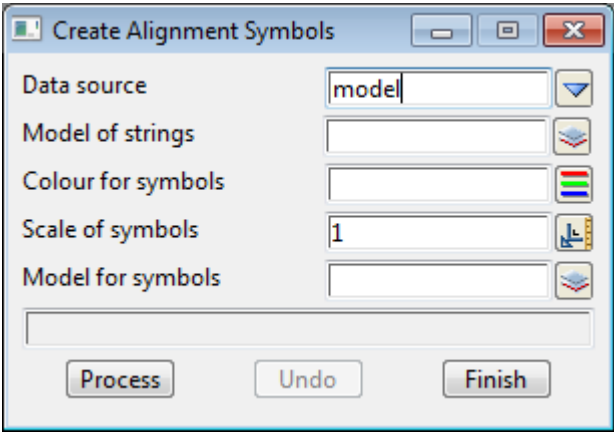

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Display <i>type of data to display.</i>	choice	colours	colours, textstyles, linestyles
Model for the display <i>model to create the display in.</i>	model box		available modes
Number of rows <i>the display is created by first doing a column of the given "Number of rows" and then moves on to another column until all the data is drawn.</i>	input	20	
Process <i>run the option.</i>	button		

Draw Symbols for Alignment String

Position of option on menu: Drafting => Draw symbols for alignment

This panel is used to create symbols (butterflies and dumbbells) at the spiral-tangent, spiral-curve and curve tangent points.

The fields and buttons used in this panel have the following functions:

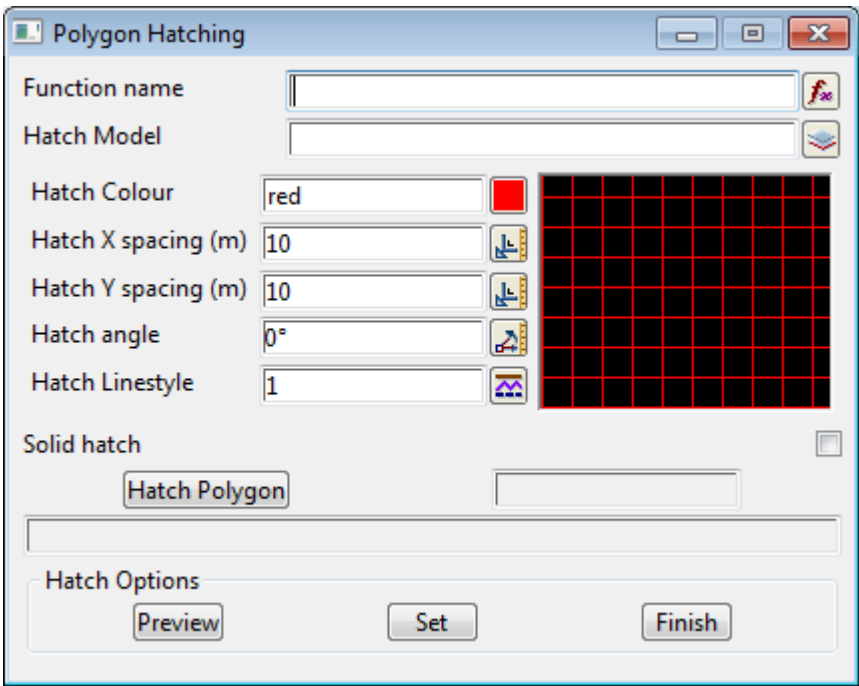

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data to create symbols for.</i>	input box		
Model/View/String <i>data source to create symbols for.</i>	input box		
Colour of symbols <i>colour to use for the created symbols.</i>	input box		
Scale of symbols <i>scale of the created symbols.</i>	input box	1	
Model for symbols <i>model to put the created symbols into.</i>	input box		
Process <i>run the option.</i>	button		
Undo <i>undo the last set of symbols created whilst the panel has been up.</i>	button		

Polygon Hatching

Position of option on menu: Drafting =>Hatch polygon

This option is used to create hatching within a user selected string. A function is created so that the hatching can be recalcd if the string is modified.

Selecting **Hatch polygon** brings up the Polygon Hatching panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the hatching function.model</i>	input box		
Hatch model <i>model to place the hatching in.</i>	input box		
Hatch colour <i>colour for the hatch lines</i>	colour box	red	
Hatch x/y spacing (m) <i>distance in world units between the x/y hatching lines.</i>	input box	10	
Hatch angle <i>angle of the hatch lines.</i>	input box	0	
Hatch linestyle <i>linestyle for the hatch lines.</i>	input box	1	

Solid hatch

tick box

if ticked, a solid fill of the given hatch colour is used.

Hatch polygon

string select

select the string to hatch.

Preview

button

draw the hatching to see if it is correct - the hatching function has not been defined.

Set

button

define the hatching function with the values given in the panel fields.

Translate Strings

Position of option on menu: Drafting =>Multi string translate
This panel is used to translate strings selected by name group of a window.
Selecting **Multi string translate** brings up the **Translate Strings** panel.

The fields and buttons used in this panel have the following functions:

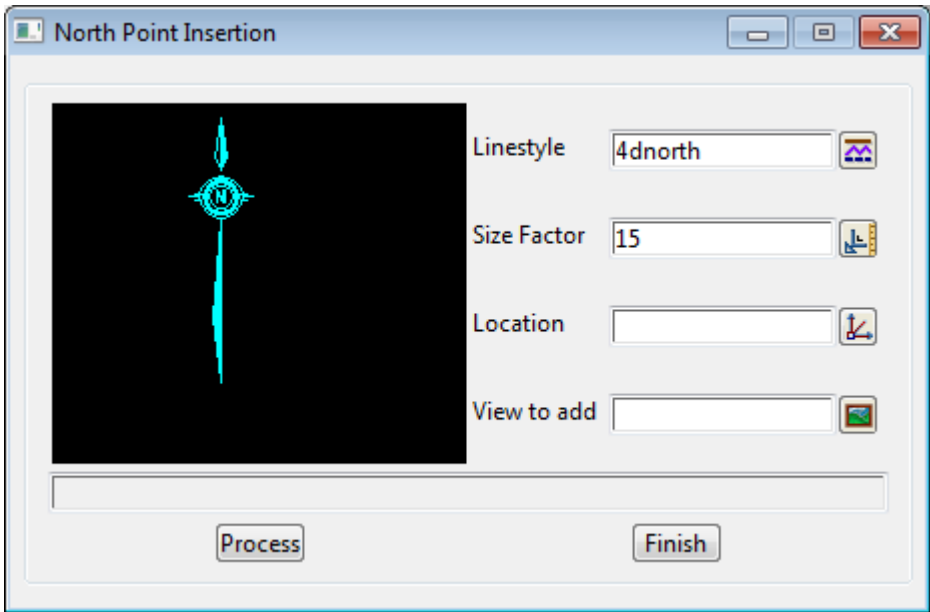

Field Description	Type	Defaults	Pop-Up
Single <i>select a single string to translate.</i>	button		
Name <i>select a string and all strings with the same name on the view will be translated.</i>	button		
Group <i>select a string and all strings with the same group on the view will be translated.</i>	button		
Window <i>click and release to define the first point of the window and then move the cursor and click and release to define the second point of the window. A position is then selected and as the cursor is moved, all strings in the view that are totally inside the window are translated and placed at the next selected position.</i>	button		
Undo <i>undo the last set of strings translated whilst the panel has been up.</i>	button		

North Point Insertion

Position of option on menu: Drafting =>North arrow

This option creates a point with a textstyle of the north point arrow.

Selecting **North arrow** brings up the North Point Insertion panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Linestyle	input box	4dnorth	
<i>Linestyle for the north point arrow - leave as 4dnorth.</i>			
Size factor	input box	15	
<i>factor the north arrow by this value.</i>			
Location	input box		
<i>either type in an x y position or click on "+" and use Pick xyz to locate the north arrow.</i>			
View to add	input box		
<i>view to add the arrow to.</i>			
Process	button		
<i>create the north point arrow in the model North Point.</i>			

Quarter Points

Position of option on menu: Drafting =>Quarter points bubbles and table

This option is used to create bubbles and/or a report for the critical horizontal and vertical points and quarter points (by chord or by chainage) for any arcs in an alignment string.

This option has already been documented as

Survey=>Setout=>Setout lip line

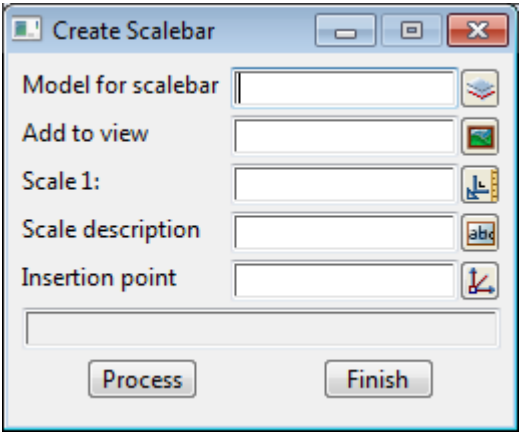

in the section [Setout Lip Line](#) in the chapter [Survey](#).

Scalebar

Position of option on menu: Drafting =>Scale bar

This option is used to create a scale bar.

Selecting Scale bar brings up the Create Scalebar panel.

The fields and buttons used in this panel have the following functions:

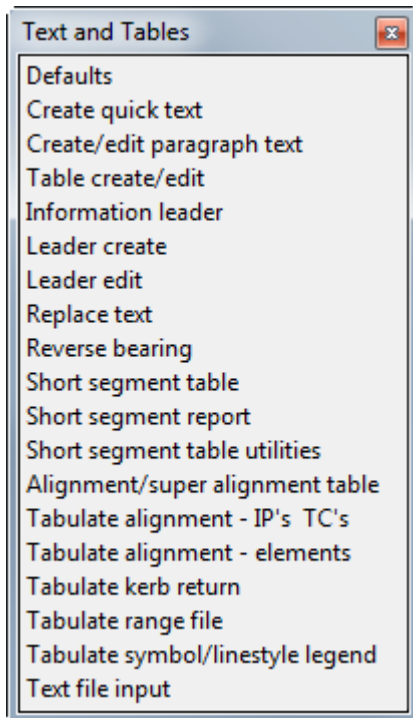

Field Description	Type	Defaults	Pop-Up
Model for scalebar <i>model to place the scalebar in.</i>	model box		available models
Add to view <i>if non-blank, the model is added to this view.</i>	input box		available views
Scale 1: <i>scale to create the scale bar at.</i>	input box		
Scale description <i>description to write under the scale bar.</i>	input box		
Insertion point <i>position to place the left hand bottom corner of the scale bar at.</i>	pick ops		pick ops
Process <i>run the option.</i>	button		

Text and Tables

Position of menu: Drafting =>Text and Tables

The Text and Tables menu contains options to create text data and tables for plots.

The Text and Tables menu is

For the option *Defaults*, go to

Create quick text
Create/edit paragraph text
Table create/edit
Information Leader
Leader create
Leader edit
Replace text
Reverse bearing
Short segment table
Short segment report

same option as [Text Creation/Edit](#)

Defaults - Text

Position of option on menu: Drafting =>Text and Tables =>Defaults

This option is used to project text defaults that are used with the "Fonts" button on many of the text options.

The fields and buttons used in this panel have the following functions:

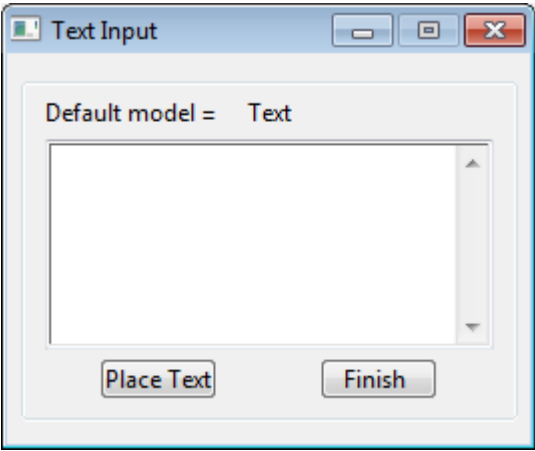

Field Description	Type	Defaults	Pop-Up
Text model <i>default model to place the text in.</i>	model box	Text	available models
Text colour <i>default colour for text.</i>	colour box	cyan	available colours
Text size <i>default size for text.</i>	input box	3	
Text width <i>default x-factor text.</i>	input box	1	
Text angle <i>default angle for text.</i>	input box	0	
Text style <i>default text style.</i>	input box	iso	
Text justify <i>default text justification.</i>	input box	bottom-left	
Set defaults	button		

set the project defaults.

Quick Text Input

Position of option on menu: Drafting =>Text and Tables =>Create quick text

The quick text option creates lines of text using the text defaults. The text can be edited and modified using the create/edit paragraph text.

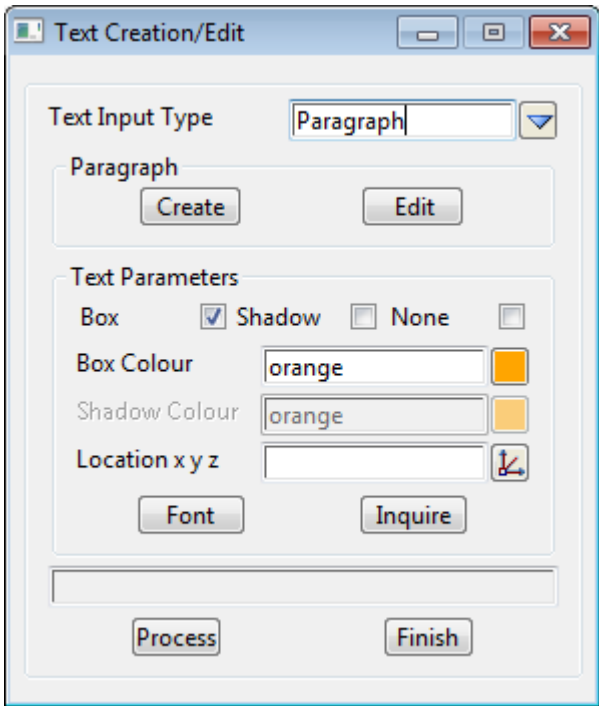

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Text box	button		
<i>type the text to be created into the text box.</i>			
Place text	button		
<i>pick a position to become the justification point for the first line of text.</i>			

Text Creation/Edit

Position of option on menu: Drafting =>Text and Tables =>Create/edit paragraph text

The option creates and edits a paragraph of text created with this option or the quick text option.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Text input type	choice box	paragraph	paragraph, file
<i>method of creating text - type in a paragraph or read from a file</i>			
if <i>Paragraph</i> selected			
Create	button		
<i>select create to bring up the text box to type text into.</i>			
Edit	button		
<i>select edit to pick and edit existing text.</i>			
if <i>File</i> selected			
Text file	file box		
<i>name of the file to read in.</i>			
Text parameters			
Box/Shadow/None	radio button	box	
<i>if box is ticked, draw a box around the text.</i>			

*if shadow is ticked, draw shadowed box around the text.
if none is ticked, don't draw a box around the text.*

Box colour colour box orange
Colour of the box around the text

Shadow colour colour box orange
Colour of the shadow around the box around the text

Location x y z x,y,z box pick ops menu
pick the position for the text.

Font button
bring up the values for the text - e.g. model, colour, size etc.

Inquire button

Process button
create the text and place it at the given location.

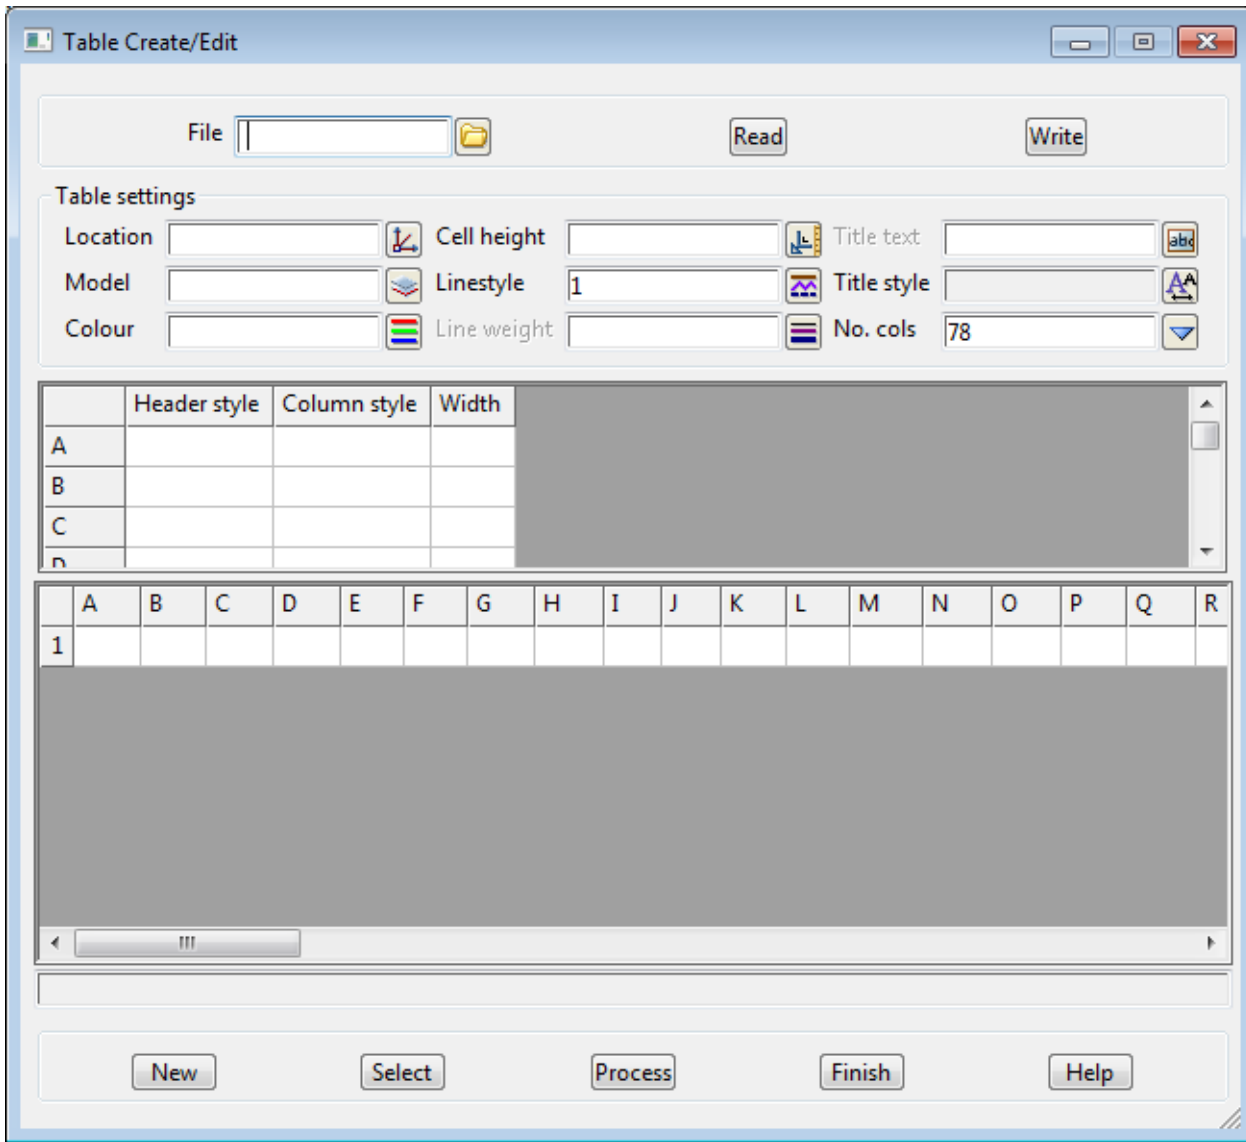

Table Create/Edit

Position of option on menu: Drafting =>Text and Tables =>Table Create/edit

This option is currently under development

This option reads in a csv file and loads the data into a grid on the panel. The data can be edited in the grid and then a table produced in a model.

An existing table in a model can also be selected and the data read into the grid on the panel. The data can then be edited and the table updated.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
File	file		
<i>file to read in and display in the grid on the panel.</i>			
Read	button		
<i>read the specified file in and display it in the grid on the panel.</i>			

Write button

write the data in the grid on the panel to the specified file.

Table settings

create the text and place it at the given location.

Leader Create (Information)

Position of option on menu: Drafting =>Text and Tables =>Information leader

This option creates a leader that can extract and list certain information about the string selected.

Information such as AREA, STRING LENGTH, SEGMENT LENGTH and GRADE can be displayed.

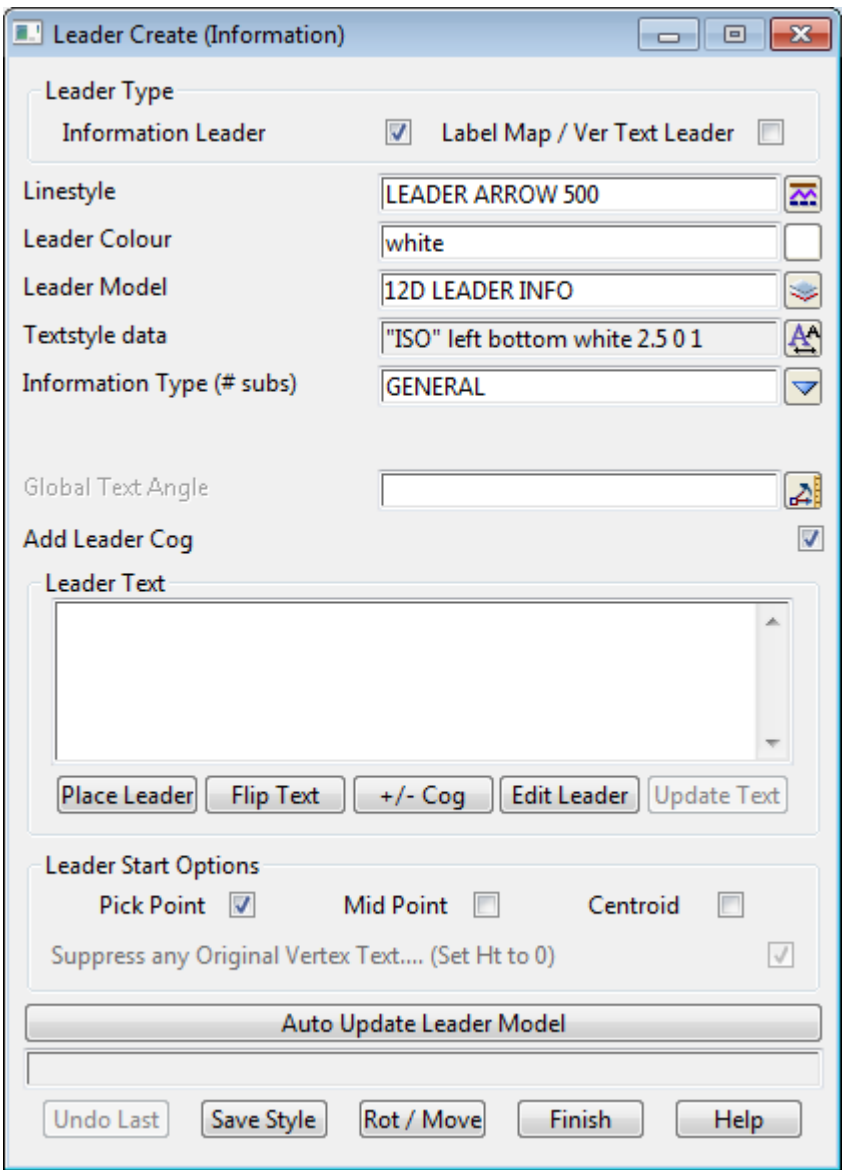

A choice list is available and can be partially user defined.

General notes can also be placed that do not extract information from any string selected.

Leaders can be moved along the string they relate to, and subsequent information values updated.

Once the timeline is written, it can be played under View =>Visualisation =>Timelines =>Play

Selecting the **Information leader** option brings up the Leader Create (Information) panel:

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Leader Type

Information Leader	tick box	ticked	
If ticked, information or general notes can be created.			
Label Map / Ver Text Leader	tick box	not ticked	
If ticked, any vertex text or text created via the Label Map File can be converted into a leader, allowing the text to be moved but still have the leader at the original location.			
Linestyle	linestyle box	LEADER ARROW 500	available linestyles
If non-blank, entry used as leader arrow scale.			
Leader Colour	colour box	white	available colours
If non-blank, entry used as leader colour.			
Leader Model	model box	12D LEADER INFO	available models
If non-blank, entry used as leader model.			
Textstyle data	input	"ISO" white 2.5	available Textdata
If non-blank, entry used as text properties.			
Information Type (# subs)	choice box	GENERAL	available choices
If non-blank, entry used as type of information leader. The list is generated from a defaults file in the library.			
Global Text Angle	real	GENERAL	
If non-blank, entry used as angle for text during placement of leader.			
Add Leader Cog	tick box	ticked	
If ticked, leader cog will be added.			

Leader Text

From the choice above, default text is placed in the Leader Text box on the panel.
Any calculated information value, such as AREA, LENGTH will be substituted for the # that may appear in the Leader Text.

Place Leader	button
Select a position along a string that suits the type of information selected from the choice box (segment for SEGMENT LENGTH, a vertex for XYZ COORDS, etc.). General notes (i.e. notes without the # in the Leader Text) may be placed using the cursor position as well. Placement of the leader is controlled by the Leader Start Options .	

Flip Text	button
Select an information leader already placed. Upon accepting the string, the text will be flipped to the opposite side of the leader.	

+/- Cog	button
Select an information leader already placed. Upon accepting the string, the cog will be added or	

The leader rotates about the arrow insertion point.

Example of Library Defaults file:

```

Area syntax special:

AREA	"Area #"	"2"
------	----------	-----

Drop down Display Text which can be set as "Area *ha" to define hectares Decimal places

TIN_DEPTH	"Depth #"	"2"
-----------	-----------	-----

Drop down Display Text which can be set as "Depth *mm" to define millimetres Decimal places

Attributes syntax special:

USER_STRING_ATTRIBUTE	"#"
USER_VERTEX_ATTRIBUTE	"#"
USER_SEGMENT_ATTRIBUTE	"#"

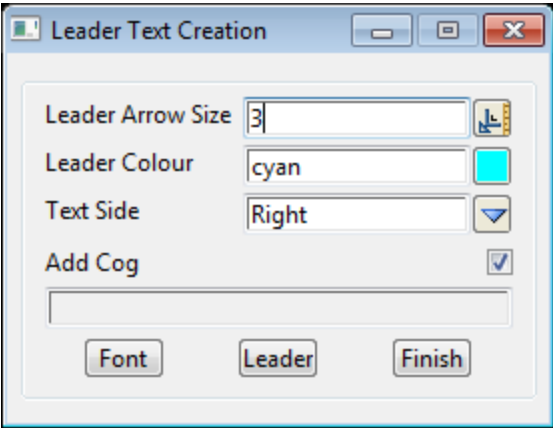

Drop down Display Text of "#" that will be substituted with attr value

Note: An attribute with the name "Leader" can be set on any string, for any of the above attributes.

It will appear automatically in the choice box along with any others set here _____

Leader Text Creation

Position of option on menu: Drafting =>Text and Tables =>Leader create
This option is used to create leader lines and text.

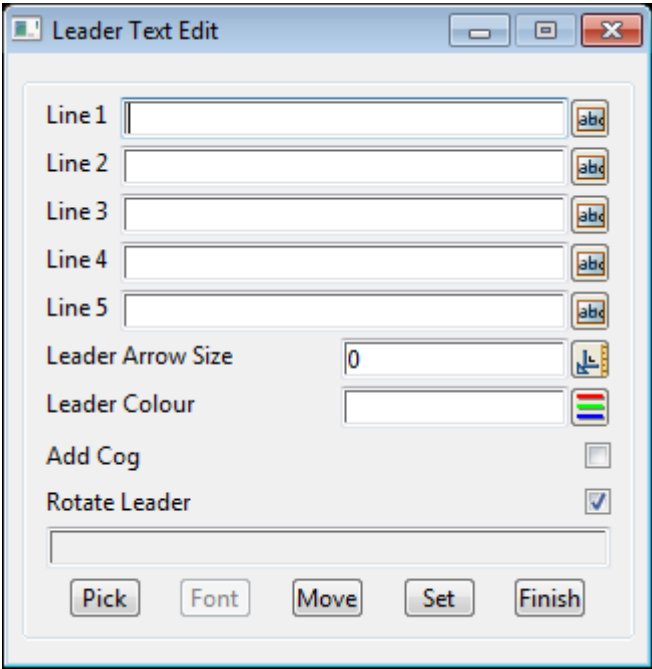

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Leader arrow size <i>length (in world units) of the head of the arrow of the leader line.</i>	input box	3	
Leader colour <i>colour of the leader line or arrow</i>	colour box	cyan	
Text side <i>side of the leader line to create the text.</i>	choice box	Right	Right, Left
Add cog <i>if tick, add a cog to the leader line.</i>	tick box	tick	
Font <i>brings up panel for defining information about the text (size, model colour etc.).</i>	button		
Leader <i>create the leader by firs picking the point for the arrow end and then the point for the opposite end.where the text goes. Once the second point is place, the "Leader Text Input" panel is displayed for entering five lines of text.</i>	button		

Leader Edit

Position of option on menu: Drafting =>Text and Tables =>Leader edit

This option is used to edit leader lines and text.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Line 1-5 <i>lines of text from the selected leader.</i>	input box		
Leader arrow size <i>length (in world units) of the head of the arrow of the leader line.</i>	input/output box		
Leader colour <i>colour of the leader line or arrow</i>	colour box	cyan	
Text side <i>side of the leader line to create the text.</i>	choice box	Right	Right, Left
Add cog <i>if tick, add a cog to the leader line.</i>	tick box	tick	
Rotate leader <i>if tick, the leader arrow remains fixed when the leader is moved. If not tick, the whole leader line and text is moved.</i>	tick box	tick	
Pick <i>select the leader to be modified.</i>	button		

Font button

brings up panel for defining information about the text (size, model colour etc.).

Move button

move the select leader and its associated text. If "rotate leader" is ticked, then the leader arrow head is left fixed.

Set button

redefine the leader line and text with the current values in the panel fields.

*if not tick, case is ignored when trying to find a match.
If tick then case is not ignored when trying to find a match.*

Regular expressions tick box

*if tick then the Find what text can contain regular expressions.
If not tick, the Find what text is not considered to contain regular expressions.*

New button

after selecting new the parameters for the find and replace can be changed.

Find button

find the search text. The text is highlighted and centred in the view.

Find Next button

find the next occurrence of the search text.

Replace button

replace the text.

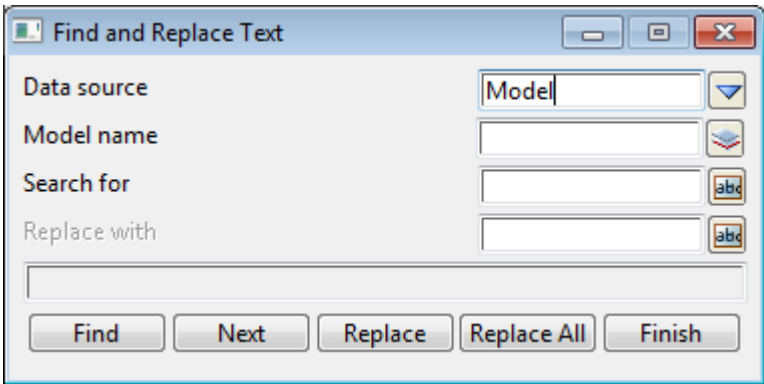

Replace all button

replace all occurrences of the text.

Find and Replace Text

Position of option on menu: Drafting =>Text and Tables =>Replace text

This option is used to find and replace text.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source type <i>data source type.</i>	input box		string, model, view
Data source <i>source of data to change text.</i>	input box		
Search for <i>text to search for.</i>	input box		
Replace with <i>if non-blank, text to replace the searched text with</i>	input box		
Find <i>find the search text</i>	button		
Next <i>find the next occurrence of the search text.</i>	button		
Replace <i>replace the text.</i>	button		
Replace all <i>replace all occurrences of the text.</i>	button		

Reverse Bearing

Position of option on menu: Drafting =>Text and Tables =>Reverse bearing

This section of documentation is a work in progress and will be updated in subsequent releases.

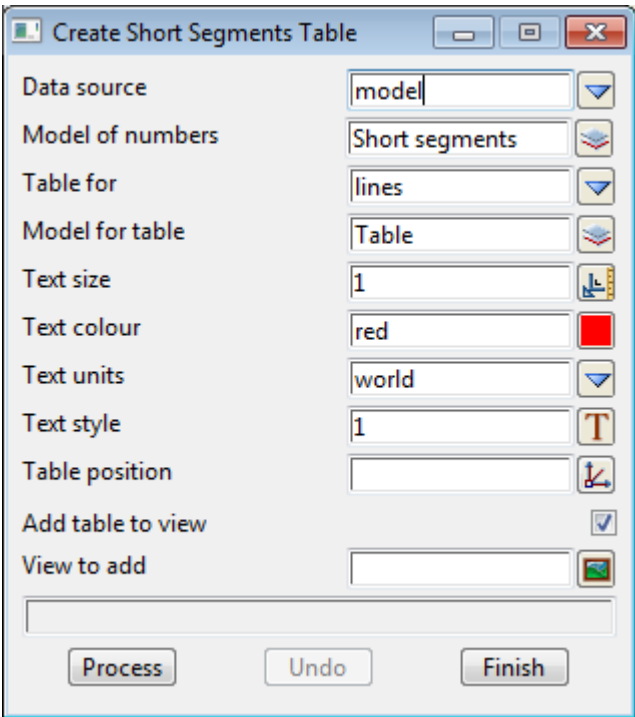

Short Segments Table

Position of option on menu: Drafting =>Text and Tables =>Short segment table

This panel is used to create a short segment table.

This option is still under development.

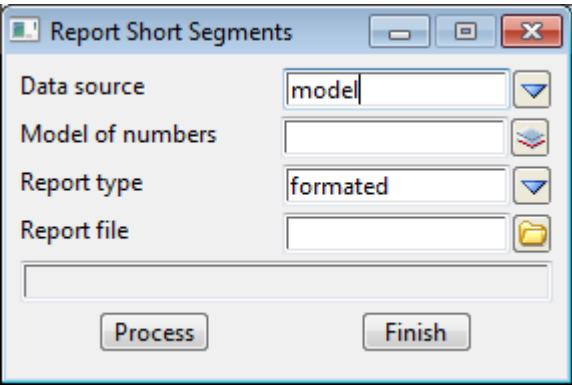

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data to process</i>	input box	model	model, string, view
Model/string/View of numbers <i>data to process and build a short segment table for.</i>			

Table for <i>type of short elements to tabulate.</i>	choice box	lines	lines, arcs, lines and arcs
Model for table <i>model to place the short segment table in.</i>	model box	Table	
Text size <i>text size.</i>	input box	1	
Text colour <i>text colour</i>	colour box	red	
Text units <i>units for the text size - default is world units.</i>	choice box	world	world, pixels
Text style <i>textstyle for the created text.</i>	input box	1	
Table position <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Add table to view <i>if tick, add the model containing the table to the view.</i>	tick box	tick	
View to add <i>view to add the table to.</i>	input box		
Process <i>create and place the short segment table</i>	button		
Undo <i>undo the last short segment table created whilst the panel has been up.</i>	button		

Short Segment Report

Position of option on menu: Drafting =>Text and Tables =>Short segment report
This panel is used create a report on the short segments.
This option is still under development

The fields and buttons used in this panel have the following functions:

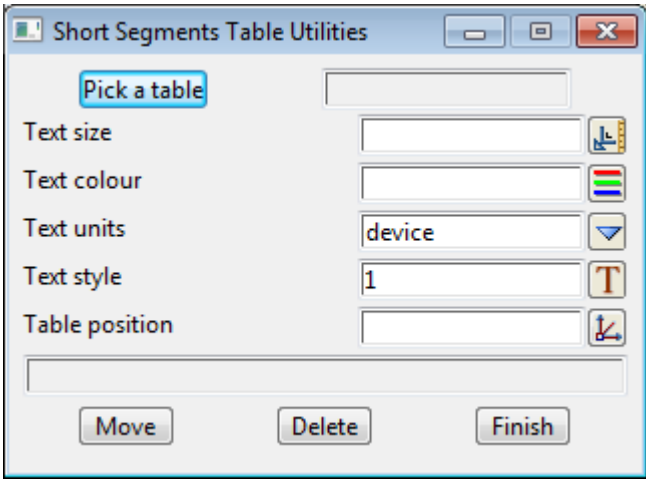

Field Description	Type	Defaults	Pop-Up
Data source <i>type of data to process</i>	input box	model	model, string, view
Model/string/View of numbers <i>data to process and report on the short segments.</i>			
Report file <i>name of the report file.</i>	report box		
Process <i>create the short segment report</i>	button		

Short Segments Table Utilities

Position of option on menu: Drafting =>Text and Tables =>Short segment table utilities

This panel is used modify an existing short segments table.

This option is still under development.

The fields and buttons used in this panel have the following functions:

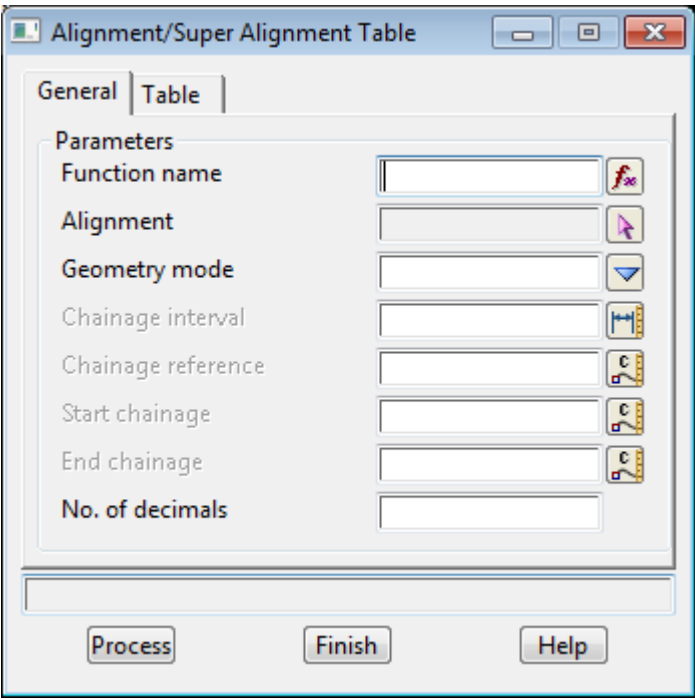

Field Description	Type	Defaults	Pop-Up
Pick a table <i>select the short segments table to modify.</i>	string select		
Text size <i>text size.</i>	input box	1	
Text colour <i>text colour</i>	colour box	red	
Text units <i>units for the text size - default is world units.</i>	choice box	world	world, pixels
Text style <i>textstyle for the created text.</i>	input box	1	
Table position <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Move <i>move the selected table to the new location.</i>	button		
Delete <i>delete the selected table.</i>	button		

Alignment & Super Alignment Table

Position of option on menu: Drafting =>Text and Tables =>Alignment/Super alignment table

This option is used to create a report and/or a table in a model for an alignment and super alignment string in an IP or element format.

This option is under development.

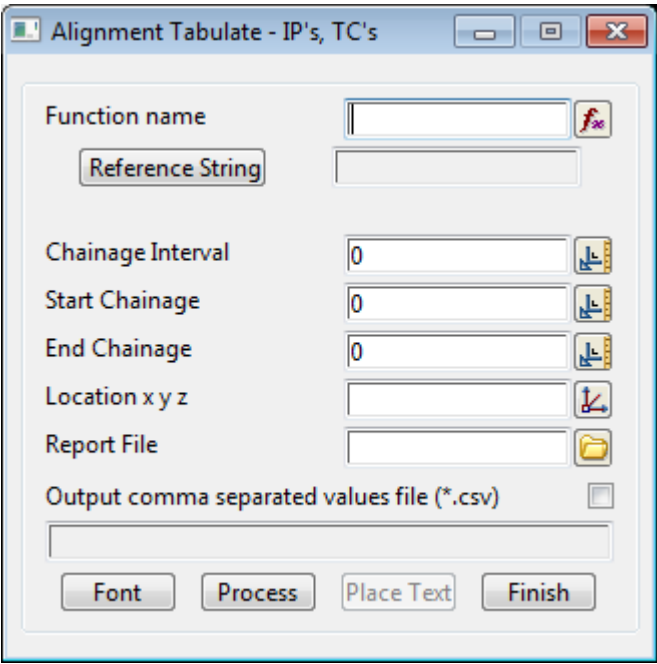

Tabulate Alignment - IP's and CT's

Position of option on menu: Drafting =>Text and Tables =>Tabulate alignment - IP's TC's

This option is used to create a report and/or a table in a model of an alignment string in an IP and tangent point format.

The table is created by a function so that if the alignment string changes, the table can be easily recalced.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function</i>	input box		
Reference string <i>select the string to create the table and/or report for.</i>	string select		
Chainage interval <i>if zero, only information on the tangent and intersection points is given. If non-zero, the chainage interval to use to report the information about the reference string. The horizontal tangent and intersection points are included.</i>	input box	0	
Start/End chainage <i>start/end chainage to use. If 0, the start/end chainage is used.</i>	input box	0	
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Report file	file box		

*if non blank, name of the report file.
If blank, don't create the report.*

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

Place text button

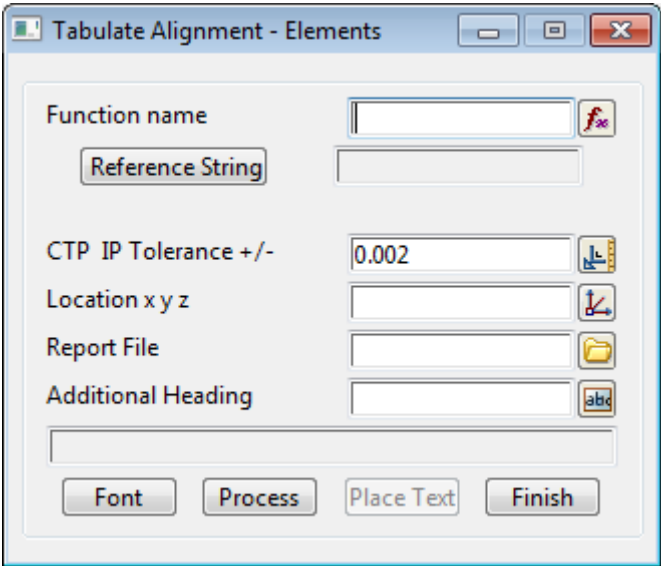

create the table and place it at the given location.

Tabulate Alignment - Elements

Position of option on menu: Drafting =>Text and Tables =>Tabulate alignment - elements

This option is used to create a report and/or a table in a model of an alignment string in an horizontal element format.

The table is created by a function so that if the alignment string changes, the table can be easily recalced.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function</i>	input box		
Reference string <i>select the string to create the table and/or report for.</i>	string select		
CTP IP tolerance +/- <i>xxxx.</i>	input box	0.002	
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Report file <i>if non blank, name of the report file. If blank, don't create the report.</i>	file box		
Additional heading <i>additional information for the heading above the table.</i>	input box		
Font	button		

brings up panel for defining information about the text (size, model colour etc.).

Process button

process the reference string and create the report. The table is not yet created.

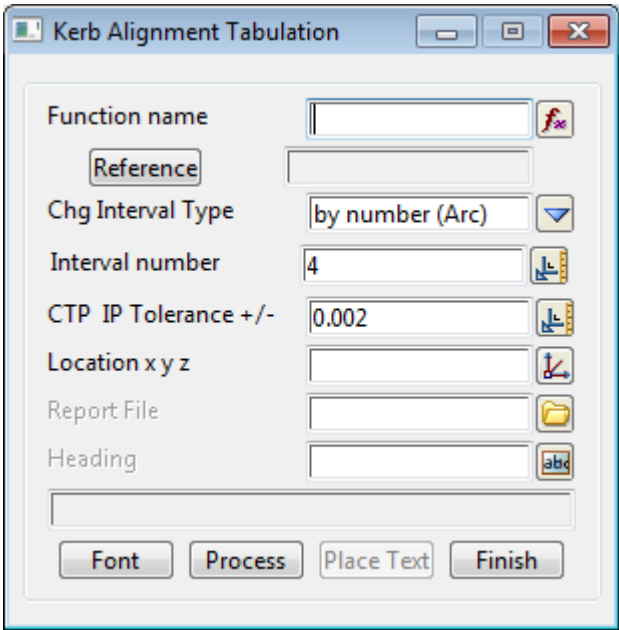

Place text button

create the table and place it at the given location.

Tabulate Kerb Return

Position of option on menu: Drafting =>Text and Tables =>Tabulate kerb return

This option creates a table for a kerb return.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Function name <i>name of the function</i>	input box		
Reference <i>select the string to create the kerb return table and/or report for.</i>	string select		
Chg interval type	choice box	by number (Arc)	by number (Arc) by distance (Arc) by special chg file by number (Chord)
Interval number <i>number of points to divide the alignment into.</i>	input box	4	
CTP IP tolerance +/- <i>xxxx.</i>	input box	0.002	
Interval number <i>xxxx.</i>	input box	4	
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		

Report file file box

*if non blank, name of the report file.
If blank, don't create the report.*

Heading input box

heading above the table.

Font button

brings up panel for defining information about the text (size, model colour etc.).

Process button

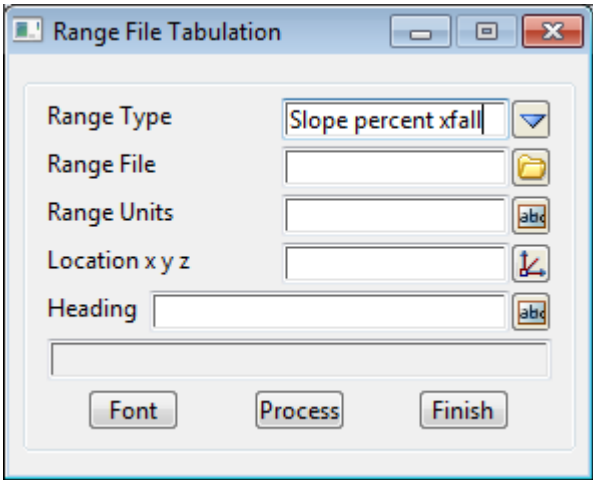

process the reference string and create the report. The table is not yet created.

Place text button

create the table and place it at the given location.

Tabulate Range File

Position of option on menu: Drafting =>Text and Tables =>Tabulate range file
This option creates a table for a range file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range type <i>type of range file to be created.</i>	choice box	slope percent xfall	slope percent xfall slope 1 v in, slope degrees depth, aspect, height
Range file <i>name of the range file.</i>	file box		
Range units <i>text to place beside each line of upper and lower values.</i>	input box		
Heading <i>heading to place at the top of the table.</i>	input box		
Location x y z <i>location for the top left hand corner of the table. Either type in an x y position or click on "+" and use "Pick xyz" to locate the table.</i>	input box		
Font <i>brings up panel for defining information about the text (size, model colour etc.).</i>	button		
Process <i>create and place the range table.</i>	button		

Symbol / Linestyle Legend - Tabulation

Position of option on menu: Drafting =>Text and Tables =>Tabulate symbol/linestyle legend

This option can create a legend showing features and their associated linestyle, colour, symbol *etc.*

There are 3 distinct parts to the macro. Once a data selection is chosen, the data can be analysed by either using a map file or the data features themselves.

Map File Extraction:

If specified, the 12d Map File is read and data sorted by string name (*Name* column).

If the **Extract Data** button is clicked, the **Map File Extraction** grid is populated.

The *Description* column is used in the legend and is controlled by the *Mode* selected, either *Model Name* or *Comment*.

Data only Extraction:

If no map file is specified, then the data is sorted in relation to *Name*, *Linestyle*, *Colour* and *Weight*.

If the **Extract Data** button is clicked, the **Data Only Extraction** grid is populated.

The *Description* column is used in the legend and is controlled by the *Mode* selected: *Model Name*, *String Name*, *Linestyle*, *Symbol*, *Ver attr + Name*, *Name +Ver Attr*.

Once a mode is selected, clicking the Update button will update the *Description* field.

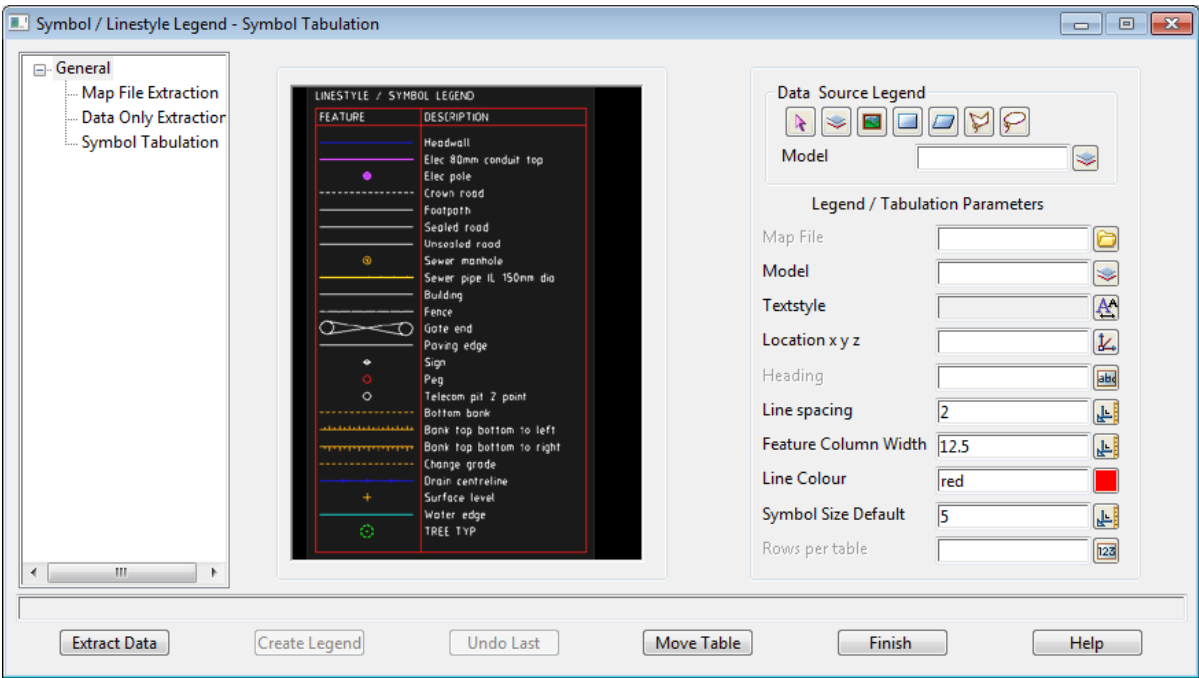

Symbol Tabulation:

This tabulation is for symbols, *e.g.* survey station points.

The table is in the format of Name, Easting, Northing & Level.

The title of the Name column can be changed.

The data to be tabulated is given by the Tabulation by choice box. It can be either tabulating the *Point ID* or the *Vertex Text*.

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Legend / Tabulation Parameters			
Data Source Legend <i>selection data to extract legend information</i>	selection		model, view, string
Map File <i>if non-blank, then the map file is used with the data selection to sort and populate the < Map File Extraction > grid</i>	input		
Model <i>model name for legend tabulation</i>	input		
Textstyle <i>text parameters for all text</i>	input		
Location x y z <i>insertion point for top left corner of legend</i>	xyz box		
Heading <i>if non-blank, heading placed at top of legend</i>	input		
Line spacing <i>spacing for adjustment of lines of text</i>	real	2	
Feature Column Width <i>width for display of sample line and symbol in legend</i>	real	12.5	
Line Colour <i>the colour of separation lines in the tabulation</i>	input	red	available colours
Symbol Size Default <i>default size for symbols in table</i>	real	5	
Rows per table <i>if blank, the legend table will be created vertically if non-blank, more than one legend may be created, arrayed in either horizontal or vertical the format is: +ve number for Horizontal array -ve number for Vertical array</i>	integer		
Extract Data <i>Sorts the source data and populates either the Map File Extraction grid or Data only Extraction grid</i>	button		
Create Legend <i>Creates the tabulation using all parameters set in the general tab</i>	button		
Undo Last <i>this undo is only available while the panel is still open and only works on the last table created. Once the panel is finished all tables can be accessed via the normal 12d undo.</i>	button		T

Move Table button

Any Legend Tabulation can be moved for clarity (Esc or rmb to cancel)

Symbol Tabulation

Data Source Tabulation selection

selection data to extract tabulation information

Model model box

model name for symbol tabulation

Textstyle textstyle box

text parameters for all text

Location x y z XYZ box

insertion point for top left corner of tabulation

Heading input

if non-blank, heading placed at top of tabulation

Line colour colour box red available colours

the colour of separation lines in the tabulation

Line spacing real 2

spacing for adjustment of lines and text

Station name input STN

maximum 8 characters

Tabulation by choice box Point ID Point ID / Vertex Text

value used to define symbol e.g. Survey Station may use point number < 901 >

Process button

processes the data

Create Tab button

creates the symbol tabulation using the above parameters.

Text File Input

Position of option on menu: Drafting =>Text and Tables =>Text file input

This option has already been documented as [Text Creation/Edit](#)

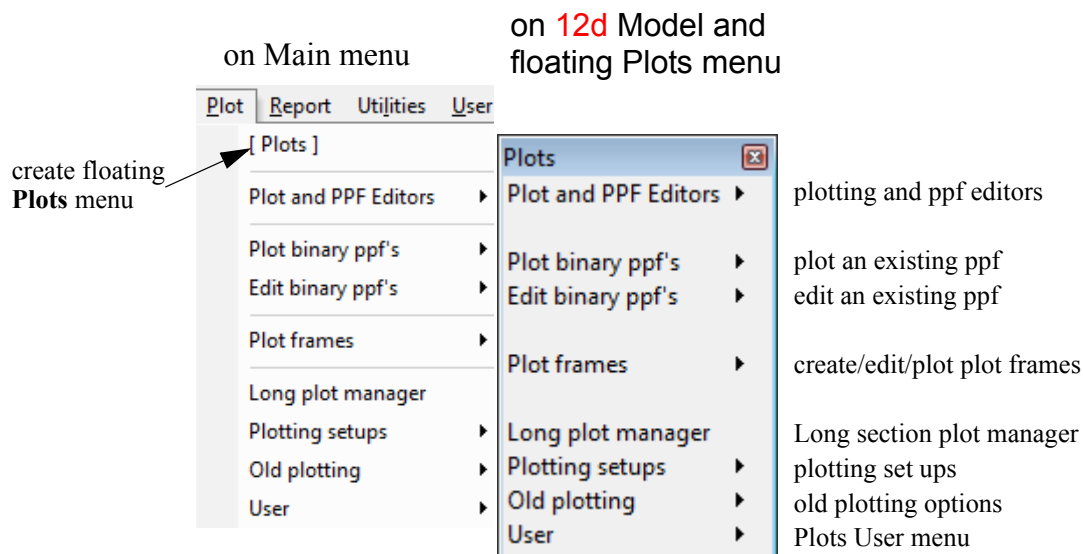

Drafting =>Text and Tables =>Create/edit paragraph text

24 Plots

Position of menu: It is on the main menu as Plot

The Plots walk-right menu is

The options [Plot Binary PPFs](#) and [Edit Binary PPFs](#) are both walk-right menus which list all the binary PPFs in the project and the when the PPF is double-clicked, it is Plotted/Edited.

Edit Binary PPFs

This section of documentation is a work in progress and will be updated in subsequent releases.

Plot Frames

Position of menu: Plot =>Plot frames

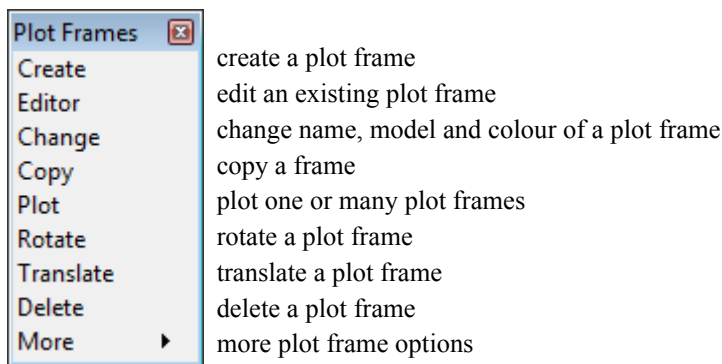

Although plan view plots can be generated in **12d Model** by plotting the contents of the plan view with the **Plot** option, the plot will only have a simple title block.

To create plan plots of an arbitrary size, rotation and scale and with complex title blocks, **12d Model** uses **plot frames**.

Basically a plot frame consists of a sheet size (in mm), margins within the sheet and a scale for the plot. This will define a plotting area in world co-ordinates (the plot frame).

The plot frame can be arbitrarily positioned and rotated on a plan view.

The **Plot frames** walk-right menu is

Origin	input		xyz ops menu

x_origin y_origin z_origin
origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the origin panel view and getting up the xyz ops menu and selecting the pick xyz option.

Draw viewport border tick box **ticked**
*if **ticked**, plot the box around the plotting area (viewport).*

Draw Frame border tick box **not ticked**
*if **ticked**, plot the box around the frame.*

Create button
create the plot frame and then put up the plot frame edit panel for the created plot frame.

Same as button
*after picking the **Same as** button, an existing plot frame is selected and its information is used to fill in the above panel fields.*

Margin tab

Left/right margin (mm) 10.0
the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0
the bottom/top margin between the sheet and the plotting area inside the sheet.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

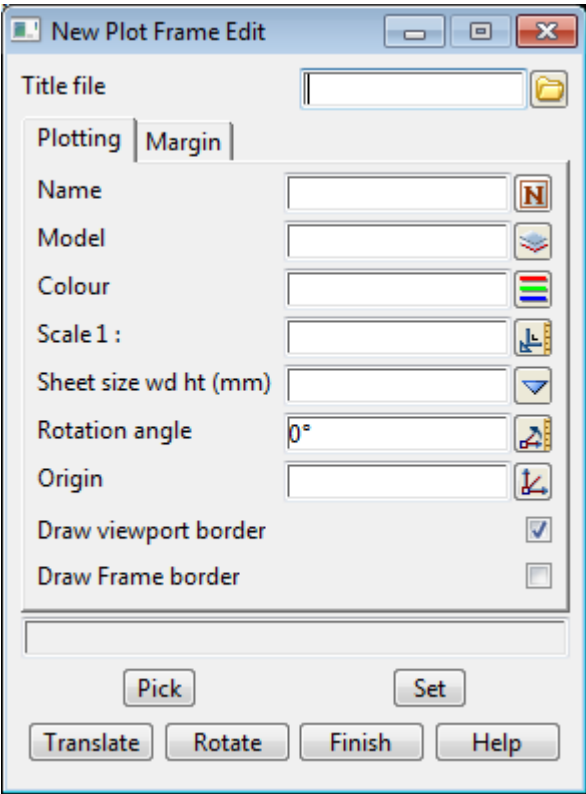

Once the frame is created, the **New Plot Frame Edit** panel for the created plot frame is automatically placed on the screen so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

Editor

Position of option on menu: Plot =>Plot frames =>Editor

The plot frame editor is used to edit existing plot frames. It is automatically placed on the screen when a plot frame is created so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

On selecting the **Editor** option, the **New Plot Frame Edit** panel is displayed.

Most of the fields and buttons used in this panel are the same as the **New Plot Frame Create** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Title file	title file box		all title files
<i>name for the title file to use when plotting the plot frame. The title block file can contain default information for the rest of the panel fields. See Values Used for Defaults when Creating Plot Frames in the Chapter PPF Editors</i>			
Name	name box		available names
<i>name for the plot frame.</i>			
Model	model box		available models
<i>the model for the plot frame.</i>			
Colour	colour box		available colours
<i>the colour for the plot frame.</i>			
Scale 1:	measure box		available measures
<i>scale for the plot.</i>			
Sheet size wd ht (mm)	choice box		available sheet sizes

the width and height values (separated by spaces) or the name of a user defined sheet size.

Rotation angle measure box 0 degrees available measures
angle of rotation for the plot frame.

Origin input xyz ops menu
*x_origin y_origin z_origin
origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the origin panel view and getting up the xyz ops menu and selecting the pick xyz option.*

Draw viewport border tick box ticked
*if **ticked**, plot the box around the plotting area (viewport).*

Draw Frame border tick box not ticked
*if **ticked**, plot the box around the frame.*

Pick button
select the plot frame to be edited.

Set button
update the plot frame with the information in the above panel fields.

Translate button
*after picking the **Translate** button, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

Rotate button
*after picking the **Rotate** button, the plot frame is further rotated around the left hand corner of the sheet, by the angle made between the rotation point and the current cursor position. The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

Margin tab

Left/right margin (mm) 10.0
the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0
the bottom/top margin between the sheet and the plotting area inside the sheet.

Change

Position of option on menu: Plot =>Plot frames =>Change

The **change** option is used to modify a plot frame's name, model or colour.

On selecting the **change** option, the **Plot Frame Change** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
New name	name box		available names
<i>if non-blank, then the name of the selected plot frame will be changed to the name given in the new name field.</i>			
New model	model box		available models
<i>if non-blank, then the selected plot frame will be moved to the model given in the new model field.</i>			
New colour	colour box		available colours
<i>if non-blank, then the colour of the selected plot frame will be changed to the colour given in the new colour field.</i>			
Pick	button		
<i>select the plot frame to be changed.</i>			
Change	button		
<i>update the plot frame with the information in the above panel fields.</i>			

Copy

Position of option on menu: Plot =>Plot frames =>Copy

The **copy** option is used to make a copy of a plot frame.

On selecting the **Copy** option, the **Plot Frame Copy** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for frame <i>if blank, then the model of the copied plot frame will be the same as that of the picked frame.</i> <i>if non-blank, then the copied plot frame will be placed in the model given in the model for frame field.</i>	model box		available models
dx dy <i>dx_val dy_val</i> <i>translation in world units to apply to the copied plot frame - given as two values separated by spaces.</i>	input		xyz ops menu
Pick <i>select the plot frame to be copied - the copy will be made as soon as the selected plot frame is accepted.</i>	button		

Plot

Position of option on menu: Plot =>Plot frames =>Plot

The **Plot** option is an alternative way of bringing up the **Plot Frame PPF Editor** panel.

See [Plot Frame and PPF Editor](#).

Rotate

Position of option on menu: Plot =>Plot frames =>Rotate

The **Rotate** option is used to rotate a plot frame about a selected point.

On selecting the **Rotate** option, the **Plot Frame Rotate** panel is displayed.

The buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Rotate <i>after picking the Rotate button, the user is first asked to select a plot frame to rotate, and then to selected a point to rotate about. Once the rotation point has been selected, the plot frame is further rotated by the angle made between the rotation point and the current cursor position. The plot frame will continue to rotate until a point is selected to fix the rotation angle.</i> <i>The option then repeats.</i>	button		

Translate

Position of option on menu: Plot =>Plot frames =>Translate

The **Translate** option is used to translate a plot frame.

On selecting the **Translate** option, the **Plot Frame Translate** panel is displayed.

The button used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Move	button		

*after picking the **Move** button, the user is first asked to select a plot frame to translate. Once the plot frame has been selected, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.
The option then repeats.*

Delete

Position of option on menu: Plot =>Plot frames =>Delete

The **Delete** option just gets up the standard **String Delete** panel which can be used to delete plot frames as well as strings.
See [Delete](#) in the chapter [Strings](#)

More Plot Frames

Position of menu: Plot =>Plot frames =>More

This menu contains options to create plot frame seeds, insert plot frame seeds into a view and create plot frames along a string.
The **More Plot Frames** walk-right menu is

More Plot Frames

Plot frames along string

Plot frame insert

Plot frame seed create

insert a plot frame seed

create plot frames along a string

create a plot frame seed

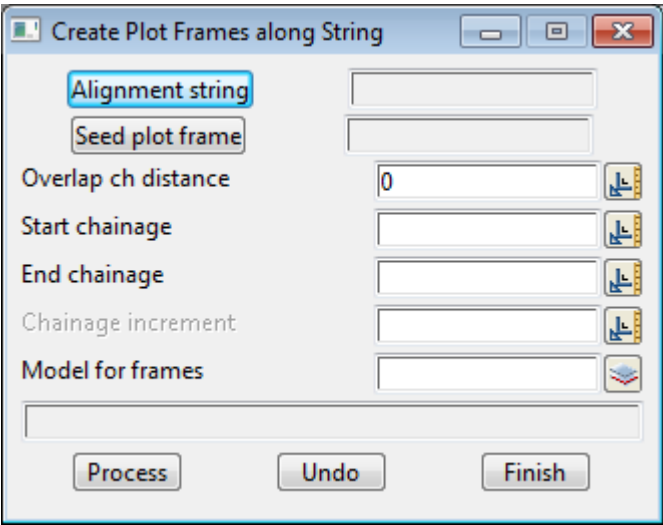

Each option in this menu will now be described.

For the option <i>Plot frames along string</i> , go to	Create Plot Frames along String
<i>Plot frame insert</i>	Insert Plot Frame
<i>Plot frame seed create</i>	Create Plot Frame Seed

Create Plot Frames along String

Position of option on menu: Plot =>Plot frames =>More =>Plot frames along string

On selecting the **plot frames along string** option, the **create plot frames along string** panel is displayed.

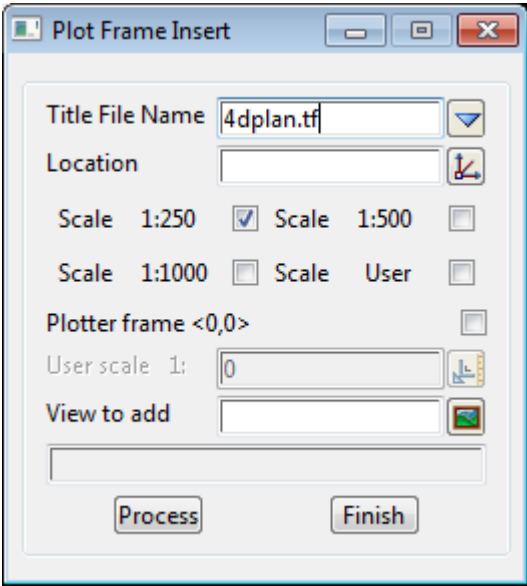

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Alignment string <i>string to create plot frame along.</i>	string select		
Seed plot frame <i>plot frame to create along the selected string.</i>	plot frame select		
Overlap chainage distance <i>if non-zero, the next plot frame is started so that it includes this chainage distance of the selected string from previous plot frame.</i>	input	0	
Start/End chainage <i>start/end chainage to restrict the amount of the selected string to place plot frames along.</i>	input	0	
Chainage increment <i>if non-blank, the start of the next plot frame is placed this chainage distance along the string from the start of the previous plot frame. Used when you want to match the plot frames with the chainage interval on a long section plot. If blank, the next plot frame is placed at the chainage point at the end of the previous plot frame (minus the overlap chainage distance).</i>	input		
Model for frames <i>model to place the created plot frames in.</i>	model box		available models
Process <i>create the plots frames along the selected string.</i>	button		
Undo <i>undo the last set of plot frames created whilst this panel is up.</i>	button		

Insert Plot Frame

Position of option on menu: Plot =>Plot frames =>More =>Plot frame insert

On selecting the Plot frame insert option, the **Plot Frame Insert** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot frame to insert <i>plot frame from the seed library to insert.</i>			plot frame seeds
Location <i>the bottom left hand corner of the plot frame in inserted at this location.</i>	xyz box		xyz ops menu
Scale <i>scale to use for the inserted plot frame.</i>	radio buttons	1: 250	1: 250, 1: 500, 1:1000, User
Plotter frame <0,0> <i>if ticked, the bottom left hand corner of the plot frame is placed at (0,0).</i>	tick box	not ticked	
User scale 1: <i>if User is selected for Scale, then the required scale is entered here.</i>	measure box		
View to add <i>if non-blank, add to plot frame to this view.</i>	view box		available views
Process <i>insert the selected seed plot frame at the given location at the given scale.</i>	button		

How To Use the Option

The selected plot frame is inserted at the given location with the given scale.

Create Plot Frame Seed

Position of option on menu: Plot =>Plot frames =>More =>Plot frame seed create

On selecting the **Plot frame seed create** option, the **Plot Frame Seed Create** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Pick	string select		
<i>pick the plot frame to add to the plot frame seed library.</i>			
Set	button		
<i>add the selected plot frame to the plot frame seed library.</i>			

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

The **Plot Frame Seed Create** panel adds selected plot frames to a library of plot frame seeds.

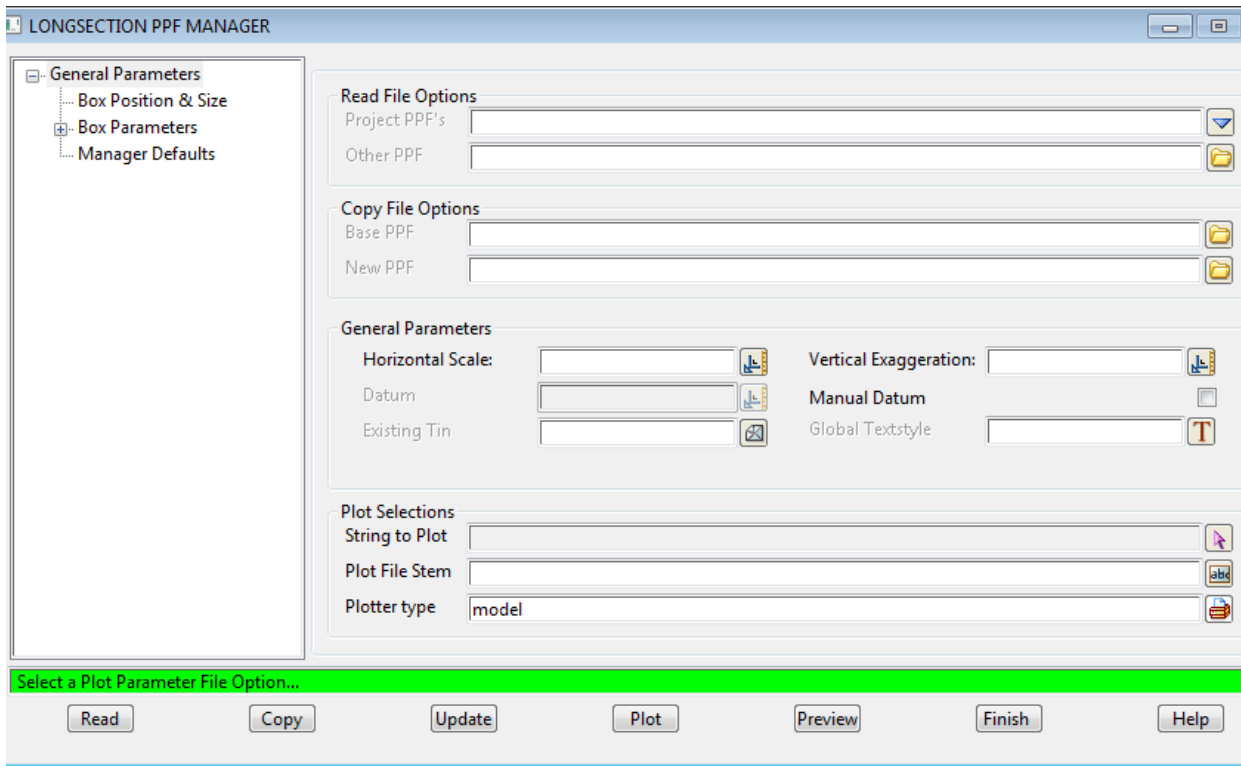

The seeds from the library can be inserted in a plan view using the **Insert plot frame seed** option.

Long Plot Manager

Position on menu: Plot =>Long plot manager

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Long plot manager** brings up the **Longsection PPF Manager** panel.

The fields and buttons used in this panel have the following functions.

Create/Edit Title Block File

Position of option on menu: Plot =>Plotting setups =>Create/edit title block file
Position of option on menu: Drafting => Create title block file

This option is used to create a title block file from string data in a model or a view.
If it is a model, the model attributes can also contain information that is used for creating plot frames. For example, Sheet size, left/right margins, *etc.*).

The data in the model/view should be set up with (0,0) representing the left hand bottom of the plotting sheet and the units in model/view represent **millimetres** on the paper. So text should be defined with **World** units and a metre in world units is taken to be a millimetre in the title block itself. That is, a text size 5 world units will plot as 5 mm.
For more information and the format of the title block file, go to the section [Title Blocks](#) in the chapter [PPF Editors](#).

The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up
Data Model/View	model/view box		available models/views
<i>the data in this model/view is written to the title block file to be used as the linework and text in a title</i>			

block.
The **Set** button is used to create model attributes for the information in the Plot frame parameters section, so if the **Set** button is to be used, then only a Data Model can be used here.

Plot frame parameters

these parameters are written to an info block in the title block file and are only used when defining a plot frame using the option **Plot =>Plot frames =>Create**. The parameters can also be written as attributes in the Data Model using the **Set** button.

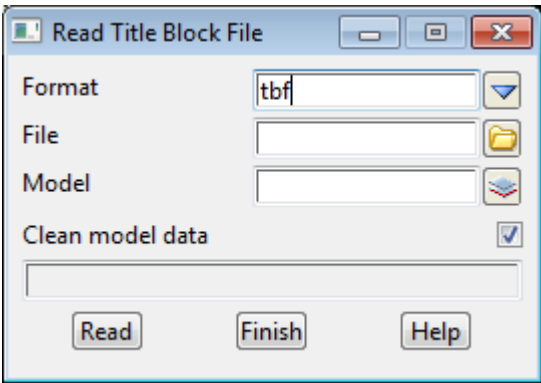

Name		
	<i>if not blank, the name to use for the plot frame.</i>	
Model	model box	available models
	<i>if not blank, model for the plot frame.</i>	
Colour	colour box	available colours
	<i>if not blank, colour for the plot frame.</i>	
Scale 1:	input	
	<i>if not blank, scale for the plot frame</i>	
Sheet size	input	available sheet sizes
	<i>if not blank, sheet size for the plot frame</i>	
Angle	angle box	
	<i>if not blank, angle of the plot frame - measured anticlockwise from the positive x-axis</i>	
Left margin, Right margin, Top margin, Bottom margin		
	<i>margins for the plot frame</i>	
Draw viewport border	tick box	tick
	<i>if ticked, a border is drawn around the view port in the colour of the plot frame.</i>	
Title block file	file box	*.tbf files
	<i>name of the file to contain the title block information.</i>	
Set	button	
	<i>save the plot frame parameters as attributes in the Data model.</i>	
Write	button	
	<i>run the option – create the title block file.</i>	

Read Title Block

Position of option on menu: Plot =>Plotting setups =>Read title block file

The **Read title block file** option is for reading in a title block file and placing the lines, arcs and text defined in the title block file into a given model.

On selecting the **Read title block file** option, the **Read Title Block File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box		tbf, tf
<i>specify if the format of the file is the V7 title block file (.tbf) or the older format (.tf).</i>			
File	file box		
<i>name of title block file to read in.</i>			
Model	model box		available models
<i>model to place the title block in when it is read. Any plot frame parameters in the info block of the title block file are set as attributes for this model. Hence these parameters can be written out again to a new title block file if the model is used as the Data Model when creating a title block file.</i>			
Clean model data	tick box	not ticked	
<i>if ticked, the data in the model given in the Model field will be cleaned prior to reading in the title block file.</i>			
<i>If not ticked, the data in the model given in the Model field will not be cleaned prior to reading in the title block file. The data is appended to the existing model data.</i>			
Read	button		
<i>read in the title block file and place the information in the given model.</i>			

Pen Mapping

This option brings up the **Edit Colours** panel.

For more information on this option, go to the section [Colours](#) in the Chapter [Tools and Concepts](#)

Plotter Mapping Editor

Position of option on menu: Plot =>Plotting Setups =>Plotter mapping editor

The **Plotter mapping editor** is used to create a plotter mapping file which is used when making a plot from **12d Model**. The plotter mapping file defines:

- (a) the mapping from **12d Model** colours to the plotter pens and weights of the plotter pen
- (b) the colours for the plotter pens

Different *plotter mapping files* are used for different plotter configurations.

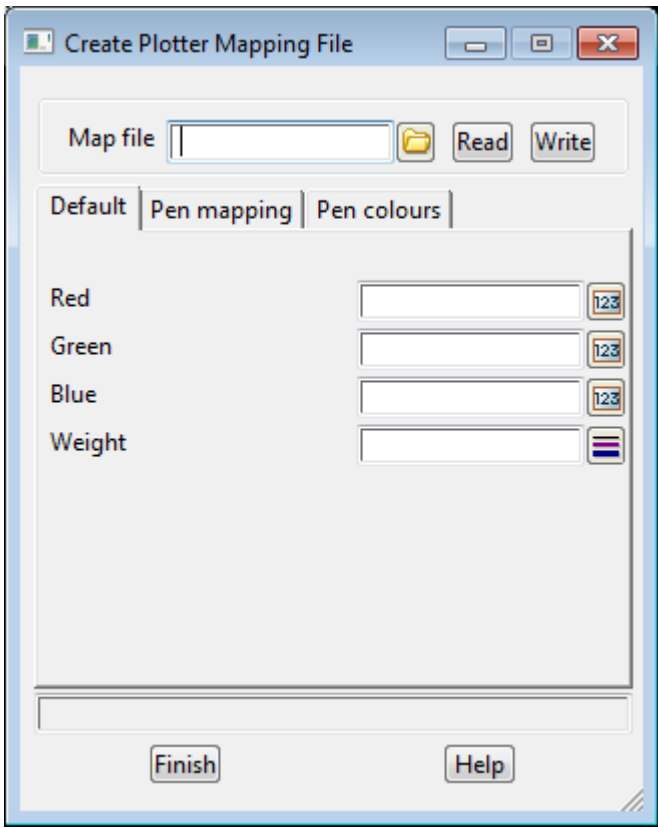

For example, different plotter mapping files would be used when plotting the same plot in **12d Model** to a mono-colour plotter or to a colour plotter.

For plotting to a mono-colour plotter, **12d Model** colours would be mapped to the one black pen but with possible different weights for different colours. So only one pen colour would be needed and its colour would be set to black (Red 0, Green 0 and Blue 0).

For plotting to a colour plotter, **12d Model** colours could be mapped to different colours and weights on the plotter.

The text definition of the plotter mapping file is given in the next section [Plotter Mapping](#).

On selecting the **Plotter mapping editor** option, the **Create Plotter Mapping File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file <i>the plotter mapping file to be created/edited.</i>	file box		*.pmf file

Read button

read in the plotter mapping file given in Map file

Write button

write out to plotter mapping information in the panel to the file given in Map file.

Default tab

Red/Green/Blue input

the value between 0 and 255 of red/green/blue to be used for the default pen colour.

Weight input

the default pen weight.

12d Colour mapping tab

12d Colour colour box

the 12d colour to define the pen mapping for.

Use Pen Number integer box

the number of the pen on the plotter for the 12d colour to be mapped to.

Weight real number box

the weight to use for the plotter pen for the given 12d colour.

Define Pen Colours tab

Pen Number integer box

the number of the plotter pen to define the colour for.

Red/Green/Blue input

the value between 0 and 255 of red/green/blue to be used for the colour of the plotter pen.

Plotter Mapping

Position of option on menu: Plot =>Plotting setups =>Plotter Mapping

The **Plotter mapping file** can be used with pen plotters but is more specifically designed for electostatic and inject plotters and allows the user to

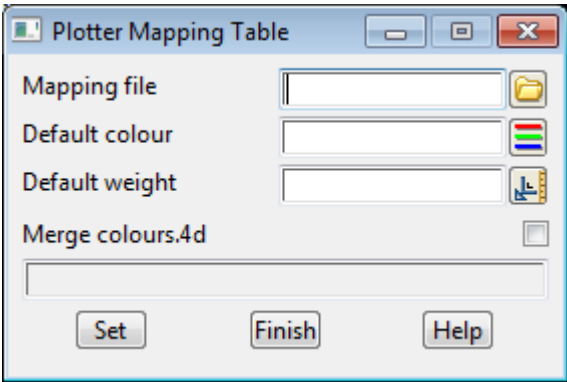

- (a) map the full 10,240 12d Model colours to particular plotter pens and also specify a width (or weight) to be used forPCL5, HPGL2 and postscript plotters.
- (b) specify the red, green and blue mix for pens on HPGL2 and colour postscript plotters

There are also two special formats of the plotter mapping file which are used for plotting to Autocad dxf/dwg and Intergraph dgn. The special mapping files use the 12d Model colour as a key to tables which control how the information is passed to DXF/DWG and DGN.

- (c) .tbl file used with plotting to Intergraph dgn
- (d) .amf used with plotting to Autocad dxf and dwg

The .tbl and .amf files are documented in the [Definition and Example of a .tbl File](#) and [Definition and Example of a .amf File](#) sections in the Appendix [Plotters and Plotting](#).

On selecting the **plotter mapping** option, the **plotter mapping table** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Mapping file	the plotter mapping file to be used when plotting. If no plotter mapping file is given, the pen mapping table is used.	input		*.pmf file
Default colour	the rgb of this colour is used as the rgb for the default pen colour.	input		available colours
Default weight	if not blank, the default pen weight.	input		
Merge colour_map.def	If ticked, the rgb columns from the colour_map.def file are used to define the pen_colours (first row is pen 0, second row is pen 1 etc.), and the pen mapping number is used to construct the pen_mapping table.	tick box	ticked	
Set	set the information in the panel	button		

Plotter Mapping File

The Plotter mapping file (.pmf) consists of two sections and two default values:

- (a) the **pen_mapping** table which defines the plotter pens that the **12d** Model colours are mapped to, and the weights for each "12d Model colour to plotter pen" mapping.

The `pen_mapping` table consists of the key word `pen_mapping` followed by the mapping for each 12d Model colour to the appropriate plotter pen number and pen weight (one per line), all enclosed in curly braces (`{ }`).

```
pen_mapping {                                     // pen mapping and weight table
//12d Model colour number                        plotter pen number          pen weight
        0                1                    0.15
        1                2                    0.25
        3                1                    0.5
//      etc.
}
```

- (b) the **pen_colours** table which defines the red, green and blue values to be used for the pens on the plotter.

The `pen_colours` table consists of the key word *pen_colours* followed by the red, green and blue values for the plotter pens (one per line), all enclosed in curly braces ({}).

```

pen_colours {           // pen colours table
//pen      red      green      blue      values 0-255
    0      0        0        0          // pen 0 is black
    1      255      0        0          // pen 1 is red
//
    etc.
}

```

- (c) the ***default_weight*** command that goes at the top of the file (not inside the *pen_mapping* or *pen_colours* table) which is used as the weight for any 12d Model colour used in the plot but not mapped and given a weight in the *pen_mapping* table.

default	weight	<i>weight</i>
---------	--------	---------------

- (d) the ***default_colour*** command that also goes at the top of the file (not inside the *pen_mapping* or *pen_colours* table) which defines the default red, green and blue for any pens used but not set in the *pen_colours* table.

```
default colour      red      green      blue
```

Initialization of the plotter mapping file

When using the plotter mapping table panel:

When used with the **Plotter mapping table** panel, the `pen_mapping` and `pen_colours` tables are initialised before the plotter mapping file is used. This is to ensure that any colours and/or pens not mentioned in the file but used in a plot, do have valid definitions.

Hence the initialisation sequence for the plotter mapping file used with the **plotter mapping table** panel is:

Before the plotter mapping file is used, a default pen_mapping table for colours 0 to 255 is set up by:

colour n goes to pen n with the default weight from the **plotter mapping table** panel.

Before the plotter mapping file is used, a default pen colours table for pens 0 to 255 is set up by:

open n is given the red, green and blue of the default colour from the **plotter mapping table**

panel.

If the **merge colours.4d** flag is set in the **plotter mapping table** panel, the rgb columns from the colours.4d file are used to define the pen_colours (first row is pen 0, second row is pen 1 etc.), and the pen mapping number is used to construct the pen_mapping table.

The **plotter mapping file** is then processed and over writes any of the above initial mapping values.

When using user defined plotters:

A plotter mapping file can be set for a user defined plotter in the file *plotters.4d*.

In this case, the **plotter mapping table** panel is **not** used and hence the initialisation sequence is slightly different.

When used with the **plotter mapping table** panel, the pen_mapping and pen_colours tables are initialised before the plotter mapping file is used. This is to ensure that any colours and/or pens not mentioned in the file but used in a plot, do have valid definitions.

For a **user defined plotter**, the initialisation sequence for the plotter mapping file is:

Before the plotter mapping file is used, a default pen_mapping table for colours 0 to 255 is set up by:

colour n goes to pen n with the **default weight** *default_weight* from the specified plotter mapping file, or zero if the default_weight does not exist.

Before the plotter mapping file is used, a default pen_colours table for pens 0 to 255 is set up by:

pen n is given the red, green and blue of the **default colour** *default_colour* from the specified plotter mapping file, or rgb 0 0 0 if the default_colour does not exist

The **plotter mapping file** is then processed and over writes any of the above initial mapping values.

An Example of a Plotter Mapping File

An example of a plotter mapping file (.pmf) is:

```
default_colour      100      0      100
default_weight      0.1

pen_mapping {                               // pen mapping and weight table

//          colour      pen      weight

          0          1          0.15      // map colour 0 to pen 1 with weight 0.15
          1          2          0.25      // map colour 1 to pen 2 with weight 0.25
          3          1          0.5       // map colour 3 to pen 1 with weight 0.5
}
pen_colours {                               // pen colours table

//pen      red      green      blue      values 0-255
  0          0          0          0      // pen 0 is black
  1          255       0          0      // pen 1 is red
  3          0          255       0      // pen 3 is green
}
```

Pixels to mm

Position of option on menu: Plot =>Plotting Setups =>Pixels to mm

To plot an object, it must be possible to calculate the size in millimetres that the object will have in the plot.

However, in **12d Model** it is possible for text and linestyles to be defined in the screen unit pixels, and since the size of a pixel varies between screens, there is no direct millimetre equivalent for a pixel.

To allow text and linestyles with only a pixel size to be plotted, a factor to convert pixels to millimetres is used.

When plotting, all text and linestyles defined only in pixel units is **multiplied** by the pixels-to-millimetre factor to determine its size in the plot.

On selecting the **pixel to mm** option, the **pixels to millimetres plot factor** panel is displayed.

To define a new factor, simply type the value into the factor field and select **set**.

The pixel-to-millimetres value is stored for the project.

For a new project, the initial value is loaded from the **defaults** file and is defined in the file by

PIXELS TO MM PLOT FACTOR value

Hardware Arcs

Position of option on menu: Plot =>Plotting Setups =>Hardware arcs

When plotting arcs, the arc can either be broken into a series of straight lines within **12d Model**, or plotted using the arc command (if it exists) for the relevant plotter.

This option allows the user to choose whether

(a) the plotter arc command is used (hardware arcs)

or

(b) before plotting, the arc is broken into a series of lines.

On selecting the **hardware arcs** option, the **draw hardware arcs** panel is displayed.

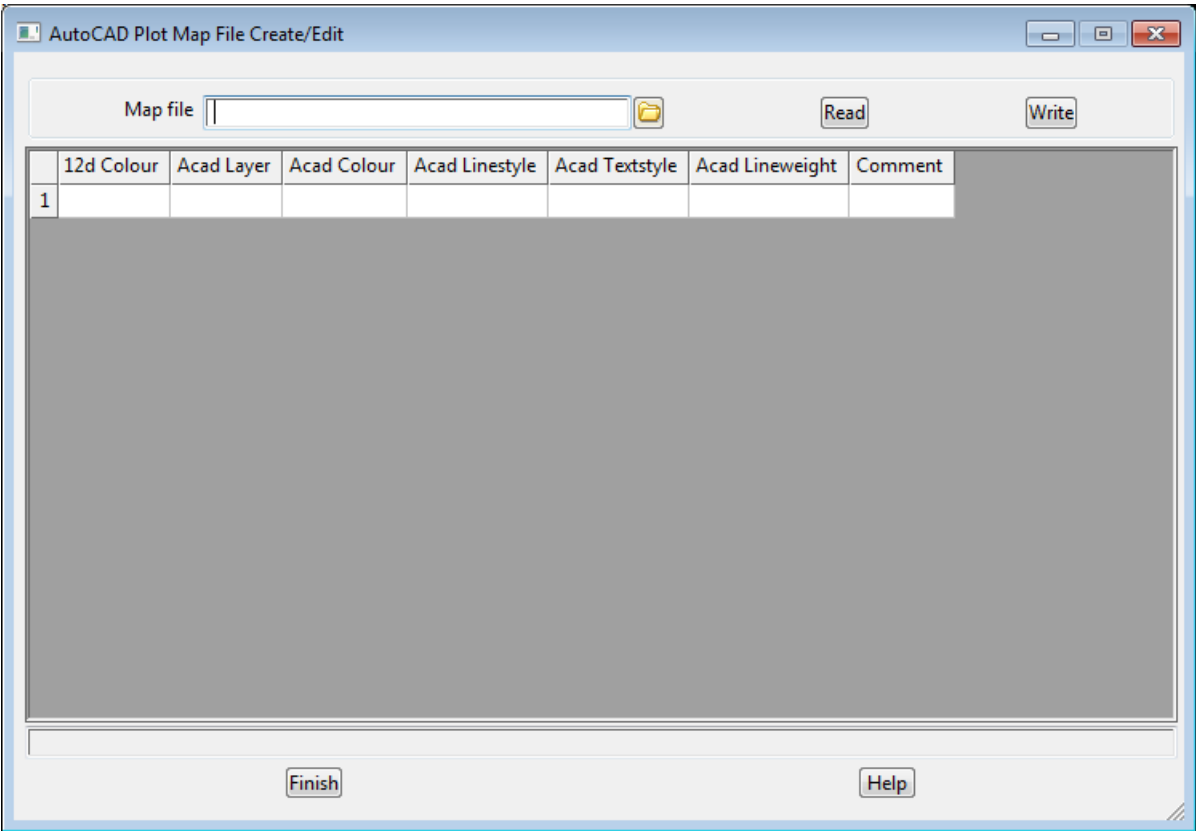

To use hardware arcs in plots, simply change the draw arcs in hardware tick box to tick and select **set**.

ACAD Plot Map File

Position of option on menu: Plot =>Plotting setups =>ACAD plot map file

When plotting to AutoCAD, an Autocad map file can be used which uses the **12d Model** colour of an entity in the plot as a key to mapping the entity into AutoCAD.

On selecting the ACAD plot map file option, the AutoCAD Map File Create/Edit panel is displayed.

Interface Colours

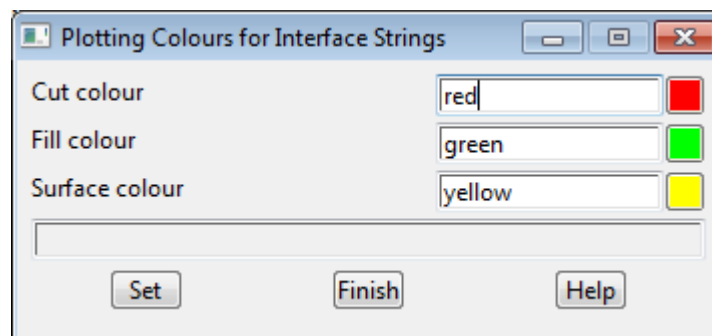

Position of option on menu: Plot =>Plotting Setups =>Interface colours

When drawing interface strings in **12d** Model, cut areas are denoted in red, fill areas in green and sections on the surface in yellow.

However, when plotting it is convenient to be able to map the interface colours to other colours.

This panel is used to define new colours for the interface colours, and the new colours are then mapped to pens using the pen mapping table or plotter mapping file.

On selecting the **interface colours** option, the **plotting colours for interface string** panel is displayed.

To define new colours, simply type the values into the appropriate panel fields and select **set**.

Note - the new interface colours are not used for displaying interface strings in **12d** Model, only for plotting.

DGN Plot Seed File

Position of option on menu: Plot =>Plotting Setups =>DGN plot seed file

When creating plot files in Intergraph DGN format, an Intergraph DGN seed file can be used.

On selecting the **DGN plot seed file** option, the **DGN plot seed file** panel is displayed.

To define an Intergraph IGDS plot seed file to use for Intergraph plotting, simply type the file name into the plot seed file panel field and select **set**.

Default DPI

Position of option on menu: Plot =>Plotting setups => Default DPI

This defines the default DPI (dots per inch) when plotting rasters.

On selecting **Default DPI**, the **Default Raster DPI** panel is displayed.

The *DPI* value give the default dots per inch that is used for plotting rasters.

DWT Plot Template File

Position of option on menu: Plot =>Plotting Setups =>DWG plot template file

When creating plot files in AutoCAD format, an AutoCAD template file can be used.

On selecting the **DWT plot template file** option, the **AutoCAD Plotter Drawing Template File** panel is displayed.

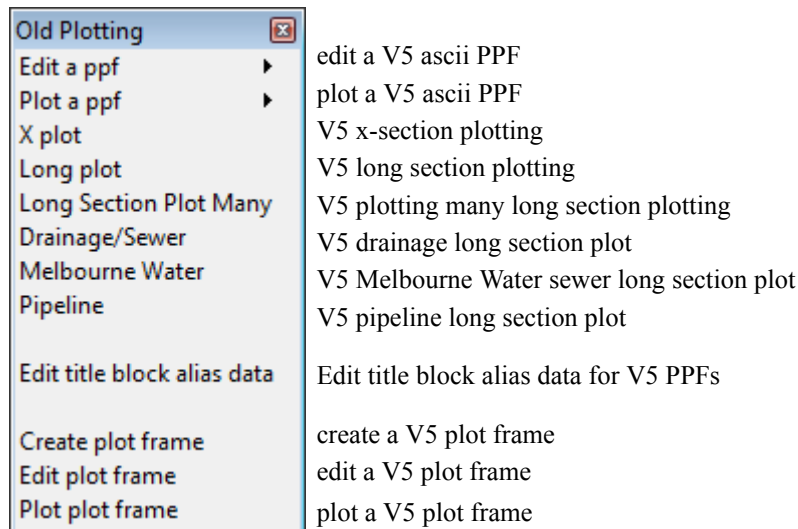

To define an AutoCAD plot seed file to use for AutoCAD plotting, simply select either *DWG* or *DXF* for the File format, type the file name into the plot seed file panel field and select **set**.

Old Plotting

Position of menu: Plot =>Plot =>Old plotting

The Old plotting walk-right menu is

Edit a ppf

Position of option on menu: Plot =>Old plotting =>Edit a ppf

The **Edit a ppf** option is used to edit V5 ascii plot parameter files (*.ppf) with the editor pointed to by the EDITOR_4D environment variable.

The **Edit a ppf** walk-right menu provides a list all the plot parameter files (files ending in .ppf) in the current folder.

When a file is selected from the list, it is loaded into the editor pointer to by the environment variable EDITOR_4D.

Plot a ppf

Position of option on menu: Plot =>Old plotting =>Plot a ppf

The V5 ascii PPFs for long section, cross section and plot frames can have enough information in them to totally generate the plot from the ppf. The **plot a ppf** option is used to plot such a plot parameter file (*.ppf).

The **Plot a ppf** walk-right menu provides a list all the plot parameter files (files ending in .ppf) in the current folder.

When a file is selected from the list, it is then used to generate a plot.

Note - the plot parameter file is defined in the chapter **Advanced Plotting**.

X Plot

Position of option on menu: Plot =>Old plotting =>X plot

The **X plot** option is used to make the traditional pages of cross-section plots, that is, stacked x-sections, with offsets and elevations labelled for each cross section string, and elevations displayed for each of the tins on the section view.

For **12d Model V5**, each string to be plotted is assumed to be on a straight line in plan. Hence the cross section is taken as a straight line from the first point of the string to the last point of the string. The chainage of the first point of the string is used as the offset.

For **12d Model V6** and above, sections do not have to be a straight line in plan. The chainage of the first point of the string is used as the offset.

The format of the x-section plot is partially controlled by fields in the **Section X Plot** panel but more extensive control is possible using a **plot parameter file** (*.ppf). The plot parameter file is fully documented in the [Cross Section Plot Parameter File](#) section of the Appendix, [Plot Parameters](#).

The cross section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

X_SECTION_PPF_4D pathname of default .ppf file

In the pathname to the default .ppf file, \$LIB is used to stand for the library folder set by LIB_4D. For example, "\$LIB/cross.ppf" is the file cross.ppf in the library area.

Which x-sections are to be plotted is specified by giving the model containing the appropriate cross sections. Sections are also drawn through any triangulations and service items on the section view. Vertical exaggeration, services and corridor settings are taken from a plot parameter file or from the settings for the section view.

X-sections can be labelled with either the offset from the centreline and heights for each of the x-section points, or simply the position of the centre-line.

The required page size is given, plus the scale (the vertical exaggeration is taken from the view

settings) and the sections are then plotted in columns on the plotter page. Once a page is full, a new plot page is automatically begun.

The stacked x-section plots in each column can be lined up by their centre-lines.

After selecting the **X plot** option, the **Cross Section Plot** panel is displayed.

The **Title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **Cross Section Plot Title** panel is displayed.

if <i>ticked</i> , the standard 4D Solutions border and two lines of title are placed on the bottom of the plot			
Title file	file box		available *.tf files
if <i>non-blank</i> and use title file is set to <i>tick</i> , then the file given in this field is used to generate a user defined title block for the plot.			
Title line 1/2	input		
first/second line of title information			
Title height (mm)	input	5	
height (in millimetres) to draw the characters in the two lines of title information.			
Title colour	input	cyan	available colours
colour used for the border and the title information.			

Long Plot

Position of option on menu: Plot =>Old plotting =>Long plot

The **Long plot** option is used to make traditional long section plots with string chainages and elevations labelled for the primary string and elevations and depths displayed for each of the tins on the section view.

The format of the long section plot is partially controlled by fields in the section long plot panel but more extensive control is possible using a **plot parameter file** (*.ppf). The plot parameter file is fully documented in the [Long Section Plot Parameter File](#) section in the chapter, [Plot Parameters](#).

After selecting the **Long plot**, the **Long Section Plot** panel is displayed.

The long section plot is tailored by using the plot parameter file (.ppf file) given in the plot parameters field. A default .ppf file is set by pointing to it with the environment variable

LONG_SECTION_PPF_4D pathname of default .ppf file

In the pathname to the default .ppf file, \$LIB is used to stand for the library folder set by LIB_4D. For example, "\$LIB/long.ppf" is the file long.ppf in the library area.

The **title** button on the bottom of this panel controls the use of a title block file and the plotting of a border and two lines of title. If the **title** button is selected, the **section long plot title** panel is displayed.

The **pagination** button on the bottom of this panel controls whether the long section plot is broken into pages, by a chainage length or millimetres of plot.

If the **pagination** button is selected, the **Section long plot pagination** panel is displayed.

The fields and buttons used in the two panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters	file box	LONG_SECTION_PPF_4D*.ppf	
<i>file of plot parameters used for extra control of the long section plot. The default .ppf file is pointed to by the environment variable LONG_SECTION_PPF_4D.</i>			
<i>For more information on the long section plot parameters, please go to the section Long Section Plot Parameter File in the Appendix Plot Parameters</i>			
Plot parameters write	file box		*.ppf
<i>file to write a copy of the plot parameters necessary to regenerate the plot.</i>			
Section view	input/output	current view	available section views
<i>section view to use for plot definitions such as the tins to profile, the models of services, corridor width and vertical exaggeration.</i>			
Plotter type	input	hp	hp, dxf, postscript etc.
<i>file format for the plot information.</i>			
Plot file	file box		*.hp etc.
<i>name of the file to write out the long section plot to.</i>			

Start/end chainage	input		
<i>the plot covers the chainage range given by the start and end chainage fields. If the start/end chainage is blank, the start/end chainage of the primary string is used.</i>			
Chainage increment	input	100	
<i>chainage increment to label the long plot with chainage and height values.</i>			
Sheet size wd ht (mm)	input		available sheet sizes
<i>The width and height values (separated by space) or the name of a user defined sheet size.</i>			
Scale 1:	input		
<i>horizontal scale for the plot. The vertical scale is taken from the ppf or the section view.</i>			
Plot primary string	tick box	ticked	
<i>if ticked, the primary string is plotted along with any horizontal geometry displayed in the section view.</i>			
Use HG VG for min, max	tick box	ticked	
<i>if ticked, the chainage range available for plotting is from the minimum of the horizontal geometry (HG) and the vertical geometry (VG) to the maximum of the HG and VG. Useful for kerb returns. If not ticked, the chainage range available for plotting is from the minimum of the horizontal geometry (HG) to the maximum of the HG.</i>			
Label depths	tick box	ticked	
<i>if ticked, label in boxes at the bottom of the plot, the distance between the primary string and the tins.</i>			
Text style	input	1	
<i>text style to be used in the long section plot boxes.</i>			
Box text ht (mm)	input	3	
<i>height (in millimetres) to plot the chainage and elevations in the boxes in the long section plot.</i>			
Box colour	colour box	cyan	available colours
<i>colour used for the chainage text and the boxes.</i>			
Datum value	input		
<i>if non-blank, the value to be used as a datum. If blank, then a suitable datum value will be calculated.</i>			
Offset model	input		available models
<i>if non-blank, then all the strings in the offset model will be projected onto the primary string and drawn and labelled on the long section plot.</i>			
Title tab			
<i>brings up the section long plot title panel.</i>			
Use title file	tick box	not ticked	
<i>if ticked, a user supplied title block file is used.</i>			
Standard Title	tick box	ticked	
<i>if ticked, the standard 4D Solutions border and two lines of title are placed on the bottom of the plot</i>			
Title file	file box		available *.tf files
<i>if non-blank and use title file is set to tick, then the file given in this field is used to generate a user defined title block for the plot.</i>			
Title line 1/2	input		
<i>first/second line of title information</i>			
Title height (mm)	input	5	
<i>height (in millimetres) to draw the characters in the two lines of title information.</i>			
Title colour	colour box	cyan	available colours

colour used for the border and the title information.

Pagination tab

brings up the section long plot pagination panel.

Pagination	tick box	ticked
-------------------	----------	--------

if **ticked**, the long section plot is broken into separate plots of length given in the **length** field, from the start chainage to the end chainage. If the **overlap** field is non-zero, then each page of the long section plot also includes the **overlap** value of the end of the previous page of plot.

*The units for length and overlap can be either **chainage distance** or **millimetres on the plot page**.*

Hence apart from the first page and possibly the last page, the plot will have a total length given by the sum of the length and the overlap panel fields.

Pagination mode	input	chainage	chainage, millimetres
------------------------	-------	----------	-----------------------

*the units for length and overlap can be either **chainage distance** or **millimetres on the plot page**.*

*If pagination mode is set to **chainage**, the units are chainage distance.*

If pagination mode is set to **millimetres**, the units are millimetres on the plot.

Length	measure box	600
---------------	-------------	-----

if pagination is set to **ticked**, the length of new plot to be included in the current plot.

Overlap	measure box	25
----------------	-------------	----

*if pagination is set to **ticked**, the length of the previous plot page to be included in the current plot.*

Plot button

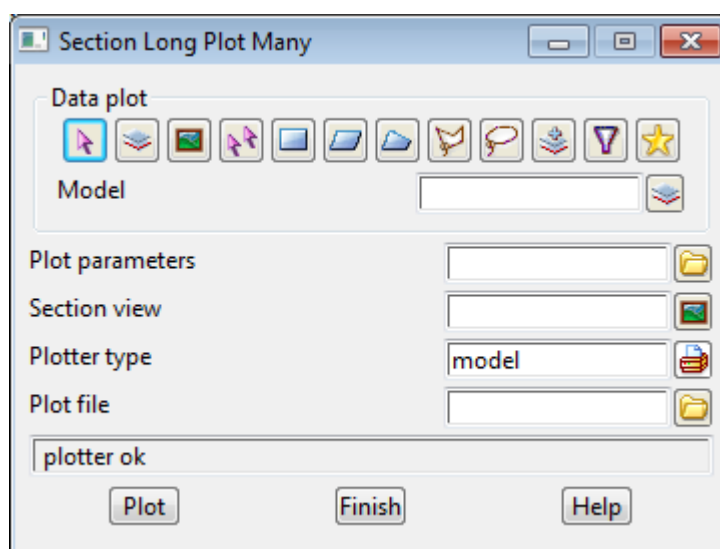

write out the plot for the long section plot between the chainages given in the start and end chainage fields. The format of the file is given by the `plotter` type

Plot Many Long Sections

Position of option on menu: Plot =>Old plotting =>Long Section Plot Many

The **Long Section Plot Many** option is used to plot individual long section plots for each string selected by the Data source.

On selecting the **Long Section Plot Many** option, the **Section Long Plot Many** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to plot - Data source type

data source type.

Data source

*when the **plot** button is selected, long section plots are created for all the strings selected by the data source.*

Plot parameters

file box

*.ppf files

file of plot parameters to be used for the long section plots.

Section view

view box

available views

name of the section view for defining information for the long section plots. For example, tins to plot.

Plotter type

input

hp

available plotters

type of plotter to plot to.

Plot file

input

stem of the name to use for the long section plots.

Plot

button

*when the **Plot** buttons is selected, individual long section plots will be created for all the strings selected in the data source field.*

Drainage/Sewer Plot

Position of option on menu: Plot =>Old plotting =>Drainage/Sewer

The **Drainage/Sewer** option is for creating drainage and/or sewer long-section plots.

The option has already been described under **Design=>Drainage-sewer =>Plots**.

See [Drainage Longsections](#).

Melbourne Water Sewer Plot

Position of option on menu: Plot =>Old plotting =>Melbourne Water

The **Melbourne Water** option is for creating sewer long-section plots to Melbourne Water specifications.

The option has already been described under **Design =>Drainage-sewer =>Plots**.

See [Melbourne Water](#).

Pipeline Plot

Position of option on menu: Plot =>Old plotting =>Pipeline

The **Pipeline** option is for creating pipeline long-section plots.

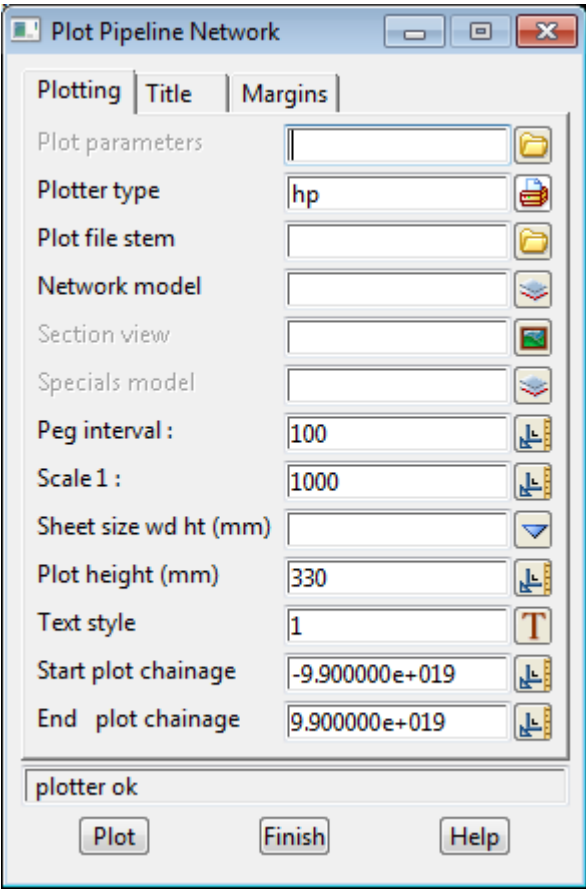

Given the plot sheet size and the horizontal and vertical scales, the longsections for the pipelines are plotted starting at the top of the sheet and moving across the sheet. Once one row is full, if there is room the plot moves down the page and begins a new row. When a plot sheet is full, a new plot sheet is automatically begun.

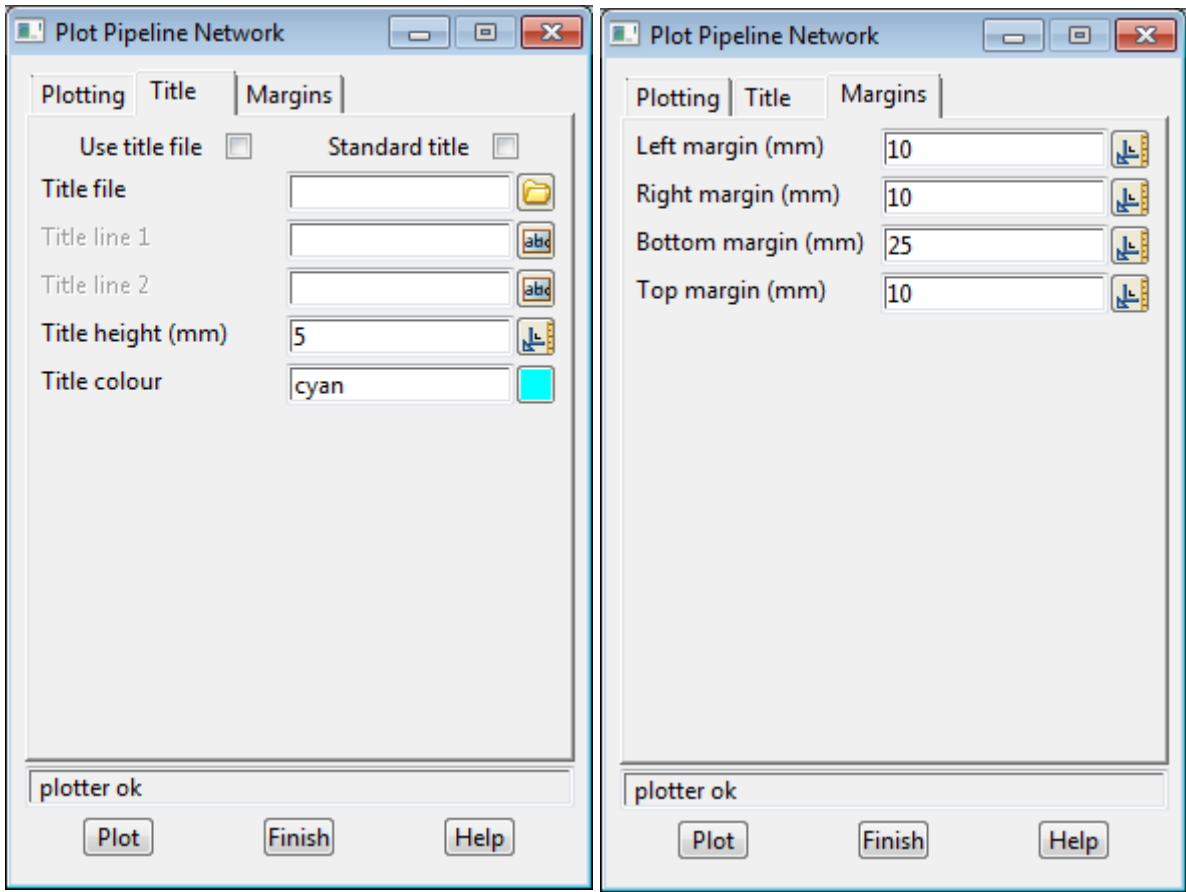

The pipeline plots include

- s the horizontal and vertical joint deflection at any vertical intersection points which have no curves on them
- s the natural surface height and chainage at any pegs or positions from the specials model, plus the invert level and depth to pipe at the position

- s for any services which cuts the pipeline, the name, diameter, invert level, the distance along the pipeline of the cut point plus the invert level and depth of the invert for the pipeline and the cut point.

After selecting the Pipeline option, the **Plot Pipeline Network** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Plot parameters <i>file of plot parameters used for extra control of the long section plot.</i>	input		*.ppf
Plotter type <i>format for the plot output.</i>	input	hp	hp, dxf, postscript etc.
Network model <i>the model containing the pipelines to be plotted.</i>	input		
Section view <i>the section view to be used to define the vertical exaggeration, corridor widths, tins to section through, services models to section etc.</i>	input		
Plot file stem <i>since more than one plot page may be produced, the plot file stem plus a plot page sequence number followed by .plt is used as the plot file names.</i>	input		
Specials model <i>model of text strings which are used as extra labels for the plots.</i>	input		
Peg interval <i>if the specials model is blank, the pipelines are labelled with the text peg at the peg interval along the</i>	input	50	

pipeline.

- Scale 1:

input

horizontal scale for plotting the pipeline long sections. The vertical exaggeration is taken from the section view given in the section view field.
- Sheet size wd ht (mm)

input

available sheet sizes

*if **non-blank**, the width and height values in millimetres (separated by space) or the name of a user defined sheet size.*

*If **blank**, the sheets size is calculated to fit the long section plot.*
- Pipeline line ht (mm)

input

*the maximum allowable height for a longsection plot for a pipeline line. Datum breaks are applied to any part of the longsection that will not fit into the **pipeline line ht**.*
- Start plot chainage

input

If blank, the start chainage of the pipelines is used; if non blank, the plots start at this chainage for each pipeline.
- End plot chainage

input

If blank, the end chainage of the pipelines is used; if non blank, the plots finishes at this chainage for each pipeline.
- Plot

button

write out the pipeline longsection plots for the pipelines in the model given in the network model field.

The fields and buttons for *margin* tab:

Left/right margin (mm) 10.0
the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0
the bottom/top margin between the sheet and the plotting area inside the sheet.

The fields and buttons for the *title* tab:

Use title file tick box
*if **ticked**, a user defined title block file is used.*

Use Standard title tick box tick
*if **ticked**, the standard border and two lines of title are placed on the bottom of the plot*

Title file input *.tf
*if **non-blank** and use title file is set to **tick**, then the file given in this field is used to generate a user defined title block for the plot.*

Title line 1/2 input
first/second line of title information

Title height (mm) input 5
height (in millimetres) to draw the characters in the two lines of title information.

Title colour input cyan available colours
colour used for the border and the title information.

Title Block Data Editor

Position of option on menu: Plot =>Old Plotting =>Edit title block data
NO LONGER USED IN V7

This panel is used to easily change to data in your drawing title blocks (set values for the `user_text_n` field in a title file).

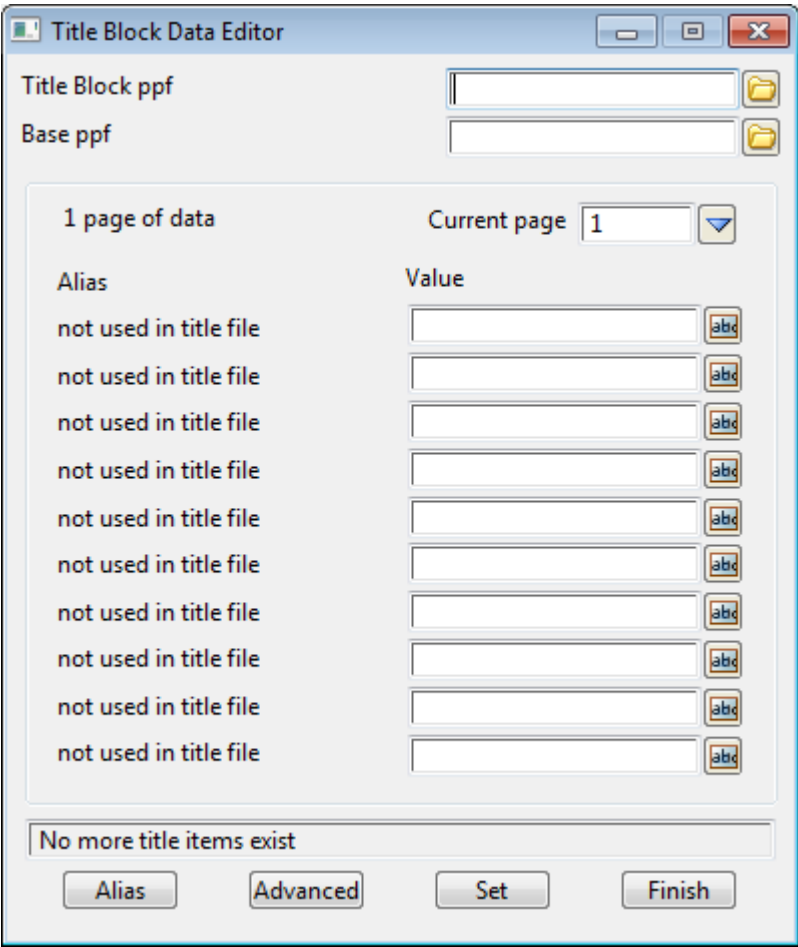

The **Title block ppf** is the ppf that is created by the panel. You may want to create a title block ppf for every drawing you create. This way you can easily re-plot a drawing with the same title block data. This is the ppf name that you will use in the future plot panels when you are ready to plot using the title block.

The **Base ppf** field is an existing ppf that includes all of your default plot parameters for creating your drawing. It must reference a title file.

12d marks the location of your title block data using the variables `user_text_1`, `user_text_2` etc. Since it is difficult to remember what `user_text_1` represents in the title block, 12d allows you to use a meaningful name reference (Main title for example) instead of `user_text_1`. The Alias button allows you to set these alias names for the title file referenced in your base ppf.

The Advanced button is only used if the same text data is to be used in another Title Block ppf (share the data between drawing).

The Set button creates/updates the title block ppf and the title file values that you entered.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Title block ppf

this is the ppf that is created by the panel. This is the ppf name that you will use in the future plot panels when you are ready to plot using the title block. The Title Block ppf is usually stored locally (in the current folder).

Base ppf

this ppf must exist (often in library or your user library). It will contain all of your default plot parameters for creating your drawing. It must reference a title file (see notes below).When you press enter, the ppf file is read to find the name of the title file you reference. Once the title file is found, the alias names are read from the title alias file if available.

To convert an existing ppf file into a Base ppf file use a text editor to delete all references to *user_text_n* variables in the file.

Current page	choice box	available pages
---------------------	------------	-----------------

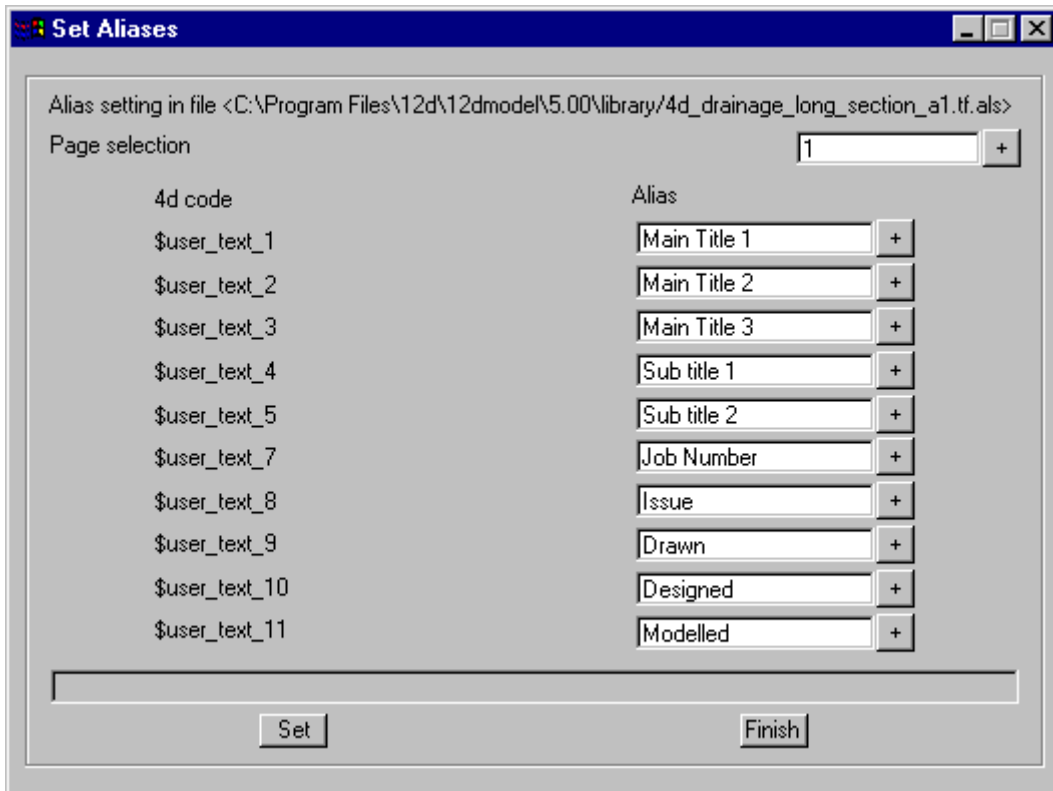

if more than one page of data (10 fields) are required additional pages will be listed here.

Value	input box
--------------	-----------

the data to be shown into your drawing title block is entered here. The description to the left is either *\$user_text_n* (Note that there may be gaps in the numbering sequence) or an alias that has been set up using the alias button below.

Alias	button
--------------	--------

if the fields have the names *\$user_text_1*, *\$user_text_2* etc. use the button to change the names to a more meaningful description. These new names will be stored in the same folder as the with the title file specified in your base ppf file (the extension *als* will be added). The following panel will be displayed.

Note that there may be gap in the *\$user_text_n* sequence. Only the variable used in the title file will be listed.

Advanced button

this feature allows you to share text data between different *title block ppf* files. The actual text data is stored in a title file txt (*.tft) file. Selecting the button will bring up the following panel and allow you to change the *.tft file to be used. Generally you will select a *.tft file previously set up for another title block file.

Select the **Set** button to set your select. The text data will be read and the main panel updated when you select the **Finish** button.

Set button

creates/updates the Title block ppf file and *.tft file.

Notes:

Short-cuts:

*.als and *.tft files can be copied, renamed and then edited using the Title Block Edit Panel or your own text editor.

Alias files (*.als) are kept in the same folder as the your title files. Once you have one alias file set up copy the alias file and rename the copy the same name as the title file but add the additional extension .als. For example:

title file	4d_drainage_long_section_a1.tf
alias file	4d_drainage_long_section_a1.tf.als

CAUTION: The *user_text_n* variables should represent the same data in both title files. For example *user_text_1* should be the main title in both files.

Title file text files (*.tft see advanced) files are kept in the same folder as the your Title block ppf. If you choose not to share a tft between Title block ppf files you can simply copy and rename them. Once you have saved one *.tft file, copy the file and rename the copy the same name as the title block file but add the additional extension .tft

Title Block ppf file	drawing 1.ppf
title file text file	drawing 1.ppf.tft

Title Block ppf

The title block ppf file does not contain any data itself. Rather it references a *.tft file containing the text data and your base ppf file (file containing all of your default plot parameters). An example ppf file follows:

The Title Block ppf file is a ppf file with the Base ppf and user text values (in the tft file) referenced by #include statements.

```
#define ALIAS 1
section_long_plot "plot 2" {
// TITLE BLOCK PPF FILE
#include "Base_ljg.ppf"
#include "Title_block.ppf.tft"
}
```

Base ppf

The Base ppf can be anywhere including local, Library and User Library. It must contain a reference to a title file in the *use_title_file* parameter. The *user_title_file* parameter must be in the file and can't be in an #include file.

The following is an example title file reference.

use_title_file	yes
title_file	"your title file.tf "

Note: If you already have user_text variables defined in your Base ppf these values will not be used and a warning message will be issued at plot time. It is best to remove all user_text variables from your existing ppfs before attempting to use them with this new 4d facility.

The panel scans the title file reference and records all of the *user_text_n* entries that are used. **Only those used are displayed in the panel.** Next a file with the (is located. If found the alias values are used in the panel instead of *\$user_text_1*, *\$user_text_2* etc.

If an alias file (same name as the title file PLUS the extension .als) has been previously created using the Alias button, the aliases for the user_text's are used on the left hand side of the panel.

If an alias file has not been found, they can be created by simply selecting the Alias button.

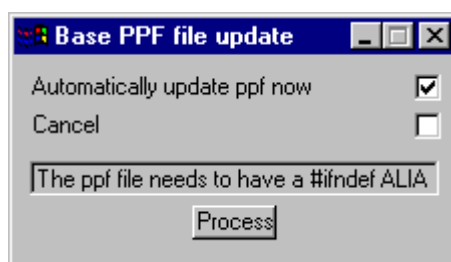

The Base ppf is also checked to see if a

```
#ifndef ALIAS
```

```
and
```

```
#endif
```

exist around the opening "xxxxxxx {" and closing "}" braces. If not, a Base PPF file update panel is displayed.

Select *Automatically update ppf now* and select the Process button. The extra lines then are added to the Base ppf.

For example, the beginning and end of the updated file will look like:

BEGINNING

```
#ifndef ALIAS
```

```
section_long_plot "plot 2" {
```

```
#endif
```

END

```
#ifndef ALIAS
```

```
}
```

```
#endif
```

Clicking on the Alias button brings up the Set Aliases panel. Simply fill in the names to use instead of the words \$user_texts_n in the Title Block - User Text Data Editor panel. Selecting Set writes out an aliases file which has the same names as the title file but with the appended ending .als.

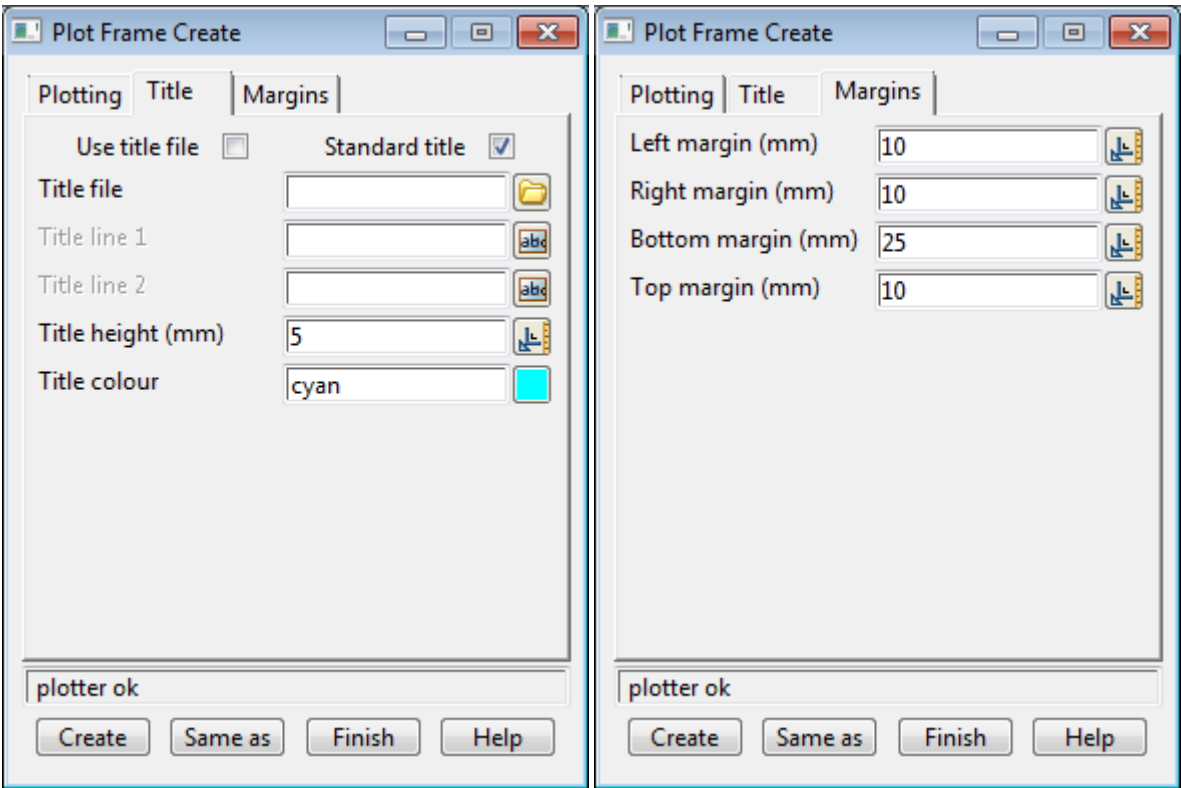

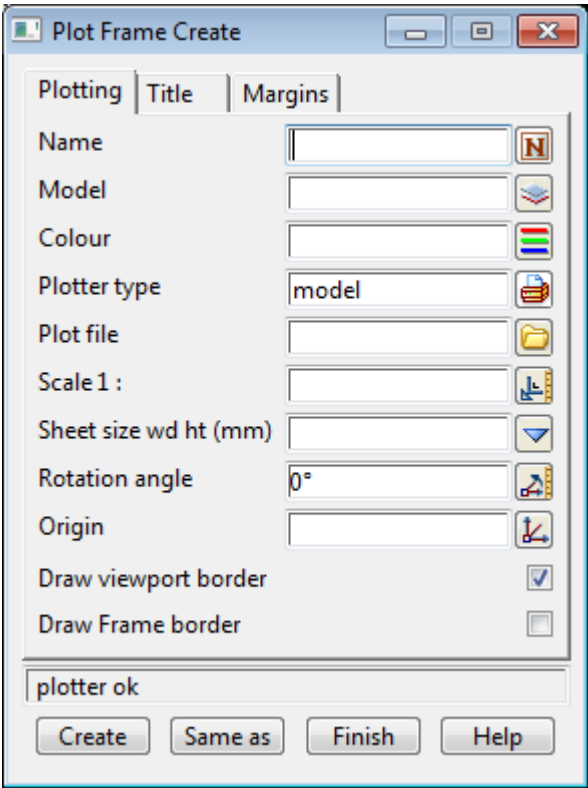

Set

After selecting Set, the values for the user_texts are written to a file specified under **Advanced** (if used) or of the same name as the Title block ppf but with .tft appended.

Create Old Plot Frame

Position of option on menu: Plot =>Old plotting =>Create plot frame

On selecting the Create old option, the **plot frame create** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>name for the plot frame.</i>	input		
Model <i>the model for the plot frame.</i>	input		available model
Colour <i>the colour for the plot frame.</i>	input		available colours
Plotter type <i>format for the plot file.</i>	input	hp	hp, dxf, dwg, postscript etc.
Plot file <i>name of the file to write the plot of the plot frame to.</i>	input		*.hp etc.
Scale 1: <i>scale for the plot.</i>	input		
Sheet size wd ht (mm) <i>the width and height values (separated by spaces) or the name of a user defined sheet size.</i>	input		
Rotation angle <i>angle of rotation for the plot frame.</i>	input	0	
Origin <i>x_origin y_origin z_origin origin (in world units) for the corner of the plot frame - given as three values separated by spaces. The values can either be typed in, or selected by clicking LB in the origin panel view and getting up the xyz ops menu and selecting the pick xyz option.</i>	input		xyz ops menu
Draw viewport border <i>if ticked, plot the box around the plotting area (viewport).</i>	tick box	tick	
Create <i>create the plot frame and then put up the plot frame edit panel for the created plot frame.</i>	button		
Same as <i>after picking the same as button, an existing plot frame is selected and its information is used to fill in the above panel fields.</i>	button		

Title tab

Use title file <i>if ticked, use the file given in the title file field to generate a title block.</i>	tick box		
Standard Title <i>if ticked, plot the standard 12d Model title block with the text, height and colour given in the following panel fields.</i>	tick box	tick	
Title line 1/2 <i>first/second line of title information in the 12d titleblock or for the user defined title block.</i>	input		
Title height (mm) <i>height (in millimetres) to draw the two lines of title information in the 12d titleblock.</i>	input	10	
Title colour	input	cyan	available colours

colour used for the border and the title information in the 12d titleblock.

Title tab

Left/right margin (mm) 10.0

the left/right hand side margin between the sheet and the plotting area inside the sheet.

Bottom/top margin (mm) 10.0

the bottom/top margin between the sheet and the plotting area inside the sheet.

How To Use the Option

The plot frame contains all the information required to define the physical area in real world units to be plotted, the position on the sheet of the area being plotted, the plotter type and the plot file name.

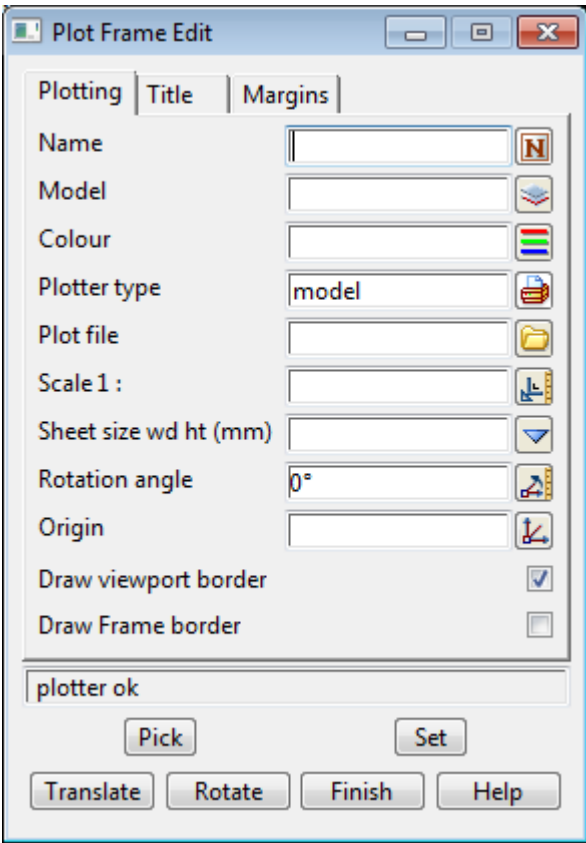

Once the frame is created, the **plot frame edit** panel for the created plot frame is automatically placed on the screen so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

Editor Old Pot Frame

Position of option on menu: Plot =>Old plotting =>Editor plot frame

The plot frame editor is used to edit existing plot frames. It is automatically placed on the screen when a plot frame is created so that the frame's position can be adjusted using the **Translate** and **Rotate** buttons.

On selecting the **Editor old** option, the **plot frame edit** panel is displayed.

Most of the fields and buttons used in this panel are the same as the **plot frame create** panel - see the previous section [Create Old Plot Frame](#). The different ones are

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Pick	button		
-------------	--------	--	--

select the plot frame to be edited.

Set	button		
------------	--------	--	--

update the plot frame with the information in the above panel fields.

Translate	button		
------------------	--------	--	--

*after picking the **translate** button, the plot frame will move with the cursor until a point is selected to give the final position of the plot frame.*

Rotate	button		
---------------	--------	--	--

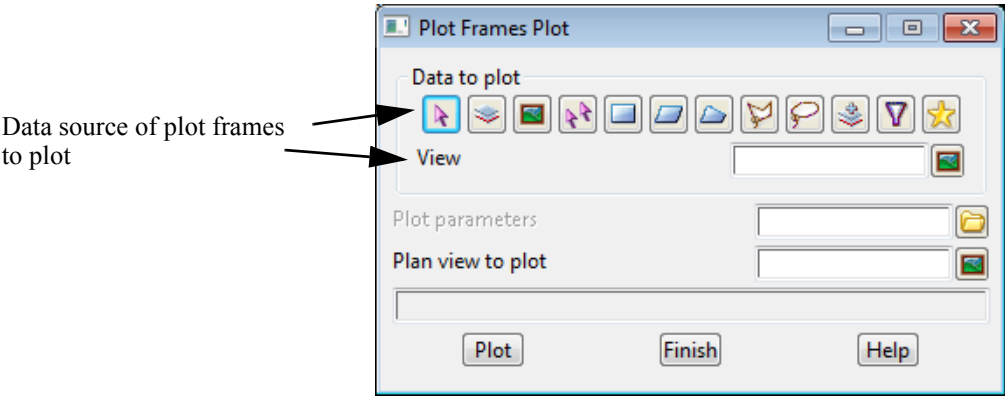

*after picking the **rotate** button, the plot frame is further rotated around the left hand corner of the sheet, by the angle made between the rotation point and the current cursor position. The plot frame will continue to rotate until a point is selected to fix the rotation angle.*

Plotting Old Plot Frames

Position of option on menu: Plot =>Old plotting =>Plot plot frame

The **plot old** option is used to make a plot of the data on a given plan view for all the selected plot frames (selected by the data source). Note that the plots are of a given plan view and the plot frames do not have to be on the plan view.

On selecting the **plot old** option, the **plot frames plot** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data to plot	Data source type			
--------------	------------------	--	--	--

data source type.

Data source

*when the **plot** button is selected, all the plot frames in the data source will be plotted.*

Plot parameters	input			*.ppf files
-----------------	-------	--	--	-------------

file of plot parameters to be used for the plot frames.

For more information on the plot frame plot parameters, please go to the section [Plot Frame Plot Parameter File](#) in the Appendix [Plot Parameters](#)

Plan view to plot	input			available views
-------------------	-------	--	--	-----------------

*the name of the view that is plotted when the plot frames are selected for plotting. Note that the plot frames **do not** have to be on the view.*

Plot	button			
------	--------	--	--	--

*when the **plot** buttons is selected, all the plot frames in the data source field will be plotted.*

Pen Mapping Old

Position of option on menu:

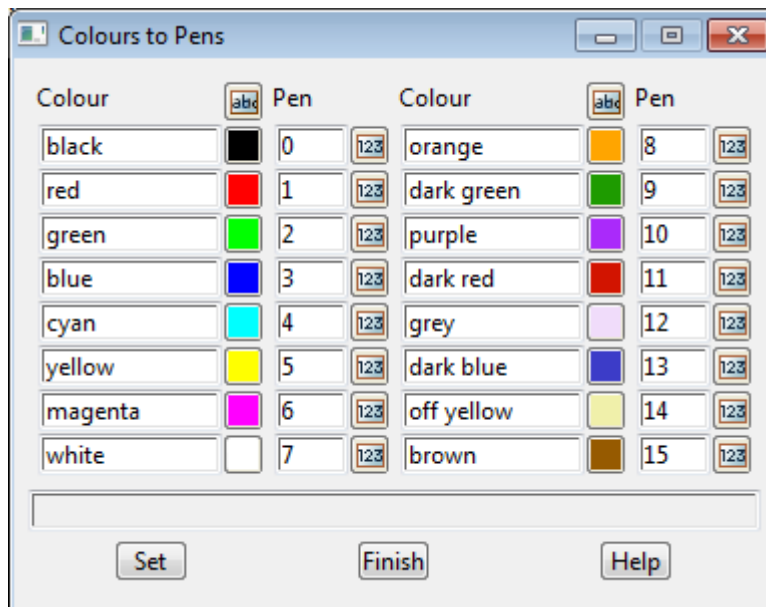

NO LONGER USED

Although **12d** Model uses up to 10,240 different colours, most plotters have a smaller number of pens. Consequently for any plot, it is necessary to define what pen number corresponds to each **12d** Model colour.

For all plotters types except Eagle, the **pen mapping** option can be used to define the correspondence between **12d** Model colours and plotter pens for the first sixteen colours. The other colours are given in the colour_map.def file. For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

The pen mapping option is only used if a plotter mapping is not being used (see next section).

On selecting the **pen mapping** option, the current pen mapping table is displayed in the **colours to pens** panel.

When starting a new project or entering an existing project, the default pen mapping table is defined by the **colours.4d** file.

Once inside the project, any pen number in the table can be modified by changing the appropriate pen field and then selecting the **set** button. The modified table is stored until **12d** Model is quit or the user changes to another project.

The pen mappings for colours above sixteen are given in the **colours.4d** file but can not be displayed or modified by the **colour to pens** panel.

Whenever a plot is created using non-eagle plotter types, the colours are mapped to the pen numbers given in the **colours to pen** table before writing out the plot file.

For Eagle plots, the **eagleplt.pmf** file is used to map colours to pens.

Note - when **12d** Model is started up again or the user changes to a new project, the table reverts to its default settings as given in the colours.4d file.

25 PPF Editors

The **PPF Editors** chapter contains information about the items used in the binary plot parameter editors.

Go to [Title Blocks](#)
[Plot Data Model](#)
[X Plot PPF Editor](#)
[Long Plot PPF Editor](#)
[Drainage Plot PPF Editor](#)
[Melbourne Water Plot PPF Editor](#)
[Pipeline Plot PPF Editor](#)
[Drainage Plan Plot PPF Editor](#)
[Plot Frame and PPF Editor](#)
[Convert Ascii PPF to Binary](#)
[Copy Title Data](#)

The first section of the documentation is [Title Blocks](#).

Title Blocks

A sheet of paper on a plotter has (0,0) in the bottom left hand corner and the units of millimetres.

So when any plot (plan, plot frame, long section, cross section, drainage network long section, Melbourne Water longsection or pipeline longsection) is generated from **12d Model**, the data is effectively translated and scaled so that it fits onto a sheet of paper with (0,0) in the left hand corner, and with drawing units of millimetres.

When generating plots from **12d Model** (other than the simple view plots), users can select to have a Standard **12d** title block, or use their own Title blocks that have been stored in **12d Model** title block file (tbf). A user defined title block is build up from lines, circles, arcs, text etc and the title block drawing commands are placed in a file with ending **.tbf**

For **12d Model 8** and above, the format for the title block information is a subset of the **12d Ascii** format with a special header title_block.

So Inside the **tbf** file, the set of all title block drawing commands is enclosed within a set of curly brackets **{ }** with the special header

title_block

before the curly brackets.

That is,

```
title_block  {
              title block drawing commands

              }
```

The easiest way to create a **tbf** file is to create the title block information in a model, or a view of models, and then write the models out to a **tbf** file using the **Create/Edit Title Block File** panel (*Plot =>Plotting setups =>Create/edit title block file* or *Drafting => Create title block file*. See [Create/Edit Title Block File](#)).

Because the units for plots are millimetres, the units for the title block drawing commands are also in millimetres. And for the purpose of drawing up a title block in a **12d Model** model, the (0,0) for the model corresponds to the **origin** (0,0) of the plot, and the units in the model are

taken to be millimetres rather than the normal standard that the World units are metres.

So for any lines and text drawn up in a model as part of a title block, think of the World units representing millimetres rather than metres.

Title Block Variables

For title blocks, the text drawing command has been extended so that special information such as the project name, project details, current date and time, plotting scales etc. can be automatically inserted into the title block at plot time.

To achieve this, special **title block variables** have been defined and wherever these variables appear in a title block text command, they are expanded to their defined value at the time of plotting.

Hence the title block variables are simply place markers which have text values substituted for them when the title block file is used in a plot.

The title block variables all begin with a \$ and are followed by either another title block variable or a single space. For example, in the 12d Ascii string definition, the line is

```
text "user text $variable more user text"
or
text "user text $variable_1 more user text $variable_2 more user text "
```

For example

```
text "Project $project"
```

will write out the word "Project " followed by the name of the project.

Note - colour, style, xfactor, slant, offset etc. are all assigned as part of the 12d Ascii string definition.

List of Title Block Variables

Project Name

\$project // the current project

Project Details

Project details which are entered by the user for each project (and defined by the option **Project =>Details =>Details**) can be included in the title block and are specified as *title block variables* by beginning with **\$project_detail** and then including the *project detail name* as part of the \$project_detail.

\$project_detail_project_detail_name

where project_detail_name is the name of the project detail as given in the **Projects Detail Editor** (and not the **Display name** which is shown in the **Setup Projects Details** or **Edit Project Details** panels)

For example

```
text "Client: $project_detail_Client"
```

will write out the word "Client: " followed by the text in the project detail with the name "Client".

Folder Details

The full path name of the working folder

\$folder

Plot Details

The following title block variables take values which are passed down from the plot itself:

\$plot_file	// the current plot file
\$scale	// for plot frames, the current scale
\$horizontal_scale	// for section plots, the current horizontal scale
\$vertical_scale	// for section plots, the current vertical scale
\$start_chainage	// for section plots, the start chainage for the plot // sheet
\$end_chainage	// for section plots, the end chainage of the plot sheet

PPF Details

The following title block variables take values which are passed down from the **plot parameter file** for the plot (plot parameter files are described in more detail in the rest of this manual):

- \$time**
The current date and time. The format for the date and time is given by the plot parameter `time_format`. See the next section for the description of the format.
- \$title_1, \$title_2**
`$title_1` takes the value from the panel field title line 1 from the **section x plot title**, **section long plot title** or **plot frame title** panels, or from the parameter `title_1` in the plot parameter file. If `title_1` doesn't exist, then `$title_1` is blank.
Similarly for `$title_2`.
- \$user_text_n** where `n=1,2,... 1000`
`$user_text_n` takes the value of the parameter `user_text_n` in the plot parameter file. If `user_n` doesn't exist, then `$user_text_n` is blank.

Aliases can also be defined for the `$user_text_n` which are used in the PPF editors. See the next section [Aliases for \\$User Text](#) on aliases.
- \$page_number**
`$page_number` has the starting value one, or the value given by the parameter **start_page_number** from the plot parameter file, and is incremented by one, for each plot produced by the plot option (for example, for each page of a long section plot, for each page of x-section plots or each plot generated from a model of plot frames).
- \$drawing_number_prefix, \$drawing_number, \$drawing_number_postfix**
The values for `$drawing_number_prefix` and `$drawing_number_postfix` are passed down from the plot parameter file by the parameters **drawing_number_prefix** and **drawing_number_postfix** respectively.

`$drawing_number` has the starting value one, or the value given by the parameter **start_drawing_number** from the plot parameter file, and is incremented by one for each plot produced by the plot option (for example, for each page of a long section plot, for each page of x-section plots or each plot generated from a model of plot frames).

Client: \$project_detail_Client			DESCRIPTION:	
SURVEYED:	FIELD BOOK:	DATE:	\$user_1	
DRAWN:	CHECKED:	\$time		
HORIZONTAL DATUM:		LEVEL DATUM:	SCALE:	DI
			\$scale	

~

Example of Model with Title Block Variables

Notes

1. For plot frames, the horizontal_scale and vertical_scale are given the current scale, and \$start_chainage and \$end_chainage are ignored.
2. For section plots, \$scale is ignored.

Model Details - for the *Drainage Long-section Plot* only

The following title block variables take values from the model containing the drainage network.

\$model_name

The name of the drainage model

\$model_event_type

Type of event of last storm analysed ("Minor" or "Major")

\$model_return_period

ARI of last storm analysed.

Aliases for \$User Text

12d Model user defined title blocks can include up to 1,000 markers for placing *user defined text* (\$user_text_n where n can be from 1 to 1000) which is only substituted for actual text at plotting time. Because of the difficulty of knowing exactly what \$user_text_n stood for when the title block is being plotted, the concept of aliases has been introduced.

For example, instead of referring to \$user_text_4, an alias can be defined to use the "Engineers name:" instead.

The definition of \$user_text_n in a title block file has been **extended** so that it also includes any **alias** for the \$user_text_n.

To define an alias for the \$user_text_n in the title block file, simply replace the

"_n" by "<n, for the alias>"

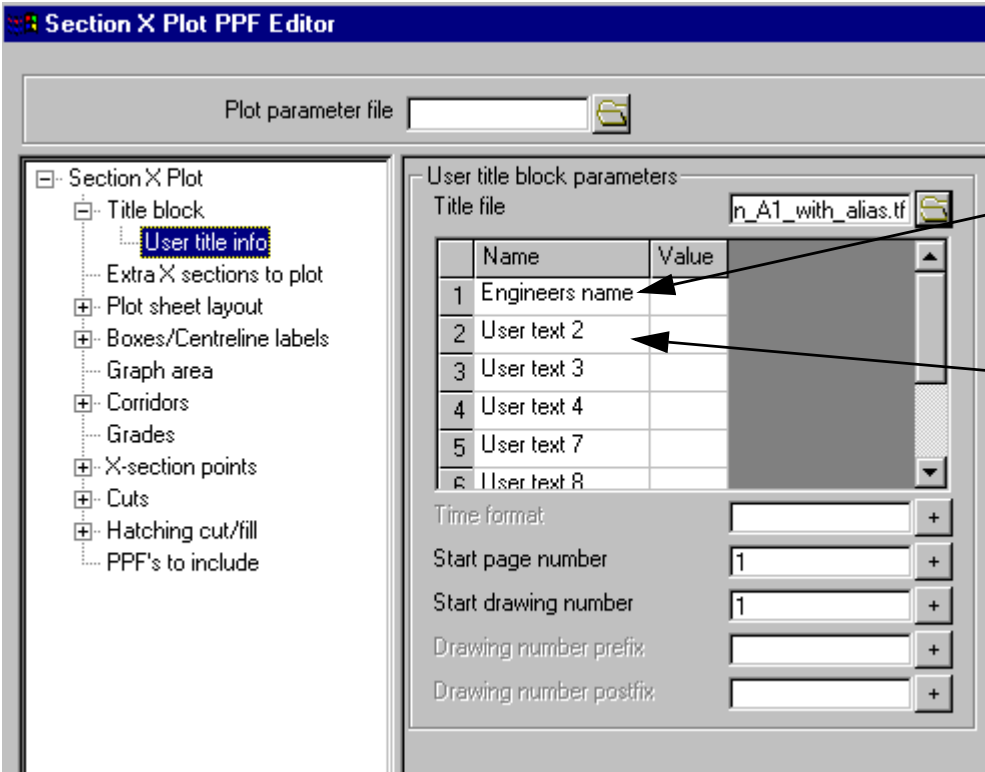

For example, if \$user_text_1 is to have the alias "Engineers name", the title block file would now contain:

```
text "$user_<1,Engineers name:>"
```

The title file and aliases work seamlessly with the interactive PPF editors and Plotters (which are described in their own sections). In the *Title block* section of the interactive PPF editors and Plotters, the user defined title block file is *scanned* for any \$user_text in it and it is presented as a grid containing all the \$user_text's in the title block with a column to fill in the values that the user wants to be plotted.

If the format \$user_text_n is in the title block file, it is displayed as "*User text n*" in the PPF editor. If an *alias* exists, then the *alias* is displayed instead of "User text n".

For example, using the \$user_text<1,Engineers name> in a title block file will give:

Values Used for Defaults when Creating Plot Frames

There are special parameters that are written in an info block at the top of title block file that are used as defaults for fields in the option **Plots=>Plot frames=>Create**.

They are

```
info {
  text "plot_frame_name"          plot_frame_name
  text "plot_frame_model"        plot_frame_model
  text "plot_frame_sheet_size"   plot_frame_model
  text "plot_frame_colour"       plot_frame_colour
  text "plot_frame_scale"        real_number
  text "plot_frame_angle"        real_number
  text "plot_frame_left_margin"  real_number
  text "plot_frame_right_margin" real_number
  text "plot_frame_top_margin"   real_number
  text "plot_frame_bottom_margin" real_number
  text "plot_frame_viewport"     0 or 1
}
```

Specifying the Format for \$time

The format for \$time is passed down by the plot parameter **time_format**.

time_format format // format for \$time

The format consists of one or more codes and the formatting codes are preceded by a percent sign (%). Characters that do not begin with a % are copied unchanged.

%a	abbreviated weekday name
%A	full weekday name
%b	abbreviated month name
%B	full month name
%c	date and time representation for locale
%d	day of month as decimal number (01 - 31)
%H	hour in 24-hour format (00 - 23)
%I	hour in 12-hour format (01 - 12)
%j	day of year as decimal number (001 - 366)
%m	month as decimal number (01 - 12)
%M	minute as decimal number (00 - 59)
%p	current locale's A.M./P.M. indicator for 12-hour clock
%S	second as decimal number (00 - 59)
%U	week of year as decimal number, with Sunday as first day of week (00 - 51)
%w	weekday as decimal number (0 - 6; Sunday is 0)
%W	week of year as decimal number, with Monday as first day of week (00 - 51)
%x	date representation for current locale
%X	time representation for current locale
%y	year without century, as decimal number (00 - 99)
%Y	year with century, as decimal number
%Z, %z	time-zone name or abbreviation; no characters if time zone is unknown
%%	percent sign

The # flag may prefix any formatting code and the meaning of the format code is changed as follows

Format Code	Meaning
%%#c	long date and time representation, appropriate for current locale. For example, "Tuesday, March 16, 1993,12:41:29"
%%#x	long date, appropriate for current locale. For example, "Tuesday, March 16"
%%#d, %%#H, %%#I, %%#, %%#m, %%#M, %%#S, %%#U, %%#W, %%#y, %%#Y	Remove leading zeros (if any).
%%#a, %%#A, %%#b, %%#B, %%#p, %%#X, %%#z, %%#Z, %%#%	# flag is ignored

Examples

The format to give the date in the form dd/mm/yy (06/09/97) is	"%d/%m/%y"
If you want to remove leading zeros from the day and month (6/9/97)	"%#d/%#m/%y"

Example Title Block File for V8 and Above

```

title_block {
  name ""
  info {      // Info block for plot frames
    text "plot_frame_name" "test 1"
    text "plot_frame_model" "test"
    text "plot_frame_colour" "blue"
    real "plot_frame_scale" 1000
    text "plot_frame_sheet_size" "A0"
    real "plot_frame_angle" 0
    real "plot_frame_left_margin" 5
    real "plot_frame_right_margin" 5
    real "plot_frame_top_margin" 5

Example of a V7 Title Block File

For **12d Model 7** and earlier, the format of the commands to draw these objects in the title block file was the same as the draw_commands for user defined linestyles. However this format is now obsolete.

```
// Information used for creating plot frames with 12d Model 7
// plot_frame_name "plot 17"
// plot_frame_model "plot frames"
// plot_frame_colour "green"
// plot_frame_scale 500.000
// plot_frame_sheet_size "A1"
// plot_frame_angle 0.000
// plot_frame_left_margin 10.000
// plot_frame_right_margin 20.000
// plot_frame_top_margin 50.000
// plot_frame_bottom_margin 100.000
// plot_frame_viewport yes
//

Plot Data Model

A sheet of paper on a plotter has (0,0) in the bottom left hand corner and the units of millimetres. So when any plot (plan, plot frame, long section, cross section, drainage network longsection, Melbourne Water longsection or pipeline longsection) is generated from **12d Model**, the data is effectively translated and scaled so that it fits onto a sheet of paper with (0,0) in the left hand corner, and the drawing units are millimetres.

If a title block is drawn, either using either the Standard title or taking the title drawing information from a user defined title file, the title block is also drawn onto the sheet of paper with the drawing units of millimetres.

In each of the **Title Block** nodes in the plot PPF editors, a model can be given in the **Plot data model** field. Like the Title Block, the **Plot data model** is also drawn onto the sheet of paper (that is, to the plot) with the drawing units of millimetres.

Because of the special nature of the **Plot data model**, (0,0) in the **Plot data model** matches the (0,0) of the plot and the units of the **Plot data model** are taken to be millimetres (unlike a normal model where the units are metres). This is also no clipping done when plotting the **Plot data model**.

So like the Title Block, the **Plot data model** is simply an overlay that is plotted on top of the paper plan/long section/x section plot that has just been generated.

In the **Plot data model** you can have information in World Units or Paper Units (which are millimetres on a plot). And because of the special nature of the **Plot data model**, one World unit in the **Plot data model** ends up as one millimetre on the plot. This applies to strings, text, linestyles and symbols in World units. For text, linestyles and symbols defined in Paper units (millimetres), one Paper unit in the **Plot data model** still ends up as one millimetre on the plot.

Special Notes

- If the **Plot data model** is added to a Plan View, for example when it is being created or edited, then the **Plotting scale** for the Plan view needs to be 1000 for any text, linestyles and symbols defined in Paper units to display as they would appear on a final plot.
- When **plotting to a model**, **12d Model** multiplies the millimetre size by 1000 so that lengths (distances) in the "model of the plot" represent millimetres on the plot page. Hence if you plot the "model of the plot", you need to plot with a scale of 1:1000 to get the correct size in the paper plot.
- Because the **Plot data model** is simply an overlay with no change of scale and is not clipped, then in the special case of **plotting to a model**, a copy of the **Plot data model** is simply added to the model containing the plot. So World text, linestyles and symbols stay as World text, linestyles and symbols. And text, linestyles and symbols in Paper units stay as

text, linestyles and symbols in Paper units.

- (d) Because of (c), when displaying the "model of the plot" on a Plan View, the **Plotting scale** for the Plan View needs to be 1000 so that text, linestyles and symbols defined in Paper units that have come from the **Plot data model** display as they would appear in a final paper plot.
- (e) If you plot to a model, and then plot the "model of the plot", all the linestyles and symbols will be exploded into lines and arcs.

When creating data in a **Plot data model**, the easiest thing is to create all the data, text, linestyles and symbols in World units, and to think of the World unit as being millimetres.

However many **12d Model** users only have their linestyles and symbols defined in Paper units and it is okay to use them in the **Plot data model** as long as (c) and (d) of the Special Notes are remembered when plotting to a model.

X Plot PPF Editor

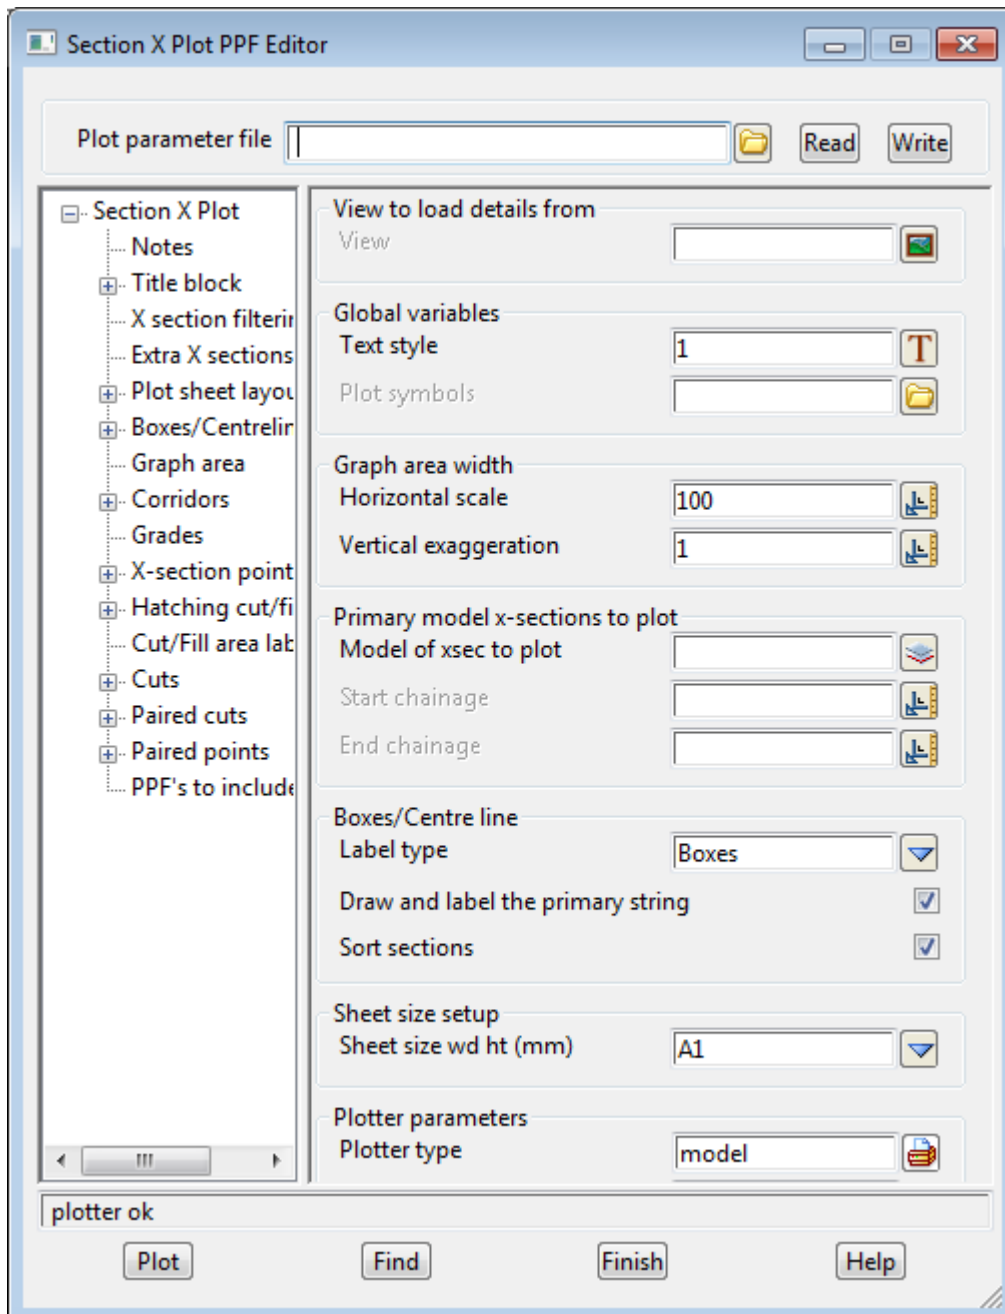

Position of option on menu: Plot =>Plot and PPF Editors =>Cross sections

The **Cross Sections PPF Editor** is for creating and/or editing a (binary) X-section PPF and for creating a cross section plot.

Note: Binary PPFs are stored *within* the project (not in the folder containing the project as the ascii PPFs were).

On selecting the **Cross sections** option, the **Section X Plot PPF Editor** panel is displayed.

The plot parameters for controlling the cross section plots are accessed by expanding the appropriate node in the **Section X Plot** tree (click on the **+** to expand to node or **-** to collapse the node) and then clicking on the required node, and the information to fill in is displayed on the right hand side of the panel.

Information on the top and bottom buttons, and all the different nodes, now follows.

Section X Plot - Front Page

Section: View to load details from

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
View		section view box	
<i>on selection of an existing section view, the vertical exaggeration, model of x-sections to plot, corridor model and corridor settings from the section view are loaded into the ppf editor.</i>			

Section: Global variables

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Text style	global_textstyle	text box	
<i>default textstyle</i>			
Plot symbols	plot_symbols	file box	
<i>specify a plot symbol file if it exists.</i>			

Section: Global area width

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Horizontal Scale	scale	measure box	available measures
<i>horizontal scale to be used for X section plots</i>			
Vertical exaggeration	vertical_exaggeration	measure box	available measures
<i>vertical scale to be used for X section plots</i>			

Section: Primary model x-sections to plot

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Model of xsec to plot	model_to_plot	model box	
<i>model of X sections to plot</i>			
Start chainage	start_chainage	input	
<i>start chainage of X sections to plot</i>			
End chainage	end_chainage	input	
<i>start chainage of X sections to plot</i>			

Section: Boxes/Centre line

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Label type	label_type	choice box	centre line boxes
------------	------------	------------	-------------------

the label type to be used for plotting.

Draw and label the primary string

primary_string	tick box
----------------	----------

if ticked, the primary string will be labelled and drawn.

Sort sections	sort_sections	tick box
----------------------	---------------	----------

if ticked, the X sections will be sorted in increasing chainage. This is important if individual cross sections are added after an apply function for example.

Section: Sheet size setup

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Sheet size wd ht (mm)	sheet_size	sheet size box	

a valid sheet size is selected.

Section: Plotter parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Plotter type	plotter_type	plotter box	

a valid plotting option is selected.

Plot file stem	plot_stem	plotter box
-----------------------	-----------	-------------

plot file name. The appropriate extension is added dependant on the plotter type selected.

Clean plot models beforehand

plot_model_clean	choice box	do not clean prompt for clean always clean
------------------	------------	--------------------------------------------------

whether to clean (delete the elements in) any resultant plot models that may already exist, before generating the plot(s). This parameter is only applicable if plotting to a model or models. Note that if the models are cleaned using this parameter, any non-plot or locked elements found in the models will not be cleaned from the models, and the plot job will be cancelled.

Title Block

Section: Common title block parameters

Panel field	Parameter name	Type
Standard title	plot_border	tick box
<i>if ticked, a standard 12d title block will be used.</i>		
Use title file	use_title_file	tick box
<i>if ticked, a user defined title file is used.</i>		
Title line 1	title_1	text box
<i>if Standard title is ticked, Title line 1 is the first line of title text. If Use title file is ticked, Title line 1 is substituted for the title block variable \$title_1.</i>		
Title line 2	title_2	text box
<i>if Standard title is ticked, Title line 2 is the second line of title text. If Use title file is ticked, Title line 2 is substituted for the title block variable \$title_2.</i>		

Section: 12d default title block parameters

Panel field	Parameter name	Type	Pop-Up
Text size	title_text_size	measure box	
<i>text size of title text.</i>			
Text colour	title_colour	colour box	available colours
<i>colour of title text.</i>			

Section: Model to plot in plotter units

Plot data model	mm_plot_model	model box	available models
<i>the model is plotted as part of the x-section plot. The Units for the Plot data model is considered to be millimetres and the (0,0) in the Plot data model corresponds to (0,0) in the plot. For more information see Plot Data Model.</i>			

Title block - User title info

The parameters shown below are subject to the appropriate title block variables existing in the title file. For more information on these variables see the section [Title Block Variables](#).

Section: User title block parameters

Panel field	Parameter name	Type	Pop-Up
Title file	title_file	file box	available title files
<i>specifies the name of the title file to use. If a valid title file exists, the specified Name values will be filled out in the grid using the title block variable \$user_text_n.</i>			
Name		output	
<i>the alias for the nth user text specified in the title file.</i>			
Value	user_text_n	input	
<i>the alias text to be substituted in for the user text specified.</i>			
Time format	time_format	input	
<i>the time format relates to the \$time title block variable. For more information on the time formats see</i>			

the section [Specifying the Format for \\$time](#).

Start page number start_page_number input

used as the starting value for the title block variable \$page_number. If missing, \$page_number starts at 1.

Start drawing number start_drawing_number input

used as the starting value for the title block variable \$drawing_number. If missing, \$drawing_number starts at 1.

Drawing number prefix drawing_number_prefix input

the value entered is used for the title block variable \$drawing_number_prefix.

Drawing number postfix drawing_number_postfix input

the value entered is used for the title block variable \$drawing_number_postfix.

Please continue to the next section [X Section Filtering](#).

X Section Filtering

The model of cross sections usually contains all the sections required to accurately model the object.

Section: X-Section Filtering

For plotting purposes, often only a subset of all the cross sections is required to be plotted so the filtering section contains methods to select only those cross sections that are to be plotted.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Filter cross-sections	filter_sections	tick box	
<i>if tick, the fields in this tab are used to filter cross sections in the X-sections model.</i>			
Filtered sections colour	filter_colour	colour box	available colours
<i>colour of the filtered cross sections</i>			
Created by function	filter_function	function box	available functions
<i>a model of sections can contain sections created by more than one function. If a function is given, only cross sections created by that function are selected.</i>			
Regular filtering interval	filter_interval	input	
<i>regular interval to use for filtering the cross sections</i>			
Regular culling tolerance	filter_tolerance	input0	
<i>tolerance to use when selecting a cross section</i>			
Include start section	filter_start	tick box	
<i>if tick, a section at the start chainage is included even if the start chainage is not a regular interval</i>			
Include end section	filter_end	tick box	
<i>if tick, a section at the end chainage is included even if the end chainage is not a regular interval</i>			
Include chainage equality sections	filter_equalities	tick box	
<i>if tick, include sections where there is a chainage equality</i>			
Reference string	filter_reference	string select	
<i>if tick, a string is selected to define which sections occur at H/V tangent points, crest and sags.</i>			
Include H tangent sections	filter_tangent	tick box	
<i>if tick, a sections at the horizontal tangent points of the reference string are included even if they are not a regular interval</i>			
Include V tangent sections	filter_tangent_vertical	tick box	
<i>if tick, a sections at the vertical tangent points of the reference string are included even if they are not a regular interval</i>			
Include V crest/sag sections	filter_crestsag	tick box	
<i>if tick, a sections at the crest and sag points of the reference string are included even if they are not a regular interval</i>			
Special chainage file	filter_spc_file	file box	*.spc files
<i>if non blank, a file of chainages to include sections at even if they are not a regular interval</i>			

Please continue to the next section [Extra X Sections To Plot](#).

Extra X Sections To Plot

The order and centreline chainages of the x-section subplots for the x-section plot are defined by the sections from the primary model of cross sections.

The sections through any specified triangulations and service models, and offsets for labelling are fully defined by these primary x-sections.

However it is also possible to plot extra x-sections on each of the sub-plots by supplying extra models of x-sections which are at the same plan positions as the primary x-section strings.

Only those x-sections from the extra models that are within a user specified tolerance of a primary x-section are plotted.

The extra models of x-sections and the plan tolerance for checking that the extra cross-sections are the same position as the primary x-sections are

Section: Extra models of x-sections to plot

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Model tolerance <i>user defined distance</i>	extra_model_tolerance_1	input	
Model name <i>extra models of x-sections to plot.</i>	extra_model_n	input	

Please continue to the next section [Plot Sheet Layout](#).

Plot Sheet Layout

X-sections are normally generated at chainages along a given centreline. This centreline chainage is stored with each x-section string.

The chainages of the actual x-sections are referred to as **offsets** from the centreline position rather than x-section chainages. The offsets of the x-section are set up so that the zero offset occurs where the x-section crossed the centreline string.

The x-sections along the centreline are stored in the one model (the primary model) which is then used to generate the cross section plot.

The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the sheet (left_margin,bottom_margin).

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Each x-section from the primary model of x-sections generates its own sub-plot for which the x-section is the primary string. Hence the cross section plot consists of many individual plots drawn on one or more plot sheets.

Each plot sheet is considered to have only positive co-ordinates with the origin (0,0) in the left hand corner. The units for the plot are millimetres.

Section: Plot width parameters

The width of the plot can be a fixed distance left or right of the centre line (zero offset) or for the full section plus an extra left and right distance:

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Absolute extensions	absolute_extensions	tick box	
<i>if ticked, the section goes from the left_extension offset on the left to the right_extension offset on the right. If unticked the section goes for the entire section length plus the left and right extension distances.</i>			
Left extension	left_extension	input	
<i>The left_extension value in world units.</i>			
Right extension	right_extension	input	
<i>The right_extension value in world units</i>			

Section: Align section parameters

If required, all the sub-plots in a column can be automatically positioned so that the zero offsets (the centrelines) of each x-section line up.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Line up centrelines	line_up_cl	tick box	
<i>if ticked, each sub plot will be aligned on the plot using the centreline of each x section.</i>			

Plot Sheet Layout - Margins

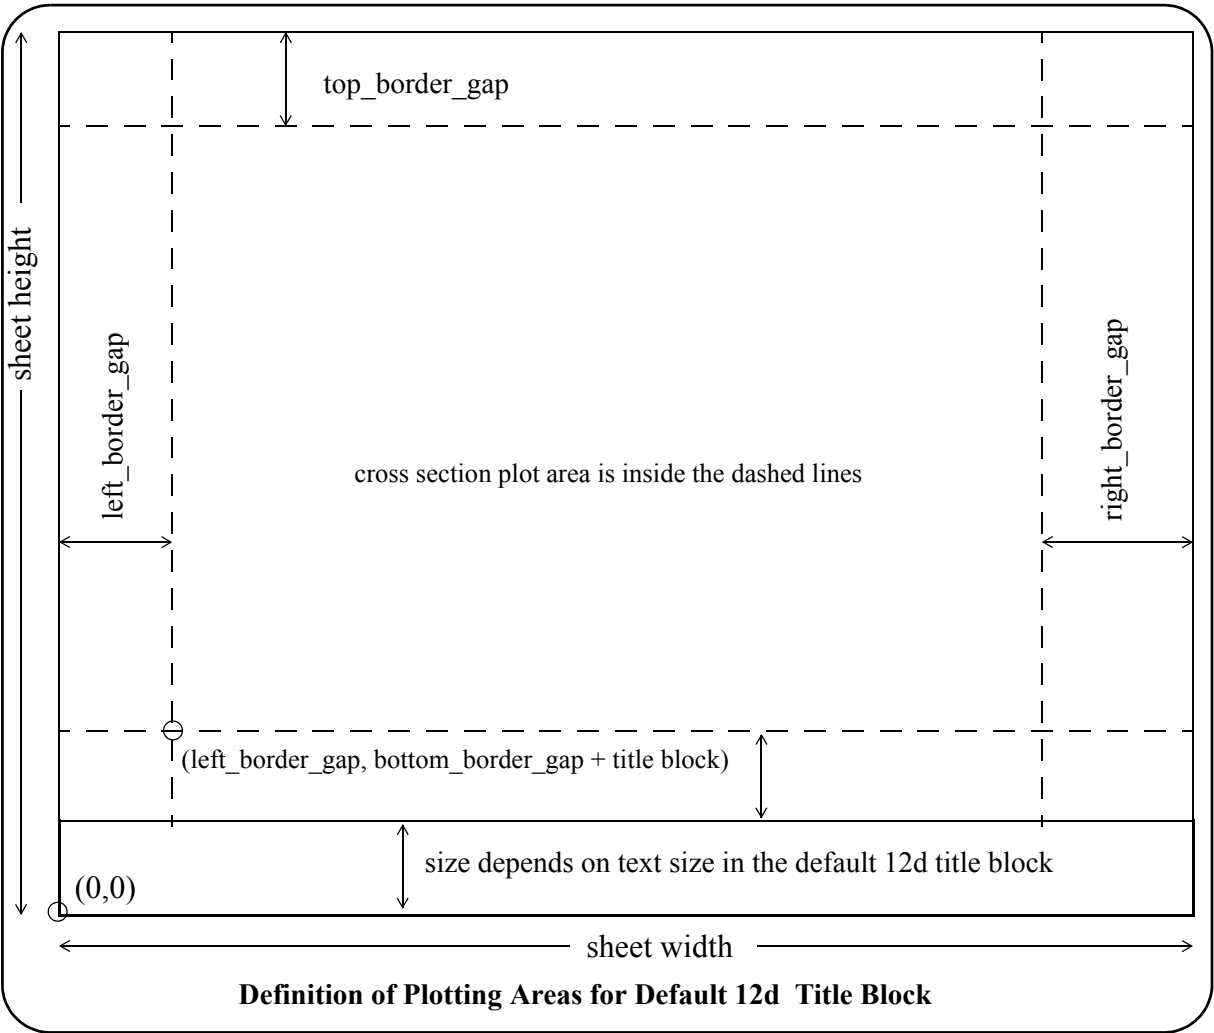

Section: Margins for standard 12d title file - Border gaps

If the *default 12d title block* is used, then the size of the bottom of title block depends on the size. The following parameters are used in the default title block case and the *bottom_border_gap* is added to the calculated height of the bottom of the title block.

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left border gap (in millimetres).</i>	left_border_gap	input	
Right (mm) <i>right border gap (in millimetres).</i>	right_border_gap	input	
Top (mm) <i>top border gap (in millimetres).</i>	top_border_gap	input	
Bottom (mm) <i>bottom border gap (in millimetres).</i>	bottom_border_gap	input	

Section: Margins for user title file

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left margin (in millimetres).</i>	left_margin	input	
Right (mm) <i>right margin (in millimetres).</i>	right_margin	input	
Top (mm) <i>top margin (in millimetres).</i>	top_margin	input	
Bottom (mm) <i>bottom margin (in millimetres).</i>	bottom_margin	input	

Because the user can easily select from the plotting panel whether a User Defined Title Block or the default 12d title block is used, both sets of margin and gap parameters can exist in the one plot parameter file.

The x-sections are plotted in the order they occur in the x-section model and start being plotted at the bottom left hand corner of the cross section plotting area.

The individual x-section plots are then drawn going up the column, and when the column is full, start from the bottom of the next column.

When a sheet is full, a follow on sheet is created.

Plot Sheet Layout - Sub Plot Gaps

The gaps between the sub plots is restricted to those specified below.

Section: Sub plot gaps parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Left (mm) <i>left margin (in millimetres).</i>	left_sub_plot_gap	input	
Right (mm) <i>right margin (in millimetres).</i>	right_sub_plot_gap	input	

Top (mm)	top_sub_plot_gap	input
-----------------	------------------	-------

top margin (in millimetres).

Bottom (mm)

bottom margin (in millimetres).

The x-section sub-plot itself consists of the three regions - boxes, datum and graph.

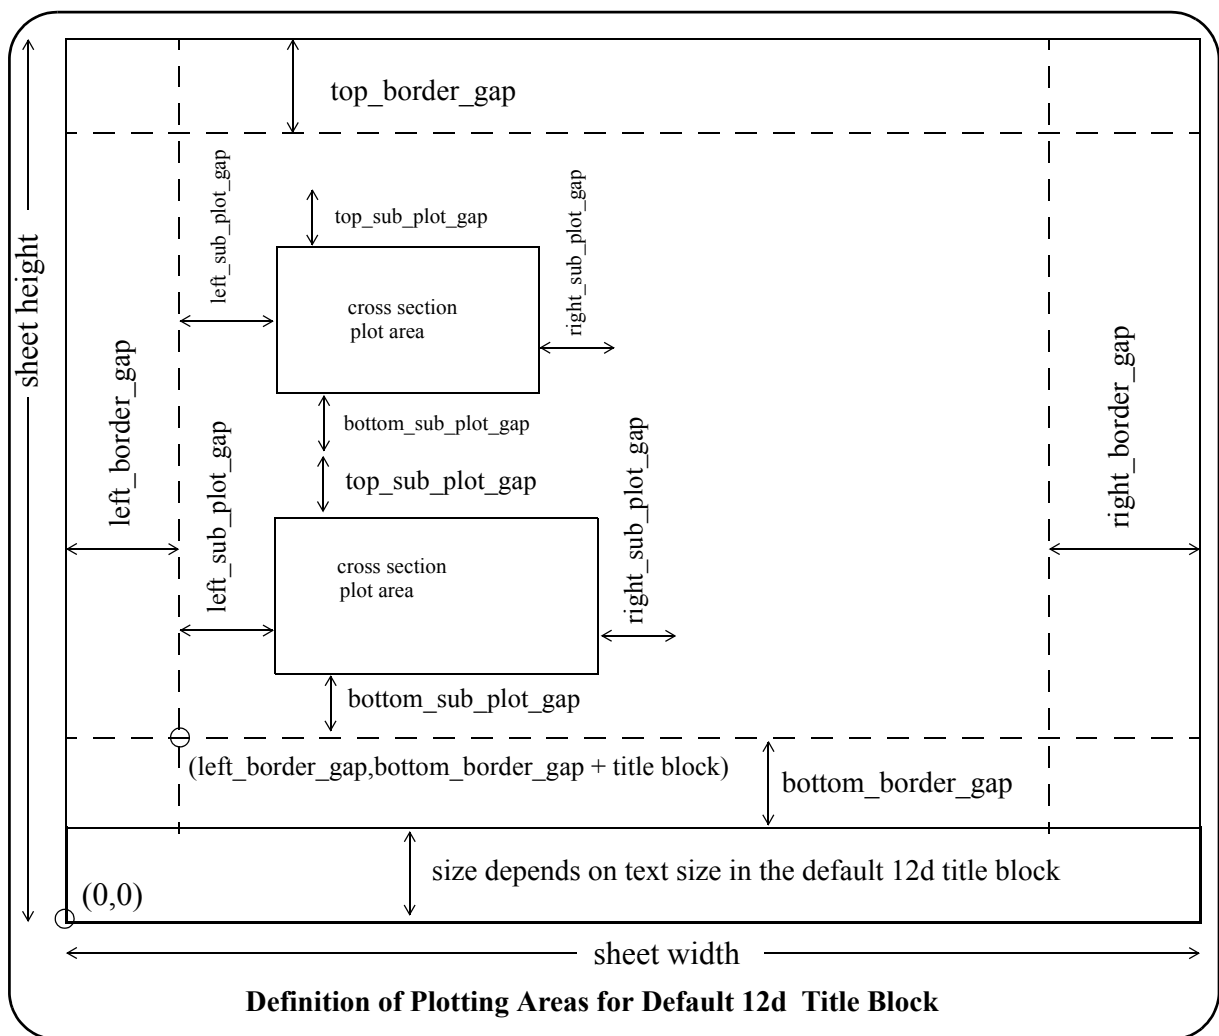

The **boxes area** is where the offset values and the heights for the strings drawn on the x-section plot are labelled.

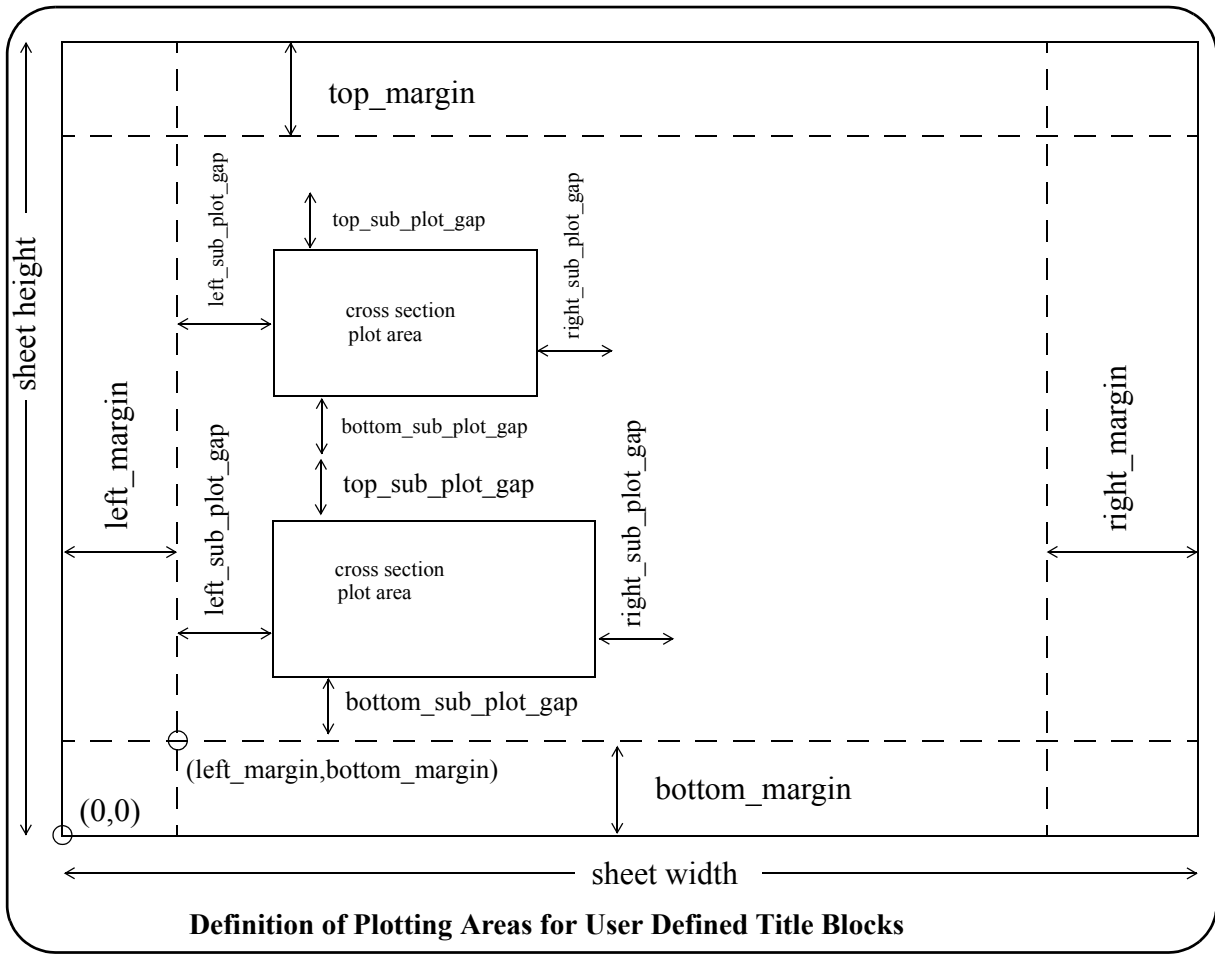

The **datum area** is the region between the boxes area and the graph area.

The **graph area** is the area where the actual plots of the strings are drawn.

Apart from information labelled in the boxes area, the x-section sub-plot can label other information such as

- (a) grades across the x-section
- (b) points across the x- section
- (c) cuts the x-section makes through strings
- (d) cut and fill areas

Please continue to the next section [Boxes/ Centreline Labels](#).

Boxes/ Centreline Labels

The x-section can be labelled with either

- (a) an upright, and the offset and height value at the zero offset (normally the centre line position) - Centre line
- (b) the heights of the x-section and the tins at all the x-section points. - Boxes

The choice is given by the parameter **label_type** defined in the section [Section: Boxes/Centre line](#).

A datum line exists for both cases.

For the boxes case, a box area for the offset and heights is created below the datum line. The available parameters for tailoring the box area will be given after describing the datum line parameters.

For the centre line case, the centre line and offset and height of the centre line are shown.

In both cases, the actual cross section plot is drawn above the datum line in the graph area.

The parameters defined below, are common to both boxes and centreline label types

Boxes/Centreline Labels - Common Parameters

Section: Common Datum Line label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Datum roundoff	datum_roundoff	input	
<i>value to roundoff the datum value to e.g. 0.5, 0.2, 1.0 (default 1.0)</i>			

The roundoff for the datum value is specified by the user (default 1.0) and the datum is automatically calculated for each sub-plot, and labelled.

Decimal places for datum	datum_decimals	input	
---------------------------------	----------------	-------	--

number of decimal places to display the datum value (default 1). If > 0, trailing zeros are removed after the decimal point. If < 0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed. For example -3 means that there is always 3 figures after the decimal place.

Datum linestyle	datum_linestyle	linestyle box	
<i>datum line linestyle (default solid)</i>			

Datum name	datum_name	input	
<i>text to write before the datum value</i>			

Datum textstyle	datum_textstyle	text box	
------------------------	-----------------	----------	--

textstyle for datum information

Datum text size (mm)	datum_text_size	input
<i>size of datum text and value (mm)</i>		
Datum colour	datum_colour	colour box
<i>colour of the datum text</i>		
Datum line colour	datum_line_colour	colour box
<i>colour of the datum line</i>		

Boxes/Centreline Labels - Common Parameters - Tins To Label

Section: Common parameters for tins to label

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define tin set #		input	
<i>where $n = 1$ to The set enables the specification of a number of parameters for a number of specified tin names.</i>			
Tin name	tin_n_name	tin box	available tins
<i>the name of the nth tin to be used for labelling.</i>			

If a tin of the name given by **tin_n_name** does not exist, then the plot is not produced and an error message is given.

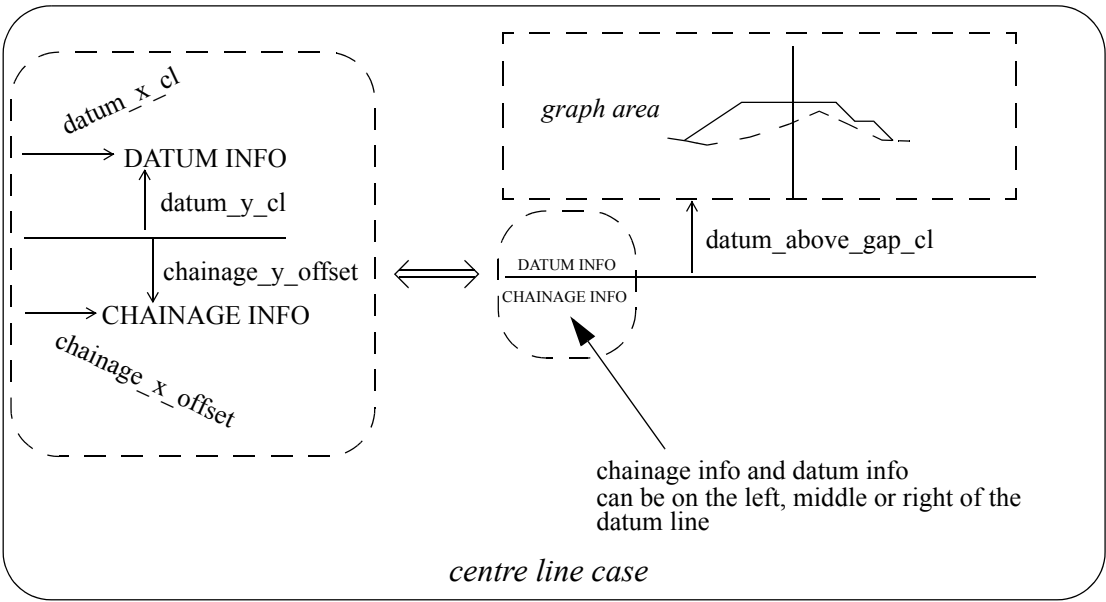

Boxes/Centreline Labels - Common Parameters - Centreline Chainage

Each x-section sub-plot can be labelled with the centreline chainage of the x-section string.

This CHAINAGE INFO label is made up of the text strings:

chainage_title followed by the *chainage-value*

and is drawn under the datum line.

Section: Common centreline chainage label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Label subplot with centreline chainage

	chainage_label	tick box	
<i>if ticked, label sub-plot with centreline</i>			

Chainage title	chainage_title	input	
<i>text before the chainage value</i>			

Chainage Decimal places	chainage_decimals	input	
<i>number of decimals in the chainage value. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the chainage values.</i>			

Chainage colour	chainage_colour	colour box	
<i>colour of the text</i>			

Chainage text size (mm)	chainage_size	input	
<i>size of the text</i>			

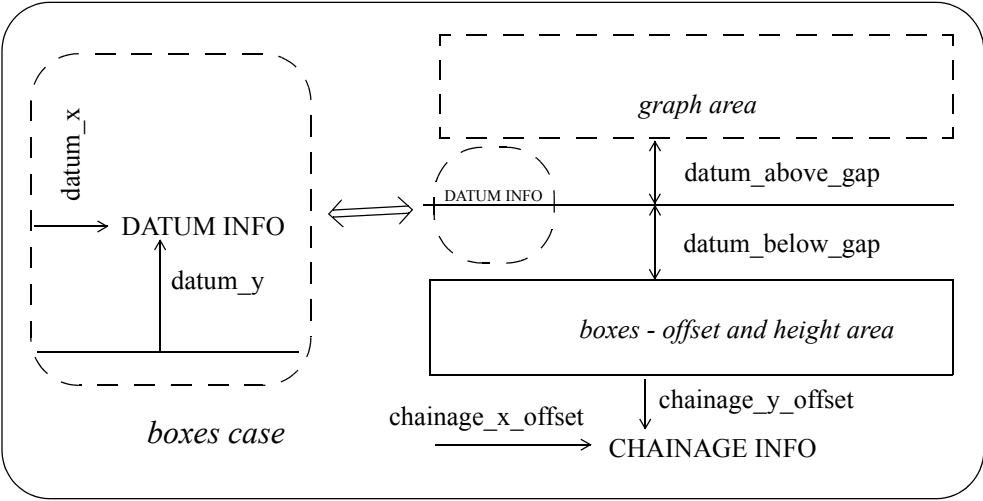

Chainage textstyle	chainage_textstyle	text box	
<i>textstyle for the chainage label</i>			

Chainage text x position (mm)	chainage_x_offset	input	
<i>x position of text (mm)</i>			

Chainage text y position (mm)	chainage_y_offset	input	
<i>y position of text (mm)</i>			

The *chainage_x_offset* is measured from the beginning of the datum line.

The *chainage_y_offset* is measured from the bottom of the datum line with positive being **down**.

The values of the height and X and Y co-ordinates of the **primary string** (usually the design cross section) at the zero offset can be labelled. Note that zero offset is normally where the alignment string cuts the cross section.

The heights of any tins (such as the natural surface) at the zero offset can also be labelled.

The labels are made up of:

pre_text value post_text

where *value* is either a height or a co-ordinate.

The label is positioned at either the left, right or middle of the datum line, with an x and y adjustment and a rotation.

Boxes/Centreline Labels - Com Params - Centreline Equality Chainage

Section: Common centreline equality chainage label parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label sub-plot with centreline equality chainage	chainage_label_eq	tick box	
Equality chainage title	chainage_title_eq	tick box	
Decimal places	chainage_decimals_eq		
1000s separator (non K-post)	chainage_thousands_separator_eq		
Zero-pack digits after 1000s separator	chainage_zero_pack_eq	tick box	
Show K-post at non-zero offset (if defined)	chainage_name_include_eq	tick box	
K-post pre text	chainage_name_pre_eq		
K-post post text	chainage_name_post_eq		
Space before offset of K-post	chainage_offset_space_eq	tick box	
Plus sign before positive offset of K-post	chainage_plus_eq	tick box	
Show equality zone (if defined)	chainage_zone_include_eq	tick box	
Space before equality zone	chainage_zone_space_eq	tick box	

Equality zone pre text	chainage_zone_pre_eq
Equality zone post text	chainage_zone_post_eq
Before/after equality separator	chainage_zone_pre_eq
Colour	chainage_colour_eq
Text size (mm)	chainage_size_eq
Textstyle	chainage_textstyle_eq
Text x position	chainage_x_offset_eq
Text y position	chainage_y_offset_eq
Text justification	chainage_text_justification_cl_eq

Boxes/Centreline Labels - Com Params - X Coordinate At 0 Offset

Section: Common labelling for X coord at 0 offset

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Draw Label <i>if ticked draw the label -default</i>	primary_x0_draw_mode	tick box	
Pre text <i>pre- text for label - def " "</i>	primary_x0_pre_text	input	
Post text <i>post-text for label - def " "</i>	primary_x0_post_text	input	
Decimal places <i>number of decimal places to display - def 1. If > 0, trailing zeros are removed after the decimal point If < 0, the absolute value is taken as the number of decimal places to report i.e. no trailing zeros are removed</i>	primary_x0_decimals	input

Position of text	primary_y0_position	choice box	
<i>Section: Labelling for height of primary string at 0 offset</i>			
Position of text	primary_height_position	choice box	
<i>Section: Parameters for text labelling</i>			
Position of text	extra_text_position	choice box	

Please continue to the next section [Boxes/Centreline Labels - Boxes](#).

Boxes/Centreline Labels - Boxes

When **boxes** is selected for *label_type*, the primary string (usually the design cross section) and each tin in the x-section sub-plot can be labelled with one or two lines of title, and the height at the offset position for each point in the primary string.

The **title** for the strings, is drawn in the **title area** of the **boxes area**.

The offsets/heights are drawn in the **heights area** of the **boxes area**.

Consequently the boxes area is made up of rows of text consisting of:

string/tin titles followed by the **offset/height values** across the string/tin.

Each row is surrounded by lines to form a box.

The default order of the boxes from the bottom up is

- (a) offset title and values
- (b) tin title and heights - natural surface etc. (optional)
- (c) primary string title and heights - design x-section (optional)

The **title area** starts at the relative position (left_sub_plot_gap,bottom_sub_plot_gap).

Section: Default box parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Colour <i>the default box colour</i>	box_colour	colour box	
Insert 0 offset <i>if ticked, a zero offset will be calculated if not already defined on the x section.</i>	offset_insert_zero	tick box	
Draw box mode	draw_box_mode	choice box	Do not draw any box lines Draw box lines around height area only Draw box lines around title and height area only Use parameters defined in boxes - heights

mode for drawing the boxes for the x section plot.

Boxes/Centreline Labels - Boxes - Datum Lines

For the boxes case, the **datum line** is positioned the distance **datum_below_gap** above the top of the boxes area and the graph area is then positioned the distance **datum_above_gap** above the datum line.

Hence the graph area is distance (datum_below_gap + datum_above_gap) above the top of the boxes area.

Section: Boxes - datum line parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Graph area to datum line gap (mm) <i>dist from datum line to bottom of the</i>	datum_above_gap	input	

Datum line gap to top of boxes (mm) datum_below_gap **input**
dist from datum line to the top of the boxes

X adjustment (mm) datum_x **input**
distance to move the datum text along the datum line

Y adjustment (mm) datum_y **input**
distance to raise the datum text above the datum line (used to be called datum_offset) The datum_x and datum_y can be positive, zero or negative.

Centreline Chainage - LJG ??

Section: Boxes - Centre Line Parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Justification of chainage text	chainage_text_justification	justification box	bottom-left bottom-centre bottom-right bottom-decimal middle-left middle-centre middle-right middle-decimal top-left top-centre top-right top-decimal decimal-left decimal-centre decimal-right decimal-point

justification of the chainage text.

Boxes/Centreline Labels - Boxes - Title Area

Many distance definitions in the plot parameter file are given in terms of distance above the **top** of the boxes area.

The size of the title text is given by the **title_box_text_size** parameter.

The width of the title area is either given by the **space_for_titles** parameter, or if omitted, the required width is automatically calculated.

Section: Boxes - Title area parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Size of titles (mm) <i>size of offset, height label and values</i>	title_box_text_size	input	
Space for titles (mm) <i>size of title area.</i>	space_for_titles	input	

There can be two lines of title text and the title text, textstyle and colour can be set independently for the primary string and each tin.

The x position of the title text is the same for all the lines of title text and can be set to be a fixed distance from the left hand side of the boxes.

X adjustment (mm) <i>distance to move the title text from the left hand side of the boxes</i>	box_titles_x	input
---------------------------------------------------------------------------------------------------------	--------------	-------

The text in the title area is the same for each cross section plot on the sheet so it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections.

Title area mode <i>it is possible to restrict the title area to be only on the first cross section on the sheet or the first column of cross sections</i>	label_first_only	choice box	on all sections on first x-sec of page only on x-sec's in first column
---------------------------------------------------------------------------------------------------------------------------------------------------------------------	------------------	------------	------------------------------------------------------------------------------

Boxes/Centreline Labels - Boxes - Heights Area

The **heights area** starts at the end of the title area.

The height text is written at right angles to the bottom of the boxes. It can be either top or bottom justified with respect to the box (**box_text_justification**).

The number of decimal places and the size of the heights text can also be specified.

The height of each individual box area is either given by the **horizontal_line_spacing** parameter, or if omitted, the required height is automatically calculated.

Section: Boxes - Height area parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Number of decimals <i>number of decimal places in the offset height boxes. If <0, the absolute value is taken as the number of decimal places i.e. no trailing zeros are removed for the values in the offset, heights area.</i>	number_of_decimals	input	
Text size (mm) <i>text size of the height values</i>	text_size	input	

Justification

box_text_justification

choice box

bottom of individual boxes
top of individual boxes

justification of box text.

Horizontal line spacing (mm)

horizontal_line_spacinginput

height of each individual box area of title area. Calculated if omitted

The total height of the boxes area is simply given by number of boxes drawn multiplied by the height of one box (they all have the same height).

The **width** of the heights area is determined by the number of chainages to be labelled and whether the values are staggered to prevent over writing.

Hence the total width of the boxes area is the width of the labels area plus the width of the heights area.

Boxes/Centreline Labels - Boxes - Outside Linework

Section: Boxes - Outside linework parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Draw the left side of title area(1)

	draw_box_side_1	tick box	
--	-----------------	----------	--

if ticked, draw the left side of the title area (def).

Draw the top line of title area(2)

	draw_box_side_2	tick box	
--	-----------------	----------	--

if ticked, draw the top line of the title area (def).

Draw the bottom line of title area(4)

	draw_box_side_4	tick box	
--	-----------------	----------	--

if ticked, draw the bottom line of the title area (def).

Draw the left side of heights area(5)

	draw_box_side_5	tick box	
--	-----------------	----------	--

if ticked, draw the left side of the heights area (def).

Draw the top line of heights area(6)

	draw_box_side_6	tick box
if ticked, draw the top line of the heights area (def).		
Draw right side of heights area(7)		
	draw_box_side_7	tick box
if ticked, draw right side of the heights area (def).		
Draw bottom side of heights area(8)		
	draw_box_side_8	tick box
if ticked, draw bottom side of the heights area (def).		
Colour (1)	box_side_colour_1	colour box
colour to draw left side of title area		
Colour (2)	box_side_colour_2	colour box
colour to draw top of title area		
Colour (4)	box_side_colour_4	colour box
colour to draw bottom of title area		
Colour (5)	box_side_colour_5	colour box
colour to draw left side of heights area		
Colour (6)	box_side_colour_6	colour box
colour to draw top of heights area		
Colour (7)	box_side_colour_7	colour box
colour for right side of heights area		
Colour (8)	box_side_colour_8	colour box
colour for bottom of heights area		

Boxes/Centreline Labels - Boxes - Inside Linework

The lines at the top of the individual boxes inside the title area and heights area (separation lines) are controlled by the parameters *box_line_draw_mode* and *box_line_mode_n*.

The separation lines can be drawn just in the title area, just in the heights area or in both areas.

The parameter *box_line_draw_mode* can be set to control all the separation lines but there are additional parameters, *box_line_mode_n*, which override *box_line_draw_mode* for each of the individual boxes where n = 1, ... number of boxes -1.

The top of the top box is not controlled by *box_line_mode_n* but is controlled by the parameters *draw_box_side_2* and *draw_box_side_6*.

Section: Boxes - Inside linework parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Separation line mode	box_line_draw_mode	choice box	Do not draw any separation lines
			Draw the separation lines in both areas

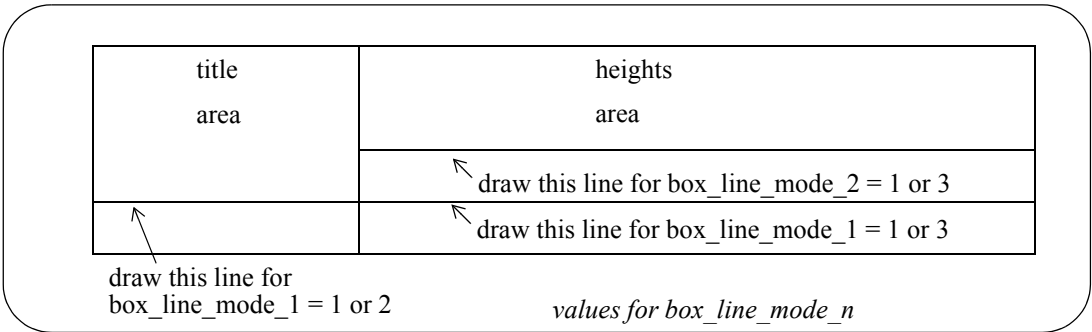

Draw the separation lines in the title area only

Draw the separation lines in the heights area only

the separation line draw mode.

Box #	input		
<i>Where box # = 1 to number of boxes(n). Box 1 is the bottom box, increasing upwards.</i>			
Line mode	box_line_mode_n	choice box	No top line for title or height area (mode=0)
			Draw top line for title or height area (mode=1)
			Draw top line for title area only (mode=2)
			Draw top line for height area only (mode=3)

line mode for top of title and height areas for box number specified.

Boxes/Centreline Labels - Boxes - Extension Mode

The right hand end of the boxes can stop at the end of the design x-section or extend to the end of the right_extension distance.

Section: Boxes - Extension mode parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Extension mode	box_extension_mode	choice box	extend boxes to end of design x-section (mode=0) extend boxes to end of right extension distance (mode=1)

Boxes/Centreline Labels - Boxes - Offset Titles/Values

Section: Boxes - Offset title/value parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line of offset title <i>first line of offset title</i>	offset_title	input	
Second line of offset title <i>second line of offset title</i>	offset_title_2	input	
Offset title textstyle <i>offset title textstyle</i>	offset_title_textstyle	text box	
Offset title colour <i>offset title colour</i>	offset_title_colour	colour box	
Offset title size (mm) <i>offset title size</i>	offset_title_size	input	
Offset value mode	offset_value_mode	choice box	

<i>offset value mode</i>			
Offset value colour <i>offset value colour</i>	offset_colour	colour box	
Offset value textstyle <i>offset value textstyle</i>	offset_textstyle	text box	
Offset value size (mm) <i>offset value size</i>	offset_size	input	

Boxes/Centreline Labels - Boxes - Primary String Titles/Values

Section: Boxes - Primary string title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
First line <i>first line of primary string title</i>	primary_title	input	
Second line <i>second line of primary string title</i>	primary_title_2	input	
Textstyle <i>primary string title textstyle</i>	primary_title_textstyle	text box	
Colour <i>primary string title colour</i>	primary_title_colour	colour box	
Size (mm) <i>primary string title size</i>	primary_title_size	input	
Y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the primary string title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the primary string title.</i>	primary_title_y_pos	input	

Section: Boxes - Primary string value parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Colour <i>primary string value colour</i>	primary_colour	colour box	
Textstyle <i>primary string value textstyle</i>	primary_textstyle	text box	
Size (mm) <i>primary string value size</i>	primary_size	input	
Y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the primary string value text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the primary string values.</i>	primary_y_pos	input	
Decimal places <i>number of dec places in primary string height. < 0 to keep all trailing zeros</i>	primary_decimals	input	

Boxes/Centreline Labels - Boxes - Tin Titles/Values

Section: Tin titles/values - Tin parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set # <i>set number to be used to define sets of tin parameters i.e. n value</i>		input	
Tin draw mode	tin_n_draw_mode	choice box	Draw the tin Do not draw the tin

draw tin mode for the nth tin specified by set #.

Tin colour	tin_n_draw_colour	colour box	
<i>tin colour mode for the nth tin specified by set #.</i>			
Tin label mode	tin_n_label	choice box	Label the tin
			Do not label the tin
<i>tin label mode for the nth tin specified by set #.</i>			

Boxes/Centreline Labels - Boxes - Tin Titles/Values - Tin Titles

Section: Tin title parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set #		input	
<i>set number to be used to define sets of tin parameters i.e. n value</i>			
First line of tin title	tin_n_title	input	
<i>first line of nth tin title</i>			
Second line of tin title	tin_n_title_2	input	
<i>second line of nth tin title</i>			
Tin title textstyle	tin_n_title_textstyle	text box	
<i>nth tin title textstyle</i>			
Tin title colour	tin_n_title_colour	colour box	
<i>nth tin title colour</i>			
Tin title size (mm)	tin_n_title_size	input	
<i>nth tin title size</i>			
Title Y position (mm)	tin_n_title_y_pos	input	
<i>if set, the height in mm above the bottom of all the boxes that the nth tin title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>			

Boxes/Centreline Labels - Boxes - Tin Titles/Values - Tin Heights

Section: Tin height parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set #		input	
<i>set number to be used to define sets of tin parameters i.e. n value</i>			
Decimals	tin_n_decimals	input	
<i>number of dec places in nth tin height. < 0 to keep all trailing zeros</i>			
Textstyle	tin_n_textstyle	text box	
<i>textstyle of nth tin height</i>			
Colour	tin_n_colour	colour box	
<i>nth tin height and depth colour</i>			

Size (mm)	tin_n_size	input
<i>nth tin height size</i>		

Y pos (mm)	tin_n_y_pos	input
<i>if set, the height in mm above the bottom of all the boxes that the tin height text is drawn.If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>		

Boxes/Centreline Labels - Boxes - Tin Titles/Values - Tin Depths

Section: Tin depth parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Use tin set # <i>set number to be used to define sets of tin parameters i.e. n value</i>		input	
Depth label mode <i>depth label mode for the nth tin specified by set #.</i>	tin_n_depth_label	choice box	Label depths Do not label depths
First line of tin depth title <i>first line of nth tin depth title</i>	tin_n_depth_title	input	
Second line of tin depth title <i>second line of nth tin depth title</i>	tin_n_depth_title_2	input	
Depth title textstyle <i>nth tin depth title textstyle</i>	tin_n_depth_title_textstyle	text box	
Depth title colour <i>nth tin depth title colour</i>	tin_n_depth_title_colour	colour box	
Depth title size (mm) <i>nth tin depth title size</i>	tin_n_depth_title_size	input	
Depth title Y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the tin depth title text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>	tin_n_depth_title_y_pos	input	
Decimals in depth value <i>number of dec places in tin height. < 0 to keep all trailing zeros</i>	tin_n_depth_decimals	input	
Depth value textstyle <i>nth tin depth textstyle</i>	tin_n_depth_textstyle	text box	
Depth value colour <i>nth tin depth colour</i>	tin_n_depth_colour	colour box	
Depth value size (mm) <i>nth tin depth size</i>	tin_n_depth_size	input	
Depth value Y position (mm) <i>if set, the height in mm above the bottom of all the boxes that the tin depth text is drawn. If not set, then the text is placed at a height that puts it inside the default box for the tin heights.</i>	tin_n_depth_y_pos	input	
Multiplier for positive depths <i>if set, this value will be used to multiply positive depth values.</i>	depth_positive_factor	input	
Multiplier for negative depths <i>if set, this value will be used to multiply negative depth values.</i>	depth_negative_factor	input	

The depth from the primary string to a tin, at a particular offset is defined as

depth = tin height value - height of the primary string

That is, the depth that the primary string is **below** the tin.

Before plotting, the value of depth is multiplied by either the *depth_positive_factor* or *depth_negative_factor*.

```
if (depth >= 0)  plotted_depth_value = depth * depth_positive_factor
if (depth < 0)   plotted_depth_value = depth * depth_negative_factor
```

Hence the definition of depth can be modified by the parameters:

```
depth_positive_factor    value    // multiplier for positive depths
depth_negative_factor    value    // multiplier for negative depths
```

For example, if the opposite sign is required for depth, that is,

depth = height of the primary string - tin height value

simply set

```
depth_positive_factor    -1
depth_negative_factor    1
```

Boxes/CL Labels - Boxes - Upright Offset/Staggering Parameters

For each sub-plot, the offsets of the points across the x-section string (primary string) are used for positioning uprights (leader lines), and the offset and height labels for the uprights.

By default, there is an upright at each point across the primary string.

However, if the primary string is a 4d string, then the text at the points on the 4d string can be used as a key to **suppress** the labelling and upright at that point. See [Section: Exclude uprights at nominated x-sec points](#)

If the real offset position is used for the horizontal position of the offset/height text, text over writing can easily occur. To prevent over writing, the text is automatically **staggered**.

When staggering occurs, the real offset position is then indicated by the offset markers which are drawn at the top of the text boxes from the staggered text position back to the actual offset position of the upright.

The size and position of the staggers are given by:

Section: Upright offset/staggering parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	TypePop-Up
Offset label tolerance <i>weed out offset values closer together (in offset units) than this value.</i>	offset_label_tolerance	input
Top of stagger to boxes distance (mm) <i>distance from boxes to top of stagger.</i>	stagger_gap_top	input
Bottom of stagger to boxes distance (mm) <i>distance from boxes to bottom of stagger.</i>	stagger_gap_bottom	input
Stagger gap factor <i>distance between staggers is box_text_size * stagger_gap_factor</i>	stagger_gap_factor	input

Boxes/CL Lab - Boxes - Upright Off/Stag Params - Uprights To Exclude

For each sub-plot, the offsets of the points across the x-section string (primary string) are used for positioning uprights (leader lines), and the offset and height labels for the uprights.

By default, there is an upright at each point across the primary string.

However, if the primary string is a 4d string, then the text at the points on the 4d string can be used as a key to **suppress** the labelling and upright at that point.

The parameters to **stop** labelling and uprights are:

mask_name_n 4d_string_point_text where n=1,100

After any *name masks* have been applied, it is often desirable to weed out offset values that are too close together before doing any labelling.

Section: Exclude uprights at nominated x-sec points

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Set #		input	
set number to be used to define a number of uprights to suppress			
X-sec points to exclude	mask_name_n	input	
the string name to be excluded. Note: the name can include wild cards (*) and characters (?). n is the value from the Set # provided.			

Boxes/Centreline Labels - Boxes - Upright Off/Stag Params - Uprights

Section: Uprights

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Upright draw mode	uprights_draw_mode	choice box	none
ticks to stagger height			
to uprights_y above boxes			
to primary string			

- to tin 1
- to tin 2
- to tin 3
- to tin 4
- to tin 5
- to tin 6
- to tin 7
- to tin 8
- to tin 9
- to tin 10

Upright draw mode above boxes.

Uprights Y distance (mm)

uprights_y

input

distance to draw the uprights for `uprights_draw_mode = "to uprights_y above boxes"`

Uprights colour

uprights_colour

colour box

uprights colour: Default is box_colour

Uprights bottom mode

uprights_bottom_mode

choice box

stop at top of boxes

draw to bottom of boxes

draw to `uprights_bottom_y`

below top of boxes

draw to `uprights_bottom_y`

above bottom of boxes

ticks at chainage

Upright draw mode below top of boxes.

Uprights bottom Y distance (mm)

uprights_bottom_y

input

distance in mm.

Uprights text offset factor

uprights_text_offset_factor

input

*move the text by this factor*size.*

When uprights go below the top of the boxes, the height and offset text is moved to the left so that the upright does not go through the text. The left hand side of the heights boxes also moves to the left to leave room for the height text.

Please continue to the next section [Boxes/Centreline Labels - Centreline](#).

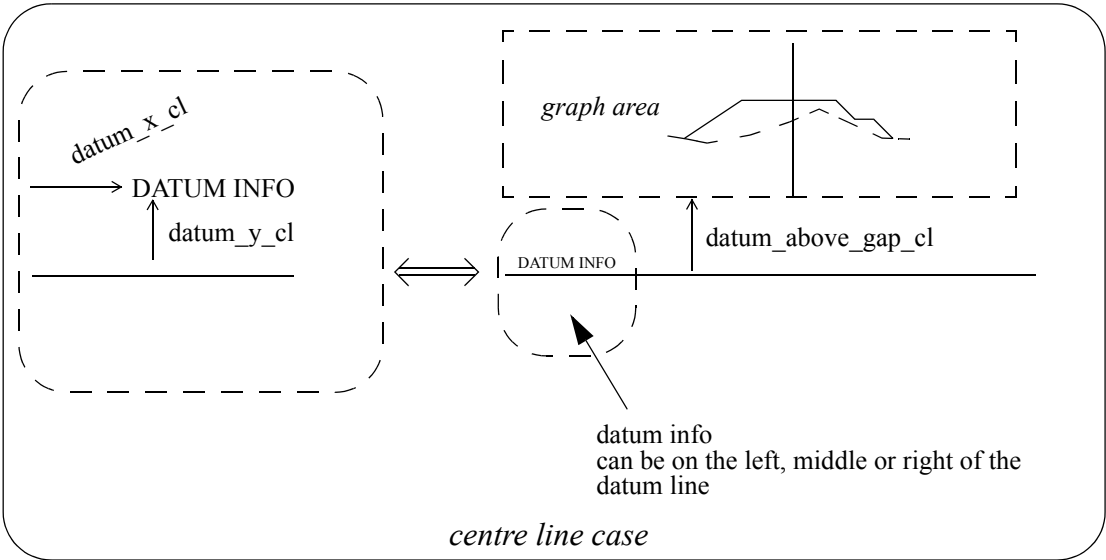

Boxes/Centreline Labels - Centreline

Section: Centreline linestyle

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Linestyle of centreline	cl_linestyle	linetype box	
<i>linestyle to be used for drawing centreline</i>			

Boxes/Centreline Labels - Centreline - Datum Lines

For the centreline case, the graph area is positioned the distance datum_above_gap_cl above the datum line.

Section: Centreline - datum line parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Graph area - datum line gap (mm)	datum_above_gap_cl	input	
dist from datum line to bottom of the graph area			
Position of text	datum_side_cl	choice box	Middle of datum line Left of datum line Right of datum line
side of centreline to position text.			
Text justification	datum_text_justification_cl	just. box	bottom-left bottom-centre bottom-right bottom-decimal middle-left middle-centre middle-right middle-decimal top-left top-centre top-right top-decimal decimal-left decimal-centre decimal-right decimal-point

justification of the datum text. **NOTE:** - this is not normally required since by default the text justification is set to match datum_side_cl.

Datum text position along datum line (mm)

datum_x_cl	input
distance to move the datum text along the datum line	

Boxes/CL Labels - Centreline - Labelling Offset/Height (Superseded)

In the centre line case, the value of the height of the **primary string** (usually the design cross section) at the zero offset can be labelled. This is normally where the alignment string cuts the cross section.

The label is made up of the texts:

primary_title offset_title offset_value height_text height_value

Note: These parameters have now been superseded. The parameters for labelling the height of the primary string at zero offset covers this case. To use the zero offset parameters instead, the *primary_height_pre_text* would include all text required for the Primary_title, offset_title, offset_value and height_text (offset_value is always 0.0).

Section: Centreline - Labelling offset/height parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
-------------------	----------------	------	--------

Include primary title in label

primary_mode_cl	Tick box
-----------------	----------

*The parameter primary_mode_cl controls whether the **primary_title** is included in the label.*

Include height in label

height_mode_cl	Tick box
----------------	----------

*The parameter height_mode_cl controls whether the **height_title** and **height_value** are included in the label.*

Include offset in label

offset_mode_cl	Tick box
----------------	----------

*The parameter offset_mode_cl controls whether the **offset_title** and **offset_value** are included in the label.*

Position of text	offset_height_side_cl	Choice	0
		Choice	1
		Choice	2

The label can be placed on the left, centre of right side of the datum line.

Justification of text	offset_height_text_justification_cl
------------------------------	-------------------------------------

*justification of the offset height text. **NOTE:** - this is not normally required since by default the text justification is set to match offset_height_side_cl*

Height text label	height_text	Input
--------------------------	-------------	-------

height text.

Distance to move text position along datum line (mm)

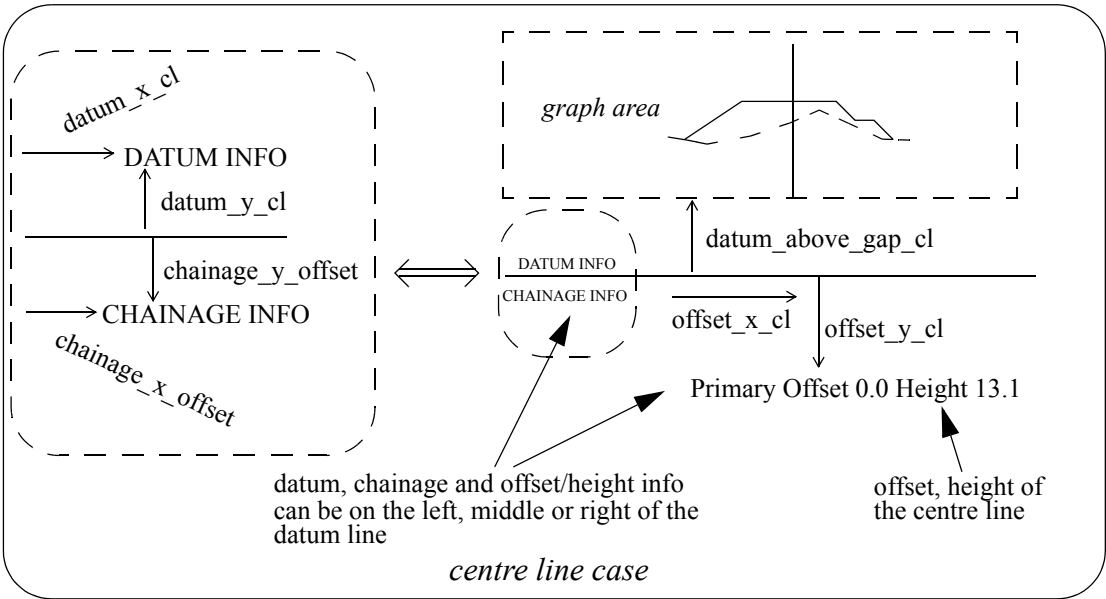

offset_x_cl	Input
-------------	-------

distance to move the text along the datum line.

Distance to move text position below datum line (mm)

offset_y_cl	Input
-------------	-------

distance to move the text below the datum line.

Boxes/CL Labels - Centreline - Position Of Ch, X, Y, Ht, Text LJG ??

Section: Centreline - Chainage Text Position

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Position of chainage value	chainage_side_cl	choice box	Middle of datum line
			Left of datum line
			Right of datum line
<i>side of centreline to position chainage text.</i>			
Justification of chainage text			
	chainage_text_justification_cl	just. box	bottom-left bottom-centre bottom-right bottom-decimal middle-left middle-centre middle-right middle-decimal top-left top-centre top-right top-decimal decimal-left decimal-centre decimal-right decimal-point

justification of the chainage text.

Section: Labelling for X Coord At 0 Offset

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Position of text	primary_x0_position	choice box	Middle of datum line Left of datum line Right of datum line

side of centreline to position x coord text.

Section: Labelling for Y Coord At 0 Offset

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Position of text	primary_y0_position	choice box	Middle of datum line Left of datum line Right of datum line

side of centreline to position y coord text.

Section: Labelling for height of primary string at 0 offset

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Position of text	primary_height_position	choice box	Middle of datum line Left of datum line Right of datum line

side of centreline to position height text.

Section: Parameters for text labelling

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Position of text	primary_height_position	choice box	Middle of datum line Left of datum line Right of datum line

side of centreline to position text.

Please continue to the next section [Graph Area](#).

Graph Area

The **graph area** for each section sub-plot is the area where the actual plot of the x-section string is drawn.

The **width** of the graph area is determined by the width of the x-section string being plotted, the left and right extensions and horizontal scale (scale) given by the parameters.

The size of the graph area can be extended to allow for symbols by the following parameters:

The types of strings that are drawn in the graph area of a cross section plot are:

- (a) primary string the x-section string from the x-section model that is being drawn.
Called the primary string and is usually the design x-section.
- (b) tins sections of the primary string through any tins in models in the corridor models.
- (c) services parts of strings (from models in corridor models) that cut the defined corridor.

The **colour** of the strings in the plot is the actual string colour for cases (a) and (c), and the colour of the tin used for the section in case (b).

Although all the strings are plotted, the plot parameter file can be used to select which ones are labelled with heights.

Section: Graph area - Extra space parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Extra space units	extra_space_units	choice box	world units millimetres

units for specifying extra space.

Extra space left (units)	extra_space_left	input
<i>distance to subtract from left of plot area</i>		
Extra space right (units)	extra_space_right	input
<i>distance to add to right of plot area</i>		
Extra space top (units)	extra_space_top	input
<i>distance to add to top of plot area</i>		

Extra space bottom (units) extra_space_bottom input
distance to subtract from bottom of plot area

Please continue to the next section [Corridors](#).

Corridors

A corridor around the primary string is defined by giving a left and right corridor width.

Any string in a model added to the section view is checked to see if it appears in the corridor, and if it does, it is drawn on the cross-section plot.

To be drawn, strings do not have to cross the primary string, but just be in the corridor.

Section: Corridor parameters

Panel field	Parameter name	Type
Left corridor width (world units)		
	corridor_width_left	input
<i>left corridor width</i>		
Right corridor width (world units)		
	corridor_width_right	input
<i>right corridor width</i>		
Left corridor overlap (world units)		
	corridor_overlap_left	input
<i>left corridor overlap</i>		
Right corridor overlap (world units)		
	corridor_overlap_right	input
<i>right corridor overlap</i>		
Chord-arc tolerance (world units)		
	corridor_chord_arc	input
<i>chord-arc tolerance used near any bends in the corridor.</i>		

Corridors - Model Selection

Panel field	Parameter name	Type
Corridor model	corridor_model_n	model box

models containing tins and service strings to be drawn on the section. Where n = 1, 2, ... ,100 given by

line number on grid.

Please continue to the next section [Grades](#).

Grades

The plot of the x-section string is made up of straight lines joining the individual points of the x-section.

Section: Grade parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Label grades <i>if ticked, label grades.</i>	grade_label	tick box	

Either the individual lines can be used as the segments to be labelled for grade, or adjacent lines of the same grade can be considered to be just one segment and labelled only once.

Hence the segments to be labelled for grade can be the individual lines of the x-section, or the segments defined by changes of grade.

Label change of grade segments

grade_change_only	tick box
<i>if ticked, label change of grade segments. If not, label individual lines.</i>	

It is also possible to ignore segments smaller than a given minimum width on the plot.

Minimum segment 3d length	grade_minimum_width	input
<i>segments smaller than specified value (in mm) are not labelled</i>		

The grade labels are drawn parallel to the segment, centred about the segments end points, and a distance *grade_offset* above the segment. The size, colour and number of decimal places can all be set.

Minimum segment plan length	grade_minimum_width_2d	input
Minimum slope (m/m)	grade_minimum_slope	input
Maximum slope (m/m)	grade_maximum_slope	input

Decimal places for grades	grade_decimals	input
<i>number of decimal places in grade</i>		

Size for grade text (mm)	grade_size	input
<i>size of the grade label</i>		

Textstyle for grades	grade_textstyle	text box
<i>textstyle of the grade label</i>		

Colour for grades	grade_colour	colour box
<i>number of decimal places in grade</i>		

Grade offset (mm)	grade_offset	input
<i>distance above the segment for label</i>		

Show grade sign	grade_offset	tick box
<i>if ticked, the sign of the grade is labelled.</i>		

The grade can be labelled as percent cross-fall, 1 in slope, m/m or VicRoads x:1.

Also a threshold value can be set and any grades whose absolute value are below the threshold can be labelled in one way, and those above the threshold labelled a different way.

Hence, if the absolute value of the grade is less that or equal to the absolute value of *grade_threshold*, then **grade_mode** is used, otherwise **grade_upper_mode** is used.

Grade mode	grade_mode	choice box	% grade 1 in m/m VicRoads x:1
-------------------	------------	------------	----------------------------------------

type of grade value

Grade threshold	grade_threshold	input
------------------------	-----------------	-------

grade threshold for type of grade labelling

Grade threshold mode	grade_threshold_mode	choice box	% grade 1 in m/m VicRoads x:1
-----------------------------	----------------------	------------	----------------------------------------

type of grade value

Grade upper mode	grade_upper_mode	choice box	% grade 1 in m/m VicRoads x:1
-------------------------	------------------	------------	----------------------------------------

type of grade value

Decimal places for grades above threshold value

grade_upper_decimals	input
----------------------	-------

number dec places in grades above threshold value

Please continue to the next section [X-Section Points](#).

X-Section Points

The points across each x-section can be automatically labelled on the x-section plots.

The **offset**, **height** and **name** of the point can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the point.

The height position for the labelling can be specified as the

- (a) top of the boxes for the x-section
- (b) above the maximum height of the strings on the plot
- (c) height of the point on the x-section string (primary string)
- (d) height of a tin.

The actual position of the label is defined relative to the above point.

Note:

Only case (b) involves the actual height of the point on the cross section string. For all other cases, only the offset of the cut string is used.

Other heights, for example, the height of the tin at that offset can be used as the height (case (d)).

Section: X-section point mask parameters

The fields and buttons used in this section have the following functions.

Field Description	Parameter name	Type	Pop-Up
Define Set #		input	

set number to be used to define a number of points to include

Point mask	points_n_mask	input
-------------------	---------------	-------

The points of the x-section to be labelled for the nth set of parameters is restricted to all the points whose name satisfying the points_n_mask. For example

points_1_mask = "ke"*

or

points_1_mask = "?bank"*

or, if both masks are required,

points_1_mask = "ke ?bank*"*

X Section Points - Offsets

size of symbol. A value of 0 = no symbol

Please continue to the next section [Hatching Cut/Fill](#).

Hatching Cut/Fill

This option is used to hatch cut and/or fill areas between sets of tins.

For each set, the name of the two tins, the hatch linestyle, colour and separation and whether cut and/or fill regions are required are all user definable.

Up to twenty (20) separate sets of tins may be hatched.

Section: Hatching cut/fill - Tin parameters

Panel Field	Parameter name	Type
Define Set #		input
set number to be used to define different original/new tin sets.		
Original tin	hatch_original_tin_n	tin box
tin_name for original surface		
New tin	hatch_new_tin_n	tin box
tin_name for final surface		

Notes

- (a) cut is when the new tin is below the original tin.
fill is when the new tin is above the original tin.
- (b) cut hatching is turned off by setting hatch_cut_separation_n to 0.0.
fill hatching is turned off by setting hatch_fill_separation_n to 0.0.

Hatching Cut/Fill - Cut

Section: Hatching cut/fill - Cut parameters

Panel Field	Parameter name	Type
Use Set #		input
set number as specified in the Define set#.		
Cut separation (mm)	hatch_cut_separation_n	input
distance between cut hatch lines. If 0, no hatching.		
Cut hatch angle (dms)	hatch_cut_angle_n	input
angle of hatching.		
Cut colour	hatch_cut_colour_n	colour box
colour of the hatching.		
Cut linestyle	hatch_cut_linestyle_n	linestyle box
linestyle of the hatching.		
Draw sides of cuts	hatch_cut_draw_sides_n	choice box

draw mode for sides of cut regions.

Draw original tin	hatch_cut_draw_original_n	choice box
<i>draw mode for sides of original tin in cut.</i>		

Draw new tin	hatch_cut_draw_new_n	choice box
<i>draw mode for sides of new tin in cut.</i>

Please continue to the next section [Cuts](#).

Cuts

The cuts that each x-section string makes though strings in any user-specified model, can be automatically labelled on the x-section plots.

The **height**, **offset**, **name**, **attributes**, **diameter**, **x** and **y coordinates**, **3d length of CL until cut point** of the cut string can be labelled as well as a **symbol** drawn. The height of tins at the same offset value can also be labelled.

The offset position for the labelling is the offset of the cut string.

The height position for the labelling can be specified as the:

- (a) top of the boxes on the x-section,
- (b) above the maximum height of the strings on the plot,
- (c) height value of the cut string,
- (d) height of the x-section string (the primary string),
- (e) height of a tin.

The actual position of the label is defined relative to the above point.

Note: Only case (c) involves the actual height of the cut string. For all other cases, only the offset of the cut string is used. Hence, for all cases except (c), the string does need to have a sensible height to be used for cuts through strings. For example, a boundary string may have null heights but only the offset is required and the height of the tin at that offset can be used as the height (case (e)).

The method for specifying which strings are to be checked for cuts is by first specifying the **model** which contains the strings, and then a **name mask** which is used to restrict the strings in the model to only those whose names match the name mask.

Up to twenty five different sets of models and name masks can be used so that different cut sets can be labelled in different ways.

Section: Cuts - Model/Name mask parameters

Panel Field	Parameter name	Type
Define Set #		input
<i>set number to be used to define different model/mask sets.</i>		
Model	cuts_n_model	model box
<i>model from which cut masks are derived</i>		
Name mask	cuts_n_mask	input
<i>text string containing the name masks, each separated by one or more spaces, to test the string name</i>		

against. Each mask can include wild cards and wild characters.

For example: "ke*" or,
 "?bank*" or, if both masks are required,
 "ke* ?bank*"

If cuts_n_mask is blank, then all strings in the model are used. This is equivalent to name mask being set to "*".

All strings in the model cuts_n_model whose name satisfy the name mask cuts_n_mask are then checked for cuts with the x-sections, and if a cut occurs, the cut point will be labelled according to the rest of the parameters in the nth set.

Cuts - Offsets

Section: Cuts - Offset parameters

Panel Field	Parameter name	Type	Pop-Up
Use Set #		input	
set number as specified in the Define set#.			
Position	cuts_offset_n_position	choice box	at cut string height above top of boxes above top of graph area to primary string to tin 1 to tin 2 to tin 3 to tin 4 to tin 5 to tin 6 to tin 7 to tin 8 to tin 9 to tin 10
