12d Model Reference Manual

This book is the reference manual for the software product 12d Model.

First Release Dates of Software and Manual

V2.0	July 1990
V3.0	October 1995
V4.0	April 1999
V5.0	December 2000
V6.0	September 2002
V7.0	January 2005
V8.0	March 2007
V9.0	May 2009
V10.0	April 2012

Disclaimer

12d Model is supplied without any express or implied warranties whatsoever.

No warranty of fitness for a particular purpose is offered.

No liabilities in respect of engineering details and quantities produced by 12d Model are accepted.

Every effort has been taken to ensure that the advice given in this manual and the program 12d Model is correct, however, no warranty is expressed or implied by 12d Solutions Pty Ltd.

Preface

Introduction

12d Model is an object oriented, interactive graphics program designed to process survey data, quickly build terrain, conceptual and detail design models. It is used in constructing the design, doing quality check and collecting as-constructed data.

So **12d Model** is used in all stages of the civil planning, design and construction.

Data is easily read in, triangulated and contoured to build an initial terrain model. Roads, platforms, channels or other design features can be added interactively and a merged model containing the initial terrain and the new design features formed to produce conceptual design models.

All Models can be examined in plan, section or perspective views. The number and type of views displayed on the screen is totally user defined.

By using a mouse and flexible on-screen menus, **12d Model** is easy to use and requires a minimum of training.

This document is the **12d Model Reference** manual.

Reference Manual in PDF Form

12d Model 10 has a Help available from within **12d Model** for most panels and menus.

However, because Microsoft's Help system only allows individual topics to be printed, the entire **12d Model Reference** manual has also been supplied as a PDF file. The PDF file can be used to print out large sections of the manual. Adobe's PDF format can be read by Adobe Acrobat or the free Acrobat Reader

The PDF file for the **12d Model Reference** manual is called

12dm_ref.pdf

and is in the folder on the **12d Model Installation** DVD called

Documentation\Reference_Manual

If you do not have an *Acrobat* Reader installed, it is available on the **12d Model Installation** DVD under **Install**.

Getting Started Manuals and Data

12d Model is supplied with a very comprehensive on-line Reference manual which describes the function of each menu option in detail. However it is a Reference manual and makes no attempt to describe how to use 12d for production surveying and civil engineering work.

The *12d Model installation* DVD also contains two (2) Training manuals:

Getting Started for Design manual

Getting Started for Surveying manual

The **Getting Started for Design** manual is available as a printed manual and as a PDF file on the *12d Model Installation* DVD.

The **Getting Started for Surveying** has the first seven chapters in common with the *Getting Started for Design* manual (installing 12d Model, on-line help and basic modelling) but then diverts to cover topics from the direction of a Surveying whereas the *Getting Started for Design* manual continues on with alignment design techniques.

The *Getting Started for Surveying* manual is available as a printed manual and as a PDF file on the *12d Model Installation* DVD.

As well as the **Getting Started** manuals, there are videos on a DVD which also work through all the material in the **Getting Started** manuals.

The **Getting Started** tutorials assumes that a series of files are already on your hard disk. These tutorial files are automatically installed from the DVD during installation of the 12d Model software

Training Courses

There is a wide range of *12d Model Training* Courses given by official 12d Model training centres.

Each training course usually has its own set of training files, manual in pdf form and videos going through the training course. This material is distributed on DVD's.

Using the Practise and Small Versions of 12d Model

The Practise version of 12d Model is limited to a maximum of 5,000 points. Following the procedures as stated in the training manuals may create projects with more than 5,000 points.

Where appropriate, the text will suggest how to vary the input for each instruction so that the example feature can be completed within the limits of the 12d Model Practise version.

The number of points used at any time in the Practise and small release versions can be displayed by the option

Projects => Check points

The easiest way to reduce the current point count is to delete any unwanted models with

Models => Delete

The installed icon on your desktop for running the practise version of 12d with these training files is labelled **12d 10 Practise Training**.

Please Note: Projects created by Practise versions of 12d Model cannot be accessed by Release versions of 12d Model and vice-versa.

1 12d Model 10 - 32 bit or 64 bit Version ?

Microsoft now has a 32 bit Windows and a 64 bit Windows operating system.

So when installing **12d Model 10**, you need to select either the 64 bit 12d installation or the 32 bit installation.

In 64 bit Windows, Microsoft have allowed for both 32 bit and 64 bit versions of the same software to coexist on the same computer so you could install both the 32 bit and the 64 bit version of **12d Model 10**.

However unlike **12d Model 9**, the 64 bit **12d.exe** for **12d Model 10** can be any of the **12d Model** point sizes from 5K right through to 5M and 250M.

So with **12d Model 10**, you normally only install the 64 bit **12d Model 10** on 64 bit Windows and 32 bit **12d Model 10** on 32-bit Windows.

2 Installation of 12d Model 10 Release Version

The *12d Model 10 Installation DVD* can be used to install the *Release* and *Practise* versions of **12d Model 10**.

The *Practise* version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the *Release* versions of *12d Model* and vice-versa. However the *Practise* version can be used free of charge by *12d Solutions* customers and registered *Practise* Users.

These notes are for installing the **Release** version of *12d Model 10*. There are separate notes for installing the *Practise* version.

For a new installation of the *Release* version of *12d Model 10*, the user is provided with

- one *12d Model* dongle

- one *12d Model 10 Installation DVD*

- an email with the *12d Model 10* authorization file *nodes.12d10n* attached, or a folder with the *12d Model 10* authorization file *nodes.12d10n* or *nodes.4d* in it.

Please check that you have all three items before commencing the installation.

For existing *12d Model 10* users, the user is provided with

- one *12d Model 10 Installation DVD*

- an email with the *12d Model 10* authorization file *nodes.12d10n* attached, or a folder with the *12d Model 10* authorization file *nodes.12d10n* or *nodes.4d* in it.

For existing users, the dongle you already have for *12d Model 10* will work with the new version of *12d Model 10* once you have the new *nodes* file for *12d Model 10*. If *12d Model 10* is **already** running on your computer, please **uninstall** it before installing a new version of *12d Model 10*.

Important Note on *Nodes.12d10n* and *Nodes.4d*

The *12d Model 10 nodes.12d10n* file will normally be emailed to you.

During the installation of *12d Model 10*, an association is created for files ending in **.12d10n** so after the installation, opening the **nodes.12d10n** will automatically copy it to the required area (normally C:\12d\10.00) and rename it to **nodes.4d**.

If you do not have the **nodes.12d10n** attached to an email but instead have it in a folder, clicking on the **nodes.12d10n** file after installing *12d Model 10* will also automatically copy it to the required area (normally C:\12d\10.00) and rename it to **nodes.4d**. Or if the *12d Model 10* icon is clicked on, the **Project Selection** panel will be brought up and clicking on the **Nodes** button will allow the **nodes.12d10n** or **nodes.4d** file to be selected and then processed.

Please **do not change** the **name** of the created **nodes.4d** file. *12d Model* will only search for an authorization file called *nodes.4d*.

Extra Notes for All Installations

1. A three-button mouse is essential.
2. The *12d Model Installation DVD* contains extra information other than just the installation version of 12d Model. For example, documentation, source to macros and plot parameter files.

The extra data can be copied from the *12d Model Installation DVD* but the copied files may only have a “read only” attribute set. This means that the files can not be edited or modified in any way.

To change the attribute so that a file can be modified, select the file in Explorer, bring up the *Properties* sheet and under the *General* tab sheet change the “read only” box so that it is not ticked on.

Selecting **OK** or **Apply** will then modify the attribute of the file.

Installing the Release Version of 12d Model 10

These notes are for installing the Release version of *12d Model 10*. There are separate notes for installing the Practise version.

A. Disk Space required for installing 12d Model 10

Approximately 900 megabytes of disc space will be required for the installation to succeed. After installation this can be reduced to a minimum of 100 megabytes.

B. Before installing from the DVD

For Windows 2000, XP, Vista, Windows 7:

It is usually best to reboot the PC **before** installing **12d Model** from the DVD and have no other applications running.

Your login must have Administrator privileges.

C. Do not attach the 12d dongle before installing dongle drivers

USB dongles must not be attached to the computer before the dongle drivers are installed.

D. Using the email with the *nodes.12d10n* file attached to it

The *12d Model 10 nodes.12d10n* file will normally be emailed to you.

During the installation of *12d Model 10*, an association is created for files ending in **.12d10n** so after the installation, opening the **nodes.12d10n** will automatically copy it to the required area (normally C:\12d\10.00) and rename it to **nodes.4d**.

If you do not have the **nodes.12d10n** attached to an email but instead have it in a folder, clicking on the **nodes.12d10n** file after installing *12d Model 10* will also automatically copy it to the required area (normally C:\12d\10.00) and rename it to **nodes.4d**. Or if the *12d Model 10* icon is clicked on, the **Project Selection** panel will be brought up and clicking on the **Nodes** button will allow the **nodes.12d10n** or **nodes.4d** file to be selected and then processed.

E. Starting the Installation of 12d Model 10

Insert the **12d Model 10 Installation DVD** into the DVD drive.

On inserting the DVD, the **12d Model Installation** program automatically begins.

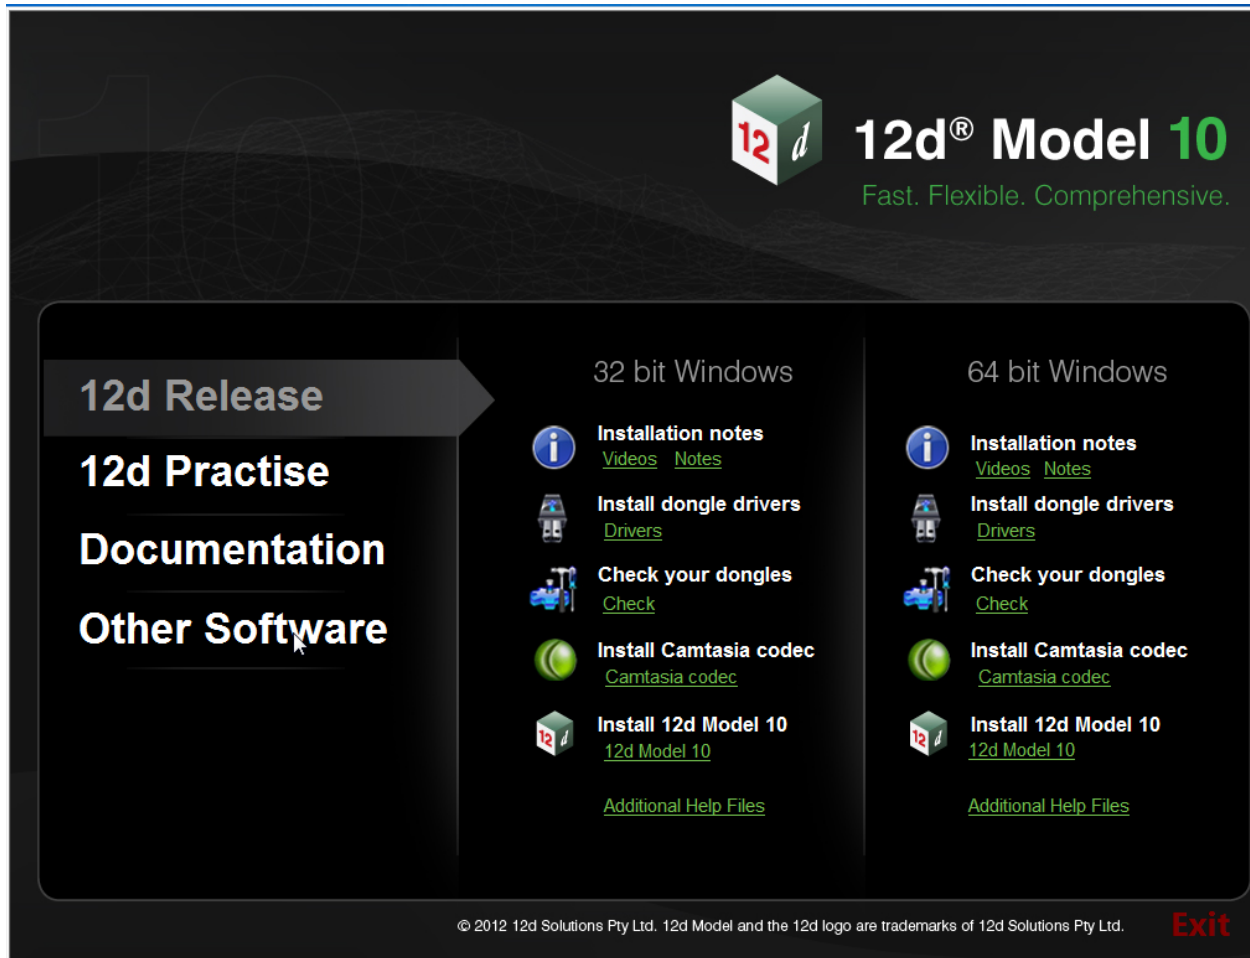

If it doesn't, simply double click on the program **Launch.exe** on the DVD.

Depending on the Windows operating system and your settings, you may be asked to allow **Launch.exe** to run. If so, click on **Run Launch.exe**.

F. Installing

The *12d Model Release* screen will appear.

The Steps on the **12d Release** tab of the *12d Model Installation DVD* will lead you through the installation of the Release version of *12d Model*. The sequence on the left is for installing on 32 bit Windows, and the sequence on the right is for installing on 64 bit Windows.

For running 12d Model 10 on 32 bit Windows:

If you are running 12d Model on 32 bit Windows, then you need to install the *12d Model* 32 bit 12d.exe and 32 bit dongle drivers. So go down the options on the left hand side of the screen.

Note- the 32 bit 12d.exe will run point versions **up to 5M**. The 250M version of *12d Model* is only available as the 64 bit *12d Model* and it only runs on a Windows 64 bit operating system.

For running 12d Model 10 on 64 bit Windows:

If you are running 12d Model on 64 bit Windows, then you need to install the *12d Model* 64 bit 12d.exe and 64 bit dongle drivers. So go down the options on the right hand side of the screen.

The 64 bit 12d.exe runs all point versions up to and including 250M.

For each installation, **Installation Notes** in pdf format can be viewed by clicking on **Notes** under the **Installation notes** heading. If **Videos** also appears then a video to guide you through the installation process can be viewed by clicking on **Videos** under the **Installation notes** heading.

NOTE - If the correct dongle drivers and the Camtasia codec are already installed on your computer then you can proceed to [Installing 12d Model 10 Release Program files](#)

Step 1. Install the Wibu or Hardlock Dongle Drivers

You need to have System Administrator rights to install the dongle drivers.

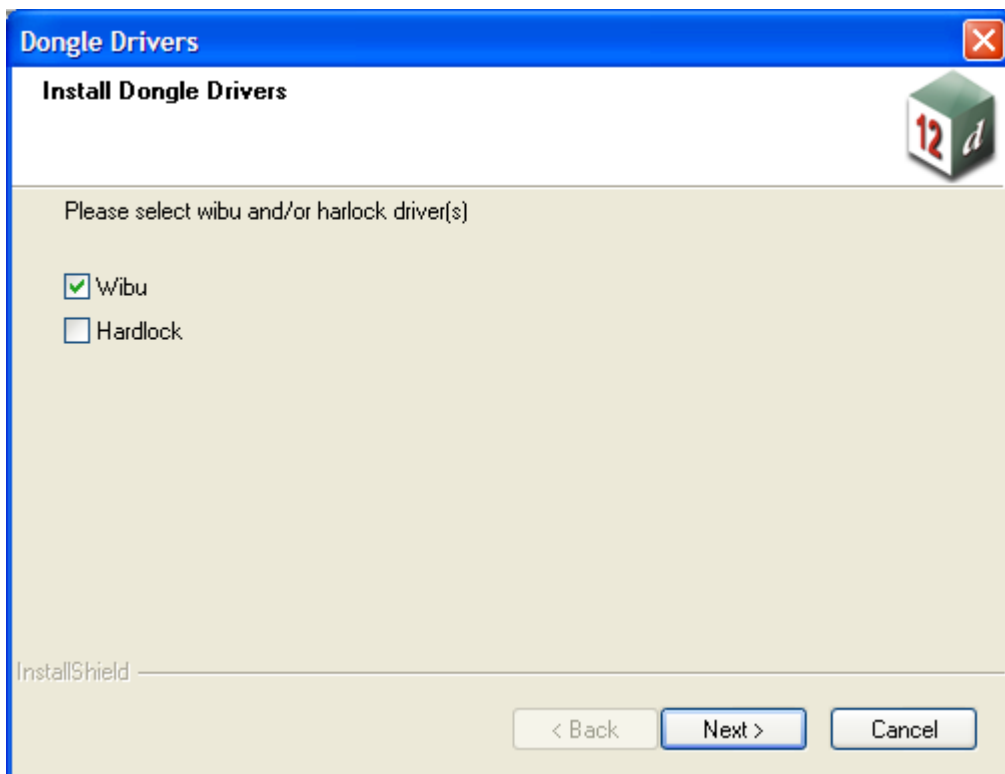

Installing Wibu Drivers:

On the *12d Model Release* screen, under *Install Dongle Drivers*, click on **Drivers** to bring up the **Dongle Drivers** panel:

Depending on the Windows operating system and your privileges (you need Administrator rights to install the drivers), the **User Account Control** panel may appear and you will be asked

*Do you want the following program to make changes to your computer? If so, click on **Yes**.*

The **Dongle Drivers** panel will then appear.

If you only have one type of dongle Wibu (green USB, translucent green USB) or Hardlock (black parallel, blue USB) then you only need to install the drivers for those dongles.

If you have both *Hardlock* and *Wibu* dongles then both sets of drivers **must** be installed.

If you have a Wibu dongle, tick on *Wibu* and then click Next:

The script to install the Wibu dongle drivers begins.

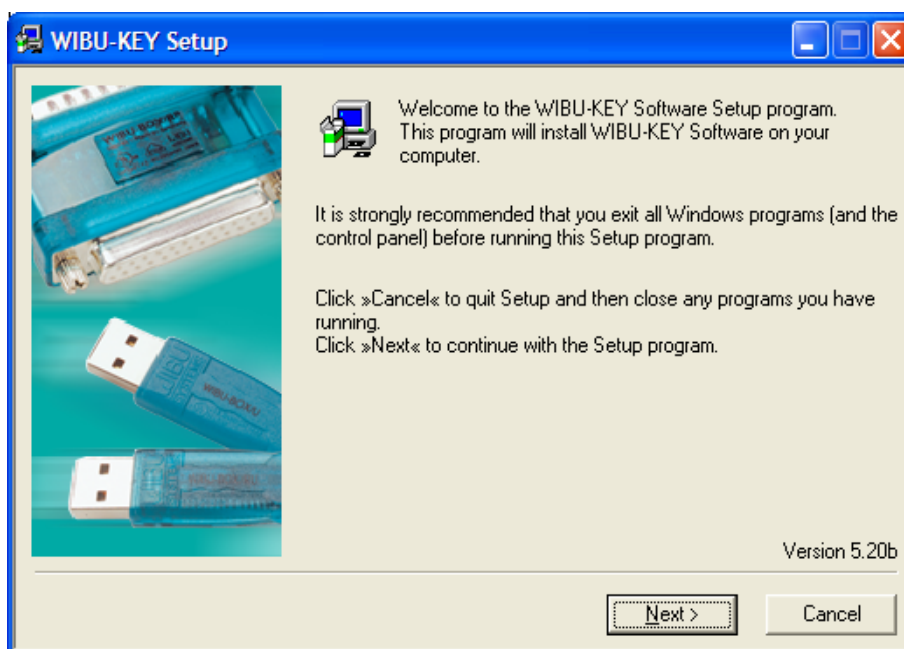

Under Windows XP you may get an *Open File - Security Warning*

select **Run** to continue

WIBU-KEY Setup

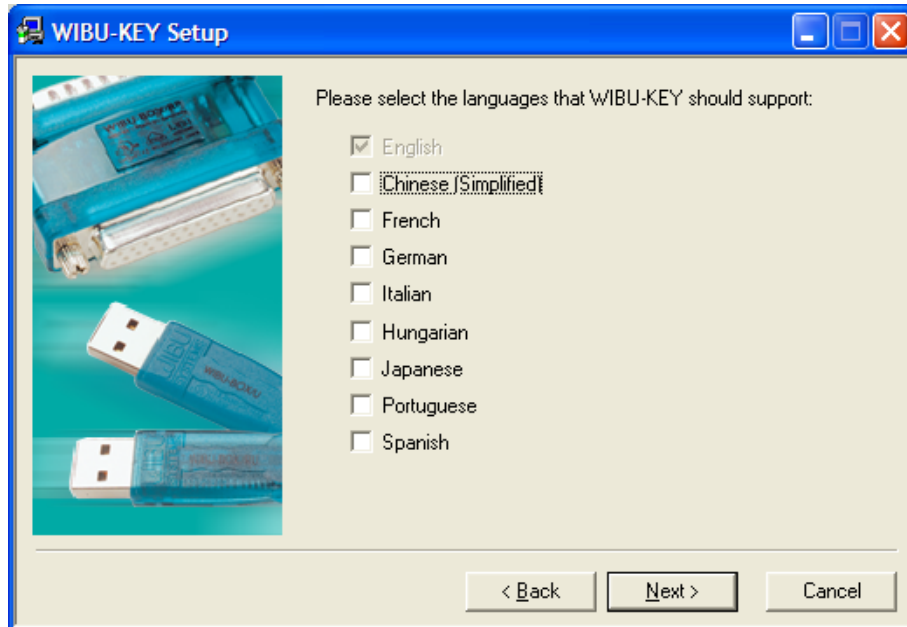

Welcome to WIBU-KEY Software Setup

select **Next** to continue

WIBU-KEY Setup

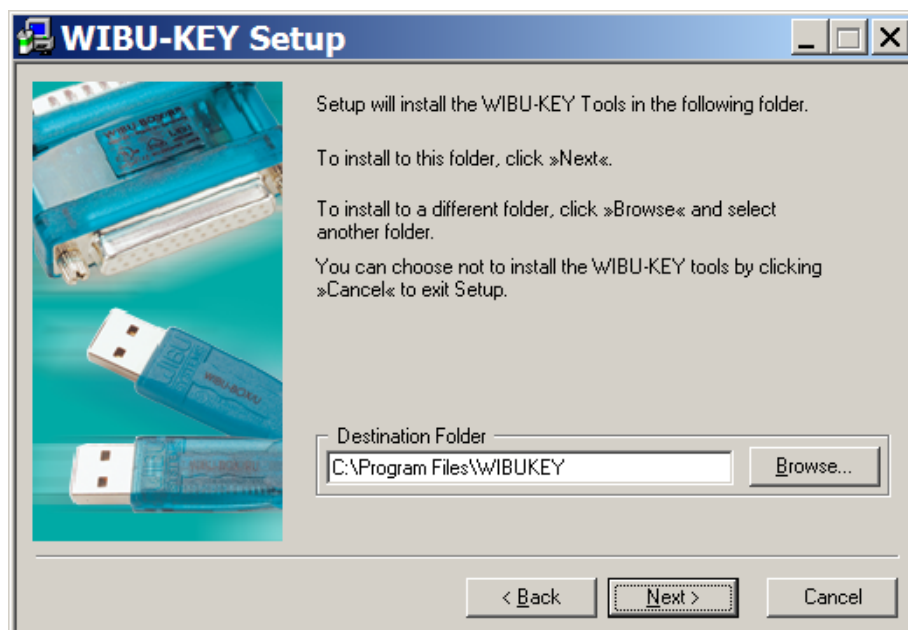

Language Selection

tick your language and then select **Next** to continue

WIBU-KEY Setup

Installation folder

select **Next** to continue

WIBU-KEY Setup

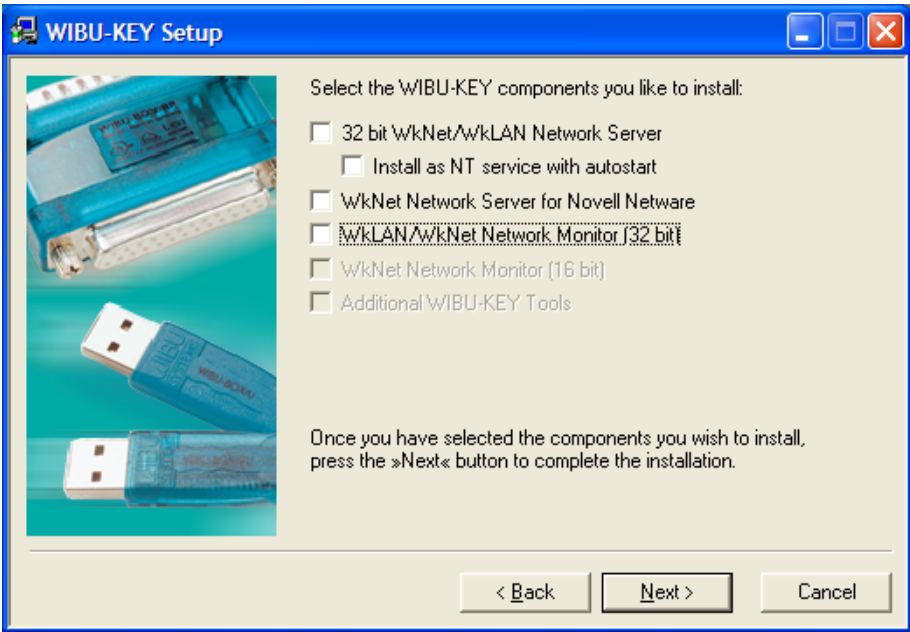

Installation folder doesn't exist

click Yes to continue

WIBU-KEY Setup

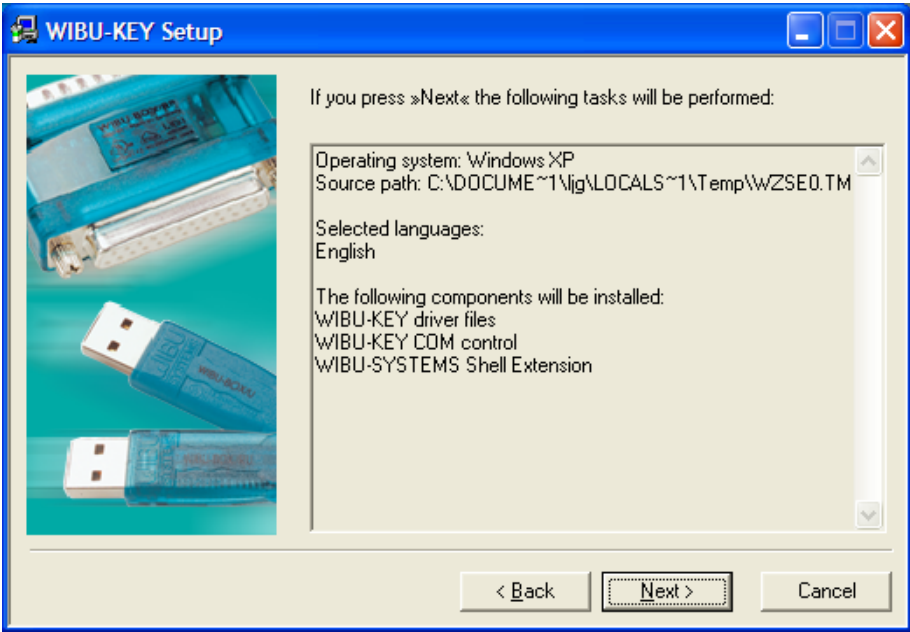

Component Selection

make sure nothing is ticked and then select **Next** to continue

WIBU-KEY Setup

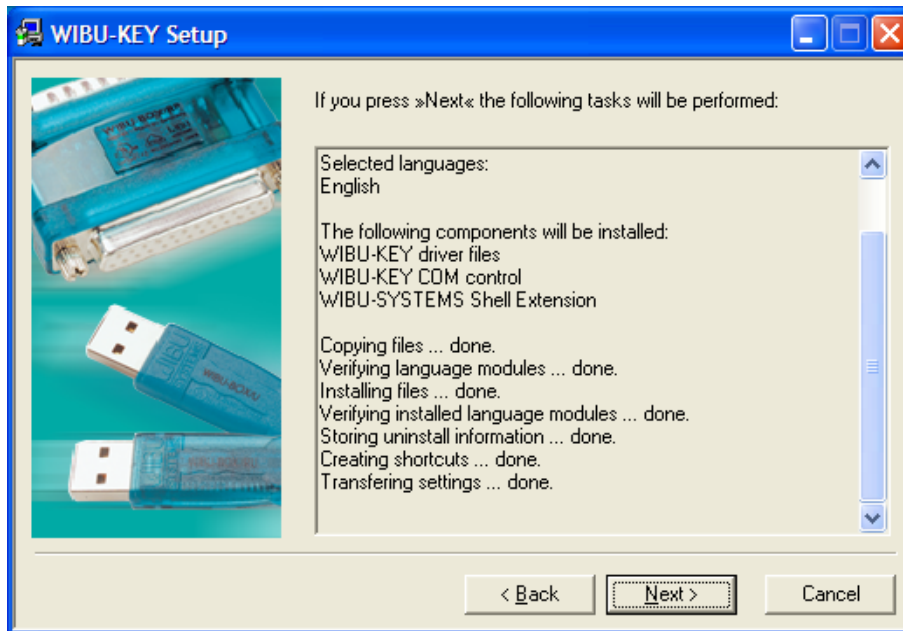

Tasks to be Performed

select **Next** to continue

WIBU-KEY Setup

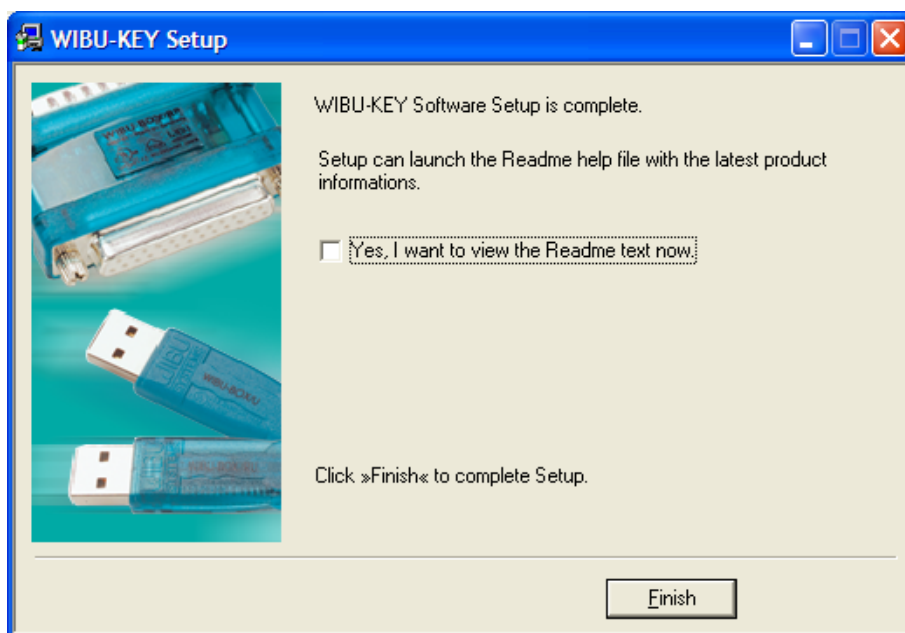

Tasks done

select **Next** to continue

WIBU-KEY Setup

Setup Complete

leave **Yes, I want to view the Readme text now** unticked and select **Finish**

Setup OK

Setup OK

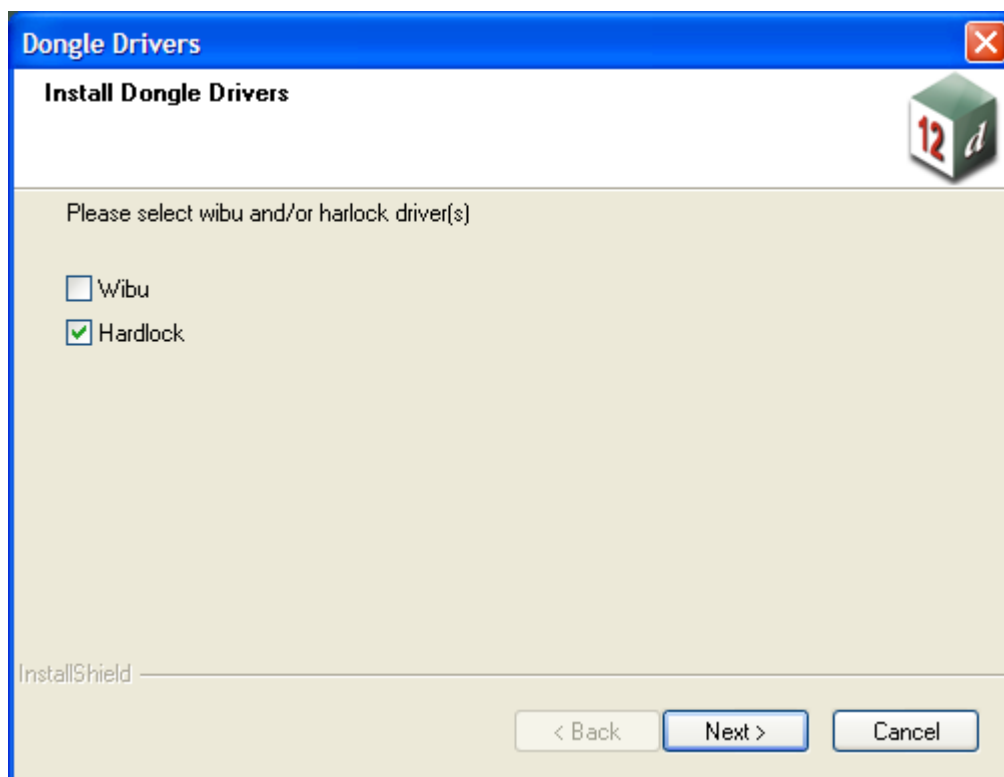

click **OK**

The WIBU dongle drivers have now been installed.

The *12d Model Release* screen will then appear.

Installing Hardlock Drivers:

If you have a Hardlock dongle, on the *12d Model Release* screen, under *Install Dongle Drivers*, click on **Drivers** to bring up the **Dongle Drivers** panel:

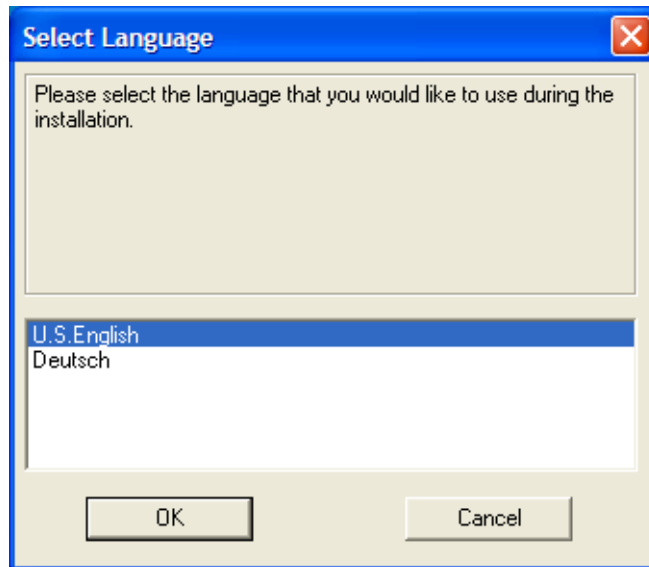

Tick on *Hardlock* and then click Next:

The script to install the hardlock dongle drivers begins.

Select language

Language for hardlock installation

select U.S. English and then **OK** to continue

Hardlock Device Driver Installation

Installing dongle drivers

select **Next** to continue

Hardlock Device Driver Installation

Finish installing dongle drivers

select **Finish** to continue

The Hardlock dongle drivers have now been installed.

The *12d Model Release* screen will then appear.

Step 2. Check the dongle

The 12d Model dongle (Hardlock or Wibu) can now be attached to the computer.

For USB dongles:

Warning: you must have System Administrations rights the first time you attach a USB dongle to any USB port:

When a USB dongle is attached for the first time to any USB port, Windows will detect that it is new hardware and needs to load the dongle drivers for that USB port - this will require System Administration rights.

Since the dongle drivers have already been loaded onto your computer, when the USB dongle is attached to a new USB port, it will be recognised as new hardware

and Windows should automatically install the correct dongle driver.

IMPORTANT NOTE IF THE WIBU DONGLE IS NOT RECOGNISED:

If the WIBU dongle is not recognised and you get the **Found New Hardware** screen

please go to the section [Wibu XP SP2 Problems](#) on how to find the Wibu drivers

NOTE - even though your dongle is working on one USB port, if you try and attach the dongle to a new USB port, the dongle drivers will need to be installed for the new USB port. You will need System Administration rights to install the dongle drivers on the **new** USB port.

The dongle must be attached to the USB port at all times, otherwise 12d Model will stop running.

For Parallel dongles:

Attach the dongle to the printer port. The dongle must be attached to the printer port at all times, otherwise 12d Model will stop running.

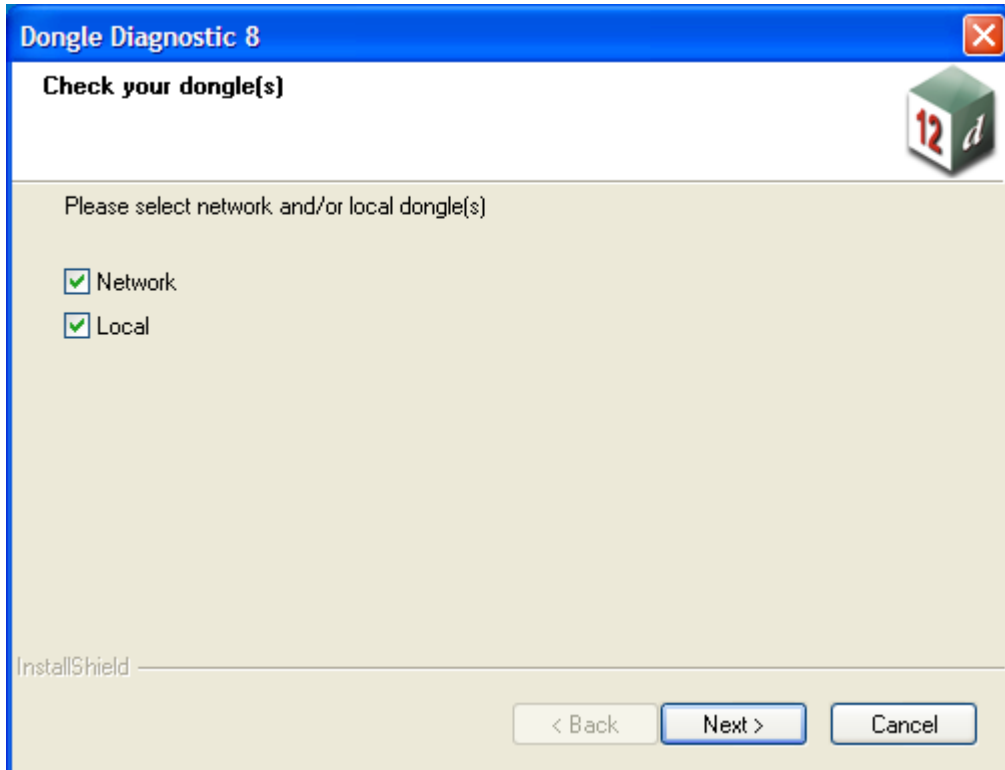

Important Note - the 12d parallel dongle must be **before** any Rainbow dongles (e.g. AutoCad).

On the *12d Model Release* screen, click on *Check*:

The dongle checking program begins.

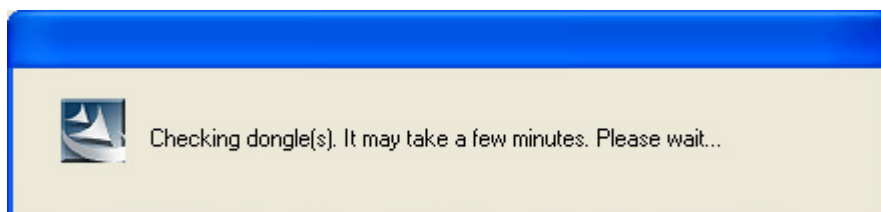

Installation

Installation message

Tick **Local** and select **Next**

The computer/network will be checked for *12d dongles* and also for your *System Date*.

Check Report

The correct dongle number should be displayed and also a check on the date in the computer is correct.

select **Finish**

This completes the dongle *Check*.

The *12d Model Release* screen will then appear.

Step 3. Install Camtasia Codec

The Camtasia Codec is used for displaying the images on the *12d Model Training* CDs and DVDs.

You need to have System Administrator rights to install the Camtasia Codec.

On the *12d Model Release* screen, under *Install Camtasia codec*, click on *Camtasia Codec*:

The Camtasia Codec installation begins.

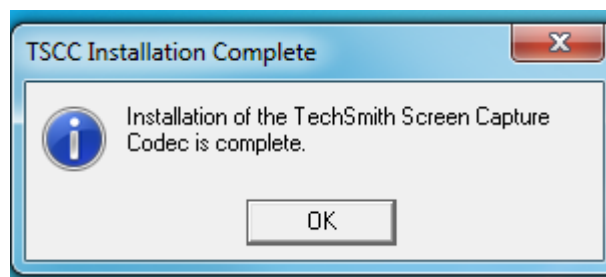

Installation

Installation message

Select **Install** to continue with the installation

Installation Complete

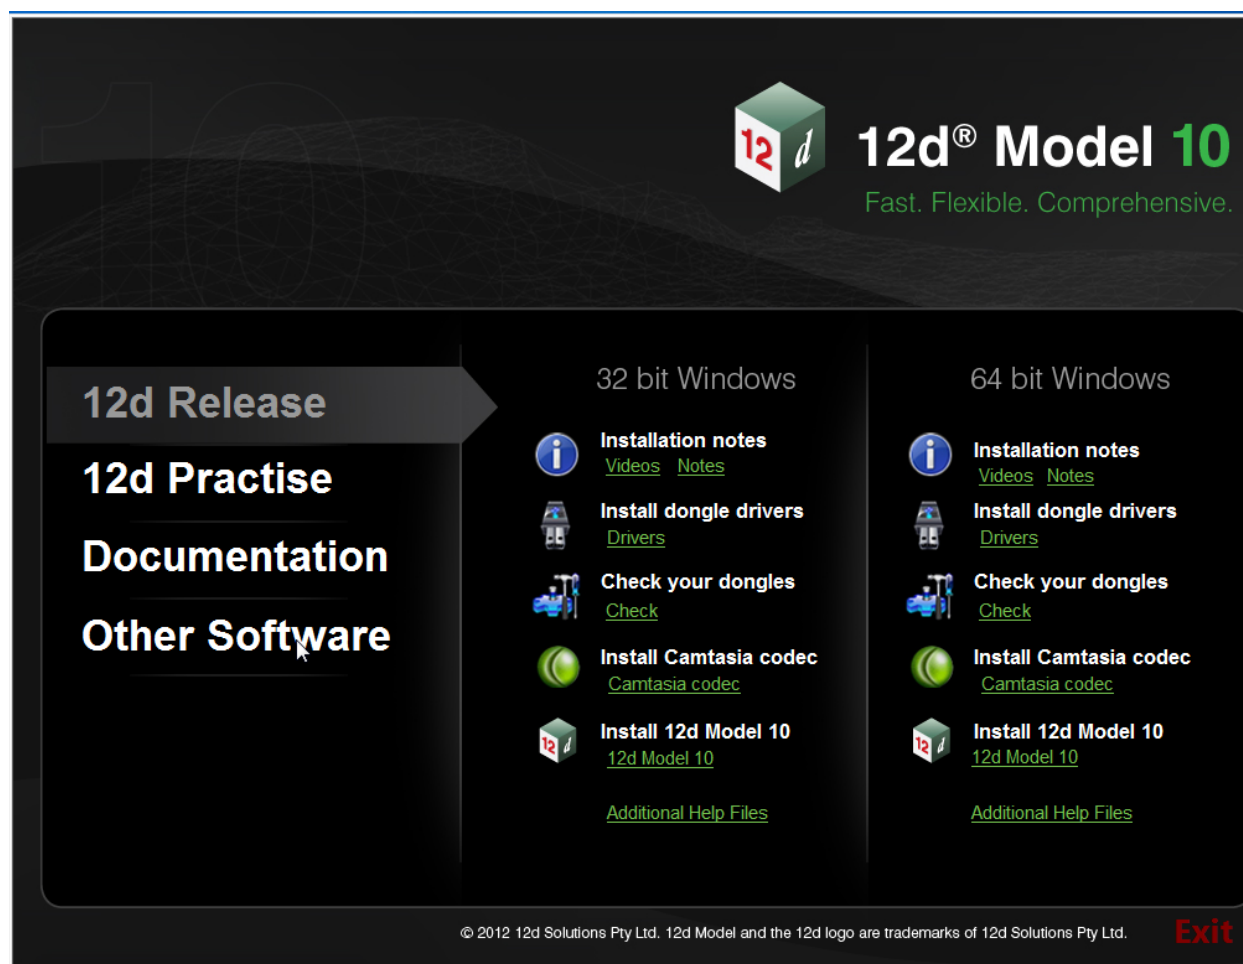

Select **OK**.

This completes the installation of the *Camtasia Codec*.

The *12d Model Release* screen will then appear.

Step 4. Installing 12d Model 10 Release Program files

**For running 12d Model 10 on 32 bit Windows:**

If you are running 12d Model on 32 bit Windows, then you need to install the *12d Model* 32 bit 12d.exe and 32 bit dongle drivers. So go down the options on the left hand side of the screen.

Note- the 32 bit 12d.exe will run point versions **up to 5M**. The 250M version of *12d Model* is only available as the 64 bit *12d Model* and it only runs on a Windows 64 bit operating system.

For running 12d Model 10 on 64 bit Windows:

If you are running 12d Model on 64 bit Windows, then you need to install the *12d Model* 64 bit 12d.exe and 64 bit dongle drivers. So go down the options on the right hand side of the screen. The 64 bit 12d.exe runs all point versions up to and including 250M.

So if you are installing on 32 bit Windows, then select the **12d Model 10** under **Installing 12d Model 10** under the **left** hand column.

If you are installing on 64 bit Windows, then select the **12d Model 10** under **Installing 12d Model 10** under the **right** hand column.

The **12d Model 10** installation begins.

Note - the following screens are for the 64 bit install but the 32 bit install is identical except the words **64 bit** are replaced by **32 bit**.

Welcome

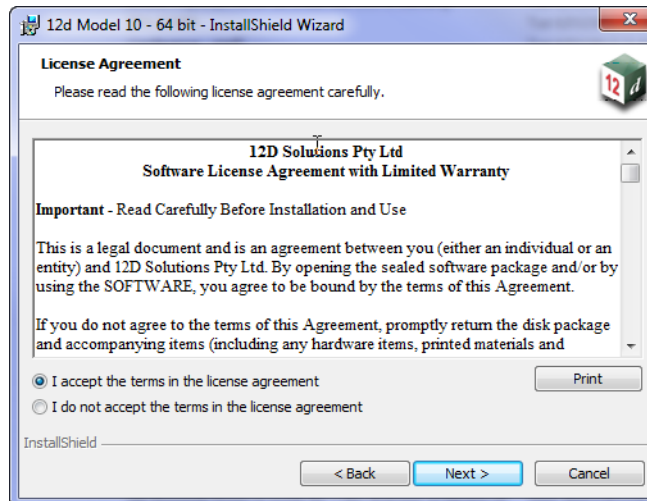

Welcome message

Select **Next** to continue with the installation

Software License Agreement

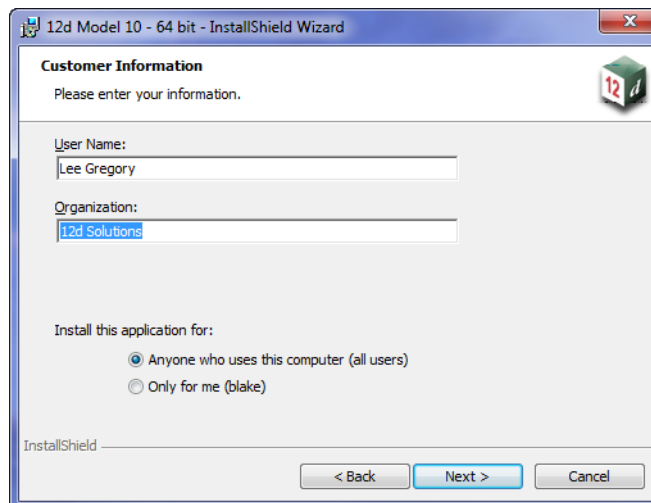

12D Solutions license agreement

If you agree with the License conditions, click on *I accept the terms in the license agreement*.

Select **Next** to continue with the installation

Customer Information

fill in *User Name* and *Organisation*, tick who can use the computer

select **Next** to continue with the installation

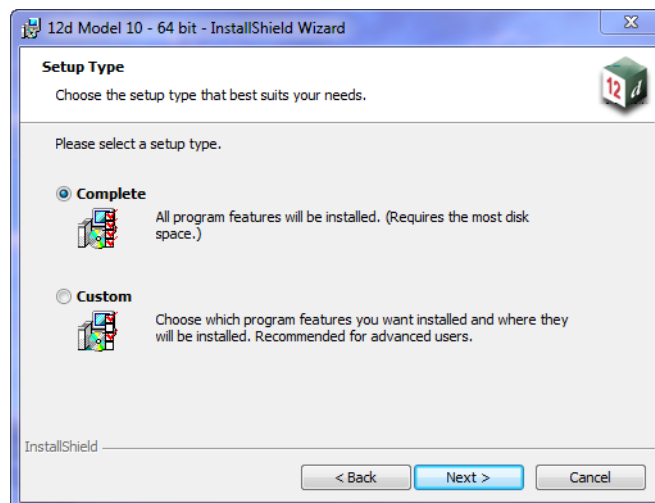

Destination Folder

continue with the default installation area for the software *c:\Program Files* or click on *Change* to browse to another area for installation

select **Next** to continue with the installation

Setup Type

select **Complete**

select **Next** to continue with the installation

Ready to Install

select **Next** to begin the actual installation

The software will be copied and installed onto the computer.

Setup Complete

End of installation.

Select **Finish** to complete the installation

The *12d Model Release* screen will then appear.

Select **Exit** at the bottom right hand corner of the screen to end the installation.

This completes the installation of the **12d Model** software.

12d Model will not function without an authorisation file called **nodes.4d**.

So the next step is to install and test the **nodes** file.

Folders Created by the Installation

(a) For *12d Model* on Windows 32 bit operating systems, or the 64 bit *12d Model (Bigfoot)* on Windows 64 bit operating systems:

the *12d Model* installation loads the **12d Model software** into the folder

C:\Program Files\12d\12dmodel\10.00

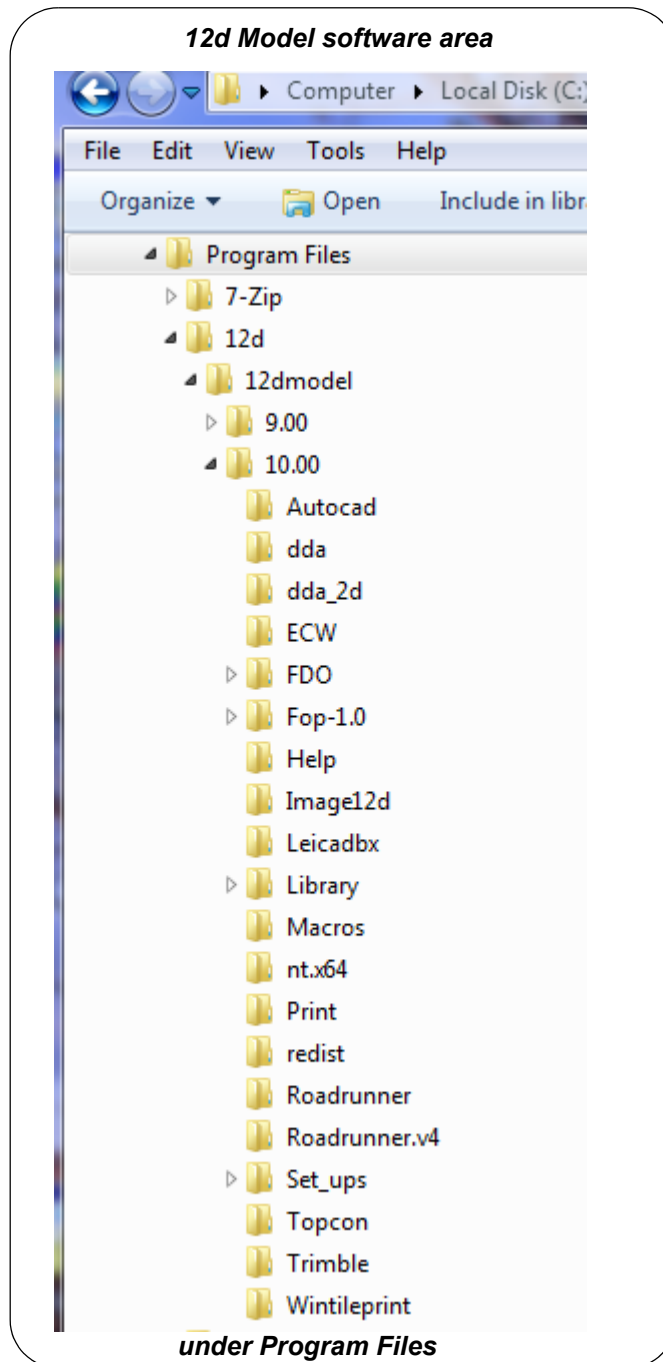

OR

(b) For the *12d Model* 32 bit exe (for versions up to 5M) on Windows 64 bit operating systems:

the *12d Model* installation loads the **12d Model software** into the folder

C:\Program Files (x86)\12d\12dmodel\10.00

12d Model users normally only have **read** access to the *Program Files* and/or *Program Files (x86)* areas.

The *12d Model* installation on either 32 bit or 64 bit WIndows, also creates an area

C:\12d\10.00

which during the installation is given read/write access for the user.

The folder 12d\10.00 contains the training data used with the *Getting Started for Design and Getting Started for Surveying* manuals and the subfolders **User** and **User_Lib** are created for future user customisations of *12d Model*

Icons Created by the Installation

The installation loads the appropriate components and creates the **12d Model 10** icon

icon for 12d Model 32 bit exe

icon for 12d Model 64 bit exe

The **12d Model 10 - 32** and **12d Model 10 - 64** icons fire up **12d Model** and attach to the folder 12d\10.00.

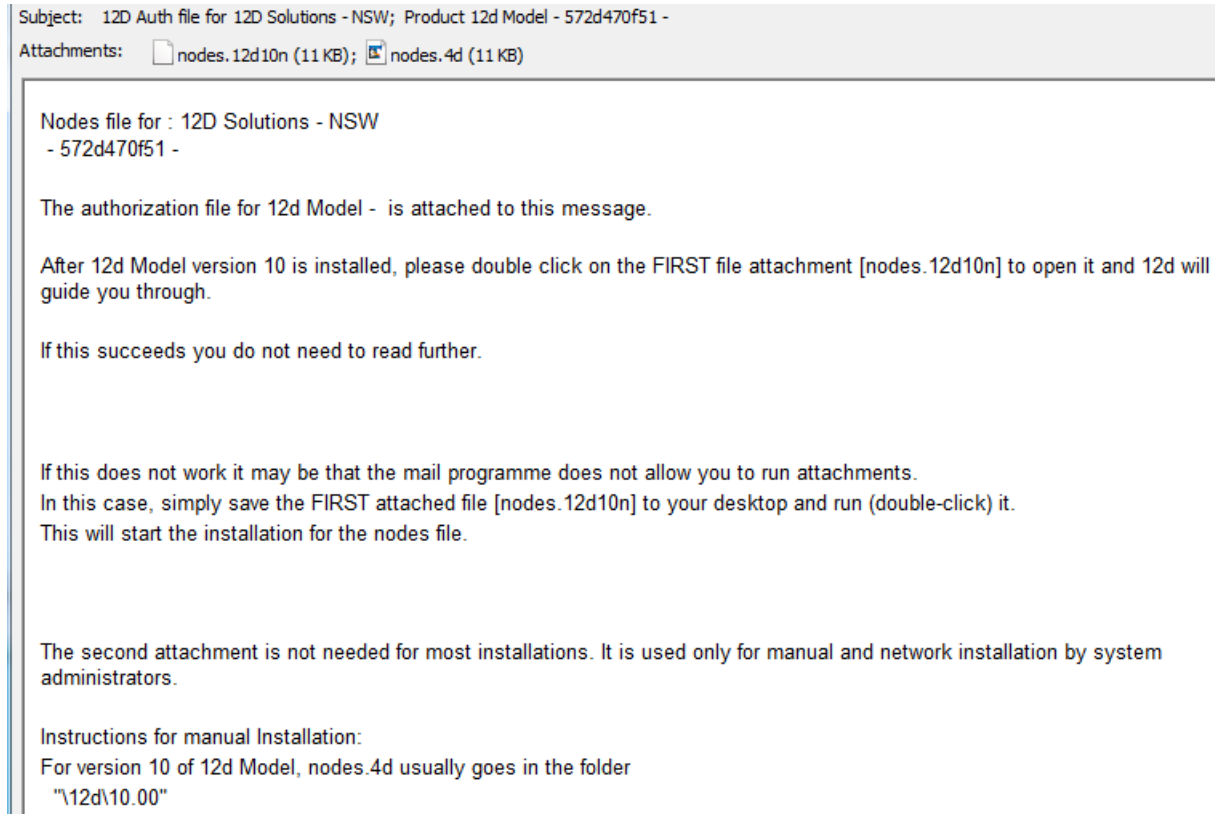

Step 5. Installing the **Nodes.4d** file

12d Model will not function without an authorisation file called **nodes.4d**.

The information inside **nodes.4d** controls

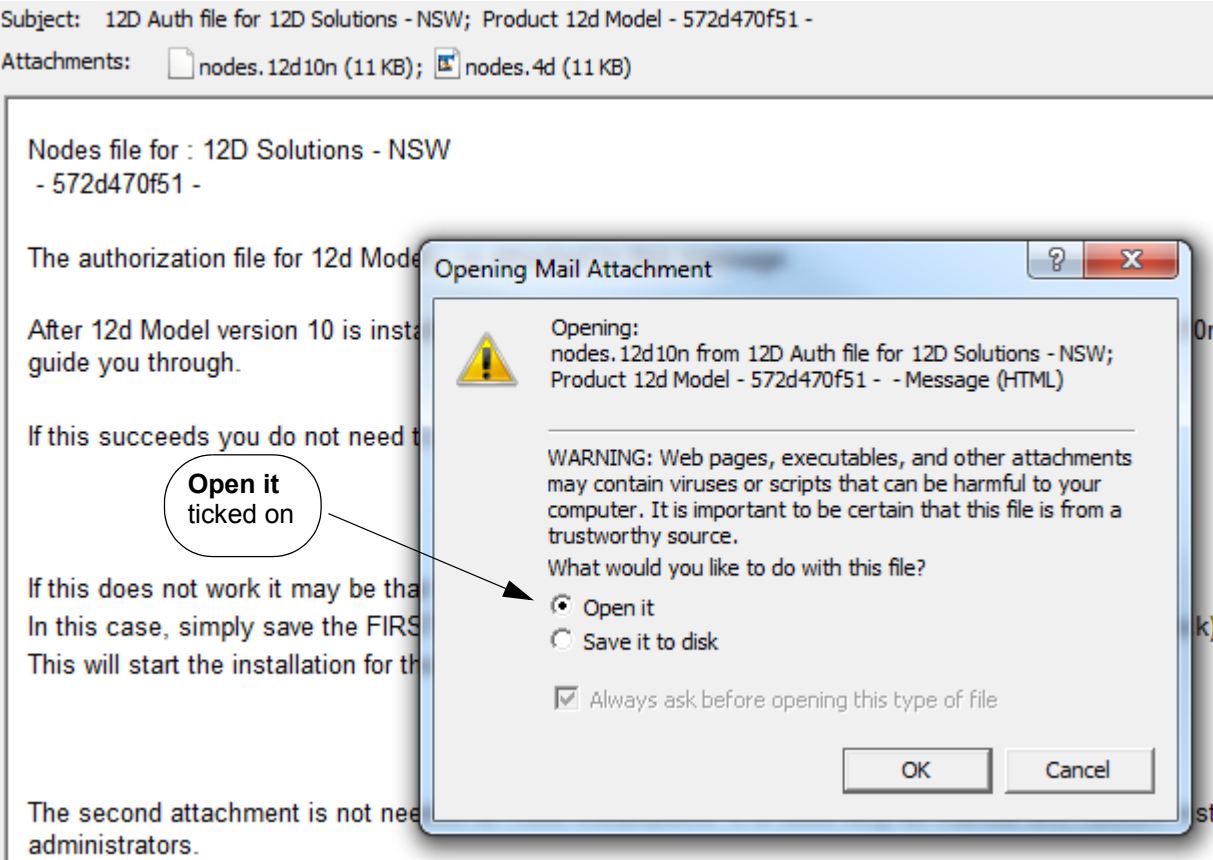

- (a) **which dongles** are authorised to run **12d Model**
- (b) what **version** of **12d Model** will run for a dongle
- (c) what **modules** are authorised to run for a dongle

To authorise your **12d Model**, two files **nodes.12d10n** and **nodes.4d** will have been emailed to you by your local **12d Model** Distributor.

Installing **12d Model** sets up a *Windows* file association so that a **nodes.12d10n** file is recognised by **12d Model** and automatically installs a **nodes.4d** file in the correct location.

In the email, double click on the files **nodes.12d10n**, click on **Open it** and then click on **OK**

The **Accept Nodes** panel then appears

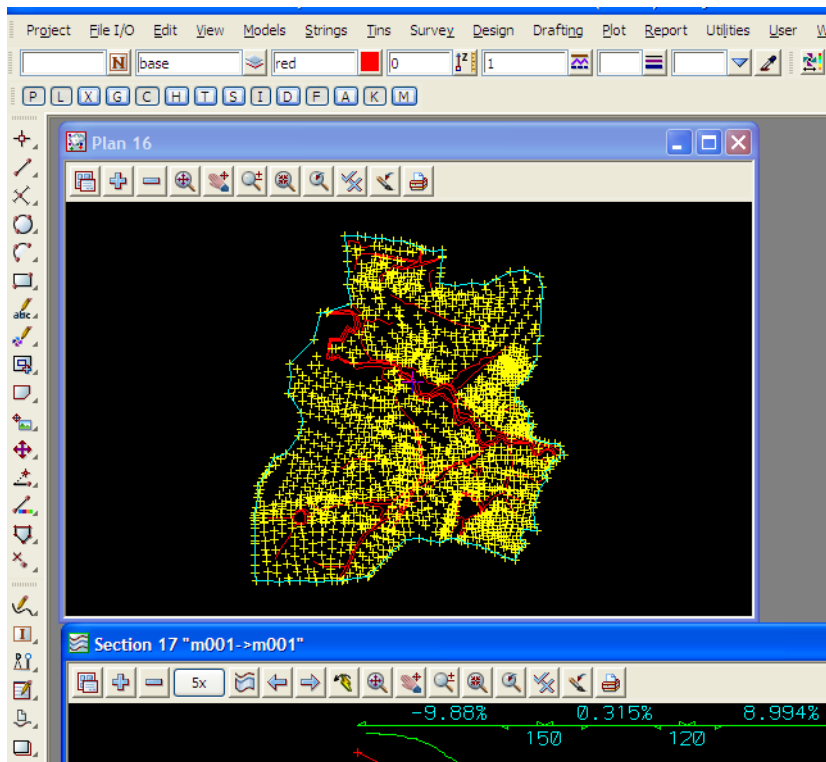

Select **Back up and Replace** for Operation, tick on **Test after update**, and then click **Update**.
12d Model saves the **nodes.4d** file to the folder **C:\12d\10.00** and then loads the project **Dam**.

Note - if you don't have one or both of the files **nodes.4d** or **nodes.12d10n** attached to an email but instead have either of the files in a folder accessible from your computer, then you can do the following:

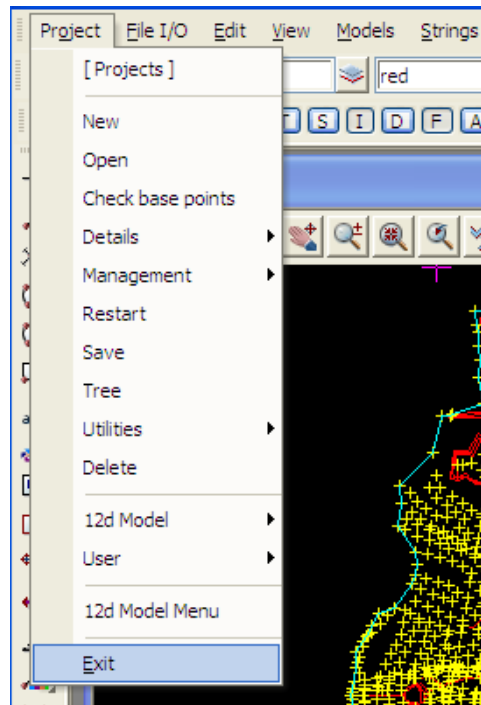

If there is a **nodes.12d10n** file, double click on that file and the **Accept Nodes** panel should appear and you continue with the instructions above.

If that doesn't work or you only have a **nodes.4d** file, start up **12d Model** and click on the **Nodes** button at the bottom of the **Project Selection** panel. This will also bring up the **Accept Nodes** panel and you can browse for the **nodes.4d** or **nodes.12d10n** file in the New nodes file panel field. You can then continue with the instructions above.

12d Model starting up and displaying the dam project shows that:

- (a) the dongle drivers have been successfully installed
- (b) **12d Model** has been successfully installed
- (c) the **12d Model** dongle is accessible
- (d) the **nodes.4d** file has been successfully installed and matches the dongle.

Click on **Project** and then **Exit** to shut down **12d Model**.

Step 6. Installing 12d Model Context Sensitive Help for Vista and Win 7

12d Model has a context sensitive reference help system which can be accessed directly from most menus and panels:

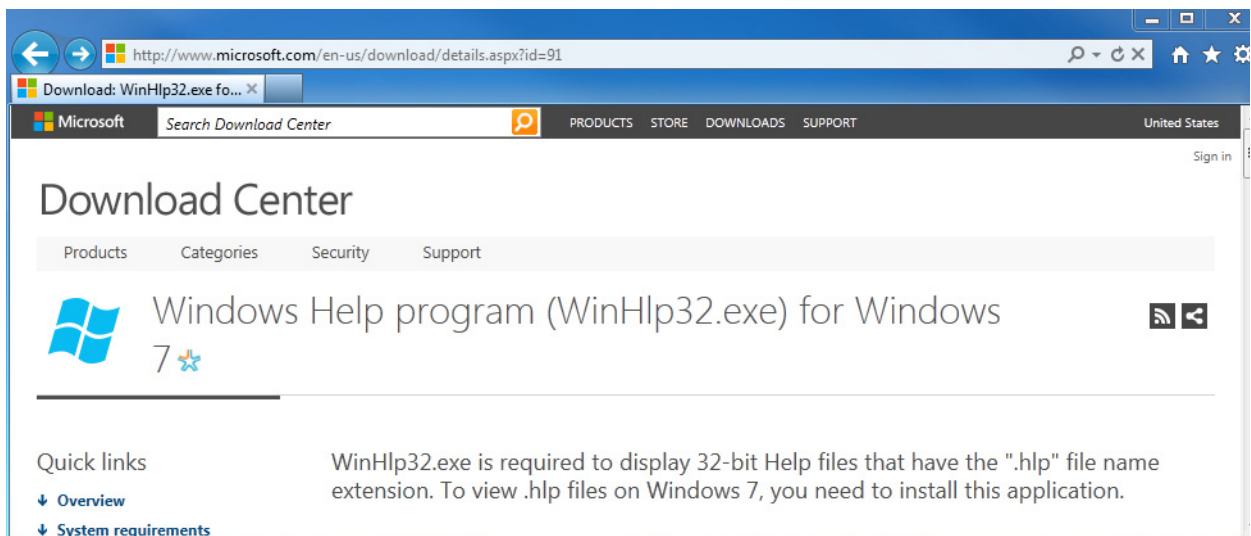

- For most menus in **12d Model**, when the menu is on the screen and has the Windows focus, simply press F1 and the **12d Help** will open automatically at that menu
- For most panels in **12d Model**, when the panel is on the screen and has the Windows focus, simply press F1 and the **12d Help** will open automatically at that panel
- Most panels in **12d Model** have a **Help** button on them and clicking on the **Help** button opens the **12d Help** at that panel
- By clicking on the option **Help =>12d Model**

The **12d Model** context sensitive help uses Microsoft's **WinHlp**.

For *Vista* and *Win 7*, Microsoft no longer ships the WinHlp.exe executable and Microsoft will no longer allow it to be installed by the 12d Model installation DVD.

So if you are running Vista or Win 7, you need to download and install WinHlp.exe from Microsoft's website to access the **12d Model Help** files. The link to the area for the download is

www.microsoft.com/en-us/download/details.aspx?id=91

Or if you have 12d Model up and running, the link is available on the menu

Help =>Microsoft 7

Note: the entire **12d Model Reference** manual is available in pdf format on the **Documentation** tab of the **12d Model 10 Installation** DVD.

CONGRATULATIONS - 12d Model has now been successfully installed and you have finished with these notes.

If **12d Model** did **not** install correctly, please continue to the next section, [12d Model 10 Not Authorising](#), of these notes.

12d Model 10 Not Authorising

If there is an **error** with the installation, then the **Error Authorizing Release Version** panel appears with possibly error message in the panel message area.

Dongle: NO DONGLE FOUND

Current date: 07, October 2012

If no dongle has been detected then the NO DONGLE FOUND message is displayed. Otherwise the detected dongle number is displayed in this field

Please check that

- (a) the **12d** dongle is firmly attached to the computer.
If not, please attach the dongle and retry starting up **12d Model** and accessing a project.
- (b) if it is a parallel dongle, the dongle is before any Rainbow dongles. For example, before any AutoCAD dongle.
- (c) your computer has the latest dongle drivers installed. These can be obtained from *Updates* section of the web site www.12d.com.

If the dongle number still does not come up in the **Error Authorizing Release Version** panel, please click on the **Email info** button to bring up the **Email Information on 12d Model to 12D Solutions** panel. Fill in the panel and click on **Email** to send the information to 12D Solutions and then contact 12d Solutions or your local distributor.

Special Note If Using a Network Dongle

If you are using a network dongle, then your **env.4d** needs to be modified so that **12d Model** will correctly **search** for the Network dongle. In that case there will be information in the **Wibu Key** section of the **Error Authorizing Release Version** panel.

Aladin/Hardlock
HARDLOCK_4D
DONGLE_4D
HLS_IPADDR

Wibu Key
WIBU_4D
WIBU_DONGLE_4D
WIBU_IPADDR

Accessing a 12d Network Dongle requires additional information in the env.4d file and this will appear in the Wibu Key section of the panel

If the Wibu Key section is blank then a network dongle can not be accessed.

-local -network_last

If the Wibu Key section is blank then a network dongle will not be searched for and so cannot be accessed.

Please see the notes on *Installing a Network Dongle* under the **Documentation** tab of the **12d Model 10 Installation** DVD on how to set up the env.4d file correctly for accessing a network dongle.

- 2. Check if there is a recent **nodes.4d** or **nodes.12d10n** file in the correct area on your computer, which by default is in the folder C:\12d\10.00.

The nodes.4d file found is displayed in the **Authorization** field.

Error Authorizing Release Version

Environment Information
HOME_4D
authorization
Client

C:\Program Files (x86)\12d\12dmodel

C:\12d\10.00\nodes.4d

12D Solutions - NSW

if not blank, it shows where the **nodes.4d** file is coming from

If it is blank then no nodes.4d has been found.
If you do not have a **nodes.4d** or **nodes.12d10n** file, contact your local distributor.

- 3. The **Client** field in the **Error Authorizing Release Version** panel has NO CLIENT FOUND.

Client: NO CLIENT FOUND
Dongle: 572d470f51
Current date: 08, October 2012

If no valid client has been found in the nodes.4d file then the NO CLIENT FOUND message is displayed.
Otherwise the detected client name is displayed in this field

Client: 12D Solutions - NSW
Dongle: 572d470f51
Current date: 08, October 2012

If the **Client** field has a valid *Client Name* in it then that indicates that a **12d Model 10 nodes.4d** file is being read and has a valid Client line in it.

4. Client and Dongle fields look correct but you now get an **error -206**

Client: 12D Solutions - NSW
Dongle: 572d470f51
Current date: 08, October 2012

using DISPLAY = :0.0
using Registry Key "SOFTWARE\Microsoft\Windows\CurrentVersion\App Paths\12d.exe\10\\
Nodes file found <C:\12d\10.00\nodes.4d>
nodes.4d: error -206: cpu line is missing for matching dongle

There is no valid line for the dongle in the nodes.4d file

This error now indicates that there is **no** line, or no valid line, in the **nodes.4d** file for the dongle number given in the **Dongle** field.

If you do not have the correct **nodes.4d** file, contact your local distributor.

5. Check that the date on your computer is correct.

Client: 12D Solutions - NSW
Dongle: 572d470f51
Current date: 08, October 2012

Is this todays date?
Having the incorrect date can corrupt files.

If the date is not correct then be very careful. Having an incorrect date in your computer can

corrupt computer files and **12d Model** projects.

- 6. If the date on your computer is correct then you need to check that it is between the *start* and *end dates* given in the line in the *nodes.4d* file for your dongle.

Client	12D Solutions - NSW
Dongle	572d470f51
Current date	08, October 2012

If there is no valid date line in your *nodes.4d* file for your dongle, then contact your local distributor for a new *nodes.4d* file.

- 7. **12d Model** still can't access a project.
Please contact your local distributor.

Licence Expiry Warning

The **nodes.4d** file that controls *12d Model*, only validates *12d Model* to run for a certain period of time.

If when running **12d Model**, the **Licence Expiry Warning** panel appears:

it simply means that the **nodes.4d** file needs to be updated.

Please contract your **12d Model Distributor** to obtain a new **nodes.4d**.

Dongle Missing

If when running **12d Model**, the **Dongle Missing** panel appears:

it simply means that the **12d** dongle can no longer be seen by **12d Model**.

Please check that your **12d** dongle is still attached to your computer, or if you are using a network dongle, that your network is still active.

Even if you can not see the dongle, **12d Model** will allow to save your current work do nothing is lost.

Wibu XP SP2 Problems

Once the WIBU drivers been successfully installed and the WIBU USB dongle is attached to the USB port, **Windows XP** realises new hardware has been attached to the USB port and the *Found New Hardware (WIBU-BOX/RU)* message is displayed

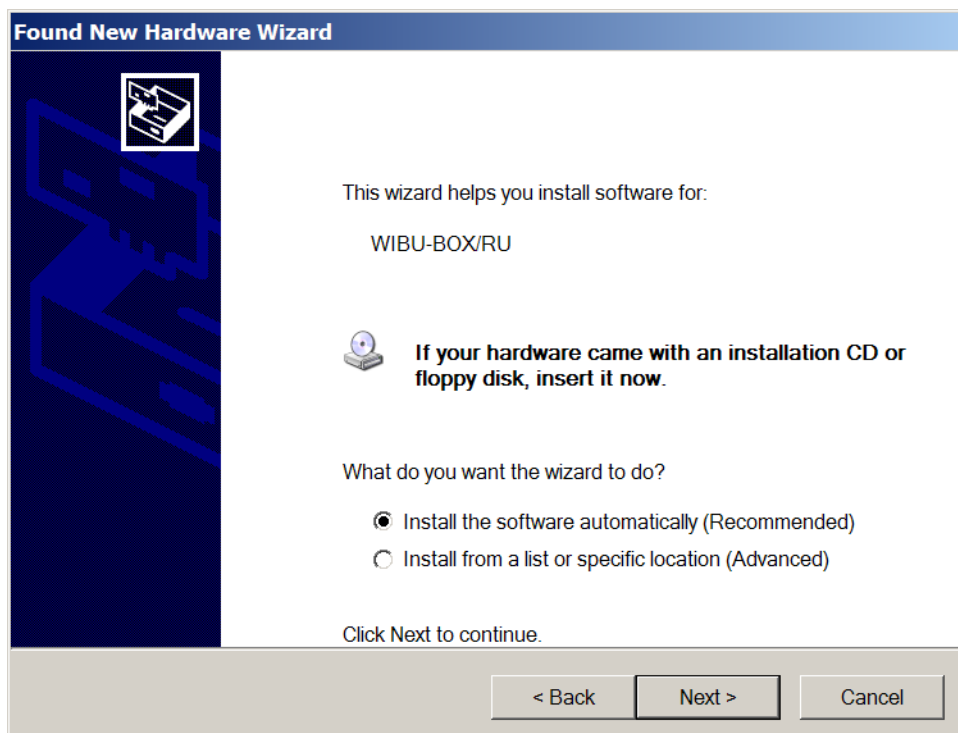

Unfortunately, XP SP2 does not find the WIBU-BOX/RU drivers and automatically install them and you get the Found New Hardware Wizard instead:

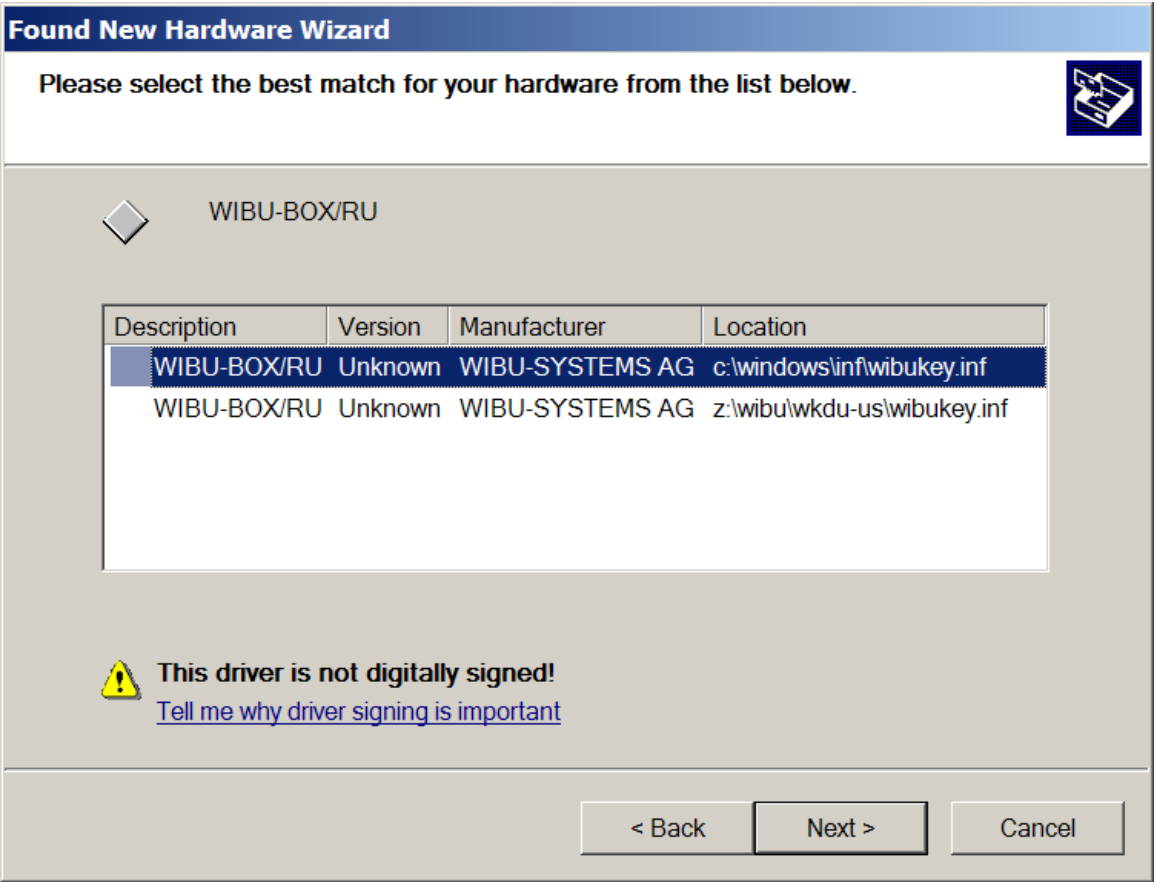

Click on **No, not this time** and select **Next** to continue

tick **Install the software automatically** and select **Next** to continue

NOTE: XP now finds **C:\windows\inf** but for some reason can't when it first detects the new hardware (as it used to do in earlier XP's and Win 2000).

choose either location and select **Next** to continue

select **Finish**

The new hardware has now been installed

2 Installation of 12d Model 10 Practice Version

The *Practise* version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the *Release* versions of **12d Model** and vice-versa. However the *Practise* version can be used free of charge by 12d Solutions customers and registered *Practise* Users.

These notes are for installing the ***Practise version*** of **12d Model 10**. There are separate notes for installing the *Release* version.

The *Practise* version must be Registered with 12d Solutions once it is installed on a computer. A new Registration is required for each computer that the *Practise* version is run on.

The *12d Model 10 Installation CD* can be used to install the *Practise* versions of **12d Model 10**.

Or

The file *12dModel 10 Practise.exe* can be down loaded from the web site www.12d.com. The file *12dModel 10 Practise.exe* is a self-extracting file for installing the *Practise* version of **12d Model**.

Extra Notes for All Installations

1. A three-button mouse is essential.
2. The *12d Model Installation CD* contains extra information other than just the installation version of *12d Model*. For example, extra documentation, course notes and source code to macros.

The extra data can be copied from the *12d Model Installation CD* but the copied files may only have a “read only” attribute set. This means that the files can not be edited or modified in any way.

To change the attribute so that a file can be modified, select the file in Explorer, bring up the Properties sheet and under the General tab sheet change the “read only” box so that it is not ticked on.

Selecting **OK** or **Apply** will then modify the attribute of the file.

Installing the Practise Version of 12d Model 10

These notes are for installing the **Practise** version of 12d Model 10. There are separate notes for installing the **Release** version.

A. Disk Space required for installing 12d Model 10

Approximately 200 megabytes of disc space will be required for the installation to succeed. After installation this can be reduced to a minimum of 60 megabytes.

B. Before installing from the DVD or the Web

For Windows 2000, XP, Vista, [Windows 7](#):

Reboot the PC **before** installing 12d Model from the DVD or the Web.

Your login must have Administrator privileges.

C. Installing 12d Model from the Web

The self-extracting file *12dModel 10 Practise.exe* can be down loaded from the web site www.12d.com and used to install the *Practise* version of *12d Model*.

After down loading *12dModel 10 Practise.exe*, double-click on *12dModel 10 Practise.exe* and the installation software will be automatically extracted from the file and fires up the **Install 12d Model Practise** screen.

Please go to section [Dialogues from the 12d Model 10 Practise InstallShield Wizard](#):

D. Installing Using the 12d Model 10 Installation DVD

Insert the **12d Model 10 Installation DVD** into the CD drive.

On inserting the CD, the **12d Model** Setup program automatically begins.

If it doesn't, simply double click on the program **Launch.exe** from the DVD.

The **12d Model Release** front screen will appear.

Click on the **12d Practise** tab

The **12d Model Practise** screen will appear.

E. 12d Model Practise Screen

The **12d Model Practise** screen:

Note - when installing from the web, the *tabs* with *12d Release*, *12d Practise*, *Other Software* and *Documentation* will not appear. The extra tabs only appear if you are installing from the *12d Model Installation DVD*.

The Steps on the **12d Practise** tab of the *12d Model Installation DVD* will lead you through the installation of the *Practise* version of *12d Model*.

A **video** to guide you through the installation process can be viewed by clicking on **Videos** under the **Installation notes** heading. Or the **Installation Notes** in pdf format can be viewed by clicking on **Notes** under the **Installation notes** heading.

NOTE - If the *Camtasia* codec is already installed on your computer then you can proceed to **Install 12d Model 10 Practise**.

Step 1. Install Camtasia Codec

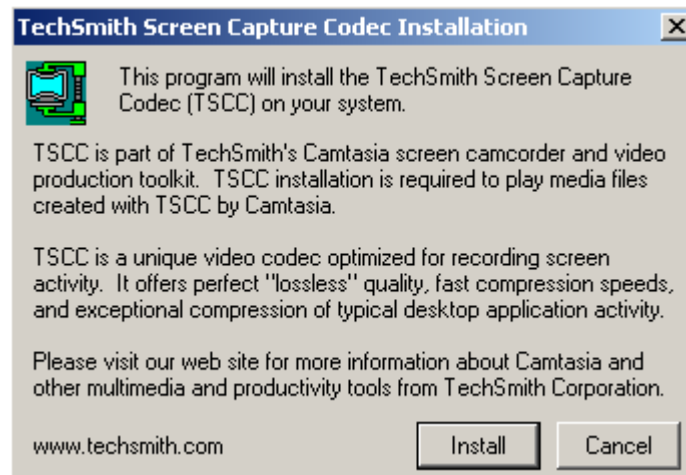

Install the Camtasia Codec that is used for displaying some of the videos on the **12d Model Training CDs** and DVDs.

Note - you need Administrator rights to install the Camtasia Codec.

Click on *Camtasia codec*:

Installation

Installation message

Select **Install** to continue with the installation

Installation Complete

Select **OK**.

This completes the installation of the *Camtasia Codec*.

The **12d Model Practise** screen will then appear.

Step 2. Install 12d Model 10 Practise From DVD

Installing the 12d Model Practise software and Training area:

Note - you need Administrator rights to install **12d Model 10 Practise**.

Click on **12d Model 10 Practise**:

The installation will then start.

Step 3. Dialogues from the 12d Model 10 Practise InstallShield Wizard:

Welcome

Welcome message

Select **Next** to continue with the installation

Warning for commercial competitors

12d Solutions warning

The **12d Model Practise** version and all documentation are supplied by *12d Solutions Pty Limited* for the use of **12d Model** Customers and genuine prospects only. The use of the **12d Model** practise versions by commercial competitors to **12d Model** is strictly prohibited.

Select **Next** to continue if you are a **12d Model** Customers or a genuine prospect

Software License Agreement

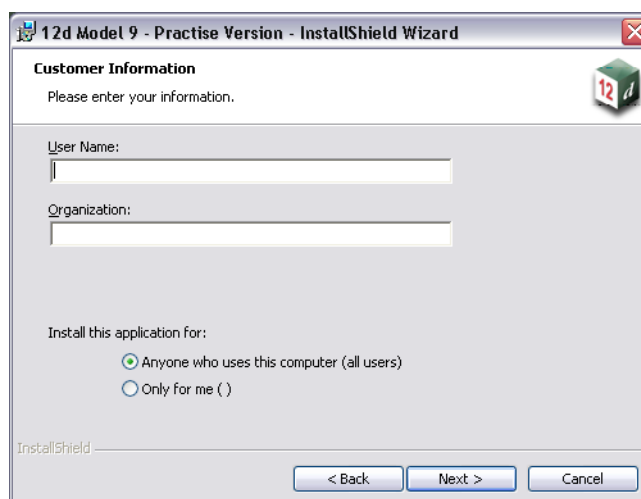

12d Solutions license agreement

If you agree with the License conditions, click on *I accept the terms in the license agreement*

Select **Next** to continue with the installation

Customer Information

fill in *User Name* and *Organisation*, tick who can use the computer

select **Next** to continue with the installation

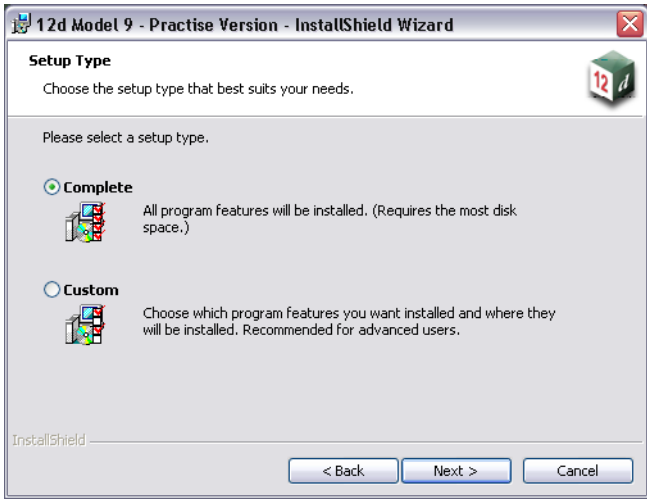

Destination Folder

continue with the default installation area for the software *c:\Program Files* or click on *Change* to browse to another area for installation

select **Next** to continue with the installation

Setup Type

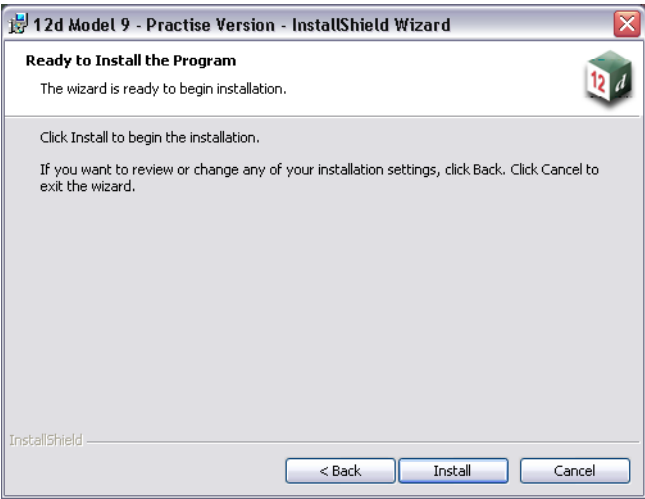

select **Complete**

select **Next** to continue with the installation

Ready to Install

Begin the installation

select **Install** to continue the installation

The software will be copied onto the computer and installed.

Setup Complete

End of installation

Select **Finish** to complete the installation

The **12d Model Practise** screen will then appear.

Select **Exit** at the bottom right hand corner of the screen to end the installation.

For **Practise** versions, the software needs to be authorised by emailing information about your computer to 12d Solutions.

The form for the required information is automatically created when an unauthorised *12d Model Practise version* is **started up**. The form can be emailed to *12d Solutions* from the *12d Model Practise* software.

Folders and Icons Created by Installing 12d Model Practise

Folders Created by the Installation

(a) For *12d Model Practise* on Windows 32-bit operating systems:

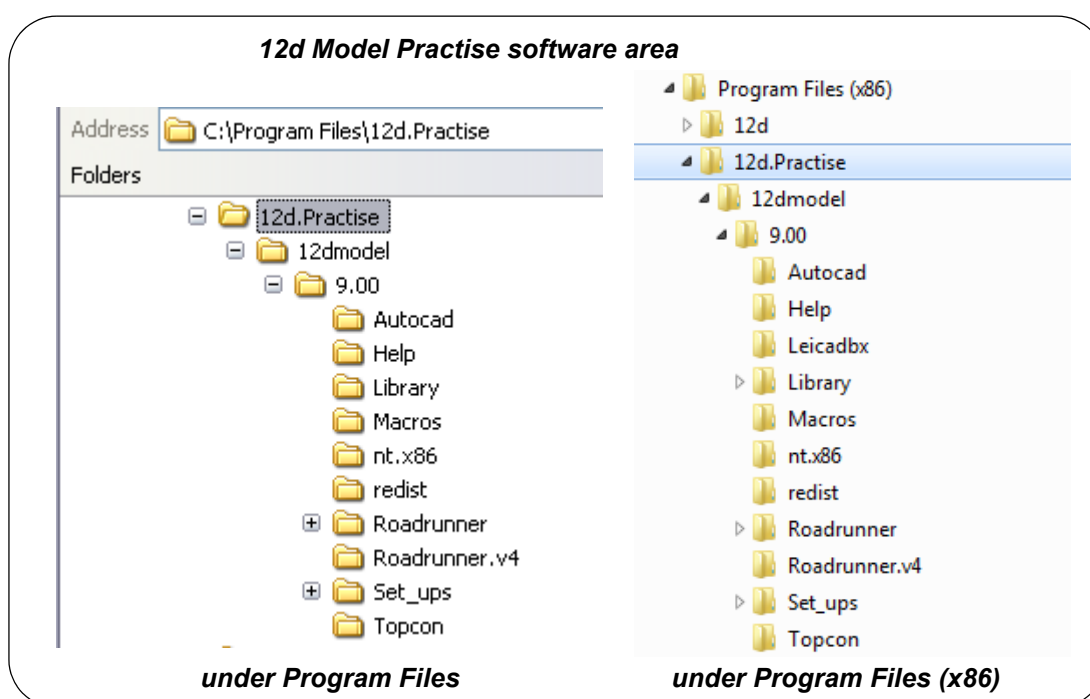

the *12d Model Practise* installation loads the **12d Model Practise software** into the folder
C:\Program Files\12d Practise\12dmodel\10.00

OR

(b) For *12d Model Practise* on Windows 64-bit operating systems:

the *12d Model Practise* installation loads the **12d Model Practise software** into the folder
C:\Program Files (x86)\12d Practise\12dmodel\10.00

12d Model Practise users normally only have **read** access to the *Program Files* and/or *Program Files (x86)* areas.

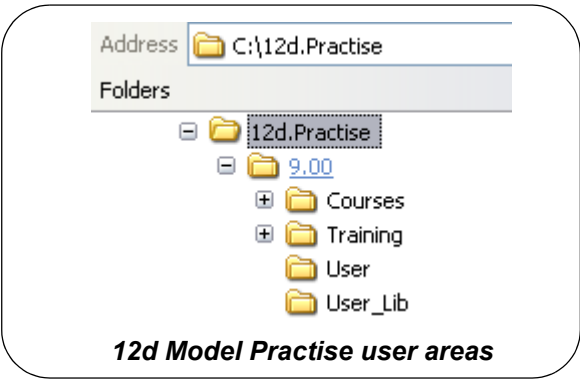

The *12d Model* installation also creates an area

C:\12d Practise\10.00

which during the installation is given read/write access for the user.

The folder 12d Practise\10.00 contains the training data used with the *Getting Started for Design* and *Getting Started for Surveying* manuals and the subfolders **User** and **User_Lib** are created for future user customisations of *12d Model*

Icon Created by the Installation

The installation loads the appropriate components and creates the **12d Model 10 Practise** icon

The *12d Model 10 Practise* icon fires up **12d Model Practise** and attaches to the folder *12d Practise\10.00*.

Authorizing the Practise Version of 12d Model 10

Warning

The *12d Model Practise* version and all documentation is supplied by *12d Solutions Pty Ltd* for the use of 12d Model Customers and genuine prospects only. The use of the *12d Model Practise* version by commercial competitors to **12d Model** is strictly prohibited.

The Practise version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the Release versions of 12d Model and vice-versa. However the Practise version can be used free of charge by *12d Solutions* customers and registered Practise Users.

The Practise version needs to be Registered with *12d Solutions* once it is installed on a computer and a new Registration is required for each computer the Practise version is run on.

The installation creates the **12d Model 10 Practise** icon:

Next fire up **12d Model Practise** by double clicking on the *12d Model 10 Practise* icon.

*This will bring up the Project Selection panel with an **Authorize** button it.*

Click on **Authorize** to display the **Authorize Request Form** panel.

Authorization Request Form

WARNING!

The 12d Model practise version and all documentation is supplied by 12d Solutions Pty Ltd for the use of 12d Model customers and genuine prospects only. The use of 12d Model practise version by commercial competitors to 12d Model is strictly prohibited. The Requester hereby acknowledges that they are not using 12d Model for competitive purposes or passing any information on to a third party that is using the information for competitive purposes. The Requester hereby acknowledges 12d Solutions copyright in the 12d Model software and documentation whether or not it has been filed with the copyright office.

practise.4d: error 0:

Fill in the details (all those in black type must be filled in) and then either

- (a) click on the **Email** button to send the information to 12d Solutions Pty Ltd or if this fails
 - (b) click on the **Save** button. A file called *12d_auth.12d10r* is then written out to the folder **My Documents**. Please email this file (as an attachment) to authorize@12d.com
- Then click on the **Finish** to exit *12d Model*.

On receiving your request, 12d Solutions will generate an authorization code and send an email back to you with an attachment called **12d_auth.12d10c**

When you receive the email with the file *12d_auth.12d10c* attached to it, double click on the attached file *12d_auth.12d10c*, click on **Open it** and finally click on **OK**.

12d Model Practise will then start up and

validate the *12d_auth.12d10c* file, and if it is valid

save the authorization code away as the file *practise.4d* in the folder

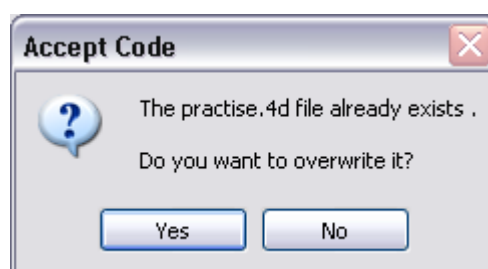

c:\12d Practise\10.00

and then bring up the *Accept Code* panel with the *practise.4d updated* message.

Click on **OK** and 12d Model Practise will open and display the project Road.

*Note: if you already have a *pratis.4d* file in the folder then the **Accept Code** panel will be brought up, stating that the *practise.4d* file already exists, and asking to overwrite it.*

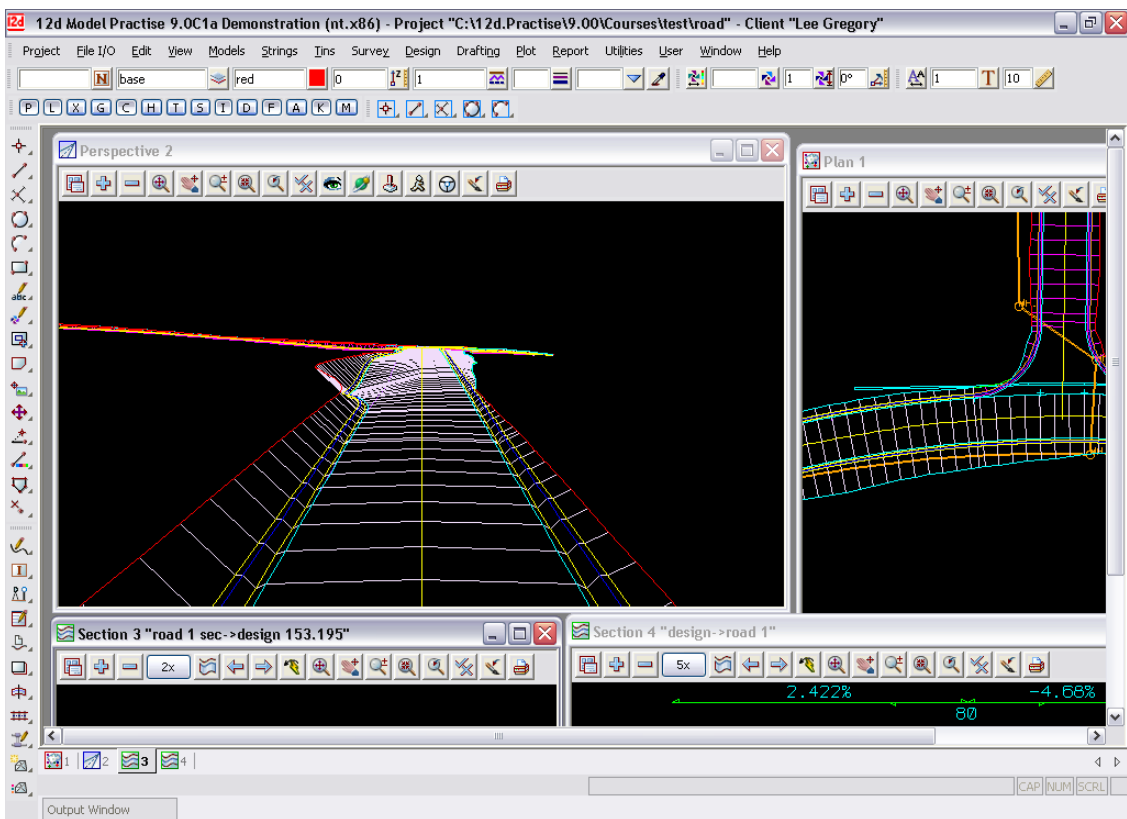

Click on **Yes** and the new authorization code will be saved away as the file **practise.4d** in the folder

c:\12d Practise\10.00

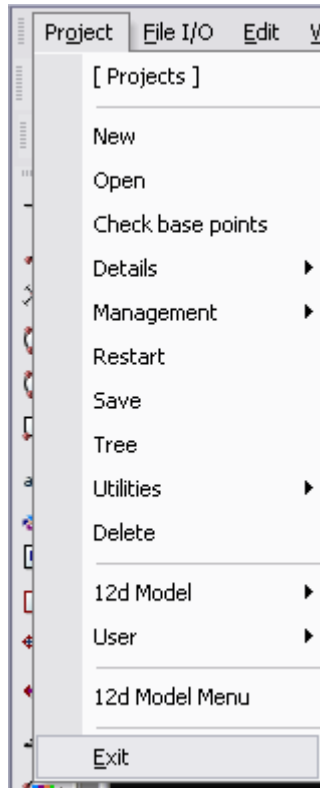

The **Accept Code** panel then comes up with the *practise.4d updated* message.

Click on **OK** and *12d Model Practise* will open and display the project *Road*.

To exit *12d Model Practise*, click on **Project =>Exit**

If *12d Model Practise* does not start up correctly, please go to the next section [Possible Problems When Authorizing the Practise Version](#)

Possible Problems When Authorizing the Practise Version

1. The date on your computer is not the correct date.
2. The computer your are authorizing is not the same one that the *Authorisation Request Form* was generated for.

The **12d_auth.12d10c** and the generated **practise.4d** file are only valid for the computer that the *Authorisation Request Form* was generated on. If you want the Practise version to run on another computer, you need to generate a new *Authorisation Request Form* on that computer and send it to 12d Solutions.
3. If you change your network card after generating the *Authorisation Request Form* then the authorization will stop working. A new *Authorisation Request Form* needs to sent to 12d Solutions.
4. If the file **12d_auth.12d10c** does not appear as an attachment then your email system can't handle MIME attachment. Please contact 12d Solutions at authorize@12d.com

4 Tools and Concepts

The **Tools and Concepts** chapter contains information about the definitions and behaviour of general items used in **12d Model** such use of the mouse, keyboard, how information is displayed on the screen, picking items *etc.*

For documentation on the first item, continue to the next section [The Mouse](#).

The Mouse

The mouse is used extensively in **12d Model**.

12d Model can be operated with either a two or a three button mouse but a three button mouse is preferred.

In this manual the buttons will be denoted by

LB = the left button

MB = the middle button

RB = the right-button

12d Model monitors the mouse being pushed down and when it is subsequently released as separate events. Unless otherwise specified in the manual, **clicking** a button will mean **pressing the button down and releasing it again**. The **position of the mouse** is normally taken as being when the **button is released**.

In screen messages, the effect of pressing each button on the mouse is shown by enclosing the effect for each button in square brackets ([]) in left-to-right button order. That is

[left button effect] [middle button effect] [right button effect]

Empty brackets, [], indicate that pressing the button has no effect at that time.

NOTE: If the Middle button is also a wheel, then the wheel can be used in some **12d Model** operations such as zoom.

Please continue to the next section [The Keyboard](#).

The Keyboard

For clarity, the characters and special keys on the keyboard will be enclosed in the angle brackets < >. For example, the delete key is .

When two or more keys are to be pressed down together, they will be shown in angle brackets separated by a plus sign (+). For example, <ctrl> + <d> means that the control key and d are pressed down together.

In **12d Model**, the *escape* key (normally labelled **Esc** on the keyboard and denoted by <esc> in this manual) is used to **stop drawing** in a view or to **break out** of computer intensive options (*escape* or *abort* the option) but still remain in **12d Model**. Options which can be terminated by <esc> are noted in the manual.

Please continue to the next section [Screen Layout](#).

Screen Layout

Inside the **12d Model** screen are six distinct areas (main menu, top tool bar area, side tool bar area, view area, output window and status bar) which create and control nine associated objects (panels, tool bars, control bars, floating menus, plan views, section views, perspective views, hidden perspective views and OpenGL perspective views) displayed on the screen.

The main areas and their purposes are:

(a) Main Menu

The **Main Menu** is at the top of the **12d Model** screen and is a standard Microsoft type menu. Options are selected in the standard Microsoft way and bring up **12d Model panels** and **floating menus**.

(b) Views Area

The **Views Area** displays the **12d Model** drawing views for seeing and examining the data. There is no limit to the number of **plan**, **section** or **perspective** and **hidden perspective views** that can be created, overlapped or iconized.

(c) Output Window

The **Output Window** displays **12d Model** system and error messages, and intelligent log lines. The Output Window can be turned on/off from the Main menu.

(d) Status Bar

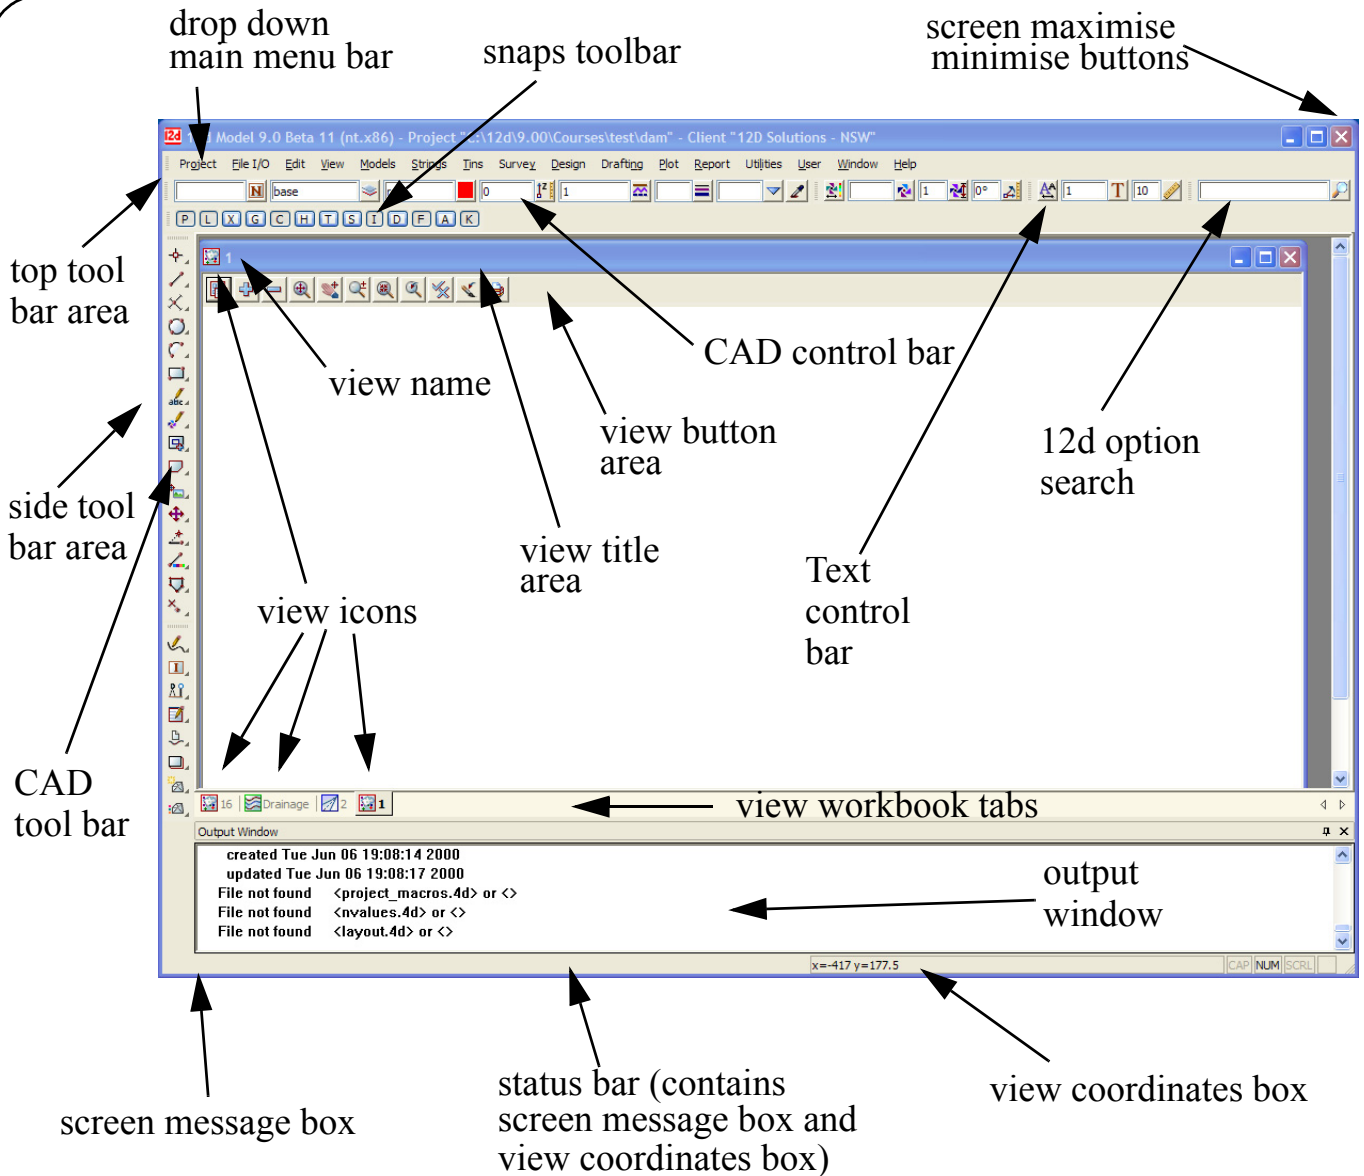

The **Status Bar** displays message prompts and the x, y and z co-ordinates of the cursor when it is in a drawing view. The Status Bar can be turned on/off from the Main menu.

(e) Top Tool Bar area

The **Top Tool bar area** is below the Main Menu and contains the CAD control bar, Text control bar and the snaps toolbar.

(f) Side Tool Bar area

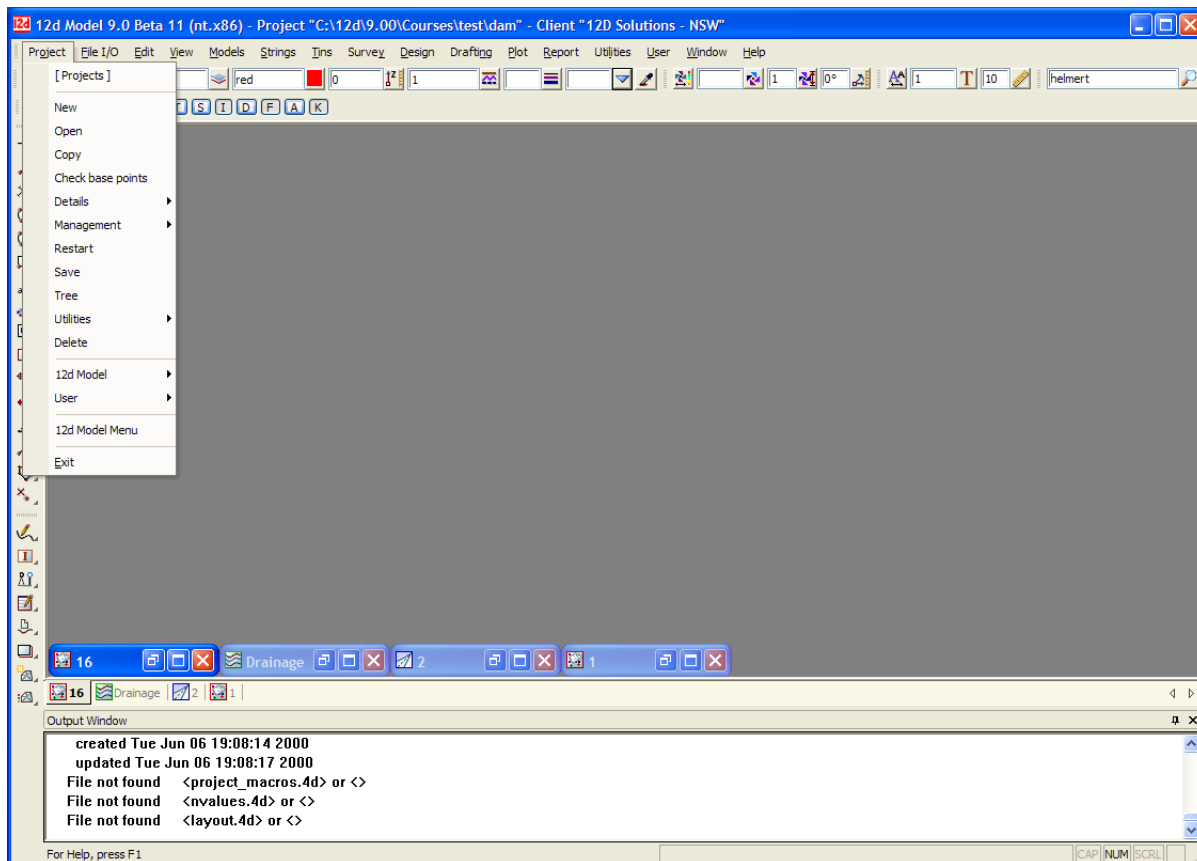

The **Side Tool bar area** is on the far left side and the CAD tool bar and other tool bars defined in *Toolbars.4d*

Please continue to the next section [Main Menu](#).

Main Menu

At the top of the **12d Model** window is the **Main** menu, a standard Microsoft type menu.

Options can be selected in the standard Microsoft way and bring up **12d Model** panels (dialogues) or create floating menus.

The **Main** menu can be moved around, or docked on any of the four sides of the window.

If the window is not wide enough, the **Main** menu will automatically wrap around onto two or more lines.

Please continue to the next section [Floating Menus](#).

Floating Menus

As well as the standard Microsoft type menu, **12d Model** has the concept of **floating (tear away) menus**.

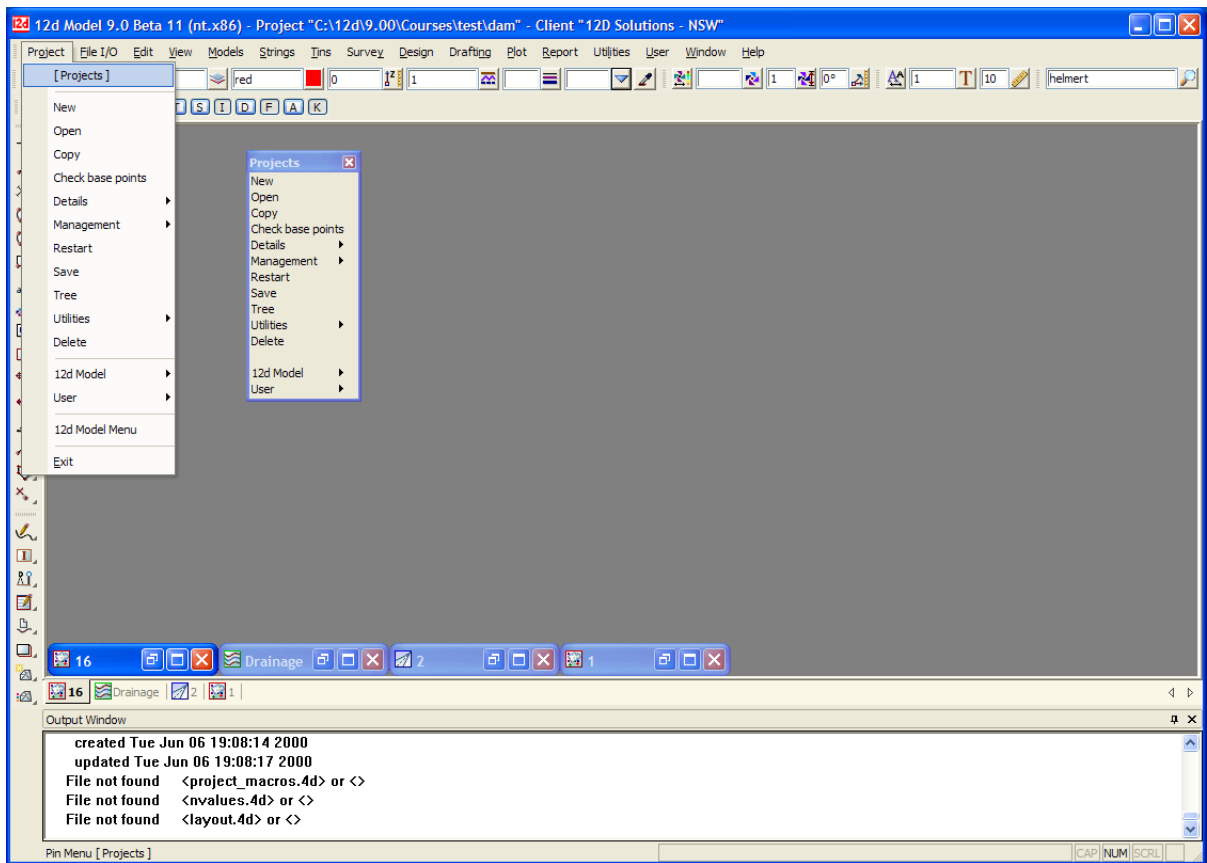

The presence of a floating menu on the Main menu is indicated by a menu item enclosed in square brackets []. Selecting a menu item in square brackets will create a floating menu of that name.

For example, selecting [Project] from the top menu Project creates the floating menu called **Projects**.

A floating menu can be moved around the screen, even outside the **12d Model** window, and will stay up until the [X] button is selected on the top right hand side of the floating menu.

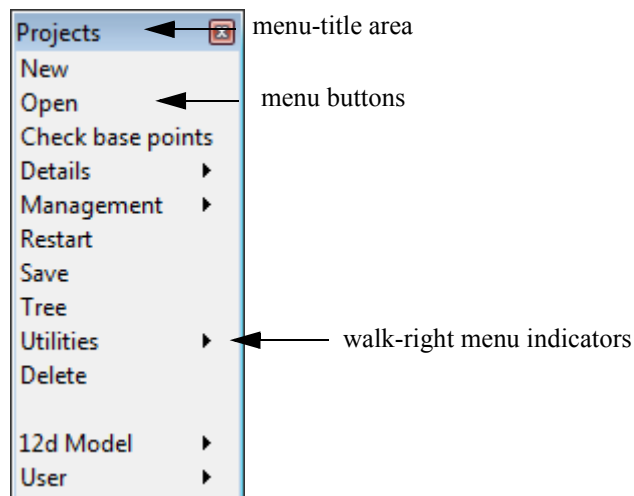

A floating menu created from the Main menu usually contains the same items and walk-right menus as the Main menu but has the distinct advantage that it doesn't disappear when the

cursor is moved to select other menus from the Main menu.

Floating menus or just Menus, consist of a menu title area and a series of options, called menu buttons, lined up under the menu title.

For example, the Projects menu looks like

An option on the menu is invoked (or selected) by clicking LB whilst over the option.

If no option exists, a **No Option** panel is placed on the screen. The panel will remain until the **OK** or **[X]** button is selected.

A ">" on a menu-option indicates that there is a **walk-right** menu attached to that button.

The walk-right menu only appears as the cursor **moves over** the >.

The walk-right menu can consist of further menu options and walk-rights.

If a walk-right menu is showing and the user wanders back into the menu where the walk-right originated, the walk-right menu will collapse back to the >.

Moving a Menu

A menu can be moved (dragged) by **holding down LB** anywhere in the menu title area (except on the [X] button) and then moving the cursor with the LB still depressed. A menu outline appears and moves with the cursor to indicate where the new menu position will be. The menu is finally positioned when LB is released.

When an expanded walk-right menu is moved, a **copy** of the walk-right menu will be moved and placed on the screen as a new floating menu. The original menu still contains the walk-right menu.

Dumping a Menu or Panel

The menu or panel can be written out to disk in a variety of images formats, as a screen layout file, and for a panel, as a defaults file. This is called dumping the menu or panel.

The **dump** option is invoked by clicking the middle mouse button (MB) anywhere in the menu/panel title area. The **Menu/Panel Dump** panel is then displayed.

Note: If a screen layout file is created and added to the *layout.4d* file (by selecting *layout.4d* as the file name and selecting **Append**), then the menu/panel will appear whenever a project is opened. See [layout.4d](#)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Format

choice box

screen layout file

format for writing the menu/panel to disk.

File

file box

disk file to write the image or screen layout information to.

Dump

button

dump the menu information to disk.

Deleting a Menu

A floating menu is deleted by selecting the **[X]** button in the menu-title area.

Please continue to the next section [12d Model Menu](#).

12d Model Menu

The **12d Model** menu familiar from **12d Model** version 3.20 is available by selected **12d Model Menu** on the **Projects** menu.

Selecting **12d Model Menu** again will *remove* the **12d Model** menu.

All of the options down the **12d Model** menu are also available in the same order going across the **Main** menu.

Please continue to the next section [Toolbars and Controlbars](#).

Toolbars and Controlbars

Toolbars

Options can be grouped together on *toolbars*. *Toolbars* are made up entirely of *icons* and each icon can have a **12d Model** option attached to it.

Toolbars have unique names which are displayed on the top of the toolbar when it is not docked.

Toolbars can also have one level of **Flyouts** of other toolbars and when a flyout exists, there is a small arrow on the bottom right of the icon to indicate a flyout exist. The *tool tip* for the icon gives the *name* of the flyout toolbar. The actual icon itself is the icon of the *first item* on the *flyout* toolbar.

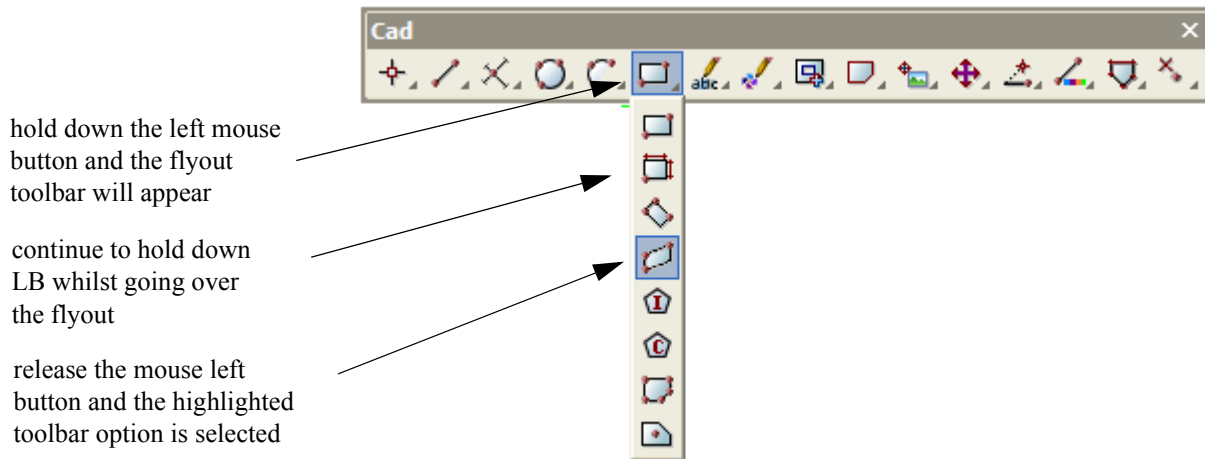

For example, the *CAD toolbar* is entirely made up of flyout toolbars.

To display and select from a flyout toolbar, hold down LB whilst over the icon on a toolbar with a

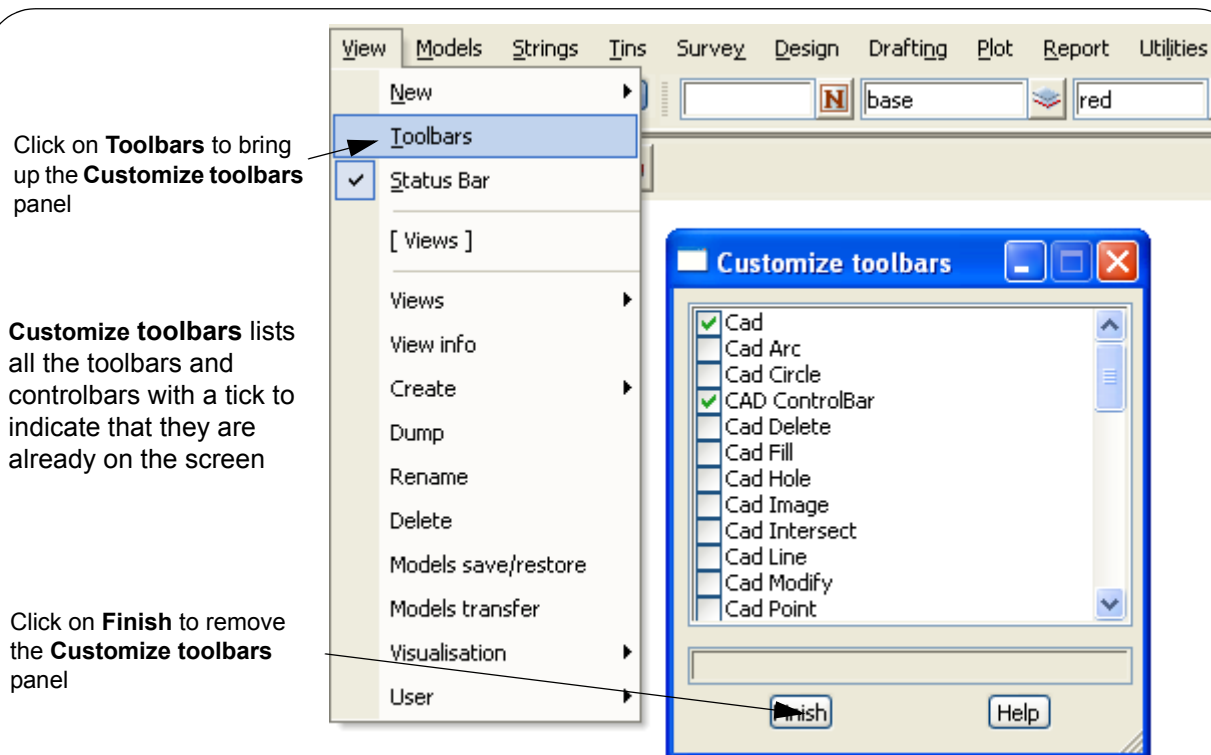

flyout menu and the flyout menu will appear. Whilst still holding down LB, move along the flyout toolbar to the appropriate option and then release LB. The option attached to the highlighted icon will then be selected.

Note - if LB is released whilst a icon with a flyout toolbar is highlighted, the first option on the flyout tool bar is selected.

All the toolbars in **12d Model** are defined in a file with the default name *toolbars.4d* (for the definition of toolbars, see the section [User Defined Toolbars](#) in the Appendix [Functions Keys, Menus, Toolbars](#)).

The list of all defined toolbars is given by selecting **View => Toolbars** from the main menu which brings up the **Customize toolbars** panel. A toolbar is shown with a tick if it is already on the screen.

Ticking **on** a toolbar in the list brings up the toolbar in the top left hand corner of the screen. The toolbar can then be moved or docked.

Ticking **off** a toolbar in the list removes the toolbar from the screen.

Important Note - the toolbars are not active whilst the **Customize toolbars** panel is on the screen. Close the

Customize toolbars panel as soon as you finished with it.

What toolbars are on the screen and their position is recorded with the project so that when a project is existed and later started again, the final position of the toolbars is restored.

Also at any time, a workspace file can be read in and define a new setup and position of toolbars. For more information on using workspace files, please go to the section [Project Workspace](#) in the chapter [Projects](#).

For links to the options on each *Toolbar*, go to [Options on Toolbars](#)

Controlbars

Controlbars can have icons on them but they also have controls such as a model box on them.

Controlbars are not user defined and there are only four of them in **12d Model** - the **Cad Controlbar**, **Symbol Controlbar**, **Text Controlbar** and **Search bar**.

This default position of the *controlbars* is on the top left hand side of the screen under the main menu.

Although not toolbars, the *Controlbars* do appear in the *Toolbars* list in the **Customize** panel and can be turned on/off and docked just like toolbars.

Important Note - the toolbars are not active whilst the **Customize** panel is on the screen. Close the **Customize** panel as soon as you finished with it.

The *controlbars* CAD, Symbol and Text are used by *CAD toolbars* and the *Strings Create* options. *Strings* created by the *CAD toolbars* and *Strings Create* options use values in the *controlbars* to define string properties such as name, model and colour.

Like toolbars, the type and position on the screen of controlbars is recorded with the project so that when a project is exited and then started later, the final position of the *controlbars* is restored.

Also at any time, a workspace file can be read in and define a new setup and position of the *controlbars*. For more information on using workspace files, please go to the section [Project Workspace](#) in the chapter [Projects](#).

The three *Controlbars* CAD, Symbol and Text will be described in detail in the section [CAD, Symbol and Text Controlbars](#) in the chapter [Strings](#):

The special **Search bar** will be described in the next section [12d Options Search Bar](#)

12d Options Search Bar

The **Search Bar** allows quick access to any option in **12d Model**.

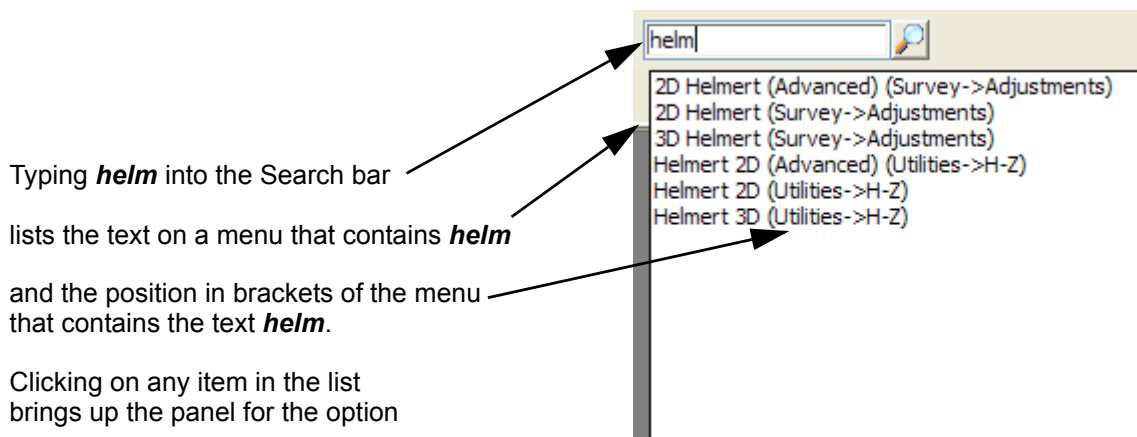

Search bar

By simply typing text into the **Search Bar**, the option finds all menus containing the text and lists the menu items and the position of the menu that contains the menu item.

Clicking on an item in the list brings up the panel for that item.

Snap Toolbar

The **Snaps (Horiz)** menu has been replaced by the **Snaps Toolbar** which has the default position at the top left hand side of the **12d Model** screen, under the controlbars.

snaps toolbar

Snaps are documented in the section [Snaps](#).

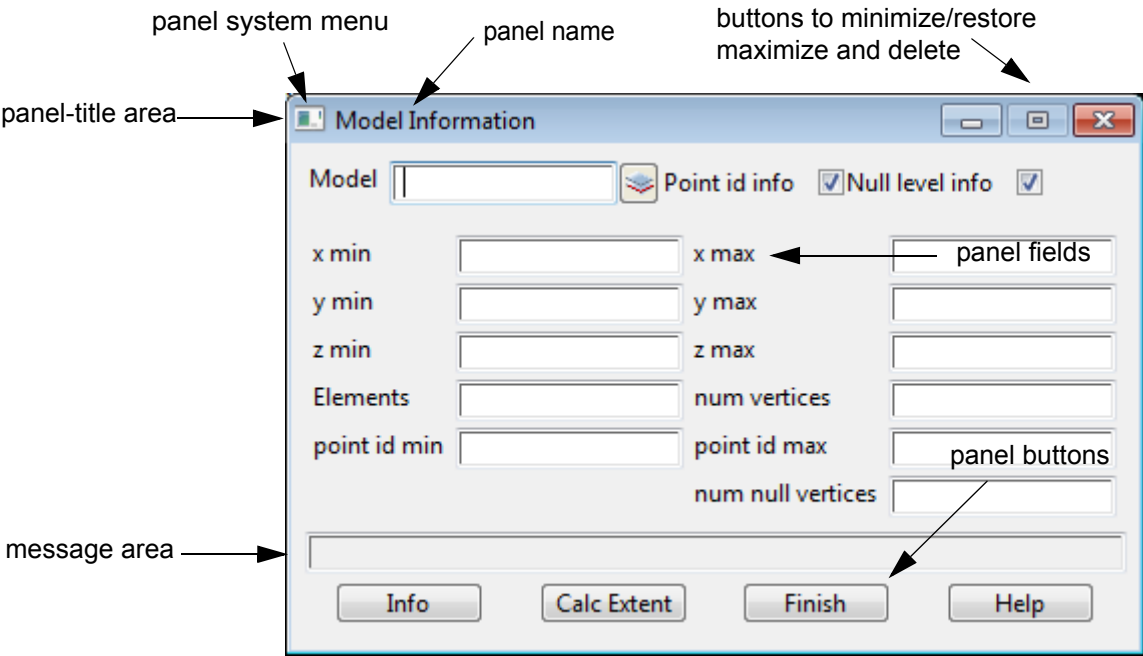

Panels

After a menu option has been selected, extra information is often required before the operation represented by the menu option can begin.

For example, before the contour option can proceed, the required contour interval must be supplied.

In **12d Model**, an object called a **panel** is used to collect and validate any extra information required to run the option.

For example, the **Model Information** panel is

A Panel consists of four types of areas.

Panel title area

Contains the title (name) of the panel, the buttons to minimize and restore the panel, and the [X] button. In the example above, the panel title is **model information**.

Panel fields

These are both input and output areas for the panel. The user can type answers into some fields (input and output fields) or the program may display special information in the fields (output only fields). In the example, Model is an input/output field, xmin is only an output field.

If the panel field is *optional*, then the description text is greyed out - entering data into the field will cause the text to be redrawn in black.

If there are choices available to select from for the panel field, a + is displayed at the right hand side of the field. Selecting the + brings up a panel field pop-up (documented below).

Message area

Each panel has its own area where **12d Model** displays messages for the option.

Messages are used for a variety of purposes including

- s indicating the **next step** in a complex option
- s reporting **errors**

- s giving **progress** in time consuming operations
- s informing that an option has **completed** successfully.

Most messages are sent to the panel message area but a few are displayed in the Status Bar.

Panel buttons

Buttons are used on the panel to select things or control the processing of the panel. Almost every panel has minimize and restore button, and a **Finish** and **[X]** buttons which when selected will end the option and remove the panel from the screen. All panels also has a **Help** button which brings up on-line help about the panel.

The minimize, restore, **Finish**, **[X]** and **Help** buttons will not be documented for each panel.

Data Entry in a Panel

To help save the user time, many panel fields have default answers.

However, any panel field value can be replaced by typing in new information (**typed input**) or when available, by selecting an answer from the **panel field pop-up** or using special name completion characters.

All panel fields are validated before the option runs and any error messages displayed in the panel message area.

Typed input

To type information into a panel field, move the cursor to the position for the information, left click to get focus in the panel field and then start typing. The information will go into the field starting at the input-position indicator (a upright bar in the panel field).

The input-position indicator can be moved by

- s clicking LB when the cursor is at the new position for input
- s using the keys `->`, `<-`, home and end

The **backspace** key, `<backspace>`, will delete one character before the input-position indicator and the **delete** key, ``, will delete one character after the input-position indicator.

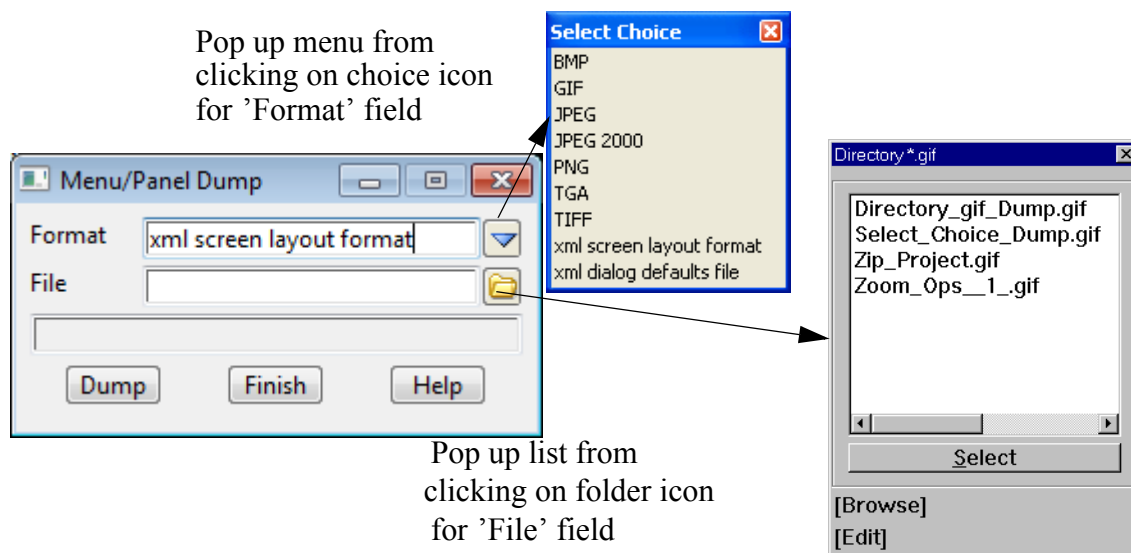

The user can move to any field in the panel by using the mouse. The `<tab>` key will move the cursor to the next panel field or button and `<shift>+<tab>` will move the cursor to the previous panel field or button.

Note - the entire field is used as the answer, not just up to the input-position indicator. The input-position indicator indicates where the characters will go when typing, not the end of the data.

Pop-Up Lists and Menus

The **panel field pop-up list** or **menu**, or panel field pop-up, is raised by clicking LB on the **[+]** or other choice icons at the right of the panel field.

A panel field pop-up consists of a list of choices which may be displayed as either a *menu* or a *list*.

For a pop-up list, an answer is chosen from the list by **double** clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up list disappears.

For a pop-up menu, an answer is chosen from the pop-up menu by clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up menu disappears.

The pop-up list or menu can also be removed without a selection by clicking LB on the **[X]** on the pop-up list or menu, by clicking LB again on the icon or **[+]** for the panel field, or by simply typing into any visible part of the panel field that the pop-up is for (some of the field may be obscured by the pop-up itself).

The pop-up lists and menus and the choice icons are described in more detail in the section on *Special Panel Fields*.

Name completion

To help speed data entry a process called **name completion** is available in most panel fields.

<ctrl> + <d> is the special key combination used for name completion and how it works will now be described.

If one or more characters have been typed into a panel field and the **<ctrl> + <d>** combination is pressed, then **12d Model** checks to see how many answers in the available pop-up start with the same typed characters. If a unique match exists, then it will be placed into the panel field. If more than one match exists, a pop-up menu with all the matches will be presented for the user to select from.

Name mapping

When typing a string name into a panel field, a **name mapping file** can be specified and is used to fill out information such as colour, model *etc.* for given string names.

The name mapping works in two ways. After typing part or all of a string name,

- if **<enter>** is entered, the name map file is searched for a match in the first column (the key). If a match is found, the name, colour, model, style *etc.* from the other columns in the name mapping file are used to fill out the panel fields. The key can contain wild cards and/or characters.
- if **<ctrl> + <d>** is entered, the **second** column of the name mapping file is searched for a list of completions which is written to the field if it is unique or displayed in a pop-up if there is more than one match. If a ***** is found in the second column, the first column is used for matching. When an entry is selected from the completion list, the name, colour, model, style

etc. from the columns in the name mapping file are used to fill out the panel fields.

If a name mapping file exists, then the **[+]** for the *name* panel field will include the entries from the first column of the name mapping file. If an item is selected from the list, then the name, colour, model, style *etc.* from the columns in the name mapping file are used to fill out the panel fields

The name mapping file is pointed to by the environment variable

NAME_MAPPINGS_4D

or is if the environment variable is not set, the default name is **names.4d**.

During a **12d Model** session, the name mapping file can be changed by the *Name Settings* tab on the option **Utilities=>Defaults**. Note that this new name mapping file is not saved with the project.

Validation

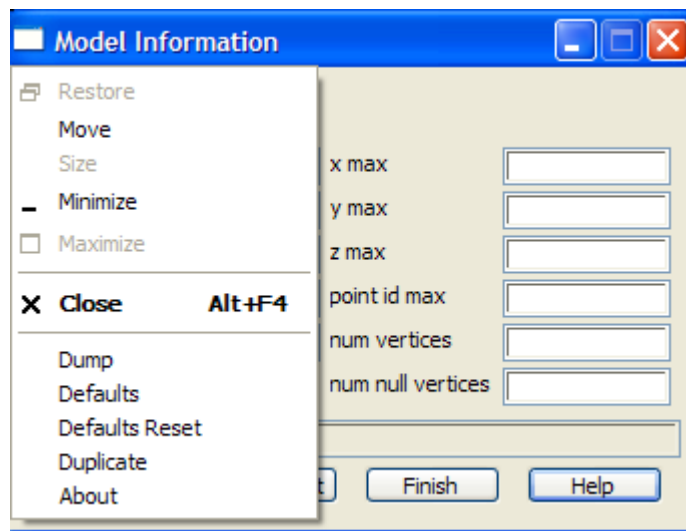

After the panel field information is entered, an <enter> key requests that the panel field information be validated. Any error message will be displayed in the panel's message area. If there is no error, the cursor will move onto the next panel field. If an error occurs, the cursor will remain in the invalid panel field.

New panels or menus can be fired up before completing panels or menus already on the screen. This gives the user full control over the work flow, rather than being locked in by fixed sequences in a program.

Panel System Menu

The **Panel System** menu is brought up by clicking LB on the windows icon on the left hand corner of the panel title area.

The **Panel System** menu has options to move, minimize, close, dump (write out an image of the panel), create ddf file, reset a ddf file and duplicate the panel.

For the option *Move*, go to

TODO: Replace-Cancel
TODO: Append-Replace-Cancel

Moving a Panel

A panel can be moved (dragged) by **holding down LB** anywhere in the menu title area (except over the windows icon on the left and the minimize, restore and [X] buttons on the right) and then moving the cursor with the LB still depressed.

The panel (or panel outline) moves with the cursor to indicate where the new panel position will be, and the panel is finally positioned when LB is released.

Move can also be started by selecting **Move** from the **Panel System** menu and then holding down LB in the menu title area and continuing as described above,

Minimizing and Maximizing a Panel

The **panel** can be minimized (iconized)/restored and maximized using the standard Windows minimize/restore and maximize buttons on the top right hand corner of the panel.

A panel can also be minimized by selecting **Minimize** from the **Panel System** menu.

Resizing Some Panels

Some panels can be resized in *width* and have a *Resize motif* on the bottom right hand corner. For example

Dumping a Panel, Creating a Screen Layout File or Default File

The panel can be written out to disk in a variety of images formats, or as a screen layout file or a default file. This is called dumping the panel.

The **Dump** option is selected by clicking MB in the panel title area, or by selecting **Dump** from the **Panel System** menu which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the panel title area.

The **Menu/Panel Dump** panel is then displayed and for its description, go to [Dumping a Menu or](#)

Panel.

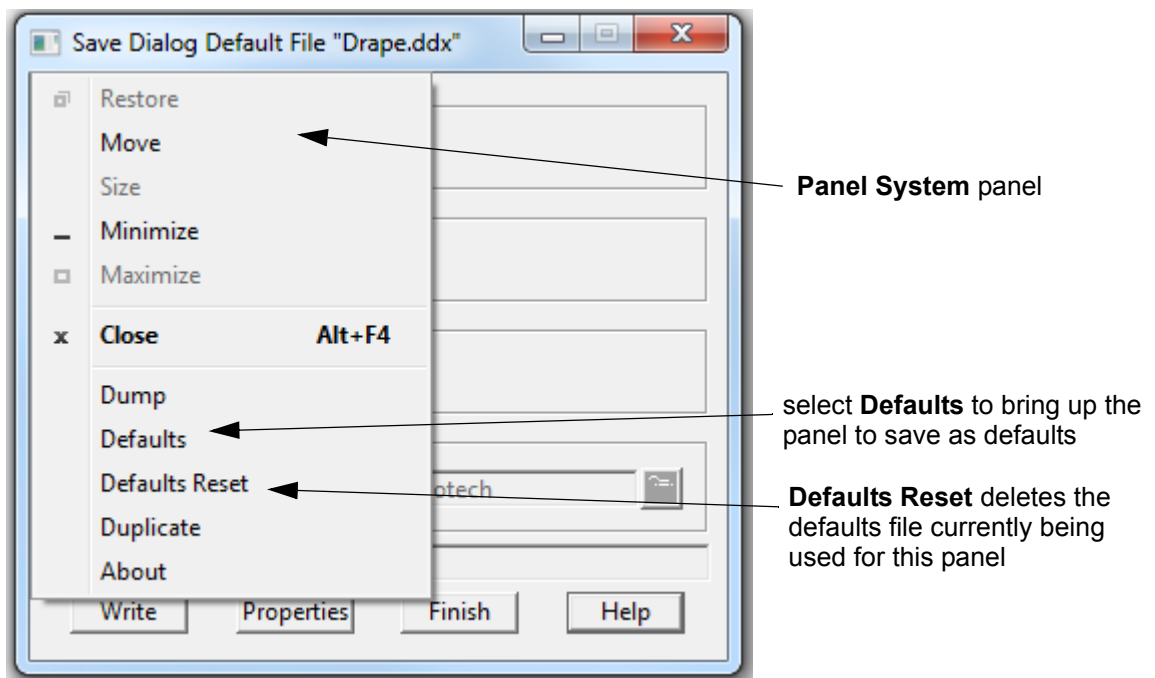

Panel Defaults - ddx Files

When a panel is opened, **12d Model** may set some default values.

However for most panels **the user can supply the values** to be used **for** all the **panel fields** each time a panel is opened. This information is stored in a defaults file for a panel. The defaults file has the file ending .ddx (or a pre- **12d Model** 10 format, .ddf).

If no defaults file exists for a panel, then the **12d Model** defaults are used for the panel.

To set user defined defaults for a panel, simply open the panel, fill in the default values that are required, and then bring up the **Panel System** menu (by clicking LB in the top left had corner of the panel) and select **Defaults**.

A panel comes up asking what folder to write the **ddx** file for the panel to.

Clicking on **Write** writes out the ddx file for the panel.

When a **12d Model** panel starts up, the standard paths are searched for a defaults file to use to set the default values for the panel fields.

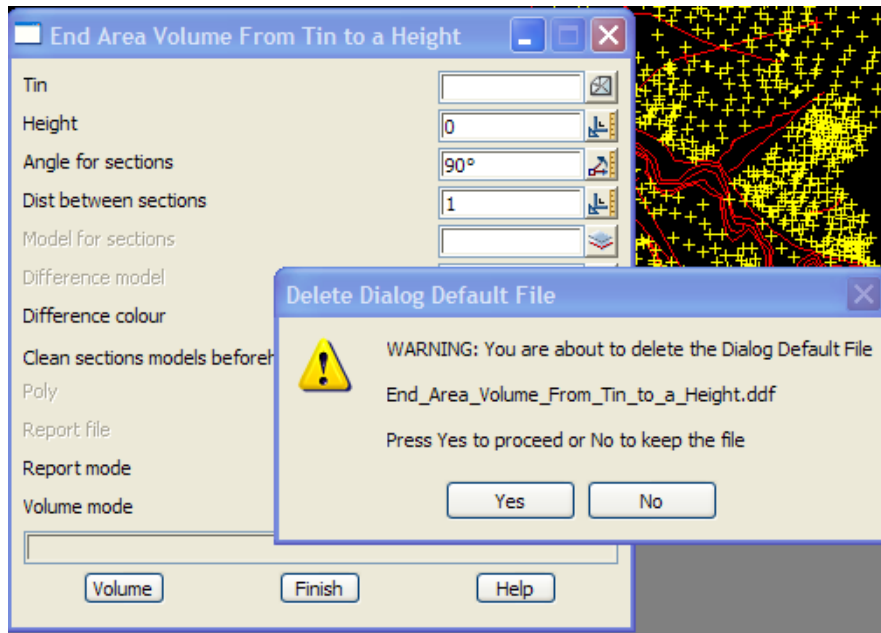

If no defaults file is found for the panel, the **12d Model** system defaults are used.

Note - for **12d Model 10** and above, the defaults file has an xml structure and is written to a file ending in **.ddx**. An earlier format ended in **.ddf**. If both a **.ddx** and a **.ddf** file exists for the panel, then the **.ddx** file is used.

Defaults Reset - Deleting a ddx File

If user defined defaults are no longer required for a panel, simply bring up the panel and then the **Panel System** menu by clicking LB in the top left had corner of the panel.

Select **Defaults Reset** and the default **ddx** file for the panel is deleted.

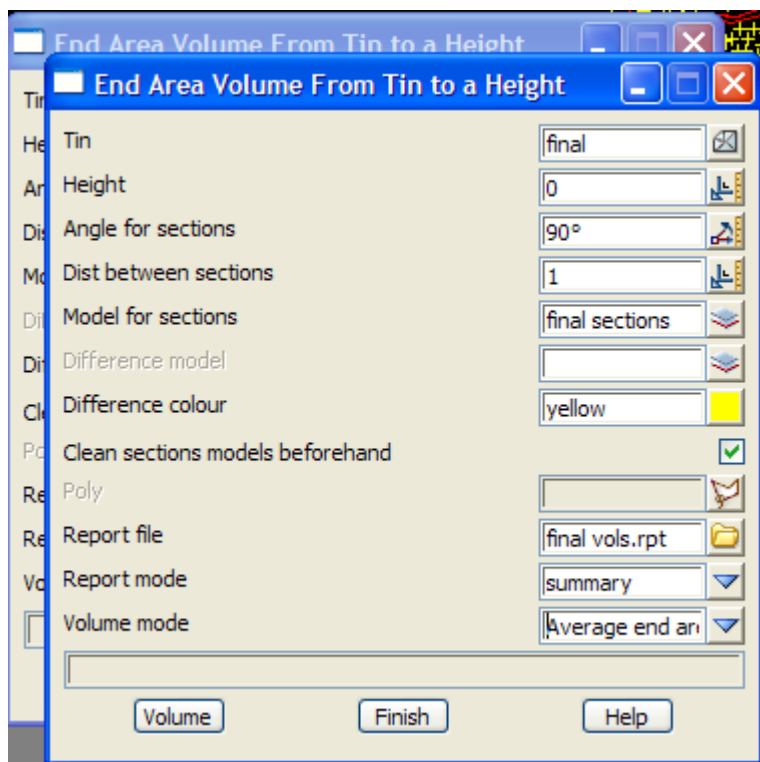

Duplicating a Panel

After filling in all the fields of a panel, it is often useful to have a copy of the panel with almost all the same panel field values.

For example, when calculating the volume from a tin to a height using end area, it is normal to run the option with a number of different angles for the sections, and maybe different distances between the sections.

To create a new panel with all the same values in the panel fields, bring up the **Panel System** menu for the panel and select **Duplicate**.

Deleting a Panel

There are three methods available for deleting a panel. Picking the **[X]** button in the panel title area, using the **finish** button or by selecting **close** from the **Panel System** menu.

OK Panel

The **OK** panel requires the selecting of the button **OK**.

Yes-No Panel

The **yes no** panel requires the selecting of the button **yes** or **no**.

Yes-No-Cancel Panel

The **yes no cancel** panel requires the selecting of the button **yes**, **no** or **cancel**.

Yes-No-All-Cancel Panel

The **yes no all cancel** panel requires the selecting of the button **yes**, **no**, **all** or **cancel**.

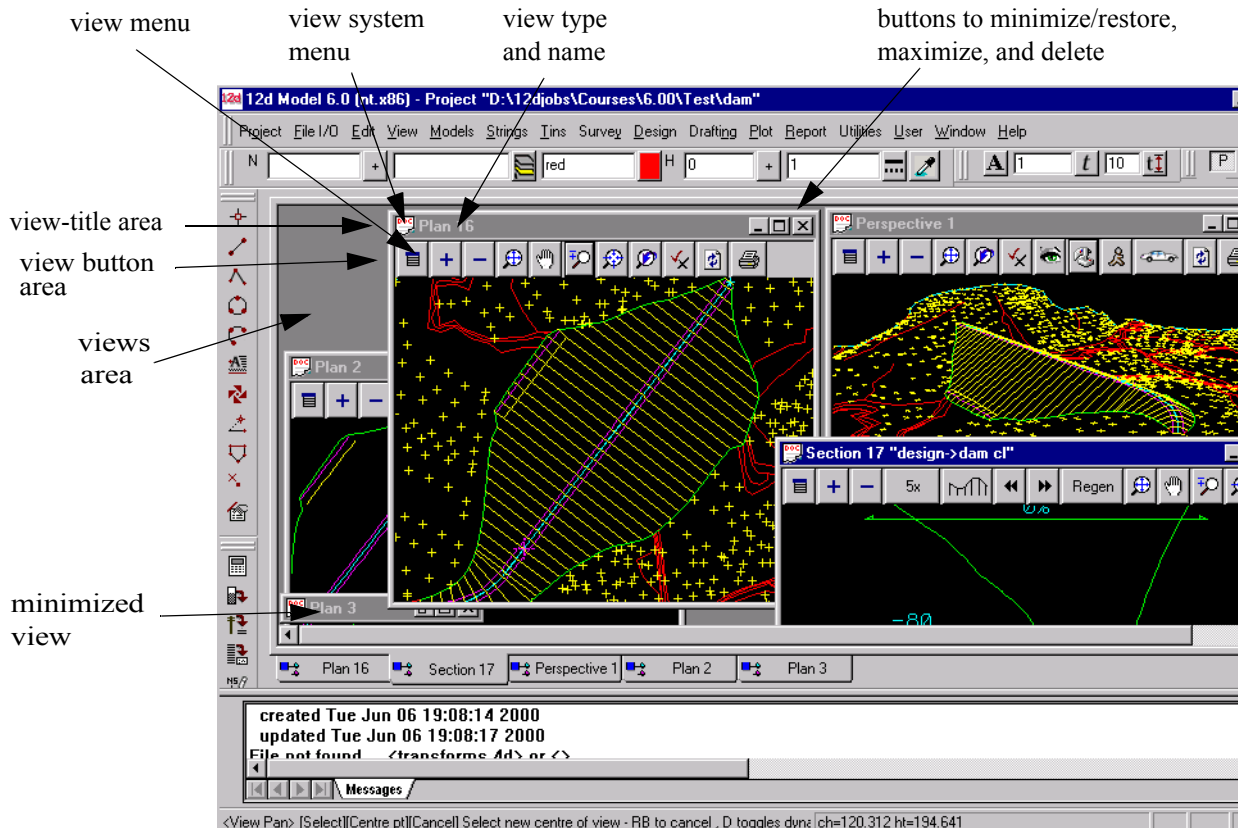

The next section is [Views](#).

Views

Views are the screen drawing areas for **12d Model** and come in four flavours - plan, section, perspective and opengl perspective.

Views can be created and deleted as required by the user and there is no limit to the number of views on the screen. Views can be overlapped and minimized.

Each view has a unique name of up to two hundred characters. The **view type** and **name** are displayed on the top left corner of the view in what is called the **view-title area**.

For information on *View buttons*, go to

View Buttons

On the row under the view type and name, are a number of options called **view buttons**.

The view buttons act like menu items and are activated by clicking LB when the cursor is above the button.

The function of each view button will be described elsewhere in this manual.

Plan/Section/Perspective View Menu

If LB is clicked on the **Menu** icon in the view buttons area, or RB is clicked in the *View Title area* or the *View Buttons area*, a new menu called the **Plan/Section/Perspective View menu** appears (or just **View menu** for short).

To remove the **Plan/Section/Perspective View menu**, select **[X]** on the **View menu** or click RB again in the *View Title area* or the *View Button area*.

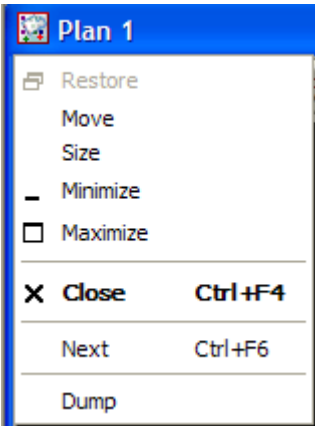

Because of the differences between plan, perspective and section views, the options on the **View menu** vary for each view type. For example, the perspective **View menu** is

The **View menus** will be discussed in the chapter [View Menus](#).

View System Menu

The **view system menu** is brought up by clicking LB on the windows icon on the left hand corner of the *view title area*.

The **View system** menu has options to move, resize, minimize, maximize, close (delete) and dump the view.

For information on *Moving a view*, go to
Resizing a view
Minimizing/maximizing a view

[Dumping a View](#)

Dumping a View

An image of the view can be written out to disk in either bmp, tif, postscript format or as a screen layout file. This is called dumping the view.

The **Dump** option is selected from the **View System** menu which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the view-title area. The **View Dump** panel is then displayed

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input	view option is picked from	available views
<i>the view to dump out in the specified format.</i>			
Include title	tick box		
<i>if ticked, the view title area is included in the dump.</i>			

Format	input	GIF	BMP, GIF, JPEG, JPEG 2000, PNG, TGA
--------	-------	-----	----------------------------------------

the format to dump the view out in.

File	input	*.gif
------	-------	-------

the file to dump the view images out to

Dump	button
------	--------

dump in the given format the image of the view given in the view field to the file given in the file field.

Moving a View

A view can be moved (dragged) by **holding down LB** anywhere in the view-title area (except over the windows icon on the left and the minimize, restore and **[X]** buttons on the right) and then moving the cursor with the LB still depressed. Or **Move** can be selected from the **View System** menu.

The view (or a view outline) moves with the cursor to indicate where the new view position will be. The view is finally positioned when LB is released.

Resizing View

A view can be resized using the standard Windows resize methods of holding down LB on the view border and moving the mouse to the new position for the view border. and then releasing LB.

Minimizing and Maximizing a View

A view can be minimized (iconised), restored and maximized using the standard Windows minimize/restore and maximize buttons on the top right hand corner of the view, or by selecting **Minimize** or **Maximize** from the **View System** menu

Deleting a View

Picking the **[X]** button in the *view-title area* or selecting **Close** from the **View System** menu will delete the view.

If the environment variable **Prompt on close** is set on, then a prompt will be displayed to confirm that the view is to be closed./deleted

Please continue to the next section [Status Bar](#).

Status Bar

The Status Bar is used to display many of the messages generated by **12d Model** options (each panel also has its own special message area) and the dynamic coordinate position of the cursor as it moves around in any view on the screen.

The co-ordinate values displayed depends on the view type. For example, the world co-ordinate (x,y) position of the cursor is displayed when inside plan views, and a (chainage,height) position when in a section view.

The messages are displayed on the left hand side of the Status Bar and the view co-ordinates on the right hand side of the Status Bar.

The Status Bar is toggled on/off by the option **View => Status Bar** on the Main menu.

Please continue to the next section [Output Window](#).

Output Window

The **Output Window** displays **12d Model** system and error messages.

The Output Window is toggled on/off by the option **Window => Output Window** on the Main menu.

If an error message is sent to the Output Window and the Output Window is turned off, then the Output Window is automatically toggled on to indicate an error has occurred.

Hence the Output Window can be left turned off and it will reappear when an error message occurs.

Message lines which are intelligent log lines are begun with a green exclamation mark!

Please continue to the next section [Ascii, Ansi and Unicode](#).

Ascii, Ansi and Unicode

From **12d Model 10** onwards, text is stored in the **12d Model** database as Unicode (UTF-16 Unicode) and the default format for all output files produced by **12d Model** is for them to be Unicode files.

But what does that mean?

Computers can only understand numbers (only zeros and ones actually), so a common code is needed for the numerical representation of characters such as 'a' or '1' or some action such as TAB and a number of common codes have evolved over time.

The common code is not only needed for text in a file or text on a Web page, but also for the names of the files and folders on a computer disc or an internet site.

See [ASCII Character Set](#)
[ANSI Character Set](#)
[Unicode Character Set](#)
[Unicode Encoding: UTF-8](#)
[Unicode Encoding: UTF-16](#)
[Endian and BOM](#)
[Writing out Files from 12d Model](#)

ASCII Character Set

The ASCII (American Standard Code for Information Exchange) was first published in 1963 and was adopted by the American National Standards Institute (ANSI) during the 1960s and has been in common use since then.

The ASCII definition used 7 bits to define characters and some non character codes such as tab, back space and line feed (new line). The seven bits means that only a maximum of 127 codes are allowed.

An examples of the ASCII codes are:

2 is the ASCII code for start of text (STX)
8 is the ASCII code for back space (BS)
9 is the ASCII code for horizontal tab (TAB)
10 is the ASCII code for line feed, new line (NL)
27 is the ASCII code for escape (ESC)
32 is the ASCII code for a space (" ")
36 is the ASCII code for a dollar sign \$
40 is the ASCII code for a left parenthesis (
41 is the ASCII code for a right parenthesis)
48 is the ASCII code for the digit zero 0
49 is the ASCII code for the digit zero 1
65 is the ASCII code for the Latin capital letter A A
97 is the ASCII code for the Latin small letter a a
126 is the ASCII code for a tilde ~
127 is not used

Even with the newer standards, the 7-bit ASCII table continues to be the backbone of modern computing and data storage. Is is so ubiquitous that the terms "text file" and "ascii file" have come to mean the same thing for most computer users.

The ASCII standard was good, as long as you were only working in US English.

Go to the next section [ANSI Character Set](#) or back to [Ascii, Ansi and Unicode](#).

ANSI Character Set

The ANSI standard extended the ASCII character set. In the ANSI standard, the first 128 characters were the same as for ASCII but from character 128 onwards, there were different ways depending on where you lived. These different ways were called **code pages**.

For example, in Israel DOS used a codepage called 862 while Greek users used code page 737.

The ANSI set of 218 characters (also known as Windows-1252) was the standard for core fonts supplied with US versions of Microsoft Windows up to and including Windows 95 and Windows NT 4 (character 218 was the euro currency symbol was added during this time).

ANSI characters 32 to 127 correspond to those in the 7-bit ASCII character set.

Some of the extra ANSI codes are:

163 is the ANSI code for a currency Pound sign

165 is the ANSI code for a currency Yen sign

If you use a version of Windows that is designed for a non-Latin alphabet such as Arabic, Cyrillic, Greek or Thai to view a document that has been typed using the ANSI character set, then in the codepage for the characters from these languages may replace some of those in the 128-255 range and so the document will look different.

There are similar problems when transferring ANSI documents to DOS or Macintosh computers, because DOS and MacRoman arrange characters differently in the 128-255 range.

Go to the next section [Unicode Character Set](#) or back to [Ascii, Ansi and Unicode](#).

Unicode Character Set

Today people want to transfer information around the world in emails and on Web sites but the ASCII and ANSI character sets can not work with a variety of Latin and non-Latin alphabets in the one document.

The solution is to move to a system that assigns a unique number to each character in each of the major languages of the world. Such a system has been developed and is known as **Unicode** and it is intended to be used on all computer systems, not just Windows.

The Unicode Standard covers more than 110,000 characters covering 100 scripts, a set of code charts for visual reference, an encoding methodology and set of standard character encodings, an enumeration of character properties such as upper and lower case, a set of reference data computer files, and a number of related items such as character properties, rules for normalisation, decomposition, collation rendering and bidirectional display order (for the correct display of text containing both right-to-left scripts such as Arabic and Hebrew and left-to-right scripts such as English). As of 2012, the most recent version is **Unicode 6.1**

Unicode's success at unifying character sets has led to its widespread use in computer software and the standard has been implemented in XML, Java, Microsoft .NET Framework and modern operating systems.

To make it Unicode compatible with ASCII, the first 128 characters were the same as for ASCII but from character 128 onwards they are totally different.

All the Unicode characters can be covered with 32 bits but to use a 32-bit representation in a file means that a standard ASCII file would be four times as large when written out in Unicode.

So to save on disk space, and the size of files for emailing etc, there are a number of different mapping methods, or character encodings, for writing Unicode characters to a file.

The Unicode standard defines two mapping methods: the Unicode Transformation Format (UTF) encodings, and the Universal Characters Set (UCS) encodings. An encoding maps the range of Unicode characters (or possibly a subset) to sequences of values in some fixed-size range.

Note: Even though software stores Unicode characters, the computer system still needs the graphics for the character sets to be able to correctly display the Unicode characters.

Go to the next section [Unicode Encoding: UTF-8](#) or back to [Ascii, Ansi and Unicode](#).

Unicode Encoding: UTF-8

One of the most common character encodings is UTF-8.

In UTF-8 encoding, only 8-bits are used for any ASCII characters from 0 to 127. For characters 128 and above, it uses between 16, 24 and up to 48 bits.

And because the representation of the first 128 characters are the same in Unicode and ASCII, US English text looks exactly the same in UTF-8 as it did in ASCII.

So why can't a standard ASCII text editor, or a program requiring plain ASCII text have problems with a Unicode file just containing ASCII characters?

The main reason is that in many Unicode files, a special character called a BOM (see [Endian and BOM](#)) is often placed at the beginning of the file, and the BOM would not be recognised by a program only expecting ASCII and would generate an error, or show up as blank spaces or strange-looking characters.

Go to the next section [Unicode Encoding: UTF-16](#) or back to [Ascii, Ansi and Unicode](#).

Unicode Encoding: UTF-16

In UTF-16 encoding, 16-bits are the basic unit and depending on the Unicode character, UTF-16 encoding may require one or two 16-bit code units. Using the two 16-bit code units, UTF-16 is capable of encoding up to 1,112,064 numbers.

The basic unit of computers is a byte which consists of 8-bits. Because the UTF-16 encoding uses 16-bit and so is made up of two bytes and the order of the bytes may depend on the endianness (byte order) of the computer architecture.

To assist in recognizing the byte order of code units, UTF-16 allows a Byte Order Mark (BOM - see [Endian and BOM](#)), a code with a special value to precede the first actual coded value.

Because the fundamental unit in UTF-16 is 16 bits, storing a text file only containing ASCII text will take twice as much disk space as the ASCII version.

Microsoft has used UTF-16 for internal storage for Windows NT and its descendants including Windows 2000, Windows XP, Windows Vista and Windows 7.

Go to the next section [Endian and BOM](#) or back to [Ascii, Ansi and Unicode](#).

Endian and BOM

From early computing, the fundamental unit of storage was a byte consisting of 8-bits (a bit is a one or a zero). When computers started using 16-bits, this could be stored as two bytes but there was a choice of the order of storing the two bytes. Two different approaches arose and are referred to the endian or endianness.

Big endian stores the most significant byte first and the least significant byte second. Similar to a number written on paper. **Little endian** stores the least significant byte first and the most significant byte second.

The **byte order mark** (BOM) is a Unicode character used to signal endianness (byte order) of a text file or character stream.

A BOM is essential when the basic unit of an encoding consists of two bytes such as in UTF-16.

Beyond its specific use as a byte-order indicator, the BOM character may also indicate which of the Unicode encoding has been used because the values of the bits in the BOM will be different for the different Unicode encodings.

So although a BOM is not strictly necessary for UTF-8 when it only contains ASCII data, it still alerts the software that it is UTF-8.

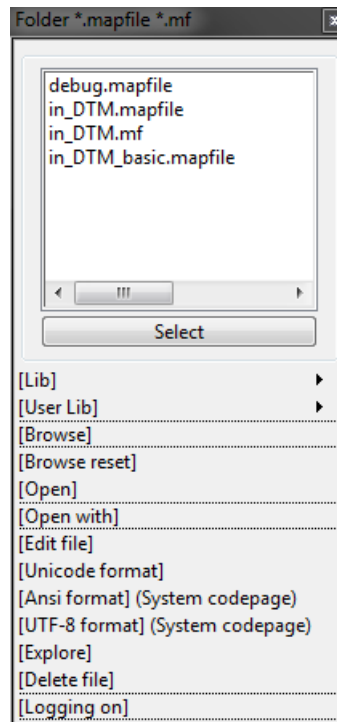

Some common programs from Microsoft, such as Notepad and Visual C++, add BOMs to UTF-8 files by Default. Google Docs adds a BOM when a Microsoft Word document is downloaded as a .txt file.

When a BOM is used, it should appear at the **start** of the text.

Go to the next section [Writing out Files from 12d Model](#) or back to [Ascii, Ansi and Unicode](#).

Writing out Files from 12d Model

When a file box is used in a **12d Model** panel, clicking **LB** of the **Folder** icon will bring up the folder pop-up and on the pop-up is the choice for writing out the file in ANSI, or UTF-8 rather than the default of Unicode (UTF-16).

File Box Pop Up List

For more information on the **File Box**, see [File Box](#).

Please continue to the next section [Data Types](#) (or back to [Ascii, Ansi and Unicode](#)).

Data Types

12d Model was designed from the ground up as an object based system and programmed in C++, the most widely used Object Oriented programming language.

As objects, strings know what type of string they are and behave accordingly without user intervention. As a simple example, when selecting a string for editing, the string knows what type of string it is and brings up the appropriate editor.

A more complicated example is a super alignment with computations. Such a string can be constructed from references to other string, automatic fillets, automatic draping on tins *etc.* and if any of this auxiliary information changes, the super alignment will change as well.

See [Strings](#)

See [General String Properties](#)

See [Models](#)

See [Tins](#)

See [Templates](#)

See [Projects](#)

See [Attributes or Meta Data](#)

Strings

12d Model uses the string object as one of its basic modelling elements.

In its simplest form, a **12d Model** string is an *ordered* series of vertices or points, joined by a segment.

However a **12d Model** string can also be much more complex including referencing to other objects and complicated construction methods. The string object can also have an almost unlimited number of user defined attributes for the whole string, for each vertex and for each segment joining vertices.

However, as an object, the **12d Model** string shields the user from its full complexity and only displays the relevant information and properties as required for a particular context.

So starting with the basics, a **12d Model** string is an *ordered* series of vertices or points.

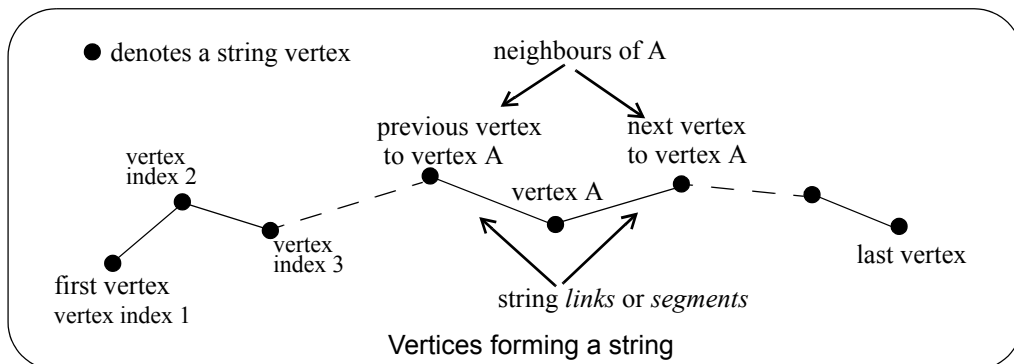

Apart from the first and last vertex in a string, each vertex in a string has a unique **previous vertex** (predecessor) and a unique **next vertex** (successor). The previous and next vertices for a vertex are called its **string neighbours**.

The objects joining a vertex with its neighbours are called string links or **segments**. Segments may be straight lines or plan arcs, or transition elements such as spirals. The segments can be *visible* or *invisible*.

The string has an implied **direction** starting from the first vertex of the string and then proceeding to the successor vertices in the string.

The ordering along a strings allows each vertex to be given a **vertex index** where the first vertex has vertex index **1**. Note that if additional vertices are inserted or vertices deleted then the vertex indices will change. Also note that for super strings, a vertex may have a **point id** (also called a **vertex id** and sometimes a **point number**) which is **not** the same thing as the **vertex index**.

A string which has the same first and last vertex is called a **closed** string otherwise a string is said to be **open**.

Strings are very useful in the modelling of terrain and design surfaces and when using strings, for some applications they need to a particular properties.

For example, a **contour** displayed on maps is actually a string with the special property that all the vertices have exactly the same height (z value). And if the height of one vertex of the contour is modified, then all the vertices of the contour string must also be modified to have exactly the same height or the string is no longer a contour. So a **contour** string is a special type of string that **knows** how to behave when the z-value of the string is modified. This is why strings are **objects** - they intrinsically know how to behave.

To make it easier to refer to particular sets of properties that some strings must have, **12d Model** defines a number of different **types** of strings. Using the string **type** is a convenient short hand for saying the string has certain well defined properties.

[feature string](#)
[interface string](#)
[pipe super string](#)
[pipeline string](#)
[polyline super string](#)
[text string](#)
[General String Properties](#)

super string

A super string is a general purpose string.

Each vertex can have tinability, a symbol with its own size and rotation, z-value, text and an unlimited number of user definable attributes.

Segments can be lines, arcs or transitions (for example spirals). Each segment (link) has visibility, colour and breakline flags (segment tinability) and values for diameter or width and height (box culvert), radius, text and an unlimited number of user definable attributes.

2d, 3d, 4d, polyline and pipe strings are special cases of the super string.

2d or contour super string

The z-value of a 2d super string is the same at every vertex in the string.

Consequently the entire string has a height (the **string height**) rather than having to refer to the height at each vertex. By changing the string height, the heights of all the vertices are modified. The height of a single vertex of a 2d string **can not** be changed to a height that is different to the string height.

So if a **2d** string is selected by the string editor, as an object the **2d** string can signal the object editor that it has a **string height** and that the editors height command can only work on the string height and won't allow the individual vertex heights to be modified.

3d super string

The z-value can vary for each vertex in the string.

So if a **3d** super string is selected by the string editor, as an object the **3d** string can signal the object editor that each vertex has an individual height, and that the editors height command must select an individual vertex and modify that vertex's height.

4d super string

A **4d** super string has (x,y,z) values at each vertex **plus** vertex text defined at each string vertex. Useful when a description is needed at each vertex. For example, design sections are created as 4d strings and the vertex text records the name of the string that goes through that vertex.

alignment string

An **alignment** string is a more complicated string object which defines the string by specifying the horizontal and the vertical geometry for the string.

The horizontal geometry of the string is a series of horizontal intersection points (HIP's) with plan arcs and leading (left) and trailing (right) transitions defined for each HIP. This defines the plan geometry of the alignment string.

The vertical geometry of the alignment string is defined as a series of vertical intersection points (VIP's) defined by horizontal chainage along the string and height. Each VIP can have a parabolic or circular curve on it.

Alignment strings are used for defining entities such as the centre line or a simple road or railway.

The alignment string has been superseded by the super alignment string which not only has IP methods but also fixed and floating definitions of elements.

super alignment string

A **super alignment** string is also specified by defining the horizontal and the vertical geometry for the string but neither of the geometries is restricted to just intersection (IP) points. The horizontal geometry can be made up of almost any combination of straights, arcs, transitions, partial transitions, horizontal IP's. Similarly the vertical geometry is made up of combinations of straights, arcs and parabolas.

In the super alignment object, the elements of the horizontal and vertical geometries can be defined by referencing to other strings, offsets, intersections *etc.* and if these items change, the super alignment object knows how to re-calculate itself.

arc string

An arc string is an arc in a plan projection but with a linearly varying z-value on the circumference. So the arc string is actually a 3d helix. The centre point of the arc is for display purposes only.

circle string

A circle string is a plan circle a constant z-value around the circumference. Hence the circle string is always parallel to the (x,y) plane. The centre point of the circle is for display purposes only.

control station

control stations are used in the survey reduction option where a name of a station can be given in the 12d survey field file and the coordinates of the station can given by the control station of that name in the specified model of control points. In **12d Model**, a Control station is represented by a one vertex 4d or super string and the name of the control station is the name of the one vertex string. Usually the point id for the vertex of the super string, or the text for the 4d string, is also the Control station name.

drainage and sewer string

Special string made up of straights, arcs and manholes.

feature string

A feature string is a plan circle with a z-value at the centre point but only null values on the circumference.

If a feature string is given a **world** line style, then the style is centred on the centre point of the feature string and scaled up to the radius of the feature string.

If a feature string is given a **screen** or **paper** line style, then the style is wrapped around the circumference of the feature string.

interface string

An interface string is a special string constructed from a string and a surface. Each vertex of the interface string records whether the corresponding vertex on the original string was above or below the surface.

pipe super string

A pipe string is a 3d string with a diameter.

pipeline string

A pipeline string is an alignment string with a diameter.

polyline super string

A polyline string is similar to a 3d string except that there can be straights or arcs joining the string vertices.

text string

a text string has an (x,y) position and contains characters and information about how the characters are displayed (textstyle, units, height, offset, raise, justification, angle, slant and x factor). For more information on angle, offset and raise, go to the section [Text Definitions](#).

Super strings can also have text defined on its vertices and segments, and 4d strings can have text defined on each vertex,

Go to the next section [General String Properties](#) or back to [Data Types](#).

General String Properties

See [Name and Model](#)
[Breakline Type](#)
[Tinable](#)
[Linestyle and Colour](#)
[String Chainage](#)

Name and Model

Strings have a text name of up to two hundred alphanumeric characters, spaces and dots (.). The string name does not have to be unique and can be blank. When strings are created, they are stored in **models**. A string is in one and only one model. Models are discussed in the next section.

Breakline Type

When triangulating data, if all the vertices and all the segments of a string are to be preserved as the sides of triangles and hence are part of the triangulation the string is called a **breakline** or **line** string. **Note** - all the segments of all the breaklines can only be preserved with there are no crossing segments amongst any of the breakline strings

If all the vertices are included in the triangulation but none of the segments are, then the string is called a point string.

For triangulation purposes, each of the super string types 2d, 3d, 4d and polyline can be used as **either** breaklines (line strings) or point strings.

Line strings are useful in describing terrain features such as ridge lines and creek beds or design features such as the edge of a building platform. Point strings can represent information such as spot heights.

Alignments, arcs, circles, pipelines, interfaces, drainage and sewer strings can only be breakline strings. Feature strings can only be point strings with a z-value at the centre of the circle.

Tinable

For a **super string**, the concept of breakline has been **extended** to a property called **tinable** which can be set *independently* for each vertex and each segment of the super string.

If a **vertex** is tinable, then the vertex is included in triangulations. If the vertex is not tinable, then the vertex is ignored when triangulating.

If a **segment** is tinable, then the segment is used as a side of a triangle during triangulation. That is, the segment is used as a breakline. This may not be possible if there are *crossing* tinable segments.

Note that for a segment to be used as a side of a triangle, then its end vertices must also be tinable.

So a **breakline string** is one where all the vertices and all the segments are tinable.

A **point** string is one where all the vertices are tinable and all the segments are not tinable.

Linestyle and Colour

All strings (except text) can be given a user defined **linestyle** or simply **style**. The style describes how the string is drawn on the screen and on plots. The default style is 1.

A style can also be continuous or just at the vertices of a string, regardless of the breakline type

of the string. A breakline string (line string) with default style **1** will be drawn with solid lines between the nodes, and a non breakline string (point string) with default style will be drawn with crosses at the string nodes with no visible lines between the nodes.

Strings have a default colour but how that colour is used depends on the breakline type and style of the string. For example, a line string with default style **1** is drawn with the string's links in the string colour and for a point string with default style **1**, crosses are drawn at each string point in the string colour. However, styles can have their own colours which override the default colour of the string. Interface strings have two colours (red and green) which are used to represent cut and fill information.

Hence super strings with **default styles** appear on the screen as

point string (non breakline string)

each string link is considered to be an **invisible** line. String values are not defined along the invisible string links.

line string (breakline string)

each string link is considered to be a **solid** line. String values are defined along the string links by linear interpolation between the end points of the string link.

String Chainage

Every vertex along a string has a unique **chainage** value. This chainage is calculated by taking the start chainage defined for the first vertex of the string, and adding to it the **plan** distance along the string from the start vertex to the selected vertex on the string.

Go to the next section [Models](#) or back to [Data Types](#).

Models

Within a **12d Model** project, information is collected in units called **MODELS**. Models contain strings and tins (see the next section).

Each model has a unique user-defined text name of up to two hundred alphanumeric characters and spaces.

For convenience, model names should reflect the nature of the information in the model. For example, a model containing terrain data could be called **terrain**. **design** could be another model containing design data.

Each model has minimum and maximum x, y and z values which define a bounding box which encloses all the data in the model (the model bounding box). The size of the model bounding box is automatically updated as new data is added to the model, but not adjusted as data is deleted. A re-calculation of the model bounding box is performed by the **calc extents** buttons on the model and view information panels.

There is an option to list all the models available in a **12d Model** session (the model list). The model list is also used in various pop-ups and walk-right menus.

Displaying Models

The screen display areas in **12d Model** are the views. Models are displayed in views by “adding” the model to the view. Similarly, when a model is “removed” from a view, it is no longer displayed in that view.

There are options in the **12d Model** menu and on each view to add and remove models from views.

Go to the next section [Tins](#) or back to [Data Types](#).

Tins

To form a continuous surface representing the data in a model, a process called triangulation is used. Triangulation creates a web of non-overlapping triangles whose nodes are the model data points. Because the data points are normally irregularly spaced, the triangulation is referred to as a **TIN** - a Triangulated Irregular Network.

For 2d, 3d, 4d and interface strings, all non null points are included in the triangulation. For super strings, only vertices that are tinable are included in a triangulation.

To allow the triangulation to accurately represent features such as ridge lines and creek beds, the links of breakline strings (line strings) are preserved as edges of triangles in the tin.

For a super string, only segments that are tinable and whose end vertices are also tinable, are included as break lines.

Each tin is given a unique user-defined name of up to two hundred alphanumeric characters and spaces.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be **displayed** in a view or used for **profiling** on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called "tin **tin_name**". This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins when using <ctrl> + <d> for name completion.

There is an option to list all the tins available in a **12d Model** session (the tin list) which also displays the models the tin is in as a walk-right. The tin list is also used in various pop-ups and walk-right menus.

Tins can be "added" and "removed" from models with options in the **triangles** option in the **12d Model** menu. If a tin is to be displayed in a view, it must be "added" to a model that is being displayed in that view.

Tins can only be **deleted** by using the **Triangles=>Delete** options - for safety, they are **not** deleted when any model containing them is cleaned or deleted.

WARNING

Tins are stored with **copies** of the points that were triangulated. If the original points are then modified, the triangulation will not reflect this change.

Go to the next section [Templates](#) or back to [Data Types](#).

Templates

Templates are used as a quick and easy method for defining design details along a string for use in conceptual and detail designs, and visualizations. Templates are stored with each project but can be written out and read in using a readable file format.

Go to the next section [Projects](#) or back to [Data Types](#).

Projects

In **12d Model**, information is organised into **projects**.

When **12d Model** begins, the user specifies the name of the project to work on. A project name can be up to two hundred alphanumeric characters and spaces.

All the information created for that project is kept together in a special folder called the **project area**.

The project area contains all the models, templates and tins associated with the project. Copies of models and tins created in other projects can be added to another project from within **12d Model**.

External data files can be read into the project (imported) using special input options. Similarly, output options are provided to write data out for use in other software packages (exported).

Go to the next section [Attributes or Meta Data](#) or back to [Data Types](#).

Attributes or Meta Data

Extra data can be attached to the Project, Models, Strings, Tins and other Elements as **attributes**, including **user defined attributes**. Attributes are also called **meta data**.

Super strings can not only have attributes defined for the entire string (**string attributes**) but can also have attributes defined for each vertex (**vertex attributes**) and also for each segment (**segment attributes**).

An attribute has a **name** and can store either an **integer** (32 bit), a **real** (64-bit double precision), a **text**, a **64-bit integer**, an **uid** (which is just a number), or it can be a special attribute called a **group** attribute that can store other attributes.

Hence attributes in **12d Model** can be grouped into a **hierarchy** or **tree**.

That is, there are attributes at the **Top** level (the first level), and amongst the top level attributes can be group attributes that contain zero or more other attributes. Attributes in a first level group attribute are said to be in the **second** level.

Similarly an attribute in the second level can be a group attribute and hence contain other attributes which are said to be in the **third** level.

So attributes form a tree structure much like a folder structure for files.

Within a group, all the attributes must have unique names.

See [Attribute Pathname](#)
 [Accessing Attribute Values](#)
 [Attribute Data Panel](#)
 [Comparing Attribute Data](#)
 [Accessing Attribute Values](#)

Attribute Pathname

The **pathname** of an attribute is the list of attribute names that you must go through, starting at the top level, until you get to the attribute. That is, the path name is the path through the attribute structure that you must go through until you reach the attribute.

The attribute names that you pass through at each level are unique so the pathname to an attribute is unique and is written by listing the attribute names you pass through at each level separating each name by a */*:

first_level_att_name / second_level_att_name/ .../attribute_name

For example, if the first level contains the attributes

sun, moon and earth top or first level

and **earth** is a group attribute containing the attributes

asia, africa, lee, america europe and australia second level

and **australia** is a group attribute containing the attributes

brisbane, melbourne, perth and sydney third level

and **sydney** is a group attribute containing

fred, joe, mary, sam and lee fourth level

then the path name to **lee** in the group **sydney** is

earth/australia/sydney/lee

Note that there is also a **lee** in the second level but there is only one **lee** at each level so there is no problem. The pathname to the first **lee** is:

earth/lee

In **12d Model** options where attribute names are required in an input field, the full **pathname** of the attribute must be given to uniquely identify the attribute.

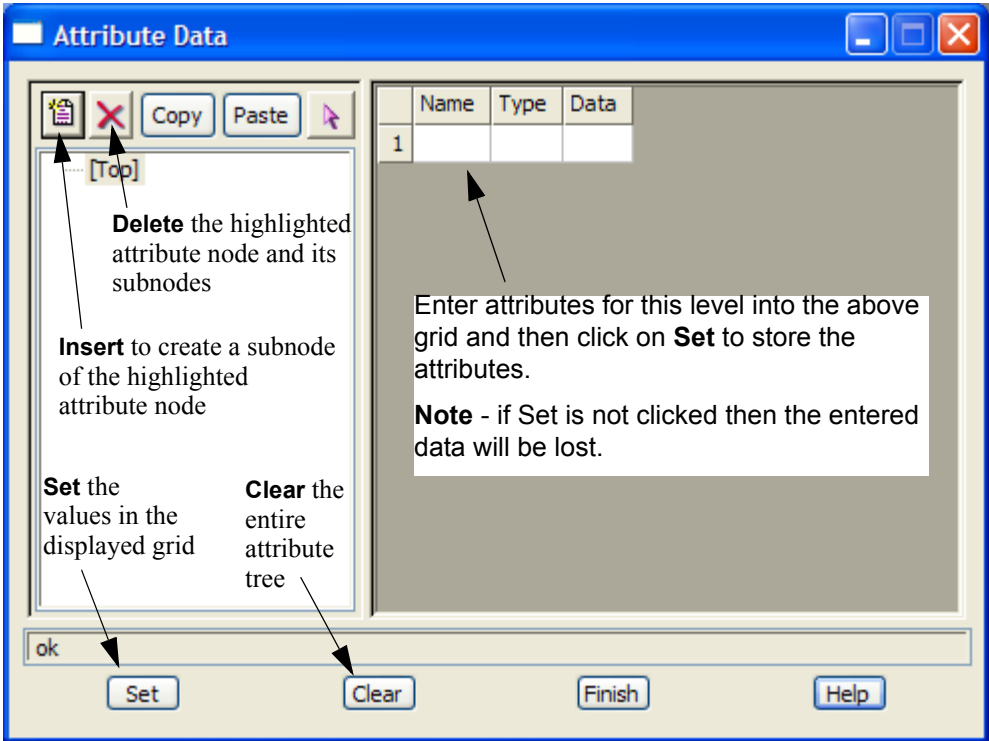

Attribute Data Panel

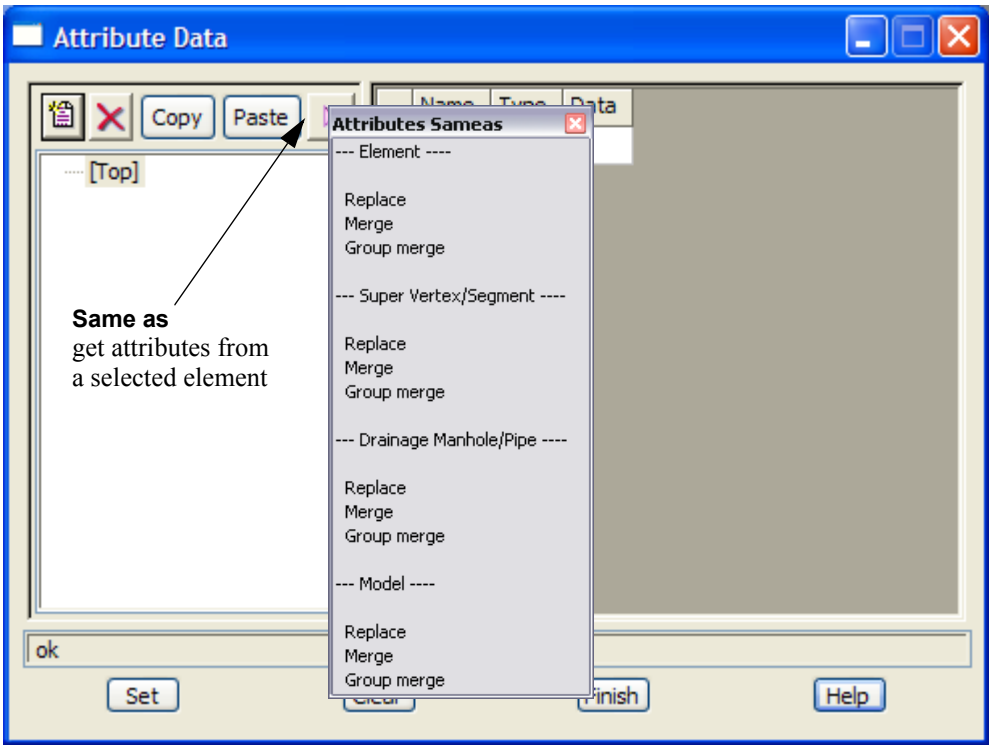

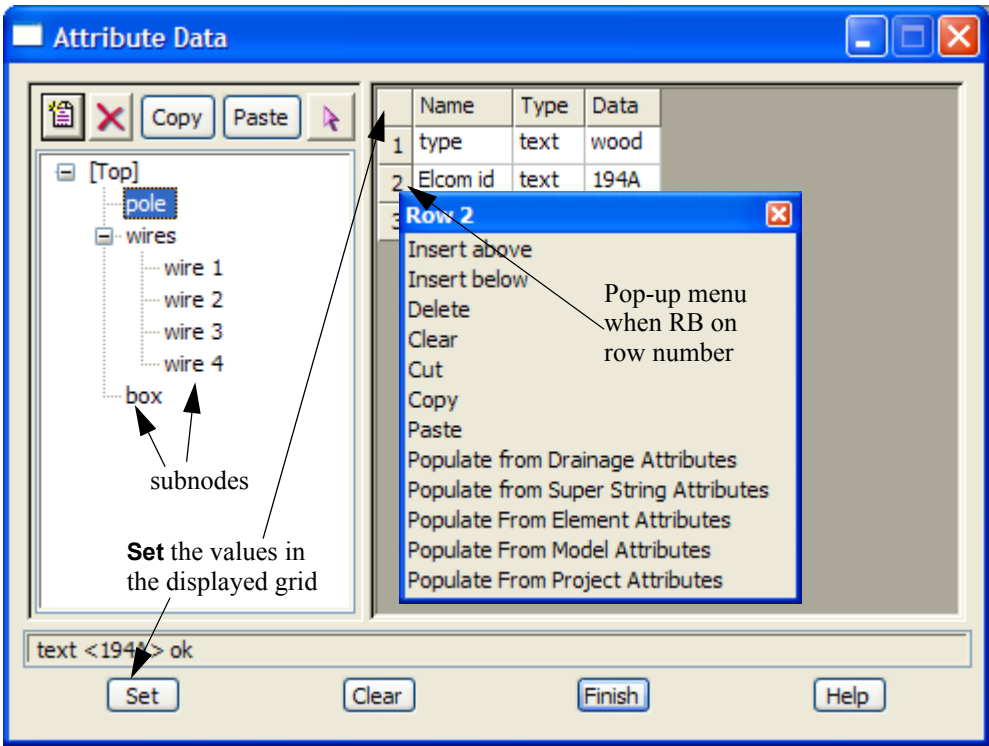

In many options when attributes are to be defined, the **Attribute Data** panel is displayed.

The **Attribute Data** panel can create and edit attributes.

When no attributes exist for an object, the **Attribute Data** panel just shows the **Top** of the attribute tree. New attributes for the top level can be added in the right hand side grid.

Sub nodes (the lower levels of the attribute tree) of an attribute node are created by simply highlighting the attribute node and then clicking on the **Insert** icon. Attributes for the subnode are then entered into the right hand grid and the **Set** button clicked to save the subnode and its attributes.

The buttons used in this panel have the following functions.

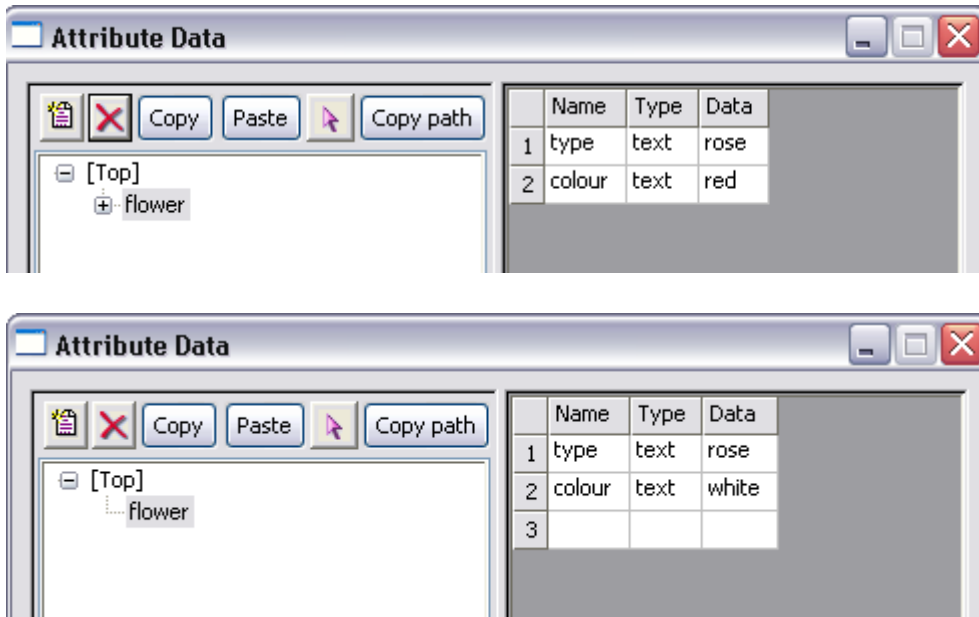

Field Description	Type	Defaults	Pop-Up
Insert	button		

create a new attribute node (subnode) beneath the highlighted attribute node

- Delete** button
delete the highlighted attribute node
- Copy** button
copy the highlighted attribute node into the attribute buffer
- Paste** button
paste the attribute buffer to the highlighted attribute node
- Same As** button
paste the attribute buffer to the highlighted attribute node
- Set** button
set the values given in the current grid in the attribute tree
- Clear** button
clears out the entire attribute tree

Comparing Attribute Data

Two Attribute Datas are the same if each Attribute Data has exactly the same groups, and each group has exactly the same attributes in them, and each identical attribute has **exactly the same value**.

For example, the two attribute data shown above have exactly the same attribute group "flower" and the group "flower" has exactly the same attributes "type" and "colour", the attribute data are not the same because the value of "colour" is "red" for one attribute data, and "white" for the other attribute data.

Accessing Attribute Values

In some options, in particular in the Map File, the actual **value** of a given attribute (the column called Data in the **Attribute Data** panel), is specified by putting a \$ in front of the attribute path name.

That is

\$earth/australia/sydney/lee

refers to the actual value of the attribute given by the path name *earth/australia/sydney/lee*.

For example, see [Map File Substitution by Attributes](#).

Please continue to the next section [Text Definitions](#).

Text Definitions

Text can occur as a text string, or on vertices and segments of a super string.

The Text itself consists of one or more lines of text but the display position of the text is not as straight forward as simply placing a vertex.

The **text display position** of is defined by

- (a) an initial start position - usually a vertex or a segment
- (b) the **direction** for the text - the invisible line that the text runs along

- (c) the **text justification point** and the **offset**, **raise** and **angle** defined with respect to the justification point. Note that the definition of the justification point and the offset, raise and angle depend on whether the text is vertex text or segment text.
- (d) the justification (top left etc) for the text about the justification point

Apart from text display positioning, text also has a

- (e) textstyle
- (f) text units for text height, offset and raise value
- (g) height (size)
- (h) width factor (x factor)
- (i) slant
- (j) colour
- (k) weight
- (l) underline, strikeout and italic
- (m) whiteout, border and border type

There are also special ways of defining characters which are not available on the keyboard. For example the degree character and the squared and cube characters.

Instead of having separate variables on each panel for all of these text definition values, a **Textstyle Data** has been introduced to hold all the Text variables.

Apart from saving a massive amount of room on panels, another major benefit of the **Textstyle Data** is that in the future, extra variables can be added to the **Textstyle Data** structure and the variables are then available everywhere a **Textstyle Data** is used.

The **Textstyle Data** or **Textstyle Info** panels are usually brought up to enter Text setup data. For information on those panels, see [Textstyle Data and Textstyle Info](#).

For definitions on textstyle data values, see

[Justification Point and Offset, Raise, Angle](#)

[Text Justification](#)

[Special Text Characters](#)

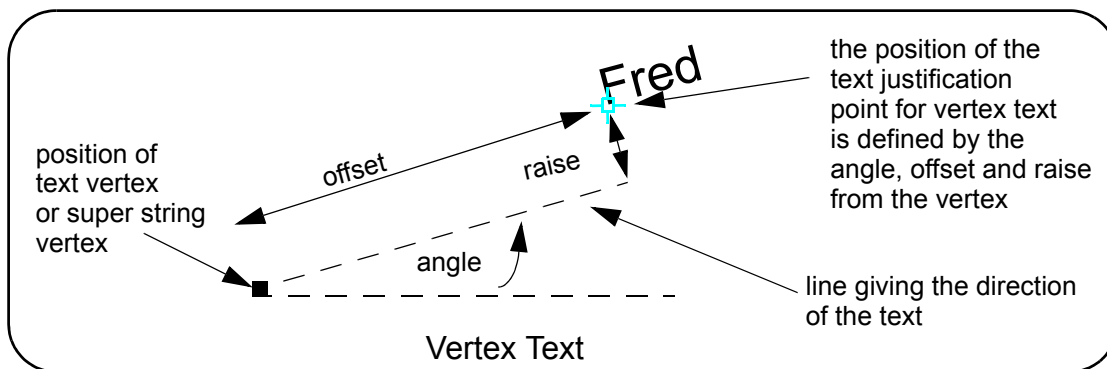

Justification Point and Offset, Raise, Angle

Vertex Text

Vertex text refers to the text of a *text string* or text at a super string vertex (vertices are displayed by toggling on **Vertices** for a plan view).

For vertex text, the text **justification point** and the **direction of the text** are defined by:

- (a) the *direction of the text* is given as a *counter clockwise angle of rotation* (measured from the x-axis) about the vertex
- (b) the *justification point* is given as an **offset** from the vertex *along the line through the vertex with the direction of the text*, and a perpendicular distance (called the **raise**) from that offset point to the justification point.

The vertex and justification point only coincide if the offset and raise values are both zero.

All text on a 4d string must have the same height, colour, angle, offset and raise.

What parts of the text on a super string vertex can be independently modified depends on the settings for the super string.

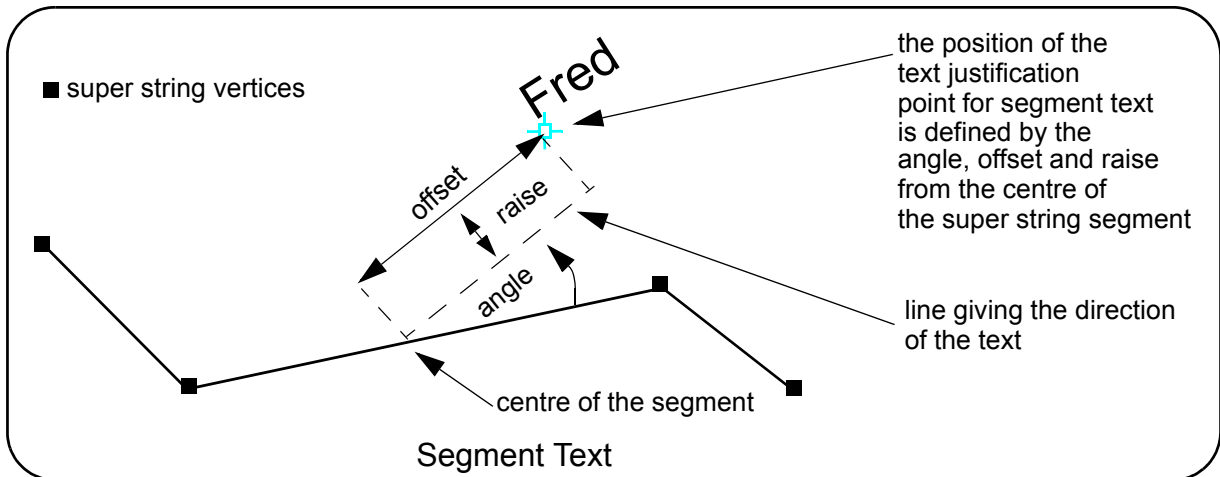

Note that these definitions are relative to the vertex and if the vertex moves, then the text moves with it.

Segment Text

Segment text is a special type of text that can only be placed on the *segment* of a super string. Unlike text at a vertex, the segment for segment text has a direction and mostly the text is required to be parallel, or related to the segment direction.

For segment text, the text **justification point** and the **direction of the text** are defined by:

- (a) the *direction of the text* is given as a *counter clockwise angle of rotation*, measured from the segment, about the centre of the segment
- (b) the *justification point* is given as an **offset** from the centre of the segment *along the line through the centre of the segment with the direction of the text*, and a perpendicular distance (called the **raise**) from that offset point to the justification point.

The direction of the text is parallel to the segment if the angle is zero.

Note that these definitions are relative to the segment and if the vertex segment in any way, then the text also moves with it.

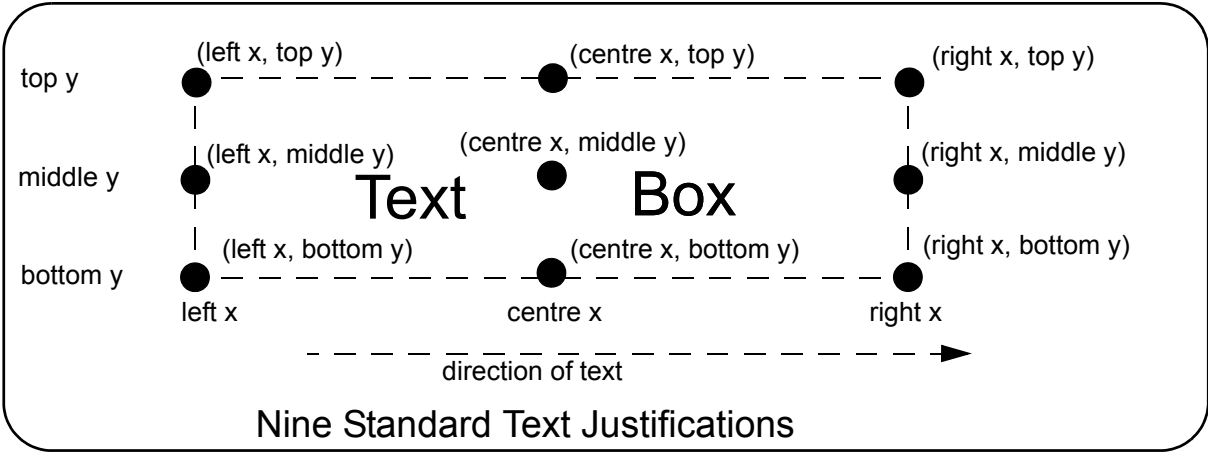

Please continue to the next section [Text Justification](#) or return to [Text Definitions](#).

Text Justification

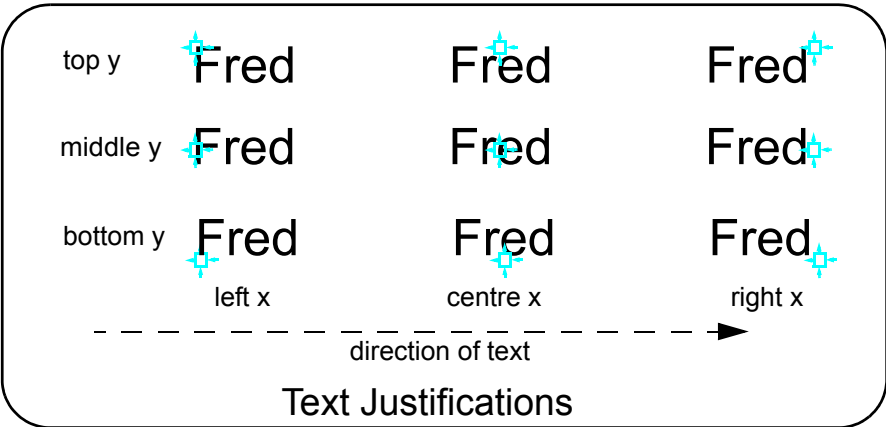

There are nine ways that any text can be positioned relative to the *justification point*, and sixteen ways for numbers with a decimal point.

For standard text, the justification is defined in terms of the rectangular box surrounding the text, and this box depends on the height of the text, the text font, and the actual characters in the text (especially for proportional fonts).

In term of the text box, the nine justifications are formed by dividing the bottom and sides of the box in half and calling bottom points left x, centre x and right x, and the side points bottom y, middle y and top y. The nine justifications are

As an example, for the text **Fred**

For numbers with a decimal point, the position of the decimal point gives an addition point on the bottom called decimal x and on the side called decimal y.

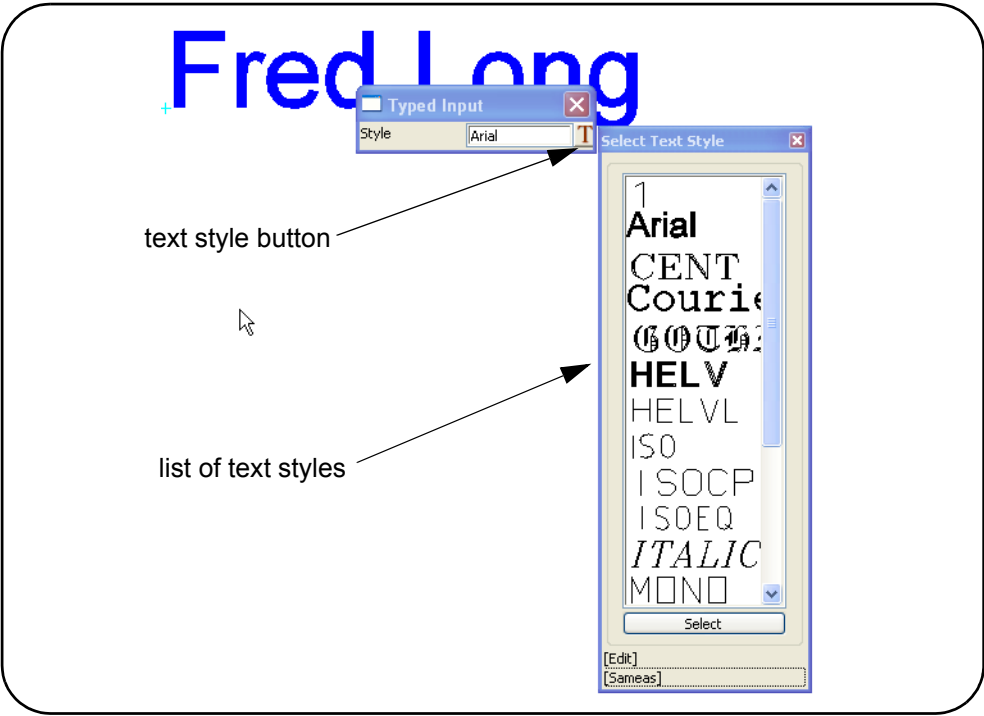

So there are sixteen possible justification for numbers.

Please continue to the next section [Textstyle](#) or return to [Text Definitions](#).

Textstyle

The available text styles for a **12d Model** project are defined by textstyles definition file (see the section [Textstyles and Fonts](#) in the Appendix [Line styles, Symbols and Textstyles](#)).
The text style is selected from the pop-up list displayed when clicking on the **Text style** button.

Please continue to the next section [Text Units](#) or return to [Text Definitions](#).

Text Units

Text occurs in **12d** Model in three ways -

- s user defined **text strings**
- s automatic text such as grid values, x-section and long-section plot annotation.
- s text within linestyles.

The most difficult thing about text is that because of the different uses of text, there needs to be more than one systems of **units** to define text heights.

The height of text for a given textstyle is defined to be the height of a capital A. However, in **12d** Model, there are three methods of defining the units for measuring this height.

- s world units - the units used for data
- s screen units - pixels (the screen is 1000 pixels wide)
- s plot paper units - millimetres.

World Units

World units are the units of user data. For most users, the base unit for user data is metres. However **12d** Model is a dimensionless system and the base unit is totally dependent on the user.

The height of world text when displayed in a view depends upon on the text height and the scale of the view.

When plotted, the height that world text appears on a plot sheet is the same as for any data defined in world units - the height depends on the **scale** used for the plot.

Text heights that are only given in world units have (**w**) after them.

For some text, the choice of units is either world or pixels. The text parameters then have a (**u**) after them.

Screen Units - pixels

When screen units (pixels) are used, the text is a fixed height on the screen. If the user zooms in on text given in pixels, the text remains the same height.

To have a height on a plot, screen unit text needs a height defined in millimetres.

For some screen text, both a pixel and a millimetre height is supplied when the text is defined.

For text with only a pixel height, there is a plotting multiplication parameter called **pixels-to-millimetres** which is used to convert pixel heights to plot paper heights. The value of pixels-to-millimetres is set using the **plots=>pixels to mm** option and is stored for the project.

Text heights that are only given in pixels have a (**pix**) or (**p**) after them.

For some text, the choice of units is either world or pixels. These text parameters then have a (**u**) after them.

Plot Paper Units - millimetres

Text defined in plot paper units (millimetres) has a well defined height on a plot sheet. When a view scale is set for a plan view, then paper text will draw at the correct size for that scale.

Text heights that are only given in millimetres have (**mm**) after them.

Please continue to the next section [Text Height](#) or return to [Text Definitions](#).

Text Height

The height of text is defined to be the height measured from the line that the text sits on to the top of the upper case characters such as F.

Text descenders are not included in the definition of height.

Please continue to the next section [Text Width Factor or X Factor](#) or return to [Text Definitions](#).

Text Width Factor or X Factor

In a text font, each character has a defined width which may depend on the character.

For a **non-proportional font** such as `Courier New`, all the characters in the font have the same width.

For a **proportional font** such as `Arial`, the width varies for each character.

The character width is actually defined as part of the font and is not available to 12d text but the character widths are multiplied by a *width factor* (*x factor*) which is set for each text string.

Proportion Font - Arial

x factor = 1 Fred Long

x factor = 2 Fred Long

Non-Proportion Font - Courier New

x factor = 1 Fred Long

x factor = 2 Fred Long

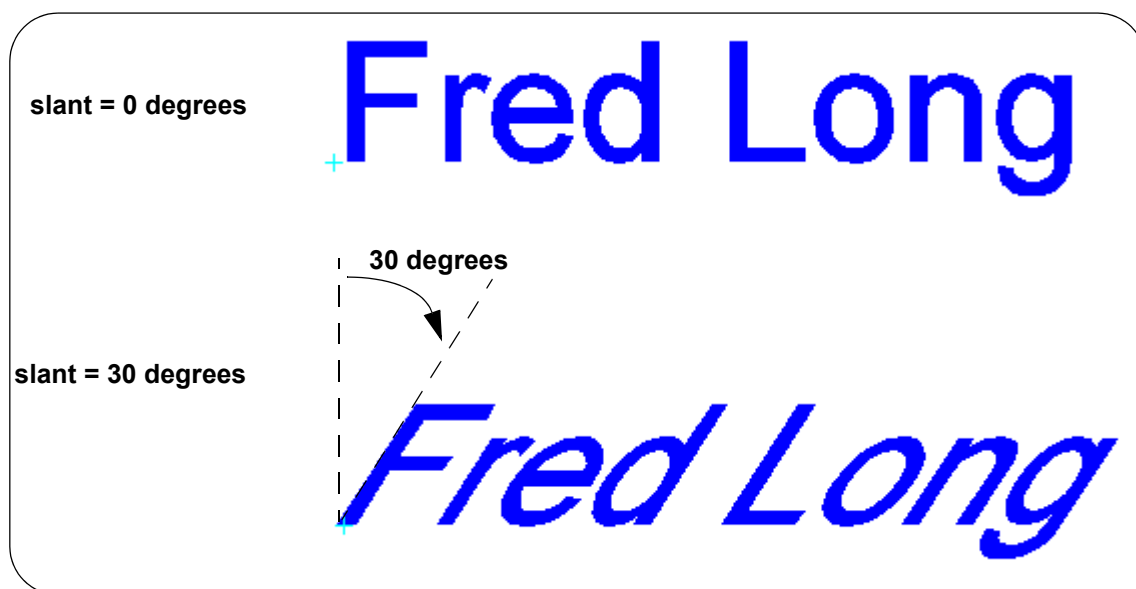

Please continue to the next section [Text Slant](#) or return to [Text Definitions](#).

Text Slant

A **slant** angle of between 0 and 45 degrees can be defined for a text string.

For non-zero slant angles, the text characters are slanted by the given angle measured in a clockwise direction from the vertical (a bearing).

Currently the text *slant* angle can only be set by the **Slant** field in the Textstyle Data panel field. The value is in degrees in the format ddd.mmssfff.

Please continue to the next section [Weight, Underline, Strikeout, Italic, Outline](#) or return to [Text Definitions](#).

Weight, Underline, Strikeout, Italic, Outline

For *True Type Fonts* only:

Please continue to the next section [Whiteout, Border and Border Style](#) or return to [Text Definitions](#).

Whiteout, Border and Border Style

Note: Border Style is for V11 only. Rectangle is the only Border Style in V10.

text with no fill and no border

text with a yellow fill and an orange border

text with "view colour" fill and an orange border

strikeout

underlined

italic

black view colour

white view colour

off yellow view colour

Please continue to the next section [Special Text Characters](#) or return to [Text Definitions](#).

Special Text Characters

There are special text characters that do not appear on the standard keyboard but can still be entered into text strings, vertex text and segment text with textstyles using **true type fonts**.

The special characters are entered by holding down the Alt key and typing in certain numbers on the *number pad* whilst the Alt key is still being held down). The character will appear when the Alt key is released.

Some commonly used special characters and their Alt codes are

Squared character	²	Alt 0178
Cubed character	³	Alt 0179
Middle dot character	·	Alt 0183
Large diameter character	∅	Alt 0216
Small diameter character	ø	Alt 0248
Degree character	°	Alt 0176
Copyright character	©	Alt 0169
Registered character	®	Alt 0174
British Pound character	£	Alt 0163
Japanese Yen character	¥	Alt 0165

The Alt values come from the character map for Windows. This can be quickly viewed by
run charmap.

NOTE - these values may depend on the true typed font used in the textstyle.

Please continue to the next section [Textstyle Data and Textstyle Info](#) or return to [Text Definitions](#).

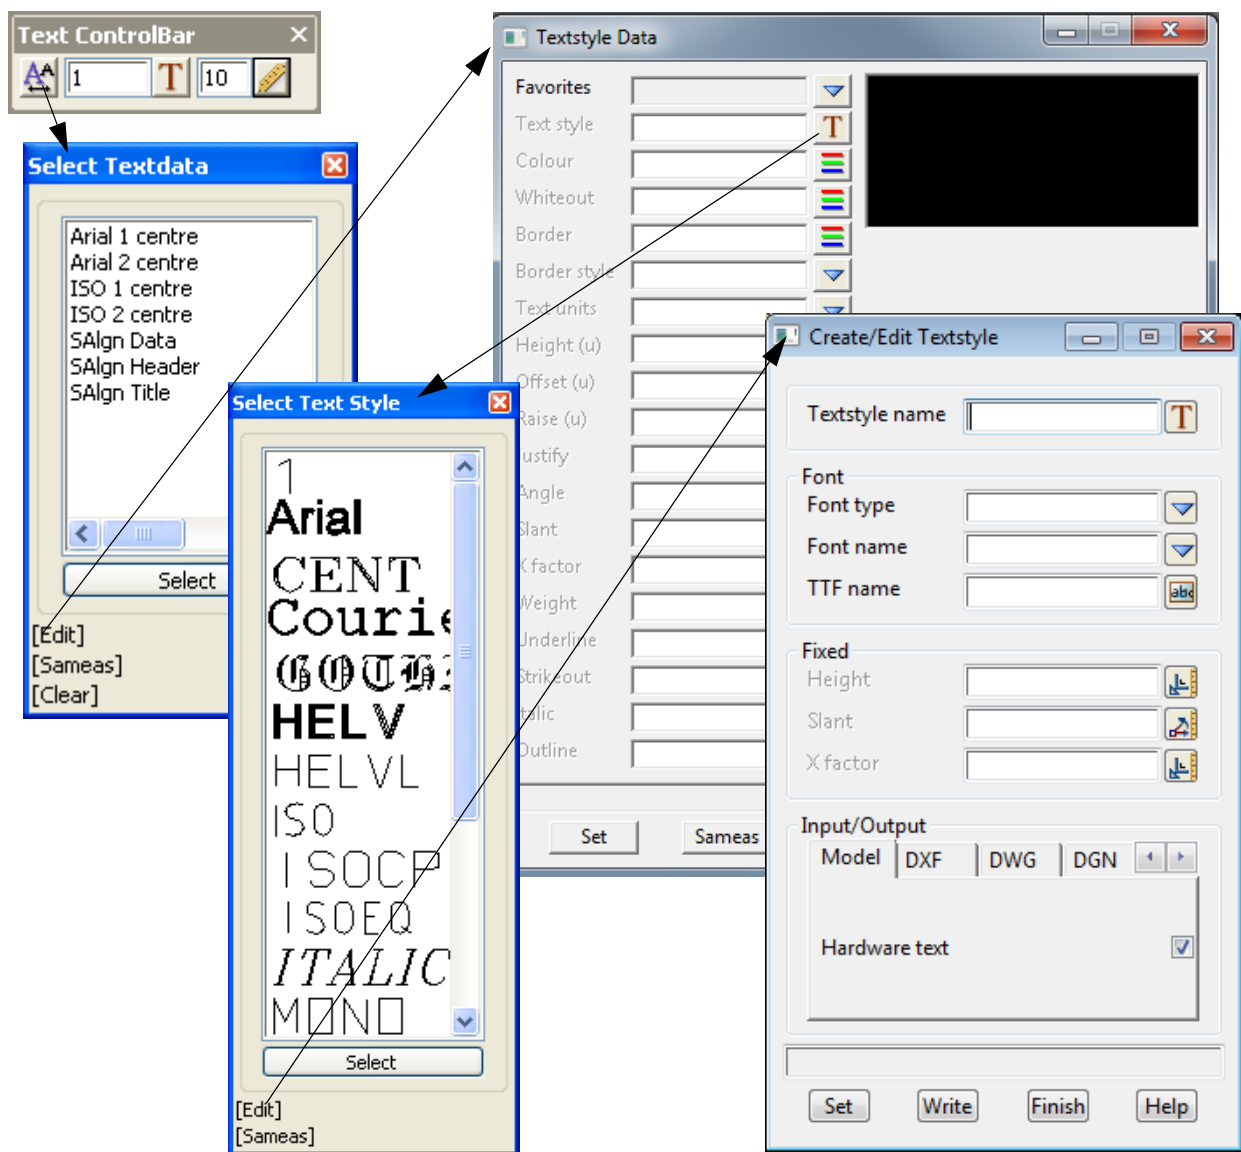

Textstyle Data and Textstyle Info

Text_info

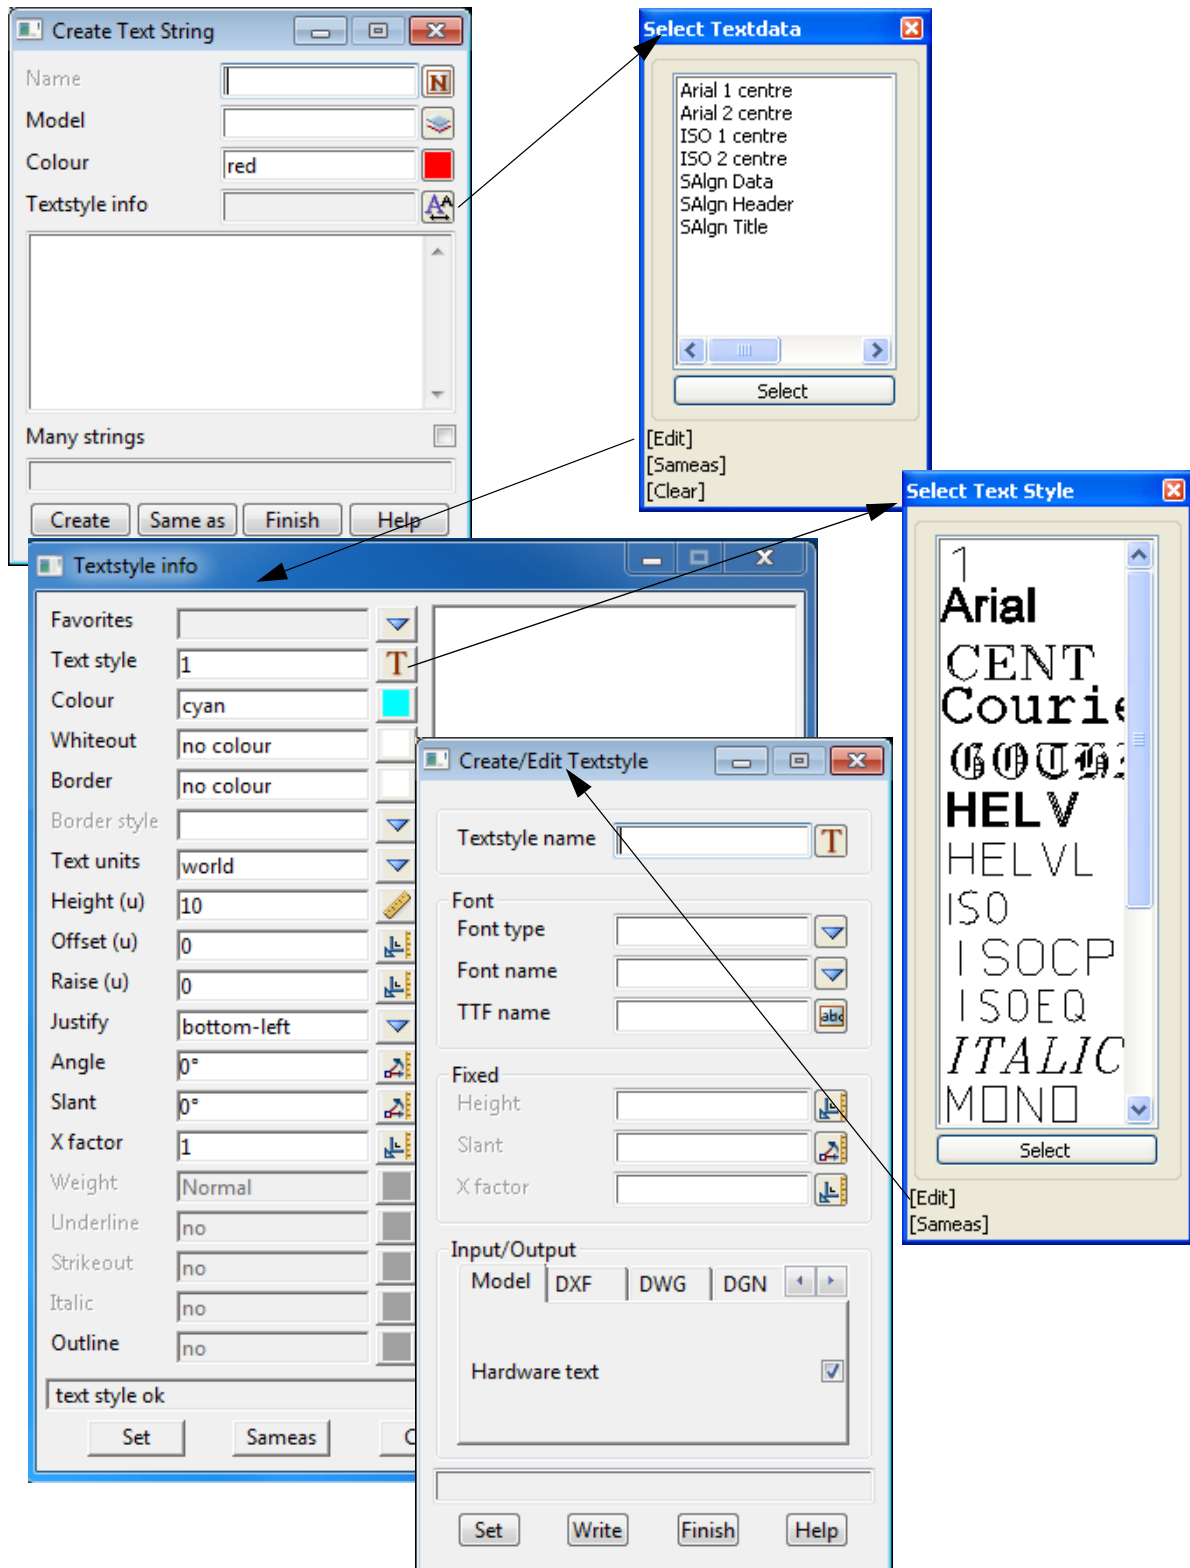

There is a textstyle info panel field for defining the text parameters. Clicking on the textstyle info icon on the Text Controlbar or on a panel, brings up the Select Textdata pop-up menu which lists the textstyle favourites. By clicking on [Edit], the **Textstyle Info** panel is brought up and all the definitions for the text style can be modified and written to the textstyle info panel field by clicking on **Set**.

Textstyle favourites are defined in the Browse option **Projects=>Browse=>Textstyle data favourites** and documented in the section [Textstyle Data Favourites](#) in the chapter [Projects](#).

Note that there is a **Textstyle Data** panel that is identical to the **Textstyle Info** panel except that it doesn't have the Colour field. The Textstyle Data panel is brought up by clicking on the A on the Text Controlbar.

For information about the **Create/Edit Textstyle** panel, see [Textstyles](#).

For information about the **Create/Edit Textstyle** panel, see [Textstyles](#).

For information on the definitions of the fields in the **Textstyle Data** and **Textstyle Info** panels, go to the section [Text Definitions](#)

Please continue to the next section [Symbol Definitions](#).

Symbol Definitions

Symbols are often on a one vertex super string but they can be placed on any vertex of a super string.

The displayed symbol is defined by

- (a) an initial start position
- (b) the actual symbol
- (c) the **x offset** and **y offset** of the **symbol justification point** from coordinates of the vertex. The vertex and justification point only coincide if the x offset and y offset values are both zero.
- (d) the rotation *angle of the symbol* is given as a *counter clockwise angle of rotation* (measured from the positive x-axis) about the symbol justification point.

Note that these definitions are relative to the vertex and if the vertex moves, then the symbol moves with it.

What parts of the symbols on the vertices of the same super string can be independently modified depends on the settings for the super string. For example, all symbol angles may have to be the same.

The **Symbol Information** panel is usually brought up to enter symbol information (see [Symbol Data](#)).

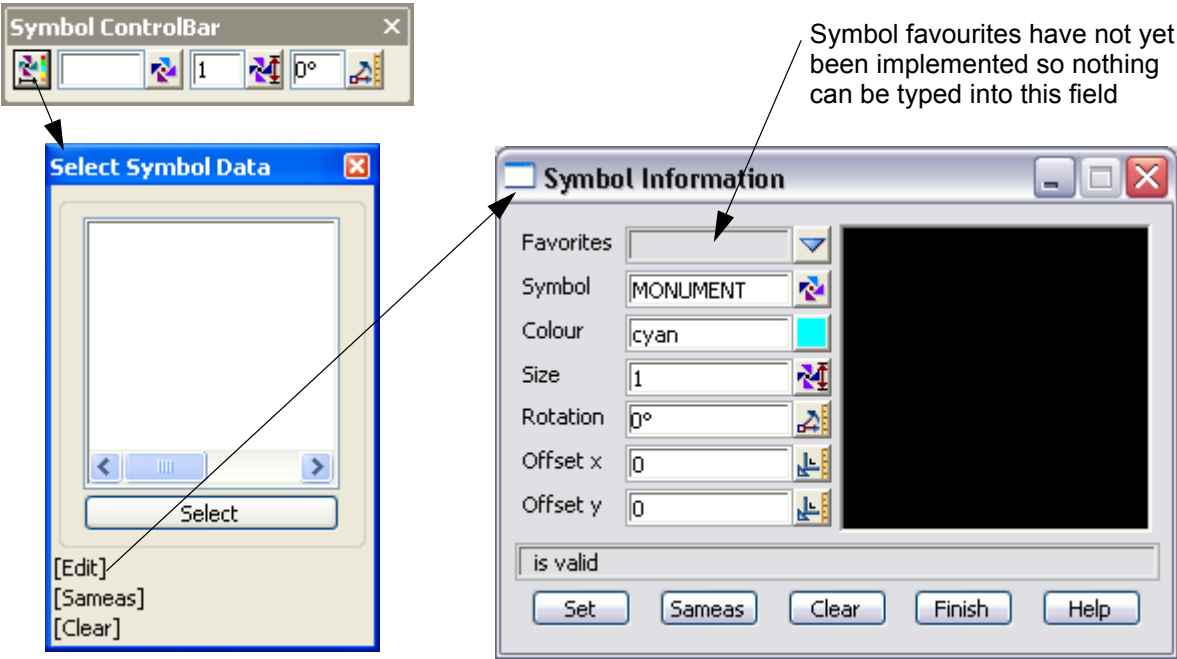

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Favourites			
<i>not yet implemented.</i>			
Symbol	Symbol box		available symbols
<i>the name of the symbol. This field can not be blank.</i>			
Colour			select colour menu
<i>the colour of the symbol</i>			
Size			measures menu
<i>the size of the symbol. This field can not be blank.</i>			
Rotation			measures menu
<i>the angle of rotation of the symbol. The angle is measured in a counterclockwise direction from the positive x-axis. The units for angle are degrees minutes and seconds and it is entered in HP Notation. If blank then the rotation is 0.</i>			
Offset x/y			measures menu
<i>the x/y-distance to offset the symbol from each vertex of the string. If blank the value is 0.</i>			
Set	button		
<i>set the values to be those in the panel.</i>			
Sameas	button		
<i>another string can be selected and the information about it automatically put in the panel fields.</i>			
Clear	button		
<i>clear all the values in the panel fields.</i>			

Symbol Data

There is a Symbol Information panel for defining symbol parameters.

Clicking on the **Symbol info** icon on the **Symbol Controlbar** or on a panel, brings up the **Select Symbol Data** pop-up menu. By clicking on [Edit], the **Symbol Information** panel is brought up and all the definitions for the symbol can be modified and written to the Symbol Info panel field by clicking on **Set**.

For information on the **Symbol Information** panel and the definitions for *symbols*. go to [Symbol Definitions](#)

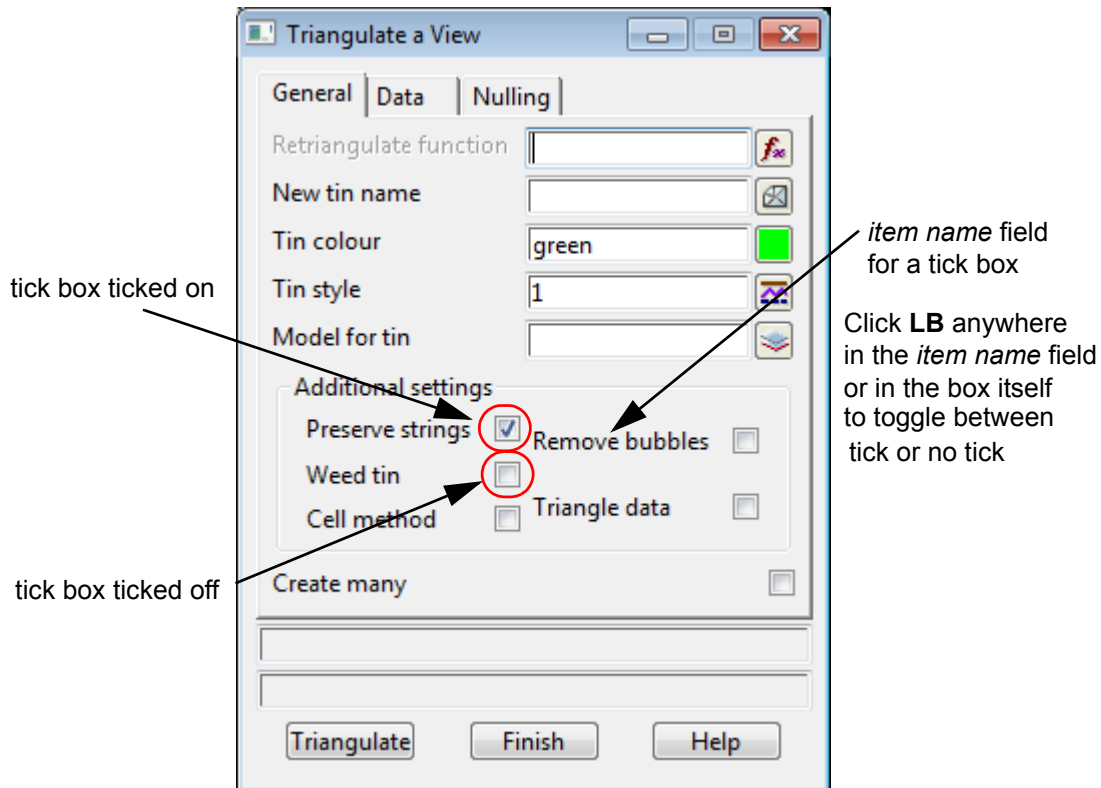

Please continue to the next section [Tick Box](#).

Tick Box

Many items require a mode to be either on or off.

In **12d Model**, there is a special box with a **tick** to indicate that the setting is **on** and **nothing** to indicate that the setting is **off**.

In a **tick** box, the tick is changed to the nothing state by clicking LB in the box surrounding the tick or clicking LB on the **item name** field for the tick box.

Please continue to the next section [Picking Strings](#).

Picking Strings

In many **12d Model** options, the user is required to “pick” the string to be used in the option, or to get information about a string.

After any option requiring a pick is selected, a message regarding the function of the mouse buttons is written to the screen message area.

<option> [picks][fast][menu]

There are three picking method available in **12d Model**:

- (a) fast pick where the pick and the accept occur as one operation
- (b) fast accept where the if there is only one item satisfying the snap conditions then it is automatically accepted but if there is more than one, the tentative pick mechanism is used and
- (c) tentative picks with a separate pick and accept mechanism

Fast pick will be documented first, followed by **fast accept** and **tentative pick** (pick and accept).

Go to the next section [Fast Pick](#) or back to [Picking Strings](#).

Fast Pick

To **fast pick** a string, simply move the cursor near the string and **click MB** or type <Enter>. The nearest string to the cursor satisfying the snap conditions is selected.

Fast pick is used when the **F** snap is on.

Various snap modes can be set for the fast pick. The available snaps are point (vertex), line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the section [Snaps](#).

Go to the next section [Fast Accept](#) or back to [Picking Strings](#).

Fast Accept

To **fast accept** a string, simply move the cursor near the string and **click LB** or type <Enter>. If there is only one string satisfying the snap conditions, then it is automatically accepted.

If there is more than one string satisfying the snap conditions, the nearest string to the cursor satisfying the snap conditions highlighted and an information menu containing information about the selected string is displayed.

If the correct string has been tentatively picked, **click MB** or **type <enter>** accepts the string. If the incorrect string is tentatively picked, click LB and the next closest string satisfying the snap conditions will be highlighted. See the section [Tentative Pick](#) for more information on tentative picking.

Fast accept is used when the **A** snap is on.

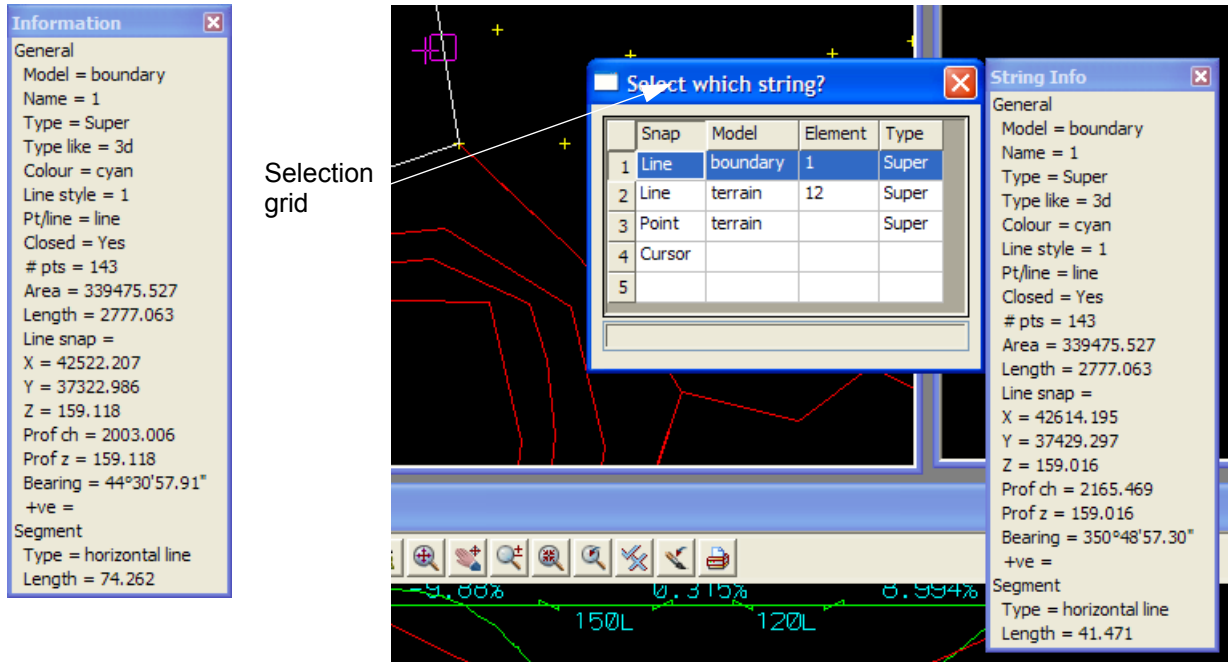

Various snap modes can be set for the fast pick. The available snaps are point (vertex), line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the next major section [Snaps](#).

Go to the next section [Tentative Pick](#) or back to [Picking Strings](#).

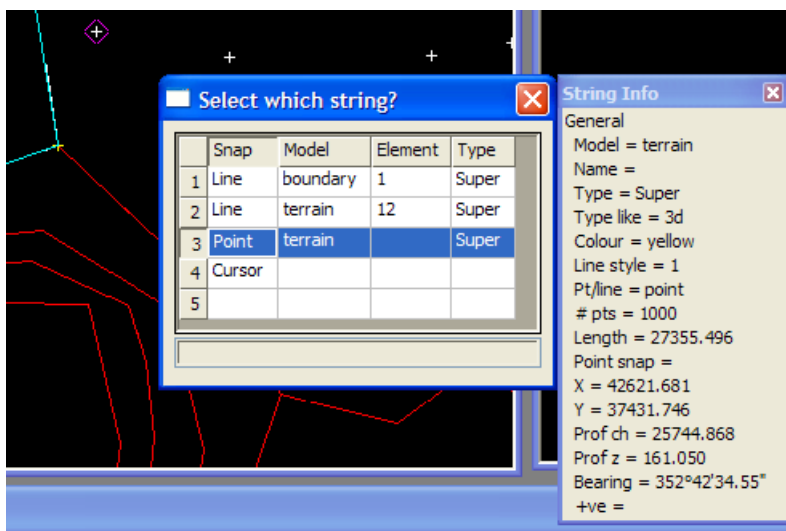

Tentative Pick

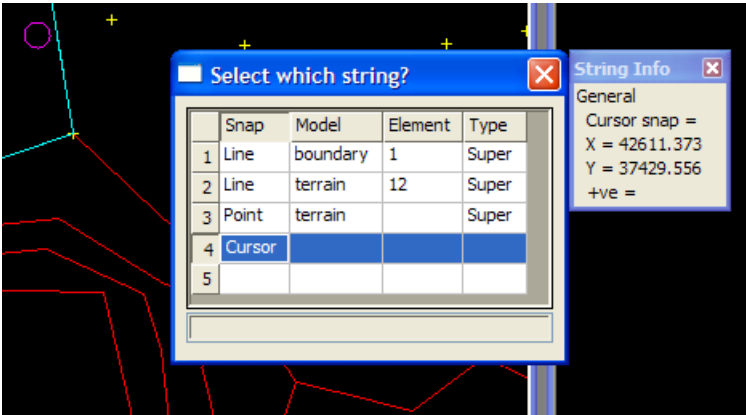

To **tentatively pick** (or tentatively select) a string, move the cursor near the string and **click LB**. The nearest string to the cursor satisfying the snap conditions (see the next section on Snaps) is highlighted and an information menu containing information about the selected string is displayed (the information varies for each string type- see the section [String Information](#) in the chapter [Strings](#)).

If **M** snap is on, all the strings satisfying the search criteria are listed in a grid (the selection grid) as well as the Information panel.

When the selection grid is displayed, any other string in the grid can be made the considered string by simply clicking on the row containing the string in the grid. The new string will highlight and the snap position displayed.

The information menu disappears if the cursor is moved slightly.

The string name, the string model and the mouse button functions are also displayed in the Status Bar when the picked string is highlighted:

```
<option> [selects][accepts][menu] "model->string name"
```

If the correct string has been tentatively picked, **click MB** or **type <enter>** to accept the string. If the information menu was still up, it disappears when the string is accepted.

Note - if the information menu does not appear when a string is highlighted, then the *information snap* may be set to off. See the section [Snaps](#).

Tentative Picking and Repicking

If **M** snap is **off**, and one string is tentatively picked (and highlighted) but another string was intended to be picked, click **LB** again without moving the cursor and the next nearest string to the current cursor position will be selected, highlighted and an information menu put up for it. Any strings already rejected during the pick will be ignored. Continuing to click **LB** again without moving the cursor will sequentially pick the next nearest string and ignore the earlier rejected strings.

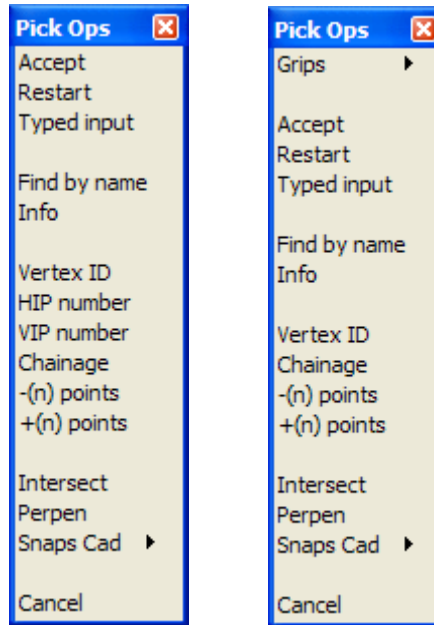

To allow **all** strings to be eligible for picking again, simply move the cursor a small distance (the reset distance - default five pixels) and start picking again. This will automatically **reset** the rejection list.

When **M** snap is **on**, all strings are shown in the selection grid and any one can be picked without the need to keep clicking **LB**.

Pick Ops Menu

Options to allow all strings to be eligible for picking again, to cancel the pick operation and to accept a picked string are all available from the **Pick Ops** menu.

The **Pick Ops** menu appears whenever RB is clicked whilst in the pick option. The **Pick Ops** menu is

Alignment and
Pipeline stringsFor most other
string types

To allow all strings to be eligible for picking again, select **Restart** from the **Pick Ops** menu. This has the same effect as moving the cursor the reset distance.

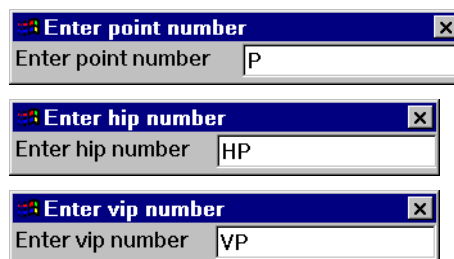

To cancel the pick without selecting any string, select **Cancel** from the **Pick Ops** menu.

Selecting **Accept** from the **Pick Ops** menu, accepts the current picked string. This is the same as clicking MB without calling up the **Pick Ops** menu.

The **Find by name** option allows the user to specify a string name to restrict the pick by. This options is also available in the snap option and will be described there.

Selecting **Info** will redisplay the information menu for the string.

If **Vertex/HIP/VIP number**, is selected, the **enter vertex/hip/vip number** box is displayed.

Typing the number into the box terminated by <enter> will move the pick position to that vertex or IP point.

If **Chainage** is selected, the **Enter Chainage** box is displayed.

Typing a chainage into the box terminated by <enter> will move the pick position to that chainage on the tentatively selected string.

If **-(n)** vertices or **+(n)** vertices is selected, the **Enter relative vertex index** box is displayed.

Typing a positive/negative number into the box terminated by <enter> will move the pick vertex to that many vertices after/before the selected position on the tentatively selected string.

The left and right arrow keys (<-, ->) can also be used to move the pick position to the previous or following vertex respectively.

When selecting **Snaps Cad**, the **Snaps Cad Menu** appears on the screen. The **Snaps Cad Menu** can also be accessed by walking right on **Snaps Cad**. For more information please go to [Snaps Cad](#)

To remove the **Pick Ops** menu without selecting an option, either select the **[X]** button from the **Pick Ops** menu title area or simply click RB again whilst the cursor is in a view.

Various snap modes can be set for the pick. The available snaps are point, line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the next section.

Go to the next section [Picking with Direction](#) or back to [Picking Strings](#).

Picking with Direction

Picking a string is one operation where **12d Model** is monitoring the cursor position when button LB (or MB for fast pick) is pushed down and also the cursor position when button LB (MB) is subsequently **released**.

The **pick position** is taken as the cursor position when button LB (MB) is released, but the difference between the down and up positions for button LB (MB) defines a **direction** vector or **sense** to the pick. This direction is called the **picking direction** or **picking sense**.

The **picking direction** is used in a number of **12d Model** options.

For example, in the information panel displayed for any picking operation, if the picking direction is the same as the string direction, a **+ve** is displayed at the bottom of the panel. If the directions are opposite, then a **-ve** is displayed in the panel.

Important Note

If a string was picked with direction, then to automatically reset the rejection list, the cursor must be move fifty (50) pixels rather than the five required for a non-directional pick.

Go to the next section [Summarising the 12d Model Picking Mechanisms](#) or back to [Picking Strings](#).

Summarising the 12d Model Picking Mechanisms

Tentative picking - pick and accept as separate operations

- | | |
|-------------------------|-----------------------------------------------------------------------------------------------|
| LB - left button | select the next nearest string. |
| | moving the cursor more than five pixels resets the rejection list for a non-directional pick. |
| | moving the cursor more than fifty (50) pixels resets the rejection |

list for a directional pick.

MB - middle button

accept the current selected (highlighted) string - ends the pick.

RB - right button

brings up the **Pick Ops** menu.

Typing **<Enter>**
ends

same as MB: accepts the current selected (highlighted) string -
the pick

Fast accepting - pick and accept in one operation if there is only one item satisfies the snap conditions or a tentative pick if more than one item.

LB - left button

select the next nearest string. If there is only one item possible then it is automatically accepted. Otherwise it is the same as for a tentative pick.

moving the cursor more than five pixels resets the rejection list for a non-directional pick.

moving the cursor more than fifty (50) pixels resets the rejection list for a directional pick.

MB - middle button

accept the current selected (highlighted) string - ends the pick.

RB - right button

brings up the **Pick Ops** menu.

Typing **<Enter>**
ends

same as MB: accepts the current selected (highlighted) string -
the pick

Fast picking - pick and accept in one operation

MB - middle button
or

pick and accepts the nearest string.

Typing **<Enter>**

same as MB: pick and accepts the nearest string - ends
the pick.

Please continue to the next section [X Y Z and Ch Ht Typed Input Box](#) (or back to [Picking Strings](#)).

	ddd	whole degrees	
	.	separator between degrees and minutes	
	mm	whole minutes	
	ss	whole seconds	
	fff	fractions of seconds (as many as required)	
s	bearing in decimal degrees	distance	actual z
	dbd	ddd.dd	distance z
s	angle in degrees-minutes-seconds	distance	actual z
	ad	ddd.mmss	distance z
s	angle in decimal degrees	distance	actual z
	dad	ddd.dd	distance z

The default mode for the **Enter Ch Ht** box is to receive *chainage* and *height* values.

However, by typing special character codes before the values, the **Enter Ch Ht** box can be used to enter data in a variety of formats including grade distance and slope distance.

The full list of typed input codes now follows (the text will be given in lower case, but it can be typed in either upper or lower case).

s	actual <i>chainage</i>	actual <i>height</i>	
		<i>chainage height</i>	
	or		
	a	<i>chainage height</i>	
s	relative <i>chainage</i>	relative <i>height</i>	
	r	<i>chainage height</i>	
s	<i>slope</i> and <i>distance</i>		
	sd	<i>slope distance</i>	
		where slope is 1 vertical in slope horizontal units	
s	<i>grade</i> and <i>distance</i>		
	gd	<i>grade distance</i>	
		where grade is 1/slope as a percentage	

Please continue to the next section [Tentative Typed Inputs](#).

Tentative Typed Inputs

If the string has been **tentatively** selected (by clicking LB and highlighting the string but not yet accepting it), then further typed inputs are available which then work for the **highlighted** string only.

The **Tentative typed inputs** are:

CH <i>chainage</i>	go to the given chainage
V <i>vertex-index</i>	go to the vertex number <i>vertex-index</i>
P <i>point-id</i>	go to vertex with the given point-id (vertex-id)
+	go to the next vertex
-> (right arrow)	go to the next vertex
+number	go forward <i>number</i> vertices
-	go back to the previous vertex
<- (left arrow)	go back to the previous vertex
-number	go backward <i>number</i> vertices
HP <i>number</i>	go to horizontal IP number number
VP <i>number</i>	go to vertical IP number number

When a string is *tentatively* selected, the above *typed input* options are also available as *menu items* from the **Pick-Ops** menu. This has been documented in the section [Pick Ops Menu](#) in this chapter.

Warning - If **M** snap is on and the selection grid is displayed, the tentative typed inputs will not work. Either turn **M** snap off, or move the cursor so the selection grid disappears before typing, or use **RB** to bring up the **Pick Ops** menu and select the required command from there.

Please continue to the next section [Picking Point Ids \(Point Numbers, Vertex ids\)](#).

Picking Point Ids (Point Numbers, Vertex ids)

When a **12d Model** option uses a *cursor select* (picking) in a plan view to pick strings, then *typed input* can be used to select a point id (point number, vertex id) which exists in any model on the view (note that a point id can be numeric or alphanumeric).

When over the plan view, instead of clicking **LB** to select a string, simply type:

number to select a *numeric* point id

or

P*text* to select an *alphanumeric* point id of name *text*.

This will bring up the **Enter X Y Z** box and the typed information will go into the box. Type <enter> and the view will then be searched for the given point number.

If the **point id** exists, then a large cross will be drawn over the vertex on the view and the string containing the point id will be highlighted.

Note that if a string is *tentatively* selected (i.e. highlight but not yet accepted), then

Vn will select the nth vertex of the tentatively selected string (vertex index of n)

Please continue to the next section [Snaps](#).

Snaps

In most **12d Model** options, the mouse is used to pick data from a string displayed on the screen.

Unfortunately different options usually require different data so an easy method is needed to help select from all the strings on the screen, a specific string or part of a string.

In **12d Model**, **Snaps** are used as part of the string picking mechanism (discussed in the previous sections) to help filter out what data is interactively selected on a view.

Using the **12d snaps** it is possible to

- s restrict any string picks to selected string names and/or models
- s set modes which are used to determine what parts of strings are used for picking
- s set the search distance for picking vertices (point snap tolerance)
- s set the search distance for picking (snap tolerance)
- s give the name of a tin to be used to set z-values at a (x,y) position
- s set whether the user is prompted for a new height (z-value) after every point edit
- s turn on/off the information menu when picking
- s turn on/off the *selection* grid when picking
- s

Go to the next section [Point and Line Snaps](#) or back to [Snaps](#).

Point and Line Snaps

When trying to interactively pick a string in **12d Model**, the user moves the cursor near the string in a view and clicks LB (or the MB for a fast pick). **12d Model** then makes a search of all the strings on the view to make a selection.

The help restrict the search, only strings that are partially or totally within an x and y distance called the **snap tolerance** of the cursor are eligible for picking. That is, only strings that have part, or all, of them within the *snap box* can be selected.

For strings inside the snap box, **12d Model** has two snap modes, *point* and *line*, to specify which parts of the strings can be selected.

If **point** snap is set on, the vertices (points) of a string can be selected. If only *point* snap is on, then the string containing the **closest vertex** to the cursor is selected.

If **line** snap is set on, then the position on the string that is determined by dropping the cursor perpendicularly onto the string, can be selected. Note that there is usually no string vertex at the perpendicular position (line snap position). If only **line** snap is on, then the string containing the closest perpendicular position to the cursor is selected.

Since in general it is rare for a vertex of a string to be closer to the cursor than the line snap position, then with only the above definitions and **point** and **line** snap both on, the line snap position usually wins. Hence to pick a vertex, line snap would have to be turned off. Since this can lead to line snap being regularly toggled on and off, another distance called the **point snap tolerance** has been introduced to give vertices **priority** over line snaps when both snaps are on.

When **point snap** is set on, any vertex of a string that is within an x and y distance called the **point snap tolerance** of the cursor when LB is clicked, is considered for selection **before** any other type of snap is considered. That is, any vertices in the **point snap box** are selected before any line snap positions.

Point Snap Box and Snap Box

In the area between the point snap box and the snap box, vertices and line snap positions are treated equally and the closest one to the cursor is selected.

The other types of snaps are not as complicated and will be discussed in the following sections.

Go to the next section [Setting Snaps](#) or back to [Snaps](#).

Setting Snaps

Snaps can be toggled on and off from the snaps tool bar, or the snap settings can be set from the **Snaps** menu under *Utilities* on the Main menu.

snaps toolbar

The menu **Utilities => Snaps** is:

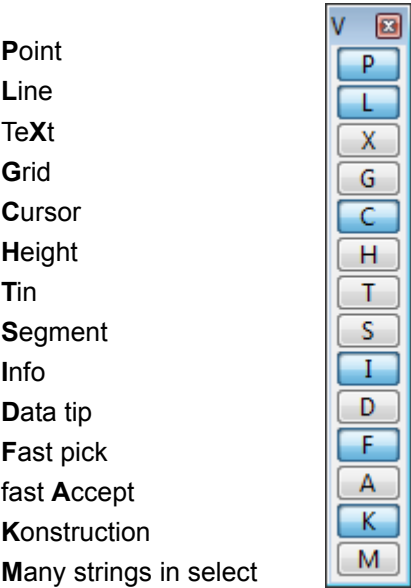

The *Snaps (Vert)* option brings up a Snaps toggle menu similar to the *Snaps* toolbar except that the *Snaps (Vert)* runs vertically rather than horizontally. Either can be used to toggle the snaps on and off.

Snaps toolbar

The Snaps (Vertical) menu

The option **Utilities=> Snaps=>Snaps** option brings up a menu that provides tick boxes to turn the various snap modes on or off plus it is used to set the snap tolerance value, the point snap tolerance value, the tin for tin snaps and string and/or model names for restricting the snaps.

Any combination of snap modes and names can be set.

The **Snaps** menu is

Snaps		
Point	<input checked="" type="checkbox"/>	point snap on/off
Line	<input checked="" type="checkbox"/>	line snap on/off
Text	<input type="checkbox"/>	text snap on/off
Grid	<input type="checkbox"/>	grid snap on/off
Cursor	<input checked="" type="checkbox"/>	allow cursor point on/off
Height	<input type="checkbox"/>	ask for z value at each point in edits
Tin ""		name of tin to snap to
Tin	<input type="checkbox"/>	tin snap on/off
Segment	<input type="checkbox"/>	turn segment snap on/off
Name ""		restriction on string names
Model ""		restriction on model names
Tolerance 50		set snap tolerance
Pt tolerance 10		set point snap tolerance
Info	<input checked="" type="checkbox"/>	bring up info panel on/off
Data tip	<input type="checkbox"/>	turns data tips on/off
Fast pick	<input checked="" type="checkbox"/>	turns fast pick snap on/off
Fast accept	<input type="checkbox"/>	turns fast accept snap on/off
Fast cad	<input checked="" type="checkbox"/>	turns fast construction snap on/off
Display many	<input type="checkbox"/>	display the selection grid (many strings)

The snaps point, line, grid, cursor, tin and info are all set on or off using the tick boxes.

The *snap tolerance* is displayed on the **Tolerance** line of the menu.

The *point snap tolerance* is displayed on the **Pt tolerance** line of the menu.

When a select with snap is made, the type of snap is given in the **Information** panel and also graphically displayed by **changing** the **shape** of the snap cursor. The shape of the snap cursor is

a **diamond** for a **point** snap
square for a **line** snap
circle for a **cursor** snap
circle for a **grid** snap
squiggles under a line for a **tin** snap.

Each of these snaps/settings will now be discussed.

Point Snap - diamond

When point snap is set on, any vertex of a string within the point snap box around the cursor when LB is clicked, is considered for selection before any other type of snap is considered. Centres of circles, centres of arcs and arc end points are considered to be vertices.

Note that if there are no vertices within the point snap box then any vertices within the snap box of the cursor are considered for selecting

Line Snap - square

When line snap is set on, the cursor only needs to be within the tolerance distance of any visible segment of a string when LB is clicked, and that string is considered for selection. Also arcs and circles are considered for selection.

Note that if a non-zero point snap tolerance is given and point snap is set on, then any vertices that are closer than the point snap tolerance to the cursor will be considered for snapping before any line snap is considered.

Grid Snap - circle

When grid snap is set on, the cursor will snap to the intersection of any grid lines that are displayed in a view.

Cursor Snap - circle

If cursor snap is set on and the other snaps are either not set on or have failed, the cursor position is used for the (x,y) and possibly the z value of the pick.

Tin Snap - squiggles under a line

Tin snap means that when an (x,y) point is selected, the z-value for the point is taken to be the z-value on the tin at the same (x,y) position.

To use tin snap, the name of the tin to snap to must first be given. Then, snapping to that tin is controlled by the state of the tin snap tick box.

If the tick box is **on** (a tick), snapping to the tin is used. If the tick box is **off**, no tin snaps are used.

The name of the tin to snap to is set by selecting the **Tin " "** item on the **Snaps** menu to bring up the **Snap Tin** panel.

Model

The user can restrict the snap to only strings from a specific model. The name of the model to restrict the snap to is set by selecting the **Model " "** item on the **Snaps** menu to bring up the **Snap Model** panel.

Name

The user can restrict the snap to only strings of a specific name. The name of the strings to restrict the snap to is set by selecting the **Name " "** item on the **Snaps** menu to bring up the **Snap Name** panel.

When **12d Model** creates a new project, **line** and **point** snap are set to **on** and all other snaps set off.

Point Snap Tolerance

Point snap tolerance is not a tick box but a menu item. The point snap tolerance value is the distance to be used for considering vertices over anything else when point snap is on.

The point snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a point snap tolerance of say 10 means that the point snap distance about a vertex is one hundredth of the screen width.

The *point snap tolerance* is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current point snap tolerance value is displayed as **Pt tolerance** on the **Snap** menu.

The *Point snap tolerance* is modified by selecting the **Pt tolerance** item on the **Snaps** menu to bring up the **Point Snap Tolerance** panel.

Snap Tolerance

Snap tolerance is not a tick box but a menu item. The snap tolerance value is the distance to be used for considering data when snaps are on.

The snap tolerance distance is given in screen units (pixels). There are one thousand pixels per screen width, hence a snap tolerance of say 50 means that the snap distance about a point, line *etc.* is one twentieth of the screen width.

Snap tolerance is given in terms of screen units rather than world units because it is a distance on the screen, independent of any co-ordinate system being used in a view.

The current snap tolerance value is displayed as **Tolerance** on the **Snap** menu.

The *Snap tolerance* is modified by selecting the **Tolerance** item on the **Snap** menu to bring up the **Snap Tolerance** panel.

Height

If *height* is set, then when creating and/or editing strings, the z-value for a vertex is displayed.

Info

If *info* is set, then the information panel comes up whenever a string is picked.

Data Tip

If *data tip* is set, then data tipping for strings occurs.

Fast Snap

If *fast snap* is set, then fast picking is allowed.

M Snap

If *M snap* is set, when selecting a string, all the strings satisfying the search criteria are listed in a grid (the selection grid - **Many** strings listed, not just the one). If not set, the selection grid is not displayed.

NOTE: The **Text** snap (**X**) and **Segment** snap (**S**) are currently under development.

Summarising, the available snap modes are

- s point - diamond cursor
- s line - square
- s grid - circle
- s cursor - circle
- s tin - squiggles under a line
- s name
- s model

On starting up a new project, point and line snap are on, all others off, point tolerance is set to 10 and tolerance is set to 50.

When an existing project is saved, the snap settings, point snap tolerance, snap tolerance and positions of any **snaps** menus on the screen, are also saved.

Please continue to the next section [Text Grips](#) (or back to [Snaps](#)).

Text Grips

When text is selected for editing, **grips** are displayed for quick editing. Vertex text has four grips and segment text three grips.

Note - see the section [Text Definitions](#) for the definitions of vertex and segment text, text justification point, text height, text angle, text offset and text raise.

Go to the next section [Vertex Text](#) or back to [Text Grips](#).

Vertex Text

When vertex text is selected for editing, four **grips** are displayed for

- (a) modifying the text height (diamond)
- (b) rotating the text around the text justification point (circle)
- (c) moving the text justification point (square)
- (d) moving the string vertex (X)

There are two modes for the grips:

The grips for modifying text height (diamond) and rotating the text (circle) are joined to the justification point to form a right angle (J mode).

Screen Message Area

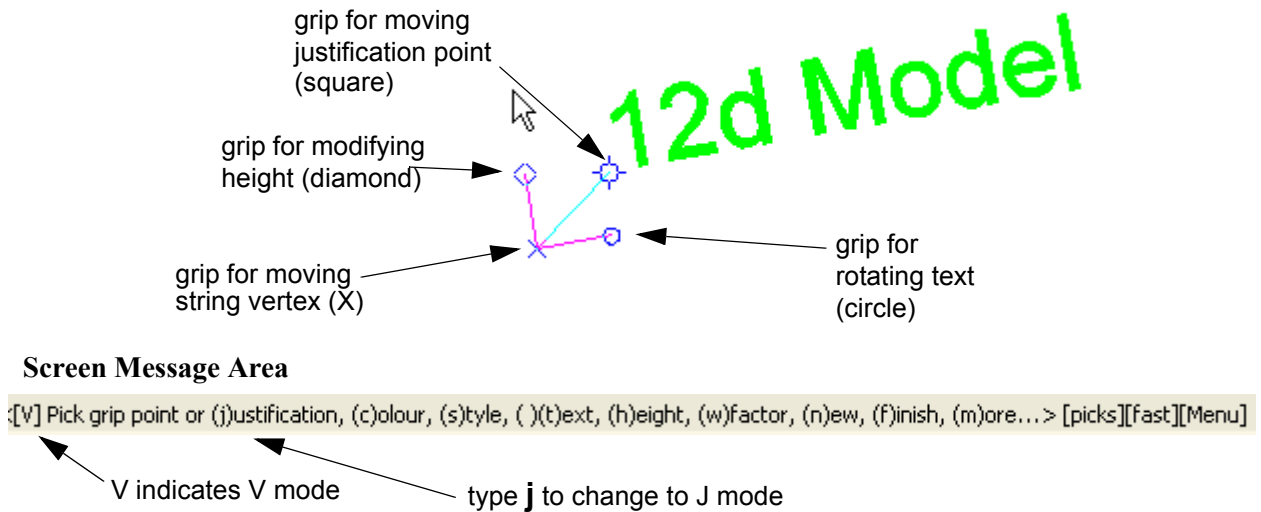

<[J] Pick grip point or (v)ertex, (c)olour, (s)tyle, () (t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]

J indicates J mode type **v** to change to V mode

Grips on the Justification Point for Vertex Text - J Mode

OR

The grips for modifying text height (diamond) and rotating the text (circle) are joined to the text vertex to form a right angle (V mode).

Grips on the Vertex for Vertex Text - V Mode

The main difference between the J and the M modes is that in J mode, the rotation is about the text justification point, and in V mode the rotation is about the text vertex.

The appropriate grip is then selected for quick editing.

Go to the next section [Segment Text](#) or back to [Text Grips](#).

Segment Text

When segment text is selected for editing, three ***grips*** are displayed for

- (a) modifying the text height (diamond)
- (b) rotating the text around the text justification point (circle)
- (c) moving the text justification point (square)

For segment text, the grips for modifying text height (diamond) and rotating the text (circle) are joined to the justification point to form a right angle (S mode).

Grips on the Justification Point for Segment Text - S Mode

The appropriate grip is then selected for quick editing.

Note - there is no equivalent of the Vertex grip for segment text because the segment text is locked to the centre point of the segment rather than a vertex.

See the section [Text Definitions](#) for the definitions of vertex and segment text, text justification point, text height, text angle, text offset and text raise.

Height or Size Grip (diamond):

J Mode

In J mode: if the **Height grip** is selected, a circle is drawn from the text justification point to the Height grip and this represents the height of the text. As the cursor is moved, the distance from the cursor to the text justification point is taken as the circle radius and the text height.

Modifying Height - J Mode

V Mode

In V mode: if the **Height grip** is selected, a circle is drawn from the text vertex to the Height grip and this represents the height of the text. As the cursor is moved, the distance from the cursor to the text vertex is taken as the circle radius and the text height.

Modifying Height - V Mode

S Mode

In S mode: if the **Height grip** is selected, a circle is drawn from the text justification point to the Height grip and this represents the height of the text. As the cursor is moved, the distance from

the cursor to the text justification point is taken as the circle radius and the text height.

In J, V and S mode, the text height is dynamically displayed as part of the *Enter height* prompt in the screen message area

The text height is set when the cursor position is accepted.

When the text is being dynamically sized, pressing the **d** key brings up the **Enter distance** typed input box with the current **dynamic** text height in it.

An **exact** text height can be typed into the **Enter distance Typed Input** box and accepted by pressing <Enter>.

If instead of typing **d**, the <space bar> is pressed, the **Enter distance Typed Input** box is displayed with a space in it. The required height can be typed into the box and accepted by pressing <Enter>.

If instead of typing **d**, any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact height required), the **Enter distance Typed Input** box is displayed with the typed characters in it. The height is accepted by pressing <Enter>.

For more information on typing **t**, **p**, **c** or **n**, go to the section [Typing t, p, c or n](#)

To return to dynamic sizing without entering a distance into the **Enter distance** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

Rotate Grip (circle):

J Mode

In J mode: if the **Rotate grip** is selected, a line from the text justification point to the cursor position is taken as the text angle. As the cursor is moved, the angle from the cursor to the text justification point defines the text angle.

Modifying Angle - J Mode

V Mode

In V mode: if the **Rotate grip** is selected, a line from the text vertex to the cursor position is taken as the text angle. As the cursor is moved, the angle from the cursor to the text vertex defines the text angle.

Modifying Angle - V Mode

S Mode

In S mode: if the **Rotate grip** is selected, a line from the text justification point to the cursor position is taken as the text angle. As the cursor is moved, the angle from the cursor to the text justification point defines the text angle.

Modifying Angle - S Mode

In J, V and S mode, the angle of the text is displayed as part of the *Enter angle* prompt in the screen message area.

The text angle is set when the cursor position is accepted.

When the angle is being dynamically changed, pressing the **d** key brings up the **Enter angle** typed input box with the current **dynamic** text angle in it.

An **exact** text angle can be typed into the **Enter angle Typed Input** box and accepted by pressing the <enter key>.

If instead of typing **d**, the <space bar> is pressed (shown as **()**), the **Enter angle Typed Input** box is displayed with a space in it. The required angle can be typed into the box and accepted by pressing the <enter key>.

If instead of typing **d**, any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact angle required), the **Enter angle Typed Input** box is displayed with the typed characters in it. The angle is accepted by pressing the <enter key>.

For more information on typing **t**, **p**, **c** or **n**, go to the section [Typing t, p, c or n](#)

To return to dynamic angling without entering an angle into the **Enter angle** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic angling will resume.

Justification Grip (square):

In J, V and S Mode: if the **Justification grip** is selected, the cursor position is taken as the text justification point. As the cursor is moved, the text justification point moves with it.

Moving Text Justification Point - J Mode

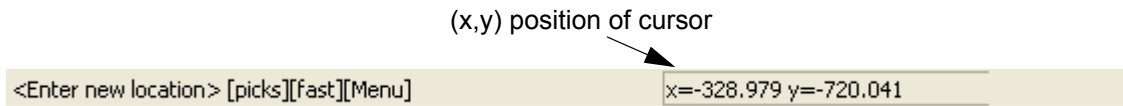

Moving Text Justification Point - V Mode

Moving Text Justification Point - S Mode

In J, V and S mode, the (x,y) position of the text is displayed in the screen message area.

The text justification point is set when the cursor position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x* and *y* coordinates are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Go to the next section [Vertex Grip \(X\): - for Vertex Text Only](#) or back to [Text Grips](#).

Vertex Grip (X): - for Vertex Text Only

In J and V mode: if the **Vertex grip** is selected, the cursor position is taken as the text vertex, As the cursor is moved, the text vertex moves with it.

Note - the Vertex can not be selected when it is in **locked** mode.

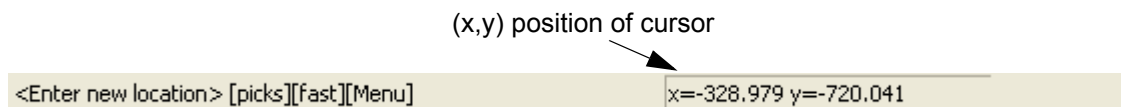

Moving Text Vertex - J Mode

Moving Text Vertex - V Mode

In both J and V mode, the (x,y) position of the text is displayed in the screen message area.

The text vertex is set when the cursor position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x* and *y* coordinates are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Go to the next section [Typing t, p, c or n](#) or back to [Text Grips](#).

Typing t, p, c or n

After selecting the **Height** grip (diamond) or the **Rotate** grip (circle), the screen message area shows that there are the typed option **t, p, c, n, ()** and **d** available.

Modifying Height

Modifying Angle

Type **t**: snap cursor tangential to a selected string - go to [Snap Tangential - Typing t](#)

Type **p**: snap cursor perpendicular to a selected string - go to [Snap Perpendicular - Typing p](#)

Type **c**: return to cursor movement - go to [Cursor Mode - Typing c](#)

Type **n**: return to cursor movement - go to [Negative Angle - Typing n](#)

Type **<space bar>**: bring up typed input box for value - go to [Hitting Space Bar](#)

Type **d**: bring up dynamic value - go to [Display Dynamic Value - Typing d](#)

Snap Tangential - Typing t

Snap Tangential - Rotation Grip (Circle)

After selecting the **Rotation** grip (circle), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) tangential to the selected string.

Rotation Tangential Snap - J Mode

Rotation Tangential Snap - V Mode

Snap Tangential - Height Grip (Square)

After selecting the **Height** grip (diamond), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) tangential to the selected string.

Height Tangential Snap - J Mode

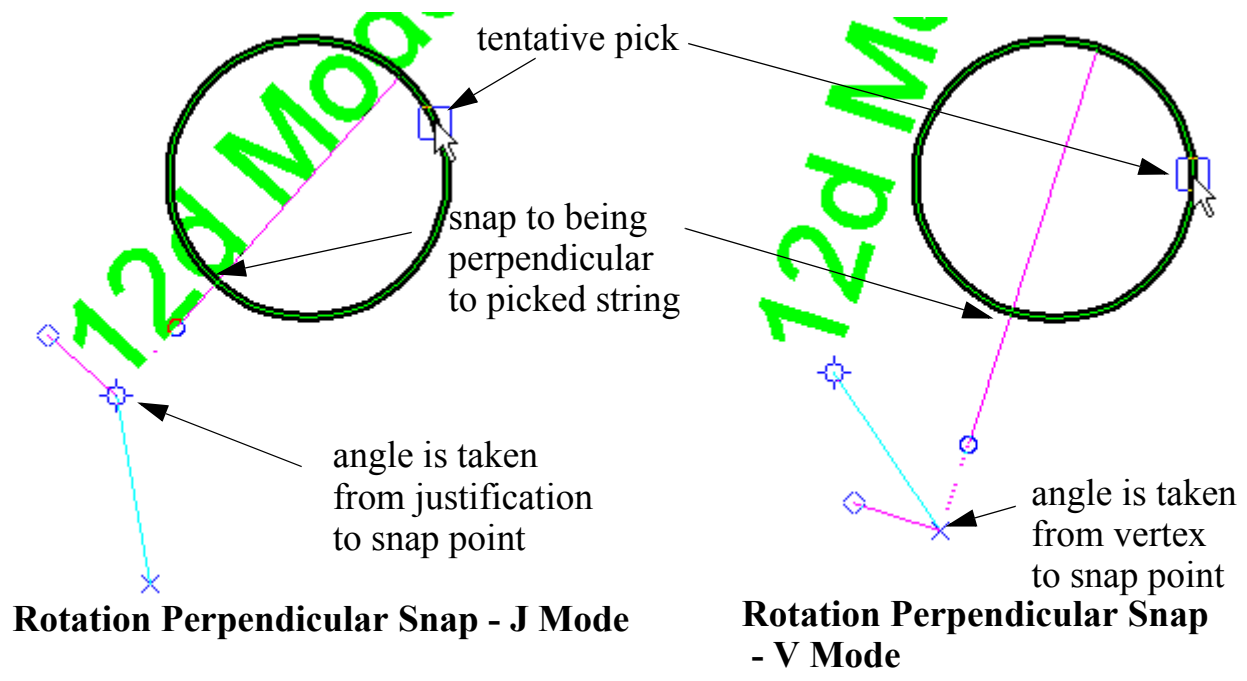

Before the accept button is selected, **p** can be typed to toggle to perpendicular snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Snap Perpendicular - Typing p

Snap Perpendicular - Rotation grip (Circle)

After selecting the **Rotation** grip (circle), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) perpendicular to the selected string.

Snap Perpendicular - Height grip (Square)

After selecting the **Height** grip (diamond), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) perpendicular to the selected string.

Before the accept button is selected, **t** can be typed to toggle to tangential snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Cursor Mode - Typing c

If in either Tangential or Perpendicular mode, typing **c** return to cursor mode.n

Negative Angle - Typing n

Adds 180 degrees to the current angle.

Hitting Space Bar

Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) Typed input box with no value in it.

Display Dynamic Value - Typing d

Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) Typed input box with the *dynamic* value in it.

Please continue to the next section [Symbol Grips](#).

Symbol Grips

When a symbol is selected for editing, four ***grips*** are displayed for quick editing.

Note - see the section [Symbol Definitions](#) for the definitions of symbol justification point, symbol angle, x offset and y offset.

When a symbol is selected for editing, four ***grips*** are displayed for

- (a) modifying the symbol height (diamond)
- (b) rotating the symbol around the symbol justification point (circle)
- (c) moving the symbol justification point (square)
- (d) moving the string vertex (X)

There are two modes for the grips:

The grips for modifying symbol height (diamond) and rotating the symbol (circle) are joined to the justification point to form a right angle (J mode).

Screen Message Area

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][Fast][Menu]

Modifying Height - J Mode

V Mode

In V mode: if the *Height* grip is selected, a circle is drawn from the symbol vertex to the Height grip and this represents the height of the symbol. As the cursor is moved, the distance from the cursor to the symbol vertex is taken as the circle radius and the symbol height.

Modifying Height - V Mode

In J and V mode, the symbol height is dynamically displayed as part of the *Enter height* prompt in the screen message area

Screen Message Area

dynamic height value

<Enter height> (t)angental (p)erpendicular (c)ursor (n)egative (i)typed (d)62.312 [picks][fast][Menu]

The symbol height is set when the cursor position is accepted.

When the symbol is being dynamically sized, pressing the **d** key brings up the **Enter distance** typed input box with the current **dynamic** symbol height in it.

An **exact** symbol height can be typed into the **Enter distance Typed Input** box and accepted by pressing the <enter key>.

If instead of typing **d**, the <space bar> is pressed, the **Enter distance Typed Input** box is displayed with a space in it. The required height can be typed into the box and accepted by pressing the <enter key>.

If instead of typing **d**, any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact height required), the **Enter distance Typed Input** box is displayed with the typed characters in it. The height is accepted by pressing the <enter key>.

For more information on typing **t**, **p**, **c** or **n**, go to the section [Typing t, p, c or n](#)

To return to dynamic sizing without entering a distance into the **Enter distance** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

Rotate Grip (circle):

J Mode

In J mode: if the **Rotate grip** is selected, a line from the symbol justification point to the cursor position is taken as the symbol angle. As the cursor is moved, the angle from the cursor to the symbol justification point defines the symbol angle.

Modifying Angle - J Mode

V Mode

In V mode: if the **Rotate grip** is selected, a line from the symbol vertex to the cursor position is taken as the symbol angle. As the cursor is moved, the angle from the cursor to the symbol vertex defines the symbol angle.

Modifying Angle - V Mode

In J and V mode, the angle of the symbol is displayed as part of the *Enter angle* prompt in the screen message area.

The symbol angle is set when the cursor position is accepted.

When the angle is being dynamically changed, pressing the **d** key brings up the **Enter angle** typed input box with the current **dynamic** symbol angle in it.

An **exact** symbol angle can be typed into the **Enter angle Typed Input** box and accepted by pressing the <enter key>.

If instead of typing **d**, the <space bar> is pressed (shown as **()**), the **Enter angle Typed Input** box is displayed with a space in it. The required angle can be typed into the box and accepted by pressing the <enter key>.

If instead of typing **d**, any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact angle required), the **Enter angle Typed Input** box is displayed with the typed characters in it. The angle is accepted by pressing the <enter key>.

For more information on typing **t**, **p**, **c** or **n**, go to the section [Typing t, p, c or n](#)

To return to dynamic angling without entering an angle into the **Enter angle** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic angling will resume.

Justification Grip (square):

In J and V Mode: if the **Justification grip** is selected, the cursor position is taken as the symbol justification point. As the cursor is moved, the symbol justification point moves with it.

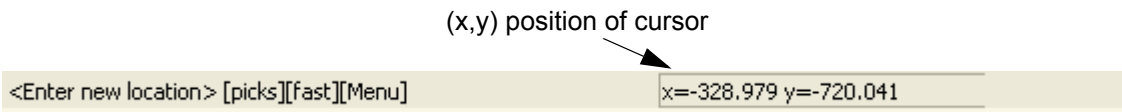

Moving Symbol Justification Point - J Mode

Moving Symbol Justification Point - V Mode

In J and V mode, the (x,y) position of the symbol is displayed in the screen message area.

The symbol justification point is set when the cursor position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Vertex Grip (X):

In J and V mode: if the **Vertex grip** is selected, the cursor position is taken as the symbol vertex. As the cursor is moved, the symbol vertex moves with it.

Note - the Vertex can **not** be selected when it is in **locked** mode.

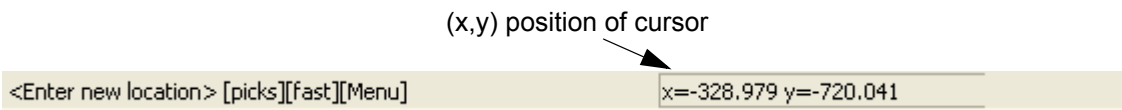

Moving Symbol Vertex - J Mode

Moving Symbol Vertex - V Mode

In both J and V mode, the (x,y) position of the symbol is displayed in the screen message area.

The symbol vertex is set when the cursor position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Typing t, p, c or n

After selecting the **Height** grip (diamond) or the **Rotate** grip (circle), the screen message area shows that there are the typed option **t, p, c, n, ()** and **d** available.

Modifying Angle

Screen Message Area

<Enter angle> (t)angental (p)erpendicular (c)ursor (n)egative ()typed (d) 38° 4' 9" [picks][fast][Menu]

Type **t**: snap cursor tangential to a selected string - go to [Snap Tangential - Typing t](#)

Type **p**: snap cursor perpendicular to a selected string - go to [Snap Perpendicular - Typing p](#)

Type **C**: return to cursor movement - go to [Cursor Mode - Typing c](#)

Type **n**: return to cursor movement - go to [Negative Angle - Typing n](#)

Type **<space bar>**: bring up typed input box for value - go to [Hitting Space Bar](#)

Type **d**: bring up dynamic value - go to [Display Dynamic Value - Typing d](#)

Snap Tangential - Typing t

Snap Tangential - Rotation Grip (Circle)

After selecting the **Rotation** grip (circle), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point in J mode (or to the vertex in V-mode) **tangential** to the selected string.

Rotation Tangential Snap - J Mode

Rotation Tangential Snap - V Mode

Snap Tangential - Height Grip (Square)

After selecting the **Height** grip (diamond), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point (J mode)/vertex (V-mode) tangential to the selected string.

Height Tangential Snap - J Mode

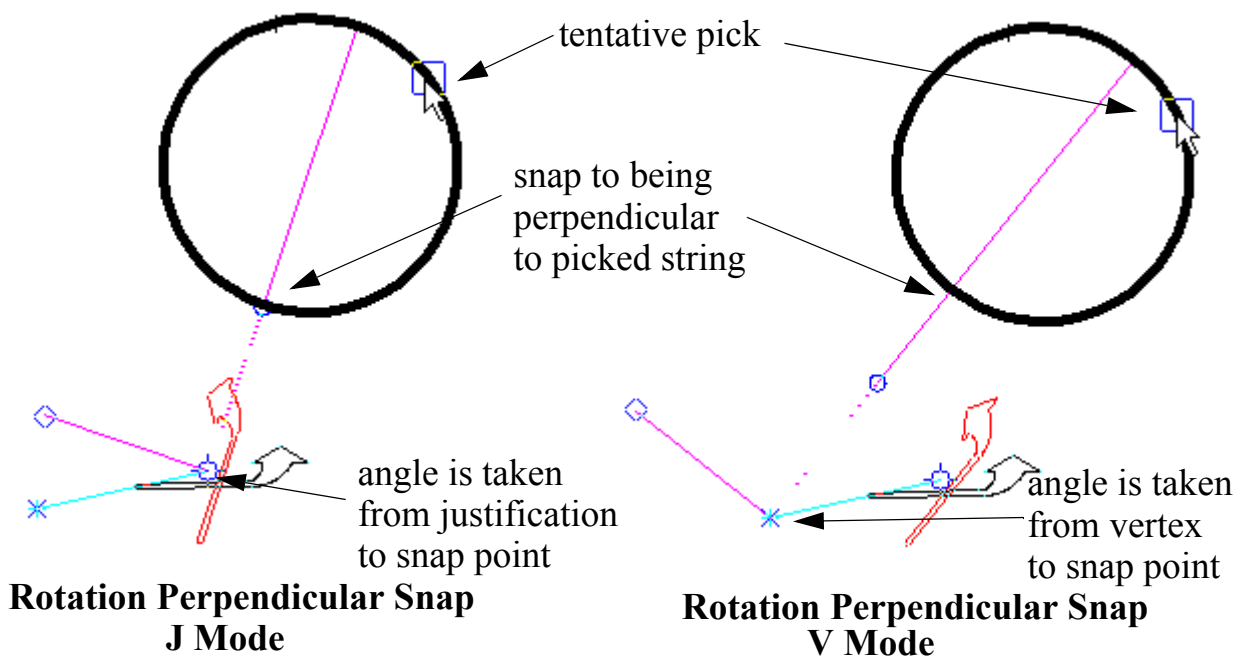

Before the accept button is selected, **p** can be typed to toggle to perpendicular snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Snap Perpendicular - Typing p

Snap Perpendicular - Rotation grip (Circle)

After selecting the **Rotation** grip (circle), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point in J mode (or the vertex in V-mode) perpendicular to the selected string.

Snap Perpendicular - Height Grip (Square)

After selecting the **Height** grip (diamond), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point in J mode (or vertex in V-mode) perpendicular to the selected string.

Before the accept button is selected, **t** can be typed to toggle to tangential snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Cursor Mode - Typing c

If in either Tangential or Perpendicular mode, typing **C** return to cursor mode.

Negative Angle - Typing n

Adds 180 degrees to the current angle.

Hitting Space Bar

Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) **Typed input** box with no value in it.

Display Dynamic Value - Typing d

Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) **Typed input** box with the *dynamic* value in it.

Please continue to the next section [Expressions in Panel Fields](#).

Expressions in Panel Fields

Non Bearing/Angle Panel Fields

Whenever a **real value** such as height or width is required in a box (other than an angle or bearing panel field), mathematical expressions can be typed in and then evaluated by **12d Model** when <enter> is pressed. See the section [Expressions in Bearing, Angle Panel Fields](#) for what is allowed in angle/bearing panel fields.

Expressions can be made up from the operators

*	multiply
/	divide
+	addition
-	subtraction

where * and / take precedence over + and -.

Nested brackets "(" and ")" are supported to any level.

The following functions are also supported

sin
cos
tan
sqrt
square
null

Note that for the trigonometric functions, the angle is in **degrees, minutes and seconds** (see section on Angles and Bearings) and is either a cartesian angle or a bearing depending on the setting of the Angle mode in the *System Settings* tab of *Utilities=>Defaults*.

For example, cos(90) is 0 for a Cartesian angle of 90 or 1 for a bearing of 90 degrees.

Examples of expressions are:

10.0 + 19.7
sin(90.30)
(10 + sin(45))/3.0

After the expression has been evaluated, it is still possible to bring back the last expressions, make modifications to the expression and then re-evaluate it.

To get the last expression, simply click on the **[+]** button at the end of the field to bring up the **measures** menu and select **Last expression** from it. The last expression is then returned to the panel field ready for modifications.

Warning

Only limited expressions are supported for bearing/angle boxes. See the section [Expressions in Bearing, Angle Panel Fields](#) for what is allowed in the angle/bearing panel fields.

Please continue to the next section [Special Panel Fields](#).

[Same As for Panel Fields](#)

Pre*Postfix Panel Fields

In many options in **12d Model**, text needs to be added to the beginning (prefix) of a name and also added to the end (postfix) of a name. For example, the

Instead of needing a panel field for the prefixed text and another for the postfixed text, **12d Model** often uses a special shorthand notation called pre*postfix to combine the two into one text field.

When the word **pre*postfix** is used on a panel field, it has the special meaning that for any text type into the panel field, any text before the * is considered to be text for prefixing, and any text after the * is taken to be text for postfixing. Note that spaces are significant.

Hence "E * m" means that "E " is prefix text and " m" is postfix text.

If prefix text only is required, just give the text since the * is not required at the end of the text. For example "E " or "E *" will prefix the text "E ".

If postfix text only is required then the text must be preceded by a *. For example "*" m" will postfix the text " m".

For example, if a panel field had

Pre*postfix for models

new * data

then "new " would be added to the beginning of the model names and " data" would be added to the end of the model names.

Click on [Data Source](#) to go to the next section.

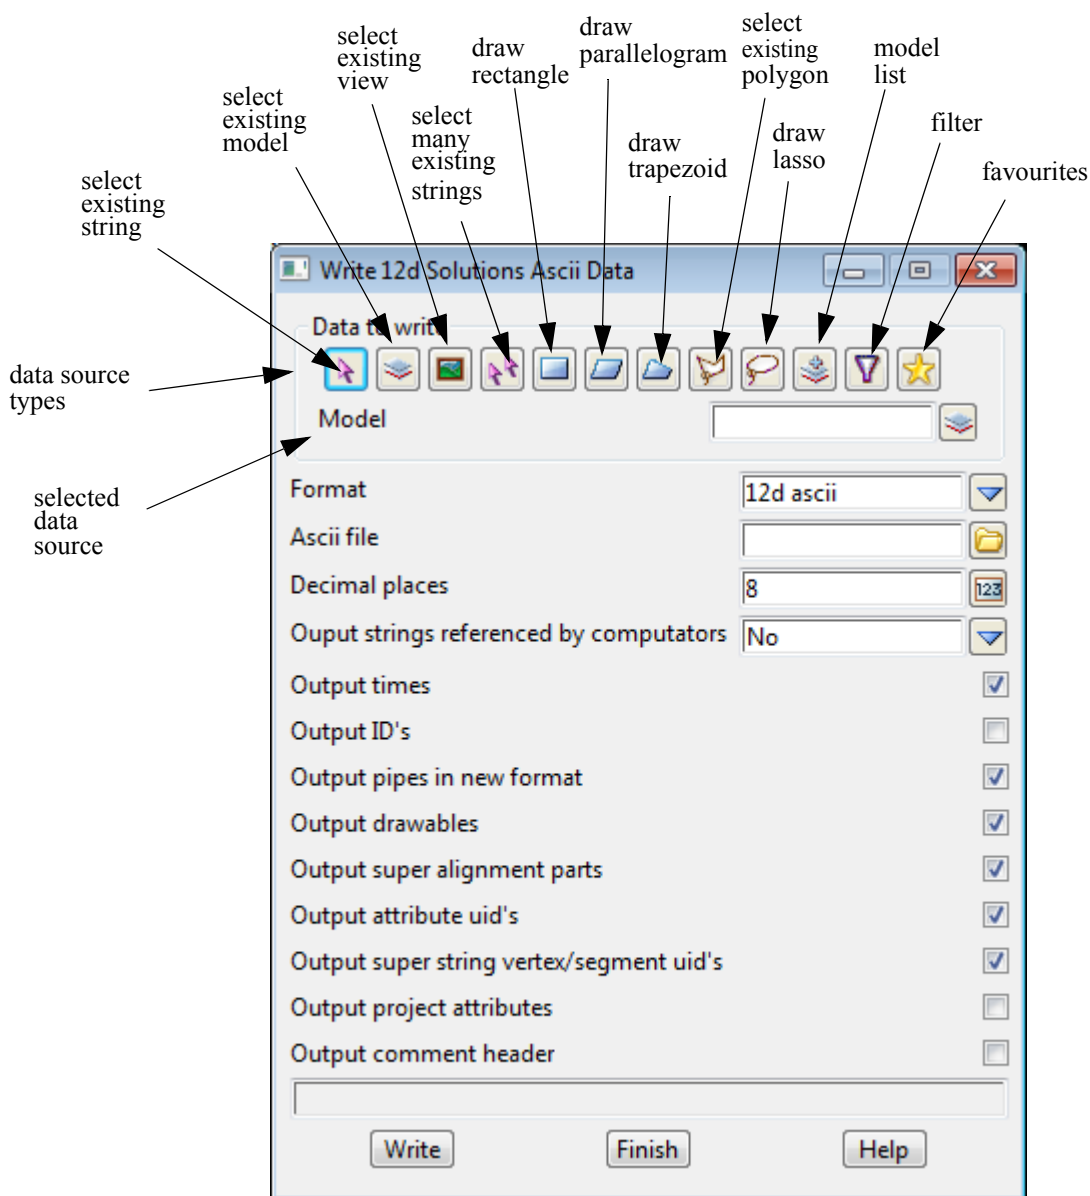

Data Source

Many options contain the panel field **Data source** which may have one or more of the selection choices:

string, model, view, multi-pick strings, rectangle, parallelogram, polygon, lasso, model list, filter, favourites

Depending on the Data Source choice, the panel fields after the Data Source icons will be changed to suite the Data Source choice.

For example, for the choice **Model**, the next field will be Model.

 See [Favourites](#)

Select Existing String

After clicking on the **Select String** icon, a String Select is started and the Select String panel field called **String** is placed under the Data Source icons.

When a string is selected, its model and name of the string is displayed in the String Select information field.

To selected a different string, the Select icon for the String Select panel field (to the right of the string name field) must be used as the Data Source Select String icon is now inactive.

Continue to [Select Existing Model](#) or return to [Data Source](#)

Select Existing Model

After clicking on the **Select Model** icon, a Model panel field is placed under the Data Source icons.

A model name can be typed into the panel field or a model selected from the Model icon from the Model panel field (to the right of the model name field).

To select a different model, the Model icon for the Model panel field must be used as the Data Source Select Model icon is now inactive.

Continue to [Select Existing View](#) or return to [Data Source](#)

Select Existing View

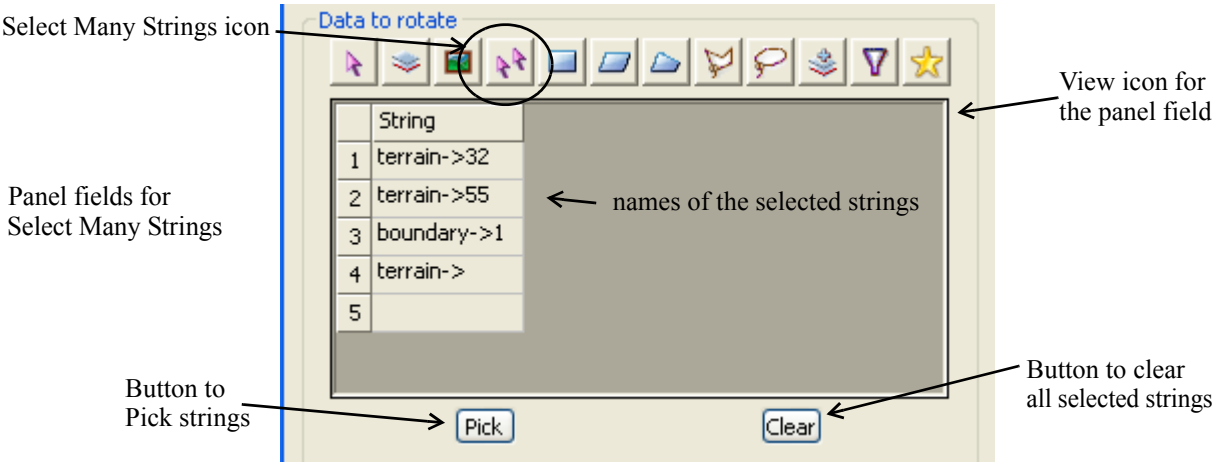

After clicking on the **Select View** icon, a View panel field is placed under the Data Source icons.

A view name can be typed into the panel field or a view selected from the View icon from the View panel field (to the right of the view name field).

To select a different view, the View icon for the View panel field must be used as the Data Source Select View icon is now inactive.

Continue to [Select Many Strings](#) or return to [Data Source](#)

Select Many Strings

After clicking on the **Select Many Strings** icon, the panel fields for the Select Many Strings are placed under the Data Source icons.

The Select Many Strings panel fields consists of a grid to display the model and string name of selected strings, a Pick button to start selecting strings and a Clear button to deselect the currently selected strings.

To begin selecting strings, click on the **Pick** button. Strings are then selected and accepted and this continues until RB is pushed and **Cancel** selected from the **Pick Ops** menu. As each string is selected it is highlighted and the selected strings stay highlighted after they are selected.

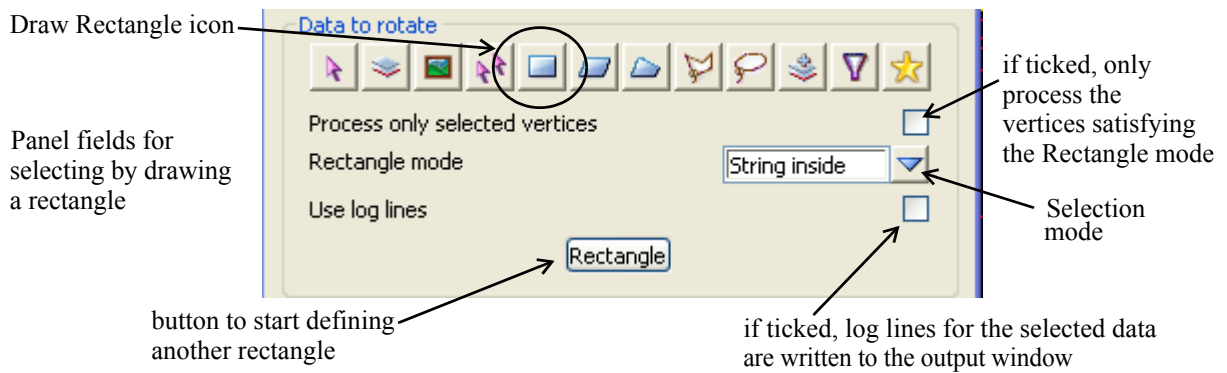

To pick **more** strings, simply click on **Pick** and start selecting again. The new strings are added to the bottom of the String name grid and all the new strings also remain highlighted.

To clear all the selected string, simply click on **Clear**.

The Data Source Select Many Strings icon is made inactive after the option is first selected.

Continue to [Select Using a User Drawn Rectangle](#) or return to [Data Source](#)

Select Using a User Drawn Rectangle

After clicking on the **Draw Rectangle** icon, the panels fields for selecting by drawing a rectangle are placed under the Data Source icons and the rectangle drawing process is automatically started.

First the position of one corner of the rectangle is selected by clicking LB on a plan view and then a rectangle parallel to the x and y axis is drawn to the current cursor position. The rectangle is completed by clicking LB at a second position.

Strings are selected by using the rectangle and the **Rectangle mode** which is:

if **Process only selected vertices** is ticked on, **Rectangle mode** choices are:

Vertices inside or Vertices outside

if **Process only selected vertices** is not ticked, **Rectangle mode** choices are:

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

Any strings/vertices satisfying the **Rectangle mode** will be highlighted when the rectangle is completed.

If **Process only selected vertices** or **Rectangle mode** is modified, the new strings/vertices satisfying the new parameters are highlighted.

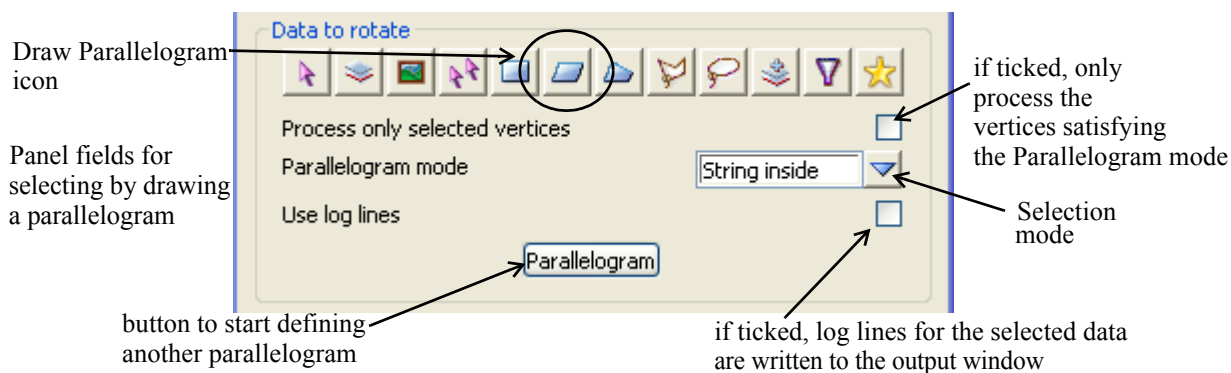

If **Use log lines** is ticked, log lines for the selected data are written to the output window.

To draw a new rectangle, click on the **Rectangle** button and draw a new rectangle.

The Data Source Draw Rectangle icon is made inactive after the option is first selected.

Continue to [Select Using a User Drawn Parallelogram](#) or return to [Data Source](#)

Select Using a User Drawn Parallelogram

After clicking on the **Draw Parallelogram** icon, the panel's fields for selecting by drawing a parallelogram are placed under the Data Source icons and the parallelogram drawing process is automatically started.

First two positions defining one side of the parallelogram by clicking LB at each position. A parallelogram is then drawn to the current cursor position. The parallelogram is completed by clicking LB at a third position.

Strings are selected by using the parallelogram and the **Parallelogram mode** which is:

if **Process only selected vertices** is ticked on, **Parallelogram mode** choices are:

Vertices inside or Vertices outside

if **Process only selected vertices** is not ticked, **Parallelogram mode** choices are:

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

Any strings/vertices satisfying the **Parallelogram mode** will be highlighted when the parallelogram is completed.

If **Process only selected vertices** or **Parallelogram mode** is modified, the new strings/vertices satisfying the new parameters are highlighted.

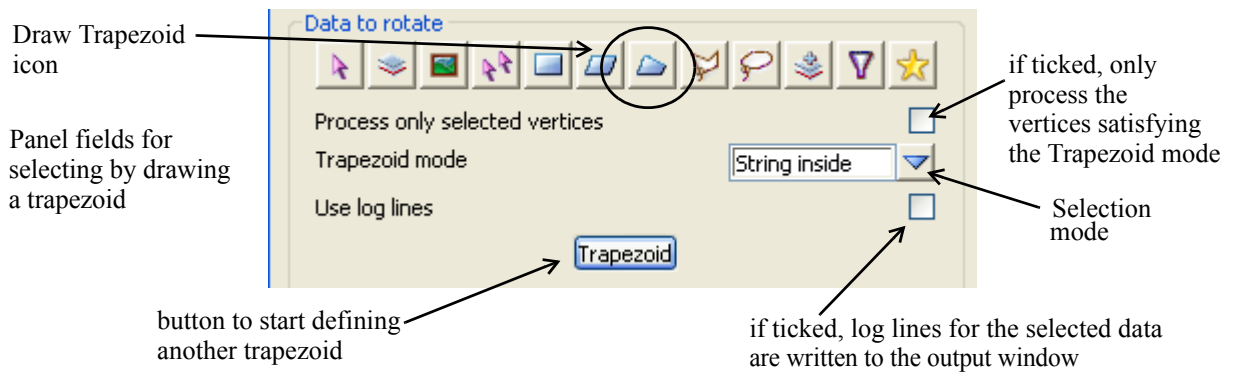

If **Use log lines** is ticked, log lines for the selected data are written to the output window.

To draw a new parallelogram, click on the **Parallelogram** button and draw a new parallelogram.

The Data Source Draw Parallelogram icon is made inactive after the option is first selected.

Continue to [Select Using a User Drawn Trapezoid](#) or return to [Data Source](#)

Select Using a User Drawn Trapezoid

After clicking on the **Draw Trapezoid** icon, the panel fields for selecting by drawing a trapezoid are placed under the Data Source icons and the trapezoid drawing process is automatically started.

Four positions representing the four vertices of the trapezoid by clicking LB at each of the positions. The trapezoid is completed after the fourth position is selected.

Strings are selected by using the trapezoid and the Trapezoid mode which is:

if **Process only selected vertices** is ticked on, **Trapezoid mode** choices are:

Vertices inside or Vertices outside

if **Process only selected vertices** is not ticked, **Trapezoid mode** choices are:

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

Any strings/vertices satisfying the **Trapezoid mode** will be highlighted when the trapezoid is completed.

If **Process only selected vertices** or **Trapezoid mode** is modified, the new strings/vertices satisfying the new parameters are highlighted.

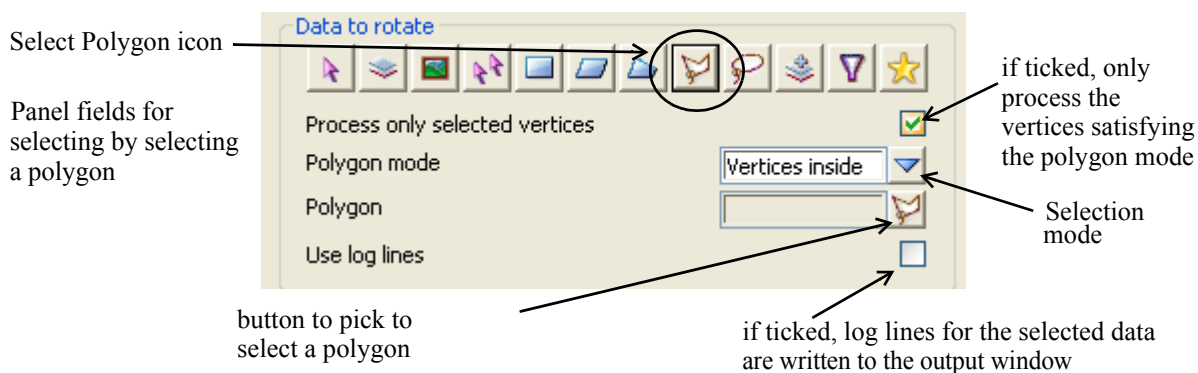

If **Use log lines** is ticked, log lines for the selected data are written to the output window.

To draw a new trapezoid, click on the **Trapezoid** button and draw a new trapezoid.

The Data Source Draw Trapezoid icon is made inactive after the option is first selected.

Continue to [Select an Existing Polygon](#) or return to [Data Source](#)

Select an Existing Polygon

After clicking on the **Select Polygon** icon, the panel fields for selecting by selecting a polygon are placed under the Data Source icons.

A polygon is then selected by clicking on the Select polygon button on the right of the Polygon panel field, and then selecting a polygon.

Note: a polygon is just a closed string. If an open string is selected then a closed string is automatically created by joining the first and the last vertices of the string.

if **Process only selected vertices** is ticked on, **Polygon mode** choices are:

Vertices inside or Vertices outside

if **Process only selected vertices** is not ticked, **Polygon mode** choices are:

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

Any strings/vertices satisfying the **Polygon mode** will be highlighted when the polygon is selected.

If **Process only selected vertices** or **Polygon mode** is modified, the new strings/vertices satisfying the new parameters are highlighted.

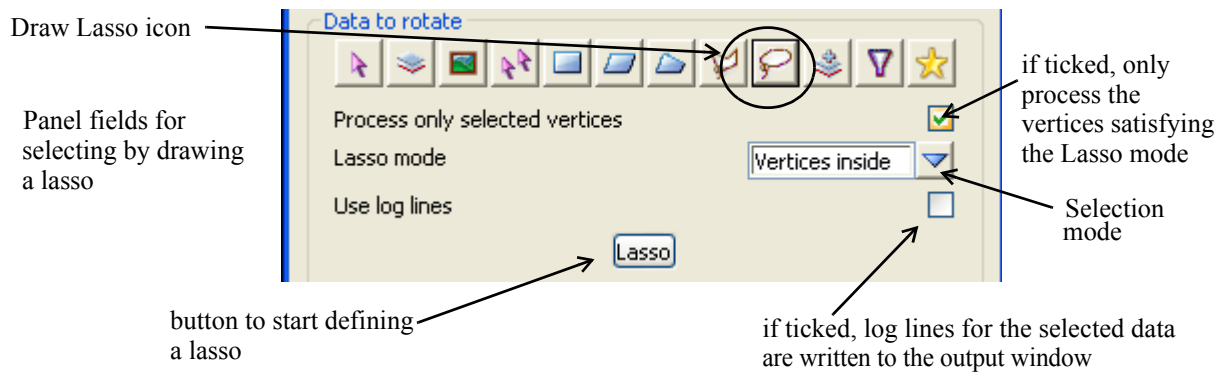

If **Use log lines** is ticked, log lines for the selected data are written to the output window.

To select a new polygon, click on the Select polygon button on the right of the Polygon panel field and select a new polygon.

The Data Source Select Polygon icon is made inactive after the option is first selected.

Continue to [Select Using a User Drawn Lasso](#) or return to [Data Source](#)

Select Using a User Drawn Lasso

After clicking on the **Draw Lasso** icon, the panel fields for selecting by drawing a lasso are placed under the Data Source icons.

The lasso drawing process is started by clicking on the **Lasso** button.

A lasso is then defined by clicking down on the LB and whilst holding the LB down, moving the cursor around to define a freehand lasso. The lasso is completed by letting the LB up and then clicking and releasing MB.

Strings are selected by using the lasso and the Lasso mode which is:

if **Process only selected vertices** is ticked on, **Lasso mode** choices are:

Vertices inside or Vertices outside

if **Process only selected vertices** is not ticked, **Lasso mode** choices are:

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

Any strings/vertices satisfying the **Lasso mode** will be highlighted when the lasso is completed.

If **Process only selected vertices** or **Lasso mode** is modified, the new strings/vertices satisfying the new parameters are highlighted.

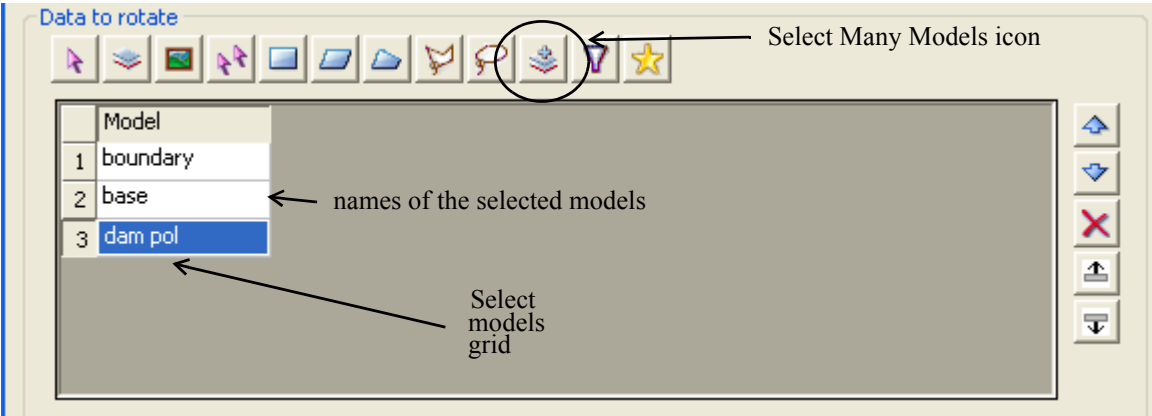

If **Use log lines** is ticked, log lines for the selected data are written to the output window.

To draw a new lasso, click on the **Lasso** button and draw a new lasso.

The Data Source Draw Lasso icon is made inactive after the option is first selected.

Continue to [Select many models](#) or return to [Data Source](#)

Select many models

After clicking on the **Select Many Models** icon, the Select Many Models grid is placed under the Data Source icons.

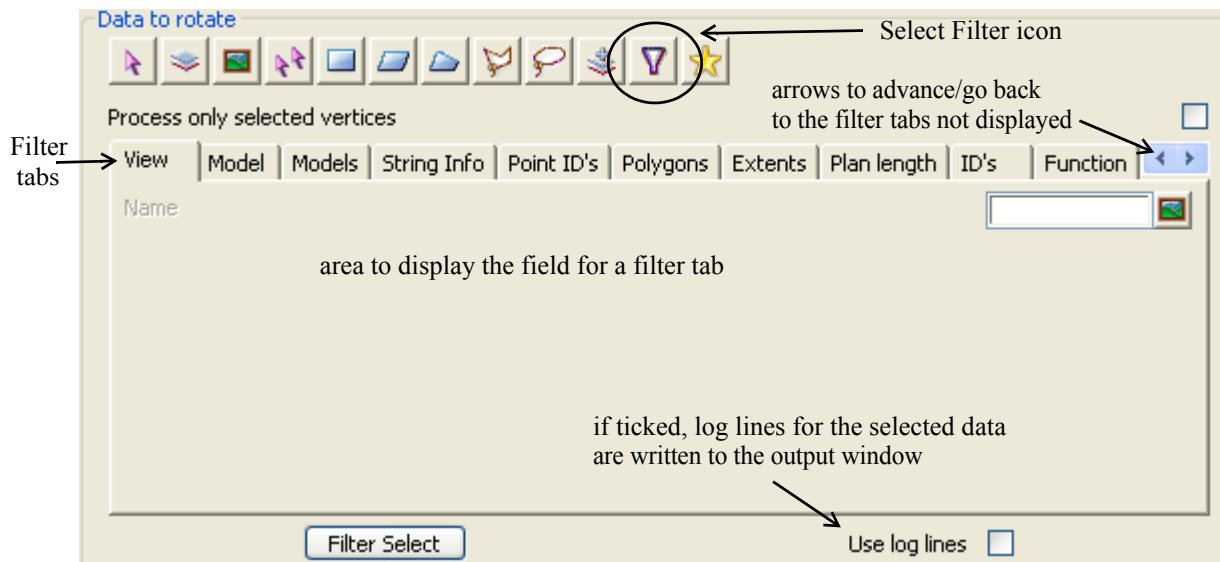

To begin selecting models, type the model name into the a field of the grid, or click RB in the grid and select from the Select Model pop-up (if a pop-up with Browse comes up, select Browse to bring up the Select Model pop-up).

Pressing the <Enter> key will add another blank row to the grid. Or clicking RB on the numbers on the left of the grid will bring up a menu to insert, delete, clear, cut, copy and paste rows. The buttons on the right hand side of the grid will also allow for rows to be moved up or down, delete rows and insert blank rows.

The Data Source Select Many Model icon is made inactive after the option is first selected.

Continue to [Select Filter](#) or return to [Data Source](#)

Select Filter

After clicking on the **Select Filter** icon, the **Process only selected vertices** tick box, the **Select Filter** tabs, **Filter Select** button and **User log lines** tick box are placed under the Data Source icons.

The option works by selecting the data that satisfies EVERY filter tab. That is, the data satisfies ALL the values in ALL the filter tabs.

So **all** the filter tabs work together to define the selected data.

For each filter tab required, the user clicks on the tab and fills in the required fields in the filter tabs that are to be satisfied by the selected strings.

When all the required filter tabs filled in, click on the **Filter Select** button to select the data that satisfies all the filter tabs.

If **Process only selected vertices** is ticked, only the vertices of the strings that satisfy the filters are used. are selected are

If **Use log lines** is ticked, log lines for the selected data are written to the output window.

The full set of filter tabs are:

See View Filter	Model Filter	String Info Filter

+

Point Id's Tab

Minimum - if non-blank, then if a string vertex has a Point Id, then this is the minimum value that it can be. The Point id can be text so the ascii sort sequence is used for comparisons.

Maximum - if non-blank, then if a string vertex has a Point Id, then this is the maximum value that it can be. The Point id can be text so the ascii sort sequence is used to comparisons.

If a field is left blank, then it is not used in the selection process.

Continue to [Polygons Filter](#) or return to [Select Filter](#) or [Data Source](#)

Polygons Filter

A polygon is selected/created to restrict the selection of strings by the choice given in the Polygon mode field.

Clicking LB on the Select Polygon icon on the right hand side of the Polygon field allows the user to select a polygon.

Clicking RB on the Select Polygon icon on the right hand side of the Polygon field brings up the Polygon Choice Box for the user to select a method of creating/selecting a polygon.

Clicking MB does nothing.

The strings selected are then restricted to those using the polygon and satisfying the **Polygon mode**:

String inside - strings totally inside the polygon

String outside - strings totally outside the polygon

String crossing - strings crossing the polygon

String inside/crossing - strings totally inside or crossing the polygon

String outside/crossing - strings totally outside or crossing the polygon

Polygon Modes

Clicking MB does nothing.

Name Masks Filter

Name Masks Tab

The Name Masks are used to restrict the strings by comparing the string name with the masks in the Name Mask column.

The order of the Names Masks is important.

The string name is first compared to the first Name Mask and if the string satisfies the Name Mask, then the string satisfies the Name Masks Tab and no more tests are done for that string.

If the string does not satisfy the first Name Mask, then the string is then compared to the second Name Mask.

This process is repeated until either the string matches a Name Mask and is selected, or the string matches no Name Mask and so is not selected.

The Name Masks can include the wild card character "*" which stands for zero or characters, and the wild character "?" which stands for just one character.

If **Not** is ticked, then strings are selected if they **don't satisfy** that Name Mask.

include all strings starting with "Fence"
include all strings starting with "Bound" then any two characters and then "y"
So only include the "Fence" strings and "Bound??y" strings

include all strings starting with "Prj A Road"
exclude all other strings starting with "Prj A"
include all other strings
So only include the "Prj A Road*" strings from "Prj A",
and all other strings not starting with "Prj A"

If a field is left blank, then it is not used in the selection process.

Continue to [Favourites](#) or return to [Select Filter](#) or [Data Source](#)

Favourites

After clicking on the **Select Favourites** icon, the **Folder *.sbf** pop-up is raised showing any local source box favourites files (*.sbf) and with options to look in Lib, User Lib, Customer Lib (if it exists) or to Browse for a sbf file.

If a sbf file is selected, then the values in it will be used to set up the Data Source Selection.

To write out an sbf file that saves all the parameters for the current Source Box Selection, click on [Create]. This will bring up the Source Box Favourites Create panel.

To create a sbf file, simply type the name for the sbf file into the Favourite file panel field and then click on **Create**.

In the documentation for a panel with a data source, only the panel for **Data Source type Model** will be shown.

Click on [Data Target](#) to go to the next section or return to [Data Source](#).

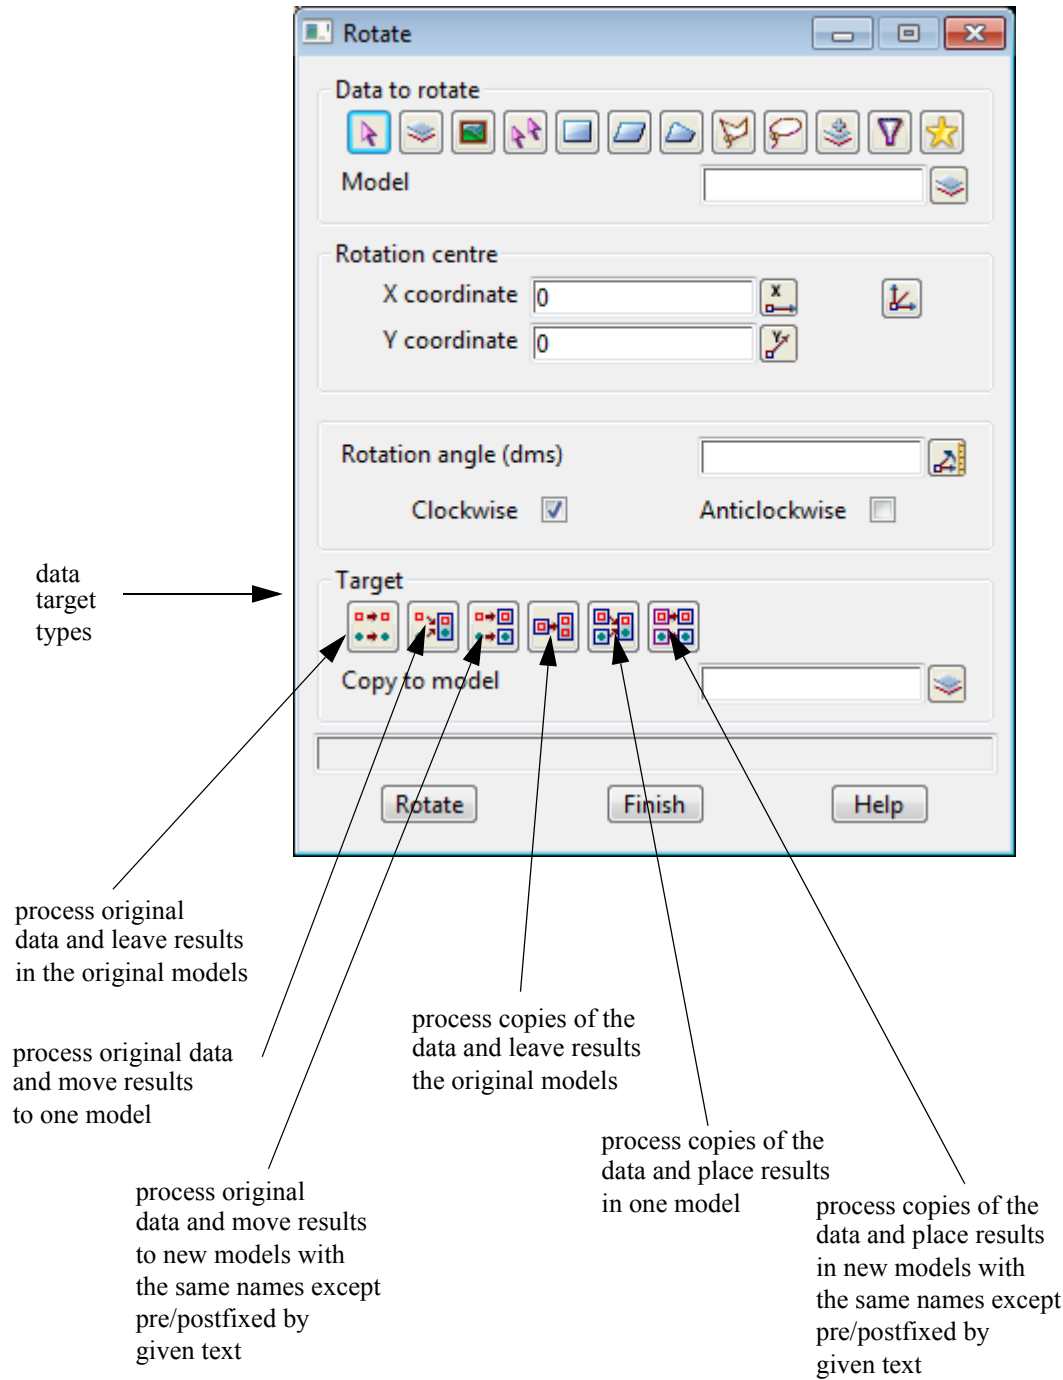

Data Target

Many options contain the panel field **Data target** which may have one or more of the selection choices:

move to original model(s)/replace	// process the original data and leave in models
move to one model	// move the processed data to one model
move to many models	// move processed data to models with the same // names as the original models except the model // names are pre/postfixed by given text.
copy to original model(s)/replace	// process copies of the data and leave in models
copy to one model	// process copies of the data and place in one model
copy to many models	// process copies of the data and place in models with // the same names as the original models except the // model names are pre/postfixed by given text.

Depending on the choice, the next panel field will be changed to suite the choice of target.

For example, for the choice **Copy to one model**, the next field will be Copy to model.

In the documentation for a panel with a data target, only the panel for **Data Target type Copy to Model** will be shown.

Click on [Pop-Up Lists and Menus](#) to go to the next section.

Pop-Up Lists and Menus

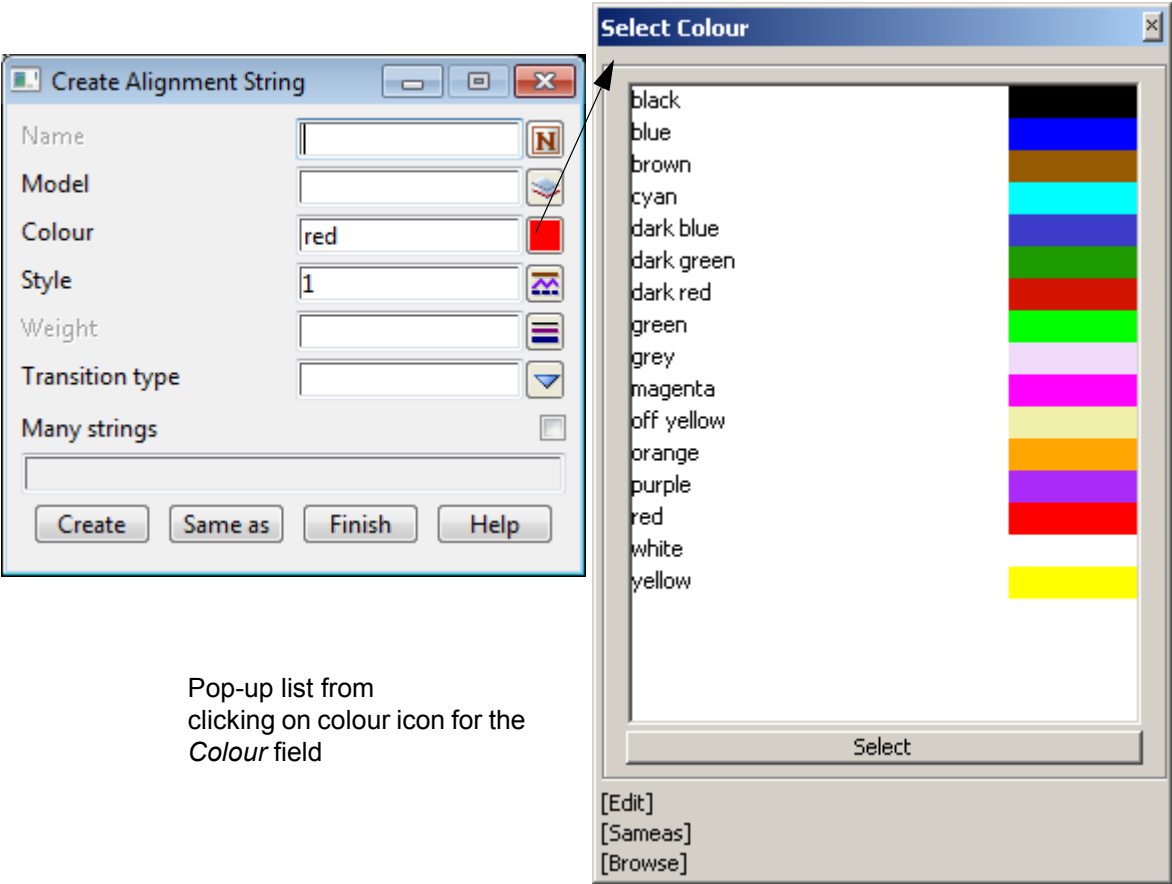

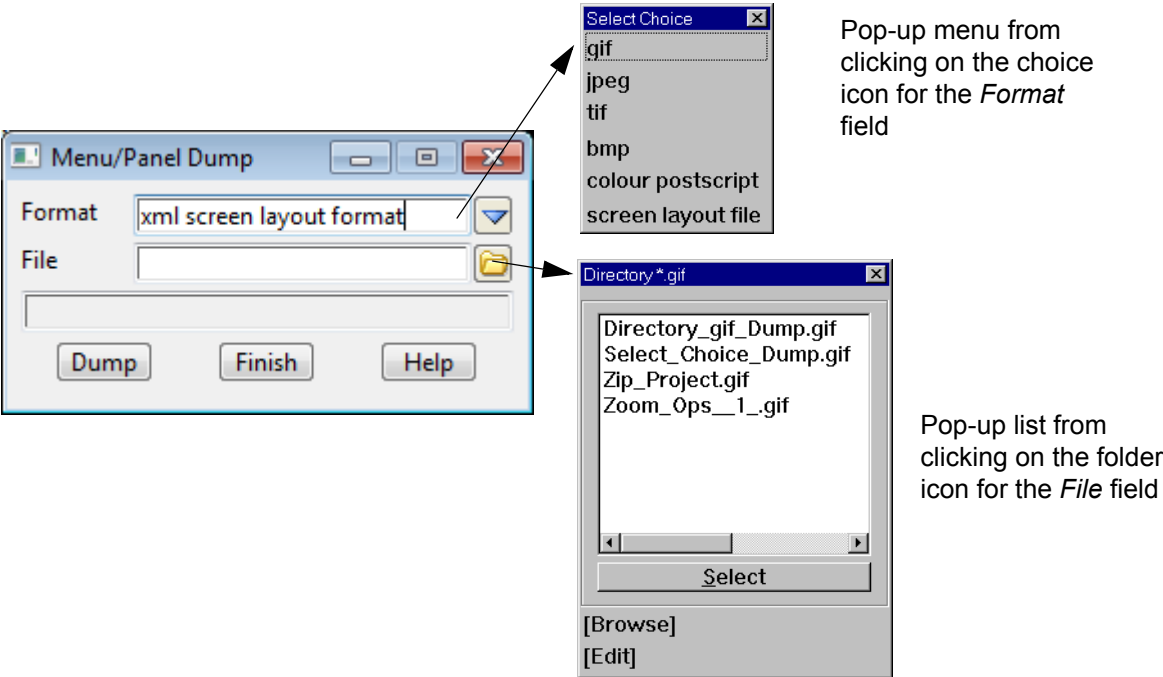

If there are choices available to select from for the panel field, there is a [+] or another special icon displayed at the right hand side of the panel field.

For example, icons that may be used in place of the + are:

	file		tin		textstyle info
	model		choice		line weight
	colour when none selected		selected colour		view
	line style		polygon		symbol
	project		XYZ		X
	Y		Z		chainage
	string name		select		angle
	date/time		function		typed input
	ID		plotter/printer		same as

Clicking LB on the one of the above icons or a [+] brings up a the **panel field pop-up list** or **pop up menu**.

A panel field pop-up consists of a list of choices which may be displayed as either a *menu* or a *list*

For a *pop-up list*, an answer is chosen from the list by **double** clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up list disappears.

At the bottom of some *pop-up lists* is a [Sameas] button. If [Sameas] is selected then an object with

the require property is selected using the mouse and the value from the selected item is written to the panel field.

For some options, more than one selection from a list can be made. In that case, simply use the standard Microsoft methods for multiple selections and then click on **Select**.

For a *pop-up menu*, an answer is chosen from the pop-up menu by clicking LB over the required answer. This answer is then displayed in the panel field and the pop-up menu disappears.

If there are more than twenty five choices to be displayed in a pop-up menu (or the number Popup length in the panel **Defaults**), the list of choices will be split up alphabetically into sub-lists with walk-rights to access each of the sub-lists, A pop-up list has scroll bars on the list if it is longer than the pip-up length.

The pop-up list or menu can also be removed without a selection by clicking LB on the **[X]** on the pop-up list or menu, by clicking LB again on the choice icon or **[+]** for the panel field, or by simply typing into any visible part of the panel field that the pop-up is for (some of the field may be obscured by the pop-up itself).

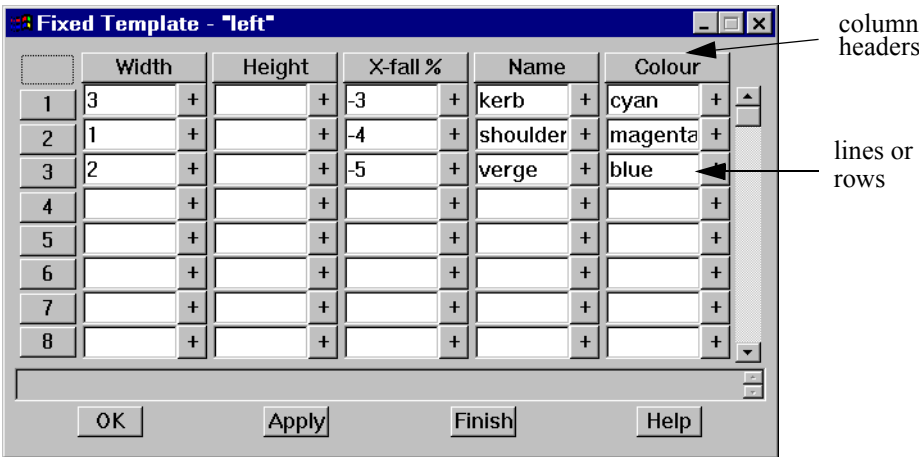

Click on [Textstyle Data and Textstyle Info](#) to go to the next section.

Scrolling Panel Tables

Many **12d Model** panels include tables or lists of information which hold an unlimited number of lines or **rows**. The tables may have more than one **column** but the number of columns is fixed for that table.

Such tables are displayed and edited in a **scrolling panel table**.

For example, the **Fixed Template** panel can contain an unlimited number of lines (rows) defining fixed links for the template.

Normally a set number of lines of the table are displayed in the **scrolling panel table** and once the number of lines exceeds the set number, the up and down arrows on the right hand side of the scrolling panel table are needed to scroll the lines up or down to see the extra information.

Each column of the panel table normally has a **column header** such as **width** and **height** in the above example of the **Fixed Template** scrolling panel table.

The **numbers** on the left hand side of the scrolling panel table indicate the line (row) numbers of the information being displayed and the line numbers are also buttons which when selected, bring up the **Edit Line n** panels. For example

The options on the **Edit Line n** panel have the following functions:

- clear** clear the current line
- copy** copy the current line into the next line; all following lines are pushed down
- delete** delete the current line
- insert** insert a blank line; the current line and all following lines are pushed down
- up** swap the current line with the preceding line
- down** swap the current line with the following line

Also, when the **number** on the left is selected, typing will **delete** the line
<insert> will **insert** a line.

Click on [File Box](#) to go to the next section.

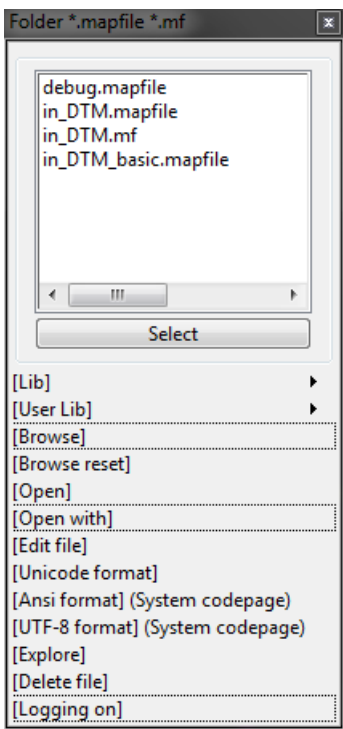

File Box

12d Model panels frequently include a field for entering a **file** name. This type of panel field is called a **file panel** field or box, or simply **file box**.

When RB is clicked on the **[+]** at the right of the panel field to bring up the list of available files, the pop-up menu can contain several different types of items:

- (a) list of **local** files satisfying the file ending for the file box
- (b) [Lib] button
- (c) [User lib] button
- (d) [Browse] button
- (e) [Open] button for some special files which have an internal 12d Model editor
- (f) [Open file]
- (g) [Edit file]
- (h) [Unicode format]
- (i) [Ansi format]
- (j) [UTF-8 format]
- (k) [Explore]
- (l) [Delete file]

For example,

local files satisfying the selection criteria

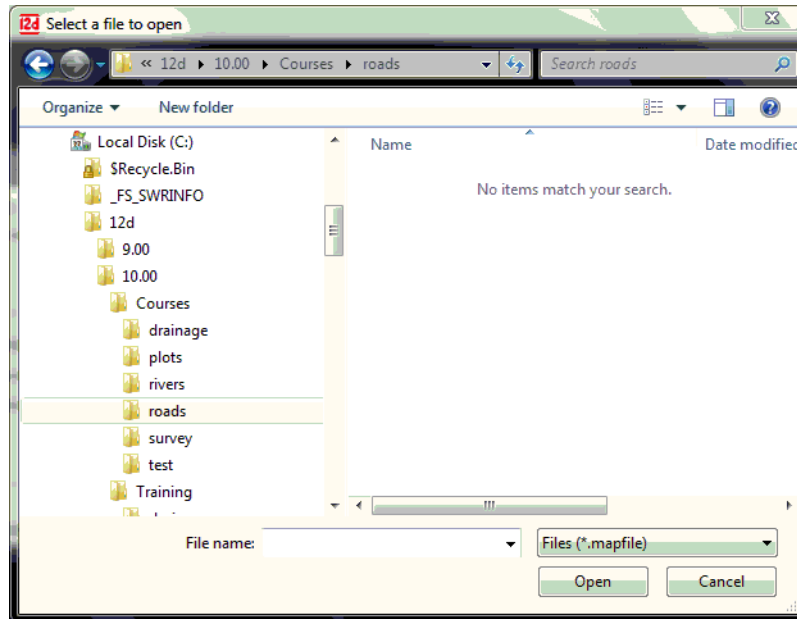

pop up list

The special menu items under the list of local files satisfying the selection criteria (usually file endings) have the following meanings:

[Lib] the walk-right lists all files satisfying the file box ending, in the library pointed to by the environment variable LIB_4D (see Appendix A)

[User Lib] the walk-right lists all the files satisfying the file box ending, in the user library pointed to by the environment variable USER_LIB_4D (see Appendix A)

[Browse] selecting **browse** brings up the **Microsoft File Browser** which can be used to search for a file with a specified ending in the local or other directories. Note that the appearance of the Browser dialog depends on the version of Windows you are using.

[Browse reset] selecting **browse reset** sets the 'browsing' directory back to the working directory of the project, and then starts [Browse].

[Open] selecting **Open** will bring up the special **12d Model** editor for the file. If not a special **12d Model** file, the standard Windows File Associations will be used to open the file. So if the file is an Adobe PDF file, and a PDF 'Viewer' is installed, then the PDF file will be opened in that viewer. Note that in earlier versions of **12d Model**, this was known as [Edit].

[Open with] selecting **Open with** will bring up the Windows Open with program selector to allow the user to choose which program to open the selected file with. If there is one or more than one program associated with a file type, the dialog gives you the choice. Note that the appearance of the Open dialog depends on the version of Windows you are using.

[Edit file] selecting **edit file** when there is a file name already in the file box, will edit the file using the editor pointed to by the EDITOR_4D environment variable.

[Unicode format]

selecting **Unicode format** sets the output format of currently selected file to the **Unicode** format with UTF-16 encoding.

Unicode allows for most languages of the world to be used concurrently. The resulting file will be marked with the Unicode BOM (byte order mark - see [Endian and BOM](#)) so that other programs know this file is in Unicode format with UTF-16 encoding (see [Ascii, Ansi and Unicode](#) and [Unicode Encoding: UTF-16](#)).

Note **12d Model** is Unicode enabled to the UTF-16 level and allows the use of non-Latin alphabets supported by UTF-16. Not all programs can work with Unicode files so if the file being outputted is to be used by another program, you need to check if

UTF-16 files can be read by the intended software.

[Ansi format]

selecting **Ansi format** sets the output format of currently selected file to the 'Ansi' format (see [Ascii, Ansi and Unicode](#)). The resulting file will not be marked with any BOM (byte order mark - see [Endian and BOM](#)). Writing Unicode information to an Ansi file may result in the loss of information.

[UTF-8 format]

selecting **UTF-8 format** sets the output format of currently selected file to the 'UTF-8' format which is a special Unicode format (see [Ascii, Ansi and Unicode](#) and [Unicode Encoding: UTF-8](#)). The resulting file will also be marked with the UTF-8 BOM (byte order mark - see [Endian and BOM](#)) so that other programs know this file is in UTF-8 format.

Note **12d Model** is Unicode enabled to the UTF-16 level and allows the use of non-Latin alphabets supported by UTF-16. Not all programs can work with Unicode files so if the file being outputted is to be used by another program, you need to check if UTF-8 files can be read by the intended software.

[Explore]

selecting **Explore** opens a new Windows Explorer window to the currently 'browsed' folder.

[Delete file]

selecting **Delete file** will prompt the user to send the currently file to the Windows Recycle Bin if it exists for the drive that the file is on. Note this depends on which drive the file resides. Many network drives do not support Recycle Bins and so a deleted file is lost. It is up to the user to implement good backup procedures to avoid permanent loss of files.

[Logging off/on]

Toggle between *Logging on* and *Logging off*. This is only used for Map files and when **Logging on** is set, then entries are made as log lines in the Output Window that show what tabs in the Map File were used in creating and attributing the string.

Note that certain 'types' of File Box many have additional [...] fields.

Click on [Model Panel Field](#) to go to the next section.

Model Panel Field

12d Model panels frequently include a field for entering the name of a model. These fields are called **model panel** fields or simply model fields.

Because models are often required to be displayed on views and hence, need to be **added** to a view, there is a short-hand method for adding models to views when using a model field.

After the model name is entered into the model field, the name of the view that the model is to be added to is typed in, preceded by a comma. If the model is to be added to more than one view, simply type in each of the view names separated by commas.

For example, to add the model **fred** to the views **1**, **3**, and **5**, type

fred,1,3,5

into the model field.

Alternatively, the view names can be enclosed in round brackets.

For example,

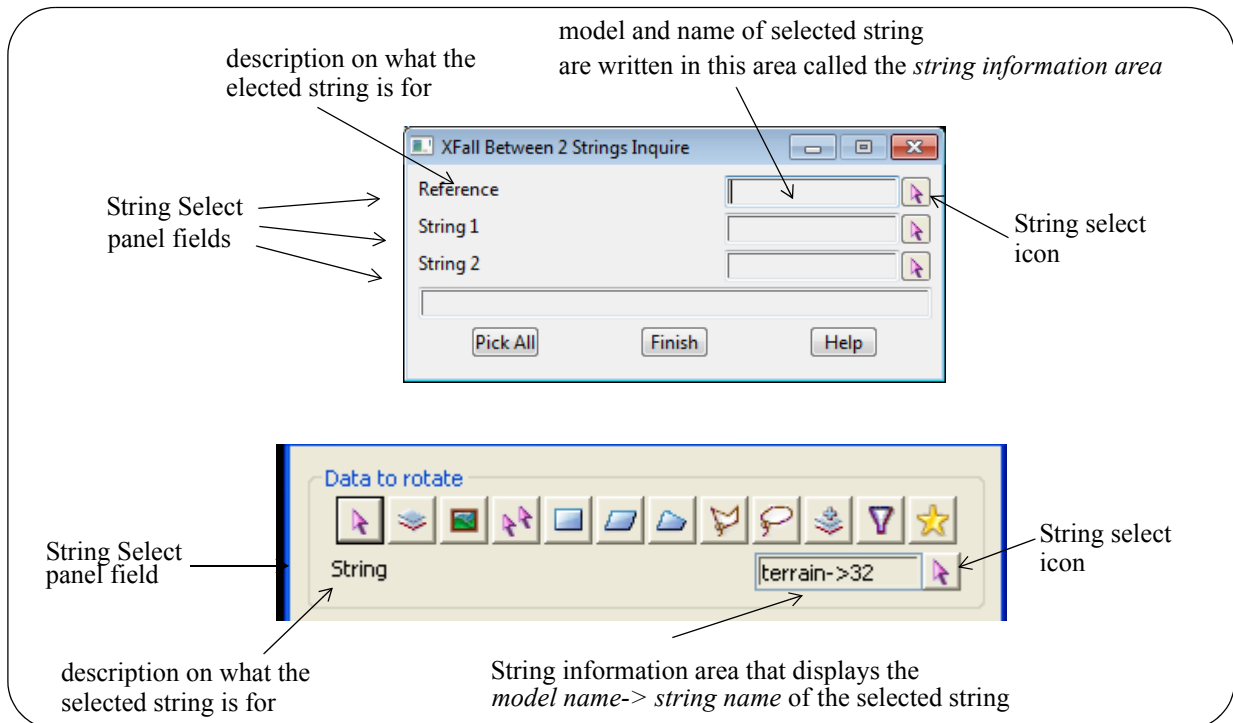

fred (1,3,5)

Click on [String Select Panel Field](#) to go to the next section.

String Select Panel Field

There is a special panel field called a **string select** panel field which is used for **selecting** a string and **recording** the string and model name in the panel field. The string select panel field consists of

- a description of what the field is for
- n string information area where the model and string name of a selected string are displayed and
- the **string select** icon which is clicked on to start selecting a string.

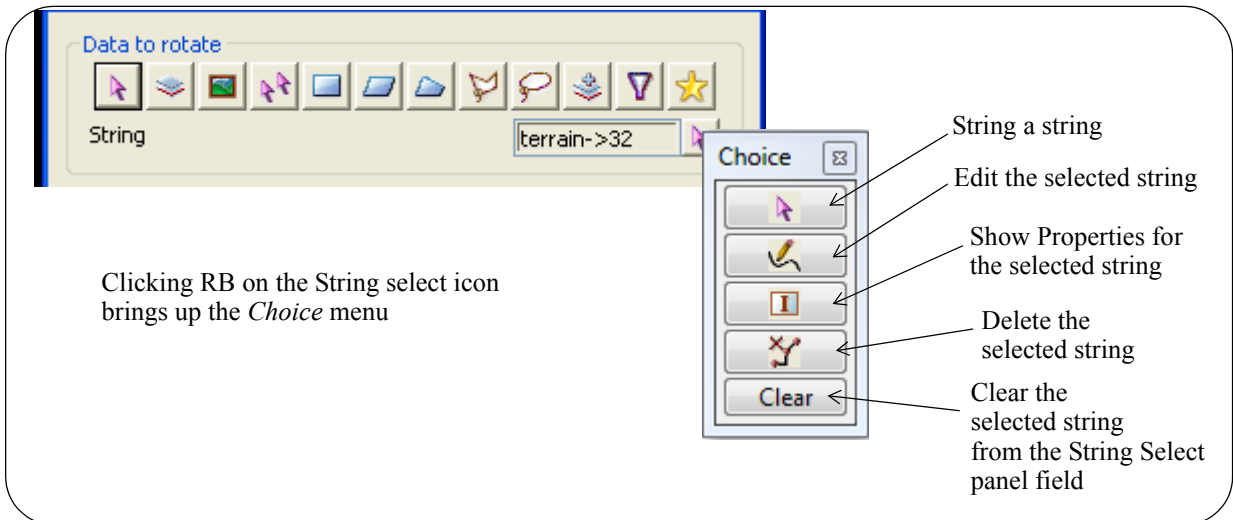

Clicking LB on the *String Select* icon will start the string selection process.

Clicking MB on the *String Select* icon does nothing.

Clicking RB on the *String Select* icon brings up the Choice menu which has options to

- Select a string (same as clicking LB on the *String Select* icon)
- Edit the string that has already been selected for the String Select field. The string to be edited will have its model name and string name shown in the string information area.
- Show the Properties panel for the string that has already been selected for the String Select field.
- Delete the string that has already been selected for the String Select field. The string to be deleted will have its model name and string name shown in the string information area.
- Clear the String Select panel of the string that had already been selected.

If a *String Select* operation has been started, it can be cancelled by clicking *RB* to bring up the *Pick Ops* menu and selecting *Cancel* from the menu.

Click on [Same As for Panel Fields](#) to go to the next section.

Same As for Panel Fields

For most panel fields/input boxes, clicking the middle mouse button (MB) in the field will activate a **same as** pick which allows the user to get information from other objects.

After clicking MB, simply select a string, plot frame *etc.* from a view and the appropriate value will be extracted from the selected item and piped into the panel field.

At present **same as** picks works for

- models
- colours
- justify
- text styles
- text units
- names
- plotter (from plot frames)
- sheet size (from plot frames)
- line styles

Please continue to the next section [Measures](#).

Measures

Whenever a real value is required in a box (e.g. height, width), the pop-up menu on the **[+]** button includes a **measures** menu.

The **Measures** menu allows the user to pick a selected measure value from existing strings, and the picked value is displayed and piped into the panel field.

For example, the x, y, or z coordinate of a point or the plan distance between two points.

If default values already exist for the pop-up menu, the options on the **measures** menu will be added to the bottom of the default list.

The measures functions support dynamic measures to give the user more visual feedback. This includes the drawing of a rubber line in the case of **Point Point** and **String to Point** measures, or a cross in the case of **At Point**.

The measures and their dynamic aspect can be easily explored via the option

Utilities=>Measure=>Value

The walk-right **Measure** menus are documented in the next four sections.

The stand alone **Measures** menus is

For the option At point, go to
 Point to point
 String from point
 String to point
 Last expression

[Measure At Point](#)
[Measure Point to Point](#)
[Measure String from Point](#)
[Measure String to Point](#)
[Last Expression](#)

If information on measures is not required, please continue to the next section [Last Expression](#).

Measure At Point

- get x co-ordinate of selected point
- y co-ordinate
- z co-ordinate
- chainage at the point
- instantaneous angle
- instantaneous bearing
- cross-fall of selected point
- slope at the point
- radius (0 if no curve)

The **At Point** measures calculate and display the picked measure at a selected point.

For example, **X** gets the x-coordinate of a selected point.
Bearing gets the instantaneous bearing of a selected point.

The dynamic aspect of the **at point** measures is as follows:

after the desired **at point** option is picked and the string for the **at point** measure is tentatively selected but not yet accepted, and if the cursor is moved around, then the cursor position is dynamically dropped perpendicularly onto the highlighted string and a cross displayed on the string at the dropped point, and the picked measure value is dynamically displayed in the panel field.

For example, if the **x** measure was picked from the **Measure Point** menu and a string highlighted but not yet accepted, then as the cursor is moved around the screen, the cursor position is dropped perpendicularly onto the highlighted string and displayed as a cross and the **x**-coordinate of the cross is displayed in the panel field.

Measure Point to Point

- get 2d length between selected points
- 3d length
- delta x
- delta y
- delta z
- delta chainage
- angle of line joining selected points
- bearing of line
- cross-fall of line
- slope of line

The **Point to Point** measures calculate and displayed the picked measure between two selected points.

For example, **Length** gets the plan distance between two selected points.
X-fall % gets the % cross fall of the line joining two selected points.

The dynamic aspect of the **point to point** measures is as follows:

after the desired **point to point** measure is picked, and the first point for the **point to point** measure is selected, then a rubber line is dynamically drawn between the selected point and the current cursor position and the picked measure value is dynamically displayed in the panel field.

Further, if the selected string for the **second** point is tentatively selected but not yet accepted, and if the cursor is moved around, then the cursor position is dynamically dropped perpendicularly onto the highlighted string and the picked measure value to the second string is dynamically displayed in the panel field.

For example, if the **length** measure was picked from the **Measure Point to Point** menu and the first point selected, then a rubber line is dynamically drawn between the selected point and the cursor position and the plan length from the selected point to the current cursor position is dynamically displayed in the panel field.

If a string is selected for the second point but not yet accepted, the cursor position is dynamically dropped onto the highlighted string and the plan distance from the first point to the dropped point is dynamically displayed in the panel field.

Measure String from Point

Measure String from Point	
X	get x co-ordinate of point dropped onto string
Y	y co-ordinate
Z	z co-ordinate
Chainage	chainage at the point
Angle	instantaneous angle
Bearing	instantaneous bearing
X-fall %	cross-fall of selected point
Slope 1v in	slope at the point
Radius	radius (0 if no curve)

The **String from Point** measures calculate the picked measure *from the selected string* by taking the current cursor position and dropping it perpendicularly onto the selected string and using the dropped point on the string to get the measure value.

- For example, **X** gets the x-coordinate from the string of the cursor dropped onto the selected string.
- Z** gets the z-coordinate from the string of the cursor dropped onto the selected string
- Bearing** gets the instantaneous bearing from the string of the cursor dropped onto the selected string.

The dynamic aspect of the **string from point** measures is as follows:

after the desired **string from point** measure is picked and the string for the **string from point** measure is selected, then as the cursor is moved around, a rubber line is dynamically drawn between the cursor and the cursor position dropped perpendicularly onto the selected string, and the picked measure value of the dropped cursor position is dynamically displayed in the panel field.

For example, if the z measure was picked from the **Measure String from Point** menu and a string selected, then as the cursor is moved around the screen, the cursor position is dropped perpendicularly onto the selected string. The perpendicular line is dynamically redrawn and the z-coordinate of the dropped point on the string is dynamically displayed in the panel field.

Measure String to Point

Measure String to Point	
Length	get 2d length between selected points
Length(3d)	3d length
DX	delta x
DY	delta y
DZ	delta z
Chainage	delta chainage
Angle	angle of line joining selected points
Bearing	bearing of line
X-fall %	cross-fall of line
Slope 1v in	slope of line

The **String to Point** measures are similar to the *point to point* measures and calculate the picked measure from a point and the point **dropped perpendicularly** onto the selected string.

For example, **Length** gets the plan distance between the point and the point dropped perpendicular on a selected string.
Bearing gets the bearing of line joining the point and the point dropped perpendicularly onto a selected string

The dynamic aspect of the **string to point** measures is as follows:

after the desired **string to point** measure is picked, and a *string* selected, then a line is dynamically drawn between the cursor position and the cursor position *dropped perpendicularly* onto the selected string. The **string to point** value is dynamically displayed in the panel field as the cursor is moved around.

Further, if the cursor position is on a string which has been selected but not accepted and the cursor is moved around, then the cursor is *constrained* to remain on the tentatively selected string. It is dynamically dropped perpendicularly onto the original string and the measure value to the dropped point displayed in the panel field.

Hence the selected point is **constrained** to remain on the tentatively picked string and the measure dynamically calculated and displayed.

For example, if the **length** measure was picked from the **Measure String to Point** menu and the first string selected, then a line is dynamically drawn perpendicularly between the selected string and the current cursor position and the plan length from the string to the current cursor position is dynamically displayed in the panel field.

If a string is tentatively selected (picked but not yet accepted), the cursor position is dynamically dropped onto the first string and the plan distance measured perpendicularly from the point to the first string is dynamically displayed in the panel field.

Please continue to the next section [Last Expression](#).

Last Expression

Brings up the last expression or real value typed into the box. For example, if 3*4 is typed and <Enter> pressed, 12 will be displayed. The **Last Expression** pop-up will bring back the 3*4.

Please continue to the next section [Bearings and Angles](#).

Bearings and Angles

HP Notation

Many panels and options take angles or bearings as input. The **12d** Model default for most angles or bearings is in degrees, minutes and second (dms).

To save typing, this is written in **HP Notation** in the form

ddd.mmssfff

where **ddd.mmssfff** is the angle or bearing expressed in degrees, minutes and seconds as

ddd	whole degrees
.	separator between degrees and minutes
mm	whole minutes
ss	whole seconds
fff	fractions of seconds (as many as required)

Notes

1. The decimal point . indicates where the degrees stops and the minutes begin.
2. If there is only whole degrees, the .**mmssfff** can be omitted. However, if there are any minutes, seconds or fractions of seconds, there must be **two digits** of whole minutes.
3. If there are no seconds or fractions of seconds, then the **ssfff** can be omitted. However, if there are any seconds or fractions of seconds, there must be **two digits** of whole seconds.
4. There are as many digits of fractions of seconds as required (possibly none).

For example

35	is 35 degrees
35.09	is 35 degrees and nine minutes
35.0901	is 35 degrees, nine minutes and one second
35.090107	is 35 degrees, nine minutes and 1.07 seconds

Decimal Degrees for Angles

At times, angles or bearings are given as decimal degrees rather than in [HP Notation](#).

For decimal degrees, positions after the decimal point represent decimal degrees.

Go to the next section [Expressions in Bearing, Angle Panel Fields](#) or return to [Bearings and Angles](#).

Expressions in Bearing, Angle Panel Fields

Because bearings (angles) and numbers **can not** be used interchangeably in mathematical expressions, only a limited number of expressions can be supported in a bearing or angle panel field.

Bearings (angles) can be added or subtracted from other bearings (angles) but a number can not be added or subtracted from a bearing (angle). So the addition and subtraction of bearings (angles) is supported but addition/subtraction of a bearing (angle) and a number is invalid.

Bearings (angles) can not be multiplied or divided by another bearing (angle) but a bearing (angle) can be multiplied or divided by a number. However because the input of a bearing (angle) in degrees, minutes and seconds looks like a decimal number (see the previous section [Bearings and Angles](#)), a rule must be made to distinguish between bearings (angles) and numbers for multiplication and division. In **12d Model**, the bearing (angle) is on the left of the number it is being multiple or divided by.

So in a bearing (angle) panel field and grid, the following is supported:

- (a) add or subtract bearings (angles) i.e. bearing + bearing or bearing - bearing is allowed
- (b) type bearing*number + bearing *number - note that the number is on the right of the *
- (c) type bearing *number - bearing *number - note that the number is on the right of the *
- (d) type bearing /number + bearing *number - note that the number is on the right side of the /
- (e) type bearing /number + bearing *number - note that the number is on the right side of the /

Because a user often wishes to add or subtract 90 degrees from a bearing or angle, the Page Down/Page Up keys have a special meaning when the focus in on the bearing (angle) panel field. For a bearing (or angle) panel field (but **not for a grid**):

- | | |
|------------------------------|---------------------------------------------|
| (f) Page up | - subtracts 90 degrees to the bearing/angle |
| (g) Ctrl + page up | - subtracts 15 degrees to the bearing/angle |
| (h) Shift + page up | - subtracts 10 degrees to the bearing/angle |
| (i) Shift + Ctrl + page up | - subtracts 6 degrees to the bearing/angle |
| | |
| (j) Page down | - adds 90 degrees to the bearing/angle |
| (k) Ctrl + page down | - adds 15 degrees to the bearing/angle |
| (l) Shift + page down | - adds 10 degrees to the bearing/angle |
| (m) Shift + Ctrl + page down | - adds 6 degrees to the bearing/angle |

Please continue to the next section [Precision](#).

Precision

Double precision variables are used throughout **12d Model** for all coordinate values and calculations.

Although this increases the time taken for calculations, it is more than offset by the increase in the accuracy of the data and the results of any calculations.

Because of the accuracy of double precision variables (fourteen significant figures), there is no practical restriction on the co- ordinate area covered by projects.

The default number of decimal places for displaying values in the *information menu* is three (3).

This number of decimal places is controlled by the display precision field in the **System Settings** tab of the **Defaults** panel (option **Utilities=>Defaults**).

The default number of decimal places for displaying values in *boxes* and *panels* is four(4).

This number of decimal places is controlled by the box precision field in the **System Settings** tab of the **Defaults** panel (option **Utilities=>Defaults**).

Please continue to the next section [Colours](#).

Colours

The palette of colours available for elements drawn in a view depends on the **12d** colour definition file, colours.4d (see section [Colours File](#) in Appendix [Setting Up and Configuring 12d](#)). A default file is distributed with **12d Model** and resides in the *set_ups* folder. Up to 10,240 colours can be defined.

In this manual, colours will be referred to by names. However, **12d Model** stores colours by the **colour number**. This is independent of the colour names and if a different *colours.4d* is used, the colours on the screen may change.

Note: colour numbers can be used instead of a colour name in any panel fields.

Please check your colours.4d file if your screen colours do not match those mentioned in this manual.

The colour names are used (sorted into alphabetical order) in colour pop-ups. When a large number of colours have been defined, the pop-up list can get unwieldy so there is a default parameter, display colours (in the panel brought up by **Project=>Management=>Defaults (System Settings) Display Colours**), which gives the number of colours to use in a pop-up.

The order that the colours are taken from the colour file for the pop-up is **not** the colour number but the *pop-up number order* which can be completely different. This means that the user can add extra colours after the standard 2000 **12d Model** colours number and easily have the new colours come up in the colours pop-up.

Hence it is possible to have thousands of defined colours for shades and plots, but still have only a selected sixteen displayed in colour pop-ups.

WARNING

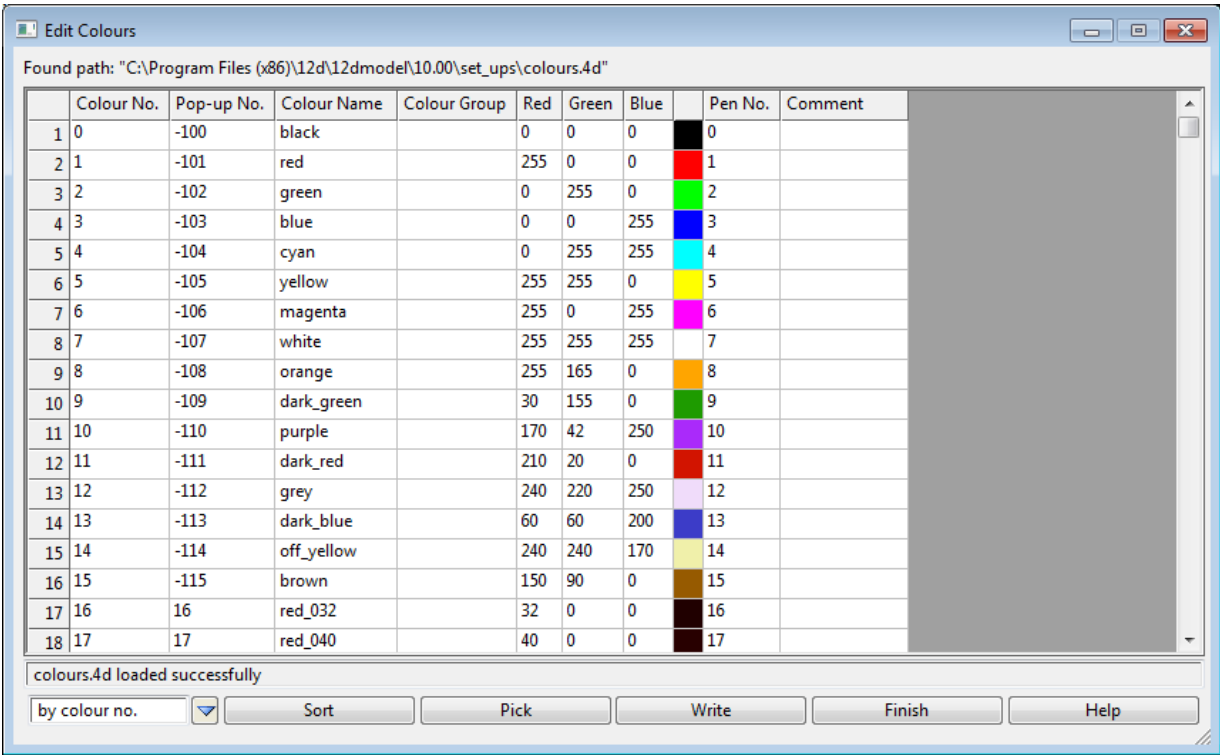

Do not change the colour numbers and definitions for colour numbers 0 to 2000 - they are restricted for 12D Solutions use only.

In the **12d Model** database, only the colour number is saved so if any of the first 2000 colour numbers are changed then the display of colours in existing projects may change.

Go to the next section [Editing Colours](#) or return to [Colours](#).

Editing Colours

To add/modify colours to the **12d Model** colours.4d file, bring up the **Edit Colours** panel by clicking on the [Edit] section of the Select Colours pop-up.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Grid Cells

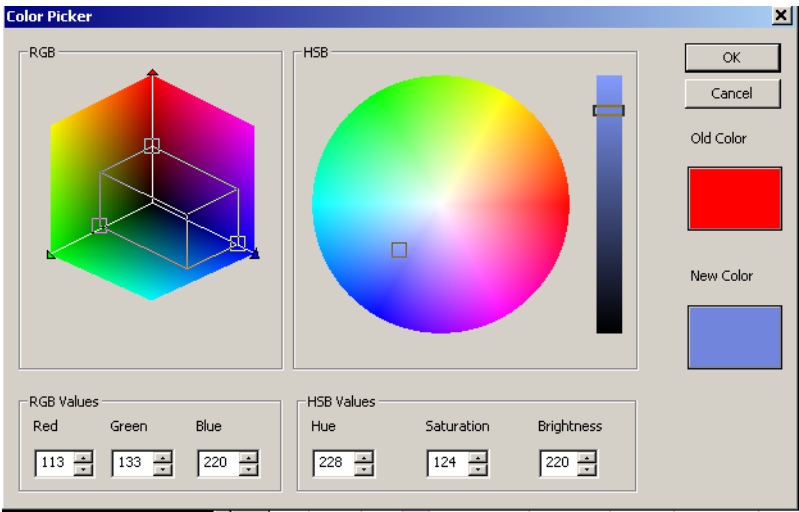

- Colour No.** integer
number of the colour. A unique integer value between 0 and 10,239.
- Pop-up No.** integer
the colours are selected for the pop-up by this number. It is a unique integer - positive, 0 or negative.
- Colour name** text
text name for the colour.
- Colour Group** text
group for the colour.
- Red/Green/Blue** integer
amount of red/green/blue in the colour. Value is between 0 and 255.
- Pen No.** text box
pen number to map the colour to.
- Comment** text box
optional comment.

Buttons

- Sort** button
sort the table with respect to the column given in the adjacent field.

Picker button

*if a row of the table is highlighted, selecting **Picker** brings up the **Color Picker** to interactive define the RGB for new colours.*

Write button

write the table out to a colours.4d file.

Please continue to the next section [Range Files](#).

Range Files

Range files consist of a list of ranges and colours, one set per line

lower_value upper_value range_colour

where this line represents all values satisfying

lower_value < value <= upper_value.

Go to the next section '[1v in' Slope Range File](#) or return to [Range Files](#).

' 1v in' Slope Range File

For 1v in slope colouring, the range file consists of a list of ranges of slopes (in "1 in" values) and colours, one set per line, in the grid

lower_value upper_value range_colour

where this line represents all "1 in" slopes satisfying

lower_value < value <= upper_value.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Range file <i>the name of the 1v in slope range file</i>	file box		available *.srf files
Read <i>read in the file in the Range file field</i>	button		
Write <i>write out the file in the Range file field</i>	button		

Grid Cells

for 1v in slope colouring, the range file consists of a grid of ranges and colours, one set per line, in the grid

lower_value upper_value range_colour

where this line represents all "1 in" slopes satisfying

lower_value < value <= upper_value

See [Creating Ranges in a Range File](#) for quickly creating numbers of range file lines with colours.

a comment for this line of the grid

Go to the next section [Creating Ranges in a Range File](#) or return to [Range Files](#).

Creating Ranges in a Range File

To quickly create a number of lines of ranges in a Range file, when a **Range File** panel is displayed, click RB in the blank cell at the top left hand corner of the grid title area (to the left of the **From** text) to bring up the All Cells choices and select **Populate Range**.

Selecting **Populate Range** brings up the **Populate Range** panel which is used to insert a number of range lines into the grid of the **Range File** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
From	real		
<i>the lower value for the generated range</i>			

To	real	
	<i>the upper value for the generated range</i>	
Interval	measure box	
	<i>the interval between values for the generated range</i>	
Start colour	colour box	available colours
	<i>the start colour for the generated range. The colours are interpolated in RGB between the Start colour and the End colour.</i>	
End colour	colour box	available colours
	<i>the end colour for the generated range. The colours are interpolated in RGB between the Start colour and the End colour.</i>	
Skip results on non selected row	tick box	not ticked
Populate	button	
	<i>generate the defined grid lines and insert them into the grid. The new lines will be inserted at the highlighted grid lines and can replace any highlighted lines in the grid.</i>	

The **Populate Range** panel can be used a number of times to generate range lines in various colours.

Return to [Range Files](#) or continue to the next section [Defaults](#).

Defaults

Defaults

Many options in **12d Model** require settings which are almost always the same. To save repetitious typing, **12d Model** provides a number of user defined defaults that are used throughout **12d Model**.

For example, the chord to arc tolerance, point cross size and highlight cross size and colour.

Certain default values are read in from a file when a new project is created. These defaults can also be modified inside **12d Model** using the **Defaults** panels.

The lay out of the file used to define the default values for a new project is given in the appendix **Set Ups**.

User defaults can also be set for entire panels - see the section [Panel Defaults - ddx Files](#).

Go to the next section [Default Panel Values](#) or return to [Defaults](#).

Default Panel Values

When a panel is opened, **12d Model** may set some default values.

However for most panels **the user can supply the values** to be used **for** all the **panel fields** each time a panel is opened. This information is stored in a defaults file for a panel.

For more information on the panel default files and how to create them, go to the section [Panel Defaults - ddx Files](#).

Go to the next section [Default File Ending](#) or return to [Defaults](#).

Default File Ending

In any panel pop-up requiring a file name, default file endings are used to restrict the names of the files selected from the current folder to be displayed in the pop-up.

The list of special file endings is given in the section [Default File Ending](#) in the appendix [Special File Formats](#).

Return to [Defaults](#) or continue to the next section [Plotters](#).

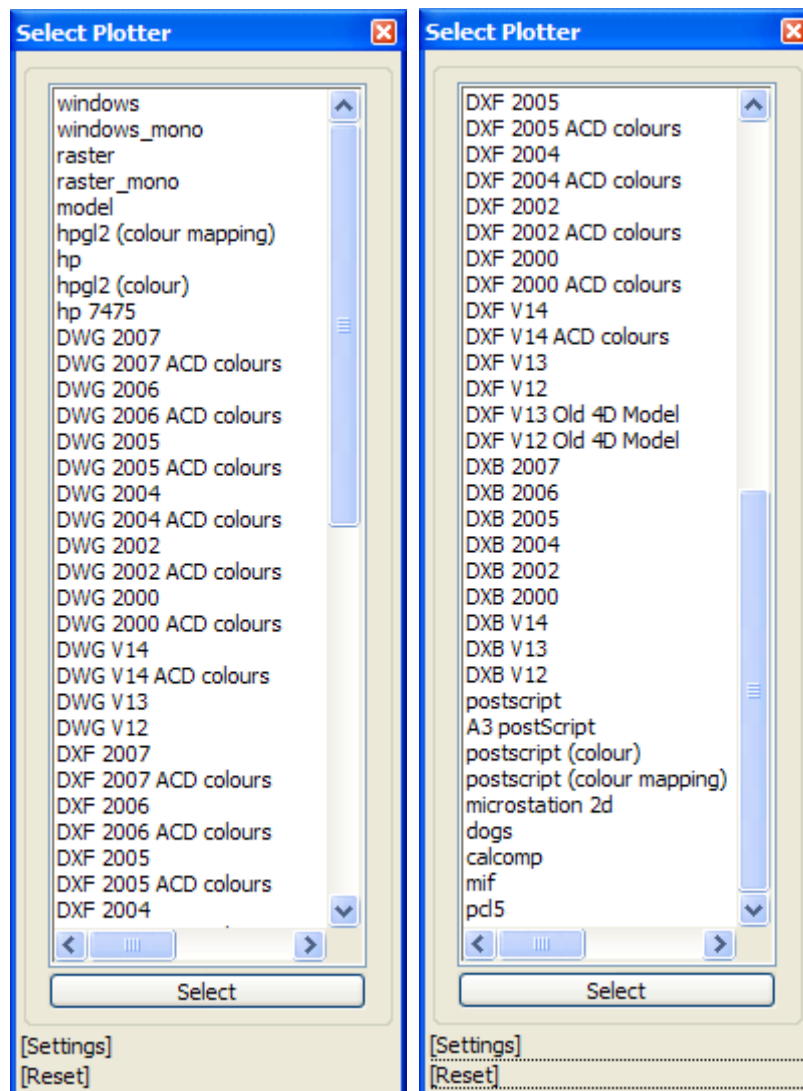

Plotters

When creating a plot, 12d Model can either drive the plotter directly using Windows printer drivers, raster plotter drivers if the plot includes rasters (pictures), or plot indirectly by creating a computer disk file (the plot file) containing the relevant plotter instructions for producing the plot, or in the case of the plotter type **model**, a 12d Model model is created.

If a plot file is created then there is a variety of formats available, each with its own special file ending.

In the plotting options, the choice of plotters that is available through the pop-up menu can be the default 12d Model list or a user defined list of plotters.

The default 12d Model list is

When the plot file is created, it can be passed to a user specified program or batch file which can automatically direct the plot file to a plotter.

See the appendices [Setting Up and Configuring 12d](#) and [Plotters and Plotting](#) for more information on plotters and defining plotters.

Miscellaneous Panels

The value is entered into the typed-input box, terminated with <enter>.
The **Enter Value** typed-input box then disappears.

The length is entered into the typed-input box, terminated with <enter>.
The **New Length** typed-input box then disappears.

The radius is entered into the typed-input box, terminated with <enter>.
The **New Radius** typed-input box then disappears.

No Option Available

12d Model consists of a base module of varying point sizes and optional modules.

If a module has not been purchased and any options included in that option are selected then a **No licence available** message will be displayed.

The missing module can be purchased by contacting your **12d Model** distributor or **12d Solutions Pty Ltd**.

No Information Available

There is no information available on this panel or menu.

Options on Toolbars

Snaps Cad

Position of option on menu: various

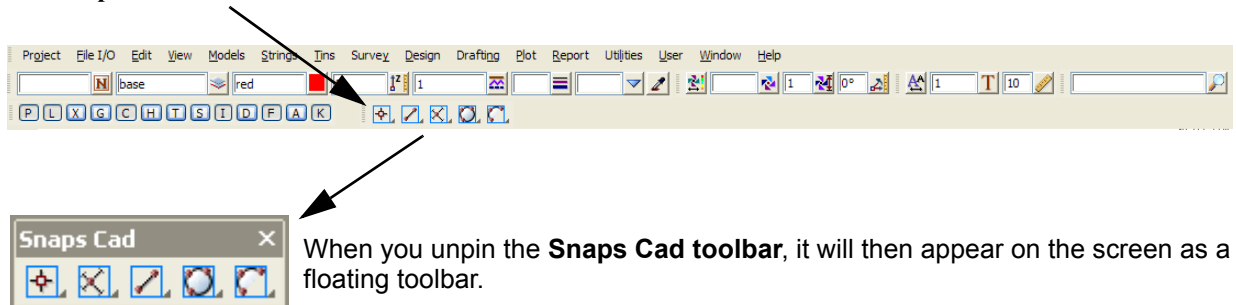

The Snaps Cad Menu can be accessed the following ways:

- by selecting **Snaps Cad** from the **Pick Ops** menu
- by walking right on **Snaps Cad** on the **Pick Ops** menu

- From the toolbar, as long as **Snaps Cad** is ticked in the **Customize toolbars** panel (View => Toolbars).

snaps cad toolbar

When you unpin the **Snaps Cad toolbar**, it will then appear on the screen as a floating toolbar.

The **Snaps Cad Menu** walk- right menu is:

For the option <i>Point</i> , go to	Snaps Cad Point
<i>Intersection</i>	Snaps Cad Intersection
<i>Line</i>	Snaps Cad Line
<i>Circle</i>	Snaps Cad Circle
<i>Arc</i>	Snaps Cad Arc

Note: Snap Cads work in a very similar pattern to the normal Cad options. However, they create virtual points and segments which can be used by either **Cad** or **Snap Cad** options. **Snap Cad**

options don't create any points or strings.

Point

On selecting **Point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the virtual point is created at the selected position and ready to be used by the calling option.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Mid- segment

This option creates a virtual point in the middle of a selected line or arc segment.

On selecting **Mid- segment**, the user is prompted to select a segment and a virtual point is created at the mid point of the segment.

Centre

This option creates a virtual point at the centre of a selected segment.

On selecting **Centre** the user is prompted to select a segment and a virtual point is created at the centre of the segment.

Mid point

This option creates a virtual point in the middle of two selected positions.

On selecting **Mid point**, the user is prompted to select the first position and then the second position. A virtual point is created at the mid point of the two selected positions.

Chainage

This option creates a virtual point at the position of a user specified chainage of an existing string.

On selecting **Chainage**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a valid string (left mouse button) and accepts that string (Middle mouse button or enter).

**STEP 2:**

The user enters a chainage value where a point should be placed followed by the enter key. This chainage is with respect to the selected string.

**STEP 3:**

A virtual point is created at the positioned on the string at the given chainage.

Bearing and distance

This option calculates a virtual point that is located at a given bearing and distance from a start position.

On selecting **Bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position is selected and accepted.

STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start

typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the Enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**

A distance is selected and accepted with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the distance entry box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the

mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

STEP 4:

A virtual point is created using created using the information supplied. By entry into the input boxes:

Or by using the perpendicular/tangential tools:

Offset

This option creates a virtual point that is located by reference to a string, a control point, a chainage distance along the string from the control point and an offset to the selected string.

After selection and acceptance of a string, a control point is selected and accepted. This point is dropped perpendicular onto the string. The distance along the string is measured from this dropped point. Positive distances are in the direction that the string was picked. Finally a offset to the string can be specified for the placement of the new virtual point.

On selecting **Offset**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects and accepts a string with direction. This defines what side the offset applies to.

STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.

STEP 3:

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.

**STEP 4:**

An offset relative to the selected string (and direction) is specified in the input box followed by the Enter key.

**STEP 5:**

A virtual point is created using the information supplied.

Chainage offset

This option creates a virtual point that is located perpendicular to the reference string with a defined offset.

STEP 1:

The user selects the reference string with direction.

STEP 2:

The user specifies a chainage on the reference string.

STEP 3:

The user specifies an offset distance from the reference string.

A virtual point is created using the information supplied.

Chainage offset extended

Is similar to chainage offset except the specified chainage can be extended beyond the start and end chainages of the selected string.

Deflection

This option creates a virtual point that is located by reference to a string, a control point, a distance along the string from the control point, a deflection angle and deflection distance.

After selection of a string, a control point is selected. This point is dropped perpendicular onto the string. A distance along the string can be entered to move the measure point. Positive distances are in the direction that the string was picked. A deflection angle is specified which is a clockwise angle from the measure point. The deflection distance is the distance from the measure point to the point which is to be created.

On selecting **Deflection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects and accepts a string with direction.

**STEP 2:**

The user picks and accepts a control point to be dropped onto the selected string.

**STEP 3:**

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.

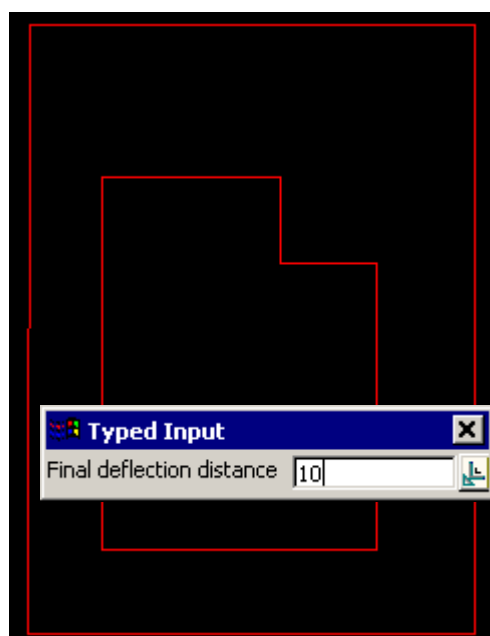

**STEP 4:**

A deflection angle is specified. This angle is clockwise, relative to the direction of the string selection pick. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**

A deflection distance is supplied. Positive is in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.

**STEP 6:**

A virtual point is created using the information supplied.

Drop perpendicular

This option creates a virtual point by dropping from a user selected position perpendicularly onto a user selected string.

On selecting **Drop perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a string and accepts (with direction) to have the point dropped onto.

STEP 2:

The user picks and accepts a position to drop onto the nominated string

**STEP 3:**

A virtual point is created at the perpendicular drop point.

**Angle**

This option creates a virtual point that is located by projecting a selected position back to a string by a specified angle.

STEP 1:

User selects and accepts a string to have the point projected onto.

STEP 2:

User specifies an angle for the projection.

STEP 3:

User selects a position on the screen to be projected back to the string.

STEP 4:

A virtual point is created, which form the nominated angle with the selected position on **STEP 3**.

Projection

This option creates a virtual point that is located by firstly dropping a point onto a string and then giving a distance along the string from the dropped point.

On selecting **Projection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects and accepts a string (with direction) to have the point dropped onto

**STEP 2:**

The user picks and accepts a position to drop onto the nominated string

STEP 3:

The user is prompted for the distance along the string. Positive distances are in the direction that the string was picked. A value is entered into the input box followed by the Enter key.

STEP 4:

The virtual point is created the nominated distance along the string from the dropped point.

Between Points

This option creates a virtual point that is on the line between two selected positions and a given distance from the first point.

On selecting **Between points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

STEP 2:

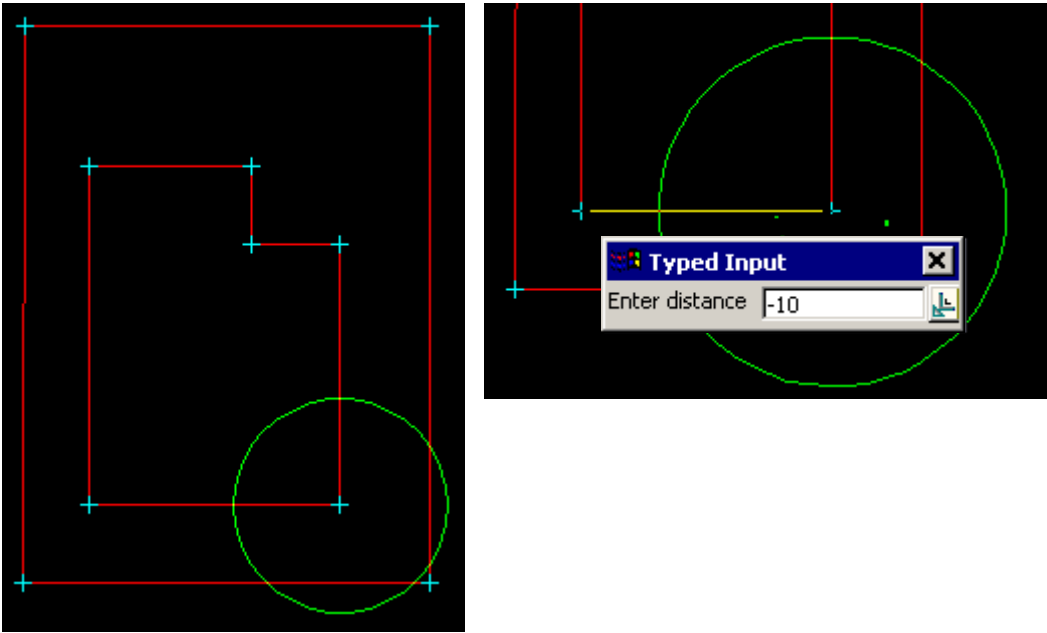

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

STEP 3:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

STEP 4:

A virtual point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.

Between points 3d

This option creates a virtual point that is on the line between two selected positions and a given distance from the first point. The z-value of the string is interpolated from the two selected positions.

On selecting **Between points 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or Enter).

STEP 2:

The user picks a 2nd point and accepts that point (Middle mouse button or <Enter>) to define the reference line.

STEP 3:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

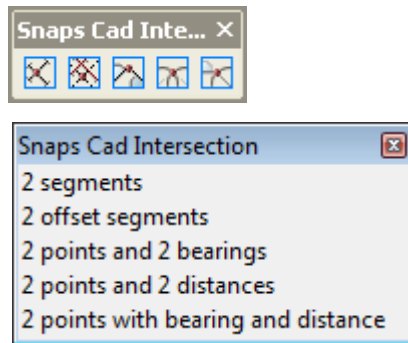

STEP 4:

A virtual point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.

Snaps Cad Intersection

This section of documentation is a work in progress and will be updated in subsequent releases.

2 segments

This option creates a virtual point at the intersection of the projections of two line or arc segments.

On selecting 2 segments, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st segment is selected and accepted.

STEP 2:

The 2nd segment is selected and accepted.

STEP 3:

A virtual point is created at the intersection of the two segments (if a solution exists). Note that the 2nd segment in this case has been projected to enable a solution to be calculated.

2 offset segments

This option creates a virtual point at the intersection of the offsets of two selected segments.

On selecting **2 offset segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st segment is selected and accepted with direction. This sets the positive direction of the offset to the right of the direction of pick.

**STEP 2:**

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the Enter key.

**STEP 3:**

The 2nd segment is selected with direction and accepted. This sets the positive direction of the offset to the right of the direction of pick.

**STEP 4:**

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the Enter key.

**STEP 5:**

A virtual point is created at the intersection of the projected lines offset to the segments (if a solution exists).

2 points and 2 bearings

This option creates a virtual point by using two points and two bearings.

On selecting **2 points and 2 bearings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected and accepted.

STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the Enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

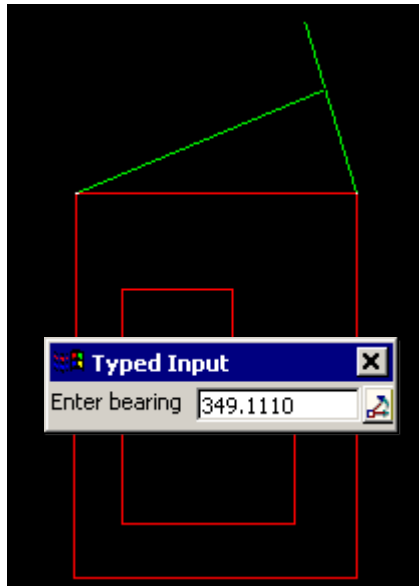

STEP 3:

The 2nd point to create the point from is selected and accepted.

STEP 4:

A bearing from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**

The virtual point created if there is a valid solution.

**2 points and 2 distances**

This option creates a virtual point using two points and two distances.

On selecting **2 points and 2 distances**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected and accepted.

**STEP 2:**

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

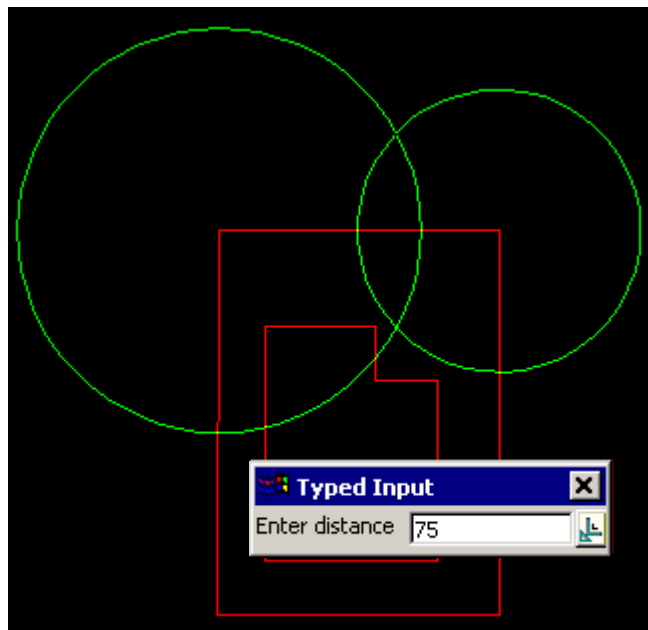

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The 2nd point to create the point from is selected.

**STEP 4:**

A distance from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**

As there is two solutions, the user can select the correct one depending on the method of construction. This can be done by the direct entry of distances or by use of the mouse.

1. Distance entry. After the entry of the 1st distance, the 2nd point is selected. Following the selection of the 2nd point, the 2nd radius is shown (rubber banding). The user can select one of the two solutions by choosing with a **LB** mouse click over the approximate position of the required solution. The solution chosen is the closest solution to the selected point. The final radius can then be entered via the keyboard by simply starting typing which brings up the radius entry panel automatically. This panel can also be activated by pressing the space bar.
2. Use of the mouse. The 1st point is selected and the radius entered by using the mouse or by direct entry from the keyboard. The 2nd point is then selected and the 2nd radius is displayed (rubber banding). A

solution can be chosen by selecting with a **LB** mouse click over the required solution. The final solution will be the closest one to the selection. **MB** to accept the intersection and create the point.

STEP 6:
The virtual point is created if there is a valid solution.

2 points with bearing and distance

This option creates a virtual point from a given point and a bearing, and a second point and a distance.

On selecting **2 points with bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:
The 1st point is selected and accepted.

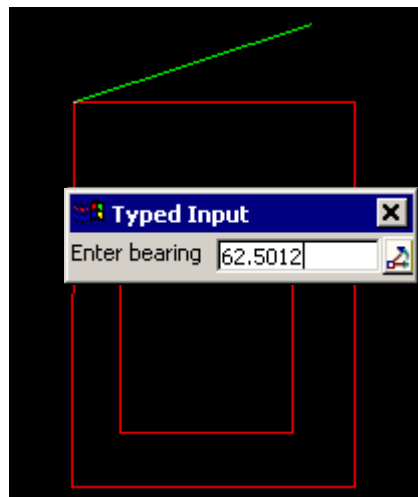

**STEP 2:**

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the Enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

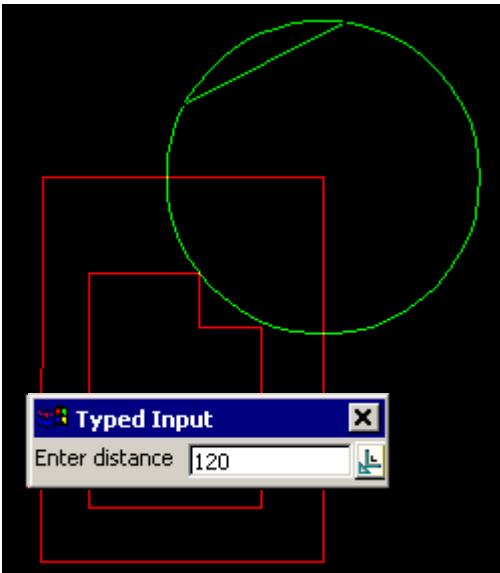

The 2nd point to create the point from is selected and accepted.

STEP 4:

A distance from the 2nd point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the Enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

A line is drawn between the two possible solutions.

STEP 5:

As there is two solutions, the user can select the correct one with the mouse.

**Snaps Cad Line**

This section of documentation is a work in progress and will be updated in subsequent releases.

For the option, 2 Points go to
Tangent
Perpendicular

[2 Points](#)
[Tangent](#)
[Perpendicular](#)

2 Points

This option creates a virtual line segment.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar**

The 2nd virtual point is selected in the same way as the 1st virtual point. The line is created after successful selection and acceptance of the 2nd virtual point.

Tangent

This option creates the virtual tangential line between two elements.

NOTE: When Selecting an arc or circle, the selection must be a line snap with direction. If a point is selected on the arc/circle the line will be draw between the selected points and not the tangent.

On selecting **Tangent**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position of the reference line is selected and accepted.

STEP 2:

The user selects and accepts the arc/circle segment with direction. The direction is required because there are two possible solutions. In this case, the direction was anti clockwise.

STEP 3:

After accepting the segment, a line is draw from the 1st selected point to the tangent point. Note that in this example, the arc is produced around so that a solution can be found.

Perpendicular

This option creates a virtual line by selecting a reference string and a reference point the create a line from the reference point perpendicular to the reference string.

On selecting **Perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A reference string is selected and accepted.

STEP 2:

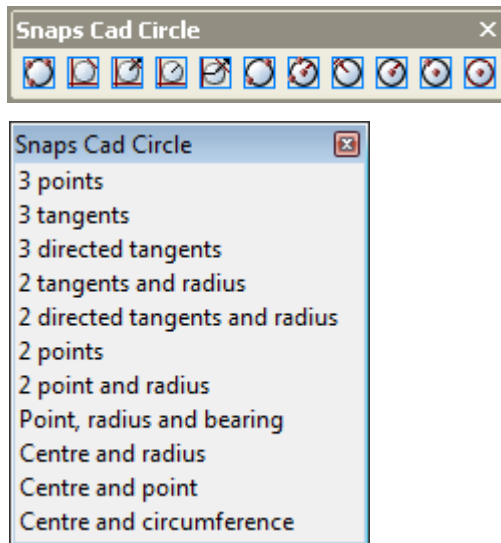

A line is drawn from the current mouse position perpendicular to the reference string

STEP 3:

After the final position is accepted, a virtual line is created which start from the selected position and perpendicular to the reference string.

Snaps Cad Circle

This section of documentation is a work in progress and will be updated in subsequent releases.

For the option *3 points*, go to

3 tangents

[2 point and radius](#)
[Point, radius and bearing](#)
[Centre and radius](#)
[Centre and point](#)
[Centre and circumference](#)

3 points

This option creates a virtual circle through three selected points.

On selecting **3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

**STEP 2:**

The 2nd point is selected and accepted.

After the 2nd point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

**STEP 3:**

The 3rd point is selected and accepted.

**STEP 4:**

A virtual circle is constructed through the three selected points

3 tangents

This option creates a virtual circle that is tangential to three selected segments.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

The 3rd tangent is selected and accepted.

STEP 4:

A virtual circle is constructed that touches each of the three selected tangents.

3 directed tangents

This option creates a virtual circle that is tangential to three selected segments. The segments are selected in order and with direction and the circle is to the right of the direction of the selected segments.

On selecting **3 directed tangents** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

The 3rd tangent is selected and accepted.

STEP 4:

If a solution exists, a virtual circle is constructed using the given information.

2 tangents and radius

This option creates a virtual circle with a given radius that is tangential to two selecting segments.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the 1st tangent with the mouse (Left Button) and accept it (Middle Button).

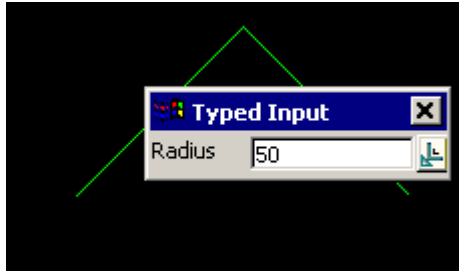

STEP 2:

Select the 2nd tangent and accept it.

STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the Enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.

**STEP 4:**

If a solution exists, a virtual circle is fitted touching the two selected tangents using the given radius.

**2 directed tangents and radius**

This option creates a virtual circle with a given radius that is tangential to two selected segments that are picked with direction.

On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

If a solution exists, a virtual circle is constructed using the given information.

2 points

This option creates a virtual circle by selecting two points that define the diameter of the circle.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor (cursor position taken as the other end of a diameter). This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected and accepted.

**STEP 3:**

The virtual circle is constructed through the two selected points. The two points define the diameter.

2 point and radius

This option creates a virtual circle of a given radius that goes through two selected points.

On selecting **2 point and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected and accepted.

**STEP 3:**

After the 2nd point is accepted, the Radius Input box will appear. The radius value is entered into the input box followed by the Enter key.

**STEP 4:**

If a solution exists, the virtual circle is fitted through the two selected points using the given radius.

Point, radius and bearing

This option creates a virtual circle of a given radius, a selected point on the circle and the bearing of the tangent to the circle at that point.

On selecting **Point, radius and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

After the 1st point is accepted, the **Enter radius** input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the radius has been entered, the **Enter bearing** input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The **Page Up** and **Page Down** keys can be used when the **Enter Bearing** input box comes up to add or subtract intervals of 90 degrees.

STEP 4:

If a solution exists, a virtual circle is fitted from the given bearing at the selected point using the

selected radius.

Centre and radius

This option creates a virtual circle of a given radius and a selected centre point

On selecting **Centre and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

The virtual circle is constructed through the centre point using the specified radius.

Centre and point

This option creates a virtual circle by selecting a centre point and then using the cursor to select a second point that is on the circle.

On selecting **Centre and point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

**STEP 2:**

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the

mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the point into the Input box and press the Enter key.

STEP 3:

A virtual circle is constructed using the two points defined by the user.

Centre and circumference

This option creates a virtual circle by selecting the centre point and giving a circumference value.

On selecting **Centre and circumference**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

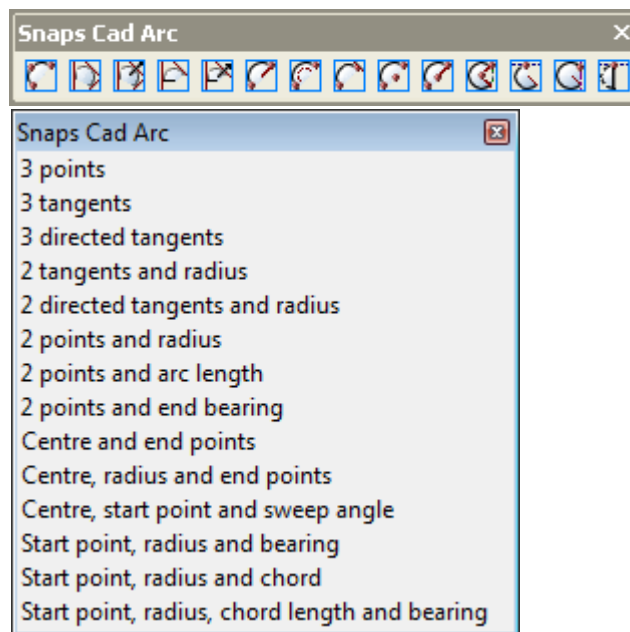

After the centre point is accepted, the **Circumference** Input box will appear. Type the circumference length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

A virtual circle is constructed using the centre point and the given circumference.

**Snaps Cad Arc**

3 Points

This option creates a virtual arc through three selected points and the first and third points are the start and end of the arc.

On selecting 3 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

The 2nd point is selected and accepted.

After the 2nd point is accepted an arc will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

STEP 3:

The 3rd point is selected and accepted.

**STEP 4:**

A virtual arc is constructed through the three selected points.

**3 Tangents**

This option creates a virtual arc that is tangential to three selected segments. The first and third segments are the start and end of the arc.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

STEP 4:

The virtual arc is constructed touching the three selected tangents.

3 directed tangents

This option creates a virtual arc that is tangential to three selected segments. The segments are selected in order and with direction and the arc is to the right of the direction of the selected segments. The first and third segments are the start and end of the arc.

On selecting **3 directed tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of the tangent. A user may reverse the direction of the tangent by selecting a tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**

If a solution exists, a virtual arc is constructed using the given information.

2 tangents and radius

This option creates a virtual arc with a given radius that is tangential to two selecting segments. This is the same as a fillet.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

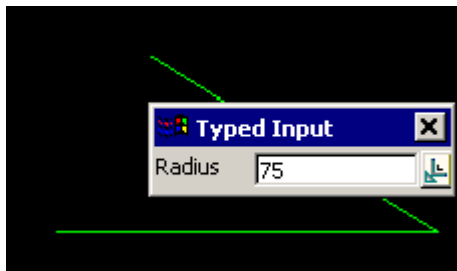

STEP 2:

The 2nd tangent is selected and accepted.

**STEP 3:**

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 4:**

If a solution exists, the virtual arc is fitted through the two selected tangents using the given radius.

2 directed tangents and radius

This option creates a virtual arc with a given radius that is tangential to two selected segments that are picked with direction.

On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the Enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 4:**

If a solution exists, the virtual arc is fitted through the two selected tangents using the given radius.

2 points and radius

This option creates a virtual arc of a given radius that starts and ends on two selected points.

On selecting **2 points and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.

2 points and arc length

This option creates a virtual arc of a given arc length that starts and ends on two selected points. On selecting **2 points and arc length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point

with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

After the start point is accepted, the Arc length Input box will appear. Type the arc length value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc length by measuring existing elements.

STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.

2 points and end bearing

This option creates a virtual arc that starts and end on two selected points and has a given bearing of the tangent at the end point (the end bearing).

On selecting **2 points and end bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

The 2nd point is selected and accepted.

STEP 3:

After the 2nd point is accepted, the Enter bearing input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.

STEP 4:

If a solution exists, the arc is fitted through the two selected points with the end point of the given bearing.

Centre and end points

This option creates a virtual arc by selecting in order, the centre point and the start and end points. The radius of the arc is the distance between the centre and the start point.

On selecting **Centre and end points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

STEP 2:

Select and accept the start point. This point defines the radius and the start of the arc.

STEP 3:

The end point of the arc is specified.

STEP 4:

The virtual arc is constructed using the given information.

Centre, radius and end points

This option allows the creation of a virtual arc given a centre point, radius, start and end points. This option creates an arc of a given radius by selecting in the centre point and the start and end positions.

On selecting **Centre, radius and end points** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

STEP 2:

A radius value is selected with the mouse or entered in via the keyboard. To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the Enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

STEP 3:

A start point defines the start of the sweep angle to define where to start the arc. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

**STEP 4:**

The end point of the arc is specified. The start and end points define the sweep angle to define the arc. The rubber banding of the arc will use the cursor position as the end position until a end point is selected and accepted. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The end point does not have to be on the arc itself. It is used to define the sweep angle.

**STEP 5:**

The arc is constructed using the given information.

**Centre, start point and sweep angle**

This option creates a virtual arc by selecting a centre point and a start points and giving a sweep angle. The radius of the arc is the distance between the centre and start point.

On selecting **Centre, start point and sweep angle**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

STEP 2:

The 2nd point is selected with the mouse or entered in via the keyboard. This point defines the radius as well as the start point of the arc. To specify the 2nd point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 3:

After the 2nd point is accepted, the **Sweep Angle** input box will appear. Type the sweep angle value into the input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

STEP 4:

The virtual arc is created using the information supplied

Start point, radius and bearing

This option creates a virtual arc of a given radius, starting at a selected point and bearing of the tangent at the start point and going for a given arc length.

On selecting the **Start point, radius and bearing** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

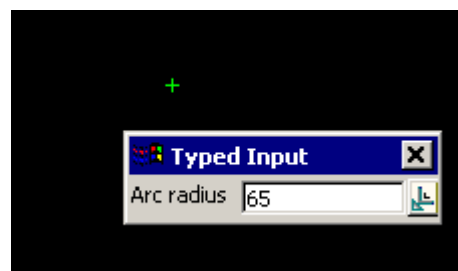

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the radius has been entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 4:**

After the arc length is accepted, the Bearing Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP5:**

The virtual arc is created with the given information.

**Start point, radius and chord**

This option creates a virtual arc of a given radius, starting from a selected point and with a given chord bearing at the start point and a given arc length.

On selecting **Start point, radius and chord**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

**STEP 2:**

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the arc radius is entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 4:**

After the arc length is entered, the **Chord Bearing** Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The **Page Up** and **Page Down** keys can be used when the **Chord Bearing** Input box comes up to add or subtract intervals of 90 degrees.

STEP 5:

A virtual arc is created with the given information.

Start point, radius, chord length and bearing

This option creates a virtual arc of a given radius, starting from a selected point, with a given bearing of the tangent at the start point and a given chord length from the start point.

On selecting **Start point, radius, chord length and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the radius has been entered, the **Chord Length** Input box will appear. Type the chord length into the Input box and press the enter key. The browse button  on the Input box can be used to define the chord length by measuring existing elements.

**STEP 4:**

After the chord length has been entered, the **Bearing** Input box will appear. Type the bearing of the start tangent into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**

The virtual arc is created with the given information.

5 Starting Up

The **Starting Up** chapter contains information about how to start **12d Model**, organising **12d Model** error logging and how to run chains and macros when starting up **12d Model**.

Go to [Initial Screens](#)
[Organizing Working Areas](#)
[Error Logging File](#)
[Running Macros and Chains on Start Up](#)

Initial Screens

When **12d Model** is installed from the **12d** Installation CD, the **12d** icon **12d Model 10** is created.

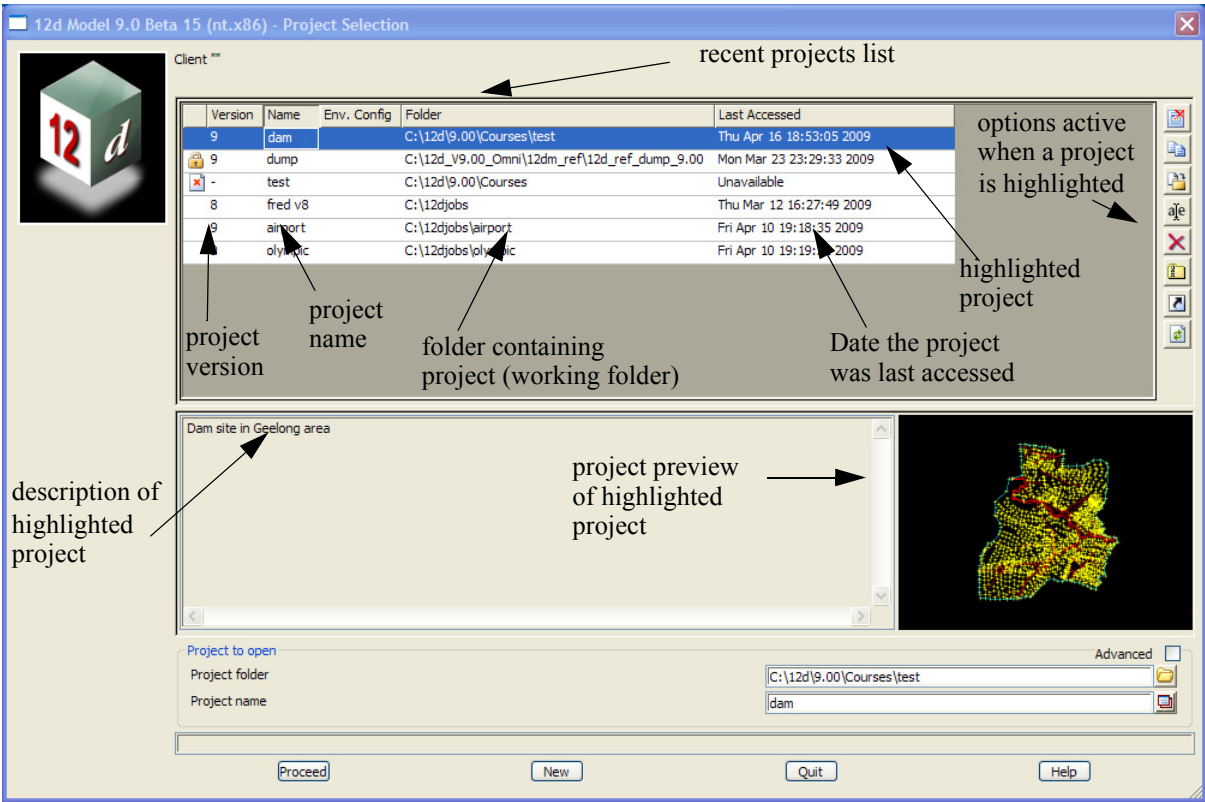

icon for 12d Model 32 bit exe

icon for 12d Model 64 bit exe

The **12d Model** icon is a **shortcut** to start **12d Model** and then attach to the folder C:\12d\10.00.

Clicking the **12d Model** icon starts **12d Model**. First the **12d Model** splash screen will appear and then the initial **12d Model** screen with the **Project Selection** panel.

Note

If this does not work, please contact your 12d Model administrator to check the procedure to be used on your system. For a detailed description on how to install 12d Model, please refer to the *Installing 12d Model* chapter in the *Getting Started* manuals.

To select a project is the **Recent projects list**, simply double click on the entry in the list and 12d Model will open the project up.

Alternatively, the Project folder and Project name fields can be used to select another project.

To open an existing project not on the *recent projects list*, simply provide

- (a) the name of the folder that the project is in (working folder)
- (b) the name of the project inside the working folder (working project).

If no folder is given, the project is assumed to be in the folder the user is currently in.

If the project does not exist, a new project is created.

The description of the functions of the fields and buttons in the **Project Selection** panel are:

Field Description	Type	Defaults	Pop-Up
Recent projects list	output	recent projects	
<i>names and folders of project recently select. Single clicking on an entry in the list displays the projects description in the Project description area. Double clicking on an entry in the list changes to this project</i>			
Project description	output		
<i>description of the project highlighted in the Recent projects list.</i>			

To create a **new** project, click on the **New** button which brings up the **Create New Project** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Advanced				
		tick box		
<i>if tick, environment configurations can be assigned to the project and extra panel fields are displayed to allow for this. For more information, please go to the section New Project Panel with Advanced Ticked in the chapter Projects.</i>				
<i>If not tick, no extra panel fields are displayed.</i>				
Project name		typed input		
<i>name of the new project to be created.</i>				
Folder		folder box	current folder	select folder panel
<i>if Create working folder is ticked, a folder with the same name as the project is created in the folder given in this panel field, and the project will be created inside this folder with the same name as the project. This is to encourage the habit of creating a folder of the same name of the project and then creating the project inside the folder.</i>				
<i>If Create working folder is not ticked, the project is created in the folder given in this panel field.</i>				
Create working folder		tick box		
<i>if tick, a folder of the same name as the project is created in the folder Folder, and the project is created inside this folder. The folder with the same name as the project is then the working folder.</i>				
<i>If not tick, the project is created in the folder Folder and this folder is the working folder.</i>				
Description		typed input		
<i>a description of the project can be typed into this field. This is stored with the project.</i>				
Create		button		
<i>after selecting this button, the new project created in either the Folder or if Create working folder</i>				

is ticked, inside a folder created in the **Folder** of the same name as the project.

12d Model then opens the newly created project.

Open button

goes back to the **Project Selection** panel for opening an existing project (see the section [Initial Screens](#)).

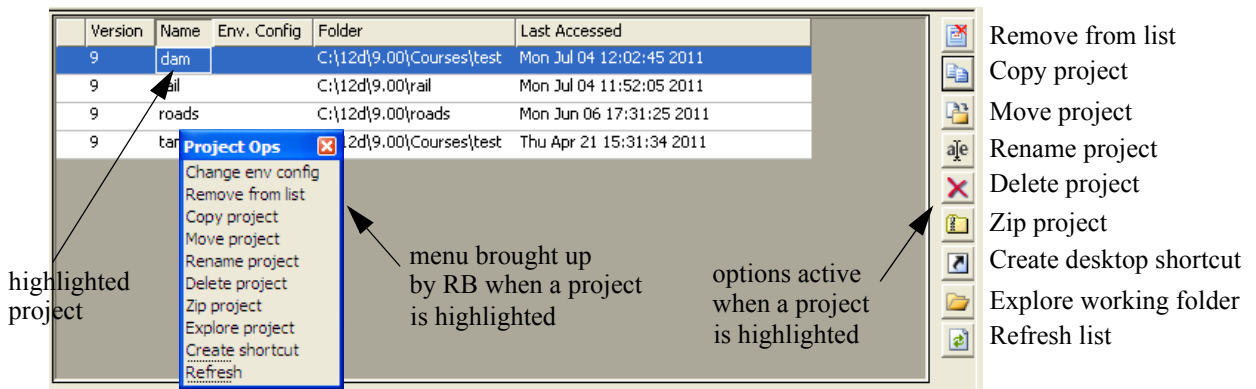

Quit button

exit out of **12d Model**.

For information on options when a project is highlighted, go to the next section [Options on Highlighted Project in Selection Panel](#)

Options on Highlighted Project in Selection Panel

When a project is highlighted in the list of recent projects, icons for options are activated on the right hand side of the **Project Selection** panel, and a **Project Ops** menu (which contains the same options), can be brought up by clicking **RB** anywhere in the recent projects list area.

Remove from list - remove the project from the *recent projects* list

Copy project - copy the project and the working folder

Move project - move the project and working folder to a new folder

Rename project - rename the project and the working folder

Delete project - delete the project and the working folder

Zip project - zip up the project and the working folder

Create desktop shortcut - create a shortcut on the desktop that starts **12d Model** and opens the project - see [Project Shortcuts](#)

Explore working folder - open Windows Explorer and show the contents of the working folder

Refresh list - refresh the *recent projects* list

Change env configuration - change the environment configuration. This is only available on the **Project Ops** menu.

These options are documented in the section [Options Active When Project Highlighted](#) in the chapter [Projects](#).

Go to the next section [Organizing Working Areas](#)

Organizing Working Areas

For each project, 12d Model creates a unique sub-folder of the working folder with the name consisting of the project_name followed by **.project**. For example, for the project **Olympic**, and folder called **Olympic.project** is created.

This sub-folder (Olympic.project) is called the **project area**. All the internal 12d Model information for that project is kept inside the project area.

All outputs, reports and plots are written to the working folder (the folder containing the project) and are **not** held inside the project area.

Hence to get a complete backup of the project and all associated information, it is best to **backup the entire working folder**.

The project name, which can be up to 256 alphanumeric characters and can include spaces, must be unique within the working folder but other folders may include 12d Model projects with the same name - these projects are distinct and are not related in any way.

There is no limit to the number of projects in a particular working folder but because all the outputs, reports and plots for each project in the same working folder would be mixed in together, **it is recommended to have each project in its own working folder**. That way the inputs files, output files, plots, reports etc. from the separate projects do not end up in the same working folder. Each separate working folder can then be easily backed up.

As an example, if three unrelated projects - olympics, airport, and dam - are to be created in a folder called 12djobs, it is suggested that the project **olympic** is created in a **sub folders** of 12djobs called **olympic**, **dam** is created in a **sub folders** of 12djobs called **dam** and **airport** is created in a **sub folders** of 12djobs called **airport**.

To help users adhere to this convention, when creating new projects, there is a Create working folder tick box which if ticked, will first create a folder of the same name as the project being created and then create the project in that folder.

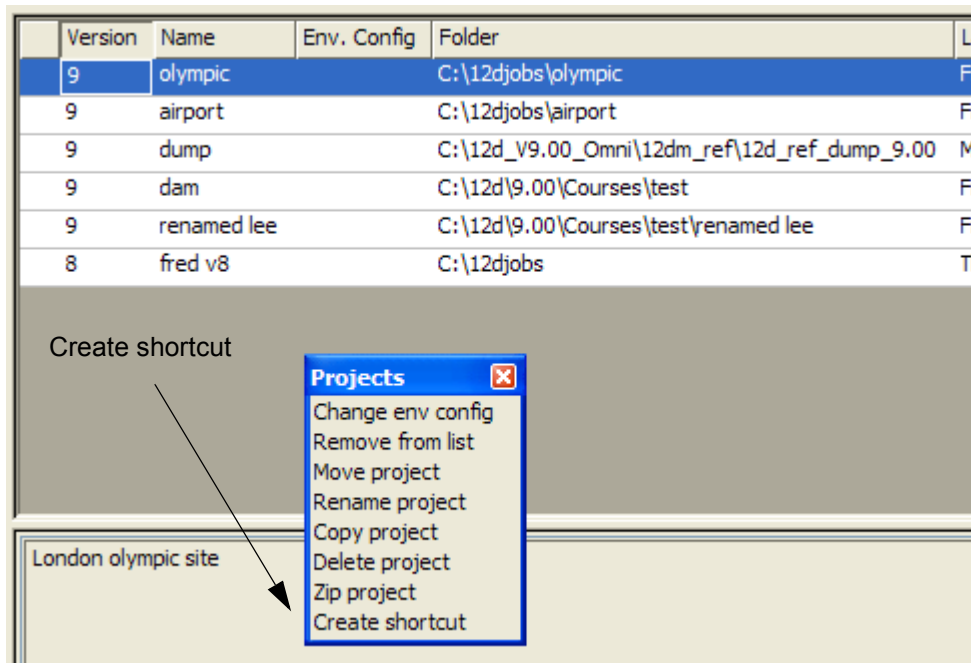

Project Shortcuts

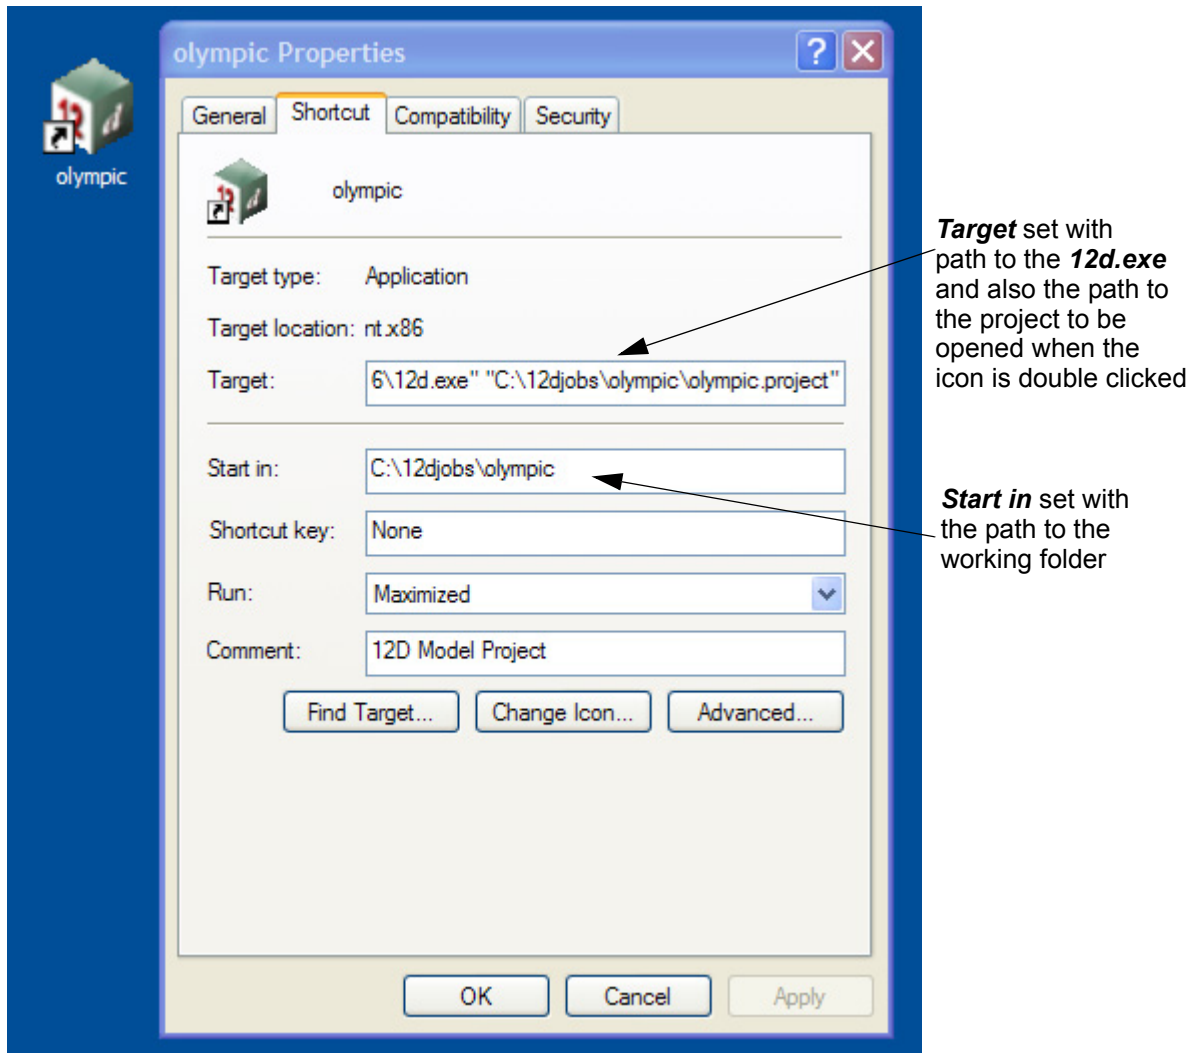

The list of most recent projects makes it very easy for 12d operators to get into their projects.

However if there is a folder of projects, or even a particular project, that a user wants to get into by simply double clicking on an Icon on the screen, then a Windows shortcut can be used to do it.

The easiest way to create the shortcut is to first make sure that the project is in the recent projects list. To do this, just open up the project and then exit **12d Model**.

Then start up **12d Model** again by clicking on the **12d Model 9** icon on the desktop, highlight the project in the **recent projects list** and then click RB to bring up the Projects menu and select **Create shortcut**. This will create an shortcut on the desktop with the name of the project, and the shortcut set to open up the project when it is double clicked.

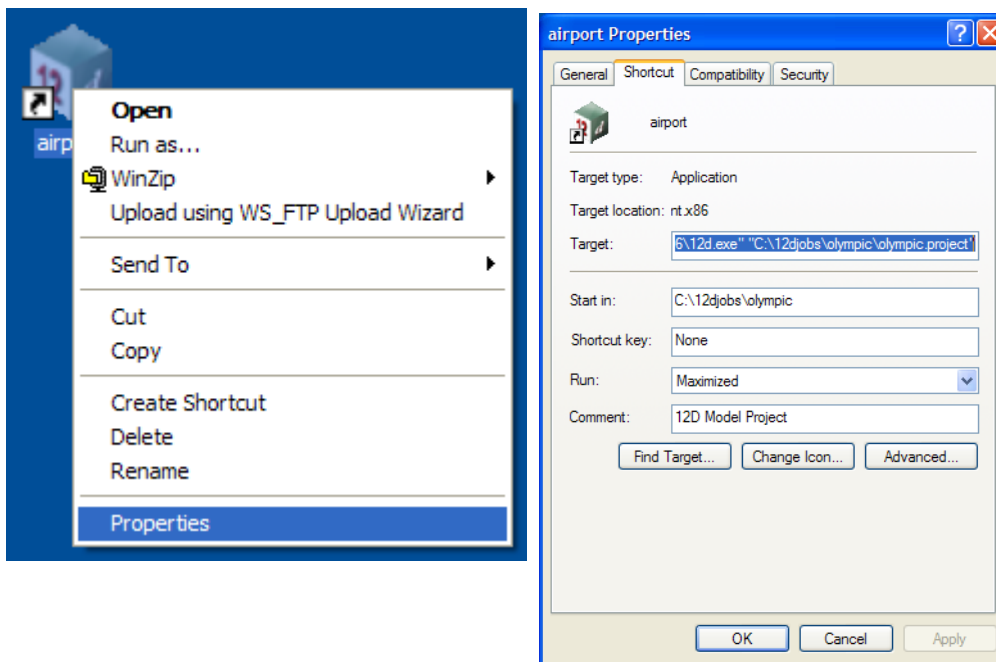

This can also be done by hand by copying a **12d Model 9** icon that is already on the screen, rename the copied icon to the name of the project (say *airport*).

The Properties for the icon *airport* must now be modified to point to the project *airport*

To display and modify the properties of an icon, click RB over the icon and select *Properties* from the menu.

Click on the *Shortcut* tab

The Properties for the icon *airport* can now be modified.

If an icon is to start in a given folder, then the **Start in** field is set to the desired folder.

For example, if the **12d Model** project *airport* was in the folder "12djobs\airport", set the **Start in** for the icon *airport* to:

"C:\12djobs\airport"

The icon *airport* would then automatically start in the folder **C:\12djobs\airport**

Note that if the pathname for **Start in** contain spaces, then it must be enclosed in double quotes ("").

If the *airport* icon was double clicked on, it would now attach to the working folder *airport*

Only the appropriate project would then need to be selected from the project field of the **12d Model Project Selection** panel

Further, if a project such as *airport* already exists in the folder, then by setting the **Target** field, the icon can be set so that **12d Model** starts up in that existing project.

If the **Target** for the shortcut has the **project_name** added after the path to 12d.exe, then **12d Model** will actually start up with that project opened. The project_name can be a path name.

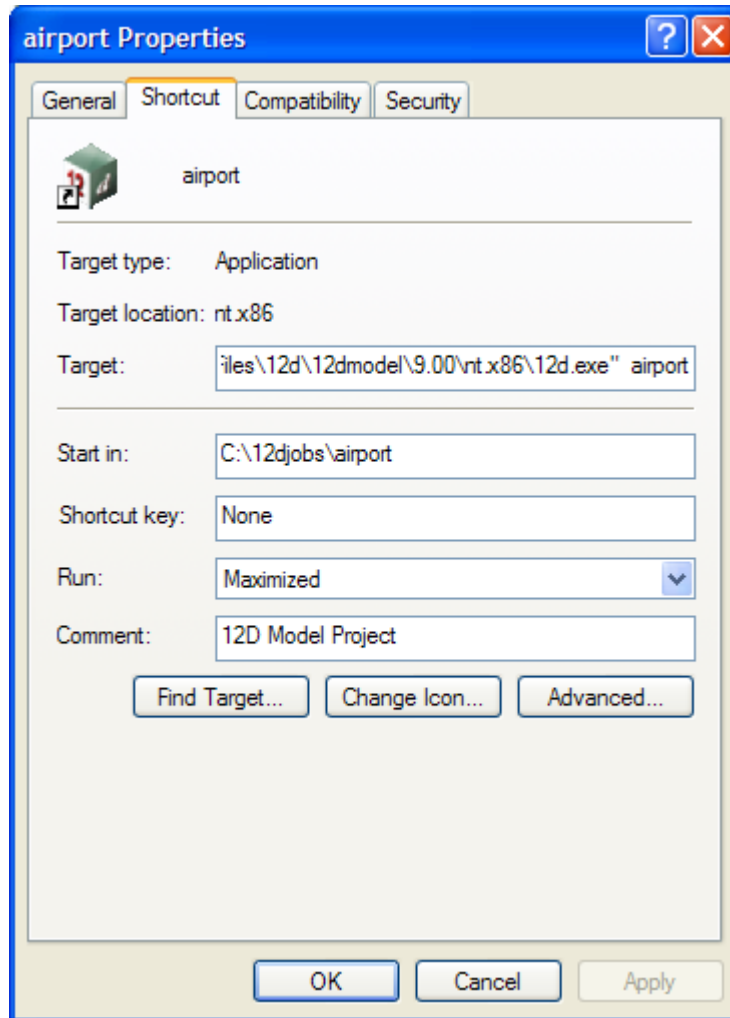

For example, the **Target**:

"C:\12d\12dmodel\10.00\nt.x86\12d.exe" airport

would automatically open the project *airport* in the **Start in** folder of the shortcut.

Note that if either the pathname for the Target or the project_name contain spaces, then they must be enclosed in double quotes ("").

The following picture shows the Properties setting for **Target** and **Start in** for the *airport* icon so that double clicking on *airport* would automatically start **12d Model** with the project *airport* in the folder **C:\12djobs\airport**

Environment Variables Shortcut

If a file of 12d Model environment variables has been set up by the user (see section [Environment Variables](#) in Appendix [Setting Up and Configuring 12d](#)), then instead of setting the environment variable ENVIRONMENT_4D to point to the file or setting it up with the default name, env.4d, the environment file can be passed to **12d Model** using the **Target** of the icon properties.

For example, the **Target**:

```
C:\12d\12dmodel\10.00\nt.x86\12d.exe -env F:\12d\env.4d
```

would fire up 12d using the file of environment variables called F:\12d\env.4d

The **Target**:

```
C:\12d\12dmodel\10.00\nt.x86\12d.exe -env F:\12d\env.4d airport
```

would fire up 12d using the file of environment variables called F:\12d\env.4d **and** also automatically open the project **airport** in the **Start in** folder of the shortcut.

Again if any of the pathnames contain spaces, then they must be enclosed in double quotes ("").

Please continue to the next section [Error Logging File](#).

Error Logging File

When **12d** Model starts up, it tries to create an **error logging file**, called

log?????.4de

where **?????** is a hashed number using your login name, process id & the current time.

When **12d** Model terminates, the error log file is deleted if no errors were logged.

The **folder** that the error log file is created in is given by the environment variable LOG_DIR_4D

If LOG_DIR_4D is not used, **12d** Model tries to create the log file in the current folder, the HOME folder, the TMP folder and the TEMP folder.

If creating a **error log file** fails in all these areas, **12d** Model will not start up. This should never happen.

Please continue to the next section [Running Macros and Chains on Start Up](#).

Running Macros and Chains on Start Up

To allow for tailoring *12d Model* when a new project is created or an existing project opened, *12d Model* runs user supplied files of macros and/or chains.

For **new** projects, the default name of the file is

macros.4d

This can be changed to a different file by setting the environment variable

`RUN_MACROS_FILE_4D` *file_of_macros_to_run_for_new_projects*

For **existing** projects, the default name of the file is

project_macros.4d

This can be changed to a different file by setting the environment variable

`RUN_PROJECT_MACROS_FILE_4D` *file_of_macros_to_run_for_existing_projects*

(the environment variables can be set on the **Extra A** tab of the env.4d editor - see [env.4d](#))

The files consist of macros and/or chains, one per line, where

for macros, just the *name of the macro* is needed on the line

and for chains, the command **run_chain** *name_of_the_chain* is needed on the line.

The macros and chains are run in the order that they occur in the file.

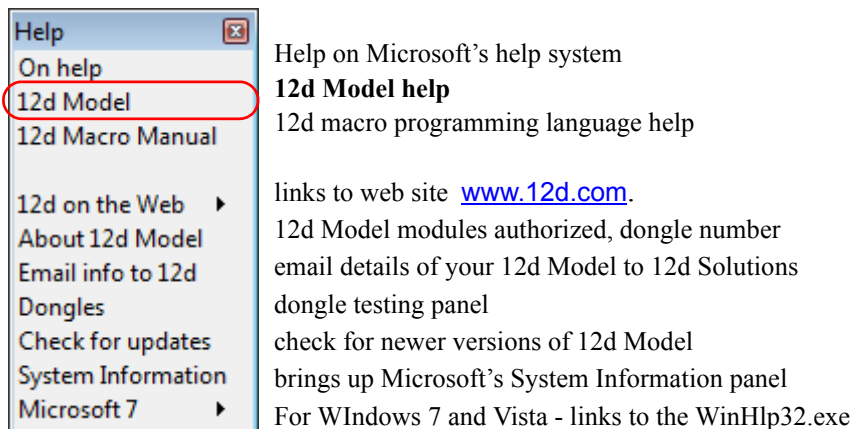

To return to the beginning of this chapter, click on [Starting Up](#).

6 12d Model Help

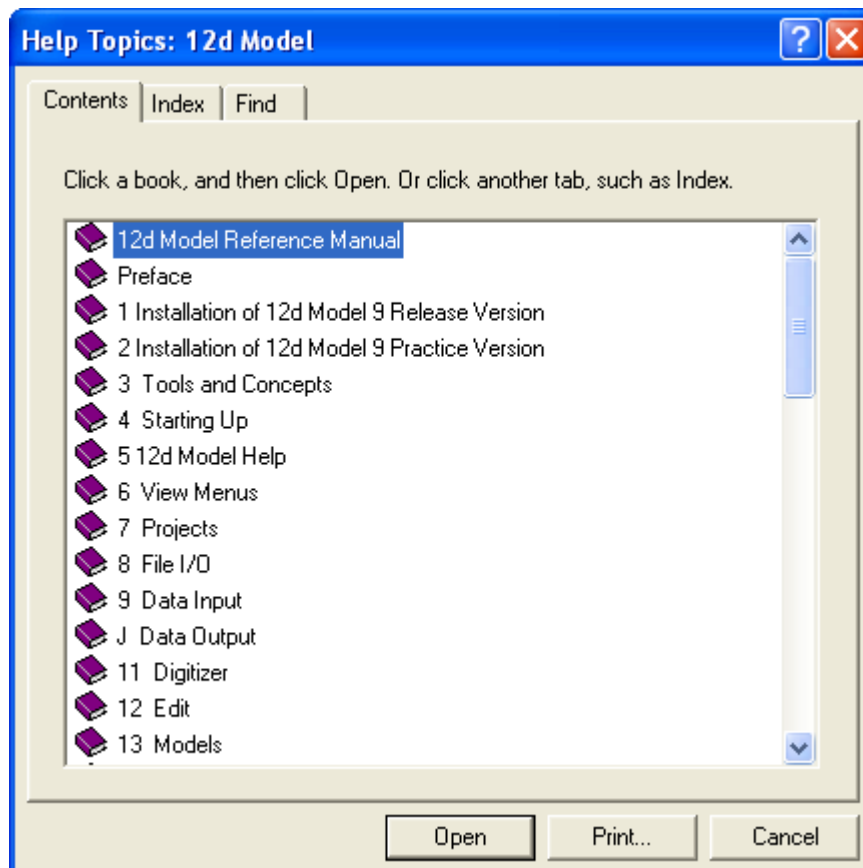

Position of option on menu: Help =>12d Model

From *12d Model V5.0* onwards, the 12d Model Reference manual has been supplemented by electronic **Help** accessed from within *12d Model* (also know as the **12d Model** context sensitive Help).

The entire *12d Model Help* manual can be accessed by selecting *12d Model* on the **Help** menu item on the main *12d Model* menu.

Clicking on 12d Model brings up **Help Topics: 12d**

The panel **Help Topics: 12d** is actually using Microsoft's **WinHlp** system and it allows you to look

at the overall structure of the *12d Model Help* and access any part of it. More information on using the tabs **Contents**, **Index** and **Find** will follow in the next section.

Alternatively, individual topics for a panel or menu can be invoked by pressing the F1 key whenever the focus is on the menu or panel, or by clicking on the *Help* button on any *12d Model* panel (see [F1 Key](#)). This is the *context sensitive* nature of the **12d Model Help**.

For some options, there is also additional help files and videos. This is denoted by a * after **Help** on the **Help** button. That is **Help*** (see [Extra Help](#)).

It is also possible to have a **Help** button and **F1** key available for **12d Model** macro programs written by 12d Solutions or by Users. Please see the *12d Model Macro Language Programming* manual for more information on this feature.

Note: The *12d Model Reference* manual is available in pdf on the *12d Model* installation DVD, or on the 12d web site www.12d.com.

More information on the **Help** system will now be given in the next section [Contents](#).

and the following sections

[Index](#)

[Find](#)

[Panel Help Button](#)

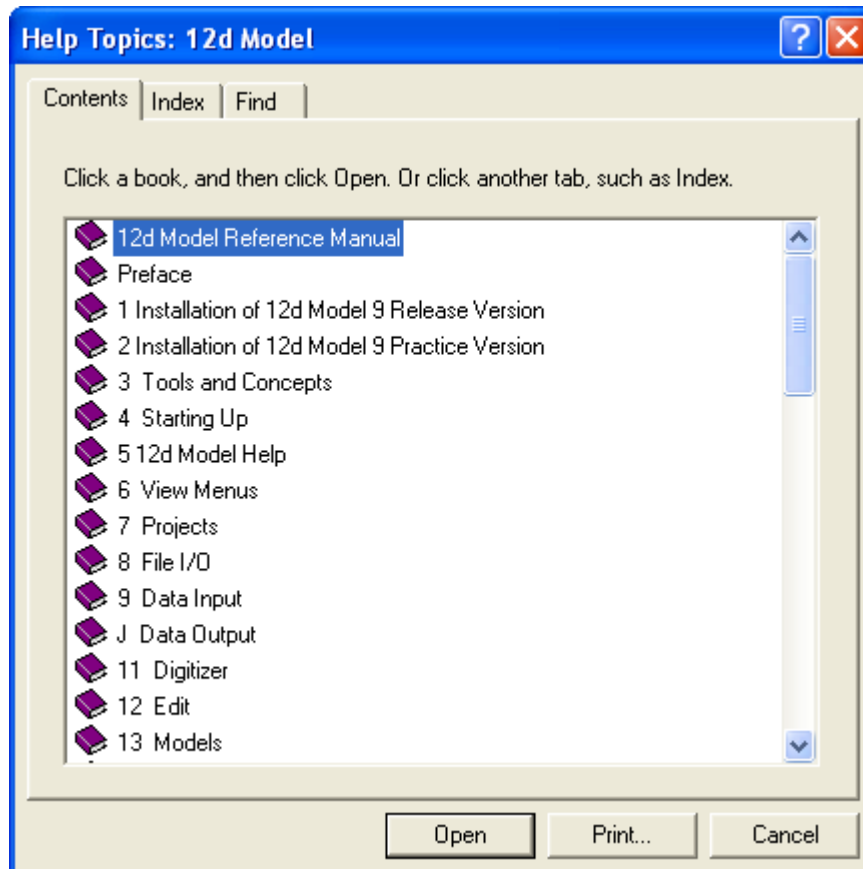

[F1 Key](#)

[Navigating in Help](#)

[Extra Help](#)

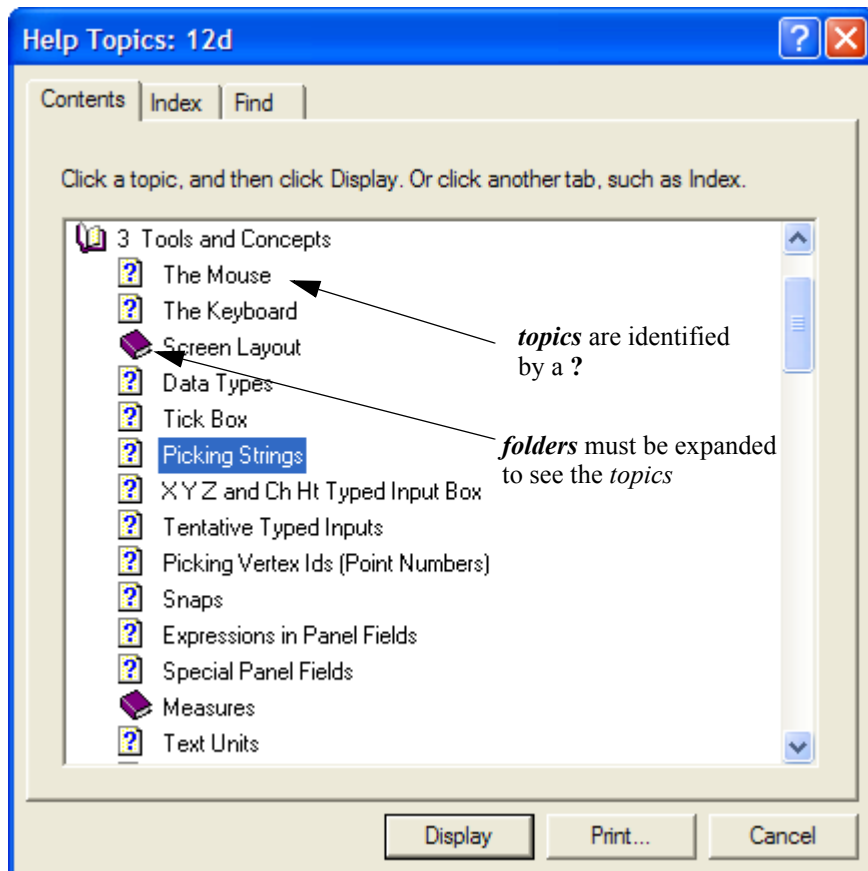

Contents

The **Contents** tab allows you to look at the overall structure of the *12d Model Help* and access any part of it.

Warning - only *topics* in the *Contents* can be viewed in *Help* so any folders in *Contents* folders must be expanded until *topics* are displayed. *Topics* can be easily identified because they have a question mark beside them indicating that *Help* is available and can be viewed.

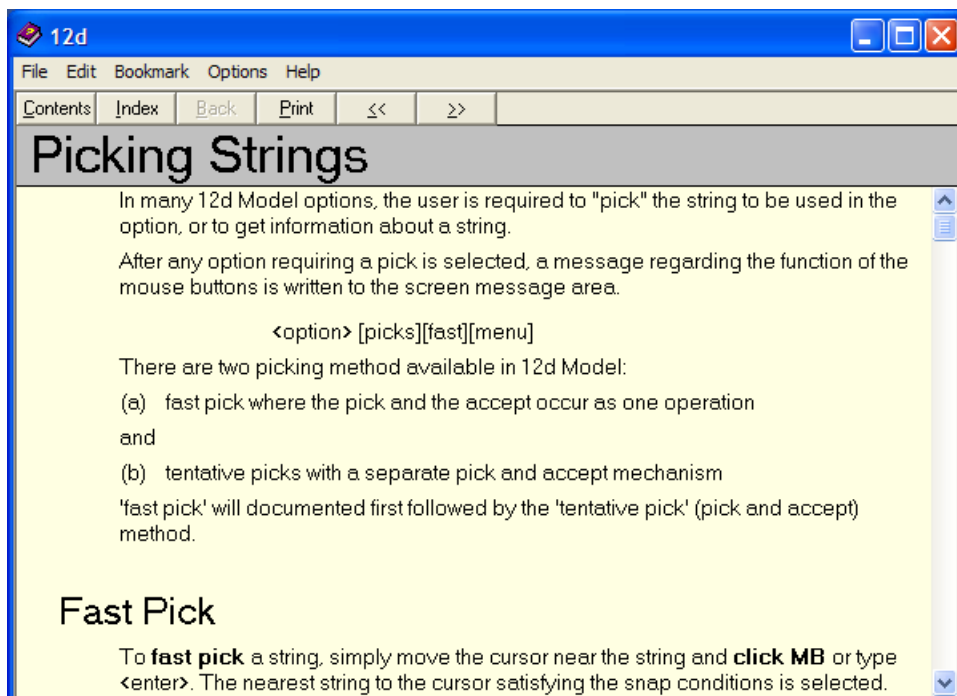

For example, double clicking on ***Tools and Concepts*** expands the next level of ***Tools and Contents***.

and topics are *The Mouse*, *The Keyboard* etc.

Double clicking on the topic **Picking Strings** will then display the topic.

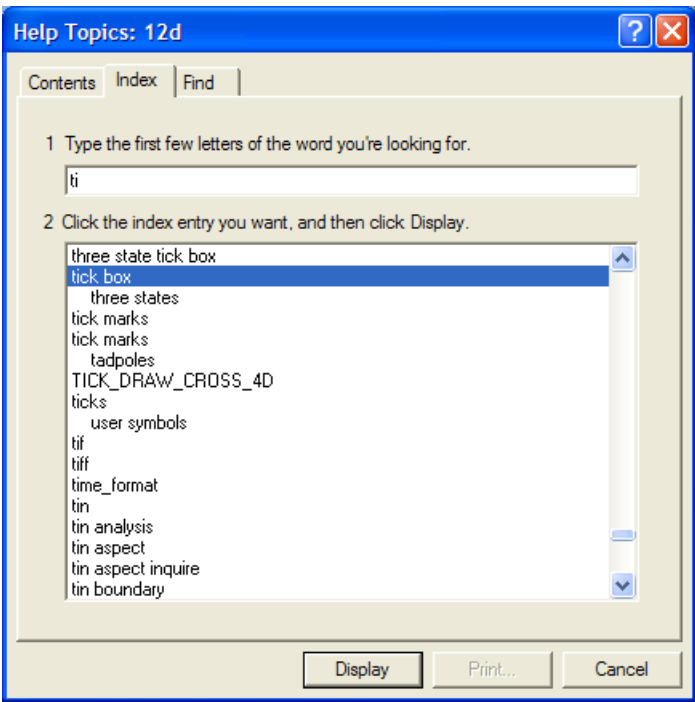

The **Contents** then disappear leaving *Help* open at the selected topic.

Double clicking on **Contents** on the top of the *Help* will bring the Contents listing back up.
More information on the **Help** system will now be given in the next section [Index](#).

Index

The *Index* tab searches through all entries in the Index of the Help. As the first few characters of the required entry are typed in, the matching index entries are displayed.

Double clicking on the displayed entries will go to the topic in the Help containing the selected index entry. If more than one topic includes the index entry, then the list of topics is displayed.

If the index has sub-indices, they can be searched by first typing in the main index followed by a comma, then a space and the first few characters of the sub-index.

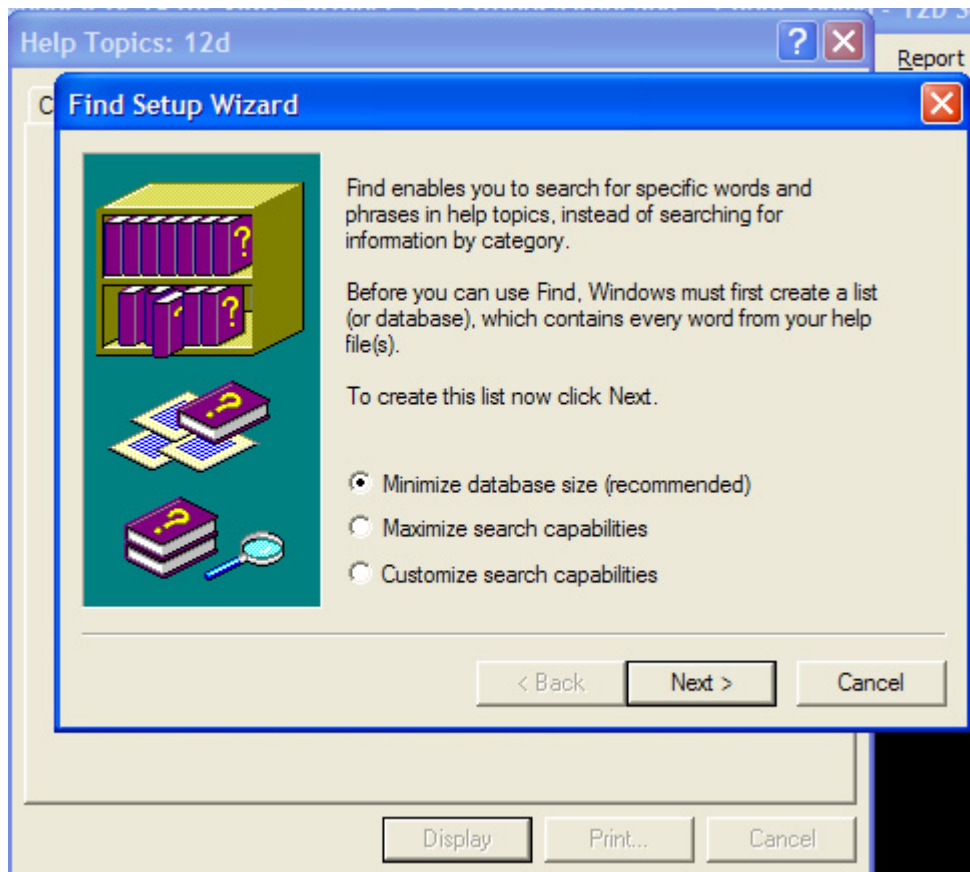

More information on the **Help** system will now be given in the next section [Find](#).

Find

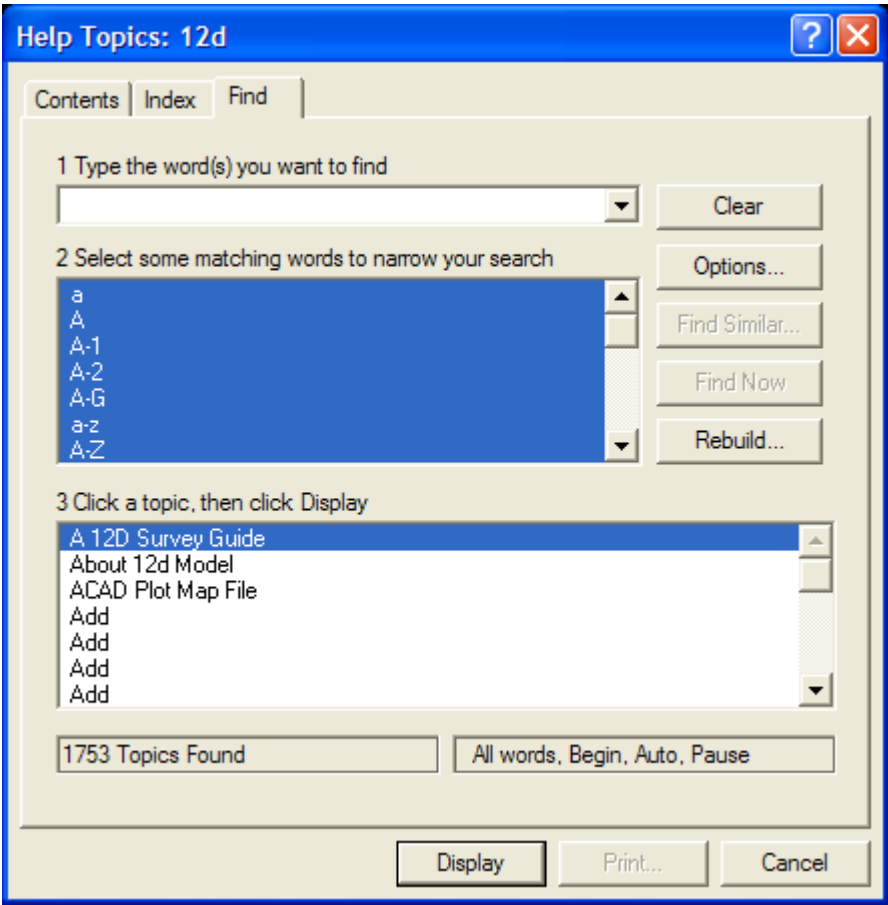

The most powerful searching method for the *Help* system is *Find*.

Simply click on the *Find* tab to search for words or phrases that may be contained in a Help topic.

If *Find* is being invoked for the first time, the **Find Setup Wizard** runs to create an index of every word in the Help.

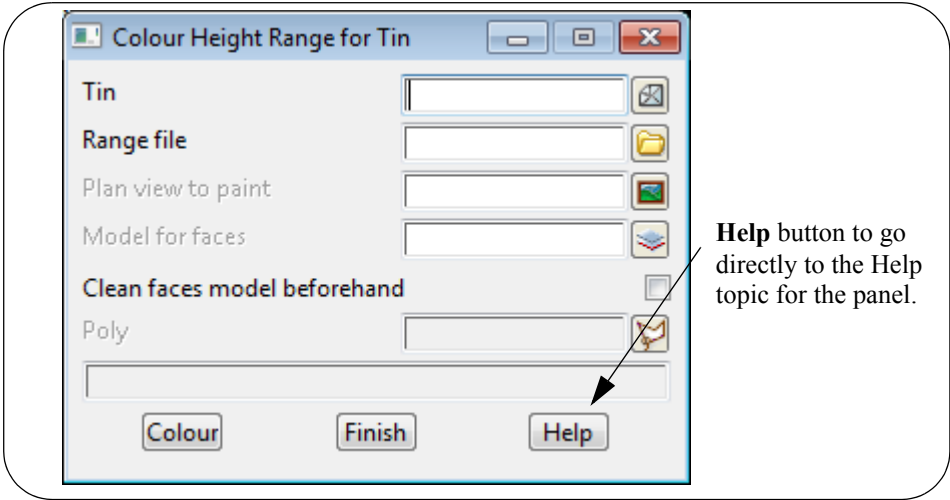

From then on, selecting the *Find* tab goes straight to the *Find* screen.

More information on the **Help** system will now be given in the next section [Panel Help Button](#).

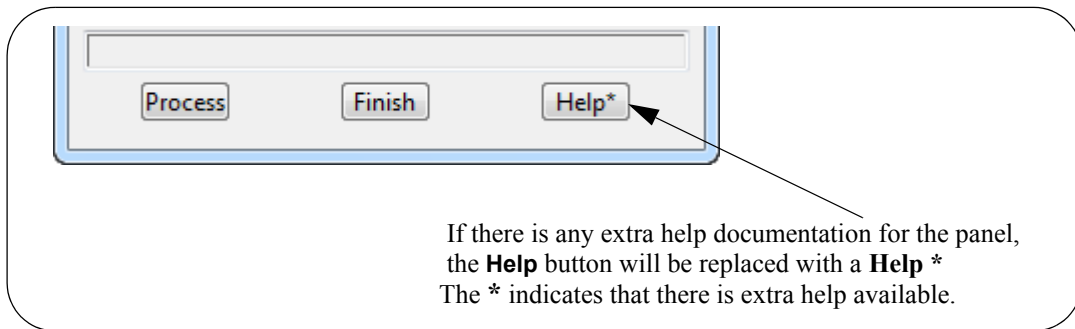

Panel Help Button

Every panel has a **Help** button which when selected goes to the *topic* describing that panel.

The default *12d Model Help* is all in one *Winhlp* file but a method for displaying additional help information exists so 12d Solutions, 12d Distributors and Users can supply additional (extra) **Help** information.

If there is extra help available for an option, then **Help*** will appear instead of **Help** on the panel button.

Information on how the extra help is set up is given in the section [Extra Help](#).

More information on the **Help** system will now be given in the next section [F1 Key](#).

F1 Key

Another method of invoking **Help** is by using the **F1** key as follows:

when a **menu** or **panel** is on the screen and has focus (the menu or panel title area will be highlighted), or the cursor is over an item on a **toolbar**, pressing **F1** will bring up the *help* for that menu, panel or toolbar item.

Warning - some of the items on the *Strings* menu automatically start up a string select and change the focus from the panel to a View. This means that pressing F1 will bring up the Help for the View and not the Help for the panel.

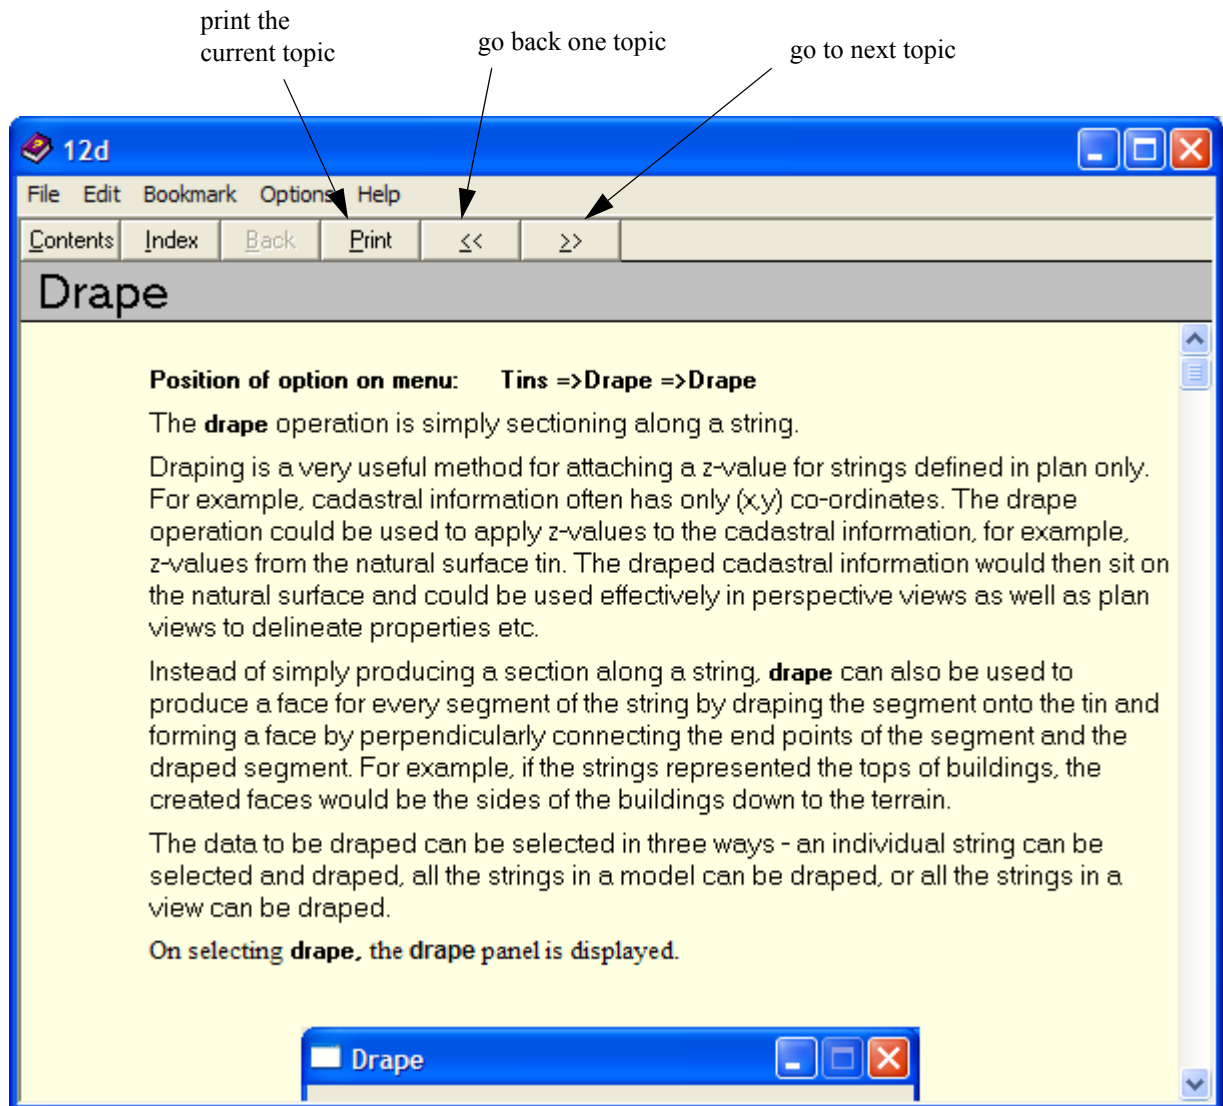

To get **Help** for such a panel, click on the panel to bring the focus back to the panel before pressing F1. The top of the panel will highlight showing that it has focus.

More information on the **Help** system will now be given in the next section [Navigating in Help](#).

Navigating in Help

Once at a *topic* in the Help, the << and >> buttons at the top of the Help topic will go to the previous and next Help topics respectively.

Individual Help topics can be printed by clicking **Print** at the top of the Help page.

Because it is difficult to print large sections of Microsoft's Help system, a PDF file of the entire **12d Model Reference** Manual has been created and can be used to print out large sections of the manual.

The **12d Model Reference** Manual PDF file is on the *12d Model 9 Installation DVD* in the folder Documentation\Reference_Manual.

More information on the **Help** system will now be given in the next section [Extra Help](#).

Extra Help

The default context sensitive **12d Model Help** is all in one help file supplied by **12d Solutions** but a method for displaying additional help information exists so **12d Solutions**, **12d Distributors** and **Users** can supply additional (extra) **Help** information. This extra information can also be supplied by **12d Model** macros written by **12d Solutions** or **Users**.

How to Set Up Extra Help

Any extra help for an inbuilt panel (that is, one not created by a macro) is placed in a folder with the same name as the dump name for the panel without the ending after the "." (to get the dump

name, see [Dumping a Panel, Creating a Screen Layout File or Default File](#) in the chapter [Tools and Concepts](#) in *12d Help* or the *12d Model Reference manual*).

For macros, created by Users or 12d Solutions, there can only be the same Help button for any panels created by the macro and the extra help for the macro is placed in a folder with the same name as the macro without the ending "4do" after the "." **and** with any blanks or non alphanumeric characters replaced by a underscore ("_"). For example, the extra help files for the macro called "testing help (3) system.4do" go in a folder called testing_help__3__system. Note there is an underscore for the blanks and the "(" and ")" in the macro name.

The extra help files for an inbuilt panel or macro can have *any name* and can be a pdf, wmv, avi, txt etc.

For example, for the panel **Project Tree** brought up by selecting **Project =>Tree**, the extra documentation would be in a folder called **Project_Tree**.

The folder of extra help for a panel, is then placed in any one of the three places:

- (a) in the *Help* folder in the 12d Model installation area: For example, for version 10

c:\Program Files\12d\12d Model\10.00\Help

- (b) in a folder called *Help* inside the *Set_ups* folder in the 12d Model installation area. For example

c:\Program Files\12d\12d Model\10.00\Set_ups\Help

or

- (c) in a folder called *Help* inside the *User* folder in the 12d User area. For example

c:\12d\10.00\User\Help

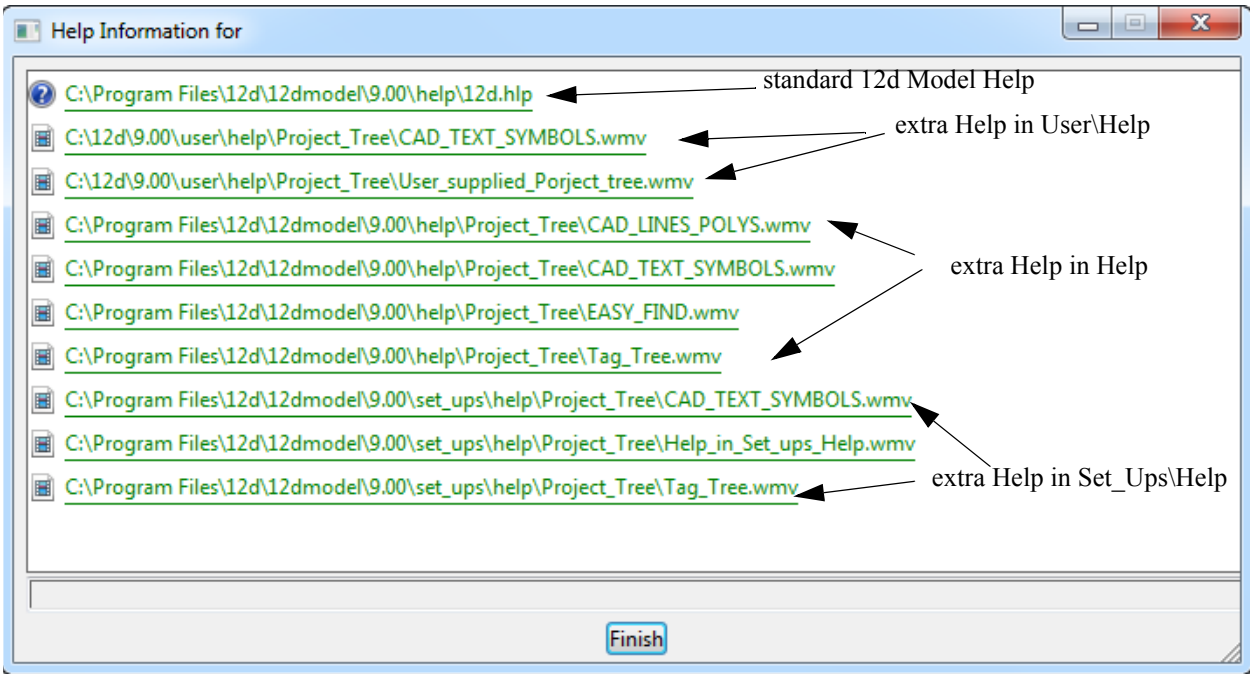

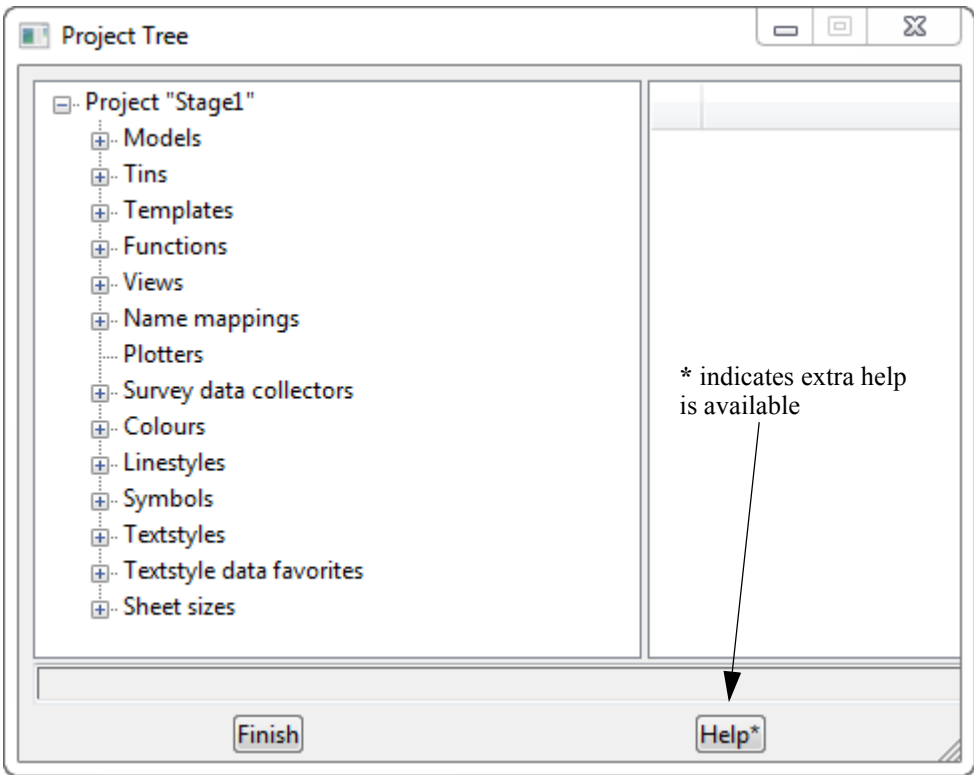

For an inbuilt panel an macro, each of these areas is searched and if any extra help is found, it is listed with the full path to each extra help file.

If there is any extra help for a inbuilt panel or macro, the **Help** button on the panel will be replaced with a **Help *** button. The * indicates that there is extra help available.

When you click on the **Help *** button, you will get a list of all the extra help files for that inbuilt panel or macro with the full pathname to the extra help. Clicking on the file name will bring up that extra help.

For example,

Users Own Extra Help Files

Note that users can also have their own extra help files and the files are simply placed in the correctly named folder under User\Help.

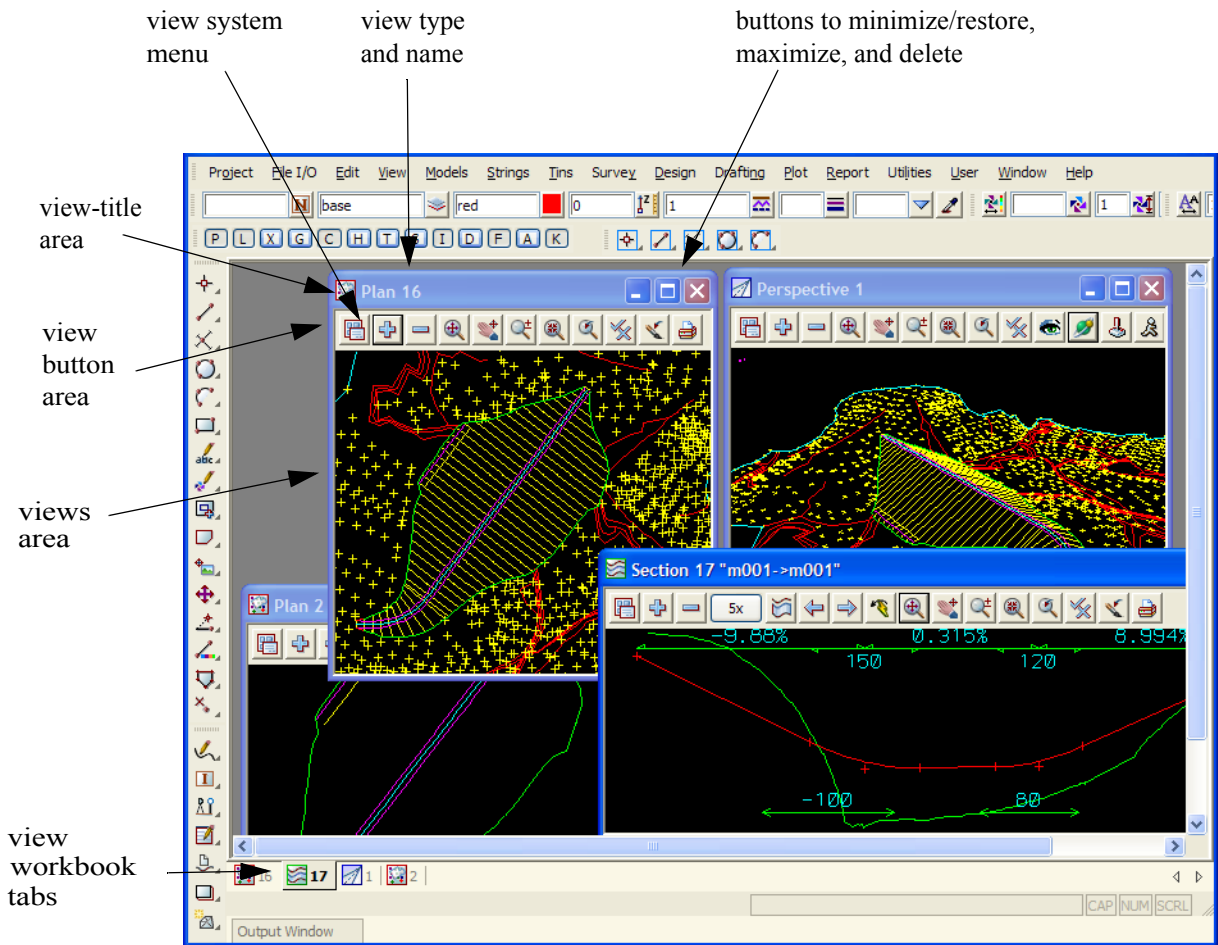

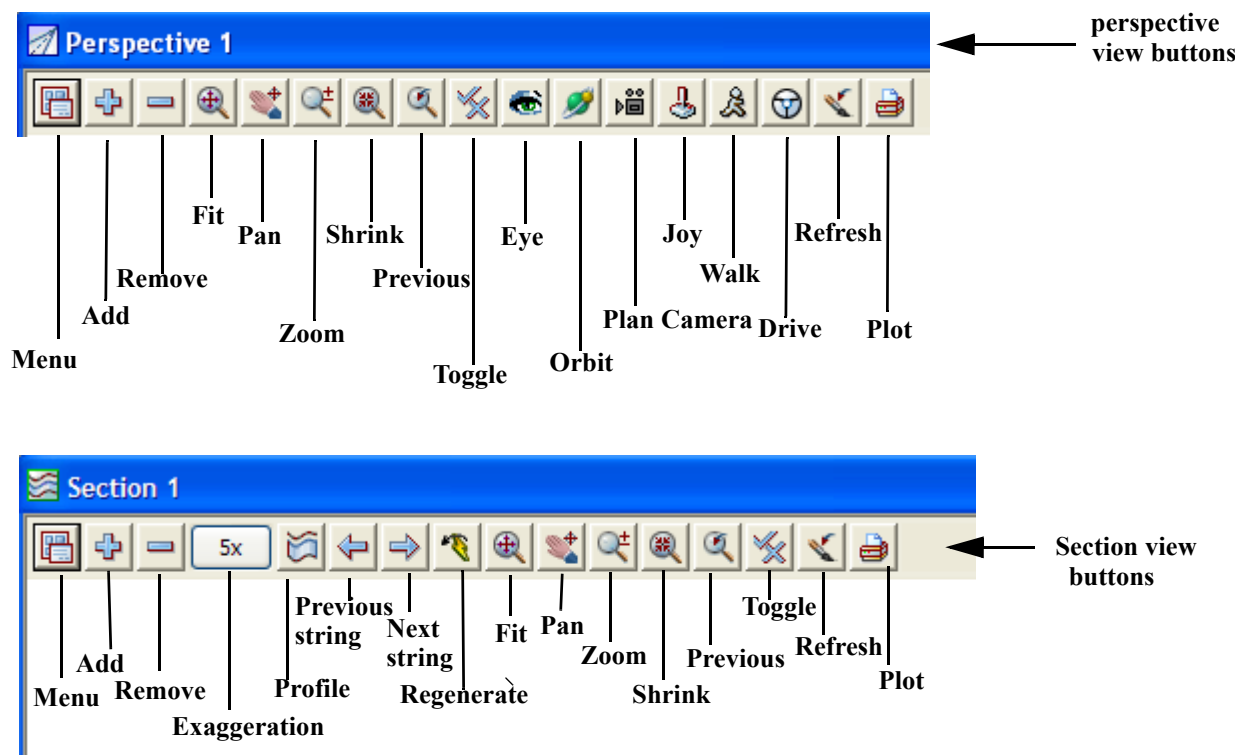

7 View Menus

Views are the screen drawing areas for **12d Model** and come in three flavours - plan, perspective and section. Views can be created and deleted as required by the user and there is no limit to the number of views on the screen. The views can overlap and be minimized.

Each view has a unique name of up to two hundred characters.

Each view has a *view title area* which is used to display the view name and a *view button area* which displays the view buttons.

The *View Buttons* are documented in the section [View Buttons](#)

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the View menu appears.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type. The plan, perspective and section View menus are

Plan View Menu

Perspective View Menu

Section View Menu

The View menu is removed by selecting the **[X]** button or if the View menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the View menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

For further documentation on the options on the View menus, please see:

for the option *Models*, go to [Model Ops](#)

<i>Settings</i>	Plan View Settings or Perspective View Settings or Section View Settings
<i>Redraw</i>	Redraw

Models

Position of menu:	Plan View Menu	View => Models =>Models
Position of menu:	Section View Menu	View => Models =>Models
Position of menu:	Perspective View Menu	View => Models =>Models

Models is a walk-right option which lists the models currently attached to that view.

If a model is selected from the displayed list, the model will be redrawn on the view. It will also be brought to the top of the display list, i.e., it is in the foreground and all the other models on the view are drawn before it.

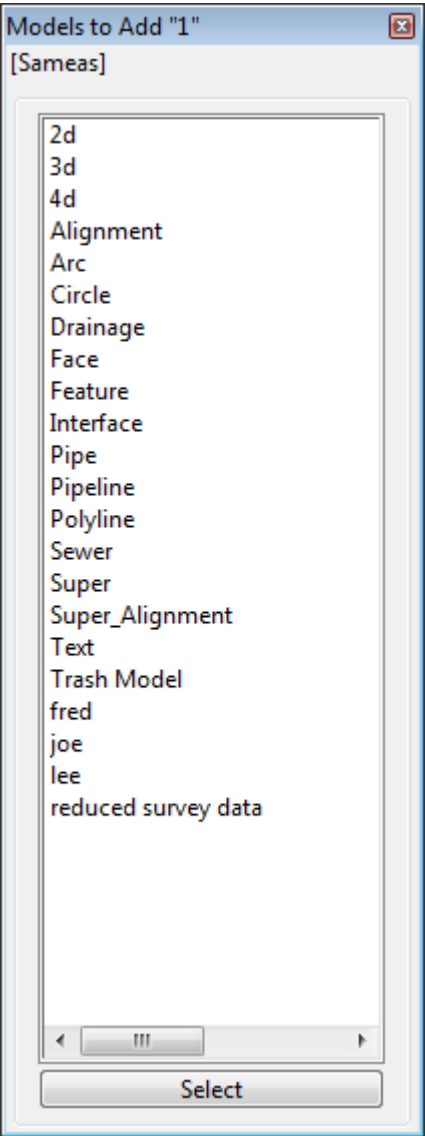

Add Model

Position of menu:	Plan View Menu	View => Models =>Add model
Position of menu:	Section View Menu	View => Models =>Add model
Position of menu:	Perspective View Menu	View => Models =>Add model

The **Add model** menu item operates two ways.

The **Add model** walk-right brings up the **Models to Add** list which is a list of all the models not currently added to the view.

By double clicking on one of the models from the **Models to Add** list, it is added to the view. The list is then removed. To add a number of models from the list to the view, select the models in the list in the standard Microsoft way and then click on **Select**.

If the **Models to Add** list has been moved or pinned, models can be selected from the list and added to the view and the **Models to Add** list will remain with the selected models removed from the list. When all the required models have been added, delete the list using the **[X]** button.

If **Add model** itself is activated (by clicking LB when **Add model** is highlighted), the **Add Model to a View** panel appears. The **Add Model to a View** panel can be used to create new models as well as add existing models to any view. Wild cards and characters are allowed for adding models.

Any models added to a view are immediately drawn on the view.

Add All Models

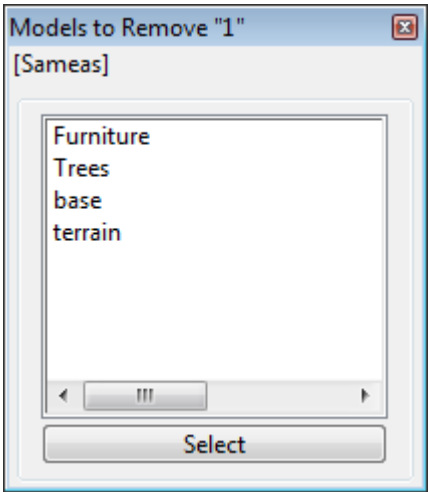

- Position of option on menu: Plan View Menu View => Models =>Add all models
- Position of option on menu: Section View Menu View => Models =>Add all models
- Position of option on menu: Perspective View Menu View => Models =>Add all models

The **Add all models** option adds all the models to the view.

Remove Model

- Position of menu: Plan View Menu View => Models =>Remove model
- Position of menu: Section View Menu View => Models =>Remove model
- Position of menu: Perspective View Menu View => Models =>Remove model

The **Remove model** menu item also operates in two ways. The **Remove model** walk-right brings up the **Models to Remove** list which is a list of all the models currently added to the view.

By double clicking on one of the models from the **Models to Remove** list, it is removed from the view. The list is then removed. To remove a number of models on the list from the view, select the models in the list and then click on **Select**.

If the **Models to Remove** list has been moved or pinned, models can be selected from the list and removed from the view and the **Models to Remove** list will remain with the selected models removed from the list. When all the required models have been removed, delete the list using the

[X] button.

If **Remove model** itself is activated, the **Remove Model from a View** panel appears. The **Remove Model from a View** panel can be used to remove any models from any view. Wild cards and characters are allowed for removing models.

NOTE
Models still exist after they are removed from a view. Models can only be deleted from **12d Model** by using the **Models=>Delete** option.

Remove All Models

- | | | |
|------------------------------------|------------------------------|-------------------------------------------------|
| Position of option on menu: | Plan View Menu | View => Models =>Remove all models |
| Position of option on menu: | Section View Menu | View => Models =>Remove all models |
| Position of option on menu: | Perspective View Menu | View => Models =>Remove all models |

The **Remove all models** option removes all the models from the view and clears the view.

Add Tin Models

- | | | |
|--------------------------|------------------------------|----------------------------------------------|
| Position of menu: | Plan View Menu | View => Models =>Add tin models |
| Position of menu: | Section View Menu | View => Models =>Add tin models |
| Position of menu: | Perspective View Menu | View => Models =>Add tin models |

The **Add tin models** walk-right brings up the **Tin Models to Add** list of all tins in the project whose models have not been added to the view

By double clicking on one of the tins from the **Tin Models to Add** list, all the models in the tin are

added to the view. The list is then removed. To add the models from a number of tins from the list to the view, select the tins in the list in the standard Microsoft way and then click on **Select**.

If the **Tin Models to Add** list has been moved or pinned, tins can be selected from the list and their models added to the view and the **Tin Models to Add** list will remain with the selected tins removed from the list. When all the required tins have been added, delete the list using the **[X]** button.

Any models added to a view are immediately drawn on the view.

Remove Tin Models

- | | | |
|--------------------------|------------------------------|-------------------------------------------------|
| Position of menu: | Plan View Menu | View => Models =>Remove tin models |
| Position of menu: | Section View Menu | View => Models =>Remove tin models |
| Position of menu: | Perspective View Menu | View => Models =>Remove tin models |

The **Remove tin models** walk-right brings up the **Tin Models to Remove** list of all tins whose models are currently added to the view.

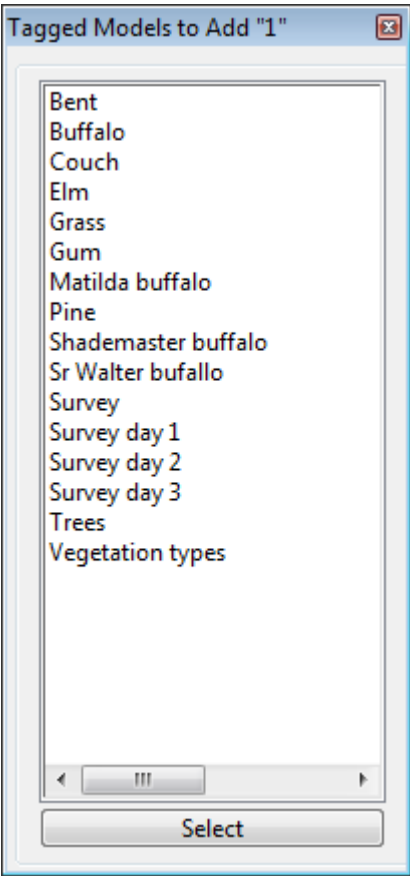

By double clicking on one of the tins from the **Tin Models to Remove** list, all the models in the tin are removed from the view. The list is then removed. To remove the models from a number of tins on the list from the view, select the tins in the list and then click on **Select**.

If the **Tin Models to Remove** list has been moved or pinned, tins can be selected from the list and removed from the view and the **Tin Models to Remove** list will remain with the selected tins removed from the list. When all the required tins have been removed, delete the list using the **[X]** button.

Add Tagged Models

- | | | |
|--------------------------|------------------------------|-------------------------------------------------|
| Position of menu: | Plan View Menu | View => Models =>Add tagged models |
| Position of menu: | Section View Menu | View => Models =>Add tagged models |
| Position of menu: | Perspective View Menu | View => Models =>Add tagged models |

The **Add tagged models** walk-right brings up the **Tagged Models to Add** list of all the tags (first level and subtags) defined in the project.

By double clicking on one of the tag names from the **Tagged Models to Add** list, all the models with that tag name, or models whose tag is a subtag of the tag name, are added to the view. The list is then removed. To select a number of tags from the list, select the tags in the standard Microsoft way and then click on **Select**.

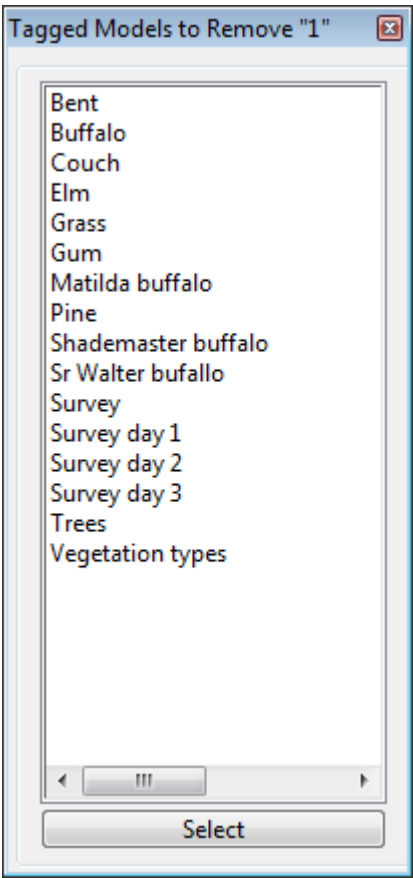

If the **Tagged Models to Add** list has been moved or pinned, tags can be selected from the list and their models added to the view and the **Tagged Models to Add** list will remain with the selected tags removed from the list. When all the required tags have been added, delete the list using the **[X]** button.

Any models added to a view are immediately drawn on the view.

Remove Tagged Models

- | | | |
|--------------------------|------------------------------|----------------------------------------------------|
| Position of menu: | Plan View Menu | View => Models =>Remove tagged models |
| Position of menu: | Section View Menu | View => Models =>Remove tagged models |
| Position of menu: | Perspective View Menu | View => Models =>Remove tagged models |

The **Remove tagged models** walk-right brings up the **Tagged Models to Remove** list of all tins whose models are currently added to the view.

By double clicking on one of the tag name from the **Tagged Models to Remove** list, all the models with that tag name, or models whose tag is a subtag of the tag name, are removed from the view. The list is then removed. To select a number of tags from the list, select the tags in the standard Microsoft way and then click on **Select**.

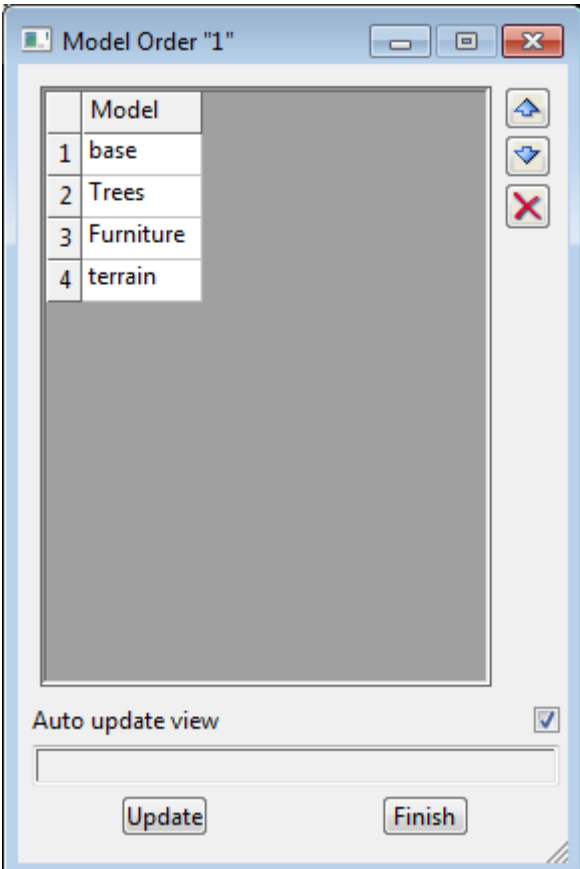

If the **Tagged Models to Remove** list has been moved or pinned, tags can be selected from the list and removed from the view and the **Tagged Models to Remove** list will remain with the selected tags removed from the list. When all the required tags have been removed, delete the list using the [X] button.

Model Order

- Position of menu:** Plan View Menu **View => Models =>Model order**
- Position of menu:** Section View Menu **View => Models =>Model order**
- Position of menu:** Perspective View Menu **View => Models =>Model order**

The **Model order** options displays the list of all models on a view in the reverse model drawing order. That is, the first model on the list is the last model drawn and hence the most visible model.

Selecting **Model order** brings up the **Model Order** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Model

list of models on the view in the reverse drawing order. That is, the first model on the list is drawn last and so is the most visible.

Up Arrow, Down Arrow

when a model name is highlighted, clicking the Up/Down arrow will change the order of the model.

Delete

when a model name is highlighted, clicking the Delete icon will remove the model from the view.
when a model name is highlighted, clicking on the Cross will remove the model from the view.

Auto update view	tick box	tick
-------------------------	----------	------

if ticked then the view is redrawn each time a model is moved in the list or added/removed from the list.

Update	button
---------------	--------

redraws the view using the new model order.

Models to Front

Position of menu:	Plan View Menu	View => Models =>Models to front
Position of menu:	Section View Menu	View => Models =>Models to front
Position of menu:	Perspective View Menu	View => Models =>Models to front

Models to front is a walk-right option. When the walk-right is chosen, the list of models currently attached to that view is displayed.

If a model is selected from the displayed list, the model will be the last to be drawn on the view. Hence, it is in the foreground and all the other models on the view are drawn before it.

Models to Back

- Position of menu:** Plan View Menu **View => Models =>Models to back**
- Position of menu:** Section View Menu **View => Models =>Models to back**
- Position of menu:** Perspective View Menu **View => Models =>Models to back**

Models to back is a walk-right option. When the walk-right is chosen, the list of models currently attached to that view is displayed.

If a model is selected from the displayed list, the model will be the first to be drawn on the view. Hence, it is in the background and all the other models on the view are drawn after it.

Calc Extents

- Position of option on menu:** Plan View Menu **View => Models =>Calc extents**
- Position of option on menu:** Section View Menu **View => Models =>Calc extents**
- Position of option on menu:** Perspective View Menu **View => Models =>Calc extents**

For each model on the view, the size of the x, y, z box required to enclose the data in the model is calculated. That is, the option calculates the model bounding box for each model on the view.

Redraw

Position of option on menu:	Plan View Menu	View => Models =>Redraw
Position of option on menu:	Section View Menu	View => Models =>Redraw
Position of option on menu:	Perspective View Menu	View => Models =>Redraw

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

NOTES

- 1. When a model is removed from a view, it is “undrawn”, that is, drawn in black. This may also black out important details of other models still attached to the view. If this happens, use the **redraw** option to refresh the view.
- 2. Clicking MB in the view-title area is the easiest method of redrawing a view.

Fit

Position of option on menu:	Plan View Menu	View => Models =>Fit
Position of option on menu:	Section View Menu	View => Models =>Fit
Position of option on menu:	Perspective View Menu	View => Models =>Fit

When the **Fit** option is chosen, **12d Model** calculates viewing parameters which will allow all the models attached to the view to be fully displayed. The view is then redrawn using these new drawing parameters.

Note if the data does not fill the view after a fit, then a **Calc Extents** may be needed to re-calculate the model bounding boxes.

Previous

Position of option on menu:	Plan View Menu	View => Models =>Previous
Position of option on menu:	Section View Menu	View => Models =>Previous
Position of option on menu:	Perspective View Menu	View => Models =>Previous

Each time a view has its viewing parameters changed, the old set is recorded as the previous parameter set. The previous option sets the viewing parameters back to this previous parameter set.

The view is then redrawn using those settings. The last set then becomes the old set.

Delete

Position of option on menu:	Plan View Menu	View =>Delete
Position of option on menu:	Section View Menu	View =>Delete
Position of option on menu:	Perspective View Menu	View =>Delete

This option is used to delete the view and remove it from the screen. After selecting the **Delete** option, a **Delete View** yes-no panel appears. If **Yes** is selected, the view is deleted and removed from the screen. Selecting **No** removes the **Yes-No** pop-up and leaves the view as it is.

Plan View Menu

Position of menu: Plan View Menu View

The **Plan** view menu is

For the option *Models*, go to

<i>Drawing filter</i>	<u>View Drawing Filter</u>

Plan Toggle

Position of menu: Plan View Menu View => Settings =>Toggle
The Toggle walk right brings up the **Toggle** plan view menu.

Selecting any options from this menu will toggle the option on/off.

Culling Plan View

Position of option on menu: Plan View Menu View =>Settings => Culling

The Culling option is used to suppress the drawing of strings whose on-screen extent is less than a user defined pixel size.

Selecting Culling raises the Culling Plan View panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set cutting for.</i>	input/output	current view	available views
Use culling <i>if ticked, a string is not drawn on the plan view whenever the string's extent box when drawn on the view would be smaller than the culling size given in the culling size field.</i>	tick box		
Culling size <i>pixel size used for culling</i>	input	10	
Use image culling	tick box		
Image culling size			
Cull <i>record the culling size given in the culling field. If the use culling field is set to tick, the recorded culling size will be used whenever the plan view is redrawn.</i>	button		

Face Flags for View

Position of option on menu: Plan View Menu View =>Settings => Faces

The **Faces** option allows the user to specify how faces are displayed in the plan view and on any plan view plots.

Selecting **Faces** fires up the **Face Flags for View** panel.

The fields and buttons have the following functions.

Field	Description	Type	Defaults	Pop-Up
View	<i>name of the view to set for drawing faces.</i>	input/output	current view	available views
Draw fill	<i>if ticked, all faces in the view are drawn in their fill colour.</i>	tick box	tick	
Draw edges	<i>if ticked, all face edges in the view are drawn.</i>	tick box		
Draw hatch	<i>if ticked, all faces in the view are drawn in their hatch pattern.</i>	tick box		
Set	<i>set the draw fill/edges/hatch fields to the value in the panel fields. The plan view is then redrawn using this value.</i>	button		

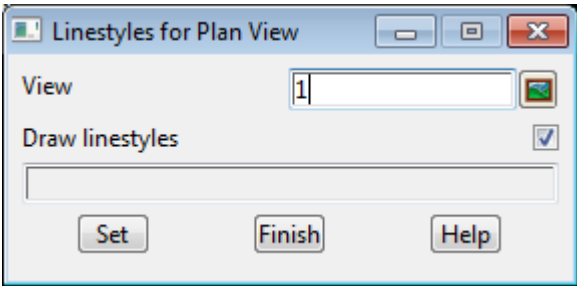

Linestyles for Plan View

Position of option on menu: Plan View Menu View => Settings => Linestyles

The **Linestyles** option allows the user to specify how linestyles (**styles**) are displayed in the plan view and on any plan view plots.

If linestyles are not used for drawing in a view then all strings are drawn according to their breakline type. That is, line strings are drawn with solid lines for each line in the string and point strings with only crosses at the string points. This style is the default style, 1.

Selecting **Linestyles** fires up the **Linestyles for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify draw linestyle flag for.</i>	input/output	current view	available views
Draw linestyles <i>if ticked, all strings in the view are drawn with linestyles. If not ticked, all lines strings are drawn as solid lines and point strings with crosses at their vertices.</i>	tick box	tick	
Set <i>set the draw linestyles field to the value in the panel field. The plan view is then redrawn using this value.</i>	button		

Rotate Plan View

Position of option on menu: Plan View Menu View => Settings => Rotate

The **rotate** option is used to rotate a plan view through a user supplied angle about the centre point of the plan view.

After selecting the **Rotate** option, the **Rotate Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set rotation angle for.</i>	input/output	current view	available views
Rotate angle <i>angle (in degrees) to rotate the view to.</i>	input	0	angles
Rotate	button	<i>rotate the view about the view centre point until the angle the view makes with the positive x axis is the angle given in the rotate angle field.</i>	

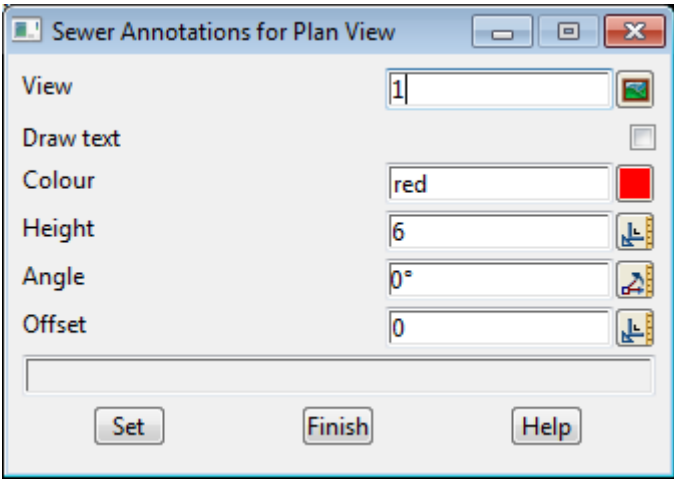

Sewer Annotations for Plan View

Position of option on menu: Plan View Menu View => Settings => Sewer

This is part of the optional sewer module.

The Sewer option allows the user to specify how sewer text is displayed in the plan view and on any plan view plots.

Selecting sewer fires up the **Sewer Annotations for Plan View** panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
<i>name of the view to set sewer annotation information for.</i>			
Draw text	tick box		
<i>if ticked, sewer text annotation will be drawn for any sewer strings in the plan view.</i>			
Colour	input	red	available colours
<i>the colour for any sewer text annotation.</i>			
Height	input	default text height	
<i>the height for any sewer text annotation.</i>			
Angle	input	0	
<i>the angle for any sewer text annotation.</i>			
Offset	input	0	
<i>the offset for any sewer text annotation.</i>			
Set	button		
<i>set the values in the panel fields and then redraw the view.</i>			

Plan Plotting Scale

Position of option on menu: Plan View Menu View => Settings => Plotting scale

The **Plotting scale** option is used to set a scale for the plan view which is used to determine the size to draw any *paper* text on the plan view.

After selecting **Plotting scale**, the **Plan Plotting Scale** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set the scale for.</i>	input/output	current view	available views
Scale <i>"1 in" to use to calculate a drawing size for any paper text on the view.</i>	input	250	
Set <i>set the plotting scale for the view.</i>	button		

Text

Position of menu: Plan View Menu View => Settings =>Text

The **Text** option allows the user to specify whether the text from any strings (text strings, 4d strings and survey strings) in models on the plan view is

- (a) not drawn at all
- or
- (b) if drawn and the text is defined in world units, then the text can be drawn in full, quick mode or not at all depending on the display size of the text on the screen. This stops the drawing of *world* text when its display size is **small** on the screen (e.g. when zooming out).
- (c) if drawn and the text is defined in pixel units, then when the screen scale is such that the height of the text in world units is too large, then the text is not drawn. This stops the drawing of *pixel* text when its displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **text** option tries to control the drawing of *both* pixel and world text in models on the view so that the text stops displaying in the view as the user *zooms out*

The choice of drawing text in full, quick mode or not at all also applies to the Vertex ids and Z values text turned on by view settings (view text).

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Text option draws/doesn't draw text for *any* model on the view, or the drawing of text can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

The options in the **Text** walk-right are used to display/not display text for **all** models on the plan view and the walk-right menu only contains the two options, **Text** and **Single**.

Selecting **Single** brings up the **Model Text for Plan View** panel, without the Model field and is only used to set a maximum height, not parameters for individual models.

If *plan_table_settings_4d* is non-zero:

The options in the **Text** walk-right can be used to specify for *individual* models if the text in the model is display/not display text on the plan view.

For any setting *plan_table_settings_4d*, if **Text** is selected without walking right, then the **Plan Text** panel is brought up (documented in the next section).

The **text** walk-right menu is

For more information on Text go to

[Toggle](#)

Plan Text

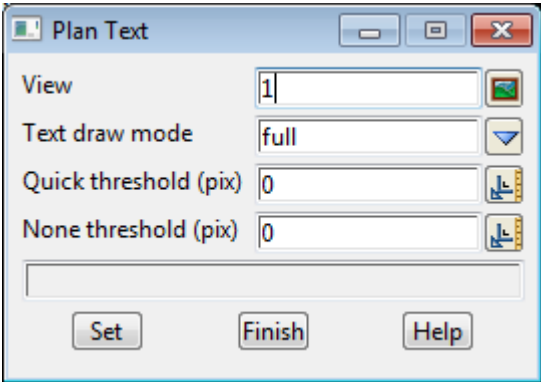

Position of option on menu: **Plan View Menu** **View => Settings => Text => Text**

The **Text** option allows the user to specify how text is displayed in the plan view and on any plan view plots. Text can be drawn in **full**, **quick mode** consisting of the bottom half of a rectangle indicating the height and the length of the text, or **not drawn at all**.

This setting also applies to the z-values and vertex ids controlled by view settings.

There are also two text threshold values (quick and none) designed for use with world text. When the *screen* size of text drops below the thresholds, the mode of display is automatically adjusted. Hence when the *screen* size of **world** text gets small, the text can be drawn as quick text or even not displayed at all.

Selecting **Text** fires up the **Plan Text** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify text drawing flags for.</i>	input/output	current view	available views
Text draw mode <i>if full, any text in the plan view will drawn as expected. If quick, the text will not be drawn but replaced by a three sided box to indicate where the text is. If none, nothing is displayed where the text would have been.</i>	input	full	full, quick, none
Quick threshold (pix) <i>if the screen size of text displayed on the plan view goes below this pixel size, then the text is automatically drawn in quick mode.</i>	input	4.5	
None threshold (pix) <i>if the screen size of text displayed on the plan view goes below this pixel size, then the text is not drawn.</i>	input	2	
Set <i>set the text draw mode and thresholds to the values given in the panel fields. The plan view is then redrawn using the new values.</i>	button		

Note

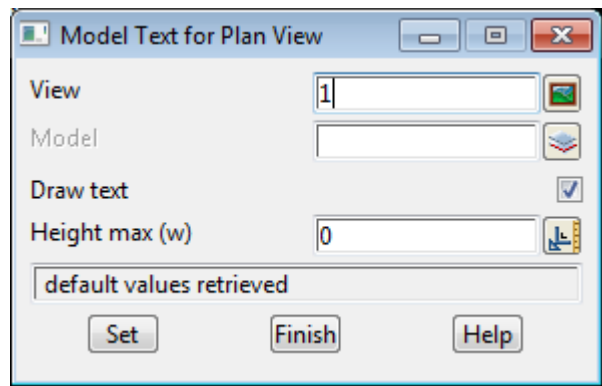

The **Text=>Text** option applies to *all* text on the view. That is, for any text from strings in models on the view, or for the z-values and vertex ids text controlled by view settings (view text). The **Single** and **Table** options of **Text** are *only* for text in models. There are **Single** and **Table** options for view text under the **Vertex no.s** and **Z values Settings** options.

Model Text for Plan View

Position of option on menu: Plan View Menu View => Settings => Text => Single

The **Single** option allows the user to stop drawing any text from models on the view (world or pixel), or if text is drawn, set a maximum equivalent world size that is used as an upper limit for drawing *pixel* text in the model.

Selecting **Single** fires up the **Model Text for Plan View** panel.

The fields and buttons used in this panel have the following functions.

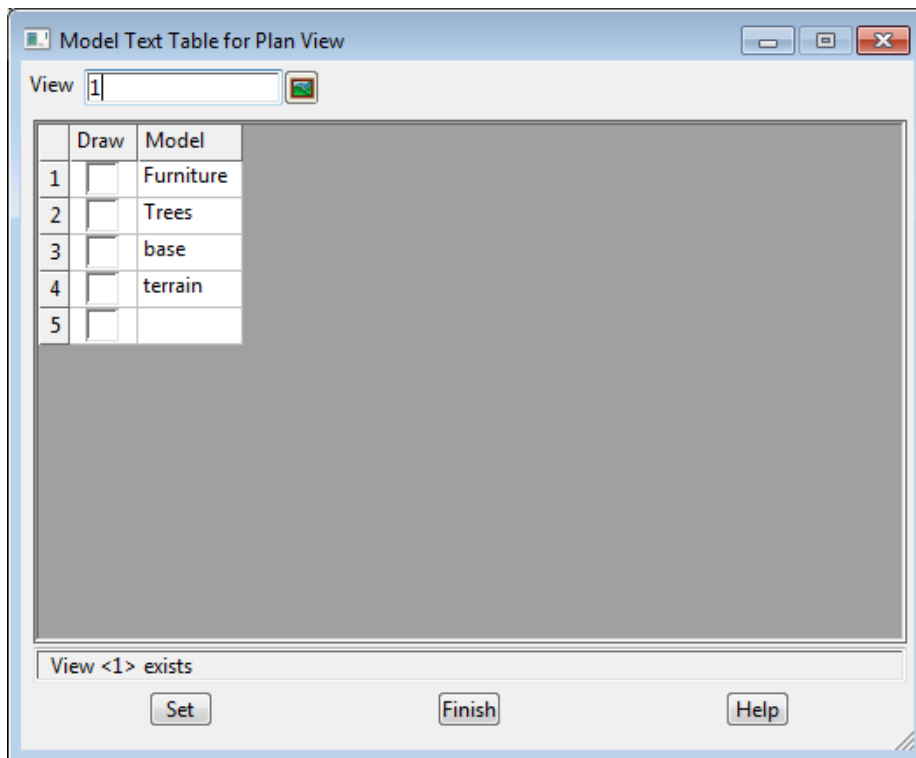

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify model text drawing flags for.</i>	input/output	current view	available views
Model <i>the model to set the Draw text and Height max parameters for.</i>	input		
Draw text <i>If not ticked, then no text from strings in models (text, 4d and survey strings) is drawn. if ticked, any text from strings in models (text, 4d and survey strings) will then be checked against the height max for pixel text, or text drawn mode for world text, to see if it is drawn.</i>	tick box	tick	
Height max (w) <i>if non-zero, then when the screen scale is such that the height of any string text defined in pixels converted to a world size is greater than height max (w), then the text is not drawn. Hence on zooming out, any pixel text in the models will eventually stop drawing.</i>	input	0	
Set <i>set the text draw mode and thresholds to the values given in the panel fields. The plan view is then redrawn using the new values.</i>	button		

Model Text Table for Plan View

Position of option on menu: Plan View Menu View => Settings => Text => Table

The **Table** option displays a list a models on the view with their draw flag. The draw flag can be toggled to allow the drawing/stop drawing text from the model on the view (world or pixel).

Selecting **Table** fires up the **Model Text Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
<i>name of the view to modify model text table drawing flags for:</i>			

Draw ☐ tick box

If **not ticked**, then **no** text from strings in models (text, 4d and survey strings) is drawn.
if **ticked**, any text from strings in models (text, 4d and survey strings) will then be checked against the height max for pixel text, or text drawn mode for world text, to see if it is drawn.

Model	input
	<i>the model to set the Draw flag for.</i>

Set **button**
set the text draw flags for the models in the table.

Toggle

Position of menu: **Plan View Menu** **View => Settings => Text => Toggle**

Walking-right on the **Toggle** option displays a list a models on the view with their text draw flag. The text draw flag can be toggled on/off by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general **Text** toggle is used for the model.

Tins

Position of menu: Plan View Menu View => Settings => Tins

The options on the Tins walk-right menu control the display of tins on the view. The Tins walk-right menu is

Tin Draw Contours for View

Position of option on menu: Plan View Menu View => Settings => Tins => Contours

Position of option on menu: Perspective View Menu View => Settings => Tins => Contours

The Contours option defines contour and bold increments and colours, and also whether these contours are displayed for the triangles from any tins on the view. Because the contours are just drawn separately for each triangle, they are know as **quick** or **fast contours**.

Selecting Contours fires up the Tin Draw Contours for View panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
<i>name of the view to modify fast contour drawing parameters for:</i>			

Draw triangles contours	tick box		
<i>if ticked, the contours for any triangles in any tins on the view are displayed.</i>			
Cont inc	input	1.0	
<i>increment between contoured values.</i>			
Cont ref	input	0.0	
<i>reference value for the contour increments.</i>			
Cont colour	input	cyan	available colours
<i>colour of the contours</i>			
Bold inc	input	5.0	
<i>increment for the bold contours. If the bold increment is blank or zero, then no bold contours are drawn. If the bold increment is non-zero, it must be an integer multiple of the contour increment</i>			
Bold colour	input	magenta	available colours
<i>colour of the bold contours</i>			
Set	button		
<i>set the value in the panel and then redraw the plan view.</i>			

Tin Draw Edges for View

Position of option on menu:	Plan View Menu	View => Settings => Tins => Edges
Position of option on menu:	Perspectives View Menu	View => Settings => Tins => Edges

The Edges option allows the user to specify whether the edges of triangles from any tins on the view are displayed. Selecting Edges fires up the **Tin Draw Edges for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
<i>name of the view to modify tin edge drawing flag for.</i>			

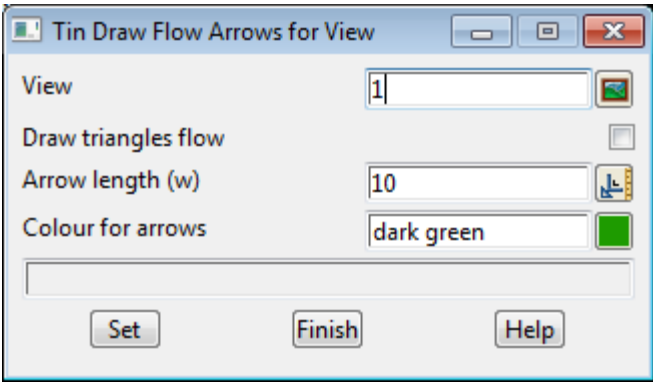

Draw triangles edges	tick box
<i>if ticked, the edges of any triangles in any tins on the view are displayed.</i>	
Set	button
<i>set the value and then redraw the plan view.</i>	

Tin Draw Flow Arrows for View

Position of option on menu:	Plan View Menu	View =>Settings =>Tins =>Flow arrows
Position of option on menu:	Perspective View Menu	View =>Settings =>Tins =>Flow arrows

The **Flow arrows** option defines the colour and length of flow arrows, and also whether the flow

arrows are displayed for the triangles from any tins on the view. Selecting **Flow arrows** fires up the **Tin Draw Flow Arrows for View** panel.

The fields and buttons used in this panel have the following functions.

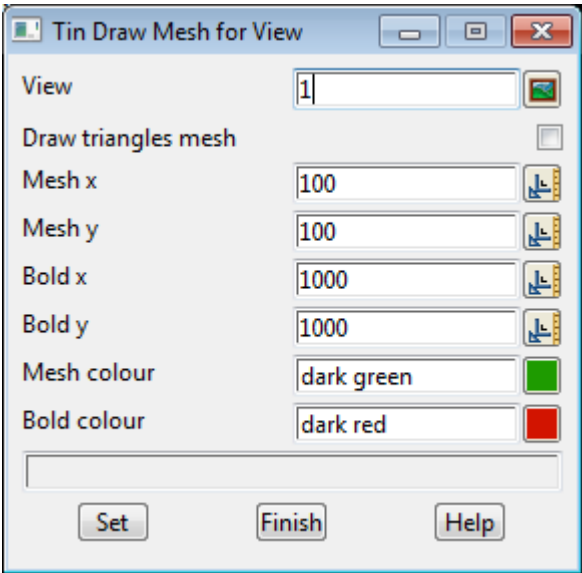

Field	Description	Type	Defaults	Pop-Up
View	<i>name of the view to modify tin arrow drawing flag for.</i>	input/output	current view	available views
Draw triangles flow arrows	<i>if ticked, the flow arrows for any triangles in any tins on the view are displayed.</i>	tick box		
Arrow length (w)	<i>length in world units to draw flow arrows.</i>	input		
Colour for arrows	<i>colour for the arrows.</i>	input	cyan	available colours
Set	<i>set the value in the panel and then redraw the plan view.</i>	button		

Tin Draw Mesh for View

Position of option on menu: Plan View Menu View => Settings => Tins => Mesh

Position of option on menu: Perspective View Menu View => Settings => Tins => Mesh

The `mesh` option defines a rectangular mesh, and also whether the mesh is displayed for the triangles from any tins on the view. Selecting **Mesh** fires up the **Tin Draw Mesh for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify tin mesh drawing flag for.</i>	input/output	current view	available views

Draw triangles mesh <i>if ticked, a rectangular mesh for any triangles in any tins on the view are displayed.</i>	tick box		
-----------------------------------------------------------------------------------------------------------------------------	----------	--	--

Mesh x <i>the distance between the x mesh lines. If this value is zero, the x mesh lines will not be drawn.</i>	input	100

Bold y <i>the distance between the bold y mesh lines. If this value is zero, the bold y mesh lines will not be drawn.</i>	input	100	
-------------------------------------------------------------------------------------------------------------------------------------	-------	-----	--

Mesh colour <i>colour that the mesh is drawn in.</i>	input	dark green	available colours
----------------------------------------------------------------	-------	------------	-------------------

Bold colour <i>colour that the bold mesh is drawn in.</i>	input	dark green	available colours
---------------------------------------------------------------------	-------	------------	-------------------

Set <i>set the value in the panel and then redraw the plan view.</i>	button		
--------------------------------------------------------------------------------	--------	--	--

Tin Draw Solid for View

Position of option on menu: Plan View Menu View => Settings => Tins => Solid

The **solid** option allows the user to specify whether the triangles from any tins on the view are displayed as solid colour. Selecting **Solid** fires up the **Tin Draw Solid for View** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
View	<i>name of the view to modify tin solid drawing flag for.</i>	input/output	current view	available views
Draw triangles solid	<i>if ticked, any triangles in any tins on the view are displayed in solid colour.</i>	tick box		
Set	<i>set the value and then redraw the plan view.</i>	button		

Vertices

Position of menu: Plan View Menu View => Settings => Vertices

The Vertices option allows the user to specify whether crosses at the vertices of strings are

- (a) not drawn at all
- or
- (b) if set to draw, then only drawn if equivalent world size is not too large. This stops the drawing of *crosses* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the Vertices option tries to control the drawing of vertex crosses on the view so that the crosses stop displaying as the user *zooms out*

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Vertices option draws crosses for string vertices for *any* model on the view, or the drawing of crosses can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the Vertices option is used to display/not display crosses at the vertices of strings in **all** models on the plan view. For a text string, a cross is placed at the text justification position.

Selecting Vertices brings up the **Crosses at String Vertices for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the Vertices option then has a walk-right menu with options to specify for *each* model on the plan view whether crosses at the vertices of strings in the model are

- (a) not drawn at all
- or
- (b) if set to draw, then the crosses are only drawn if equivalent world size is not too large. This stops the drawing of *crosses* when its displaying world size is large in proportion to other world units (e.g. when zooming out).

If Vertices is selected without walking right, the **Crosses at String Vertices for Plan View** panel is brought up (documented in the next section).

The Vertices walk-right menu is

For the option *Single* go to
Table
Toggle

[Crosses at String Vertices Table for Plan View](#)
[Toggle](#)

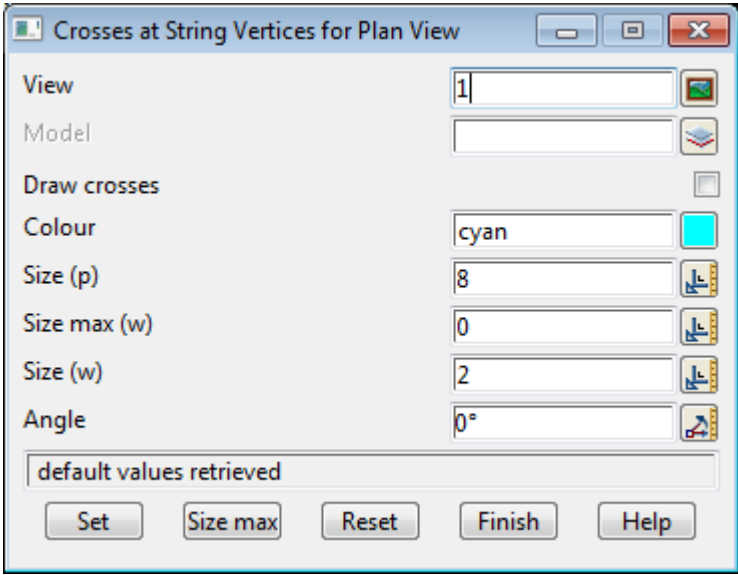

Crosses at String Vertices for Plan View

Position of option on menu: Plan View Menu View => Settings => Vertices => Single

The *Single* option is used to set parameters for drawing crosses at vertices of strings for all models not defined in the *Table* option or for a single model on the plan view. For a text string, a

cross is placed at the text justification position.

After selecting the **Single** option, the **Crosses at String Vertices for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify string vertices drawing parameters for.</i>	input/output	current view	available views
Model <i>if blank, then all models not mentioned in the Table option use these parameters for drawing crosses on a view. If non blank, then this model only will be set to draw crosses with the parameters on this panel.</i>	input		
Draw crosses <i>If ticked, vertex crosses for the model will be checked against the Size max (w) before being drawn. If not ticked, then no vertex crosses for strings in the given model are drawn on the plan view.</i>	tick box		
Colour <i>colour of the crosses</i>	input	default pt colour	available colours
Size (p) <i>size in pixels that the crosses are drawn on a plan view</i>	input	default text height	
Size max (w) <i>if non-zero: when the cross is displayed on a plan view then there is an equivalent size of the cross in world units that matches the display size. If Size max (w) has a non-zero value, then if the equivalent world size of the cross on the plan view is greater than Size max (w), then the cross is not drawn. Hence zooming out will eventually stop the crosses from drawing.</i>	input	0	
Size (w) <i>size in world units of the cross when plotted or output.</i>	input	0	
Angle <i>angle in degrees that the cross is rotated about the (x,y) position of the string vertices.</i>	input	0	
Set <i>set the values in the panel and then redraw the plan view.</i>	button		

Size max (w) button
*sets Size max (w) to be the world size of crosses as they are currently displayed on the given plan view. Hence if any further zoom out is done, the crosses will stop drawing. The **set** button must then be clicked to set the values for the view.*

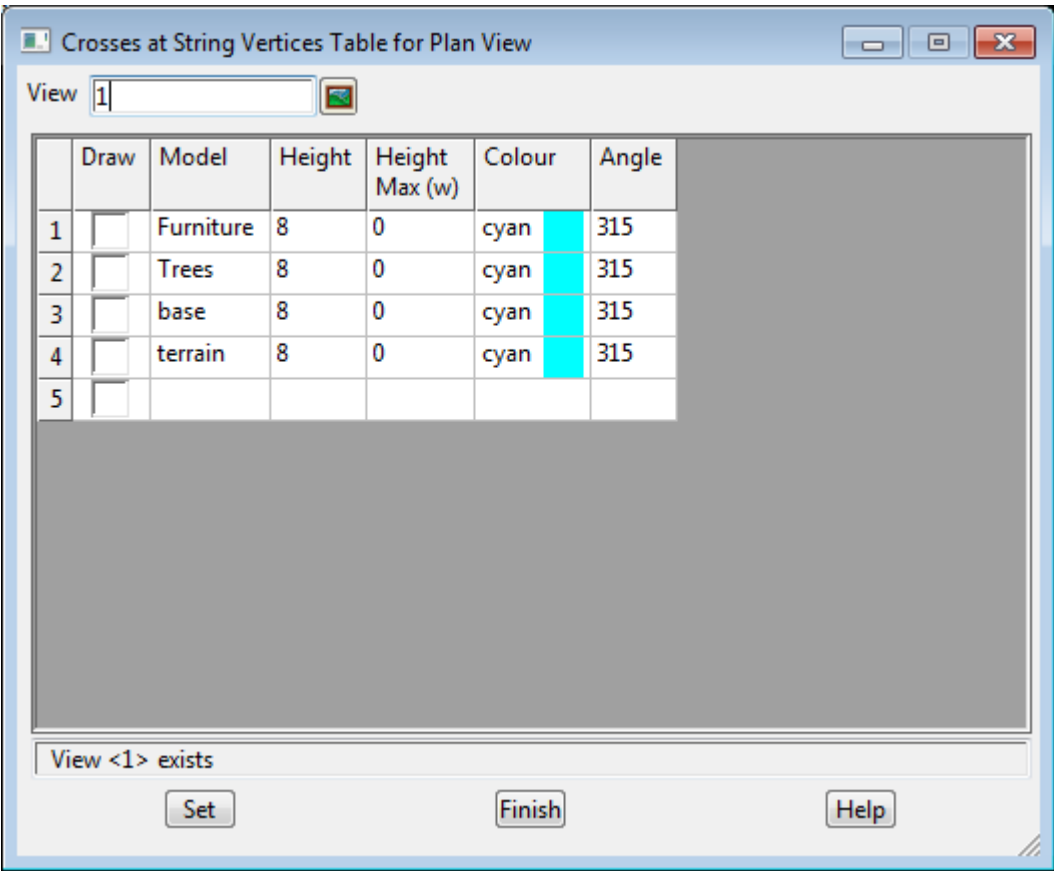

Reset button
reset all the parameters so no models are individually set for the view.

Crosses at String Vertices Table for Plan View

Position of option on menu: Plan View Menu View => Settings => Vertices => Table

The **Table** option displays a list of models on the view with their vertex drawing parameters which can then be modified from the table.

Selecting **Table** fires up the **Crosses at String Vertices Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify string vertices drawing parameters for.

Draw tick box
*If **not** ticked, then **no** vertex crosses from strings in the given model are drawn on the plan view. if **ticked**, any cross for vertices in the model will be checked against the Sz max (w) to see if it is drawn.*

Model input
the model to set the parameters for:

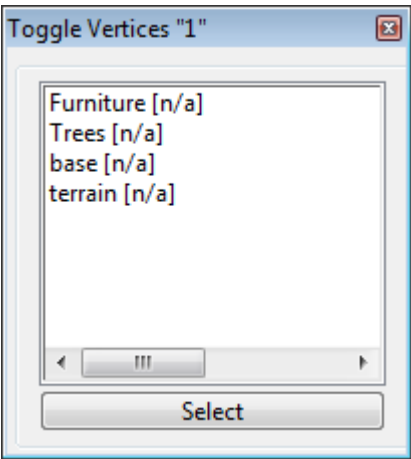

Colour	input	default pt colour	available colours
<i>colour of the crosses at the vertices</i>			
Size	input	default text height	
<i>size in pixels that the crosses are drawn on a plan view.</i>			
Sz max (w)	input	0	
<i>if non-zero: the size of the crosses in world units is greater than Sz max (w), then the crosses are not drawn. Hence zooming out will eventually stop the crosses from drawing.</i>			
Angle	input	0	
<i>angle in degrees that the cross is rotated about the (x,y) position of the string vertices.</i>			
Set	button		
<i>set the vertex cross drawing parameters for the models in the table.</i>			

Toggle

Position of option on menu: Plan View Menu View => Settings => Vertices => Toggle

Walking-right on the **Toggle** option displays a list of models on the view with their vertex cross draw flag. The vertex cross draw flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general **Vertex** toggle is used for the model.

Vertex/Segment UIDs

Plan_View_Vertex_Segment_UIDs_Settings_MenuPosition of menu: Plan View Menu View => Settings => Vertex/Segment UID's

The Vertex/Segment UID's option allows the user to specify whether the vertex/segment UIDs for any super string vertex/segment are:

- (a) not drawn at all
- or
- (b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *vertex/segment UIDs* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the Vertex/Segment UID's option tries to control the drawing of vertex/segment UIDs on the view so that the UIDs stop displaying as the user *zooms out*.

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Vertex/Segment UID's option draws vertex/segment UIDs for string vertices for *any* model on the view, or the drawing of Vertex/Segment UIDs can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:
the Vertex/Segment UID's option is used to display/not display vertex/segment UIDs at the vertices/segments of strings in **all** models on the plan view.

Selecting Vertex/Segment UID's brings up the **Vertex/Segment UID's for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:
the Vertex/Segment UID's option then has a walk-right menu with options to specify for *each* model on the plan view whether vertex/segment UIDs for strings in the model are

- (a) not drawn at all
- or
- (b) if set to draw, then the vertex/segment UIDs are only drawn if the equivalent world size is not too large. This stops the drawing of vertex/segment UIDs when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If Vertex/Segment UID's is selected without walking right, the **Vertex/Segment UID's for Plan View** panel is brought up (documented in the next section).

The Vertex/Segment UID's walk-right menu is

For the option *Single*, go to

Reset	button		
<i>reset all the parameters so no models are individually set for the view.</i>			

Vertex/Segment UUIDs Table for Plan View

Vertex_Segment_UUID_s_Table_for_Plan_ViewPosition of option on menu: Plan View Menu View
=> Settings => Vertex/Segment UID's => Table

The Table option displays a list of models on the view with their vertex/segment UUIDs drawing parameters which can then be modified from the table.

Selecting Table fires up the Vertex/Segment UUIDs Table for Plan View panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
<i>name of the view to modify vertex/segment UUIDs drawing parameters for.</i>			

Draw	tick box
<i>If not ticked, then no vertex/segment UUIDs for strings in the given model are drawn on the plan view.</i>	
<i>if ticked, vertex/segment UUIDs for strings in the model will be checked against the Ht max (w) to see if they are drawn.</i>	

Model	input
<i>the model to set the parameters for.</i>	

Colour	input	default pt colour	available colours
<i>colour of the vertex/segment UUIDs</i>			

Text style	input	1	available text styles
<i>textstyle of the vertex/segment UUIDs</i>			

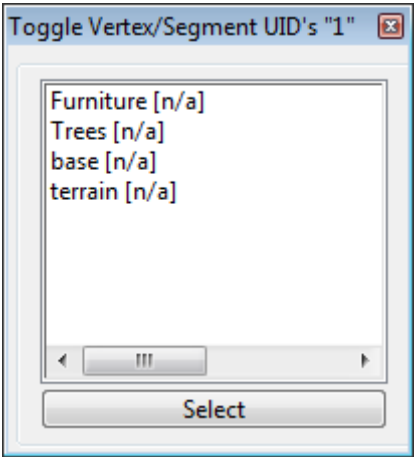

Height	input	8
<i>height in pixels of the vertex/segment UUIDs</i>		

Ht max (w)	input	0
<i>if non-zero: when the plan view is such that the height of the point id's in world units is greater than Height max (w), then the vertex/segment UIDs are not drawn. Hence as one zooms out, the vertex/segment UIDs will eventually stop drawing.</i>		
Angle	input	-45
<i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>		
Offset	input	default text height
<i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>		
Set	button	
<i>set the values in the panel and then redraw the plan view.</i>		

Toggle Vertex/Segment UIDs

Plan_View_Toggle_Vertex_Segment_UID_sPosition of menu: **Plan View Menu** **View => Settings => Vertex/Segment UID's => Toggle**

Walking-right on the **Toggle** option displays a list of models on the view with their point/vertex id's draw flag. The vertex/segment UIDs draw flag can be toggled on/off for the model by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general **Vertex/Segment UIDs** toggle is used for the model.

Point/Vertex IDs

Position of menu: Plan View Menu View => Settings => Point/Vertex id's

The **Point/Vertex IDs** option allows the user to specify whether the point/vertex ID (a point ID recorded for a vertex) for any super string vertex are

- (a) not drawn at all
- or
- (b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *point/vertex IDs* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **Point/Vertex IDs** option tries to control the drawing of point ids on the view so that the ids stop displaying as the user *zooms out*

Note - Point/Vertex IDs are not to be confused with *vertex indices* which are simply the position of the vertex in the string.

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Point/Vertex IDs option draws point/vertex IDs for string vertices for *any* model on the view, or the drawing of vertex IDs can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the **Point/Vertex IDs** option is used to display/not display vertex ids at the vertices of strings in **all** models on the plan view.

Selecting **Point/Vertex IDs** brings up the **Vertex IDs for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the **Point/Vertex IDs** option then has a walk-right menu with options to specify for *each* model on the plan view whether point ids for strings in the model are

- (a) not drawn at all
- or
- (b) if set to draw, then the point ids are only drawn if the equivalent world size is not too large. This stops the drawing of point *ids* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If **Point/Vertex IDs** is selected without walking right, the **Vertex IDs for Plan View** panel is brought up (documented in the next section).

The **Point/Vertex IDs** walk-right menu is

For the option Single, go to

Vertex IDs for Plan View

Position of option on menu: Plan View Menu View =>Settings =>Point/Vertex id's=> Single

The **Single** option is used to set parameters for drawing point/vertex id's of strings for all models not mentioned in the *Table* or set the parameters for an individual model on the plan view.

After selecting the **Single** option, the **Vertex IDs for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
View	<i>name of the view to modify point/vertex id's drawing parameters for.</i>	input/output	current view	available views
Model	<i>if blank, then all models not mentioned in the Table option use these parameters for drawing point IDs on a view. If non blank, then this model only will be set to draw point/vertex IDs with the parameters on this panel.</i>	input		
Draw IDs	<i>If ticked, point/vertex id's will be checked against the Height max (w) before being drawn. If not ticked, then no point/vertex id's for strings are drawn on the plan view.</i>	tick box		
Colour	<i>colour of the point/vertex id's</i>	input	default pt colour	available colours
Text style	<i>textstyle of the point/vertex id's</i>	input	1	available text styles
Height (p)	<i>height in pixels that the point/vertex id's are drawn on a plan view.</i>	input	8	
Height max (w)	<i>if non-zero: when the point/vertex id's is displayed on a plan view then there is an equivalent height of the id's in world units that matches the display size. If Size max (w) has a non-zero value, then if the equivalent world size of the id's on the plan view is greater than Size max (w), then the id's is not drawn. Hence zooming out will eventually stop the point/vertex id's from drawing.</i>	input	0	

- Height (w)

input

2

height in world units of the point/vertex id's when plotted or output.
- Angle

input

-45

angle in degrees that the text is rotated about the (x,y) position of the string vertices.
- Offset (p)

input

default text height

distance in pixels that the text is drawn from the (x,y) position of the string vertices.
- Offset (w)

input

default text height

distance in world units that the text is drawn from the (x,y) position of the string points when plotted
- Set

button

set the values in the panel and then redraw the plan view.
- Size max (w)

button

when clicked, size max (w) is set to be the world size of point IDs displayed on the given plan view. Hence if any further zoom out is done, the point IDs will stop drawing. The **set** button must then be clicked to set the values for the view.
- Reset

button

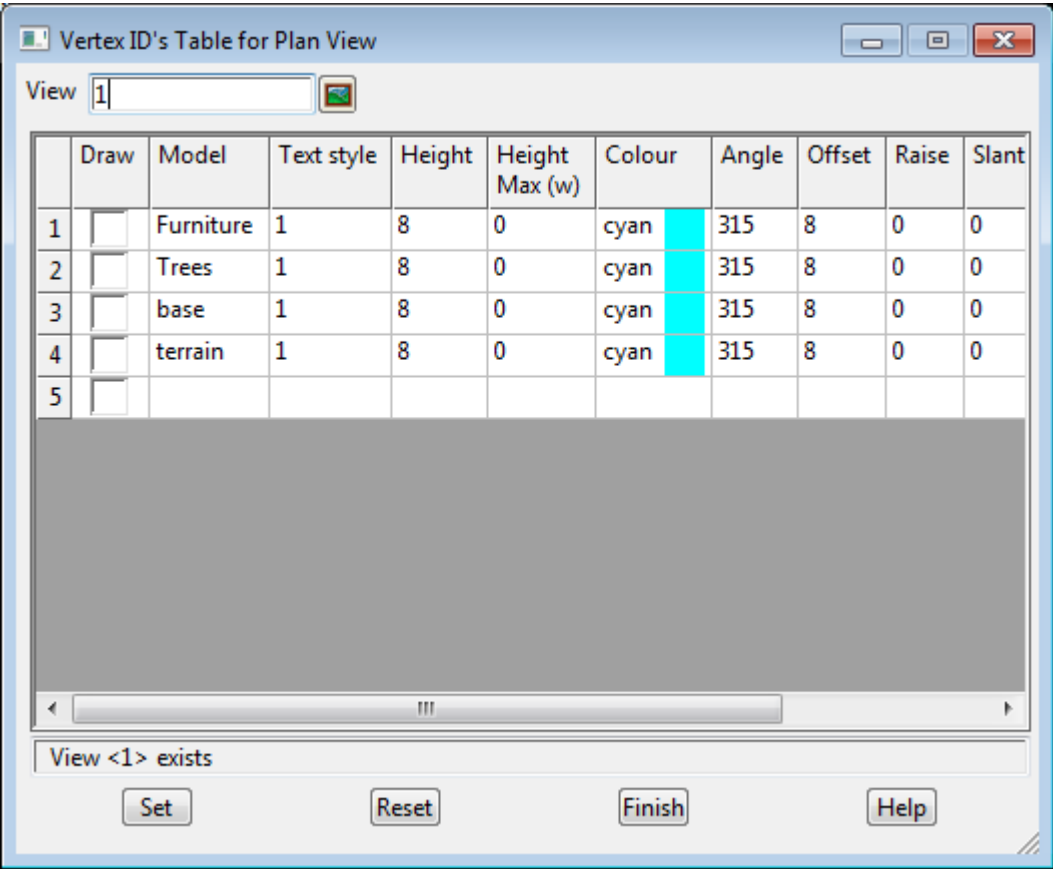

reset all the parameters so no models are individually set for the view.

Vertex IDs Table for Plan View

Position of option on menu: Plan View Menu View => Settings => Point/Vertex IDs => Table

The **Table** option displays a list of models on the view with their point id's drawing parameters which can then be modified from the table.

Selecting **Table** fires up the **Vertex IDs Table for Plan View** panel.

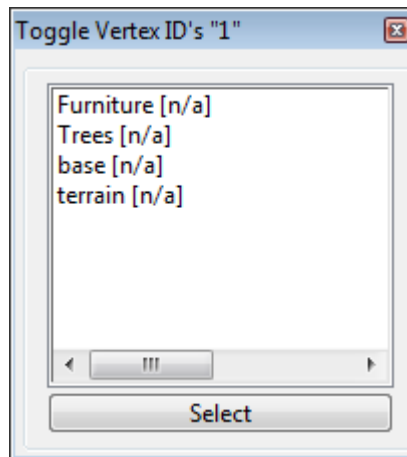

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify point IDs drawing parameters for.</i>	input/output	current view	available views
Draw <i>If not ticked, then no point IDs for strings in the given model are drawn on the plan view. if ticked, point IDs for strings in the model will be checked against the Ht max (w) to see if they are drawn.</i>	tick box		
Model <i>the model to set the parameters for.</i>	input		
Colour <i>colour of the point IDs</i>	input	default pt colour	available colours
Text style <i>textstyle of the point IDs</i>	input	1	available text styles
Height <i>height in pixels of the point IDs.</i>	input	8	
Ht max (w) <i>if non-zero: when the plan view is such that the height of the point id's in world units is greater than Height max (w), then the point IDs are not drawn. Hence as one zooms out, the point IDs will eventually stop drawing.</i>	input	0	
Angle <i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	
Offset <i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>	input	default text height	
Set <i>set the values in the panel and then redraw the plan view.</i>	button		

Toggle Vertex IDs

Position of menu: Plan View Menu View => Settings => Point/Vertex IDs => Toggle

Walking-right on the **Toggle** option displays a list of models on the view with their point/vertex id's draw flag. The point/vertex id's draw flag can be toggled on/off for the model by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general **Point/vertex IDs** toggle is used for the model.

Vertex Indices

Position of menu: Plan View Menu View => Settings => **Vertex Indices**

The **Vertex Indices** option allows the user to specify whether the vertex indices (position of the vertex in the string) for all vertices of strings are

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *vertex indices* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **Vertex Indices** option tries to control the drawing of vertex indices on the view so that the indices stop displaying as the user *zooms out*

Note - vertex indices are not to be confused with *point/vertex IDs* which may not be defined for a vertex in the string.

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the Vertex indices option draws vertex indices for string vertices for *any* model on the view, or the drawing of vertex indices can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the **Vertex Indices** option is used to display/not display vertex indices at the vertices of strings in **all** models on the plan view.

Selecting **Vertex Indices** brings up the **Vertex Indices for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the **Vertex Indices** option then has a walk-right menu with options to specify for *each* model on the plan view whether vertex indices for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the vertex indices are only drawn if the equivalent world size is not too large. This stops the drawing of *indices* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If **Vertex Indices** is selected without walking right, the **Vertex Indices for Plan View** panel is brought up (documented in the next section).

The **Vertex Indices** walk-right menu is

<i>set the values in the panel and then redraw the plan view.</i>			
Size max (w)	button		
<i>when clicked, size max (w) is set to be the world size of vertex indices displayed on the given plan view. Hence if any further zoom out is done, the vertex indices will stop drawing. The set button must then be clicked to set the values for the view.</i>			
Reset	button		
<i>reset all the parameters so no models are individually set for the view.</i>			

Vertex Indices Table for Plan View

Position of option on menu: Plan View Menu View => Settings => Vertex indices => Table

The Table option displays a list of models on the view with their vertex indices drawing parameters which can then be modified from the table.

Selecting Table fires up the Vertex Indices Table for Plan View panel.

The fields and buttons used in this panel have the following functions.

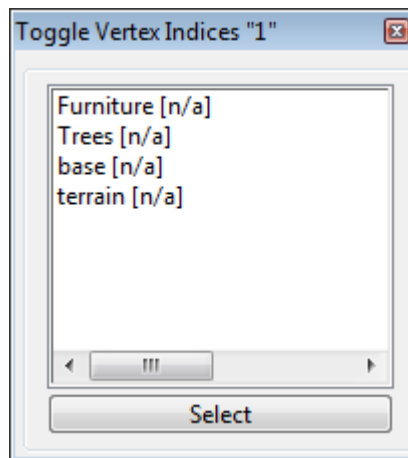

Field	Description	Type	Defaults	Pop-Up
View	<i>name of the view to modify vertex indices drawing parameters for.</i>	input/output	current view	available views
Draw		tick box		
	<i>If not ticked, then no vertex indices for strings in the given model are drawn on the plan view. if ticked, vertex indices for strings in the model will be checked against the Ht max (w) to see if it is drawn.</i>			
Model	<i>the model to set the parameters for.</i>	input		
Colour	<i>colour of the vertex indices</i>	input	default pt colour	available colours
Text style	<i>textstyle of the vertex indices</i>	input	1	available text styles
Height	<i>height in pixels of the vertex indices.</i>	input	8	
Ht max (w)	<i>if non-zero: when the plan view is such that the height of the vertex indices in world units is greater than Height max (w), then the vertex indices are not drawn. Hence as one zooms out, the vertex indices will eventually stop drawing.</i>	input	0	
Angle	<i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>	input	-45	

Offset	input	default text height
	<i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>	
Set	button	
	<i>set the values in the panel and then redraw the plan view.</i>	

Toggle Vertex indices

Position of menu: Plan View Menu View => Settings => Vertex Indices => Toggle

Walking-right on the **Toggle** option displays a list of models on the view with their vertex indices draw flag. The vertex indices draw flag can be toggled on/off for the model by selecting the model on the list. Note that [n/a] means that the model has *not* been individually set on or off and the general **Vertex Indices** toggle is used for the model.

Z Values

Position of menu: Plan View Menu View => Settings => Z values

The **Z values** option allows the user to specify whether the z co-ordinate for all vertices of strings are

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *z values* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **Z values** option tries to control the drawing of vertex z values on the view so that the numbers stop displaying as the user *zooms out*

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the **Z values** option draws z values for string vertices for *any* model on the view, or the drawing of vertex z values can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the **Z values** option is used to display/not display vertex z values at the vertices of strings in **all** models on the plan view.

Selecting **Z values** brings up the **Z Values for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the **Z values** option then has a walk-right menu with options to specify for *each* model on the plan view whether vertex z values for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the z values are only drawn if the equivalent world size is not too large. This stops the drawing of *numbers* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If **Z values** is selected without walking right, the **Z Values for Plan View** panel is brought up (documented in the next section).

The **Z values** walk-right menu is

Height max (w) <i>if non-zero: when the plan view is such that the height of the z values in world units is greater than Height max (w), then the z values are not drawn. Hence as one zooms out, the z values will eventually stop drawing.</i>	input	0	

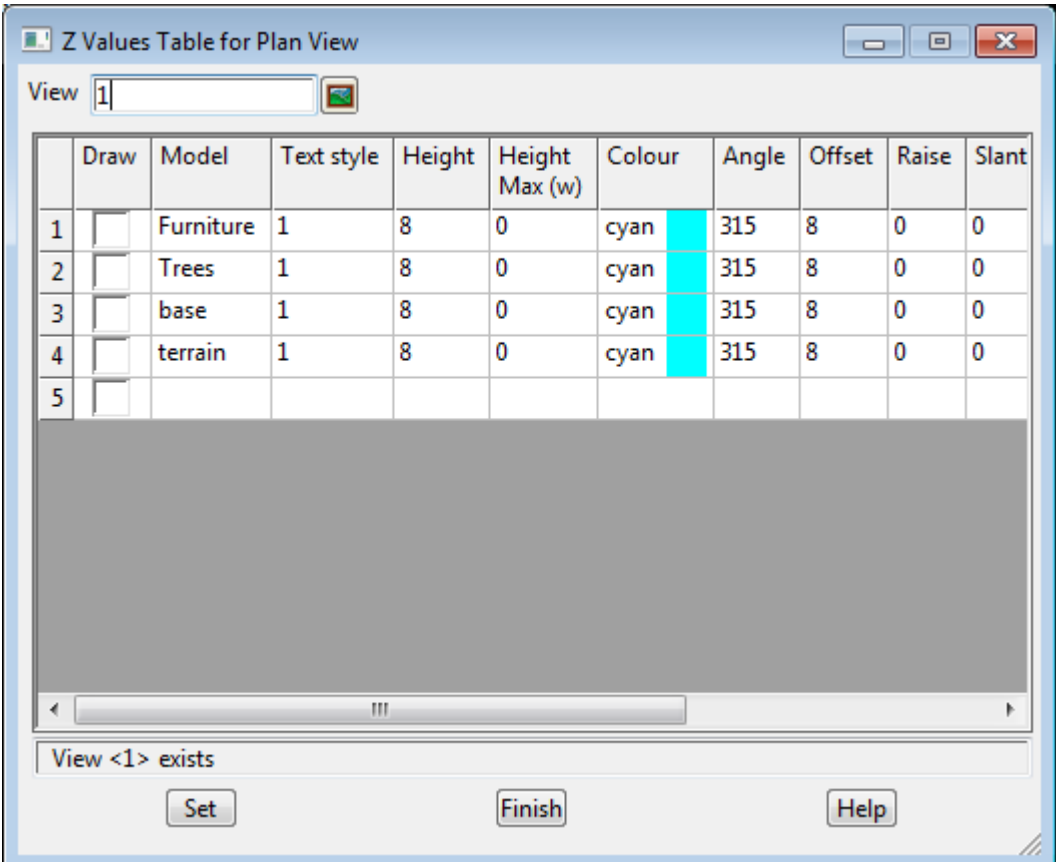

Height (w)	input	2	<i>height in world units of the z values when plotted or output.</i>
Angle	input	-45	<i>angle in degrees that the text is rotated about the (x,y) position of the string vertices.</i>
Offset (p)	input	default text height	<i>distance in pixels that the text is drawn from the (x,y) position of the string vertices.</i>
Offset (w)	input	default text height	<i>distance in world units that the text is drawn from the (x,y) position of the string points when plotted or output.</i>
Decimal places	input	3	<i>number of decimal places when displaying the z value</i>
Show null z's	tick box		<i>if ticked, null z values are displayed as null. If not ticked, no z value is displayed at null z-values.</i>
Set	button		<i>set the values in the panel and then redraw the plan view.</i>
Size max (w)	button		<i>when clicked, size max (w) is set to be the world size of vertex z-values displayed on the given plan view. Hence if any further zoom out is done, the vertex z-values will stop drawing. The set button must then be clicked to set the values for the view.</i>
Reset	button		<i>reset all the parameters so no models are individually set for the view.</i>

Z Values Table for Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Z values => Table**

The **Table** option displays a list of models on the view with their vertex z value drawing parameters which can then be modified from the table.

Selecting **Table** fires up the **Z Values Table for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
<i>name of the view to modify vertices z values drawing parameters for.</i>			

Draw tick box
*If **not** ticked, then **no** vertex z values for strings in the given model are drawn on the plan view.
if **ticked**, z values for strings in the model will be checked against the Ht max (w) to see if it is drawn.*

Model input
the model to set the parameters for.

Colour input default pt colour available colours
colour of the z values

Text style input 1 available text styles
textstyle of the z values

Height input 8
height in pixels of the z values.

Ht max (w) input 0
if non-zero: when the plan view is such that the height of the z values in world units is greater than Ht max (w), then the z values are not drawn. Hence as one zooms out, the z values will eventually stop drawing.

Angle input -45
angle in degrees that the text is rotated about the (x,y) position of the string points.

Offset	input	default text height	
	<i>distance in pixels that the text is drawn from the (x,y) position of the string points</i>		
Decimal places	input	3	
	<i>number of decimal places when displaying the z value</i>		
Nulls	yes-no	no	yes, no
	<i>if tick, null z values are displayed as null. If not tick, no z value is displayed at null z-values.</i>		
Set	button		
	<i>set the values in the panel and then redraw the plan view.</i>		

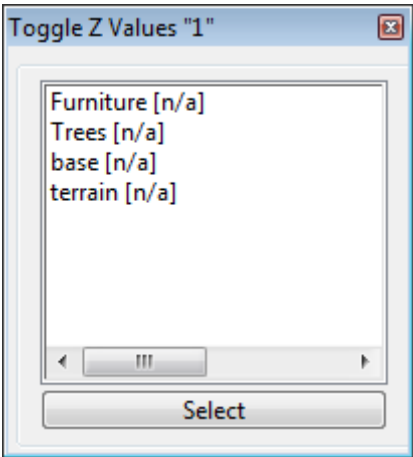

Toggle Z Values

Position of menu: Plan View Menu View => Settings => Z values => Toggle

Walking-right on the **Toggle** option displays a list of models on the view with their vertex z values draw flag. The vertex z value draw flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general Z values toggle is used for the model.

Names

Position of menu: Plan View Menu View => Settings => Names

The **names** option allows the user to specify whether the string name is drawn at each string vertex. The string names can be

(a) not drawn at all

or

(b) if set to draw, then only drawn if the equivalent world size is not too large. This stops the drawing of *string names* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **Names** option tries to control the drawing of string names on the view so that the numbers stop displaying as the user *zooms out*

Depending on whether the environment variable *plan_table_settings_4d* is zero or not, the **names** option draws string names for string vertices for *any* model on the view, or the drawing of string names at vertices can be set for individual models.

If the environment variable *plan_table_settings_4d* is set to 0:

the **names** option is used to display/not display the string name at the vertices of strings in ***all*** models on the plan view.

Selecting **Names** brings up the **Plan String Names for Plan View** panel, without the Model field.

If *plan_table_settings_4d* is non-zero:

the **Names** option then has a walk-right menu with options to specify for *each* model on the plan view whether string names are drawn at vertices for strings in the model are

(a) not drawn at all

or

(b) if set to draw, then the string names are only drawn if the equivalent world size is not too large. This stops the drawing of *names* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

If **Names** is selected without walking right, the **Plan String Names for Plan View** panel is brought up (documented in the next section).

Height	<i>height in pixels of the vertex attributes</i>	input	8	

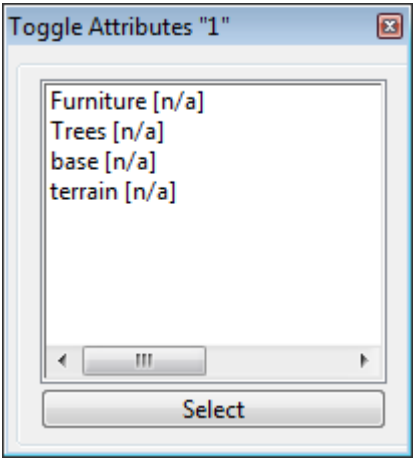

Ht max (w)	input	0
<i>if non-zero: when the plan view is such that the height of the vertex attributes in world units is greater than Ht max (w), then the vertex attributes are not drawn. Hence as one zooms out, the vertex attributes will eventually stop drawing.</i>		
Angle	input	-45
<i>angle in degrees that the text is rotated about the (x,y) position of the vertex attributes.</i>		
Offset	input	default text height
<i>distance in pixels that the text is drawn from the (x,y) position of the string vertices</i>		
Precision	input	3
<i>number of decimal places to use for any real attributes</i>		
Null	tick box	
<i>if ticked, real attributes that are null z values are displayed as null. If not tick, no real attribute is displayed when it has a null z-value.</i>		
Set	button	
<i>set the values in the panel and then redraw the plan view.</i>		

Toggle Attributes

Position of menu: Plan View Menu View => Settings => Names => Toggle

Walking-right on the **Toggle** option displays a list of models on the view with their vertex attribute draw flag. The vertex attribute flag can be toggled on/off for the model by selecting the model on the list.

Note that [n/a] means that the model has *not* been individually set on or off and the general **attributes** toggle is used for the model.

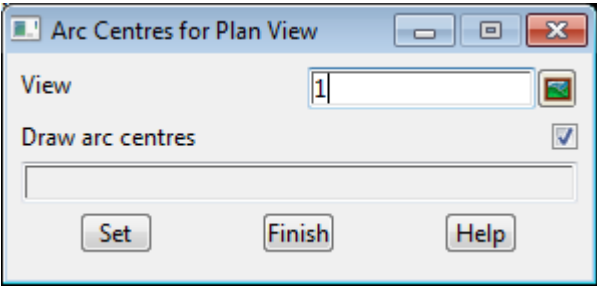

Arc Centres for Plan View

Position of option on menu: Plan View Menu View => Settings => Arc centres

The **arc centres** option allows the user to specify whether the centres of arcs and circles are displayed on the view.

Selecting **Arc centres** fires up the **Arc Centres for Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to modify arc centres flag for.</i>	input/output	current view	available views
Draw arc centres <i>if ticked is selected, any arcs or circles on the view will also have their centres drawn. Otherwise the centres are not displayed.</i>	tick box	tick	
Set <i>set the draw arc centres mode to the value in the draw arc centre tick box panel box. The plan view is then redrawn using the mode.</i>	button		

Work Plane

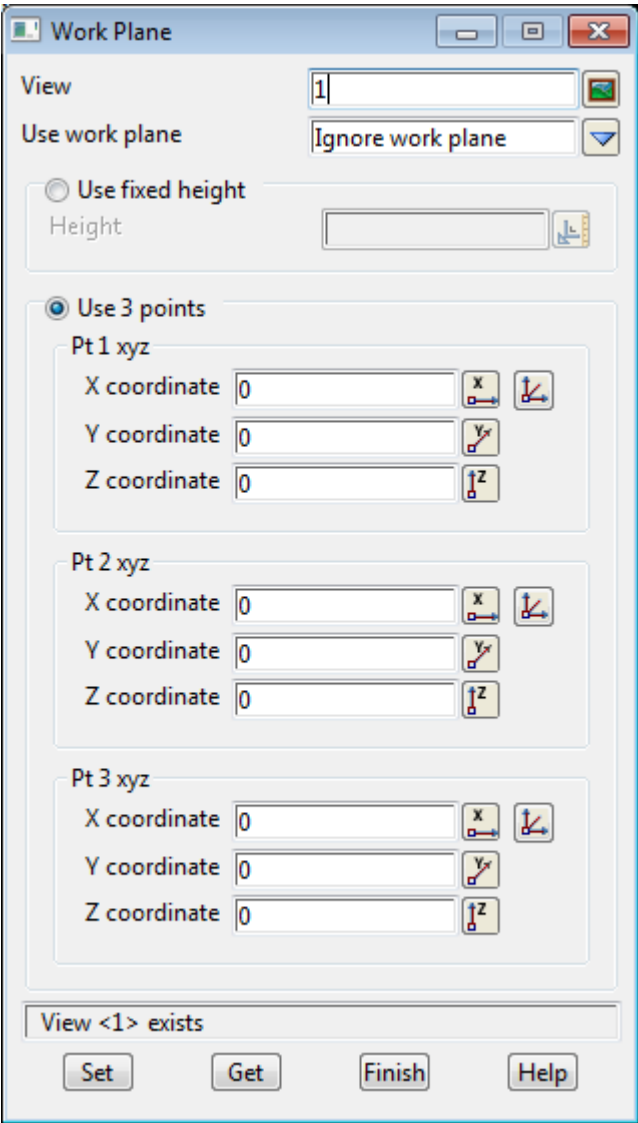

Position of option on menu: Plan View Menu View => Settings => Work plane

A plane not perpendicular to the (x,y) plane, can be used to define a unique z-value for any (x,y) co-ordinate pair. This fact is often invaluable when trying to defined three dimensional points using two-dimensional views.

In **12d Model**, a **work plane** can be defined by giving three non-colinear points. If the work-plane is used in a plan or perspective view, then the (x,y,z) values are restricted to lie in the defined work plane.

The **Work plane** option is used to define and set work planes.

After selecting the **Work Plane** option, the **Work Plane** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to get or set the work plane in.</i>	view box		available views
User work plane	choice box	ignore work plane	ignore work plane

use work plane

the work plane is used or not depending on this field value.

Use fixed height tick box
if ticked, all the created points are given the height from the Height panel field, instead of the z-value from the plane.

Height Real value
if User fixed height is ticked, this is the height to use for all the created points instead of the z-value from the plane.

Pt 1/2/3 xyz input/output 0 0 0
points in the work plane

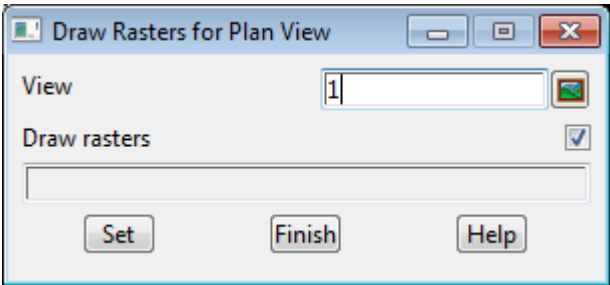

Set button
*A plane is defined by the three points given in the Pt xyz fields. This plane is set as the work plane for the view given by the view field. Although the work plane is set, it is not active unless the use work plane field is set to **use work plane**.*

Get button
get the three points of the defined work plane for the view given in the view field. The points are displayed in the Pt xyz fields of the panel.

Draw Rasters for Plan View

Position of option on menu: Plan View Menu View => Settings => Rasters

The **Rasters** option is used to turn on or off the drawing of any rasters in models on the view.
After selecting the **Rasters** option, the **Draw Rasters for Plan View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to toggle the drawing of rasters on or off.</i>	view box	current view	available views
Draw rasters <i>if ticked, draw any rasters in any models on the view.</i>	tick box	ticked	
Set <i>set the draw rasters mode.</i>	button		

Clouds

Draw_Clouds_for_ViewPosition of option on menu: Plan View Menu View => Settings => Clouds

Point clouds can consist of millions, or even billions, of individual points. The drawing of them on

a plan view may slow things considerably.

The **Clouds** option is used to optionally draw point clouds in any models on the view.

After selecting the **Clouds** option, the **Draw Clouds for View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to toggle the drawing of point clouds on or off.</i>	view box	current view	available views
Draw clouds <i>if ticked, draw any point clouds in any models on the view.</i> <i>if not ticked, don't draw any point clouds in any models on the view.</i>	tick box	ticked	
Set <i>sets the draw clouds mode.</i>	button		

Grid on View

Position of option on menu:	Plan View Menu	View => Settings => Grid
	Section View Menu	View => Settings => Grid
	Perspective View Menu	View => Settings => Grid

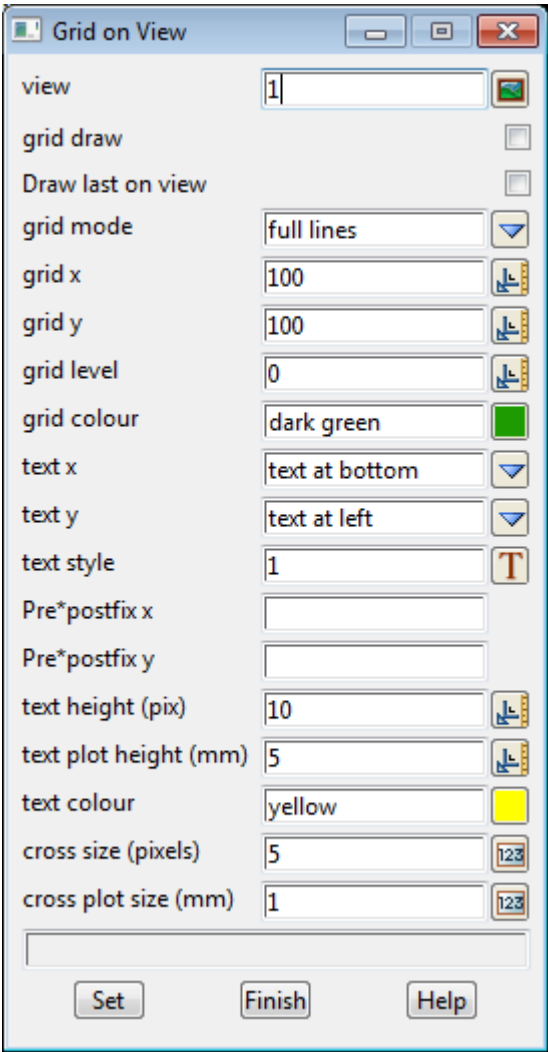

A regular grid of x (East) and/or y (North) lines can be displayed in a view. The grid is set in a plane of constant z (the level of the grid). The x and y spacing for the grid lines can be set and labelled independently.

For a plan or section view, the grid covers the entire view. However, for a perspective view, the grid only covers the maximum extents of the models in the view.

If the grid mode is set to

full lines	solid lines are drawn at the grid x (East) and y (North) spacing
crosses	crosses are drawn at the intersection of the grid x and y spacing
marks	lines are drawn at the beginning/end of the grid at x and y spacing
marks and crosses	marks and crosses are drawn

On selecting the option, the **Grid on View** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the name of the view to define a grid for.</i>	input/output	current view	available views
Grid draw <i>if ticked, the grid is drawn according to parameters in the rest of the panel.</i>	tick box		
Grid mode <i>the style of the grid being drawn - full lines, crosses or marks. If full lines, then solid lines are drawn at the grid x and y spacing. If crosses, then crosses of size cross size are drawn at the intersection of the grid x and y spacing. If marks, then solid lines size cross size are drawn at the beginning/end of the grid at the x and y spacing. If marks and crosses, then marks at the beginning/end of the grid at the x and y spacing, and crosses are drawn.</i>	input	full lines	full lines, crosses, marks marks and crosses
Grid x <i>the distance between the x (East) grid lines. If this value is zero, the x grid lines will not be drawn.</i>	input	100	
Grid y	input	100	

grid level	input	0
<i>the (x,y) grid is set in a plane of constant z. The grid level is the value of the constant z. This will only be used for a perspective view.</i>		

Text x	input	text at bottom	text off, text at top, text at bottom, text at top and bottom
---------------	-------	----------------	------------------------------------------------------------------------

Text y	input	text at left	text off, text at left, text at right, text at left and right
---------------	-------	--------------	------------------------------------------------------------------------

Text style	input	1
<i>the text style of any grid labels.</i>		

Pre*postfix y input

*prefix/postfix (pre*post) to be applied to the value of y (North). If pretext only, just give the text. If post text is required, precede it by a *. For example N*m will place N before the y value and m after the number.*

Text plot height (mm)	input	10.0
<i>height in millimetres of any grid labels in a plot.</i>		

Text colour	input	yellow	available colours
	<i>colour that any grid labels are drawn in.</i>		

Cross size (pixels)	input	5.0
<i>size in screen pixels of grid crosses.</i>		

Cross plot size (mm)	input	1.0
<i>size in millimetres of grid crosses in a plot.</i>		

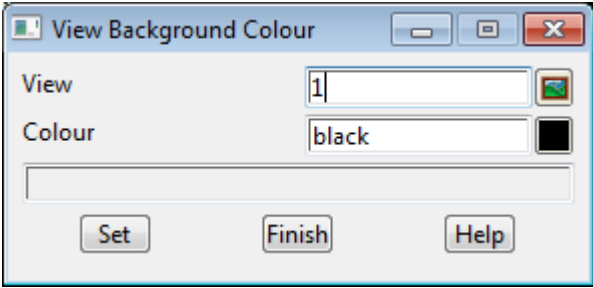

Set button

the grid parameters are set to the values given in the panel. The grid is then redrawn in the view.

Note - If the view name is selected from the pop-up, or a <enter> is done after the view name is entered into the view field, the data for the grid on the named view is placed in the panel fields.

Position of option on menu: Plan View Menu View => Settings => Colour

The **Colour** option is used to set the background colour for the view.
After selecting the **Colour** option, the **View Background Colour** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set the background colour for.</i>	input/output	current view	available views
Colour <i>if ticked, draw any rasters in any models on the view.</i>	colour box	black	available colours
Set <i>set the background colour.</i>	button		

View Drawing Filter

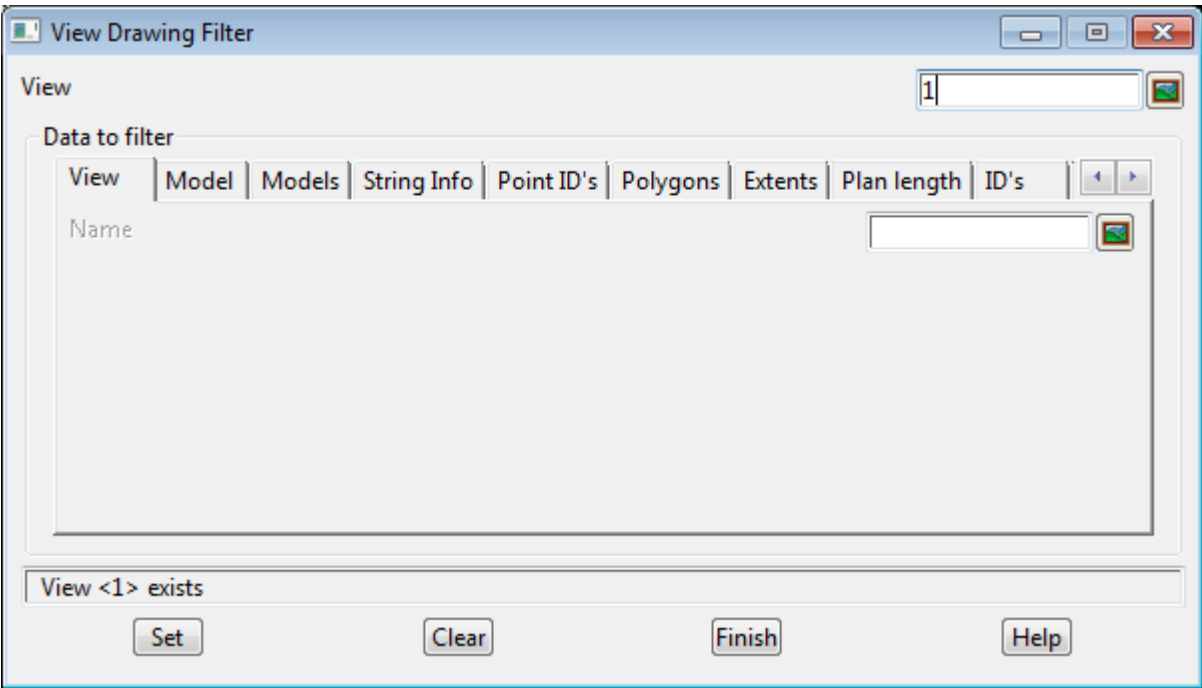

Position of option on menu: Plan View Menu View => Settings => Drawing filter

Position of option on menu: Perspective View Menu View => Settings => Drawing filter

The Drawing filter option is used to set a filter on the view so that only the data satisfying the filter is drawn.

NOTE: the filter is not saved with the project.

After selecting the Drawing filter option, the **View Drawing Filter** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to apply the drawing filter to.</i>	view box	current view	available views
Data filter <i>only the data satisfying the drawing filter is drawn on the view.</i>	view box	current view	available views
Set <i>apply the drawing filter to the view.</i>	button		
Clear <i>clear the drawing filter being applied to the view.</i>	button		

Zoom

Position of menu: Plan View Menu View => Settings => Zoom

Position of menu: Section View Menu View => Settings => Zoom

The zoom option operators in the same way for Plan and Section views.

The **zoom** option can be selected in three ways. By clicking LB on **zoom** on a view button area, selecting the **zoom option** itself by clicking LB when the zoom option is highlighted on the zoom menu, or by activating the zoom option's walk-right menu, **Zoom Ops**.

The zoom uses either a *dynamics zoom* or a *zoom box*

For more information on **zoom ops** go to [Zoom Ops menu](#)

Dynamic Zoom

After selecting the **Zoom** option, *dynamic zoom* is selected by clicking MB or by typing **d**.

Then press LB at the point that is to stay put during the dynamic zoom and then move the mouse up to zoom in or move the mouse down to zoom out. Another point can be selected to dynamically zoom in or out about.

The dynamic zoom continues until either RB is clicked, or MB is clicked (or **d** typed) to place the zoom option into *zoom box* mode.

Zoom Box

Position of option on menu: Plan View Menu View => Settings => Zoom =>Zoom

After selecting the **zoom** option, the user can define the zoom box by

- (a) pressing down LB at one corner of the box and dragging the mouse and releasing LB when at the other corner of the zoom box

or

- (b) picking two points from any plan views (by clicking LB in a plan view for each point) to define the diagonally opposite points of the zoom box. Note that the two points **do not** have to be from the same plan view.

Next the user selects the view (by clicking LB in the view) which is to be redrawn using this rectangle as the new drawing limits.

Often the same view is chosen for both defining the rectangle and redrawing. However, the power of the option is that the area to be “zoomed in” or “blown up” can be selected from one view and the zoomed area displayed in another view. The other view may not only be different to the views used to defined the zoom box, but may also have different models attached to it.

It is a useful technique to have a master view displaying the entire area of interest in one view, and use it to define zoom-rectangles for use in viewing smaller regions of data in other plan views.

To cancel the zoom after the zoom operation has been selected, click RB.

Next step messages - sent to the screen message area

- <View Zoom> [Select][] select 1st corner of box - RB to cancel
- <View Zoom> [Select][] select 2nd corner of box - RB to cancel
- <View Zoom> [Select][] select destination view - RB to cancel

WARNING - this option can not be applied to a perspective view.

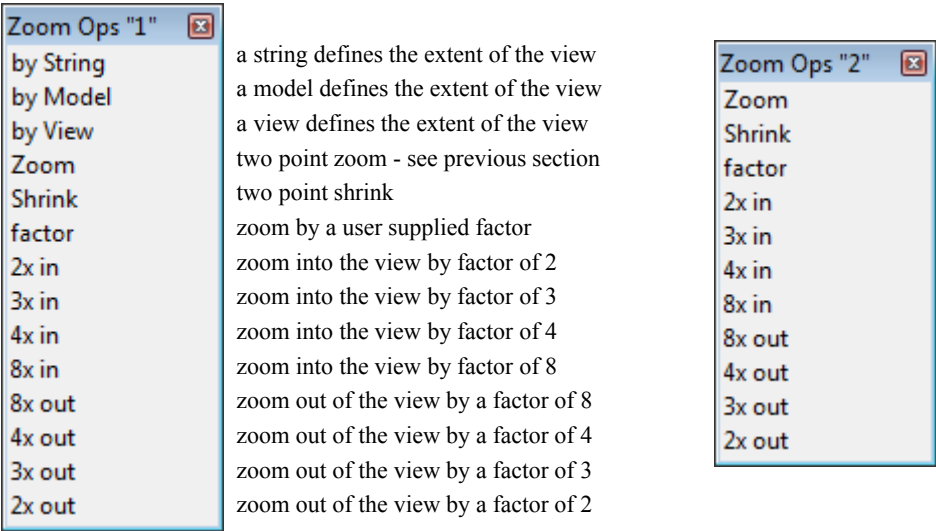

Please continue to the next section [Zoom Ops menu](#).

Zoom Ops menu

Position of menu: Plan View Menu View => Settings => Zoom

Position of menu: Section View Menu View => Settings => Zoom

The Zoom walk-right menu is

The **by String**, **by Model** and **by View** options use the x and y extents of the String, Model or View to define the display area for the view. These options will be described in more detail.

The option **zoom** is the same operation as the option just discussed, **factor** - to enlarge or reduce the view by a given magnification/reduction factor, and a number of preset view magnification and reduction factors.

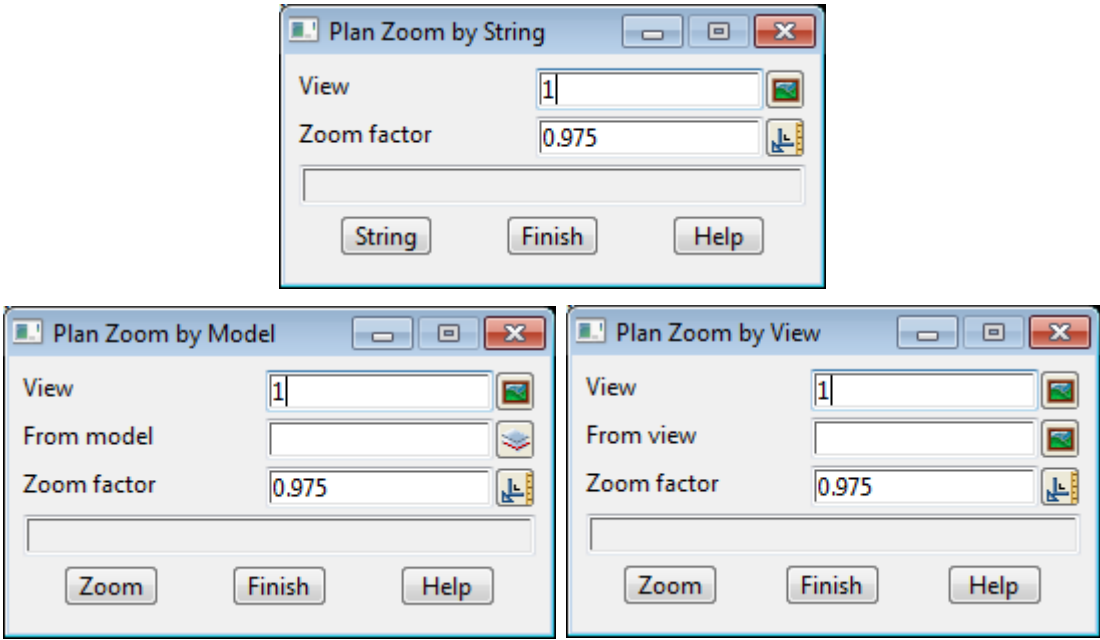

By String, by Model and by View

Position of option on menu: Plan View Menu View =>Settings =>Zoom =>by string

Position of option on menu: Plan View Menu View =>Settings =>Zoom =>by model

Position of option on menu: Plan View Menu View =>Settings =>Zoom =>by view

The three zoom options **by String**, **by Model** and **by View** work in a similar manner. After selecting the option, the **Plan Zoom by String/ Model/ View** panel is brought up.

For **by String**, the user selects a string using the **String** button and the data on the view is redrawn so the selected string is fitted to the view, adjusted by the Zoom factor given in the panel.

Note that the selected string can be from a different view.

For **by Model**, the user enters a model name into the Model field and then selects the **Zoom** button. The data on the view is redrawn so the specified model is fitted to the view, adjusted by the Zoom factor given in the panel.

Note that the specified model does not have to be on the view.

For **by View**, the user enters a view name into the View field and then selects the **Zoom** button. The data on the view is redrawn so the specified view is fitted to the current view, adjusted by the Zoom factor given in the panel.

Note that the specified view does not have to be on the current view.

Shrink

Position of option on menu: Plan View Menu View =>Settings =>Zoom =>Shrink

Shrink is the opposite of zoom: instead of the information in the view box being expanded to fill the view, the information in the view is shrunk to fit into the zoom box.

After selecting the shrink option, the user picks two points from any plan views (by clicking LB in a plan view for each point) to define the diagonally opposite points of a rectangle. Note that the two points **do not** have to be from the same plan view.

Next the user selects the view (by clicking LB in the view) which is to be redrawn by shrinking the data on the view to fit into this rectangle.

To cancel the zoom after the zoom operation has been selected, click RB.

WARNING - this option can not be applied to a perspective view.

Factor

Position of option on menu: Plan View Menu View => Settings => Zoom => Factor

Position of option on menu: Section View Menu View => Settings => Zoom => Factor

In Plan View, when selecting the Factor option, the **Zoom Plan View** panel is displayed.

In Section View, when selecting the Factor option, the **Zoom Section View** panel is displayed.

This option is used to magnify or reduce the information in the view by a user given amount.

The field and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to set zoom factor for.</i>	input/output	current view	available views
Zoom factor <i>factor to magnify/reduce the information inside the view by. The value can be greater than 1.0 (zoom</i>	input	1.0	

in) or less than 1.0 (zoom out).

Zoom button

the information displayed in the view is magnified/reduced by the factor given in the zoom factor field.

WARNING - this option can not be applied to a perspective view.

Pre-set Zoom Factors

Upon selecting a particular zoom factor (e.g. 4 x in), the user is asked to indicate a point in a view which is to become the new view-centre. The user then indicates (by clicking LB in the view) which view is to be redrawn with this point as the new centre and with the selected zoom factor applied to that view.

To cancel the zoom after the zoom operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Magnify> [Select] select new centre of view - RB to cancel
<View Magnify> [Select] select destination view - RB to cancel

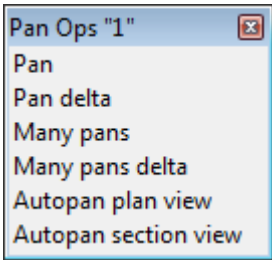

Pan

Position of menu: Plan View Menu View => Settings => Pan

Position of menu: Section View Menu View => Settings => Pan

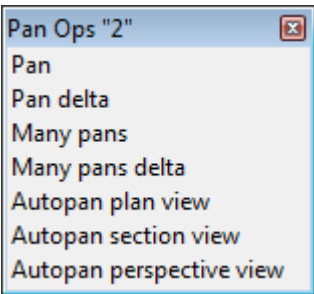

The Pan walk-right menu for Plan and Section views are

Plan View Pan Menu

make selected point the new view centre
pick a point and the place it is to be moved to on the screen
repeated pan
repeated pan delta
autopan for plan locked to plan view
autopan for plan locked to section view

Section View Pan Menu

make selected point the new view centre
pick a point and the place it is to be moved to on the screen
repeated pan
repeated pan delta
autopan for plan locked to section view
autopan for section locked to section view
autopan for perspective locked to section view

Pan operates the same way for Plan and Section views.

The pan option can be selected in four ways:

- (a) by clicking LB on Pan on a view button area
- (b) by clicking on <Control> LB whilst in the view

- (c) selecting the **Pan option** itself by clicking LB when the **Pan** option is highlighted on the **Pan** menu
 - (d) by activating the Pan option's walk-right menu, **Pan OpS**.
- The *pan* uses either a *dynamics pan* or two point mode.

Dynamic Pan

After selecting the **pan** option, *dynamic pan* is selected by clicking MB or by typing **d**.

Then press LB at the point that is to be dragged across the view during the dynamic pan and then move the mouse to the new position for the point. Another point can then be selected to dynamically pan.

The *dynamic pan* continues until either RB is clicked, or MB is clicked (or **d** typed) to place the pan option into *two point* mode.

After activating the **Pan** walk-right menu, the user is presented with the option **Pan** (which is the same operation as the option just discussed), **Pan delta**, and **Many pans** and **Many pans delta**.

Pan

Position of option on menu: **Plan View Menu** **View => Settings => Pan => Pan**

Position of option on menu: **Section View Menu** **View => Settings => Pan => Pan**

After selecting **Pan**, the user is asked to indicate a point in a view which is to become the new view-centre. The user then indicates (by clicking LB in the view) which view is to be redrawn with this point as the new centre.

To cancel the **Pan** after the *pan* operation has been selected, click **RB**.

Next step messages - sent to the screen message area

<View Pan> [Select][][] select new centre of view - RB to cancel
<View Pan> [Select][][] select destination view - RB to cancel

Pan Delta

Position of option on menu: **Plan View Menu** **View => Settings => Pan => Pan delta**

Position of option on menu: **Section View Menu** **View => Settings => Pan => Pan delta**

After selecting the **Pan delta** option, the user is asked to indicate a point in a view and the point on a view where the first point will be moved to. The user then indicates (by clicking LB in the view) which view is to be redrawn with the new position of the point on the view.

To cancel the **Pan delta** after the *pan delta* operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Pan> [Select][][] select 1st position of pan - RB to cancel
<View Pan> [Select][][] select 2nd position of pan - RB to cancel
<View Pan> [Select][][] select destination view - RB to cancel

Many Pans

Position of option on menu: **Plan View Menu** **View => Settings => Pan => Many pans**

Position of option on menu: **Section View Menu** **View => Settings => Pan => Many pans**

The **Many pans** option is simply one *pan* operation followed by another.

After one *pan* operation has been performed, a new *pan* operation is begun.

The sequence is terminated by clicking RB.

Many Pans Delta

Position of option on menu: Plan View Menu View => Settings => Pan => Many pans delta

Position of option on menu: Section View Menu View => Settings => Pan => Many pans delta

The **Many pans delta** option is simply one *pan delta* operation followed by another.

After one *pan delta* operation has been performed, a new *pan delta* operation is begun.

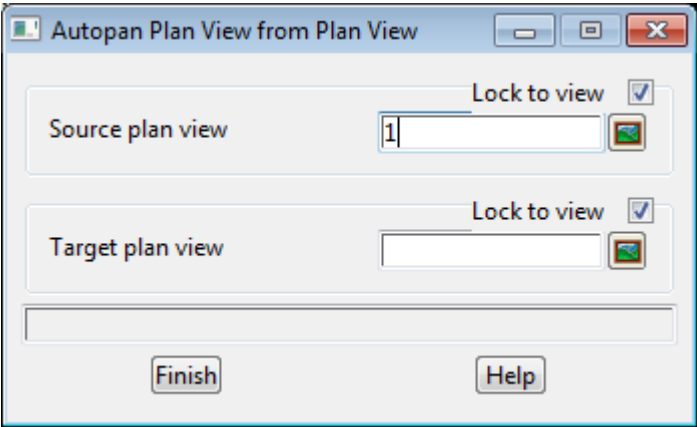

The sequence is terminated by clicking RB.

Autopan Plan View Locked to a Plan View

Position of option on menu: Plan View Menu View =>Settings =>Pan =>Autopan plan view

The Autopan plan view option locks a target plan view to a source plan view. As the cursor is moved in the source plan view, the target plan view is automatically panned to keep the cursor in the middle of it. The target plan view keeps its scale.

Selecting Autopan plan view brings up the Autopan Plan View from Plan View panel.

The fields and buttons used in this panel have the following functions.

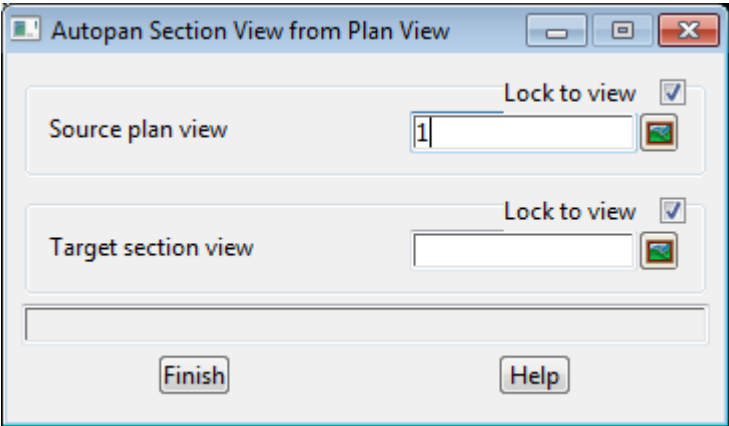

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view <i>plan view to lock the target plan view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target plan view <i>plan view to lock the source plan view. As the cursor moves in the source plan view, the target view is automatically panned so that the cursor is in the centre of the target plan view.</i>	view box		available plan views

Autopan Section View Locked to a Plan View

Position of option on menu: Plan View Menu View =>Settings =>Pan =>Autopan section view

The Autopan section view option locks a target section view to a source plan view. As the cursor is moved in the source plan view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

Selecting Autopan section view brings up the Autopan Section View from Plan View panel.

The fields and buttons used in this panel have the following functions.

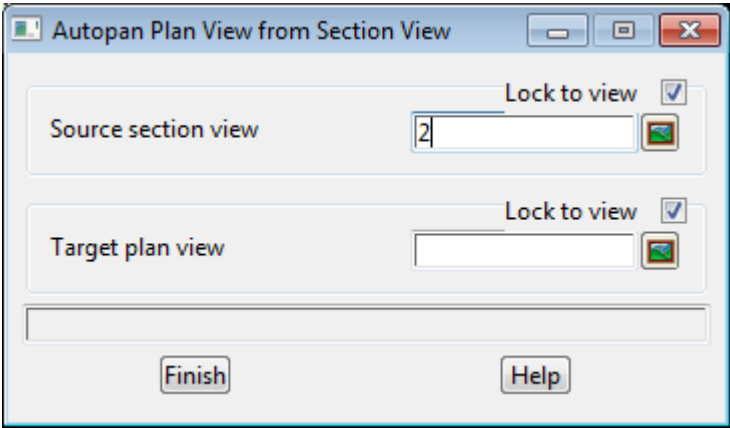

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view <i>plan view to lock the section view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target section view <i>section view to lock the source plan view. As the cursor is moved in the source plan view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.</i>	view box		available section views

Autopan Plan View Locked to a Section View

Position of option on menu: Section View Menu View => Settings => Pan => Autopan plan view

The Autopan plan view option locks a target plan view to a source section view. As the cursor is moved in the source section view, the target plan view is automatically panned to keep the cursor in the middle of it. The target plan view keeps its scale.

Selecting Autopan plan view brings up the Autopan Plan View from Section View panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view <i>section view to lock the target plan view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target plan view <i>plan view to lock the source section view. As the cursor moves in the source section view, the target view is automatically panned so that the cursor is in the centre of the target plan view.</i>	view box		available plan views

Autopan Section View Locked to a Section View

Position of option on menu: Section View Menu View =>Settings =>Pan =>Autopan section view

The Autopan section view option locks a target section view to a source plan view. As the cursor is moved in the source section view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

Selecting Autopan section view brings up the Autopan Section View from Section View panel.

The fields and buttons used in this panel have the following functions.

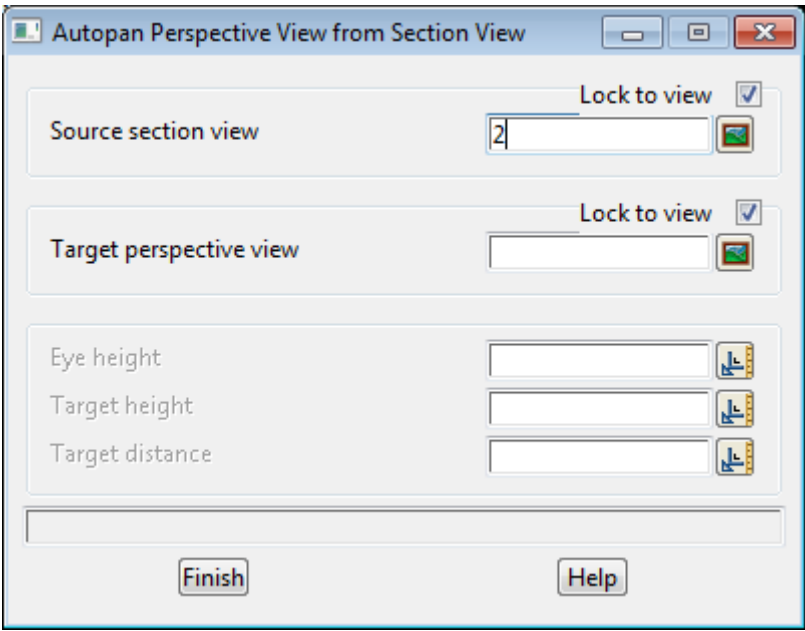

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view <i>section view to lock the target section view to.</i>	view box	current view	available section views
Lock to view	tick box	tick	
Target section view <i>section view to lock the source section view. As the cursor is moved in the source section view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.</i>	view box		available section views

Autopan Perspective View Locked to a Section View

Position on menu: Section View Menu View => Settings => Pan => Autopan perspective view

The Autopan perspective view option locks a target perspective view to a source section view. As the cursor is moved in the source section view, the eye and target for the perspective view is automatically changed. Only the eye and target positions are modified for the target perspective view.

Selecting Autopan perspective view brings up the Autopan Perspective View from Section View panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
<i>if ticked, the source view is used.</i>			
Source section view	view box	current view	available section views
<i>section view to lock the target perspective view to.</i>			
Lock to view	tick box	tick	
<i>if ticked, the target view is used.</i>			
Target perspective view	view box		available perspective views
<i>perspective view to lock to the source section view. As the cursor moves in the source section view, the eye and target position for the target perspective view is calculated from the (x,y,z) of the profiled string in the section view, and the eye and target information in the panel.</i>			

Plan Utilities

Position of menu: **Plan View Menu** **View => Settings => Utilities**

The **Utilities** menu contains miscellaneous options involving the plan view. The **Utilities** walk-right menu is

For the option *Autosync plan view*, go to [Autosync Plan View Locked to a Plan View](#)

New View Settings

Dump [View Dump](#)

Quick *plot* Quick Plan Plot

Quick sheet *plot* Quick Sheet Plot

Plot frames

[View to raster](#) [Create Raster from Plan View](#)

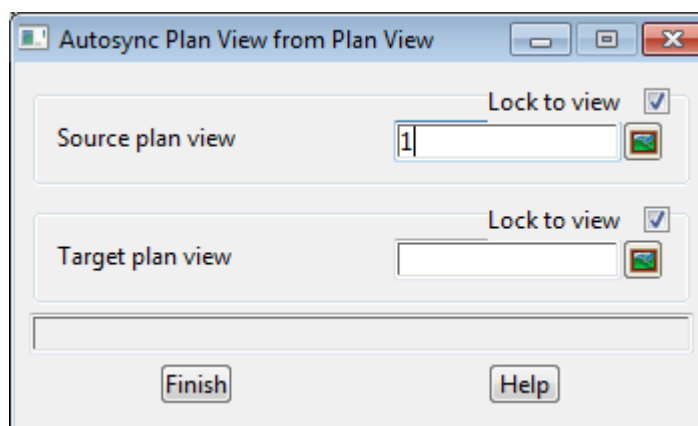

[View Info](#)

Autosync Plan View Locked to a Plan View

Position of option on menu: Plan View Menu View =>Utilities =>Autosync plan view

The **Autosync plan view** option locks a target plan view to a source plan view. As the cursor is moved in the source plan view, the same movement is made in the target plan view.

Selecting **Autosync plan view** brings up the **Autosync Plan View from Plan View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view <i>plan view to lock the target plan view to.</i>	view box	current view	available plan views
Lock to view	tick box	tick	
Target plan view <i>plan view to lock to the source plan view. As the cursor is moved in the source plan view, the same movement is made in the target plan view.</i>	view box		available plan views

New View Settings

Position of option on menu: Plan View Menu View =>Settings =>Utilities =>New view settings

The **new view settings** option displays the current view setting and permits the user to specify new x and y minimum and maximum values as the viewing parameters.

Selecting **New view settings** fires up the **Plan View** panel.

Because the aspect ratio of the view may be different from the aspect ratio defined by the user supplied x and y minimums and maximums, slightly more data than the specified range may need to be drawn in the view. However, the view will always **include** the user given range.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set min and max for.</i>	input/output	current view	available views
x min/max <i>minimum/maximum x co-ordinate for the view</i>	input/output	current x min/max	
y min/max <i>minimum/maximum y co-ordinate for the view</i>	input/output	current y min/max	
View <i>define the view parameters according to the information in the panel. If the box given by the x and y values in the panel is not the same shape as the view itself (that is, has the same aspect ratio), the x and y values will be modified so that the x and y values match the view shape. The final x and y values are displayed in the panel.</i>	button		

View Dump

Position of option on menu: Plan View Menu View => Settings => Utilities => Dump

This option is used to write the image of the view out to disk in a user selected format.
Selecting **Dump** brings up the **View Dump** panel.

The fields and buttons have the following functions.

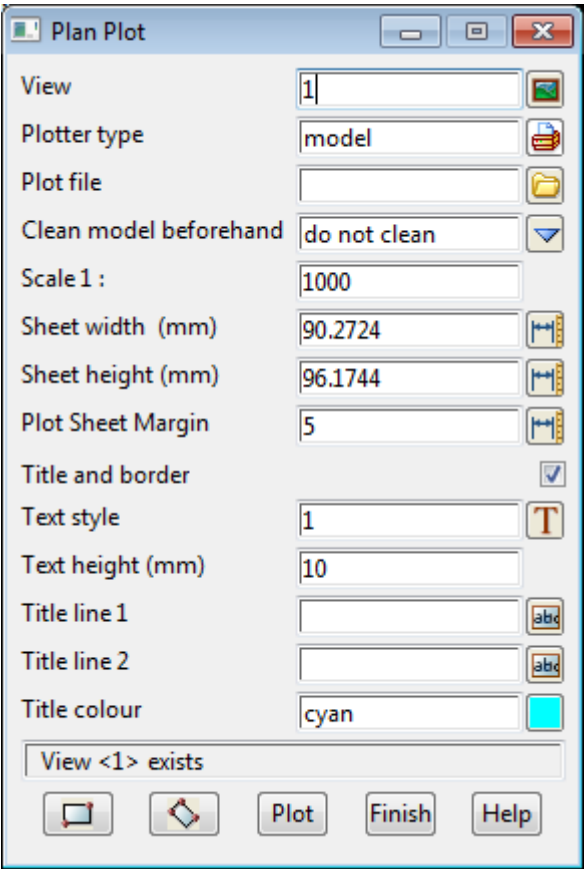

Field Description	Type	Defaults	Pop-Up
View <i>view to dump out in the specified format.</i>	input	view option picked from	available views
Include title <i>if ticked, the view title area is included in the dump.</i>	tick box		
Format <i>the format to dump the view out in.</i>	input	gif	gif, xwd, colour postscript
File <i>the file to dump the view images out to</i>	input	*.gif	
Dump <i>dump in the given format the image of the view given in the view field to the file given in the file field.</i>	button		

Quick Plan Plot

Position of option on menu: Plan View Menu View =>Settings =>Utilities =>Quick plot

The Quick plot option writes out all the information displayed in the plan view to either a plot file (in a user selected format) or to a 12d Model model. The user selects a scale for the plot and the sheet width and height are calculated by 12d Model.

Selecting Quick plot brings up the Plan Plot panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to plot.</i>	view box	current view	available views
Plotter type <i>format for the plot information.</i>	input	hp	hp, dxf, postscript etc.
Plot file <i>stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.</i>	input	depends on plotter type	
Clean model beforehand <i>only applicable if plotting to a model.</i> <i>if always clean, the model is cleaned before the plot is created.</i> <i>If prompt for clean, the user is prompted that the model will be cleaned before the plot is created.</i> <i>If do not clean, the model is not cleaned before the plot is created.</i>	choice box		do not clean prompt for clean always clean
Scale 1:	input		

if a value is entered by the user and an <enter> given, the sheet width and height required by the plot are calculated and displayed in the sheet width and sheet height fields.

Sheet width (mm) output

*if a value is entered by the user and an <enter> given, the scale and height required by the plot are calculated and displayed in the scale and sheet height fields. The units for sheet width are **millimetres**.*

Sheet height (mm) output

*if a value is entered by the user and an <enter> given, the scale and width required by the plot are calculated and displayed in the scale and sheet width fields. The units for sheet height are **millimetres***

Title and border tick box

*if **ticked**, a border and two lines of title are placed on the bottom of the plot.*

Title line 1/2 input

first/second line of title information.

Title height (mm) input 10

*height (in **millimetres**) to draw the two lines of title information.*

Title colour input cyan available colours

colour used for the border and the title information.

Rectangle button

<i>select or type in the position of the bottom left hand corner of the plot region.</i>		
View controlled/ Data controlled	radio buttons	
<i>if Data controlled, the plot sheet maintains its size and position with respect to the data in the view. That is, the plot sheet origin is locked to the selected data co-ordinates, and the plot scale is fixed so that the plot sheet then has a set size in world (data) units. If pans and zooms are made to the data in the view, the plot sheet will then move/zoom with data.</i>		
<i>if View controlled, the plot sheet maintains its size and position with respect to the view itself. That is, the plot sheet is locked in size and position with respect to the view itself. If pans and zooms are made to the data in the view, the sheet scale and origin are automatically modified to keep the plot frame in exactly the same position and size in the view.</i>		
Title and border	tick box	
<i>if ticked, a border and two lines of title are placed on the bottom of the plot.</i>		
Title line 1/2	input	
<i>first/second line of title information.</i>		
Title height (mm)	input	10
<i>height (in millimetres) to draw the two lines of title information.</i>		
Title colour	input	cyan available colours
<i>colour used for the border and the title information.</i>		
Rectangle	button	
<i>if selected, the plot frame is placed by selecting a cursor position from a view. This defines the Origin of the plot sheet. The sheet size, plot sheet scale and sheet rotation are taken from the panel fields.</i>		
Centre and Rotate	button	
<i>if selected, a centre of for the plot sheet is selected and then an second point to define the rotation of the plot sheet. This defines the Origin and Rotation of the plot sheet. The sheet size and scale are taken from the panel fields.</i>		
Plot	button	
<i>write out the plot of the information displayed in the plot sheet to the file given in the plot file field. The format of the file is given by the plotter type.</i>		

Plot Frames

Position of option on menu: **Plan View Menu** **View => Settings => Utilities => Plot frames**

To create plan plots of an arbitrary size, rotation and scale, 12d Model uses **plot frames**.

Basically a plot frame consists of a sheet size (in mm), margins within the sheet and a scale for the plot. This will define a plotting area in world co-ordinates (the plot frame).

The plot frame can be arbitrarily positioned and rotated on a plan view.

This option is documented in the section [Plotting Old Plot Frames](#) in the chapter [Plots](#)

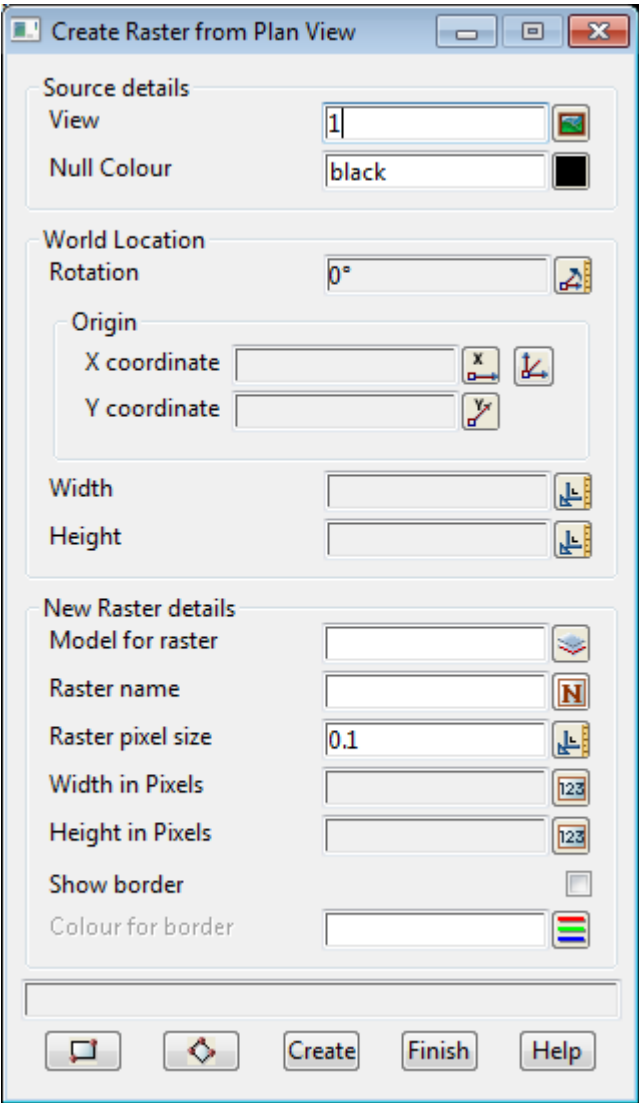

Create Raster from Plan View

Position of option on menu: Plan View Menu View => Settings => Utilities => View to raster

Position of option on menu: Strings =>Raster => Plan to raster

This option creates a 12d raster of a user specified pixel size, for the image on a plan view. This is useful for creating a 12d raster from an ECW file to use in draping on a tin in visualisations.

On selecting the View to Raster option, the **Create Raster from Plan View** panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Source Details			
View <i>view to create raster from.</i>	view box	current view	available views
Null colour <i>colour to set to no pixel in the raster</i>	colour box		available colours

World Location

- Anticlockwise rotation

angle box

the world rotation of the selected rectangle.
- X/Y co-ordinate

real box

the world x/y co-ordinate of the corner of the bottom left corner of the rectangle.
- Width/height

real box

the width/height in world units of the rectangle.

New Raster Details

- Model for raster

model box

available models

name of the model for the raster element.
- Raster name

text box

the name for the raster.
- Raster pixel size

input

the size (in world units) for each pixel in the created raster.
- Width/Height in pixels

output only

the width/height in pixels of the created raster.
- Show border

tick box

tick

if ticked then the border of the created raster element is displayed.
- Colour for border

input

default colour

available colours

the colour of the border for the created raster.
- Rectangle

button

create a rectangle (parallel to the x,y axis) that the created raster is restricted to.
- Rotated Rectangle

button

create a rotated rectangle that the created raster is restricted to.
- Create

button

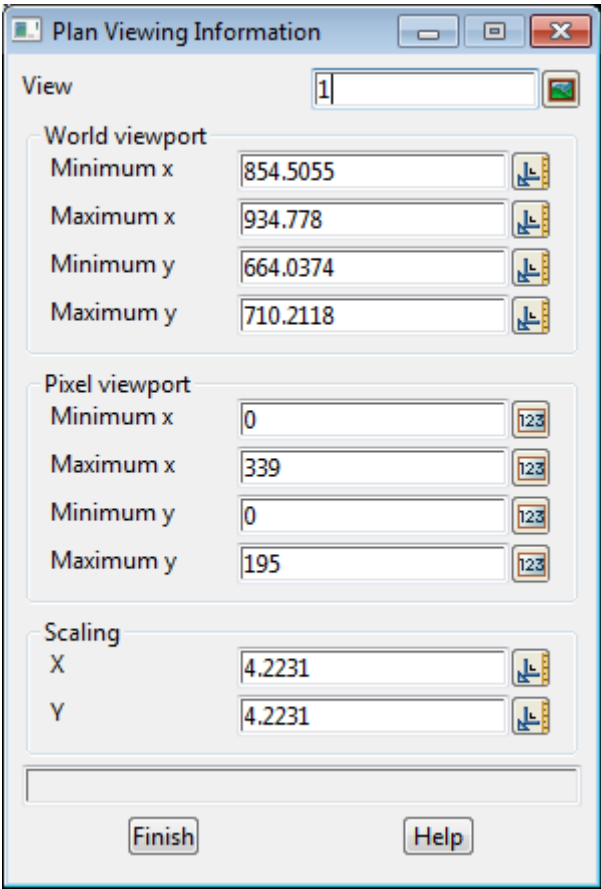

create a 12d raster from the image on the plan view.

View Info

Position of option on menu: Plan View Menu View => Utilities => Info

This option displays information about the world and pixel size of a plan view.

On selecting the Info option, the Plan Viewing Information panel is displayed.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>when activated from the Plan View menu, the name of the view is placed into this field and the information about this view is displayed in the panel fields.</i> <i>Once the panel is up, a different Plan View name can be selected and the information will be displayed for that view.</i>	view box	current view	available plan views

World viewport

- Minimum, Maximum x** display only
display the world minimum and maximum x coordinates for the view.
- Minimum, Maximum y** display only
display the world minimum and maximum y coordinates for the view.

Pixel viewport

- Minimum, Maximum x** display only
display the minimum and maximum x pixels coordinates for the view.

Minimum, Maximum y display only

display the world minimum and maximum y pixels coordinates for the view.

Note - for pixels coordinates, (0,0) is at the top left hand corner of the view and positive x goes to the right, and positive y goes down the view.

Scaling

X display only

the ratio of x pixel length of the view to the x world unit length of the view. That is,

(maximum x pixels - minimum x pixels)/ (maximum x world units - minimum x world units)

Y display only

the ratio of y pixel length of the view to the y world unit length of the view. That is,

(maximum y pixels - minimum y pixels)/ (maximum y world units - minimum y world units)

Perspective View Menu

Position of menu: Perspective View Menu View

The perspective view menu is

For the option *Models*, go to the section

- Settings*
- Redraw*
- Fit*
- Previous*
- Eye/Target*
- Joy*
- Orbit*
- Plan Camera*
- Utilities*
- Delete*

- [Model Ops](#)
- [Perspective View Settings](#)
- [Redraw](#)
- [Fit](#)
- [Previous](#)
- [Eye/Target](#)
- [Joy View](#)
- [Orbit](#)
- [Plan Camera](#)
- [Perspective Utilities](#)
- [Delete](#)

Perspective View Settings

Position of menu: Perspective View Menu View =>Settings

If the **Settings** option is picked rather than moving onto the walking right, then the **Toggle** menu from the **Toggle** walk-right menu is displayed on the screen. The **Toggle** menu will be described in the next section.

The **Settings** walk-right menu for the perspective view is

For the option <i>Toggle</i> , go to	Perspective Toggle
<i>Culling</i>	Culling
<i>Faces</i>	Face Flags for View
<i>Hide</i>	Hide View
<i>Planes</i>	Clipping Planes for View
<i>Exaggeration</i>	Perspective View Exaggeration
<i>Tins</i>	Tins
<i>Shade</i>	Shade
<i>Work Plane</i>	Work Plane
<i>Grid</i>	Grid on View
<i>Colour</i>	View Background Colour
<i>Drawing filter</i>	View Drawing Filter

Perspective Toggle

Position of menu: Perspective View Menu View =>Settings =>Toggle

The **Toggle** walk right brings up the **Toggle** perspective view menu.

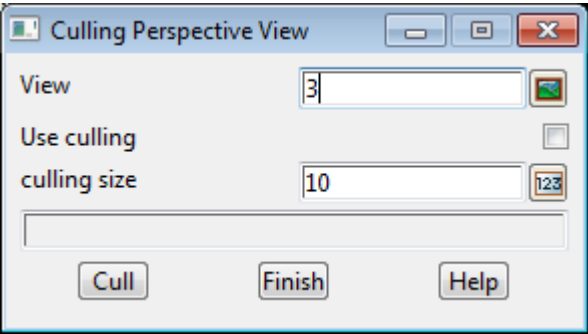

Selecting any options from this menu will toggle the option on/off.

Culling

Position of option on menu: Perspective View Menu View =>Settings =>Culling

The **Culling** option is used to suppress the drawing of strings whose on-screen extent is less than a user defined pixel size.

Selecting **Culling** raises the **Culling Perspective View** panel.

The fields and buttons used in this panel have the following functions.

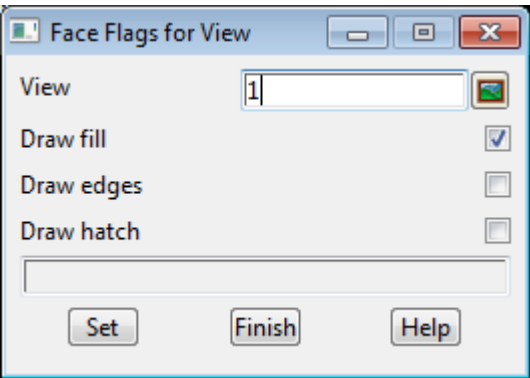

Field Description	Type	Defaults	Pop-Up
View <i>view to set culling parameters for.</i>	input/output	current view	available views
Use culling <i>if ticked, a string is not drawn on the perspective view whenever the string's extent box when drawn on the view would be smaller the culling size given in the culling size field.</i>	tick box		
Culling size <i>pixel size used for culling</i>	input	10	
Cull <i>record the culling size given in the culling field. If the use culling field and redraw the view.</i>	button		

Face Flags for View

Position of option on menu: Perspective View Menu View =>Settings =>Faces

The **faces** option allows the user to specify how faces are displayed in the perspective view and on any perspective view plots.

Selecting **Faces** fires up the **Face Flags for View** panel.

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to face flags for.</i>	input/output	current view	available views
Draw fill <i>if ticked, all faces in the view are drawn in their fill colour.</i>	tick box	tick	
Draw edges <i>if ticked, all face edges in the view are drawn.</i>	tick box		
Draw hatch <i>if ticked, all faces in the view are drawn in their hatch pattern.</i>	tick box		
Set <i>set the draw fill/edges/hatch fields to the value in the panel fields. The plan view is then redrawn.</i>	button		

Hide View

Position of option on menu: Perspective View Menu View =>Settings =>Hide

When looking across a landscape, part of the terrain is often hidden by other parts of the terrain. For example hills in the foreground will hide hills behind them.

In **12d Model**, a landscape is represented by a triangulated surface (a tin) and a tin can be used by a hidden line algorithm to determining what is visible is a scene.

The **hide** option in **12d Model** uses a tin to define a surface and processes any strings on the perspective against the tin to determine what is visible or hidden.

Only strings that lie on the tin can be sensibly processed. For example, contours, meshes, draped strings and any of the data that was used to create the tin.

When viewing a terrain from an eye point, the **ridge lines** are the edges of transition between visible and invisible areas. The **hide** option displays the ridge lines to delineate the hidden regions.

Once the **hide** option is set on, a hide will be done on the view whenever the view parameters are changed. If a model is added to the view when hide is set on, the strings in the model are processed and only the visible sections displayed in the view.

Note - strings can still be selected in a hidden view.

Selecting **Hide** raises the **Hide View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set hide parameters for.</i>	input/output	current view	available views
Tin <i>the name of the triangulated surface (tin) to be used for determining what is visible or not.</i>	input		available tins
Hide view <i>if ticked, then the view is processed when the set button is selected.</i>	tick box		
Ridges colour <i>the colour for the ridge lines.</i>	input		available colours
Set <i>record the answers for the hide view, tin and ridges colour fields and then process the perspective view using the new parameters. The view type will be changed to hidden.</i>	button		

WARNING - a hide can be very slow for large tins and/or large data sets.

Clipping Planes for View

Position of option on menu: Perspective View Menu View =>Settings =>Planes

The perspective viewing direction is defined by specifying an eye and target point. The three dimensional view is then projected onto a plane at right angles to the eye-target line, and at a user defined distance from the eye-point. This plane is called the focal plane and the distance from the eye-point to the focal plane is the focal distance. The projection of all the data onto the focal plane is what is seen on the screen in a perspective view. Moving the focal plane has the same effect as varying the telephoto lens on a camera - it gives the impression of zooming into and out of the view. It is not always desirable to include all the data in the perspective view. For example, data behind the viewer is not normally required to be seen. The user can specify the position of two planes (called the front and back clipping planes) parallel to the focal plane. Only data lying between the clipping planes will be seen. Thus the view is “clipped” using the front and back clipping planes. The distance to the clipping planes is measured from the eye point along the line joining the eye and target points (the eye-target line). Selecting **Planes** fires up the **Clipping Planes for View** panel. This panel allows the user to set the focal distance and the front and back clipping plane distances.

The fields and buttons used in this panel have the following functions.

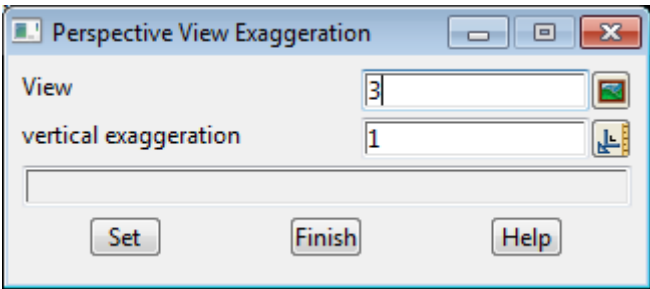

Field Description	Type	Defaults	Pop-Up
View <i>view to set clipping plane for:</i>	input/output	current view	available views
Front dist <i>distance from the eye point to the front clipping plane. If this field is blank, no front clipping plane is used.</i>	input/output		
Back dist <i>distance from the eye point to the back clipping plane. If this field is blank, no back clipping plane is use.</i>	input/output		
Focal dist <i>distance from the eye point to the focal plane. This distance must be non-zero.</i>	input/output		
Set <i>set the distances to the front and back clipping planes and the focal plane. If the front or back clipping distance is blank, that plane is not set. After the set button is chosen, the view is redrawn using the new parameters,</i>	button		

Perspective View Exaggeration

Position of option on menu: Perspective View Menu View =>Settings =>Exaggeration

The exaggeration option allows the user to specify the vertical exaggeration in the perspective view. The heights (z values) are multiplied by the vertical exaggeration value before drawing on the perspective view.

Selecting **Exaggeration** fires up the **Perspective View Exaggeration** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set exaggeration for.</i>	input/output	current view	available views
Vertical exaggeration <i>value to multiply the heights (z values) by before drawing in the perspective view.</i>	input	10	1,5,10
Set <i>set the vertical exaggeration to the value in the vertical exaggeration field.</i>	button		

Tins

Position of menu: Perspective View Menu View =>Settings =>Tins

The options on the **Tins** walk-right menu control the display of tins on the view. The **Tins** walk-right menu is

For the option **Contours**, go to

Edges	Contours
Flow arrows	Edges
Mesh	Flow Arrows
Shade	Mesh
	Shade

Contours

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Contours

The **contours** option defines contour and bold increments and colours, and also whether these contours are displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Edges

Position of menu: Perspective View Menu View =>Settings =>Tins =>Edges

The **Edges** option allows the user to specify whether the edges of triangles from any tins on the view are displayed. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Flow Arrows

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Flow arrows

The **Flow arrows** option defines the colour and length of flow arrows, and also whether the flow arrows are displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Mesh

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Mesh

The **Mesh** option defines a rectangular mesh, and also whether the mesh is displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Shade

Position of option on menu: Perspective View Menu View =>Settings =>Tins =>Shade

Position of option on menu: Perspective View Menu View =>Settings =>Shade

In **12d Model**, a landscape is represented by a triangulated surface - a tin. Each triangle in the tin is a part of a plane and has its own colour.

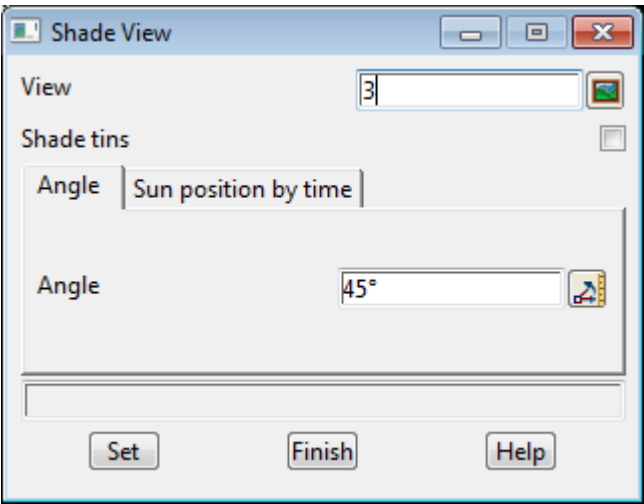

In a perspective view, each triangle can be drawn with a colour that is modified depending on the angle that the triangle makes with the sun (a point light source at infinity). This is called a **flat shade**.

If the triangles are drawn in a back to front order, then when the shaded landscape is drawn, any triangles in the foreground obscure triangles in the background and it looks like a hidden view.

If **shade** is set for a view, all the triangles in all the tins on the view are drawn as shaded triangles and the triangles are drawn in a back to front order.

Once the **Shade** is set on, a shade will be done on the view whenever the view parameters are changed. A plot of the shaded view can be made using the **dump** option on the view.

Selecting **Shade** fires up the **Shade View** panel:

The fields and buttons used in this panel have the functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set shade parameters for.</i>	input/output	current view	available views
Shade tins <i>if ticked, draw all the tins on the perspective view in shade mode.</i>	tick box		
Angle <i>angle of the sun (measured from the horizon).</i>	input	45	
Set <i>record and redraw the view using the current parameters.</i>	button		

Shade

Position of option on menu: Perspective View Menu View =>Settings =>Shade

This is exactly the same option as the Shade described in the previous section [Shade](#).

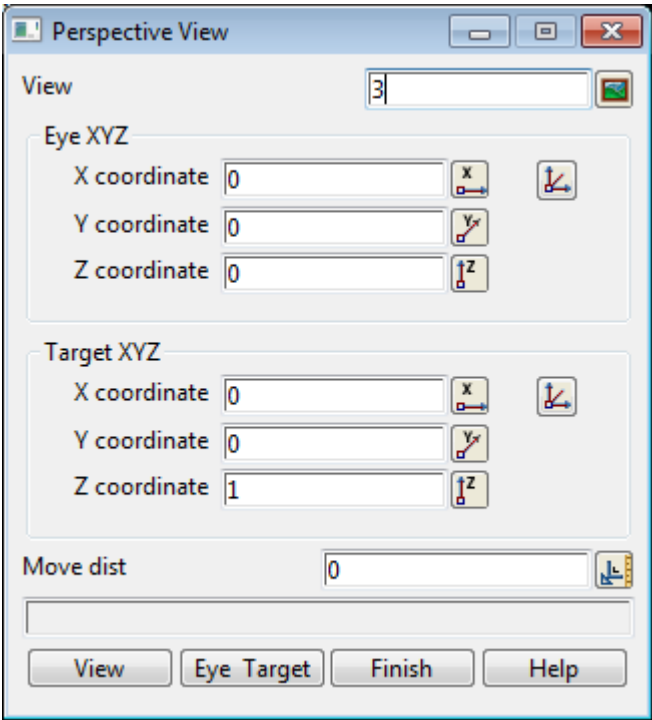

Eye/Target

Position of option on menu: **Perspective View Menu** View =>Eye/Target

The **Eye/Target** option displays the current eye and target co-ordinates and also allows the user to specify new eye and target points. The points can be chosen from any plan view using the cursor or by typed-input.

The view is projected onto a focal plane using a perspective transformation, and clipped using front and back clipping planes. The focal distance and the front and back clipping plane distances are set and modified in the **planes** option.

Selecting **Eye/Target** fires up the **Perspective View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set perspective parameters for.</i>	view box	current view	available views
Eye X Y Z <i>co-ordinates of the eye viewing point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	XYZ select	current eye position	xyz ops menu
Target X Y Z <i>co-ordinates of the target viewing point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	XYZ select	current target position	xyz ops menu
Move dist <i>distance to move the eye point along the eye-target line in the direction of the target point. The target point is also moved the same distance along the eye-target line so that the eye-target distance is kept constant.</i>	input/output		
View <i>define the perspective parameters according to the information in the panel. If the move distance is</i>	button		

non-zero, then the eye and target points are both moved along the eye-target line by the distance given in the Move field. In this case, the new eye and target positions will be written to the eye and target fields.

Eye Target button

allows the user to define the (x, y) position of the eye and target points using the cursor and views.

After selection the button, the user is asked to select the eye position from a view by clicking LB in a view. A level input box is then displayed on the screen for the user to enter the level (z value) for the eye point. The level is recorded and the level box removed after a <enter> is entered in the level input box.

The user is then asked to select the target point from any view by clicking LB at the position of the target point. A level input box is then displayed for the user to enter the level (z value) for the target point.

After the target point is defined, the view is redrawn using the new eye and target positions.

How to Use the Panel and Panel Messages

- (a) The eye and target points are set by using typed-input, or by selection in either the eye XYZ or target XYZ fields, or the **Eye Target** button.
- (b) When the **View** button is selected, the perspective viewing parameters are calculated according to the information in the panel. If a non-zero move distance is given, the eye and target points are both moved along the eye-target line through the move distance. The new values for the eye and target points are written into the panel. If no errors are detected in calculating the new viewing parameter, the view is redrawn using the new parameters.

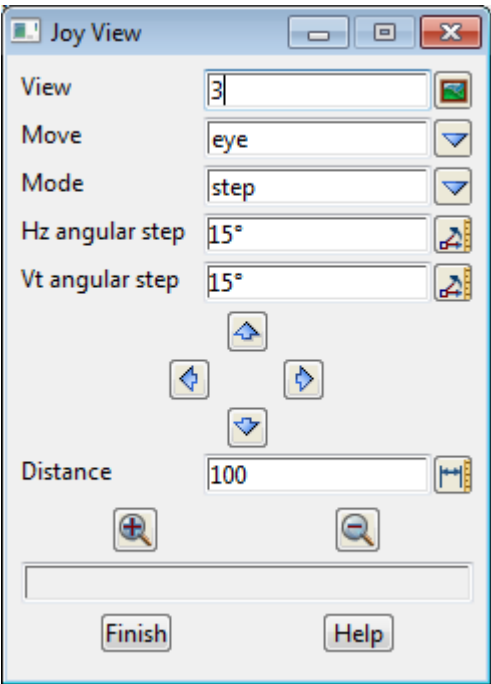

Joy View

Position of option on menu: Perspective View Menu View =>Joy

The hardest thing in a perspective view is finding a good viewing position. The joy option makes it easy to construct a new perspective viewing position relative to the existing position.

The panel can be used to move the eye or target point by rotating them through a given angle to the left, right, up or down, or to move one towards or away from the other. It is also possible to move the eye and target points keeping the distance between them the same.

Selecting Joy fires up the Joy view panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set joy parameters for.</i>	input/output	current view	available views
Move <i>move the eye point, the target point or both.</i>	input	eye	eye, target, eye & target
Mode <i>in step mode, the view is modified each time an appropriate button is picked. In continuous mode, after the view is redrawn, the picked joy option is continually re-applied until either a new joy button is picked, button LB is clicked anywhere else in the joy panel.</i>	input	step	step, continuous
Hz angular step <i>angle in degrees (in HP Notation) that is used with the joy buttons left and right when moving just the eye or target point.</i>	angle box	15	
Vt angular step <i>angle in degrees (in HP Notation) that is used with the joy buttons up and down when moving just the eye or target point.</i>	angle box	15	
Distance <i>distance used to move the eye or target point.</i>	input	100	

Joy buttons up, down, left, right, in, out

The joy buttons are used to modify the perspective parameters and then redraw the view with the new parameters.

The effect of each joy button depends on whether the move field is set to *eye*, *target* or *eye & target*.

move **field set to eye**

up/down button

rotate the eye-target line about the target point up/down by the angle given in the angle step field. That is, the eye point is moved upwards/downwards, the target point kept fixed.

left/right button

rotate the eye-target line about the target point to the left/right by the angle given in the angle step field. The target point kept fixed.

in/out button

move the eye point towards/away the target point along the eye-target line by the distance given in the distance field. The target point kept fixed.

move **field set to target**

similar to the movements when the move field is set to *eye* except the eye point is kept fixed and the target point is moved.

move **field set to eye & target**

up/down/left/right button

the eye and target points are both moved up/down/left/right by the distance given in the distance field. That is, the entire eye-target line is moved up/down/left/right and neither the eye or target point is kept fixed.

in/out button

move the eye and target points along the eye-target line by the distance given in the distance field. The direction is towards/away the target point.

How to Use the Panel

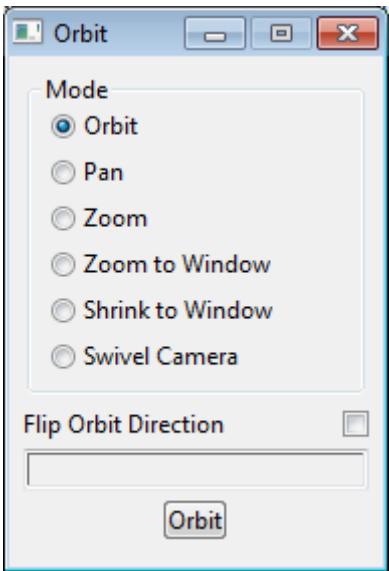

- (a) The move, mode, angular step and distance field are given the desired values and then one of the joy buttons (up, down, left, right, in or out) is selected. The perspective view is then redrawn
- (b) If the mode is set to continuous, once drawing is completed, the selected joy option will be re-applied. This sequence is repeated until either a new joy button is picked, button LB is clicked anywhere else in the joy panel or a *c* key is typed.

Orbit

Position of option on menu: Perspective View Menu View =>Orbit

The orbit option quickly rotates the data around in the perspective view.

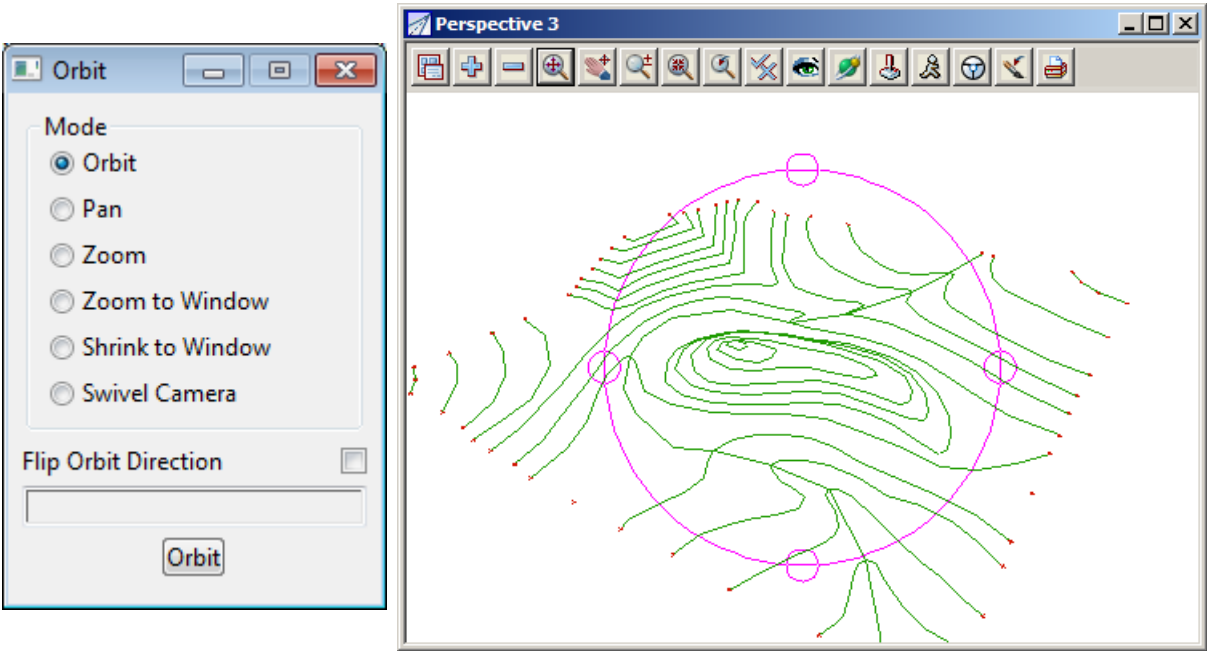

Selecting **Orbit** fires up the **Orbit** panel.

To use Orbit:

Orbit radio button **on:** **Flip orbit direction** radio button **off:**

*when the left button is clicked in the perspective view, the orbit circle appears and
holding LB down and **moving up** in the orbit circle tilts the **object up**
holding LB down and **moving down** in the orbit circle tilts the **object down**
holding LB down and **moving left** rotates the **object to the left**
holding LB down and **moving right** rotates the **object to the right***

Orbit radio button **on:** **Flip orbit direction** radio button **on:** the movement is reversed

Pan radio button on:

*holding LB down and **moving up** in the view **raises the object***

*holding LB down and **moving down** in the view **lowers the object***

*holding LB down and **moving left** in the view **pans the object to the left***

*holding LB down and **moving right** in the view **pans the object to the right***

Zoom radio button on:

*holding LB down and **moving up** in the view **zooms into** the object*

*holding LB down and **moving down** in the view **zooms out** from the object*

Zoom to window radio button on:

when a zoom box is drawn on the view, the perspective is modified so that the contents of the zoom box fill the entire view.

Shrink to window radio button on:

when a zoom box is drawn on the view, the perspective is modified so that the contents of the window are shrunk to fit into the zoom box.

Swivel camera radio button on:

holding LB down moves the target point.

Plan Camera

Position of option on menu: Perspective View Menu View =>Plan Camera

This creates a camera for the current perspective OpenGL view, which can be controlled from a plan view. This allows you to see where a camera is and where it is looking and move those points together or independently.

Selecting **Plan Camera**  brings up the **Plan Camera** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the view to control</i>	view box		select view
Colour <i>the colour to draw the plan camera and target symbol in</i>	colour box		
Set <i>Create the plan camera</i>	button		

Setting the plan camera will create two symbols on your plan view, as shown below:

Camera / Eye

The target

To move the camera, simply click on one of these images and drag it. The perspective OpenGL view will move with it. If you wish to lift or lower the selected component, use the scroll wheel on your mouse. The distance you move is proportional to the zoom level on your plan view.

Key Strokes

There are a number of key strokes available when running the plan camera.

(S)et
sets a component (x, y, z) coordinate of the camera to be equal to the target or vice versa

(L)ock
locks the camera and target together, so they will maintain the same distance from each other when either one or the other is moved.

Perspective Utilities

Position of option on menu: Perspective View Menu View => Utilities

The **Utilities** menu contains miscellaneous options involving the perspective view.

The **Utilities** walk-right menu is

For the option *String drive*, go to

String walk

String movie

Tin shade

Dump

Plot

[String Drive](#)

[String Walk](#)

[String Movie](#)

[Tin Shade](#)

[Dump](#)

[Perspective Plot](#)

String Drive

Position of menu: Perspective View Menu View => Utilities =>String drive

The string drive option makes it easy to construct the perspective view one gets when moving along a string (for example, driving along a road centre line).

The two options on the **String drive** walk-right menu are

and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a selected fixed point.

Note - the **string drive** option can be aborted by pressing the **<esc>** key or clicking RB.

For the option *Along string*, go to

Fixed target

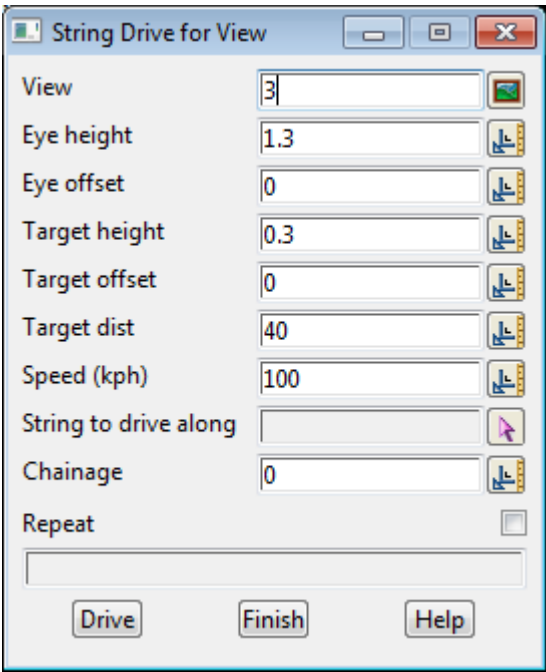

[String Drive - Along String](#)

[String Drive - Fixed Target](#)

String Drive - Along String

Position of option on menu: Perspective View Menu View => Utilities =>String drive =>Along string

Selecting *Along string* fires up the **String Drive for View** panel.

For **string drive along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string drive** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
View		view box	current view	available views
<i>view to set drive parameters for</i>				
Eye height		input	1.3	
<i>height of the eye viewing point above the picked string</i>				
Eye offset		input	0	
<i>offset of the eye viewing point from the picked string</i>				
Target height		input	0.3	
<i>height of the target viewing point above the picked string</i>				
Target offset		input	0	
<i>offset of the target viewing point from the picked string</i>				
Target distance		input	40	
<i>distance (in string chainage) from the eye point to the target point.</i>				
Speed (kph)		input	100	
<i>speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.</i>				

String to drive along string select box

a string to drive along is selected from any view. The string must have z-values.

Chainage input/output 0

*the chainage that the eye point is at on the string. The chainage is updated as the eye and target points are automatically moved along the string. The drive can be set to start at a specific start chainage by simply entering the start chainage into the chainage field and then selecting the **Drive** button.*

Repeat tick box

*if **ticked**, the drive starts again at the beginning of the string.*

Drive button

*When the **drive** button is selected, the eye and target points are placed above the string as specified in the panel fields, and the view redrawn. The eye and target points are then moved along the string at the given speed until either reaches the end of the string. The chainage of the eye point is continually updated.*

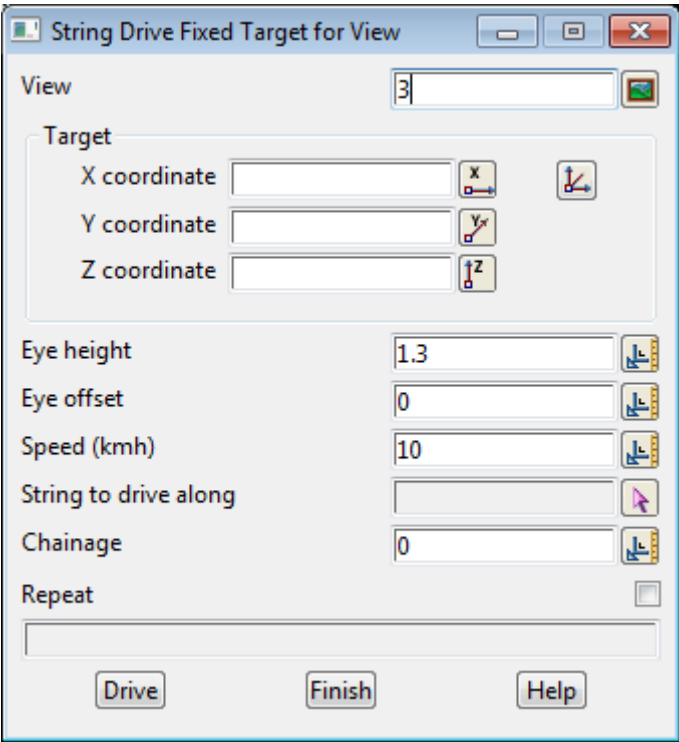

Notes

- s the target distance and speed can be positive or negative.
- s the eye and target points are shown on any view displaying the string being driven along. The eye point is drawn as a red cross, the target point, a green cross.
- s if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.

String Drive - Fixed Target

Position of option on menu: Perspective View Menu View => Utilities =>String drive =>Fixed target

Selecting **Fixed target** fires up the **String Drive Fixed Target for View** panel.

For **string drive fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the eye height field in the **String Drive Fixed Target fro View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set drive parameters for.</i>	view box	current view	available views
Target <i>a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.</i>	xyz select box		
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Speed (kph) <i>speed in kilometres per hour (that is, in one thousand of the base units per hour that the eye point moves along the string.</i>	input	100	
String to drive along <i>a string to drive along is selected from any view. The string must have z-values.</i>	string select box		
Chainage <i>the chainage that the eye point is at on the string. The chainage is updated as the eye point</i>	input/output	0	

automatically moves along the string. The drive can be set to start at a specific start chainage by simply entering the start chainage into the chainage field and then selecting the **Drive** button.

Target button

a fixed target point is selected from any view. The point's co-ordinates are displayed in the target panel field.

Repeat tick box

if **ticked**, the drive starts again at the beginning of the string.

Drive button

When the **drive** button is selected, the eye point is placed above the string at the chainage given in the chainage field, and the view redrawn. The eye point is then moved along the string at the given speed until it reaches the end of the string. The chainage of the eye point is continually updated.

Notes

- s the speed can be positive or negative.
- s the eye point is shown on any view displaying the string being driven along. The eye point is drawn as a red cross, the target point, a green cross.
- s if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view

String Walk

Position of menu: Perspective View Menu View => Utilities =>String walk

The *string walk* option makes it easy to construct the perspective view one gets when walking along a string (for example, walking along a road centre line).

The two options on the **String Walk** walk-right menu are

and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

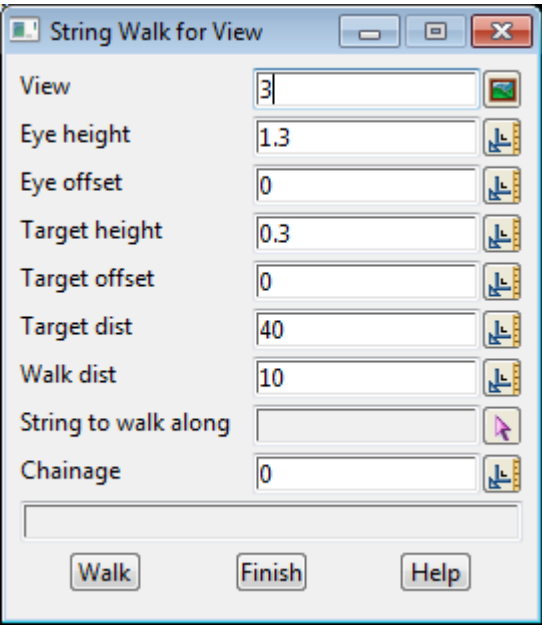

fixed target - the eye point automatically moves along the selected string but the target point is a selected fixed point.

For the option Along string, go to [String Walk - Along String](#)
 Fixed target [String Walk - Fixed Target](#)

String Walk - Along String

Position of option on menu: Perspective View Menu View => Utilities =>String walk =>Along string

Selecting along string fires up the **string walk for view** panel

For **string walk along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string walk** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set walk parameters for.</i>	view box	current view	available views
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Target height <i>height of the target viewing point above the picked string</i>	input	0.3	
Target offset <i>offset of the target viewing point from the picked string</i>	input	0	
Target distance <i>distance (in string chainage) from the eye point to the target point.</i>	input	40	
String to walk along <i>a string to walk along is selected from any view. The string must have z-values.</i>	string select box		
Walk dist <i>distance to move the eye point along string from the previous eye point chainage. The target point is also moved the same distance along the eye-target line so that the eye-target distance is kept constant.</i>	input	10	

Field Description	Type	Defaults	Pop-Up
View <i>view to set walk parameters for.</i>	view box	current view	available views
Target <i>a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.</i>	xyz box		
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Walk dist <i>distance to move the eye point along string from the previous eye point chainage.</i>	input	10	
String to walk along <i>a string to walk along is selected from any view. The string must have z-values.</i>	string select		
Chainage <i>the chainage that the eye point is at on the string. The chainage is updated as the eye point automatically moves along the string. The walk can be set to start at a specific start chainage by simply entering the start chainage into the chainage field and then selecting the Walk button.</i>	input/output	0	
Walk <i>the perspective parameters are defined according to the information in the panel. The first time the Walk button is selected, the eye point is placed above the string at the chainage given in the chainage field. For subsequent selections of the Walk button, the eye point is moved along the string by the chainage distance given in the walk dist field.</i> <i>The view is redrawn with the new view parameters and the new eye-chainage displayed in the panel message area and the chainage field.</i>	button		

Notes

- s the walk distance can be positive or negative.
- s the eye point is shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- s if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view

String Movie

Position of menu: Perspective View Menu View => Utilities =>String movie

The **String movie** option makes it easy to construct and save to disk the sequence of perspective views one gets when walking along a string (for example, walking along a road centre line).

The screen images are automatically written out to disk in gif format so that they can be replayed at a later time.

This is especially useful when it takes a while to construct each view, for example, when hidden line is turned on.

Under NT/95, the screen images are written to an **avi** file.

Under Unix, the screen images are written to a **gif** file and there can be up to 99,999 of them in the one movie.

The two options on the **String movie** walk-right menu are

and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a fixed selected point.

Note - the **string movie** option can be aborted by pressing the <esc> key or clicking RB.

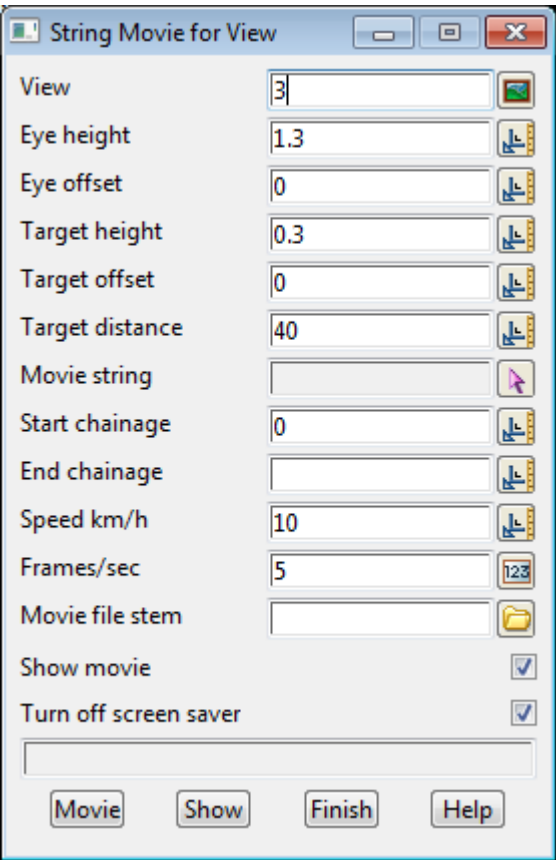

For the option Along string, go to [String Movie - Along String](#)

Fixed target [String Movie - Fixed Target](#)

String Movie - Along String

Position of option on menu: Perspective View Menu View => Utilities =>String movie =>Along string

Selecting **Along string** fires up the **String Movie for View** panel

For **string movie along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string movie** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set movie parameters for.</i>	view box	current view	available views
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Target height <i>height of the target viewing point above the picked string</i>	input	0.3	
Target offset <i>offset of the target viewing point from the picked string</i>	input	0	
Target distance <i>distance (in string chainage) from the eye point to the target point.</i>	input	40	

Movie string	string select	
<i>a string to drive along is selected from any view. The string must have z-values.</i>		
Start chainage	input/output	0
<i>the chainage that the eye point starts on the string for the movie.</i>		
End chainage	input/output	0
<i>the chainage to stop the movie at.</i>		
Speed (kph)	input	10
<i>speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.</i>		
Frames/sec)	input	5
<i>number of frames per second to produce for the movie.</i>		
Movie file stem	input	4d-
<i>each frame of the drive in the view is written to disk in avi format using the movie file stem plus the ending .avi as the file name.</i>		
Show movie	tick box	tick
<i>if ticked, after all the views along the string are written to disk, a new window, the same size as the perspective view, will be created and movie then run.</i>		
Turn off screen saver	tick box	tick
<i>if ticked, the screen saver is disabled so it doesn't come on whilst creating the movie.</i>		
Movie	button	
<i>the perspective parameters are defined according to the information in the panel. When the Movie button is selected, the eye point is placed above the string at the chainage given in the chainage field. The view is drawn with these view parameters. After that view is processed and written to disk, the eye and target points are moved along the eye-target line and frames written out to simulate the given speed.</i>		
Show	button	
<i>This button is used to display a previously created movie. If selected, the movie created with the stem given in the movie file stem field is displayed. If Unix, there is a pause between each frame by the number of seconds given in the delay field.</i>		

Displaying the Movie

If a movie has just been created and the show movie field is set to tick, or an existing movie name is given in the movie file stem field and the **show** button is selected, then a new window will be created and the movie will be displayed frame by frame. Outside of **12d Model**, the movie can be displayed by simply double clicking on the **avi** file.

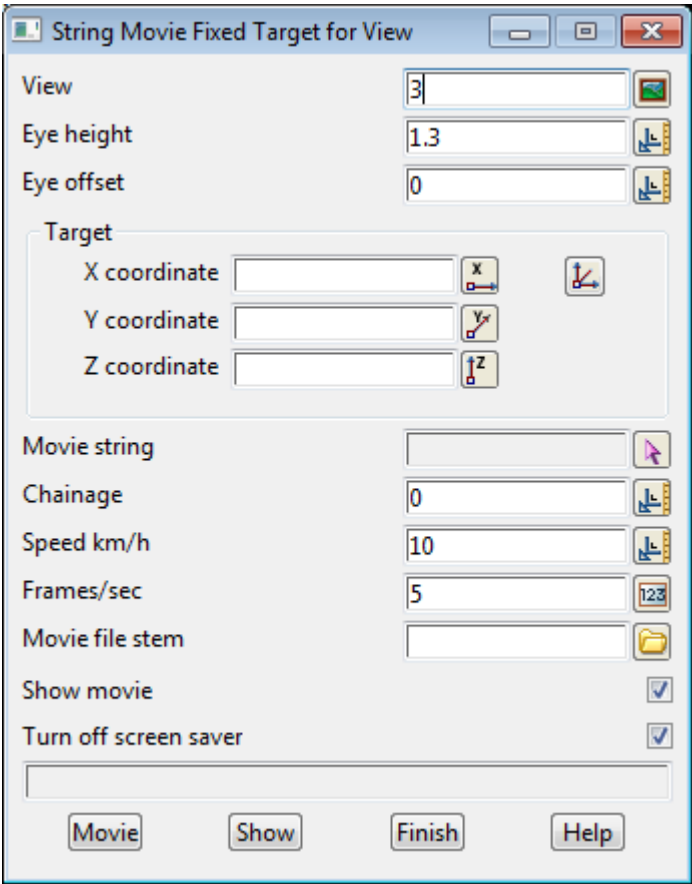

Notes

- s the target and move distances can be positive or negative.
- s the eye and target points are shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- s if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.
- s the movie can also be displayed from outside **12d Model** by simply double clicking on the avi file
movie-file-stem.avi

String Movie - Fixed Target

Position of option on menu: Perspective View Menu View => Utilities =>String movie =>Fixed target

Selecting Fixed target fires up the **String Movie Fixed Target for View** panel.

For **string movie fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the eye height field in the **String Movie Fixed Target for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set movie parameters for.</i>	view box	current view	available views
Eye height <i>height of the eye viewing point above the picked string</i>	input	1.3	
Eye offset <i>offset of the eye viewing point from the picked string</i>	input	0	
Target <i>a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.</i>	xyz box		
Movie string <i>a string to drive along is selected from any view. The string must have z-values.</i>	string select		

Chainage	input/output	0	<i>the chainage that the eye point starts on the string for the movie.</i>
Speed (kph)	input	10	<i>speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.</i>
Frames/sec)	input	5	<i>number of frames per second to produce for the movie.</i>
Movie file stem	input	4d-	<i>each frame of the drive in the view is written to disk in avi format using the movie file stem plus the ending .avi as the file name.</i>
Show movie	tick box	tick	<i>if ticked, after all the views along the string are written to disk, the movie is then run.</i>
Turn off screen saver	tick box	tick	<i>if ticked, the screen saver is disabled so it doesn't come on whilst creating the movie.</i>
Movie	button		<i>the perspective parameters are defined according to the information in the panel. When the Movie button is selected, the eye point is placed above the string at the chainage given in the chainage field. The view is drawn with these view parameters. After that view is processed and written to disk, the eye and target points are moved along the eye-target line by the chainage distance given in the step distance field and the new view drawn and processed.</i> <i>This sequence is repeated until the end of the string is reached or the c key is pressed.</i>
Show	button		<i>This button is used to display a previously created movie. If selected, the movie created with the stem given in the movie file stem field is displayed.</i>

Tin Shade

Position of option on menu: Perspective View Menu View => Utilities => Tin shade

In **12d Model**, a landscape is represented by a triangulated surface - a tin. Each triangle in the tin is a part of a plane and has its own colour.

In a perspective view, each triangle can be drawn with a colour that is modified depending on the angle that the triangle makes with the sun (a point light source at infinity). This is called a **flat shade**.

If the triangles are drawn in a back to front order, then when the shaded landscape is drawn, any triangles in the foreground obscure triangles in the background and it looks like a hidden view.

If **Shade** is set for a view, all the triangles in all the tins on the view are drawn as shaded triangles and the triangles are drawn in a back to front order.

Once the **Shade** is set on, a shade will be done on the view whenever the view parameters are changed. A plot of the shaded view can be made using the **Dump** option on the view.

The **Tin shade** option draws the selected tin over the perspective view as a shade. The selected tin does not have to be on the view for the shade to function.

When the view is refreshed, the shade is lost (the **Shade** option under settings is used for setting a shade permanently on). A plot of the shaded view can be made using the **Dump** option on the view.

Selecting **Tin shade** fires up the **Tin Shade View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set shade parameters for.</i>	view box	current view	available views
Tin <i>name of the tin to be used for the shade.</i>	input		available tins
Angle <i>angle of the sun.</i>	input	45	
Shade <i>draw the given tin on the view as a shaded tin.</i>	button		

Dump

Position of option on menu: Perspective View Menu View => Utilities =>Dump

This option is used to write the view image out to disk in a user selected format. It is the same as the **Dump** option for a plan view.

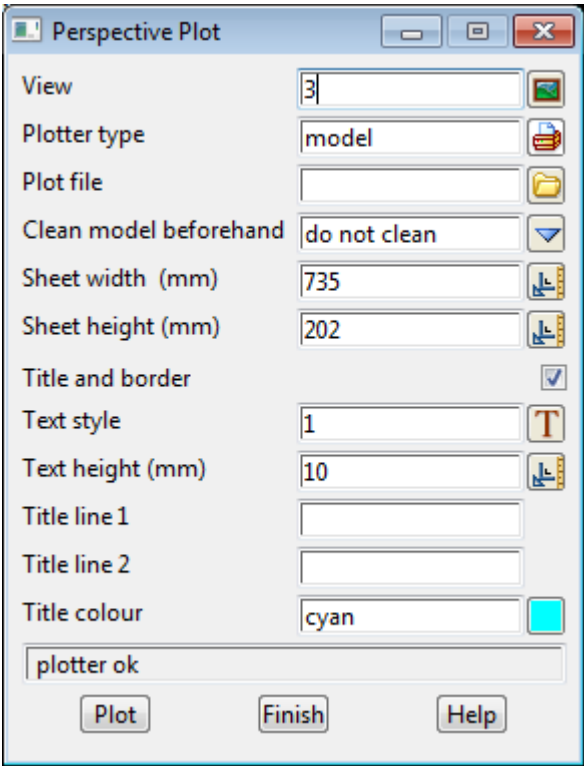

Perspective Plot

Position of option on menu: Perspective View Menu View => Utilities =>Perspective plot

The **Perspective plot** option is used to make a plot file of all the information displayed in the perspective view.

The user simply gives a sheet width and height and **12d Model** calculates the scaling factor required to best fit the plot of the view to the sheet.

Selecting **Plot** displays the **Perspective Plot** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set perspective plot parameters for.</i>	view box	current view	available views
Plotter type <i>file format for the plot information.</i>	input	hp	hp, dxf, postscript etc.
Plot file <i>stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.</i>	input	depends on plotter type	
Clean model beforehand <i>only applicable if plotting to a model. if always clean, the model is cleaned before the plot is created. If prompt for clean, the user is prompted that the model will be cleaned before the plot is created. If do not clean, the model is not cleaned before the plot is created.</i>	choice box		do not clean prompt for clean always clean
Sheet width/height (mm) <i>if a value is entered by the user and an <enter> given, the height/width required by the plot is calculated and displayed in the sheet height/width field. The units for sheet width and height are millimetres. If both Sheet width and height are given with no <enter>, then a scaling factor is calculated by 12d Model to best fit the plot of the view to a rectangle of size given by the sheet width and height.</i>	input		
Title and border <i>if ticked, a border and two lines of title are placed on the bottom of the plot</i>	tick box		

Title line 1/2	input		
	<i>first/second line of title information</i>		
Title height (mm)	input	10	
	<i>height (in millimetres) to draw the two lines of title information</i>		
Title colour	input	cyan	available colours
	<i>colour used for the border and the title information</i>		
Plot	button		
	<i>write out the plot of the information displayed in the view to the file given in the plot file field. The format of the file is given by the plotter type</i>		

Section View Menu

Position of menu: Section View Menu View

The section view is used to display string profiles and sections through tins and service items. The horizontal units are taken to be the **chainage** along a particular string called the **primary string** for the view. The z-values (heights) are the vertical units for the section. Hence, the section view is a (chainage, z-value) diagram with respect to the primary string on the view. The primary string's model and name is displayed in the view title area of the section view.

Since a tin represents a two dimension continuous surface, sectioning through a tin along a string appears as a continuous line string in a section view. For example, the natural surface on a road long-section is the section of the road centre-line through the natural surface tin.

When a corridor is set, any strings in models added to the section view (service items) will be drawn on the section view wherever they are inside the corridor.

A section view has a **vertical exaggeration** and whenever a string is profiled on the view, the vertical exaggeration is displayed inside square brackets after the view name in the view title area. For example **[10x]** is a vertical exaggeration of 10.

The Section views menu is

Section Toggle

Position of menu: Section View Menu View => Settings =>Toggle

The **Toggle** walk right brings up the **Toggle** section view menu.

Selecting any options from this menu will toggle the option on/off.

Corridor

Position of option on menu: Section View Menu View => Settings =>Corridor

The standard section view is designed to profile any selected string and create and display sections along the profiled string through any tins in any models added to the section view.

Hence the section view is like a vertical ribbon tracing out the path of the primary string.

The **Corridor** option extends the ribbon to the left and right and projects any strings in any models added to the section view back onto the section view.

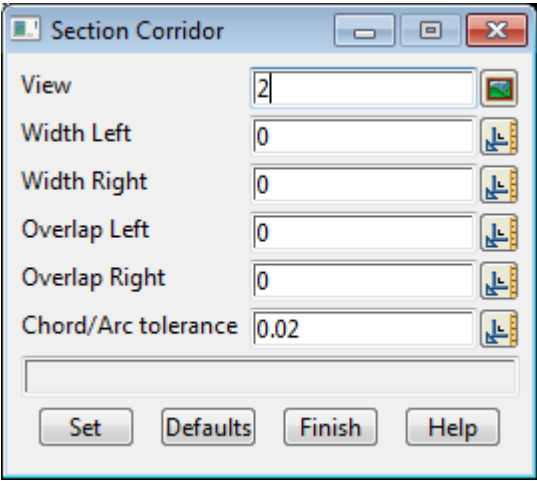

Consequently, the section view will display any strings or parts of strings that cross the corridor, run parallel to the primary string but stay within the corridor as well as displaying the standard sections through any tins in any models added to the section view.

The corridor is particularly useful for examining any **clashes** of strings with the primary string.

For example, services such as telephone cables, water and gas pipes and electricity cables could be modelled as 3d or pipe strings and added to the section view.

The section view with non-zero corridor widths would then display any of the services that lie within the corridor about the chosen primary string.

Selecting **Corridor** fires up the **Section Corridor** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View <i>view to set corridor parameters for:</i>	view box	current view	available views
Width left/right <i>width of the corridor to the left/right of the primary string.</i>	input	0.01	
Overlap left/right <i>for each straight/arc in the primary string, extend the straight/arc to the left/right by the value of the overlap left/right field before drawing the straight/arc. Section through the extended string.</i>	input	0.01	
Chord/Arc tolerance <i>value of the chord to arc ratio to be used when approximating circles in alignments, arcs and pipeline strings.</i>	input	0.02	
Set <i>define the corridor parameters according to the information in the panel. The section view for the new corridor will then be calculated and displayed.</i>	button		
Defaults <i>reset the corridor settings to the default values.</i>	button		

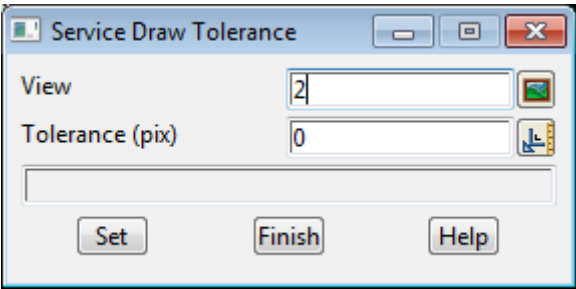

Draw Tolerance

Position of option on menu: Section View Menu View => Settings =>Draw tolerance

It is possible for the bits of services displayed on a section view to be very small and possibly too small to be easily seen. This is often the case for strings that are perpendicular to the corridor.

To overcome this visualization difficulty, a tolerance can be defined for the section view and when the size of any piece of a service is below the tolerance, it will be drawn as a cross.

Selecting Draw tolerance fires up the **Service Draw Tolerance** panel.

The fields and buttons used in this panel have the following functions.

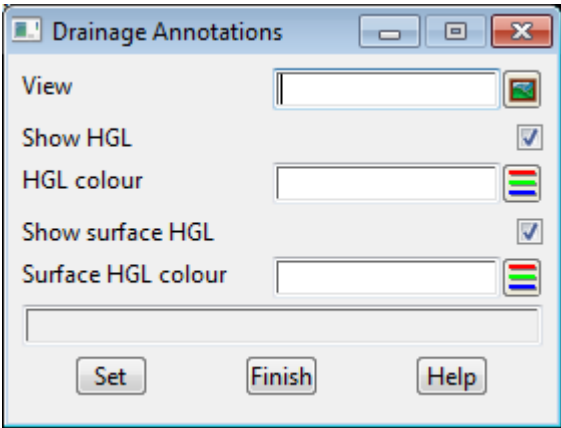

Field Description	Type	Defaults	
View	view box	current view	available views
<i>view to set service parameters for.</i>			
Tolerance (pix)	input	4	
<i>if the size of any piece of a service is below this tolerance, it will be drawn as a cross.</i>			
Set	button		
<i>set the service draw tolerance.</i>			

Drainage HGL

Position of option on menu: Section View Menu View => Settings =>Drainage

If the data exists in the drainage string, the HGL line can be drawn when profiling a drainage string.

Selecting **Drainage** fires up the **Drainage Annotations** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View	input/output	current view	available views
<i>view to set HGL parameters for.</i>			
Show HGL	tick box	tick	
<i>if ticked then the HGL line is drawn for any drainage strings that are profiled (and have HGL data)</i>

set the HGL drawing parameters

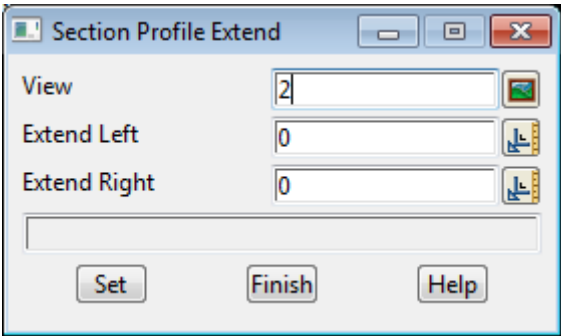

Extend

Position of option on menu: Section View Menu View => Settings =>Extend

When displaying the profile of a string on a section view, the user often wishes to see sections through the information before the string begins and after the string ends. This is particularly useful if it is intended to extend the string in either direction.

The **Extend** option allows the user to extend the profile length.

Selecting **Extend** fires up the **Section Profile Extend** panel.

The fields and buttons used in this panel have the following functions.

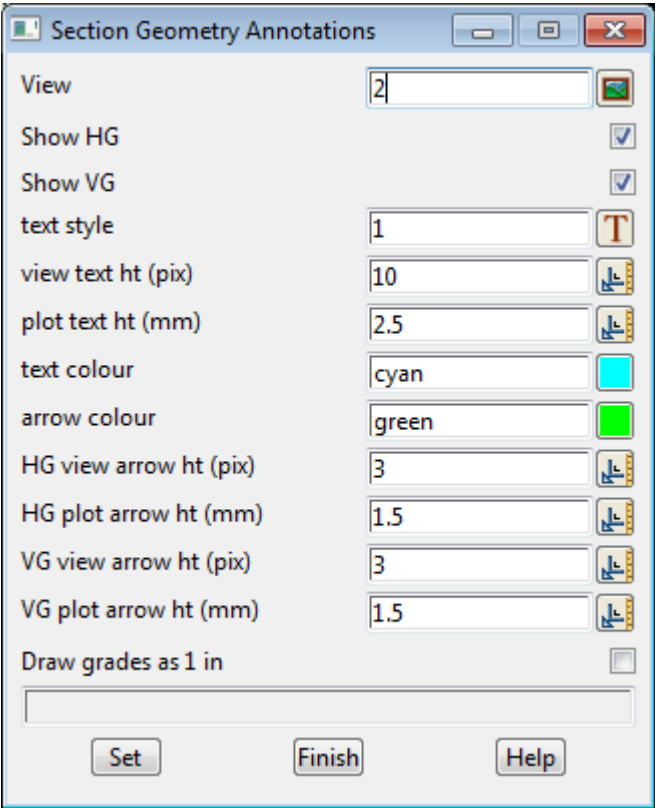

- | Field Description | Type | Defaults |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|--------------|
| View | view box | current view |
| view to set extension parameters for. | | |
| Extend left | input | 0 |
| pre-extend the profile by this distance before sectioning through any tins or models on the view. | | |
| Extend right | input | 0 |
| post-extend the profile by this distance before sectioning through any tins or models on the view. | | |
| Set | button | |
| define the profile length according to the length of the primary string plus the two extend lengths. The section view for the new length will then be calculated and displayed. | | |

Geometry Annotation

Position of option on menu: Section View Menu View => Settings =>Geom annot

The **Geom annot** option allows the user to specify whether horizontal geometry and/or vertical geometry is displayed for any alignment and pipeline strings profiled in the section view and hence on any section view plots.

Selecting **Geom annot** fires up the **Section Geometry Annotations** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set alignment geometry parameters for.

Show HG	tick box	tick
----------------	----------	------

*if **ticked**, the value of the radii and spiral lengths for any horizontal curves selected as the primary string will be shown plus an arrow indicating the chainage extent of the radii.*
*If **no ticked**, the horizontal geometry will not be displayed in the section view or on any plots of the section view.*

Show VG	tick box	tick
----------------	----------	------

*if **ticked**, the value of the curve length for any vertical curves selected as the primary string will be shown, plus an arrow indicating the chainage extent of the curve length. The percentage grades for any vertical straights will also be displayed with an arrow indicating the chainage extent of the vertical straight.*
*If **no ticked**, the vertical curve lengths and percentage grades will not be displayed in the section view or on any plots of the section view.*

Text style	input	1
-------------------	-------	---

text style to be used for all text in the geometry annotation.

View text ht (pix)	input	10
---------------------------	-------	----

height (in pixels) to draw the geometry annotation values in the section view (the screen width is approximately 1000 pixels).

Plot text ht (mm)	input	10
--------------------------	-------	----

height (in mm) to draw the geometry annotation values on any plots of the section view.

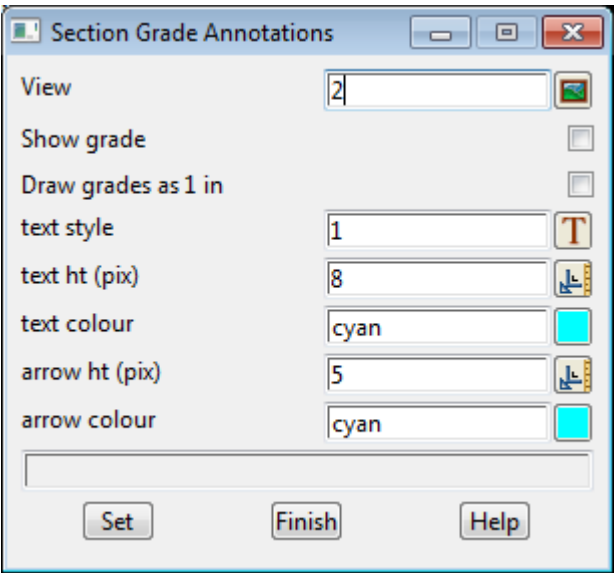

Text colour	input	cyan	available colours
<i>colour of the geometry annotation values drawn on the screen and any plots.</i>			
Arrow colour	input	green	available colours
<i>colour of the HG arrows drawn on the screen and any plots.</i>			
HG view arrow ht (pix)	input	3	
<i>height (in pixels) of the arrow head above the arrow line when drawing the HG arrows in the view.</i>			
HG plot arrow ht (mm)	input	1.5	
<i>height (in mm) of the arrow head above the arrow line when drawing the HG arrows on any plots of the section view.</i>			
VG view arrow ht (pix)	input	3	
<i>height (in pixels) of the arrow head above the arrow line when drawing the VG arrows in the view.</i>			
VG plot arrow ht (mm)	input	1.5	
<i>height (in mm) of the arrow head above the arrow line when drawing the VG arrows on any plots of the section view.</i>			
Draw grades as 1 in	tick box		
<i>if ticked, grades are drawn as 1:in values.</i>			
<i>if not ticked, grades as drawn as percent (%)</i>			
Set	button		
<i>set the section settings values to the values in the above panel fields. The section view is then redrawn using these values.</i>			

Grade Annotation

Position of option on menu: Section View Menu View => Settings =>Grade annot

The grade annot option allows the user to specify whether the grades and plan widths of string links are displaced for strings profiled in the section view.

Selecting Grade annot fires up the Section Grade Annotations panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set grade annotation parameters for.</i>	view box	current view	available views
Show grade <i>if ticked, the value of the grades (in percent grade) and plan widths of string links for any strings selected as the primary string will be shown plus an arrow indicating the chainage extent of the grade. If no ticked, the grades and widths will not be displayed in the section view or on any plots of the section view.</i>	tick box	tick	
Text style <i>text style to be used for all text in the grade annotation.</i>	input	1	
Text ht (pix) <i>height (in pixels) to draw the grade annotation values in the section view (the screen width is approximately 1000 pixels).</i>	input	8	
Text colour <i>colour of the grade annotation values drawn on the screen and any plots.</i>	input	cyan	available colours
Arrow ht (pix) <i>height (in pixels) of the arrow head above the arrow line when drawing the arrows in the section view.</i>	input	3	
Arrow colour <i>colour of the arrows drawn on the screen.</i>	input	cyan	available colours
Set <i>set the section settings values to the values in the above panel fields. The section view is then redrawn using these values.</i>	button		

Exaggeration

Position of option on menu: Section View Menu View =>Settings =>Exaggeration

The **exaggeration** option allows the user to specify the vertical exaggeration for the section view. The heights (z values) are multiplied by the vertical exaggeration value before drawing on the section view.

Whenever a string is profiled on the section view, the **vertical exaggeration** is displayed inside square brackets after the view name in the view title area. For example **[10x]** is a vertical exaggeration of 10.

Selecting **Exaggeration** fires up the **Section View Exaggeration** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set exaggeration parameters for.</i>	view box	current view	available views
Vertical exaggeration <i>value to multiply the heights (z values) by before drawing in the section view.</i>	input	10	1,5,10
Set <i>set the vertical exaggeration to the value in the vertical exaggeration field.</i>	button		

Profile

Position of menu: Section View Menu View => Profile

The **Profile** option is used to display a long-section view of a selected string. That is, the co-ordinate system for the section view is defined in terms of the chosen string by

- (a) the chainage along the selected string defines the horizontal axis for the section view
- (b) the vertical axis is the z-axis (heights).

Hence a (chainage,height) diagram of the selected string is drawn in the section view. The scale is automatically chosen so that all of the selected string fits into the section view.

The string selected to be profiled is called the **primary string** for the section view.

The model and name of the primary string is displayed in the section view's title area (after the vertical exaggeration).

The primary string is drawn on the section view in the primary string's colour.

If the primary string is an alignment or pipeline string, the radii and chainage extent of any horizontal curves can be displayed in the section view plus any vertical curve lengths and percent-grades of vertical straights. For other strings, the grade and widths of each string link can be displayed.

For any tins in the models added to the section view, the section along the primary string through the tin will be calculated and drawn on the section view in the same colour as the tin colour. Any strings (service items) in models added to the section view, the parts of the strings in any corridor defined for the primary string will be calculated and drawn on the section view in the same colour as the strings.

Each time a new primary string is chosen with the profile option, the sections along the new primary string are calculated and displayed for all the tins and strings in the models added to the section view.

The **Profile** walk-right menu is

The **One string** option allows one string to be profiled and then the option terminates (see [One String](#)).

The **Many strings** option profiles one string and then allows the user to select another string to be profiled without leaving the profile option. The **Many strings** option is very useful when a number of strings need to be examined one after another in a section view (see [Many Strings](#)).

The **Model strings** option profiles the strings from a given model, one at a time. For example, it is used to sequentially examine each cross-section down a road when all the cross-sections are stored in one model (see [Model Strings](#)).

The **2 points** option dynamically profiles between two selected points. The profile between the first selected point and the cursor position is dynamically recalculated as the cursor is moved around the view (see [2 Points](#)).

The **Perpendicular to CL** option dynamically profiles along a cross-section which is perpendicular to a selected string. The cross section profile is dynamically recalculated as the cursor is moved

along the selected string (see [Perpendicular to CL](#)).

The **One substring** and **Many substrings** options are used to section along house connections and property controls for sewer and drainage strings (see [One String](#), [Many Strings](#)).

For the option <i>One String</i> , go to	One String
<i>Many strings</i>	Many Strings
<i>Model strings</i>	Model Strings
<i>2 points</i>	2 Points
<i>Perpendicular to CL</i>	Perpendicular to CL
<i>One substring</i>	One Substring
<i>Many substrings</i>	Many substrings
<i>Super alignment</i>	Super alignment

One String

Position of option on menu: **Section View Menu View =>Profile =>One string**

After choosing the **One string** option, the user selects the string to be profiled. The option then terminates.

To cancel the option without selecting any string, click LB to bring up the **Pick Ops** menu and select **Cancel**.

Many Strings

Position of option on menu: **Section View Menu View =>Profile =>Many strings**

The **many strings** option is designed for profiled a number of strings one after another.

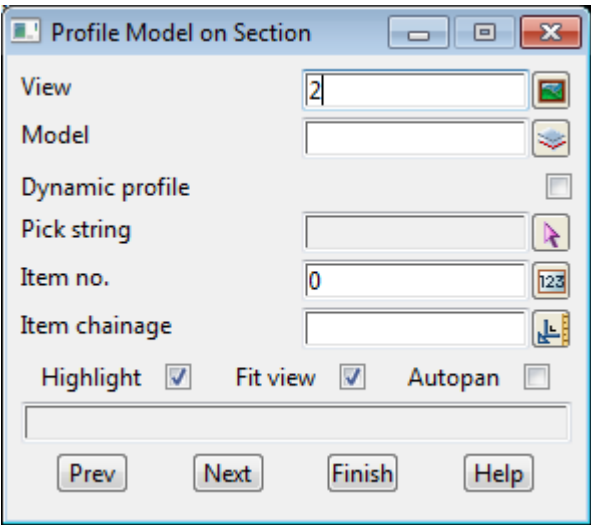

After selecting **Many strings**, a string is selected for profiling. After the string has been profiled, another string is selected for profiling.

The option will keep profiling selected strings until the option is terminated by clicking LB to get the **Pick Ops** menu and selecting **Cancel**.

Model Strings

Position of option on menu: **Section View Menu View =>Profile =>Model strings**

After selecting **Model strings**, the **Profile Model on Section** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
View	view to set profile parameters for:	view box	current view	available views
Model	name of the model containing the strings to be profiled one at a time	model box		available models
Dynamic profile	if ticked, as you move over each string in the given model in a plan or perspective view, the string under the mouse is selected and profiled on the section view.	tick box		
Item no.	number of the string in the model being profiled.	input/output		
Item chainage	only applicable if the selected strings are X-section strings The chainage of the section string in the model being profiled. Also if a chainage is typed in followed by an <Enter> then the model will be searched for a X-section of that chainage and if it exists, it will be profiled.	input/output		
Highlight	if ticked , the string being profiled in the section view is locked and highlighted on any views where it is visible.	tick box	tick	
Fit view	if ticked , the string being profiled is fitted to the section view. if not ticked , the same scale is used for the next section being profiled.	tick box	tick	
Autopan	if ticked , then if the profiled string is not visible on any plan views that the model containing the string is on, then the plan view is modified so that the profiled string is in the centre of the plan view.	tick box		
Pick	after selecting the pick button, a string is selected. The string is automatically profiled and its model becomes the model being profiled and item no. is set to the string's number in the model.	button		
Prev	the previous string given by the item no. field is profiled and the item no. field decremented by one.	button		

Next button
the next string given by the item no. field is profiled and the item no. field incremented by one.

How to Use the Panel

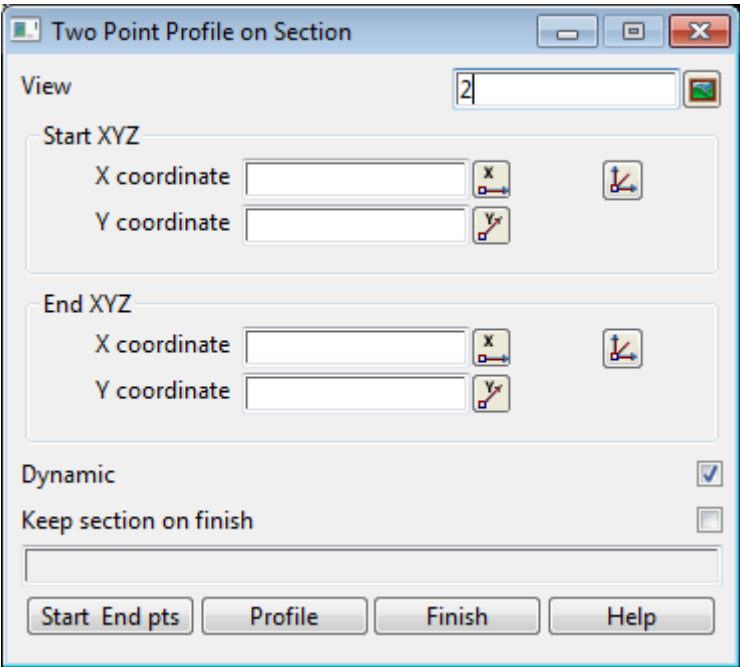

- (a) Either a string is picked after selecting the **Pick** button, or the name of the model containing the strings to be profiled is entered into the model field.
- (b) The item no. field is initially set to the picked strings item no. or 0, but can be set to the number of any string in the model.
- (c) When the **Prev** or **Next** button is selected, the string given by the number in the item no. field is decremented or incremented and the string given by the new item no. is profiled in the section view.

Hence with the **Model strings** option, a number of strings in the one model can be profiled (one after another) by simply repeatedly selecting the **Prev** or **Next** buttons.

2 Points

Position of option on menu: **Section View Menu** **View ==>Profile ==>2 points**

After selecting 2 points, the **Two Point Profile on Section** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set profile parameters for.</i>	input/output	current view	available views
Start X Y Z <i>co-ordinates of the start section point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	input/output		xyz ops menu
End X Y Z <i>co-ordinates of the end section point. New values can be typed, or a point selected using the xyz ops pop-up menu.</i>	input/output		xyz ops menu

Dynamic tick box tick

*if **ticked**, the profile will be dynamically calculated between the first selected point and the cursor position.*

Keep section on finish tick box

*if **ticked**, the two point profile will be remembered by the section view when the **Finish** button is selected.*

*if **not ticked**, the definition of the two points to profile is lost when the **Finish** button is selected.*

Start End pts button

*after selecting the **Start End pts** button, the first point of the section to be profiled is selected and its value written to the start xyz field. If dynamic is set on, then a profile from the first point to the cursor position is automatically calculated as the cursor is moved around the view. Selecting the second points finalises the section and the co-ordinates of the final point is written to end xyz field.*

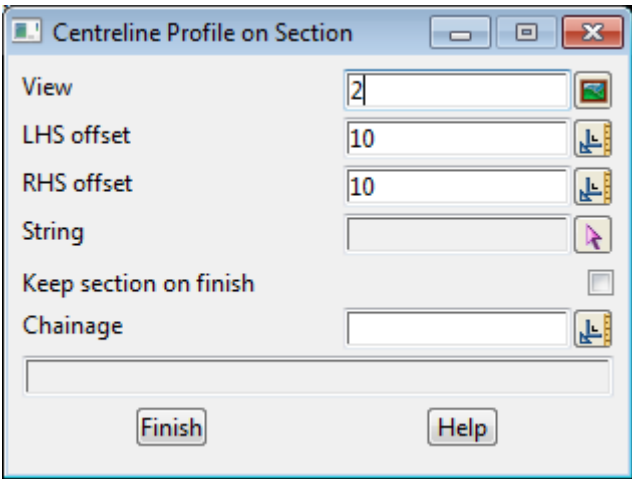

Profile button

*after selecting the **Profile** button, a section is calculated between the start xyz and end xyz points.*

Perpendicular to CL

Position of option on menu: Section View Menu View =>Profile =>Perpendicular to CL

After selecting Perpendicular to CL, the **Centreline Profile on Section** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set profile parameters for.</i>	view box	current view	available views
LHS offset <i>distance (in world units) to take the section to the left of the selected string.</i>	input	10	
RHS offset <i>distance (in world units) to take the section to the right of the selected string.</i>	input	10	
String <i>the selected string is used to specify the position where a cross-section is defined. Once the string is selected, then as the cursor is moved around in a view, its position will be dynamically be dropped perpendicularly onto the selected string, and a cross-section defined at right angle to the selected string. A profile along the cross-section will then be drawn in the section view. The cross-section profile will be dynamically modified as the cursor position is modified.</i>	string-select		
Keep section on finish <i>if ticked, the final definition of the profile for the section view will be remembered by the section view when the Finish button is selected.</i> <i>if not ticked, the definition of the profile for the section view is lost when the Finish button is selected.</i>	tick box		
Chainage <i>dynamically displays the centreline chainage of the selected string</i>	output		

One Substring

Position of option on menu: Section View Menu View =>Profile =>One substring

As well as profiling strings, the **One substring** option can profile a house connection or property control (**substrings**) in a drainage or sewer string.

After choosing **One substring** from the menu, the user selects a substring for profiling. After the string or substring has been profiled, the option terminates.

Many substrings

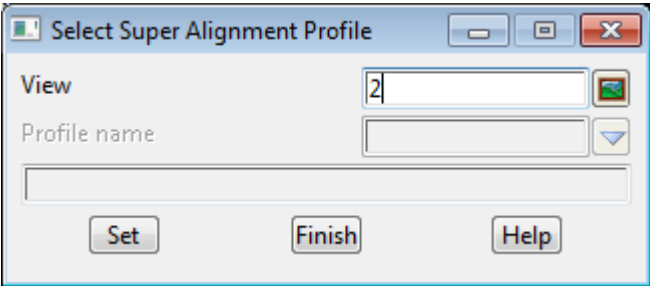

Position of option on menu: Section View Menu View =>Profile =>Many substrings

The **Many substrings** option is designed for profiled a number of substrings, one after another. After choosing **Many substring**, the user selects a substring for profiling. After the substring has been profiled, another string or substring can be chosen for profiling. The option is terminated by clicking LB to get the pick ops menu and selecting **cancel**.

Super alignment

Position of option on menu: Section View Menu View =>Profile =>Super alignment

A super alignment contains one horizontal string but can have more than one vertical dimension. For example, vertical geometry, super elevation, widening and sight distance. When a super alignment is being profiled on the section view, this option allows you to specify which of the vertical dimensions is displayed on the section view. Selecting **Super alignment** brings up the **Select Super Alignment Profile** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current section view	all views
Profile Name	choice box		super alignment dimensions on the profiled super alignment

If profile name is blank, all profiles are shown or the user can select an individual profile to display from the choice box.

The possible vertical dominions are Left Super Elevation, Right Super Elevation, Left Widening, Right Widening, Sight Distance and Stopping Distance.

Set

profile the super alignment with the selected vertical dimension.

Regenerate

Position of option on menu: Section View Menu View =>Regenerate

The **Regenerate** option is used to re-calculate and re-display the profile of the primary string of the section view.

This is necessary because modifications to the primary string or any strings or tins one the view may make the initial profile invalid. A **Regenerate** is a quick method of bringing the profile up to date.

Section Plotting

Position of menu: Section View Menu View =>Plotting

The **Plotting** walk-right menu contains the options **Plot**, **Long plot**, **X plot**, **Drainage/Sewer**, **Melbourne Water** and **Pipeline**.

The **Plot** option is used to make a plot file of all the information displayed in the section view.

The **Long plot** option is used to make a traditional long section plot with string chainages and elevations displayed for each of the strings in the section view. The form of the long plot can be finely controlled by a file of plot parameters.

The **X plot** creates the traditional stacked x-section plots for each x-section string in a given model. The form of the x-plot can be finely controlled by a file of plot parameters.

For the option *Plot*, go to

Long plot

X plot

Drainage/Sewer

Melbourne water

Pipeline

Section Plot

Position of option on menu: Section View Menu View =>Plotting =>Plot

The **Plot** option writes out all the information displayed in the section view to either a plot file (in a user selected format) or to a **12d Model** model. The user selects a scale for the plot and the sheet width and height are calculated by **12d Model**.

After selecting **Plot** plot, the **Section Plot** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>view to set plot parameters for.</i>	input/output	current view	available views
Plotter type <i>file format for the plot information.</i>	input	hp	hp, dxf, postscript etc.
Plot file <i>stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.</i>	input	depends on plotter type	
Clean model beforehand <i>only applicable if plotting to a model. if always clean, the model is cleaned before the plot is created. If prompt for clean, the user is prompted that the model will be cleaned before the plot is created. If do not clean, the model is not cleaned before the plot is created.</i>	choice box		do not clean prompt for clean always clean
Scale 1: <i>if a value is entered by the user and an <enter> given, the sheet width and height required by the plot are calculated and displayed in the sheet width and sheet height fields.</i>	input		
Sheet width (mm) <i>if a value is entered by the user and an <enter> given, the scale and height required by the plot are calculated and displayed in the scale and sheet height fields. The units for sheet width are millimetres.</i>	output		

Sheet height (mm)	output		
if a value is entered by the user and an <enter> given, the scale and width required by the plot are calculated and displayed in the scale and sheet width fields. The units for sheet height are millimetres			
Title and border	tick box	tick	
if ticked then a border and two lines of title are placed on the bottom of the plot			
Text style	input	1	
text style for the title information			
Text Height (mm)	input	10

Title line 1/2	input		
first/second line of title information			
Title colour	input	cyan	available colours
colour used for the border and the title information			
Plot	button		
write out the plot of the information displayed in the view to the file given in the plot file field. The format of the file is given by the plotter type			

Long Plot

Position of option on menu: Section View Menu View =>Plotting =>Long plot

The option is for creating long section plots.

The Long plot option is documented in the section [Long Plot](#) in the chapter [Plots](#)

X Plot

Position of option on menu: Section View Menu View =>Plotting =>X plot

The x plot option is for creating x-section plots.

The option is documented in the section [X Plot](#) in the chapter [Plots](#)

Drainage/Sewer Plot

Position of option on menu: Section View Menu View =>Plotting =>Drainage/Sewer

The *Drainage/Sewer plot* option is used to make the long section plots for a drainage or sewer network.

This option is documented in the section [Drainage Longsections](#) in the chapter [Drainage and Sewer](#)

Melbourne Water Plot

Position of option on menu: Section View Menu View =>Plotting =>Melbourne Water

The *Melbourne Water plot* option is used to make the long section plots for a sewer network to Melbourne Water standards.

This option is documented in the section [Melbourne Water](#) in the chapter [Drainage and Sewer](#)

Pipeline Plot

Position of option on menu: Section View Menu View =>Plotting =>Pipeline

The *Pipeline plot* option is used to make the long section plots for a sewer network to Melbourne Water standards.

This option is documented in the section [Longsections](#) in the chapter [Pipeline](#)

Section Utilities

Position on menu: Section View Menu View =>Utilities

The **Utilities** menu contains miscellaneous options involving the section view. The **Utilities** walk-right menu is

For the option *New view settings*, go to the section [New View Settings](#)
[Report](#)
[VG Edit](#)
[View Dump](#)

New View Settings

Position of option on menu: Section View Menu View =>Utilities =>New view settings

The **New view settings** option displays the current minimum and maximum chainage and height values for the view, and permits the user to specify new values as the section's viewing parameters.

Selecting **New view settings** fires up the **Section View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults
View <i>view to set section parameters for:</i>	input/output	current view available views
chain min/max <i>minimum/maximum string chainage for the view. Chainage is used as the x-axis co-ordinates in a section view.</i>	input/output	current chainage min/max
Ht min/max <i>minimum/maximum height (z value) for the view. Height is used as the y-axis co-ordinates in a section</i>	input/output	current height min/max

view.

View button

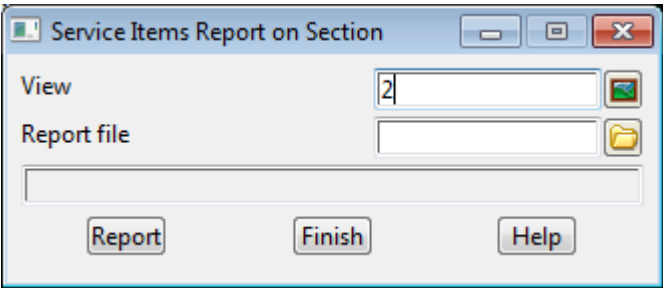

define the section view parameters according to the information in the panel. If the box given by the chainage and height values in the panel is not the same shape as the view itself, the chainage and height values will be modified so that the chainage and height values match the view shape. The final chainage and height values are displayed in the panel.

Report

Position of option on menu: Section View Menu View =>Utilities =>Report

This Report option is for producing information on all the items displayed in the section view.

After selecting Report, the **Service Items Report on Section View** panel is displayed

For the profiled string, this option generates a report which includes the

- s section through any tins on the section view
- s name and model of any services in the corridor defined by the section view
- s co-ordinates and chainages of the parts of the service in the corridor, and the chainage and offset for each of the point of the parts projected onto the profiled string.
- s clearance at the point where any service goes under or over the profiled string.

VG Edit

Position of option on menu: Section View Menu View =>Utilities =>VG Edit

The VG edit option is used to interactively create and modify the vertical geometry of a 12d Model alignment string, or the vertical information of any string that can be edited in a section view (e.g. drainage string). Vertical geometry can only be created for an existing string.

After selecting the VG edit option, the **VG edit string** panel is placed on the screen.

The option is already in **Pick** mode and the user simply picks and accepts the string whose vertical geometry is to be created and/or edited The **Pick Edit** button only needs to be used if the pick was cancelled from the **Pick Ops** menu.

Once the string has been selected, it is automatically made the primary string for the section view and a string profile created along the string.

As discussed in the section view profile options, for each tin in a model added to the section view, the section through the tin along the primary string (the selected string) is calculated and displayed in the section view.

The **VG edit** option then fires up the standard string editor which is described in detail in the **string edit** options.

View Dump

Position of option on menu: **Section View Menu View =>Utilities =>Dump**

This option is used to write the view out in a user selected format. It is the same as the dump option for the plan view and is fully documented in the plan **View => Utilities** section.

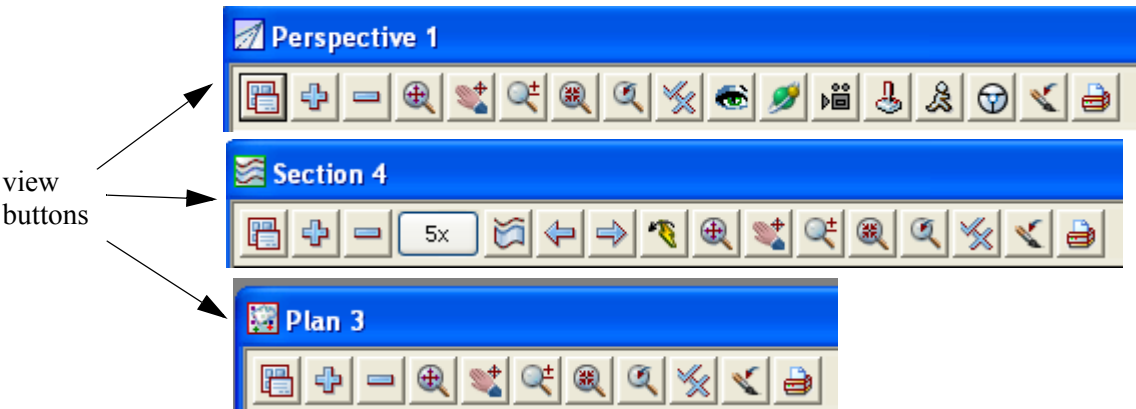

For more information please go to [Dump](#).

View Buttons

For each view type, there are a number of selected View menu options available as buttons (view buttons) in the *view title area*.

The options on each view type are

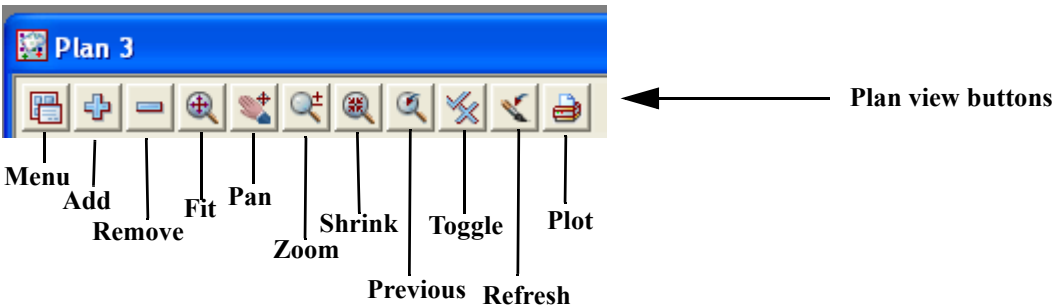

To select one of the view buttons, click LB whilst the cursor is over the button.

Note that the view buttons do not highlight when the cursor passes over them.

If RB is clicked over any view button other than **Profile** on the section view, the View menu for the view type will be displayed.

For documentation on the *Plan view buttons*, go to the section [Plan View Buttons](#).
Perspective view buttons, go to the section [Perspective View Buttons](#).
Section view buttons, go to the section [Section View Buttons](#).

Plan View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the View menu appears.

Because of the differences between plan, perspective and section views, the options on the View menu vary for each view type.

The plan View menus is

The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved **View** menu.

+ or Add

The + view button works in four modes.

- s clicking LB whilst the cursor is over the + brings up the **Models to Add** list. This list contains all of the models not yet added to the view.
- s typing a keyboard character whilst the cursor is over the + brings up a **Models to Add** list containing only those models not on the view **with names beginning** with the typed character.
- s typing a * character whilst the cursor is over the + brings up a **Add Models to View** panel which can then be used with wild cards and characters.
- s clicking MB whilst the cursor is over the + brings up the **Add Models to View by Pick** panel and starts up a **same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See chapter **Tools and Concepts** for further documentation on **same as**.
- s clicking RB whilst the cursor is over the + brings up the **View** panel documented earlier in this chapter.

For the **Same as** option for the + and - view buttons, please continue to the section [Same As for Views](#).

-or Remove

The - view button works in four modes.

- s clicking LB whilst the cursor is over the - brings up the **Models to Remove** list. This menu lists all of the models on the view.
- s typing a keyboard character whilst the cursor is over the - brings up a **Models to Remove** list containing only those models on the view with names beginning with the typed character.
- s typing a * character whilst the cursor is over the - brings up a **Remove Models from View** panel which can then be used with wild cards and characters.
- s clicking MB whilst the cursor is over the - brings up the **Remove Models from View by Pick** panel and starts up a **same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **same as**.
- s clicking RB whilst the cursor is over the - brings up the **View** panel documented earlier in this chapter.

For the **Same as** option for the + and - view buttons, please continue to the section [Same As for Views](#).

Fit

This is the same as **Fit** from the **view** menu.

If LB is clicked on the **Fit**, then the **Fit** option is activated.

If RB is clicked on the **Fit**, then the **View** option is activated.

Pan

This is the same as **Pan** from the **View=>Pan** menu.
If LB is clicked on the **Pan**, then the **Pan** option is activated.

Zoom

This is the same as the two point **Zoom** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Zoom**, then the **zoom** option is activated.

Shrink

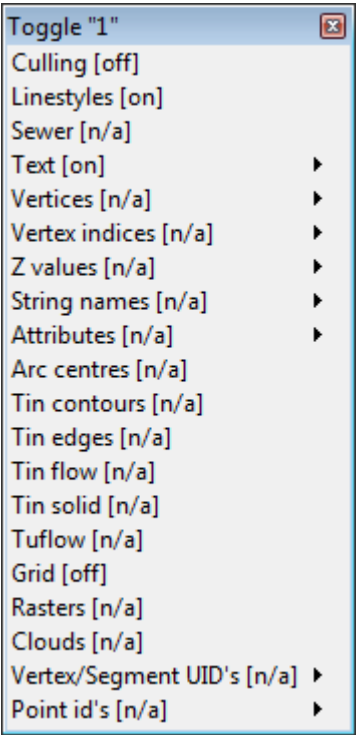

This is the same as the two point **Shrink** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Shrink**, then the **Shrink** option is activated.

Previous

This is the same as **Previous** from the **view** menu.
If LB is clicked on the **Prev**, then the **Previous** option is activated.
If RB is clicked on the **Prev**, then the **View** option is activated.

Toggle

This is the same as **Toggle** from the **View=>Settings** menu.
If LB is clicked on the **Toggle**, then the **Toggle** menu is activated.
If RB is clicked on the **Toggle**, then the **View** option is activated.
The **Toggle** menu for the plan view types is:

Refresh

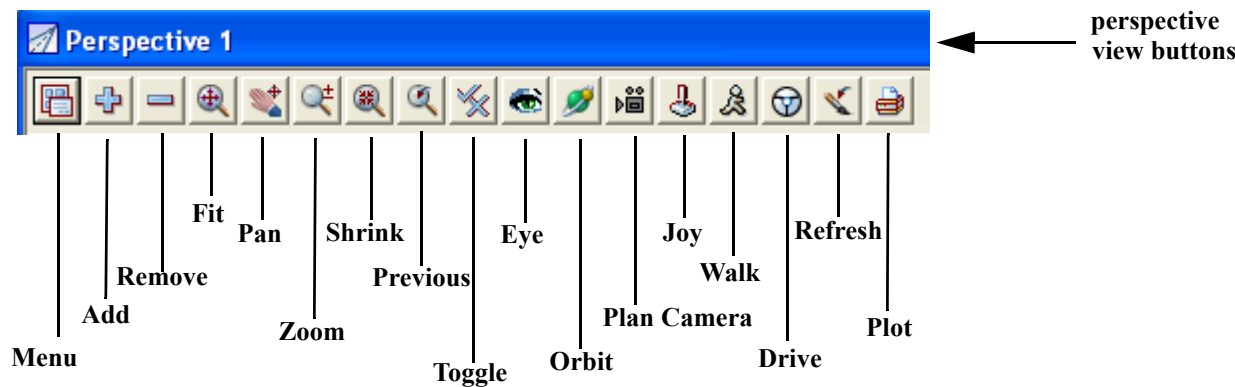

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot

If LB is clicked on **Plot**, then the **View Plotting** menu for the plan view is activated.

Perspective View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the **View** menu appears.

Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type.

The **Perspective View** menu is

The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved **View** menu.

+ or Add

The + view button works in four modes.

- s clicking LB whilst the cursor is over the + brings up the **Models to Add** list. This list contains all of the models not yet added to the view.

- s typing a keyboard character whilst the cursor is over the **+** brings up a **Models to Add** list containing only those models not on the view **with names beginning** with the typed character.
- s typing a ***** character whilst the cursor is over the **+** brings up a **Add Models to View** panel which can then be used with wild cards and characters.
- s clicking MB whilst the cursor is over the **+** brings up the **Add Models to View by Pick** panel and starts up a **Same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See chapter **Tools and Concepts** for further documentation on **same as**.
- s clicking RB whilst the cursor is over the **+** brings up the **View** panel documented earlier in this chapter.

For the **Same as** option for the **+** and **-** view buttons, please continue to the section [Same As for Views](#).

- or Remove

The **-** view button works in four modes.

- s clicking LB whilst the cursor is over the **-** brings up the **Models to Remove** list. This menu lists all of the models on the view.
- s typing a keyboard character whilst the cursor is over the **-** brings up a **Models to Remove** list containing only those models on the view with names beginning with the typed character.
- s typing a ***** character whilst the cursor is over the **-** brings up a **Remove Models from View** panel which can then be used with wild cards and characters.
- s clicking MB whilst the cursor is over the **-** brings up the **Remove Models from View by Pick** panel and starts up a **Same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **Same as**.
- s clicking RB whilst the cursor is over the **-** brings up the **View** panel documented earlier in this chapter.

For the **Same as** option for the **+** and **-** view buttons, please continue to the section [Same As for Views](#).

Fit

This is the same as **Fit** from the **view** menu.

If LB is clicked on the **Fit**, then the **Fit** option is activated.

If RB is clicked on the **Fit**, then the **View** option is activated.

Previous

This is the same as **Previous** from the **View** menu.

If LB is clicked on the **Prev**, then the **Previous** option is activated.

If RB is clicked on the **Prev**, then the **View** option is activated.

Toggle

This is the same as **Toggle** from the **View=>Settings** menu.

If LB is clicked on the **Toggle**, then the **Toggle** menu is activated.

If RB is clicked on the **Toggle**, then the **View** option is activated.

The **Toggle** menu for the perspective view is:

Eye

This is the same as **eye/target** from the **View** menu.
If LB is clicked on the **Eye**, then the **Eye-target** option is activated.
For more information please see [Eye/Target](#)

Orbit

For more information please see [Orbit](#)

Plan Camera

For more information please see [Plan Camera](#)

Joy

This is the same as **Joy** from the **View** menu.
If LB is clicked on the **Joy**, then the **Joy** option is activated.
For more information please see [Joy View](#)

Walk

This is the same as **String walk =>Along string** from the **View =>Utilities** menu.
If LB is clicked on the **Walk**, then the **Walk along string** option is activated.

Drive

This is the same as **String drive => Along string** from the **View =>Utilities** menu.
If LB is clicked on the **Drive**, then the **Drive along string** option is activated.

Redraw

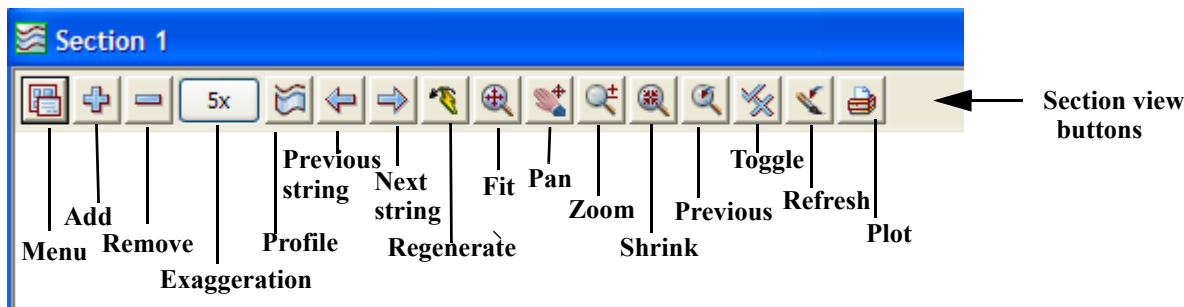

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot

If LB is clicked on **Plot**, then the **View Plotting** menu for the perspective view is activated.

Section View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the **View** menu appears.

Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type.

The **Section View** menu is

The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved **View** menu.

+ or Add

The **+** view button works in four modes.

- s clicking LB whilst the cursor is over the **+** brings up the **Models to Add** list. This list contains all of the models not yet added to the view.
- s typing a keyboard character whilst the cursor is over the **+** brings up a **Models to Add** list containing only those models not on the view **with names beginning** with the typed character.
- s typing a ***** character whilst the cursor is over the **+** brings up a **Add Models to View** panel which can then be used with wild cards and characters.
- s clicking MB whilst the cursor is over the **+** brings up the **Add Models to View by Pick** panel and starts up a **Same As** for a view. Models to add to the view are then selected by simply picking a string from the model. See chapter **Tools and Concepts** for further documentation on **Same As**.
- s clicking RB whilst the cursor is over the **+** brings up the **View** panel documented earlier in this chapter.

For the **Same As** option for the **+** and **-** view buttons, please continue to the section [Same As](#)

[for Views.](#)

- or Remove

The - view button works in four modes.

- s clicking LB whilst the cursor is over the - brings up the **Models to Remove** list. This menu lists all of the models on the view.
- s typing a keyboard character whilst the cursor is over the - brings up a **Models to Remove** list containing only those models on the view with names beginning with the typed character.
- s typing a * character whilst the cursor is over the - brings up a **Remove Models from View** panel which can then be used with wild cards and characters.
- s clicking MB whilst the cursor is over the - brings up the **Remove Models from View by Pick** panel and starts up a **Same As** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **Same As**.
- s clicking RB whilst the cursor is over the - brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, please continue to the section [Same As for Views.](#)

[Exagg]

This is the vertical exaggeration for the view.
If LB is clicked on the exaggeration, then the **Toggle** option for the section view is activated. This has options to quickly change the vertical exaggeration.

Profile

If LB is clicked on **Profile**, then the **Profile** option is activated. This option is the same as **View=>Profiling=>One string**. If a string is being profiled, then the string name is displayed after the Section view name.
If **RB** is clicked on **Profile**, then the **Profiling** menu is activated.

<<

Profile previous string.

>>

Profile next string.

Regen

This is the same as the option **Regenerate** option from the section **view** menu.
If LB is clicked on the **Regen**, then the **regen** option is activated.

Fit

This is the same as **Fit** from the **view** menu.

If LB is clicked on the **Fit**, then the **Fit** option is activated.
If RB is clicked on the **Fit**, then the **View** option is activated.

Pan

This is the same as **Pan** from the **View=>Pan** menu.
If LB is clicked on the **Pan**, then the **Pan** option is activated.

Zoom

This is the same as the two point **Zoom** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Zoom**, then the **Zoom** option is activated.

Shrink

This is the same as the two point **Shrink** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Shrink**, then the **Shrink** option is activated.

Previous

This is the same as **Previous** from the **View** menu.
If LB is clicked on the **Prev**, then the **Previous** option is activated.
If RB is clicked on the **Prev**, then the **View** option is activated.

Toggle

This is the same as **Toggle** from the **View=>Settings** menu.
If LB is clicked on the **Toggle**, then the **Toggle** menu is activated.
If RB is clicked on the **Toggle**, then the **View** option is activated.
The **Toggle** menu for the section view is:

Refresh

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot

If LB is clicked on **Plot**, then the **View Plotting** menu for the section view is activated.

Same As for Views

Clicking the middle mouse button (MB) over the **+** or **-** view buttons will activate a **Same As** pick which allows the user to select the model to add to (+) or remove from (-) the view by simply picking any string from the model to be added or removed.

After clicking MB over the **+** or **-** view button, the **Add Models to View by Pick** or **Remove Models from View by Pick** panel is brought up.

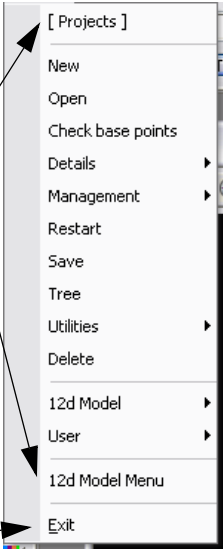

The option is already running and when a string is picked,. the model containing the string is added to/removed from the view. Further strings can then be selected to add or remove another model.

The option is terminated by selecting **[X]** or **Finish** from the panels, or **Cancel** from the **Pick Ops** menu.

8 Projects

The projects walk-right menu is:

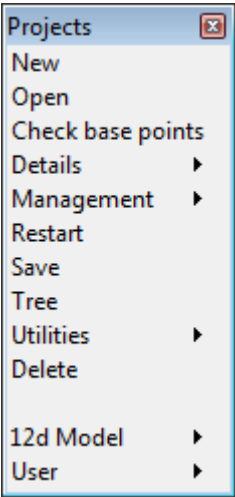

on Main menu

create floating
Projects menu

exit 12d

on **12d** Model menu and
floating Projects menu

Projects	
New	create a new project
Open	open an existing project
Check base points	number of points for base point count
Details	project description, details and diary
Management	edit project setup/management files
Restart	exit and restart in same project
Save	save the working project to disk
Tree	project data and set up files in tree form
Utilities	project utilities
Delete	delete a project from disk
12d Model	information on 12d Model
User	Projects User menu

For the option *New*, go to

[12d Model](#)
[Exit](#)

Each option will now be discussed in the order that they appear on the **Projects** menu.

New

Position of option on menu: Project =>New

New creates a new **12d Model** project.

A working folder (directory) of the same as the project can also be created with the actual project created inside the folder.

The panel can be resized.

On selecting New, the **New Project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Advanced		tick box		
	<i>if ticked, environment configurations can be assigned to the project and extra panel fields are displayed to allow for this. For more information, please go to the section New Project Panel with Advanced Ticked</i>			
	<i>If not ticked, no extra panel fields are displayed.</i>			
Project name		typed input		
	<i>name of the new project to be created.</i>			
Folder		folder box		current folder, select folder panel
	<i>if Create working folder is ticked, a folder with the same name as the project is created in the folder given in this panel field, and the project will be created inside this folder with the same name as the project. This is to encourage the habit of creating a folder of the same name of the project and then creating the project inside the folder.</i>			
	<i>If Create working folder is not ticked, the project is created in the folder given in this panel field.</i>			

Create working folder tick box

if ticked, a folder of the same name as the project is created in the folder Folder, and the project is created inside this folder. The folder with the same name as the project is then the working folder.

If not ticked, the project is created in the folder Folder and this folder is the working folder.

Description typed input

a description of the project can be typed into this field. This is stored with the project.

Create button

after selecting this button, the new project created in either the Folder or if Create working folder is ticked, inside a folder created in the Folder of the same name as the project.

12d Model then opens the newly created project.

Open button

*brings up the **Change Project** panel for opening an existing project (see the section [Open](#)).*

New Project Panel with Advanced Ticked

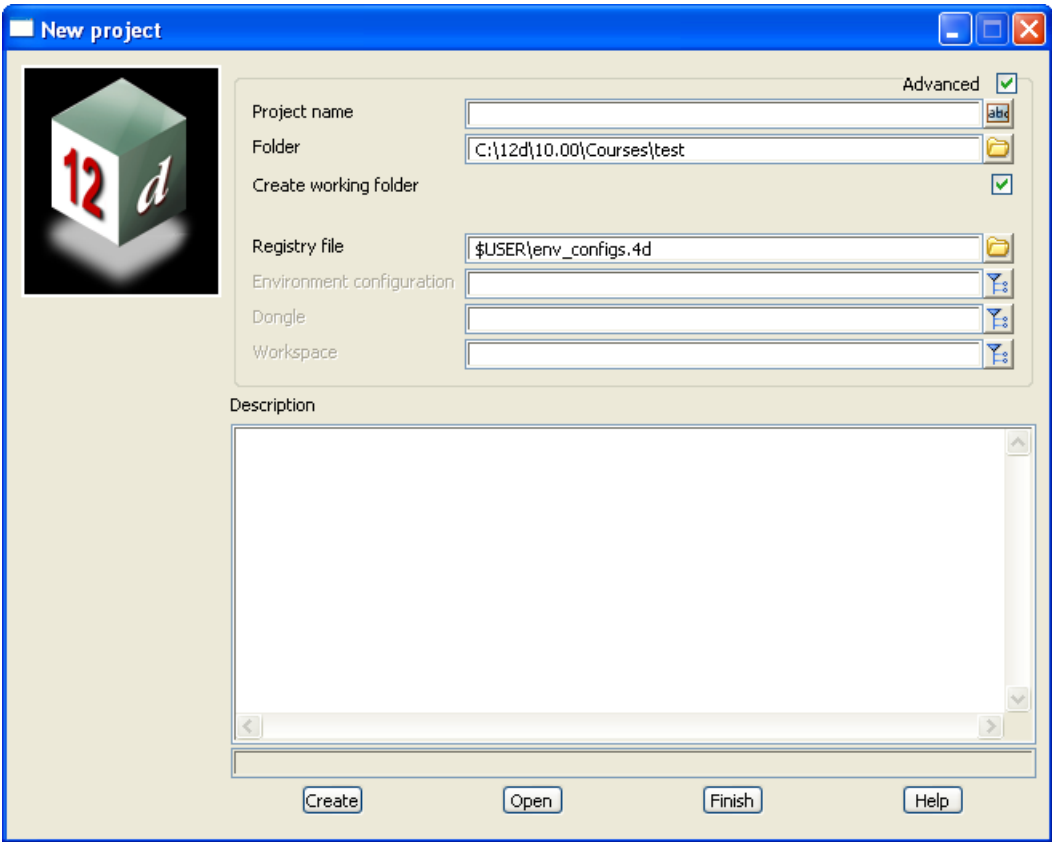

To tailor **12d Model**, there are a large number of environment variables in a file called **env.4d**. For most users, one **env.4d** file provides enough customisation for their site but for users with customers requiring very different set ups, a more flexible system is required.

For example, one project may be for a Main Roads Department which requires its own mapping files, linestyle files, ppf files etc. Another project is for a Local Authority who has totally different standards and requirements.

For this more complex situation, different **env.4d** files and environment variable overrides can be defined for each project and the Advanced tick box gives access to the advanced tailoring for a project.

For more information on the advanced tailoring, go to [Env Configuration](#).

With Advanced ticked, the **New Project** panel is:

The extra fields and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Registry file	registry box		env_configs.4d
folder browse the registry file used to define the Environments, Dongles and Workspaces definitions.			

Environment configuration

if non blank, the given Environment configuration set up is used for this project.

The choices for the Environment configuration pop-up come from the registry file. For more information on defining Registry files, go to [Env Configuration](#) and for more information on the Environmental configuration section in particular, go to [Creating/Editing an Environments Set Up](#).

Dongle

if non blank, the given Dongle set up is to be used for this project.

The choices for the Dongles pop-up come from the Registry file. For more information on defining Registry files, go to [Env Configuration](#) and for more information on the Dongles section in particular, go to [Creating/Editing a Dongles Set Up](#).

Workspace

if non blank, the given Workspace set up is used and if it includes a workspace file, then that file is used when the project is opened. However once the project is opened, the workspace file is saved locally and any changes saved with the project.

The choices for the Workspace pop-up come from the Registry file. For more information on defining Registry files, go to [Env Configuration](#) and for more information on the Workspaces section in particular, go to [Creating/Editing a Workspaces Set Up](#).

Open

Position of option on menu: Project =>Open

Position of option on menu: Project =>Utilities =>Projects

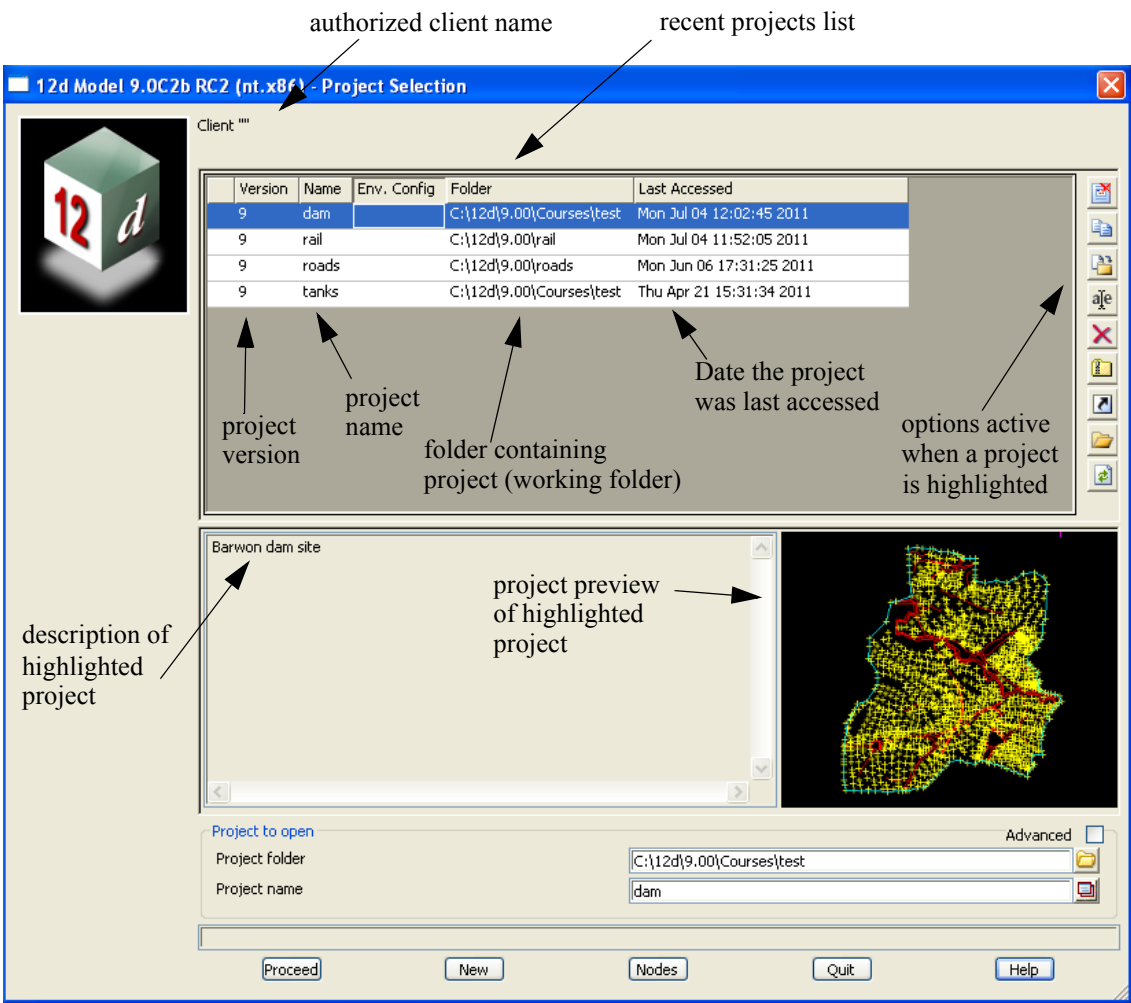

For the Project =>Utilities =>Project option, go to the section [Projects](#)

The **Open** option is used to change the working folder and the working project to an another existing project.

With **Advanced** ticked, it is also possible to set or modify one or more of the *Environment configuration*, *Dongle* or *Workspace* set ups for the projects. For more information on Environment configuration settings, go to [Env Configuration](#) or a quick discussion in the previous section [New Project Panel with Advanced Ticked](#).

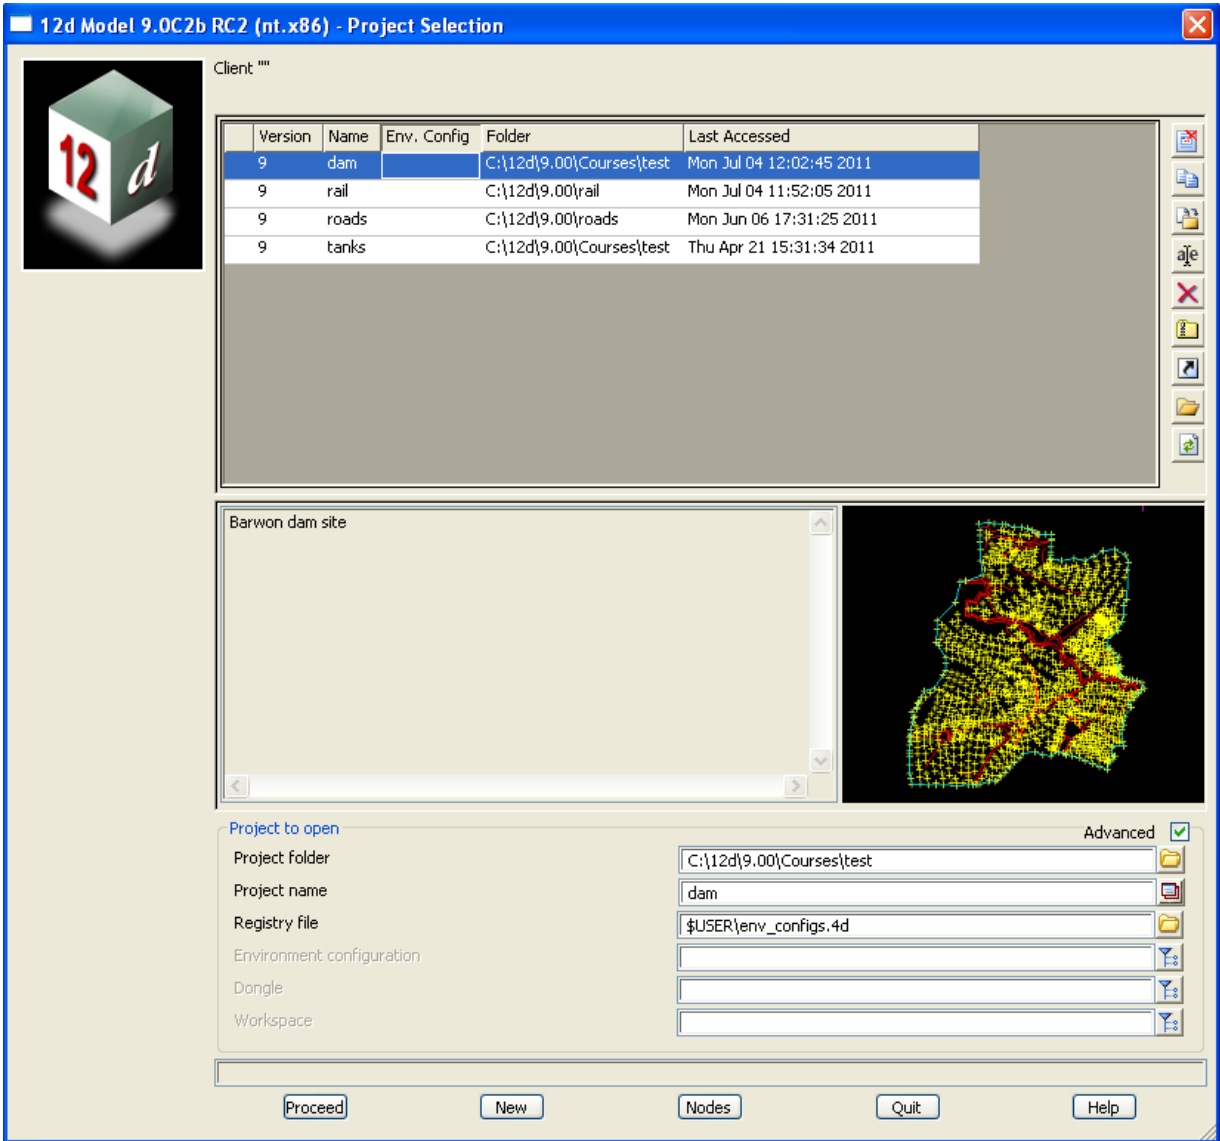

The panel can be resized.

On selecting the **Open** option, the **Change Project** panel is displayed.

NOTE: When a project is highlighted in the list of recent projects, icons for options are activated on the right hand side of the **Project Selection** panel, and a **Project Ops** menu (which contains the same options), can be brought up by clicking **RB** anywhere in the recent projects list area.

With **Advanced** ticked, the **Create Project** panel is:

Field Description	Type	Defaults	Pop-Up
Client name	display only		
<i>authorized 12d Model client.</i>			
Recent projects list	output	recent projects	
<i>names and folders of project recently select. Single clicking on an entry in the list displays the projects description and the project preview. Double clicking on an entry in the list closes the existing project and opens the selected projected.</i>			
Project description	output		
<i>description of the project highlighted in the Recent projects list.</i>			
Project preview	image		
<i>image of the active view when the project was last accessed, or a user selected image of a previous active view.</i>			
Advanced	tick box		
<i>if ticked, environment configurations can be assigned to the project and extra panel fields are displayed to allow for this.</i>			
<i>If not ticked, no extra panel fields are displayed.</i>			

Working folder	current folder	folder browse
<i>name of the folder to become the working folder (the folder that contains the project).</i>		
Project name	project box	projects in selected Working folder
<i>name of the project to open. This project become the working project.</i>		
Registry file	registry box	env_configs.4d folder browse
<i>the registry file used to define the Environments, Dongles and Workspaces definitions.</i>		

Environment configuration

if non blank, the given Environment configuration set up is used for this project.

The choices for the Environment configuration pop-up come from the registry file. For more information on defining Registry files, go to [Env Configuration](#) and for more information on the Environmental configuration section in particular, go to [Creating/Editing an Environments Set Up](#).

Dongle

if non blank, the given Dongle set up is to be used for this project.

The choices for the Dongle configuration pop-up come from the Registry file. For more information on defining Registry files, go to [Env Configuration](#) and for more information on the Dongles section in particular, go to [Creating/Editing a Dongles Set Up](#).

Workspace

if non blank, the given Workspace set up is used and if it includes a workspace file, then that file replaces the existing file of the opened project. However once the project is opened, the workspace file is saved locally again and any changes saved with the project.

The choices for the Workspace pop-up come from the Registry file. For more information on defining Registry files, go to [Env Configuration](#) and for more information on the Workspaces section in particular, go to [Creating/Editing a Workspaces Set Up](#).

Open button

after selecting this button, the current folder is closed and the selected project opened. The working folder is now the folder specified in the Working folder field.

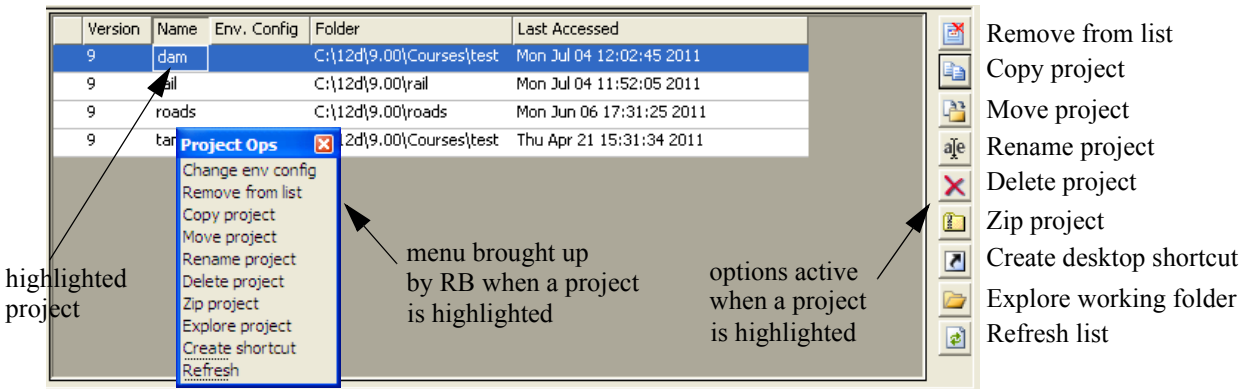

New button

*brings up the **New Project** panel.*

Note: This is a resizable panel.

Options Active When Project Highlighted

When a project is highlighted in the list of recent projects, icons for options are activated on the right hand side of the **Project Selection** panel, and a **Project Ops** menu (which contains the same options), can be brought up by clicking **RB** anywhere in the recent projects list area.

- | | |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Remove from list | remove the project from the <i>recent projects</i> list |
| Copy Project | see Copy Project - Icon |
| Move Project | see Move Project - Icon |
| Rename Project | see Rename |
| Delete Project | see Delete Project - Icon |
| Zip Project | see Zip Project - Icon |
| Create Desktop Shortcut | create a shortcut on the desktop that starts 12d Model and opens the project - see Project Shortcuts |
| Explore | open Windows Explorer and show the contents of the working folder |
| Refresh | refresh the <i>recent projects list</i> |
| Change env configuration | change the environment configuration. This is only available on the Project Ops menu. |

Copy Project - Icon

Position of option on menu: Project Selection =>Copy Project icon

Position of option on menu: Project =>Open=> Copy Project icon

This panel copies a project to a new location. If you are attempting to copy the project you are currently in, **12d Model** will prompt you to save and restart.

Selecting  brings up the **Copy Project** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Working folder	file		
<i>the folder containing the project</i>			

Project			
<i>the name of the project to copy</i>			

Target	file		
<i>where the project should copied to</i>			

Include working folder (containing project)	tick box		
<i>if ticked, the folder containing the project (and all sub folders) will also be copied</i>			

Reset project id (required for sharing)	tick box		
<i>if you are intending to share the copied project, you must reset the ID - otherwise sharing will not be allowed from the copied project</i>			

Copy	button		
<i>copies the project</i>			

Move Project - Icon

Position of option on menu: Project Selection=> Move Project icon

Position of option on menu: Project =>Open=> Move Project icon

This panel moves a project to a new location. If you are attempting to move the project you are currently in, **12d Model** will prompt you to save and restart.

Selecting  brings up the **Move Project** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Working folder	file		
<i>the folder containing the project</i>			

Project			
<i>the name of the project to move</i>			

Target	file		
<i>where the project should moved to</i>			

Include working folder (containing project) tick box

if ticked, the folder containing the project (and all sub folders) will also be moved

Reset project id (required for sharing) tick box

if you are intending to share the moved project, you must reset the id - otherwise sharing will not be allowed from the moved project.

Move	button		
<i>moves the project</i>			

Delete Project - Icon

Position of option on menu: Project Selection=> Delete Project icon

Position of option on menu: Project =>Open=> Delete Project icon

This will delete a project. This cannot be the current open project.

Selecting  brings up the **Delete Project** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Working folder	file		
<i>the folder containing the project to be deleted</i>			
Project			
<i>the name of the project to delete</i>			
Delete	button		
<i>delete the project</i>			

Zip Project - Icon

Position of option on menu: Project Selection=> Zip Project icon

Position of option on menu: Project =>Open=> Zip Project icon

This panel will zip a project. If you attempt to zip the current project, **12d Model** will prompt you to save and restart.

Selecting  brings up the **Zip Project** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Working folder <i>the folder where the project resides</i>	file box		
Project <i>the name of the project you wish to zip</i>	project box		
Zip file <i>the file to zip into</i>	file box		
Delete existing zip file <i>if ticked on, any existing zip file will be deleted</i>	tick box		
Include directory containing project <i>if ticked on, the directory containing the project (the working directory) will also be zipped, along with all sub folders</i>	tick box		
Zip <i>zips the project</i>	button		

Check Base Points

Position of option on menu: Project =>Check base points

All **12d Model** versions have a Base module that is authorised for a set number of Base Points. For example, the 50K Base allows up to 50,000 base points, the 5M version allows up to 5,000,000 base points and the 250M version allows up to 250,000,000 base points.

The **Check base points** option displays the number of base points used in the current project and the total number of base points authorised for the version of **12d Model** being used to open the project.

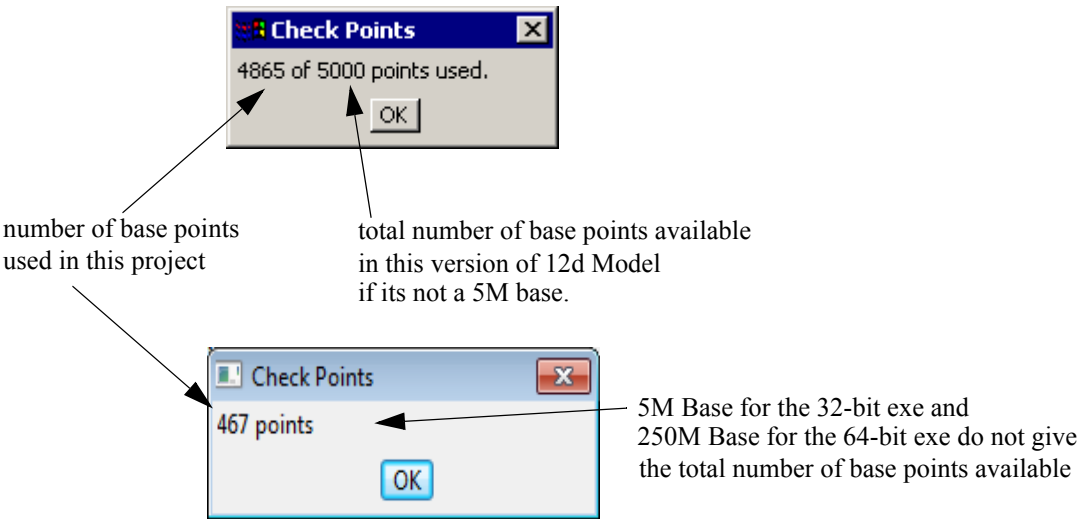

The items included in the Base Point count are:

- 1. each vertex in a string counts as a base point except
 - (a) for a project, the vertices of strings created when plotting to a model inside the project do not count as base points for that project
 - (b) for a project, contours generated by **2d Model** and written to models inside the project do not count for that project.
- 2. points in a tin count as base points
- 3. for an alignment, the number of base points is the number of HIP's plus the number of VIP's
- 4. items in models and tins shared into a project are included in the base point count.

Important Note:

If any non-counted base point data is written out as 12d Ascii and read into a project then the data read in from the 12d Ascii **will** be included in the base point count in the project that the data is read into.

Selecting **Check base points** displays the **Check Base Points** panel.

Details

Position of option on menu: Project ==>Details

A project description and project details can be defined.

The **Project details** walk-right menu contains various project items.

display/modify the project description
display/modify the project details
project diary

For the option *Description*, go to
 Details
 Diary

[Description](#)
[Details](#)
[Diary](#)

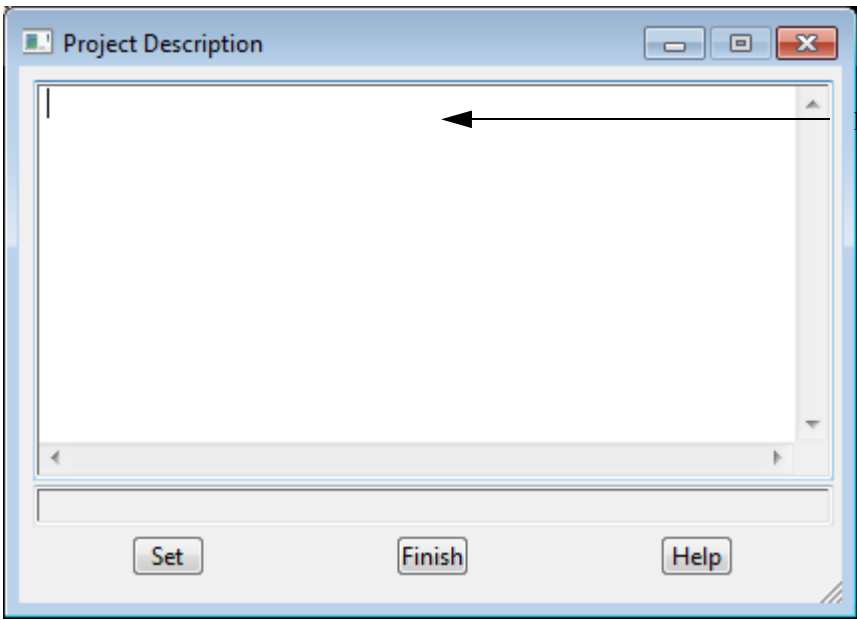

The options in the menu will now be described.

Description

Position of option on menu: Project ==>Details ==>Description

The **description** option is used to create and edit the project description.

Selecting **Description** brings up the **Project Description** panel.

← project description area

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Project description area	input		
---------------------------------	-------	--	--

the description for the project to be rebuilt. The description can be more than one line long.

Set	button		
------------	--------	--	--

set the project description.to be the text in the project description area.

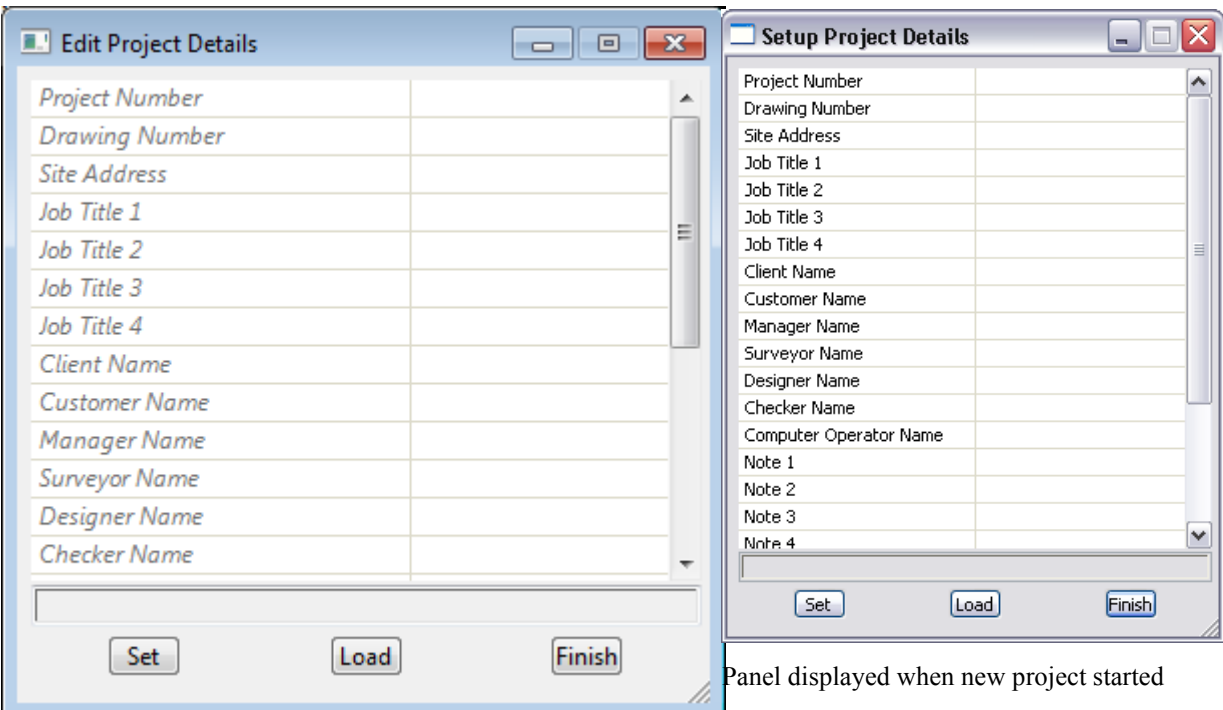

Note: This panel is a resizable panel.

Details

Position of option on menu: Project ==>Details ==>Details

The **Details** option is used to enter project details.

Selecting **Details** opens the **Edit Project Details** panel.

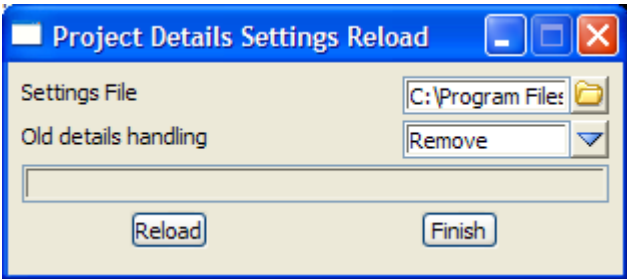

Panel displayed when new project started

What information is to be entered into the **Enter Project Details** panel is defined in the option
Project ==>Management ==>Details editor - go to [Details Editor](#)

The fields and buttons used in the **Enter Project Details** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Set	button		
<i>set the project details to the values show in the panel. The values are stored as project attributes.</i>			
Load	button		
<i>brings up the Projects Details Setting Reload panel that is used to load a new definition of project detail attributes.</i>			

A file defining a new set of project attributes of project details can be loaded. How existing project details are handled depends on the value of **Old details handling**

Old details handling

***Remove** - all existing project detail attributes are removed and totally replaced by the new set*

***Keep (no update)** - any existing project detail are kept but their values **are not** updated by the default setting if the same attribute exists in the Settings file.*

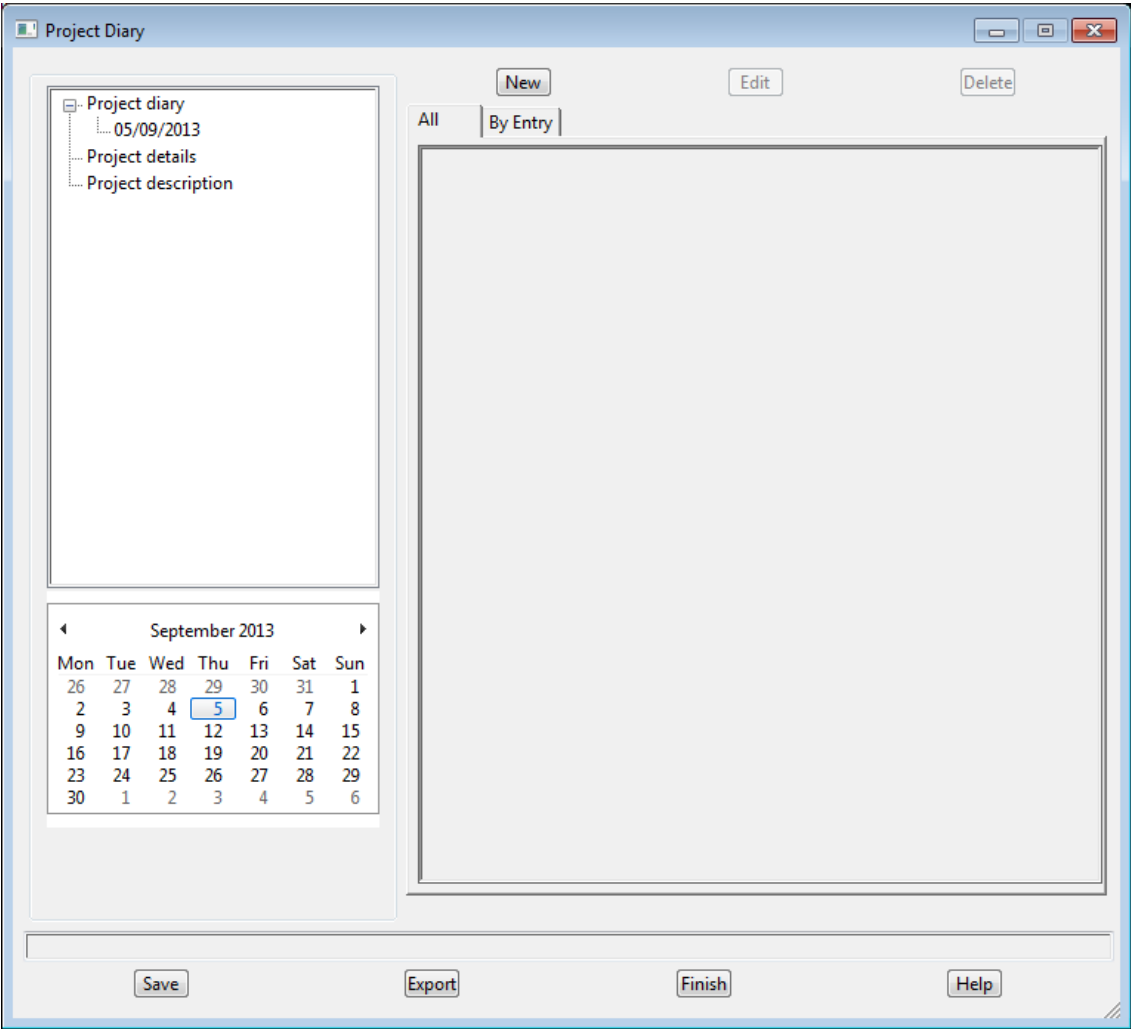

***Keep (with update)** - any existing project detail are kept and their values **are updated** by the default setting if the same attribute exists in the Settings file.*

Diary

Position of option on menu: **Project ==>Details ==>Diary**

The **Project diary** allows information to be entered for each day. It can also be used to edit project details and the project description.

Selecting **Diary** brings up the **Project Diary** panel.

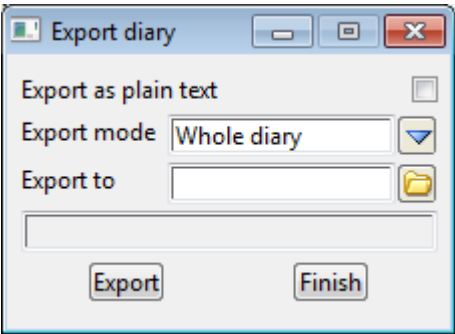

The **Project diary** panel has a grid with nodes for the Project diary, Project Details and Project description.

Clicking on the **+** on **Project diary** will expand the tree to show all the dates with diary notes as well as a position for entry at today's date. Clicking in the calendar at the bottom of the panel will allow notes to be added for earlier days that do not already have notes. Notes can not be added for future dates.

Clicking on **Project details** will display in read-only format the **Project details** information for the project with their current values. To modify any of the values, click on the **Edit** button and the **Edit Project Details** panel is displayed. The information can then be modified/saved as documented in the section [Details](#).

Clicking on **Project description** display the current description in the right hand side of the panel. The description is simply text and can be modified directly in the panel. Click on the **Write** button to save the modified description.

Clicking on **Export** display the **Export Diary** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Export as plain text <i>if ticked, exports the diary as plain text without formatting</i> <i>if not ticked, exports the diary in RTF, with all formatting retained</i>	tick box	not ticked	
Export mode <i>which data should be exported - the whole diary, the selected month or the selected day</i>	choice box	Whole diary	Whole diary, Selected month, Selected day
Export to <i>the file to export the diary to</i>	file		
Export <i>writes the current export diary settings out to the file given in the Export to field.</i>			

Management

Position of menu: Project =>Management

Options to set up the project

The **Project management** walk-right menu contains various project items.

Project Management	
Defaults	set default values for the project
Details editor	edit the details definition file
env.4d	edit the env.4d file
Env configuration	set up environments with different user, user library folders, dongles
Projections	define/use projections
N values	define/use N value parameters
7 parameters	define/use 7 value parameters
Workspace	define/use workspace setup
Tags	create tag tree
Tree	edit items on the project tree
Sharing	set share settings for this session
Forest files	look at what models and tins are in the Trash Bin
Trash bin	
Project preview	set up user defined preview rather than automatic one
Toggle density drawing	toggle density drawing - only for 250M

For the option <i>Defaults</i> , go to	Defaults
<i>Details editor</i>	Details Editor
<i>env.4d</i>	env.4d
<i>Env configuration</i>	Env Configuration
<i>Projections</i>	Projections
<i>N Values</i>	N values
<i>7 Parameters</i>	7 Parameters
<i>Workspace</i>	Project Workspace
<i>Tags</i>	Tags
<i>Tree</i>	Tree
<i>Sharing</i>	Project Sharing
<i>Forest files</i>	Forest File
<i>Trash bin</i>	Trash Bin
<i>Project preview</i>	Project Preview
<i>Toggle density drawing</i>	Toggle Density Drawing

The options in the menu will now be described.

Defaults

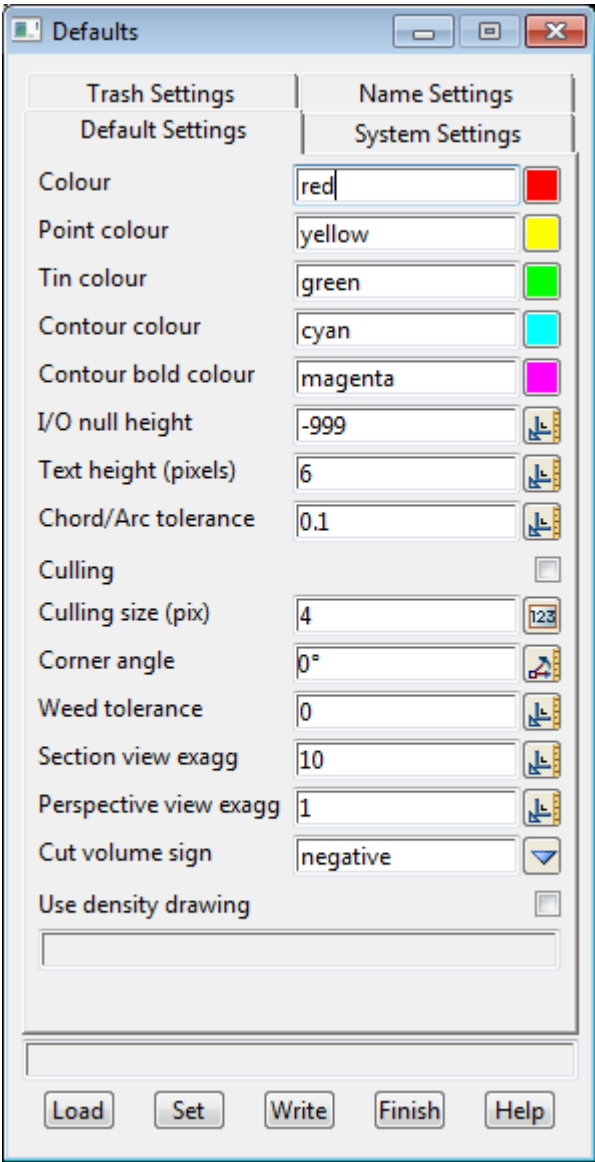

Position of option on menu: Project =>Management =>Defaults

The **Defaults** option allows the user to view and modify many of the default values used in the current 12d Model project.

NOTE - The values in the default option panels are initially set for a new project by the values in the **defaults.4d** file. For more information on the defaults.4d file, go to the section [Defaults File](#) in the Appendix [Setting Up and Configuring 12d](#)

Any changes made in the **Defaults** panel are used in the current session for the project when the **Set** button is pressed. The values are only *saved* for the project if a **Project =>Save** is done after the **Set**.

On selecting the **Default Settings** tab, the **Default Settings** are displayed.

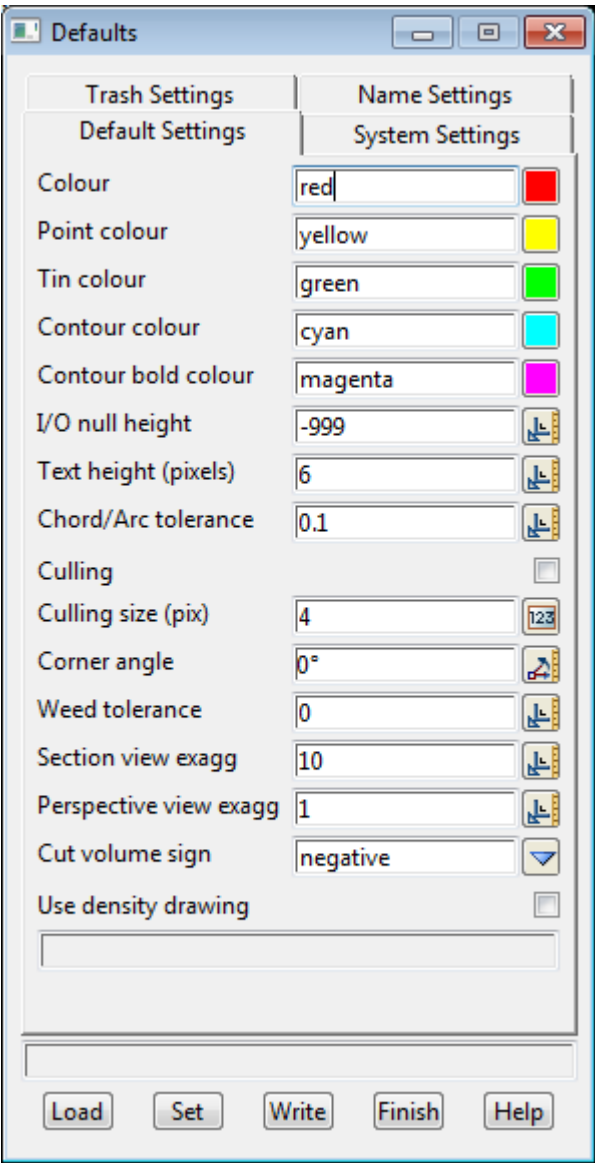

The **Defaults** panel consists of tabs for the groups of settings *Defaults*, *System*, *Trash* and *Name*.

- [Default Settings tab](#)
- [Systems Settings tab](#)
- [Trash Settings tab](#)

Names Settings tab

Default Settings tab

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Colour	colour box	default colour	available colours
<i>the name of the current default colour used for line strings.</i>			
Point colour	colour box	def point colour	available colours
<i>the current default colour used for point strings.</i>			
Tin colour	colour box	def tin colour	available colours
<i>the default tin colour used in the triangulate model and view panels.</i>			
Contour colour	colour box	default cont colour	available colours
<i>the default contour colour used in the contour panel.</i>			

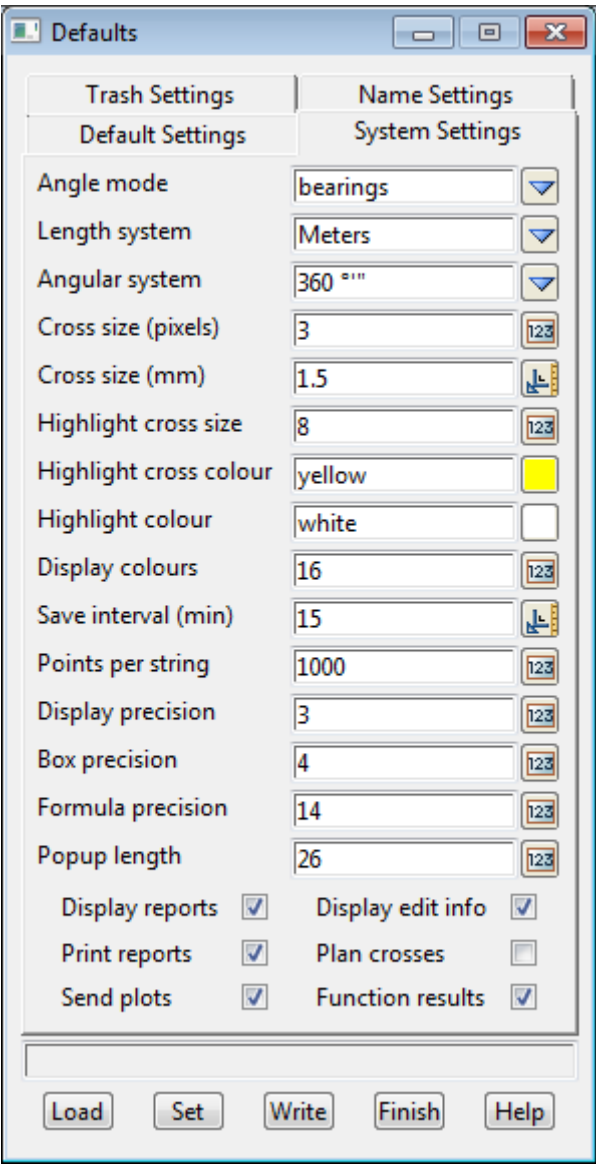

Cont bold colour	colour box	default cont index colour	available colours
<i>the default contour bold colour is used in the contour panel.</i>			
I/O null height	input	-999.0	
<i>this field contains the value of the value recognised as a null height when reading in and writing out data.</i>			
Text height (pixels)	input	8	
<i>the default text height used in the sewer option and other panels.</i>			
Chord/Arc tolerance	input	0.1	
<i>the maximum value of a chord to arc distance. If this distance is exceeded when approximating curves by chords, extra points are inserted into the curve so that the chords all have chord/arc distances less than this value. A value of zero disables the chord/arc test.</i>			
Culling	tick box		
<i>the culling setting for any new perspective or plan views.</i>			
Culling size (pix)	input	5	
<i>the culling size for any new perspective or plan views.</i>			
Corner angle	input	15	
<i>when applying templates or calculating interfaces along a string, extra sections may be required at string vertices with no horizontal curve on them. If the corner angle is non-zero, extra sections are added in at multiples of the corner angle value for the plan angle at the vertex.</i>			
Weed tolerance	input	0	
<i>if two points on a string (with the same bearing) are closer than this distance then the second point is left out. This applies to the extra points added in at chainage points in interfacing and corner angles.</i>			
Section view exagg	input	10	
<i>the vertical exaggeration used for any new section views.</i>			
Perspective view exagg	input	1	
<i>the vertical exaggeration of any new perspective.</i>			
Cut volume sign	choice box	negative	negative, positive
<i>the sign (positive or negative) used for cut volumes and areas. The sign for fill is the opposite.</i>			
Use density drawing	tick box		
<i>If Use density drawing is ticked, the data density for a model is calculated and if it is too high, a red rectangle is drawn around the model instead of the individual vertices of the strings in the model. If the data density of the model is low enough not to replace the entire model by a red rectangle, a data density is calculated for each string in the model and if the data density is too high, the string is replaced by a red rectangle.</i>			
<i>Note: This setting is only applicable to the 250M version of 12d Model.</i>			
<i>The default for a new project is given by the environment variable USE_DENSITY_CHECKS_4D.</i>			
Load	button		
<i>read the default values from the current default.4d file for the project. The values are not used for the project until the Set button is pressed. The values are not saved for the project until a Project =>Save is done after the Set.</i>			
Set	button		
<i>when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a Project =>Save is done after the Set.</i>			

Write button

*write the values in the panel to the defaults.4d file.
The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a **Project =>Save** is done after the **Set**. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#).*

Systems Settings tab

On selecting the System Settings tab, the **System Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Angle mode	choice box	bearings	cartesian, bearings
<i>specifies whether bearings or cartesian angles are used in reporting the instantaneous direction of the selected string in the information menu.</i>			
Cross size (pixels)	input/output	2	
<i>the size in pixels that crosses (for points etc.) are drawn on the screen.</i>			

Cross size (mm)	input/output	2.5	
<i>the size in millimetres that crosses (for points etc.) are drawn on any plots.</i>			
Highlight cross size	input/output	8	
<i>the size in pixels of the cross used for highlighting objects in views.</i>			
Highlight cross colour	colour box	yellow	available colours
<i>the colour of the cross used for highlighting objects in views.</i>			
Highlight colour	colour box	white	available colours
<i>the colour used to display objects in views when they are highlighted.</i>			
Display colours	input/output	0	
<i>the number of colours from the top of the colour map file, colour_map.def, that are displayed in a colour pop-up. If 0, all colours are displayed.</i>			
Save interval (min)	input/output	5	
<i>the number of minutes that elapse after a save before the save project reminder panel comes up. If 0, the panel never comes up.</i>			
Display precision	input/output	3	
<i>the number of decimal places used for values displayed in the information menus.</i>			
Box precision	input/output	4	
<i>the number of decimal places used for values displayed in boxes and panels.</i>			
Popup length	input/output	28	
<i>the maximum number of items in a pop-up before breaking the pop-up into walk-rights.</i>			
Display reports	tick box	tick	
<i>if ticked, as soon as a report is produced, it will be displayed in the editor defined by the environment variable, EDITOR_4D.</i>			
Display edit info	tick box	tick	
<i>if ticked, the edit info panel is automatically displayed whenever a string is created or edited.</i>			
Print reports	tick box	tick	
<i>if ticked, as soon as a report is produced, it will be passed to the script/program defined by the environment variable, PRINTER_4D.</i>			
Send plots	tick box	tick	
<i>if ticked, as soon as a plot is produced, it will be passed to the script/program defined by the environment variable, PLOTTER_4D.</i>			
Plan crosses	tick box		
<i>This option is experimental - at the moment things will look messy when editing in a section view with plan crosses turned on.</i>			
<i>if ticked, when the cursor is in a plan or perspective view, it is projected onto any section views as well.</i>			
Function results	tick box	tick	
<i>if ticked, function results such as volumes will be displayed on the screen every time a recalc is done.</i>			
<i>if not ticked, no function results as displayed on a function recalc.</i>			
Load	button		
<i>read the default values from the current default.4d file for the project. The values are not used for the project until the Set button is pressed. The values are not saved for the project until a Project =>Save is done after the Set.</i>			
Set	button		
<i>when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a Project =>Save is done after the Set.</i>			

Write button

*write the values in the panel to the defaults.4d file.
The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a **Project =>Save** is done after the **Set**. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

Trash Settings tab

On selecting the **Trash Settings** tab, the **Trash Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Trash mode	choice box	trash string	keep string, trash string, delete string
<i>In many string options, new strings are created from existing strings. What happens to the original strings may be determined by the trash mode. If set to keep string, the original strings will not be touched trash string, the original strings will be moved to the trash model</i>			

delete string, the original strings will be deleted.

Trash model model box Trash Model available models

the model that trashed strings are put into. This model needs to be cleaned or deleted to permanently remove the strings.

Load button

*read the default values from the current default.4d file for the project. The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a **Project =>Save** is done after the **Set**.*

Set button

*when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a **Project =>Save** is done after the **Set**.*

Write button

*write the values in the panel to the defaults.4d file.
The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a **Project =>Save** is done after the **Set**. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

Names Settings tab

On selecting the Name Settings tab, the **Name Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Names <i>name of the mapping file used as the default name mapping file.</i>	input		*.mf files
Load <i>read the default values from the current default.4d file for the project. The values are not used for the project until the Set button is pressed. The values are not saved for the project until a Project => Save is done after the Set.</i>	button		
Set <i>when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a Project => Save is done after the Set.</i>	button		
Write <i>write the values in the panel to the defaults.4d file. The values are not used for the project until the Set button is pressed. The values are not saved for the project until a Project => Save is done after the Set. For more information on the Write button, go to the</i>	button		

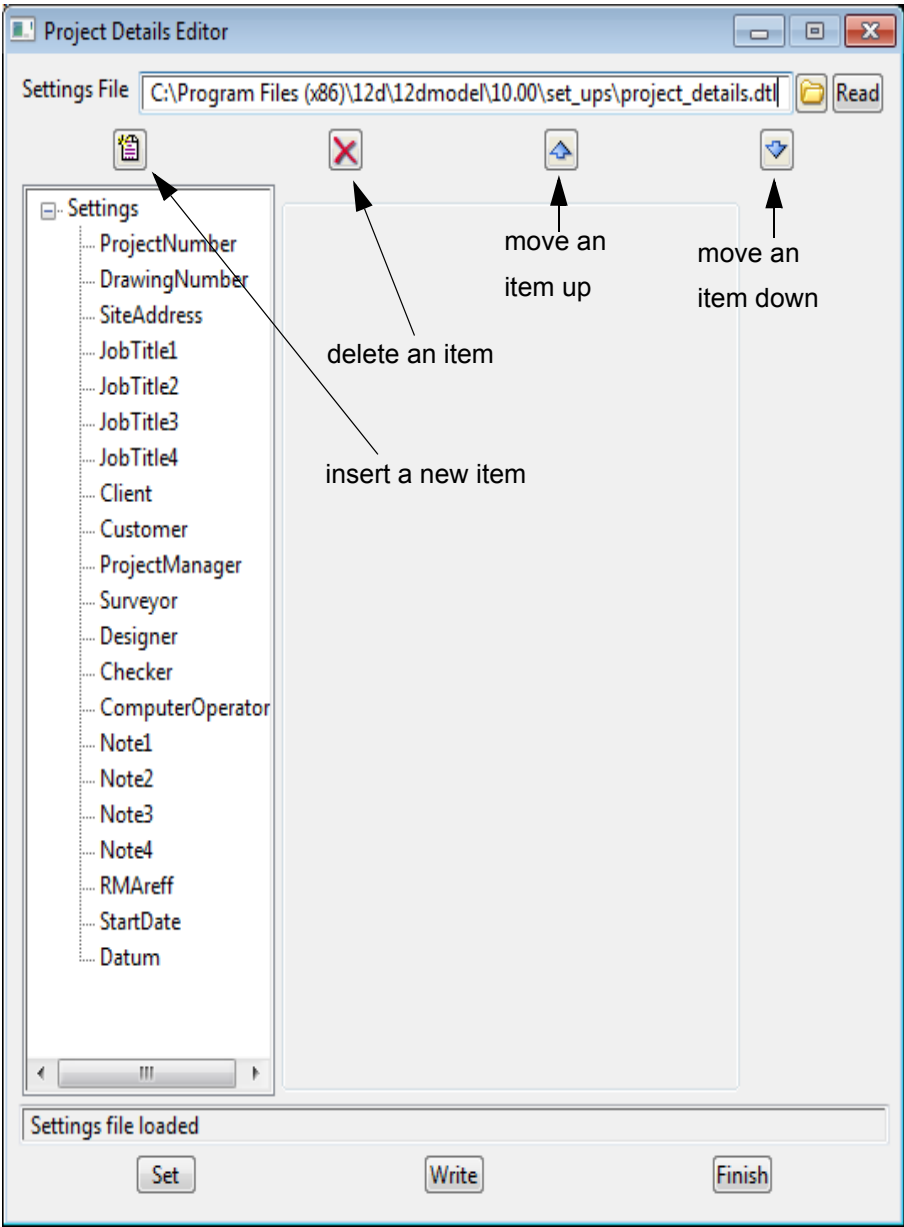

section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#).

Details Editor

Position of option on menu: Project =>Details =>Management =>Details editor

The **Details Editor** s option creates the files used to define the project attributes displayed in the **Project Details** panel.

On selecting the **Details Editor** option, the **Project Details Editor** panel is displayed.

The items defined in the **Project Details Editor** panel can be of type Text (e.g. fred), Integer (e.g. 11) or Real (e.g. 23.15).

The fields and buttons used in the **Enter Project Details** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Set	button		
<i>the values in the panel are set as the project details setup</i>			
Write	button		

writes out a project details file.

When inserting a new **detail**, the following is displayed

Field Description	Type	Defaults	Pop-Up
Type <i>the detail can be text, an integer or a real value</i>	choice box		TextText, Integer, Real
Name <i>name of the project attribute used to store the detail</i>	input		
Display name <i>name to appear in the Enter Project Details panel</i>	input		
Description <i>description that appears when the Display name is clicked in the Enter Project Details panel</i>	input		
Default value <i>default value for the detail</i>	input		
Precision <i>only for Type Real - number of decimal places</i>	integer box		
Is optional <i>if ticked, then the detail does not have to be filled in. If not ticked, it is compulsory to fill in the detail in the Enter Project Details panel before leaving the panel.</i>	tick box		tick

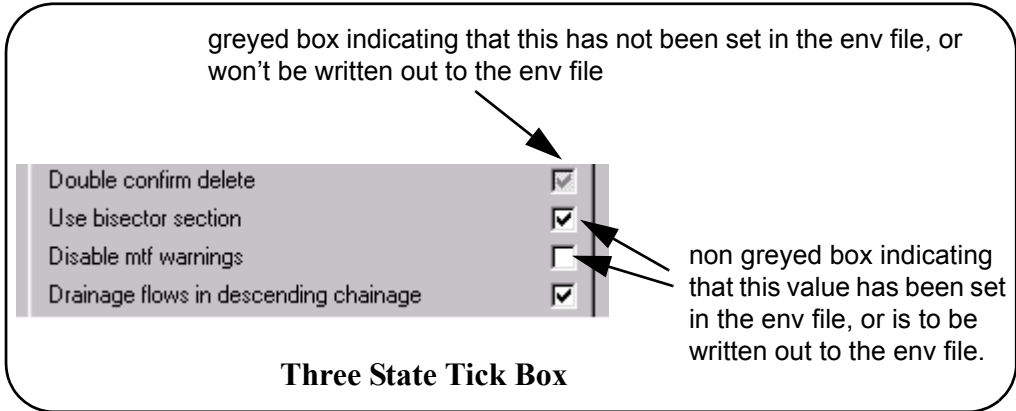

env.4d

Position of option on menu: Project =>Management =>env.4d

The env.4d option is used to create/update the *env.4d* file of environmental variables.

When the option is selected, it reads in the *current* env.4d file and displays in the panel, the values for any environment variables *in the file*. Hence the panel shows the values for the environment variables *in the file*, not those that are not in the file and have default values set by **12d Model**.

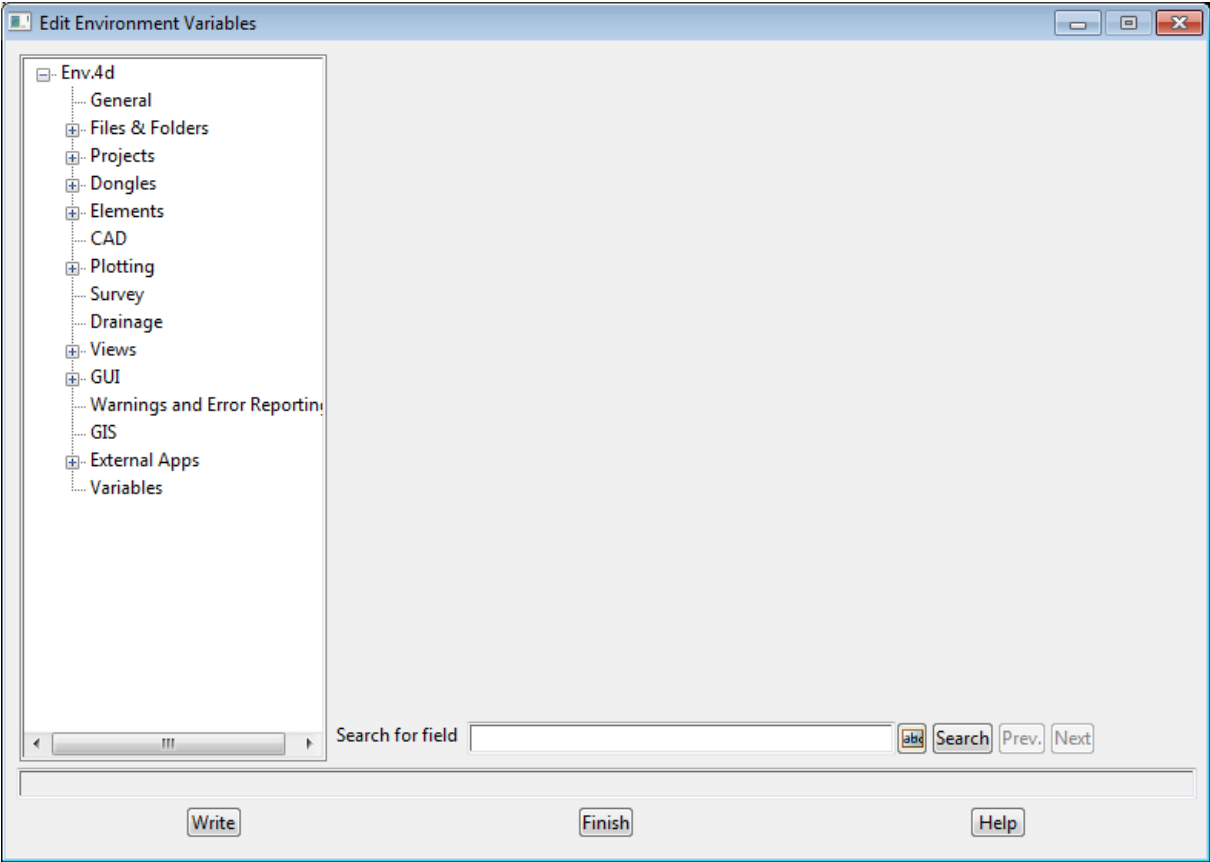

Hence the tick boxes in the *Edit Environment Variables* panel have three states rather than the standard two states. There is the standard tick or nothing to denote the value of the variable is set from the env file (or is going to be written out to the env file) or a greyed out tick or greyed out blank box to indicate that the value has *not* been set by the environment variable. Clicking on the tick box will toggle between the three states - on, off and no value.

After any modifications are made, the parameters are written out to an env.4d file.

Note that the *env.4d* file is only used when a project is loaded so the parameters written to an *env.4d* file can only take affect for the current project if a project *restart* is done.

Selecting env.4d displays the **Edit Environmental Variables** panel.

This panel has a tree on the left hand side and clicking on the + will expand the node and - will collapse the node.

The fields and buttons at the bottom of the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Search for field	typed input		

text to search for on the env.4d panel (not the env variable name).

Search button - search for the text in the Search for field. The search starts from where your cursor is in the panel fields.

Prev. button - search for the previous occurrence of the text in the Search for field.

Next button - search for the next occurrence of the text in the Search for field.

Write button

*write the values in the panel to a file. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

Note - the env.4d file is only used when a project is loaded so the parameters written to the env.4d file will only take affect for the current project if a project *restart* is done.

Variables	Variables

The environment variables are described in more detail in the section [Environment Variables](#) of the Appendix [Setting Up and Configuring 12d](#).

Field Description	Type	Defaults	Pop-Up
General			
Show full path name	tick box		
<i>if ticked, when 12d Model fires up the actual file names defined by any environment variables are written to the output window. This is useful for debugging.</i>			
<i>Env variable and full documentation: see SHOW_PATHS_4D</i>			
Show Vista full path name	tick box		
<i>if ticked, then for Microsoft Vista, when 12d Model fires up, the actual file names defined by any environment variables are written to the output window. This is useful for debugging due to the fact that Vista may put file sin strange places.</i>			
<i>Env variable and full documentation: see SHOW_VISTA_VIRTUAL_STORE_PATHS_4D</i>			
Enable undo	tick box		
<i>if ticked, allow Undos.</i>			
<i>Env variable and full documentation: see UNDO_4D</i>			
Plan table settings	tick box		
<i>if ticked, allow the drawing of z-values, vertices etc. on the plan view to be set by individual models rather than for all models on the view.</i>			
<i>Env variable and full documentation: see PLAN_TABLE_SETTINGS_4D</i>			
MTF extra start/end	tick box		
<i>if ticked, Extra start/end is turned on by default in the MTF Editor.</i>			
<i>Env variable and full documentation: see EXTRA_START_EXTRA_END_4D</i>			
Use names.4d comment field	tick box		
<i>if ticked,.</i>			
<i>Environment variable</i>	USE_NAMES_COMMENT_4D		
Check for updates on startup	tick box		
<i>if ticked,.</i>			
<i>Environment variable</i>	CHECK_FOR_UPDATES_4D		
Show time taken for options	tick box		
<i>if ticked,.</i>			

Environment variable	SHOW_OPTIONS_EXECUTION_TIME_4D	
Text editor	file box	
<i>if non-blank, the script or program that is fired up when a report is created. It usually points to an editor.</i>		
Env variable and full documentation: see EDITOR_4D		
Typed units mode	choice box	
<i>Controls the typed input units for feet - international and/or US.</i>		
Environment variable	TYPED_UNITS_MODE_4D	
System names	Choice box	Long, Short, Short then long
<i>for file name compatibility with DOS 8.3 format, the default names for all set up files can be restricted to just short names (8.3), long names, or short and then long.</i>		
Environment variable	SYSTEM_NAMES_4D	
Web search	typed input	www.google.com
<i>Web address that is used in 12d option Help =>12d on the Web =>Search the web</i>		
Env variable and full documentation: see WEB_SEARCH_4D		
Processor affinity	typed input	
Environment variable	PROCESSOR_AFFINITY_4D	

Files and Folders

Files and Folders > Folders

User "Documents and Settings\All Users" for env.4d, users user_lib folders	tick box	
Env variable and full documentation: see USE_ALL_USERS_PROFILE_4D		
Setups folder	folder box	default set_ups
<i>if non blank, the full path name of the folder to use for the 12D Solutions supplied setup files.</i>		
Env variable and full documentation: see SET_UPS_4D		
Library folder	folder box	default library
<i>if non blank, the full path name of the folder to use for the 12D Solutions supplied library files.</i>		
Env variable and full documentation: see LIB_4D		
User folder	folder box	default user
<i>if non blank, the full path name of the folder to use for the User supplied setup files.</i>		
See User and Customer_User .		
Env variable and full documentation: see USER_4D		
User library folder	folder box	default user_lib
<i>if non blank, the full path name of the folder to use for the User supplied library files.</i>		
See User Library .		
Env variable and full documentation: see USER_LIB_4D		
Customer user folder	folder box	no default

if non blank, the full path name of the folder to use for the Customer User supplied setup files.

See [User and Customer User](#).

Env variable and full documentation: see [CUSTOMER_USER_4D](#)

Customer library folder folder box no default

if non blank, the full path name of the folder to use for the Customer supplied library files.

See [Customer Library](#).

Env variable and full documentation: see [CUSTOMER_LIB_4D](#)

Log folder folder box default working folder

*if non blank, the full path name of the folder to use for the **12d Model** log files.*

Env variable and full documentation: see [LOG_DIR_4D](#)

Help folder folder box default help

*If non blank, the full path name of the folder containing the **12d Model** help files.*

Env variable and full documentation: see [HELP_4D](#)

Files and Folders > Files

Fonts file file box default fonts.4d

if non blank, the full path name of the file to use for defining text fonts.

Env variable and full documentation: see [FONTS_4D](#)

Function keys file file box default userkeys.4d

if non blank, the full path name of the file to use for function keys definitions.

Env variable and full documentation: see [FUNCTION_KEYS_4D](#)

Linestyles file file box default linestyl.4d

if non blank, the full path name of the file to use for defining linestyles.

Env variable and full documentation: see [LINESTYLES_4D](#)

Name mappings file file box default names.4d

if non blank, the full path name of the file to use for defining the mapping of string names.

Env variable and full documentation: see [NAME_MAPPINGS_4D](#)

Textstyles file file box default textstyl.4d

if non blank, the full path name of the file to use for defining the text styles and fonts they use.

Env variable and full documentation: see [TEXTSTYLES_4D](#)

Textstyles favourite file file box default textstyle_names.4d

if non blank, the full path name of the file to use for defining the textstyles favourites.

Env variable and full documentation: see [TEXTSTYLE_MAPPINGS_4D](#)

Colours.4d file box default colours.4d

*If non blank, the full path name of the file to use as the **12d Model** colour file.*

Env variable and full documentation: see [COLOURS_4D](#)

Defaults.4d file box default defaults.4d

If non blank, the full path name of the file to use as the **12d Model** defaults file.

Env variable and full documentation: see [DEFAULTS_4D](#)

Digitizers.4d file box default digitizers.4d

If non blank, the full path name of the file to use as the **12d Model** digitizers file.

Environment variable DIGITIZERS_4D

Symbols.4d file box default symbols.4d

If non blank, the full path name of the file to use as the **12d Model** symbols file.

Env variable and full documentation: see [SYMBOLS_4D](#)

Super alignment styles file box default astyles.4d

If non blank, the full path name of the file to use for defining super alignment symbology.

Environment variable SUPER_ALIGNMENT_STYLE_4D

On duplicate toolbar choice box Do nothing, Take First, Take last

This environment variable manages what to do if toolbars with the same name are read from a toolbars.4d file.

Do nothing - accept all toolbars of the same name

Take first - accept only the first instance of the toolbar

Take last - accept only the last instance of the toolbar

Env variable and full documentation: see [TOOLBAR_DUPLICATE_MODE_4D](#)

On duplicate linestyle / symbol Do nothing, Take First, Take last

This environment variable manages what to do if symbols or linestyles with the same name are read from the symbols.4d or linestyle.4d file

Do nothing - accept all instances of symbols / linestyles of the same name

Take first - accept only the first instance of the symbol / linestyle

Take last - accept only the last instance of the symbol / linestyle

Env variable and full documentation: see [LINESTYLE_DUPLICATE_MODE_4D](#)

Files and Folders > File input

Use anonymous functions for file inputs tick box

if tick, when a file is read with a File input option, a function is automatically created and named. This function must exist to allow the data to be added to a view after it is read in, to be able to delete all the data read in at a later time, and to re-run the function to reread the data file and replace the data read in last time.

Env variable and full documentation: see [ALLOW_ANONYMOUS_FUNCTIONS_4D](#)

Add file input data to a view choice box

if anonymous function are set, the data created by the File input option can be added to a view. The choices are:

Do nothing - don't add the data read in to any view

Add to current view - add the data read in to the current view (the current view is the view that highlighted)

Add to new view - automatically create a new view and add the data read in to that view

Add to named view - add the data read in to the view given by `FILE_READ_ADD_TO_VIEW_NAME_4D` (see **Add file input data to view name**).

Env variable and full documentation: see [FILE_READ_ADD_TO_VIEW_4D](#)

Add file input data to view name text box

*name of the view to use if `FILE_READ_ADD_TO_VIEW_4D` is set to **Add to named view**. (see **Add file input data to a view** and **Use anonymous functions for file inputs**).*

If the view does not exist then it is created.

Env variable and full documentation: see [FILE_READ_ADD_TO_VIEW_NAME_4D](#)

Genio wildcard typed input *.mos

*sets the ending of the files selected for the pop-up list for the File field in the **Read Genio Data** panel.*

Env variable and full documentation: see [GENIO_WILDCARD_4D](#)

Files and Folders > File backups

Use backups.4d folder tick box default tick

if tick, backup files are placed in the folder backups.4d. in the project working folder (that is, in the folder containing the .project folder).

Env variable and full documentation: see [USE_BACKUPS_4D_FOLDER_4D](#)

Files and Folders > Usage Logs

Usage log folder folder box

if non blank, log files of the form

<log file folder>\(<dongle> <user> <computer> <time stamp> <process ID>).log)

will be created in the given folder.

Env variable and full documentation: see [USAGE_LOG_4D](#)

Usage logs folder folder box

if non blank, log files of the form

<log file folder>\<dongle>\<user>\<computer>\(<time stamp> <process ID>).log)

will be created in the given folder.

Env variable and full documentation: see [USAGE_LOGS_4D](#)

Projects

Projects > General

Short project names tick box

if ticked, use short extension names (3 characters after the .) for all internal files such as models, tins, projects.

Env variable and full documentation: see [PROJECT_NAMES_4D](#)

Setups file file box default setups.4d

if non blank, the full path name of the file to use for setting up the initial screen layout for new projects.

Env variable and full documentation: see [SETUPS_FILE_4D](#)

Recent projects positive integer box default 20

*if non blank, the maximum number of accessed projects displayed in the Project list when **12d Model** first starts up.*

Env variable and full documentation: see [RECENT_PROJECTS_4D](#)

Projects > Macros

Macro input mode tick box

controls whether or not the value passed down in the variable to receive the answer for any macro prompt, is actually placed into the console panel as the default answer so that it can be accepted by just typing <enter> into the console panel.

If ticked, put the passed down values into the console panel.

Env variable and full documentation: see [MACRO_INPUT_MODE_4D](#)

macros.4d (run on new project) file box default macros.4d

*if non blank, the full path name of the file of macros that is run when **12d Model** creates a **new** project.*

Env variable and full documentation: see [RUN_MACROS_FILE_4D](#)

project_macros.4d (run on every project) file box default project_macros.4d

*If non blank, the full path name of the file of macros that is run when **12d Model** opens an existing project.*

Env variable and full documentation: see [RUN_PROJECT_MACROS_FILE_4D](#)

Projects > Details

Show project details on new project tick box

If ticked, the Edit Project Details panel is displayed when a new project is created.

Env variable and full documentation: see [SHOW_PROJECT_DETAILS_4D](#)

Validate project details on startup tick box default tick

If ticked, the Project Details are validated when a project is opened and the user can not continue until all the details validate. See [Details](#).

Env variable and full documentation: see [ALWAYS_VALIDATE_PROJECT_DETAILS_4D](#)

New project details file file box default

If non blank, the full path name of the file of project details file to use for new projects.

Env variable and full documentation: see [PROJECT_DETAILS_4D](#)

Projects > Reports

Amount of report header choice box no header, minimal header, full header

controls the amount of header information in reports.

Env variable and full documentation: see [REPORT_HEADER_4D](#)

Printer script file box

If non blank, points to a script or program which is fired up whenever a report is generated.

Env variable and full documentation: see [PRINTER_4D](#)

Projects > Sharing

Auto sync tins tick box default off

if ticked, the server projects for any shared tins added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any tins have been modified, they are re-copied to this project.

Env variable and full documentation: see [AUTO_TIN_SYNC_4D](#)

Auto sync models tick box default off

if ticked, the server projects for any shared models added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any models have been modified, they are re-copied to this project.

Env variable and full documentation: see [AUTO_MODEL_SYNC_4D](#)

Interval to check for updates positive integer default 0

if non zero, the number of seconds between checks to see if any of the shared tins or models added to the project have been modified.

Env variable and full documentation: see [SHARE_CHECK_INTERVAL_4D](#)

Share locking folder folder box default inside project

if non blank, the full path name of the folder used to keep lock files for shares.

Env variable and full documentation: see [SHARE_LOCKS_FOLDER_4D](#)

Colour for shared elements in list boxes colour box default blue

if non blank, the colour to use for showing shared tins/models in a list of tins/models. That is, the tins/models that have been added to the project as shared tins/models are shown in this colour. Setting the colour to black will disable this feature.

Env variable and full documentation: see [SHARED_ELEMENT_COLOUR_4D](#)

Colour for sharing elements in list boxes colour boxdefault 255,165,0

if non blank, the colour to use for showing tins/models that are allowed to be shared in a list of tins/models. That is, those tins/models in the project that the user has allowed others to share are shown in this colour. Setting the colour to black will disable this feature.

Env variable and full documentation: see [SHARING_ELEMENT_COLOUR_4D](#)

Sharing map file file box default none

If non blank, the full path name of the map file to be applied to shared models.

Env variable and full documentation: see [SHARE_MAP_FILE_4D](#)

Projects > Trash bin

Use trash bin tick box default tick

if ticked, any deleted models or tins, or cleaned models, are placed in the Trash bin.

Env variable and full documentation: see [USE_TRASH_BIN_4D](#)

Days before auto purge positive integer default 0 (don't purge)

*the number of days before the Trash Bin is automatically purged of tins and models. If 0, the Trash Bin is **not** purged.*

Env variable and full documentation: see [PURGE_TRASH_DAYS_4D](#)

Maximum trash bin size (Mb) positive integer default 0 (don't limit)
*maximum number of Mb that the trash file can be.
If 0, the Trash Bin is **not** limited in size.*

Env variable and full documentation: see [MAXIMUM_TRASH_SIZE_4D](#)

On overflowing trash bin Choice box Auto manage, auto empty default Auto manage
the action to take when the trash bin exceeds the maximum trash bin size.
*If **Auto manage**, the oldest files in the trash bin are deleted until the new item can fit in the trash bin.
if **Auto empty**, files in the trash bin are deleted.*
*Note - if a large model or tin is deleted and it is bigger than the maximum trash bin size, the user is
alerted and asked to decide if they want the element to go in the trash bin anyway, or if they want to
permanently delete it.*

Env variable and full documentation: see [OVERFLOWING_TRASH_MODE_4D](#)

Projects > Workspace

New project workspace file file box default
if non blank, the full path name of the workspace file for new projects.
Env variable and full documentation: see [WORKSPACE_FILE_4D](#)

Always show new toolbars tick box default
*if ticked, when a project starts up, all the toolbars are checked to see if they are listed in the workspace
(visible or invisible) and if the toolbar does not exist, then the toolbar will be displayed. This is to allow
any new toolbars added to toolbars.4d to be automatically displayed so that the user knows that it
exists.*
Env variable and full documentation: see [NEW_TOOLBARS_VISIBLE_4D](#)

Dongles

Dongles > General

Dongle order choice box Hardlock/Wibu, Wibu/Hardlock
*the order to search for network dongles. All new dongles are Wibu so most sites now only have Wibu
dongles.*
Env variable and full documentation: see [DONGLE_ORDER_4D](#)

Time dongle access positive integer
time between searches for a dongle
Env variable and full documentation: see [DEBUG_DONGLE_ACCESS_4D](#)

Nodes file file box default nodes.4d
*if non blank, the full path name of the **12d Model** authorization file.*
Env variable and full documentation: see [AUTHORIZATION_4D](#)

Dongles > Wibu

User wibu dongle tick box
*if **ticked**, search for 12d Wibu dongles*

If **not ticked**, don't search for Wibu dongles

Env variable and full documentation: see [WIBU_4D](#)

Local choice box local, no local

if **local**, then a stand alone Wibu dongle is looked for on the computer hat the user is on.

If **no local**, then no stand alone Wibu dongle is looked for on the computer

Env variable and full documentation: see [WIBU_DONGLE_4D](#)

Network choice box no network, network first, network last

if **no network**, then no Wibu network dongle is looked for:

If **network first**, then a Wibu network dongle is looked for before a single user local dongle.

If **network last**, then a Wibu network dongle is looked for after looking for a single user local dongle.

Env variable and full documentation: see [WIBU_DONGLE_4D](#)

Login retries positive integer

number of retries to find a Wibu dongle

Env variable and full documentation: see [WIBU_DONGLE_4D](#)

Login wait positive integer

time in seconds to wait between Wibu dongle retries

Env variable and full documentation: see [WIBU_DONGLE_4D](#)

Disable dongle tick box

if **ticked**, don't search for a Wibu dongle

if **not ticked**, search for a Wibu dongle

Env variable and full documentation: see [WIBU_DONGLE_4D](#)

Wibu IP/Name addresses

if **non blank**, a list of IP addresses and/or computer names to search for a 12d Wibu network dongle.

The items in the list are separated by commas

If **blank**, search the entire network for a 12d Wibu network dongle

Env variable and full documentation: see [WIBU_IPADDR](#)

Dongles > Hardlock

User hardlock dongle tick box

if **ticked**, search for 12d Hardlock dongles

If **not ticked**, don't search for Hardlock dongles

Env variable and full documentation: see [HARDLOCK_4D](#)

Local choice box local, no local

if **local**, then a stand alone Hardlock dongle is looked for on the computer that the user is on.

If **no local**, then no stand alone Hardlock dongle is looked for on the computer

Env variable and full documentation: see [DONGLE_4D](#)

Network choice box no network, network first, network last

if **no network**, then no Hardlock network dongle is looked for:

If **network first**, then a Hardlock network dongle is looked for before a stand alone local dongle.

If **network last**, then a Hardlock network dongle is looked for after looking for a stand alone local dongle.

Env variable and full documentation: see [DONGLE_4D](#)

Login retries	positive integer	
<i>number of retries to find a Hardlock dongle</i>		
<i>Env variable and full documentation: see DONGLE_4D</i>		
Login wait	positive integer	
<i>time in seconds to wait between Hardlock dongle retries</i>		
<i>Env variable and full documentation: see DONGLE_4D</i>		
Disable dongle	tick box	
<i>if ticked, don't search for a Hardlock dongle</i>		
<i>if not ticked, search for a Hardlock dongle</i>		
<i>Env variable and full documentation: see DONGLE_4D</i>		
Debug dongle	tick box	
<i>if ticked, write out Hardlock dongle debug information</i>		
<i>Env variable and full documentation: see DONGLE_4D</i>		
Hardlock IP/Name addresses		
<i>if non blank, a list of IP addresses and/or computer names to search for a 12d Hardlock network dongle. The items in the list are separated by commas</i>		
<i>If blank, search the entire network for a 12d Hardlock network dongle</i>		
<i>Env variable and full documentation: see HLS_IPADDR</i>		

Elements

Elements > Rasters

Use image server	tick box	
<i>If ticked</i>		
<i>Environment variable</i>	USER_IMAGE_SERVER_4D	
Use ECW server	tick box	
<i>If ticked</i>		
<i>Environment variable</i>	USER_ECW_SERVER_4D	

Elements > Strings

Use new strings create	tick box	
<i>If ticked then the String Creates are for super strings.</i>		
<i>If not ticked, the String Creates are the non-super string creates.</i>		
<i>Environment variable</i>	NEW_STRING_CREATES_4D	
Super strings ?	tick box	default tick
<i>if ticked, super strings are allowed.</i>		
<i>If not ticked super strings are not allowed.</i>		
<i>Environment variable</i>	SUPER_STRINGS_4D	
Only use super string	tick box	default no tick
<i>if ticked, only super strings are created by all options.</i>		
<i>Environment variable</i>	SUPER_STRINGS_4D	
Always user Super Strings advanced mode	tick box	default no tick

if ticked, the super string editor always comes up in the Advanced mode with all options available.

Environment variable SUPER_ADVANCED_MODE_4D

Use speed tables tick box default tick

if ticked, speed tables are enabled.

If not ticked, speed tables are not allowed.

Environment variable SUPER_STRINGS_4D

Alignment VG Corridor fixup tick box default tick

if ticked, alignment corridor calculations introduced in V8 are used.

If not ticked, the V7 alignment corridor calculations are used.

Env variable and full documentation: see [ALIGNMENT_CORRIDOR_FIXUP_4D](#)

Use bisector section tick box default no tick

at a HIP with no curve on it, either two sections can be applied at the HIP point or just a single bisector section applied to the bisector of the change of angle through the HIP.

If ticked, the bisector section is used.

If not ticked, two sections will be created at the HIP.

Env variable and full documentation: see [BISECTORS_4D](#)

Weed Tolerance positive real

Used in Alignment and Super strings so that when arcs have been chord-to-arc'd, the resulting points are weeded so that no point is closer than the weed tolerance. Is also used in Apply and Apply Many so that no cross sections are closer than the weed tolerance.

Env variable and full documentation: see [WEED_TOLERANCE_4D](#)

Polyline draw choice box don't use speed ups
intermediate speed ups
faster speed ups

Different methods that speed up drawing of polylines.

Env variable and full documentation: see [POLYPOLYLINES_4D](#)

Elements > Tins

Tin viewport clip tick box shipped env.4d has this ticked

If ticked then some experimental techniques for speeding up the drawing of tins, fast contours is used.

Env variable and full documentation: see [TIN_VIEWPORT_CLIP_4D](#)

Pre*postfix for model for tin text box default is "tin "

This environment variable is used to customize the default model for the tin in the panels for creating triangulations. Text can be defined for prepending and/or appending to the tin name to create a default model name from the tin name.

*The text for prefixing and postfixing is given in a special form: **pre-text*post-text***

If pretext only, just give the text. If post text is required, precede it by a "".*

If the environment variable is not set, the default "tin " is used.

Env variable and full documentation: see [MODEL_FOR_TIN_PREFIX_4D](#)

Allow exact calculations for super tins tick box

Options using tins are split into two categories:

- (1) options that require sections through tins
- (2) options that require the triangles of the tin

if ticked, this allows super tins to be used in options where triangles are required for calculations.

if not ticked, this prevents super tins to be used in options where triangles are required for calculations.

Note: ticking this option requires super tins to be updated when a tin within the super tin changes, so there is a time, storage, and memory cost. It was found that some projects only ever required options that used sections (not triangles), so for these type of projects, there is an efficiency gain by turning off this option.

Env variable and full documentation: see [ALLOW_SUPER_TINS_EXACT_CALCS_4D](#)

Elements > Selects

Autopan on selects tick box default tick

if ticked, if you have accepted but not accepted a string and are zoomed in on the strings and type **ch** value where the position at that chainage is off the view, the view will autopan so that the new selection point (at chainage value) is on the view. This applies for all typed selects.

Env variable and full documentation: see [AUTO_PAN_SELECT_4D](#)

Auto hide panel on selects tick box default not tick

if ticked, when the string select icon is picked on a panel, the panel minimises until a string is selected and accepted.

Env variable and full documentation: see [AUTO_HIDE_PANEL_SELECTS_4D](#)

Pick only on selects tick box

if ticked,

Env variable and full documentation: see [PICK_ONLY_ON_SELECTS_4D](#)

Display all string at snap tick box

if ticked,

Env variable and full documentation: see

CAD

Fast accept tick box

If ticked, the **Fast Accept** snap (**A** snap) is turned on by default for new projects.

If Fast Accept (**A** snap) is on, when an item is picked and there is one item in the selection list, then the item is automatically accepted without clicking MB.

Env variable and full documentation: see [FAST_ACCEPT_4D](#)

Fast Construction snap tick box

If ticked, the **Fast Construction** snap (**K** snap) is turned on by default for new projects.

Env variable and full documentation: see [FAST_CONSTRUCTION_SNAP_4D](#)

Never snap to self tick box default tick

If ticked, the software tries to stop snapping to itself during editing.

Env variable and full documentation: see [NEVER_SNAP_ITSELF_4D](#)

Construction snaps model

If non blank, the model to use for objects created during construction snaps.

Env variable and full documentation: see [CONSTRUCTION_SNAP_MODEL_4D](#)

Plan height max real value box default 0

set the default value to use in Plan Settings panels that have a Height max (w) field.

Env variable and full documentation: see [HEIGHT_MAX_DEFAULT_4D](#)

Plotting

Plotting > General

Plan plot scale 1: real box default blank

if non blank, the default plot scale to be used on any new plan views.

Note that the scale is used in the plan view for displaying text, linestyles and symbols defined in paper units.

Env variable and full documentation: see [DEFAULT_PLAN_PLOT_SCALE_4D](#)

Show title variables choice box as blank
as \$variable
no substitution

*this is used for debugging the title block file. Default is **as blank**.*

*If **as blank**, any \$variable not used is left as blank.*

*If **as \$variable**, any \$variable not used is shown as \$variable.*

*If **no substitution**, all \$variable are plotted with no substitution.*

Env variable and full documentation: see [SHOW_TITLE_VARIABLES_4D](#)

Symbol file for long and x-sections file box default *plotsymb.4d*

if non blank, the full path name of the plot symbols file.

Env variable and full documentation: see [PLOT_SYMBOLS_4D](#)

Plotter script file box

If non blank, points to a script or program which is fired up whenever a plot is generated.

Env variable and full documentation: see [PLOTTER_4D](#)

User plotters file box default *plotters.4d*

if non blank, the full path name of the file containing the definitions of plotters.

Env variable and full documentation: see [PLOTTERS_4D](#)

Plotter mapping file file box default *pmf.4d*

if non blank, the full path name of the file used as the default plotter mapping file.

Env variable and full documentation: see [PLOTTER_MAPPING_4D](#)

Sheet sizes file file box default *sheets.4d*

if non blank, the full path name of the file defining the plot sheet sizes.

Env variable and full documentation: see [SHEET_SIZES_4D](#)

DGN plot seed file file box

if non blank, the full path name of the file to use as a seed file for Microstation plots.

Env variable and full documentation: see [DGN_PLOT_SEED_FILE_4D](#)

DWT plot template file file box

if non blank, the full path name of the file to use as a template file for AutoCAD plots.

Env variable and full documentation: see [DWG_PLOT_SEED_FILE_4D](#)

Acad plot unit choice box English, Metric

Env variable and full documentation: see [DWG_PLOT_UNIT_FILE_4D](#)

Use title blocks in 12a format tick box default tick

if ticked, the title block file is in 12d Ascii format.

If not ticked, the title block is in the pre V7 title block .tf format

Env variable and full documentation: see [V7_TITLE_BLOCKS_4D](#)

Use hardware arcs tick box default tick

if ticked, use computer hardware to draw arcs (rather than software).

If not ticked, draw arcs in software

Env variable and full documentation: see [HARDWARE_ARCS_4D](#)

Write all plot parameters tick box default tick

Only used in old Plot options using (ascii) ppf files which have been superseded by binary ppf files. The panels have a Plot parameters write field to write out an ascii ppf for the plot.

If ticked, when writing out an (ascii) ppf files, write out all plot parameters.

If not ticked, only write out those plot parameters that have been used in the ppf file.

Env variable and full documentation: see [WRITE_ALL_PLOT_PARAMETERS_4D](#)

Show old plotting options tick box default tick

*If ticked, then a menu **Plot =>Old plotting** is included which has all the old Ascii ppf options.*

Env variable and full documentation: see [ALLOW_OLD_PLOTTING_4D](#)

Offset chainages to output window tick box default not tick

If tick,

Environment variable SPECIAL_OFFSET_CHAINAGES_4D

Plotting > Parameter files > Binary

Binary drainage plan parameter file file box default none

*if non blank, the full path name of the file used as the default binary plot parameter file (.drainplanppf) for the plan annotation produced by the panel **Drainage Plan Plot PPF Editor**.*

Env variable and full documentation: see [NEW_DRAINAGE_PLAN_PPF_4D](#)

Binary Melbourne Water parameter file file box default none

*if non blank, the full path name of the file used as the default binary plot parameter file (.melbppf) for the long section plot produced by the panel **Sewer Plot Melbourne Water PPF Editor**.*

Env variable and full documentation: see [NEW_DRAINAGE_MELB_PPF_4D](#)

Binary drainage parameter file file box default none

*if non blank, the full path name of the file used as the default binary plot parameter file (.drainppf) for the long section plot produced by the panel **Drainage Plot PPF Editor**.*

Env variable and full documentation: see [NEW_DRAINAGE_PPF_4D](#)

Binary pipeline parameter file file box default none

if non blank, the full path name of the file used as the default binary plot parameter file (.pipelineppf)

Env variable and full documentation: see [NEW_PIPELINE_PPF_4D](#)

*if non blank, the full path name of the file used as the default binary plot parameter file (.plotframeppf) for the long section plot produced by the panel **Section Long Plot PPF Editor**.*

if non blank, the full path name of the file used as the default binary plot parameter file (.lplotppf) for the plan plot produced by the panel **Plot Frame PPF Editor**.

*if non blank, the full path name of the file used as the default binary plot parameter file (.xplotppf) for the cross section plot produced by the panel **Section X Plot PPF Editor**.*

if non blank, the full path name of the file used as the default ascii plot parameter file (.ppf) for the cross section plot produced by the panel **Cross Section Plot**.

if non blank, the full path name of the file used as the default ascii plot parameter file (.ppf) for the long section plot produced by the panel **Long Section Plot**.

*if non blank, the full path name of the file used as the default ascii plot parameter file (.ppf) for the drainage long section plot produced by the panel **New Plot Drainage Network**.*

if non blank, the full path name of the file used as the default ascii plot parameter file (.ppf) for the Melbourne Water long section plot produced by the panel **Melbourne Water Sewer Plot**.

If ticked, use Windows printers

Env variable and full documentation: see [WINDOWS_PRINTERS_4D](#)

Update document properties before printing tick box

If ticked,

Environment variable WINDOWS_PRINTER_SET_DOCUMENT_PROPERTIES_4D

Windows 2000/XP print dialog tick box

If ticked, PrintDlgEX.

If not ticked, PrintDlg

Env variable and full documentation: see [WINDOWS_PRINT_MODE_4D](#)

Use exclusive access to printer tick box

If ticked, force direct printing to the printer (the user may need Printer admin access).

Env variable and full documentation: see [WINDOWS_PRINT_MODE_4D](#)

Use intermediate print file tick box

If ticked, print to a file first and then submit the file to the printer.

Env variable and full documentation: see [WINDOWS_PRINT_MODE_4D](#)

Raster resolutions dots/inch real value box default 150.0

number of dots per inch to use for plotting rasters

Env variable and full documentation: see [DEFAULT_RASTER_DPI_4D](#)

Maximum time for Pdf995 (seconds) positive integer

the number of seconds to wait for PDF995 to finish producing the current PDF file.

Env variable and full documentation: see [PDF995_TIME_LIMIT_4D](#)

Windows printer resolution dots/mm choice box Windows 95/98/Me
Windows 2000/XP

For Windows 95, 98 and ME, the printer resolution can only be 0.04 mm when covering an A0 sheet.

Under Windows NT, 2000 and XP, no such restriction exists and the full resolution of 0.01 mm can be used so the environment variable HIMETRIC_4D allows access to the higher resolution for Windows NT, 2000 and XP.

Env variable and full documentation: see [HIMETRIC_4D](#)

Survey

Ignore extra tabs in field files tick box

If ticked, trailing tabs are not considered words in a field file. Mainly for Leica when writing a format file which can't suppress trailing tabs when writing a 12d Field file.

Env variable and full documentation: see [FLD_IGNORE_EXTERA_WORDS_4D](#)

Display commands in SDR Editor as per V8 tick box

If ticked,

Environment variable SDR_DISPLAY_V8_FORMAT_4D

Allow named point attributes tick box

If ticked,

Environment variable ALLOW_NAMED_POINT_ATTRIBUTES_4D

Data collectors file file box default survey.4d

if non blank, the full path name of the file of definitions of available data collectors.

Env variable and full documentation: see [DATA_COLLECTORS_4D](#)

Data collectors choice box data collectors in survey.4d

the data collector that is used if no data collector has been set for a project, and the default data collector that is used in the Survey Data Setup panel.

Env variable and full documentation: see [DATA_COLLECTOR_4D](#)

Station prefix text box

the Station prefix to user if no Station prefix has been set for a project, and the default Station prefix that is used in the Survey Data Setup panel.

Env variable and full documentation: see [STATION_PREFIX_4D](#)

DMS entry, treat 0.123 as 12 minutes 03 seconds tick box

if ticked, the special case of 0.mms is interpreted as mm minutes and s seconds. That is, 0.123 is interpreted as 12 minutes and 3 seconds.

If not ticked, the special case of 0.mms is interpreted as mm minutes and 10 x s seconds. That is, 0.123 is interpreted as 12 minutes and 30 seconds.

Env variable and full documentation: see [INTERPRET_DMS_INPUT_OLD_4D](#)

Drainage

Drainage flows direction same as string direction tick box

If ticked, the drainage flow direction is the same as the string direction.

If not ticked, the drainage flow direction is in the opposite direction to the string direction.

Env variable and full documentation: see [DRAINAGE_FLOW_DIR_4D](#)

Show old grading edit options tick box

If ticked, the grading options used before V8 are still in the Drainage editor.

Environment variable DRAINAGE_EDIT_GRADE_4D

Show full hydraulic report details tick box default not ticked

The rational hydraulic report contains hydrology data.

If ticked, the hydrology calculations for each catchment set (1 to 3) are written to the hydraulic report.

Env variable and full documentation: see [FULL_HYDRAULIC_REPORT_4D](#)

Label 150 and PVC pipes tick box default ticked

If ticked, the 150 PVC pipes are labelled on the drainage long section.

If not ticked, the 150 PVC pipes are not labelled on the drainage long section.

Env variable and full documentation: see [LABEL_PVC_150_PIPES_4D](#)

Drainage.4d file box default drainage.4d

*If non blank, the full path name of the file to use as the filed of **12d Model** drainage definitions.*

Env variable and full documentation: see [DRAINAGE_4D](#)

Views

Views > General

Prompt on close tick box

If ticked, when a view is closed/deleted, a prompt will ask for a confirmation of deleting/closing.

Env variable and full documentation: see [PROMPT_ON_VIEW_CLOSE_4D](#)

Default pan mode tick box default tick

If ticked, standard pan is used for pan/pans on view.
If not ticked, pane delta is used for pan/pans on view.

Env variable and full documentation: see [PAN_MODE_4D](#)

Zoom origin dynamic tick box default not tick

Controls the origin of the dynamic zoom.

If ticked, then the point selected in the view to indicate which view to dynamically zoom (and to be the zoom-in, zoom-out definition point) becomes the point to dynamically zoom about.

Whilst the dynamic zoom is running, another point can be selected to become the new zoom origin.

Env variable and full documentation: see [ZOOM_ORIGIN_DYNAMIC_4D](#)

Zoom pan dynamic tick box default not tick

*If tick then **dynamic pan** is the default for the pan options.*

Env variable and full documentation: see [ZOOM_PAN_DYNAMIC_4D](#)

Icons on views tick box default tick

If ticked then icons instead of text are used for menu items on the views.
If not ticked, text is used for menu items on the views.

Env variable and full documentation: see [VIEW_BITMAP_BUTTONS_4D](#)

Show views buttons tick box default tick

If ticked then menu items (view buttons) are displayed on the views (as icons or text).
If not ticked, menu items (view buttons) on not displayed on the views.

*Note: displaying view buttons as icons or text is controlled by **Icons on views**.*

Env variable and full documentation: see [VIEW_BUTTONS_4D](#)

Data tool tips tick box default tick

*If ticked then data tips can be displayed when the cursor moves over vertices in a plan view. The **D** snap is then operational and toggles the data tips on and off in a 12d session.*
*If not ticked, data tips will not be displayed and **D** snap has no effect.*

Env variable and full documentation: see [DATA_TIPS_4D](#)

Default view colour colour box default black

The default background colour for views. After a view is created, its background colour can then be modified and the new colour is saved for that view.

Env variable and full documentation: see [DEFAULT_VIEW_COLOUR_4D](#)

Preview view name text box default blank

if non blank, the name of the view whose image is dumped on exiting the project. The image is used as the project preview.
If blank then the last active view is used.

Env variable and full documentation: see [PREVIEW_VIEW_4D](#)

Views > OpenGL

View backing store choice box off, on

*if **on**, a backing store is used.*

*if **off**, a backing store is not used.*

For Window Vista/Windows 7, the default is on. Otherwise the default is 0.

Env variable and full documentation: see [OPENGL_VIEW_BACKING_STORE_4D](#)

Use offset tick box default tick

If ticked, the coordinates are localised for OpenGL calls. This is to work around problems with some graphics cards that can't handle large coordinates.

Env variable and full documentation: see [OPENGL_OFFSET_4D](#)

Cache tins tick box default not ticked

If ticked, tins are cached in the graphics card memory for potential speed ups. More memory in the graphics card allows more caching and usually more performance gains.

Env variable and full documentation: see [OPENGL_CACHE_TINS_4D](#)

Cache rasters and textures tick box default ticked

If ticked, rasters and textures are cached in the graphics card memory for potential speed ups. More memory in the graphics card allows more caching and usually more performance gains.

Env variable and full documentation: see [OPENGL_CACHE_4D](#)

Use mipmaps for rasters tick box default tick

If ticked, the graphics card down samples for rasters when the image is further away.

Env variable and full documentation: see [OPENGL_MIPMAP_4D](#)

Use mipmaps for billboards tick box

If ticked, the graphics card down samples for billboards when the image is further away.

Env variable and full documentation: see [OPENGL_MIPMAP_BILLBOARDS_4D](#)

Use mipmaps for plan images tick box default ticked

If ticked, the graphics card down samples plan images when draped onto a tin.

Env variable and full documentation: see [OPENGL_MIPMAP_PLAN_IMAGES_4D](#)

Use mipmaps for projector images tick box default ticked

If ticked, the graphics card down samples projector images (a projector is for the "hidden" perspective image data object of a super string).

Env variable and full documentation: see [OPENGL_MIPMAP_PROJECTOR_IMAGES_4D](#)

GUI

GUI > General

Width of edit fields (number of characters) text box default 10

if non blank, the number of characters to make the width of an Edit Box on a panel.

Env variable and full documentation: see [EDIT_BOX_WIDTH_IN_CHARACTERS_4D](#)

Show help buttons tick box

If ticked, Help buttons are added to panels.

Env variable and full documentation: see [HELP_BUTTONS_4D](#)

Use lists for popups tick box

If ticked, the popup lists are scrolling lists.

If not ticked, the popups turn into walk-right menus when too long.

Env variable and full documentation: see [LIST_POPUPS_4D](#)

Use trees for linestyles and symbols tick box default tick

If ticked, the linestyle and symbol pop-up lists are in scrolling boxes so they don't run over the bottom of the screen. The list of linestyles/symbols is displayed in a tree structure with the Groups as the nodes of the tree.

If not ticked, the linestyle and symbols lists are one long list with each Group being an item on the list. The list may get too long to fit on the screen.

Env variable and full documentation: see [USE_NEW_LINESTYLE_LIST_BOX_4D](#)

Warp cursor hide tick box default not tick

Controls whether the cursor is hidden before moving - only needed on some computers.

If ticked, don't hide the cursor before moving it.

If not ticked, hides the cursor before moving it.

Env variable and full documentation: see [WARP_CURSOR_HIDE_4D](#)

Multi-line text edits tick box default not ticked

If ticked, a Text Edit Box is used instead of the Input Box and more than one line of text can be typed.

Env variable and full documentation: see [MULTI_LINE_TEXT_4D](#)

Colour widgets with errors tick box default ticked

*If ticked, when a panel field fails to validate, the panel field is filled with the colour given in the **Colour for failed widgets**.*

Env variable and full documentation: see [USE_VALIDATION_COLOURS_4D](#)

Colour for failed widgets colour box

If non blank, the colour to fill the panel field with when there is a validation error for the field. The value is either a colour name, a colour number or RGB(x,y,z).

*This is only used if **Colour widgets with errors** is ticked (or at least not ticked since the default is ticked).*

If blank, the default colour is RGB(255,72,72),

Env variable and full documentation: see [VALIDATION_FAIL_COLOUR_4D](#)

Xtra menu file file box default xtramenu.4d

if non blank, the full path name of the 12d Solutions supplied file of definitions for some extra menus.

Env variable and full documentation: see [EXTRA_OPTIONS_4D](#)

User options file file box default usermenu.4d

if non blank, the full path name of the user supplied file of definitions for user defined menus.

Env variable and full documentation: see [USER_OPTIONS_4D](#)

Toolbars file file box default toolbars.4d

if non blank, the full path name of the toolbar definitions and names.

Env variable and full documentation: see [TOOLBARS_4D](#)

Delete walkrights distance positive integer default 32

The distance in pixels that is used to collapse the cascade of walk-right menus when the cursor moves that distance past the end of the last walk-right menu.

rag reset distance	positive integer	default 50
---------------------------	------------------	------------

Env variable and full documentation: see [AUTO RESET SELECT DRAG TOLERANCE 4D](#)

The distance in pixels to move the cursor to reset the picking rejection list for a non-directional pick. If blank then the value 5 is used.

Default table width	positive integer	default 5
----------------------------	------------------	-----------

Env variable and full documentation: see [DEFAULT TABLE WIDTH 4D](#)

*if non blank, the pixel width of the linestyle and symbol scrolling pop-ups.
If blank, the default is 256.*

Linestyle/symbol box height number box

*if non blank, the pixel height of the linestyle and symbol scrolling pop-ups.
If blank, the default is 512.*

Env variable and full documentation: see [LINESIZE BOX HEIGHT 4D](#)

On screen keyboard mode	choice box	<i>No keyboard</i> <i>Dockable keyboard</i> <i>Full screen keyboard</i>
--------------------------------	------------	-------------------------------------------------------------------------------

*if **No keyboard**, then no onscreen keyboard comes up when you double click in a panel field.*

if **Dockable keyboard**, when you double click in a panel field that takes typed input, then a dockable onscreen keyboard come up for the user to type the data for the panel field into.

*if **Full screen keyboard**, when you double click in a panel field that takes typed input, then a full screen onscreen keyboard come up for the user to type the data for the panel field into.*

Env variable and full documentation: see [ONSCREEN KEYBOARD 4D](#)

On screen keyboard layout	choice box	Full keyboard Numeric keyboard
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>
	<input type="radio"/>	<input type="radio"/>

if **Full keyboard**, then when there is an onscreen keyboard, it comes up with a full keyboard.

*if **Numeric keyboard**, then when there is an onscreen keyboard, it comes up with just a numeric keyboard.*

Env variable and full documentation: see [ONSCREEN KEYBOARD LAYOUT 4D](#)

if non blank, the pixel size of the font for the onscreen keyboard.

If blank, it defaults to the normal system font size.

Env variable and full documentation: see [ONSCREEN KEYBOARD FONT SIZE 4D](#)

GUI > Special characters

Large diameter symbol	<i>integer (base 10)</i>	default 216
<i>The integer (base 10) value of the character to use as the large diameter symbol.</i>		
<i>Env variable and full documentation: see DIAMETER_LARGE_CHARACTER_4D</i>		
Cubed symbol	<i>integer (base 10)</i>	default 179
<i>The integer (base 10) value of the character to use as the cubed symbol.</i>		
<i>Env variable and full documentation: see CUBED_CHARACTER_4D</i>		
Small diameter symbol	<i>integer (base 10)</i>	default 248
<i>The integer (base 10) value of the character to use as the small diameter symbol.</i>		
<i>Env variable and full documentation: see DIAMETER_SMALL_CHARACTER_4D</i>		
Middle dot	<i>integer (base 10)</i>	default 183
<i>The integer (base 10) value of the character to use as the middle dot symbol.</i>		
<i>Env variable and full documentation: see MIDDLE_DOT_CHARACTER_4D</i>		
Squared symbol	<i>integer (base 10)</i>	default 178
<i>The integer (base 10) value of the character to use as the squared symbol.</i>		
<i>Env variable and full documentation: see SQUARED_CHARACTER_4D</i>		
Degrees character	<i>integer (base 10)</i>	default 176
<i>The integer (base 10) value of the character to use as the degrees character.</i>		
<i>Env variable and full documentation: see DEGREES_CHARACTER_4D</i>		

GUI > MTF Editor

GUI > MTF Editor> General

Default MTF editor width	<i>number box</i>	default 750
<i>the value is the width in pixels of the MTF Left/Right Template Modifiers.</i>

GUI > MTF Editor> Fixed/Snipped/Decision Colours

Fixed colour colour box default blue

the colour of the text in the Type column for the Fixed commands in the MTF Left/Right Template Modifiers panel.

Env variable and full documentation: see [FIXED_ZONE_COLOUR_4D](#)

Fixed width colour colour box default light blue

the colour of the text in the Type column for the Fixed commands involving width, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FIXED_WIDTH_ZONE_COLOUR_4D](#)

Fixed height colour colour box default dark blue

the colour of the text in the Type column for the Fixed commands involving height, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FIXED_HEIGHT_ZONE_COLOUR_4D](#)

Fixed xfall colour colour box default dark blue

the colour of the text in the Type column for the Fixed commands involving xfall, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FIXED_XFALL_ZONE_COLOUR_4D](#)

Snippet colour colour box default RGB(155, 140, 150)

the colour of the text in the Type column for the Snippet command in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [SNIPPET_ZONE_COLOUR_4D](#)

Decision colour colour box default purple

the colour of the text in the Type column for the Decision commands in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [DECISION_ZONE_COLOUR_4D](#)

GUI > MTF Editor> Cut/Fill Colours

Cut colour colour box default red

the colour of the text in the Type column for the Cut commands (other than those involving width, height or slope) in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [CUT_ZONE_COLOUR_4D](#)

Cut width colour colour box default light red

the colour of the text in the Type column for the Cut commands involving width, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [CUT_WIDTH_ZONE_COLOUR_4D](#)

Cut height colour colour box default dark red

the colour of the text in the Type column for the Cut commands involving height, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [CUT_HEIGHT_ZONE_COLOUR_4D](#)

Cut slope colour colour box default dark red

the colour of the text in the Type column for the Cut commands involving slope, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [CUT_SLOPE_ZONE_COLOUR_4D](#)

Fill colour colour box default green

the colour of the text in the Type column for the Fill commands (other than those involving width, height or slope) in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FILL_ZONE_COLOUR_4D](#)

Fill width colour colour box default light green

the colour of the text in the Type column for the Fill commands involving width, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FILL_WIDTH_ZONE_COLOUR_4D](#)

Fill height colour colour box default dark green

the colour of the text in the Type column for the Fill commands involving height, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FILL_HEIGHT_ZONE_COLOUR_4D](#)

Fill slope colour colour box default dark green

the colour of the text in the Type column for the Fill commands involving slope, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FILL_SLOPE_ZONE_COLOUR_4D](#)

GUI > MTF Editor> Final Colours

Final colour colour box default light brown RGB(147, 87, 28)

the colour of the text in the Type column for the Final commands (other than those involving width or slope) in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FINAL_ZONE_COLOUR_4D](#)

Final width colour colour box default dark brown

the colour of the text in the Type column for the Final commands involving width, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FINAL_WIDTH_ZONE_COLOUR_4D](#)

Final cut colour colour box default light brown

the colour of the text in the Type column for the Final command for Final Cut slope, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FINAL_CUT_SLOPE_ZONE_COLOUR_4D](#)

Final fill colour colour box default light brown

the colour of the text in the Type column for the Final command for Final Fill slope, in the Modifiers section of the Left/Right Template Modifiers panel.

Env variable and full documentation: see [FINAL_FILL_SLOPE_ZONE_COLOUR_4D](#)

Final no cut colour colour box default light brown

the colour of the text in the Type column for the Final command for No Cut slope, in the Modifiers

section of the Left/Right Template Modifiers panel.

Winter data folder folder box

if non blank, the full path name of the Folder containing the Winter data of N-values for Australia.

Env variable and full documentation: see [WINTER_DATA_4D](#)

Winter faster interpretation tick box default tick

if tick, re-reading the Winter data is avoided and this speeds up the calculation for the Winter interpolations.

Env variable and full documentation: see [WINTER_USE_NEW_METHOD_4D](#)

Variables

the Variables grid allows for the entry of 12d environment variables that have not been especially included in the Edit Environment Variables panel.

Variable **Value**

*The variable tab consists of a table for specifying environment variable names (**Variable**) and setting their values (**Value**).*

*This is mainly used for setting environment variables that are not already in the **Edit Environment Variables** panel.*

Env Configuration

Position of menu: Project =>Management =>Env configuration

The default **12d Model** system uses the 12d Solutions supplied **set_ups** and **library** folders in **Program files\12d\12d Model\10.0** and the user supplied folders **user** and **user_lib** in **c:\12d\10.00**.

There are **12d Model** environment variables in **env.4d** that can modify the location of each of these folders and most set up files, dongle to be used and the workspace file for new projects.

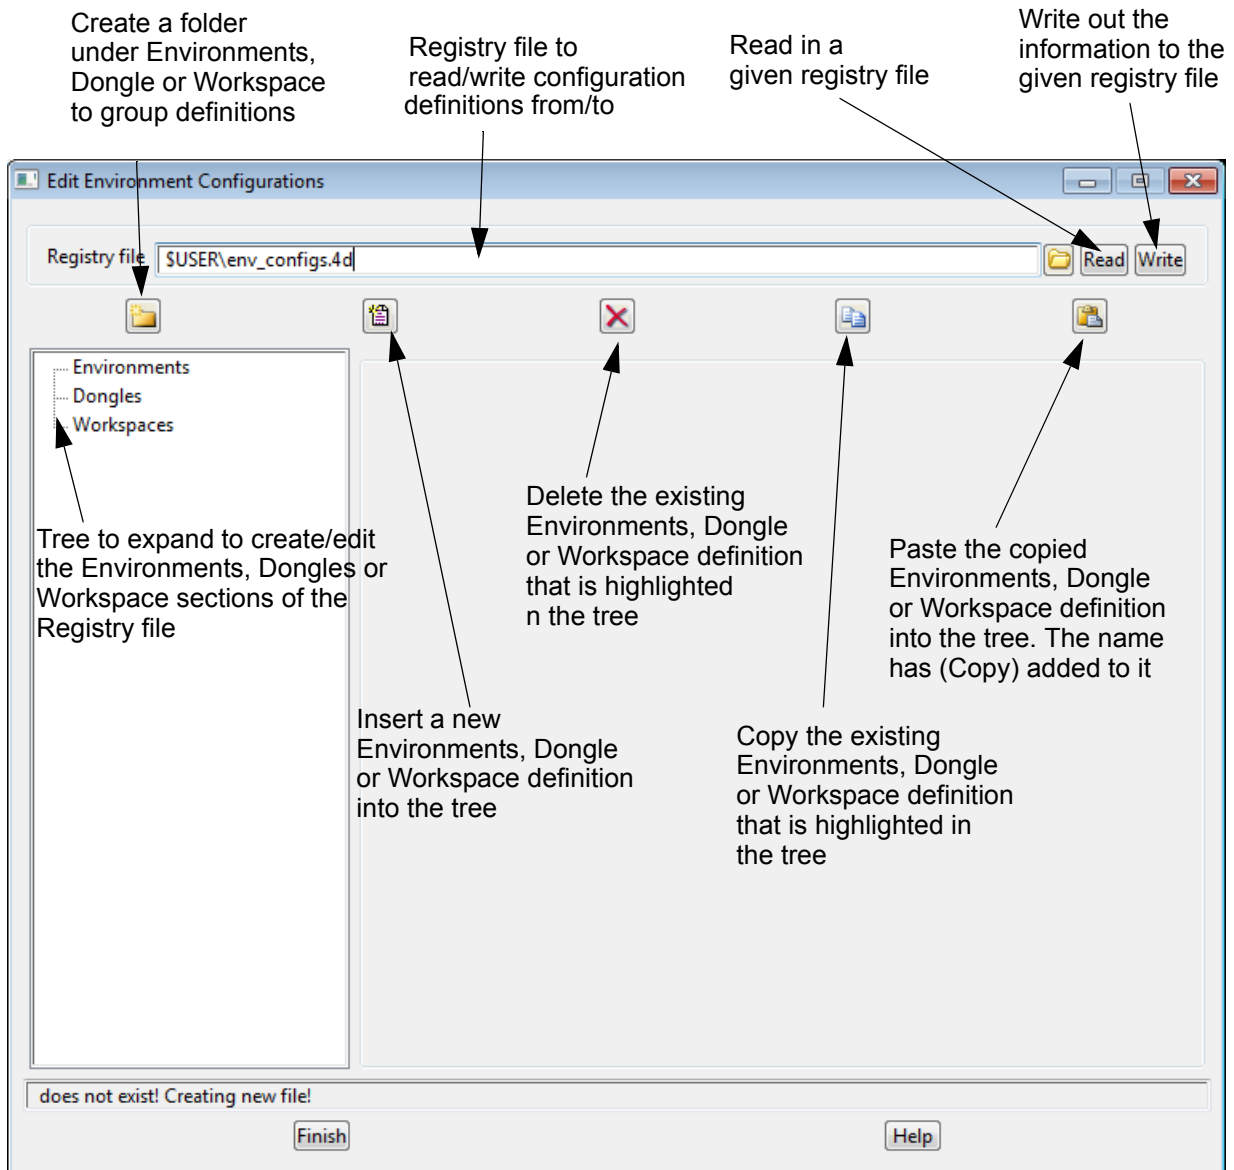

For most users this provides enough customisation however for users requiring totally different **user** and **user_lib** folders for different clients will find the above system too restricting.

For example, one project may be for a Main Roads Department which requires its own mapping files, linestyle files, ppf files etc. Another project is for a Local Authority who has totally different requirements.

Environment Configurations can

- (a) define the environment variable file **end.4d** to be used. Hence if different **env.4d** files have been set up for different clients, the environment configuration file quickly sets up that binding for a project.
- (b) define environment variables that over writes the values set up in the **env.4d** file being used for the project. Often a whole new env file is not required but just the replacement of some of the environment variables. For example, just override the location of the folders **user** and **user_lib** from those in the **env.4d** file being used.
- (c) define the computer with the network dongle to be used with the project. If used, this will override any settings in the env.4d file and values in Environments.
- (d) define the workspace file to be used for new projects. If used, this will override any settings in the env.4d file or values in *Environments*.

Selecting **Env configuration** displays the **Edit Environment Configuration** panel which defines the different Environment configurations, Dongle and Workspace settings.

**Buttons at Bottom**

grid

Write

button

*write out a Registry file***Read**

button

read in the registry file given in the Registry file field.

Each of the sections Environments, Dongles and Workspaces will now be described in greater detail.

Workspaces

[Creating/Editing a Registry File](#)

[Creating/Editing an Environments Set Up](#)

[Creating/Editing a Dongles Set Up](#)

[Creating/Editing a Workspaces Set Up](#)

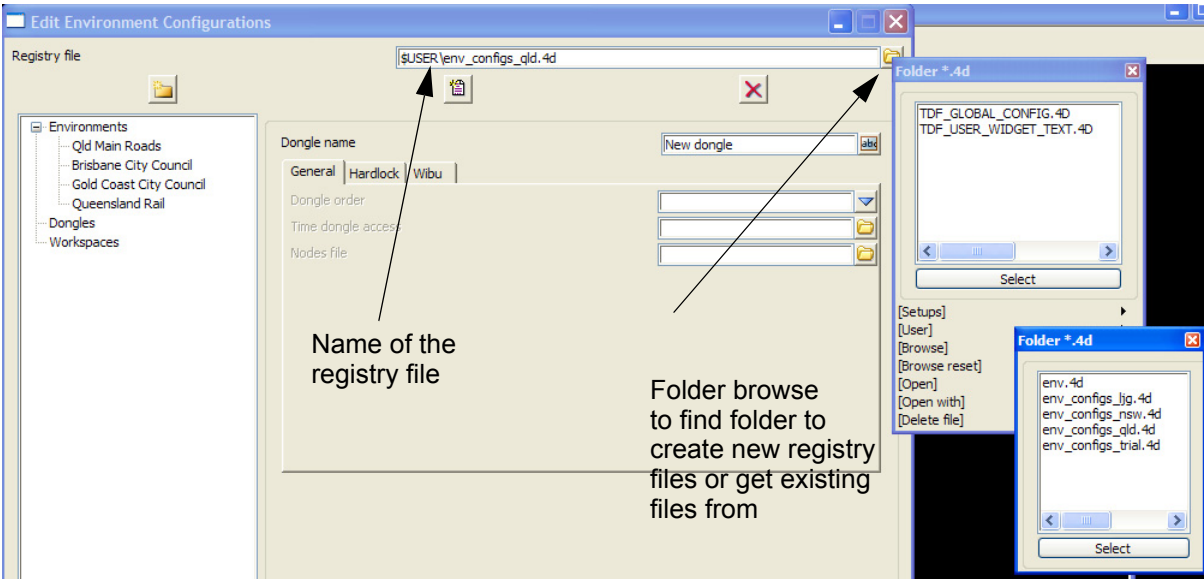

How To Use the Edit Environment Configurations Panel

Creating/Editing a Registry File

When the **Edit Environment Configurations** panel is opened, if no **env_configs.4d** file exists in the **User** folder for that project, a new blank **env_configs.4d** file is automatically created.

To create a **Registry file** of a different name, navigate to the folder to write the registry file to, type the registry file name into the **Registry file box** and hit <enter>. All the created information will be written away to this file when the **Write** icon is clicked on the **Edit Environment Configurations** panel.

The edit and modify a **new Registry file**, type in the path name or use the navigator on the **Registry file box** and select the required registry file. Clicking on the **Read** icon reads in the information from the selected registry file.

Each of the sections **Environments**, **Dongles** and **Workspaces** will now be described in greater detail.

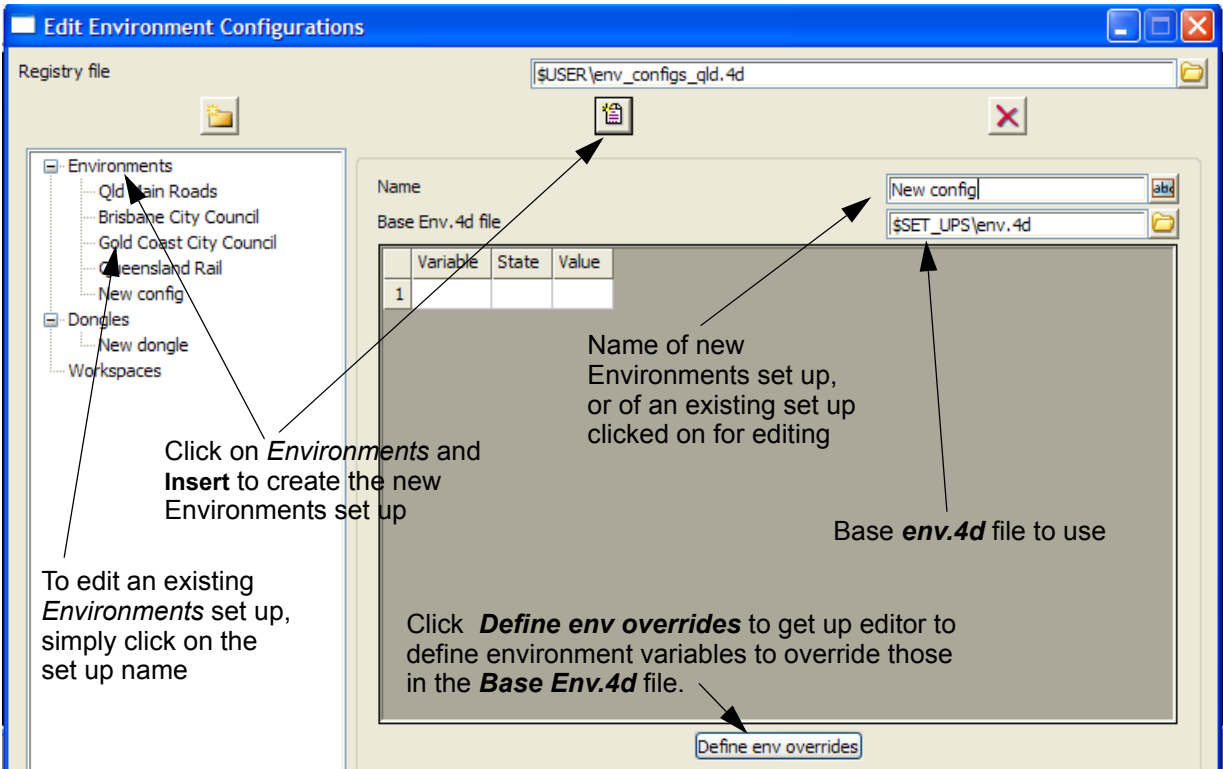

For the section *Environments*, go to [Creating/Editing an Environments Set Up](#)
Dongles [Creating/Editing a Dongles Set Up](#)
Workspaces [Creating/Editing a Workspaces Set Up](#)

Creating/Editing an Environments Set Up

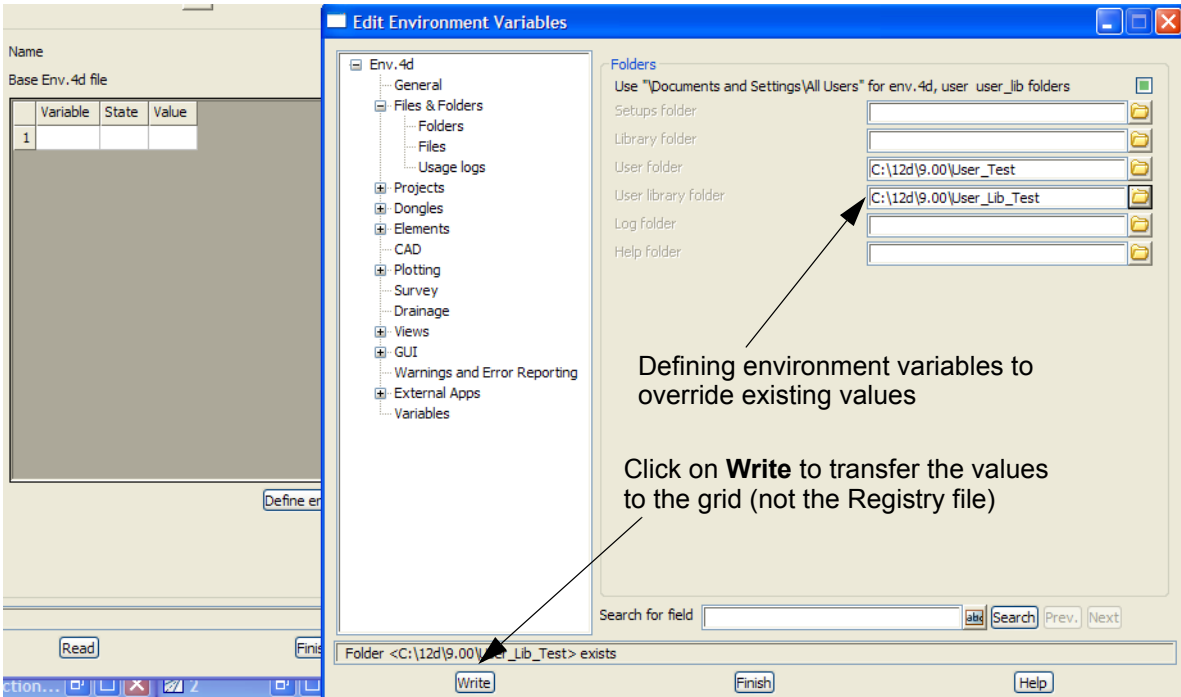

To create a new **Environments** set up, click on the **Environments** node and then on the **Insert** button.

To edit an existing **Environments** set up, simply click on the **name** of the set ups to be edited in the **Environments** section

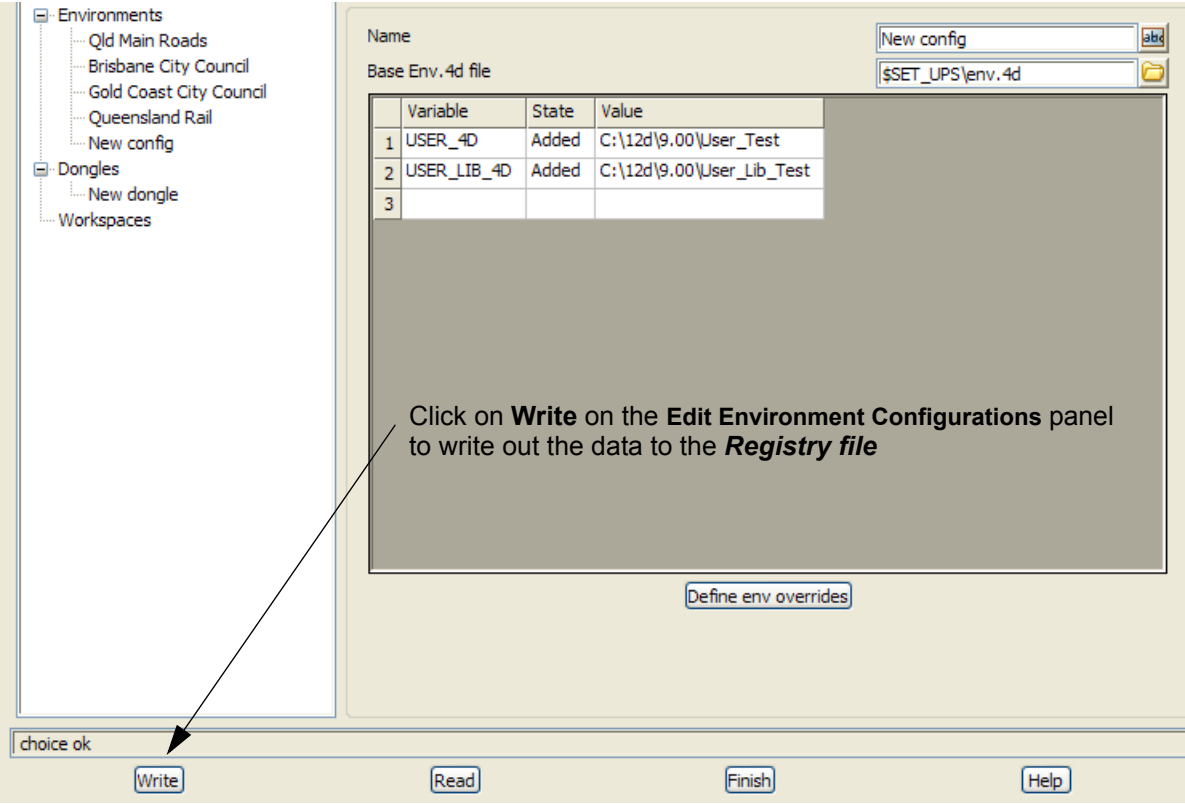

If the **Base Env.4d file** field is **blank**, then the default **env.4d** file is used for the project.
If the **Base Env.4d file** field is not blank, then it gives the (path) name of the file to use as the **env.4d** file.

Any environment variable can be overridden by typing its name and value into the grid, or by bringing up an environment variable editor by clicking on **Define env overrides** button and fill in the required values in the **Edit Environment Variables** panel that is brought up.

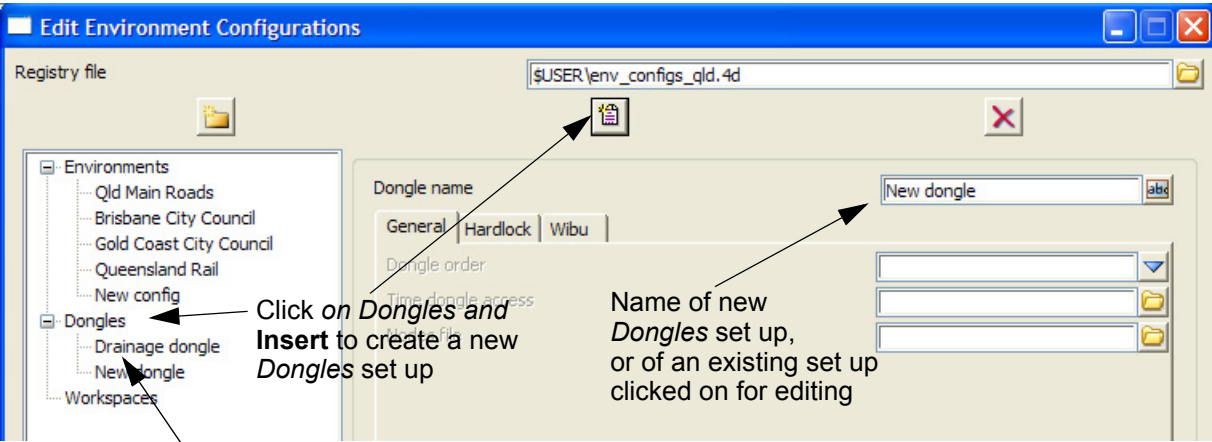

Clicking on **Write** in the **Edit Environment Configuration** panel writes out all the data for the sections *Environments*, *Dongles* and *Workspaces*, to the registry file.

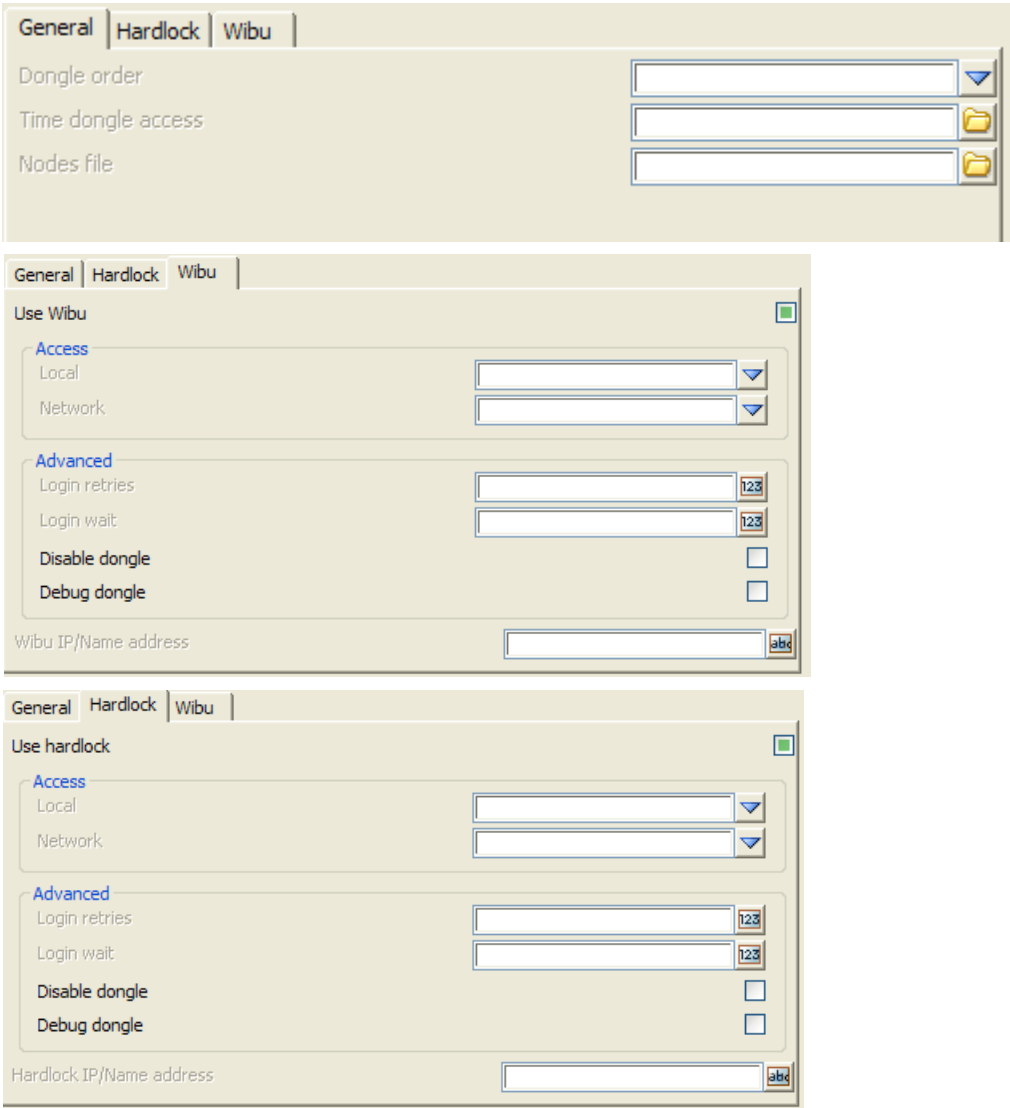

Creating/Editing a Dongles Set Up

To create a new **Dongle** set up, click on the *Dongles* node and then on the **Insert** button.
To edit an existing **Dongle** set up, simply click on the name of the **Dongle** set up to be edited.

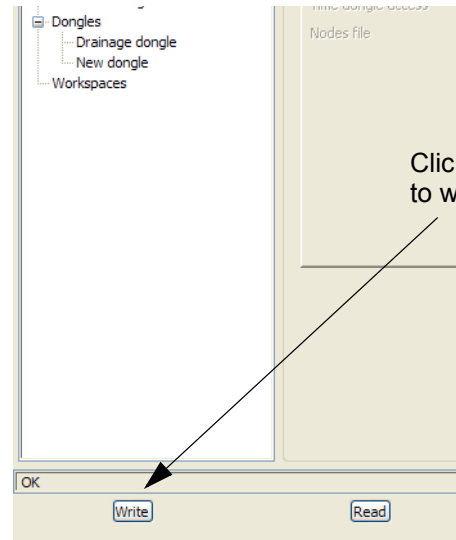

To edit an existing *Dongles* set up, simply click on the set up **name**

Any environment variable values defined in the *General*, *Hardlock* and *Wibu* tabs will override those in the environment file.

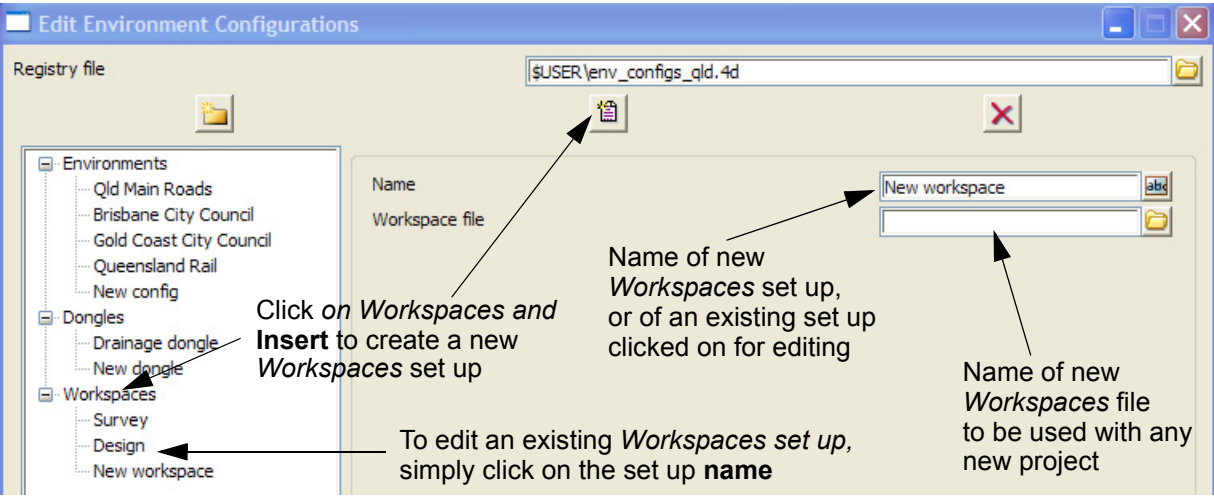

Clicking on **Write** in the **Edit Environment Configuration** panel writes out all the data for the sections *Environments*, *Dongles* and *Workspaces*, to the registry file.

Click on **Write** on the **Edit Environment Configurations** panel to write out the data to the **Registry file**

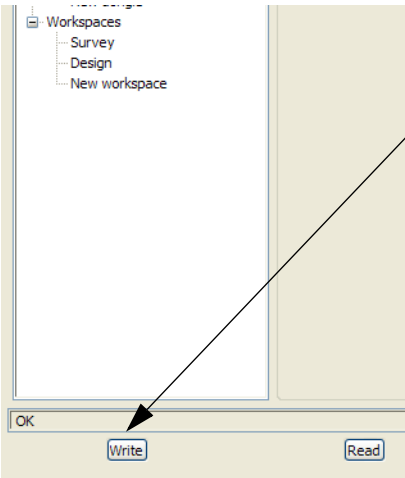

Creating/Editing a Workspaces Set Up

To create a new **Workspaces** set up, click on the *Workspaces* node and then on the **Insert** button.
To edit an existing **Workspaces** set up, simply click on the name of the **workspaces** set up to be edited.

The full path name of the *Workspaces* file to be used when creating new projects is recorded in the **Workspace file** panel field.

Clicking on **Write** in the **Edit Environment Configuration** panel writes out all the data for the sections *Environments*, *Dongles* and *Workspaces*, to the registry file.

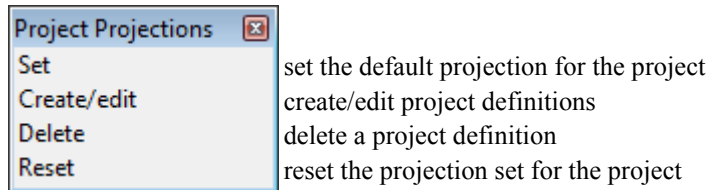

Click on **Write** on the **Edit Environment Configurations** panel to write out the data to the **Registry file**

Projections

Position of option on menu: Project =>Management =>Projections

User defined Projections can be defined using the Create/edit option. A user defined projection can then be set for the project (the project projection). Values from the project projection (e.g. scale factor) are used in various options.

The **Project projections** walk-right menu contains various projection items.

For the option *Set*, go to the section

Create/edit

Delete

Reset

[Set Projection.](#)

[Create/Edit Projection.](#)

[Delete Projection.](#)

[Reset Projection.](#)

The options in the menu will now be described.

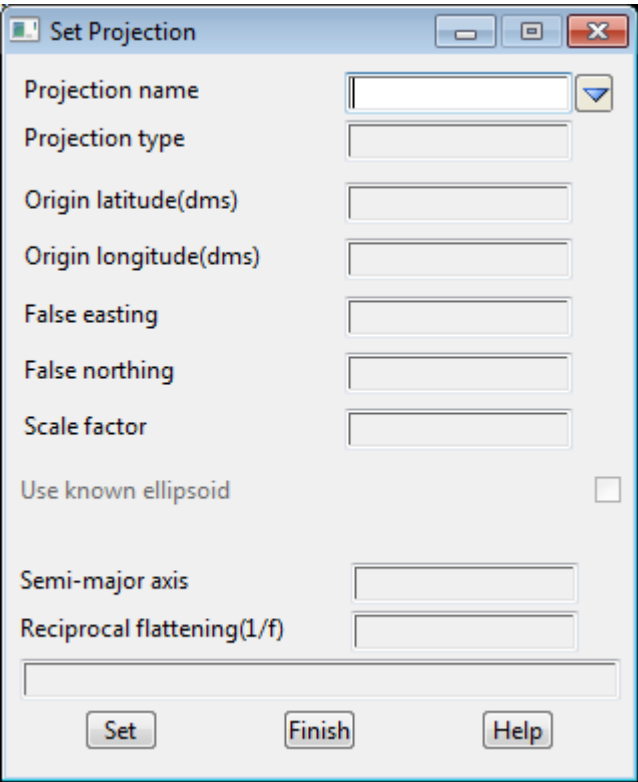

Set Projection

Position of option on menu: Project =>Management =>Projections =>Set

The *Set* option sets the *Project Projection* to be the one selected from the list defined projections.

To define a new projection, see [Create/Edit Projection.](#)

On selecting the *Set* option, the **Set Projection** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Datum name	input		all defined projections
<i>name of the projection to be set as the Project projection.</i>			
<i>Depending on the projection type, the relevant projection parameters are displayed in the rest of the fields in the panel.</i>			
<i>To define a new projection, see Create/Edit Projection.</i>			

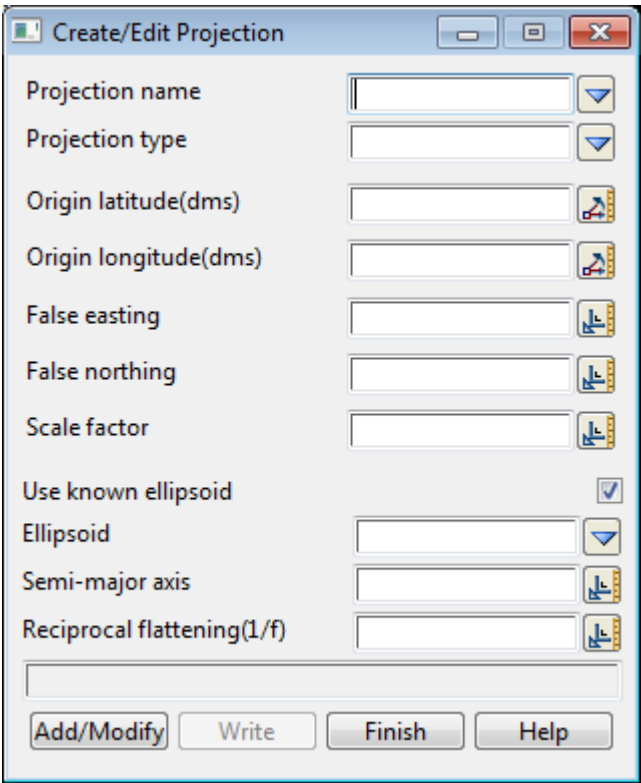

Set	button
<i>after selecting this button, the projection for the project is set to that given in the Project name field. The project projection is used in a number of options in 12d Model.</i>	

Create/Edit Projection

Position of option on menu: Project =>Management =>Projections =>Create/Edit

This option defines a new projection, or edits an existing projection in the current list of available projections.

On selecting the Create/edit option, the Create/edit Projection panel is displayed.

For more information about terminology used in this sections, see the Appendix [Geodetics Summary](#).

Field Description	Type	Defaults	Pop-Up
Datum name <i>name of the projection to be set as the Project projection.</i>	input		all defined projections
Projection Type <i>the type of projection to be set as the Project projection.</i>	input		Transverse Mercator, UTM RSO, General

For more information on defining a **general** projection, please go to [Defining a General Cartographic Projection](#)

Depending on the projection type, the relevant projection parameters can be entered.

Use known ellipsoid <i>if ticked, the ellipsoid for the projection has been defined previously and the parameters for the particular ellipsoid can be used. The values of defined ellipsoids are displayed when a selection is made from the ellipsoid pop-up box (e.g. GRS80).</i>	tick box	tick
<i>if not ticked then the ellipsoid parameters can be defined by entering the ellipsoid parameters.</i>		

Add/Modify button
after selecting this button, the user defined projection is added to the current list or the existing projection definition is modified. using the entered values. A number of new projections can be added by simply entering the relevant data and selecting the add/modify button.

Write button
after selecting this button, the user defined projections defined by the add/modify process are written to a carto.4d file which can be written to various locations. This means that the new

defined projections can be used for other **12d Model** projects. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)

Defining a General Cartographic Projection

A general *cartographic projection* is defined by giving a series of parameters starting with the mandatory +proj parameter giving the projection type. For example,

+proj=*projection_type* e.g. +proj=tmerc or +proj=utm

To specify the Earth's elliptical figure used in the projection, two parameters are required.

The first required value is the major semi-axis of the ellipse or equatorial radius,

major semi-axis of the ellipse +a= *value*

and the second parameter can be any one of the following standard forms:

minor semi-axis of the ellipse	+b= <i>value</i>
flattening	+f= <i>value</i>
reciprocal flattening (i.e. 1/f)	+rf= <i>value</i>
eccentricity	+e= <i>value</i>
eccentricity squared	+es= <i>value</i>

For example, the Australian National Spheroid (ANS) is defined by:

+a=6378160
+rf= 298.25

GRS80 is defined by:

+a=6378137
+rf= 298.257222101

WGS84 is defined by:

+a=6378137
+rf= 298.257223663

A further three parameters are common to most projections:

the central meridian +lon_0=*value*, and the cartesian offsets for the respective x and y axis, +x_0=*value*, +y_0=*value* (often referred to as false easting and northing).

central meridian	+lon_0= <i>value</i>	<i>units in decimal</i>
<i>degrees</i>		
x offset- false easting	+x_0= <i>value</i>	
y offset - false northing	+y_0= <i>value</i>	

A fourth parameter, +lat_0=*value*, is used to designate a central parallel and associated y axis origin for a projection.

Unless a value is specified for the parameters lon_0, lat_0, x_0 and y_0, they are assumed to be zero.

Other parameters will depend on the particular projection used.

Transverse Mercator Projection +proj=tmerc

project	+proj=tmerc
scale factor	+k= <i>value</i>

e.g. Metro-Perth is:

+proj=tmerc +a=6378160 +rf=298.25 +lon_0=115.833333333 +lat_0=0.0 +x_0=54466.561
+y_0=3690893.265 +k=1.0

Perth Coastal Grid 1984 (PCG84) is:

+proj=tmerc +a=6378160 +rf=298.25 +lon_0=115.833333333 +x_0=40000 +y_0=3800000
+k=1.000006

Universal Transverse Mercator Projection +proj=utm

This is a special form of the Transverse Mercator Projection. The central meridian is constrained to 6 degree intervals starting at 3 degrees. An extra parameter exists called +zone where +zone=1 specifies the region from 180 degree W to 174 degrees W (equivalent to +lon_0=177 degrees W) and proceeds easterly until +zone=60 for the region from 174 degree E to 180 degrees E (i.e. +lon_0=177 degrees E). Hence

$$+zone=N \quad N = 1, 2, \dots, 60$$

which automatically defines the central meridian $+lon_0 = 6 \times N - 183$ where N = zone number.

The +south option adds a false northing of 10,000,000 m (used for AMG and MGA co-ordinates) for projection in the Southern Hemisphere.

$$+south \quad \text{defines } +y_0 = 10000000$$

In all cases, for a Universal Transverse Mercator projection, a false easting of 500,000 m is used.

$$+x_0 = 500000$$

Australian Map Grid (AMG84)

The Australian Map Grid is a Universal Transverse Mercator Projection with

- (a) coordinates are in metres
- (b) zones are 6 degrees wide plus overlapping belts of 80 kilometres at each grid junction
- (c) AMG zones are numbered from zone 49 with central meridian 111 degrees E to zone 57 with central meridian 159 degrees E.
- (d) the origin of each zone is the intersection of the central meridian with the equator
- (e) a central scale factor, k, is defined as 0.9996
- (f) a false easting of 500,000 and a false northing of 10,000,000 are used
- (g) uses the Australian National Spheroid +a=6378160 +rf=298.25

For example, the definition of AMG zone 50 is:

$$+proj=utm \quad +south \quad +zone=50 \quad +k=0.9996 \quad +a=6378160 \quad +rf=298.25$$

Map Grid of Australia (MGA94)

The Map Grid of Australia is a Universal Transverse Mercator Projection with

- (a) coordinates are in metres
- (b) zones are 6 degrees wide plus overlapping belts of 80 kilometres at each grid junction
- (c) MGA zones are numbered from zone 49 with central meridian 111 degrees E to zone 57 with central meridian 159 degrees E.
- (d) the origin of each zone is the intersection of the central meridian with the equator
- (e) a central scale factor, k, is defined as 0.9996
- (f) a false easting of 500,000 and a false northing of 10,000,000 are used.
- (g) uses GRS80 +a=6378137 +rf=298.257222101

For example, the definition of MGA zone 50 is:

$$+proj=utm \quad +south \quad +zone=50 \quad +k=0.9996 \quad +a=6378137 \quad +rf=298.257222101$$

Lambert Conformal Conic Projection +proj=lcc

This is a special from of the Conic Projection.

There are two standard parallels +lat_1 and +lat_2 and the projection is centred on +lat_0 and +lon_0

For example, a Lambert Conformal Conic Conformal with standard parallels of 15 degrees South and 39 degrees South, centred at centred at 27degrees South 134degrees East, with a false origin at that point is 5,000,000m/5,000,000m and using the Australian National Spheroid (i.e. AGD84) is

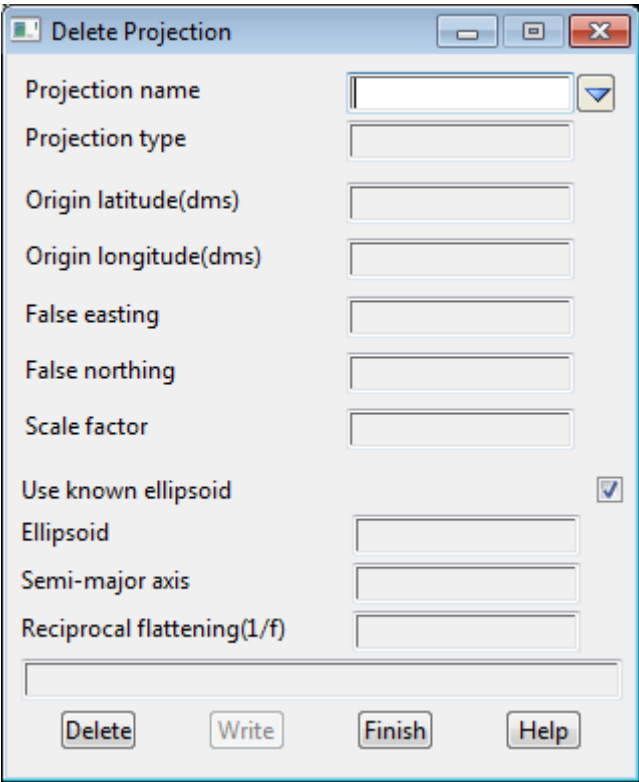

```
+proj=lcc +lat_1=-15 +lat_2=-39 +lon_0=134 +lat_0=-27
+x_0=5000000 +y_0=5000000 +a=6378160 +rf=298.25
```

Delete Projection

Position of option on menu: Project =>Management =>Projections =>Delete

The **Delete** option deleted a projection from the list of available projections.

On selecting the **Delete Projection** option, the **Delete Projection** panel is displayed.

The fields and buttons used in this panel have the following functions.			
Field Description	Type	Defaults	Pop-Up
Datum name	input		all defined projections
<i>name of the projection to be deleted from the Project projection list.</i>			
<i>Depending on the projection type, the relevant projection parameters are displayed.</i>			
Delete	button		
<i>after selecting this button, the selected projection is deleted from the project projection list. This can be done for a number of projections by simply selecting the projection to be deleted and selecting the delete button.</i>			
Write	button		

after selecting this button, the list of projections altered by the delete process can be written in various locations. This means that the updated projections list will be used to set current and future projects. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)

Reset Projection

Position of option on menu: Project =>Management =>Projections =>Reset

The Reset option is used to remove the projection set for the project.

On selecting the reset Projection option, the Project Projection Reset panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	pop-Up
-------------------	------	----------	--------

Current projection	output only		
<i>name of the projection currently set for the project.</i>			

Reset	button		
<i>after selecting this button, the projection for the project is set to none. That is, no project has been set for the Project</i>			

N values

Position of option on menu: **Project =>Management =>N values**

N values are the separation distances between the geoid and the ellipsoid. In GPS surveys, heights are often given in ellipsoid heights whilst most other level datums are based on the geoid. Since most geodetic calculations are based on the ellipsoid, any observations should be reduced onto the ellipsoid. This reduction process takes into the consideration the heights above the ellipsoid. Therefore, it is necessary to convert non ellipsoid heights to ellipsoid values by adding the geoid-ellipsoid separations (n values). There are various methods for determining the N values.

An N value method can be defined using the Create/edit option. Values from the project N value settings are used to determine which method is used to calculate N values. These values are used in various options where the level values are not ellipsoid values and require the N value to be added to get to an ellipsoid height. A user defined N value method can then be set for the project (the project N value setting) which is then the default N Values in any panel.

For more information about terminology used in this section, see the Appendix [Geodetics Summary](#).

The **Project n value** walk-right menu contains various projection items.

Project N value settings

Set

Create/edit

Delete

Reset

set the default N-values for the project

create/edit N-values definitions

delete a N-values definition

reset the N-values set for the project

- For the option *Set*, go to the section

[Set N-Values.](#)
- Create/edit*

[Create/Edit N-Values.](#)
- Delete*

[Delete N-Values.](#)
- Reset*

[Reset N-Values.](#)

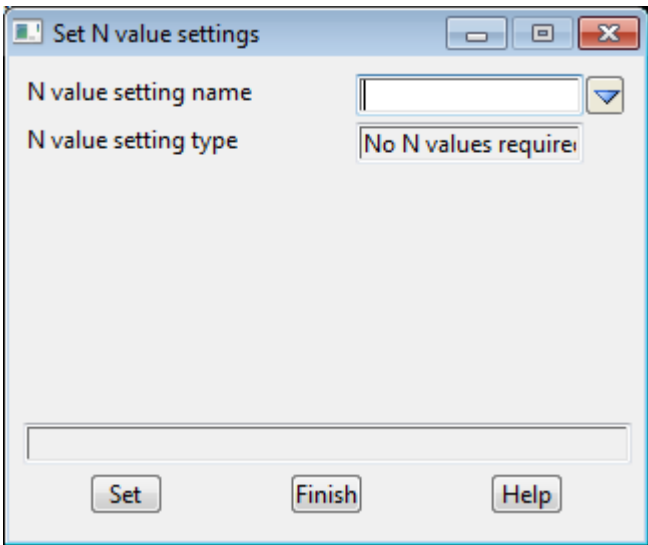

The options in the menu will now be described.

Set N-Values

Position of option on menu: **Project =>Management =>N values =>Set**

The **Set** option sets the Project N Values and these are then used as the default in panels.

On selecting the **Set** option, the **Set N value settings** panel is displayed.

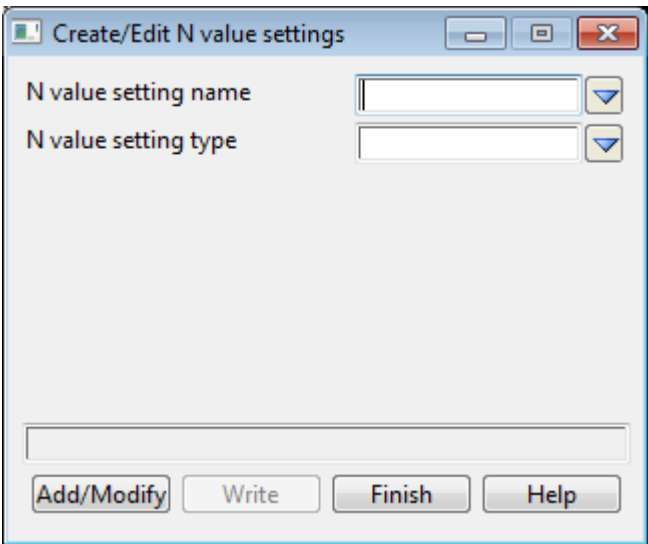

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
N value setting name <i>name of the n value setting to be set as the Project N value setting.</i>	choice box		all defined N value settings
N value setting type <i>Depending on the N value interpolation method, the relevant method is displayed.</i>	input		defined N value types
Set <i>after selecting this button, the current N value setting is set using the displayed values. These values are used as defaults in panels that need N values for calculations</i>	button		

Create/Edit N-Values

Position of option on menu: Project =>Management =>N values=>Create/Edit

On selecting the Create/edit option, the Create/edit N value settings panel is displayed.

Field Description	Type	Defaults	Pop-Up
N value setting name <i>name of the n value setting to be set as the Project N value setting.</i>	choice box		all defined N value settings
N value setting type <i>There are various methods for the determination of the N values. These are given in the choice box:</i>	choice box		defined N value types

Depending on the setting type chosen, the panel will display the appropriate fields.

No N values required: This applies to data that already has ellipsoid heights and requires no interpolation for N values.

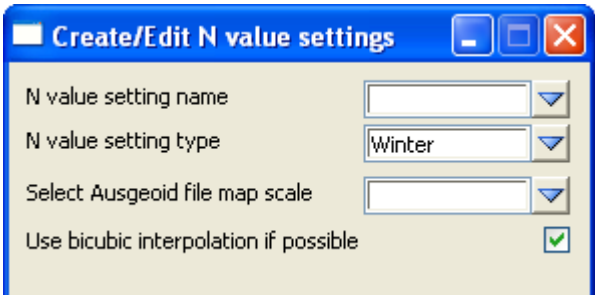

For N value setting type = Constant N value

Field Description	Type	Defaults	Pop-Up
Constant N value <i>this N value will be used for the entire n value interpolation process. (i.e. it will not change).</i>	input box		

For N value setting type = Winter

This method uses the same method as the Winter interpolation software supplied by Auslig. The data files used should be winter compatible and reside in a folder that is pointed to by the WINTER_DATA_4D parameter in the env.4d file. The data files can be downloaded from the Auslig website.

Field Description	Type	Defaults	Pop-Up
Select Ausgeoid file map scale	choice box		1:100,000
			1:250,000
			1:1,000,000

*this value will be dependant on the type of files to be used by winter. **The files themselves should be in a folder that is pointed to by the WINTER_DATA_4D parameter in the setup area of the env.4d file.***

Use bicubic interpolation if possible	tick box	ticked
---------------------------------------	----------	--------

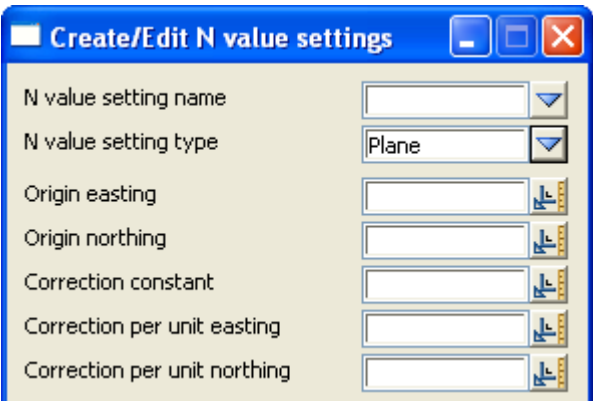

if ticked, the bicubic interpolation method will be used if possible.

For N value setting type = NGS

This method is currently under development.

For N value setting type = Plane

This method allows a plane to be defined allowing N values to be derived from that plane.

Field Description	Type	Defaults	Pop-Up
Origin easting	input box		
<i>the origin easting value.</i>			
Origin northing	input box		
<i>the origin easting value.</i>			
Corr constant	input box		
<i>the constant z value of the plane.</i>			
Corr per unit easting	input box		
<i>the z value correction per unit easting.</i>			
Corr per unit northing	input box		
<i>the z value correction per unit nothing.</i>			

For N value setting type = Difference tin

This method allows value to be interpolated from a difference tin. A difference tin is simply a tin of difference values (N values). This tin can be re-triangulated as new points become available, thus introducing more points than a regular grid.

Field Description	Type	Defaults	Pop-Up
Difference tin	tin box		Available tins

the difference tin from which the N values will be interpolated.

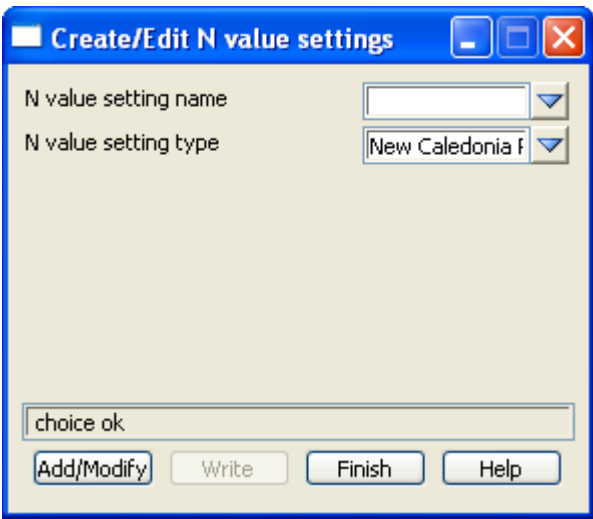

Add/Modify button

after selecting this button, the user defined N value settings are added to the current list or the existing N value settings is modified. using the entered values. A number of new settings can be added by simply entering the relevant data and selecting the add/modify button.

Write button

*after selecting this button, the user defined N value settings defined by the add/modify process can be written to the file nvalues.4d in various locations. This means that the defined N value settings will be allowed to be set in current and future projects. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

For N value setting type = New Caledonia RANC00

Delete N-Values

Position of option on menu: **Project =>Management =>N value =>Delete**

The **Delete** option deleted a projection from the list of available projections.

On selecting the Delete option, the Delete N value setting panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
N value setting name	input		all defined N value settings
<i>name of the setting to be deleted from the N value setting list. Depending on the setting type, the relevant setting parameters are displayed.</i>			
Delete	button		
<i>after selecting this button, the selected N value setting is deleted from the setting list. This can be done for a number of n value settings by simply selecting the projection to be deleted and selecting the delete button.</i>			
Write	button		
<i>after selecting this button, the list of n value settings altered by the delete process can be written to the nvalues.4d file in various locations. This means that the updated n value settings list will be used to set current and future projects. For more information on the Write button, go to the section Writing Set Up Files in the Appendix Setting Up and Configuring 12d</i>			

Reset N-Values

Position of option on menu: Project =>Management =>N values =>Reset

The.Reset option is used to remove the projection set for the project.

On selecting the reset option, the Project N value setting reset panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Current N value setting output only
name of the n value setting, set for the project.

Reset button
after selecting this button, the N value setting for the project is set to none. That is, no N value setting has been set for the Project

7 Parameters

Position of option on menu: Project =>Management =>7 parameters

Seven (7) parameter transformations are used to transform data between two ellipsoids. They are also known as 7 parameter similarity transforms, Bursa-Wolf and 7 parameter Helmert transformations.

Warning: the definition and hence sign of some terms varies between countries.

In **12d Model**, the seven parameter similarity transformations are used in the **General Transformation** option Survey =>Conversions =>General transformations (see [General Transformations](#) in the chapter [Survey](#)) and the transformation is applied in the Global XYZ system.

The 7 parameters walk-right menu contains options to create and delete seven parameter transformation setting.

create/edit 7 parameter definitions
delete 7 parameter definitions

For the option *Create/edit*, go to
Delete

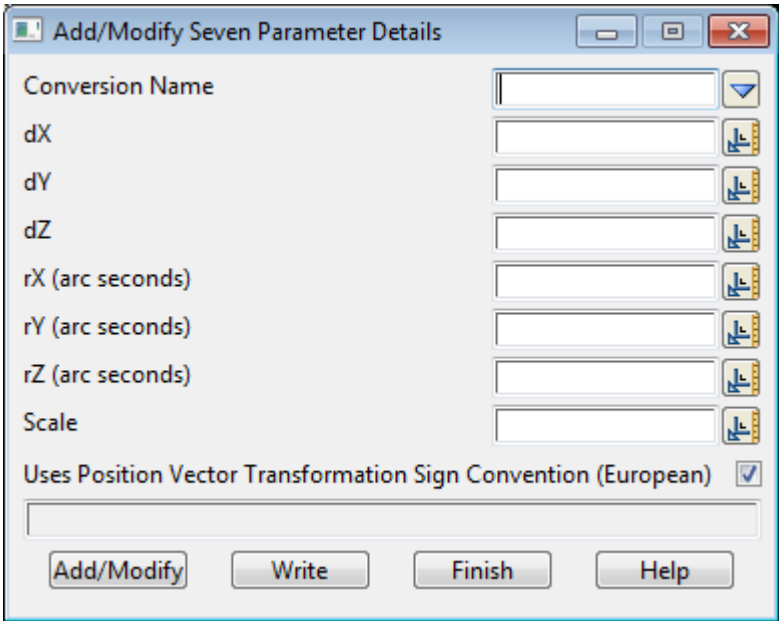

[Create/Edit 7 Parameters](#)
[Delete 7 Parameters](#)

The options in the menu will now be described.

Create/Edit 7 Parameters

Position of option on menu: Project =>Management =>7 parameters=>Create/Edit

On selecting the *Create/edit* option, the **Add/Modify Seven Parameter Details** panel is displayed.

Field Description	Type	Defaults	Pop-Up
Conversion name <i>name of the 7 parameter setting to be created/edited.</i>	choice box		all defined 7 param settings

DX, DY, DZ input box
the translations for the 7 parameter transformation.

rX (arc seconds), rY (arc seconds), rZ (arc seconds)input box
the rotations, in arc seconds, for the 7 parameter transformation.

Scale input box
the scale for the 7 parameter transformation.

Use Position Vector Transformation sign convention (European) tick box
*if ticked, the European Position Vector Transformation convention is used.
If not ticked, PVT sign is not used (mainly not used for USA).*
Depending on the sign convention, some of the parameters will have the opposite sign.

Add/Modify button
*after selecting this button, either the new 7 parameter set is created or an exiting one modified. To save the setting list, use the **Write** button.*

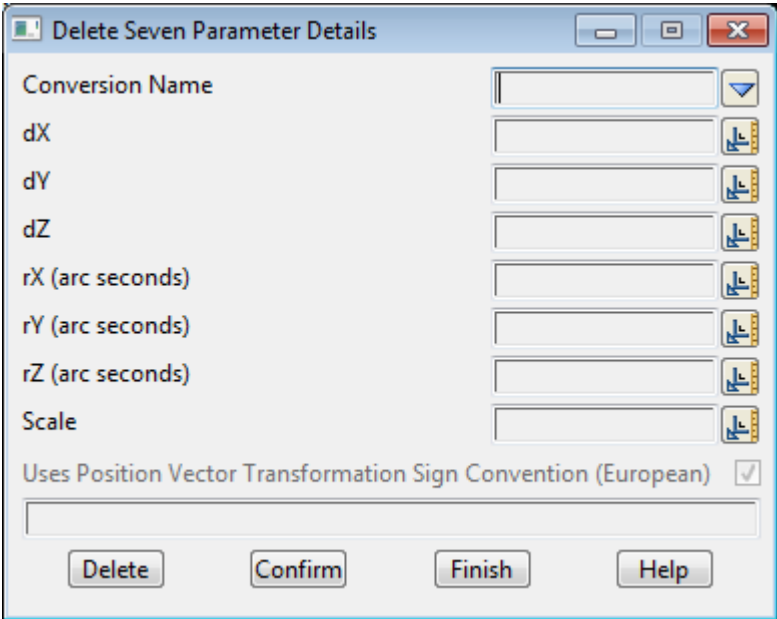

Write button
*after selecting this button, the user defined 7 parameter settings are written out to the file **7params.4d** in the user selected folder. This means that the 7 parameter settings will be available in the current and future projects. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

Delete 7 Parameters

Position of option on menu: Project =>Management =>7 parameters =>Delete

The **Delete** option deleted a seven parameter set from the list of available seven parameter settings.

On selecting the **Delete** option, the **Delete 7 Parameter Details** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Conversion name input all defined 7 param settings

name of the 7 parameters setting to be deleted from the 7 parameter settings list.
The relevant setting parameters are displayed.

Delete button

*after selecting this button, the selected 7 parameter setting is deleted from the setting list. This can be done for a number of 7 parameter sets by simply selecting the name to be deleted and selecting the delete button. To save the modified setting list, use the **Write** button*

Write button

*after selecting this button, the user defined 7 parameter settings are written out to the file **7params.4d** in the user selected folder. This means that the 7 parameter settings will be available in the current and future projects. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

Project Workspace

Position of option on menu: Project =>Management =>Workspace

Options to set up the project

The **Project Workspace** walk-right menu contains various projection items.

For the option *Setup*, go to
Load

[Workspace Setup](#)
[Project Workspace Load](#)

Workspace Setup

Position of option on menu: Project =>Management =>Workspace =>Setup

The workspace file is used to define the position of toolbars and output window for a new projects.

Once inside an existing project, the workspace file is no longer used and the final positions of the toolbars and output window are recorded inside the project so they come up in the same final position as when the project is reopened.

The **Workspace Setup** option allows the user to define new workspace setup files that can be loaded at any time in an existing project or used as the default workspace file used for all new projects.

On selecting the **Setup** option, the **Workspace Setup** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Write	button		
<i>write out the current toolbar configuration to a .4dw file.</i>			
Load	button		
<i>read in the workspace.4dw file in the current project folder.</i>			

- Clear

button

remove all the current toolbars and read in the default workspace.4dw file
- Workspace file

file box

current workspace file*.4dw files

name of the workspace file to re imported/exported
- Import

button

read in and use the workspace file given in the Workspace file field.
- Export

button

write the current toolbar settings out to the workspace file given in the Workspace file field.

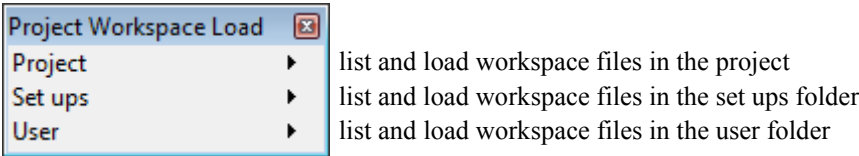

Project Workspace Load

Position of option on menu: Project =>Management =>Workspace >Load

This option displays and selects a project workspace file to set up the icons etc. on the screen.

The **Project Workspace Load** walk-right menu contains further walk-rights to display the workspace files in the local project, the set ups folder and the user folder.

To load a workspace file, simply click on the name in the walk-right lists.

Tags

For the option *Tag tree* go to
Find new tags

[Tag Tree](#)
[Register new tags](#)

Tag Tree

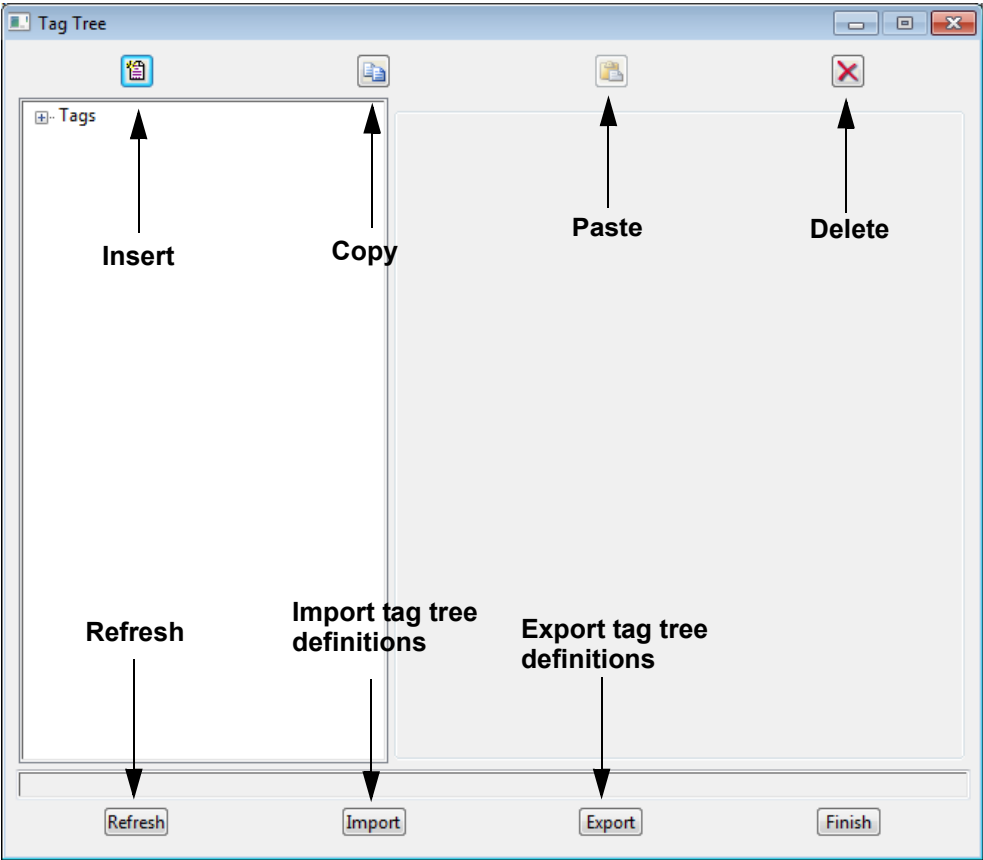

Position of option on menu: Project =>Management =>Tags =>Tag tree

The **12d Model** objects *models*, *tins* and *strings* can be tagged with an unlimited number of user defined text strings called **tags**. For example, a string may be tagged with the two tags, "survey day 1" and "sewer".

Tags names are **case sensitive** and must be **unique**. Tags are used in an increasing number of **12d Model** options. For example, on a view, models can be selected for adding/removing by giving a *tag* name.

To further increase their usefulness, tags in a project can also be assigned a **hierarchy**, or **tree structure**. However that will be discussed shortly after first describing how to create, apply and removed simple tags (see [Defining a Tag Tree \(Tag Hierarchy\)](#)).

Selecting **Tags** displays the **Tag Tree** panel which is used to defined tags, and also apply and remove tags from objects.

Buttons at Bottom

grid

Refresh

button

refresh the grid.

Import

button

import a tag tree definition file.

Clicking on Import brings up the Tag Tree Import panel.

Tag file

tags box

all .tags files

name of the tag file to read the tag definitions from.

Import

button

*read in the tag definitions from the **Tag file** and merge them with the current definitions for the project.*

Export

button

export a tag tree definition file.

*Clicking on **Export** brings up the **Tag Tree Export** panel.*

Tag file

tags box

all .tags files

name of the tag file to write the project tag definitions out to.

Export

button

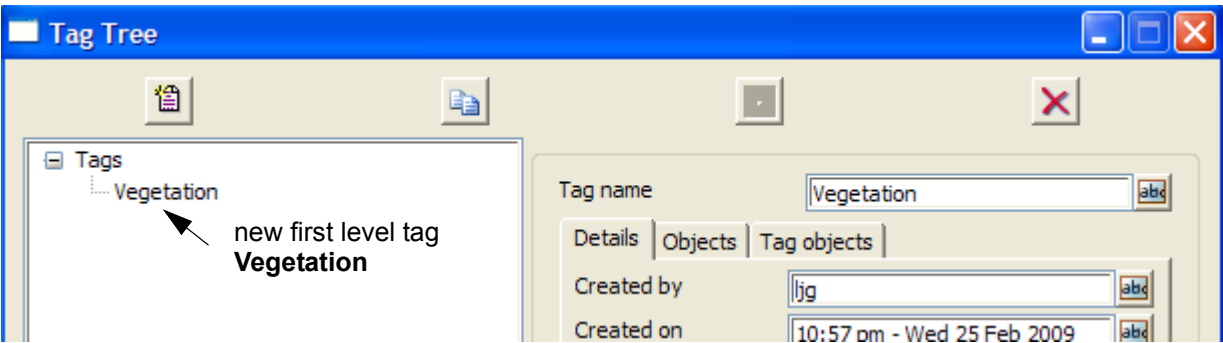

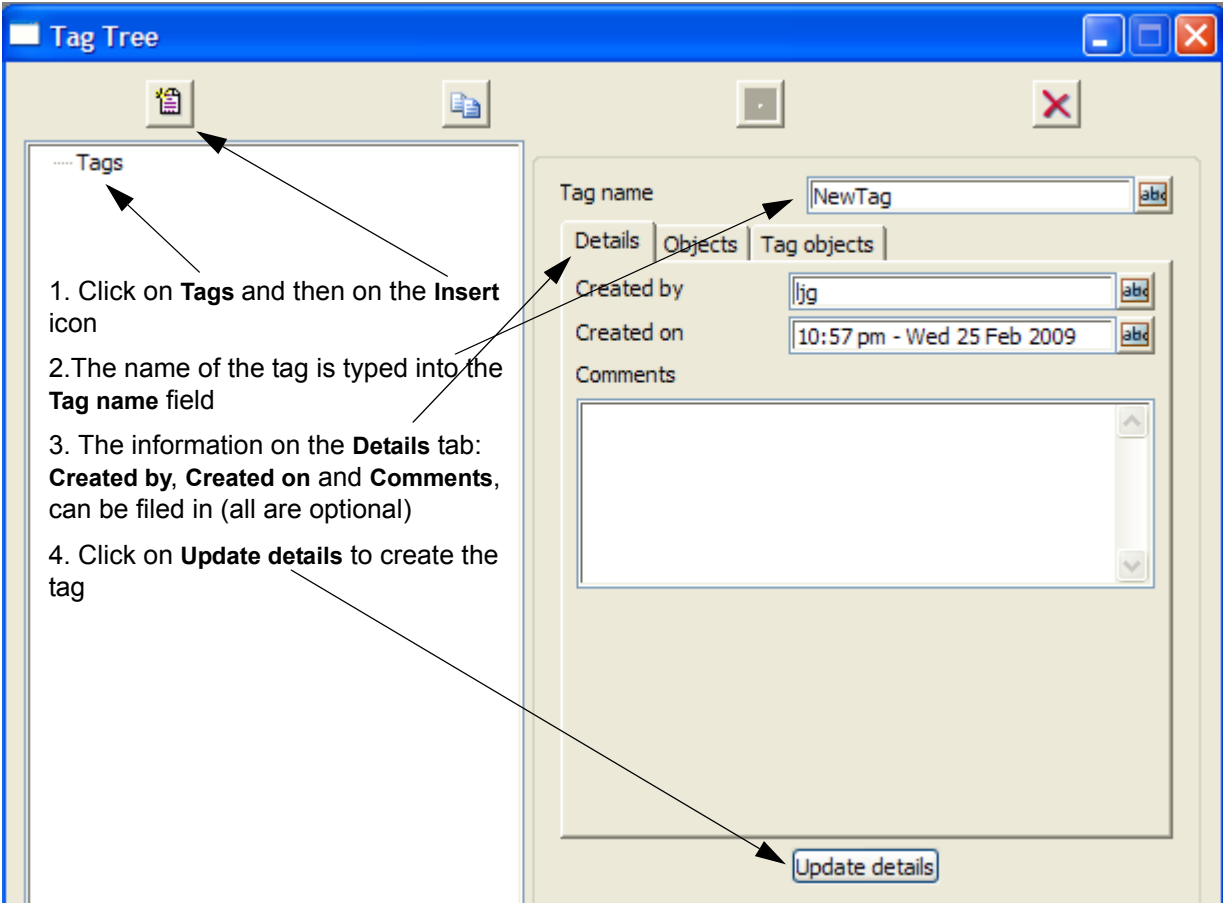

*write out the tag tree definition for this project to the **Tag file**.*

How To Use the Tag Tree Panel

Creating a Tag

To create a **new first level tag**, click on **Tags** and then the **Insert** icon.

The name of the tag is typed into the Tag name field, the information on the Details tab: Created by, Created on and Comments, can be filled in (all are optional) and then click on Update details to create the tag.

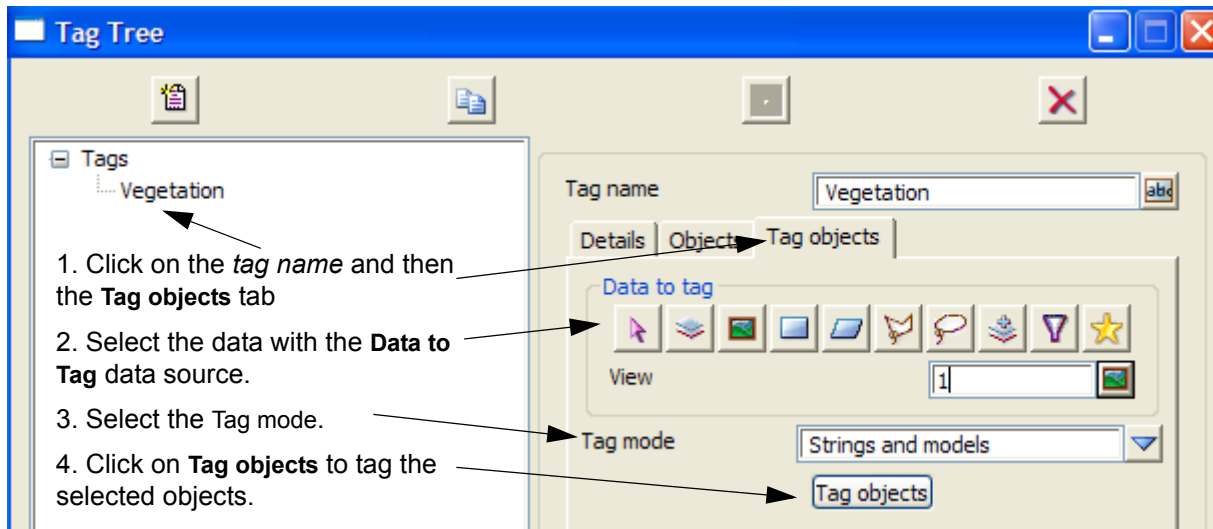

Applying a Tag To Objects

To apply a tag, click on the *tag name* and then the Tag Objects tab.

Select the data with the **Data to Tag** data source.

Select the Tag mode (choice of *Strings only*, *Models only*, *Strings and models*).

Click on Tag objects to tag the selected objects.

Retrieving and Deleting Tagged Objects

To retrieve a list of data tagged with a certain tag, click on the *tag name* and then the Objects tab.
Click on Retrieve to list all the objects with the tag.
To remove tags, click the tick on in the Remove column.
Click on Remove to remove the tag from the ticked objects.

Note - clicking RB on the **Remove** at the *top of the column* in the grid brings up a panel with options to set all the ticks on, set all the ticks off or toggle the tick state.

Tag Tree

Tags

Vegetation

1. Click on the *tag name* and then the **Objects** tab

2. Click on **Retrieve** to list all the objects with the tag.

3. To **remove** tags, click the tick on in the Remove column.

4. Click on **Remove** to remove the tag from the objects with a tick in the **Remove** column.

Tag name

11	<input type="checkbox"/>	String	xs 3
12	<input type="checkbox"/>	String	xs 4

Retrieve

Remove

Defining a Tag Tree (Tag Hierarchy)

Tag names are **case sensitive** and must be **unique** and objects can be tagged with **more than one** tag. For example, a string may be tagged with the two tags, "survey day 1" and "sewer"

To further increase their usefulness, tags in a project can also be assigned a **hierarchy**, or **tree structure**.

A **tag tree structure** can be created for the project by following the rules:

1. Tags can be **first level tags** or **sub-tags**, but not both.
2. **First level tags** are tags created at the top level of the tag tree. That is, they are the level directly below the **Tags** label in the **Tag Tree** panel.
3. **Sub-tags** are tags that are created as sub-tags of a **first level tag**, or **sub-tags of other sub-tags**
4. First level tags can not be used as sub-tags and sub-tags can not be a first level tag.
5. **Tag names** must be **unique** amongst **all tags - first level tags** and **sub-tags**. So you can't have a first level tag with the same name as a sub-tag, and vice-versa.
6. The same subtag name can not appear more than once in any single **tag-subtag** sequence.

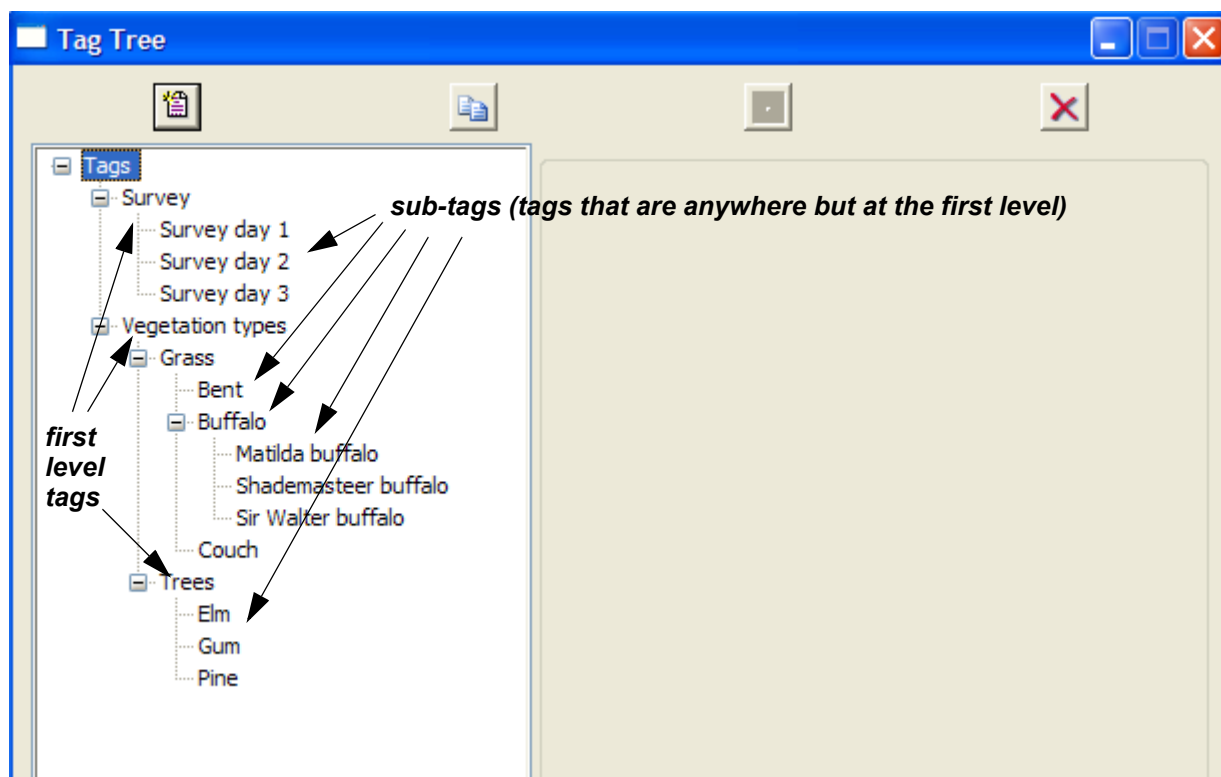

For example, you can have a tag *Vegetation types* with a subtag of *Grass* and with a sub-sub-tag of *Bent*. but you can't have a tag *Vegetation types* with a subtag of *Grass*, a sub-subtag of *Bent*, and a sub-sub-subtag of *Grass*.

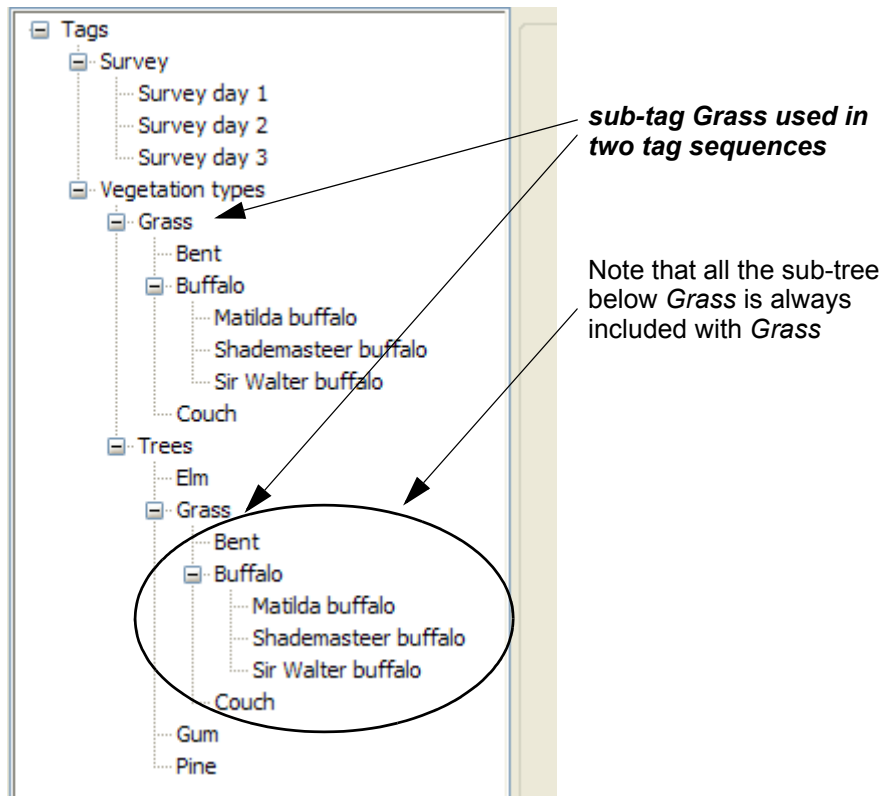

That is *Vegetation types > Grass > Bent* is allowed
but *Vegetation types > Grass > Bent > Grass* is **not allowed**

Note that because tags are case sensitive

Vegetation types > Grass > Bent > grass is allowed.

7. A subtag can appear in more than one tag sequence as long as Rule 6 is not violated.

A tag hierarchy can be very useful.

For example, if we have the tags and tag tree as defined in the previous picture, adding the models tagged as *Trees* with the **Add Tagged Models** option will also add the models tagged with *Elm*, *Gum*, *Pine*, *Grass*, *Bent*, *Buffalo*, *Matilda buffalo*, *Shademasteer buffalo*, *Sir Walter buffalo* and *Couch* **even if they are not tagged as Trees**.

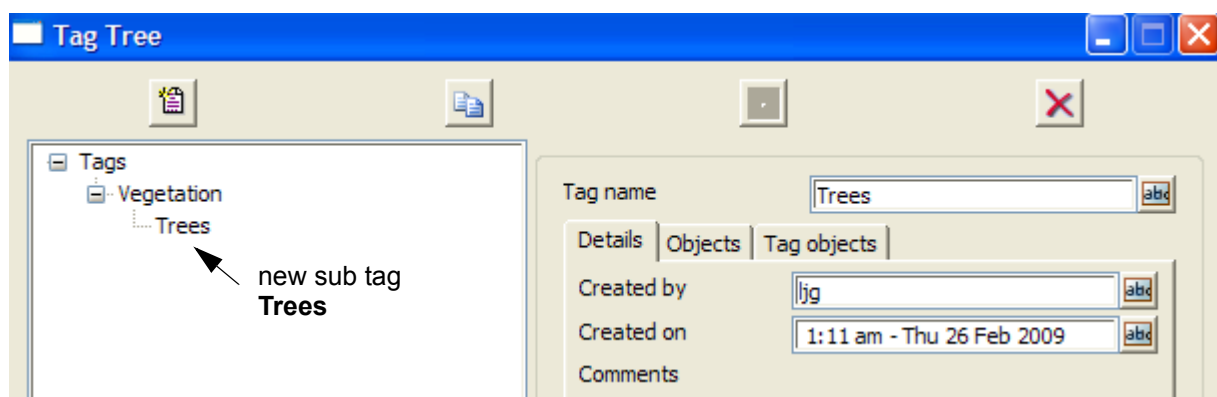

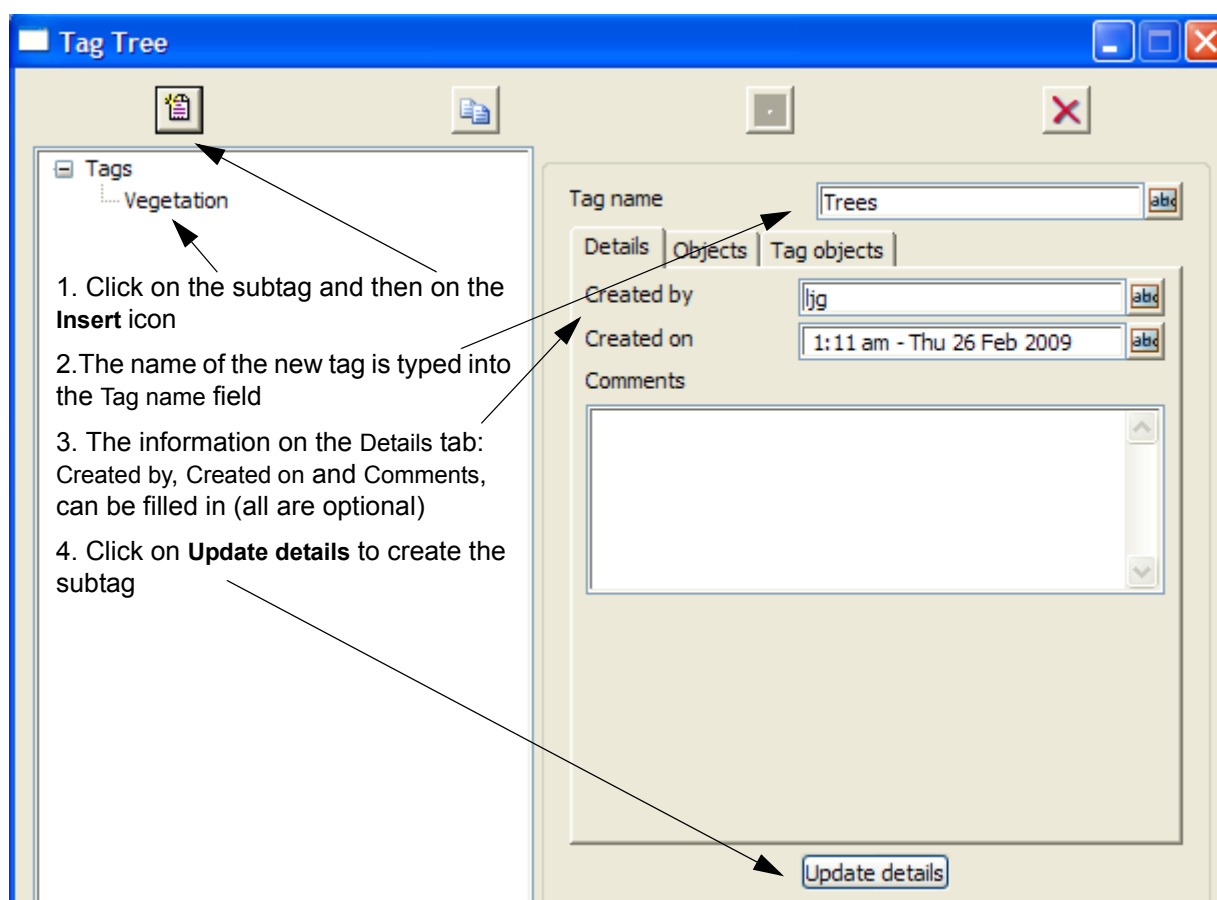

If *Grass* was removed as a subtag of *Trees* then adding *Trees* with the **Add Tagged Models** option will then only add the models tagged with *Trees*, *Elm*, *Gum* and *Pine*. So no new tagging was needed, just a modification to the tag tree definition.

Creating a Tag Tree Structure

To create a subtag of any tag is very similar to creating a first level tag.

To create a **new sub tag**, click on the tag to have the subtag, and then click on the **Insert** icon.

The name of the subtag is typed into the Tag name field, the information on the Details tab: Created by, Created on and Comments, can be filled in (all are optional) and then click on Update details to create the subtag.

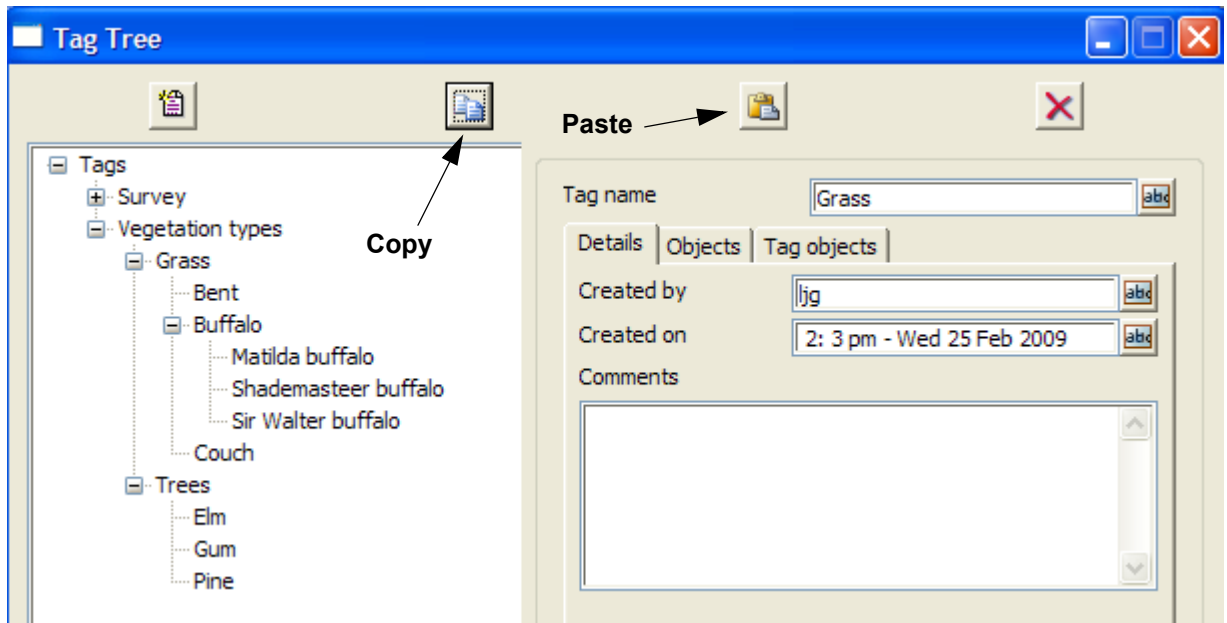

Copy and Paste in a Tag Tree Structure

The **Copy** and **Paste** icons are used to copy subtags around the tag tree structure.

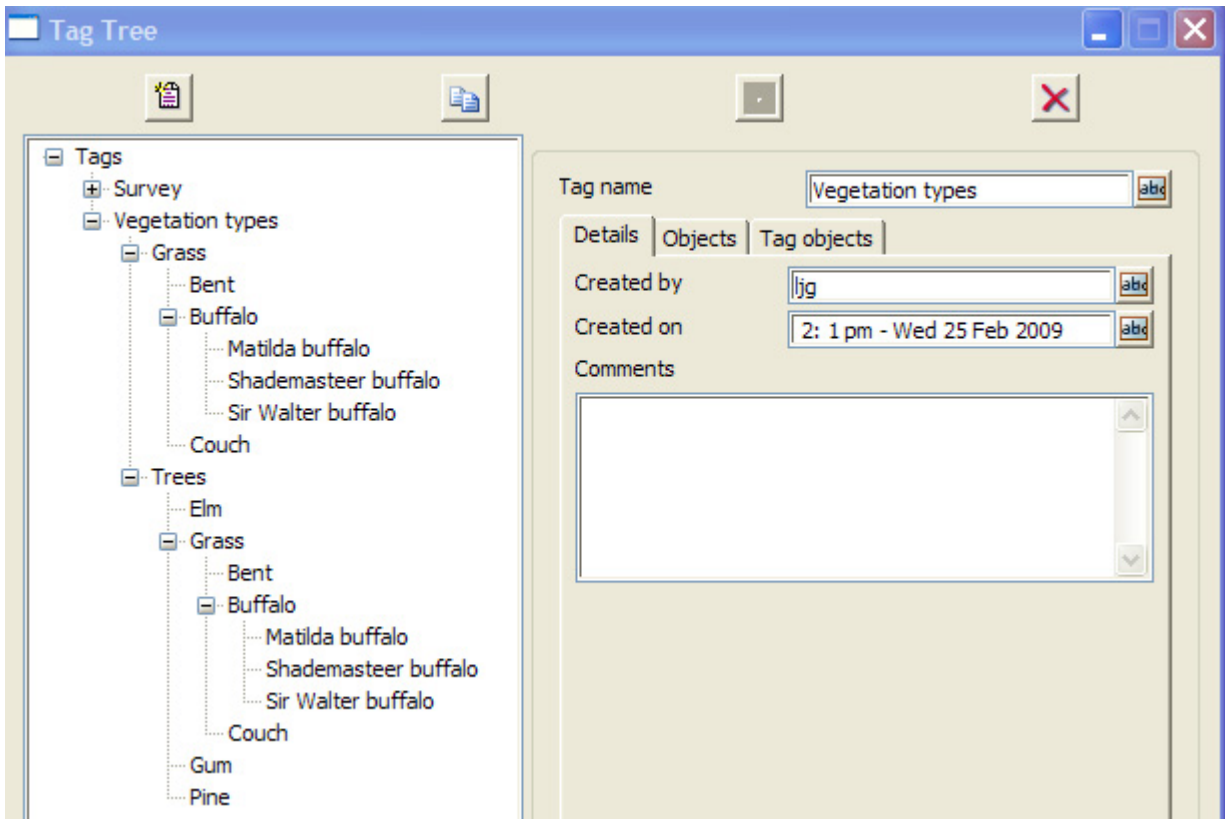

To copy, first click on the subtag you wish to copy (say *Grass*), and then click on the Copy icon.

The Paste button will then become active.

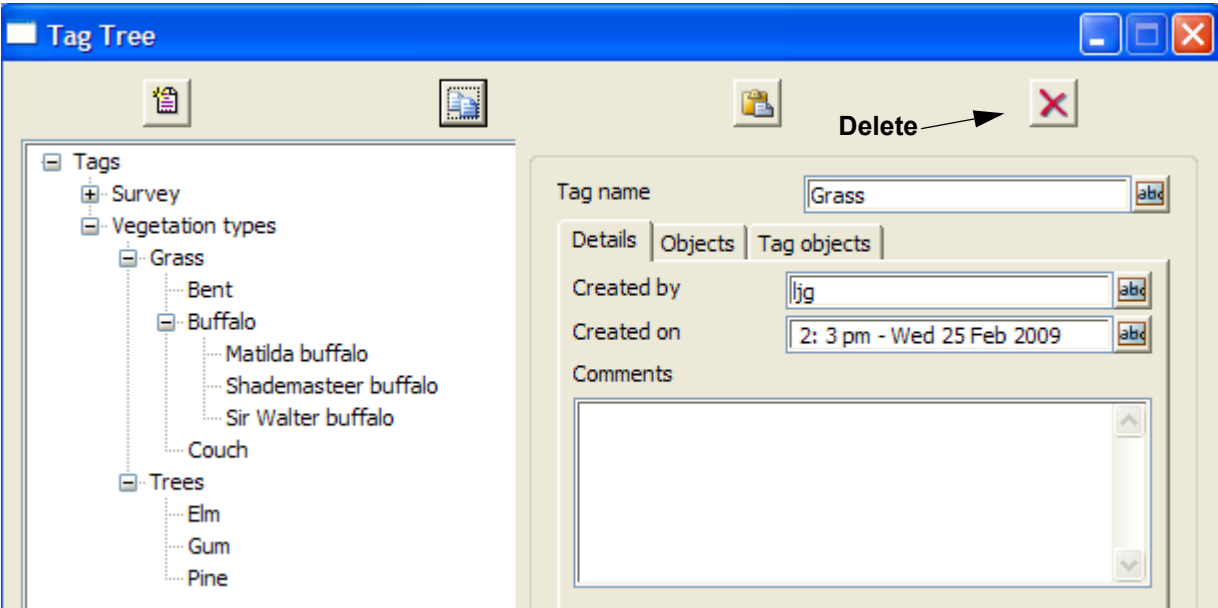

Now click on the first level tag or subtag to copy the subtag to (say *Trees*), and then click on the **Paste** icon.

The subtag (and the tree below it) will now be copied as a subtree of the selected tag.

Deleting a Subtag in Tag Tree Structure

A first level tag or subtag can be deleted from anywhere in the tree by simply clicking on the tag to be deleted and then clicking on the **Delete** icon.

Register new tags

Position of option on menu: Project =>Management =>Tags => Find new tags

Register new tags is used to locate any new tags that have been added on models or strings which have not been registered with the project.

Unregistered tags may occur when reading in a 12da that contains models or strings with tags. Until a tag is registered, it can not be used in source boxes or other panels.

Selecting **Find new tags**, brings up the **Register new tags** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Data to search		source		

Data to search - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Search	button
<i>perform the search</i>	

Tree

- Position of option on menu:

Project =>Tree
- Position of option on menu:

Project =>Management =>Tree
- For documentation on this option, go to the section

Project =>Tree (see [Tree](#))

Project Sharing

The **Sharing** walk-right menu is:

- For the option Settings please go to

[Project Share Settings](#)
- Share info

[Sharing Information](#)
- Read share index

[Add Shares By Index File](#)
- Export share index

[Export A Share Index File](#)
- Convert share paths to relative

[Convert Share Paths To Relative](#)
- Subscribe to share master files

[Subscribe to Sharing Master Files](#)
- Create share master file

[Sharing Master File](#)

Project Share Settings

Position of option on menu: Project =>Management =>Sharing =>Settings

There are three environment variables that control the auto-synchronizing of any shared models or tins added to this project.

SHARE_CHECK_INTERVAL_4D	number_of_seconds
AUTO_MODEL_SYNC_4D	1 or 0
AUTO_TIN_SYNC_4D	1 or 0

This option will temporarily modify the values for this session. When the project is restarted, the values will revert to those given by the environment variables.

Selecting **Share settings** brings up the **Project Share Settings** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Interval to check for updates	input
--------------------------------------	-------

time in seconds to check if any of the shared models or tins added to the project have been updated in the server projects.

The environment variable controlling this when the project starts up is

`SHARE_CHECK_INTERVAL_4D` number_of_seconds

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Autosync tins	tick box
----------------------	----------

if ticked, the server projects for any shared tins added to this project are checked to see if they have been modified (checked every `SHARE_CHECK_INTERVAL` seconds). If any tins have been modified, they are re-copied to this project.

The environment variable controlling this when the project starts up is

`AUTO_TIN_SYNC_4D` 1 or 0

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Autosync models	tick box
------------------------	----------

if ticked, the server projects for any shared models added to this project are checked to see if they have been modified (checked every `SHARE_CHECK_INTERVAL` seconds). If any models have been modified, they are re-copied to this project.

The environment variable controlling this when the project starts up is

`AUTO_MODEL_SYNC_4D` 1 or 0

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Set	button
------------	--------

set the values in the panel for this session. The values will revert back to the ones given by the environment variables when the project is restarted.

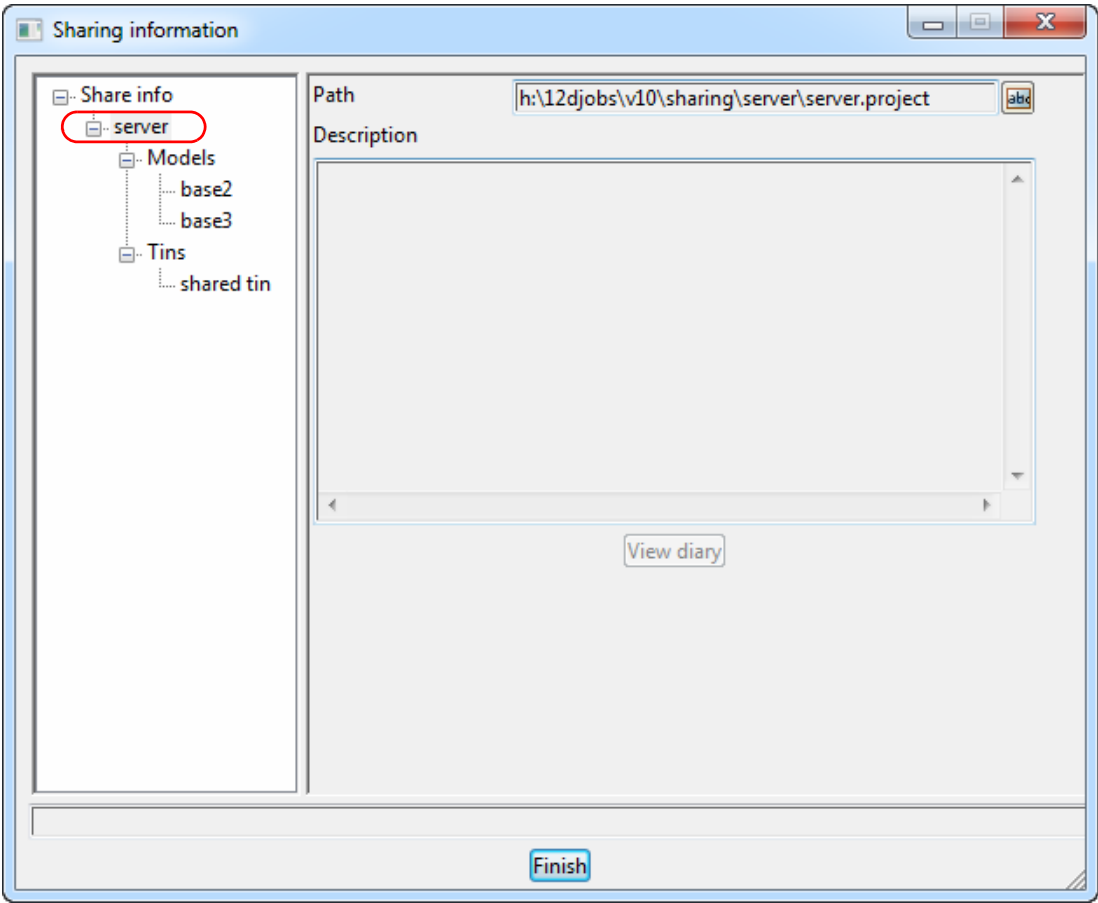

The values are only modified for this session and will evert back to the ones given by the environment variables when the project is restarted. To permanently change the value, please modify the environment variable.

Sharing Information

Position of option on menu: Project =>Management =>Sharing =>Share info

This panel shows information about all models and tins shared into your current project.
Selecting Share info brings up the **Sharing information** panel.

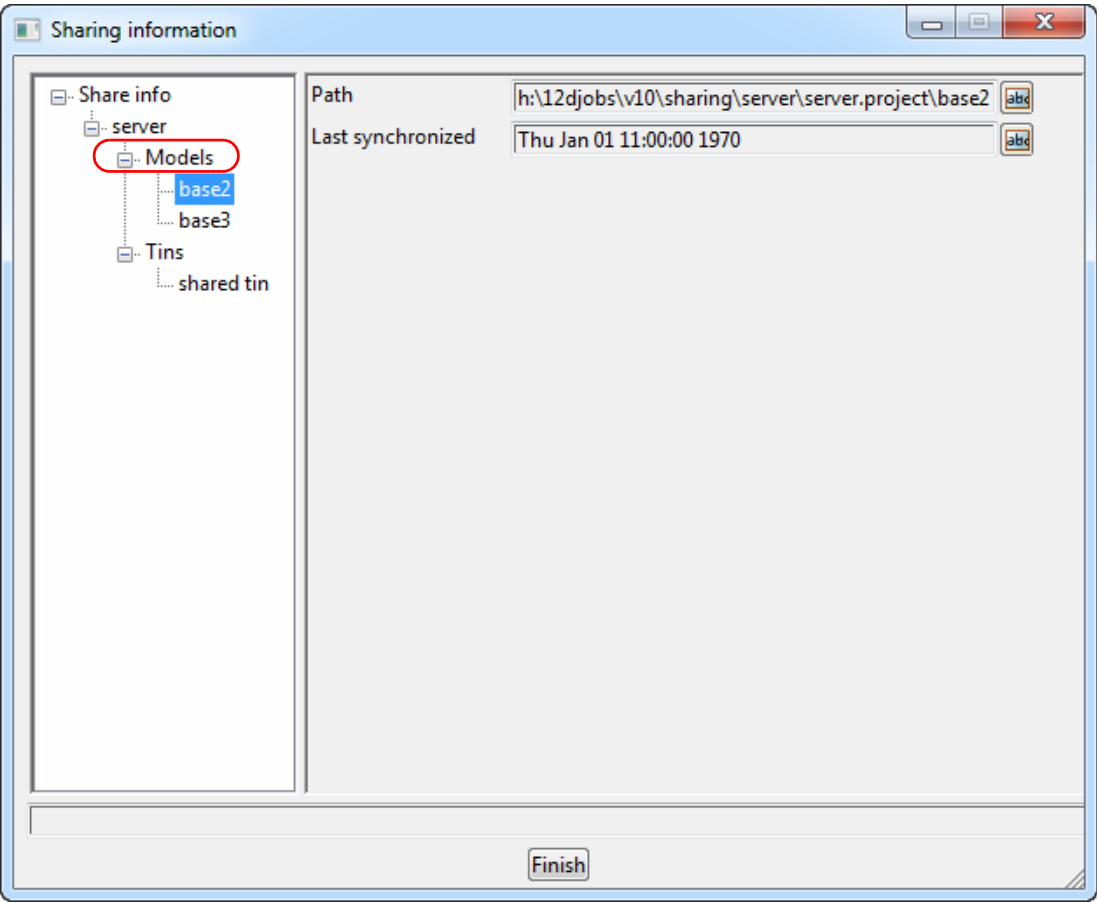

Server Node

Each server you are sharing from is listed in the tree.
Selecting the server node displays the path of the server, the project description and an option to view the diary for that project.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
View diary		button		

Views the diary for that project - disabled if no project diary created

Models Node

Each Model Node shows details about the shared model.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Path

the path to the original source of the model

Last Synchronized

the time the model was last synchronized

Tin Node

Each Tin Node shows details about the shared tin.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Path

the path to the original source of the tin

Last Synchronized

the time the tin was last synchronized

Add Shares By Index File

Position of option on menu: Project =>Management =>Sharing =>Read share index

This panel loads shared tin and model details from a share index file, created by [Export A Share Index File](#) and allows you to choose which items should be shared into your project.

Selecting **Read share index** brings up the **Add Shares By Index File** panel.

The fields and buttons used in this panel have the following functions.

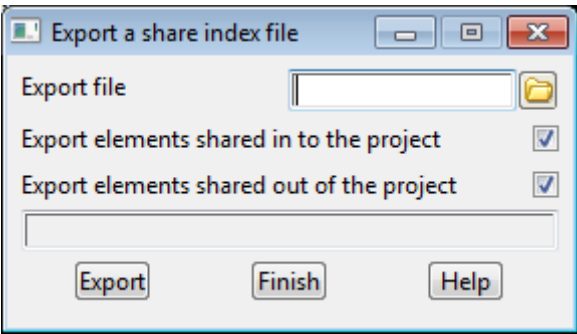

Field	Description	Type	Defaults	Pop-Up
Index file		file		
	<i>the sharing index file to read</i>			
Type				
	<i>the type of element (model or tin)</i>			
Name				
	<i>the name of the element</i>			
Share?		tick box		
	<i>whether or not to share the element in</i>			
Load		button		
	<i>loads the information from the selected index file</i>			
Share		button		
	<i>adds the selected shares to the project</i>			

Export A Share Index File

Position of option on menu: Project =>Management =>Sharing =>Export share index

This panel exports a list of all the shared elements (models and tins) that have been shared into this project. This can then be used to recreate the same sharing setup in another client project.

Selecting **Export share index** brings up the **Export a share index file** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Export file <i>the file to export details to</i>	file		
Export <i>exports the sharing information</i>	button		

Convert Share Paths To Relative

Position of option on menu: Project =>Management =>Sharing=>Convert share paths to relative

This option changes the share paths of models and tins from absolute path names to relative path names. It is mainly used for projects where the share names were recorded as full paths names (e.g. V8 projects).

Selecting **Convert share paths to relative** brings up the **Convert Share Paths to relative** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Convert model paths <i>if ticked, the absolute path names of shared models added to this project will be converted to relative</i>	tick box		tick

paths.

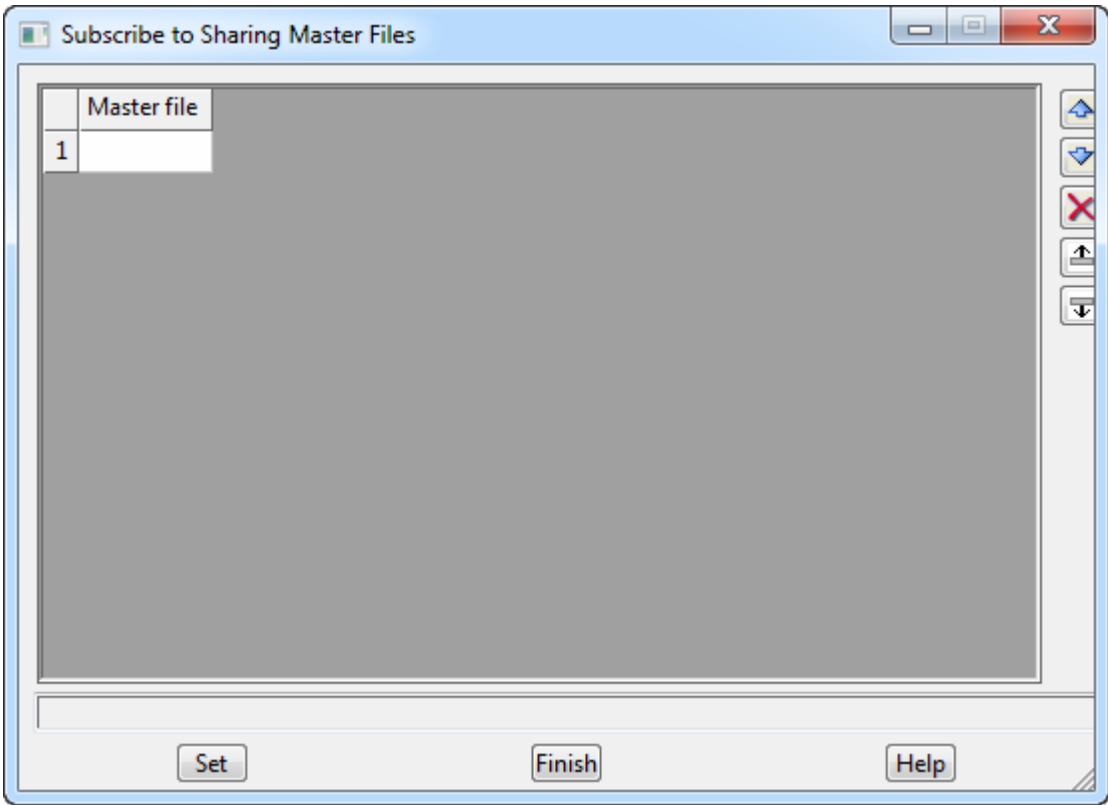

Convert tin paths	tick box	tick
if ticked, the absolute path names of shared tins added to this project will be converted to relative paths.		
Convert	button	
convert absolute paths to relative.		

Subscribe to Sharing Master Files

Position of option on menu: Project =>Management =>Sharing =>Subscribe to share master files

This panel allows you to subscribe to a set of sharing master files. Each master file defines a set of known models and tins, which will be shared into this project.

Selecting **Subscribe to share master files** brings up the **Subscribe to Sharing Master Files** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Set	button		
sets the list of files to which you wish to subscribe			

Note that the share check interval must be set, which can be set from the [Project Share Settings](#) panel.

Sharing Master File

Position of option on menu: Project =>Management =>Sharing =>Create share master files

This panel allows you to define a sharing master file. A sharing master file can be created and subscribed to by a number of clients. This will enforce and define the set of shared models and tins the clients will consume. Updating the sharing master file will likewise update the clients, at a set interval as defined by the client.

This panel will list all models and tins that the user has marked as shareable.

Selecting **Create share master files** brings up the **Sharing master file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Master file			
<i>the file to write to</i>			
Add?	tick box		
<i>whether or not to add the item to the sharing master file</i>			
Name			
<i>the name of the model or tin</i>			
Type			
<i>the type of the element (model or tin)</i>			

- Write

button

writes the sharing master file
- Refresh

button

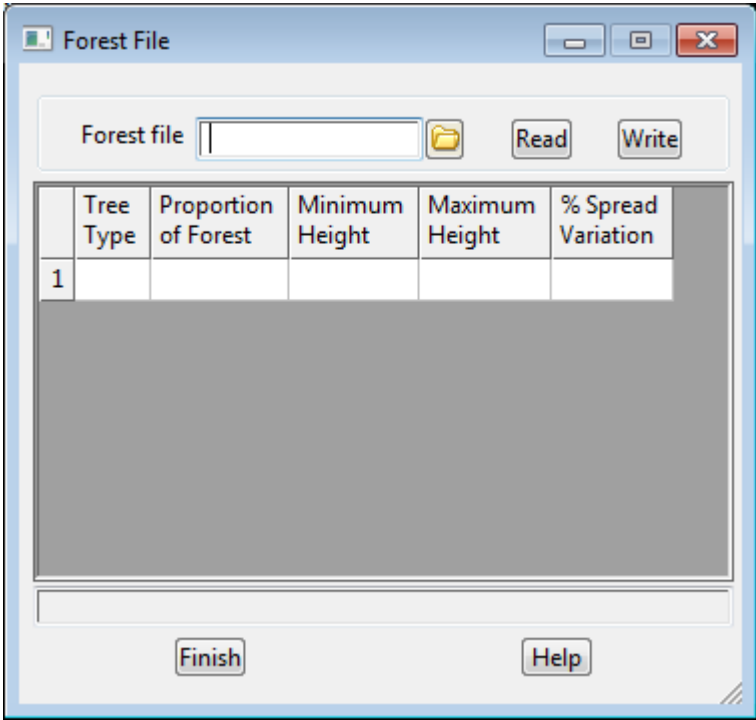

refreshes the list of shareable models and tins

Forest File

Position of option on menu: Project =>Management =>Forest file

The **Forest file** option creates files to control the types of trees, variation in heights and spreads and relative proportions of the various tree types in the file.

Selecting Forest file brings up the **Forest file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Forest file	file box		*.forest
<i>name for the forest definitions.</i>			
Read	button		
<i>read in the forest file given in Forest file</i>			
Write	button		
<i>write out to forest file to the file given in Forest file.</i>			
Tree grid	grid		
Tree type	billboard select		
<i>name of the billboard to be placed for the tree - 12d trees are under the Trees, Palms and</i>			

Shrubs section of the billboards.

Proportion of Forest positive real *.forest

relative proportions of the forest made up of this tree. The actual proportion is this value over the sum of all the values in this column.

Maximum/Minimum Height positive reals

min and maximum heights to use for this tree type.

% Spread Variation positive real between 0 and 100

Trash Bin

Position of option on menu: Project =>Management =>Trash bin

If the **Trash Bin** is turned on (by setting the env variable USE_TRASH_BIN_4D) then any deleted models, tins, functions and templates are not deleted from the disk but moved to the **12d Trash Bin**. Also for any models that are cleaned, the strings are moved to the trash bin.

If there is any data in the trash bin, a trash bin icon is displayed in the bottom left had corner of the project window.

Clicking on the trash bin icon, brings up the **Trash Bin** panel which displays the tins, templates or functions that have been deleted, and the models that have been deleted or cleaned. The delete/cleaned objects can be restored to the project.

Selecting Trash bin from Project =>Management =>Trash bin, also brings up the **Trash Bin** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Trash Bin Grid		grid		
Type		output only		model, tin
	<i>type of object - model or tin.</i>			
Name		output only		
	<i>name of the object.</i>			
Deleted by		output only		
	<i>name of the user who deleted/cleaned the object.</i>			
Time		output only		
	<i>time of the deletion.</i>			
Select		tick box		
	<i>ticked if this object is to be Restored/Deleted. Note that right bottom on Select brings up a menu to Toggle (tick to no tick, no tick to tick), Set (set all to tick), or Clear (set all to no tick) for the entire column.</i>			
Restore As		text		
	<i>if not blank, the name the restore the object as.</i>			
	<i>If blank, restore the object with its original name in the Name column.</i>			
Buttons		grid		
Restore		button		
	<i>restore all the ticked objects.</i>			

- Delete

button

delete all the ticked objects from the trash. These items are then permanently deleted.
- Refresh

button

refresh the grid.

Project Preview

Position of option on menu: Project =>Management =>Project preview

When a **12d Model** project is exited, an image is saved to display in the New/Open project options. The image can be the last active view or an image defined by the user. The *Project preview* option can write out a user selected image or remove one if a fixed image has been previously set.

Selecting **Project preview** brings up the **Project Preview** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Take preview	button		
<i>if clicked, the image of the current active view is written and set to be used as a fixed project preview image. That is, this image is always used as the project preview.</i>			
Release preview	button		
<i>active when a fixed image is being used for the project preview. In that case if it is then clicked, the fixed image is deleted. An automatic image of the last active view will then be saved each time the project is exited.</i>			

Toggle Density Drawing

Position of option on menu: Project =>Management =>Toggle density drawing

Toggles the **Use density drawing** tick box in the **Defaults** panel.

For more information on **density drawing**, see [Use density drawing tick box](#).

Note: This setting is only applicable to the 250M version of **12d Model**.

Restart

Position of option on menu: Project =>Restart

The **Restart** option exits the current **12d Model** project and then restart using the same project.
Useful for testing changes to set up files etc.
It will prompt if project **Save** is required.

Save

Position of option on menu: Project =>Save

The **Save** option saves the working project to disk.
On the **Save** from the Main menu, simply select the option and the project is saved.
On selecting **Save** from the floating Projects menu, the **save project** panel is displayed.

The position of the **save project** panel is also saved and the panel automatically placed on the screen when the project is started up again.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

after selecting this button, the working project is saved to disk.

Tree

Position of option on menu: Project =>Tree

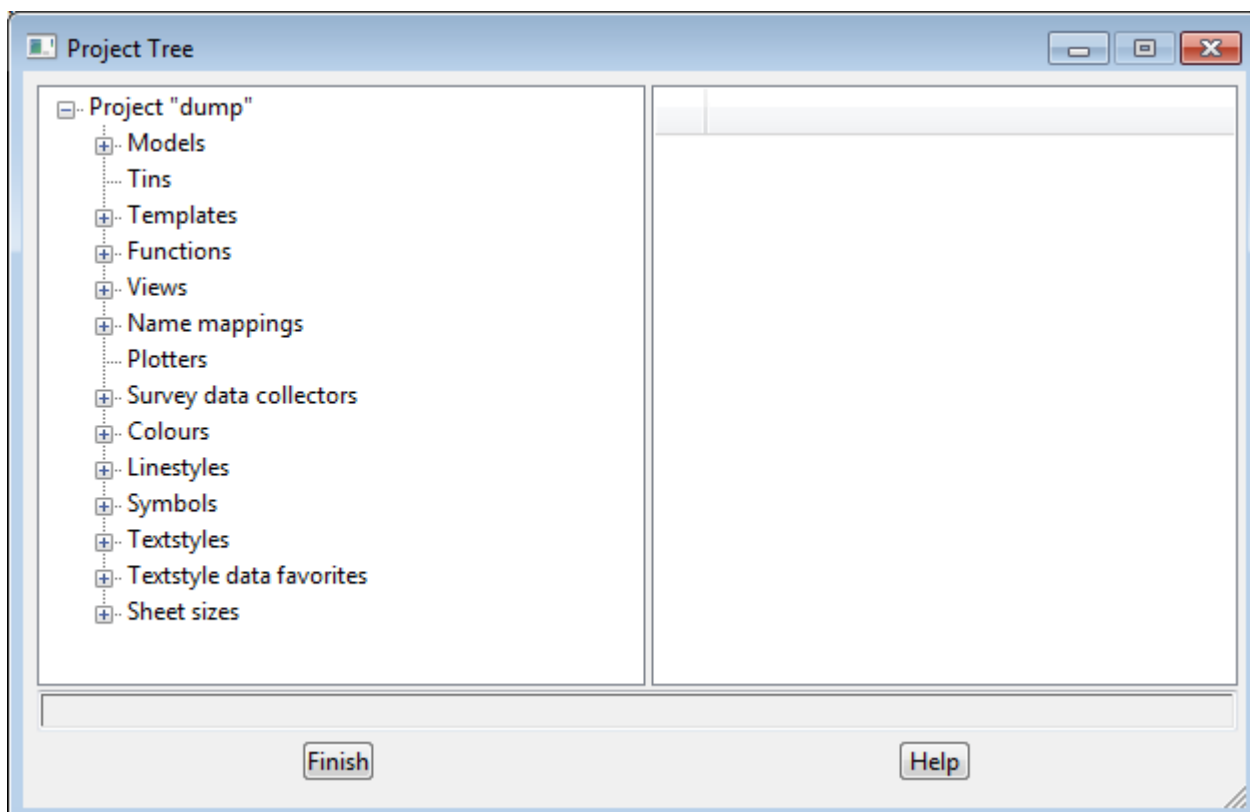

Position of option on menu: Project =>Management =>Tree

The **Tree** option is under continual development and being extended with each version of 12d Model.

Tree is used to drill down through information about the data in the project (for example models, tins and views) and also to interactive create/edit/edit most of the set-up information that is contained in text files. These include:

- (a) Name mapping (file names.4d) documented in the section [Name Mappings](#)
- (b) Plotters set-ups (file plotters.4d) which is not yet documented. See the section [Plotters](#).
- (c) Survey data collectors (file survey.4d) documented in the section [Survey Data Collectors](#)
- (d) Linestyles (file linestyl.4d) documented in the section [Linestyles](#)
- (e) Symbols (file symbols.4d) documented in the section [Symbols](#)
- (f) Textstyles (file textstyl.4d) documented in the section [Textstyles](#)
- (g) Textstyle data favourites (file textstyle_names.4d) documented in [Textstyle Data Favourites](#)
- (h) Sheet sized (file sheets.4d) documented in the section [Sheet Sizes](#)

On selecting the **Tree** option, the **Project Tree** panel is displayed.

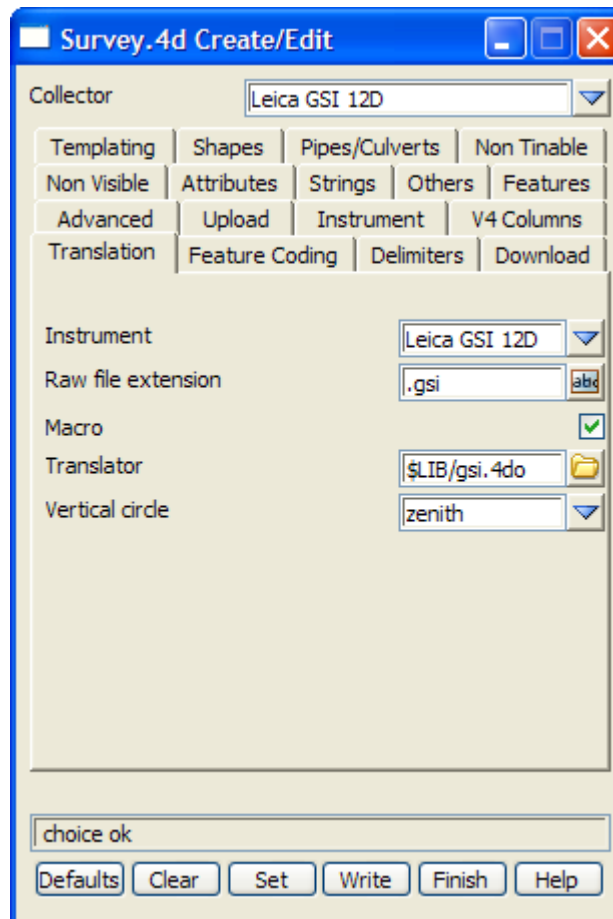

Note: This is a resizable panel.

Clicking on a **+** expands that browse tree node to show what items are available to get more information on. Clicking on a **-** collapses that browse tree node,

For the items *Name mappings*, *Plotters*, *Survey data collectors*, *Textstyles* and *Textstyle data favourites*, once they are expanded then the items displayed need no further expansion (there is no + displayed in front of the items) and double clicking on the expanded items brings up the create/edit panels for the item.

For example, clicking on + for *Survey data collectors* and then double clicking on a data collector brings up the *Survey.4d Create/Edit* panel.

For the option *Name mappings*, go to
Plotters
Survey data collectors
Linestyles
Symbols
Textstyles
Textstyle data favourites
Sheet sizes

[Name Mappings](#)
[Plotters](#)
[Survey Data Collectors](#)
[Linestyles](#)
[Symbols](#)
[Textstyles](#)
[Textstyle Data Favourites](#)
[Sheet Sizes](#)

Name Mappings

Position of option on menu: Project =>Tree

The name mapping file is used in all panel fields requiring the *name* of a string and the name field in the CAD Controlbar.

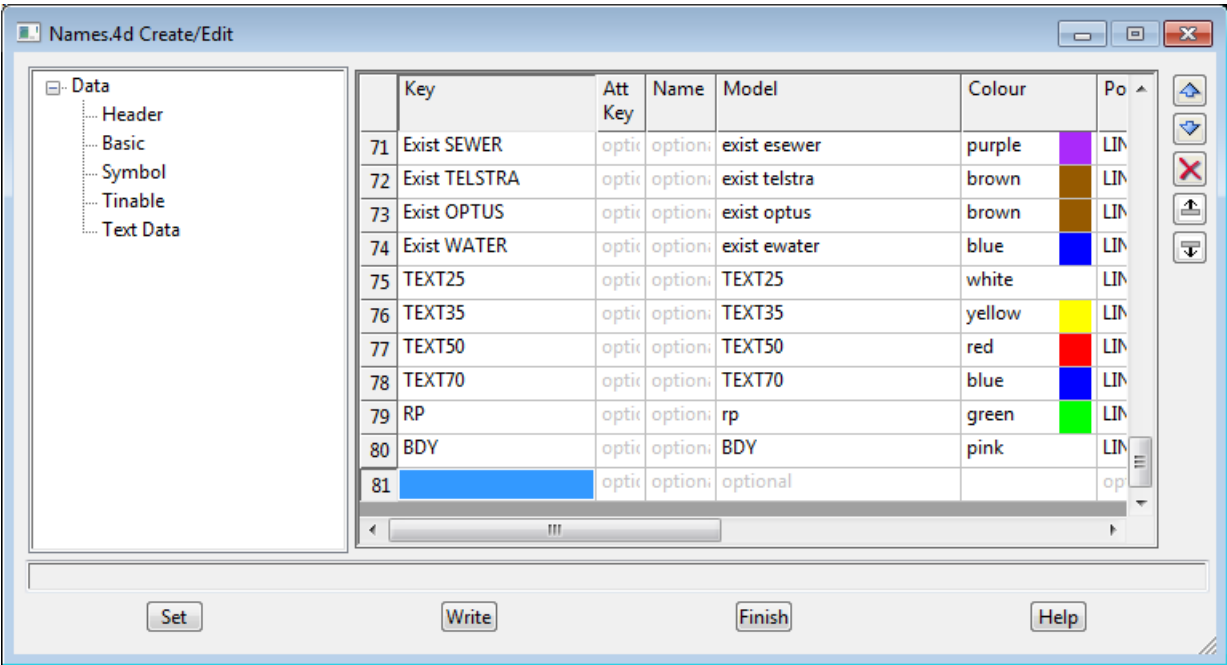

After the string name is typed, if the <Enter> is pressed then each section of the name mapping file being used for the project is searched for matches with the key.

If there is a match of the string name with a key, then the name, model, colour point/line type etc. for that key will be used in the appropriate panel fields, or toolbar fields, that go with the string name.

Click on *Name mapping* to expand the items and then double click LB on *Create name mapping* to create/edit the name mapping file *names.4d*.

Double clicking LB on any of the items below *Create name mapping* will also create/edit the *names.4d* file.

In either case, the **Names.4d Create/Edit** panel will then appear.

Buttons

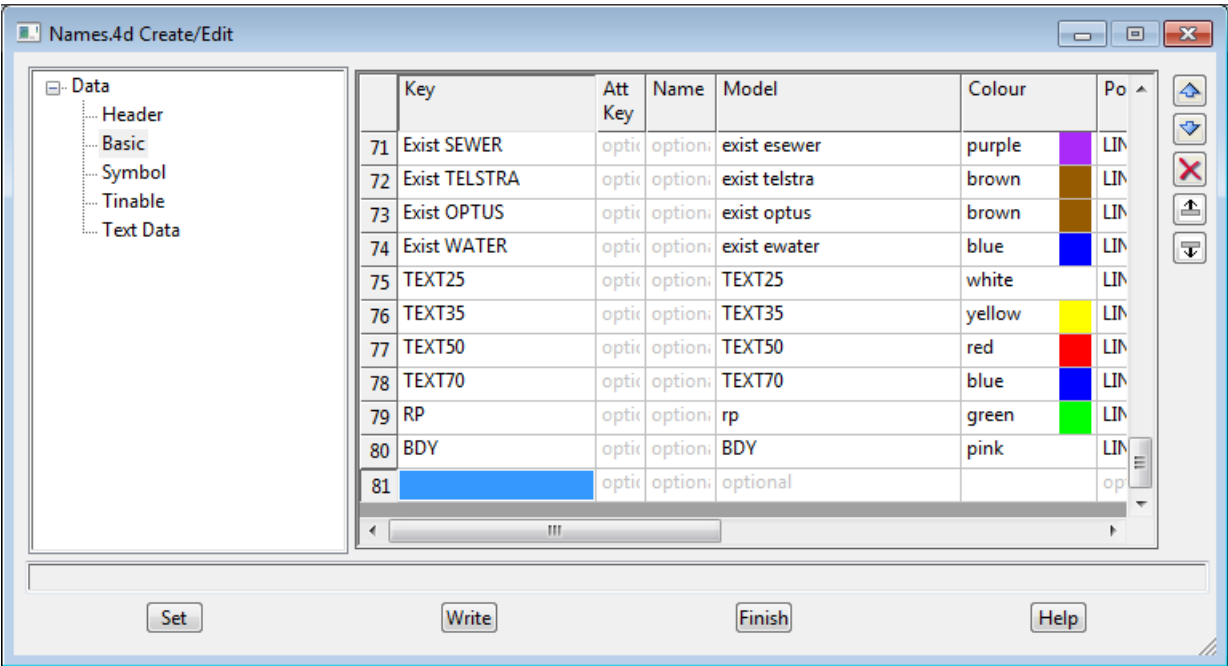

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

*write the information to the file names.4d. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** button is selected as well. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

Basic Tab

Key input
*the string name is searched against the list of keys for the **Basic** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters (?)*

Name input
if not blank, name used to replace the string name by. This is usually blank.

Model model grid available models
if not blank, model to use

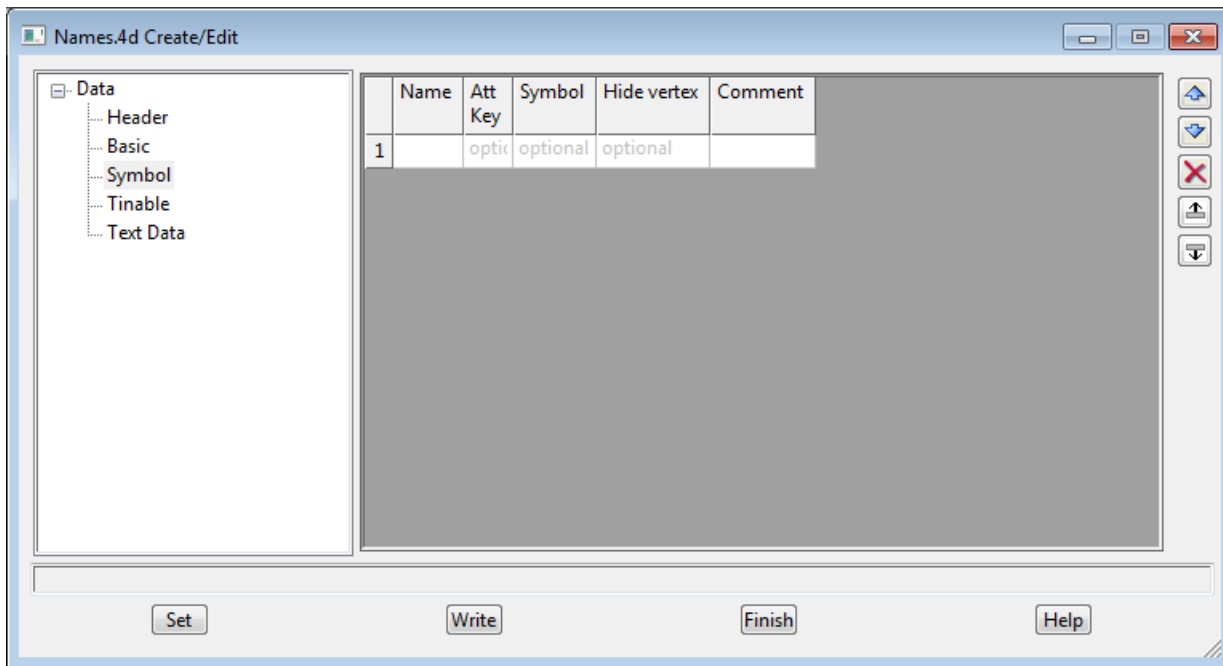

Colour colour grid available colours
if not blank, colour to use

Point Line point/line grid point/line
if not blank, point-line type to use

Weight input
if not blank, weight to use for strings with linestyle 1

Comment input
user comment

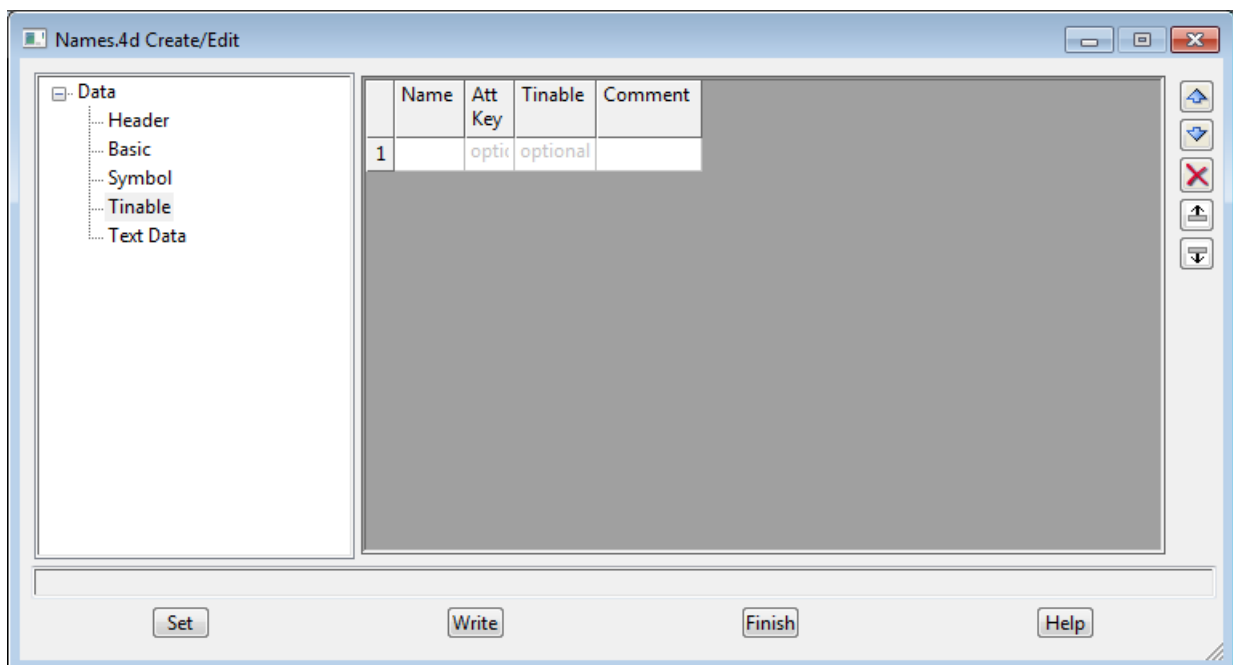

Symbols Tab

Key input

*the string name is searched against the list of keys for the **Symbols** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters*

Tinable Tab

Key input

*the string name is searched against the list of keys for the **Tinable** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters*

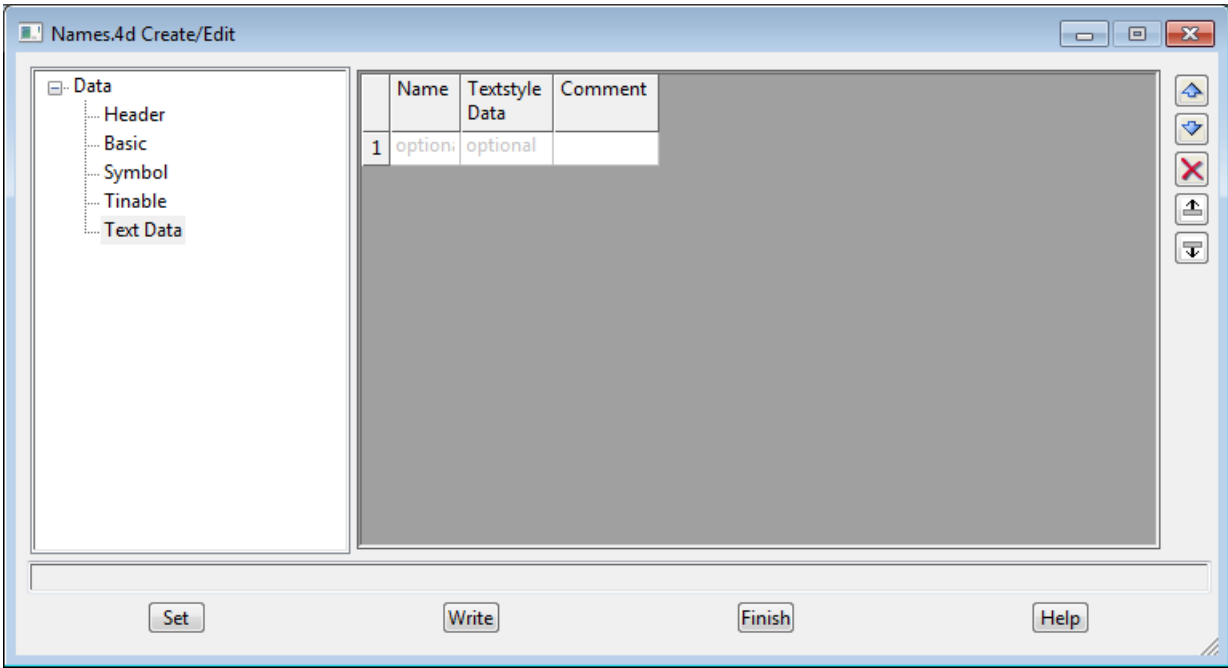

Tinable tinability grid

*if **no**, the entire string is non tinable. That is, the vertices are not included in any triangulation.*

*If **yes**, the entire string is tinable. That is, the vertices are used in any triangulation and the segments between the vertices are used as breaklines.*

*If **points**, the vertices of a string are tinable but the segments are not. That is, the vertices are used in any triangulation but the segments between the vertices are used as breaklines.*

Text Data Tab

Key input

*the string name is searched against the list of keys for the **Text Data** tab until a first match is found. If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The key can include wild cards (*) or wild characters*

Plotters

User defined plotters can be set up in **12d Model** and the information is stored in the file `plotters.4d` which is fully documented in the section [User Defined Plotters](#) in the Appendix [Plotters and Plotting](#).

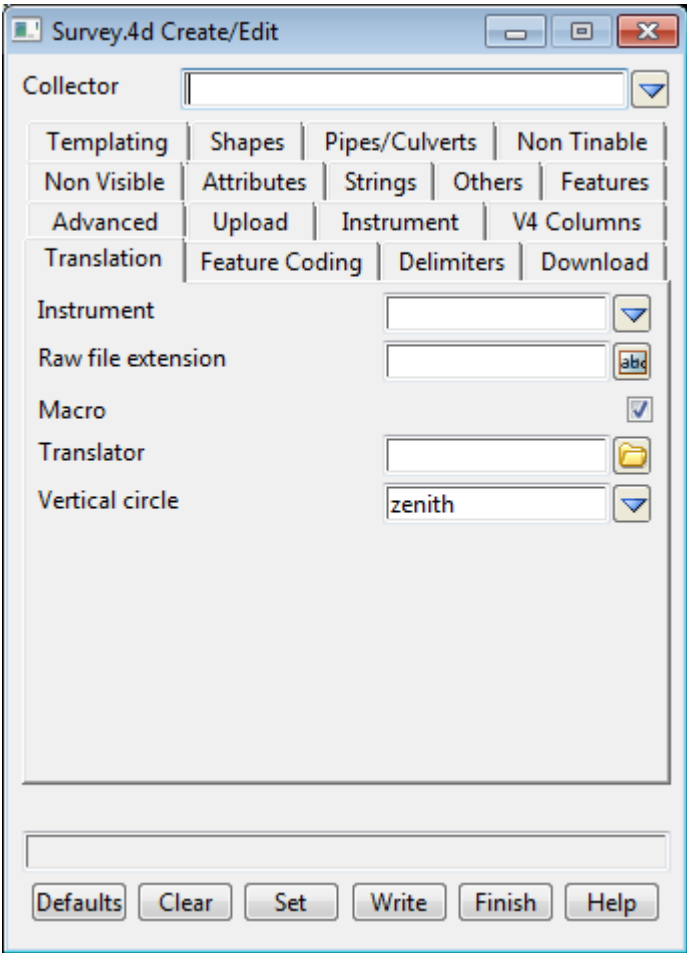

The interactive editor **Plotters** on the Browse option is not yet fully implemented or documented.

Survey Data Collectors

Position of option on menu: Project =>Tree

Click on *Survey data collectors* to expand the item and then double click LB on *Create data collector* to create a new data collector, or double click LB on an existing data collector in the list to edit an existing data collector definition.

The **Survey.4d Create/Edit** panel will then appear.

This option is fully documented in the [Data Collector Definitions](#) section in the Appendix [12d Survey Guide](#).

Linestyles

Position of option on menu: **Project =>Tree**

Click on *Linestyles* to expand the item and then double click LB on *Create linestyle* to create, edit or delete linestyles, or double click LB on an existing textstyle in the list to edit an existing linestyle definition. The **Linestyle Create/Edit/Delete** panel will then appear.

The linestyle can be created interactively in **12d Model** by drawing the new linestyle using strings containing lines, arcs, circles and text. This information can then be used to create the linestyle.

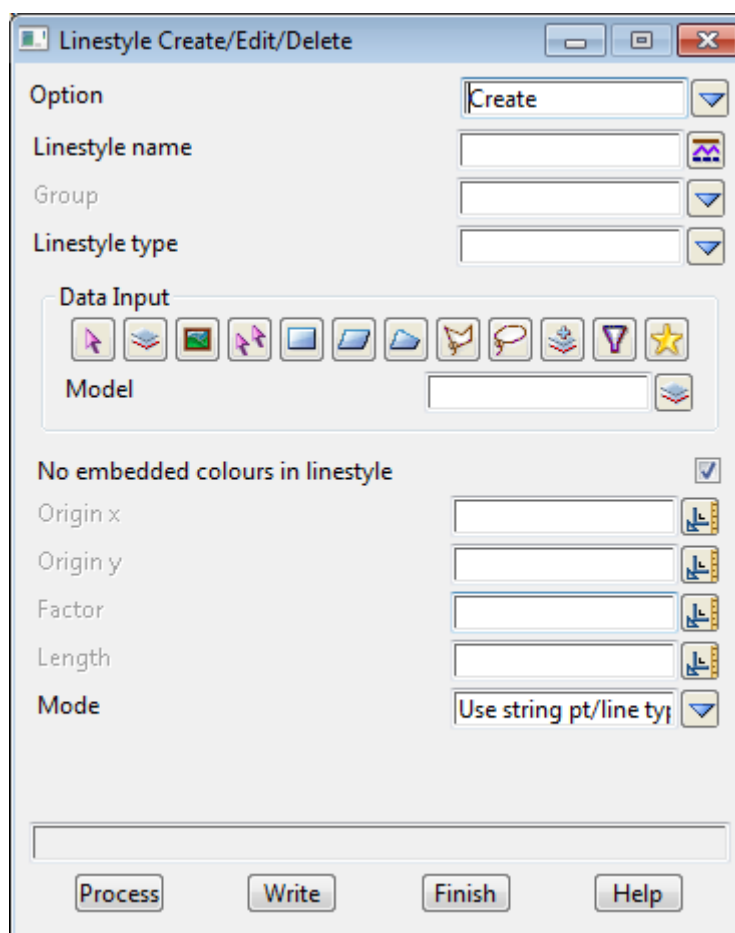

To edit a linestyle, the current definition is written to a model which can then be edited to create the modified linestyle.

The definition of a linestyle includes:

- (a) a unique name
- (b) the Group to show the linestyle under in the linestyle pop-up
- (c) the linestyle type

All the information for linestyles is stored in the text file *linestyl.4d* but the **Linestyle Create/Edit/Delete** panel is normally used to create and modify the file rather than using a text editor. (the file *linestyl.4d* is fully documented in the [Line Styles](#) section of the Appendix [Line styles, Symbols and Textstyles](#)).

The **Linestyle Create/Edit/Delete** panel is:

Help

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Option <i>type of edit</i>	choice box	Create	Create, Edit, Delete
Linestyle name <i>name of the linestyle to be created, edited or deleted.</i>	input		available linestyles
Group <i>name of the group for the linestyle - can be a new group name.</i>	input		available groups
Linestyle type <i>type of the linestyle.</i>	choice box	world	user, pixel, world, paper, 2 point, group

For Option choice "Create" - Data input

Data input <i>data to be used to create the linestyle.</i>	source box	model
----------------------------------------------------------------------	------------	-------

For Option choice "Edit" - Edit line work

Model for linestyle <i>model to write the linestyle out to so that it can be edited.</i>	model box	available models
Write out linestyle <i>when selected, the linestyle is written out to the Model for linestyle.</i>	button	

For Option choice "Delete"

Linestyle to delete	linestyle box	available linestyle
<i>name of the linestyle to delete.</i>		
Linestyle to replace it with	linestyle box	1 available linestyle
<i>when the linestyle is deleted, any string with that linestyle has to have a new linestyle. This is the linestyle that is set for strings with the deleted linestyle</i>		

For the Linestyle type - User, Pixel, World, Paper

No imbedded colours in linestyle	tick box	tick
<i>if ticked then no colours from the data are used in the linestyle.</i>		
<i>If not ticked then any colours used in the data are used in the linestyle</i>		
Origin x/y	double box	
<i>if non blank, the x/y value for the origin of the linestyle.</i>		
<i>If blank, a value is calculated by 12d.</i>		
Factor	double box	
<i>if non blank, the linestyle is factored up by this value.</i>		
<i>If blank, the factor is taken to be 1.</i>		
Length	double box	
<i>if non blank, the linestyle is repeated after this length.</i>		
<i>If blank, the linestyle length is calculated by 12d.</i>		
Mode	choice box	use string pt/line type only at vertices, repeat style
<i>if use string pt/line type, then if the string pt/line type is line then the linestyle is repeated after the Length value. If the string pt/line type is point, then the linestyle is only drawn at each vertex of the string.</i>		
<i>If only at vertices, then the linestyle is only drawn at each string vertex regardless of the strings pt/line type.</i>		
<i>If repeat style, then the linestyle is repeated after the Length value regardless of the strings pt/line type.</i>		

For the Linestyle type - 2 point

No imbedded colours in linestyle	tick box	tick
<i>if ticked then no colours from the data are used in the linestyle.</i>		
<i>If not ticked then any colours used in the data are used in the linestyle</i>		
Origin x/y	double box	
<i>if non blank, the x/y value for the first origin of the linestyle.</i>		
<i>If blank, a value is calculated by 12d.</i>		
Origin 2 x/y	double box	
<i>if non blank, the x/y value for the second origin of the linestyle.</i>		
<i>If blank, a value is calculated by 12d.</i>		
Stretch in	choice box	one direction, both directions
<i>if "one direction", the linestyle is only stretched along the axis joining the two original points. The linestyle is not stretched perpendicular to that axis.</i>		
<i>If "both directions", the linestyle is stretched in all directions.</i>		
Drawn on	choice box	every line/arcevery line/arc, every second line/arc

*if "one direction", the linestyle is only stretched along the axis joining the two original points. The linestyle is not stretched perpendicular to that axis.
If "both directions", the linestyle is stretched in all directions.*

For Linestyle type - Group

Linestyle grid

list of linestyles that make up the this one linestyle.

Buttons

Process button

process the data in the panel fields. The internal definitions of the linestyles is modified. The definitions are not written to the linestyle file.

Write button

*write the modifications to the file `linestyl.4d` file. This files can then be used when projects are opened up. The information won't be used for the current session unless the **Process** button is selected as well. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

This option updates the files `linestyles.4d` which is fully documented in the [Line Styles](#) section in the Appendix [Line styles, Symbols and Textstyles](#).

Symbols

Position of option on menu: Project =>Tree

Click on *Symbols* to expand the item and then double click LB on *Create symbol* to create, edit or delete symbols, or double click LB on an existing symbol in the list to edit an existing symbol definition. The **Symbol Create/Edit/Delete** panel will then appear.

The symbol can be created interactively in **12d Model** by drawing the new symbol using strings containing lines, arcs, circles and text. This information can then be used to create the symbol.

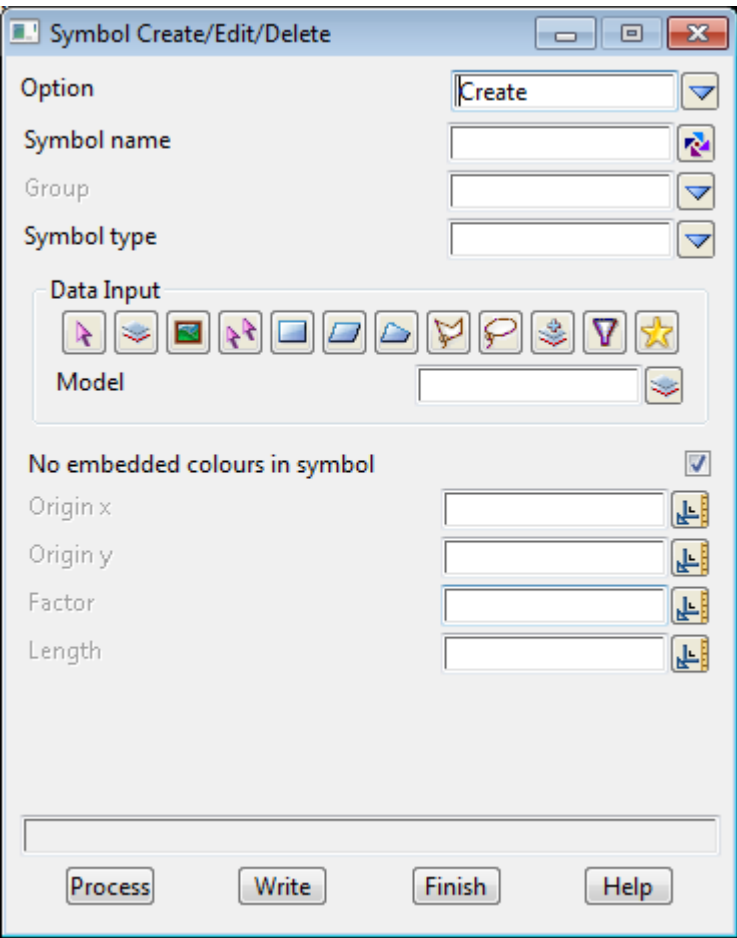

To edit a symbol, the current definition is written to a model which can then be edited to create the modified symbol.

The definition of a symbol includes:

- (a) a unique name
- (b) the Group to show the symbol under in the symbol pop-up
- (c) the symbol type

All the information for linestyles is stored in the text file symbols.4d but the **Symbol Create/Edit/Delete** panel is normally used to create and modify the file rather than using a text editor. (the file *symbols.4d* is fully documented in the [Line Styles](#) section of the Appendix [Line styles, Symbols and Textstyles](#)).

The **Symbol Create/Edit/Delete** panel is:

Model for symbol <i>model to write the symbol out to so that it can be edited.</i>	model box		available models
Write out symbol <i>when selected, the symbol is written out to the Model for symbol.</i>	button		

For Option choice "Delete"

Symbol to delete symbol box available symbols
name of the linestyle to delete.

Symbol to replace it with symbol box 1available symbols
when the symbol is deleted, any vertex of a string with that symbol has to have a new symbol. This is the symbol that is set for strings with the deleted symbol

No imbedded colours in symbol tick box tick
*if **ticked** then no colours from the data are used in the symbol.
If **not ticked** then any colours used in the data are used in the symbol*

Origin x/y double box
*if non blank, the x/y value for the origin of the symbol.
If blank, a value is calculated by 12d.*

Factor double box
*if non blank, the symbol is factored up by this value.
If blank, the factor is taken to be 1.*

Length double box
*if non blank, the symbol is repeated after this length.
If blank, the symbol length is calculated by 12d.*

Process button
process the data in the panel fields. The internal definitions of the symbols is modified. The definitions are not written to the symbol file.

Write button
*write the modifications to the file symbols.4d file. This files can then be used when projects are opened up. The information won't be used for the current session unless the **Process** button is selected as well. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

This option updates the files symbols.4d which is fully documented in the [Symbols](#) section of the Appendix [Line styles, Symbols and Textstyles](#).

Textstyles

Position of option on menu: **Project =>Tree**

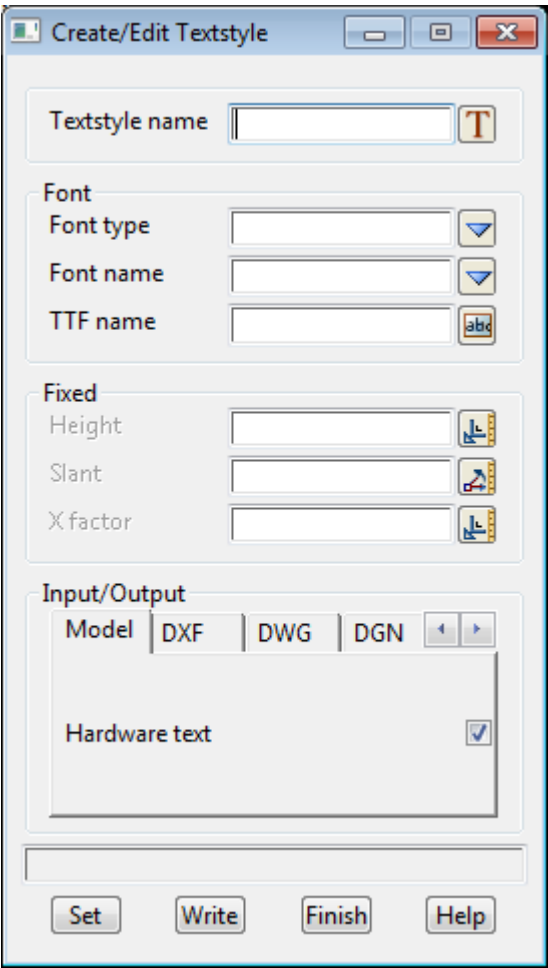

Click on *Textstyles* to expand the item and then double click LB on *Create textstyle* to create a new textstyle, or double click LB on an existing textstyle in the list to edit an existing textstyle definition. The **Create/Edit Textstyle** panel will then appear.

The textstyle definition includes

- (a) a unique name
- (a) the font used for textstyle - this may be a true type font
- (b) mappings of textstyle names when reading in data from AutoCAD and Microstation
- (c) mappings of textstyle names when writing data out to AutoCAD, Microstation and **12d Model** Models.

All the information for textstyles and fonts is stored in text files (textstyl.4d and fonts.4d) but the **Create/Edit Textstyle** panel is normally used to create and modify the files rather than using a text editor. (the files *textstyles.4d* and *fonts.4d* which are fully documented in the [Textstyles and Fonts](#) section of the Appendix [Line styles, Symbols and Textstyles](#)).

The **Create/Edit Textstyle** panel is:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Textstyle name	input		available textstyles

name of the textstyle to be defined or edited.

Font section

Font name	output	recent projects
name of the font to be used for the textstyle.		
True type font	tick box	tick
if ticked then the font is a true type font. The next box asks for the True Type Font name. If not ticked then the font needs an SHP file to define the characters. The next box asks for the SHP name.		
TTF name	input	available true type fonts
name of the true type font.		
SHP name	input	available SHP files
name of the SHP file to define the characters.		

Fixed section

Input/Output section

Model tab

Hardware text	tick box	tick
if ticked then any 12d Model text is written out to a model as text strings. If not ticked then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).		

DXF tab

Hardware text	tick box	tick
if ticked then any 12d Model text is written out to the DXF file as text. If not ticked then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).		
Input name	input	
when a DXF file is read in, any text in the DXF file with style of this Input name , is converted to 12d Model text strings with the textstyle Textstyle name .		
Output name	input	
if the Hardware text flag is set to tick - when data is written out to a DXF file, any 12d Model text with the textstyle of the name in the field Textstyle name , is converted to DXF text with style of this Output name . If the Hardware text flag is not set to tick, then this field is ignored.		

DWG tab

Hardware text	tick box	tick
if ticked then any 12d Model text is written out to the DWG file as text. If not ticked then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).		
Input name	input	
when a DGN file is read in, any text in the DGN file with style of this Input name , is converted to 12d Model text strings with the textstyle Textstyle name .		
Output name	input	
if the Hardware text flag is set to tick - when data is written out to a DWG file, any 12d Model text with the textstyle of the name in the field Textstyle name , is converted to DWG text with style of this Output name . If the Hardware text flag is not set to tick, then this field is ignored.		

DGN tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to the DGN file as text.
If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

*when a DGN file is read in, any text in the DGN file with style of this **Input name**, is converted to **12d Model** text strings with the textstyle **Textstyle name**. For DGN, the text style must be a number between 1 and 64.*

Output name input

*if the **Hardware text** flag is set to tick - when data is written out to a DGN file, any **12d Model** text with the textstyle of the name in the field **Textstyle name**, is converted to DGN text with style of this **Output name**. For DGN, the text style name must be a number between 1 and 64.
If the **Hardware text** flag is not set to tick, then this field is ignored.*

Other tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to the file as text.
If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

*when a file is read in, any text in the file with style of this **Input name**, is converted to **12d Model** text strings with the textstyle **Textstyle name**.*

Output name input

*if the **Hardware text** flag is set to tick - when data is written out to a file, any **12d Model** text with the textstyle of the name in the field **Textstyle name**, is converted to text with style of this **Output name**.
If the **Hardware text** flag is not set to tick, then this field is ignored.*

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

*write the information to the files **textstyle.4d** and **fonts.4d** files. These files can then be used when projects are started. The information won't be used for the current session unless the Set button is selected as well. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

*This option updates the files **textstyles.4d** and **fonts.4d** which are fully documented in the [Textstyles and Fonts](#) section of the Appendix [Line styles, Symbols and Textstyles](#).*

Textstyle Data Favourites

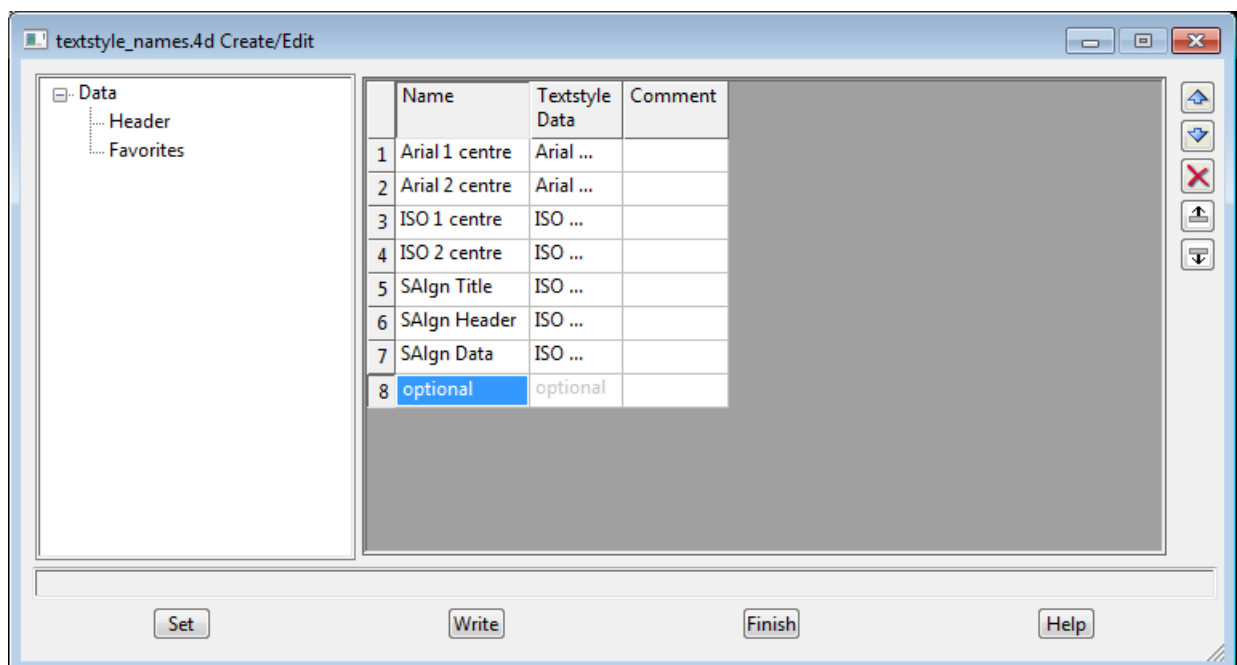

Position of option on menu: **Project =>Tree**

The *textstyle data favourites* option defines a set of text style parameters recorded with a user given name. When ever a text style needs to be defined, the name of a *textstyle data favourite* can be selected and the values of the favourite used for the text.

To define or modify a textstyle favourite, click on *Textstyle data favourites* in the *Browse* list to expand the item and then double click LB on *Create textstyle data favourite* to create/edit the *textstyle_names.4d* file.

Double clicking LB on any of the items below *Create textstyle data favourite* will also create/edit the *textstyle_names.4d* file.

In either case, the **Textstyle_names.4d Create/Edit** panel will then appear.

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

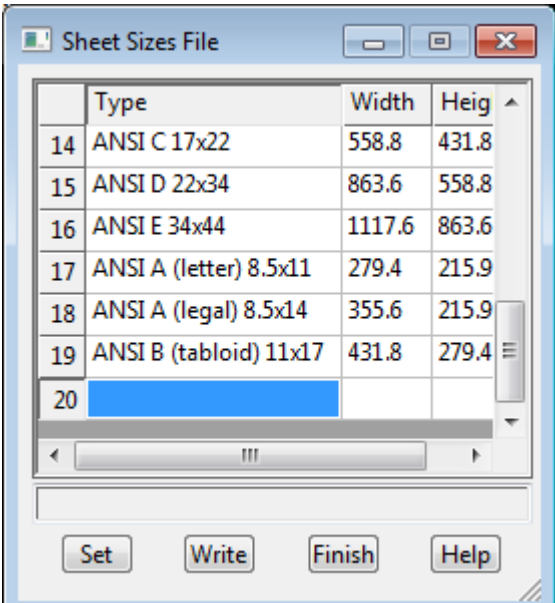

Write button

write the information to the `textstyle_names.4d` file. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** button is selected as well. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)

Sheet Sizes

Position of option on menu: Project =>Tree

Click on *Sheet sizes* to expand the item and then double click LB on *Create sheet size* to bring up the **Sheet Sizes File** panel to create, edit or delete sheet size definitions, or double click LB on an existing sheet size in the list to also bring up the **Sheet Sizes File** panel.

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

*write the information to the file sheets.4d. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** button is selected as well. For more information on the **Write** button, go to the section [Writing Set Up Files](#) in the Appendix [Setting Up and Configuring 12d](#)*

This option updates the file *sheets.4d* which is fully documented in the [Sheet Sizes File](#) section of the Appendix [Setting Up and Configuring 12d](#).

Utilities

Position of menu: Project =>Utilities

The *utilities* walk-right menu contains various project items.

For the option *Attributes*, go to

Projects

Create

Rebuild

Zip

Explore

Copy

Rename

Reset Project Id

[Attributes](#)

[Projects](#)

[Create](#)

[Rebuild](#)

[Zip](#)

[Explore](#)

[Copy](#)

[Rename](#)

[Reset Project ID](#)

The options in the menu will now be described.

Attributes

Position of option on menu: Project =>Utilities =>Attributes

The *Attributes* options displays, creates and edits the attributes for the current project

On selecting *Attributes*, the **Project Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Name
name of the attribute

Type integer, real, text
type of attribute - integer, real or text

Data
value for the attribute

OK button
set the attributes to the values in the panel and then exit the panel.

Apply button
set the attributes to the values in the panel but don't exit the panel.

Projects

Position of option on menu: Project =>Utilities =>Projects

The **projects** walk-right menu provides a list of all the projects available in the working folder. Each project is contained in a sub-folder of the working folder.

Selecting a project from the walk-right list will bring up the **Change Project** panel with the selected project name already in the New project panel field.

For more in formation on the **Change Project** panel, go to the earlier section [Open](#)

Create

Position of option on menu: Project =>Utilities =>Create

On selecting the Create option, the **Create Project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		
<i>name of the new project to be created.</i>			
Create	button		
<i>after selecting this button, a new project folder is created. The working project does not change to the new project.</i>			

Rebuild

Position of option on menu: Project =>Utilities =>Rebuild

The **rebuild** option is used to try and rebuild a project if some of the information has been corrupted.

On selecting the option, the project header file will be deleted and re-created and all the models, tins, templates and functions inside the project's folder added back into the project. The view information for the original project will be lost.

On selecting the **rebuild** option, the **rebuild project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		
<i>the name of the project to be rebuilt.</i>			
Rebuild	button		
<i>after selecting this button, the project given in the project field is rebuilt.</i>			

Note - the current (working) project cannot be rebuilt.

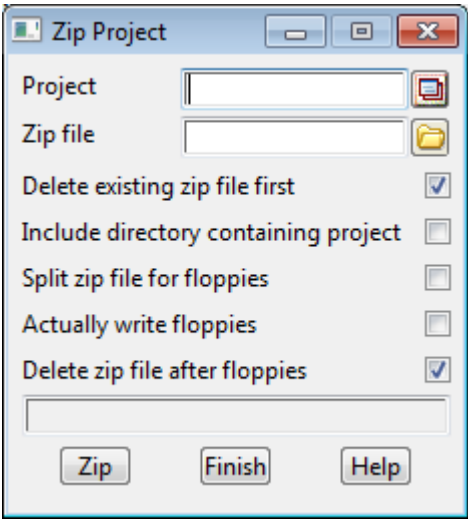

Zip

Position of option on menu: Project =>Utilities =>Zip

The **zip** option is used to make a zipped up a copy of any project (including the saved current project) in the working folder.

NOTE - this only contains the information in the ".project" folder. It does not include any files in the working folder.

On selecting the **zip** option, the **zip project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project <i>name of the project to be zipped up.</i>	input	none	projects in folder
Zip file <i>name of the zip file for the project.</i>	input		*.zip
Delete existing zip file first <i>if ticked and a zip file already exists, the existing file is deleted before the zip is done. If not ticked, any existing files of the same name in the existing zip file will be replaced and any new files will be added to the zip file.</i>	tick box	tick	
Include folder containing project <i>if ticked, the whole folder containing the project (not just the project) will be zipped.</i>	tick box		
Split zip file for floppies <i>if ticked, the zip file will be split into 1.4 Mb files.</i>	tick box		
Actually write floppies <i>if ticked, a batch file will be created and begun which asks for floppies to be inserted and then writes the split zip files onto them.</i>	tick box		
Delete zip file after floppies <i>if ticked, delete the zip file and any split files after the floppies are created.</i>	tick box	tick	
Zip <i>after selecting this button, a zip file of the project (or directory containing the project) given in the project field is made.</i>	button		

Explore

Position of option on menu: Project=>Utilities=>Explore

The **Explore** brings up the Windows Explorer showing the contents of the working folder. That is, showing the contents of the folder *containing* the project.

Copy

Position of option on menu: Project =>Utilities =>Copy

The **copy** option is used to make a copy of any project (other than the current project) in the working folder.

On selecting the **copy** option, the **copy project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Copy current working folder	tick box		none
<i>if ticked, the entire working folder containing the project is copied to the New folder.</i>			
Old project	input	none	projects in folder
<i>name of the project to be copied.</i>			
New folder	input		current working folder
<i>name of the folder to copy the project to.</i>			
New project	input		
<i>name of the copy of the project. The new project name cannot be the same as an existing project in the New folder.</i>			
Reset project ID (required for sharing)	tick box		
<i>if ticked, 12d will automatically reset the project id in the new copy of the project. This will prevent multiple projects with the same id, which are not allowed when sharing from one project to another. if not ticked, 12d will not reset the project id in the new copy of the project.</i>			
Copy	button		
<i>after selecting this button, a complete copy of the project given in the old project field is made and saved under the name given in the new project field. If Copy current working folder is ticked, the contents of the working folder containing the project is also copied.</i>			

Rename

Position of option on menu: Project =>Utilities =>Rename

The **Rename** option is used to rename any project (other than the current project) in the working folder, and if required, the working folder as well.

On selecting **Rename**, displays the **Rename project** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Working folder		folder box		folder browse
	<i>name of the folder that contains the project to be renamed (the working folder for the project).</i>			
Project		project box		projects in working folder
	<i>name of the project to rename - this can't be the project currently opened.</i>			
New name		input		
	<i>name of the new name for the project. The new project name cannot be the same as an existing project in the working folder.</i>			
Rename working folder (containing the project)		tick box		
	<i>if tick, if the working folder containing the project to be renamed is the same as the project name, then the working folder will also be renamed.</i>			
Rename		button		
	<i>after selecting this button, the selected project will be given the new name. If 'Rename working folder (containing project)' is ticked and the name working folder is the same as the project, then the working folder will also be renamed.</i>			

Reset Project ID

Position of option on menu: Project =>Utilities =>Reset Project ID

This option is used when a project has the same id as another project. If a user wishes to share from a server project that is a copy of another project, then the project ID must be reset.

On selecting the **Reset Project ID** option, the **Reset Project ID** panel is displayed.

Selecting **Change** displays the **Reset Project ID?** panel on the screen.

Selecting the **Yes** button will cause the project to resave and **12d Model** will restart.

Delete

Position of option on menu: Project ==>Delete

On selecting the delete project option, the **delete project** panel is displayed.

The fields and buttons used in the delete project panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		available projects

name of project to delete

Delete	button
---------------	--------

*after selecting this button, a **yes-no** pop-up menu appears to confirm that deleting the project is required. If deletion is confirmed, the selected project is deleted from the computer disk.*

12d Model

Position of option on menu: Project =>12d Model

The 12d model walk-right menu and the walk-right by menu are

12d Solutions phone, fax
etc.

12d Model version
date version compiled

12d Solutions phone, fax etc.

The walk-right menu for **Originators** is:

12d Model Menu

Position of option on menu: Project =>12d Model menu

Selecting the **12d Model Menu** option brings up the floating **12d Model** menu as described at the beginning of this chapter.

For the option *Projects*, go to the chapter

9 File I/O

Position of menu: File I/O

The facilities for reading and writing data files, layout files, textstyle definitions, template files into and out of **12d** Model, plus screen dumps are collected under the **File i/o** menu.

The **file i/o** walk-right menu containing these options is:

For *Data input*, go to

Data output

Layouts

Digitizer

GIS

Label Map files

Map files

Screen dump

Templates

Textstyle input

Edit file

[Data Input](#)

[Data Output](#)

[Layouts](#)

[Digitizer](#)

[GIS](#)

[Label Map Files](#)

[Map Files](#)

[Screen Dump](#)

[Templates](#)

[Textstyle Input](#)

[Edit a File](#)

Layouts

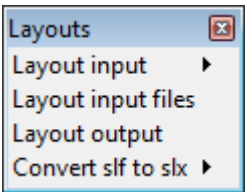

Position of menu: File I/O =>Layouts

The options under **Layouts** read and write screen layout files.

The screen layout format to use is the slx format (an XML format) introduced in **12d Model 10**.

There is also an option to convert the older format, slf, to slx.

The **Layouts** walk-right menu is

	
Layout input	read in layout files from working folder, Lib or User Lib
Layout input files	read in one of more layout files
Layout output	write out a screen layout file
Convert slf to slx	convert a pre V10 layout file (slf) to V10 layout file (slx)

For *Layout input*, go to
Layout input files
Layout output
Convert slf to slx

[Layout Input](#)
[Layout Input Files](#)
[Layout Output](#)
[Convert slf to slx Format](#)

Layout Input

Position of option on menu: File I/O =>Layouts =>Layout input

Walking right on **layout input** lists all screen layout files (files ending in .slx or .slf) in the working folder, or by further walking right on the [Lib] or [User lib], all screen layout files in [Lib] or [User lib] will be listed.

Clicking on a file in a one of the list runs the selected screen layout file and places on the screen, the menus and panels recorded in the screen layout file.

If Clicking on reads in a screen layout file (*.slf) which can create most menus and panels and place them on the screen.

The screen layout file can be created by the **layout output** option, the Menu/Panel Dump option, or by any text editor.

Note

If the *File I/O* menu or the *Layouts* menu, is pinned, clicking LB on **Layout input** brings up the **Read Screen Layout** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layout file	input		*.slx and *.slf
<i>the name of the screen layout file to read the screen layout information from.</i>			
Read	button		
<i>after selecting this button, the screen layout file will be read in.</i>			

Layout Input Files

Position of option on menu: File I/O =>Layouts =>Layout input files

The **layout input** files option reads in one or more screen layout files (files ending in .slx or .slf) which can create most menus and panels and place them on the screen.

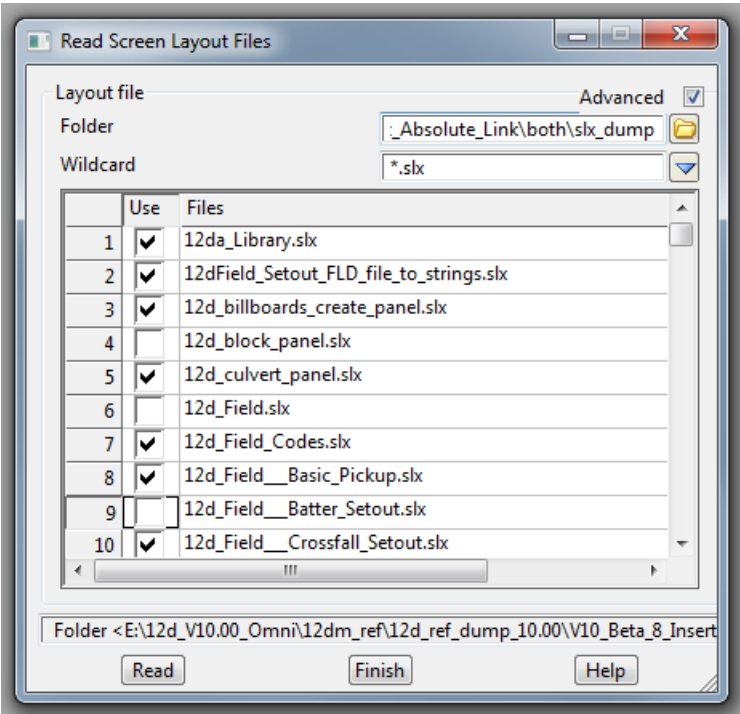

The screen layout file can be created by the **Layout output** option or by any editor.

On selecting the **Layout input** files option, the **Read Screen Layout Files** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Advanced	tick box	not ticked	
<i>if ticked, a folder containing slx/slf files can be selected, an optional Wildcard given, and all the slx/slf files satisfying the Wildcard are displayed in a grid. Files in the grid can be selected/not selected.</i>			

When **Read** is pressed, all the selected files are read.

Layout file input *.slx and *.slf

the name of the file to read the screen layout information from.

Read button

after selecting this button, the screen layout file will be read in.

Layout Output

Position of option on menu: File I/O =>Layouts =>Layout Output

The **layout output** option writes out information on almost all the objects on the screen, and for views, their sizes, into what is called a **screen layout file**.

For any menus, its screen position is recorded, and for panels, its position and all the information set for the panel is also recorded.

The screen layout file can then be read back in by options such as **layout input** and **Layout input files**, to recreate on the screen the menus and panels recorded in the screen layout file (but not the views).

Since the screen layout file is editable, users can create their own special layout files.

The view size information is helpful in building up a set_up_file to define the initial screen layout.

On selecting the **Layout output** option, the **Write Screen Layout** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layout file <i>the name of the file to print the screen layout information to.</i>	input		*.slf
Save <i>after selecting this button, the screen layout information will be printed out.</i>	button		

Convert slf to slx Format

Position of option on menu: File I/O =>Layouts =>Layout Convert

The options on the **Layout Convert** walk-right menu convert the older screen layout format (*.slf) to the new xml format (*.slx) introduced in **12d Model 9**.

Layout Convert walk-right menu containing these options is:

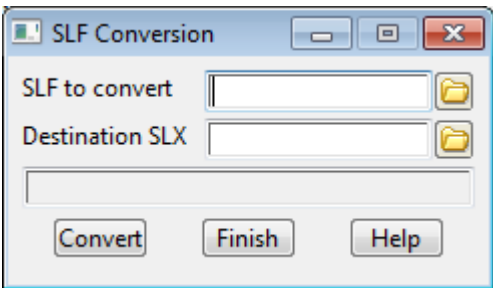

For the option *One*, go to [SLF Conversion](#)
For the option *Folder*, go to [Convert a Folder of Screen Layout Files](#)

SLF Conversion

Position of option on menu: File I/O =>Layouts =>Layout Convert=> One

The **One** option is for converting a single slf to a slx file.

Selecting **One** brings up the **SLF Conversion** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Slf to convert	file box		*.slf
<i>the name of the pre v9 format screen layout file to convert to a XML screen layout file.</i>			
<i>When a slf file is selected from the pop-up list, or types in and <enter> hit, then the slf file name, with the slf replaced by slx, is written to the Destination slx field.</i>			
Destination slx	file box		*.slx
<i>the slf file is converted to an XML screen layout file and given the name in Destination slx.</i>			
Convert	button		
<i>after selecting this button, the slf file will be converted to a slx file</i>			

Convert a Folder of Screen Layout Files

Position of option on menu: File I/O =>Layouts =>Layout Convert=> Folder

The **Folder** option is for converting a folder of slf files to a slx files.

Selecting **Folder** brings up the **Screen Layout Folder Conversion** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder to convert	input		*.slf
<i>the folder containing all the slf files to convert to slx files</i>			
Convert	button		
<i>after selecting this button, the all the slf files in the folder Folder to convert are converted to slx files. The converted files are given the same name as the slf files except the slf is replaced by slx.</i>			

Textstyle Input

Position of option on menu: File I/O =>Textstyle Input

When 12d Model starts up, a textstyles definition file can be automatically read in. The textstyles definitions file defines the textstyles and fonts used in the project.

It is possible to redefine the textstyles by reading in another textstyles definitions file using the **Textstyle input** option.

On selecting the **Textstyle input** option, the **Read Textstyles Definitions** panel is displayed.

The fields and buttons used in this panel have the following functions.

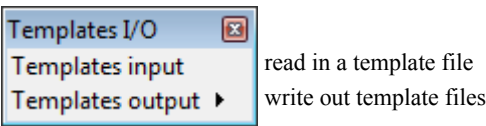

Field Description	Type	Defaults	Pop-Up
Textstyle file <i>the name of the file to read the textstyle information from.</i>	input		*.tsf
Read <i>after selecting this button, the textstyles definitions file will be read in.</i>	button		

Templates

Position of menu: File I/O =>Templates

The option under **Template** read and write Design Template files.

The **Templates** walk-right menu is

For *Templates input*, go to
Templates output

[Templates Input](#)
[Templates Output](#)

Templates Input

Position of option on menu: File I/O =>Templates =>Templates Input

This option is used to read in templates from files in the special 12d Model template format.

On selecting the **Templates input** option, the **Read Templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>name of the 12d template file to be read in</i>	input		*.tpl files
Read <i>read the data in.</i>	button		

Note if a template already exists, then the template in the file is ignored.

Templates Output

Position of menu: File I/O =>Templates =>Templates Output

The **templates output** option writes out one or all templates in the 12d Model template format. The **Output** walk-right menu is

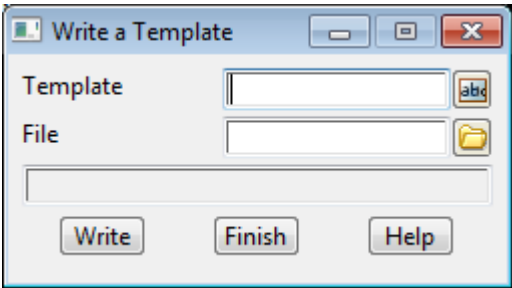

For the option **One template**, go to [One Template](#)

One Template

Position of option on menu: File I/O =>Templates =>Templates Output =>One Template

This option is for writing a single template out in the special 12d template format.

On selecting the One template option, the **Write a Template** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	input		available templates
<i>name of the template to be written out.</i>			
File	input		
<i>name of the file to write the template to.</i>			
Write	button		
<i>after selecting this button, the template given in the template field will be written out to the file with the name given in the file field.</i>			

All Templates

Position of option on menu: File I/O =>Templates =>Templates output =>All templates

This option is for writing all template out in the special 12d Model template format.

On selecting the All templates option, the **Write All Templates** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	input		
<i>name of the file to write all the templates to.</i>			
Write	button		

*all the templates will be written out to the file with the name given in the **file** field.*

Screen Dump

Position of option on menu: File I/O =>Screen dump

The 12d Model screen can be dumped to disk in a variety of images formats, or as a screen layout file.

On selecting the Screen dump option, the **Screen Dump** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box	BMP	

format to write the screen dump out in.

File	file box	*.bmp files
-------------	----------	-------------

file to write the screen. dump to.

Dump	button
-------------	--------

after selecting this button, the screen/window is dumped out in the selected format.

Map Files

Position of menu: File I/O => Map files

The main options under **Map files** is **Create/edit** which creates and edits **12d Map Files** which are used in many **12d Model** panels

The Map File format uses is the **.mapfile** format (an XML format) introduced in **12d Model 10**.

There is also an option to convert the older format, **.mf**, to the XML **.mapfile**.

Note: if the **Create/edit** option is used on an old format file, it is automatically converted to the new format.

The **Map files** walk-right menu is

create/edit a mapfile

convert pre-V9 map file format to XML format map files

create/edit a pre-V9 map file

For **Create/edit**, go to

Convert .mf to .mapfile

Create/edit .mf

[Create/Edit a Map File](#)

[Convert .mf Files to .mapfile](#)

[Create/Edit .mf File](#)

Create/Edit a Map File

Position of option on menu: File I/O =>Map files =>Map File

The **Map file** option is used to **create** or **edit 12d Map Files** which are used in many **12d Model** options for reading in data, reducing surveys, mapping existing data etc.

A **12d Map file** consists of sections of tables or grids of keys or entity-masks which are used to select specific data to set many string properties such as string name, colours, linestyles, symbols, models, extrusions and tinability for the strings that are being created and/or modified by the **12d Model** option.

For example, the **X Y Z Input** options reads in an XYZ file and creates strings of (x,y,z) data with string names for the lines strings. A **12d Map File** can be used in option to give the strings other properties such as colour, linestyle, colour fills, pipe diameters etc.

The Map File consists of sections such as Basic, Fills and Pipes, which are displayed as a tree. The strings are processed by each section of the tree, going in order from the top to the bottom of the Map File tree.

Each section of the Map File uses matching of specific string information against a **Key** to select strings and/or vertices and/or segments for processing by that section of the Map File.

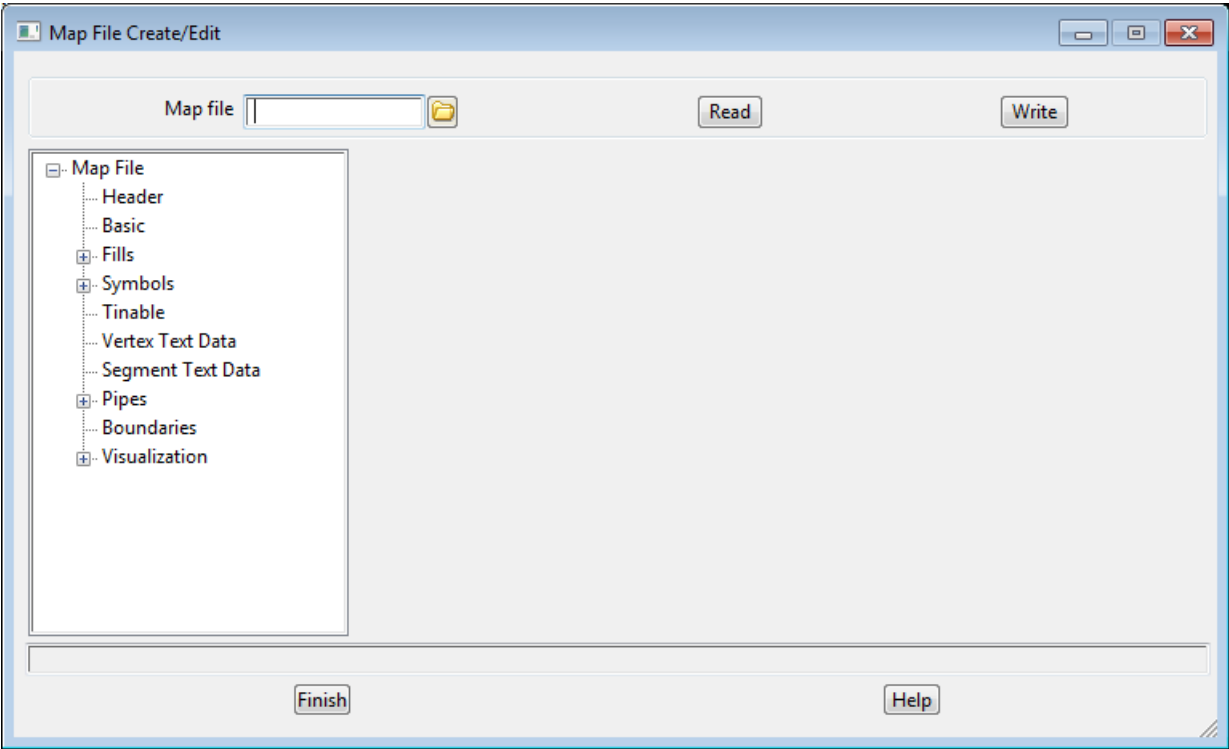

The **Basic** section is the first section used and takes the data that had been created by the option and uses the Entity Name and string attributes created by the option to set string properties such as string name, colour, point-line type, linestyle, weight and model. What the Entity Name actually is depends on the particular option that the Map File is being used in.

For example, the Survey Data Reduction option uses the **field code** as the entity-name, the xyzs reader uses the **string name** in the xyzs file as the entity-name but in the DWG reader, no entity name exists and the **AutoCAD layer** can be used as the entity-name. For the DGN reader, a combination of Level, Colour, Linestyle and Weight can be the entity name.

After the **Basic** section is applied, the string has a definite string name that is used as part of the matching key in all the other sections of the Map File.

In the other sections of the Map File, the **Key** is a combination of string names, and/or string attribute values **Att key**, and/or vertex attribute values **Vertex Att key** and/or segment attribute values **Segment Att key**

Selecting **Map file** brings up the **Map File Create/Edit** panel:

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file <i>name of the map file to be created or edited.</i> <i>If it is a .mf file, it is automatically converted to the new xml format and written out as a .mapfile.</i>	input		*.mapfile, *.mf
Read <i>read in the map file given in the map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.</i>	button		
Write <i>write out the data in the table to the file name given in the Map file field. If the file already exists, a replace-cancel panel checks to see if the existing file is to be over written - if cancel is selected, nothing is written out.</i>	button		

For more information on *Header*, go to

Using attribute values [Map File Substitution by Attributes](#)

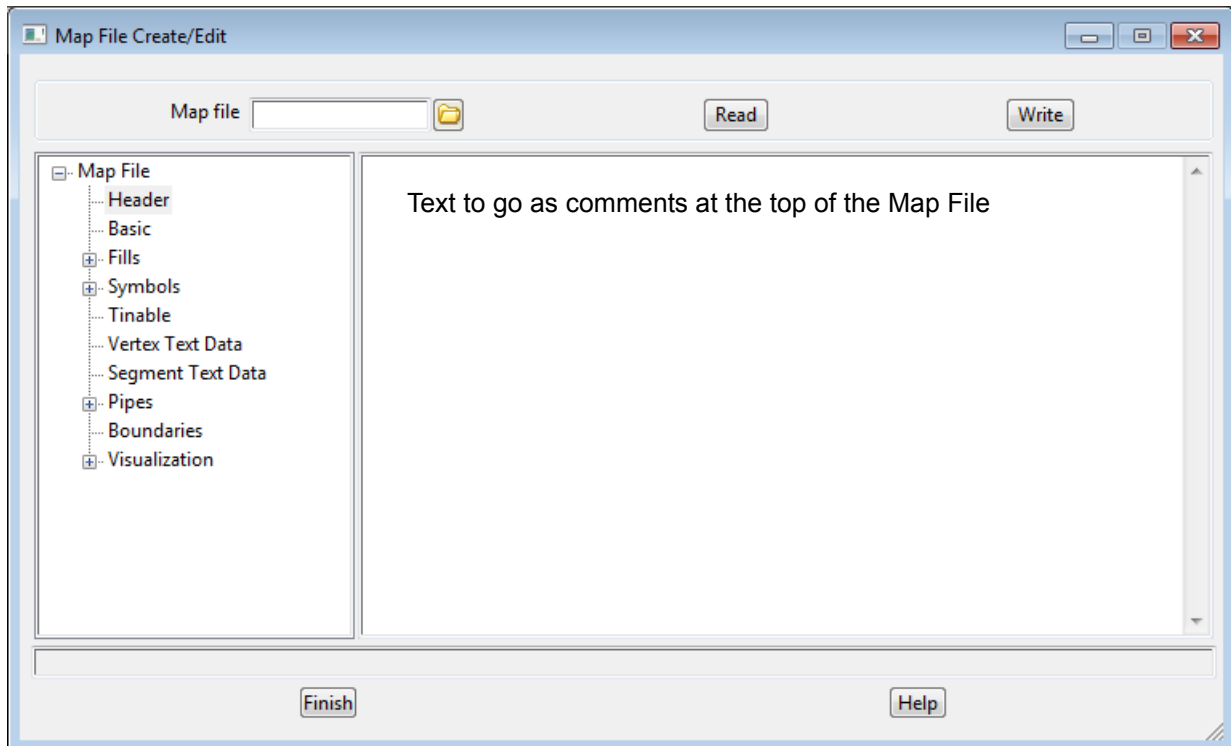

Logging in the Map File

[Map File Logging](#)

Header

Header just has lines of comment text. A common use is to document which client the file is to be used for, or the revision history.

The text written in the right hand side of the panel is written out as comments at the top of the Map file.

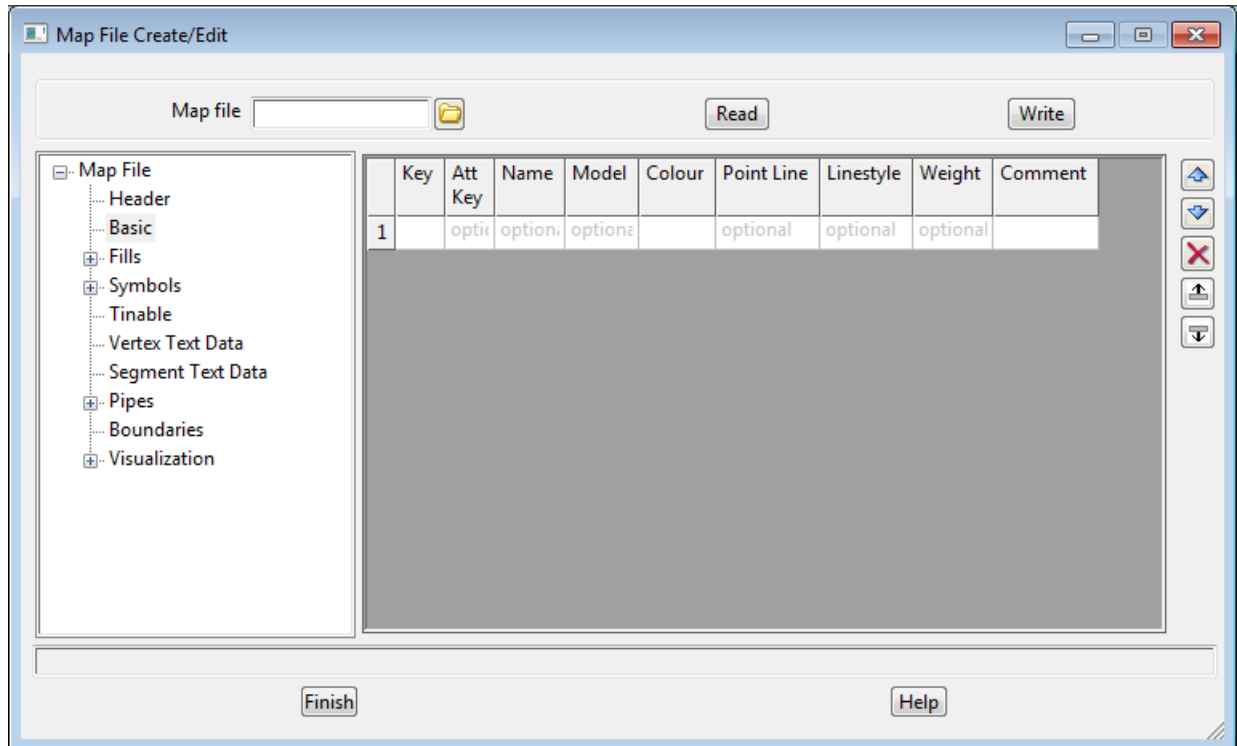

Go to the next section [Basic](#) or return to [Create/Edit a Map File](#).

Basic

The **Basic** grid selects data using the **Key** and **Att Key** and sets the name, model, colour, linestyle, point-line type, and weight for the created strings.

Note: the **final string name** is the **Name** set by the **Basic** grid, or if none is set in the **Basic** grid, then it is the **Entity Name**.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Processing Using Key and Att Key

when an Entity finds a first match with **Key** and **Att Key** in the grid (see [Matching Using Key and Att Key](#)), the created string is given the properties as defined in the parameters of the matching line.

Key and Att Key

select colour pop-up

Key is a Text grid cell and the text entered into **Key** can include wild cards * and wild characters ?. The **Entity Name** is matched against **Key**.

Att Key is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.

The **Entity Attributes** are matched against the attribute details in **Att Key**.

To access **Att Key**, click LB on the **Att Key** field to highlight the field, then click LB again to bring up the **Attribute Data** panel. To enter data see [Attribute Data Panel](#).

Matching Using Key and Att Key:

The Entity being mapped needs an Entity Name (which may be blank) and can also have Entity Attributes. The Entity may even have some other properties such as colour, linestyle etc.

Starting with the first line of the grid, matching and processing occurs as follows

*If **Key** and **Att Key** are not blank, and a match of the Entity Name occurs with **Key** and a match of the Entity Attributes occurs with **Att Key**, then the rest of the fields for this line of the Map File grid are used on the created string.*

If **Key** is not blank and **Att Key** is blank, and a match of the Entity Name occurs with **Key**, then the rest of the fields for this line of the Map File grid are used on the created string.

If **Key** is blank then no match occurs and this line of the Map File grid is ignored.

If a **match occurs**, then no tests for matches against **Key** and **Att Key** further down in the grid are made.

If **no match occurs**, then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Name select name pop-up

if non-blank, the created string is given this **Name**.

if blank, the original Entity Name (which matched against **key**) is used as the string name.

Important Note: the resulting string name is used for matching in all the subsequent Map File nodes (e.g. Fills, Symbols, Pipes, Visualisation etc).

Model select model pop-up

if non-blank, the model to be used for all strings produced by this line of the map file grid.

if blank, the string's model is not modified. Note: some options may allow **Model** to be ignored.

Colour select colour pop-up

if non-blank, the colour to be used for all strings produced by this line of the map file grid.

if blank, the string's colour is not modified.

Point Line select choice point, line

if non-blank, the breakline type to be used for all strings produced by this line of the map file grid.

if blank, the string's point-line type is not modified. If data is coming from a field file, then the data may be coded as a line or point string.

Linestyle select linestyle pop-up

if non-blank, the linestyle to be used for all strings produced by this line of the map file grid.

if blank, the string's linestyle is not modified.

NOTE: If the point-line type is point then the linestyle is used as a symbol at each vertex of the string. The size of the symbol at each point is given in the linestyle definition. If a symbol at each point is required whose size, colour and rotation may need to be modified at each point, then the **Symbol** section must be used to place a symbol at each vertex and a world style must be used in the symbol name field in the **Symbol** tab. See [Symbols](#).

Weight

if non-blank, the weight to be used for all strings produced by this line of the map file grid.

if blank, the string's weight is not modified.

Comment

comment to be used in this line of the map file.

To assist in debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Fills](#) or return to [Create/Edit a Map File](#).

Fills

Fills creates fills for the selected super strings (closed and non-closed).

Super strings can support more than one fill type per string. For example, a super string can have a solid fill, and an I Acad fill at the same time.

The order of drawing the fill types is: solid, bitmap, pattern, hatch, acad.

For more information on *Solid Fill*, go to

[Fills >Solid Fill](#)

Bitmap Fill

[Fills >Bitmap Fill](#)

Pattern Fill

[Fills >Pattern Fill](#)

Autocad Fill

[Fills >Autocad Fill](#)

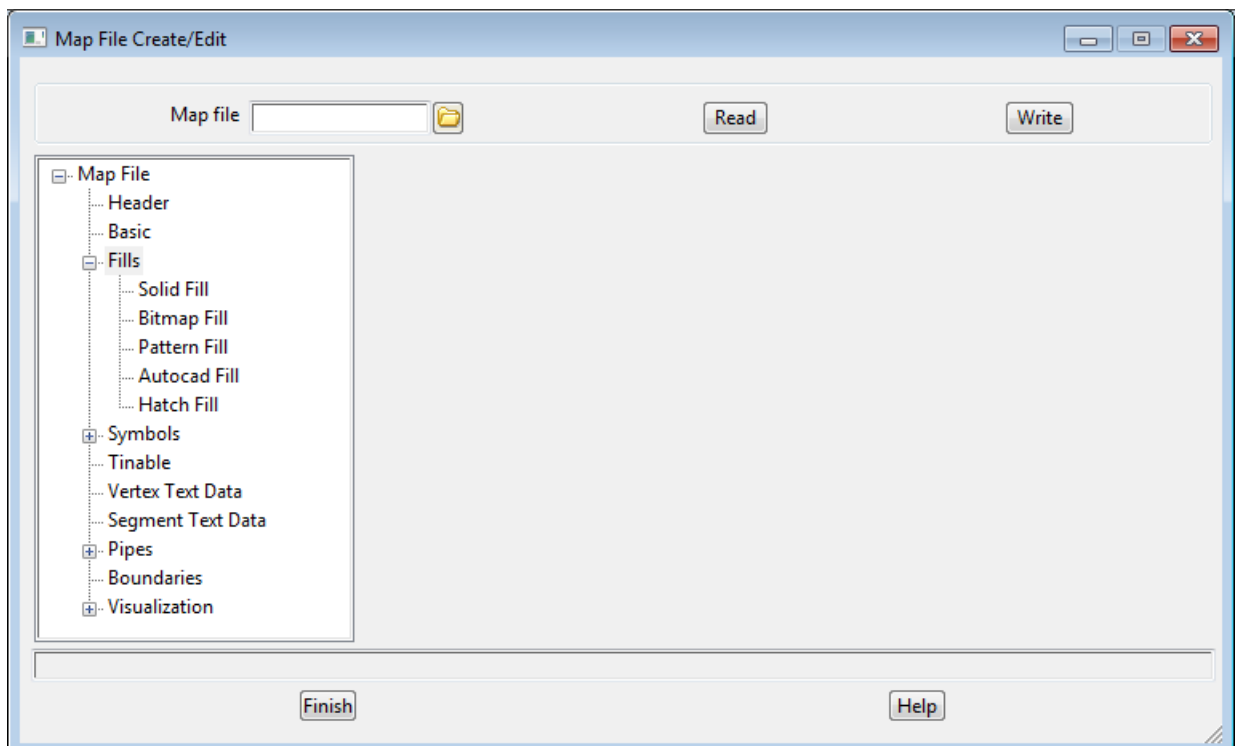

Hatch Fill

[Fills >Hatch Fill](#)

Multiple Fills

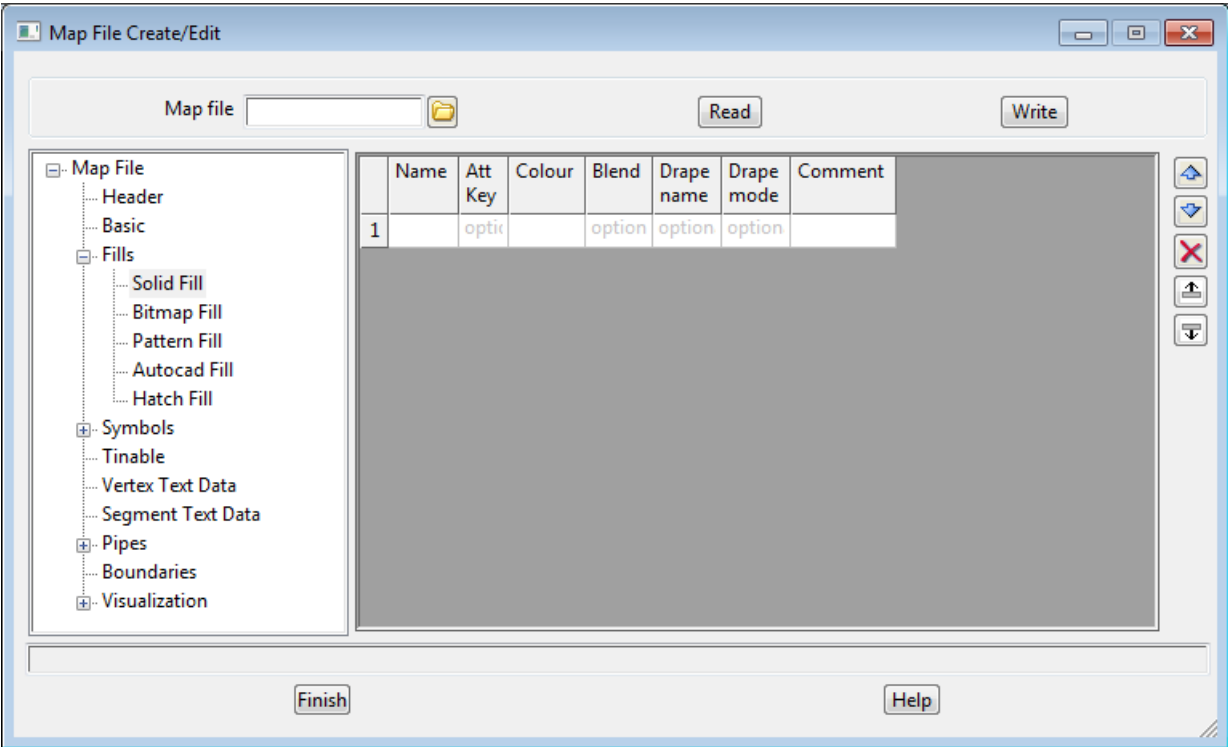

[Multiple Fills](#)

Note: there are settings for Plan Views that determines how fills are drawn on plan views (see [Face Flags for View](#) in the chapter [View Menus](#)).

Fills >Solid Fill

Solid Fill sets whether super strings (closed and non-closed) are filled with a "solid" colour, and optionally with some level of blending (transparency).

Field Description Type Defaults Pop-Up

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given a Solid Fill as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid and the text entered into **Name** can include wild cards * and wild characters ?. The string name is matched against **Name**.

Att Key is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.

The **string** attributes are matched against the attribute details in **Att Key**.

To access **Att Key** data, click LB on the **Att Key** field to highlight the field, then click LB again to bring up the **Attribute Data** panel. To enter data, see [Attribute Data Panel](#).

Matching Using Name and Att Key:

Strings are first created via the **Basic** node and given a string name of either the Entity Name or the text given in the Name column of the Basic Map File grid.

Starting with the first line of the grid, matching and processing occurs as follows

If **Name** and **Att Key** are not blank, and a match of the string name occurs with **Name** and a match of the string attributes occurs with **Att Key**, then the rest of the fields for this line of the Map File grid are used on the string.

If **Name** is not blank and **Att Key** is blank, and a match of the string name occurs with **Name**, then the rest of the fields for this line of the Map File grid are used on the string.

If **Name** in blank then no match occurs and this line of the Map File grid is ignored.

If a **match occurs**, then no tests for matches against **Name** and **Att Key** further down in the grid are made.

If **no match occurs**, then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Colour

select colour pop-up

colour to use to fill the super string with. If the super string is not closed, the fill will apply as if the super string was closed.

This field can not be blank.

Blend

measures box

At Point, Point to Point, String from Point, String to Point)

if **not blank**, the blend value to use for the solid fill. This value is between 0.0 and 1.0 and controls the amount of transparency of the fill.

if **blank** the blend value of 1.0 is assumed.

TODO: measures box makes no sense....

Drape name

if **not blank**, the string is given this as a Drape name. That is, a name that is used to specify which strings are draped as the solid filled super string onto a tin.

This allows the plan shape of a polygon to be drawn on top of a tin. A good example would be a polygon defining the shape of a "left turn arrow" which the user wants drawn on top of the road design tin. If the user adds the road design tin (and the tin has a **Plan polygon drape name** set to the **Drape name** set here), then the model containing the polygon onto an OpenGL perspective view, the "left turn arrow" will be drawn after the tin and draped onto the tin.

If **blank**, no drape name is given to the string.

To access the render settings panel use **View=>Visualisation=>Tin Render Settings** (see [Tin Render Settings](#)). To see the effect of the drape requires the visualisation module.

Drape mode

choice box

Colour, Colour to texture

if **Drape name** is blank this field is not used.

if non blank, and the value is

Colour, the solid fill colour of the super string is used to draw onto the surface of the tin.

Colour to texture, the value of the solid fill colour is mapped via the **Texture mapping** field of the **Tin Render Settings** panel and a texture drawn inside the polygon draped onto the tin.

Drape mode cannot be blank if **Drape name** is present.

To access the render settings panel use **View=>Visualisation=>Tin Render Settings** (see [Tin Render Settings](#)). To see the effect of the drape requires the visualisation module.

Comment

comment to be used in this line of the map file.

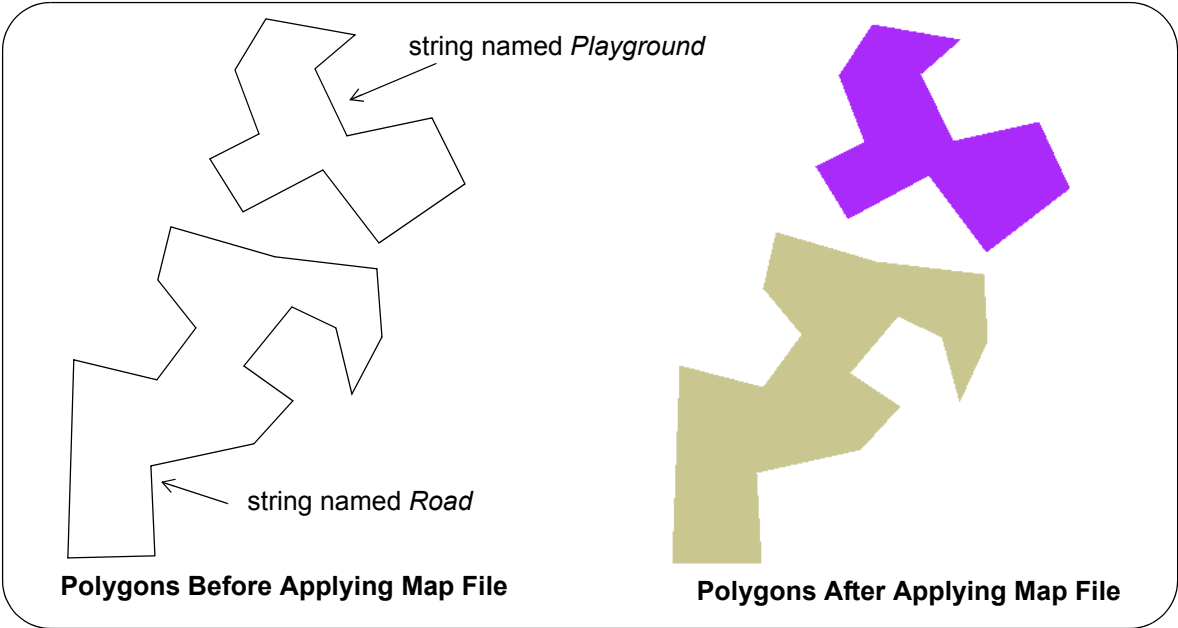

To assist in debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Example of Solid Fill

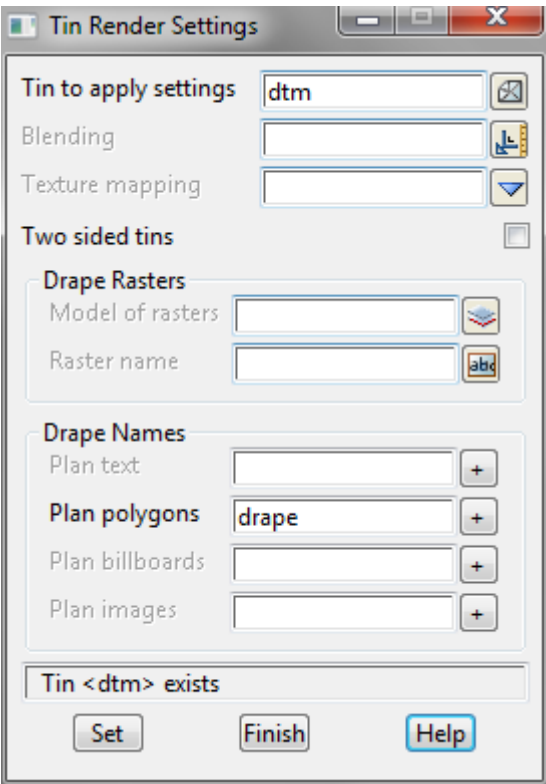

Applying the following **Solid Fill** entries to polygons called *Road* and *Playground*:

	Name	Att Key	Colour	Blend	Drape name	Drape mode	Comment
1	Road*		concrete1	1	drape	Colour to texture	
2	Playground		purple	1	drape	Colour	

produces the solid filled polygons

If the above solid fill details have been applied to a closed super string, and using the **Tin Render Settings** panel to set **Plan polygon** field to "drape" for the tin called "dtm"

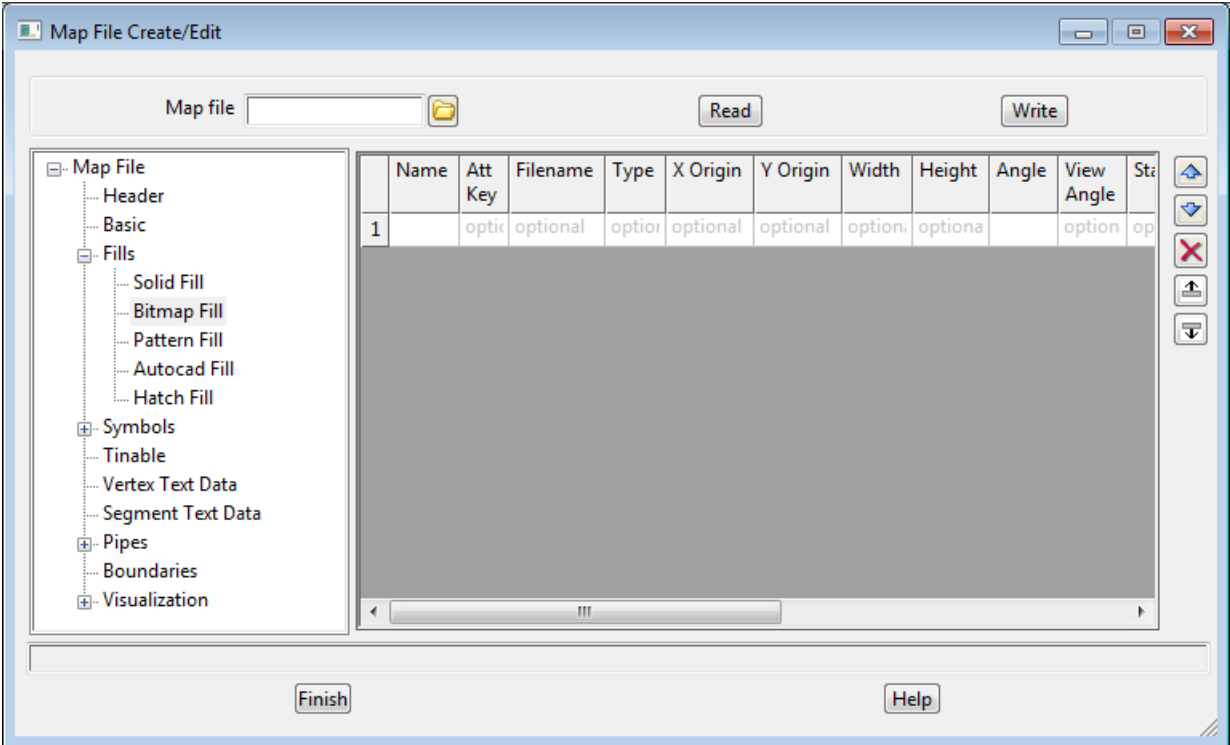

the result will be

Go to the next section [Fills >Bitmap Fill](#) or return to [Fills](#) or [Create/Edit a Map File](#).

Fills >Bitmap Fill

Bitmap Fill sets whether super strings (closed and non-closed) are filled with a bitmap pattern.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given a **Bitmap Fill** as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.
Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.
For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Filename	file	.*bmp
The bitmap file to be used for filling. Only BMP files are currently supported.		
Type	choice box	paper, world, device, screen (device), pixels (device)
The units of size. This means the bitmap can be drawn with either world size, paper size (mm) or device size.		
X/Y Origin	measures box	At Point, Point to Point, String= from Point, String to Point)
The x/y co-ordinate of the origin point of the repeated pattern.		
Width/Height	measures box	At Point, Point to Point, String= from Point, String to Point)

The width/height of the bitmap in the selected units.

Angle measures box At Point, Point to Point, String=
from Point, String to Point)

*The orientation of the bitmap pattern relative to the x axis measured in the anti-clockwise direction.
The units are dms (degrees minutes and seconds) and typed in using [HP Notation](#).*

View Angle choice box yes, no

*if not blank, this field controls whether **Angle** is relative to the x axis or to the plotting x axis.
If **yes** and we are plotting, **Angle** is measured relative to the x axis of the plot rotation.
If **no**, **Angle** is measured absolute to the world x axis
If blank, **Angle** is measured absolute to the world x axis.*

Stagger measures box At Point, Point to Point, String=
from Point, String to Point)

*if not blank, this field allows each alternate row of bitmaps to be staggered (offset) by the specified
value. **Stagger** is measured in the selected units along the x axis in the rotated system.
If blank, a **Stagger** of 0.0 is assumed.*

Space X/Y measures box At Point, Point to Point, String=
from Point, String to Point)

*The distance in the selected units along the x/y axis in the rotated system between each instance of the
bitmap.*

Transparent select colour pop-up

*The transparency colour within the bitmap. This means any pixel of this colour within the bitmap is not
drawn.*

Solid Colour select colour pop-up

*if not blank, when the bitmaps become too small to be legible, instead of drawing the bitmaps, the
super string is solid filled with colour **Solid colour**.*

Solid Blend measures box At Point, Point to Point, String=
from Point, String to Point)

*if not blank, and **Solid Colour** is specified, the solid fill is drawn with blend value **Solid Blend**. The
blend value is between 0.0 and 1.0.
If blank, **Solid Blend** is assumed to be 1.0.*

Drape Name

reserved for future use

Comment

comment to be to be used in this line of the map file.

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Fills >Pattern Fill](#) or return to [Fills](#) or [Create/Edit a Map File](#).

Fills >Pattern Fill

Pattern Fill uses a pattern from the **12d Model** pattern file, *12d.pattern*, to fill the selected super strings.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given a 12d Pattern Fill as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The **string name** is matched against **Name**.
Att Key is an Attribute Data grid cell. The **string attributes** are matched against the attribute details in **Att Key**.
For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Pattern select Pattern pop-up
The pattern name to be applied. These patterns are defined in the file **patterns.12d**
For more information on the 12d pattern definition please go to the section [12d Patterns File](#).

Type choice box paper, world, device
The units of size. This means the pattern can be drawn with either world size, paper size (mm) or device size.

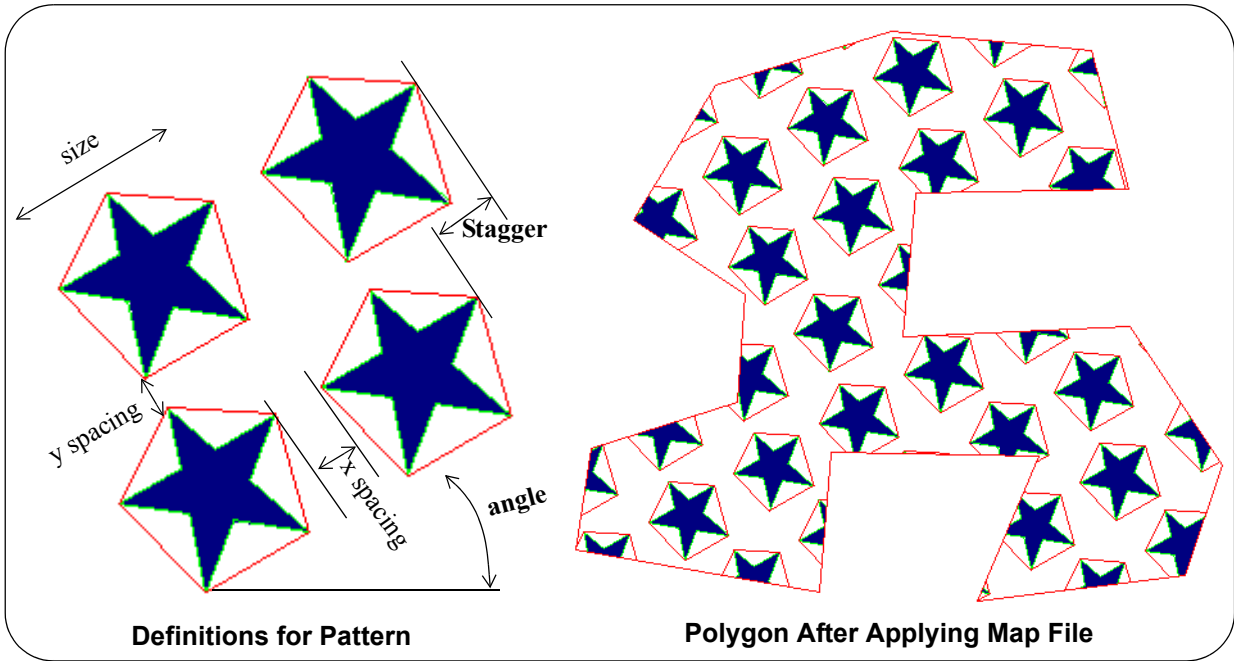

X/Y Origin measures box At Point, Point to Point, String= from Point, String to Point)
The x/y co-ordinate of the origin point of the repeated pattern.

Size	measures box	At Point, Point to Point, String= from Point, String to Point)
<i>The size of the pattern in the selected units given in Type.</i>		
Angle	measures box	At Point, Point to Point, String= from Point, String to Point)
<i>The orientation of the pattern relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using HP Notation.</i>		
View Angle	choice box	yes, no
<i>if not blank, this field controls whether Angle is relative to the x axis or to the plotting x axis.</i>		
<i>If yes and we are plotting, Angle is measured relative to the x axis of the plot rotation.</i>		
<i>If no, Angle is measured absolute to the world x axis</i>		
<i>If blank, Angle is measured absolute to the world x axis.</i>		
Stagger	measures box	At Point, Point to Point, String= from Point, String to Point)
<i>if not blank, this field allows each alternate row of patterns to be staggered (offset) by the specified value. Stagger is measured in the selected units along the x axis in the rotated system.</i>		
<i>If blank, a Stagger of 0.0 is assumed.</i>		
Space X/Y	measures box	At Point, Point to Point, String= from Point, String to Point)
<i>The distance in the selected units along the x/y axis in the rotated system between each instance of the pattern.</i>		
Solid Colour		select colour pop-up
<i>if not blank, when the pattern become too small to be legible, instead of drawing the pattern, the super string is solid filled with colour Solid colour.</i>		
Solid Blend	measures box	At Point, Point to Point, String= from Point, String to Point)
<i>if not blank, and Solid Colour is specified, the solid fill is drawn with blend value Solid Blend. The blend value is between 0.0 and 1.0.</i>		
<i>If blank, Solid Blend is assumed to be 1.0.</i>		
Comment		
<i>comment to be to be used in this line of the map file.</i>		

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Examples of Pattern Fill

	Name	Att Key	Pattern	Type	X Origin	Y Origin	Size	Angle	View Angle	Stagger	Space X	Space Y	Solid Colour	Solid Blend	Comment
1	pf46		star with bitmap dots	world	0	0	20	30	no	6	6	4			

Go to the next section [Fills >Autocad Fill](#) or return to [Fills](#) or [Create/Edit a Map File](#).

Fills >Autocad Fill

AutoCad Fill uses a pattern from the **AutoCAD pattern** file to fill the selected super strings.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given an AutoCAD Pattern Fill as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.
Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.
For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Pattern select autocad pattern

The autocad pattern name to be applied. These patterns are defined via acad.pat.
This is an autocad file.

Type

The units of size. This means the pattern can be drawn with either world size, paper size (mm) or device size.

Size

The size of the pattern in the units given by **Type**.

Angle measures box At Point, Point to Point, String=
from Point, String to Point)

The orientation of the pattern relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using [HP Notation](#).

View Angle	choice box	yes, no
-------------------	------------	---------

*if not blank, this field controls whether **Angle** is relative to the x axis or to the plotting x axis.*

If **yes** and we are plotting, **Angle** is measured relative to the x axis of the plot rotation.

*If no, **Angle** is measured absolute to the world x axis*

If blank, **Angle** is measured absolute to the world x axis.

This is an extension.

Colour

The colour of the pattern.

Comment

comment to be to be used in this line of the map file.

To assist in debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Example of AutoCAD Fill

	Name	Att Key	Pattern	Type	Size	Angle	View Angle	Colour	Comment
1	pl04		ESCHER	world	10	30	no	dark blue	

Go to the next section [Fills > Hatch Fill](#) or return to [Fills](#) or [Create/Edit a Map File](#).

Fills > Hatch Fill

Hatch Fill sets whether super strings (closed and non-closed) are filled with a hatch pattern. The hatch pattern consists of one or two sets of lines drawn at specified angles.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given a Hatch Pattern Fill as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.
Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Type select choice box

The units of **Spacing 1** and **Spacing 2**. This means the pattern can be drawn with either world size, paper size (mm) or device size.

X/Y Origin

The x/y co-ordinate of the anchor point of the repeated pattern.

View Angle choice box yes, no

if not blank, this field controls whether **Angle 1** and **Angle 2** are relative to the x axis or to the plotting x axis.

If yes and we are plotting, **Angle 1** and **Angle 2** are measured relative to the x axis of the plot rotation.

If no, **Angle 1** and **Angle 2** are measured absolute to the world x axis

*If blank, **Angle 1** and **Angle 2** are measured absolute to the world x axis.*

Angle 1 measures box At Point, Point to Point, String=
from Point, String to Point)

*The orientation of the first set of lines relative to the x axis measured in the anti-clockwise direction.
The units are dms (degrees minutes and seconds) and typed in using [HP Notation](#).*

Spacing 1

*The distance between the first set of lines (drawn at an angle **Angle 1**) in the units selected in the **Type** column.*

Colour 1

The colour of the first set of lines.

Angle 2 measures box At Point, Point to Point, String=
from Point, String to Point)

*The orientation of the second set of lines relative to the x axis measured in the anti-clockwise direction.
The units are dms (degrees minutes and seconds) and typed in using [HP Notation](#).*

Spacing 2

*The distance between the second set of lines (drawn at an angle **Angle 2**) in the units selected in the **Type** column.*

Colour 2

The colour of the second set of lines.

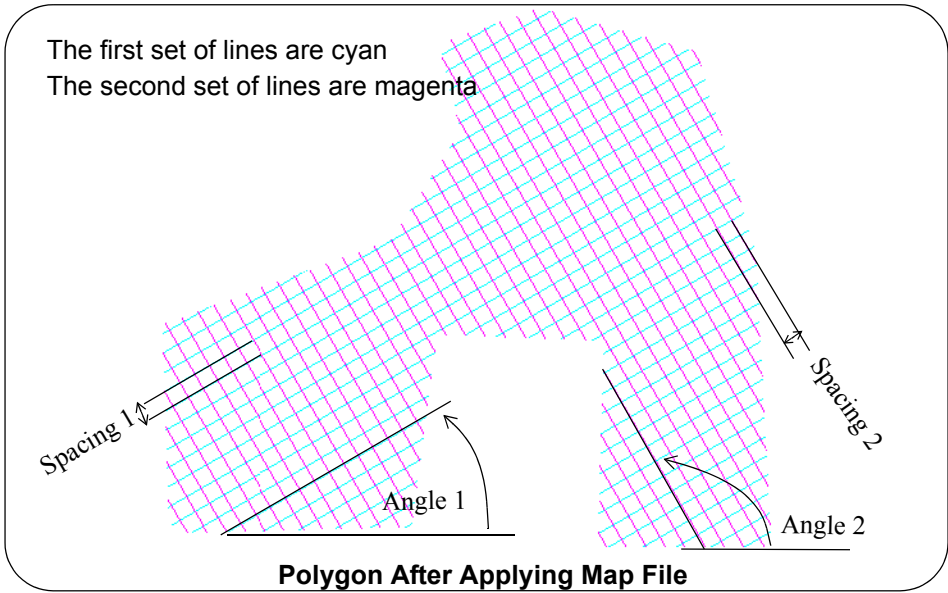

Comment

comment to be to be used in this line of the map file.

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Example of Hatch Fill

	Name	Att Key	Type	X Origin	Y Origin	View Angle	Angle 1	Spacing 1	Colour 1	Angle 2	Spacing 2	Colour 2	Comment
1	ht07		world	0	0		30	10	cyan	120	10	magenta	

Go to the next section [Multiple Fills](#) or return to [Fills](#) or [Create/Edit a Map File](#).

Multiple Fills

Super strings support more than one fill type per string. For example, a super string can have a solid fill, and an I Acad fill at the same time.

The order of drawing the fill types is: solid, bitmap, pattern, hatch, acad.

Go to the next section [Symbols](#) or return to [Fills](#) or [Create/Edit a Map File](#).

Symbols

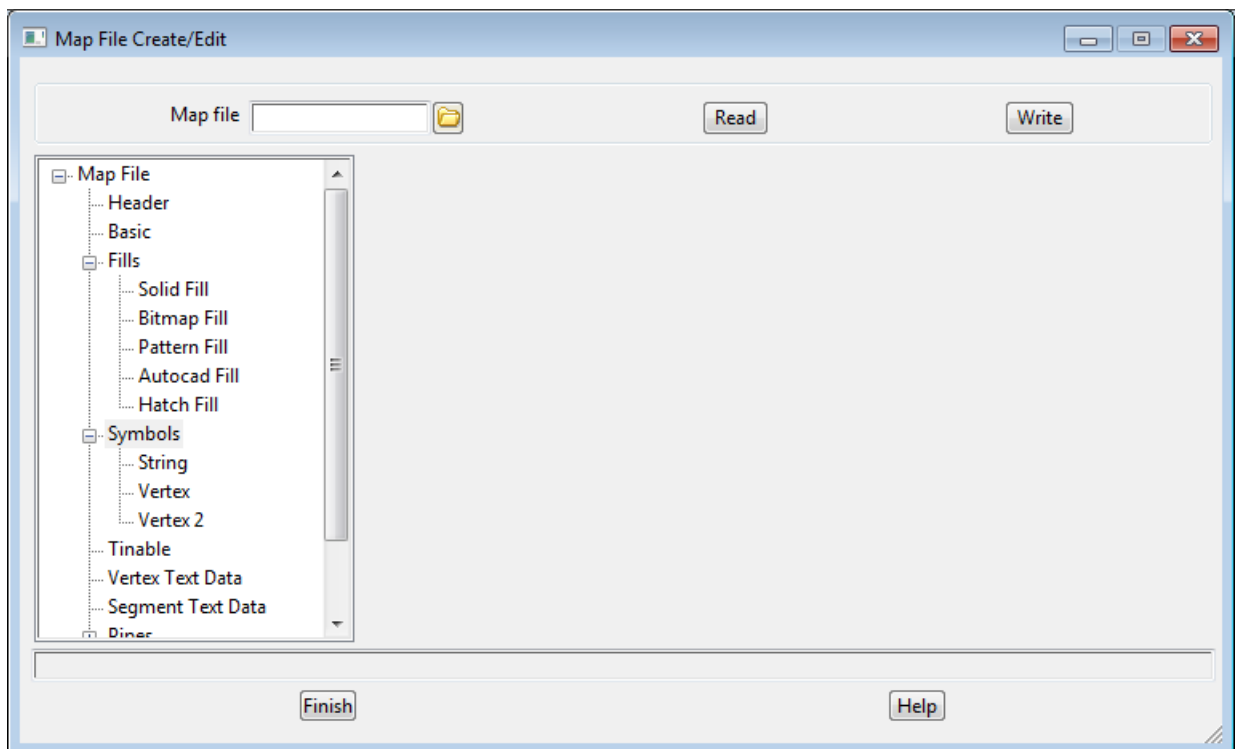

The **Symbols** node creates symbols at the vertices of the super strings.

There can only be **one** symbol at each vertex so if **Symbols >String** is used to set symbols for every vertex of a string, and **Symbols >Vertex** applies a different symbol to any of those vertices, then the symbols from **Symbols >Vertex** are used at the appropriate vertices.

Symbols >Vertex 2 can be used to generate a second symbol at a vertex position BUT **Symbols >Vertex 2** creates a **new** string with a vertex and the second symbol.

For more information on *String*, go to
Vertex
Vertex 2

[Symbols >String](#)
[Symbols >Vertex](#)
[Symbols >Vertex 2](#)

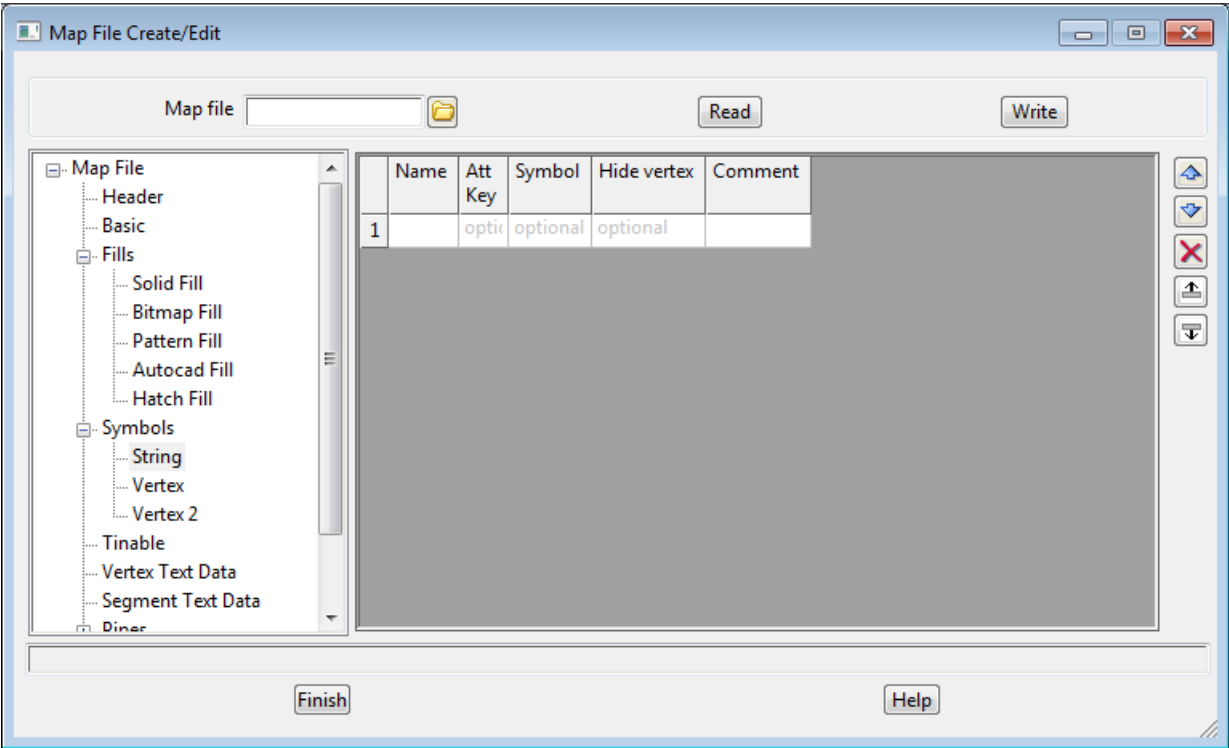

Symbols >String

String sets the same symbol at each vertex of a super string

IMPORTANT NOTE:

There can only be **one** symbol at each vertex so if **Symbols >String** is used to set symbols for every vertex of a string, and **Symbols >Vertex** applies a different symbol to any of those vertices, then the symbols from **Symbols >Vertex** are used at the appropriate vertices.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), each vertex of the string is given a **Symbol** as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The **string name** is matched against **Name**.
Att Key is an Attribute Data grid cell. The **string attributes** are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Symbol

select symbol data

Symbol is an **Symbol Information** grid cell and sets parameters for creating a symbol on the vertices of super strings. The symbol is positioned about the vertex.

This field can not be blank.

To access **Symbol**, click LB on the **Symbol** field to highlight the field, then click LB again to bring up the **Symbol Information** panel. See [Symbol Data](#) for information about the field to enter.

Note: Fields in the **Symbol Information** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Hide vertex

tick box

if ticked, no default cross is placed at the vertex of the string.

*Note: **Hide Vertex** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).*

Comment

comment to be to be used in this line of the map file.

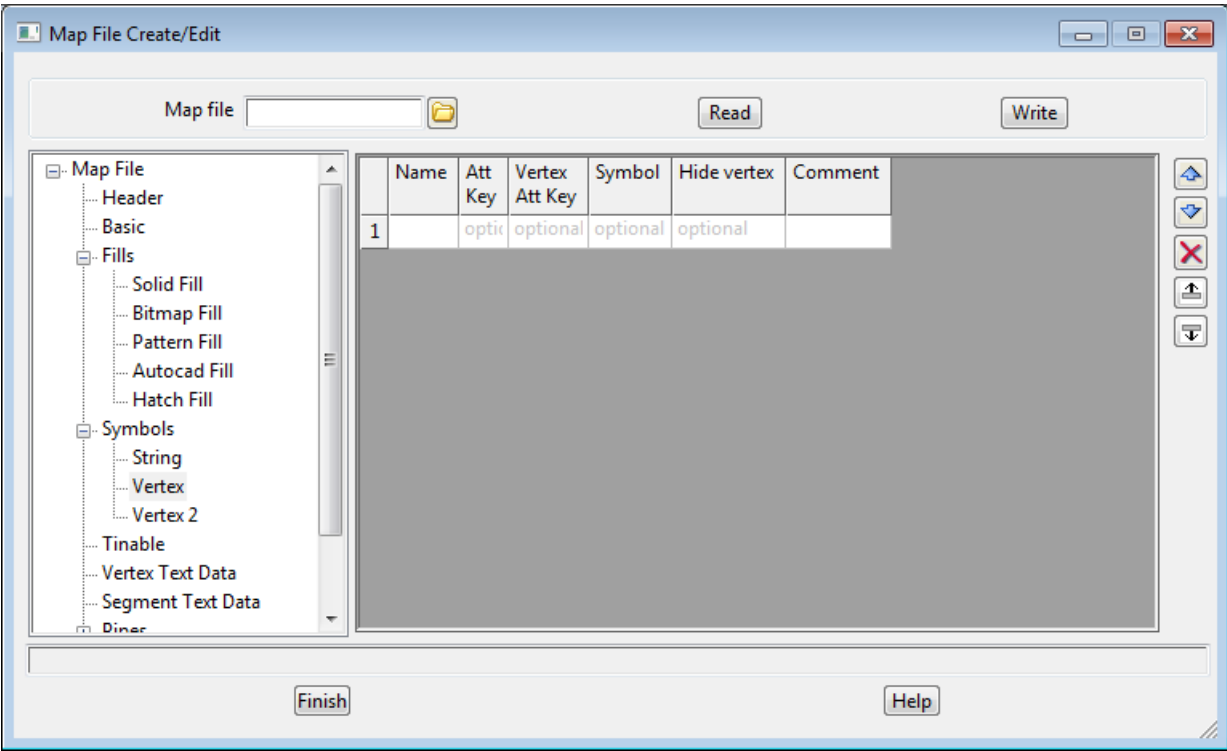

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Symbols >Vertex](#) or return to [Symbols](#) or [Create/Edit a Map File](#).

Symbols >Vertex

Vertex sets a given symbol for each vertex of a super string that matches a string name, a string attribute value and a vertex attribute value.

There can only be **one** symbol at each vertex so if **Symbols >String** is used to set symbols for every vertex of a string, and **Symbols >Vertex** applies a different symbol to any of those vertices, then the symbol from **Symbols >Vertex** is used at the appropriate vertices.

Processing Using Name, Att Key and Vertex Att Key

when a string finds a first match with **Name**, **Att Key** and **Vertex Att Key** in the grid (see [Matching Using Name, Att Key and Vertex Att Key](#)), each matching vertex of the string is given a Symbol as defined in the parameters of the matching line.

Name, Att Key and Vertex Att Key

Name is at Text grid and the text entered into **Name** can include wild cards * and wild characters ?. The string name is matched against **Name**. This field can not be blank.

Att Key is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.

The **string** attributes are matched against the attribute details in **Att Key**.

Vertex Att Key is an Attribute Data grid cell which contains the definition of the vertex attributes and their values that are to be matched against. There can be more than one vertex attribute in the Attribute Data but they must have unique names.

The **vertex** attributes are matched against the attribute details in **Vertex Att Key**.

To access **Att Key** or **Vertex Att Key** data, click LB on the **Att Key/Vertex Att Key** field to highlight the field, then click LB again to bring up the **Attribute Data** panel. To enter data, see [Attribute Data Panel](#).

Matching Using Name, Att Key and Vertex Att Key:

Strings are first created via the **Basic** node and given a string name of either the Entity Name or the text

given in the **Name** column of the Basic Map File grid.

Starting with the first line of the grid, matching and processing occurs as follows

*If **Name**, **Att Key** and **Vertex Att Key** are not blank, and a match of the string name occurs with **Name**, a match of the string attributes occurs with **Att Key** and a match of the string vertex attributes occurs with **Vertex Att Key**, then the rest of the fields for this line of the Map File grid are used on this string vertex.*

*If **Name** and **Att Key** are not blank, and **Vertex Att Key** is blank, and a match of the string name occurs with **Name** and a match of the string attributes occurs with **Att Key**, then the rest of the fields for this line of the Map File grid are used on each string vertex.*

*If **Name** and **Vertex Att Key** are not blank, and **Att Key** is blank, and a match of the string name occurs with **Name** and a match of a string vertex attribute occurs with **Vertex Att Key**, then the rest of the fields for this line of the Map File grid are used on this string vertex.*

*If **Name** is not blank and **Att Key** and **Vertex Att Key** are blank, and a match of the string name occurs with **Name**, then the rest of the fields for this line of the Map File grid are used on each string vertex.*

*If **Name** is blank then no match occurs and this line of the Map File grid is ignored.*

*If a **match occurs**, then no tests for matches against **Name**, **Att Key** and **Vertex Att Key** further down in the grid are made.*

*If **no match occurs**, then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.*

Symbol

select symbol data

Symbol is Symbol Information grid cell and sets parameters for creating a symbol on the vertices of super strings. The symbol is positioned about the vertex.

This field can not be blank.

*To access **Symbol**, click LB on the **Symbol** field to highlight the field, then click LB again to bring up the **Symbol Information** panel.*

***Note:** Fields in the **Symbol Information** can have attribute substitution from vertex attributes. See [Map File Substitution by Attributes](#).*

Hide vertex

tick box

if ticked, no default cross is placed at the vertex of the string.

***Note:** **Hide Vertex** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).*

Comment

comment to be to be used in this line of the map file.

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

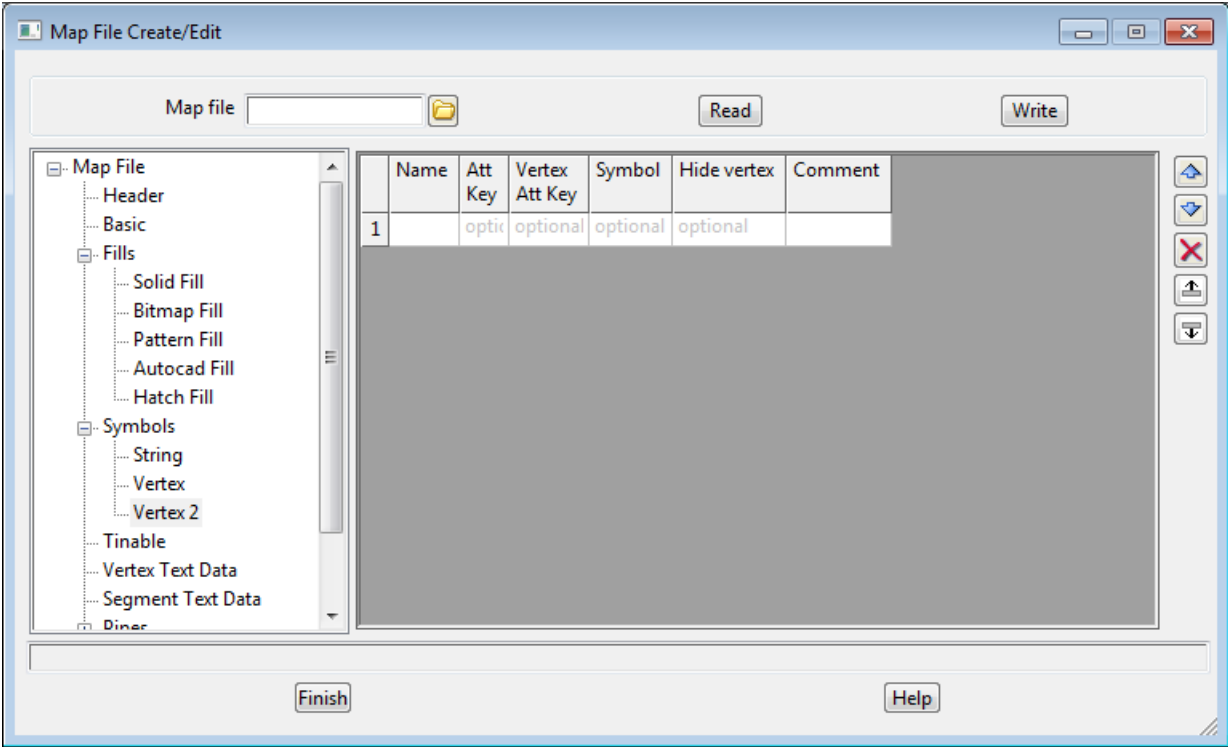

Go to the next section [Symbols >Vertex 2](#) or return to [Symbols](#) or [Create/Edit a Map File](#).

Symbols >Vertex 2

Vertex 2 creates a *new* string with vertices and symbols at those super strings that match a string name, a string attribute value and a vertex attribute value in the **Symbols >Vertex 2** grid.

IMPORTANT RESTRICTION:

Symbols >Vertex 2 does not work for **Utilities =>H-Z =>Map**.

Processing Using Name, Att Key and Vertex Att Key

when a string finds a first match with **Name**, **Att Key** and **Vertex Att Key** in the grid (see [Matching Using Name, Att Key and Vertex Att Key](#)), each matching vertex of the string is given a **Symbol** as defined in the parameters of the matching line.

Name, Att Key and Vertex Att Key

Name is at Text grid. The *string name* is matched against **Name**.

Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.

Vertex Att Key is an Attribute Data grid cell. The *vertex attributes* are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name, Att Key and Vertex Att Key](#).

Symbol

select symbol data

Symbol is Symbol Information grid cell and sets parameters for creating a symbol on the vertices of super strings. The symbol is positioned about the vertex.

This field can not be blank.

To access **Symbol**, click LB on the **Symbol** field to highlight the field, then click LB again to bring up the **Symbol Information** panel.

Note: Fields in the **Symbol Information** can have attribute substitution from vertex attributes. See [Map File Substitution by Attributes](#).

Hide vertex

tick box

if ticked, no default cross is placed at the vertex of the string.

Note: **Hide Vertex** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Comment

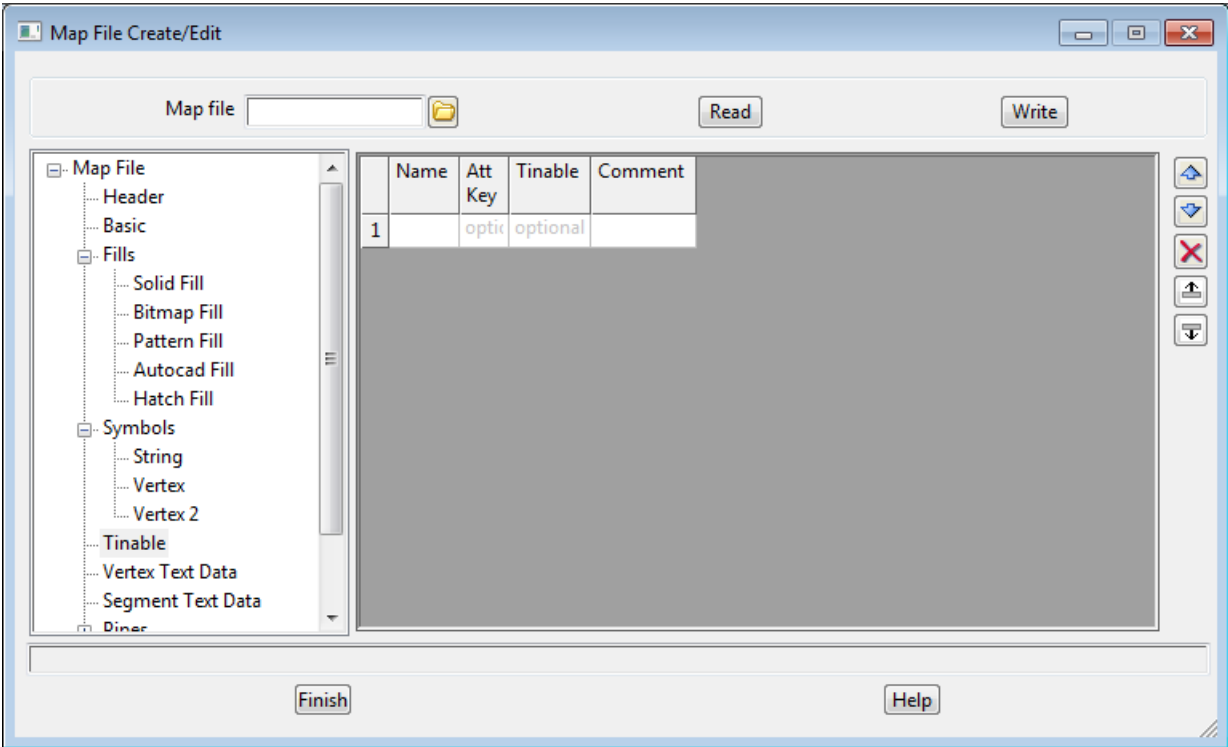

comment to be to be used in this line of the map file.

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Tunable](#) or return to [Symbols](#) or [Create/Edit a Map File](#).

Tinable

Tinable sets whether the vertices and segments are tinable (used in triangulations), not tinable (not used in triangulations) or only the vertices (points) are tinable.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), each vertex and segment of the string is given a tinability value as defined in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The **string name** is matched against **Name**.
Att Key is an Attribute Data grid cell. The **string attributes** are matched against the attribute details in **Att Key**.
For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Tinable

yes, no, points

if **yes**, the vertices and segments for all the strings matching the **Name** and **Att Key** are tinable.
If **no**, the vertices and segments for all the strings matching the **Name** and **Att Key** are not tinable.
If **points**, the segments are not tinable and the vertices are tinable for all the strings matching the **Name** and **Att Key**.
This field can not be blank.

Note: **Tinable** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

To assist in debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Vertex Text Data](#) or return to [Create/Edit a Map File](#).

Vertex Text Data

Vertex Text Data sets parameters for displaying vertex text on super strings.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), a **Textstyle Data** for use with vertex text on the string is given in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The **string name** is matched against **Name**.
Att Key is an Attribute Data grid cell. The **string attributes** are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Textstyle Data

select textstyle data menu

Textstyle Data is a Textstyle Data grid cell. The Textstyle Data sets text parameters (see [Text Definitions](#)) for displaying vertex text on all strings matching **Name** and **Att Key**.

To access the **Textstyle Data**, click LB on the **Textstyle Data** field to highlight the field, then click LB again to bring up the **Textstyle Data** panel.

Note: Fields in the **Textstyle Data** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Comment

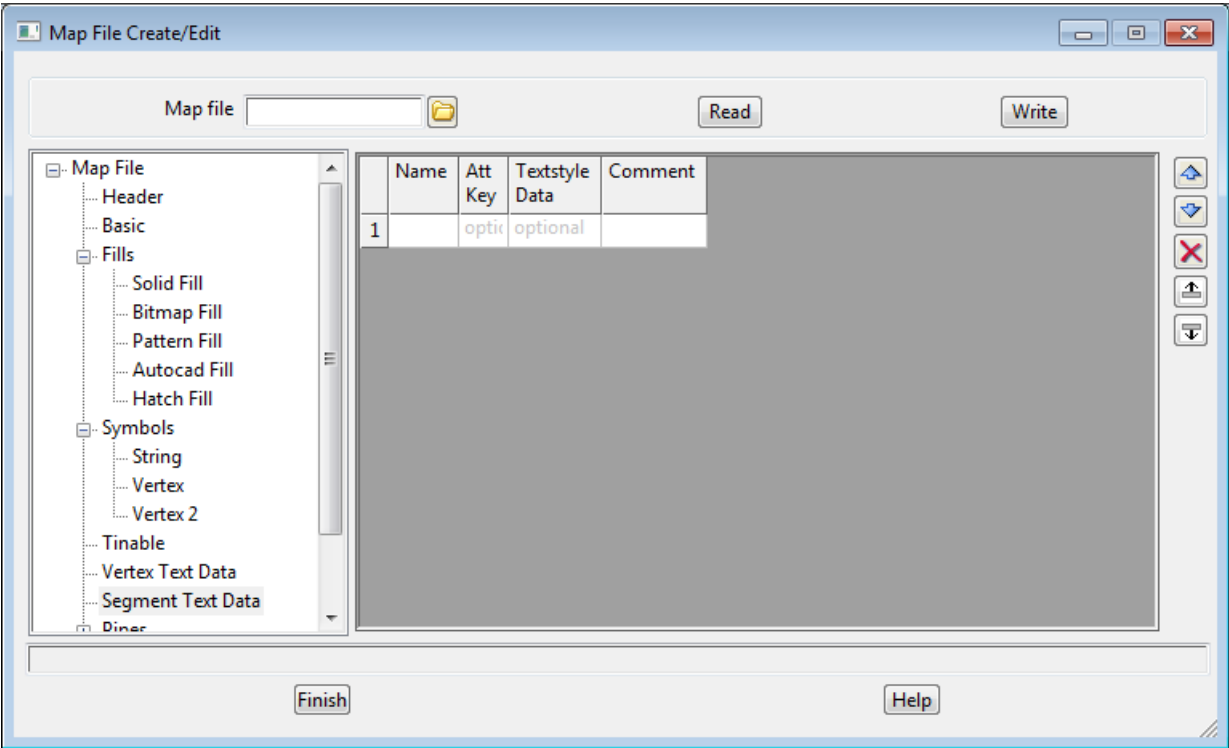

comment to be to be used in this line of the map file.

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Segment Text Data](#) or return to [Create/Edit a Map File](#).

Segment Text Data

Segment Text Data sets parameters for displaying segment text on super strings.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), a **Textstyle Data** for use with segment text on the string is given in the parameters of the matching line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.
Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.
For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Textstyle Data

select textstyle data menu

Textstyle Data is a Textstyle Data grid cell. The Textstyle Data sets text parameters (see [Text Definitions](#)) for displaying segment text on all strings matching **Name** and **Att Key**.
To access the **Textstyle Data**, click LB on the **Textstyle Data** field to highlight the field, then click LB again to bring up the **Textstyle Data** panel.
Note: Fields in the **Textstyle Data** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Comment

comment to be to be used in this line of the map file.

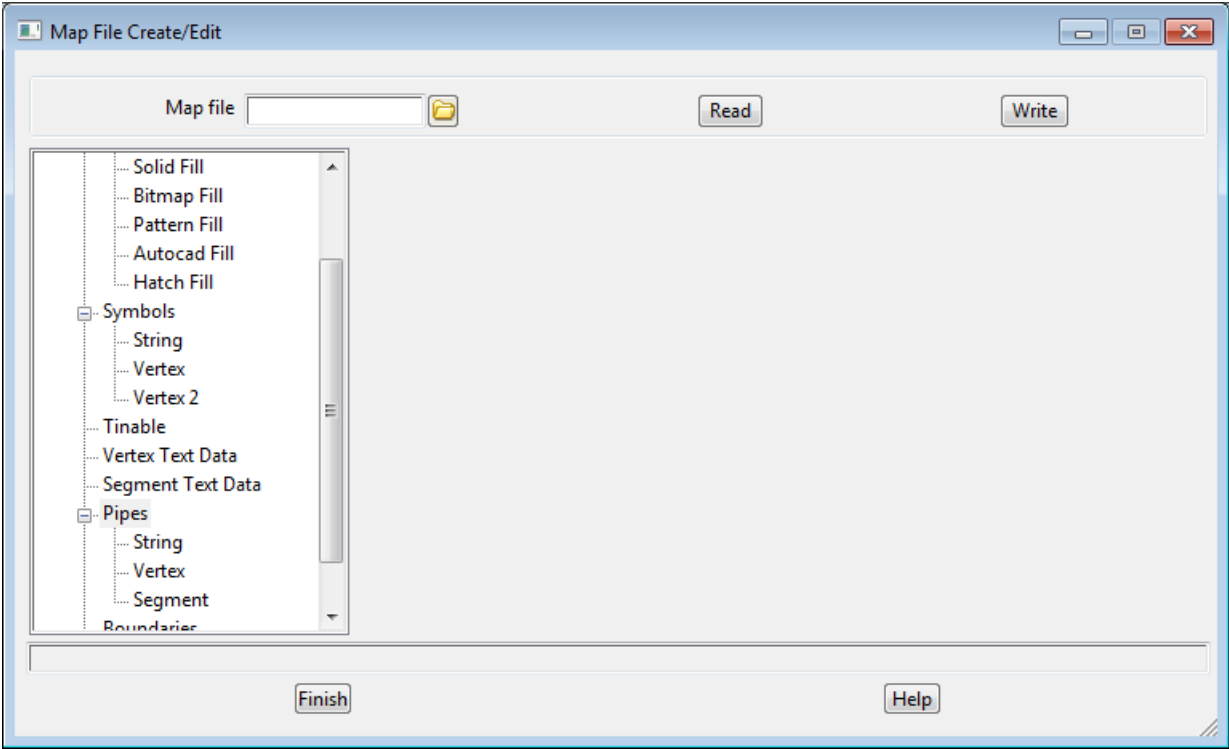

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Pipes](#) or return to [Create/Edit a Map File](#).

Pipes

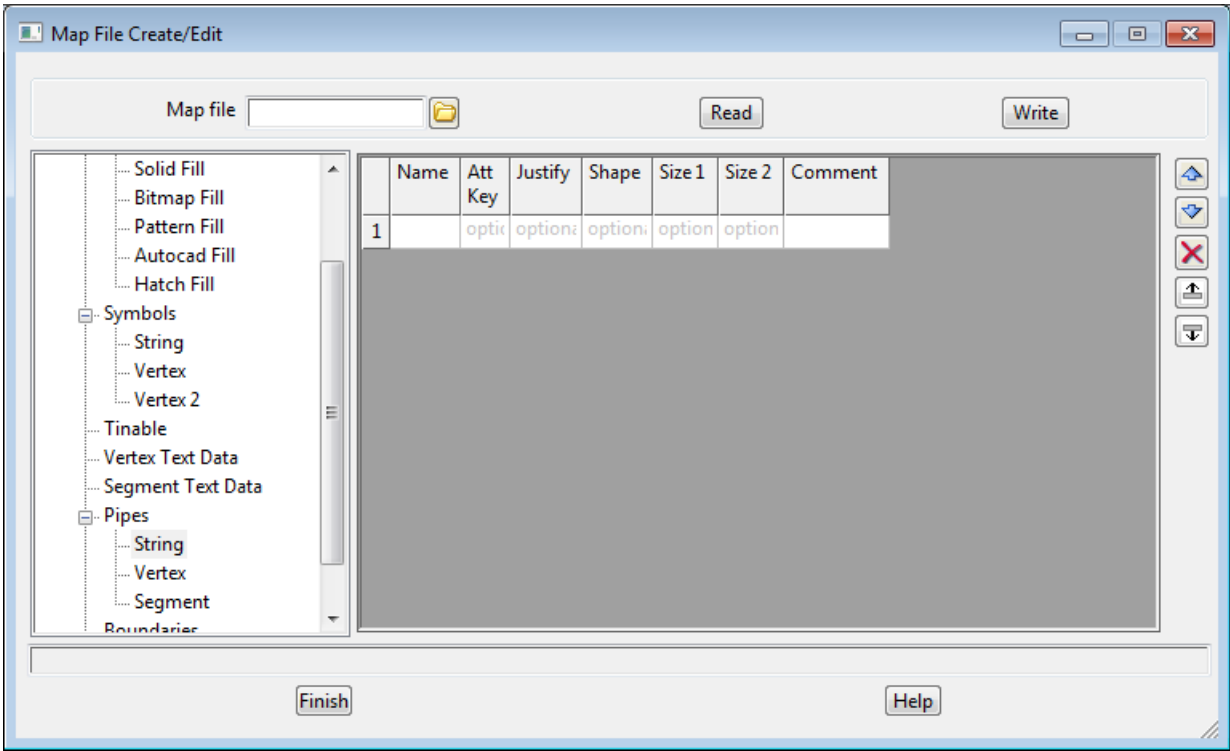

The **Pipes** node turns the string into a super pipe and sets parameters for pipe justification, whether it is round pipe and its diameter, or a rectangular pipe (culvert) and its width and height.

For information on *String*, go to [Pipes >String](#)
 Vertex [Pipes >Vertex](#)
 Segment [Pipes >Segment](#)

Pipes >String

Strings matches on string name and string attributes to make the selected string a pipe string with either a diameter (round pipe) or a width and height (rectangular pipe), and a justification for the z-values of the string.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the super string is turned into a super pipe using the parameters of the matching grid line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.
Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Justify invert, centre, obvert

the justification for the pipe string.
This field can not be blank.

Shape diameter, culvert

sets whether the pipe is a round pipe or a rectangular pipe (culvert).
If **diameter**, the string is made a round pipe.
If **culvert**, the string is made a rectangular pipe.
This field can not be blank.

Size 1 measures menu

for **Shape choice diameter**, the diameter of all the segments of the pipe are set to the value in **Size 1**.
For **Shape choice culvert**, the width of all the segments of the pipe are set to the value in **Size 1**.
This field can not be blank.

Size 2

measures menu

for **Shape choice culvert**, the height of all the segments of the pipe are set to the value in **Size 2**.
for **Shape choice diameter**, this field is ignored.
This field can only be blank for a **Shape choice diameter**.

Visualisation >Library Extrude

Library Extrude applies an extrude from the 12d library to selected super strings. Note that extrudes can only be applied to super strings.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given the Library Extrude as defined in the parameter of the matching line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.
Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Extrude

select extrudes menu

the library extrude to apply to the super string. This extrude can any extrude type, and is applied to the entire length of the string.

Note: **Extrude** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Comment

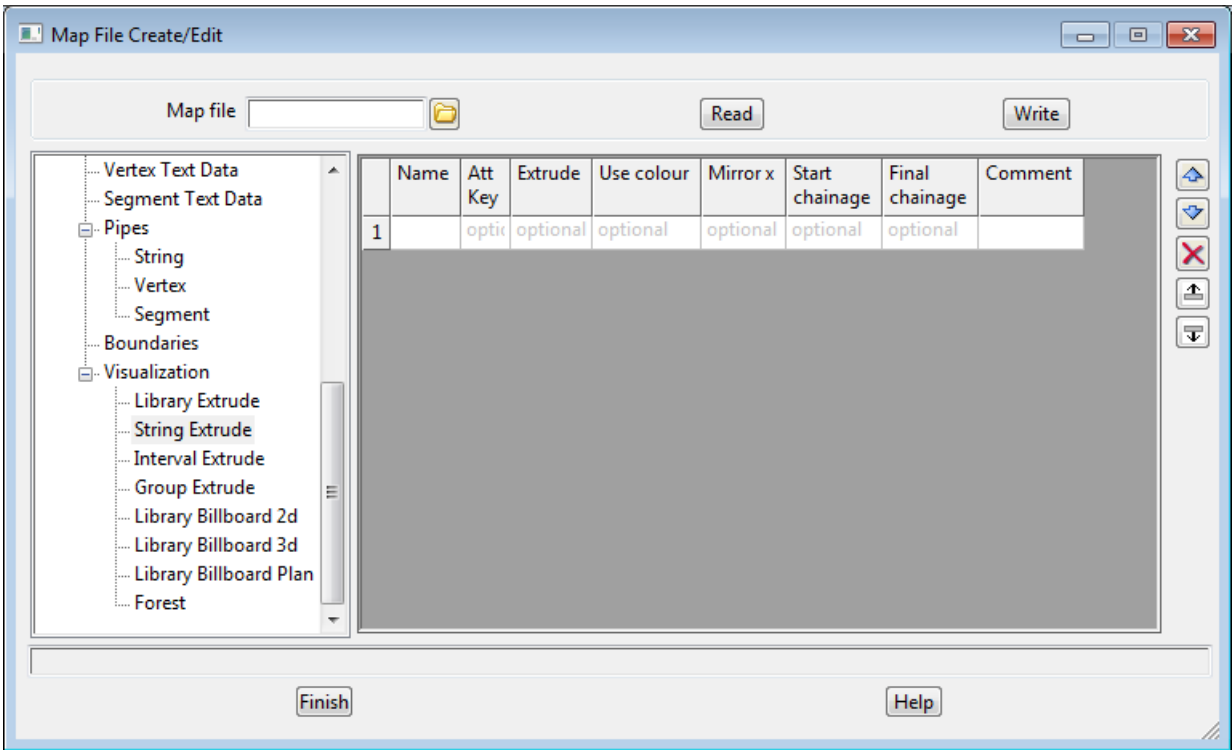

comment to be to be used in this line of the map file.

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Visualisation >String Extrude](#) or return to [Visualization](#) or [Create/Edit a Map File](#).

Visualisation >String Extrude

String Extrude applies an extrude to selected super strings. Note that extrudes can only be applied to super strings or super alignments.

Processing Using Name and Att Key

when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given the extrude as defined in the parameter of the matching line.

Name and Att Key

Name is at Text grid. The *string name* is matched against **Name**.

Att Key is an Attribute Data grid cell. The *string attributes* are matched against the attribute details in **Att Key**.

For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Extrude

the library extrude to be applied. This extrude must be of the type *string extrude*.

If *blank*, no extrusion is applied.

Use Colour

if *yes*, the colours in the extrusion are used.

If *no* or *blank*, the colour of the super string is used.

Mirror X

if *yes*, the x values of the extrusion are mirrored. This allows for one extrusion definition to be used in both a left and right context.

If *no* or *blank*, not mirroring occurs.

Start Chainage

*if **not blank**, the extrusion starts at this chainage.*

*If **blank**, the extrusion starts at the beginning of the string.*

Final Chainage

*if **not blank**, the extrusion ends at this chainage.*

*If **blank**, the extrusion end at the end of the string.*

Comment

comment to be to be used in this line of the map file.

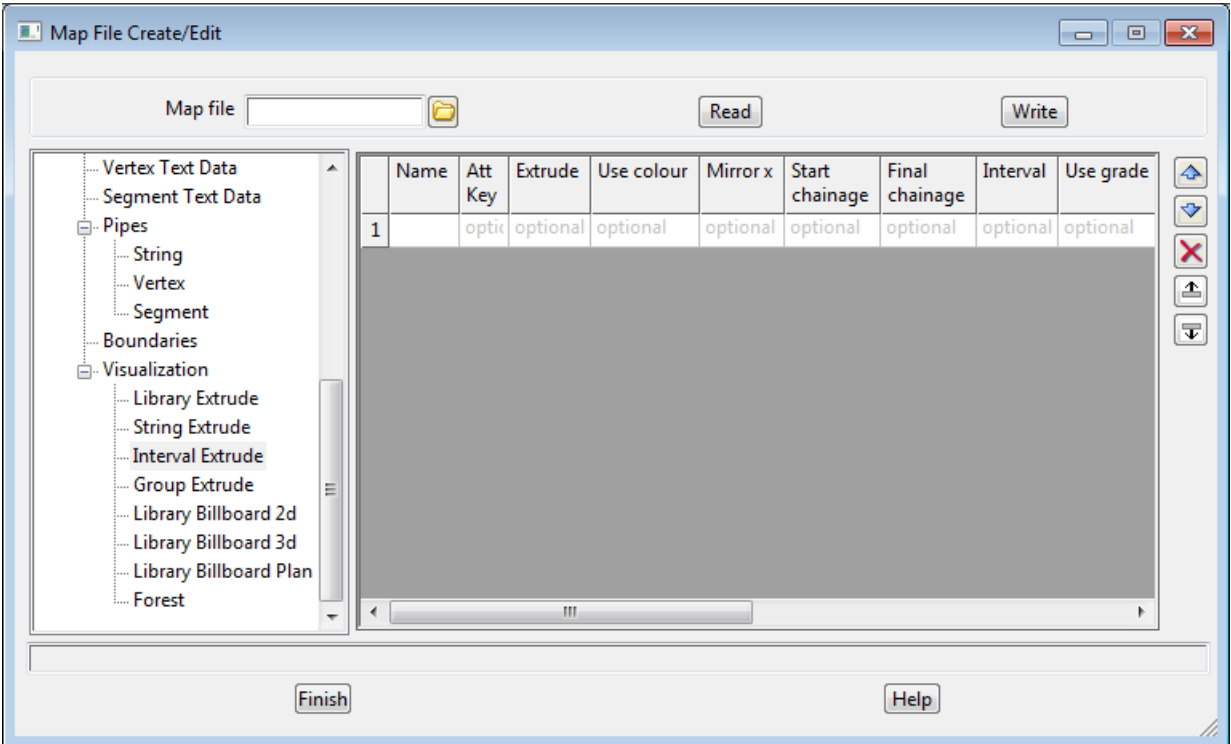

To assist is debugging a **Map File**, match logging can be turned on. See [Map File Logging](#).

Go to the next section [Visualisation >Interval Extrude](#) or return to [Visualization](#) or [Create/Edit a Map File](#).

Visualisation >Interval Extrude

Interval Extrude applies an extrude to selected super strings. Note that extrudes can only be applied to super strings and super alignments. A typical use of interval extrudes is placing guide posts down the length of a string at a regular interval. The process here is that you reference an existing interval extrude, and can optionally apply one more components of a 3d transformation to it. For more information on transformations, see [3D Transformations](#).

Each **extrude** drawn at the interval will take the x,y,z, and direction from the string first, then any transformation is applied. So in the example of the post, if no transformation is applied, each post will be positioned on the string and oriented in the direction of the string.

Processing Using Name and Att Key

*when a string finds a first match with **Name** and **Att Key** in the grid (see [Matching Using Name and Att Key](#)), the string is given the interval extrude as defined in the parameters of the matching line.*

Name and Att Key

Name is at Text grid. The **string name** is matched against **Name**.
Att Key is an Attribute Data grid cell. The **string attributes** are matched against the attribute details in **Att Key**.

*For further information on what is allowed in **Name** and **Att Key**, and how to access **Att Key**, see [Name and Att Key](#).*

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See [Map File Substitution by Attributes](#).

Extrude

*the library extrude to be applied. This extrude must be of the type **interval extrude**.
If **blank**, no extrusion is applied.*

Use Colour

*if **yes**, the colours in the extrusion are used.*

*If **no** or **blank**, the colour of the super string is used.*

Mirror X

*if **yes**, the x values of the extrusion are mirrored. This allows for one extrusion definition to be used in both a left and right context.*

*If **no** or **blank**, not mirroring occurs.*

Start Chainage

*if **not blank**, the extrusion starts at this chainage.*

*If **blank**, the extrusion starts at the beginning of the string.*

Final Chainage

*if **not blank**, the extrusion ends at this chainage.*

*If **blank**, the extrusion end at the end of the string.*

Interval

the spacing between instances of the extrude along the string.

Use grade

*if **no** or **blank**, the interval extrude is drawn upright.*

*If **yes**, the interval extrude is on the same angle as the segment of the string it is on.*

X/Y/Z rotation

the relative rotation about the x/y/z-axis.

*If **blank**, no rotation is applied.*

X/Y/Z factor

the factor applied to x/y/z coordinates of the extrusion.

*If **blank**, no factor is applied.*

X/Y/Z offset

the offset applied to the x/y/z coordinate of each interval point on the string.

*If **blank**, no offset is applied.*

Comment

Map File Substitution by Attributes

Once there has been a first match for an element with the **Name and Att key (or Vertex Att key or Segment Att key)** of a line in the grid, the remaining fields in the rest of the grid line are applied to the element.

To increase the usefulness of the remaining fields in the line, it is possible to use the **value of an attribute** from the element, rather than just the static value in the field.

To use the value of an attribute in the grid field, simply **specify the attribute pathname prefixed by the \$ sign**.

For example, if it was the **Tinable** section of the Map File (see [Tinable](#)), and the tinability of the string is to be given by a string attribute called **12d Field/My Tinability**, type

```
$12d Field/My Tinability
```

into the **Tinable** cell of the grid.

So **\$** denotes the start of the attribute substitution.

The **value of the attribute** must be a **valid** answer (in the case of the Tinable cell, it must be **no**, **yes**, or **point**). If the value of the attribute is **not** a valid answer, a logline in the output window will be generated to identify the element in error and the line in the mapfile.

Note that the **\$** character must be the first character in the field, and that the rest of the field is taken as the attribute pathname so quotes should not be used even if there are spaces in the attribute pathname. Hence only one attribute can be used in the substitution process for a grid cell.

Remember that attribute names are case sensitive and in the case where more than one attribute of the same name exists, the first attribute found will be used.

Note - Attribute substitution is valid in the **Textstyle Data** and **Symbol Information** panels on a grid line.

Vertex

Vertex 2

Tinable

Vertex Text Data

Segment Text Data

Pipes

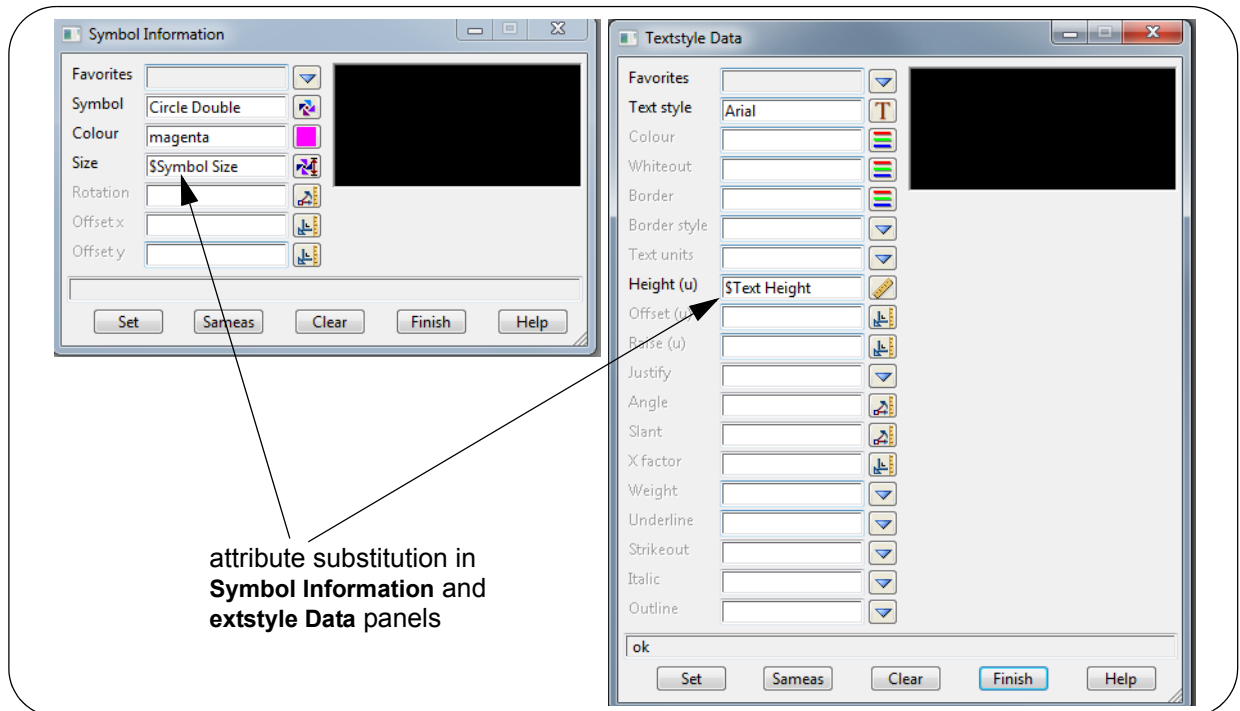

String

Vertex

	Name	Att Key	Justify	Shape	Size 1	Size 2	Comment
1	*	1 attribute	Invert	diameter	\$Diameter	optional	
2	*	attributes {		vert	\$Width	\$Height	
3		text "Shape" "Rectangular"		ional	optional	optional	

select strings with a **string text** attribute named **Shape** and with the value "Rectangle"

use the value of the **string** attribute named **Width** as the value in **Size 1** to use for the string

An Important Restriction

There is currently no way of distinguishing between string, vertex or segment attributes in the grid cells.

So if you are in a section of the Map File that has:

- only an **Att Key**, then **only string attributes** can be used for substitution in the grid cells in that section. For example [Tunable](#).
- an **Att Key** and a **Vertex Att Key** then **only vertex attributes** can be used for substitution in the grid cells in that section. For example [Symbols >Vertex](#).
- an **Att Key** and a **Segment Att Key** then **only segment attributes** can be used for substitution in the grid cells in that section. For example [Pipes >Segment](#).

Go to the next section [Map File Logging](#) or return to [Visualization](#) or [Create/Edit a Map File](#).

Map File Logging

To help determine what is going on, or not going on, when using a Map File, **Logging** can be turned on.

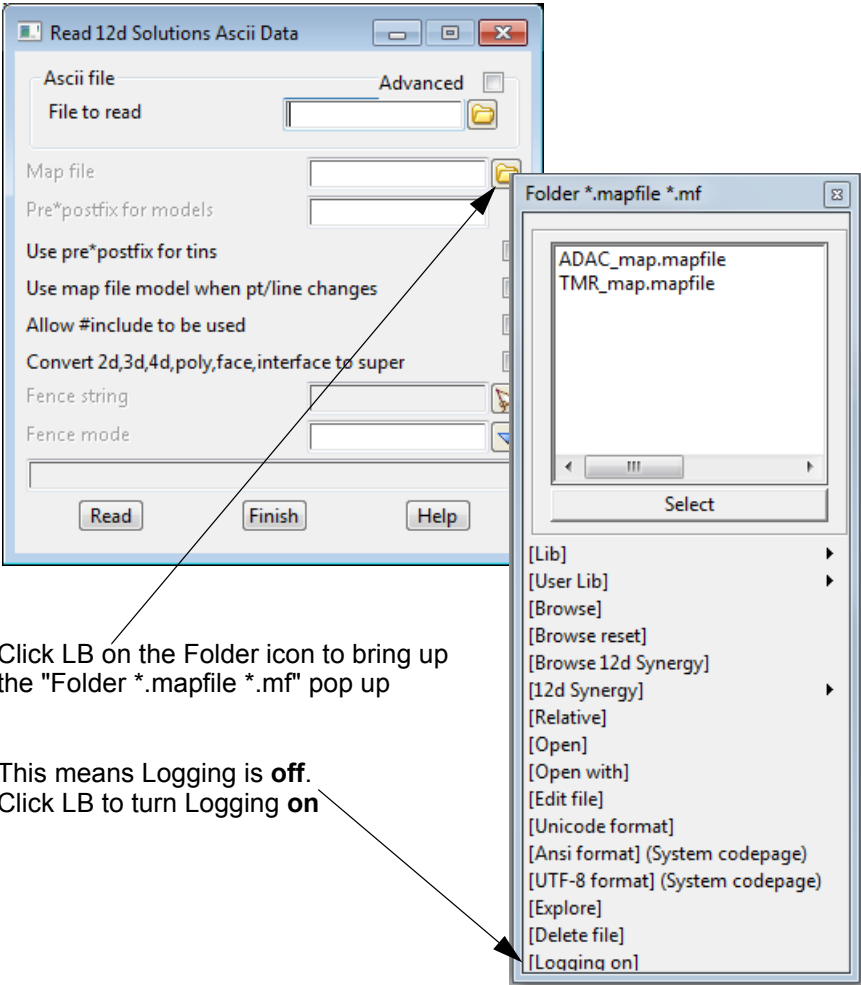

When turned on, as a Map File processes the data and a match occurs, an entry is written to the **Output Window** giving in what section of the Map File section the match occurred, the line number of that section of the grid that the match occurred (written as item number), and by clicking onto the created log line, the mapped object will be highlighted.

To turn **Map File Logging** on or off, click LB or RB on the folder icon at the end of the **Map File** panel field to bring up the **Folder *.mapfile *.mf** pop up.

If **[Logging off]** is displayed then Logging is now turned **on** and clicking LB on [Logging off] will turn Logging off.

If **[Logging on]** is displayed then Logging is now turned **off** and clicking LB on [Logging on] will turn Logging on.

For example, when reading in a **12d Ascii** file, clicking LB on the **Map file** panel field brings up the **Folder *.mapfile *.mf** pop up.

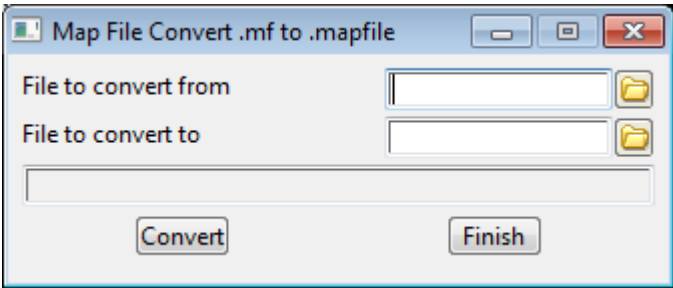

Note: Logging can generate a large number of log lines and this could affect the performance of 12d Model. So it is a good idea to save the project first, or run the logging in a temporary project.

Convert .mf Files to .mapfile

Position of option on menu: File I/O =>Map files =>Convert .mf to .mapfile

The **map file convert** option converts a map file in the pre-V9 format to the XML map file format introduced in **12d Model 9**.

Selecting **Convert .mf to .mapfile** displays the **Map File Convert .mf to .mapfile** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File to convert from <i>name of the pre-V9 map file to be converted to the new map file format</i>	file box		*.mf
File to convert to <i>name of the new converted map file</i>	file box		*.mapfile
Convert <i>convert a file in the pre-V9 map file format to the new map file format.</i>	button		

Create/Edit .mf File

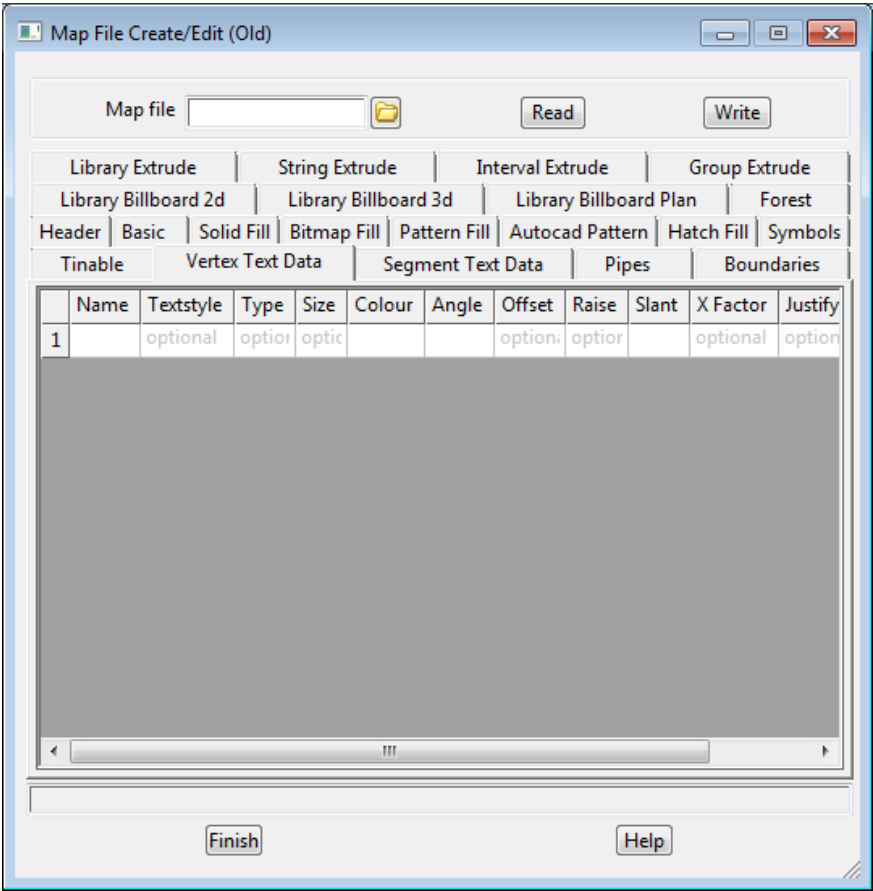

Position of option on menu: File I/O =>Map files =>Create/edit .mf

The Create/edit .mf option **creates** and/or **edit** the 12d Map Files in the pre-V9 format.

This old format is now superseded so the user should use [Convert .mf Files to .mapfile](#) to convert old .mf files to the .mapfile format, or the option [Create/Edit a Map File](#) does this conversion when you select a .mf file. This editor is only supplied for a while and will be removed in a future version.

Vertex Text Data

The **Vertex Text Data** tab sets parameters for drawing text on the vertices of super strings.

Key

Label Map Files

Position of menu: File I/O =>Label Map files

The option Create/edit creates and edits **Label Map** files which are then used in the Label Map File **Apply** option.

From **12d Model 10**, the Label Map file has an XML format (the file ends in .label_mapfile). Before **12d Model 10** there was a format with files ending in .lmf so there is an option to convert from the older format, .lmf, to the newer .label_mapfile format.

Note: if the **Create/edit** option is used on an old format file, it is automatically converted to the new format.

The Map files walk-right menu is

- create/edit a label mapfile
- apply a label map file to data
- convert pre-V10 label map file format to XML format label map files
- create/edit a pre-V10 label map file

For *Create/edit*, go to
Apply
Convert .lmf to .label_mapfile
Create/edit .lmf

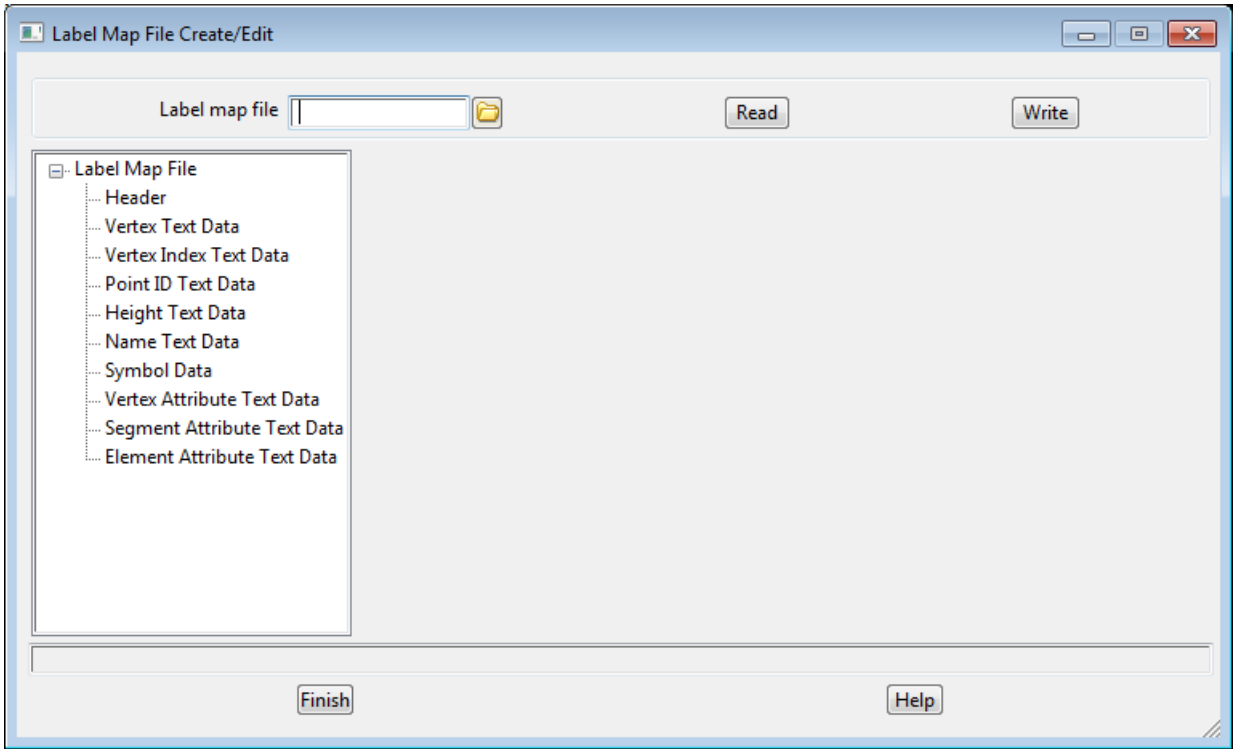

- [Create/Edit Label Map File](#)
- [Apply a Label Map File](#)
- [Convert .lmf Files to .label_mapfile](#)
- [Create/Edit Pre-V10 Label Map File](#)

Create/Edit Label Map File

Position of option on menu: File I/O =>Label Map files =>Create/edit

The **label map file** option **creates** or **edits** the label map files which is used in the **Apply Label Map File** option to create various labels at string vertices and segments.

Selecting Create/edit brings up the **Label Map File Create/Edit** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Label map file	input		*.label_mapfile and *.lmf
<i>name of the label map file to be created or edited.</i>			
<i>If it is a .lmf file, it is automatically converted to the new xml format and written out as a .label_mapfile file.</i>			

Bottom buttons

Read	button
<i>read in the label map file given in the Label map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.</i>	
Write	button
<i>write out the data in the table to the file name given in the Label map file field. If the file already exists, a Replace-Cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.</i>	

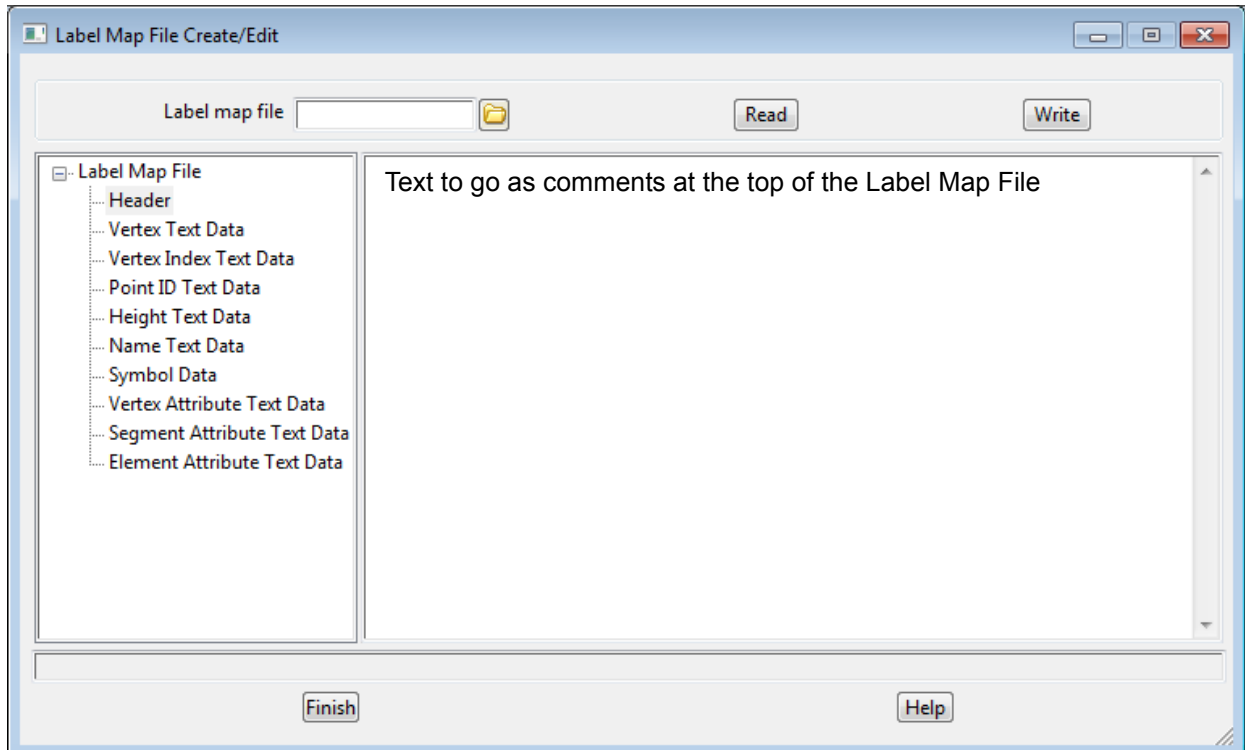

For more information on Header	Header

Header

Header just has lines of comment text. A common use is to document which client the file is to be used for, or the revision history.

The text written in the right hand side of the panel is written out as comments at the top of the Label Map file.

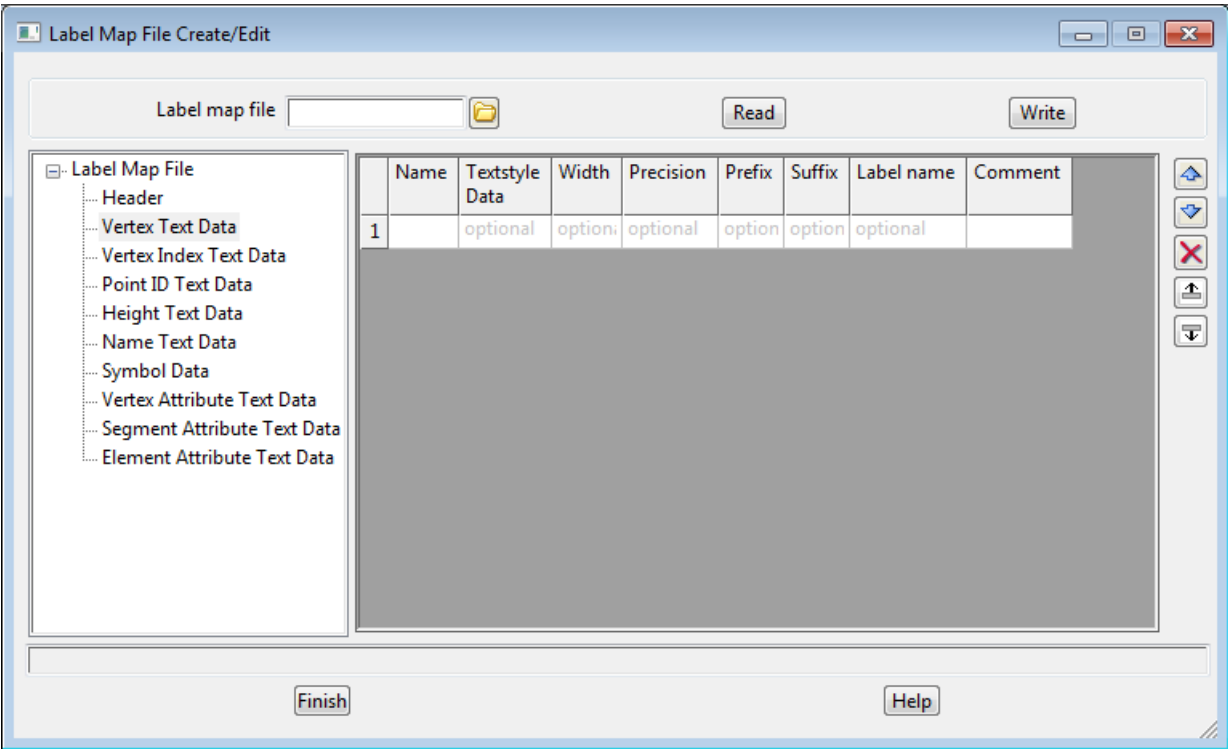

Go to the next section [Vertex Text Data](#) or return to [Create/Edit Label Map File](#).

Vertex Text Data

Super strings can have text at **each** vertex of the super string. **Vertex Text Data** creates labels from the vertex text at each vertex.

The **Vertex Text Data** grid specifies **which strings are selected** and how a label containing the **vertex text** for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Name select name menu for fields

for the selected strings, labels are created from the vertex text at each vertex. See [Selecting Strings using Name](#):

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Selecting Strings using Name:

The text in the **Name** column is the name of the strings to be selected. **Name** can include wild cards * and wild characters ? to allow matching of multiple strings.

For each string, the string name is compared to the text in the **Name** column for this line and if there is a match then the string is selected to label using the parameters in this line of the Label Map file.

If a match occurs for a line, then this line of the Label Map file grid is used and no other lines are tested against.

If no match occurs, then this line of the Label Map file grid is ignored and a test for a match is made against the next line of the grid.

Hence the order of the text in the **Names** column in the grid is important, especially when wild cards and wild characters are used.

Textstyle data select textstyle data menu for fields

textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width

if non blank, the minimum number of number of characters that is allowed for the vertex text before applying the prefix and suffix.

*If the number of characters in the vertex text is less than **Width** characters, then additional spaces are added to the left of the vertex text so that there are **Width** characters.*

*If the number of characters in the vertex text is greater than **Width**, then **Width** is ignored. Hence the vertex text is not truncated.*

*For example if **Width** is set to 20 and the vertex text has only ten characters, then an extra 10 spaces are added to the left of the vertex text before applying the Prefix/Suffix.*

if blank, the vertex text is used with no space padding.

Label name

the created super strings are given this name

Comment

comment to be to be used in this line of the map file.

Go to the next section [Vertex Index Text Data](#) or return to [Create/Edit Label Map File](#).

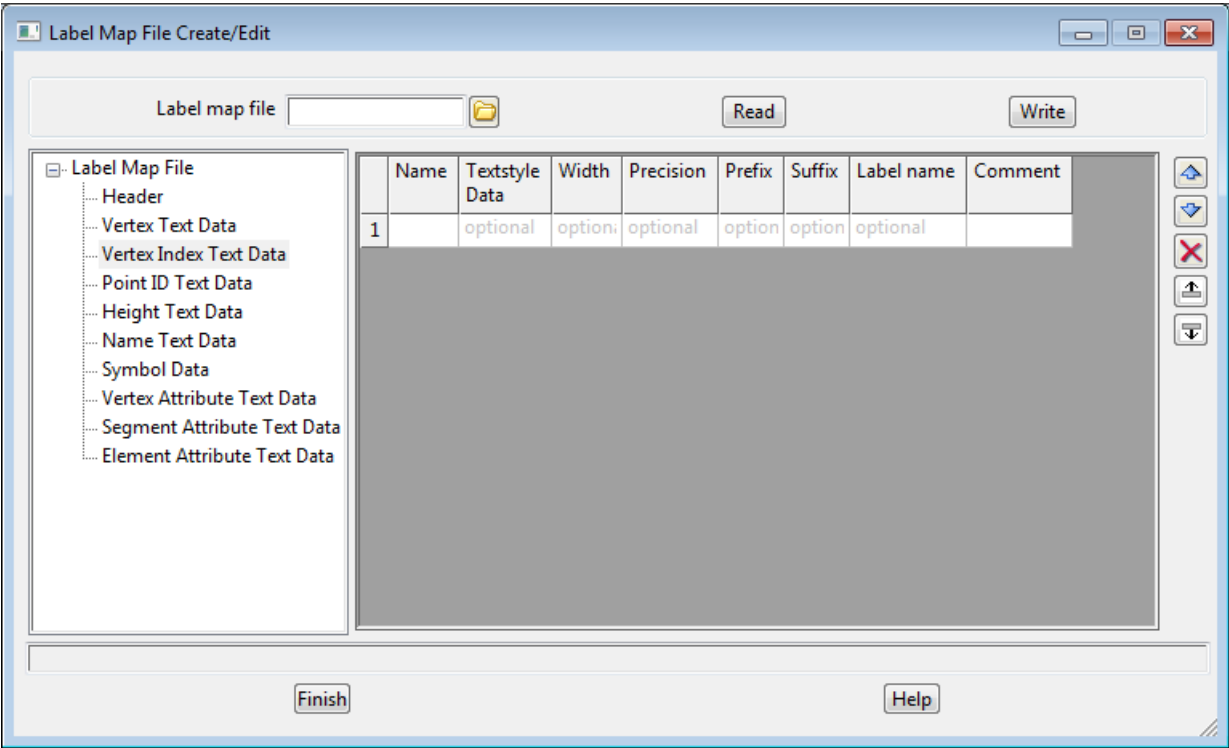

Vertex Index Text Data

Vertex Index Text Data labels the vertex index at each vertex.

The **Vertex Index Text Data** grid specifies *which strings are selected* and how a label containing the **vertex index** for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Note: the vertex index is the position of the vertex in the string. For example if the vertex is the tenth vertex in the string, then the vertex index is 10.

Name select name menu for fields
for the selected strings, labels are created from the vertex index of each vertex. See [Selecting Strings using Name:](#)
For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Textstyle data select textstyle data menu for fields
textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width
*if non blank, the minimum number of characters allowed for the vertex index (including **Precision**) before applying the prefix and suffix.*
*If the number of digits in the vertex index (including **Precision**) is less than **Width** characters, then additional spaces are added to the left of the text so that there are **Width** characters.*
*If the number of digits in the vertex index (including **Precision**) is greater than **Width**, then **Width** is ignored. Hence the vertex index value is not truncated.*
*As an example, if **Width** is set to 10 and the vertex index is 23 and **Precision** is 3, then the label is " 023". That is, an extra seven spaces is added to the left of the vertex index value.*

if blank, the vertex text is used with no modification.

Precision

*if the number of digits in the vertex index is less than the absolute value of **Precision**, then left 0 padding is used to bring the number of digits in the text up to the absolute value of **Precision**.*

*As an example, if **Width** is set to 10 and the vertex index is 23 and **Precision** is 3, then the label is "023". That is, an extra seven spaces is added to the left of the vertex index value.*

Go to the next section [Point Id Text Data](#) or return to [Create/Edit Label Map File](#).

Point Id Text Data

Super strings can have a **Point ID** at **each** vertex of the super string. **Point ID Text Data** labels the Point ID at each vertex.

The **Point ID Text Data** grid specifies **which strings are selected** and how a label containing the **Point ID**'s for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Name select name menu for fields
for the selected strings, labels are created from the Point ID of each vertex. See [Selecting Strings using Name](#):

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Textstyle data select textstyle data menu for fields
textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width
if non blank, the minimum number of characters that is allowed for the Point ID text before applying the prefix and suffix.
*If the number of characters in the Point ID text is less than **Width** characters, then additional spaces are added to the left of the Point ID so that there are **Width** characters.*
*If the number of characters in the Point ID text is greater than **Width**, then **Width** is ignored. Hence the Point ID text is not truncated.*
*For example if **Width** is set to 20 and the Point ID text has only ten characters, then an extra 10 spaces are added to the left of the Point ID text before applying the Prefix/Suffix.*
if blank, the Point ID text is used with no space padding.

Precision

not applicable

Go to the next section [Vertex Attribute Text Data](#) or return to [Create/Edit Label Map File](#).

Vertex Attribute Text Data

Super strings can have attributes at **each vertex** of the super string. **Vertex Attribute Text Data** labels the **value** of vertex attributes at each vertex.

The **Vertex Attribute Text Data** grid specifies **which strings and which vertex attributes are selected** and how a label containing the **value of the vertex attribute** is created for each vertex of the selected strings.

For each selected string, a new super string is created with vertices at the same position as the selected vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Name select name menu for fields

for the selected strings and the selected **vertex attributes** of those strings, a label is created from the **value** of the vertex attribute using the parameters in this line of the Label Map file. See [Selecting Strings and Attributes Using Name:](#).

For each selected string, a new super string is created with vertices at the same position as the selected vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Selecting Strings and Attributes Using Name:

The text in the **Name** column is made up of the name of the string to be selected, followed by / and then the path name of the attribute (see [Attribute Pathname](#)) to be selected. **Name** can include wild cards * and wild characters ? to allow matching on multiple strings and/or multiple attributes.

For each string, the string name and attribute path is compared to the text in the **Name** column for this line and if there is a match then the label from the selected attribute is created using the parameters in this line of the Label Map file.

For example

Drain*/Adac/Pit/* would search any string with the name starting with "Drain" and gets matches for any third level attribute in the second level attribute group "Adac/Pit".

Note that it is the **name** of the attribute used for **selection** but it is the **values** of the selected attribute that are used in the **labels**.

If a match occurs for a line, then this line of the Label Map file grid is used and no other lines are tested against.

If no match occurs, then this line of the Label Map file grid is ignored and a test for a match is made against the next line of the grid.

*Hence the order of the text in the **Name** column in the grid is important, especially when wild cards and wild characters are used.*

Label Map Files Page 817

Convert .lmf Files to .label_mapfile

Position of option on menu: File I/O =>Label Map files =>Convert .lmf to .label_mapfile

The Label map file convert option converts a label map file in the pre-V9 format to the XML label map file format introduced in **12d Model 10**.

Selecting Convert .lmf to .label_mapfile displays the **Label Map File Convert .lmf to .label_mapfile** panel.

The fields and buttons used in this panel have the following functions.

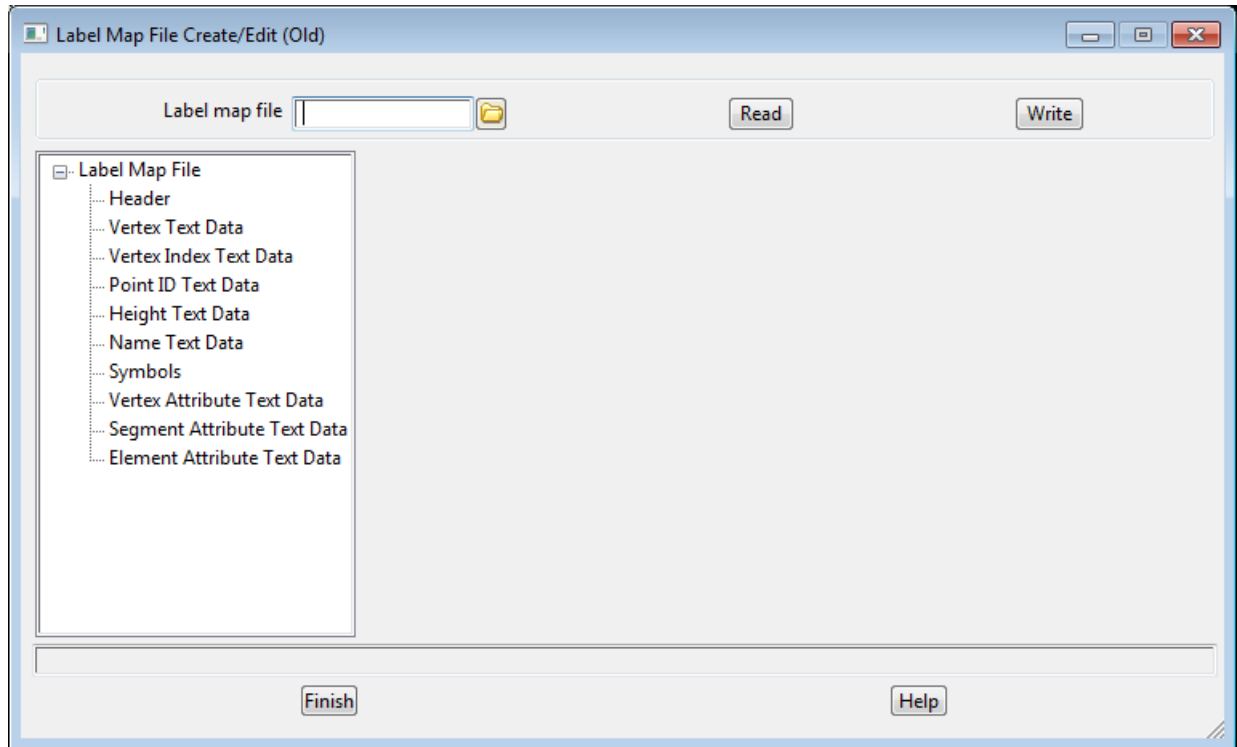

Field Description	Type	Defaults	Pop-Up
File to convert from <i>name of the pre-V10 label map file to be converted to the new label map file format</i>	file box		*.lmf
File to convert to <i>name of the new converted label map file</i>	file box		*.label_mapfile
Convert <i>convert a file in the pre-V10 label map file format to the new label map file format.</i>	button		

Create/Edit Pre-V10 Label Map File

Position of option on menu: File I/O =>Label Map files =>Create/edit .lmf

This option is for editing the superseded label map file format and should not be used.

Please use the new Label Map File format Created/edit option ([Create/Edit Label Map File](#)).

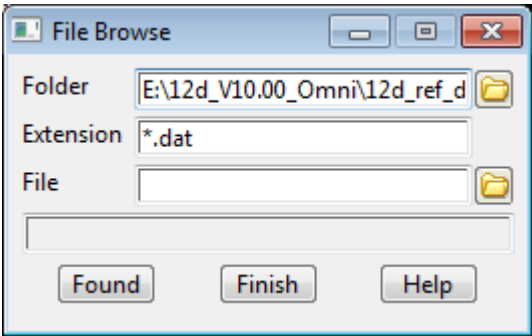

Edit a File

Position of option on menu: File I/O =>Edit

Files can be searched for and then displayed in the editor using the browse option.

Selecting **Edit** brings up the **File Browse** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	input	current folder	Microsoft browser
<i>folder to search for files with the extension given in the extension field.</i>			
Extension	input	*.dat	
<i>wild cards and extension to limit the search of files. An <enter> needs to be typed after changing the extension.</i>			
File	input		files satisfying the folder and extension fields.
<i>select the file to be displayed in the editor.</i>			
Found	button		
<i>display in the editor the file of the name given in the file field.</i>			

Note

The **editor** is pointed to by the environment variable EDITOR_4D (see Appendix A).

GIS

Position of menu: File I/O =>GIS

The **FDO (Feature Data Objects)** is used to communicate with external servers such as **GIS** packages and external databases, including **SQL Server**, **Oracle** and **MySQL**.

Depending on the services provided by the external data source, vector data may be downloaded, updated or new data inserted. Raster images may also be dynamically downloaded and displayed via the **WMS (Web Mapping Service)**.

The list of services **12d Model** currently supports includes:

- WFS (Web Feature Service)
- ArcSDE
- Oracle databases
- SQL Server databases
- MySQL databases
- Basic ODBC (Open Database Connectivity), such as Excel and Access
- PostGreSQL
- SQLite
- PostGIS
- Shape files
- SDF files
- OGR formats (see http://www.gdal.org/ogr/ogr_formats.html)
- WMS (Web Mapping Service) for Raster downloads

Some server types may not be available if you do not have the required third party components, as installed with the third party software. You may need to contact the vendors of the data source if you experience difficulty.

The GIS walk-right menu containing these options is:

For the option Servers, go to

<i>Adds a new server</i>			
Delete 	button		
<i>Deletes the selected server</i>			
Up 	button		

Moves the server up in the list

Down  button

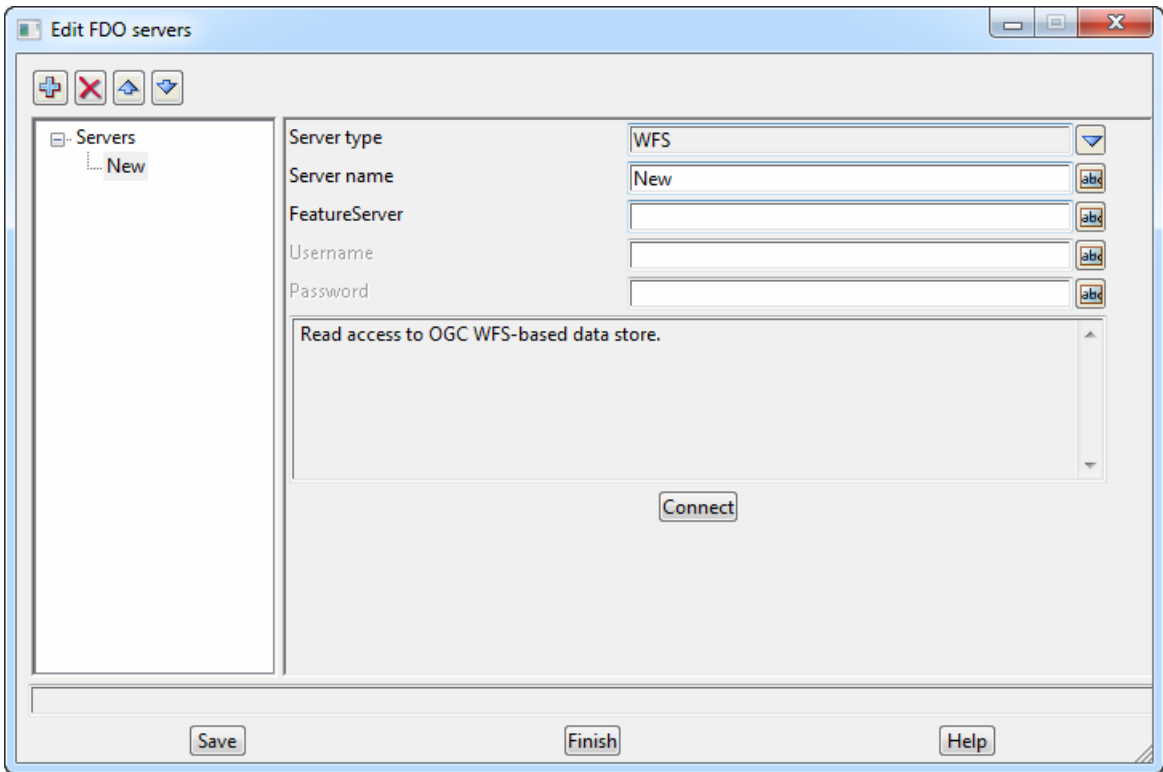

Moves the server down in the list

Save button

Saves the list of servers

WFS Server Setup

This panel provides access to edit the required information for connection to a **WFS (Web Feature Service)** server.

The fields and buttons used in this panel have the following functions.

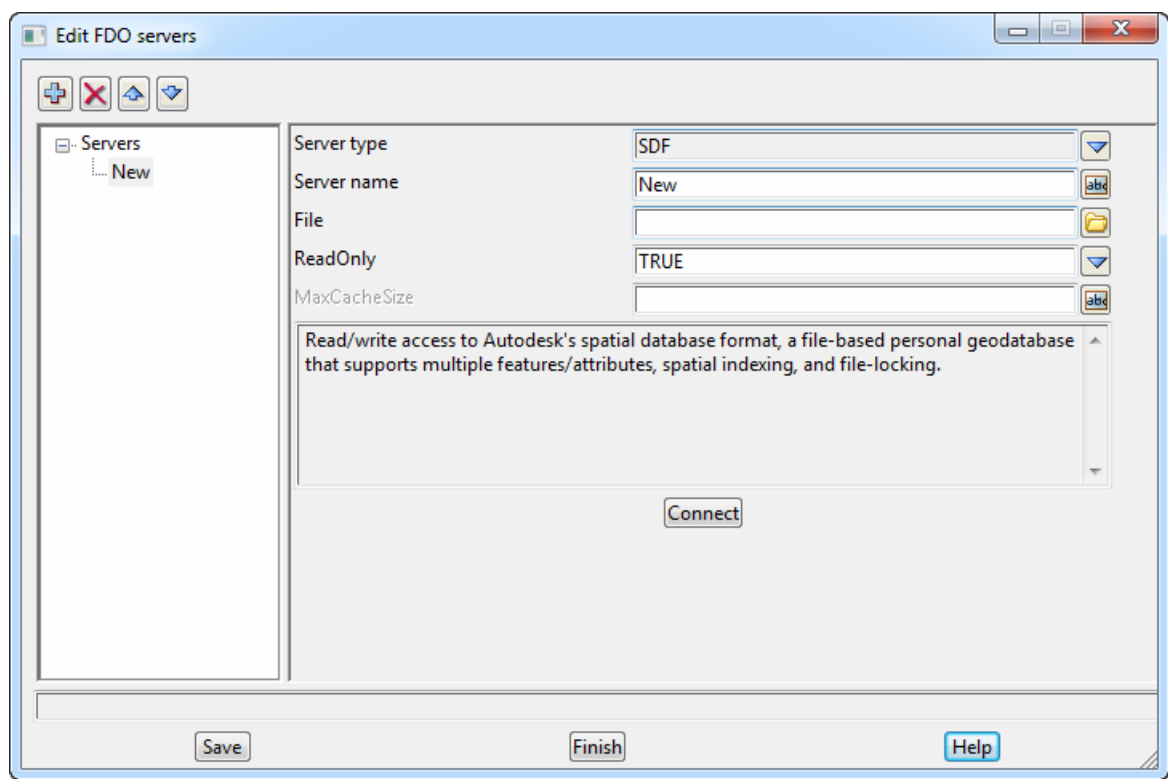

Field Description	Type	Defaults	Pop-Up
Server type <i>the type of server</i>	choice box		
Server name <i>the name by which you will refer to the server</i>			
FeatureServer <i>the HTTP address of the server</i>			
Username <i>an optional username</i>			
Password			

an optional password

Connect button
Tests the connection to the server

SDF Server Setup

This provides access to edit the required information for connection to a file in **AutoDesk's SDF format (spatial database format)**.

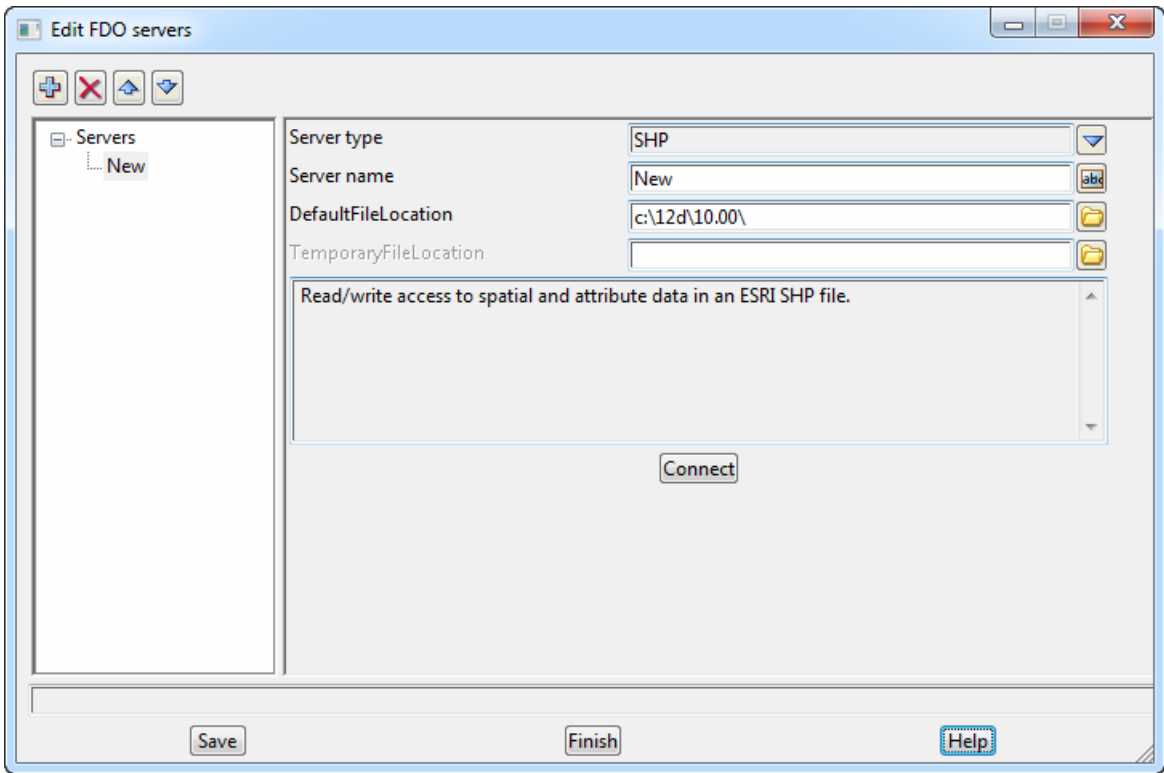

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type <i>the type of server</i>	choice box		
Server name <i>the name by which you will refer to the server</i>			
File <i>the file to read / write</i>	file		
ReadOnly <i>whether or not to access the file in a read only fashion</i>	choice box		True, False
MaxCacheSize <i>an optional setting to determine the maximum cache size used in SDF operations</i>			
Connect <i>Tests the connection to the file</i>	button		

SHP Server Setup

This provides access to edit the required information for connection to a file or set of files in **ESRI's SHP** file format.

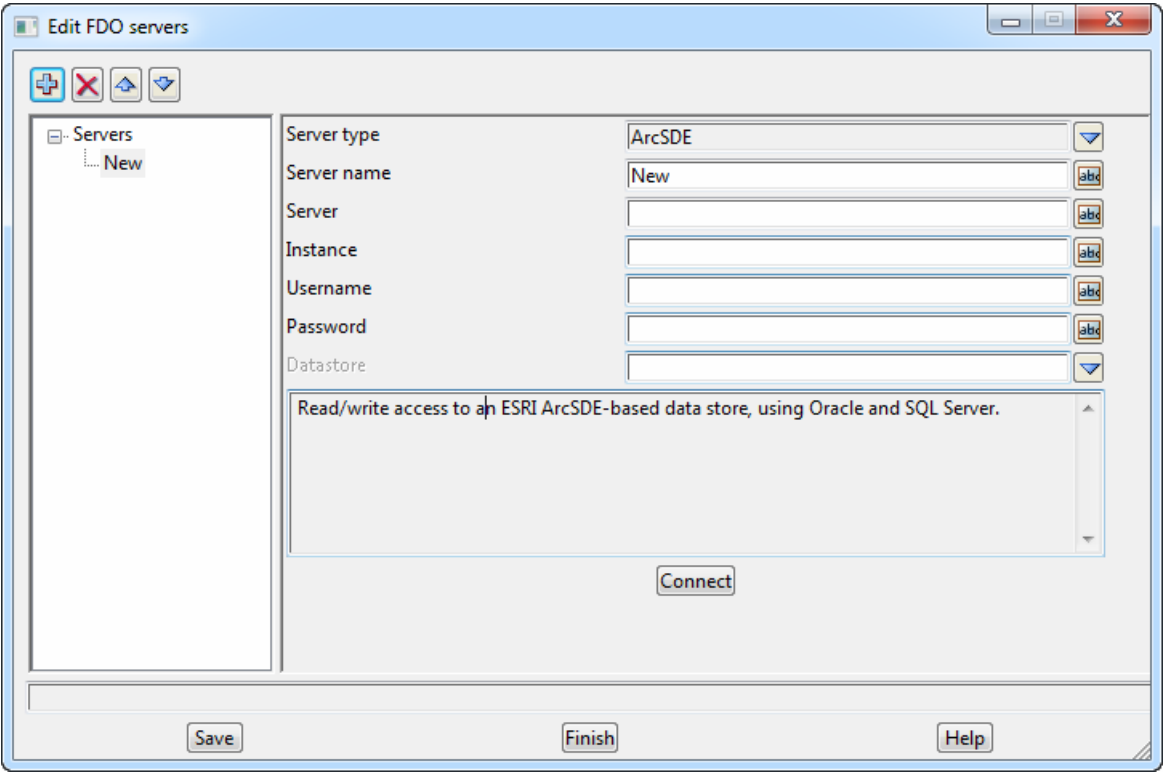

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type <i>the type of server</i>	choice box		
Server name <i>the name by which you will refer to the server</i>			
DefaultFileLocation <i>where the SHP file(s) to read/write reside</i>	file		
TemporaryFileLocation <i>an optional field to specify where the FDO should write any required temporary files</i>	file		
Connect <i>Tests the connection settings</i>	button		

ArcSDE Server Setup

This provides access to edit the required information for connection to an **ArcSDE** server. If you do not know the data store name, you may need to connect to the server once to retrieve the list of names.

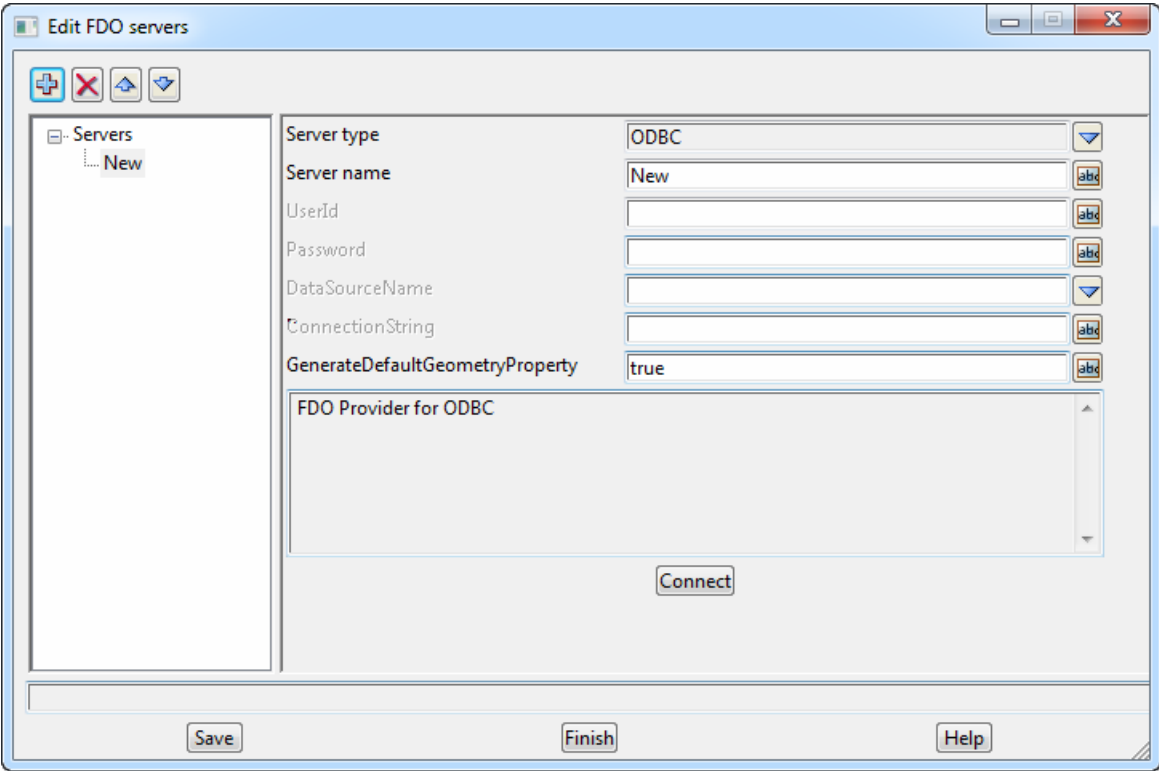

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type <i>the type of server</i>	choice box		
Server name <i>the name by which you will refer to the server</i>			
Server <i>the address of the remote ArcSDE server</i>			
Instance <i>the instance name or port number</i>			
Username <i>the username under which you will connect to the server</i>			
Password <i>the required password for connecting to the server</i>			
Datastore <i>if a datastore is required, you must enter it here. If you do not know the name of the datastore, click Connect and the list of datastores will be retrieved</i>			
Connect <i>Tests the connection to the server and retrieves the list of datastores</i>	button		

ODBC Server Setup

This provides access to setup a connection to a generic **ODBC (Open Database Connectivity)** data source, such as **Microsoft Excel** or **Microsoft Access**.

Because this is a generic connection type, you will be required to know the necessary combination of settings including DSN or Connection String. This may involve knowing the specific driver required to connect to the data source.

The fields and buttons used in this panel have the following functions.

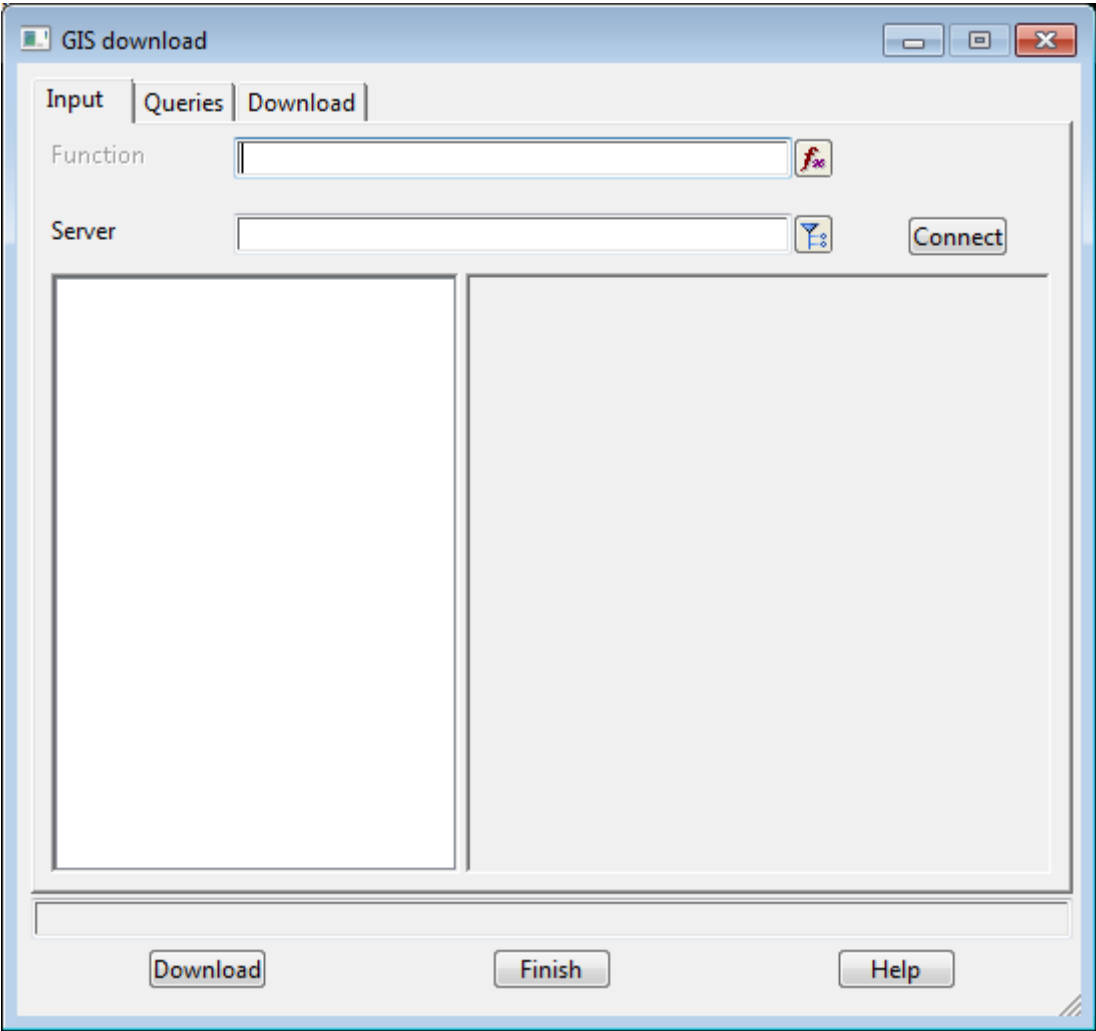

Field Description	Type	Defaults	Pop-Up
Server type <i>the type of server</i>	choice box		
Server name <i>the name by which you will refer to the server</i>			
UserId <i>an optional user id for the connection</i>			
Password <i>an optional password for the connection</i>			
DataSourceName <i>an optional data source name (or DSN)</i>			
ConnectionString <i>an optional connection string</i>			
GenerateDefaultGeometryProperty			

whether or not to generate the default geometry property if one does not exist

Connect button
Tests connection to the data source

GIS Download

Position of option on menu: File I/O =>GIS =>Download
Selecting **Download** brings up the **GIS download** panel.

- For a description of the *Input* tab, see [Input tab](#)
- For a description of the *Queries* tab, see [Queries tab](#)
- For a description of the *Download* tab, see [Download tab](#)
- For a description of the *Download* button, see [Download button](#)

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Input tab			
Function	function box		available GIS functions

an optional function. A function is required for edits and inserts

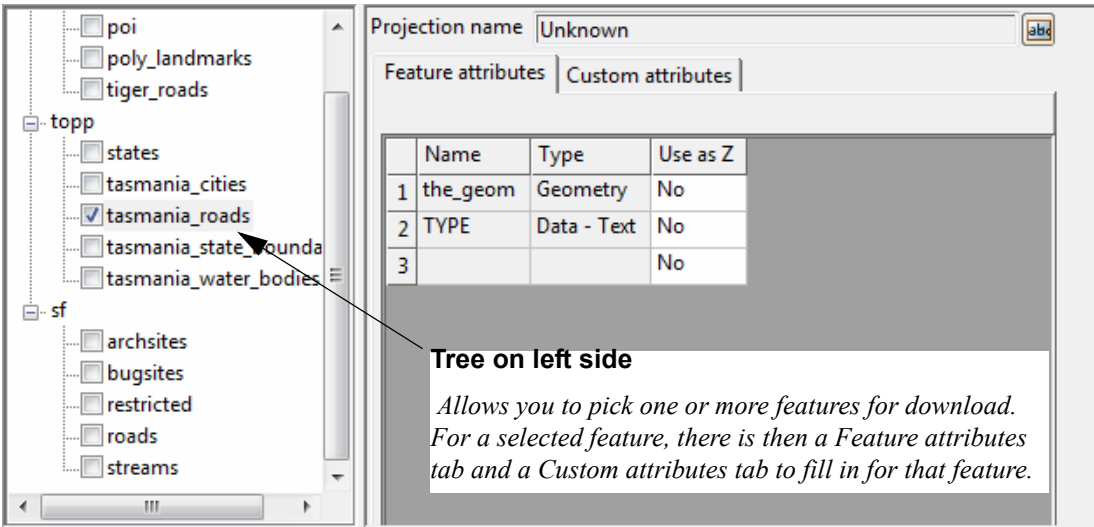

Server

the server you wish to connect to

Connect

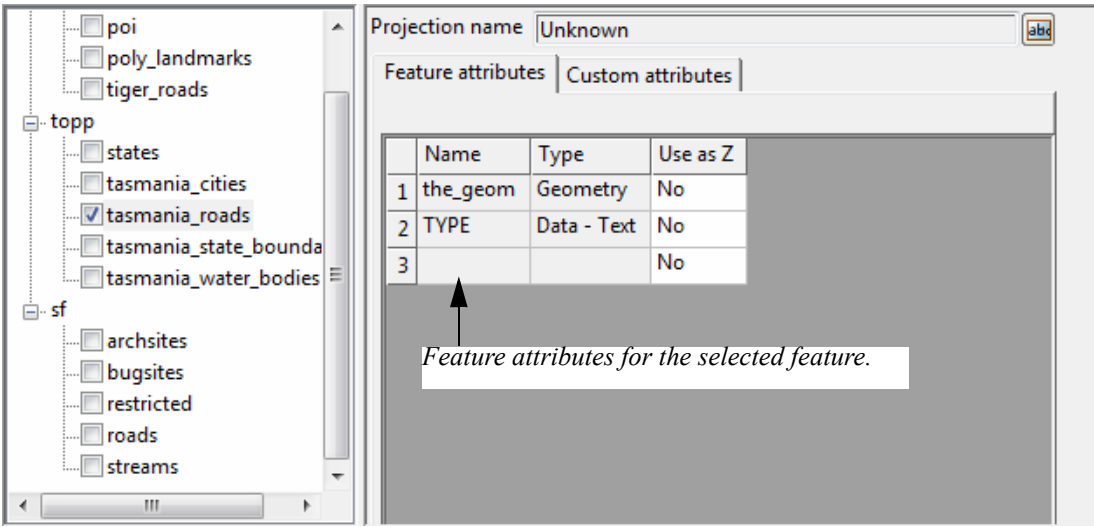

button

connects to the server and retrieves the list of features available for download. The list of features is displayed as a tree control on the left hand side of the panel.

Input tab: Feature Attributes Tab

The Feature attributes grid displays the set of attributes to be downloaded as part of the selected feature.

Name

the name of the downloaded feature attribute

Type

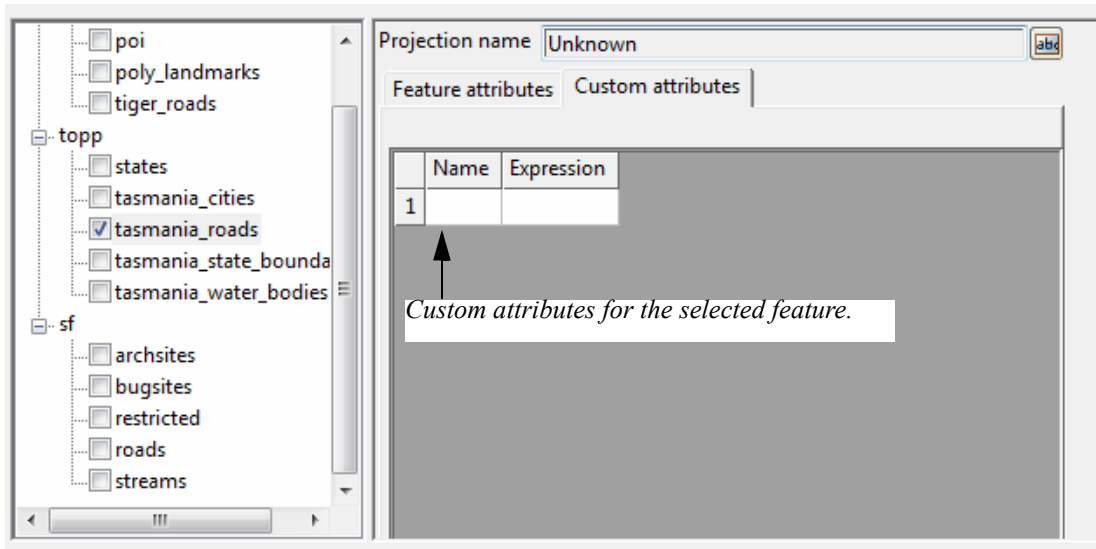

the type of the downloaded feature

Use as Z

whether or not this attribute should be used as a Z level on strings

Input tab: Custom Attributes tab

The Custom attributes grid defines the set of attributes to be downloaded as part of the selected feature.

Name

the name of the attribute to be downloaded

Expression

the expression to calculate the attribute (see [Query Building](#))

Queries tab**Feature Query**

an optional query to send to the server for downloads

Build Query button

shows a helper panel for building queries (see [Query Building](#))

downloads the requested features from the server

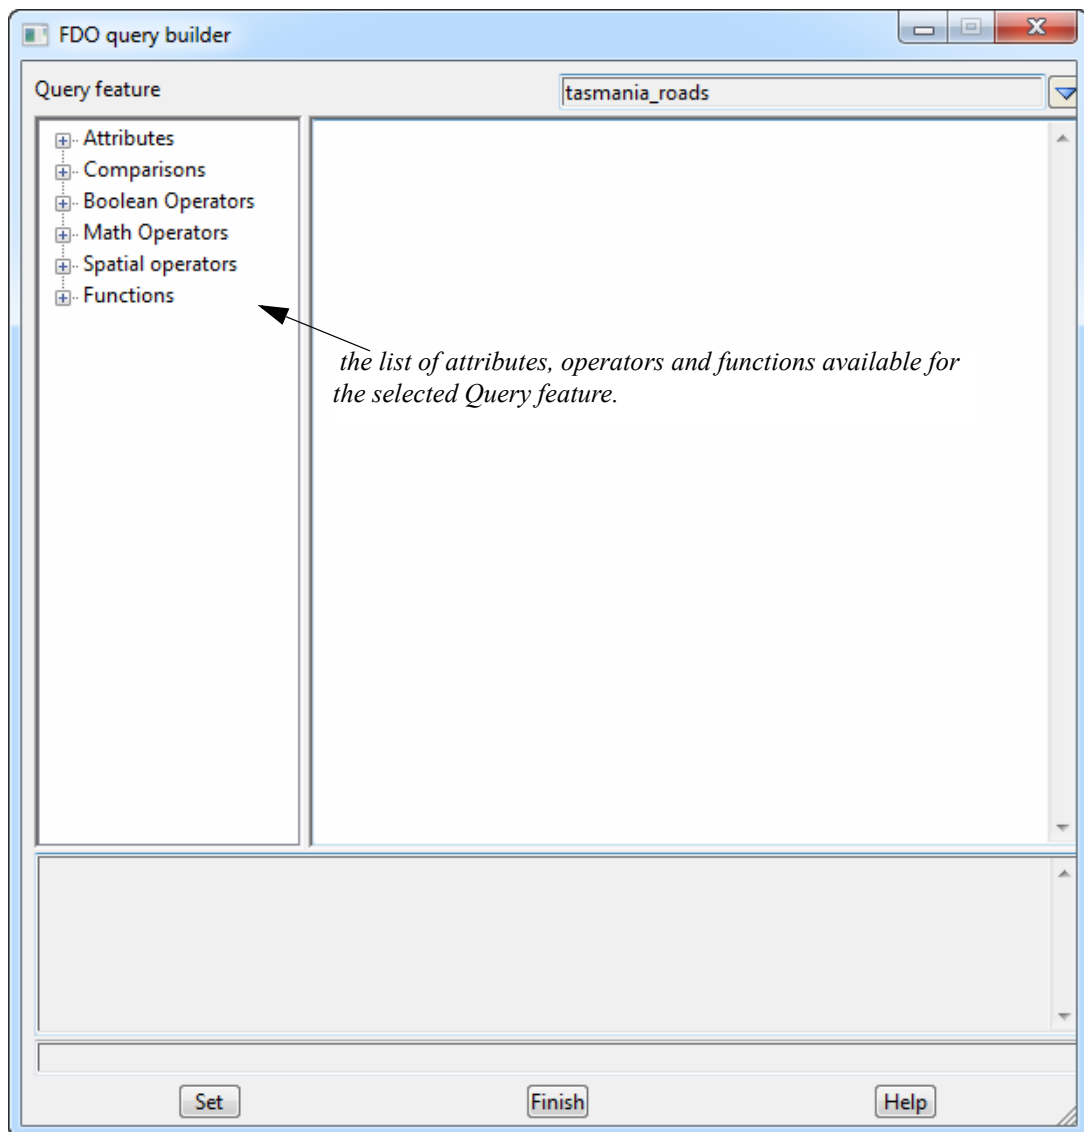

Query Building

This panel helps build queries for constraining feature downloads.

Note that the features, attributes and queries available are determined by the server you are connecting to and will not be documented here.

If the server publishes help information about the query operation, then it will be listed at the bottom of the panel.

Select **Build query**  to bring up the FDO query builder panel

Query feature

the feature to build a query for

Left side

the list of attributes, operators and functions available

Right side

the current query

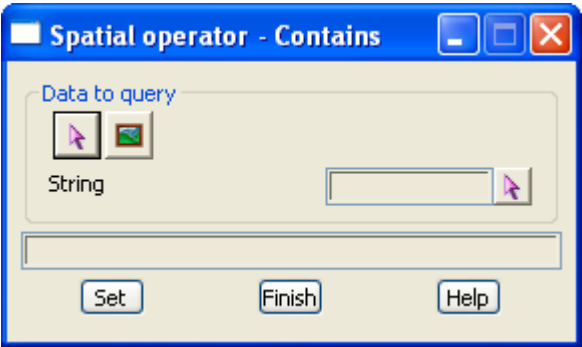

Bottom

any description of the operator

Spatial Operators

Spatial operators are special operators that allow you to refer to an operation against existing geometry. Examples may include whether or not the geometry attribute contains, crosses, intersects or touches another piece of geometry.

For these operators, a panel in the following style will be presented.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to query

the data to operate against

Set

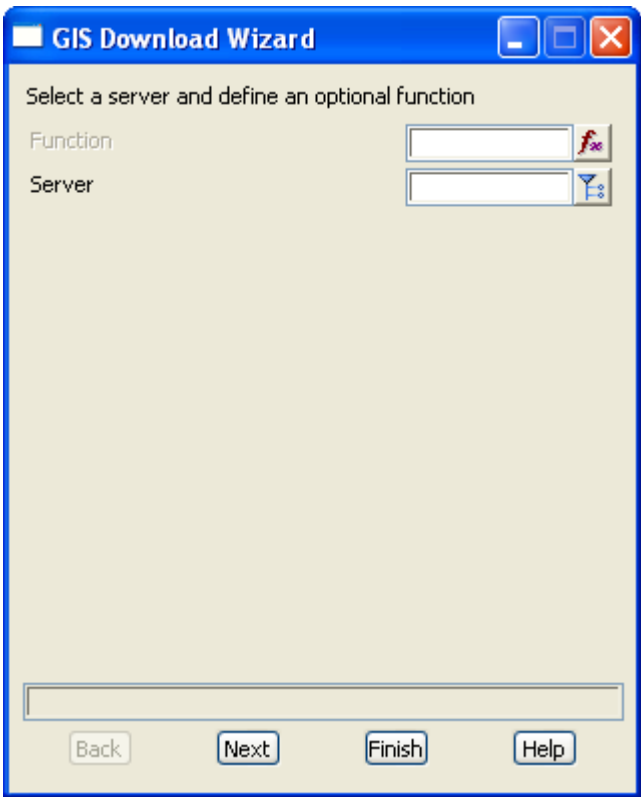

Sets the data for the query

GIS Download Wizard

Position of option on menu: File I/O =>GIS =>Download (Wizard)

This is a wizard style interface to assist in setting up an GIS download.

Selecting **Download (Wizard)** brings up the **FDO Download Wizard** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Throughout the wizard, the following buttons Back and Next will be available			

Back

Takes you back to the last step

Next

Takes you to the next step

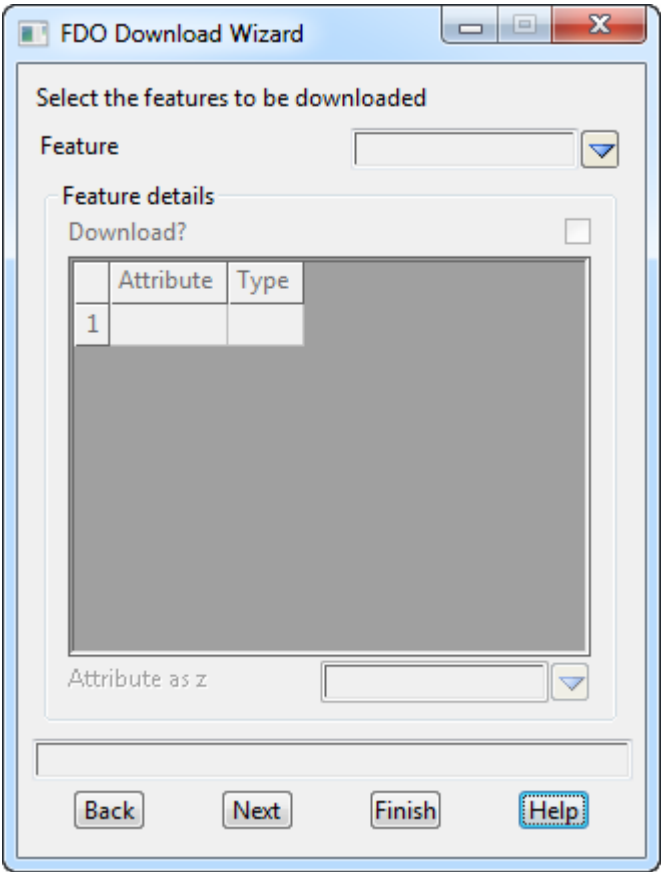

Function

an optional function to create for this FDO download

Server

the server to connect to

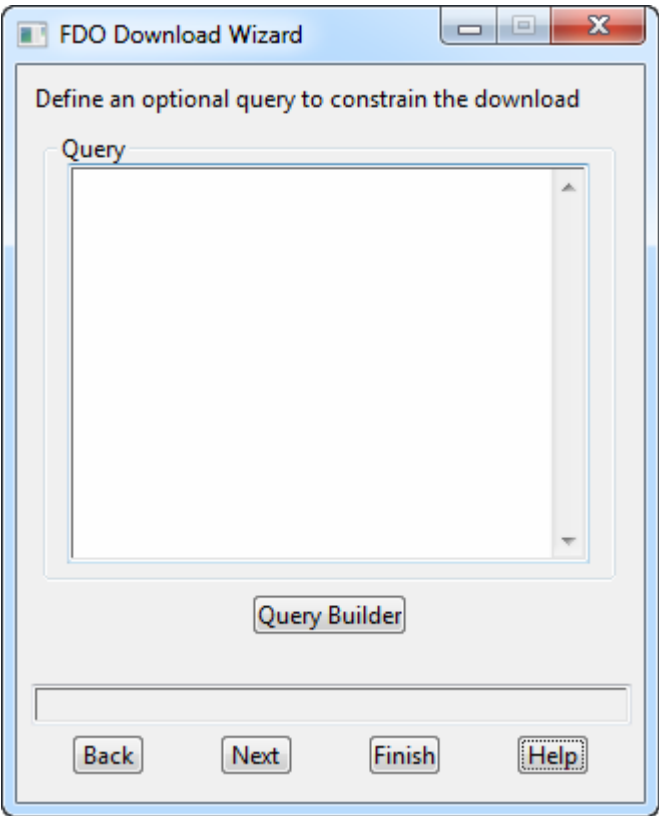

Feature Selection Step

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Feature <i>the feature to view settings for</i>	choice box		
Download? <i>whether or not to download this feature</i>	tick box		
Attribute as z <i>which attribute, if any, to use as the z level for strings</i>			

Query Step

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

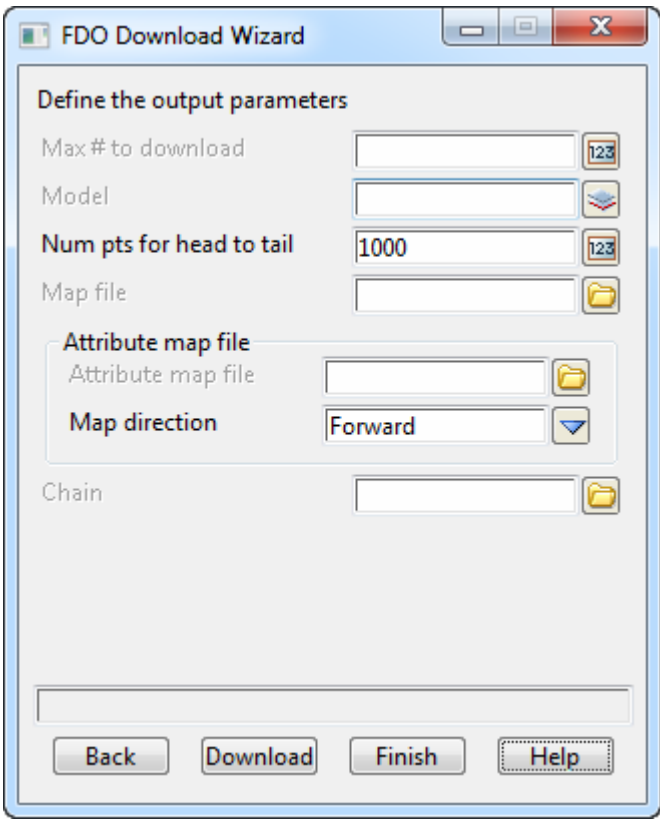

Query

the query to send to the server to constrain features

Query Builder

*opens the **FDO Query builder** panel. See the section on [Query Building](#)*

Output Parameters Step

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Define the Output parameters

Max # to download

the maximum number of strings to download

Model	model box
--------------	-----------

an optional model to download into

Num pts for head to tail

an optional number of points for head to tailing point strings

Map file	file
-----------------	------

an optional map file to apply to downloaded strings

Attribute map file

Attribute map file	file
---------------------------	------

an optional attribute map file to apply to attributes

Map direction	choice box	Forward, Backward
----------------------	------------	-------------------

the direction to apply to the attribute map file

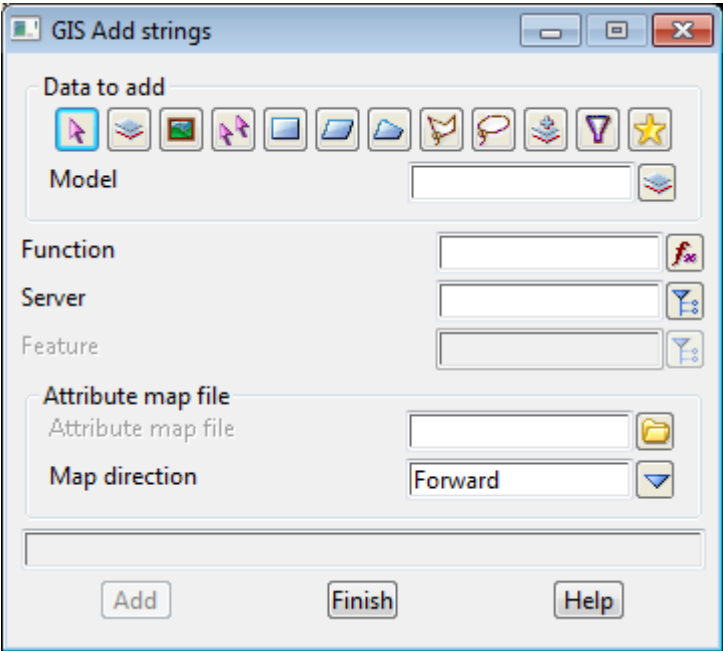

Chain	file
--------------	------

an optional chain to run after the download completes. This is only available if not run in a function.

Download button
downloads the requested features from the server

GIS Add Strings

Position of option on menu: File I/O =>GIS =>Add strings
This allows a user to add strings to a known server. This is only allowed if the server permits the operation.
Selecting Add strings brings up the **GIS Add Strings** panel.

The fields and buttons used in this panel have the following functions.			
Field Description	Type	Defaults	Pop-Up
Data to add			
<i>the data set to add to the server</i>			
Function			
<i>the existing FDO function to which strings will be added</i>			
Server			
<i>the server to connect to</i>			
Feature			
<i>the feature to add strings to</i>			
Attribute map file			
Attribute map file			
<i>an attribute map file to apply to any strings to be uploaded</i>			
Map direction	choice box		Forward, Backward
<i>the direction of mapping</i>			
Add	button		

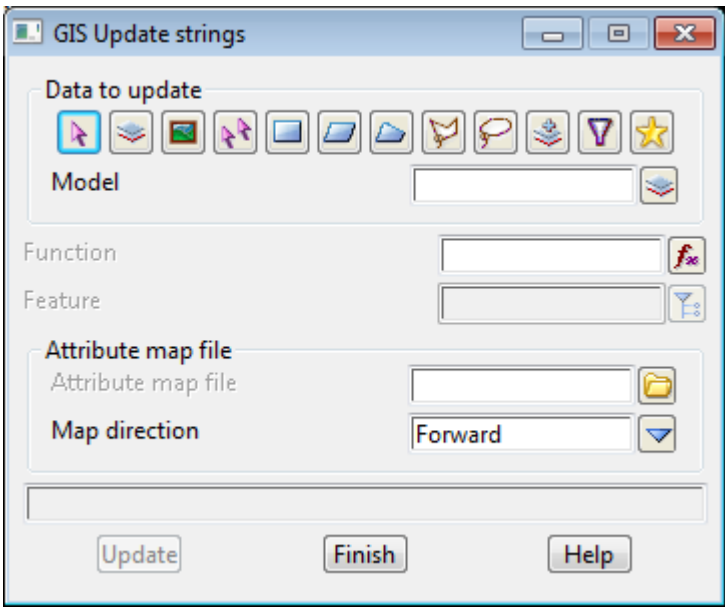

uploads the new strings to the server. Disabled until the function and server are set.

GIS Update Strings

Position of option on menu: File I/O =>GIS =>Update strings

This panel allows a user to upload / update strings on the remote server, if the server permits the operation.

Selecting **Update strings** brings up the **GIS Update Strings** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data to update

the data set of strings to update on the server

Function

the existing FDO function containing strings to be updated

Feature

the feature to update

Attribute map file

Attribute map file	file
<i>the attribute map file to apply</i>	

Map direction	choice box	Forward, Backward
<i>the attribute map file direction to apply to the attribute map file</i>		

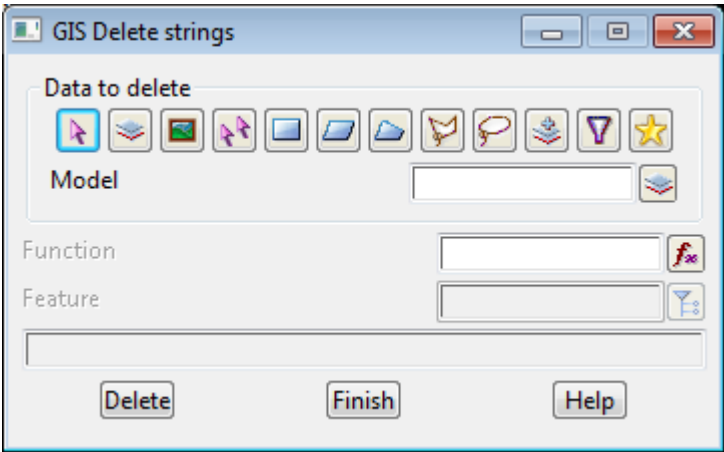

Update	button
<i>Connects to the server and sends the strings to be updated</i>	

GIS Delete Strings

Position of option on menu: File I/O =>GIS =>Delete strings

This panel allows a user to delete strings from the FDO server, if the server permits the operation.

Selecting **Delete strings** brings up the **GIS Delete Strings** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data to delete

the data set to delete from the server

Function

the existing FDO function containing the strings to be deleted

Feature

the feature from which the strings will be deleted

Delete

button

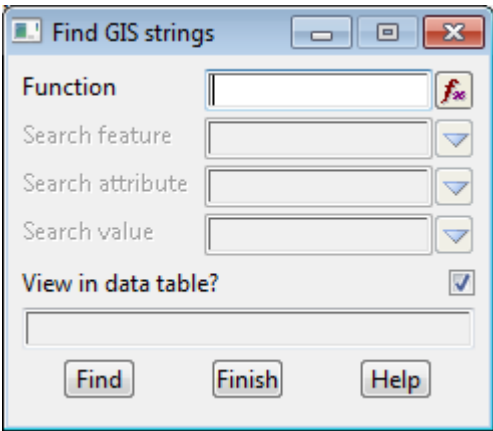

Connects to the server and deletes the specified strings

Find GIS Strings

Position of option on menu: File I/O =>GIS =>Find

This allows a user to find downloaded strings by a feature and an optional attribute / value pair.

Selecting **Find** brings up the **Find GIS Strings** panel.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Function

the FDO function containing the strings. Once entered, the list of features will become available

Search feature

the feature to search through

Search attribute

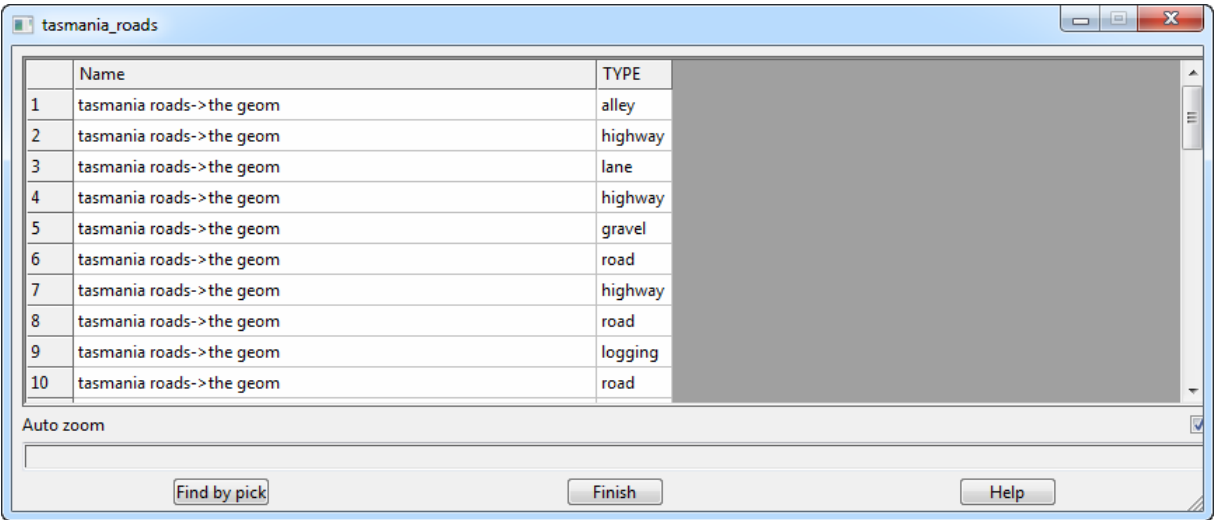

an optional attribute to search for. If not set, all strings in the feature will be found

Search value

the value of the attribute to search for

View in data table? tick box

whether or not to view in a separate data table or in the output window. The data table, below, will pan when the row is selected.

Auto zoom tick box

whether or not to zoom to the selected feature

Find by pick

finds a row based on a string selection

Find button

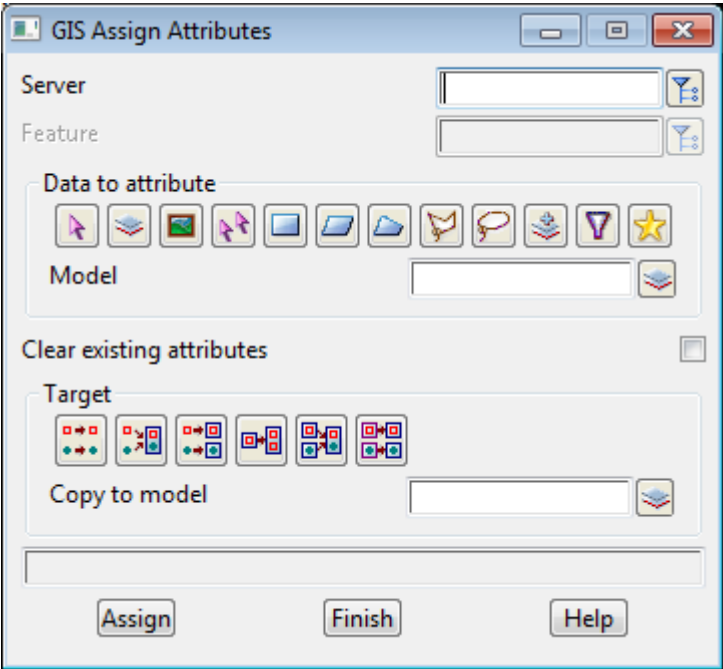

Finds the strings

GIS Assign Attributes

Position of option on menu: File I/O =>GIS =>Assign Attributes

This panel allows you to take the schema from a server and feature and create attributes with default values to a data set.

Selecting **Assign Attributes** brings up the **GIS Assign Attributes** panel.

The fields and buttons used in this panel have the following functions.

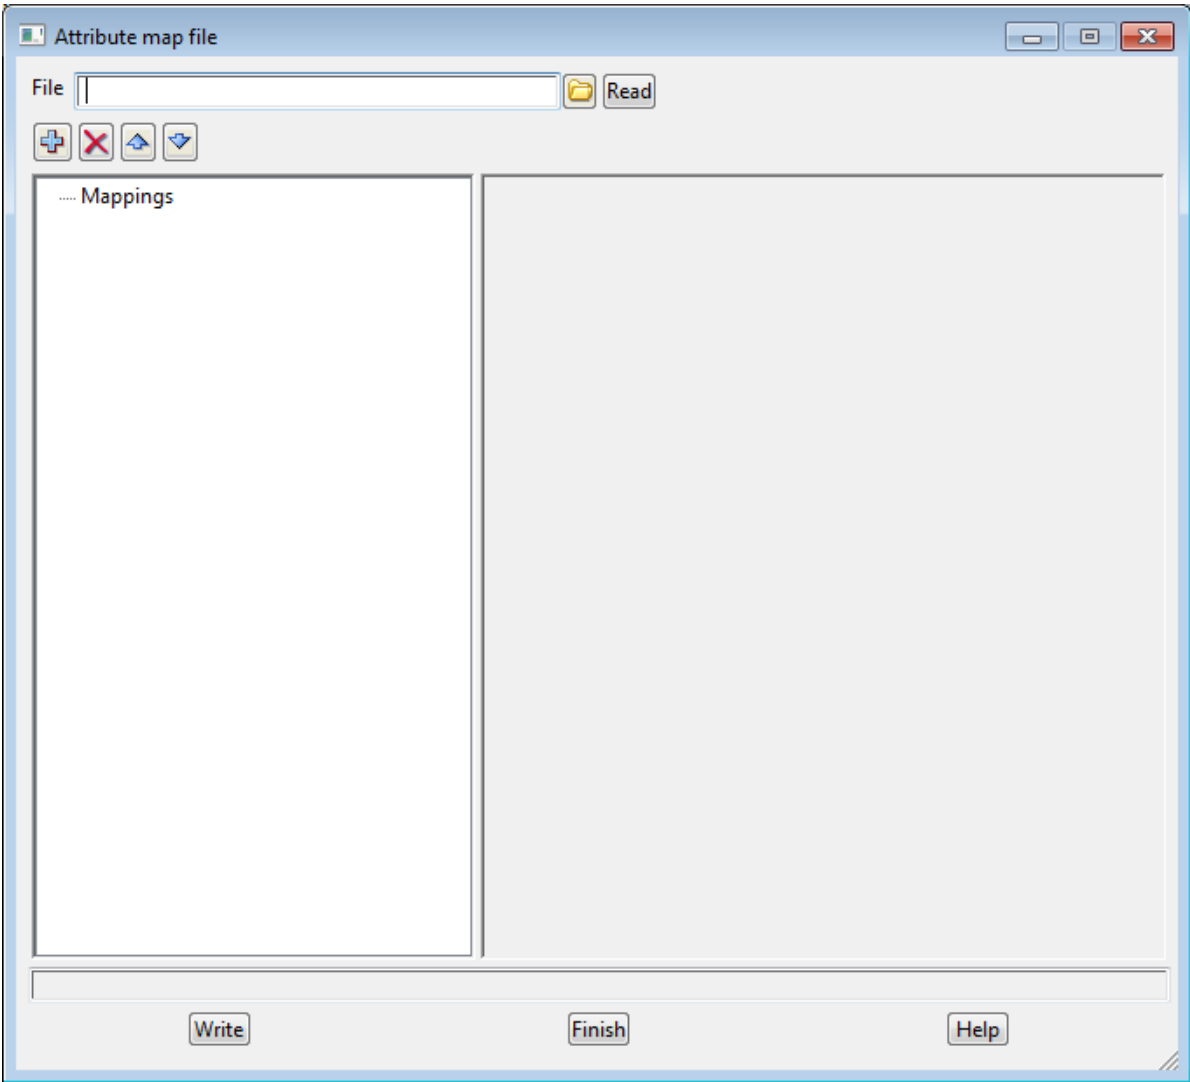

Field Description	Type	Defaults	Pop-Up
Server			
<i>the server to connect to</i>			
Feature			
<i>the feature to use the schema from</i>			
Data to attribute			
<i>the data set to apply feature attributes to</i>			
Clear existing attributes	tick box		
<i>whether or not to clear existing attributes from the data set</i>			
Target			
<i>the target data set</i>			
Assign	button		
<i>assigns the feature attributes to the data source / target set</i>			

Attribute Map File

Position of option on menu: File I/O =>GIS =>Attribute map file editor

This panel allows you to define a mapping from one attribute format to another. This allows you to map from attributes defined by an external data source to meet your attribute schema requirements, or vice versa.

Selecting **Attribute map file editor** brings up the **Attribute map file** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>the attribute mapping file to edit</i>			
Read <i>reads the file</i>	button		
Insert <i>adds a new mapping</i>			
Delete			

deletes the select mapping

Up

Moves the mapping up in the list

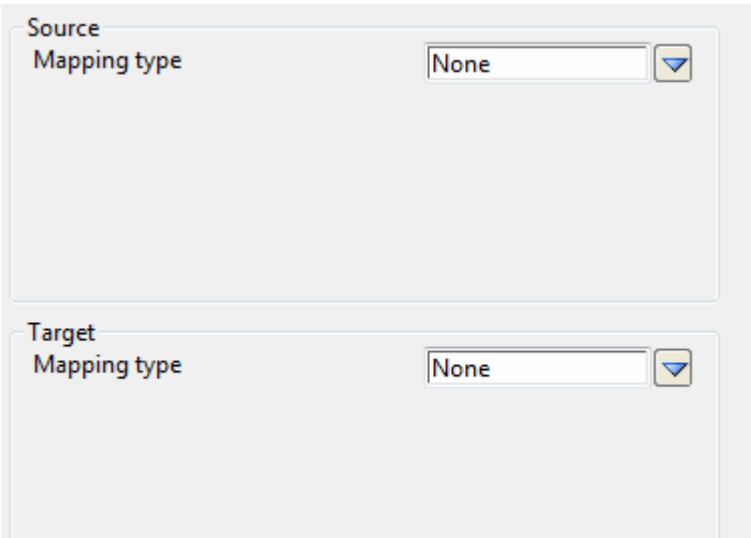

Down

Moves the mapping down in the list

Write button

writes the mapping

After selecting **insert** the **Source Mapping Type** choice box and **Target Mapping Type** choice box appear on the screen.

Source Mapping Type choice box

the type of attribute to map from

For String attribute see [String/Vertex/Segment attribute](#)

Vertex attribute see [String/Vertex/Segment attribute](#)

Segment attribute see [String/Vertex/Segment attribute](#)

String property see [String Property attribute](#)

Target Mapping Type choice box

the type of attribute to map to

For String attribute see [String/Vertex/Segment attribute](#)
Vertex attribute see [String/Vertex/Segment attribute](#)
Segment attribute see [String/Vertex/Segment attribute](#)
String property see [String Property attribute](#)

String/Vertex/Segment attribute

Mapping type	String attribute	
Name	<input type="text"/>	
Expected type	<input type="text"/>	
Date format	<input type="text"/>	
Default value	<input type="text"/>	

Name
the name of the attribute

Expected type choice box
the type of attribute to be expected

Date format
an optional date format (to convert to/from a date string)

Default value
an optional default value to use if the attribute is not found

String Property attribute
Maps to / from a property on a string, such as colour, name, height, weight etc.

Mapping type	String property	
Properties	<input type="text"/>	
Default value	<input type="text"/>	

Properties choice box
the property to map to / from

Default value
an optional default value to use if the value is not found

Manage FDO

Position of option on menu: File I/O =>GIS =>Manage
The **Manage FDO** walk-right menu containing these options is:

For the option Manage Schemas go to [GIS Schema Viewer](#)
Create Schema [Create FDO Schema](#)
Create Feature [Create GIS Feature](#)

GIS Schema Viewer

Position of option on menu: File I/O =>GIS =>Manage => Manage Schemas
This panel allows you to view and edit schemas, if editing is permitted by the server.
Selecting **Manage Schemas** brings up the **GIS Schema Viewer** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server			
<i>the server to view schemas for</i>			

Connect button
connects to the server and downloads all schema information available

When a schema is selected, the right side of the panel will display:

The screenshot shows a software panel with a 'Name' field containing 'Features' and a 'Description' text area below it. At the bottom of the panel are two buttons: 'Delete' and 'Create feature'.

Delete button
deletes the selected schema - only available if permitted by the server

Create feature button
creates a new feature in this schema - only available if permitted by the server

When a feature is selected, the right side of the panel will display the list of attributes and their types.

The screenshot shows a software panel with a 'Projection name' field containing 'Unknown'. Below it is a table with two columns: 'Name' and 'Type'. The table has two rows: row 1 with 'ID' and 'Data - Int16', and row 2 with empty cells. At the bottom of the panel are two buttons: 'Edit' and 'Delete'.

	Name	Type
1	ID	Data - Int16
2		

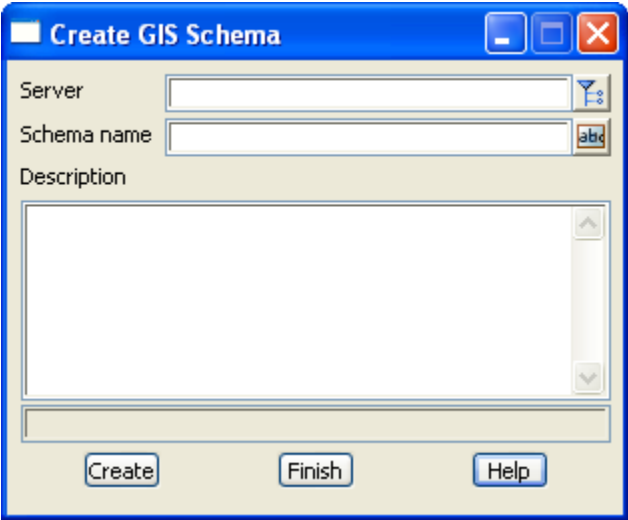

Edit
edits the selected feature see [Create GIS Feature](#)- only available if permitted by the server

Delete
deletes the current feature - only available if permitted by the server

Create FDO Schema

Position of option on menu: File I/O =>GIS =>Manage => Create Schema

This panel creates a new schema on a remote server, if the operation is permitted by the server. Selecting **Create Schema** brings up the **Create GIS Schema** panel.

The fields and buttons used in this panel have the following functions.

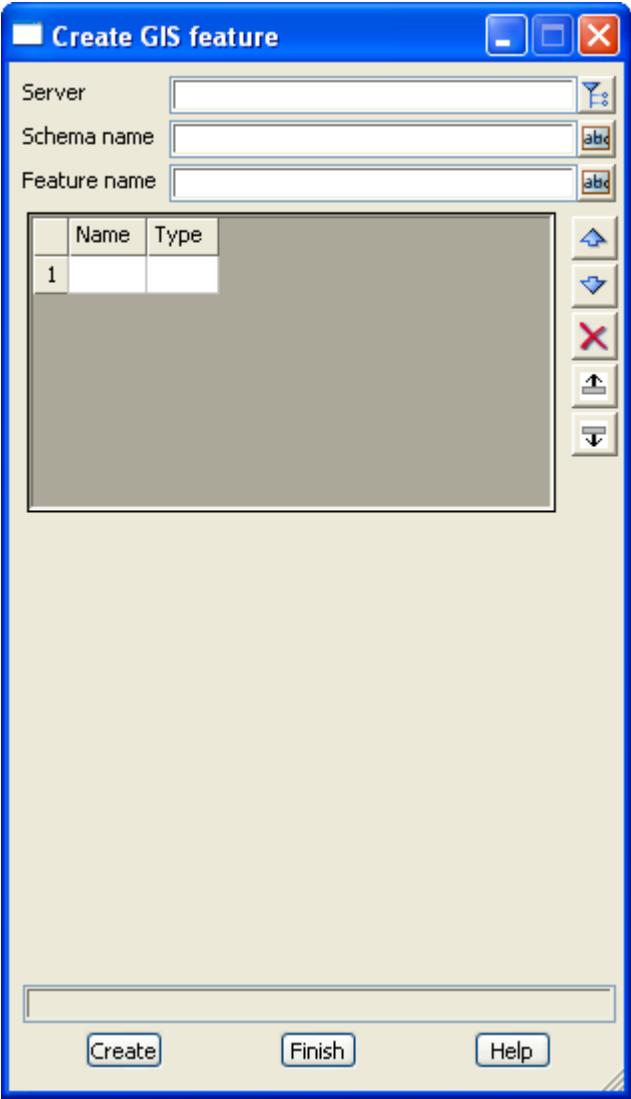

Field	Description	Type	Defaults	Pop-Up
Server				
	<i>the name of the server to create a schema on</i>			
Schema name				
	<i>the name of the schema</i>			
Description				
	<i>an optional description about the schema</i>			
Create				
	button			
	<i>attempts to create the new schema on the remote server</i>			

Create GIS Feature

Position of option on menu: File I/O =>GIS =>Manage => Create feature

This panel creates a new feature in a schema, if the remote server permits the operation.

Selecting Create feature brings up the **Create GIS Feature** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server			
<i>the name of the server to create the feature</i>			
Schema			
<i>the name of the schema to create a feature in</i>			
Feature name			
<i>the name of the feature to create</i>			
Grid Column Name			
<i>the name of the attribute to create</i>			

Grid Column Type

the type of attribute to make

Each row in the grid has a number of additional parameters to fill in.
The standard set of fields are:

Description

Default value

Identifier?

☐

Auto generate?

☐

Nullable?

☐

Read only?

☐

Description

a description of the attribute

Default value

an optional default value

Identifier? tick box

whether or not this attribute is an identifier attribute

Nullable? tick box

whether or not this attribute is nullable (can have a null value)

Auto generate? tick box

whether or not the server should auto generate the value of the attribute

Read only? tick box

whether or not the attribute is a read only attribute

Geometry attributes have the following fields:

Description

Has z values?

☐

Description

a description of the attribute

Has z values? tick box
whether or not the geometry contains z values

WMS

Position of option on menu: File I/O =>GIS =>WMS
Position of option on menu: Strings =>WMS

The WMS walk-right menu containing these options is:

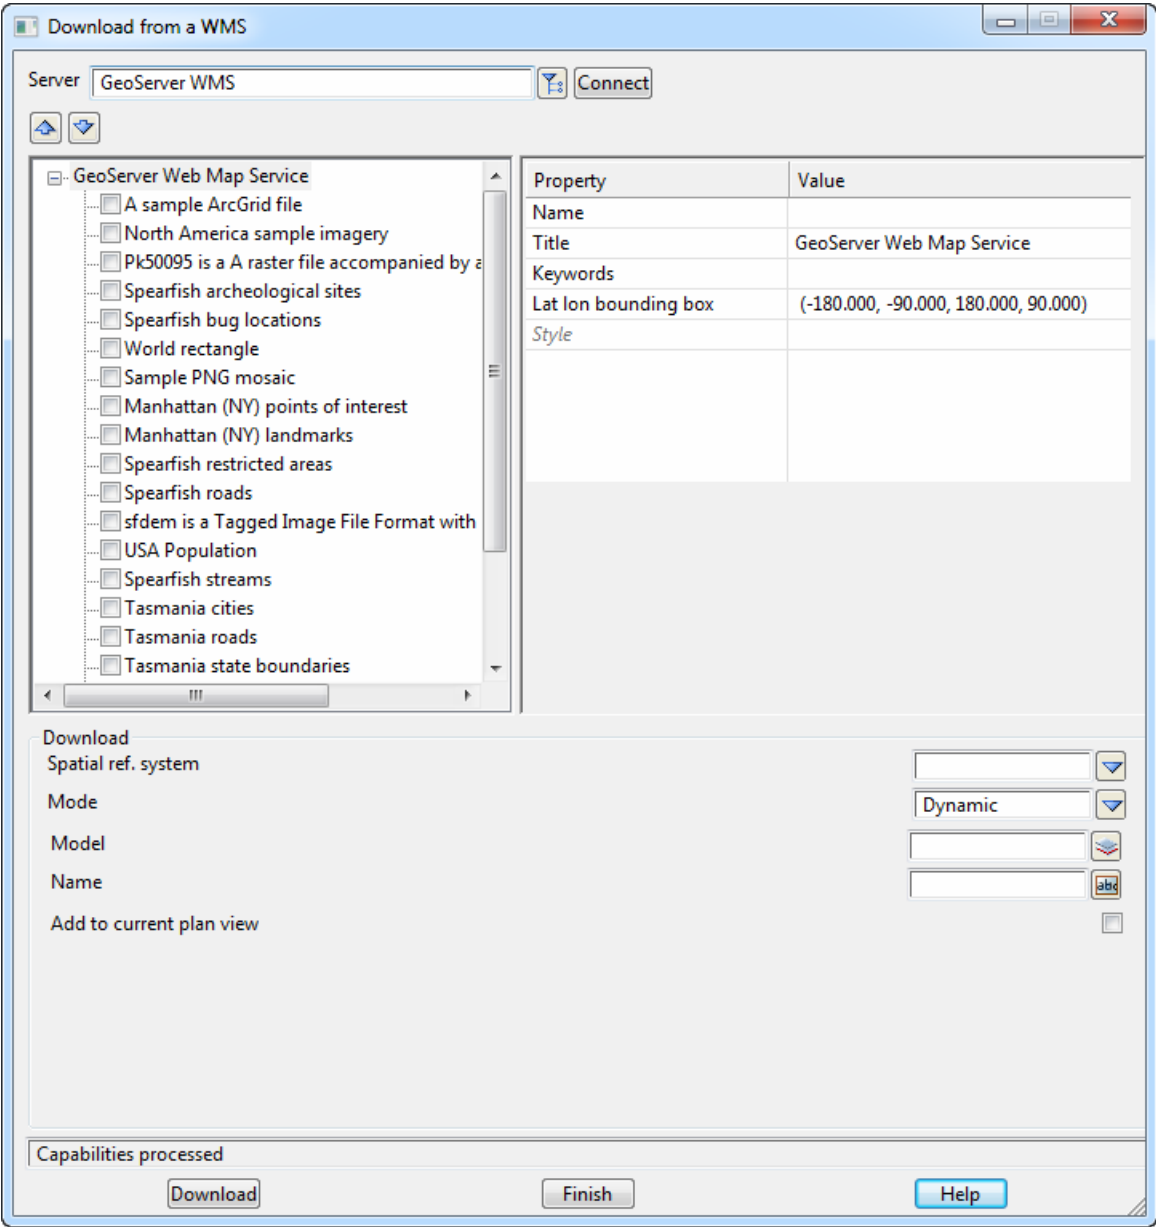

For the option Create go to	Download from a WMS
Create (Wizard)	WMS Wizard
Edit	Edit a WMS Image
Delete	Delete a WMS Image

Download from a WMS

Position of option on menu: File I/O =>GIS =>WMS =>Create

This panel allows you to set up an image to be downloaded from a **WMS (Web Mapping Server)**, either dynamically or as a once off download.
Selecting Create brings up the **Download from a WMS** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server			
<i>the WMS server to download from</i>			
Connect	button		
<i>connects to the server and downloads the schema</i>			
Up arrow			
<i>moves the layer up in order in which they will be downloaded.</i>			
Down arrow			
<i>moves the layer down in order in which they will be downloaded.</i>			
Spatial ref system			

the spatial reference system to use when downloading

Mode choice box Dynamic, Save as file
Dynamic (update as you pan around), or Save as file

Model model box
the model to add a dynamic WMS image to

Name
the name of the image

Add to current plan view tick box
Whether or not to add to the current plan view

If the mode is **Save as file**, the following fields will be displayed.:

Mode: Save as file
Format:
Bounding box:
Maintain bounding box ratio:
Size: Width: Height:
Save as:

Format
the format of the image to download

Bounding box
whether or not to define a bounding box

Maintain bounding box ratio
whether or not to maintain the ratio of the bounding box on the server

Size
defines the width and height of the image file

Save as
the target file for the image

WMS Wizard

Position of option on menu: File I/O =>GIS =>WMS =>Create (Wizard)
This panel allows you to set up an image to be downloaded from a **WMS (Web Mapping Server)**, either dynamically or as a once off download, via a wizard like interface.
Selecting Create (Wizard) brings up the **WMS Wizard** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Throughout the wizard, the following buttons will be available:

Back

Takes you back to the last step

Next

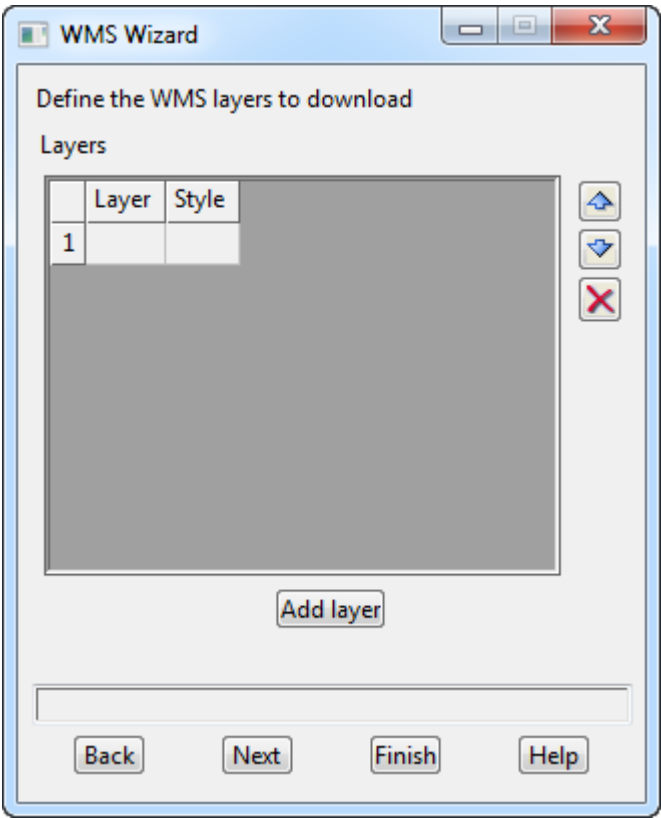

Takes you to the next step

Server

the server to download from

Layer Selection Step

This panel allows you to select the layers to be downloaded

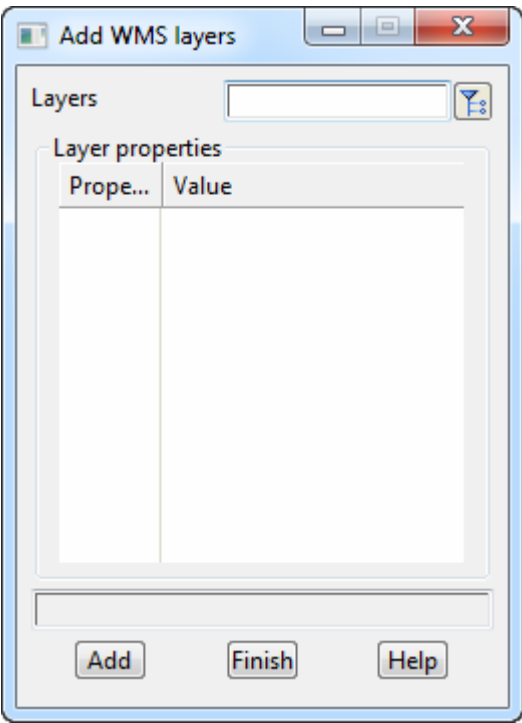

Add layers button

shows the list of layers to be downloaded

*Selecting **Add layers** bring up the **Add WMS layers** panel*

Add WMS layers

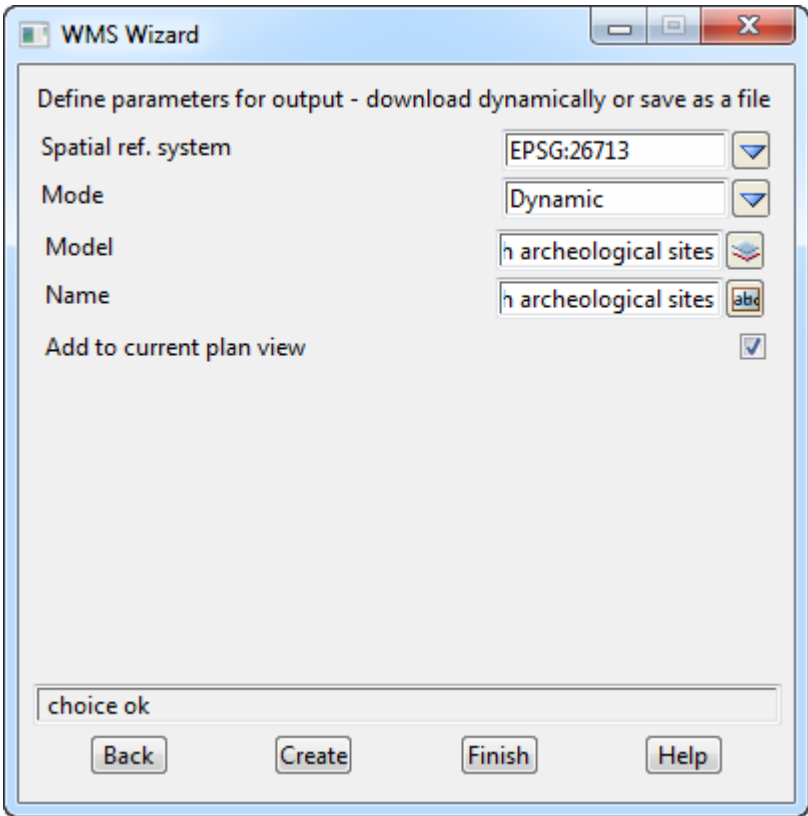

Layers

the layer to add or view properties

Add

adds the layer

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Edit by Pick

Pick	button
<i>pick the WMS image to string, by picking its extent</i>	

Edit from list

Model	model box
<i>the model to look for WMS images in</i>	

Image	
<i>the WMS image within the model to edit</i>	

Edit	button
<i>edits the selected WMS image</i>	

Delete a WMS Image

Position of option on menu: File I/O =>GIS =>WMS =>Delete

Deletes a **WMS** image, as selected by picking or by specifying by model and image name.

Selecting **Delete** brings up the **Delete a WMS Image** panel.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Delete by pick

Delete		button		
	<i>pick the WMS image to string, by picking its extent</i>			

Delete from list

Model		model box		
	<i>the model to look for WMS images in</i>			

Image				
	<i>the WMS image within the model to delete</i>			

Delete				
	<i>delete the selected WMS image</i>			

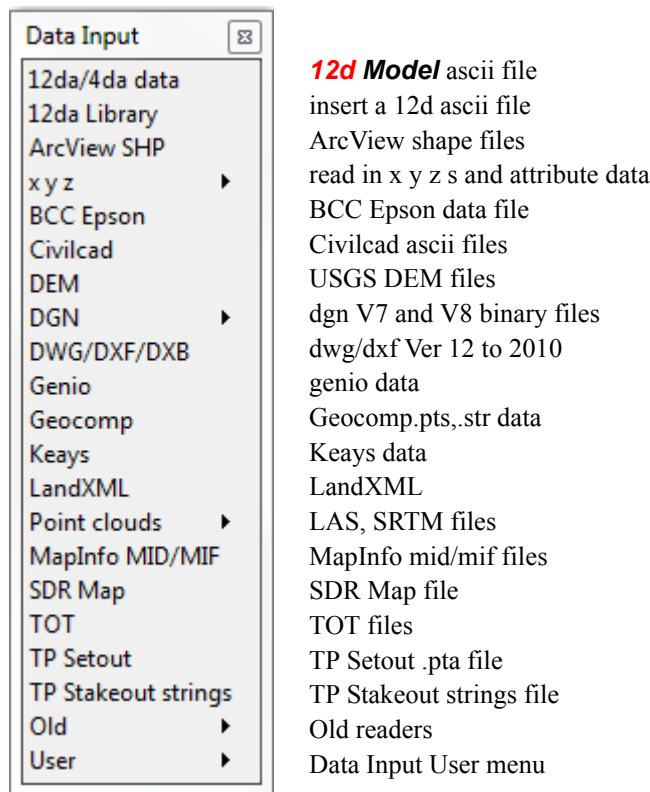

10 Data Input

Position of menu: File I/O =>Data input

The facilities for reading data files into **12d** Model are collected under the **File i/o=>Data input** menu.

Some of the formats are provided in the base product (xyz data, BCC Epson, **12d** Model HP plots and **12d** Model ascii files) and the rest are optional (dxf, genio, geocomp, etc.).

The default *Input null value* is described in the section [Input Null Value](#)

The default *Input null value* is described in the section [Input Null Value](#)

For the option *12da data*, go to

12da Library

ArcView SHP

x y z

[Input Point Cloud Files](#)

[Mapinfo Input.](#)

[SDR Map Input.](#)

[TOT Input.](#)

[TP Setout Input.](#)

[TP Stakeout Strings Input.](#)

[Old Inputs](#)

Input Null Value

In three dimensional data, it is possible that a point can have a valid plan position but an undefined height. In **12d** Model, there is a special **null** value (-9.9e29) which is used internally when height is undefined.

In other software systems, the null value may be different.

To allow for different null values, **12d** Model has an **i/o null height** parameter.

As data is read in, the height is checked and if it is equal to the **i/o null height**, then it is replaced by the **12d** Model null height.

The **i/o null height** is set in **Default Settings** tab of the **Defaults** panel in the **Project =>Management =>Defaults** (see [Defaults](#)).

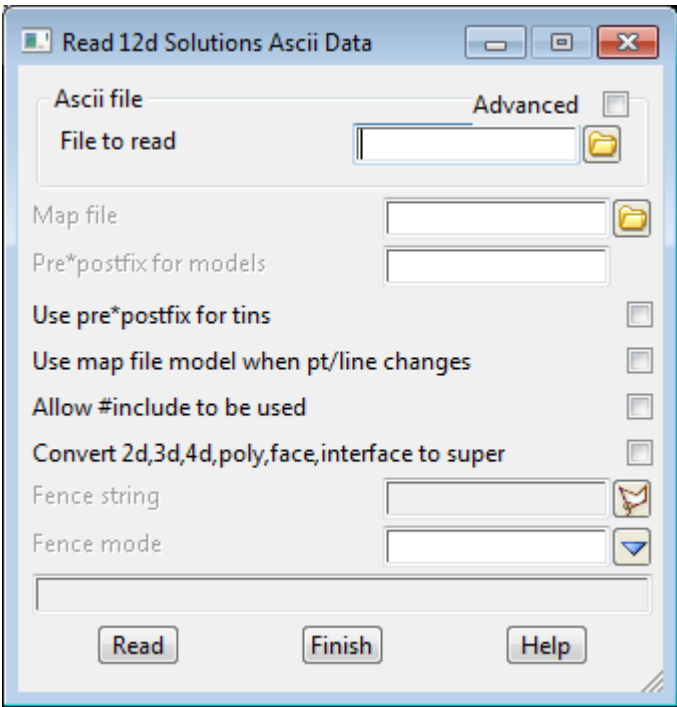

Note - some input panels have their own special null value field which is used instead of the **i/o** null height.

12d Ascii Input

Position of option on menu: File I/O =>Data input =>12d/4da data

The 12d Ascii format is a special format defined by 12D Solutions to allow data to be easily transferred from other programs into 12D Solutions software such as 12d Model. The 12d Ascii format is given in the Appendix.

Selecting the 12d/4da data brings up the **Read 12d Solutions Ascii Data** panel:

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Advanced tick box

*if **ticked**, a grid to allow multiple 12d ascii files to be read in, is opened. A wild card is used to select all the files to be read in.*

Folder folder box

folder to search for files using the Wild card

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files	output	
<i>name of the file in the folder</i>		
Size (KB)	output	
<i>file size</i>		
Pre*post	text input	
<i>if non blank, pre*post text to use for the models in this 12d ascii file (see Pre*Postfix Panel Fields) for information on using pre*postfix.</i>		
<i>If blank, use the pre*post text from the Pre*postfix for models panel field.</i>		
 <i>Note - if a non-blank value for Pre*post is given in the column for a file then the Pre*postfix for models is ignored.</i>		
File to read	file box	*.12da or *.4da files
<i>name of the 12d Model Ascii file to be read in.</i>		
Map file	file box	*.mf files
<i>if non-blank, the name of the 12d map file to be used for all strings read in, including any files given with the Advanced mode ticked on.</i>		
<i>If blank, no map file is used</i>		
 <i>When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>		
Pre*postfix for models	pre*postfix box	
<i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.</i>		
<i>Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>		
 <i>Note - if a non-blank value for Pre*post is given in the column for a file then the Pre*postfix for models is ignored.</i>		
Use pre*postfix for tins	tick box	not ticked
<i>if ticked, a prefix and a postfix are to be applied to any tin names in the 12d Ascii data.</i>		
<i>Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>		
 <i>Warning - if a tin already exists in 12d Model with the tin name, then the tin cannot be read in from the 12d Ascii file.</i>		
Use map file model when pt/line changes	tick box	
<i>if not ticked and the pt/line type of the string does not match that in the map file, then the string is placed in.</i>		
<i>If tick, the.</i>		
Allow #include to be used	tick box	
<i>if ticked, expand an files referenced by an #include.</i>		
<i>If not ticked, ignore the #includes</i>		
Convert 2d, 3d, 4d, poly, face, interface to super	tick box	
<i>if ticked, 2d/3d/4d/poly/face/interface strings are converted to super strings.</i>		
Fence string	polygon box	
<i>A polygon is selected/created and used with the Fence mode choice to restrict the selection of strings read in from the 12d Ascii file.</i>		
<i>Clicking LB on the Select Polygon icon on the right hand side of the Fence string field allows the user to select a polygon.</i>		
<i>Clicking RB on the Select Polygon icon on the right hand side of the Fence string field brings up the Polygon Choice Box for the user to select a method of creating/selecting a polygon.</i>		

Clicking MB does nothing.

Fence mode choice box available choices

The strings selected are then restricted to those using the polygon and satisfying the Fence mode:

String inside - strings totally inside the polygon
String outside - strings totally outside the polygon
String crossing - strings crossing the polygon
String inside/crossing - strings totally inside or crossing the polygon
String outside/crossing - strings totally outside or crossing the polygon

Fence Modes

Read button

reads the data in.

12da Library

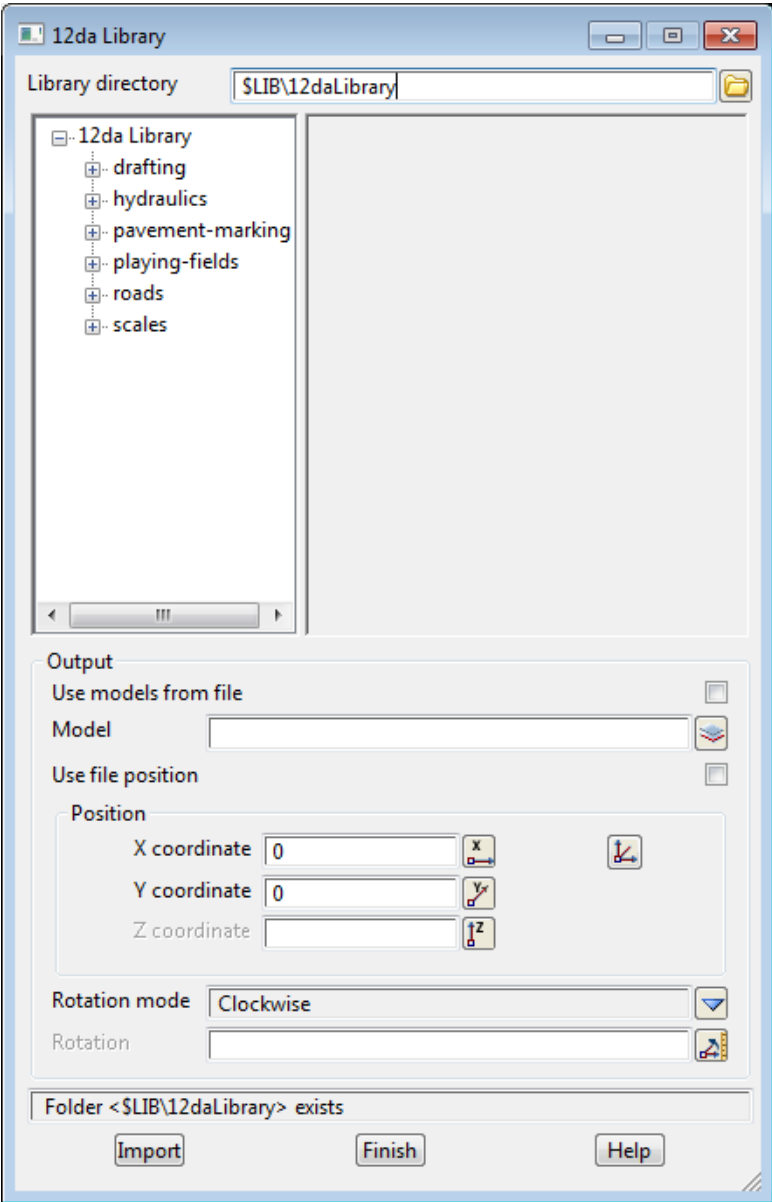

Position of option on menu: File I/O =>Data input =>12da Library

The **12da Library** allows a user to load 12das from a 'library', defined by a directory structure.

Every folder within the nominated directory will be searched for 12da files, and this directory structure will be shown in the tree on the left hand side of the panel. When selected, the 12da will be shown in a preview on the right.

These 12das can be output into a nominated model, and a specific position, or you can choose to use the file position.

Selecting **12da Library** brings up the **12da Library** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Library directory	file		
<i>the directory to search for 12das in</i>			

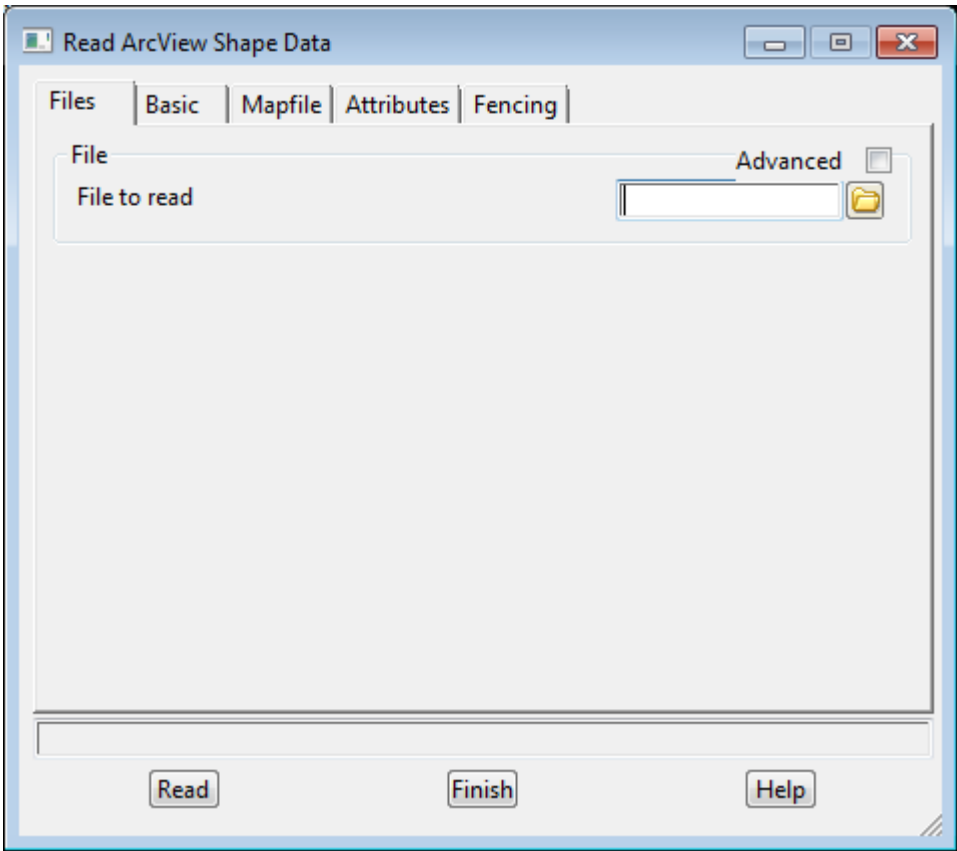

Use models from file	tick box	
<i>if ticked use the models specified in the 12da</i>		
Model	model box	
<i>if not using the models listed in the file, the model for the data in the 12da</i>		
Use file position	tick box	
<i>if ticked use the file specified in the file position</i>		
Position x coordinate		
<i>the x-coordinate for the data, if not using the position in the file</i>		
Position y coordinate		
<i>the y-coordinate for the data, if not using the position in the file</i>		
Position z coordinate		
<i>an optional y-coordinate for the data, if not using the position in the file</i>		
Rotation mode	choice box	Clockwise, Anti- clockwise
<i>how to apply an optional rotation (Clockwise or Anti -clockwise)</i>		
Rotation		
<i>an optional rotation to apply</i>		

ArcView SHP Input

Position of option on menu: File I/O =>Data input =>ArcView SHP

Option to read in ArcView shaped files.

Selecting **ArcView SHP** brings up the **Read ArcView Shape Data** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Files tab

Advanced tick box

*if **ticked**, a grid to allow multiple ArcView shape files to be read in, is opened. A wild card is used to select all the files to be read in.*

Folder folder box
folder to search for files using the Wild card

Wildcard input

wild card to use in search for files in the given folder

Use tick box
if **ticked**, read in the file

Files output
name of the file in the folder

Size output
file size

Pre*post text input
if **non blank**, pre*post text to use for the models in this Arcview shp file (see [Pre*Postfix Panel Fields](#)) for information on using pre*postfix.
If **blank**, use the pre*post text from the Pre*postfix for models panel field.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

File to read file box *.shp files
name of the ArcView shape file. **12d Model** then reads this and the two (2) other files that go with the shape file. The two other file extensions are *.shx and *.dbf.
If no attribute is mapped to model, then the file name (minus the .shp) is used as the model for the data.

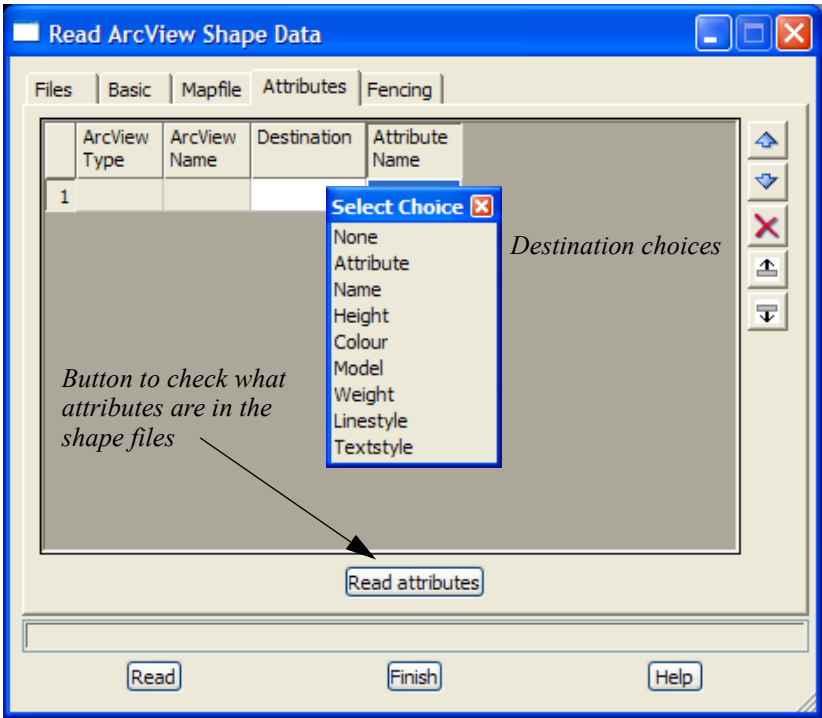

Map file tab

Map file file box *.mf and *.mapfile files
if **non-blank**, the name of the 12d map file to be used for all strings read in.
If **blank**, no map file is used

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Pre*postfix for models pre*postfix box
if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.
Go to the section [Pre*Postfix Panel Fields](#) for information on using pre*postfix.

Attributes tab

Read attributes button

Click to check what attributes are present in the ArcView shape files and any ArcView attributes found are listed in the **ArcView Type** and **ArcView Name** columns in the grid.

Destination Grid column

type of 12d attribute to map the Arcview attribute to:

- none - don't use the attribute - the attribute is ignored
- attribute - use as 12d attribute
- name - use as 12d string name
- height - use as 12d vertex height
- colour - use as 12d string colour
- model - use as model name
- weight - use as string weight
- linestyle - use as 12d linestyle
- textstyle - use as 12d textstyle

Note - if no ArcView attribute is mapped to Model, then the file name (minus the .shp) is used as the model for the data.

Attribute name Grid column

if non blank and the ArcView attribute is being sent to a 12d attribute, then this is the s12d attribute name

Fencing tab

Fence string polygon box

string to use to restrict the data being read in.

Fence mode choice box

String inside

String inside/crossing
String outside
String outside/crossing
String crossing

String inside - read string in if it is totally inside the polygon
String inside/crossing - read string in if it is totally inside, or crossing the polygon
String outside - read string in if it is totally outside the polygon
String outside/crossing - read string in if it is totally outside, or crossing the polygon
String crossing - string in if it is crossing the polygon
Note - only whole strings are read in.

Read button
read the data in.

Input X Y Z Text Files

Position of menu: File I/O =>Data input =>x y z

The options under x y z read in vertices of strings from a text format. It is also possible to read in string names, point id's, string, segment and vertex attributes.

The X Y Z walk-right menu is

- read in x y z s data
- user specified x y z s point id
- user specified x y z s point no and attribute

For x y z s, go to
x y z pt_id
x y z general

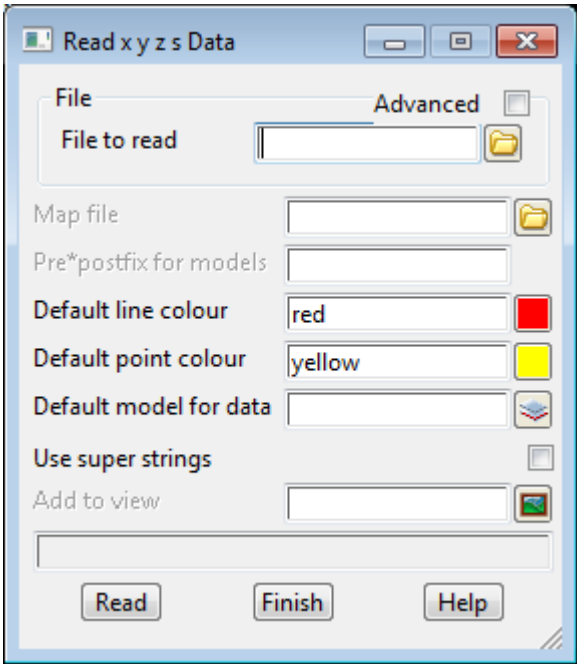

- [X Y Z Input](#)
- [X Y Z user Format Input](#)
- [X Y Z and Attributes User Format Input](#)

X Y Z Input

Position of option on menu: File I/O =>Data input =>x y z s

The x-y-z-s option reads in the xyzs format which is designed so that point and line strings can be quickly and easily coded and entered into 12d Model. It is **not** intended for more complex strings such as alignments and text where the 12d Model ascii format is more suitable. See [Input X Y Z S File Format](#))

Selecting xyzs brings up the **Read xyzs Data** panel.

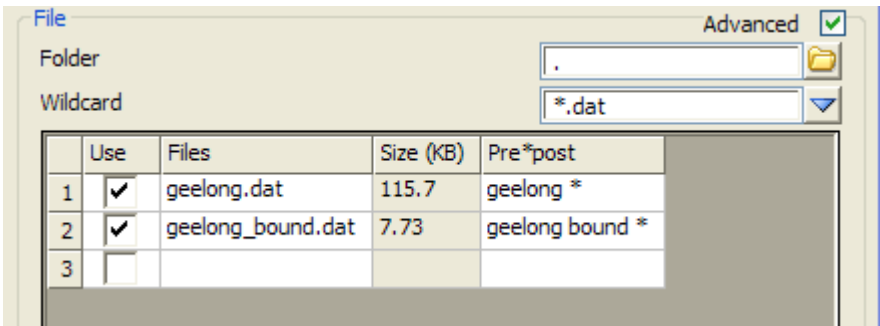

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Advanced tick box

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*

Folder folder box

folder to search for files using the Wild card

<i>read the data into the model given in the model field.</i>		

Input X Y Z S File Format

The x-y-z-s format is designed so that point and line strings can be quickly and easily coded and entered into 12d Model. It is **not** intended for more complex strings such as alignments and text where the 12d Model ascii format is more suitable.

For the x-y-z format, **point** data is set out with one point of x y z data per line. The three values are separated by one or more spaces (free format). For example

```
990          3          10
112          1001       23.5
```

A point-string is represented in 12d Model with a cross at each point. The colour of the cross can be defined by including a POINT_COLOUR command on the line before the point-string begins.

For example, a two point point-string with red crosses would be coded as

```
POINT_COLOUR      red
100.3  990.3   10
112   1001    23.5
```

Line string data is also set out with one point per line (in the order that the points occur in the string) but with a string label included at the end of each line. The string label is repeated for each point in the string. The line string terminates when the string label changes to another name for a new line string or is blank for a point string.

A line-string is drawn with a line connecting a point to its neighbouring points in the string (the string links). The colour of the links of the string can be set using the LINE_COLOUR command.

For example, a green, three point line-string called S1 becomes

```
LINE_COLOUR green
100.3  990.3  10   S1
112   1001   23.5 S1
119.3 1203.1 29.4 S1
```

Notes

- (a) The name of the line string can include spaces but in that case the name must be enclosed in quotes ". For example, the string name may be "toe 1".
- (b) If a string of a certain name is created and the string name reoccurs in the file, then a new string with the same name is created. It is not joined to the earlier string.

xyz Map File

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about **12d Map Files**.

The **name** of the xyzs string is used as the entity-name to be used for matching with a map file. The map file can be used to override the breakline type of line-strings in the x-y-z file.

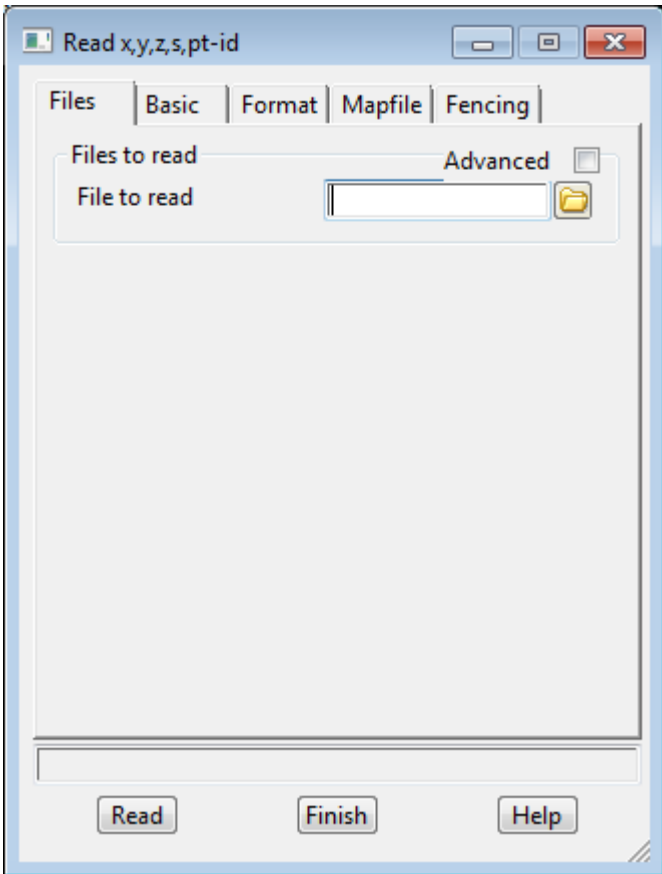

X Y Z user Format Input

Position of option on menu: File I/O =>Data input =>x y z s pt_no

On selecting the read x,yzs,pt_no option, the read xyzs pt no panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, s and point number are in and if desired, only an x and y value needs to be read in.

The fields and buttons used in this panel have the following functions.

String outside - read string in if it is totally outside the polygon
String outside/crossing - read string in if it is totally outside, or crossing the polygon
String crossing - string in if it is crossing the polygon
Note - only whole strings are read in.

Read

button

read the data into the model given in the model field.

X Y Z and Attributes User Format Input

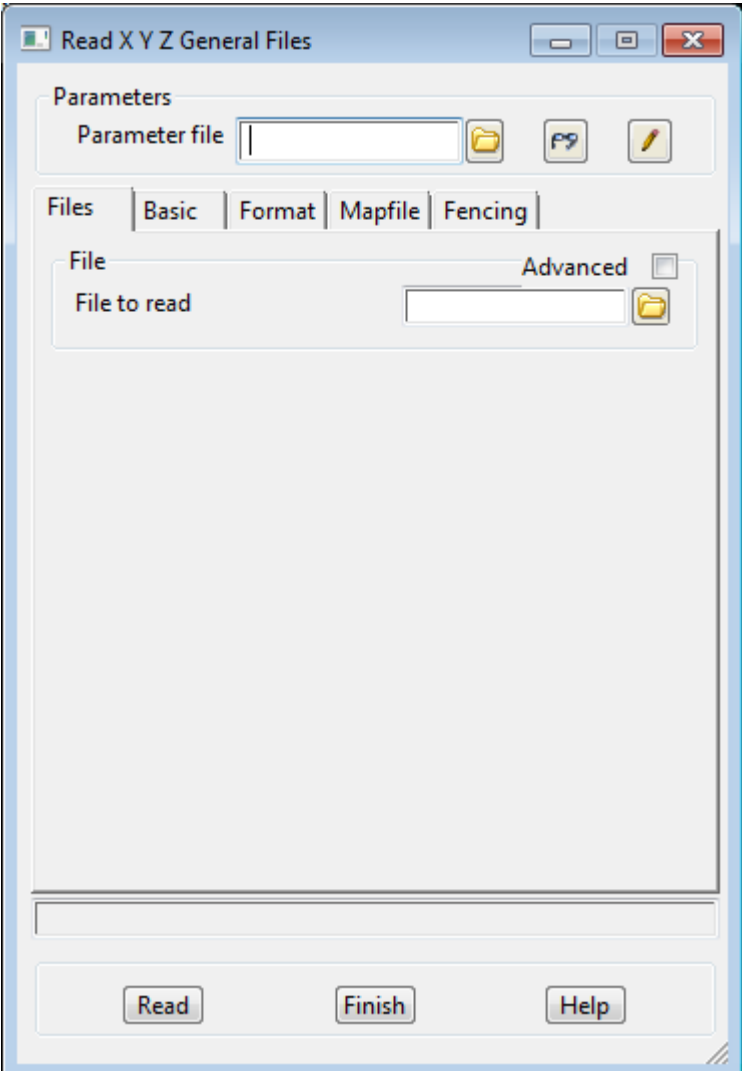

Position of option on menu: File I/O =>Data input =>x y z general

On selecting the read x,y,z general option, the **Read x y z s General Files** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point number and attributes appear in the file. If desired, only an x and y value needs to be read in.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Parameters section

Parameter file	input		*.xyf files
<i>name of the file containing the settings for how the data is positioned in the input file.</i>			
Read icon	button		
<i>read the parameter file in.</i>			
Write icon	button		

write the setting in the panel out to a parameter file.

Files tab

Advanced tick box

if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.

Folder folder box

folder to search for files using the Wild card

	<i>read in the data</i>

BCC Epson Input

Position of option on menu: File I/O =>Data input =>BCC Epson

The **BCC Epson** input option is designed to read in files in the BCC (Brisbane City Council) Epson format.

The BCC Epson format is point based with unique point numbers for each point. It also has the concept of **non-tinable** points. Since the super string supports vertex tinability, it is the best string type to use for storing data coming in BCC Epson format. Also the BCC Epson point ids are stored as the point ids of the super string vertices.

BCC Epson breaks its data up by a feature code and a **12d** Model map file can be used to define models, colours, linestyles etc. where the BCC **feature code** as the entity-name (key) in the map file.

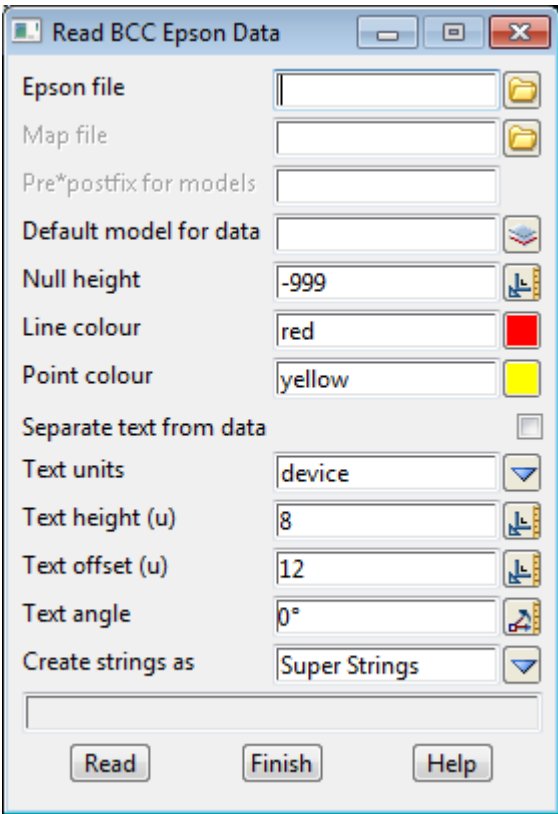

The best way to read in BCC Epson data is to have a map file which maps BCC Epson feature codes into strings with the same name as the feature code, and also places the strings into sensible models.

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files used in this option.

Note:

All text after column 68 in the BCC Epson file is considered to be a note.

On selecting the **BCC Epson** option, the **Read BCC Epson Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Epson file <i>name of the BCC Epson file to be read in.</i>	input		.dat and .sur files

Map file	input	*.mf files	
<i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The BCC Epson feature code is used as the entity-name to match against the key in the 12d map file. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files used in this option.</i>			
Pre*postfix for models	pre*postfix box		
<i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>

<i>distance (in text units) to offset the text from its (x,y) placement position.</i>			
Text angle	input		
<i>angle of the text.</i>			
Create strings as	input	Super Strings	3d, 4d, Polyline, Super
<i>type of strings to create.</i>			
Read	button		
<i>read the data in.</i>			

CivilCad Input

CivilCad input is a separate chargeable module.

Position of option on menu: File I/O =>Data input =>Civilcad

The civilcad input option is designed to read in CivilCad Version 4, 5 and some 6 ascii files.

CivilCad breaks its data up by a layer name only. By default, CivilCad layers are mapped into 12d Model models.

CivilCad has no strings but only points, lines, arcs and circles. CivilCAD spirals are ignored. When reading in CivilCad data, 12d Model will try to head to tail consecutive lines from the same layer to create strings.

The CivilCad format is point based with unique point ids for each point. It also has the concept of non-contourable or non-tinable points.

Since the super string supports point tinability, it is the best string type to use for storing data coming in CivilCad format. CivilCad point ids are stored as the point numbers of the super string vertices.

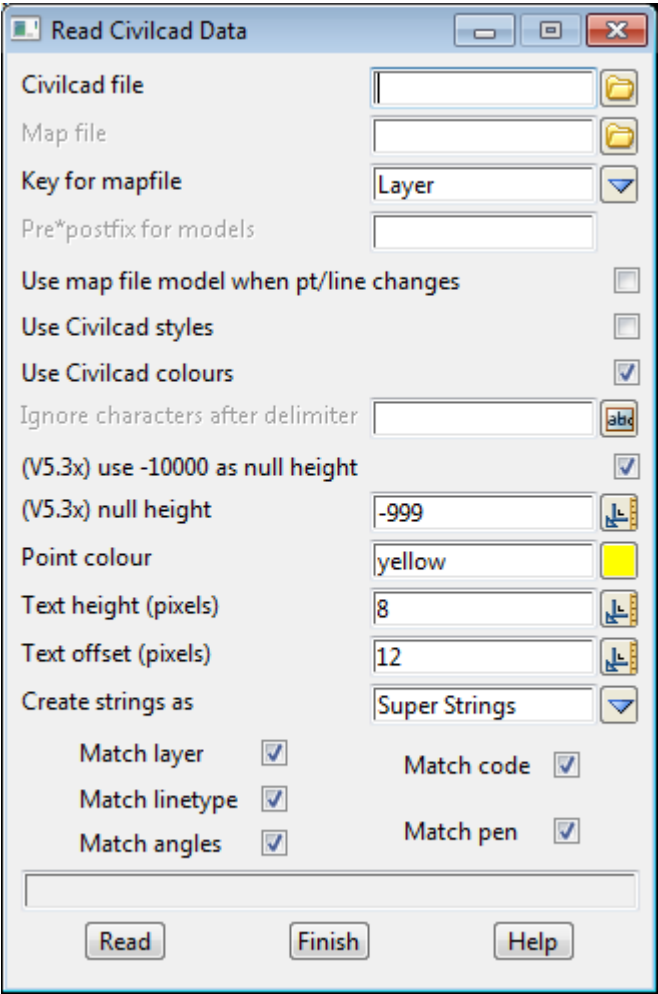

In CivilCad, a layer is defined to contain only breaklines or non-breaklines. In 12d Model, this simply corresponds to strings having a line or point *breakline* type.

If a **map** file is used when reading CivilCad data, either the CivilCad **layer** name, entity code, layer/code or code/layer can be used as the entity-name to match against the **key**.

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Warning - CivilCad has a null value of -10,000 - these values may need to be nulled in 12d Model after the CivilCad data is read in.

On selecting CivilCAD, the **Read Civilcad Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Civilcad file <i>name of the Civilcad ascii file to be read in.</i>	file box		*.asc and *.as5 files
Map file <i>if non-blank, the name of the map file to be used for all strings read in If blank, no map file is used. The Key for map file defines what is used to match against the key in the map file. See the section Create/Edit a Map File in chapter File I/O for information about 12d map files.</i>	map file box		*.mf files
Key for map file <i>if Layer, the Civilcad layer is used as the entity-name to match against the key in the map file. if Code, the Civilcad layer is code as the entity-name to match against the key in the map file.</i>	choice box	Layer	Code, Layer, Code/Layer, Layer/Code
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>	pre*postfix box		
Use CivilCad styles <i>if ticked, then the CivilCad linestyle number is used as the 12d Model linestyle name.</i>	tick box		
Use CivilCad colours	tick box		

if **ticked**, then the CivilCad colour number is used as the 12d Model colour number.

Ignore characters after delimiter tick box

if **ticked**, r.

(V5.3x) use -10000 as null height tick box tick

if **ticked**, any CivilCad z values of -10,000 are taken as null values.

(V5.3x) null height input -999

the value in the CivilCAD file to use as null height if User -10000 is not ticked.

Point colours colour box yellow available colours

colour for CivilCad points that are not part of strings.

Text height (pixels) input 8

the height in pixels of any text created, or for point numbers.

Text offset (pix) input 12

the offset (in pixels) from the (x,y) coordinate position for any text or point numbers.

Create strings as input Super Strings Lines and Arcs
3d Strings and Arcs,
Polyline Strings
Super Strings

type of strings to create.

Match flags tick box

CivilCad data consists of individual lines and arcs. When reading CivilCad data, it undergoes head to tail processing and the match flags specify what CivilCad data can be joined.

Match layer/code/linetype/angles/pen tick box

if **ticked**, then any CivilCad lines and arcs must have the same layer/code/linetype/angle/pen before they can be joined in the head to tail process.

Read button

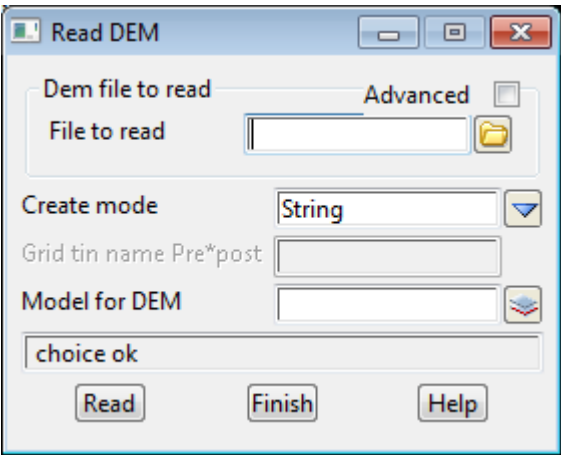

read the data in.

DEM Input

Position of option on menu: File I/O =>Data input =>DEM

The **DEM** option is designed to read in Digital Elevation Model data in the Arc/Info format.

On selecting **DEM**, the **Read DEM** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format <i>format of the DEM to read in.</i>	choice box	Arc/Info ASCII	Arc/Info ASCII Grid *.dem
Dem file to read <i>name of the DEM file to be read in.</i>	file box		
File to read			
Create mode	choice box	String	String, Grid string, Grid tin
Grid tin name Pre*post			
Model for DEM <i>model to put the DEM data in.</i>	model box		available models
Read <i>read the data in.</i>	button		

Input DGN Binary Files

Position of menu: File I/O =>Data input =>DGN

DGN input and output is a separate chargeable module.

The options under **DGN** read DGN V7 and DGN V8 binary files.

The **DGN** walk-right menu is

read DGN V8 binary file
read DGN V7 binary file

For *DGN V8*, go to [Input DGN V8](#)
DGN V7 [DGN V7 Binary Input](#)

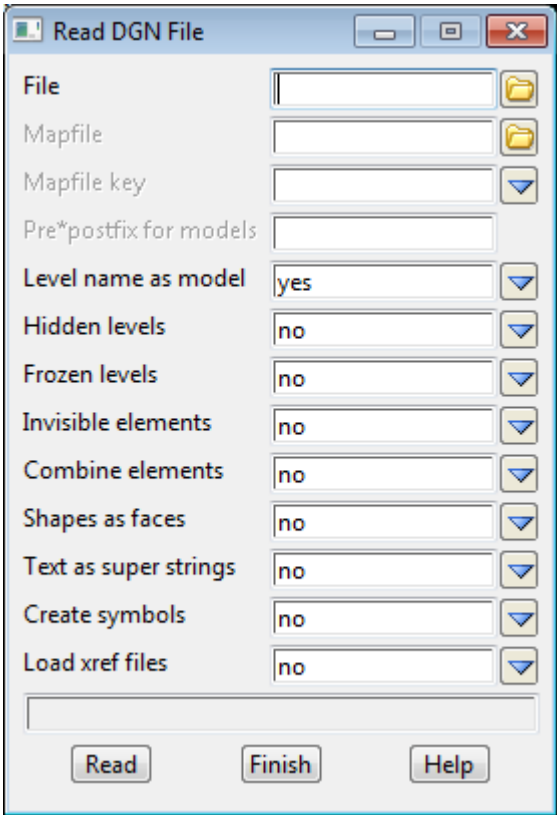

Input DGN V8

Position of option on menu: File I/O =>Data input =>DGN =>DGN V8

NOTE: the format for DGN V8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

Note: this option is under development

Selecting **DGN V8** brings up the **Read DGN File** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File <i>name of the DGN V8 binary file to be read in</i>	input		*.dgn files
Read <i>read the data in.</i>	button		

DGN V7 Binary Input

DGN binary input is a separate chargeable module.

Position of option on menu: File I/O =>Data input =>DGN =>DGN V7

The DGN input option is designed to read in Intergraph and Microstation binary models (.dgn files) up to V7. Microstation V8 has a new undocumented format which is read in with the DGN V8 options (.).

Because of the limited number of levels available in an DGN file, the colour, linestyle and weight of items are often used to differentiate data types. For special files for VicRoads, there is also an DGN attribute which can be used to tag data.

Hence the entity-name used for matching in a map file when reading DGN files into 12d Model can be either the:

- s DGN **level**
- s VicRoads **attribute**
- s DGN level, colour, linestyle, weight
- s VicRoads attribute, colour, linestyle, weight

In the DGN map file, the four level key is given as a single key made up of the four items separated by | (with no additional spaces) in the order:

level or VicRoads attribute | colour | line style | weight

For example, the key

30|2|0|0 means level 30, colour 2, style 0 and weight 0

A * can be used for any of the four items to indicate that no match is required for that item.

30|*|0|* means level 30, any colour, style 0, any weight

If a map file is not used, the DGN data is read into a 12d Model string of the same name as the DGN level and the DGN colour numbers are mapped to 12d Model colours. All the strings created go to the **Default model for data** specified in the *Read DGN Data* panel.

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Text for Points in DGN

A further complication with DGN is that many Microstation users record individual points as a text entity with a character from a possibly user defined DGN font to represent a symbol at the point. The text then often has a justification other than left-bottom.

However, Microstation does not record the (x,y) coordinates of the justification point but only the left-bottom position to draw the symbol at. The actual (x,y) point needs to be calculated from the text justification and the actual symbol size.

Unfortunately this requires a knowledge of the DGN font symbol being used to calculate the true (x,y) position for the text justification point.

To help read in text as points so that they may be included in processes such as triangulation, in the DGN reader, it is possible to create 4d strings (which consist of an (x,y,z) point plus a piece of text) instead of a text string.

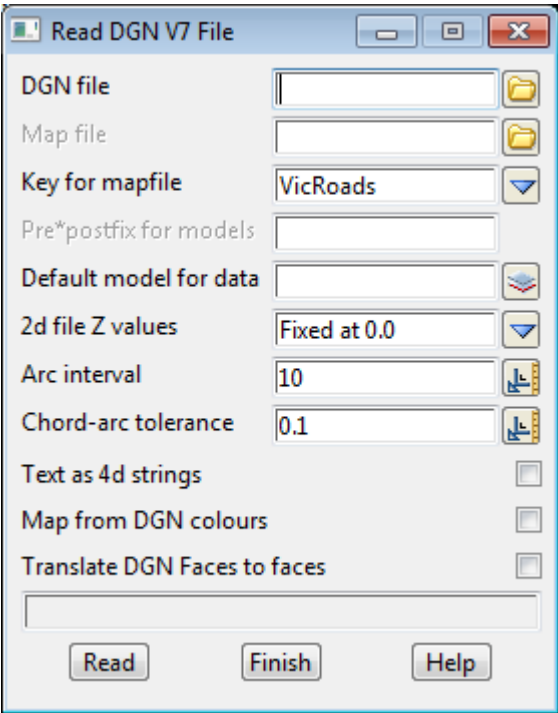

Warning

Because of the problem with needing to know the DGN font information to correctly calculate the (x,y) coordinate of the text, creating a 4d string instead of text will not fix the error in the (x,y) coordinates if an incorrect font is used in 12d Model.

The only safe solution is to avoid data in DGN format if the points are being represented by text.

NOTE: the format for DGN V8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

On selecting the DGNV7 option, the **Read DGN V7 File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DGN file <i>name of the DGN binary file to be read in</i>	input		*.dgn files
Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The DGN level is used as the string name and all strings go to the Default model for data. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>	input		*.mf files
Key for mapfile	input	VicRoads	level, VicRoads, level/colour/linestyle/weight

Vicroads/colour/linestyle/weight

specifies how the key from the mapfile is interpreted.

Pre*postfix for models pre*postfix box
*if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.
Go to the section [Pre*Postfix Panel Fields](#) for information on using pre*postfix.*

Default model for data input available models
model to use for strings not mentioned in the map file or if no map file is used.

2d file Z values input Fixed at 0.0 fixed at 0.0,
contour Z low, contour Z high
element Z low, element Z high

z value to use for 2d .dgn file

Arc interval input 10
*interval to use to break 3d circles into segments.
Note - a 3d circle in DGN is a circle in an included plane. This is not the same as a circle in civil work
which is a circle in **plan view**. A 3d circle in an included plane does not project onto a circle in a plan
view except in the special case when the inclined plane is parallel to the x-y plane.*

Chord-arc tolerance input 0.1
chord to arc tolerance to use when breaking 3d circles into segments.

Text as 4d strings tick box
*if **ticked**, text is read in as a 4d string (an (x,y,z) coordinate plus a piece of text)*

Map from DGN Colours tick box
*if **not ticked**, DGN colour number n is mapped to **12d Model** colour n.
if **ticked**, some of the DGN colours are attempted to be mapped to **12d Model** colours.*

Translate DGN faces to faces tick box
*if **ticked**, DGN faces are read in as **12d Model** face strings.*

Read button
read the data in.

DWG/DXF Input

DWG/DXF input is a separate chargeable option

Position of option on menu: File I/O =>Data input =>DWG/DXF/DX8

The **DWG/DXF** input option is designed to read most Autocad DWG and DXF files.

Each DWG/DXF item has an associated layer. By default, **12d** Model creates models of the same name as the layers (or with an additional user supplied prefix) and the DWG/DXF items placed in them.

However, this can be over written using a standard **12d map file** where the key is matched against Autocad **layers** rather than string names.

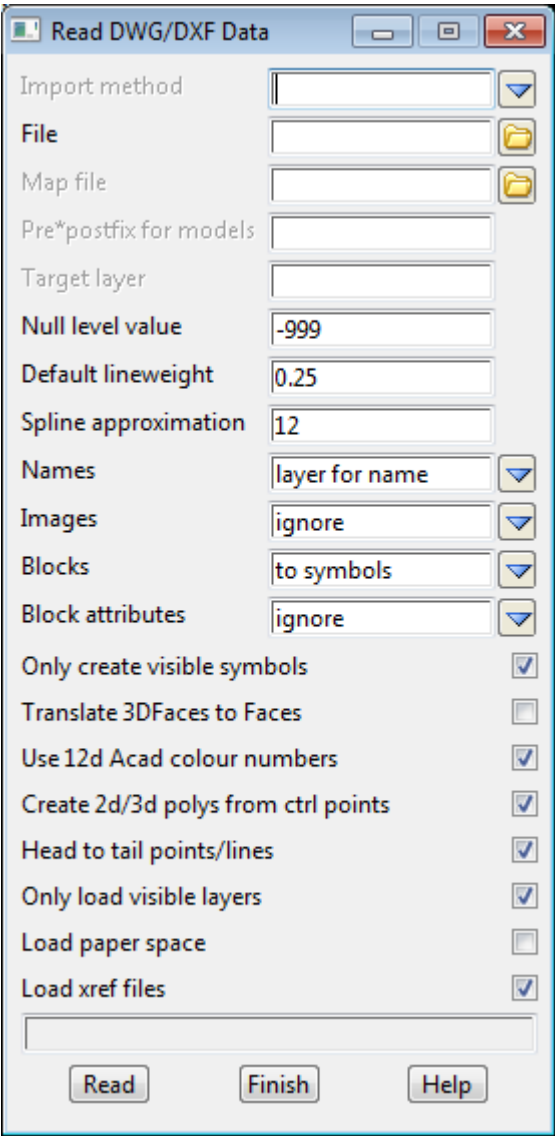

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Autocad blocks are recognised and either a point with the block name is created or the blocks are expanded into their components, each time they are referenced in the DWG/DXF file.

Bulges in polylines can only be interpreted correctly when the polyline has a constant z-value. For this case, a **12d** Model polyline string is created from the DXF polyline.

Finally, DWG/DXF POINT entities of the same layer and colour can be concatenated into one point string as they are read in.

On selecting the **DWG/DXF/DX8** option, the **Read DWG/DXF Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format <i>type of Autocad file to read in</i>	choice box	DWG	DWG, DXF
File <i>name of the DWG or DXF file to read in</i>	file box		*.dwg or *.dxf files
Map file <i>if non-blank, the name of the map file to be used for all DWG/DXF layers read in. The DWG/DXF layer is the entity-name for matching against the key in the map file. If blank, no map file is used. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>	map file box		*.mf, *.mapfile files
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>	pre*postfix box		
Target layer <i>if non-blank, only autocad items in the layer with the name given in the target layer field will be read in.</i>	input		
Null level value	input	-999	

<i>z-value to treat as a null level</i>			
Default AutoCAD lineweight	input	0.25	
<i>lineweight to use when it is undefined in an AutoCAD entity.</i>			
Spline approximation	input	12	
<i>splines are broken into small segments</i>			
Names	choice box	layer for name	no name, layer for name
<i>if no name, strings are not given a name.</i>			
<i>if layer for name, strings are given the name of the AutoCAD layer they were on.</i>			
Images	choice box	to plan images	to plan images, to rasters, ignore
Blocks	choice box	to symbols	to symbols, explode, to points
<i>if to symbols, blocks are read in as 12d Symbols of the same name.</i>			
<i>if explode, blocks are read in and exploded into vertices and line work.</i>			
<i>if to points, a 12d vertex is created at each block.</i>			
Only create visible symbols	tick box	tick	
Translate 3DFaces to faces	tick box		
<i>if tick, DWG/DXF faces are read in as 12d Model face strings.</i>			
User 12d ACAD colour numbers	tick box		
Create 2d/3d polys from ctrl points	tick box		
Head to tail points/lines	tick	tick	
<i>if ticked, DWG/DXF POINT entities of the same layer and colour are concatenated into one point string as they are read in and DWG/DXF LINE entities of the same layer and colour are</i>			
Only load visible layers	tick	tick	
<i>if ticked, only DWG/DXF visible layers are read in otherwise all layers are read in.</i>			
Load paper space	tick	no tick	
<i>if ticked, paper space data will be read in.</i>			
Load xref files	tick	no tick	
<i>if ticked, an xref files in the DWG/DXF are also read in.</i>			
Read	button		
<i>read the data in.</i>			

Genio Input

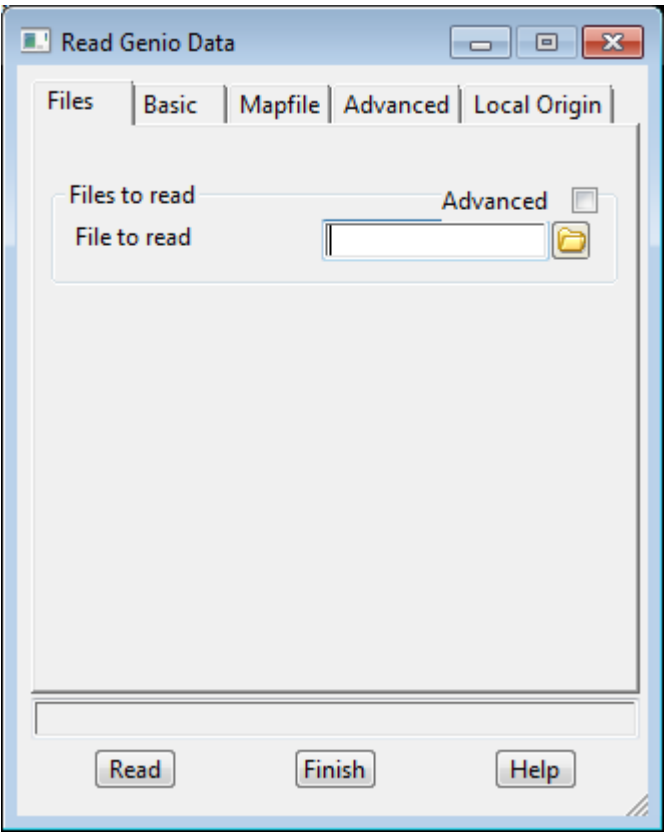

Position of option on menu: File I/O =>Data input =>Genio

Genio input is a separate chargeable module.

The software package MX (formerly called Moss) includes a data file format called GENIO for use in transferring data between Moss and other programs (see the MX Manual for a partial description of genio). There is currently two default genio input formats - versions 6 and 7.
12d Model recognizes both formats.

For information on the Genio file format support by 12d Model, please go to the section [Genio File Format](#)

On selecting the genio option, the **read genio data** panel is displayed.

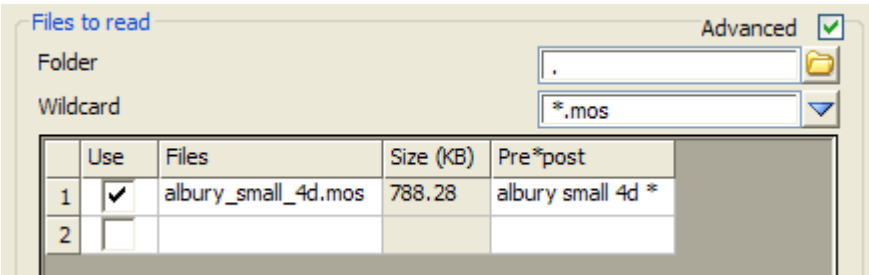

The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Files tab

Advanced	tick box
-----------------	----------

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*

Folder folder box
folder to search for files using the Wild card

Wildcard input
wild card to use in search for files in the given folder

Use tick box
if *ticked*, read in the file

Files output
name of the file in the folder

Size output
file size

Pre*post text input
if *non blank*, pre*post text to use for the models in this file (see [Pre*Postfix Panel Fields](#) for information on using pre*postfix.
if *blank*, use the pre*post text from the Pre*postfix for models panel field.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

File to read file box default *.mos files
This can be modified by the environment variable GENIO_WILDCARD_4D
name of the genio file to be read in

Basic tab

Transition type transition box clothoid transition pop-up
type of transition used in the genio file

Line colour colour box default colour available colours
colour used for line-strings

Point colour colour box default pt colour available colours
colour used for the crosses in point-strings (genio string labels starting with **P**).

Text style data for 4d strings
the text style data to use for the text in any 4d strings in the genio file

Text style data for text
the text style data to use for text strings in the genio file

Multiply text height by 10 tick box
if *ticked*, the text size is multiplied by 10

Mapfile tab

Map file file box *.mf files
if *non-blank*, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.

If blank, no map file is used

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section [Pre*Postfix Panel Fields](#) for information on using pre*postfix.

Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.

Advanced tab

Compress 3d to 2d tick box tick

if **ticked**, convert any 3d strings with constant z-value to 2d strings.

Convert 6d to alignment tick box tick

if **ticked**, convert any 6d strings to **12d Model** alignment strings.

Generate Point ID's tick box no tick

if **ticked**,.

Create control stations from SSTN tick box no tick

if **ticked**, control stations are created in **12d Model** for each point in a genio string named SSTN

Smigs file ? tick box no tick

if **ticked**, try to interpret the genio file as a Smigs genio file.

Use super strings tick box tick

if **ticked**, all strings are read in as super string

Use invisible segments for discontinuities tick box

if **ticked**, MX strings with discontinuities are read in as super strings with invisible segments.

If **not ticked**, MX strings with discontinuities are broken into pieces when read in.

G strings to super alignments tick box no tick

if **ticked**, MX G strings are read in as 12d super alignments

Debug G strings tick box no tick

because of the lack of documentation of the G string in MX, a G string may not be interpreted correctly. If **ticked**, a super string is created with the information from the MX G string to try and help interpret what the data was.

Reverse calc super alignments tick box no tick

Better way of interpreting VG tick box tick

if **ticked**, a different method for interpreting vertical geometry in a MX G strings is used. This may or may not be successful.

Local Origin tab

Local origin x y box x y selector

if **non-blank**, the given coordinates are used as a local origin when reading in the data. That is, the local origin values are subtracted from each data point as it is read in.

Read button

read in the genio data from the file given in the file field.

Genio File Format

The software package MX (formerly called Moss) includes a data file format called GENIO for use in transferring data between Moss and other programs (see the MX Manual for a partial description of genio). There is currently two default genio input formats - versions 6 and 7.

12d Model recognizes both formats.

MX provides three options (001,003,017) to allow variations in the format of the genio 080 records. 12d Model recognizes and uses each option.

MX free format (that is, using commas and the 'field-number=' syntax) is allowed.

For example

080,ABCD, ,5=0.0

MX 2d, 3d, 4d, 6d, text and most 12d and text strings are loaded directly into 12d Model strings. For 5d, the strings are processed but only the 3d information is used and loaded into 12d Model. The MX 10d (volume string) is allowed in the genio file but will not be read into 12d Model.

In the genio file, the GENIO card defines the name of the MX model for the following strings. 12d Model loads the strings into a 12d Model model with the same name as the MX model. However, 12d Model allows the user to define a map file which may over-ride the Genio card.

A genio file may contain more than one MX model, each genio model being separated by a 999 card. 12d Model will load each separate MX model into a 12d Model model with the same name as the MX model.

If an error occurs whilst reading a genio record, the genio record will be skipped and, if possible, the next genio record read.

12d Map File

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

The **name** of the MX string is used as the entity-name to be used for matching in a 12d map file.

The MX model given in the GENIO record is taken to be the default model for the genio reader.

Hence the genio map file can be used to over-ride the MX GENIO card and the MX default for point strings (this is necessary for genio files generated from non MX systems that don't use the correct point string convention).

For **text** in a Genio file (the string name for text must start with a * in the Genio file), the *key in the map file must* start with **geniotext** followed by the characters to match on which will be matched against the characters following the * in the genio string name. For example

```
geniotextEB* * text yellow point "PHCP" // matches text
will match any Genio text with the string name starting with "*EB"
```

Note that * is not a wild card in the Genio string name but the "EB*" after "geniotext" is for use by the 12d map file and hence is an "EB" followed by a wild card. Hence it matches against any Genio text name starting with "*EB".

Summary

12d Model **recognizes** the following genio options for MX V6 and V7 formats -

GENIO	
FINISH	
001	format card
003	order card
017	angle card
080	for 2d, 3d, 4d, 6d, 12d and text strings
080	the 3d information only for 5d strings
090	triangulation information
999	

genio comment lines

12d Model accepts MX null values of -999.0

12d Model **ignores** the genio options:

080 for **10d** strings

A12d map file can be used to select the colour and model for any strings read in from the MX genio file whose names match the keys in the map file.

Geocomp Input

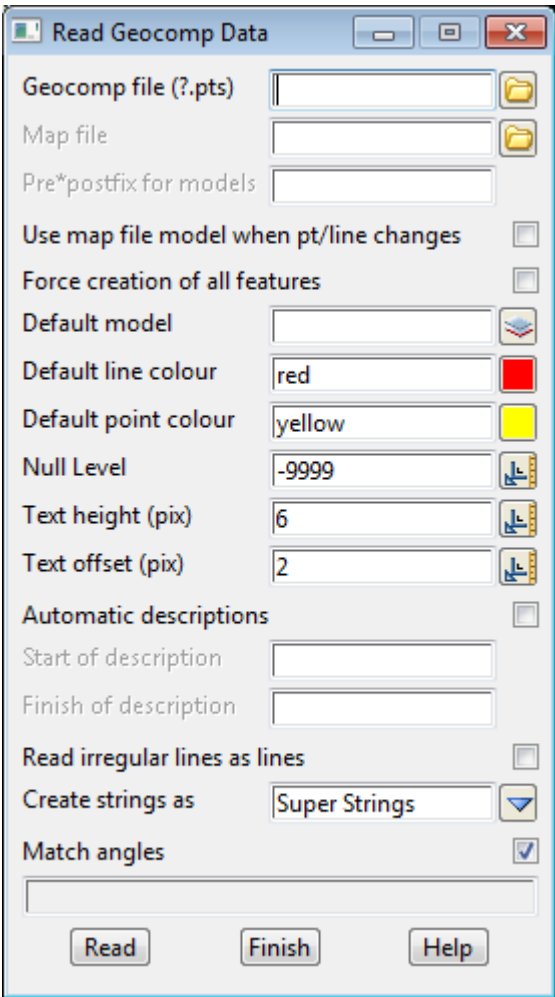

Position of option on menu: File I/O =>Data input =>Geocomp

Geocomp input is a separate chargeable module.

Geocomp is a points based software package used for manipulating and reducing survey data on a PC.

Geocomp data is held in two ascii files - the points file and the strings file. These ascii files can be used to transfer data from Geocomp to 12d Model. More information on the Geocomp data structure is given in the previous section [Geocomp File Format](#).

Selecting Geocomp displays the Read Geocomp Data panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Geocomp file (? .pts) <i>name of the Geocomp points file to be read in. The corresponding strings file is also used.</i>	file box		*.pts files
Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>	map file box		*.mf and *.mapfile files

Pre*postfix for models	pre*postfix box		
<i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>			
Use mapfile model when pt/line changes	tick box	no tick	
<i>if ticked, then if the geocomp.str file says the entity is a line (point) feature and the map file says it is a point (line), the mapfile is used.</i>			
Default model	model box		available models
<i>model to use for strings not mentioned in the map file</i>			
Default line colour	colour box	default colour	available colours
<i>colour used for line-strings</i>			
Default point colour	colour box	default pt colour	available colours
<i>colour used for the crosses in point-strings.</i>			
Null level	input	-9999	
<i>the Geocomp z-values to be considered null z-values.</i>			
Text height (pix)	input	8	
<i>the height in pixels of any text created for point number or Geocomp descriptions.</i>			
Text offset (pix)	input	2	
<i>the offset (in pixels) from the (x,y) coordinate position for the text of a 4d string.</i>			
Automatic descriptions	tick box		
<i>if ticked, then the first three characters of the entity code are compared to the first 3 characters of the 20 character description and if they are the same, the text is only characters 6 to 15 of the description.</i>			
Start of description	input		
<i>the user can restrict the amount of the geocomp description that is read in. if non-blank, this is the number of the character position to start reading the description from. If blank, the start position is 1.</i>			
Finish of description	input		
<i>if non-blank, this is the number of the character position to end reading the description from. If blank, it is the end of the geocomp description.</i>			
Read irregular lines as lines	tick		
<i>if ticked, Geocomp irregular lines are read in as strings.</i>			
Create strings as	input	Super Strings	Polyline Strings Super Strings
<i>type of strings to create.</i>			
Match angles	tick	tick	
<i>if ticked, preference is given to joining geocomp lines of similar angles first. if not ticked, geocomp lines are joined in the order they are in the file.</i>			
Read	button		
<i>read in the Geocomp data from the points file and (corresponding strings file) given in the file field.</i>			

Geocomp File Format

Geocomp input is a separate chargeable module.

Geocomp is a software package used for manipulating and reducing survey data on a PC.

Geocomp is a point based system. The fundamental data consists of individual points with unique point numbers and entities such as lines and arcs defined in terms of the points.

Geocomp data is held in two ascii files - the points file and the strings file. These ascii files can be used to transfer data from Geocomp to 12d Model.

The Geocomp **points file** is a sequential list of points, one point per line. Each point consists of the data

 easting, northing, elevation, stand-point-number

 that is

 x-value, y-value, z-value, stand-point-number

The line number of each point in the file is also the unique **point number** for that point. For example, the point defined on the eleventh line of the points file, **is** point number eleven.

The stand-point-number is the point number of the instrument station used for collecting the points coordinates. The stand-point-number is not used in 12d Model.

The Geocomp **strings file** defines how the Geocomp **entity types** are constructed from points in the point file. The Geocomp entity types are

Entity Number	Description
1	two point lines
2	irregular lines
3	arc defined by start point, point on arc, end point
4	arc defined by start point, arc centre, end point
5	point feature
6	circle defined by centre and a point on the circle

The strings file also gives each defined entity an **entity number**.

The 12d Model Geocomp data reader recognises all the entity types in the strings file **except** for irregular lines (type 2).

All point numbers referred to in the strings file are references to the (implied) point numbers of points in the points file. Hence both files are needed to define the Geocomp data and the order of points in the point file is critical and cannot be modified.

The Geocomp naming convention for the two files is to use the six digit Geocomp job number as a name stem and append **.pts** for the points file and **.str** for the strings file.

That is,

geocomp-job-number.pts	points file
geocomp-job-number.str	strings file

For example

099999.pts	is the point file for Geocomp job number 099999
099999.str	is the strings file for Geocomp job number 099999

12d Model uses a wider data set than is directly represented in the Geocomp points and strings files. However, by observing a number of conventions and processing the strings file data according to these conventions, the Geocomp data can be sensibly passed across to 12d Model.

For example, although the Geocomp strings file only defines two-point lines, 12d Model can construct strings of many points from consecutive two-point lines by joining the lines together

whenever

- (a) the second point of one line is the same as the first point of the next line in the file and
- (b) the lines have the same entity number.

The entity number of the consecutive lines is used as the 12d Model string name.

Similarly, consecutive point features with the same entity number are joined to form a 12d Model 4d **point** string with the entity number as the string name.

In the Geocomp strings file, **descriptive text** can also be included at the end of each line defining an entity. The text is enclosed within double quotes ". The descriptive text is ignored for all entities **except point features**.

For a point-feature, which is represented in 12d Model as a 4d string, the descriptive text is recorded as the text label for that point.

By using a systematic entity and descriptive text labelling system in Geocomp, it is possible to sensibly transfer all of the Geocomp data to 12d Model.

Note - in Geocomp, a z-value of -9999 represents a null z-value, that is, a z-value that has **not** been defined. Any Geocomp null values are recorded as 12d Model null values.

Geocomp Map File

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Using the conventions described in the previous section, Geocomp data can be interpreted as 12d Model strings with entity-names corresponding to the Geocomp entity numbers.

Hence the Geocomp **entity numbers** are used as the entity-names for matching with a map file.

If no match is found with the map file, the default colours and model given in the Geocomp read panel are used. The point-line type is taken to be **point** for point feature entities (entity type 5) and **line** point-line type for all other entities. The geocomp entity number is used as the string name and the style set to 1.

WARNING

If the **breakline type** in the map file is set to point or line and this does not match the point or string type coming from the geocomp file, then the string is placed in the **defaults** model. This is a consistency check for entities that can only be a point **or** a line breakline type (but not both). To disable this feature, a * can be used in the map file for the breakline type and then the breakline type is determined by whether the Geocomp entity is a point feature or not.

Summary

12d Model **recognizes** the following Geocomp entity types

Entity Number	Entity type
1	two point lines
3	arc defined by start point, point on arc, end point
4	arc defined by start point, arc centre, end point
5	point feature
6	circle defined by centre and a point on the circle

12d Model **recognizes** the Geocomp null values of -9999

12d Model **ignores** the entity type

2	irregular lines
---	-----------------

A Geocomp map file can be used to specify the string name, breakline type, colour, style and model for strings read from the Geocomp ascii files.

Note - the breakline type of a string of Geocomp point features (entity type 5) will always be set to **point** regardless of the Geocomp map file.

Keays Input

Position of option on menu: **File I/O =>Data input =>Keays**

The **Keays** input option is designed to read in Keays (RoadPak) files in trf format.

The Keays data has a code and notes, and the code and notes can be used with a **12d** Model map file to define models, colours, linestyles etc.

The Keays note is made up of individual notes separated by spaces. Each individual note (in order) can be used as part of the entity-name for use with the map file.

In the Keays map file, the multi-level key is given as a single key made up of the required items separated by | (with no additional spaces) in the order:

Code | note 1 | note 2 | ... | note n

For example, the key:

BD|building| means code BD, note 1 = "building"

A * can be used for any of the items to indicate that no match is required for that item.

BD|*|top| means code BD, anything for note 1, note 2 = "top"

A * and nothing else after the code means that all notes are accepted.

BD* means code BD and any notes

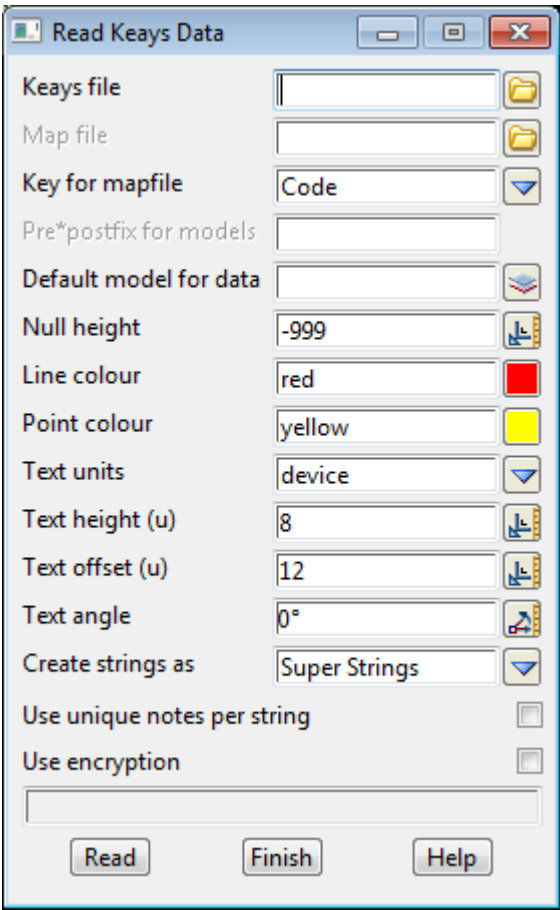

A * at the end of the notes means any note is a match from that point onwards.

BD|*|top|* means code BD, anything for note 1, note2 = "top",
and any note after note 2.

If a map file is not used or no match is found in the map file, the Keays data is placed into the default model with its code as the string name.

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

On selecting the **Keays** option, the **Read Keays Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Keays file <i>name of the Keays trf file to be read in.</i>	file box		*.trf
Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The Keays code and note can be used as the entity-name to match against the key in the map file. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>	map file box		*.mf files
Key for map file <i>if code, the Keays code is used as the key for the map file. If code/note, the Keays code and note is used as the key for the map file.</i>	input	code	code, code/note
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>	pre*postfix box		
Default model for data <i>name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.</i>	model box		available models
Null height <i>if non-blank, any Keays z values equalling this value are taken as null values.</i>	input	-999	
Line colour <i>colour for Keays string s.</i>	colour box	red	available colours

Point colour	colour box	yellow	available colours
<i>colour for Keays points that are not part of strings.</i>			
Text units	input	pixels	pixels, world
<i>units for the height of the text label.</i>			
Text height (u)	input		
<i>height of the text (in text units).</i>			
Text offset (u)	input		
<i>distance (in text units) to offset the text from its (x,y) placement position.</i>			
Text angle	input	0	
<i>angle of the note text.</i>			
Create strings as	input	Super Strings	3d, 4d, Polyline, Super
<i>type of strings to create.</i>			
Use unique notes per string	tick box		
<i>if ticked, a change of code or note is used to break Keays string data into strings. This also applies to the point ids and notes text.</i>			
Use encryption	tick box		
<i>if ticked, then the last 4 characters of the code is used to denote tinability and boundary information.</i>			
Read	button		
<i>read the data in.</i>			

LandXML Input

Position of option on menu: File I/O =>Data input =>LandXML

LandXML is a format that attempts to cover some civil and surveying entities. It does not include any information such as colours, styles etc. but just some geometry definitions.

Unfortunately to make the format useful, every vendor has their own proprietary extensions which makes the format of only limited value. A different tailored LandXML reader is required for each vendor variation. The names and definitions of transitions vary from vendor to vendor.

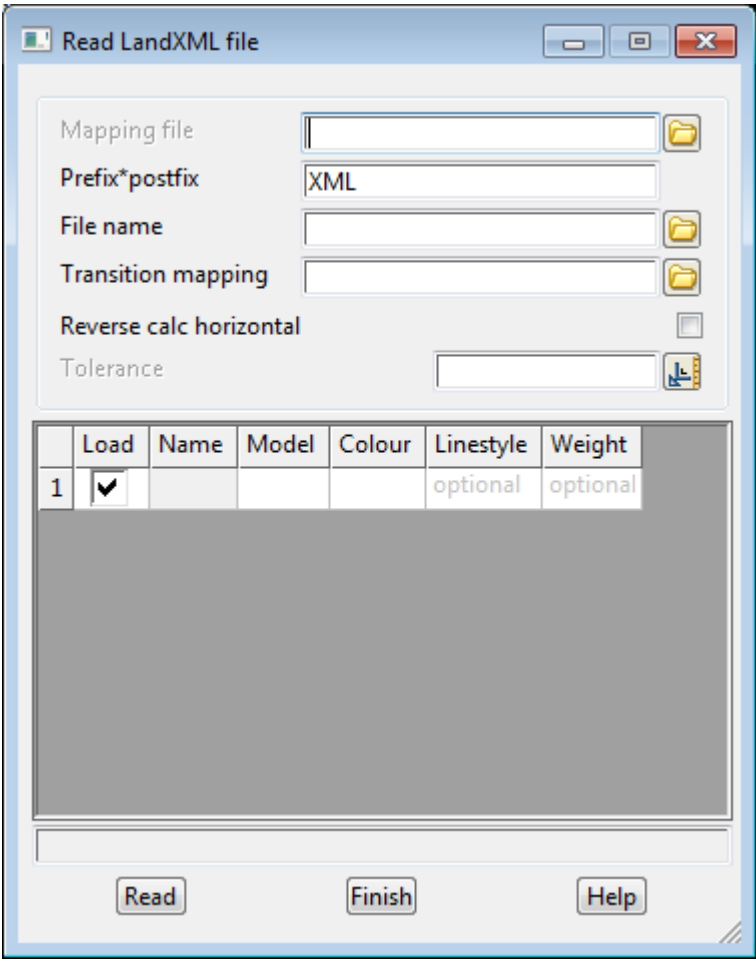

Finally the methodology behind the LandXML model is based on US ideas of using X-sections and not strings to model data. This makes is unsuitable except for simple civil models.

One possible use of LandMXL may be to get access to data from vendors packages such as AutoCAD and Microstation who only have non-published proprietary formats.

12d Model has special LandXML readers for LINZ-XML (for LandOnline NZ) and Leica-XML.

This option is under continual developed as the LandXML standard keep changing.

On selecting the **LandXML** option, the **Read LandXML File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	map file box		*.mf files
<i>if non-blank, the name of the map file to be used for all strings read in.</i>			

If blank, no map file is used.

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Pre*postfix for models pre*postfix box
if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.
Go to the section [Pre*Postfix Panel Fields](#) for information on using pre*postfix.

File file box *.xml files
name of the LandXML file to be read in

Transition mapping file box *.trans_map files
file containing the mapping of transitions between the names of LandXML transitions and equivalent transitions in 12d Model

File setting

Load tick box
if ticked, load the xml file

Name
name of the xml file

Model model cell available models
model to read the xml data into

Colour colour cell available colours
colour to use for the strings in the xml file

Linestyle linestyle cell available linestyles
linestyle to use for the strings

Weight input
weight to use for the strings

Read button
read the data into the model given in the model field.

Input Point Cloud Files

Mapinfo Input

Position of option on menu: File I/O =>Data input =>Mapinfo MID/MIF
Selecting **MapInfo MID/MIF** brings up the **Read MapInfo Mif/Tab Data** panel.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Advanced tick box

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*

Folder folder box

folder to search for files using the Wild card

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files output
name of the file in the folder

Size output
file size

Pre*post text input
*if **non blank**, pre*post text to use for the models in this file (see [Pre*Postfix Panel Fields](#) for information on using pre*postfix.
If **blank**, use the pre*post text from the Pre*postfix for models panel field.*

*Note - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read file box *.tab or *.mif files
*name of the MapInfo file.
If no attribute is mapped to model, then the file name (minus the .tab or .mif) is used as the model for the data.*

Basic tab

Default colour for black colour box white available colours
colour to use in 12d for black in MapInfo

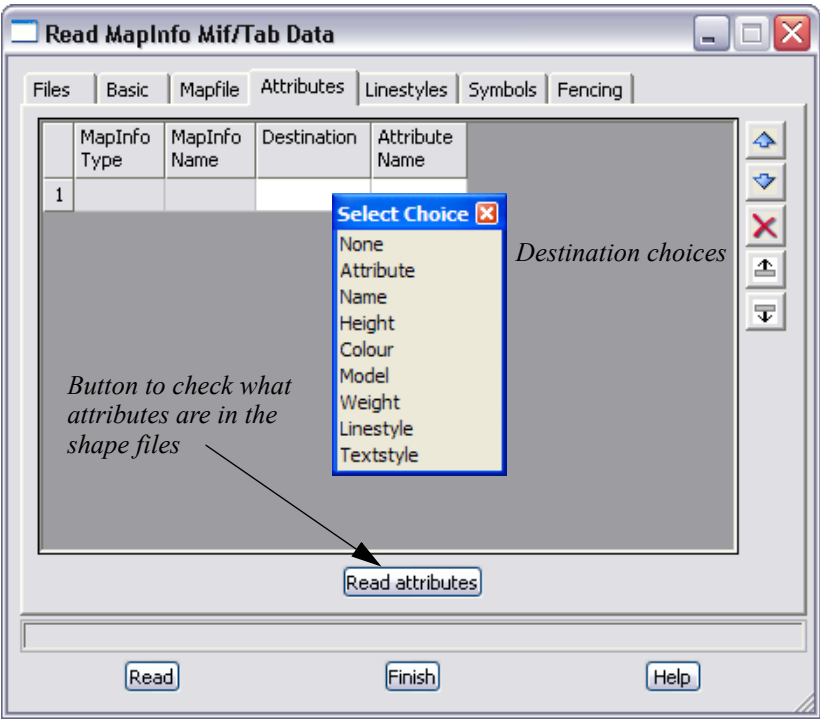

Map file tab

Map file file box *.mf and *.mapfile files
*if **non-blank**, the name of the 12d map file to be used for all strings read in.
If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Pre*postfix for models pre*postfix box
*if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file.
Go to the section [Pre*Postfix Panel Fields](#) for information on using pre*postfix.*

Attributes tab

Read attributes button

Click to check what attributes are present in the MapInfo files and any MapInfo attributes found are listed in the **MapInfo Type** and **MapInfo Name** columns in the grid.

Destination Grid column

type of 12d attribute to map the MapInfo attribute to:
none - don't use the attribute - the attribute is ignored
attribute - use as 12d attribute
name - use as 12d string name
height - use as 12d vertex height
colour - use as 12d string colour
model - use as model name
weight - use as string weight
linestyle - use as 12d linestyle
textstyle - use as 12d textstyle

Note - if no MapInfo attribute is mapped to Model, then the file name (minus the .tab or .mif) is used as the model for the data.

Attribute name Grid column

if non blank and the MapInfo attribute is being sent to a 12d attribute, then this is the 12d attribute name

Linestyles tab

MapInfo linestyle Grid column

MapInfo linestyle name

12d linestyle Grid column

12d linestyle to map the MapInfo linestyle to

Symbols tab

MapInfo symbol Grid column

MapInfo symbol name

12d symbol Grid column
12d symbol to map the MapInfo symbol to

Fencing tab

Fence string polygon box
string to use to restrict the data being read in.

Fence mode choice box

String inside
String inside/crossing
String outside
String outside/crossing
String crossing

String inside - read string in if it is totally inside the polygon
String inside/crossing - read string in if it is totally inside, or crossing the polygon
String outside - read string in if it is totally outside the polygon
String outside/crossing - read string in if it is totally outside, or crossing the polygon
String crossing - string in if it is crossing the polygon
Note - only whole strings are read in.

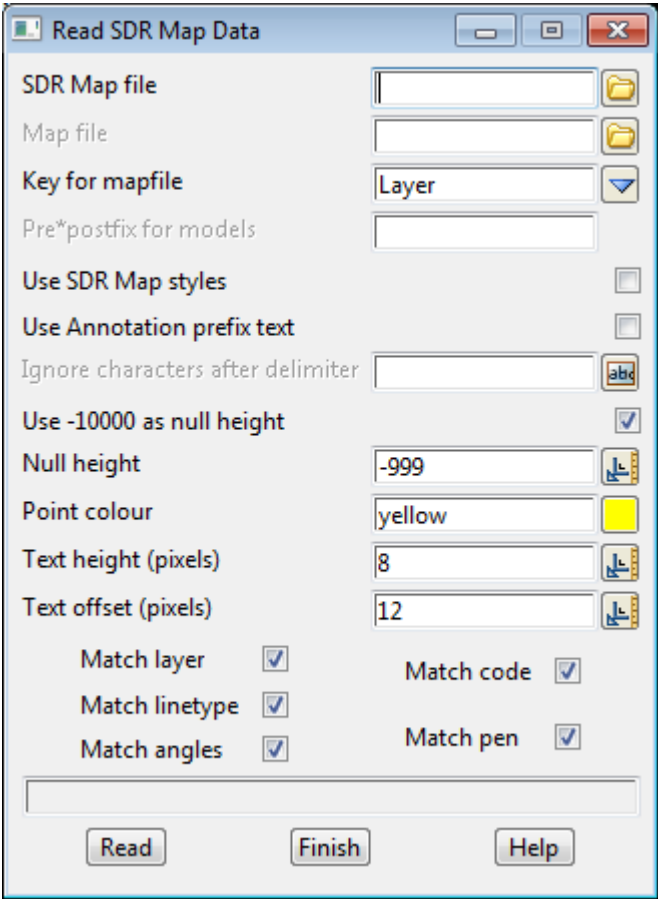

Read button
read the data in

SDR Map Input

Position of option on menu: File I/O =>Data input =>SDR Map

The **SDR Map** input option is designed to read in files in the SDR Map ASCII format.

On selecting the **SDR Map** option, the **Read SDR Map Data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
SDR Map file <i>name of the SDR Map ascii file to be read in.</i>	file box		*.txt
Map file <i>if non-blank, the name of the map file to be used for all data read in. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>	map file box		*.mf and *.mapfile files
Key for map file <i>if code, the SDRmap code is used as the key for the map file. If layer, the SDRmap layer is used as the key for the map file. If code/layer, the SDRmap code/layer is used as the key for the map file. If layer/code, the SDRmap layer/code is used as the key for the map file.</i>	choice box	code	code, layer code/layer, layer/code
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>	pre*postfix box		

- Use SDR Map styles** tick box
if ticked,
- Use Annotation prefix text** tick box
if ticked,
- Ignore characters after delimiter** input
if non-blank, all characters on the line after the given delimiter will be ignored.
- Use -10000 as null height** tick box tick
*if ticked, any z value of -10000 is converted to a null height in **12d Model**.*
- Null height** input -999
*if **non-blank**, any SDR Map z values equalling this value are converted to null values in **12d Model**.*
- Point colour** colour box yellow available colours
colour for SDR Map points that are not part of strings.
- Text height (pixels)** input
height of the text in pixels
- Text offset (pixels)** input
distance in pixels to offset the text from its (x,y) placement position.
- Match flags** tick box
SDRMap data consists of individual lines and arcs. When reading SDRMap data, it undergoes head to tail processing and the match flags specify what SDRMap data can be joined.
- Match layer/code/linetype/angles/pen** tick box
*if **ticked**, then any SDRMap lines and arcs must have the same layer/code/linetype/angle/pen before they can be joined in the head to tail process.*
- Read** button
read the data in

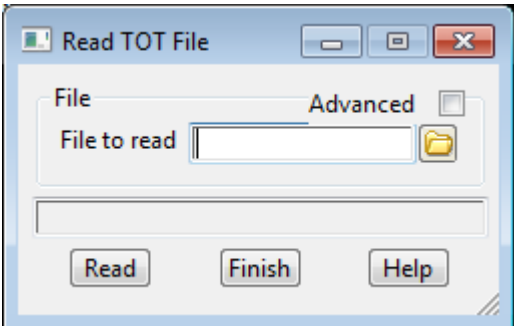

TOT Input

Position of option on menu: File I/O =>Data input =>TOT

The TOT option attempts to read in TOT files.

Note: TOT is a format used by Model Maker, a software program from South Africa.

Selecting TOT brings up the **Read TOT File** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Advanced	tick box		
<i>if ticked, a grid to allow multiple TOT files to be read in, is opened. A wild card is used to select all the files to be read in.</i>			

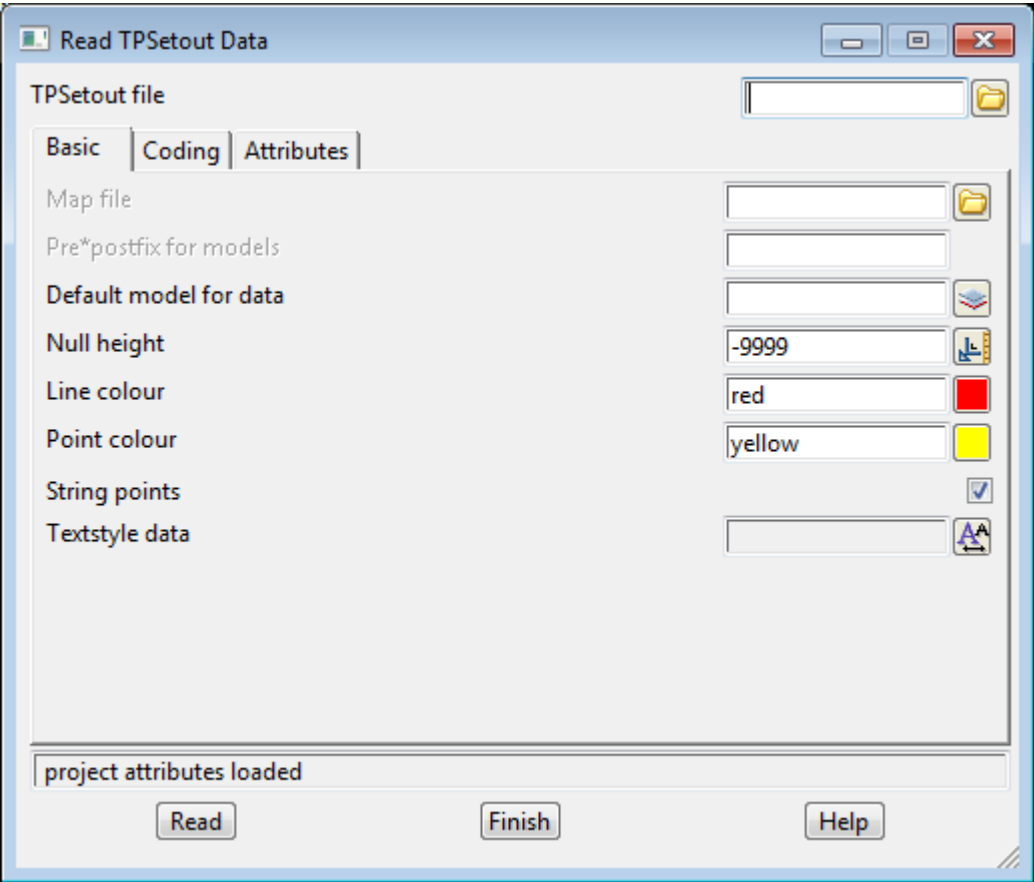

Folder	folder box	
<i>folder to search for files using the Wild card</i>		
Wildcard	input	
<i>wild card to use in search for files in the given folder</i>		
Use	tick box	
<i>if ticked, read in the file</i>		
Files	output	
<i>name of the file in the folder</i>		
Size	output	
<i>file size</i>		
File to read	file box	*.TOT files
<i>name of the TOT file to read in</i>		
Read	button	
<i>read the data in</i>		

TP Setout Input

Position of option on menu: File I/O =>Data input =>TP Setout

The TP Setout input option is designed to read in .pta files from TP Setout

Selecting TP Setout brings up the **Read TP Setout Data** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
TP Setout file <i>name of the TP Setout .pta file to be read in.</i>	file box		*.pta

Basic tab

Map file <i>if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The TP Setout code is used as the entity-name to match against the key in the map file. See the section Create/Edit a Map File in the chapter File I/O for information about 12d map files.</i>	map file box		*.mf files
Pre*postfix for models <i>if non-blank, a prefix and a postfix to be applied to the model names used in the mapping file. Go to the section Pre*Postfix Panel Fields for information on using pre*postfix.</i>	pre*postfix box		
Default model for data <i>name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.</i>	model box		available models
Null height	input	-9999	

if non-blank, any TP Setout z values equalling this value are taken as null values.

Line colour colour box red available colours
colour for TP Setout strings.

Point colour colour box yellow available colours
colour for TP Setout points that are not part of strings.

String points tick box tick
if ticked, points with the same description are joined together.
If not ticked, points with the same description are not joined together.

Textstyle data textstyle data box available textstyle datas
textstyle data used for any text labels

Coding tab

Point ids in column 5 tick box
if ticked, there are points ids in column 5 of the file.

Feature code input
number of characters in the feature code

String number input
number of characters in the string number

Point ids input
number of characters in the point ids

Attributes tab

Name
Type
Data

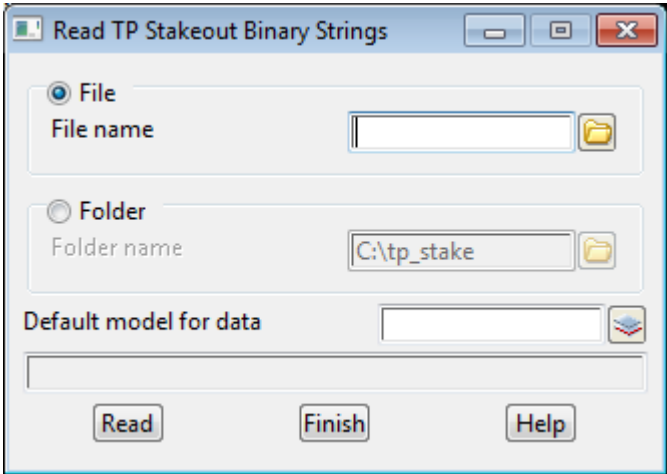

Read button
read the data in.

TP Stakeout Strings Input

Position of option on menu: File I/O =>Data input =>TP Stakeout strings

The **TP Stakeout strings** input option is designed to read in .3db files (binary strings) from TP Stakeout.

Selecting **TP Stakeout strings** brings up the **Read TP Stakeout Binary Strings** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	radio button		
<i>if on then an individual binary string file is to be read in.</i>			
File name	file box		*.3db files
<i>if non-blank, the name of the binary string file to read in.</i>			
Folder	radio button		
<i>if on then the all the binary string files in the folder are to be read in.</i>			
Folder name	folder box		
<i>if non-blank, all the binary string files in this folder are read in.</i>			
Default model for data	input		available models
<i>name of the model to read the binary strings into.</i>			
Read	button		
<i>read the data in.</i>			

Old Inputs

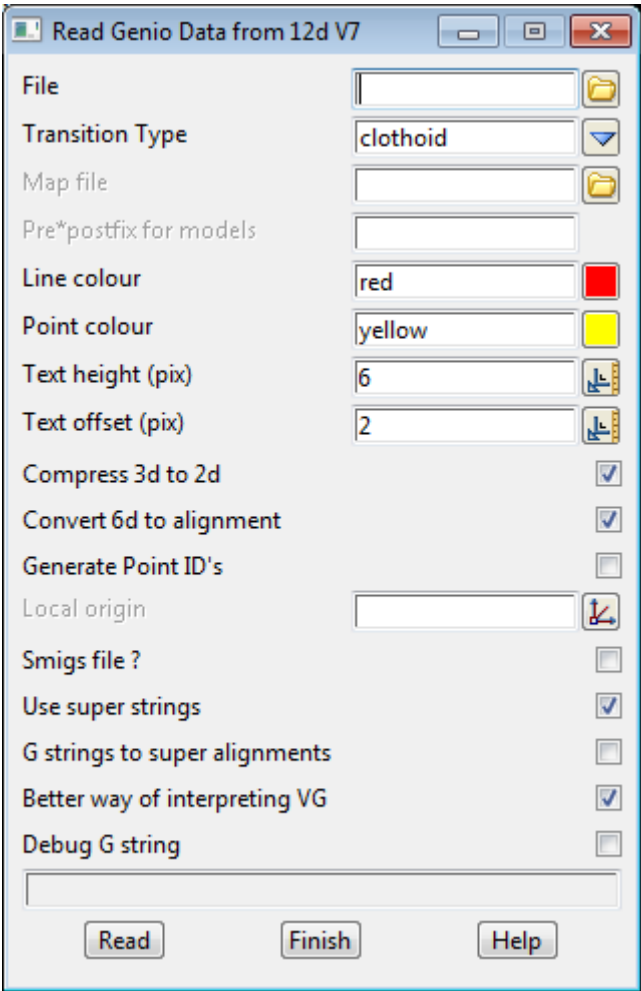

Position of menu: File I/O =>Data input =>Old

The Old menu contains superseded options. The Old walk-right menu is

Genio from 12d V7

This section of documentation is a work in progress and will be updated in subsequent releases.

12D HP Plot File

Position of option on menu: File I/O =>Data input =>Old =>4D HP plot

12d Model has options to create plots for HPGL compatible plotters. This option reads back into 12d Model any plots created by 12d Model using HPGL plot options.

A plot file is only a two dimensional file defined in millimetres. When read back into 12d Model, the units are automatically multiplied by 1000.

In the option, the user can supply a further factor to multiply the x and y coordinates by and also a z-value which is used as a z coordinate for all the lines in the plot file.

On selecting the 12d HP plot option, the read 4D HP plot file panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
HP plot file <i>name of the 12d HP plot file to be read in</i>	input		*.hp files
z value <i>z coordinate to use for the lines read in from the plot file</i>	input	0.0	
Factor <i>the default units used when reading in a plot file are multiplied by 1000. They are then multiplied by this value.</i>	input	1.0	
Model for plot <i>name of the model that the plot file is to be placed in. The model will be created if it does not already exist. This field must be filled in.</i>	input		available models
Add to view <i>if a view name is entered, then the model will be automatically added to the view. This field can be blank.</i>	input		available views
Read <i>read the plot file into the model given in the model field.</i>	button		

DXF Input

Position of option on menu: File I/O =>Data input =>Old =>DXF

DXF input is a separate chargeable option

The **DXF** input option is designed to read most autocad DXF files (up to Version 12), including binary DXF which was introduced in AutoCAD Release 10 as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. **12d Model** will automatically sense whether the input file is binary or ASCII.

The standard Autocad colours can be mapped to the equivalent **12d Model** colours or just mapped on a one-to-one basis to **12d Model** colour numbers.

Each DXF item has an associated layer. By default, **12d Model** creates models of the same name as the layers (or with an additional user supplied prefix) and the DXF items placed in them.

However, this can be over-written using a standard **12d map file** where the key is matched against Autocad **layers** rather than string names.

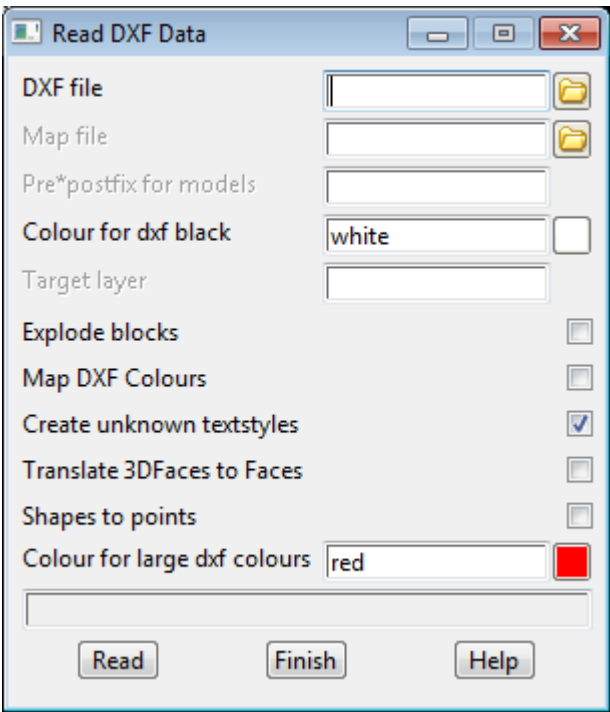

See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.

Autocad blocks are recognised and either a point with the block name is created or the blocks are expanded into their components, each time they are referenced in the DXF file.

Bulges in polylines can only be interpreted correctly when the polyline has a constant z-value. For this case, a **12d Model** polyline string is created from the DXF polyline.

Finally, DXF POINT entities of the same layer and colour are concatenated into one point string as they are read in.

On selecting the **DXF** option, the **read dxf data** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DXF File <i>name of the DXF file to be read in</i>	input		*.dxf files
Map file <i>if non-blank, the name of the map file to be used for all DXF layers read in. The DXF layer is the entity-name for matching against the key in the map file.</i>	input		*.mf files

- If blank, no map file is used.
See the section [Create/Edit a Map File](#) in the chapter [File I/O](#) for information about 12d map files.*
- Prefix for models** input
if non-blank, all 12d Model model names created by the reader will be prefixed by this name.
- Colour for dxf black** input white available colours
if the DXF colour of an item is black, then the colour in the colour for black field is used for the item in 12d Model.
- Target layer** input
if non-blank, only autocad items in the layer with the name given in the target layer field will be read in.
- Explode blocks** tick no tick
*if ticked, autocad blocks are exploded in 12d Model.
If not ticked, blocks are not exploded and a point string is placed at the position of the block.*
- Map DXF colours** tick no tick
*if ticked, the first seven DXF colours are mapped to the corresponding default 12d Model colours.
If no ticked, the nth DXF colour is mapped to the nth 12d Model colour.*
- Create unknown textstyles** tick tick
*if ticked, then if a textstyle in the DXF file is not already defined in 12d Model, then a new 12d Model textstyle of the same name is created.
If no ticked, then the 12d Model textstyle "I" is used for any unknown DXF textstyles.*
- Translate 3DFaces to face** tick no tick
if ticked, DXF faces are read in as 12d Model face strings.
- Colour for large dxf colours** input red available colours
if the DXF colour is greater than the largest colour number defined in the 12d Model colour map, then the colour in the colour for large dxf colours field is used for the DXF colour.
- Read** button
read the data in.

User X Y Z and Attributes Input - Pre V9

Position of option on menu: File I/O =>Data input =>Old => x y z general

Note - this option was replaced in **12d Model 9**.

On selecting the read x,y,z general option, the **Read x y z s General File** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point number and attributes appear in the file. If desired, only an x and y value needs to be read in.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

11 Data Output

Position of menu: File I/O =>Data output

12d Model provides output options so that data in a model or on a view can be written out to a disk file. this may be to allow data to be transferred to other programs for further processing or simply to get a readable list of data.

The default *Output null value* is described in the section [Output Null Value](#)

The data output walk-right menu containing these options is

Data Output	
12da/4da data	write out data in 12d Model Ascii format
ArcView SHP	ArcView SHP file
x y z	x y z data
DEMs	write out DEM data for a tin
DGN	DGN binary
DWG/DXF/DXB	DXF/DWG file

Output Null Value

When writing out data for other systems, it is usually not appropriate to write out the internal 12d Model null height (- 9.9e29).

Consequently as data is written out, any 12d Model null heights are replaced by the value given by the I/O null height parameter.

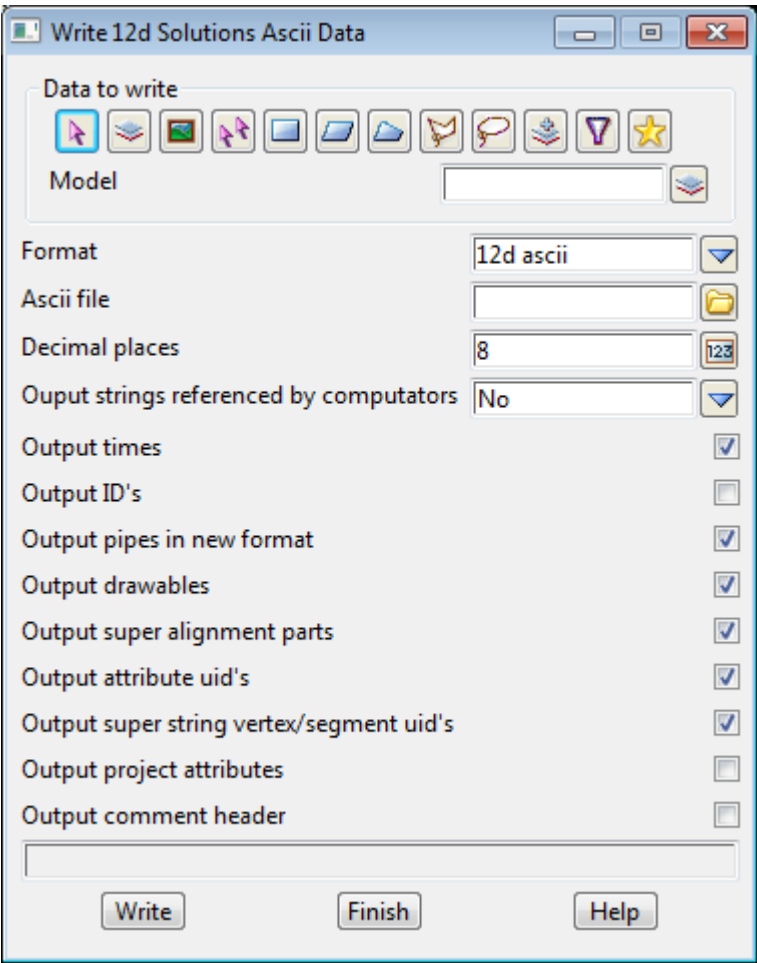

The I/O null height is set in **Default Settings** tab of the **Defaults** panel in the option **Utilities=>Defaults**.

12d Ascii Output

Position of option on menu: File I/O =>Data output =>12da/4da data

The 12d ascii (4D Ascii) format is a special text format defined by 4D Solutions (see the Appendix) for writing out **12d Model** data.This option is used to write out **12d** Model data in the 12d Ascii format.

Selecting the 12d data brings up the **Write 12d Solutions Ascii Data** for panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
Format	choice	12d ascii	12d ascii, 4d ascii
<i>use 12d ascii or 4d ascii format (the only difference is the file name ending)</i>			

Ascii file	input	*.12da or *.4da
<i>name of the file for the information to be written out to in 12d Ascii format. If the file already exists, the data will be appended to the file.</i>		
Decimal places	input	8
<i>number of decimal places used when writing the data out.</i>		
Output string references by computators	choice box	No Yes, No , De-reference
<i>if Yes, any strings referenced by computators by strings in the data source that are not in the data source, are also written out.</i>		
<i>If No, any strings referenced by computators by strings in the data source that are not in the data source, are NOT written out.</i>		
<i>If De-reference, any super strings in the data source with computators are de-referenced. That is, the computators are replaced by internal elements of the string.</i>		
Output times	tick box	
<i>if ticked, write out the creation times etc. for the objects.</i>		
<i>If not ticked, don't write out the creation times etc. for the objects.</i>		
Output ID's	tick box	
<i>if ticked, write out the object ID's.</i>		
<i>If not ticked, don't write out the object ID's.</i>		
Output drawables	tick box	
<i>if ticked, write out the internal super alignment labelling as text.</i>		
Output super alignment parts	tick box	
<i>if ticked, write out all the construction details for super alignments.</i>		
<i>If not ticked, don't write out the construction details. Just write out the HG and VG segments.</i>		
Output attribute uid's	tick box	
<i>if ticked, write out the attribute uids.</i>		
Output project attributes	tick box	
<i>if ticked, write out the project attributes. the construction details for super alignments.</i>		
Output comment header	tick box	
<i>if ticked, write out information as comments at the top of the 12da file.</i>		
Write	button	
<i>write out, in 12d Ascii format, all the string data specified by the Data source.</i>		

ArcView SHP Output

Position of option on menu: File I/O =>Data output =>ArcView SHP

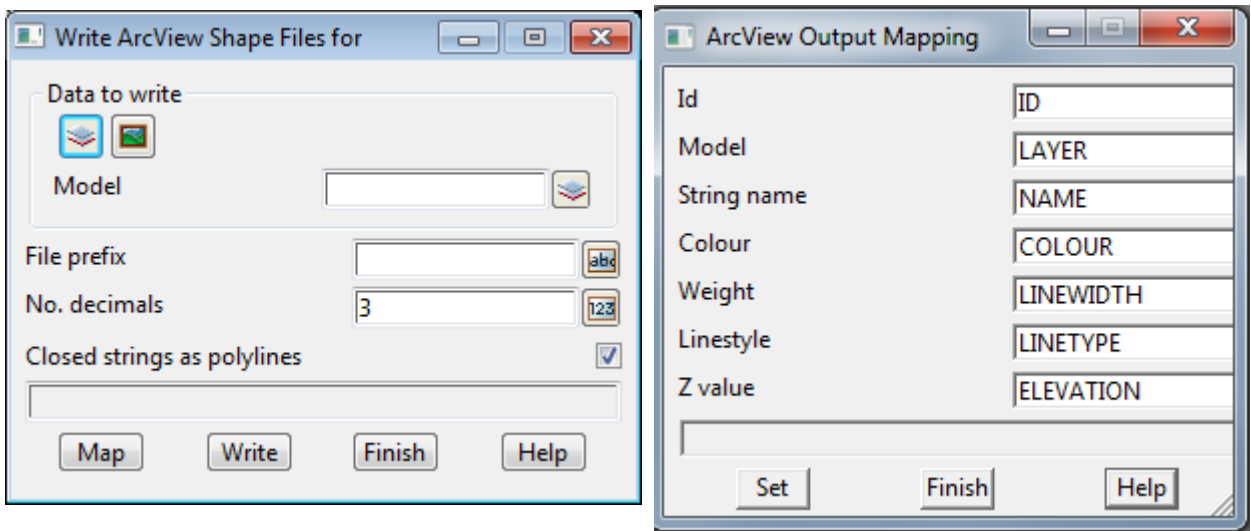

ArcView i/o is a separate chargeable module.

This Option is currently under development.

The *ArcView Shape File* format consists of nine different files containing different data types.

The ArcView shape format has no colour, model or layer information, string names etc. so this information has to be passed through as attributes for the data.

Selecting ArcView SHP displays the **Write ArcView Shape Files for** panel.

The fields and buttons used in the **Write ArcView Shape Files for** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

File prefix	input		
--------------------	-------	--	--

prefix to use for the nine different shape files to be produced for the data.

No. decimals	integer box	3	
---------------------	-------------	---	--

number of decimal places to use in the shape files.

Closed strings as polylines	tick box	3	
------------------------------------	----------	---	--

if ticked, write out closed strings in polyline shape files

Map	button		
------------	--------	--	--

*brings up the **ArcView Mapping** panel which defines the ArcView attributes to write the standard **12d Model** string header information out to.*

Write	button		
<i>write out, in ArcView shape file format, all the string data specified by the Data source.</i>			
The fields and buttons used in the ArcView Mapping panel have the following functions.			
Field Description	Type	Defaults	Pop-Up
Id		ID	
<i>if non blank, write out an integer number which increments from 1.</i>			
Model		LAYER	
<i>if non blank, write out the model of the string to this attribute.</i>			
String name		NAME	
<i>if non blank, write out the name of the string to this attribute.</i>			
Colour		COLOUR	
<i>if non blank, write out the colour of the string to this attribute.</i>			
Weight		LINEWIDTH	
<i>if non blank, write out the weight of the string to this attribute.</i>			
Linestyle		LINETYPE	
<i>if non blank, write out the linestyle of the string to this attribute.</i>			
Z value		ELEVATION	
<i>if non blank, write out the first z-value of the string to this attribute.</i>			
Set	button		
<i>record the attribute names given in the panel as the ones to be use when writing out the data.</i>			

Output X Y Z Text Files

Position of menu: File I/O =>Data output =>x y z

The options under x y z out write out vertices of selected strings in a text format. It is also possible to write out string names, point id's, string, segment and vertex attributes, and chainages and offsets from a selected string.

The X Y Z walk-right menu is

- x y z s data
- user specified x y z s point id
- user specified x y z chainage and offset
- new user specified x y z chainage and offset
- user specified x y z s point no and attribute

- For x y z s, go to
- x y z pt_id
 - x y z ch offset
 - New x y z ch offset
 - General x y z etc

- [X Y Z S Output](#)
- [User X Y Z S Output](#)
- [User X Y Z Chainage and Offset Output](#)
- [User X Y Z Chainage and Offset Output](#)
- [User X Y Z and Attributes Output](#)

X Y Z S Output

Position of option on menu: File I/O =>Data output =>x y z =>x y z s

The xyzs output format is identical to the input format - one point per line with the **x y** and **z** values separated by spaces, and **s** is the string name.

A string's colour and label are used as colour records and string labels in the output file.

4d, interface, super strings and alignment strings are only output as 3d strings. The use of the **12d** Model ascii file format is formatted for writing out all **12d Model** string types.

Selecting the xyzs option brings up the **Write XYZ File for** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

	<i>name of the file for the information to be written out to.</i>	
Write	button	
	<i>write out, in x y z s format, all the string data specified by the Data source.</i>	

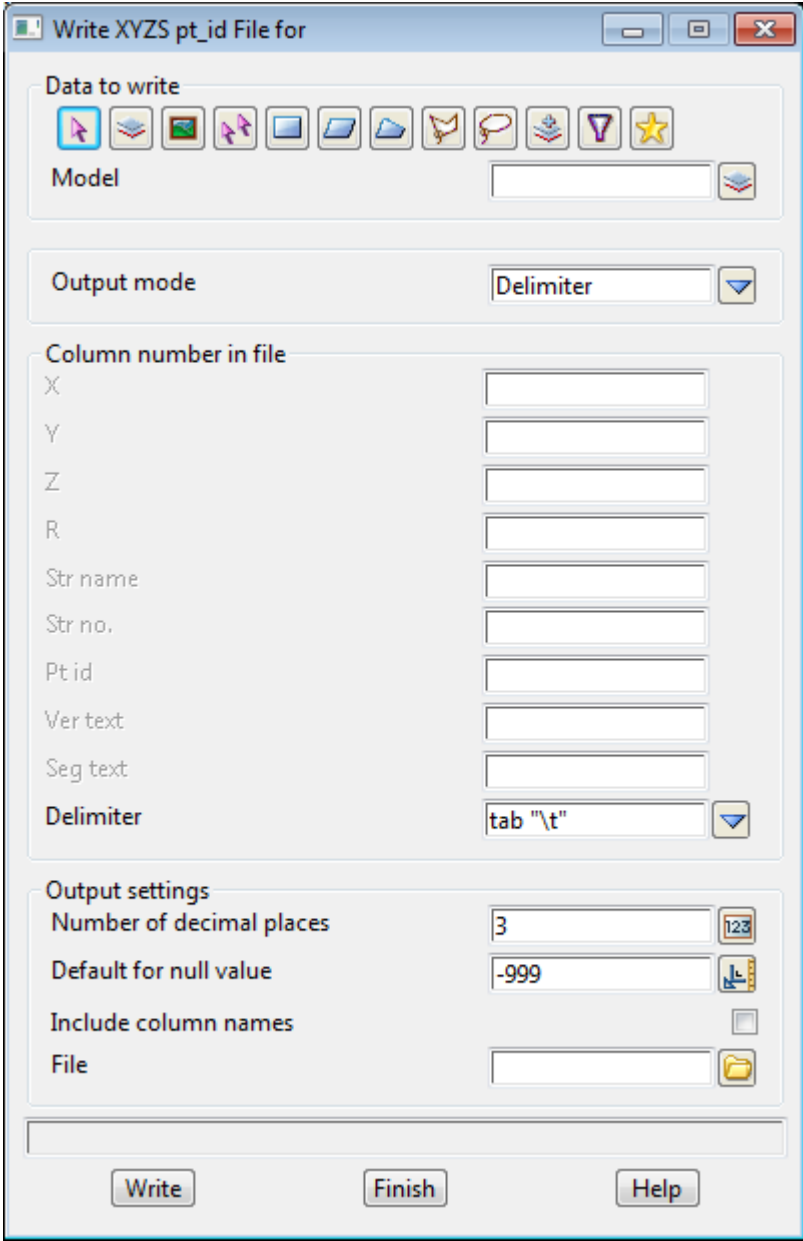

User X Y Z S Output

Position of option on menu: **File I/O =>Data output =>x y z =>x y z s pt_id**

The xyzs output format is identical to the user specified input format - one point per line with the x y z s and point id values in a user specified order separated by either delimiters or in fixed width columns.

super strings, 4d, interface and alignment strings are only output as 3d strings. The use of the **12d** Model ascii file format is used for writing out all **12d Model** strings types.

Selecting the xyzs pt_no brings up the **Write XYZS pt_id File** for panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input
<p>  </p> <p> </p> <p>  </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p>  </p> <p> </p> <p>  </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p>  </p> <p> </p>	<p>  </p> <p> </p> <p>  </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p>  </p> <p> </p> <p>  </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p> </p> <p> </p> <p>  </p> <p>  </p> <p> </p>

source of data is to be written out to a file.

Output mode	choice box	delimiter	delimiter, fixed width
--------------------	------------	-----------	------------------------

if **delimiter**, the type of delimiter and the columns for the x, y, z, name and point number are given (and are all optional).

If fixed width, the start and end column positions are given for x, y, z, name and point number which are all optional.

Output Settings

Number of decimal places input box	3
-------------------------------------------	---

number of decimal places to use in the x, y and z values.

Default for null value	input box	-999
-------------------------------	-----------	------

value to write out for z when it is a null value in **12d Model**.

Include column names tick box

if ticked, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.

File input *.dat files

name of the file for the information to be written out to.

Write button

write out all the string data specified by the Data source.

User X Y Z Chainage and Offset Output

Position of option on menu: File I/O =>Data output =>x y z =>x y z s ch offset

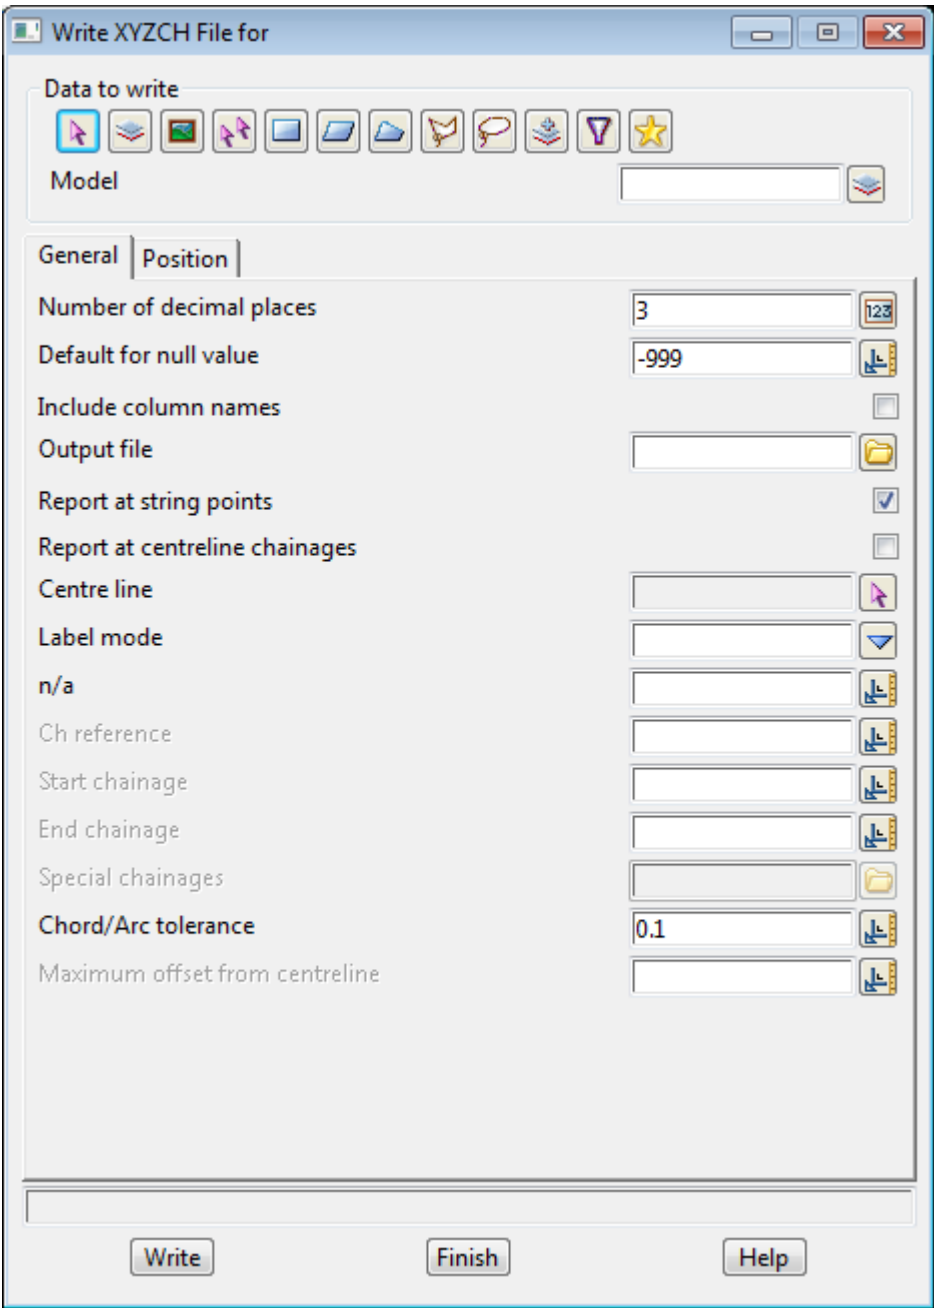

Position of option on menu: File I/O =>Data output =>x y z =>New x y z s ch offset

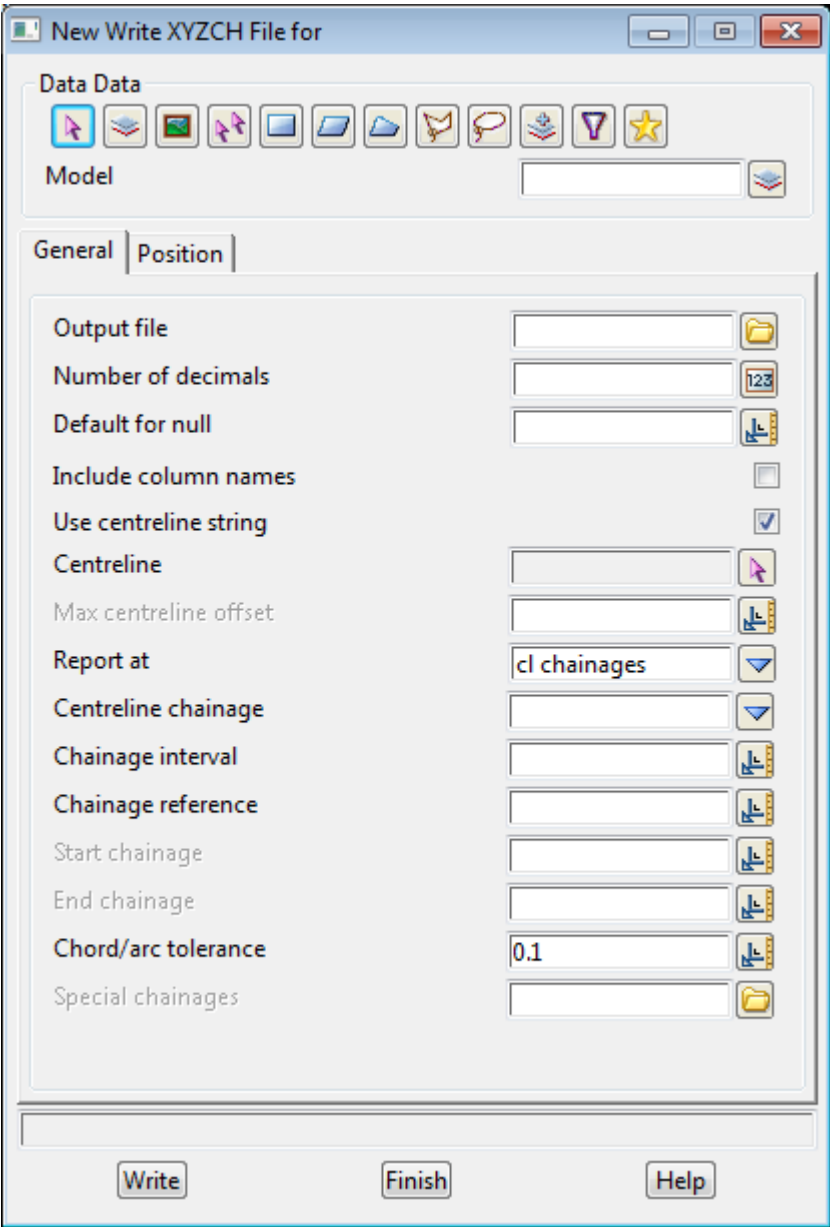

The *New xyz ch offset* option was introduced in V7C1g and will replace the standard option.

The difference is that the new option turns off the panel fields that are not required.

The *xyz and ch* output option writes out the x, y, z and chainage values for each string or a centreline string can be selected and the x, y, z and chainage values from the original string are output along with the chainage and offset from the selected reference string.

Selecting *xyzs ch offset* brings up the **Write XYZSCH File for** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

<i>number of decimal places to use in the x, y, z and chainage values.</i>			
Default for null value	input box	-999	
<i>value to write out for z when it is a null value in 12d Model.</i>			
Include column names	tick box		
<i>if ticked, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.</i>			
Output File	input		*.dat files
<i>name of the file for the information to be written out to.</i>			
Report at string points	tick box		
<i>if ticked, the values are output for the points (vertices) of the strings from the data source. If a centre line has been selected, then the chainage for the centre line is calculated by dropping the string vertex onto the centre line.</i>			
Report at centreline chainages	tick box		
<i>if ticked, the specified chainages of the selected centre line (given by label mode etc.) are used and then the positions on the strings from the data source are calculated by going out at right angles to the centre line at the chainage.</i>			
Centreline	string select		
<i>optional - a selected centreline to use for chainages.</i>			
Label mode	input		regular interval, regular interval (plus end pts) end points only horizontal TPs, vertical TPs, horizontal discontinuities vertical discontinuities all discontinuities, crests/sags all horizontal points
<i>type of chainages to use from the centreline.</i>			
Ch interval or n/a	input		
<i>the regular interval to use for chainages.</i>			
Ch reference	input	0	
<i>the chainages to user are integer multiples of the chainage interval added to the reference chainage. For example, if the reference chainage is 23.2 and the chainage interval 10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be used.</i>			
Start chainage	input		
<i>if non-blank, the string chainage to start using. If blank, start at the beginning of the string.</i>			
End chainage	input		
<i>if non-blank, the string chainage to finish.</i>			

If blank, go to the end of the selected string.

Special chainage file box
file of special chainages to use.

Chord/arc tolerance input default chord/arc tolerance
the chord to arc tolerance to use on the centreline string for determining how many points are used around horizontal curves.

Maximum offset from centreline
if non blank, any vertices further than this distance from the centreline will NOT be written out.
If non blank, all vertices will be written out.

Position tab

Output mode choice box delimiter delimiter, fixed width
*if **delimiter**, then the specified data is written out, each value separated by the delimiter given in the Delimiter field.*
*If **fixed width**, the specified data is written out to a fixed position on the line. An end position is also given.*

String name
if the column number (delimiter) or start-end position (fixed width) is given, then the name of the string from the data source is written out. Otherwise it is not written out.

String vertex index
if the column number (delimiter) or start-end position (fixed width) is given, then the vertex index of the string vertex is written out.

String point id
if the column number (delimiter) or start-end position (fixed width) is given, then the point id of the vertex of the string is written out.

String chainage
if the column number (delimiter) or start-end position (fixed width) is given, then the string chainage of the vertex of the string is written out (not the centre line chainage).

String x/y/z
if the column number (delimiter) or start-end position (fixed width) is given, then the x/y/z co-ordinate of the position on the string is written out (not the centre line x/y/z).

CL offset
if the column number (delimiter) or start-end position (fixed width) is given, then the offset of the string from the centre line is written out.

CL chainage
if the column number (delimiter) or start-end position (fixed width) is given, then the chainage of the centre line is written out.

CL x/y/z

if the column number (delimiter) or start-end position (fixed width) is given, then the x/y/z co-ordinate of the position on the centre line string is written out.

User X Y Z and Attributes Output

Position of option on menu: **File I/O =>Data output =>x y z =>x y z general**

The xyzs output format is identical to the user specified input format - one point per line with the x y z s, point id and attribute values in a user specified order separated by either delimiters or in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point id and attributes appear in the file. Only one or more of the items needs to be written out.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

Super strings, 4d, interface and alignment strings are only output as 3d strings. The 12d Model ascii file format is used for writing out all string types.

Selecting **xyzs general** brings up the **Write X Y Z General File for** panel.

Write button
write out all the string data specified by the Data source to the given file.

Clipboard button
write out all the string data specified by the Data source to the clipboard.

Output DGN Binary Files

Position of menu: File I/O =>Data output =>DGN

DGN output is a separate chargeable module.

The options under **DGN** write DGN V7 and DGN V8 binary files.

There is also an option to create/edit a DGN output map file.

The **DGN** walk-right menu is

- write DGN V8 binary file
- Create/edit Output map file for DGN V8 binary
- write DGN V7 binary file

For *DGN V8*, go to
Output map file
DGN V7

- [Output DGN V8](#)
- [DGN V8 Output Map File Create/Edit](#)
- [Output DGN V7](#)

Output DGN V8

Position of option on menu: File I/O =>Data output =>DGN =>DGN V8

DGN output is a separate chargeable module.

NOTE: the format of the DGN file has changed for DGN V8 but it is proprietary to Bentley and it has not been published. This is a beta version of the DGN V8 Writer to try and write DGN V8 binary files. At this stage it is better to use DWG I/O to go in and out of Microstation V8.

Note: this option is under development

On selecting the **DGN V8** option, the **Write DGN V8 File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type	Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>		
Data source	input	
<i>source of data is to be written out to the DGN file.</i>		
DGN V8 file	file box	*.dgn files
<i>name of the DGN V8 binary file to be write out to</i>		
Dimension	choice box	2d. 3d
<i>dimension of the DGN file</i>		
Template	file box	*.dgn files

DGN output map file	file box	*.dgnmfx files
<i>name of the DGN output mapping file to use</i>		
Write	button	
<i>read the data out as a DGN V8 binary file.</i>		

DGN V8 Output Map File Create/Edit

Position of option on menu: File I/O => Data Output => DGN => Output map file

The DGN output map file option **creates** or **edits** the map files used when writing data out to Microstation DGN V8 binary format using the DGN V8 option (not used for plotting to DGN V8).

Selecting DGN output map file brings up the **DGN Export Map File Create/Edit** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file <i>name of the DGN output map file to be created or edited.</i>	input		*.acadmf
Read <i>read in the DGN output map file given in the map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.</i>	button		
Write <i>write out the data in the table to the file name given in the map file field. If the file already exists, a Replace-Cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.</i>	button		

Grid Cells

- 12d Name**
12d Model string names for the mapping to apply to - wild cards () and characters (!) can be used.*
- DGN level**

*Microstation level to send the selected strings to. Use * to write the **12d Model** model of the string out*

Dgn colour

*Microstation colour to use for the selected strings. Use * for **12d Model** colour number.*

Dgn linestyle

*Microstation linestyle to use for the selected strings. Use * for **12d Model** linestyle*

Dgn Textstyle

*Microstation Textstyle to use for the selected strings. Use * for **12d Model** text style*

Dgn lineweight

Microstation lineweight to use for the selected strings.

Output DGN V7

Position of option on menu: File I/O =>Data output =>DGN =>DGN V7

DGN output is a separate chargeable module.

Using the DGN V7 option, 12d Model produces DGN binary files (*.dgn files - as defined in the public domain by Intergraph Corp) as used by Intergraph and Microstation. Since DGN V7 supports 3d faces, the triangles created in 12d Model can be transferred to DGN V7 for use in shaded models and walk-throughs.

DGN V7 files are either 2d or 3d. 12d Model can write either type of file. If a 3d file is being written, the 12d Model strings will be written out as three dimensional DGN lines. The alignment strings and arcs will be approximated by short lines.

If a 2d file is being written, arcs in alignment strings are written out as DGN plan arcs.

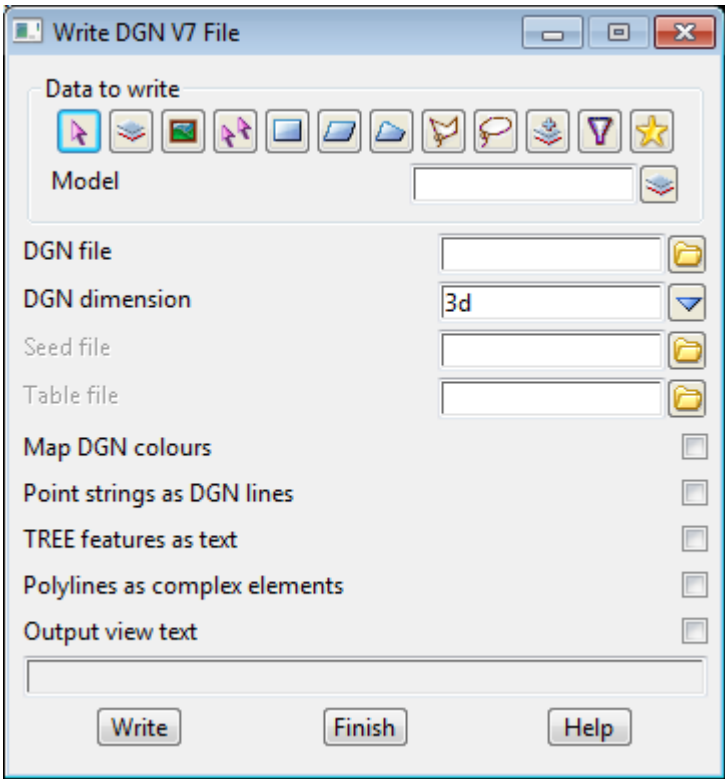

When creating a DGN V7 binary file, it is often convenient to append the information to an existing DGN file known as a seed file (the seed file usually contains set up information for the DGN V7 drawing).

In 12d Model the user can specify a folder containing seed files by pointing to it using the environment variable MS_SEEDFILES_4D. In the DGN V7 output option, the pop-up for the seed file panel field displays all the files ending in .dgn in the folder pointed to by MS_SEEDFILES_4D.

If the environment variable MS_SEEDFILES_4D has not been set, the pop-up uses the current working folder to search for seed files.

It is possible to use an output map file (called a table file) with string name as the key to set DGN V7 levels, colours, weight, style and special symbols (see next section). Because of the limitation of 64 levels in DGN V7, using a table file is normally the best method of getting data across to DGN V7.

On selecting the DGN V7 option, the Write DGN V7 File panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a DGN V7 binary file.</i>			
DGN file	input		*.dgn
<i>name of the DGN V7 file to write the model/view data out to. If the file exists, it is appended to, and the settings for TCB variables are read from the file. If the file does not exist, it is created with default TCB settings. The file is created either 2d or 3d depending on the DGN Dimension field.</i>			
DGN Dimension	input	3d	2d/3d
<i>this field controls the dimension of DGN files created for the case where the file named in the Seed file does not exist.</i>			
Seed file	input		files in the seed folder
<i>if non-blank, this field gives the name of the DGN V7 file to be used as a seed file for the DGN V7 output. The folder containing the seed files, the seed folder, is given by the environment variable MS_SEEDFILES_4D.</i>			
Table file	input		*.tbl file
<i>if non-blank, the file is used as an output map file between 12d Model and the .dgn binary file.</i>			
Map DGN Colours	tick box		
<i>if not ticked, 12d Model colour number n is mapped to DGN V7 colour n. if ticked, some of the 12d Model colours are attempted to be mapped to DGN V7 colours.</i>			
Point strings as DGN line	tick box		
<i>if ticked, 12d Model points go out as DGN V7 two point strings with the same value for each point. if not ticked, 12d Model points go out to DGN V7 points.</i>			
TREE features as text	tick box		
<i>if ticked and there is a table file match for TREE, then 12d Model writes out feature strings of name "TREE" as text in DGN. Other feature strings go out as circles. if not ticked, all 12d Model feature strings go out as DGN V7 circles.</i>			
Polylines as complex elements	tick box		
<i>if ticked and DGN dimension is 2d, 12d Model writes out polylines as complex elements made up of lines and arcs. if not ticked, the polyline goes out as individual lines and arcs.</i>			
Output view text	tick box		
<i>if ticked, any view text turned on (point numbers, z-values etc.) are output as text in DGN V7. if not ticked, view text is not output.</i>			
Write	button		
<i>write out the all the data specified by the Data source to the file given in the DGN file field.</i>			

DGN V7 Output Mapping File (Table File)

When using the output options to write out a DGN V7 file, a DGN V7 output mapping file (table file) can be used, with string names as the key, so that the user can specify DGN level, colour, weight, style and some information which is placed in an DGN attribute. The format is based on the VicRoads specification.

The key can have wild cards (*) and wild characters (?) as for the input map files.

The table consists of lines containing either 8 or 16 free format fields. Fields 9-16 can be left off if they are not needed.

The key for the map is the **12d Model** string name which is given as the first field of a line. The rest of the fields on the line are used for .dgn information.

field 1	12d Model string name (any length but if field 2 is a *, only the first four characters are passed)						
field 2	text of which the first four characters are used in a DGN V7 attribute. For example,						
	the VicRoads code						
field 3	AS2482 feature code						
field 4	description	(any length but quotes needed if there are embedded spaces)					
field 5	line level	(between 1 and 64)					
field 6	line colour	(between 1 and 256)					
field 7	line weight	(between 1 and 7)					
field 8	line style						

fields 9-16 are only used for special symbols placed at points.

field 9	symbol font	(between 0 and 7)
field 10	symbol character	
field 11	symbol character justification	
field 12	symbol character height	
field 13	symbol character width	
field 14	symbol level	
field 15	symbol weight	
field 16	symbol colour	

Field 1, the **12d Model** string name, can contain wild cards * or wild characters ?.

Field 2, a text string, and the first four characters of the text is inserted into a DGN V7 attribute. This DGN V7 attribute is used by the **12d Model** DGN V7 reader for matching with a **12d Model** input map file.

If field 2 is a * then the first four characters of the **12d Model** string name is inserted as an Intergraph attribute.

Line strings and Text strings only use fields 1 to 8 and ignore fields 9-16 (if they exist).

Fields 9 through 16 are only used for **12d Model** point strings which are then mapped with the specified Intergraph symbol at each point of the string.

If either field 12 or 13 is zero, then it is interpreted to mean that only the first 8 fields are used.

If any of the fields 5 through 16 (except 9 and 11) is a *, then that field is not used in the map.

Double quotes " are entered as text as \", a ' as \' and a \ as \\.

An example of a map table where the first four characters of the **12d Model** string names are passed directly through to the DGN attribute.

CONT	*	50020000	"Contour - Standard "	2	4	0	0
TOP	*	25060001	"Top - Cut/fill/bank "	2	11	1	2
TOE	*	25060002	"Toe - Cut/fill/bank "	3	11	1	7

Output DWG/DFX/DXB Files

Position of menu: File I/O =>Data output =>DWG/DXF/DXB

DWG/DXF/DXB i/o is a separate chargeable module.

The option under **DWG/DXF/DXB** writes DWG, DXF and DXB files in a variety of AutoCAD formats.

There is also an option to create/edit an AutoCAD output map file.

The **DWG/DXF/DXB** walk-right menu is

write DWG/DXF/DXB V8 files

Create/edit Output map file for DWG

For *DWG/DXF/DXB*, go to
Output map file

[DWG/DXF/DXB Output](#)

[AutoCAD Output Map File Create/Edit](#)

DWG/DXF/DXB Output

Position of option on menu: File I/O =>Data output =>DWG/DXF/DXB =>DWG/DXF/DXB

DWG/DXF/DXB i/o is a separate chargeable module.

The DWG/DXF output format is for writing data out in a format compatible with AutoCAD versions 2.5 to 20010.

12d Model line strings are output as POLYLINES, point strings as a series of AutoCAD POINTs and triangles as 3DFACES.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

Super strings, 4d, interface and alignment strings can only output as Autocad POLYLINES.

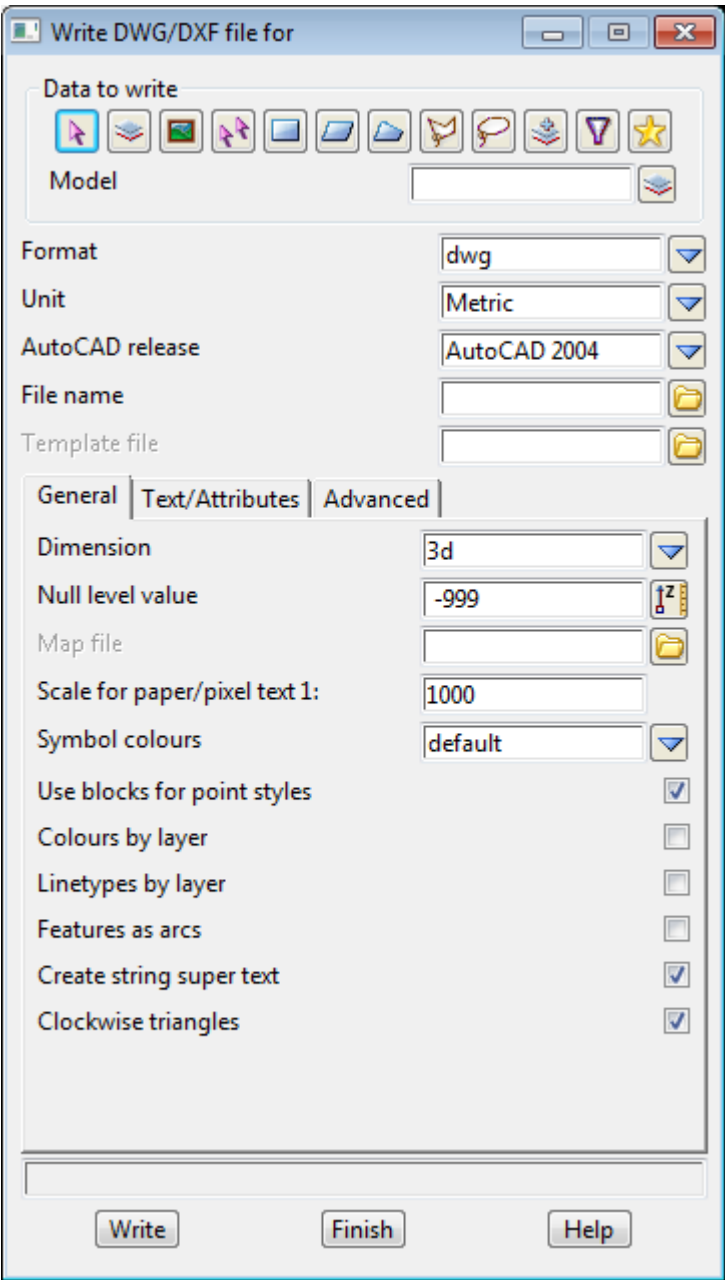

When creating an AutoCAD file, it is often convenient to use an existing AutoCAD file as a template or **seed file** (the seed file usually contains set up information for the AutoCAD drawing).

In **12d Model**, the user can specify a folder containing seed files by pointing to it using the environment variable ACAD_SEEDFILES_4D. In the AutoCAD DWG/DXF output option, the pop-up for the **seed file** panel field displays all the files with the appropriate ending in the folder pointed to by ACAD_SEEDFILES_4D.

If the environment variable ACAD_SEEDFILES_4D has not been set, the pop-up uses the current working folder to search for seed files.

It is also possible to use a label map file to create labels for vertex information such as z-values, symbols and point numbers which are written directly to the AutoCAD file. See the section [Create/Edit Label Map File](#) and [Apply a Label Map File](#) for more information on the label map file.

On selecting the **DWG/DXF** output option, the **Write DWG/DXF file for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>

----------------------------------	----------	---------

if ticked, interface strings are broken into separate strings for the cut or fill colour.
If not ticked, interface strings are written out as one string in magenta.

Use model name for mapping	tick box	no tick
-----------------------------------	----------	---------

if ticked,
if not ticked,.

Use symbol name for mapping	tick box	no tick
------------------------------------	----------	---------

if ticked,
if not ticked,.

Use textstyle_data name for mapping	tick box	no tick
--------------------------------------------	----------	---------

if ticked,
if not ticked,.

Associate vertex attributes with symbol	tick box	no tick
------------------------------------------------	----------	---------

if ticked,
if not ticked,.

Vertex attributes height	input	-999
---------------------------------	-------	------

Transition chainage interval

since AutoCAD does not have a transition element (spirals etc.), a transition can only be approximated. This is the chainage length to break up transitions.

Transition chord to arc

chord-to-arc tolerance when approximating transitions

AutoCAD Output Map File Create/Edit

Position of option on menu: **File I/O =>DWG/DXF/DXB => Output map file**

The **Output map file** option **creates** or **edits** the map files used when writing data out to AutoCAD using the DWG Output option (not used for plotting to AutoCAD).

Selecting **I**Output map file brings up the **AutoCAD Export Map File Create/Edit** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.acadmf
<i>name of the AutoCAD output map file to be created or edited.</i>			
Read	button		
<i>read in the AutoCAD output map file given in the map file field and load the data into the fields of the table. If the file doesn't exist, an error message is given.</i>			
Write	button		
<i>write out the data in the table to the file name given in the map file field. If the file already exists, a Replace-Cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.</i>			

Grid Cells

- 12d Name**
- 12d Model** string names for the mapping to apply to - wild cards (*) and characters (!) can be used.
- Acad layer**
- AutoCAD layer to send the selected strings to. Use * to write the **12d Model** model of the string out

Acad colour

*AutoCAD colour to use for the selected strings - a number between 0 and 256. Use * for **12d Model** colour number. Use BYLAYER for ACD BYLAYER*

Acad linestyle

*AutoCAD linestyle to use for the selected strings. User * for **12d Model** linestyle or BYLAYER for ACD BYLAYER*

Acad Textstyle

*AutoCAD Textstyle to use for the selected strings. Use * for **12d Model** text style*

Acad lineweight

AutoCAD lineweight to use for the selected strings.

Comment

Place comments in this field.

DWG/DXF Output Map File

See [AutoCAD Output Map File Create/Edit](#).

When using the output options to write out a DWG/DXF file, an output map file can be used, with **12d Model** string names as the entity-name to match the key, so that the user can specify AutoCAD colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files. The fields in the DWG/DXF output map file are (ACD = AutoCAD):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for 12d Model name
field 4	ACD colour	number between 0 and 256, * for 12d Model colour mapped to ACD,
		BYLAYER for ACD BYLAYER
field 5	ACD line type	* for 12d Model linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for 12d Model text style

An example of an DWG/DXF output map file is.

//	1	2	3	4	5	6
//	key	name	layer	colour	linetype	textstyle
	cont*	ignored	CONTOURS	1	1	*
	EB*	ignored	ROAD	2	CONTINUOUS	*
	103	ignored	*	3	*	*
	fe*	ignored	FENCE	*	BYLAYER	*
	SURV*	ignored	SURVEY	BYLAYER	DASH	*

Genio Output

Position of option on menu: File I/O =>Data output =>Genio

Genio i/o is a separate chargeable module.

The **Genio output** option write out the strings selected by the data source, to a genio file, the format used by MX (formerly Moss). A genio 001 option is used to specify the record format.

Because MX and in 12d Model have different data types, not all 12d Model data can be transferred to MX. The user must be aware of what data can be transferred to MX.

1. MX model names are limited to thirty two characters (in upper case). Hence the first thirty two characters of the 12d Model model name are converted to upper case and used as the MX model name.
2. MX string names can only be four characters and each string in MX must have a unique name. This limits MX to a maximum of 1,679,616 string. Strings can have the same name in the genio file but the strings will be *renamed* when read into MX to give each string a unique name.

Since 12d Model places no restrictions on string name length, the following rules are used to produce genio string names.

For a **line-string**, the first four characters of the string name are used as the genio string name. The four characters are mapped to upper case. Remember that MX line strings can not start with a P.

For a **point-strings** whose names start with **P**, the first four characters of the string name are used as the genio string name. Otherwise the genio string name is **P** plus the first three letters of the point-string name. The three letters are mapped to upper case.

3. 12d Model null heights go out as -999 to MX.
4. The four character limit and uniqueness for MX string names restricts the number of strings that can be read into MX. For example, since points strings must start with P so there can be a maximum of 46,656 point strings. Or if a MX string must start with ABB say, then there can only be 36 distinct ABB strings in the MX project.
5. All MX x and y co-ordinates have to be positive. That is, all co-ordinates must be in the first quadrant.
6. 12d text strings go out as MX text strings but there is a maximum of 44 characters in the MX text string. There is no unit for height in the MX text string as well as no font. The name of a MX text string must start with a * so 12d Model uses * and the first three characters of the text string's name.
7. 2d and 3d strings in 12d Model go out to MX as 2d and 3d strings respectively.
8. 4d strings in 12d Model go out to MX as 4d strings except that the text is restricted to four characters.
9. Alignment and super alignments can be written out to MX as MX 3d, 6d or 12d string.
10. For super strings:

Point id's are ignored in all cases.

On the Genio output panel, this is a tick box *Include segment text* and if it is ticked then segment text is written out as MX text strings, otherwise segment text is ignored.

On the Genio output panel, this is a tick box *Include vertex text* and if it is ticked then the super string is written out as a MX 4d string and with the first four characters as the vertex text for a point.

Attributes are ignored in all cases.

Diameter and culvert **width** and **height** are ignored.

Colour and **segment colour** are ignored.

If there is an **invisibility** segment, the string is broken into two.

Tinability is a real problem. MX has no such concept apart from the entire string being a point string or a line string. There is a tick box to write out non-tinable data. If a segment is non tinable, the string is broken into two.

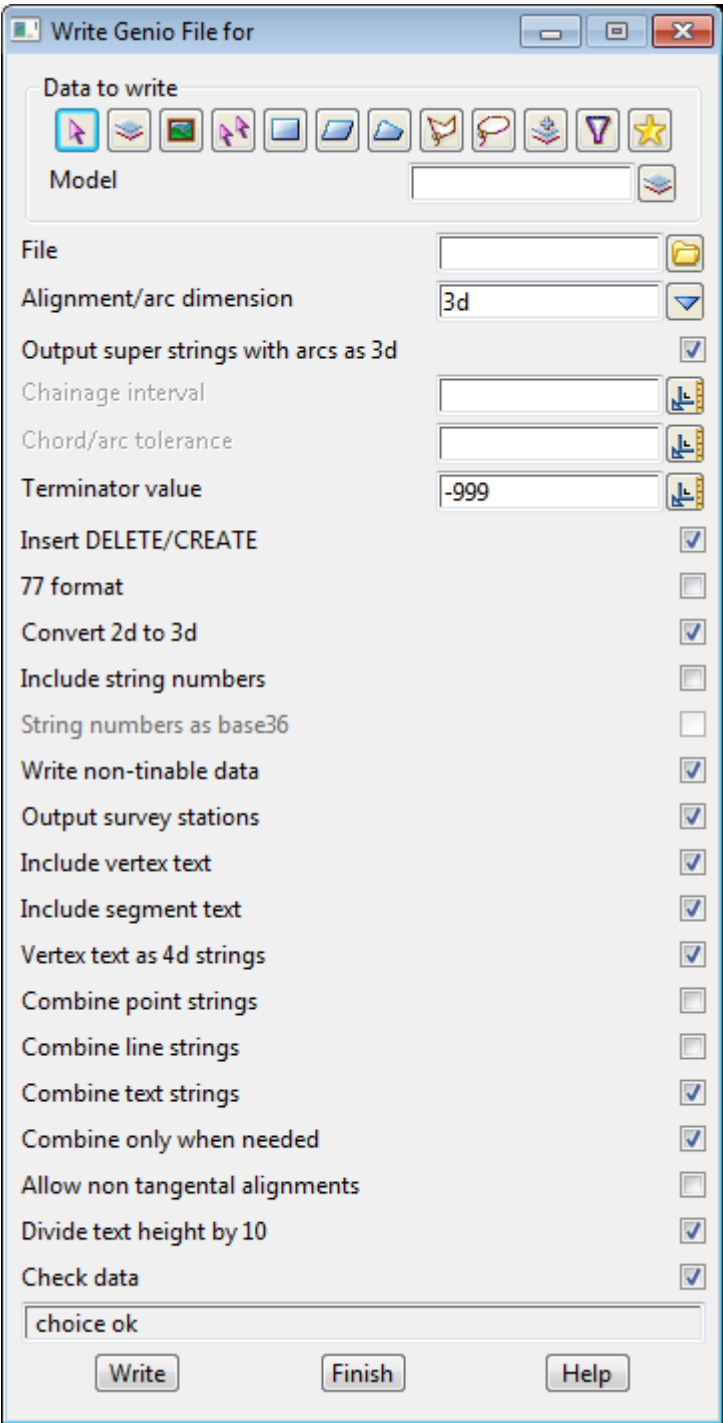

Arcs in super strings or arc strings or circles are broken into line segments using the chord to arc tolerance in the genio output panel, or the system default if there is no value in the panel.

Super strings with a fixed z-value and no vertex text (i.e. that is no z-value at each point, just the one z for the entire string) go out at MX 2d strings.

Super strings with a z-value at each vertex and no vertex text (that is a z-value at each point) go out as MX 3d string

Super strings with a z-value at each vertex and vertex text (that is a z-value at each point and text at each point) go out as MX 4d strings with the four characters of the vertex text as the forth dimension.

On selecting the **Genio** output option, the **Write Genio File for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
File	input		*.mos files
<i>name of the genio file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.</i>			
Alignment/arc dimension	input	3d	3d,6d,12d, 6d & 12d
<i>if 3d is selected, alignment and arc strings as written out as MX 3d string as a series of straight lines (x, y, z at each point).</i>			
<i>If 6d is selected, alignment and arc strings are written out as MX 6d strings (chainage, x, y, z, bearing, and radius at each point).</i>			
<i>If 12d is selected, alignment and arc strings are written out as MX geometry strings (called 12d strings in MX). This is the only way that full horizontal and vertical geometry can be transferred to MX.</i>			
<i>If 6d & 12d is selected, alignment and arc strings are written out as MX 6d strings and MX geometry strings.</i>			
Output super strings with arcs as 3d	tick box		
<i>if ticked,</i>			
Chainage interval	input		
<i>if 3d is selected as the Alignment/arc dimension, the alignments and arcs are approximated using the Chainage interval and\ the Chord/arc tolerance.</i>			
Chord/arc tolerance	input		
<i>if 3d is selected as the Alignment/arc dimension, the alignments and arcs are approximated using the Chainage interval and\ the Chord/arc tolerance.</i>			
Terminator value	input	-999	
<i>value to use to terminate strings in the genio file.</i>			
Insert DELETE/CREATE	tick box	tick	
<i>if ticked, the genio commands DELETE and CREATE are written at the top of the file to correctly define the moss models for the data.</i>			
77 format	tick box		
<i>if ticked, use the MX 77 formats for the genio strings.</i>			
Convert 2d to 3d	tick box	tick	
<i>if ticked, write strings with a fixed z-value (2d strings) out in MX 3d string format in the genio file.</i>			
Include string numbers	tick box		
<i>if ticked, the MX string name includes the surveyors string number. Note - the MX string name can still only be four characters.</i>			

String numbers as base 36 tick box

*if **ticked**, the surveyors string number is converted to Base 36 (that is user 0...9, A... Z). Note - the MX string name can still only be four characters.*

Write non-tinable data tick box tick

*if **ticked**, strings that are not tinable are written out.*

*If **not ticked**, strings that are not tinable are not written out.*

Output survey stations tick box tick

*if **ticked**,*

Include vertex text tick box tick

*if **ticked**, write out strings with vertex text as MX 4d string with the first four characters of the vertex text as the text on the MX 4d string, otherwise do not write the text out.*

Include segment text tick box tick

*if **ticked**, write out segment text as text strings otherwise do not write the text out.*

Vertex text as 4d strings tick box tick

*if **ticked**, vertex text is written out as a MX 4d string*

Combine point strings tick box

*if **ticked**, point strings of the same name in 12d are combined into one point string when written out.*

Combine line strings tick box

*if **ticked**, strings of the same name in 12d are combined into one MX string (using MX discontinuities to separate the strings) when written out. This is trying to get over the MX four character name limitation.*

Combine text strings tick box tick

*if **ticked**, text strings of the same name in 12d are combined into one MX text string when written out. This is trying to get over the MX four character name limitation.*

Combine only when needed tick box tick

*if **ticked**, when there are more strings of the same name in 12d than the MX four character name restriction would allow, the strings are combined into one MX string when written out. This is trying to get over the MX four character name limitation.*

Allow non tangential alignments tick box

*if **ticked**, alignments where some elements are not tangential are written out.*

*if **not ticked**, alignments with non tangential elements are not written out.*

Divide text height by 10 tick box tick

*if **ticked**, divide the text height by 10*

Write button

write out in genio format all the data specified by the Data source, to the file given in the file field. If the file already exist, the data will be appended to the file.

LandXML Output

Position of option on menu: File I/O =>Data output =>LandXML

LandXML i/o is a separate chargeable module.

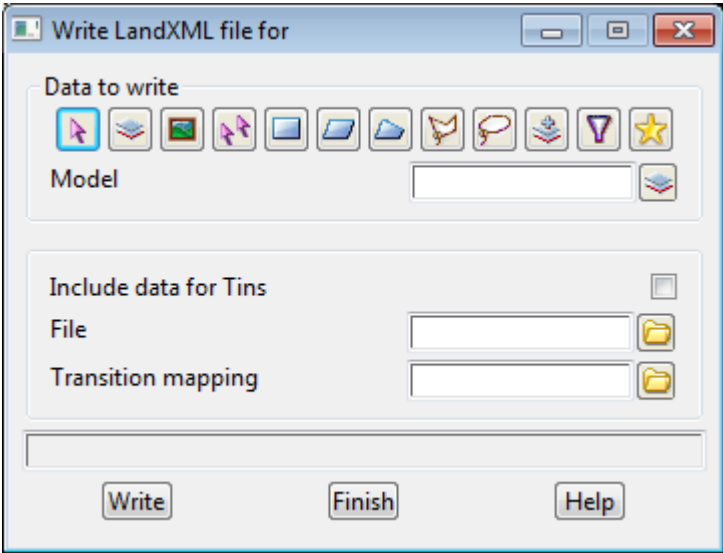

LandXML is a format that attempts to cover some civil and surveying entities. It does not include any information such as colours, styles etc. but just some geometry definitions.

Unfortunately to make the format useful, every vendor has their own proprietary extensions which makes the format of only limited value. A different tailored LandXML writer is required for each vendor variation. The names and definitions of transitions vary from vendor to vendor (**12d Model** has special LandXML writers for LINZ-XML (for LandOnline NZ) and Leica-XML)

Finally the methodology behind the LandXML model is based on US ideas of using X-sections and not strings to model data. This makes is unsuitable except for simple civil models.

This option is under continual developed as the LandXML standard keep changing.

On selecting the **LandXML** option, the **Read LandXML File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type			Model	
-------------------------	--	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input			
--------------------	-------	--	--	--

source of data is to be written out to a file.

Include data for Tins	tick box			
------------------------------	----------	--	--	--

if ticked, tins are included in the LandXML output

File	input			*.xml
-------------	-------	--	--	-------

name of the LandXML file to write to

Transition mapping				*.trans_map files
---------------------------	--	--	--	-------------------

file containing the mapping of transitions between the names of LandXML transitions and equivalent transitions in 12d Model

Write button

write the selected data to a LandXML file.

Output MapInfo MID/MIF Files

Position of menu: File I/O =>Data output =>Mapinfo

MID/MIF i/o is a separate chargeable module.

The options under MapInfo write out MapInfo MID and MIF files.

The MapInfo walk-right menu is

write out MID/MIF data
another MID/MIF writer

For MID/MIF
MID/MIF (new)

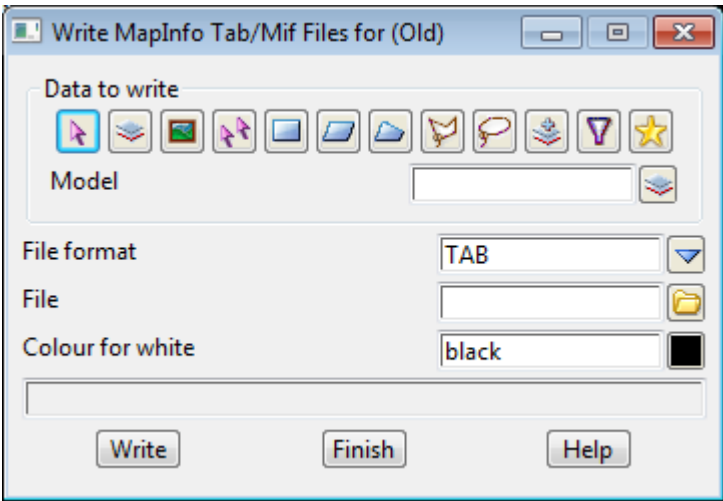

[Write Mapinfo Tab/Mif Files For](#)
[Write Mapinfo Tab/Mif Files For \(New\)](#)

Write Mapinfo Tab/Mif Files For

Position of option on menu: File I/O =>Data output =>Mapinfo =>MapInfo MID/MIF

The MapInfo MID/MIF format is used for sending data to MapInfo.

On selecting the MapInfo MID/MIF option, the Write MapInfo Tab/Mif Files for panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

File format	choice box	TAB	TAB, MIF
--------------------	------------	-----	----------

MapInfo format to use for writing out the data.

File	choice box	*.tab, *.mif files
	<i>name of the file to write the data out to.</i>	
Colour for white	colour box	available colours
	<i>colour to use in MapInfo for white in 12d Model (because MapInfo has a white background).</i>	
Write	button	
	<i>write out, in MapInfo file format, all the string data specified by the Data source.</i>	

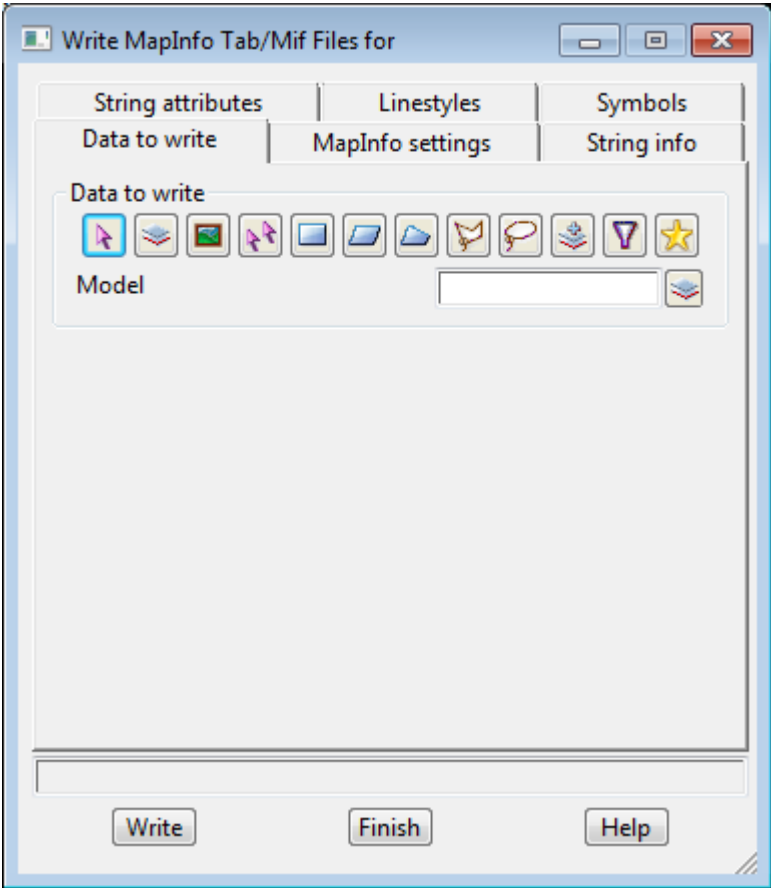

Write Mapinfo Tab/Mif Files For (New)

Position of option on menu: File I/O =>Data output =>Mapinfo =>MapInfo MID/MIF (new)

This section of documentation is a work in progress and will be updated in subsequent releases.

The *MapInfo MID/MIF* format is used for sending data to MapInfo.

On selecting the **MapInfo MID/MIF** option, the **Write MapInfo Tab/Mif Files for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to write Tab			
Data source type		Model	

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source input

source of data is to be written out to a file.

MapInfo settings Tab

Co-ordinate system choice box

MapInfo file of coordinate definitions. The coordinate system that the current data is in is selected from the list.

***Note** - data in MapInfo is stored in longitude and attitude. When MapInfo reads data in it needs to know the coordinate system that the data is in so that it can convert the data to longitude/attitude as it reads the file. The list of coordinate systems in the Coordinate system pop-up is in the file mapinfo.4d. Mapinfo.4d has exactly the same format as the file MAPINFOW.PRJ used by MapInfo.*

*If there are any coordinate systems missing that are in your MapInfo system, simply copy the file MAPINFOW.PRJ from your MapInfo system into the **12d Model User** folder and give it the name mapinfo.4d instead of MAPINFOW.PRJ*

File format choice box TAB TAB, MIF

MapInfo format to use for writing out the data.

File choice box *.tab, *.mif files

name of the file to write the data out to.

Colour for white colour box available colours

colour to use in MapInfo for white in **12d Model** (because MapInfo has a white background).

Scale for paper/pixel text 1: real box 1000

scale to use to map paper and pixel text sizes

String Info Tab

String Attributes Tab

Linestyles Tab

Symbols Tab

Write button

write out, in MapInfo file format, all the string data specified by the Data source.

Civilcad

Position of option on menu: File I/O =>Data output =>Civilcad V5

Civilcad output is an *unsupported* option supplied to users with the Civilcad input option. Civilcad input is a chargeable module.

Because of the limitations of the CivilCAD ascii format, the CivilCAD output option can only output a limited number of **12d Model** data types.

The Civilcad output option writes some **12d Model** data to a CivilCAD 5.0 ascii file. Because CivilCAD ascii can only take points, lines between two points and arcs, only **12d Model** data that can output that way can be written out.

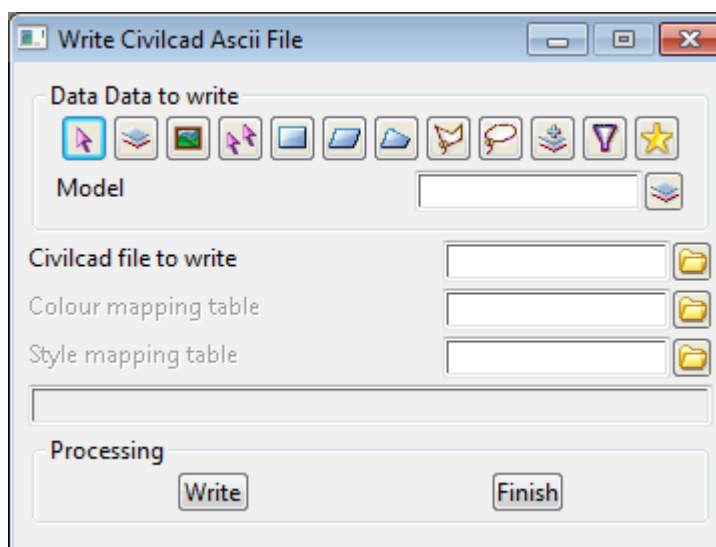

The only **12d Model** data types that can be written out to Civilcad ascii are:

- 2d strings
- 3d strings
- arcs
- circles
- polylines
- the line work from super strings
- text

Note that the following **12d Model** data that *can not* be output to CivilCAD ascii:

- alignments
- super alignments
- drainage/sewer strings
- pipeline strings
- pipe strings
- attributes
- most super string properties
- triangulations
- rasters

On selecting the Civilcad output option, the **Write CivilCAD ascii File** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
CivilCAD file to write	input		*.as5 files
<i>name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.</i>			
Colour mapping table			*.as5_colour_map files
<i>mapping of 12d colours to CivilCAD colours</i>			
Style mapping table			*.as5_style_map files
<i>mapping of 12d linestyles to CivilCAD linestyles</i>			
Write	button		
<i>write the selected data out in CivilCAD format</i>			

Geocomp

Position of option on menu: File I/O =>Data output =>Geocomp

Geocomp output is a *unsupported* option supplied to users with the Geocomp input option. Geocomp input is a chargeable module.

Because of the limitations of the Geocomp points and strings files, the Geocomp output option can only output a limited number of **12d Model** data types.

The Geocomp output option writes some **12d Model** data to Geocomp Points and Strings files. Because Geocomp can only take points, lines between two points and arcs, only **12d Model** data that can output that way can be written out.

The only **12d Model** data types that can be written out to Geocomp points and strings files are:

- 2d strings
- 3d strings
- arcs
- circles
- polylines
- the line work from super strings
- text

Note that the following **12d Model** data types that *can not* be output to Geocomp:

- alignments
- super alignments
- drainage/sewer strings
- pipeline strings
- pipe strings
- attributes
- most super string properties
- triangulations
- rasters

On selecting the Geocomp output option, the **write Geocomp ascii file** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to write <i>the type of data to be written out to a file.</i>	choice box	Model	Model, View

Data type source

source of data is to be written out to a file.

Output file

file box

.pts/.str files

name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Write

button

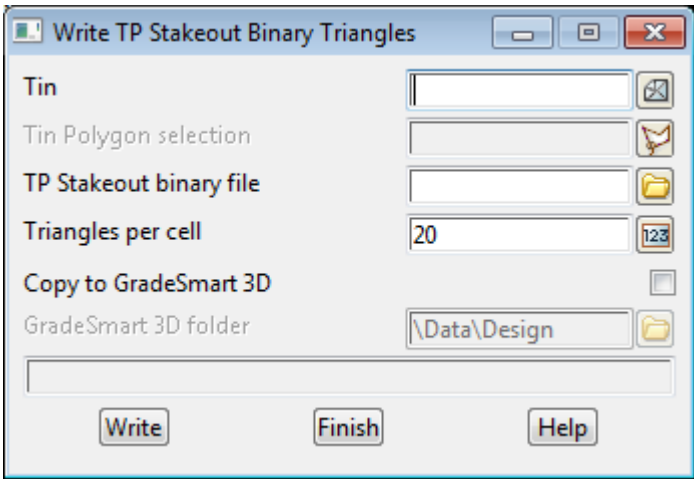

write out Geocomp Points and Strings files the data in the model/view given in the model/view field, to the file given in the output file field.

TP Stakeout Triangles Output

Position of option on menu: File I/O =>Data output =>TP Stakeout triangles

The *TP Stakeout triangles* option writes out a tin as a TP Stakeout binary file.

On selecting the TP Stakeout triangles output option, the **Write TP Stakeout Binary Triangles** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin <i>name of the tin to write out in TP Stakeout binary format.</i>	tin box		available tins
Tin polygon selection <i>if selected, only triangles with their centroid inside this string are written out</i>	poly string-select		
TP Stakeout binary file <i>name of the file for the triangles</i>	input		*.tsb
Triangles per cell <i>a TP Stakeout parameter</i>			
Copy to GradeSmart 3D <i>if ticked, copy file to GradeSmart folder</i>	tick box		
GradeSmart 3D folder <i>folder for GradeSmart files</i>	folder box		
Write <i>write out the tin in TP Stakeout binary format.</i>	button		

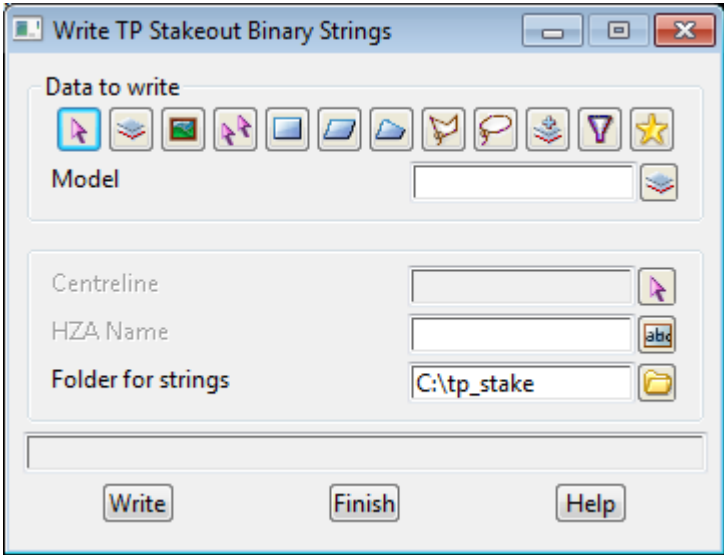

TP Stakeout Strings Output

Position of option on menu: File I/O =>Data output =>TP Stakeout strings

Note - this is a chargeable option

The *TPStakeout strings* option writes out selected strings as a TP Stakeout binary file.

Selecting TP Stakeout strings brings up the **Write TP Stakeout Binary Strings** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

Centreline	string select		
-------------------	---------------	--	--

centreline string to use as the reference chainage for other strings.

HZA name

Folder for stings	folder		
--------------------------	--------	--	--

name of the folder to write out the strings to.

Write	button		
--------------	--------	--	--

write out the strings in TP Stakeout binary format.

KML Output

Position of option on menu: File I/O =>Data output =>KML

The *KML* option writes out selected **super strings** and **tins** in the KML/KMZ file format which is used by Google Earth to load users data into the Google Earth environment.

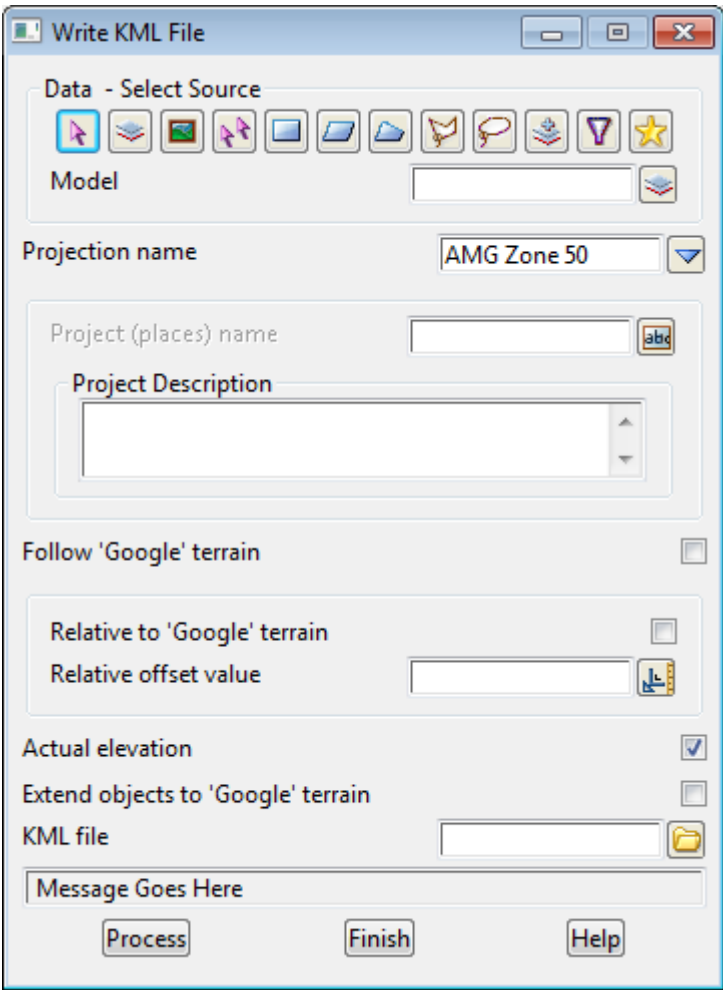

The Google terrain can be significantly different to the terrain from survey data. If the terrain is ticked on in Google Earth it may be higher than the surveyed terrain and obscure the data from 12d.

Google Earth uses the WGS84 Ellipsoid so data must be in a projection based on either the WGS84 or GSR 80 ellipsoids, and the projection for the data known.

Google Earth does not display negative elevations.

If Google Earth does not initialise correctly and centre on the data written from **12d Model**, selecting a 'model' or 'string' will fit the data to the Google Earth display.

Selecting **KML** brings up the **Write KML** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type	Model		
-------------------------	-------	--	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source input

*source of data is to be written out to a file.
Only super strings and tins are output to the KML file*

Projection name projection box

Google Earth uses Latitude and Longitude using the WGS84 spheroid (ellipsoid) to display information in its spatial location. This means that the data to be written to Google Earth should be in a coordinate system that is the same as the a mapping projection and is based on the WGS84 or GSR 80 spheroid. This field is a list of projections created from the users carto.4d file. Select the 'projection name' from the list that matches the coordinate system of the data

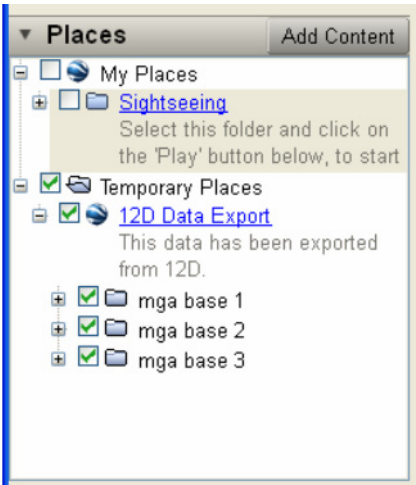

***NOTE** - this projection must be based on the WGS84 or GSR80 ellipsoid (for example MGA and NOT AMG).*

Project (Places) name

*Enter the name to be shown in the Google Earth 'Places'.
If left blank, the file name from the KML file field is shown in the Google Earth 'Places'.*

Project Description

if non blank, this text will describe the project under the 'Project Name' in Google Earth.

Note:

One and only one of the next three options Follow Google terrain, Relative to Google terrain, and Actual elevation can be ticked on. Ticking one on will untick the other one that was set. You can't untick one except by ticking on a different one.

Follow Google terrain tick box

If ticked, the elevations of the data in 12d are ignored and the objects are 'clamped' to the terrain in Google Earth.

Relative to Google terrain tick box

*If ticked, the elevations of the 12d data are ignored and the objects are 'clamped' to the terrain in Google Earth **plus** the value given in the Relative offset value field.*

Relative offset value

if Relative to Google terrain is ticked, the data is offset by this amount above the Google terrain. If this value is zero then it is the same as Follow Google terrain.

Actual elevation tick box

if ticked, the z values from the 12d are used to display the objects in Google Earth

Extend objects to Google terrain tick box

if ticked the objects are displayed in Google Earth as a shape that extends from the Google terrain to the object

KML file file box *.kmz files

name of the kmz file to be written. The kml file is an xml style of file and the kmz file is the kml file in the 'zip' compression format.

Process button

write out the data in KML format.

IFC Output

The IFC Output walk-right menu is

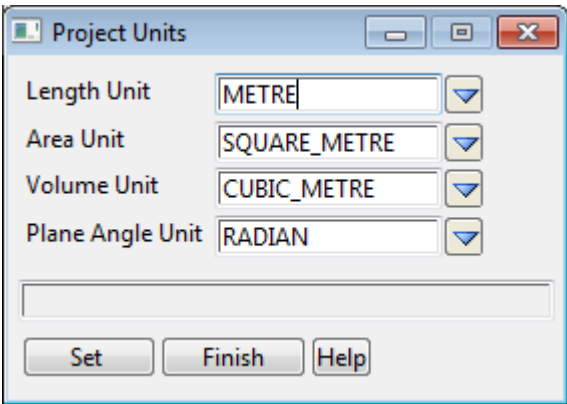

For the option <i>Project units</i> , go to	Project Units

Writing 12d Solutions Ascii Data with Place Nodes

Position of option on menu: File I/O =>Data output =>IFC => Products =>Product create

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Product create** brings up the **Write 12d Solutions Ascii Data with Place Nodes** panel.

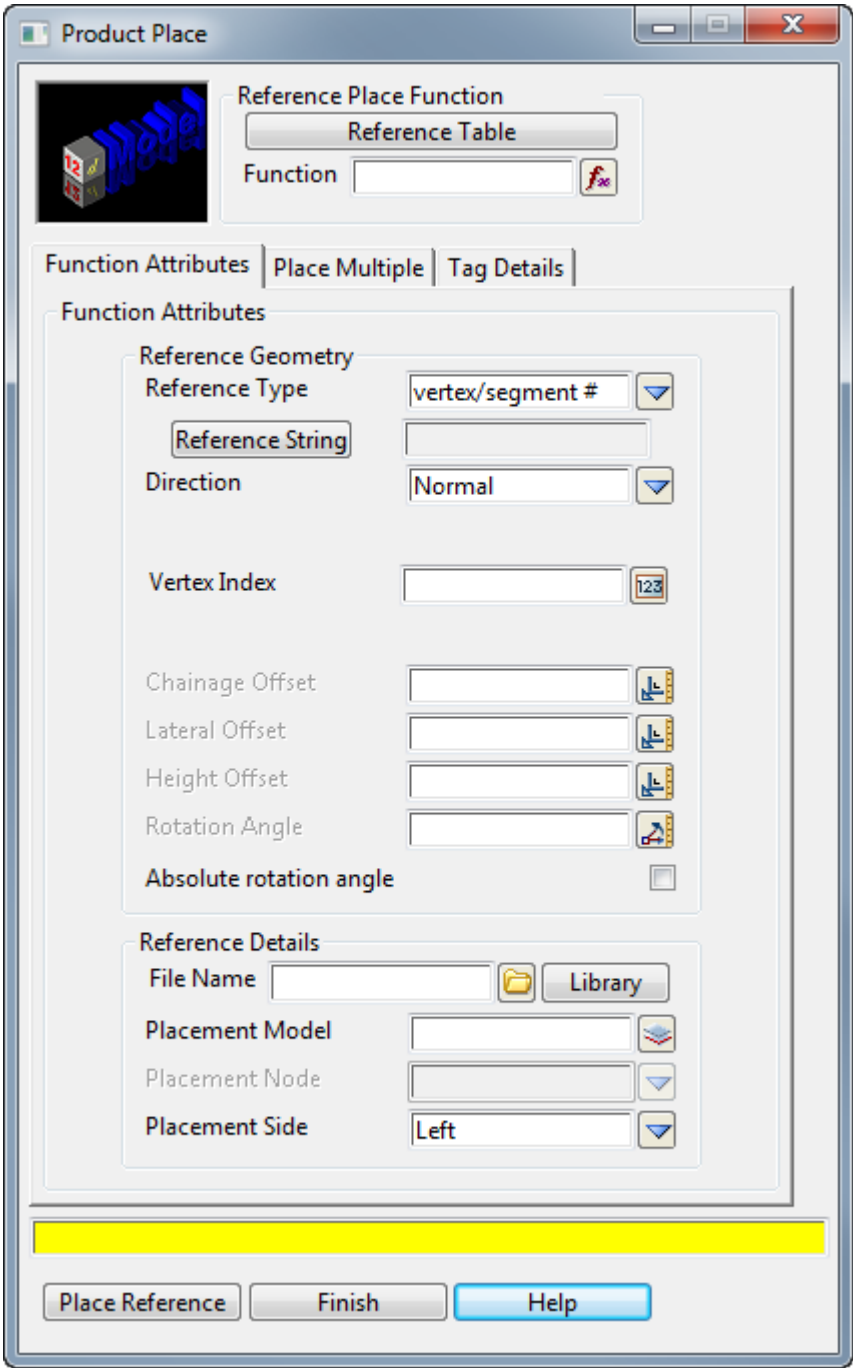

Product Place

Position of option on menu: File I/O =>Data output =>IFC => Products =>Product place

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Product place** brings up the **Product Place** panel.

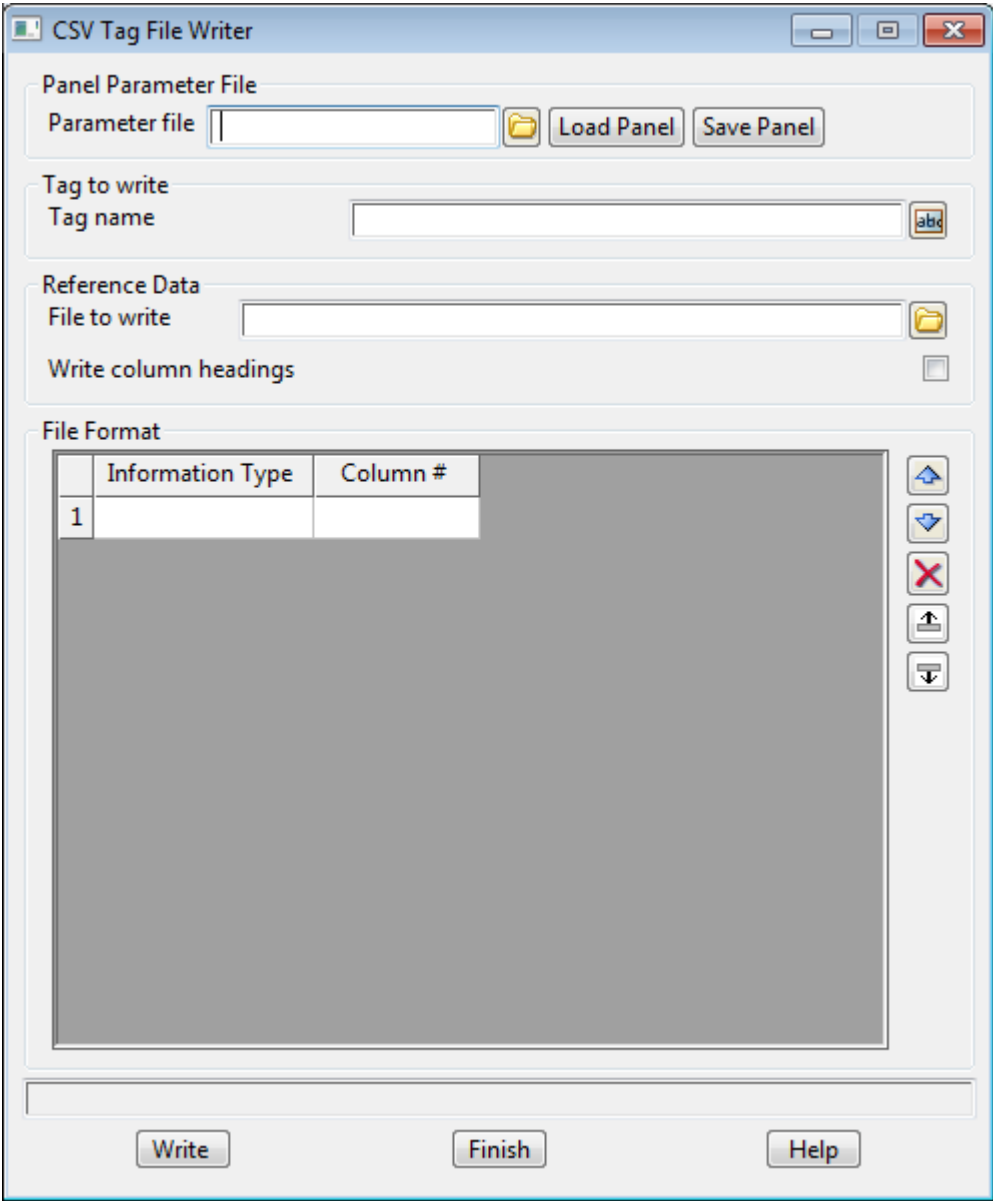

Product Place Writer

Position of option on menu: File I/O =>Data output =>IFC => Products =>Product place writer

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Product place writer** brings up the **CSV Tag File Writer** panel.

Old Outputs

Position of menu: File I/O =>Data output =>Old

The **Old** menu contains superseded options. The **Old** walk-right menu is

DXF 12-14 Output

Position of option on menu: File I/O =>Data output =>Old =>DXF 12-14

SUPERSEDED OPTION

The DXF 12-14 output format is for writing data out in a format compatible with AutoCAD. The DXF file produced **does not** have a full DXF header with the required line types, text styles, fonts already defined. Hence the DXF file needs to be loaded into an **existing** Autocad drawing.

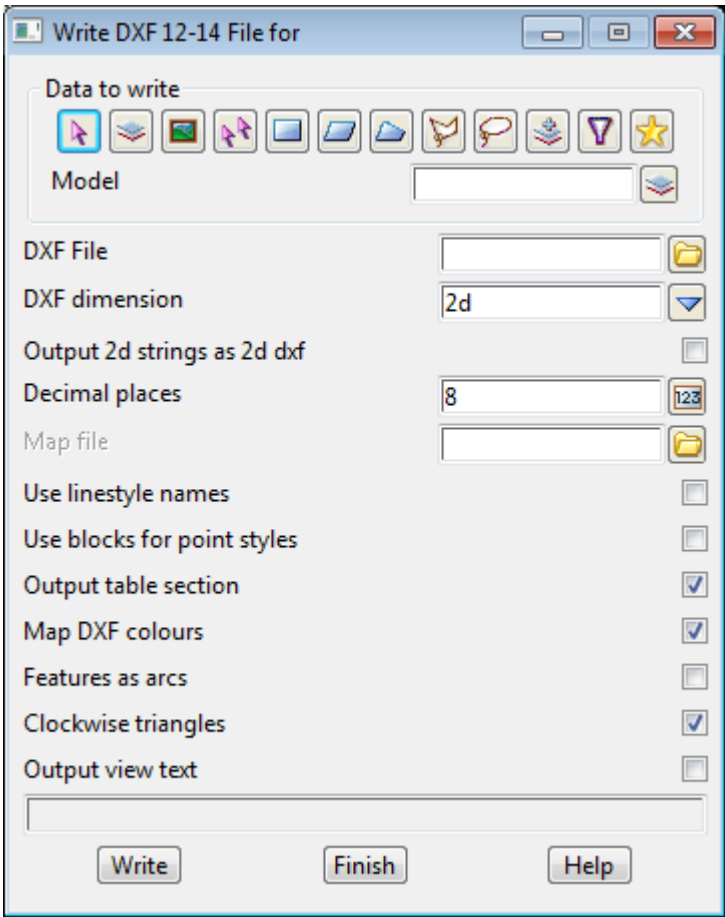

AutoCAD Release 10 introduced binary DXF files as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. 12d Model can write binary DXF files. See the Precision field below.

12d Model line strings are output as POLYLINES, point strings as a series of AutoCAD POINTs and triangles as 3DFACES.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

On selecting the **DXF 12-14** output option, the **Write DXF 12-14 File for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type	Model		
data selection type - for a full description go to Data Source in the chapter Tools and Concepts			
Data source	input		
source of data is to be written out to a file.			
DXF File	input	*.dxf files	
name of the file for the information to be written out to. If the file already exists, the data will be appended to the file.			
DXF Dimension	input	2d	2d, 3d
if 3d , strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines. If 2d , the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.			
Decimal places	input	8	
the number of decimal places to be used for co-ordinates etc. in the DXF file. If this number is negative , a binary DXF file will be written. The actual number specified becomes irrelevant in this case, since full precision is preserved in a binary DXF file.			
Map file	input	*.mf files	
if non-blank, the name of a file to be used as a 12d Model to DXF output map file.			
Use linestyle names	tick box		
if ticked , a 12d Model string's linestyle name is used as the DXF element's line type ("I" goes to CONTINUOUS). if not ticked , all DXF line types are CONTINUOUS.			
Use blocks for point styles	tick box		
if ticked , for each 12d Model point string, an AutoCAD block of the same name as the 12d Model string's linestyle is places at each point.			
Output table section	tick box	tick	
if ticked , an AutoCAD table section is written out at the top of the DXF file.			
Map DXF colours	tick box	tick	
if ticked , a mapping is made between the first seven default 12d Model colours and the corresponding DXF colours. The other 12d Model colours are mapped to the DXF colour of the same colour number. If not ticked , the nth 12d Model colour is mapped to the nth DXF colour.			
Features as arcs	tick box		
if ticked , feature strings output as arcs in DXF. if not ticked , the centre of the feature string is output as a point.			
Output view text	tick box		
if ticked , any view text turned on (point numbers, z-values etc.) are output as text in DXF. if not ticked , view text is not output.			

Write button

write out, in DXF format, the data in the model/view given in the model/view field, to the file given in the file field.

DXF Output Map File

When using the output options to write out a DXF file, an output map file can be used, with **12d Model** string names as the entity-name to match the key, so that the user can specify AutoCAD colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files. The fields in the DXF output map file are (ACD = AutoCAD):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for 12d Model name
field 4	ACD colour	number between 0 and 256, * for 12d Model colour mapped to ACD,
		BYLAYER for ACD BYLAYER
field 5	ACD line type	* for 12d Model linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for 12d Model text style

The DXF file produced needs to be loaded into an existing Autocad drawing which has the ACD layers and linetypes defined.

An example of an DXF output map file is.

//	1	2	3	4	5	6
//	key	name	layer	colour	linetype	textstyle
	cont*	CONT	CONTOURS	1	1	*
	EB*	TOP	ROAD	2	CONTINUOUS	*
	103	TOP	*	3	*	*
	fe*	TOP	FENCE	*	BYLAYER	*
	SURV*	TOP	SURVEY	BYLAYER	DASH	*

DXF Output

Position of option on menu: File I/O =>Data output =>Old =>DXF

SUPERSEDED OPTION

The DXF output format is for writing data out in a format compatible with AutoCAD version 15. The DXF file produced **does not** have a full DXF header with the required line types, text styles, fonts already defined. Hence the DXF file needs to be loaded into an existing Autocad drawing.

This option is the one used in 12d Model V3.1. It is now superseded by the **DWG/DXF** output option.

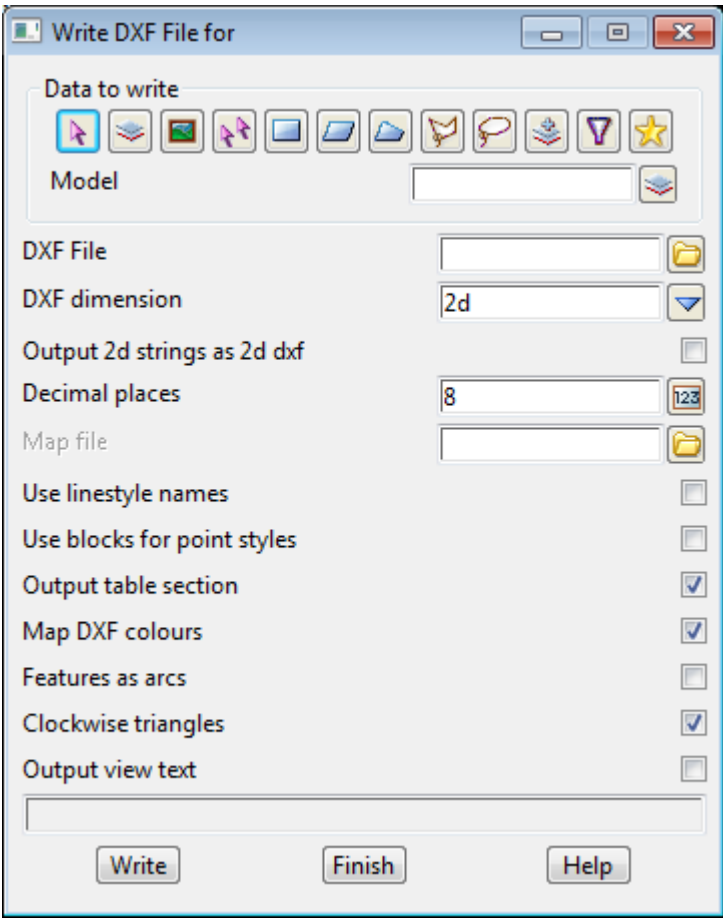

AutoCAD Release 10 introduced binary DXF files as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. 12d Model can write binary DXF files. See the Precision field below.

12d Model line strings are output as POLYLINES, point strings as a series of AutoCAD POINTs and triangles as 3DFACES.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

On selecting the **DXF** output option, the **Write DXF file for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
DXF File	input		*.dxf files
<i>name of the file for the information to be written out to. If the file already exists, the data will be appended to the file.</i>			
DXF Dimension	input	3d	2d, 3d
<i>if 3d, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines. If 2d, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.</i>			
Decimal places	input	8	
<i>the number of decimal places to be used for co-ordinates etc. in the DXF file. If this number is negative, a binary DXF file will be written. The actual number specified becomes irrelevant in this case, since full precision is preserved in a binary DXF file.</i>			
Map file	input		*.mf files
<i>if non-blank, the name of a file to be used as a 12d Model to DXF output map file.</i>			
Use linestyle names	tick box		
<i>if ticked, a 12d Model string's linestyle name is used as the DXF element's line type ("I" goes to CONTINUOUS). if not ticked, all DXF line types are CONTINUOUS.</i>			
Use blocks for point styles	tick box		
<i>if ticked, for each 12d Model point string, an AutoCAD block of the same name as the 12d Model string's linestyle is placed at each point.</i>			
Output table section	tick box	tick	
<i>if ticked, an AutoCAD table section is placed at the beginning of the DXF file.</i>			
Map DXF colours	tick box	tick	
<i>if ticked, a mapping is made between the first seven default 12d Model colours and the corresponding DXF colours. The other 12d Model colours are mapped to the DXF colour of the same colour number. If not ticked, the nth 12d Model colour is mapped to the nth DXF colour.</i>			
Features as arcs	tick box		
<i>if ticked, feature strings output as arcs in DXF. if not ticked, the centre of the feature string is output as a point.</i>			
Output view text	tick box		
<i>if ticked, any view text turned on (point numbers, z-values etc.) are output as text in DXF.</i>			

if not **ticked**, view text is not output.

Write button

write out, in DXF format, the data in the model/view given in the model/view field, to the file given in the file field.

DXF Output Map File

When using the output options to write out a DXF file, an output map file can be used, with **12d Model** string names as the entity-name to match the key, so that the user can specify AutoCAD colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files. The fields in the DXF output map file are (ACD = AutoCAD):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for 12d Model name
field 4	ACD colour	number between 0 and 256, * for 12d Model colour mapped to ACD,
		BYLAYER for ACD BYLAYER
field 5	ACD line type	* for 12d Model linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for 12d Model text style

The DXF file produced needs to be loaded into an existing Autocad drawing which has the ACD layers and linetypes defined.

An example of an DXF output map file is.

//	1	2	3	4	5	6
//	key	name	layer	colour	linetype	textstyle
	cont*	CONT	CONTOURS	1	1	*
	EB*	TOP	ROAD	2	CONTINUOUS	*
	103	TOP	*	3	*	*
	fe*	TOP	FENCE	*	BYLAYER	*
	SURV*	TOP	SURVEY	BYLAYER	DASH	*

Genio V3.1 Output

Position of option on menu: File I/O =>Data output =>Old =>Genio V31

SUPERSEDED OPTION

Genio i/o is a separate chargeable module.

This is the genio output module from 12d Model V3.1. This module has been replaced by the new genio module but the genio v3.1 will be left in V4.0 in case there a any problems with the new module.

The genio v3.1 output option uses a non-default format to write out the strings in a model or on a view, to a genio file. A genio 001 option is used to specify the record format.

The first thirty two characters of the model name are converted to upper case and used as the Moss model name.

In Moss, string labels can have a maximum of four characters. Since 12d Model places no restrictions on string name length, the following rules are used to produce genio string labels.

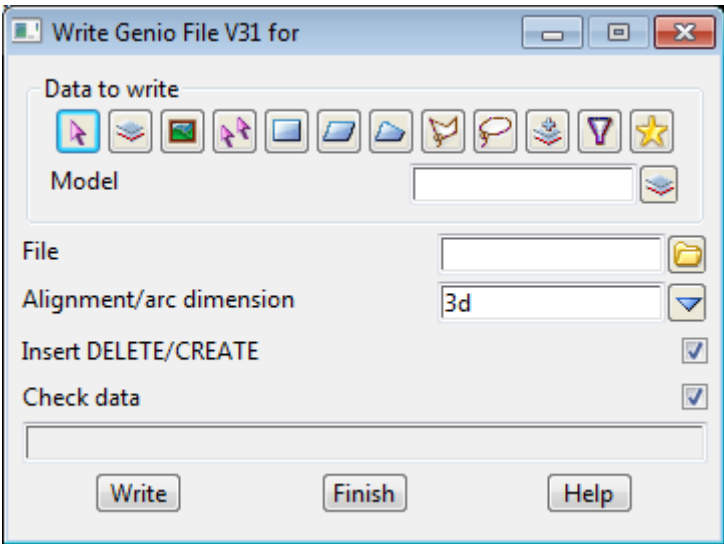

For a line-string, the first four characters of its string name are used as the genio string label. The four characters are mapped to upper case.

Similarly for point-strings whose names start with P. Otherwise the genio string label is P plus the first three letters of the point-string name. The three letters are mapped to upper case.

The name of a Moss text string must start with a * so 12d Model uses * and the first three characters of the text string's name.

An alignment string can be written out as either a moss 3d, 6d or 12 string.

On selecting the Genio V31 output option, the Write Genio File V31 for panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

File	input	*.mos files	
<i>name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.</i>			
Alignment dimension	input	3d	3d,6d,12d
<i>if 3d is selected, alignment strings as written out as a 3d string as a series of straight lines.</i>			
<i>If 6d is selected, alignment strings are written out as Moss 6d strings.</i>			
<i>If 12d is selected, alignment strings are written out as Moss geometry strings. This is the only way that full horizontal and vertical geometry can be transferred to Moss.</i>			
Insert DELETE/CREATE	tick box	tick	
<i>if ticked, the genio commands DELETE and CREATE are written at the top of the file to correctly define the moss models for the data.</i>			
Write	button		
<i>write out in genio format the data in the model/view given in the model/view field, to the file given in the file field. If the file already exist, the data will be appended to the file.</i>			

Eagle Output

Position of option on menu: File I/O =>Data output =>Old =>Eagle

Eagle is a 3D CAD package used throughout Australia, Asia and Europe.

Using the **Eagle output** option, **12d Model** produces an Eagle command file which is used by Eagle to create an Eagle model. Since Eagle supports 3D faces, the triangles created in **12d Model** can be transferred to Eagle for use in shaded models and walk-throughs.

Instead of colours, Eagle uses pens, dash styles, line thicknesses and frags. To allow the user to map **12d Model** colours to appropriate Eagle settings, an **Eagle map file** setting out the **12d Model** and Eagle relationships can be provided.

The eagle map file is a user created file consisting of a list of **12d Model** colours and the Eagle pen, dash style, pen thickness and frag to be used for the colour.

The map file is set out with one **12d Model** colour per line. The line begins with the **12d Model** colour followed by the Eagle pen number, dash style, thickness and frag to be used for the **12d Model** colour. Each item is separated by one or more spaces.

For example, if the **12d Model** colour **red** is to be mapped to Eagle pen 3, dash style 4, thickness 2 and frag 1, then the line in the eagle map file would be

red 3 4 2 1

If a map file is used, as each string is written out, the map file is searched sequentially until a colour match is made.

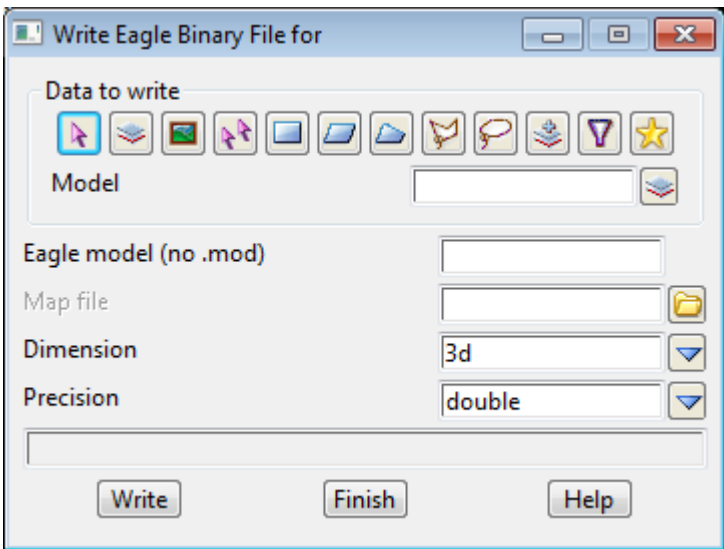

If no match is found, the colour of the string is used as a pen number and default values used for dash, thickness and frag.

Comments can be included in the map file by preceding the comment with a double forward slash (i.e. //). Anything on the line following the // will be ignored.

For example,

// 12d colour	pen	dash	thick	frag
red	3	4	2	1
green	4	1	1	2

On selecting the **Eagle** option, the **Write Eagle Command File for** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data is to be written out to a file.</i>			
Eagle Command File	input		*.cmd files
<i>name of the Eagle command file to write the model/view out to. If the file already exists, the data will be appended to the bottom of it. To be consistent with the Eagle file naming convention, the file name should end in .cmd</i>			
Eagle model	input		
<i>name of the Eagle model to be used for the data. Only the characters A-Z, a-z, 0-9 and - are allowed in an Eagle model name. Do not include a .mod in the name.</i>			
Map file	input		*.emf files
<i>if non-blank, the name of the map file to be used for all string colours. If blank, no map file is used.</i>			
Write	button		
<i>write out the data from the model/view given in the model/view field to the file given in the eagle command file field. The Eagle model has the name given in the Eagle model field. If the file already exists, the data is appended to the file.</i>			

Eagle Binary Output

Position of option on menu: File I/O =>Data output =>Old =>Eagle Binary

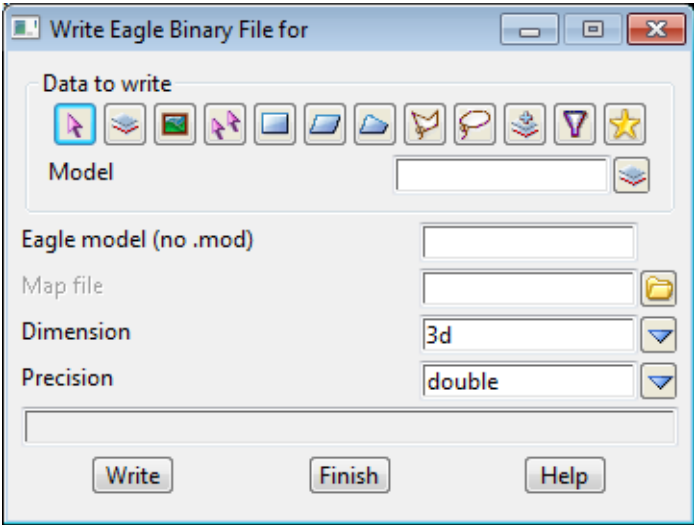

Eagle binary i/o is a separate chargeable module.

Using the Eagle binary output option, 12d Model produces Eagle binary models. Since Eagle supports 3D faces, the triangles created in 12d Model can be transferred to Eagle for use in shaded models and walk-throughs.

Since Eagle uses pens, dash styles, line thicknesses and frags rather than colours, an eagle map file is used to define the relationships between 12d Model colours and Eagle pens, dash styles, thickness and frags. The map file is the same as described in the eagle output option.

The 12d Model string name is written to the second attribute of the corresponding eagle item.

On selecting the Eagle binary option, the Write Eagle Binary File for panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input		
--------------------	-------	--	--

source of data is to be written out to a file.

Eagle model	input		
--------------------	-------	--	--

stem of the name of the eagle model to write the model/view data out to. Because an eagle model has a maximum size, more than one model may be created. The eagle model names will have a sequence number appended to the name stem given in the eagle model field.

Map file	input		*.emf files
-----------------	-------	--	-------------

if non-blank, the name of the map file to be used for all string colours. If blank, no map file is used.

Dimension	input	3d	2d/3d
------------------	-------	----	-------

if 3d, strings will be written out as three dimensional eagle lines. The alignment strings and arcs will be approximated by short lines.

If 2d, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as eagle plan arcs.

Precision input double single/double
the precision of the eagle models.

Write button
write out the data from the model/view given in the Model/view field to the file given in the eagle model field.

12 Digitizer

Position of menu: File I/O =>Digitizer

The **Digitizer** option is used with a digitizing table to create **12d** Model strings from existing maps or plans.

Contours (2d strings), feature strings (3d strings), spot heights (points strings), 4d strings, circles, arcs and text can all be digitized with this option.

The digitized data can be added to a new or existing **12d** Model project.

The digitizing process consists of a number of steps.

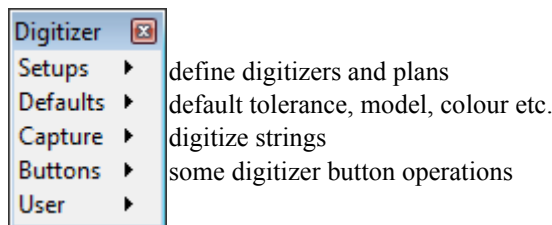

- providing a digitizer definition file
- selecting the type of digitizer to be used
- registering a new plan or map on the digitizer, or continuing with a previously registered plan (resuming).
- selecting a default digitizing tolerance, default model, colour and name for digitized strings.
- digitizing the information

These steps are described totally in the next five sections and are then summarized.

A summary of the step is given at the end of this chapter in the section [Summary](#).

The digitizer can be set up using WinTab which is preferred method, or by using a definition in the **12d** digitizer definitions file, digitize.4d. A quick description of the digitizer definition file is given in the section [Digitizer Definitions](#). The format for the digitizers_definitions file is given in the section [Digitizer Definitions File](#).

The **Digitizer** walk-right menu is laid out to reflect the standard sequence of digitizer operations.

For the option *Setups*, go to

Defaults

Capture

Buttons

[Setups](#)

[Defaults](#)

[Capture](#)

[Buttons](#)

Digitizer Definitions

Most digitizers now support the WinTab definition for communicating with Windows and that is the preferred method to be used with **12d** Model.

If the digitizer supports WinTab then the WinTab drivers need to be installed before the digitizer can be used by **12d** Model. The WinTab drivers are supplied with the digitizer, not by 12d Solutions.

Once the WinTab drivers are installed, no further information is required by **12d** Model and the

rest of this section can be ignored.

Unfortunately if WinTab is not supported, each brand of digitizer has its own method of communicating with a computer and a software package.

To allow for a variety of digitizers not supported by WinTab, 12d Solutions has its own ascii format for defining the important features of a particular digitizer. The digitizer definitions file is also used to tailor digitizer button usage at a particular site.

For example, the **digitizer file** defines which buttons on the digitizer puck are used to:

digitize new (add) points	add button
end the digitizing of a string	end button
turn tolerance on/off	tolerance button
delete the last digitized point	delete point button

When 12d Model starts up, it checks to see if an environment variable called DIGITIZERS_4D exists and if it does, then the file it points to is used to provide the definitions for the digitizers.

If the environment variable is not set, then 12d Model searches for a file called **digitize.4d** in the standard 12d Model search sequence for set up files.

Only digitizers that have been defined in the digitizers definitions file can be selected for use from within 12d Model.

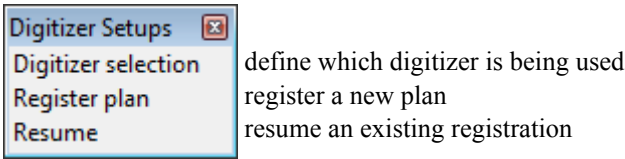

The format for the digitizers definitions file is given in the section [Digitizer Definitions File](#).

Setups

Position of menu: File I/O =>Digitizer =>Setups

The **setups** menu contains options to select the digitizer to be used, register the co-ordinate system on a new plan or map sheet and for resuming the registration for a plan or map sheet already registered.

The **setups** walk-right menu is

Each options will now be described in detail.

Digitizer Selection

Position of option on menu: File I/O=>Digitizer=>Setups=>Digitizer selection

On selecting the **digitizer selection** option, the **digitizer selection** panel is displayed.

This panel displays the current digitizer selected and allows a different one to be selected from those defined in the digitizers definitions file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use Wintab drive	tick box		
<i>if ticked then user WinTab drivers.</i> <i>If not ticked, then the Digitizer field is enabled and must have a digitizer selected.</i>			
Digitizer	input	current digitizer	available digitizers
<i>the name of the current digitizer is displayed in this field. The current digitizer is changed by selecting a different name from the pop-up for the digitizer field and then selecting the Set button.</i> <i>This field is only used if Use WinTab driver is not ticked.</i>			
Set	button		
<i>if Use Wintab driver is set to tick and the Wintab drivers exist, then the 'Wintab Monitor' panel is placed on the screen. The WinTab Monitor displays the digitizer co-ordinates and the digitizer button being used. The information describing the use of the digitizer buttons is written to the Output Window (see below). Do not close the Wintab Monitor panel or the digitizer will stop being read.</i>			

*If Use Wintab driver is set to tick and the Wintab drivers **don't** exist, an error message is displayed.*

If Use Wintab driver is not set to tick, then after selecting this button, the digitizer given in the digitizer field will be used as the current digitizer.

Typical Message to Output Window if WinTab Drivers are Installed

Register Plan

Position of option on menu: File I/O=>Digitizer=>Setups=>Register plan

Before the information on a plan or map can be digitized, the relationship between the co-ordinate system of the plan and the digitizer must be determined.

In 12d Model, this relationship is given by specifying the plan co-ordinates and then the position on the digitizer of three or more points. These special points are known as control points.

The affine transformation for the control points is then calculated and if accepted by the user, is used to convert digitizer co-ordinates to plan co-ordinates.

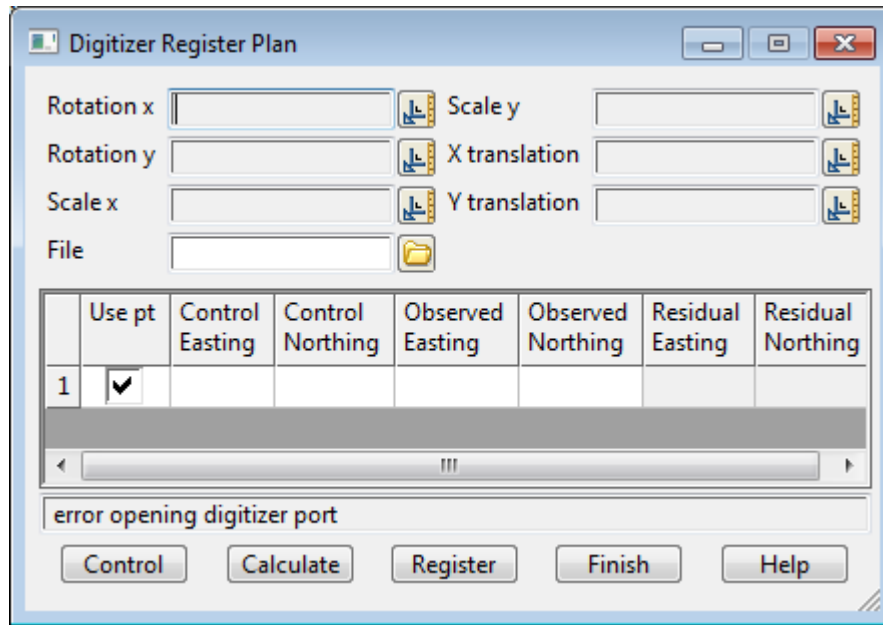

This process is called "registering a plan".

Once a plan has been registered, the information is saved to a file. This file can be used in the **resume plan** option to register the plan without having to re-enter the control points.

Warning

If the plan is moved on the digitizer, it must be re-registered since the current affine transformation will be invalid.

After selecting the **register plan** option, the **digitizer register plan** panel is displayed.

The main purpose of this panel is to display and register the affine transformation parameters. The fields and buttons used in the **digitizer register plan** panel will be discussed after the selection of the control points.

After selecting the **register plan** option, the **digitizer register plan** panel is placed on the screen and the option sits waiting for the user to enter the information for each control point.

This is achieved by

- selecting the control point with the mouse if it already exists in **12d Model**, or by typing in its plan co-ordinates (easting northing)

and then

- selecting the control point's position on the digitizer tablet using the digitizers **add point** button. Alternatively, if the control points already exist in **12d Model**, they can be selected rather than using typed input

This process is repeated for each control point and is terminated by selecting **cancel** from the **pick ops** pop-up menu instead of selecting a new control point.

The **calculate** button calculates the affine transformation for all the control points in the grid with the **Use pt** ticked on.

The affine parameters are

- the rotation of the x axis of the plan co-ordinates with respect to the digitizer x axis
- the rotation of the y axis of the plan co-ordinates with respect to the digitizer y axis
- the x and y scale factors for the plan co-ordinates with respect to the digitizer coordinates
- the x and y translations for the plan co-ordinates with respect to the digitizer coordinates

Once calculated, these values are displayed in the **digitizer register plan** panel.

If further control points are required, selecting the **control** button on the **digitizer register plan** panel will restart the control point picking mechanism. Each new control point will be added to the grid.

The new affine transformation can be calculated by selecting the **calculate** button on the **digitizer register plan** panel.

Finally, once the user is satisfied with the affine transformation, it can be **registered** and stored in

an ascii file for future use by entering a filename into the file field of the **digitizer register plan** panel and then selecting the **register** button from that panel.

Summarising, the fields and buttons in the **digitizer register plan** panel have the following functions

Field Description	Type	Defaults	Pop-Up
Rotation x/y	output		
<i>the rotation of the x/y axis of the plan co-ordinates with respect to the digitizer x/y axis</i>			
Scale x/y	output		
<i>the x/y scale factor for the plan co-ordinates with respect to the digitizer coordinates</i>			
Translation x/y	output		
<i>the x/y translation for the plan co-ordinates with respect to the digitizer coordinates</i>			
File	input	*.aff	
<i>the name of the file to record the affine parameters.</i>			
Control	button		
<i>restarts the selection process for choosing more control points.</i>			
Calculate	button		
<i>calculates the affine parameters based on the control point selection.</i>			
Register	button		
<i>write the affine transformation to the file given in the file field and register the affine transformation as the current one to be used for the digitising session.</i>			
Finish	button		
<i>remove the panel from the screen.</i>			

Warning

The affine transformation must be registered using the **register** button before the **finish** button is selected or it will be lost.

Resume Plan

Position of option on menu: File I/O=>Digitizer=>Setups=>Resume

When digitising a large plan, it is often necessary to spread the digitising over more than one session in 12d Model.

If the plan has not been moved on the digitizer since it was registered, the affine transformation can be restored with the **resume plan** option rather than having to register the plan again.

On selecting the **resume plan** option, the **digitizer resume** panel is displayed.

To resume digitizing with an affine transformation recorded during an earlier registration session, simply enter the name of the affine file into the file field on the **digitizer resume** panel and then select the **resume** button.

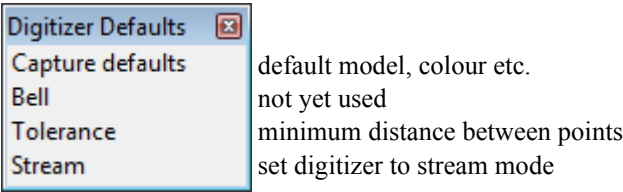

Warning

If the plan is moved on the digitizer, it must be re-registered since the current affine transformation will be invalid.

Defaults

Position of menu: File I/O=>Digitizer=>Deafults

The **defaults** menu sets default model, colour etc. and tolerance which are used when digitizing.
The **defaults** walk-right menu is

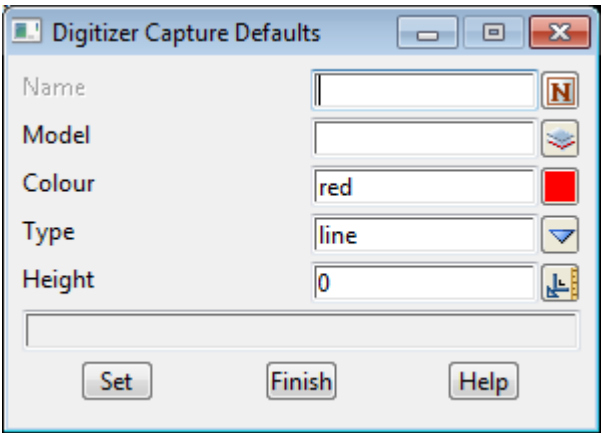

Each options will now be described.

Capture Defaults

Position of option on menu: File I/O=>Digitizer=>Deafults=>Capture defaults

For any new string a name, model, colour, breakline type and default height are needed. When digitizing, the same values are often required for a large number of the strings. The **capture defaults** panel is used to set default values for digitized strings.
On selecting the **capture defaults** option, the **digitizer capture defaults** panel is displayed.

In the digitizing **capture** options, whenever a new string is selected, the values for name, model, colour, breakline type and height are taken from the **digitizer capture defaults** panel.

Bell

Not yet implemented

Tolerance

Position of option on menu: File I/O=>Digitizer=>Deafults=>Bell

When points are being digitized, a new point is often only required when it is a certain distance from the previous point on the digitizer. This is especially important for steam digitizing when hundreds of points per second may be captured.

The **tolerance** option allows the user to specify the minimum plan distance (in millimetres) between successive digitized points in a string.

On selecting the **tolerance** option, the **digitizer tolerance defaults** panel is displayed.

The fields and buttons used in this panel have the following meanings.

Field Description	Type	Defaults	Pop-Up
Use tolerance	tick box	tick	
<i>if tick, a new point taken from the digitizer is only accepted if it is at least the distance given in the distance field away from the previous recorded point in the string.</i>			
Distance (mm)	input	2.5	
<i>the minimum separation distance, in millimetres, between successive digitized points in a string.</i>			
Set	button		
<i>set the use tolerance and distance values.</i>			

Stream

Position of option on menu: File I/O=>Digitizer=>Deafults=>Stream

Not yet documented.

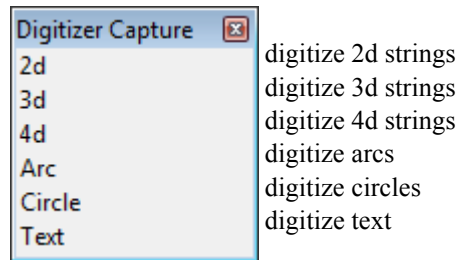

Capture

Position of menu: File I/O=>Digitizer=>Capture

The **capture** menu is for digitizing strings into **12d** Model.

The **capture** walk-right menu is

The first time any of the option from this menu is selected, the **capture** panel is placed on the screen.

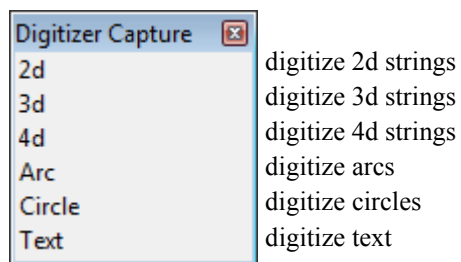

This panel is used to display the transformed co-ordinates for each digitized point that passes the tolerance test, and some special digitizer messages (for example, tolerance on/off).

To **change** the type of string being captured, simply select the new type from the **digitize capture** panel. This is normally only done at the end of capturing a string, not part way through.

To **terminate the digitizing session**, select **finish** on the **capture** panel.

Each of the methods for capturing data available in the **digitizer capture** menu will now be described.

For the option **2d**, go to [2d](#)
3d [3d](#)
4d [4d](#)
Arc [Arc](#)
Circle [Circle](#)
Text [Text](#)

2d

Position of option on menu: File I/O=>Digitizer=>Capture=>2d

This option is used to digitize 2d strings.

On selecting the 2d option, the **Digitize 2d string** panel is displayed.

The fields and buttons in the **digitize 2d string** panel have the following meanings.

Field	Description	Type	Defaults	Pop-Up
Name		input	name of new string	name from capture defaults
Model	<i>model for the new string</i>	input	capture defaults model	available models
Colour	<i>colour of the new string</i>	input	capture def colour	available colours
Type	<i>breakline type of the new string.</i>	input	capture def type	point, line
Height	<i>height of the 2d string.</i>	input	capture def height	

If the **digitize 2d string** panel is created by the 2d option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

Any of the values in the **digitize 2d string** can be modified before digitizing the 2d string begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are then displayed in the **capture** panel and the **digitize 2d string** panel removed from the screen.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

The 2d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 2d string** panel is again placed on the screen with the filled values the same as the 2d string just digitized.

The digitizing process is repeated for the new 2d string.

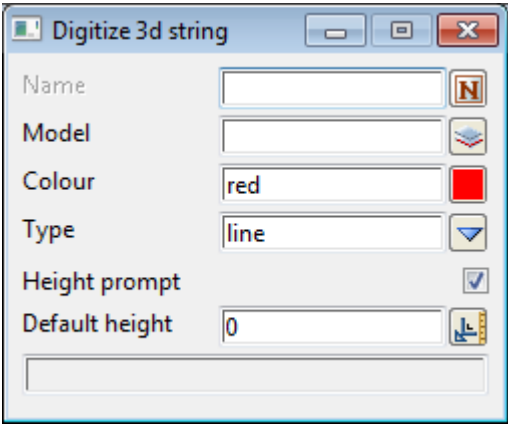

3d

Position of option on menu: File I/O=>Digitizer=>Capture=>3d

This option is used to digitize 3d strings.

Digitizing 3d strings is similar to 2d strings except that different z-values can exist at each of the digitized points.

On selecting the 3d option, the **Digitize 3d string** panel is displayed.

The fields and buttons in the **digitize 3d string** panel are similar to the **digitize 2d string** panel except for the fields

Field Description	Type	Defaults	Pop-Up
Height prompt	tick box	tick	

*if **tick**, after each point is digitized, an enter height box is placed on the screen. The height of the digitized point is typed into the box.*

*If **not tick**, the default height is used as the z-value for the digitized point.*

Default height	input	capture default height
<i>height of the point if the height prompt is set to no.</i>		

If the **digitize 3d string** panel is created by the 3d option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 2d strings, any of the values in the **digitize 3d string** can be modified before digitizing begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize 3d string** panel removed from the screen.

If the height prompt field is set to **tick**, an enter height box is placed on the screen with the previous typed height in it. The height for the digitized point in typed into the box, terminated by a <return>. The enter height box then disappears.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

Again, if the height prompt is set to **yes**, the enter height box will appear after each digitized point.

The 3d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 3d string** panel is again placed on the screen with the field values the same as the 3d string just digitized.

The digitizing process is repeated for the new 3d string.

Warning

If stream digitizing is used for the 3d string, the height prompt should be set to **not tick**.

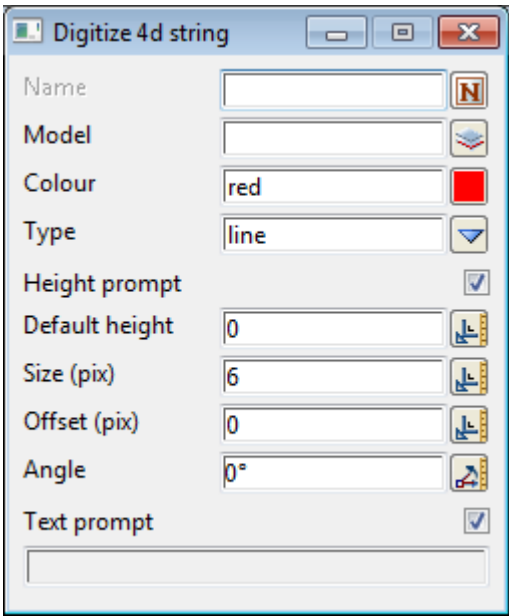

4d

Position of option on menu: File I/O=>Digitizer=>Capture=>4d

This option is used to digitize 4d strings.

Digitizing 4d strings is similar to 3d strings except that as well as a different z-value at each point, a text string also exits at each of the digitized points.

On selecting the 4d option, the **Digitize 4d string** panel is displayed.

The fields and buttons in the **digitize 4d string** panel are similar to the **digitize 3d string** panel except for the fields

Field Description	Type	Defaults	Pop-Up
Text prompt	input	yes	yes, no
<i>if tick, after each point is digitized, an enter text box is placed on the screen. The text for the digitized point is typed into the box.</i>			
<i>If not tick, no text is used at the digitized point.</i>			
Size (pix)	input	default text size	
<i>height (in pixels) of the text at each point.</i>			
Angle	input	0	
<i>angle of the text at each point.</i>			
Offset (pix)	input	0	
<i>offset (in pixels) of the text from the digitized point.</i>			

If the **digitize 4d string** panel is created by the 4d option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 3d strings, any of the values in the **digitize 4d string** can be modified before digitizing begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize 4d string** panel removed from the screen.

If the height prompt field is set to **tick**, an enter height box is placed on the screen with the previous typed height in it. The height for the digitized point is typed into the box, terminated by a <return>. The enter height box then disappears.

If the text prompt field is set to **tick**, an enter text box is placed on the screen. The text for the digitized point is typed into the box, terminated by a <return>. The enter text box then disappears.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

Again, the enter height and enter text boxes will appear after each digitized point if the height prompt and text prompts are set to **tick**.

The 4d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 4d string** panel is again placed on the screen with the values in the fields from the 4d string just digitized.

The digitizing process is repeated for the new 4d string.

Warning

If stream digitizing is used for the 4d string, the height prompt and text prompt should be set to **not tick**.

Arc

Position of option on menu: File I/O=>Digitizer=>Capture=>Arc

This option is used to digitize arcs by digitizing three points on the arc - the arc start point, a point on the arc and the arc end point.

On selecting the arc option, the **Digitize arc** panel is displayed.

The fields and buttons in the **digitize arc** panel are similar to the **digitize 3d string** panel except for the field

Field Description	Type	Defaults
Height	input	capture default height

height given to the two end points of the arc.

If the **digitize arc** panel is created by the arc option, the values in the name, model, colour and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 3d strings, any of the values in the **digitize arc** panel can be modified before digitizing an arc begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new arc.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize arc** panel removed from the screen.

Next a point on the arc between the arc end points is digitized followed by the arc end point.

After the end point is digitized, the arc is automatically created and the **digitize arc** panel again placed on the screen with the field values the same as the arc just digitized.

The digitizing process is repeated for the new arc.

Warning

Stream digitizing should not be used for arcs.

Circle

Position of option on menu: File I/O=>Digitizer=>Capture=>Circle

The **circle** option is used to digitize circles by digitizing the centre point and one point on the circle.

On selecting the **circle** option, the **Digitize circle** panel is displayed.

The fields and buttons in the **digitize circle** panel are the same as the **digitize arc** panel.

If the **digitize circle** panel is created by the **circle** option, the values in the name, model, colour and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing arcs, any of the values in the **digitize circle** panel can be modified before digitizing of the circle begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the circle point of the new circle.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize circle** panel removed from the screen.

Next a point on the circle is digitized. The circle is then fully defined and automatically created.

The **digitize circle** panel is again placed on the screen with the field values the same as the circle just digitized.

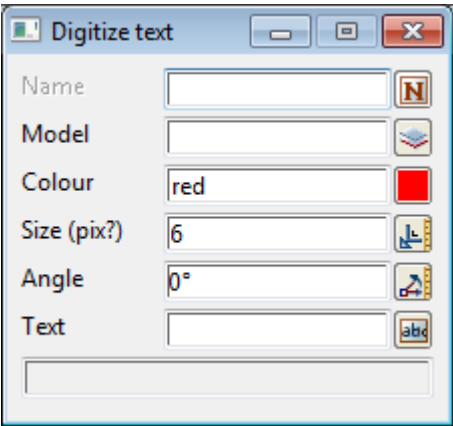

The digitizing process is repeated for the new circle.

Warning

Stream digitizing should **not** be used for circles.

Text

Position of option on menu: File I/O=>Digitizer=>Capture=>Text
Not yet implemented

Buttons

Position of menu: File I/O=>Digitizer=>Buttons

The various options on the **Buttons** menu can be used instead of pushing buttons on the digitizer puck.

The main use for this is when the digitizer puck has only a small number of buttons.

The **Buttons** walk-right menu is

Digitizer Buttons	
Delete point	delete last point
End	end string
Stream toggle	turn stream on/off
Tolerance toggle	turn tolerance on/off
Open	open string
Close	close string
Clear	delete all points in string

Summary

The steps for digitizing are

1. Point to digitizers definitions file

The file containing the definitions of the digitizers is created and either called **digitize.4d**, or the environment variable **DIGITIZERS_4D** is set to point to the file.

2. Select a digitizer

Use the menu item **File I/O =>Digitizer=> Setups=> Digitizer selection**

3. Register a new plan or resume an old plan

To register a new plan, use menu item **File I/O =>Digitizer=> Setups=> Register plan**

After selecting the option, the software is waiting for the user to give the co-ordinates and position of control points on the digitizer.

Control Point Loop

(a) type in easting northing of the control point

(b) pick point on the digitizer

The loop is terminated by getting up the **pick ops** menu with the mouse and picking **Cancel**

Then select **calculate** from the **digitizer control point table** panel and check the calculated affine parameters in the **digitizer register plan** panel.

Once happy with the affine parameters, save them away by typing a filename (ending in **.aff**) into the file field of the **digitizer register plan** panel and then select the **register** button.

Alternatively, to resume digitizing a previously registered plan that has not moved on the digitizing tablet, use menu item **File I/O =>Digitizer =>Setups=> Resume plan**

Type the affine file name into the file field of the **digitizer resume** panel and select **resume**.

4. Set the capture defaults

Menu items under **Digitizer =>Defaults**

5. Digitize a bounding polygon for the area to be digitized

Use the menu item **Digitizer =>Capture =>2d**

This step is not strictly necessary, however, the polygon can be used to easily fit the digitized data onto a view.

6. Digitize the data

Use the menu items under **Digitizer =>Capture**

Digitizer Definitions File

Unfortunately, each brand of Digitizer has its own method of communicating with a computer and a software package.

To allow for a variety of digitizers, 4D Solutions has its own ascii format for defining the important features of a particular digitizer.

When 12d Model starts up, it checks to see if an environment variable called DIGITIZERS_4D exists and if it does, then the file it points to is used to provide the definitions for the digitizers.

DIGITIZERS_4D filename

If the environment variable is not set, then 12d Model searches for a file called **digitize.4d** in the standard 12d Model search sequence for set up files.

Only digitizers that have been defined in the digitizer definitions file can be selected for use from within 12d Model.

The digitizers definition file format is a simple ascii format and consists of one or more digitizer definitions. Each digitizer definition in the file begins with the key word **digitizer** followed by the digitizer name and then appropriate digitizer commands enclosed within curly braces { }.

Available Digitizer Commands

Commands to define communication with the digitizer:

port	text
baud	300 600 1200 2400 4800 9600 19200 38400
charbits	5 6 7 8
parity	none even odd
stopbits	1 2

Commands to define the size of the digitizing area:

xdimension	integer	// length of digitizer area in mm
ydimension	integer	// height of digitizer area in mm
resolution	real	// resolution in mm

Commands to define contents of the text string returned when digitizing:

stringlength	integer	// length of the text string returned
buttonstart	integer	// position in text for button id
buttonend	integer	
xstart	integer	// position for x value
xend	integer	
ystart	integer	// position for y value
yend	integer	

Command to define sequences to send to digitizer:

startup	text	// digitizer start up sequence
finishup	text	// digitizer finish up sequence
pointmode	text	// text to put digitizer into point mode
streammode	text	// text to put into stream mode (track mode)

Commands to define the meaning of the button values returned from the digitizer:

These commands may occur more than once since some digitizers have more than one return

value for the same thing.

addpoint	text	// digitize a point
end	text	// end the string being digitized
delpoint	text	// delete the last point digitized
toggletol	text	// toggle tolerance
togglestream	text	// toggle stream mode
clearstr	text	// clear all points in the current string
openstr	text	// open the current string
closestr	text	// closes the current string

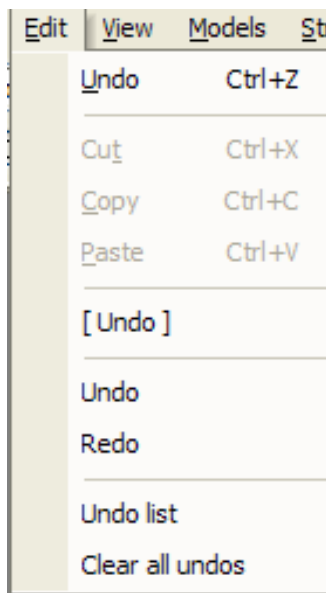

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes “ ”.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

13 Edit

The **Edit** menu contains the **Undo** and **Redo** options.

Infinite **Undo** and **Redo** facilities have been implemented for many of the **12d** Model options. However, because much of the power of **12d** Model comes from being able to leave options hanging and editing more than one string at a time, this made the standard concept of *Undo/Redo* of limited benefit to **12d** Model users.

Consequently, the following methodology has been adopted for **Undo** and **Redo** in **12d** Model:

Independent undo and redo lists are maintained for each string being edited and these list are cleared once the editor is left.

There is also a main undo/redo list which is used for all other options that can be undone. The main undo/redo lists are cleared when the **12d** Model session is exited.

Please continue to the next section [Undo and Redo for Editors](#).

Undo and Redo for Editors

Each editor contains its own **Undo/Redo** option on its **nd Edit** menu and whilst a string is being edited, the editor maintains its own undo/redo lists.

For example, for a 2d string, the **Undo/Redo** option is just above the **Quit** option.

As each edit is made to the string, the state of the string before the edit is added to the top of the string's **undo** list and the **redo** list is emptied.

If **undo** is selected from the **nd edit** menu, the last edit operation for that string will be **undone** and the undone operation added to the top of the string's **redo** list.

If another **undo** is selected before another edit is made to the string, what is now was last operation on the string will be **undone** (is was the second last operation before the previous undo) and the undone operation added to the top of the string's **redo** list.

If **redo** is selected from the **nd edit** menu, then the top operation on the **redo** list is redone, and the state of the string before the redo is added to the top of the undo list.

Hence edits for he string can be **undone** and **redone** whilst in the edit session for the string.

When the edit session is completed by selecting either **quite** or **finish** from the **nd edit** menu, the undo and redo lists for the edit session are deleted and the operations for the edit session can no longer be undone or redone.

Note

If more than one string is being edited at the same time, each string editor maintains its own undo/redo lists so that the undo/redo operations for the different strings do not get intertwined.

Hence if **undo** or **redo** is selected from a particular strings **nd edit** menu, the undo or redo applies **only** to the operations performed on that particular string, no matter what other **nd edit** options where performed on other strings.

Please continue to the next section [Undo and Redo for other Options](#).

Undo and Redo for other Options

As well as the undo/redo lists maintained by the string editors, there is another set of undo/redo list maintained for all other options that support undo and redo. These are called the **main undo** and **redo** lists.

For a description of the undo in **12d Model**, please go to the section [Edit](#).

The **undo** option which controls the main undo/redo lists, is the on the Edit menu from the main menu.

If **undo** is selected from the **undo** menu, the last undoable option performed (apart from editor operation on strings) will be **undone** and the undone operation added to the top of the main **redo** list.

If another **undo** is selected before another undoable option is performed, what is now was last operation will be **undone** (is was the second last operation before the previous undo) and the undone operation added to the top of the main **redo** list.

If **redo** is selected from the **undo** menu, then the top operation on the main **redo** list is redone, and the state before the redo is added to the top of the undo list.

Hence many operations can be **undone** and **redone**.

When the **12d** Model session is completed by selecting either **exit** from the **12d Model** menu, the undo and redo lists for the session are deleted and the operations for the session can no longer be undone or redone.

For the option <i>Undo</i> , go to the section	Undo.
<i>Redo</i>	Redo
<i>Undo list</i>	Undo List
<i>Clear all undos</i>	Clear all Undos

For some restrictions on the Undo/Redos, please continue to the section [Some Restrictions on Undo and Redo.](#)

Undo

If **undo** is selected from the **undo** menu, the **undo** panel showing the last operation to *undo* is displayed.

For some restrictions on the Undo/Redos, please continue to the section [Some Restrictions on Undo and Redo.](#)

Redo

If **redo** is selected from the **undo** menu, the **redo** panel showing the last operation to *redo* is

displayed.

For some restrictions on the Undo/Redos, please continue to the section [Some Restrictions on Undo and Redo](#).

Undo List

If **undo list** is selected from the **undo** menu, a list of all the items on the undo list is displayed in the **undo list** panel.

Clear all Undos

Selecting **clear all undo** from the **undo** menu will bring up a clear all undo's/redo's **yes-no** panel.

If **yes** is selected, the main undo and redo lists will be cleared.

Some Restrictions on Undo and Redo

Undo and Redo are available for most of the **Strings** options and most of the **Utilities** options.

Undo is available for all **File=>Input** options but there are no Redos for these Undos.

Undo is available for all **Utilities=>Global** options that use the **Output** option with the Mode set to one of the three copy modes. There are no Redos with these Undos.

There are no Undos for **Models=>Delete** and **Models=>Clean**.

14 Models

Position of menu: Model

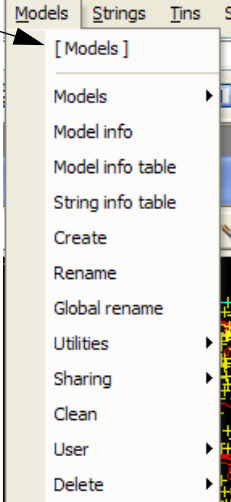

In 12d Model, models contain all the terrain and design information in the form of strings and tins.

The **Models** menu contains the options needed to create new models, rename models, report, clean models and delete models from the project.

The **models** walk-right menu is

on Main menu

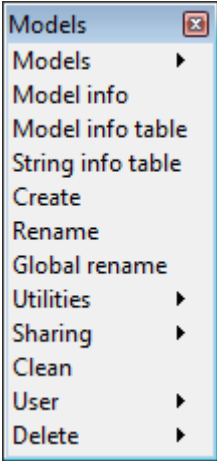

create floating

Models

Position of menu: **Model =>Models**

The **Models** walk-right menu provides options to list all the models in the project, and list all the models in the project area but not added to the project (removed models).

If a model is selected from the project model list, then it is automatically loaded into the **Model Information** panel.

The **Models** walk-right menu is

For Project models go to
Removed models

[Project Models](#)
[Removed Models](#)

Project Models

Position of option on menu: **Model =>Models =>Project models**

The **project models** walk-right menu provides a list of all the models in the project and if a model name is selected from the list, a model information panel is fired up with the selected model name already in the model field.

Removed Models

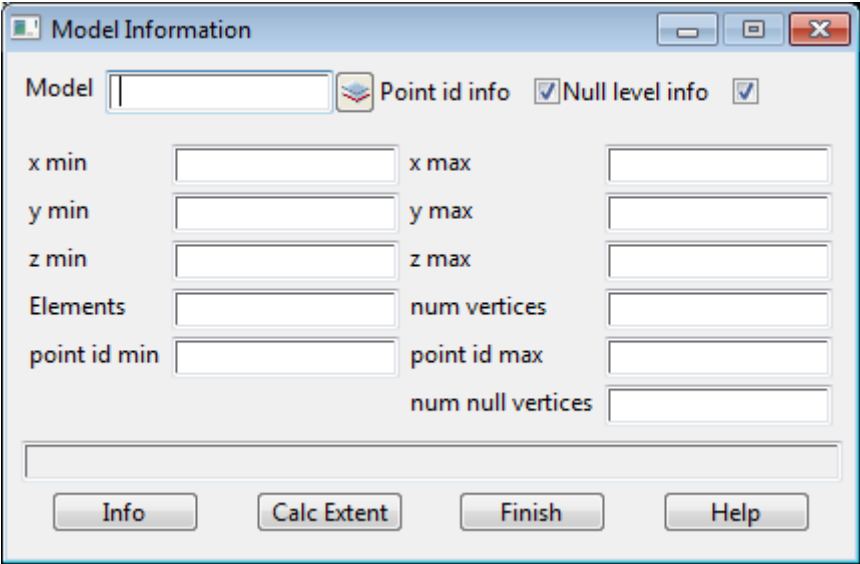

Position of option on menu: **Model =>Models =>Removed Models**

The **removed models** walk-right menu provides a list of all the models in the project area that are not in the project.

They would be mainly models that were in the project but have been removed from the project but not deleted from the disk.

Model Information

Position of option on menu: Model=>Model Info
Selecting Model info fires up the Model Information panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models
<i>input the name of the model to get information about</i>			
xmin/ymin/zmin, xmax/ymax/zmax	output		
<i>returns the model limits</i>			
point id min/max	output		
<i>minimum/maximum integer point id in the model</i>			
Elements	output		
<i>returns the number of elements in the model</i>			
num vertices	output		
returns the number of vertices in the model			
num null vertices	output		
returns the number of null vertices in the model			
Info	button		
<i>get the information for the model given in the Model field.</i>			
Calc Extent	button		
<i>recalculate the x, y, z bounding box for the model given in the Model field.</i>			

How to Use the Panel

The model information for the model given in the model field is retrieved and placed in the appropriate panel fields when the model name is entered into the model field from the pop-ups, or a <return> is entered after entering the model name into the model field, or on selecting the **Info** button.

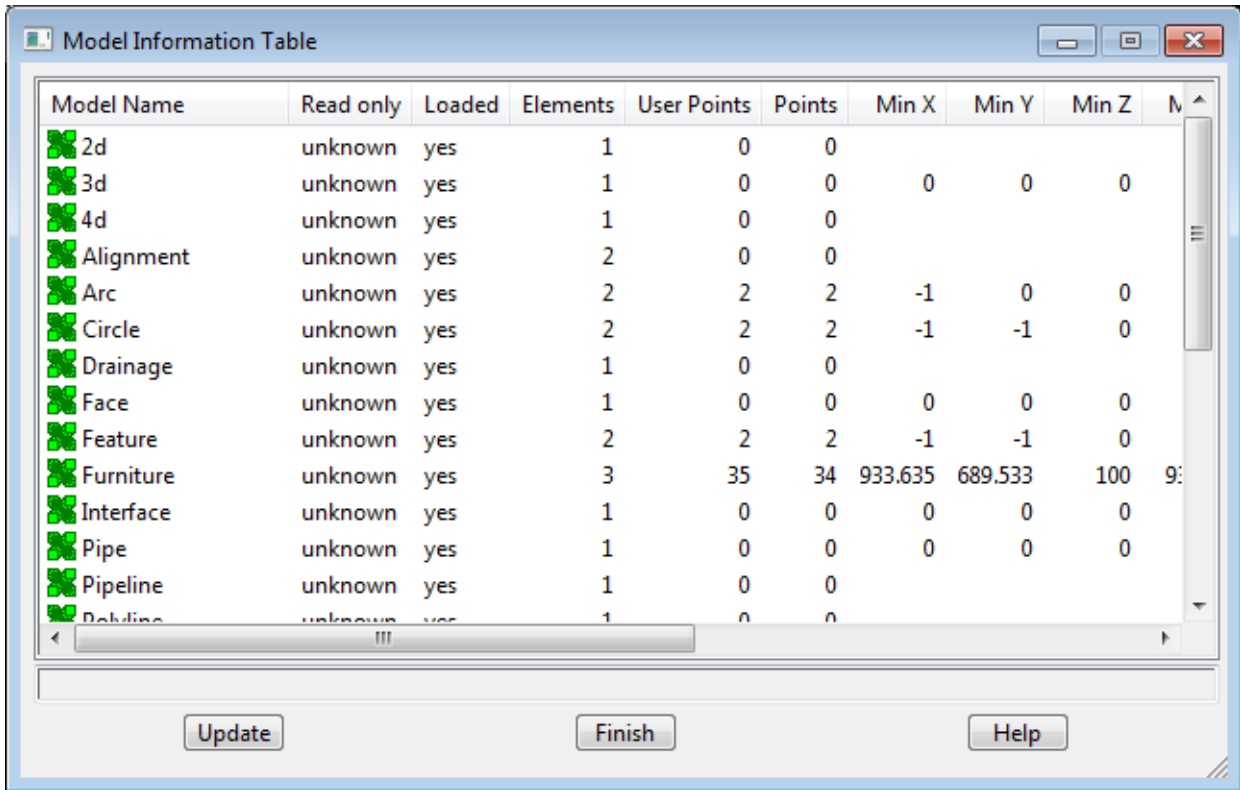

Model Information Table

Position of option on menu: Model =>Model Info Table

The **Model info table** option displays the minimum and maximum x, y and z values for every model in the project in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the **sort** menu on the column header fields.

Selecting **Model info table** fires up the **Model Information Table** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	column		sort menu

all the models in the project are listed in the model column.

Read only	column		sort menu
------------------	--------	--	-----------

Loaded	column		sort menu
---------------	--------	--	-----------

*if no, in this current opening of the project, the model has not yet been fully loaded into **12d Model**.*

Min X, Min Y, Min Z	columns		sort menu
Max X, Max Y, Max Z			

the minimum/maximum values for the model are displayed in the columns

Created/Updated	columns	dates
------------------------	---------	-------

date the model was first created/updated

Update	button
---------------	--------

recalculate the minimum/maximum information in the table.

Notes

- 1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
- 2. The grid can be sorted by any of the columns.

String Information Table

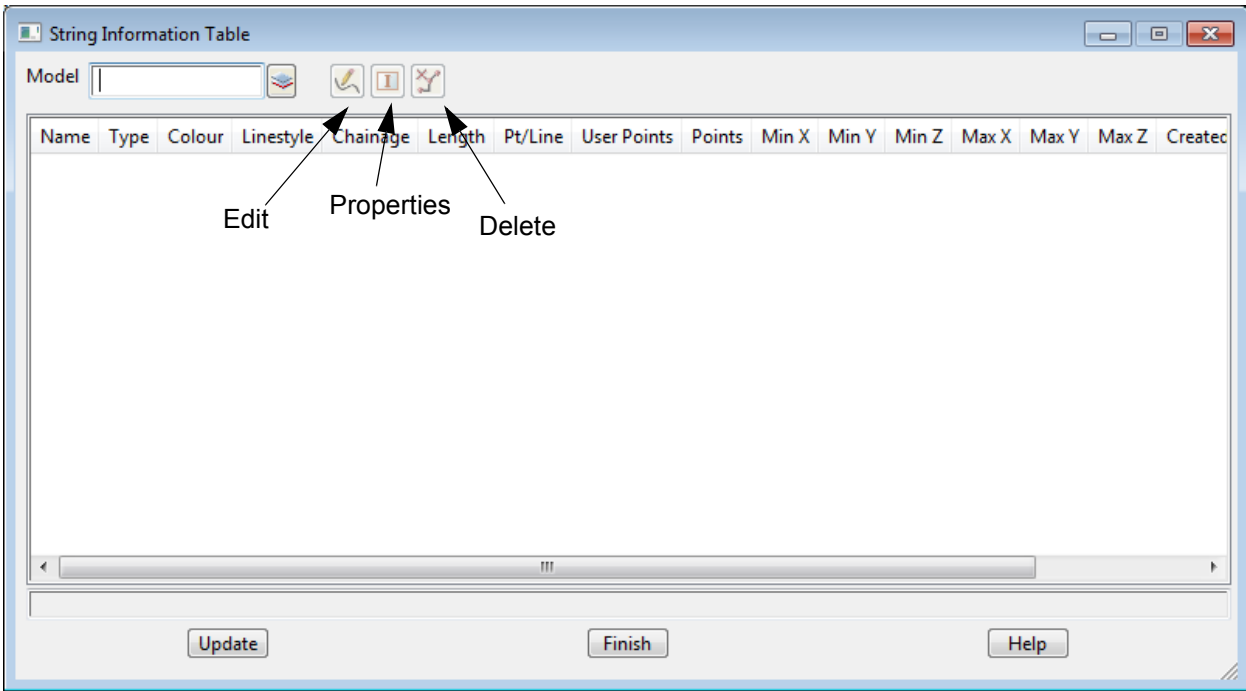

Position of option on menu: **Model =>String info table**

The **String info table** option displays the minimum and maximum x, y and z values for every string in a given model in one scrolling table.

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the **sort** menu on the column header fields.

Selecting **String info table** fires up the **String Information Table** panel.

The greyed out icons **Edit**, **Properties**, **Delete** only appear when a model has been selected and a row of the table selected.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	Model box		available models
<i>give the name of the model to calculate the minimum/maximum string information for the table.</i>			
Name	column		sort menu
<i>all the strings in the selected model are listed in the name column.</i>			
Type, Colour, Linestyle	column		sort menu
<i>type, colour and linestyle of the string</i>			
Chainage	column		sort menu
<i>start chainage of the string</i>			
Length	column		sort menu
<i>2d length of the string</i>			
Pt/Line	column		sort menu
<i>point/line breakline type for the string</i>			
Min X, Min Y, Min Z	columns		sort menu

Max X, Max Y, Max Z

the minimum/maximum values for each string in the model are displayed in the columns

Created/Updated columns dates

date the string was first created/updated

Update button

recalculate the minimum/maximum information in the table.

When data has been read in for a model, the three icons, **Edit**, **Properties**, **Delete** appear

After clicking on a row in the table (and hence specifying a string), the specified string is highlighted on any plan views it is on, and the icons can be used to *edit* the string, bring up the string properties table or *delete* the string.

Notes

1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.

Create

Position of option on menu: Model =>Create

On selecting the Create option, the **Create Model, and/or View** panel is displayed. This panel can be used to create new models and add a model to a view.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		all models
<i>name of the model to be created and/or added to a model and/or view.</i>			
Add to view	view box		all views
<i>if non-blank, the name of the view to which the model given in the model-field will be added.</i>			
Create	button		
<i>If the model given in the Model field does not exist, it will be created.</i>			
<i>If the add to view field is non-blank, then the model given in the model field will be added to the view given in the add to view field.</i>			

Rename

Position of option on menu: Model =>Rename

On selecting the **rename** option, the **Model Rename** panel is displayed. This panel can be used to change the names of existing models

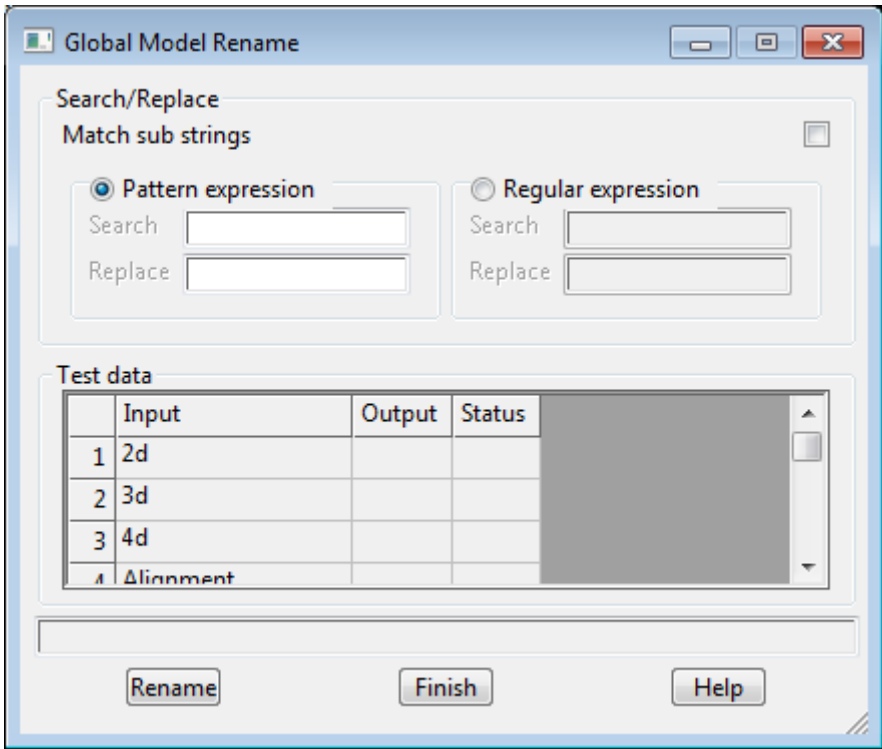

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Old model <i>name of the model to be renamed.</i>	model box		all models
New model <i>new name for the model</i>	model box		
Rename <i>Change the name of the model in the old model field to the name given in the new model field.</i>	button		

Global Rename

Position of option on menu: Model =>Global rename

Selecting the **Global rename**, displays the **Global Model Rename** panel. This panel is used to change the names of many existing models by matching according to a *pattern* expression or a *regular* expression.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Match sub strings tick box

*if **ticked**, the Search expression is used to match against part of each model name.
If **not ticked**, the Search expression is used to match against the entire model name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the Search and Replace fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the model names. For example " tin" will select all models with a name ending with " tin"*

Replace input

replacement for the search pattern found in the model name. For example, "tin " in the Replace field, takes the matched part of the model name and adds "tin " to the front of it.

Hence the Search pattern " tin" and Replace pattern "tin *" finds all models with names ending in " tin" and renames them with the name starting with "tin " (and the " tin" at the end of the name is dropped off).*

Regular expression radio button

*if set on, then **Regular** expressions given in the Search and Replace fields are used to modify model names.*

Search input

regular expression to search for in the model names.

Replace input

replacement for the search expression found in the model name.

Test data grid

The Test data grid shows the effect of the Search and Replace on all the model names in the project.

*The **Input** column shows the existing model name.*

*The **Output** column shows the name after applying the Search and Replace.*

*The **Status** column displays if their has been a **match** or **no match**.*

Rename button

change the name of all the models in the project according to the selected Search and Replace fields.

Utilities

Position of menu: **Model =>Utilities**

The **utilities** menu contains miscellaneous options involving models.

The **utilities** walk-right menu is

Model Utilities

Attributes

Add

Copy project models

Remove

Save

Project models utilities

User

create/edit attributes for models

add removed and other project models to project

copy model from another project

remove models from project

save models to disk

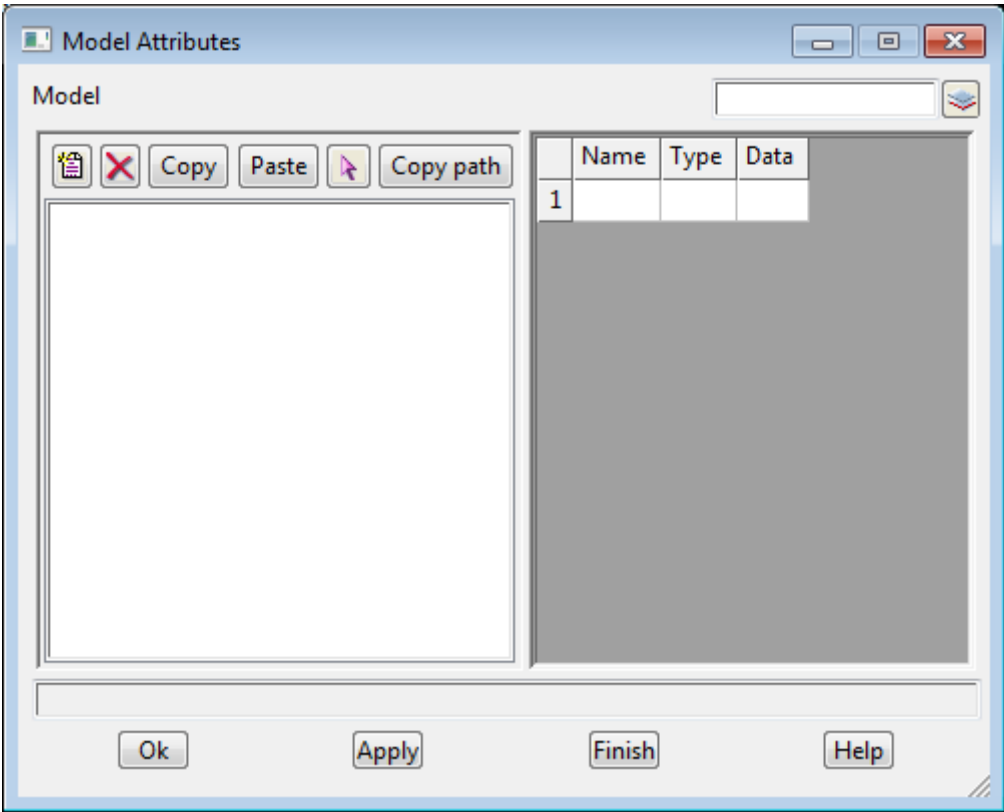

For the option <i>Attributes</i> , go to	Attributes
<i>Add</i>	Add
<i>Copy project models</i>	Copy Project Models
<i>Remove</i>	Remove
<i>Save</i>	Save
<i>Project model utilities</i>	Project Model Utilities

Attributes

Position of option on menu: **Model =>Utilities =>Attributes**

The **Attributes** options displays, creates and edits attributes for models.

On selecting **Attributes**, the **Model Attributes** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field	Description	Type	Defaults
Model	<i>model to create/edit attributes of</i>	model box	all available models
Name	<i>name of the attribute</i>		
Type	<i>type of attribute - integer, real or text</i>		integer, real, text
Data	<i>value for the attribute</i>		
OK	<i>set the attributes to the values in the panel and then exit the panel.</i>		button
Apply	<i>set the attributes to the values in the panel but don't exit the panel.</i>		button

Add

Position of menu: Model =>Utilities =>Add
Models can be added to the project and to views.
The **model adds** walk-right menu is

For the option Add to project go to [Add To Project](#)
Add all to project [Add All To Project](#)
Add to view [Add to View](#)

Add To Project

Position of option on menu: Model =>Utilities =>Add =>Add to project
The **add to project** option is used to add a removed model back into the project.
On selecting the **add to project** option, the **add model to the project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Removed model	input		removed models
<i>name of the model not in the project that is to be added to the project.</i>			
Add	button		
<i>add the model given in the removed model field to the working project.</i>			

Add All To Project

Position of option on menu: Model =>Utilities =>Add => Add all to Project
The **add all to project** option is used to add all the removed models back into the project.
On selecting the **add all to project** option, the **add all models to project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		
<i>after selecting this button, all removed models in the working project will be added to the project.</i>			

Add to View

Position of option on menu: Model =>Utilities =>Add =>Add to view

On selecting the add to view option, the add model to a view panel is displayed.

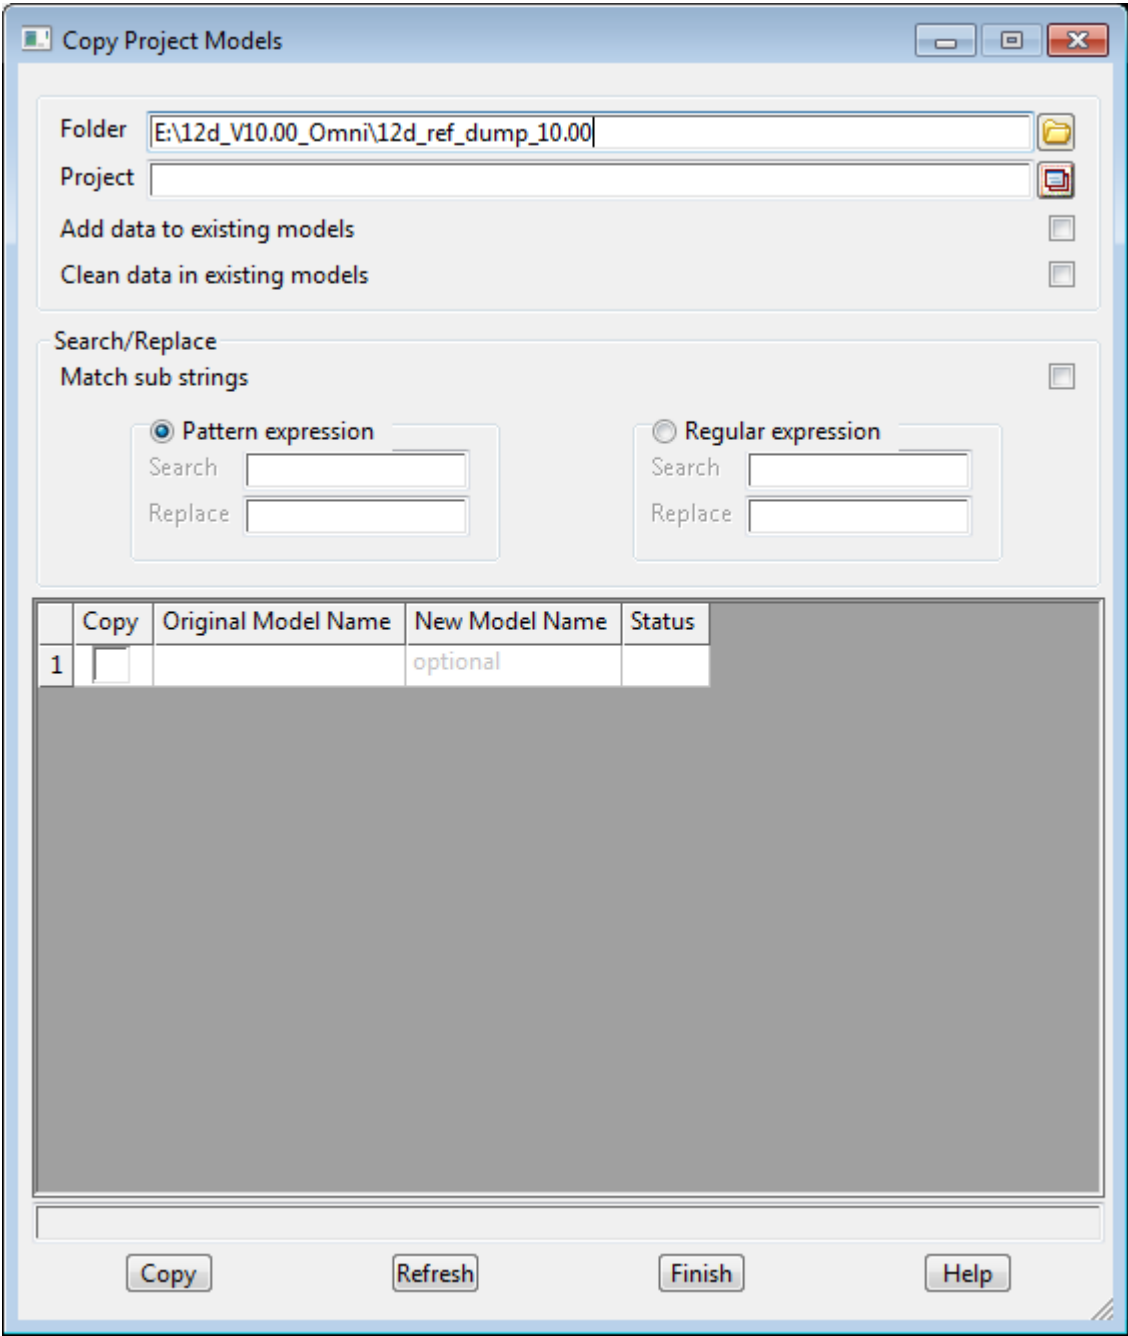

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>name of the model to be added to a view.</i>	input		available models
Add to view <i>name of the view to which the model given in the model field will be added.</i>	input		available views
Add <i>add the model given in the model field to the view given by the add to view field.</i>	button		

Copy Project Models

Position of option on menu: Model =>Utilities =>Copy Project Models

Selecting copy project models brings up the **Copy Project Models** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	input		Select folder panel
<i>name of the folder that the project to get the model from, is in.</i>			
Project	input		projects in the folder
<i>name of the project in the folder given in the folder field, that the model is to be copied from.</i>			
<i>Once a project is selected, all the models from that project will be listed in the Original Model Name</i>			

column.

Add data to existing models tick box

if ticked, if the model that the data is being read into already exists, the new data is copied into the model

Clean data in existing models tick box

if ticked, any existing data in the models being read into, is first cleaned out.

NOTE - If neither tick box is ticked then if the model already exists, **no data is copied**.

Search/Replace

section for renaming models from the selected project

Match sub strings tick box

*if **ticked**, the **Search** expression is used to match against part of each model name.
If **not ticked**, the **Search** expression is used to match against the entire model name.*

Pattern expression radio button

*if set on, then **Pattern** expressions given in the Search and Replace fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.*

Search input

pattern to search for in the model names. For example " tin" will select all models with a name ending with "tin "*

Replace input

replacement for the search pattern found in the model name. For example, "tin " takes the matched part of the model name and adds " tin " to the front of it.

Hence the Search pattern " tin" and Replace pattern "tin *" finds all models with names ending in " tin" and renames them with the name starting with "tin " (and the " tin" at the end of the name is dropped off).*

Regular expression radio button

*if set on, then **Regular** expressions given in the Search and Replace fields are used to modify model names.*

Search input

regular expression to search for in the model names.

Replace input

replacement for the search expression found in the model name.

Model Names Grid

*The models selected by the Search and Replace expressions are shown in the **Original Model Name** column. Note that if the model already exists in the current project, then the cell for that model in Original Model Name column will be displayed in yellow.*

Copy tick box

*if ticked, the model will be copied.
If not ticked, the model will not be copied*

*Clicking RB on **Copy** at the top of the column brings up a menu to **Clear** which turns all the ticks off.*

Original Model Name column

name of the existing model in the selected project

New Model Name column

*if **non-blank**, the new name to be given to the copied model.
If blank, the original model name is used.*

The New Model Names can be from applying the Search and Replace, or just typing them in.

Status column

displays if their has been a match or no match for the search/replace for renaming models

Copy button

copy to this project, the model given in the model field from the project given in the project field.

Refresh button

refresh the list of all models in the selected project

Remove

Position of menu: Model =>Utilities =>Remove

Models can be removed from the project and from views.

The **model removes** walk-right menu is

The options in the menu will now be described.

For the option Remove from project go to
Remove all from project
Remove from view

[Remove Model from Project](#)
[Remove All Models From Project](#)
[Remove From View](#)

Remove Model from Project

Position of option on menu: Model =>Utilities =>Remove =>Remove from project

On selecting the **remove from project** option, the **remove model from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models

name of the model to be remove from the working project.

Remove button

after selecting this button, the model given in the model field will be removed from the working project.

Remove All Models From Project

Position of option on menu: Model =>Utilities =>Remove =>Remove from all projects

On selecting the **remove all** option, the **remove all models from project** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Remove	button		
<i>after selecting this button, all models in the working project will be removed. Next, all views will be refreshed. Finally, unless an error occurs, the panel will be removed.</i>			

Remove From View

Position of option on menu: Model =>Utilities =>Remove =>Remove from view

On selecting the remove from view option, the **remove model from a view** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models
<i>name of the model to be removed from a view.</i>			
Remove from view	input		available views
<i>name of the view from which the model given in the model field will be removed.</i>			
Remove	button		
<i>remove the model given in the model field from the view given in the remove from view field.</i>			

Save

Position of menu: Model =>Utilities =>Save

Models can be saved on disk so that they can be used for future project work or in other projects.
The **model saves** walk-right menu is

The options in the menu will now be described.
For the option Save a model go to [Save a Model](#)
 Save all models [Save All Models](#)

Save a Model

Position of option on menu: Model =>Utilities =>Save =>Save a model

On selecting the **save a model** option, the **save model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>name of the model to be saved.</i>	input		available models
Save <i>after selecting this button, the model given in the model field will be saved to disk.</i>	button		

Save All Models

Position of option on menu: Model =>Utilities =>Save =>Save all models

On selecting the **save all models** option, the **save all models** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

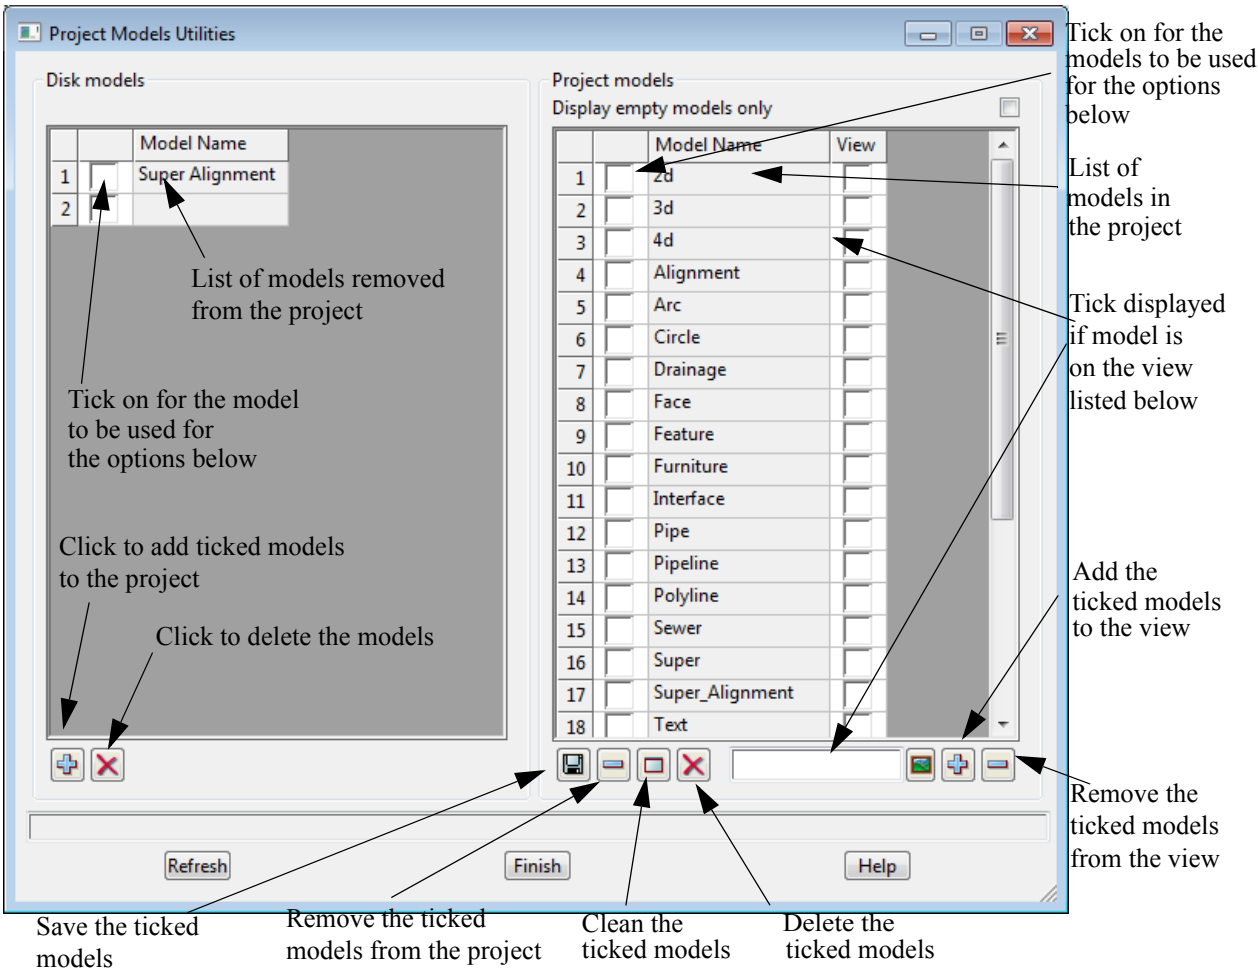

after selecting this button, all models in the working project that have been modified since they were last saved, will be saved to disk. Unless an error occurs, the panel will be removed after the saving is completed.

Project Model Utilities

Position of option on menu: Model =>Utilities =>Project model utilities

The **Project Model Utilities** panels can add/remove models from the project, clean and delete models, add/remove models from views.

On selecting **Project model utilities**, the **Project Model Utilities** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description Type DefaultsPop-Up

Disk Models section

options to add removed models to the project and delete removed models

Project Models section

options to save/remove/clean/delete models, add/remove models from a view

Display empty models only tick box

*if **ticked**, only empty models are listed.*

Refresh

button

refresh the model properties displayed in the panel

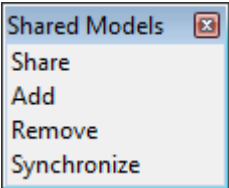

Sharing

Position of menu: **Model =>Sharing**

Sharing allows models from a project (the server project) to be added to other projects (client projects).

Before any models can be added to a client project, they must first be tagged in the server project as allowed to be shared.

The **Sharing** walk-right menu is

	<p>allow models in this project to used by other projects</p> <p>add a shared model from another project</p> <p>remove a model shared from another project</p>
-----------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------

- | | |
|-------------------------------------|-------------------------------------------|
| For the option <i>Share</i> , go to | Share Models |
| <i>Add</i> | Add Shared Models |
| <i>Remove</i> | Remove Shared Models |
| <i>Synchronize</i> | Synchronize Shared Models |

Share Models

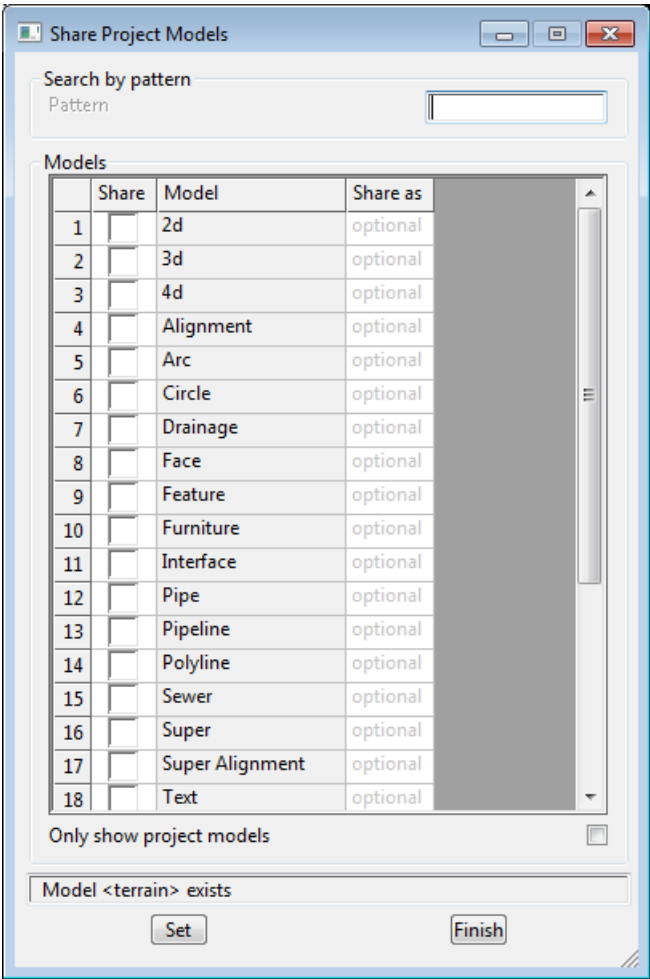

Position of option on menu: **Model =>Sharing =>Share**

Before models in a server project can be added to client projects, the models must be made available for sharing in the server project by using the **Share** option.

All models that have been made available for sharing are displayed in model lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0))

This option also can reverse the process. That is, remove the availability of a model for sharing. If this is done then clients who have shared this model will be warned.when starting up their project and/or synchronizing occurs

Selecting **Share** displays the **Share Project Models** panel.

The fields and buttons used in this panel have the following functions.

Field Description Type DefaultsPop-Up

*All the models in the project are listed in the **Share Project Models** panel and if a model has been tagged for Sharing, a tick will be displayed in the **Share** column of the grid.*

Pattern

*if a pattern is typed then all the models matching the pattern will have a tick placed in the **Share** column. If * is typed then all models are ticked for sharing.*

Share grid column

*tick if the model is to be made available for sharing when the **Set** button is pressed.*

All models that have been made available for sharing are displayed in model lists in a colour defined by an environment variable. The default colour is a yellow (RGB of (255,166,0)).

*Clicking RB on **Share** at the top of the column brings up a menu to **Toggle** the ticks, **Set** all the ticks on, **Clear** to turn all the ticks off.*

Model grid column

this column lists all the models in the project

Share as grid column

an optional name with which the model will be shared out to clients. Leave it blank to share under the original name.

Set button

clicking **Set** marks all the models with a tick in the **Tick** column as being available for sharing. Those models without a tick will not be available for sharing.

Add Shared Models

Position of option on menu: Model =>Sharing =>Add

The **Add** option is used to add shared models from a server project, to this project (a client project).

All models that have been added as shared models are displayed in model lists in a colour defined by an environment variable. The default colour is blue.

Selecting **Add** displays the **Add Shared Models to Project** panel.

	Add	Original Model Name	New Model Name	Status
1	<input checked="" type="checkbox"/>		optional	

The fields and buttons used in this panel have the following functions.

Field Description	Type	DefaultsPop-Up
-------------------	------	----------------

- Folder

folder box

select folder

folder to look for **12d Model** projects. When a folder is selected, all the **12d Model** projects in the folder will be displayed in a **Projects** pop-up list.
- Project

folder box

select folder

name of the **12d Model** project in the folder given in the **Folder** field, to search for models marked for sharing. Once a project is selected, all the models marked for sharing from that project will be listed in the **Original Model Name** column.

Search/Replace

section for renaming models from the selected project

- Match sub strings

tick box

if **ticked**, the **Search** expression is used to match against part of each model name.
If **not ticked**, the **Search** expression is used to match against the entire model name.
- Pattern expression

radio button

if set on, then **Pattern** expressions given in the **Search** and **Replace** fields are used to modify model names. Pattern expressions include the standard wild card * and wild character !.
- Search

input

pattern to search for in the model names. For example **"* exist"** will select all models with a name ending with **" exist"**
- Replace

input

replacement for the search pattern found in the model name. For example, **"exist "** in the **Replace** field takes the matched part of the model name and adds **" exist "** to the front of it.

Hence the **Search** pattern **"* exist"** and **Replace** pattern **"exist *"** finds all models with names ending in **" exist"** and renames them with the name starting with **"exist "** (and the **" exist"** at the end of the name is dropped off).

- Regular expression

radio button

if set on, then **Regular** expressions given in the **Search** and **Replace** fields are used to modify model names.
- Search

input

regular expression to search for in the model names.
- Replace

input

replacement for the search expression found in the model name.

Model Names Grid

The models available for sharing in the selected project are shown in the **Original Model Name** column. Any renaming by the **Search** and **Replace** expressions are shown in the **New Model Name** column. Note that if the model already exists in the current project, then the cell for that model in **Original Model Name** column will be displayed in yellow.

- Add

tick box

if **ticked**, the model will be added to this project as a shared model.
If **not ticked**, the model will not be added to this project as a shared model.

Clicking **RB** on **Add** at the top of the column brings up a menu to **Clear** which turns all the ticks off.

Note - a shared model that has been previously added can only be removed by using the **Model**
=>Sharing =>Remove option.

- Original Model Name

column

this column lists all the models in the server project available for sharing.
- New Model Name

column

if **non-blank**, the new name to be given to shared model in this project.
If blank, the original model name is used.

The New Model Names can be from applying the Search and Replace, or by just typing them in.

Status output column

displays if their has been a match or no match for the search/replace for renaming models

Add button

add to this project (a client project) as a shared model, the ticked models given in the Original Model Name field from the project given in the Project field.

Refresh button

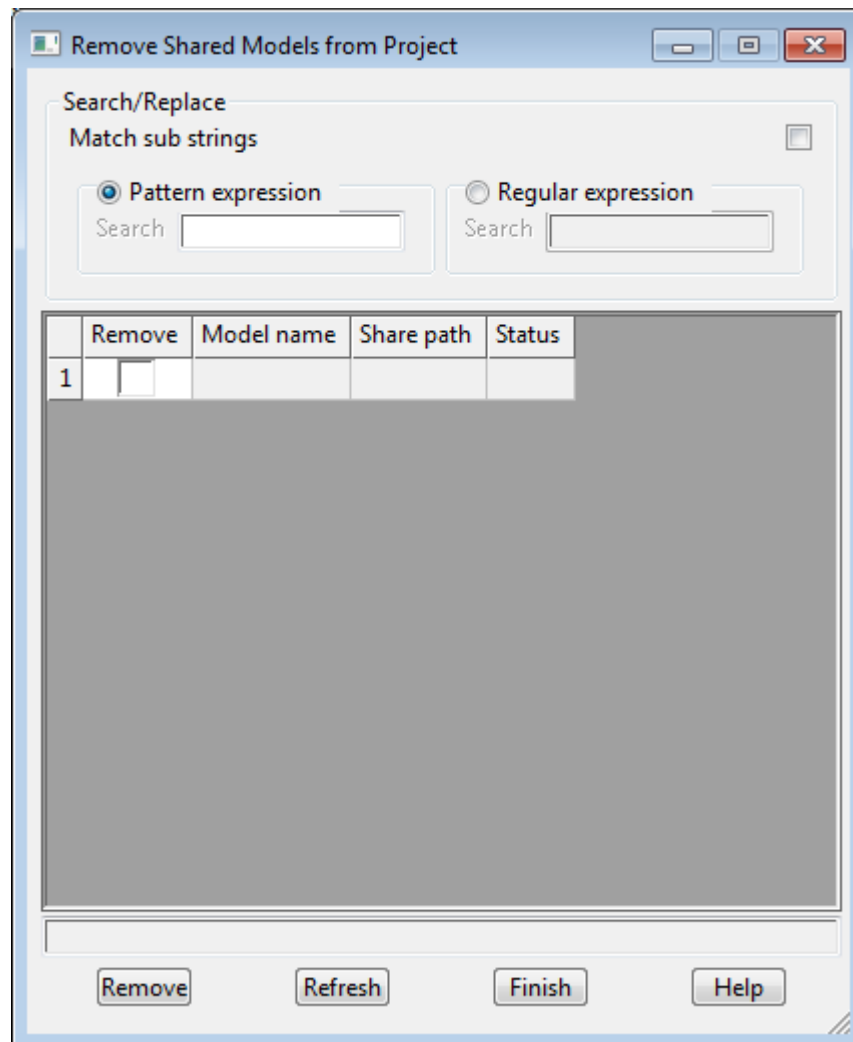

refresh the list of all models available for sharing in the selected server project

Remove Shared Models

Position of option on menu: **Model =>Sharing =>Remove**

The **Remove** option is used to remove shared models from the project. The shared models would have been previously added to the project with the **Model =>Sharing =>Add** option.

Selecting **Remove** displays the **Remove Shared Models from Project** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults
Search/Replace		
<i>section for selecting by expressions, models in this project that are shared from other projects</i>		
Match sub strings	tick box	
<i>if ticked, the Search expression is used to match against part of each model name.</i>		
<i>If not ticked, the Search expression is used to match against the entire model name.</i>		
Pattern expression	radio button	
<i>if set on, then Pattern expressions given in the Search fields are used to select shared model names.</i>		
<i>Pattern expressions include the standard wild card * and wild character !.</i>		
Search	input	

*pattern to search for in the model names. For example "** exist" will select all models with a name ending with " exist"*

Regular expression radio button

*if set on, then **Regular** expressions given in the Search field are used to select shared model names.*

Search input

regular expression to search for in the shared model names.

Model Names Grid

list of all shared models added to the project.

Remove tick box

if ticked, the model will be removed from this project as a shared model.

If not ticked, the model will not be removed.

*Clicking RB on **Remove** at the top of the column brings up a menu to **Clear** which turns all the ticks off.*

Model Name column

this column lists all the models added as shared models from other server projects

Share path

this column lists the path name to the server project and the original model name in the server project

Status column

displays if there has been a match or no match for the Search for selecting shared models

Remove button

*clicking **Remove** removes as shared models from this project, all the models with a tick.*

Refresh button

*clicking **Refresh** refreshes the list of all shared models previously added to the project*

Synchronize Shared Models

Position of option on menu: Model =>Sharing =>Synchronize

The **Synchronize** option is used to updated any added shared models. The shared models would have been previously added to the project with the **Model =>Sharing =>Add** option.

Three environment variables control the synchronization of updates of added shared models and tins. For more information on synchronizing, go to the section [Project Share Settings](#).

Selecting **Synchronize** displays the **Synchronize Shared Models** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	DefaultsPop-Up
Synchronize <i>if ticked and the model has changed in the server project, then it will be re-copied from the server project when the Synchronize button is pressed.</i> <i>Clicking RB on Copy at the top of the column brings up a menu to Toggle the ticks, Set all the ticks on, Clear to turn all the ticks off.</i>	tick boxes in grid column	
Model <i>this column lists all the models in this project that have been added from other (server) projects</i>	grid column	
Synchronize <i>clicking Synchronize re-copies any models with a tick from the server projects</i>	button	
Status <i>Status will either be Ok or No Longer Shared to reflect the status of the model on that row.</i>		

Redraw views tick box

Whether or not to redraw all the views any of the synchronized models are on.

Refresh button

*clicking **Refresh** refreshes the list of all shared models previously added to the project*

Clean

Position of option on menu: Model => Clean

The **clean** option is used to delete all the strings in a model but the model itself is not deleted. The model is still attached to any views it had been added to.

To help protect the user against disasters, when a model is selected for cleaning, a **yes-no** pop-up menu is invoked to confirm that the user did intend cleaning out the model.

Wild cards (*) and wild characters (!) can be used to select the models to clean and then a list of selected models is displayed for confirmation.

If cleaning is confirmed, all the strings in the selected models are deleted.

Selecting **Clean** displays the **Clean Model** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models
<i>name of the model to be cleaned out. Wild cards * and characters ? can be used to give a list of models to be cleaned.</i>			
Permanently clean?	tick box		
<i>if ticked, the cleaned strings will not go to the trash bin but will be permanently deleted.</i>			
Clean	button		
<i>after selecting this button, all strings in the model given in the model field will be deleted. A yes-no pop-up is used to confirm that cleaning is required.</i>			

Delete

Position of menu: Model => Delete

Using the **delete** option, models can be deleted from disk so that they no longer can be accessed or take up disk space.

To help protect the user against disasters, when a model is selected for deletion, a **yes-no** pop-up menu is used to confirm that deleting the model is intended. If deletion is confirmed, the selected model is deleted from the project and the disk. For extra security, there is also a **Trash Bin** (see [Trash Bin](#) in the chapter [Projects](#)) where models can automatically be moved to on delete before being permanently deleted from disk.

The model delete walk-right menu is

For the option <i>Delete a model</i> , go to	Delete a Model
<i>Delete empty models</i>	Delete Empty Models
<i>Delete all models</i>	Delete All Models

Delete a Model

Position of option on menu: Model =>Delete =>Delete a Model

The **delete a model** option is used to delete a model in the working project.

Wild cards (*) and wild characters (!) can be used to select the models to delete and then a list of selected models is displayed for confirmation.

If a **12d Model trash bin** is being used, the deleted models may be moved to the trash bin rather than deleted from disk (see [Trash Bin](#)).

Selecting **Delete a model** brings up the **Delete Model** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model	input		available models
<i>name of the model to be deleted. Wild cards * and characters ? can be used to give a list of models to be deleted.</i>			
Permanently delete	tick box		

if ticked, the deleted models will not go to the trash bin but will be permanently deleted from disk.

Delete button

*after selecting this button, the model given in the model field will be deleted from the computer disk. A **yes-no** pop-up is used to confirm that deletion is required.*

Delete Empty Models

Position of option on menu: Model =>Delete =>Delete Empty Models

The **delete empty models** option displays a list of all the empty models in the project and can delete selected empty models or all of them.

Selecting **Delete empty models** brings up the **Delete Empty Models** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
List of empty models	models		available models
<i>the pop-up brings up a list of all the empty models in the project. A model can be selected from the list and it will be deleted after selecting the delete button.</i>			
Delete	button		
<i>delete the model given in the list of empty models field.</i>			
Delete all	button		
<i>delete all the empty models in the project.</i>			

Delete All Models

Position of option on menu: Model =>Delete =>Delete All Models

The **delete all models** option will delete all the models in the project. It does not delete models that are in the project area but not yet added to the project.
If a **12d Model trash bin** is being used, the deleted models may be moved to the trash bin rather than deleted from disk (see [Trash Bin](#)).

On selecting the **Delete all models** option, the **Delete All Models** panel is displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Permanently delete	tick box		
<i>if ticked, the deleted models will not go to the trash bin but will be permanently deleted from disk.</i>			
Delete	button		
<i>after selecting this button, a yes-no pop-up is used to confirm that deletion is required. If it is, all models in the working project will be deleted from disk. All views will be refreshed and unless an error occurs, the panel will be removed.</i>			

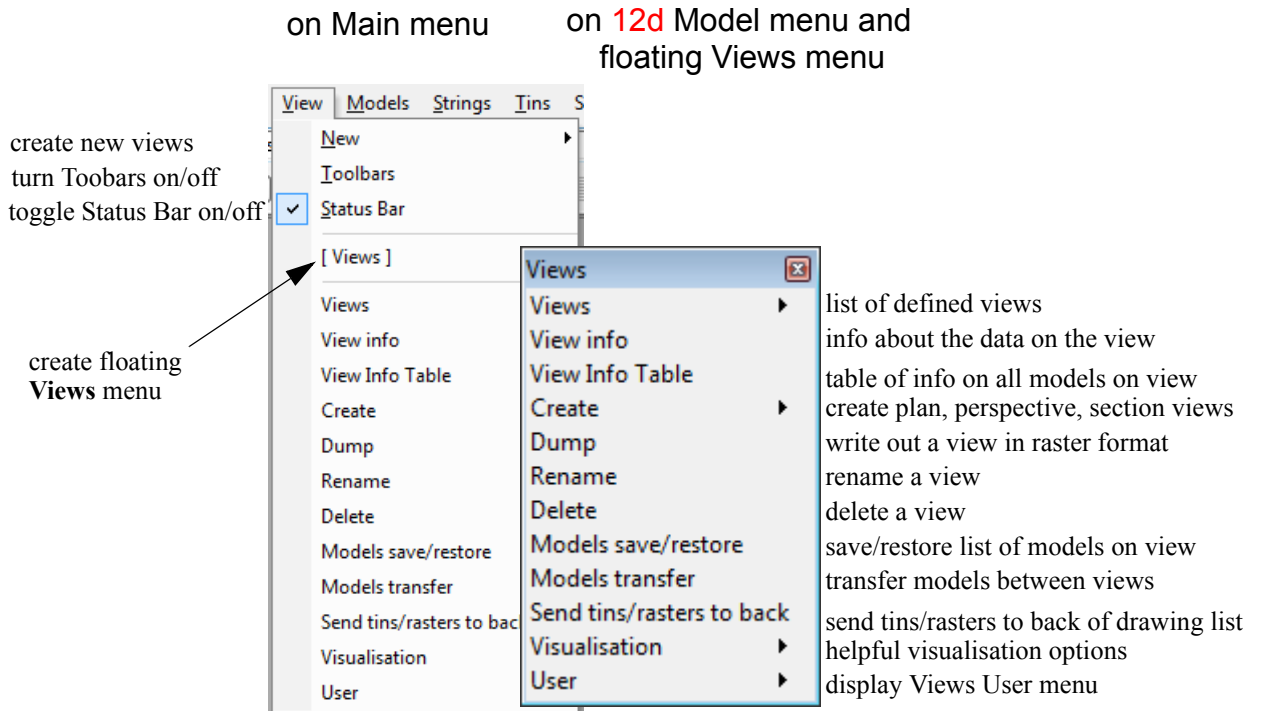

15 View

Position of menu: View

Views are the drawing display areas in 12d Model.

The View walk-right menu contains options to list existing views and create new views. The view drawing and manipulation options are in the View menus attached to each view.

The Views walk-right menu is

For the option *New*, go to

[Models Save/Restore](#)

[Models Transfer](#)

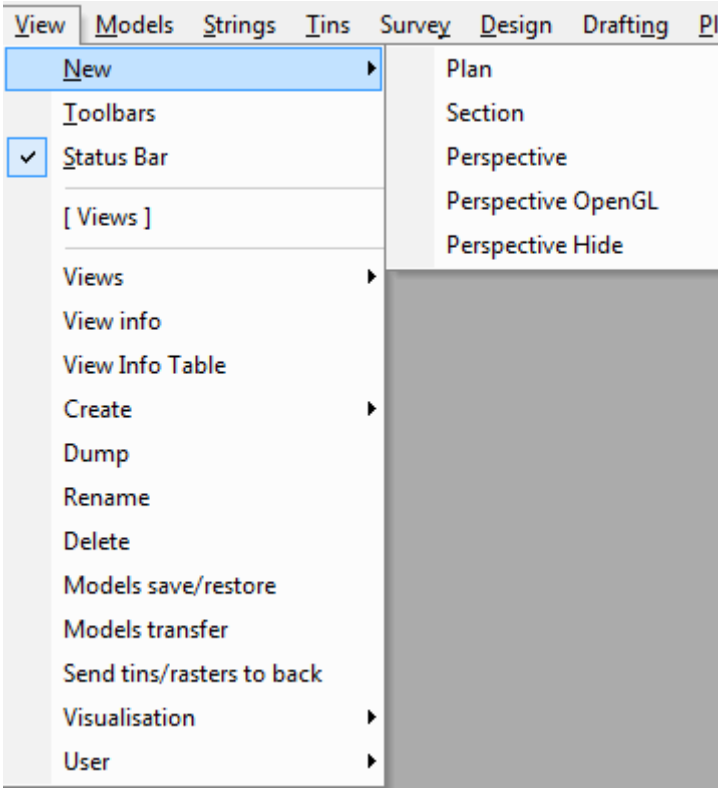

[Send Tins/Rasters to Back](#)

[Visualisation](#)

New

Position of option on menu: View =>New

The **New** walk-right menu provides options to create views of type *Plan*, *Section*, *Perspective*, *Perspective OpenGL* and *Perspective Hide*.

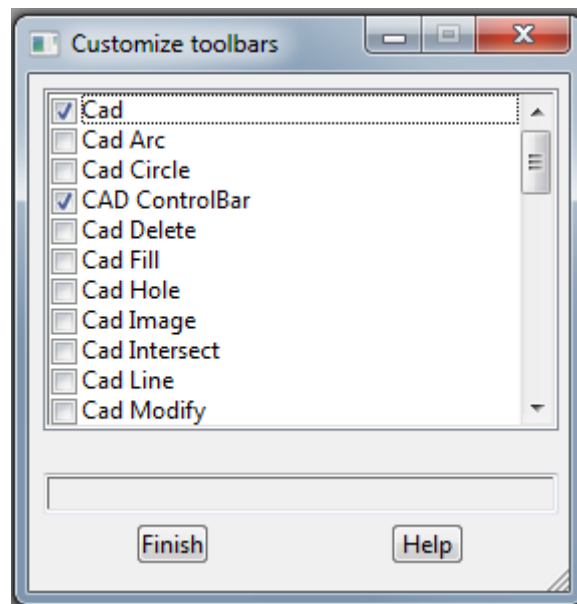

After selecting one of the options, a new view of the appropriate type with the next sequential view number is created in the Views Area.

Toolbars

Position of option on menu: View =>Toolbars

Clicking on **Toolbars** brings up the **Customize Toolbars** panel

Clicking the tick on/off for a given toolbar or controlbar in the *Toolbars* list turns the toolbar or controlbar on/off.

Status Bar

Position of option on menu: View =>Status Bar

Toggles the *Status Bar* on/off.

For more information please see [Status Bar](#) in the chapter [Tools and Concepts](#)

Views

Position of option on menu: View =>Views

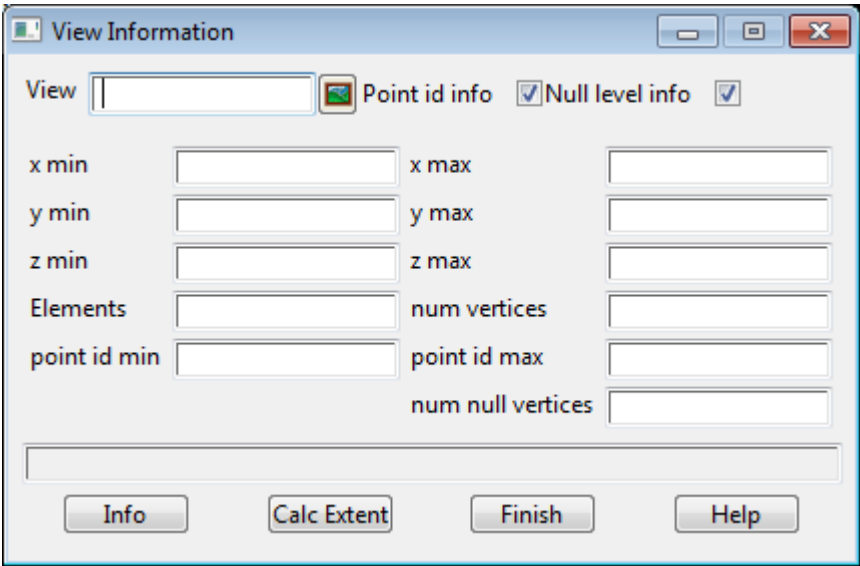

The **Views** walk-right menu provides a list of the all the views defined in this session of **12d Model**.

For each view in the list, a further walk-right menu lists all the models added to that view.

View Info

Position of option on menu: View =>View Info
Selecting View info fires up the **View information** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input		available views
<i>input the name of the view to get information about</i>			
Point id info	tick box	tick	
<i>if ticked, the Point id min and Point id max fields are shown on the panel and when the Info button is pressed, their values calculated for the data on the view. If not ticked, the Point id min and Point id max fields are not shown on the panel.</i>			
Null level info	tick box	tick	
<i>if ticked, the Num null vertices field is shown on the panel and when the Info button is pressed, the value calculated for the data on the view. If not ticked, the he Num null vertices field is not shown on the panel.</i>			
xmin/ymin/zmin, xmax/ymax/zmax	output		
<i>returns the limits of all the models on the view</i>			
Point id min/max	output		
<i>minimum/maximum integer point id in the model</i>			
Elements	output		
<i>returns the number of elements in all the models on the view</i>			
Num vertices	output		
<i>returns the number of points in all the models on the view</i>			
Point id min	output		
<i>the minimum Point id for the data on the view.</i>			

Point id max output
the maximum Point id for the data on the view.

Num null vertices output
returns the number of null vertices in all the models on the view

Info button
get the information for the view given in the view field.

Calc Extent button
recalculate the x, y, z bounding box for the models on the view given in the view field.

How to Use the Panel

The view information for the view given in the view field is retrieved and placed in the appropriate panel fields when the view name is entered into the view field from the pop-ups, or a <enter> is entered after entering the view name into the view field, or on selecting the **info** button.

View Information Table

Position of option on menu: View =>View info table

The **View information table** option displays the minimum and maximum x, y and z values for every model on the view, and by double-clicking on a model name in the list, brings up a String Information Table that lists all the strings in that model (see [Model Information Table](#)).

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the **sort** menu on the column header fields.

Selecting **View info table** fires up the **View Information Table** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the name of the view to list all the models for</i>	view box		available views
Model <i>all the models in the view are listed in the model column.</i>	column		sort menu
Read only	column		sort menu
Loaded <i>if no, in this current opening of the project, the model has not yet been fully loaded into 12d Model.</i>	column		sort menu
Min X, Min Y, Min Z Max X, Max X, Max Z <i>the minimum/maximum values for the model are displayed in the columns</i>	columns		sort menu

Created/Updated columns dates

dates the model was first created/updated

Update button

recalculate the minimum/maximum information in the table.

Notes

1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.

Create

Position of menu: View =>Create

The floating Create menu item operates in two ways.

First, if Create itself is activated (by clicking LB when Create is highlighted), the **New View** panel appears. The **New View** panel can be used to create plan, perspective and sections views.

Secondly, the Create walk-right brings up a the View Create menu. This walk-right menu has separate options for creating plan, perspective and section views.

The Main menu option View => Create will only work the second way

The Create walk-right menu is

View Create

Plan view

Perspective view

Perspective OpenGL view

Section view

create a plan view
create a perspective view
create a perspective OpenGL view
create a section view

The **New View** panel obtained by clicking LB on the Create menu item and the three options on the View Create menu will now be described.

For the option <i>New view</i> , go to	New View
<i>Plan view</i>	Plan, Perspective and Section Views
<i>Perspective view</i>	Plan, Perspective and Section Views
<i>Perspective OpenGL view</i>	Plan, Perspective and Section Views
<i>Section view</i>	Plan, Perspective and Section Views

New View

On selecting the Create option, the **New View** panel is displayed.

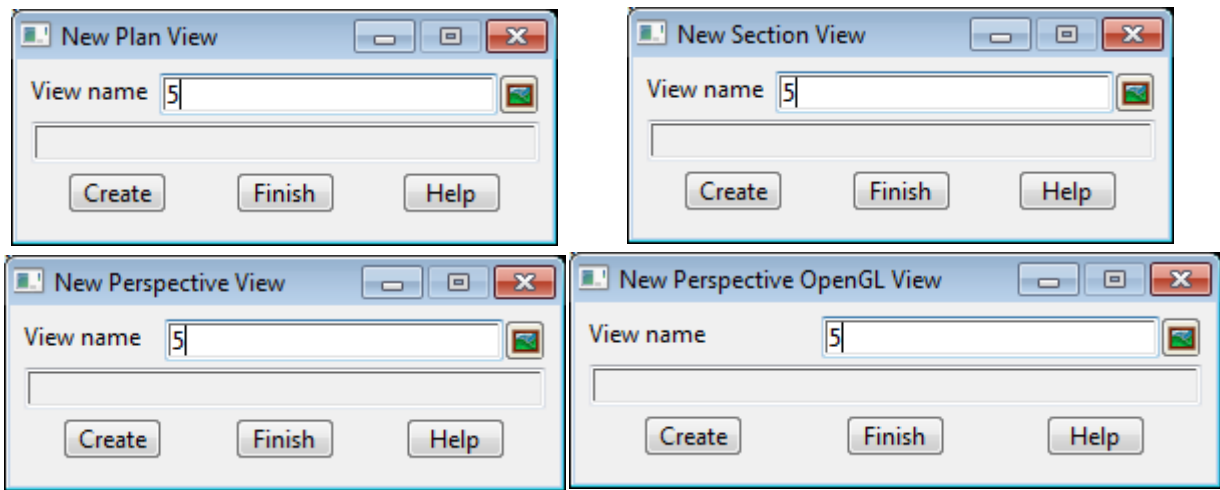

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View name <i>name of the new view to be created.</i>	view box	next view number	
View type <i>type of the view to be created. There are three types of views - plan, perspective, perspective openGL and sections views.</i>	choice box	plan	plan, persp, section, persp openGL
Create <i>after selecting this button, a new view of the name and type given in the panel is created in the Views Area. The panel then disappears.</i>	button		

Plan, Perspective and Section Views

Position of option on menu: View =>Create =>Plan/Perspective/Perspective OpenGL/Section view

On the Plan/ Perspective/Perspective OpenGL/Section view option, the **New Plan/Perspective/ Perspective OpenGL/ Section view** panel is displayed.

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
View name	input	next view number	
<i>name of the new plan/perspective/section view to be created.</i>			
Create	button		
<i>after selecting this button, the new view of the specified name is created in the Views Area. The panel then disappears.</i>			

Dump

Position of option on menu: View =>Dump

This option is used to write the view out in a user selected raster format. The option is identical to the **Dump** option on the **View System** menu.

The fields and buttons used in this panel have the following functions.

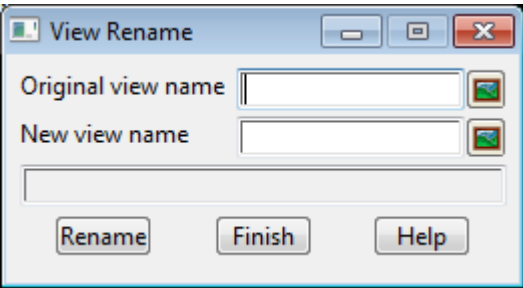

Field Description	Type	Defaults	Pop-Up
View <i>name of the view to be dumped</i>	view box		available views
Include title <i>if ticked, include the view title area in the dump</i>	tick box		
Format <i>format of the dump of the view</i>	choice box	jpeg	bmp, gif, jpeg, jpeg 2000, png, tga
File <i>name of the file for the dump of the view</i>	file box		
Dump <i>dump the view in the given format</i>	button		

Rename

Position of option on menu: View =>Rename

This option renames an existing view.

Selecting **Rename** brings up the **View Rename** panel:

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Original view name <i>current name of the view</i>	view box		available views
New view name <i>new name for the view</i>	view box		available views
Rename <i>rename the view</i>	button		

Delete

Position of option on menu: View =>Delete

This option deletes an existing view.

Since the easiest method to delete a view is to use the **[X]** in the top right hand corner of the view, the *Delete View* option is mainly used in rare cases such as when the view is not responding due a graphics card problem.

Selecting **Delete** brings up the **Delete View** panel:

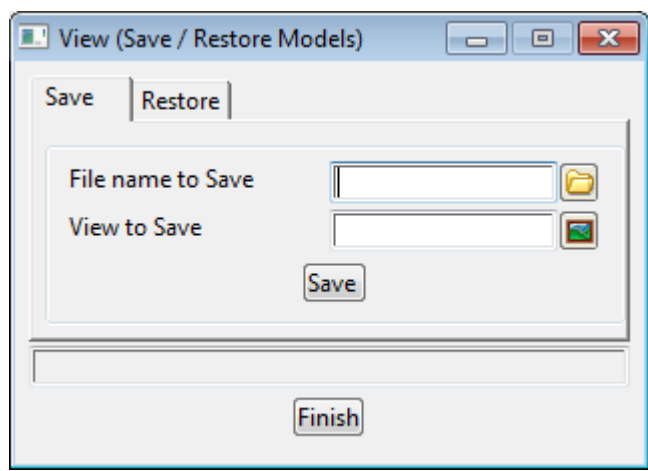

The fields and buttons used in this panels have the following functions.

Field	Description	Type	Defaults	Pop-Up
View		view box		available views
	<i>name of the view to delete</i>			
Delete		button		
	<i>delete the view</i>			

Models Save/Restore

Position of option on menu: View =>Models save/restore

This option is used to write out a list of models on the view and also to read in a list of models and add them to a given view.
On selecting the **Models save/restore** option, the **view save/restore models** panel is displayed.

The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Save tab	tab		
File name for save <i>file for model list.</i>	file		*.vml files
View to save <i>view to write out list of model for.</i>	view		available views
Save <i>after selecting this button, the names of all the model on the view are written out to the file.</i>	button		
Restore tab	tab		
File name to restore <i>file of model list.</i>	file		*.vml files
View to add <i>view to add the models in the model list to.</i>	view		available views
Read <i>read the list of models.</i>	button		
Restore <i>add the models in the list just read in to the given view.</i>	button		

Models Transfer

Position of option on menu: View =>Models transfer

This option is used to add all the models on one view to a different view.

Selecting **Models transfer** brings up the **Models Transfer** panel:

The user is then asked to click in the view to get the models from (source view) and then to select the destination view where the models are to be added to.

Note - if the destination view is a new view, click on **Fit** first to give the new view a valid co-ordinate system.

Send Tins/Rasters to Back

Position of option on menu: View =>Send tins/rasters to back

This option is used to send tins and rasters to the back of the drawing list.

Visualisation

Position of menu: View =>Visualisation

This is a chargeable module which uses the Perspective OpenGL view to create realistic 3d pictures using raster drapes, bitmaps and extrusions along super strings.

The Visualisation walk-right menu is

Visualisation	
Tin render settings	sets textures for tins
Tin height render settings	stretches an image of a tin using a height range
Render drape	set rasters for draping on
Texture map edit	edit texture map file
Billboards	creating/edit/place billboards
Extrusions	extrusions
Meshes	create/place meshes
Timelines	create/run timelines
Utilities	create clouds, fences, forests etc

For *Tin render settings*, go to
Tin height render settings
Render drape
Texture map edit
Billboards
Extrusions
Meshes
Timelines
Utilities

[Tin Render Settings](#)
[Tin Height Render Settings](#)
[Render Drape](#)
[Texture Map Edit](#)
[Billboards](#)
[Extrusions](#)
[Meshes](#)
[Timelines](#)
[Utilities](#)

Tin Render Settings

Position of option on menu: View =>Visualisation =>Tin render settings

Position of option on menu: Tins =>Edit =>Render settings

For a tin added to a Perspective OpenGL view with Shade ticked on, the triangles of the tin can be displayed as solid colour or various degrees of transparency depending of the Blending value for the tin which can vary between 1 and 0. If Blending is 1 the tin is opaque and triangles display as a solid colour, and Blending of 0 means the triangles are totally transparent.

A tin can be *one sided* and only viewable from above, or *two sided* and viewable from above or below.

Rasters, such as photos, can also be associated with a tin and when the tin is displayed in a Perspective OpenGL view with the shade turned on, the rasters are draped onto the tin wherever the triangles are still the base colour.

For triangles that are not the base tin colour, textures can be applied to the triangle using a **Texture mapping** file where the triangle colour is the index into the mapping file.

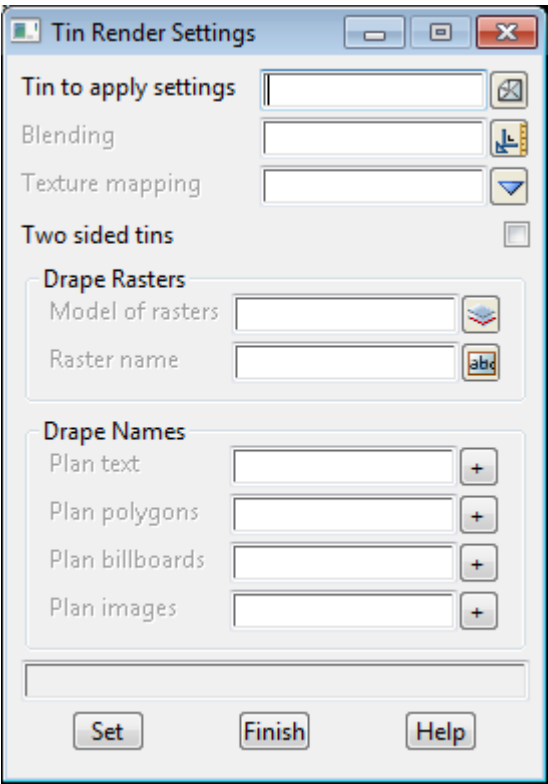

Finally text, filled polygons, text, billboards and images in models added to any Perspective OpenGL view that the tin is on can also be attributed so that they can be draped and displayed on the tin.

All these properties are known as ***Tin Render Settings*** and are set using this option.

IMPORTANT NOTE: the ***Visualisation*** module is required for the ***Tin Render Settings*** to be used on a Perspective OpenGL view.

Selecting Tin render settings brings up the **Tin Render Settings** panel

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to apply settings <i>name of the tin to apply/modify the Tin Render Settings. Any existing Tin Render Settings of the tin are loaded into the appropriate panel fields so that they can be modified.</i>	tin box		available tins
Blending <i>Blending control the level of transparency of the tin. 0 means the tin is totally transparent (and hence invisible) and 1 means that the tin is opaque (non-transparent) and can't be seen through at all. If blank, then the Blending value defaults to 1 and the tin is opaque (non-transparent).</i>	input		
Texture mapping <i>if non blank, the name of the set of colour-to-texture mappings that is defined in the file textures_maps.4d. The Texture Mapping set defines for a colour; what texture from the textures.4d file is applied to the triangles of the tin that have been coloured this colour (and the colour in no the base tin), rather than applying any raster to those triangles.</i>	texture mapping file box		
Two sided tins <i>if ticked, the tin is visible when viewed from both above and below. For example, the tin used for the bottom of a bridge needs to be two-sided. If non-tick, then the tin is one sided and only shows when viewed from above.</i>	tick box		
Drape Rasters			
Model of rasters <i>if not blank, the model of ortho-rectified rasters to be associated with the tin and draped onto the tin when the tin is on a Perspective OpenGL view. The raster images will only be draped onto triangles that have the base tin colour.</i>	model box		available models

Raster name input

if non blank, the name of an ortho-rectified raster to be associated with the tin (and hence draped onto the tin when the tin is on a Perspective OpenGL view).

Drape Names

WARNING WHEN USING DRAPE NAMES

Because draped text, billboards, images and textures can all occur at the same (x,y) value and hence have the same z-value at that point, there are certain ordering rules controlling what you see.

*First the **model** containing the **tin** needs to be brought to the **FRONT** of the view using **Perspective OpenGL View Menu: Models =>Models to front**.*

Then textures using the tin colour and the Texture mapping file will be drawn first, draped text will be next, then draped polygons and draped images fight it out.

Plan text

*if not blank, when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, all **vertex text** that is using a **true type font** are draped onto the tin.*

Plan polygons

*when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name then it is draped onto the tin and if the value of the attribute is zero (0) the super string is draped and coloured using the strings fill colour, or if the value is one (1), a texture is draped onto the tin and the fill colour is used as the **reference** to the **Texture mapping** file given in the Texture mapping field, to specify which texture to drape.*

The Integer string attribute name and value can be set using the option

***View =>Visualisation =>Render drape** (see [Render Drape](#)) or by setting an Integer string attribute of the required name and value using the option **Strings =>Properties =>Attributes** (see [Attributes](#)).*

Plan billboards

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name and any value, all horizontal billboards (i.e. have Vertical turned off) are draped onto the tin.

The Integer string attribute with this name can be set using the Drape name field in the option

***View =>Visualisation=>Billboards =>Add/Remove (ss)** (see [Add and Remove Billboard from Super String](#)) or by setting an Integer string attribute of the required name using the option **Strings =>Properties =>Attributes** (see [Attributes](#)).*

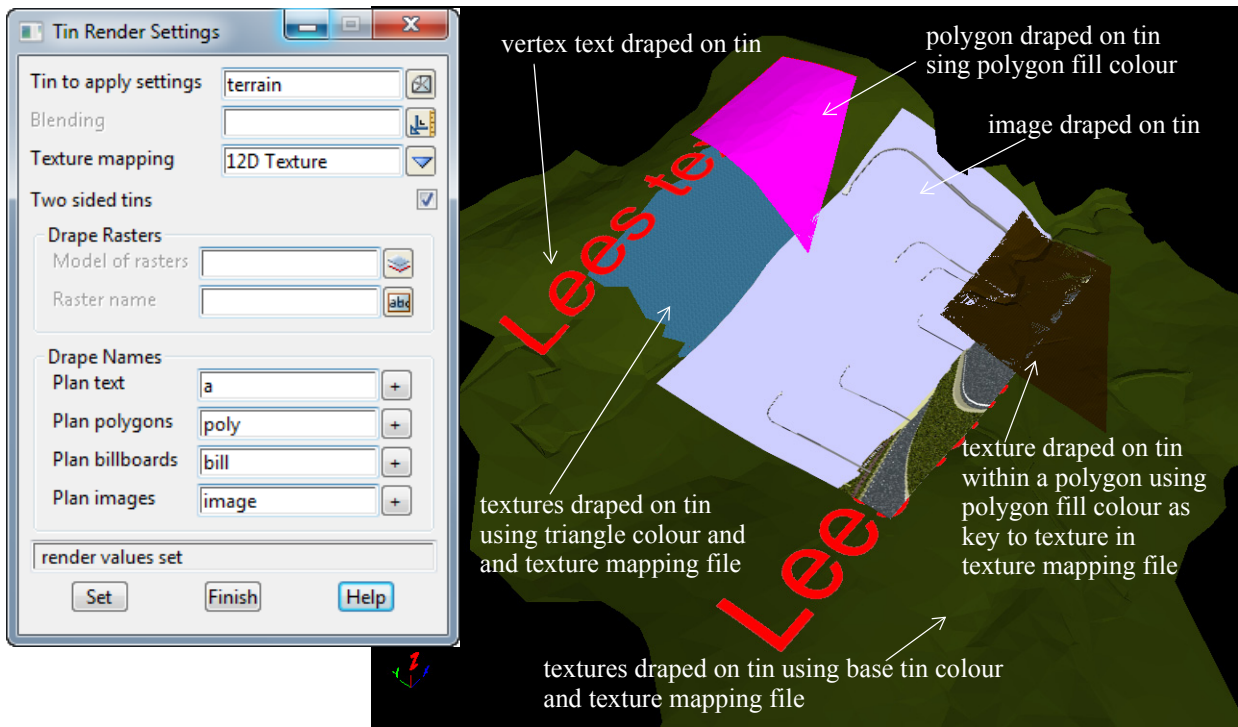

Plan images

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name and any value, all images on the super string are draped onto the tin.

*The Integer string attribute of this name is set using the option **Strings =>Properties =>Attributes** (see [Attributes](#)).*

Set button

apply the data in the panels fields to the tin.

Tin Height Render Settings

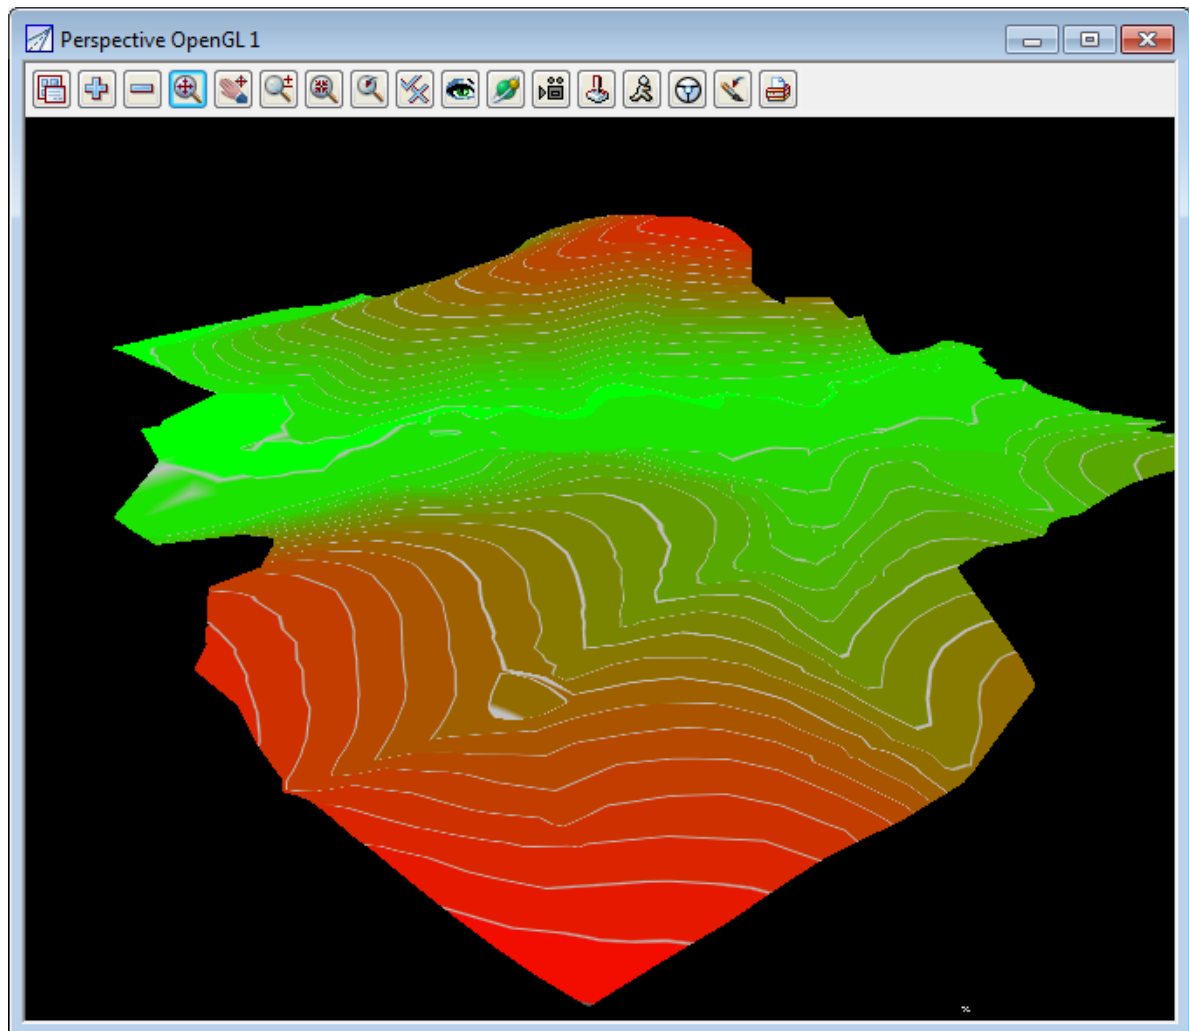

Position of option on menu: View => Visualisation => Tin height render settings

For a tin (that is not a super tin) the *Tin Height Render Setting* option sets the a texture map and parameters that can be stretched over the specified height range.

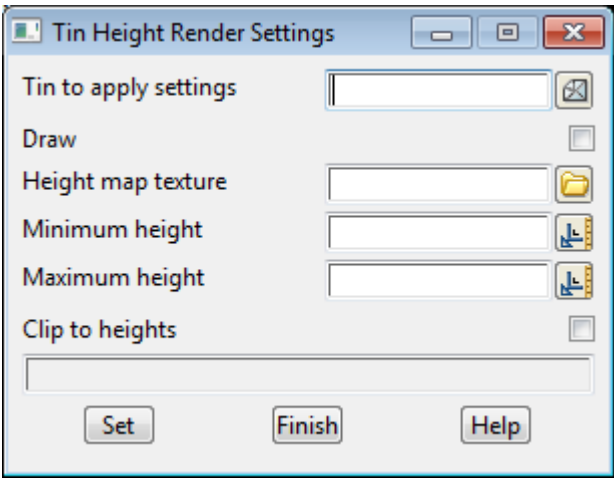

To see the effect, the tin must be on a *Perspective OpenGL* view with *Shade* ticked on, and you have the **Visualisation** module.

Notes

1. this only displays when you have the **Visualisation** module.
2. This option does not work for a Super Tin.

Selecting **Tin height render settings** brings up the **Tin Height Render Settings** panel:

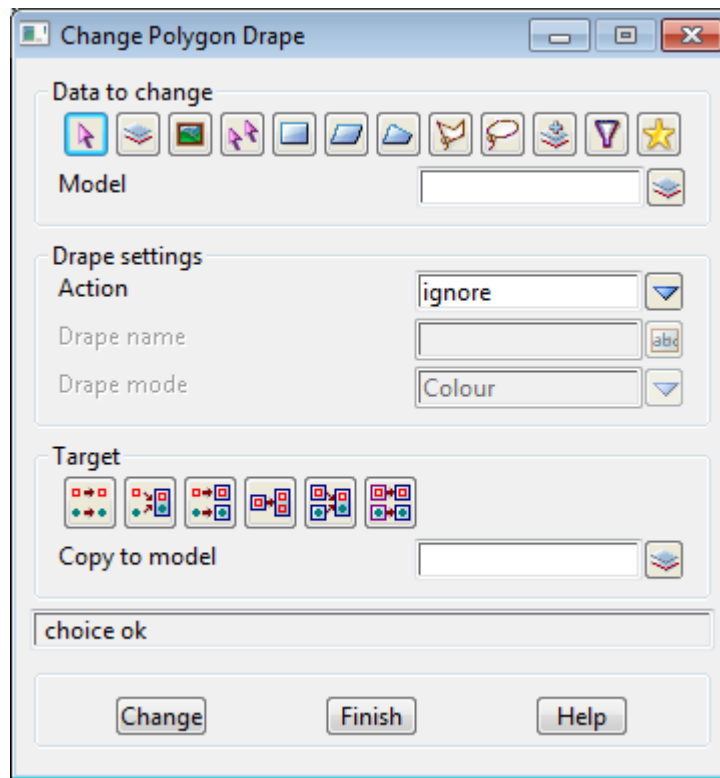

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to apply settings	tin box		available tins
<i>the tin to apply the height texture map to. This can then be toggle on/off with the Draw tick box.</i>			
Draw	tick box	not ticked	
<i>if ticked, the height texture map will be applied to the tin when it is on an Perspective OpenGL view. If not ticked, the height texture map is not applied to the tin. However the height texture map is still associated with the tin and Draw can be ticked back on at any time.</i>			
Height map texture	file box		.bmp, png file
<i>the texture map to stretched over the height range given in the Minimum height and Maximum height fields.</i>			
<i>The texture map is a bitmap that is one pixel high by n pixels wide, usually with a colour gradation going from left to right. The bitmap is stretched over the minimum and maximum height with the left side of the texture map being at the minimum height and the right side of the texture map being at the maximum height.</i>			
<i>For example, the file Height_map_texture.bmp from Library.</i>			
			
Minimum height	measure box		available measures
<i>the minimum height to stretch the height map texture over.</i>			
Maximum height	measure box		available measures
<i>the maximum height to stretch the height map texture over.</i>			
Clip to heights	tick box	not ticked	
<i>if ticked, the tin is only displayed where the height map texture is applied. That is, the tin is only displayed between the Minimum height and the Maximum height.</i>			
<i>If not ticked, the tin is displayed over the entire range of the tin.</i>			
Set	button		
<i>set the values in the panel for the tin given in Tin to apply settings.</i>			

Render Drape

Position of option on menu: View => Visualisation => Render drape

Selecting **Render drape** brings up the **Change Polygon Drape** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of data to be processed.</i>			
Action	choice box	ignore	set, clear, ignore
<i>if set, for each selected polygon, an Integer string attribute is created with the attribute name Drape name and the value of the attribute is</i>			
<i>0 if Drape mode is Colour and</i>			
<i>1 if Drape mode is Colour to texture.</i>			
<i>If clear, for each selected polygon the Integer string attribute with name Drape name is removed.</i>			
<i>If ignore, nothing is done.</i>			
Drape name			
<i>name of the Integer attribute that is set for the string. The attribute name is used to identify these polygon in the View->Visualisation->Tin Render Settings Render Settings (see Plan polygons in the Drape Names section)</i>			
Drape mode	choice box		Colour, Colour to texture
<i>if Colour - the fill colours of the selected polygons are used for the drape</i>			
<i>If Colour to texture - the fill colours of the selected polygons are used to reference the texture in the Texture Mapping file</i>			
Target type			

Data target type - where to put the processed strings. For a full description go to [Data Target](#) in the chapter [Tools and Concepts](#)

Target info input
extra information required for the target.

Change button
process the selected strings.

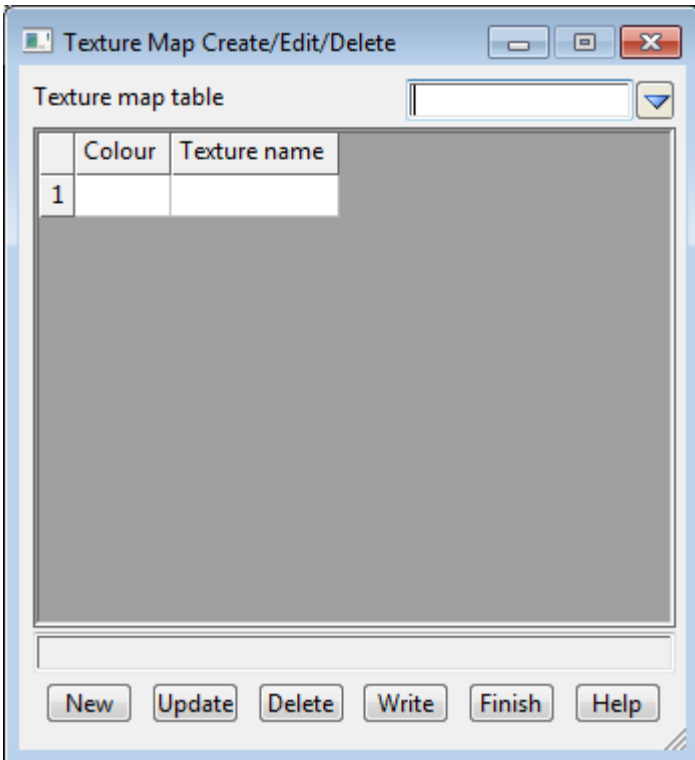

Texture Map Edit

Position of option on menu: Visualisation =>Texture map edit

This option edits the texture mapping file (texture_map.4d) which contains the *texture map tables* that can be applied to the coloured triangles of a tin in renderings.

Each texture map table must have a unique name.

On selecting the **Text map edit** option, the **Texture Map Create/Edit/Delete** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Texture map table			
<i>name of the texture map table inside the texture map file.</i>			
Colour			
		colour box	available colours
<i>colour to apply the texture to.</i>			
Texture name			
		texture box	available textures
<i>texture to apply to all triangles with the specified colour</i>			
New			
		button	
<i>to create a new texture map table, click on the New button and then type the texture map table name into the Texture map table field. Then start filling in the Colour and Texture name columns.</i>			
Update			
		button	
<i>update the given Texture map table with the values in the Colour and Texture name columns.</i>			
Delete			
		button	
<i>Delete the texture map table named in the Texture map table field.</i>			
Write			
		button	
<i>write out the texture map information to the texture map file, texture_map.4d.</i>			

Billboards

Position of menu: View =>Visualisation =>Billboards

The billboard options plane an image onto a rectangular billboard. this can be used to display background scenes, signs etc.

The **Billboard** walk-right menu is

Billboards	
Create and add	create a billboard and add an image to it
Add/Remove (ss)	add/remove a billboard to the vertices of a super string
Create many	
Create Forest	create a forest within a polygon
Trees/shrubs	place a billboard tree/shrub
Create from EXIF JPEG files	

For the option *Create and add*, go to

- Add/Remove (ss)*
- Create many*
- Create forest*
- Trees/shrubs*
- Create from EXIF JPEG files*

- [Create and Place Billboard.](#)
- [Add and Remove Billboard from Super String](#)
- [12D - Billboard Signs Create](#)
- [Create Forest](#)
- [Trees/Shrubs as Faces and Billboards](#)
- [Create Billboards from EXIF JPEG Files](#)

Create and Place Billboard

Position of option on menu: View =>Visualisation => Billboards =>Create and add

This option defines a billboard (its size and position, the image on the billboard, etc.) and adds it to a super string and can **also** add it to the file *billboards.4d* which is used by other options.

The option **always** creates a super string with the billboard on it, so if you just wanted to add a billboard definition to the *billboards.4d* file, then use this option which creates a super string with the billboard, but then **delete** the created super string.

On selecting the Create and add option, the **Create and Place Billboards** panel is displayed.

The fields and buttons used in this panels have the following functions.

Field	Description	Type	Defaults	Pop-Up
Naming tab				
tab				
Shared billboard		tick box	ticked	
<i>if ticked, the information about the billboard is added to the billboards.4d file and then when the super string is created, it only references the required billboard information from the billboards.4d file. Note: the Write button needs to be clicked to write out the billboards.4d file with the new billboard definition. If not ticked, all the information about the billboard is saved with the super string and nothing is written to, or used from the billboards.4d file.</i>				
Name for billboard		billboard box		
<i>the name of the billboard to use in the billboards.4d file. This must be unique amongst all the billboard names in the billboards.4d file.</i>				
Folder for billboard		text box		
<i>the billboard folder in which to place the billboard named above. This is just a grouping mechanism for all the billboard names. If the Folder does not exist in the billboards.4d file, it will be created.</i>				
Image Data tab				
tab				
Image file		file box		
<i>name of the file containing the image to place on the billboard</i>				
Alpha file		file box		
<i>currently not supported</i>				

Image polygon	polygon box		
<i>this polygon is used to crop the image. The billboard origin (0,0) is at the centre of the image and the world size of the image is determined by the Width and Height fields below. The Image polygon must also be drawn with the same (0,0) reference and in world units.</i>			
Number of fans	integer box		
<i>the billboard can consist of multiple copies of the image rotated equally around 180 degrees of the z-axis at x=0. This is mainly used for trees so that you see a tree no matter which direction you look from. If Number of fans = 1, then the image is used on both sides of the billboard. If Number of fans is left blank, then the image is used on one side of the billboard and the side is given the colour specified in the Colour field on the Positioning tab.</i>			
Width	measure box		
<i>the width in world units for the billboard (before the billboard it is cropped by any Image polygon).</i>			
Height	measure box		
<i>the height in world units for the billboard (before the billboard is cropped by any Image polygon).</i>			
Positioning tab	tab		
Model	model box		
<i>model for the created super string with the billboard.</i>			
Coordinate	measure box		
<i>the (x,y,z) coordinate of the vertex of the super string which has the billboard placed on it.</i>			
Colour	colour box		
<i>the colour used for the back of a billboard when Number of fans is left blank. Note if number of fans is 1 or more then the same image is used on both sides of the blades of the fan.</i>			
Billboard type	choice box	Vertical	Vertical, Threed, Plan
<i>if Vertical, the string is placed vertically (upright) and nothing else is needed. If Threed, a grid for entering Factor, Rotate and Offset values is displayed and these are used to control the position of the billboard in 3d. If Plan, the billboard is a horizontal billboard and will draw on a Plan view. A billboard must be a Plan (or Horizontal) billboard when using Drape names for Plan billboards in the Tin Render Settings panel to drape horizontal billboards onto a tin (see Tin Render Settings).</i>			
Angle	measure box		
<i>the angle the billboard is rotated in the (x,y) plane. Angle is measured counterclockwise in degrees in HP Notation with zero along the x-axis.</i>			
Offset x, Offset y, Offset z			
<i>x/y/z distance to place the billboard away from the super string vertex.</i>			
Buttons at Bottom			
Create	button		
<i>creates the super string with the billboard on it.</i>			
Write	button		
<i>writes out the new billboards.4d file.</i>			

Add and Remove Billboard from Super String

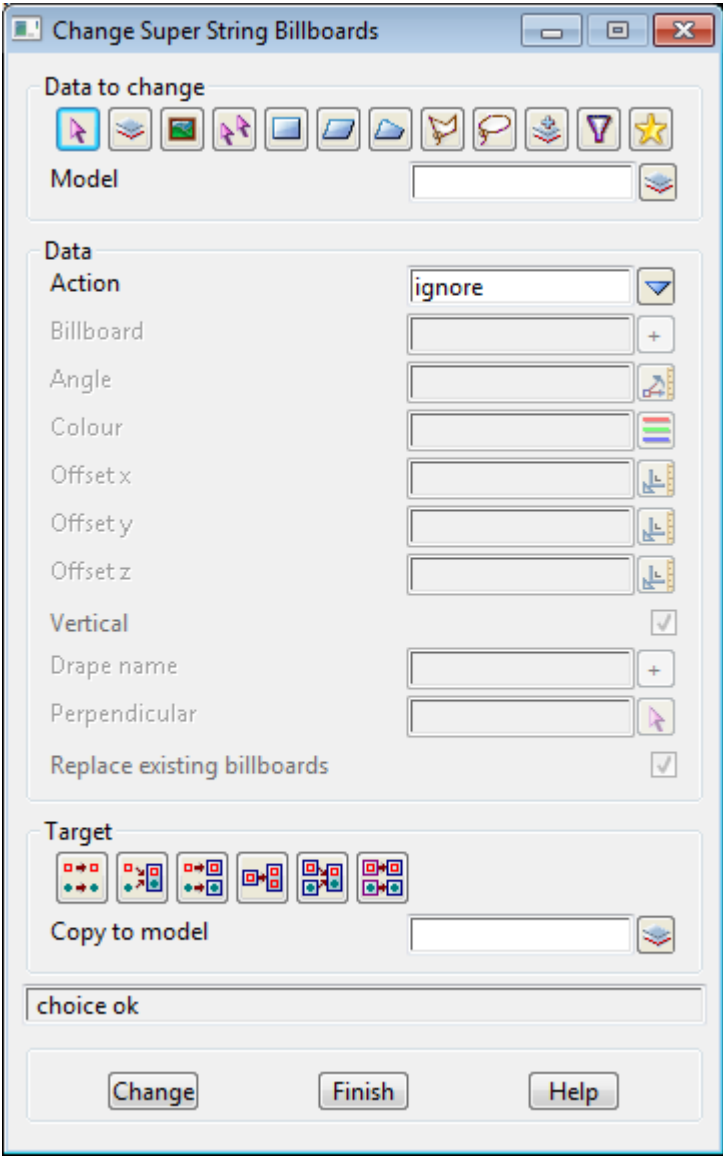

Position of option on menu: View =>Visualisation => Billboards =>Add/Remove (ss)

Each vertex of a super string can have its own billboard.

A billboard consists of an image and a width and height.

The **Add/remove from super string** option places a selected billboard either in a vertical plane or as a plan image at a user given distance from each vertex of a super string. The image is at a given angle or perpendicular to a selected string. An example could be the image on a stop sign which is in the vertical plane.

Selecting Add/Remove (ss) brings up the **Change Super String Billboard** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type

Model

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source

input

source of data to be processed.

Action	choice box	ignore	set, clear, ignore
<i>if set, the billboard is placed at each vertex in the super string.</i> <i>If clear, the billboard information at each vertex is cleared.</i> <i>If ignore, nothing is done to the billboard information.</i>			
Billboard	billboard box		
<i>billboard to be used.</i>			
Angle	angle box		
<i>angle to rotation the billboard - positive is counter clockwise. This is ignored if Perpendicular is used.</i>			
Colour	colour box		
<i>colour for the back of the billboard.</i>			
Offset x, Offset y, Offset z			
<i>x/y/z distance to place the billboard away from the super string vertex.</i>			
Vertical	tick box		
<i>if ticked, the string is placed vertically and nothing else is needed.</i> <i>If not ticked, the billboard is a horizontal billboard and will draw on a Plan view. This is also needed when using Drape names for Plan billboards in the Tin Render Settings panel to drape horizontal billboards onto a tin (see Tin Render Settings).</i>			
Drape name	input		
<i>if Vertical is not ticked, then this field can be modified.</i> <i>If not blank, an Integer string Attribute is created with this name. The Drape name is used in the Tin Render Settings panel (see Tin Render Settings) for draping horizontal billboards onto a tin.</i>			
Perpendicular	string select box		
<i>if a string is selected, then the billboard is placed on the line going through the vertex and perpendicular to the selected string. Angle is ignored.</i>			
Target type			
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>			
Target info	input		
<i>extra information required for the target.</i>			
Change	button		
<i>process the selected strings.</i>			

12D - Billboard Signs Create

Position of option on menu: View =>Visualisation =>Billboards =>Create Many

This option takes images and creates entries in the billboards.4d file.

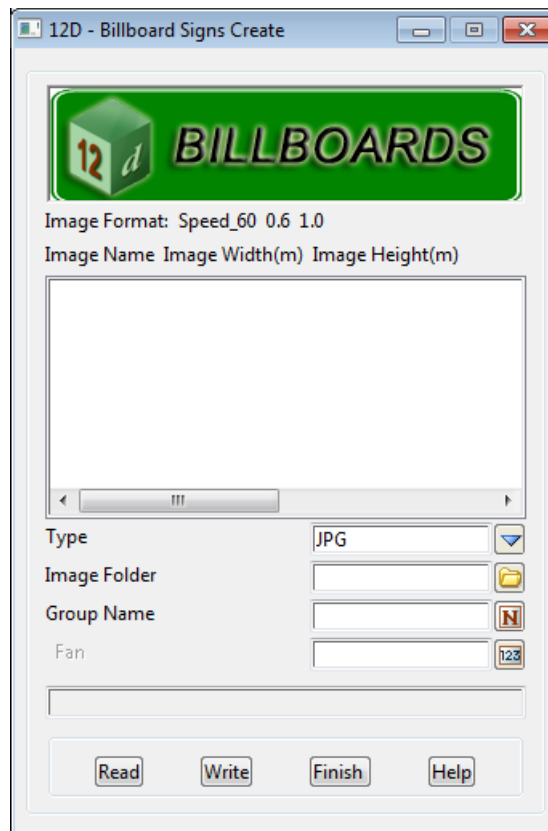

Note that it does not create a super string with a billboard on it.

The option requires that you rename your images in the appropriate format:

Name Width (m) Height (m) -> space separated.

For example, "sign 20 5.jpg" creates a billboard with the name "sign" which is 20 units wide and 5 units high.

Selecting Create Many displays the **12D - Billboard Signs Create** panel:

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Type	Type of image files to read in.	choice box	JPG	BMP, JPG, PNG,TGA, ALL
Image Folder	Browse to a dedicated folder. File names are used to create the billboard name, width and height, e.g. sign 20 5.jpg creates a billboard with the name sign 20 units wide and 5 units high.	file box		
Group Name	The billboard group to add the selected images to.	text box		
Fan	If not blank , the number of extra fans to add to the billboard. If blank , no extra fans will be added to the billboard.	number box		

Read button

Loads all the images of the specified type into 12d and adds them to the Group specified in the billboards.4d file. If the Group does not exist it is created.

Write button

Appends the new group to the billboards.4d file. You must restart 12d load the new billboards.4d file.

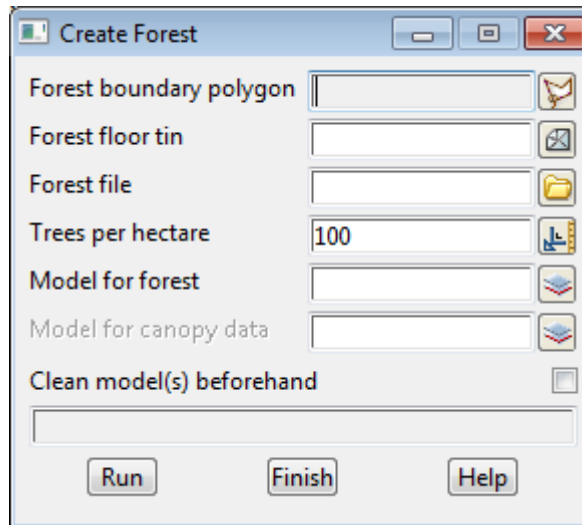

Create Forest

Position of option on menu: Visualisation =>Billboards =>Create forest

Create forest creates randomly placed trees and shrubs in a selected polygon.

The forest make up is controlled by a user defined forest file which gives the types and distribution of trees, and variation in size and spread.

Selecting Create forest displays the **Create Forest** panel

The fields and buttons used in the panel have the following functions.

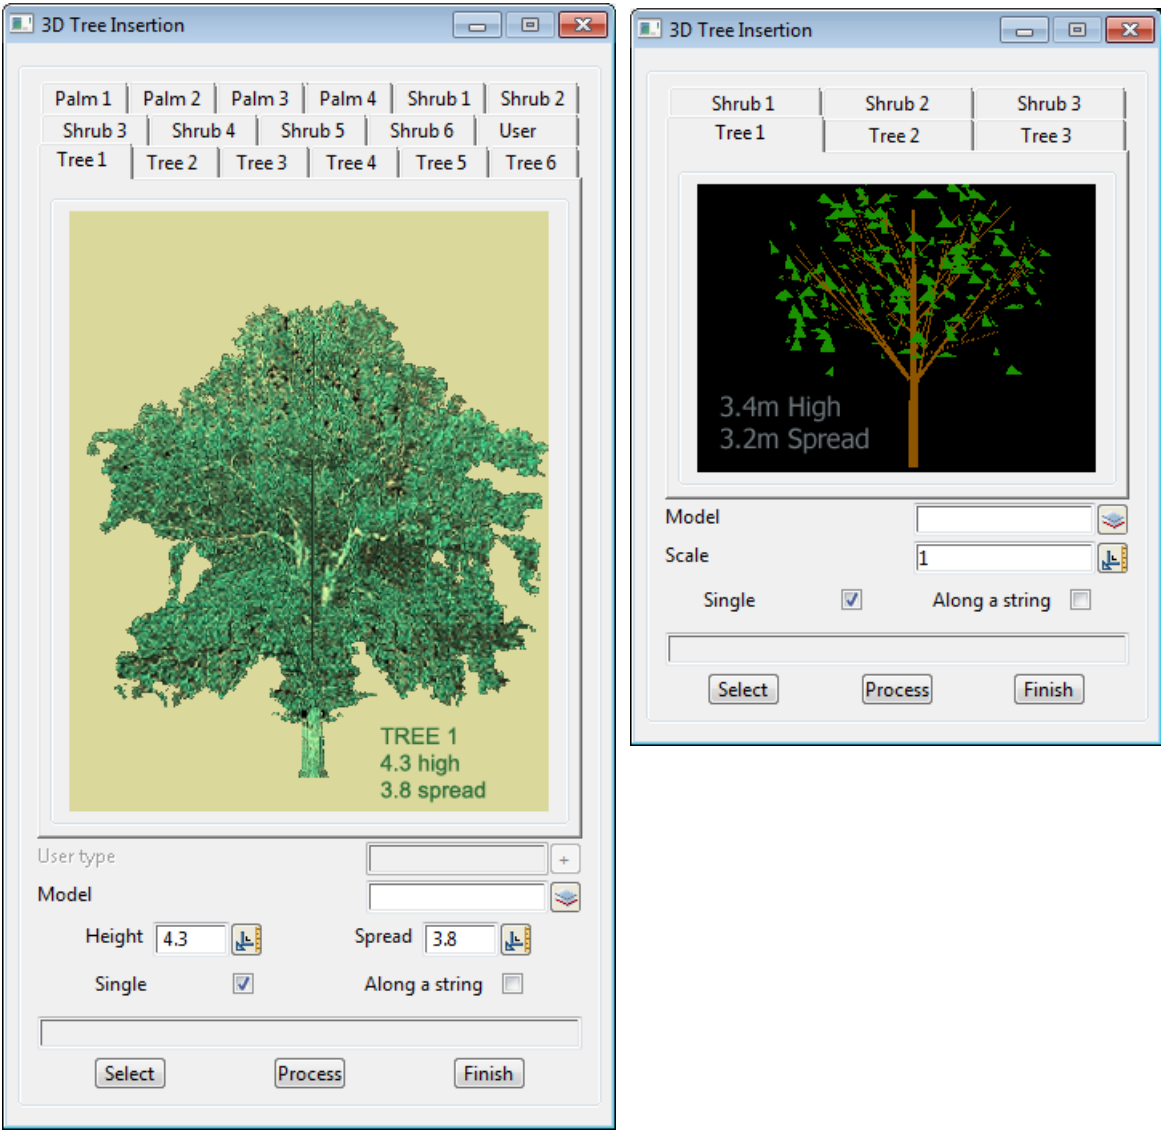

Field Description	Type	Defaults	Pop-Up
Forest boundary polygon <i>polygon to create the forest within</i>	string select		
Forest floor tin <i>tin to use for the z-value for the base of the trees</i>	tin box		available tins
Forest file <i>file to give the make up of the forest. For more information, go to Forest File</i>	file box		.forests files
Trees per hectare <i>density of the forest given by the number of trees per hectare</i>	input		
Model for forest <i>model to place the trees in</i>	model box		available models
Model for canopy data <i>if non blank, points are created for the tops of the trees in the forest. These can be used to triangulated to give a top of trees tin.</i>	model box		available models
Clean model (s) beforehand <i>if ticked, the forest and forest canopy models are cleaned before the option is run</i>	tick box		
Run <i>run the option</i>	button		

Trees/Shrubs as Faces and Billboards

Position of option on menu: View =>Visualisation => Billboards =>Trees/shrubs
Position of option on menu: View =>Visualisation => Utilities =>Trees/shrubs faces

The Trees/shrubs - faces option inserts the trees and shrubs as face elements. This means that each tree may consist of hundreds or thousands of faces.
The Trees/shrubs option inserts the images of trees and shrubs as a fanned billboard. This means that each tree consists of only one points.

On selecting the Trees/shrubs option, the 3D Tree Insertion panel is displayed and on selecting the Trees/shrubs faces option, the 3D Tree Insertion - Faces panel is displayed.

The fields and buttons used in these panels have the following functions.

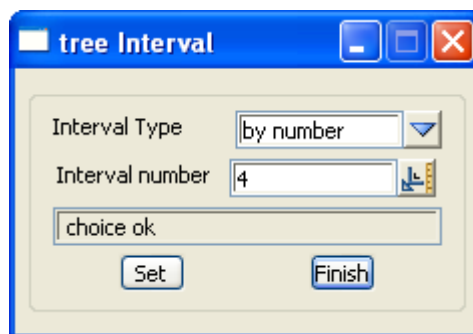

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Tree and Shrub tabs

click on the tab to display the type of tree/shrub to be inserted. The picture shows the tree height and spread.

Model	model box	available models
	<i>model to add the tree/shrub to.</i>	
Height and Spread	real value	varies
	<i>parameters for scaling</i>	
Single	radio button	
	<i>if ticked then the tree is placed at the selected position.</i>	
Along a string	radio button	
	<i>if ticked then the tree is placed along a string. When the string is selected then a Tree Interval panel is brought up to specify how the trees are placed along the string.</i>	
Select	button	
	<i>select the string or position for the tree.</i>	
Process	button	
	<i>insert the trees/shrubs.</i>	

Tree Interval

This panel is for specifying how often the trees/shrubs are to be inserted along the string.

Field Description	Type	Defaults	Pop-Up
Interval type	choice box	by number	by number by distance by special chg file by vertex

*if **by number**: an Interval number field is displayed on the panel and the tree is inserted that many times along the string.*

*if **by distance**: an Interval distance field is displayed on the panel and the tree is inserted with that distance separation along the string.*

*if **by special chg file**: a Special chg file field is displayed on the panel and the tree is inserted along the string at the chainages given in the file.*

*if **by vertex**: the tree is inserted at every vertex of the string.*

Set	button
	<i>set the parameters for tree interval to those in the panel.</i>

Create Billboards from EXIF JPEG Files

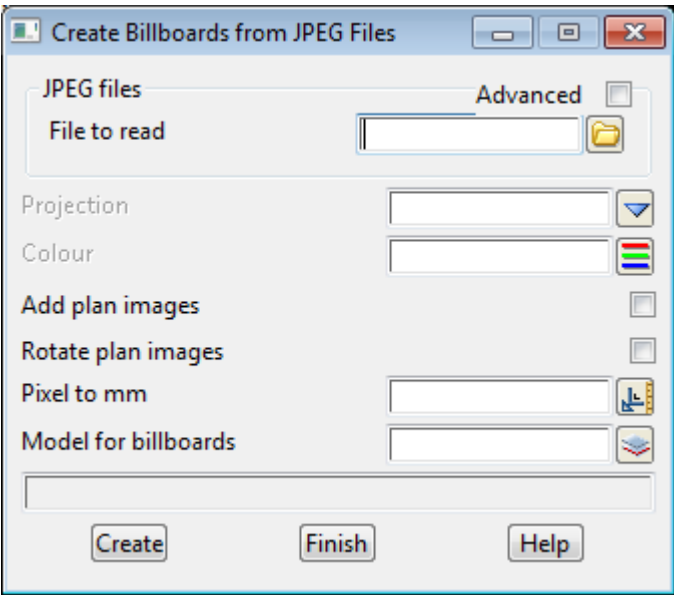

Position of option on menu: View =>Visualisation => Billboards =>Create from EXIF JPEG Files

This option reads in JPEG files which must include EXIF and GPS information. This information is then used to create and position a billboard with the image on the billboard.

If a Projection is selected by the user, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no Projection is given, then the co-ordinates are left as lat/long.

Note: EXIF is short for Exchangeable Image File, a format that is a standard for storing interchange information in digital photography image files using JPEG compression. Almost all new digital cameras use the EXIF annotation, storing information on the image such as shutter speed, exposure compensation, F number, what metering system was used, if a flash was used, ISO number, date and time the image was taken, white balance, auxiliary lenses that were used and resolution.

Selecting Create from EXIF JPEG Files brings up the **Create Billboards from JPEG Files** panel.

The fields and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

JPEG files

Advanced	tick box	not ticked
-----------------	----------	------------

clicking **Advanced** brings up a grid to allow the user to enter many JPEG files.

File to read	file box	available *.jpg files
---------------------	----------	-----------------------

the JPEG files to read in and create images from. The JPEG file must include EXIF and GPS information, which is used to position the image. If Projection is not blank, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If Projection is blank, then the co-ordinates are left as lat/long.

Projection	choice box
-------------------	------------

if a Project Projection is set, then it is placed in the Projection field. This can be changed to any other projection. The projection is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no projection is set, then the co-ordinates are left as lat/long.

Colour	colour box	available colours
---------------	------------	-------------------

if **not blank** and **Add plan images** is not ticked, then this colour is used for the back of the billboard. If **blank**, the colour is white.

Add plan images tick box not ticked

*if **ticked**, plan images are created instead of billboards.*

Rotate plan images tick box not ticked

*if **ticked** and **Add plan images** is ticked, the rotate value from the EXIF will be used to rotate the image.*

Pixel to mm measure box

*the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the **Pixel to mm** (mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.*

Model for billboards model box

the model for the image to be inserted into.

Create button

*when all the fields have been entered, the **Create** button creates images from the selected files.*

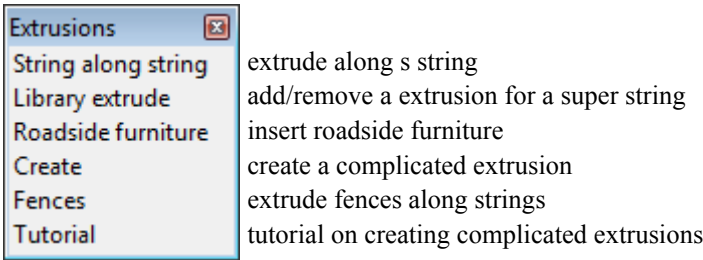

Extrusions

Position of menu: View =>Visualisation =>Extrusions

In it basic form, an extrusion is taking a cross-section and pushing it (extrude it, or sweep it) along a string to create a 3d object. For example, a circle extruded along a string creates a pipe. For more information, go to the section [Defining Extrudes and Extrusions](#).

There is a library of extrusions read in for the project, usually stored in the file extrusions.4d.

The Extrusions walk-right menu is

For the option String along string, go to	String Extrude
Library extrude	Change Library Extrude
Roadside furniture	Roadside Furniture
Create	Create Group Extrusions
Fences	Fences
Tutorial	Tutorial to Create Group Extrusions

More information on extrudes is found in the section [Defining Extrudes and Extrusions](#)

Defining Extrudes and Extrusions

In it basic form, an extrusion is simply taking a cross-section and pushing it (extrude it) along a string to create a 3d object. For example, a circle extruded along a string creates a pipe.

The string that is pushed along the string is called the **extrude**.

Note: this is also know as a Sweep or Swept Path.

Only the (x,y) co-ordinates of the string used as the extrude are used and that gives the shape of the cross section with the ((0,0) point being the point where the string being extruded along sit.

So the (x,y) co-ordinates of the extrude are being taken as (offset, height) in the plane perpendicular to the string being extruded along. So extrudes are normally defined around (0,0) in the (x,y) plane.

Interval extrude

The interval extrude can be seen as a series of string extrudes applied along the string at a specified interval distance. Here is a example of a 'Ring' interval extrude:

This extrude is defined by a diamond being extruded along a circle, and finally being instanced

along the super string at the specified interval.

The extrusions.4d fragment defining this extrude is:

```
interval_extrude {  
  
    name      "Vertical Ring"  
    colour    true  
    mirror_x  false  
  
    interval  4.0  
  
    factor_x  1.0  
    factor_y  1.0  
    factor_z  1.0  
  
    rotate_x  0.0  
    rotate_y  90.0  
    rotate_z  0.0  
  
    offset_x  0.0  
    offset_y  0.0
```

```

    offset_z    0.0

    at_grade    false

    path {

// the string that the extrude is drawn along

        name      "circle path"
        breakline line
        colour     white
        style      1
        closed     1

        data_3d {          // note must be defined with x,y,z data
            0 0.0 0.0
            1 0.0 0.0
        }
        radius_data {
            0.5
            0.5
        }
        interval {
            chord_arc  0.005
            distance    -999
        }
    }
    data {

// the shape of the extrude

        name      "path data"
        breakline line
        colour     magenta
        style      1
        closed     1

        data_2d {
            -0.1  0.0
            0.0   0.1
            0.1   0.0
            0.0  -0.1
        }
        interval {
            chord_arc  0.001
            distance    -999
        }
    }
}

```

TODO: define group extrude:

A group extrude is a combination of string and interval extrudes.

3D Transformations

This transformation consists of factor (scale), rotation, and offset (translation) for x, y, and z. Transformations are always applied in the following order

rotate, factor, offset	about the axes	z, y, x
rotate z	occurs in the x-y plane (plan rotation)	
rotate y	occurs in the x-z plane (slope rotation)	
rotate x	occurs in the y-z plane (super-elevation rotation)	
factor z		
factor y	note: factors are commutative (any order is the same)	
factor x		
offset z		
offset y	note: offsets are commutative (and order is the same)	
offset x		

Note that the rotations about each axis are in the **local** coordinate system of the object being rotated. So after each rotation, the axes are also rotated.

String Extrude

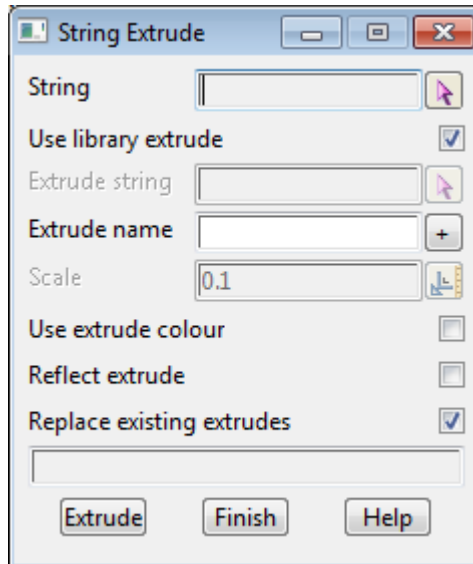

Position of option on menu: View =>Visualisation => Extrude along string

The **String along string** option extrudes a selected super string along a super string.

It can also be used to extrude a library extrude along string. But if a library extrude is to be applied to many strings, the Library Extrude option is more appropriate ([Change Library Extrude](#))

More information on extrudes is found in the section [Defining Extrudes and Extrusions](#)

On selecting the **Extrude** option, the **String Extrude** panel is displayed.

The fields and buttons in this panel have the following functions.

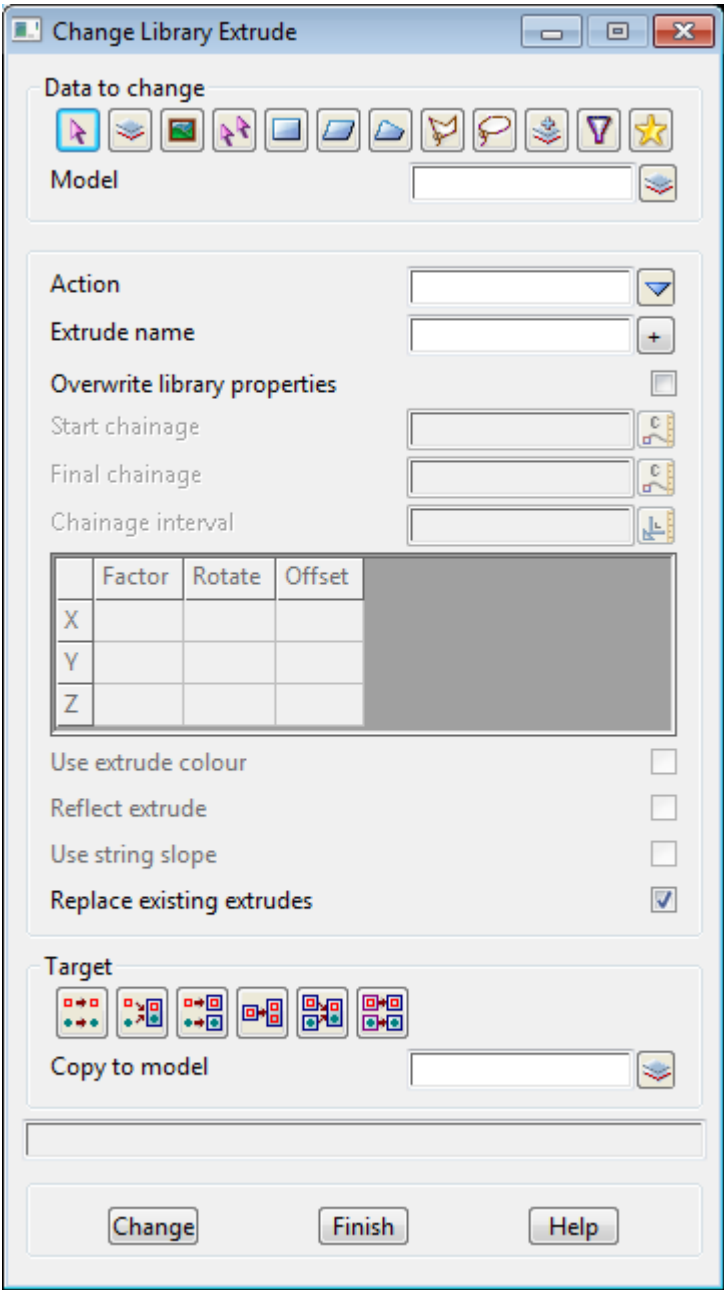

Field Description	Type	Defaults	Pop-Up
String <i>super string to extrude along</i>	string select		
Use library extrude <i>if ticked, an existing extrusion is selected from the extrusion library. The extrude from the library is selected in the Extrude name field. If not ticked, the Extrude string and Scale panel fields are used.</i>	tick box		
Extrude name <i>select the name of the extrude to use from the extrude library.</i>	extrude box		
Extrude string <i>if a library extrude is not being used, then a string is selected to define the extrusion shape.</i>	string select		
Scale <i>value to multiply the extrude string co-ordinates by.</i>	real value input	0.1	
Use extrude colour <i>if ticked, the placement uses the information in the grid on the panel. if no ticked, then the string segment colour is used for the extrusion.</i>	tick box		
Reflect extrude <i>if ticked, the extrude is reflected in the local y axis before it is applied.</i>	tick box		
Replace existing extrudes <i>if ticked, all existing extrudes are cleared before the new one is applied.</i>	tick box		
Extrude <i>Create the extrusion.</i>	button		

Change Library Extrude

Position of option on menu: Visualisation =>Library extrude

This option can apply an extrusion from the extrusions library, extrusions.4d, to a super string, or change the extrusion applied to a super string, or remove an extrusion from a super string.

Selecting **Library extrude** brings up the **Change Library Extrude** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data source type			Model	
-------------------------	--	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input			
--------------------	-------	--	--	--

source of data to be processed.

Action	choice box	set, clear
<i>if clear, all existing extrusions are removed from the selected super strings. The only other fields to be filled in is the Target.</i>		
<i>If set, a library extrude is applied to the selected super strings.</i>		
Extrude name	extrude box	list of extrusions
<i>extrude to be applied to the super strings.</i>		
Overwrite library properties	tick box	
<i>if ticked, the placement of the extrude uses the information in the grid on the panel.</i>		
<i>If not ticked, the placement properties are taken from the extrude in the library.</i>		
Start/end chainage	chainage box	
<i>start/end chainage for applying the extrusion.</i>		
Start/end chainage	chainage box	
<i>start/end chainage for applying the extrusion. If blank, use the strings start/end.</i>		
Chainage interval		
<i>for an interval extrude only - interval to use for the extrude.</i>		
Grid of X,Y,X against Factor, Rotate, Offset		
<i>placement information for applying the extrude.</i>		
Use extrude colour	tick box	
<i>if ticked, the placement uses the information in the grid on the panel.</i>		
<i>if no ticked, then the string segment colour is used for the extrusion.</i>		
Reflect extrude	tick box	
<i>if ticked, the extrude is reflected in the local y axis before it is applied.</i>		
Replace existing extrudes	tick box	
<i>if ticked, all existing extrudes are cleared before the new one is applied.</i>		
Target type		
<i>Data target type - where to put the processed strings. For a full description go to Data Target in the chapter Tools and Concepts</i>		
Target info	input	
<i>extra information required for the target.</i>		
Change	button	
<i>process the selected string</i>		

Roadside Furniture

Position of option on menu: View =>Visualisation => Extrusions =>Roadside furniture

This option is for inserting extruded objects that have been supplied by 12D Solutions Pty Ltd. It includes street lights, log barriers, park bench, posts and columns, walls, timber fences, guard rails, signs etc.

The list of items that can be inserted is being continuously upgraded by 12D Solutions.

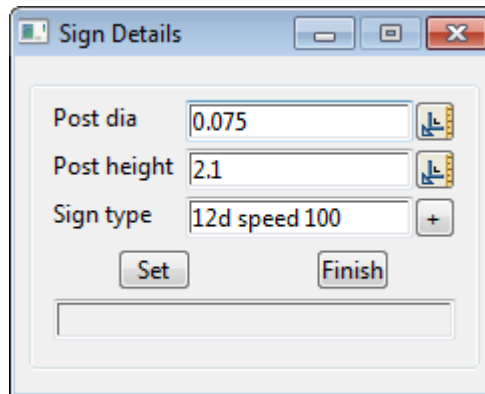

Selecting **Roadside furniture** brings up the **Roadside Furniture** panel.

Clicking on the tabs brings up the information required for that piece of roadside furniture.

For all the tabs other than Park Bench, Street Light and Guard Rail, once a tab had been selected, moving the cursor over the picture brings up a special panel for the extra information required.

For example, for the Sign tab, moving the cursor over the picture brings up the Sign Details panel:

New 12D Ascii

This option is similar to the others e.g. Street Light, but allows the user to create their own features and place them in the same manner as the others on the panel.

Specifications for an ascii file:

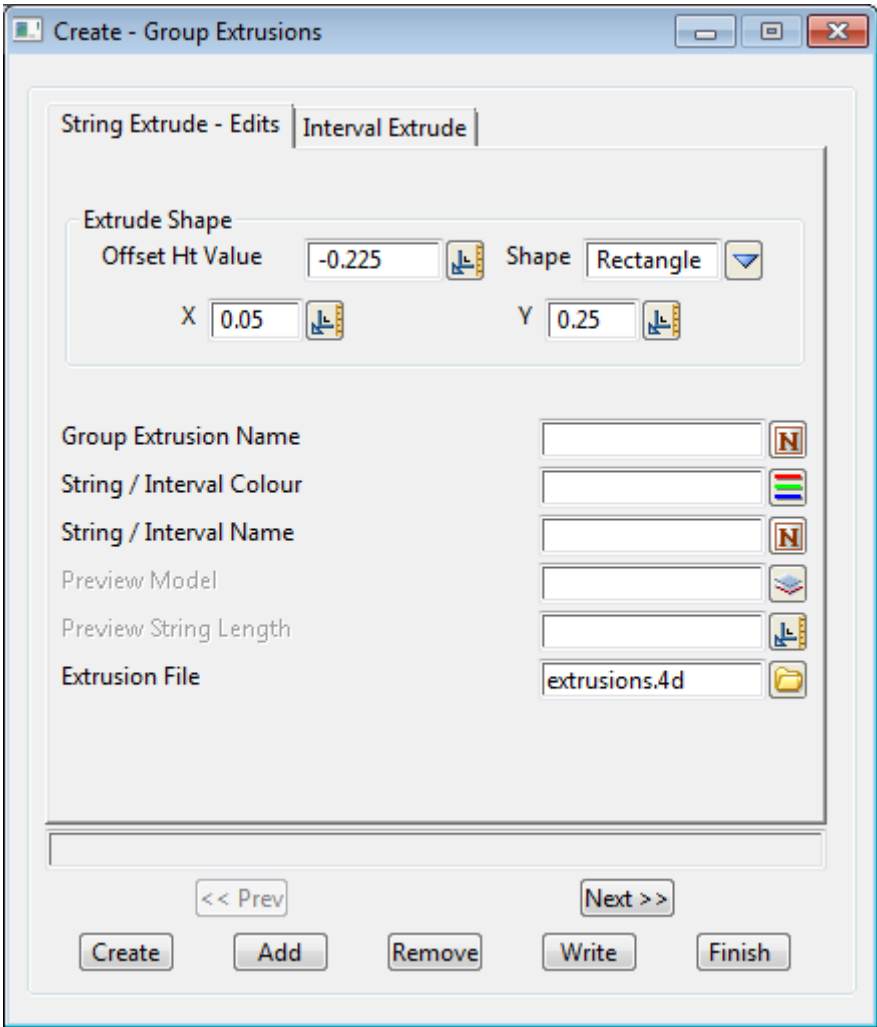

The stem of the ascii file name, the model name in the ascii file and the stem of the bitmap name showing the picture of the object..... "MUST" be the same e.g. File: User Street Light.12da Model: User Street Light Bitmap: User Street Light.bmp

Bitmap size to be 345W x 250H pixels

Place the 12da file and the bitmap in your User_Library

Create Group Extrusions

Position of option on menu: View =>Visualisation => Extrusions =>Create
The Create option creates groups extrusions and saves then to the extrusions.4d file.
Selecting Create brings up the **Create - Group Extrusions** panel.

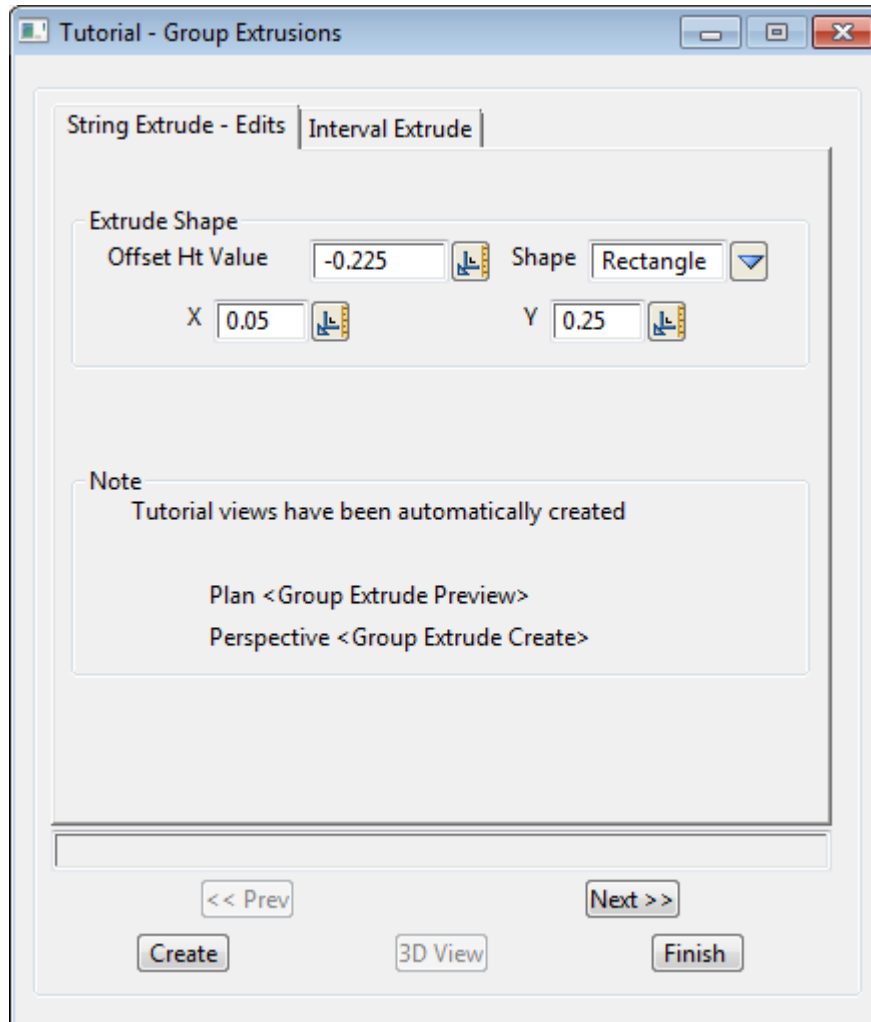

Tutorial to Create Group Extrusions

Position of option on menu: View => Visualisation => Extrusions => Tutorial

The **Tutorial** option demonstrates how to create group extrusions and will also create group extrusions.

Selecting **Tutorial** brings up the **Tutorial - Group Extrusions** panel.

Meshes

Position of menu: View =>Visualisation =>Meshes

The **Meshes** walk-right menu is

For the option Mesh library go to

[Mesh Library](#)

Place Mesh

[Place a Mesh](#)

Convert to 12dmesh

[Convert to 12dMesh Format](#)

Mesh Library

Position of option on menu: View =>Visualisation =>Meshes =>Mesh Library

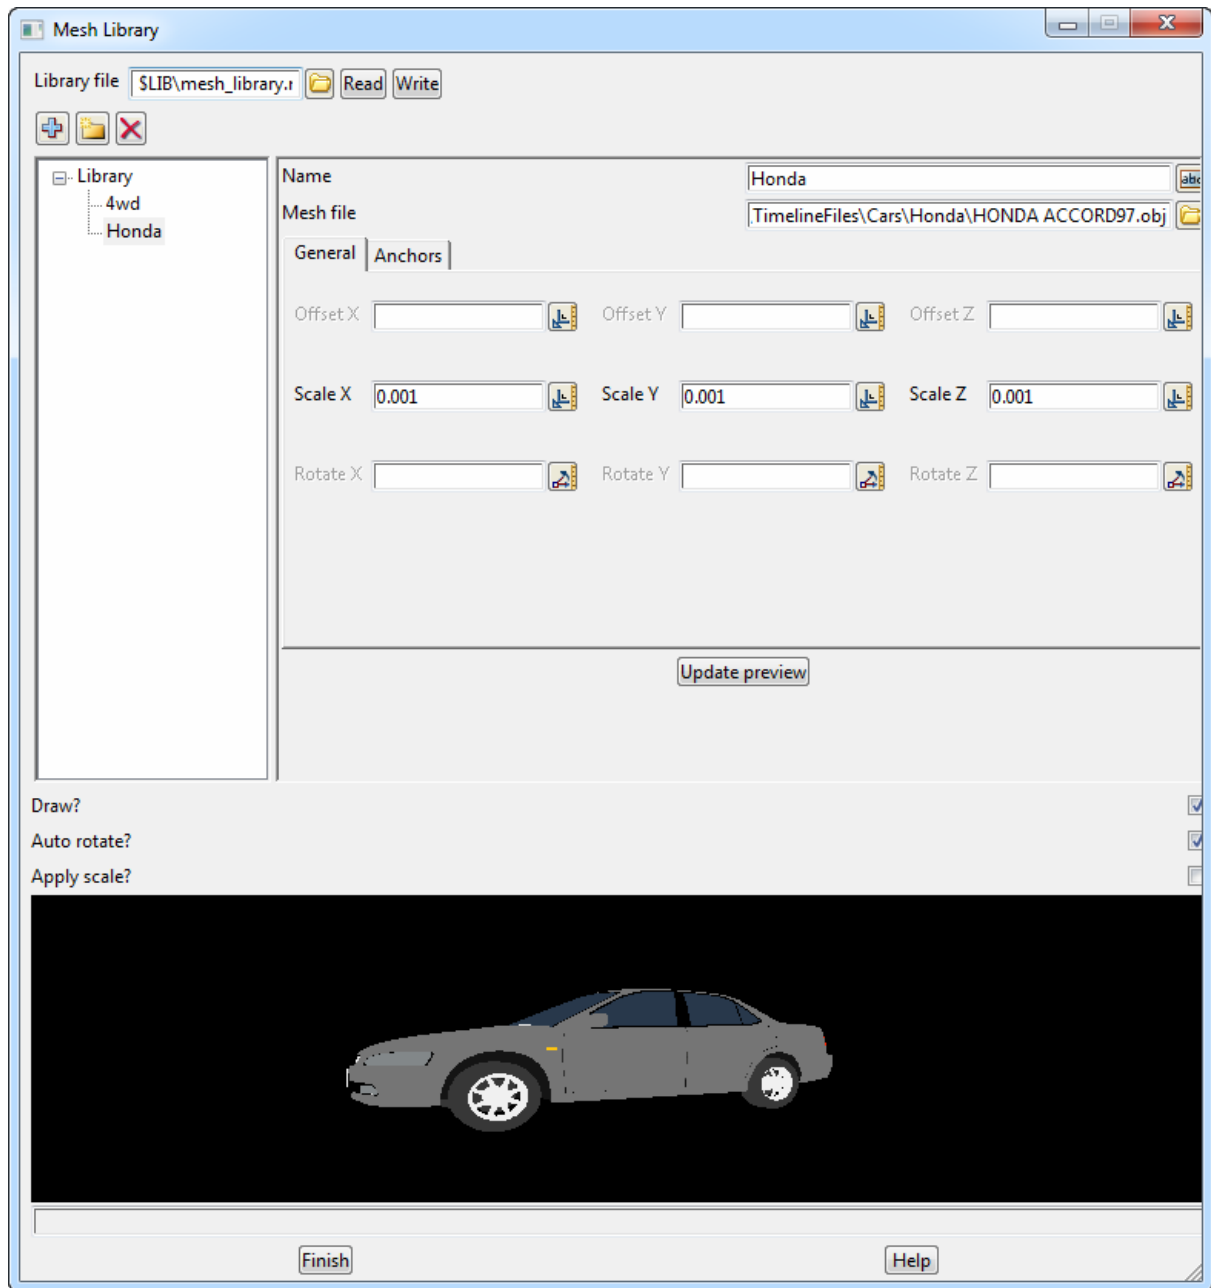

Position of option on menu: View =>Visualisation =>Timelines =>Mesh Library

The **Mesh Library** allows you to predefine meshes and the standard transformations required to get them into a world co-ordinate system. As meshes may come from a variety of packages that use arbitrary scales, rotations or offsets, this may be necessary.

It can also be used to define anchors, to anchor a mesh to the tin. This can be useful to get your mesh to conform to a terrain, such as a vehicle running down a road.

The mesh can then be written to the mesh library file, mesh_library.4d

Selecting **Mesh Library** brings up the **Mesh Library** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Library file	file		
<i>the mesh library file to read/write</i>			
Read	button		
<i>reads a mesh library file</i>			
Write	button		
<i>writes a mesh library file</i>			
+ (Add)	button		
<i>adds a new mesh</i>			

Folder (Create Folder)

Creates a new folder for categorising meshes

Delete

Deletes a mesh or folder

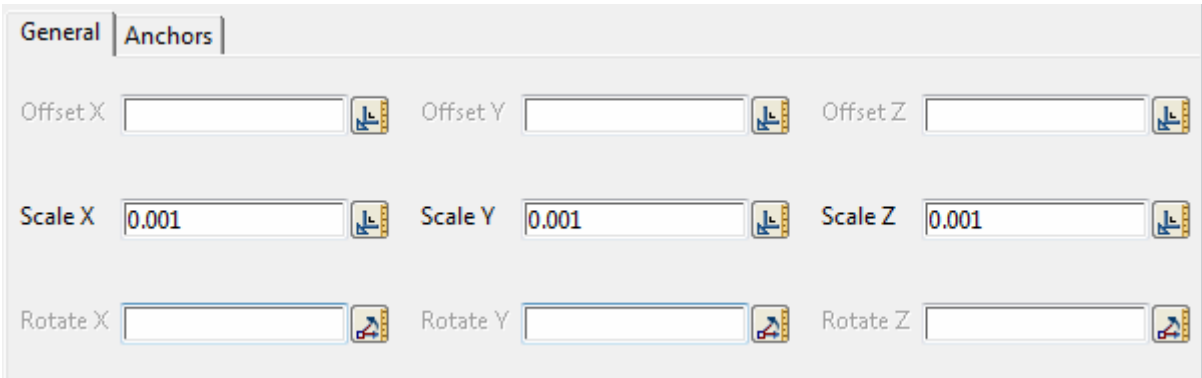

Name

the name of the current mesh

Mesh file

the mesh file, in OBJ format

General tab

Offset x

an optional offset along the x axis to apply

Offset y

an optional offset along the y axis to apply

Offset z

an optional offset along the z axis to apply

Scale x

an optional scale to apply to the x scale of the object

Scale y

an optional scale to apply to the y scale of the object

Scale z

an optional scale to apply to the z scale of the object

Rotate x

an optional rotation around the x axis

Rotate y

an optional rotation around the y axis

Rotate z

an optional rotation around the z axis

Anchors tab

The **Anchors** tab is used to define anchors, for anchoring a mesh to a tin. To do this, you must

define four anchors, at each corner of the mesh.

The screenshot shows a software interface with a tabbed window. The 'Anchors' tab is selected. It contains four sections for defining mesh anchors: 'Back left', 'Back right', 'Front left', and 'Front right'. Each section has three input fields for X, Y, and Z coordinates, each with a small icon to its right. At the bottom of the tab is a 'Find anchors' button.

Back left

defines the co-ordinates of the back left point of the mesh

Back right

defines the co-ordinates of the back right point of the mesh

Front left

defines the co-ordinates of the front left point of the mesh

Front right

defines the co-ordinates of the front right point of the mesh

Find anchors button

*As you may not know the co-ordinates, you may use the **Find Anchors** button to see a list of a number of the lowest points on the mesh. For more information see [Find Anchors](#)*

Update Preview button

updates the preview based on the transformation settings

Draw? tick box

whether or not to draw the mesh in the viewer at the bottom

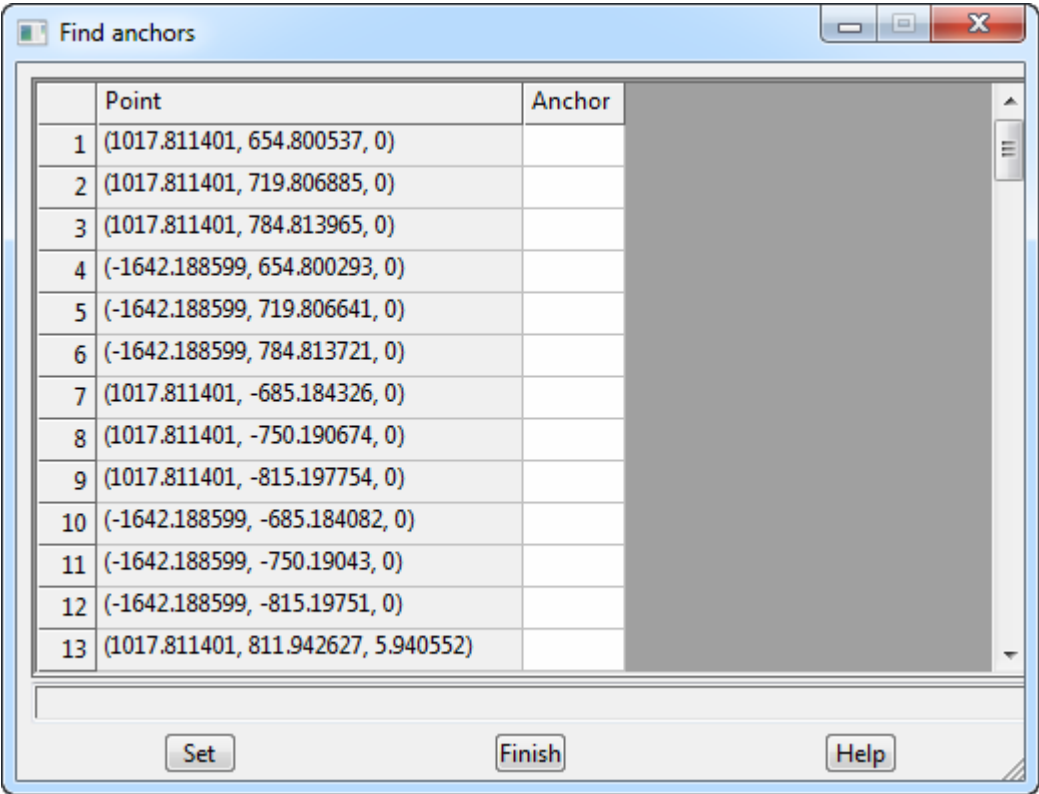

Auto rotate? tick box

whether or not to automatically rotate the mesh

Auto scale? tick box

whether or not to scale the mesh based on supplied transformations

Find Anchors

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Point
a known anchor point

Anchor
the anchor to set. You only need to set four anchors.

Set button
sets the anchor points

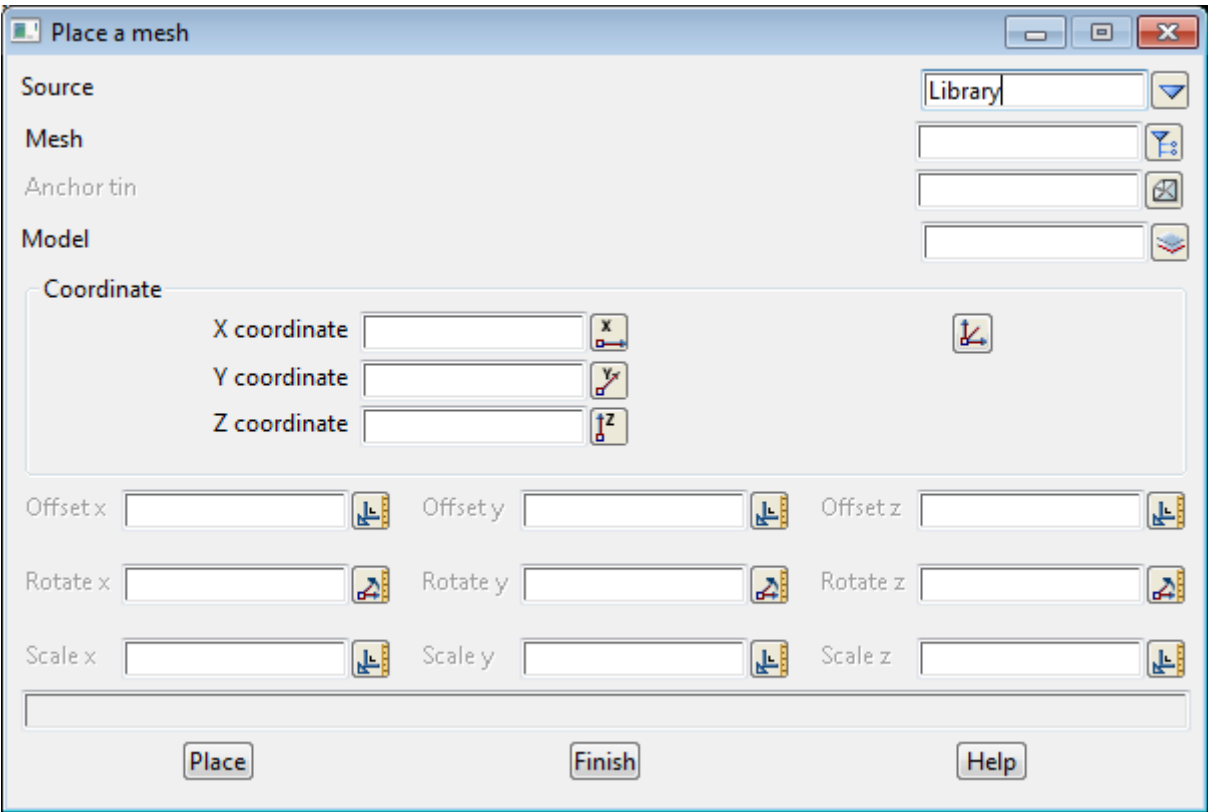

When you select a row, the preview on the [Mesh Library](#) will show a symbol to indicate where that co-ordinate is located.

Place a Mesh

Position of option on menu: View =>Visualisation =>Meshes =>Place a mesh

This panel allows you to place a mesh as the vertex of a super string.

Selecting Place a mesh brings up the Place a mesh panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Source		choice box		Library, File

Whether the mesh comes from the Mesh Library or a separate file

if Sources is Library:

Mesh

the name of the mesh (from the mesh library) to place

Anchor tin

an optional tin to anchor the mesh to

if Source is File:

Mesh file

the file (containing the mesh definition) to use

Model model box

the model to place the mesh in

Coordinate

the co-ordinate to place the mesh at

Offset x

an optional offset along the x axis to apply

Offset y

an optional offset along the y axis to apply

Offset z

an optional offset along the z axis to apply

Scale x

an optional scale to apply to the x scale of the object

Scale y

an optional scale to apply to the y scale of the object

Scale z

an optional scale to apply to the z scale of the object

Rotate x

an optional rotation around the x axis

Rotate y

an optional rotation around the y axis

Rotate z

an optional rotation around the z axis

Place button

places the mesh

Convert to 12dMesh Format

Position of option on menu: View =>Visualisation =>Meshes =>Convert to 12dmesh

This option converts most files in OBJ format to the 12dmesh format.

Selecting Convert to 12dmesh brings up the **Convert to 12dmesh format** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
OBJ file <i>the OBJ file to convert to 12dmesh format.</i>	file box		available *.obj files
12dmesh file <i>the name of the new .12dmesh file.</i>	file box		available *.12dmesh files
Convert <i>converts the OBJ file.</i>	button		

Timelines

Group Timeline

The editor for a group timeline, which consists of other timelines.

The fields and buttons used in the panel have the following functions.

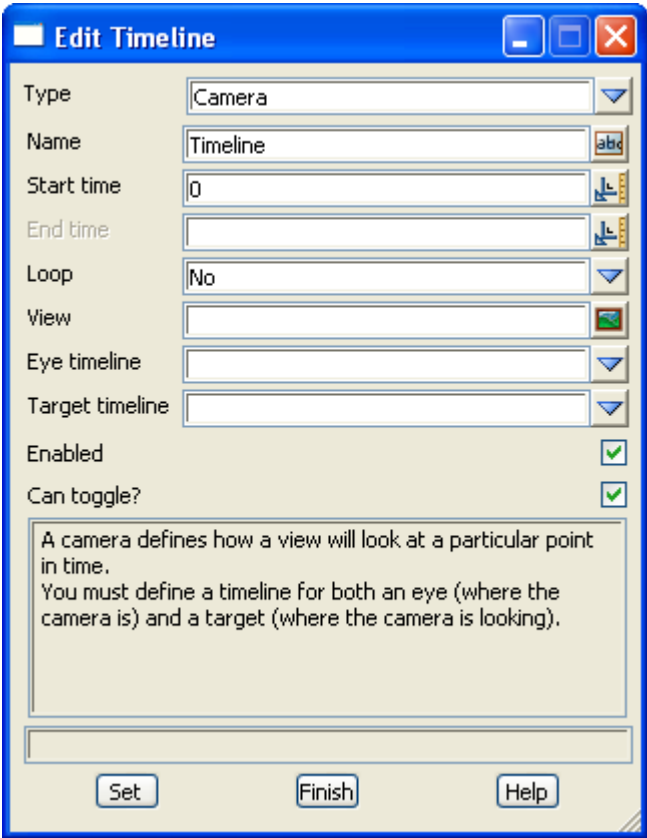

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

There are no fields other than common fields and buttons. For more information on common fields and buttons please see [Timeline Common Fields and Buttons](#).

Camera Timeline

The **Camera Timeline** directs a perspective view where to look at a given time. It is defined by two other timelines - an **eye** and a **target**. There are several different types of timelines available for both **eye** and **target**. When the details are set, two children timelines will be created, one for the **eye** and one for the **target**.

The details for how the **eye** and **target** should behave should be accessed through these two children timelines.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the view to control</i>	view box		
Eye timeline <i>the type of eye timeline</i>	choice box		

- Linear Path* - See [Linear Path Timeline](#)
- Chainage String* - See [Chainage Timeline](#)
- Fixed Position* - See [Fixed Position Timeline](#)
- Transformation String* - See [Transformation String Timeline](#)
- Offset from Target* - Offsets the eye from the target. See [Manual Transform Timeline](#)
- Transform Reference* - See [Transform Reference Timeline](#)

Floating Camera - See [Floating Eye Timeline](#)

Target timeline choice box
the type of target timeline

Linear Path - See [Linear Path Timeline](#)

Chainage String - See [Chainage Timeline](#)

Fixed Position - See [Fixed Position Timeline](#)

Transformation String - See [Transformation String Timeline](#)

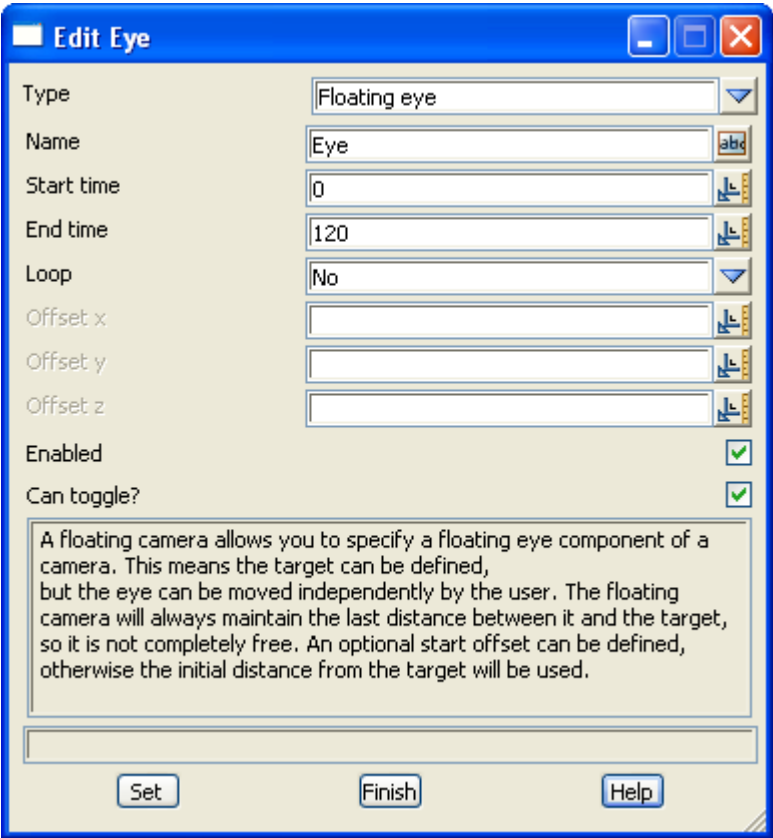

Offset from eye - Offsets the target from the eye. See [Manual Transform Timeline](#)

Transform Reference - See [Transform Reference Timeline](#)

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Floating Eye Timeline

A **Floating Eye** allows the camera to be fixed on a known target, but the user can retain control over the position of the eye. The **Floating Eye** is a camera type. It can only be accessed by first setting the eye type of a camera to **Floating Camera**.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Offset x

an optional x offset from the target. If not set, the current x offset from the target will be used.

Offset y

an optional y offset from the target. If not set, the current y offset from the target will be used.

Offset z

an optional z offset from the target. If not set, the current y offset from the target will be used.

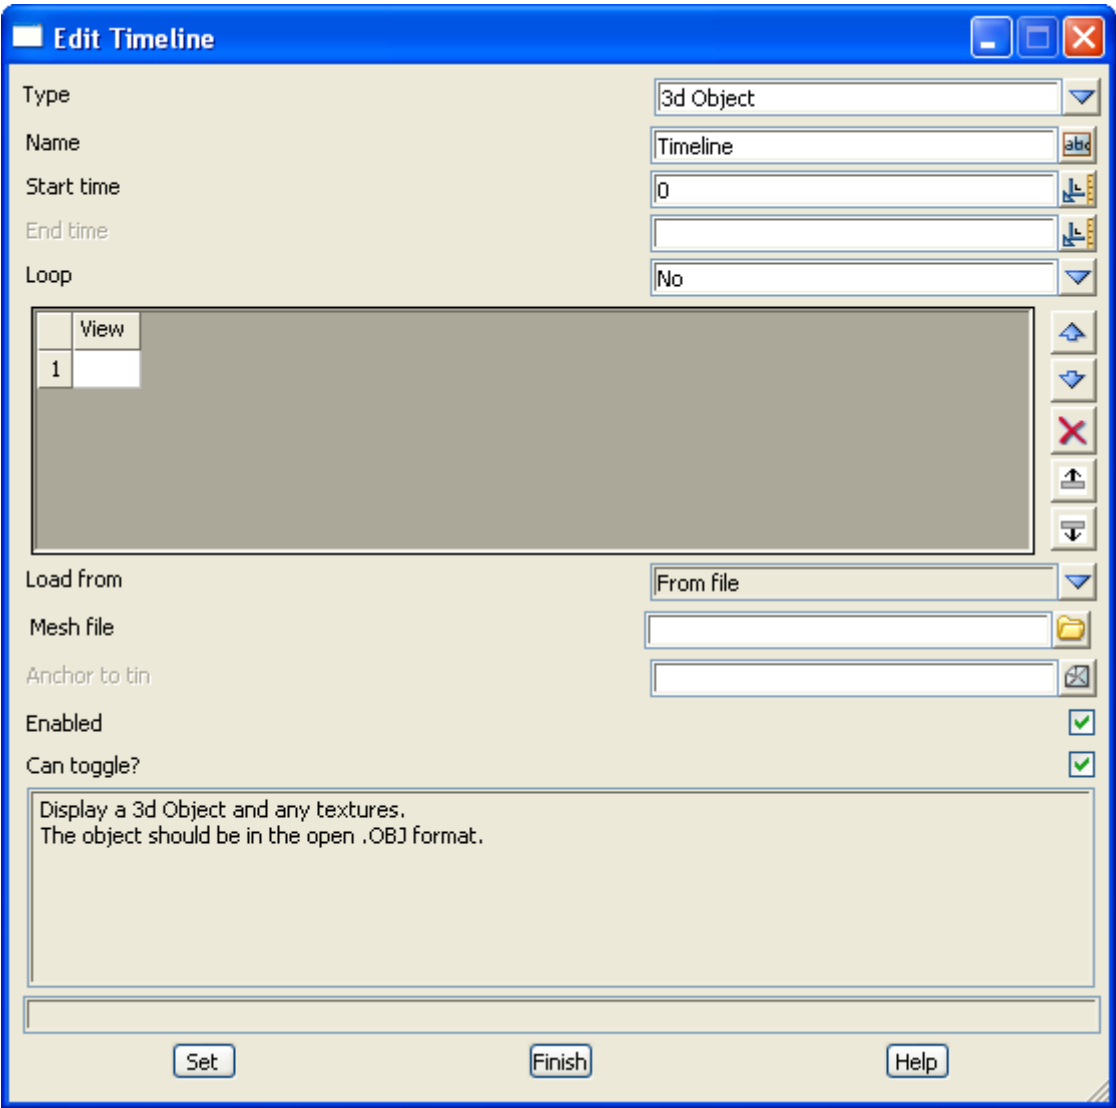

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

3d Object Timeline

The **3d Object Timeline** draws a 3d object on any number of views at a given time. A 3d object may include a mesh from another package, in the OBJ (Alias Wavefront) format.

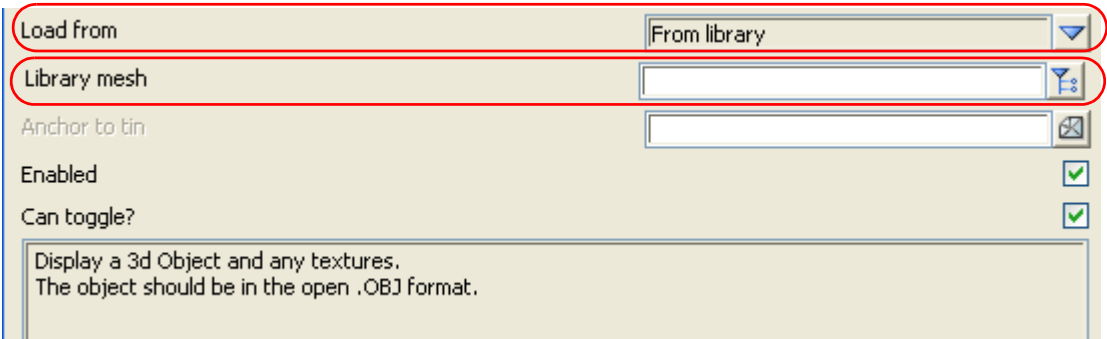

Creating a **3d Object Timeline** will create two sub timelines automatically - the initial transformation and other transformations.

Initial transformations should be used to convert your mesh into world co-ordinates, as meshes may come from a number of packages with arbitrary scale, offsets or rotations.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View Grid <i>the list of OpenGL perspective views to draw on</i>			
Load From <i>whether to load from a known file or the library</i>	choice box		From library, From file
Mesh file <i>when loading from file, the mesh file to use</i>	file		
Anchor to tin <i>a tin to anchor the mesh to - useful for vehicles on terrain. Note that this will only work for a library mesh that has anchor points defined.</i>			

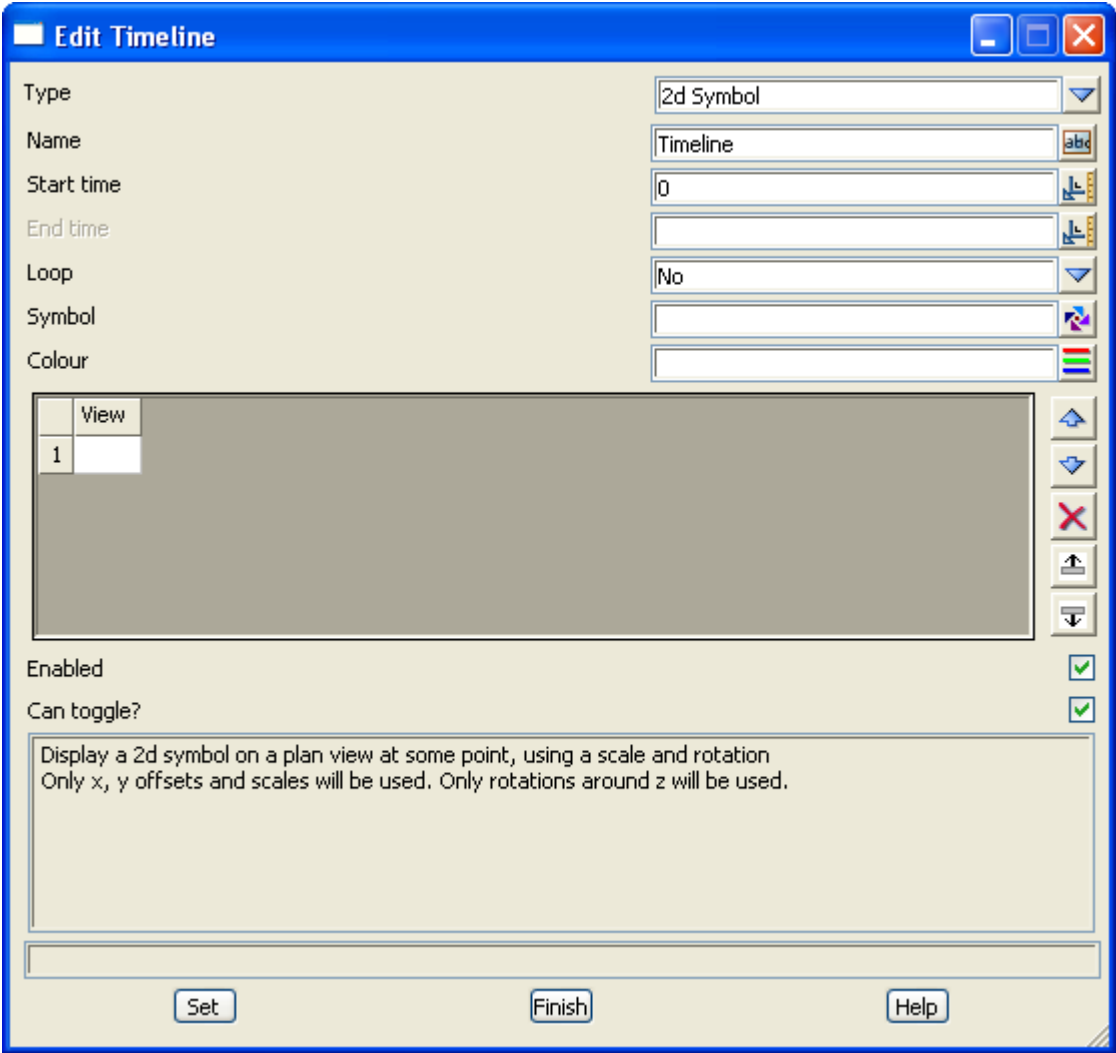

Library mesh

*this field is displayed when **From Library** is selected from the **Load From** choice box.
when loading from a library, the mesh to use*

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

2d Symbol Timeline

This allows you to define the settings for drawing a 2d symbol on a number of plan views.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Symbol <i>the symbol to draw</i>	symbol box		
Colour <i>the colour for the symbol</i>	colour box		
View grid <i>the list of plan views to draw the symbol</i>			

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Linear Path Timeline

This editor defines the settings for a **Linear Path Timeline**. A **Linear Path Timeline** returns the position and direction on a string linearly, to fit the amount of time supplied.

Help

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Path string	string select		

the string to follow

Start chainage

the optional start chainage

End chainage

the optional end chainage

Offset

an offset from the path string

Reverse? tick box

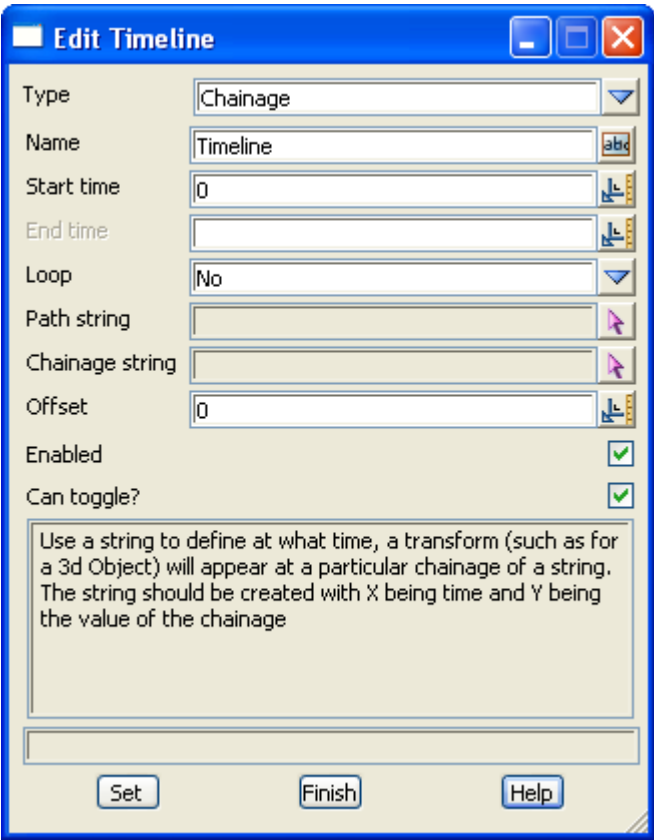

whether or not to reverse the direction (start at end)

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Chainage Timeline

This editor allows you to define the settings for a **Chainage Timeline**. The **Chainage Timeline** follows a string or path by querying another string that defines the chainage to use at a given time. For the **Chainage Timeline**, the chainage string should be defined with X being time and Y being the chainage.

The **Chainage Timeline** will return the position and direction at the current chainage of the path string.

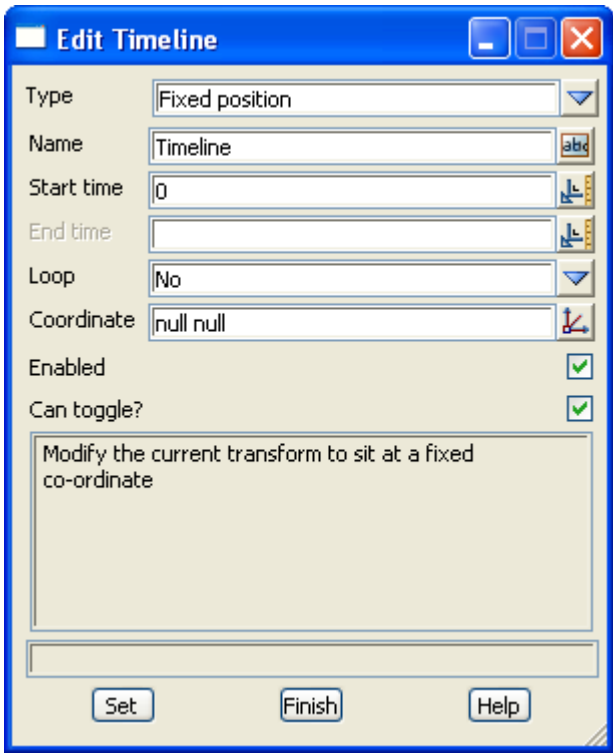

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Path string <i>the string to follow</i>	string select		
Chainage string <i>the string that defines what chainage to use at what time</i>	string select		
Offset <i>an offset from the path string</i>	input		

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Fixed Position Timeline

This editor allows you to define the settings for a **Fixed Position Timeline**. A **Fixed Position Timeline** will always return the supplied position.

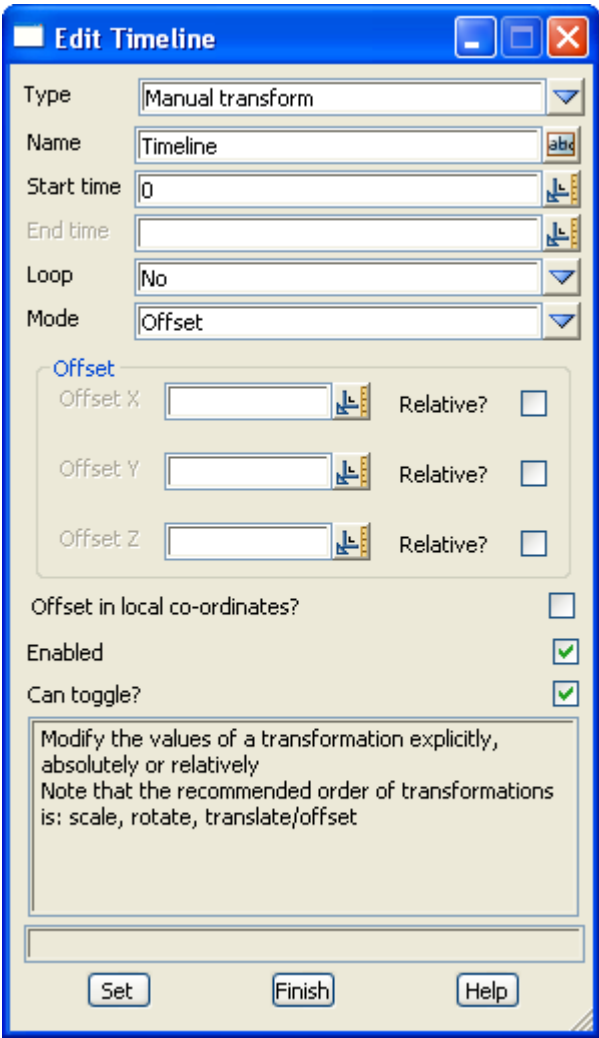

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Coordinate <i>the coordinate of the fixed position</i>			

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Manual Transform Timeline

This editor defines the settings for a **Manual Transform Timeline**. A manual transform is either an offset, rotation or scale on the current transformation being applied to a timeline.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box		Offset, Rotate, Scale
<i>the mode of transformation: offset, rotate or scale</i>			
Offset defines the parameters for an offset transformation			

Offset X

the optional offset to x

Relative?

tick box

whether or not Offset X is a relative or absolute offset

Offset Y

the optional offset to y

Relative?

tick box

whether or not Offset Y is a relative or absolute offset

Offset Z

the optional offset to z

Relative?

tick box

whether or not Offset Z is a relative or absolute offset

Offset in local co-ordinates tick box

whether or not the offset should be applied before or after the transformation to local co-ordinates

Rotate defines the parameters for a rotation transformation
Rotate X

the optional rotation around the x axis

Relative?

tick box

whether or not the X rotation is relative or absolute

Rotate Y

the optional rotation around the y axis

Relative?

tick box

whether or not the Y rotation is relative or absolute

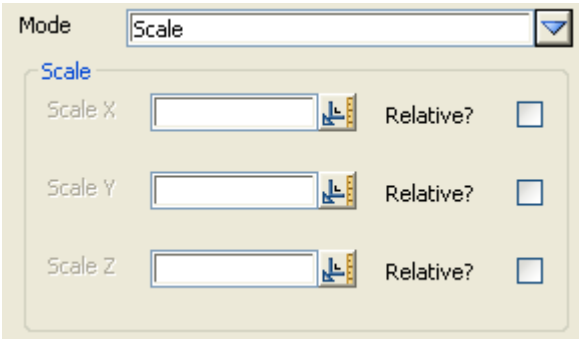

Rotate Z

the optional rotation around the z axis

Relative? tick box

whether or not the Z rotation is relative or absolute

Scale defines the parameters for a scaling transformation

Scale X

the optional x scale

Relative? tick box

whether or not the x scale is relative

Scale Y

the optional y scale

Relative? tick box

whether or not the y scale is relative

Scale Z

the optional z scale

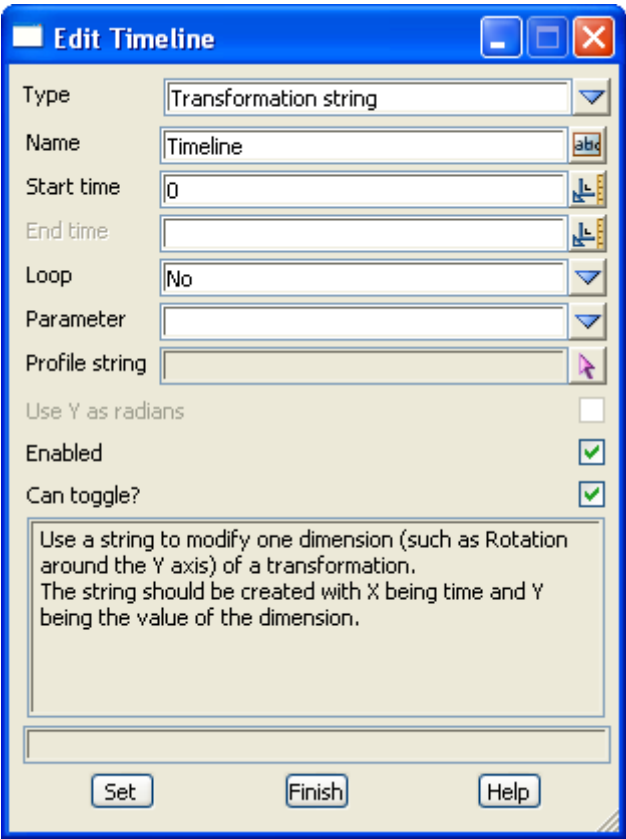

Relative? tick box

whether or not the z scale is relative

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Transformation String Timeline

The **Transformation String Timeline** modifies one parameter of a transformation, based on a profile string. The profile string should be created such that x is time and y is the value of the parameter.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter <i>the parameter to update.</i>	choice box		

Options are: Offset X, Offset Y, Offset Z, Rotate around X, Rotate around Y, Rotate around Z, Scale X, Scale Y, Scale Z

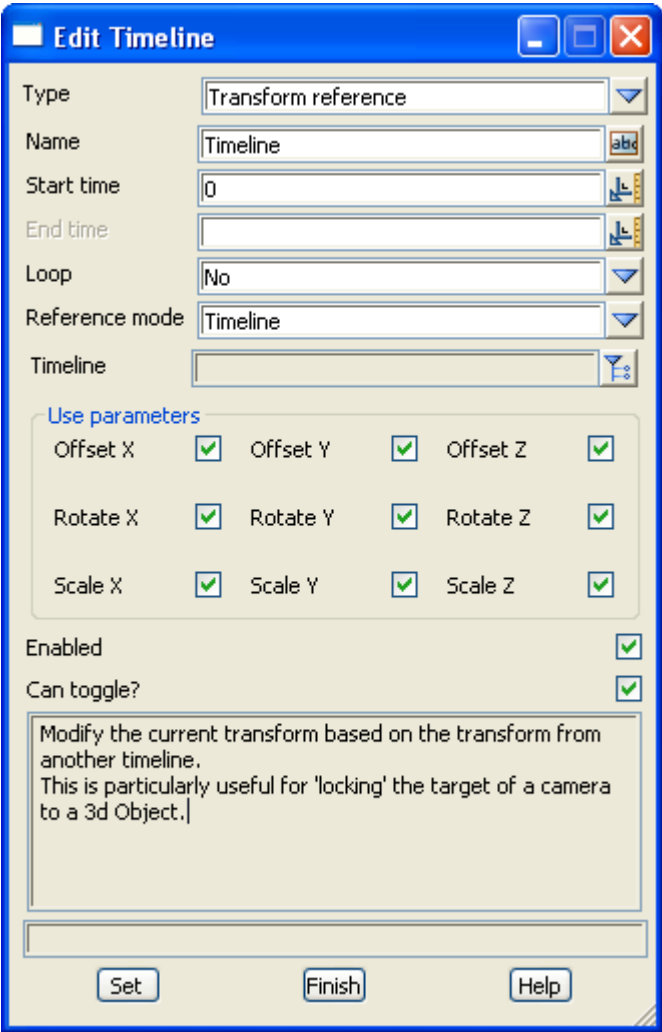

Profile string <i>the profile string to use to modify the parameter</i>	string select
-----------------------------------------------------------------------------------	---------------

Use Y as Radians <i>enabled when the parameter is a rotation parameter.</i> <i>if ticked, the value of Y will be considered to be radians rather than degrees.</i>	tick box
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Transform Reference Timeline

This editor defines the settings for a **Transform Reference Timeline**. A **Transform Reference Timeline** uses the transformation as supplied by another timeline. It is useful, for example, to make the target of a camera follow a vehicle, as it will return all the transformations from the reference timeline.

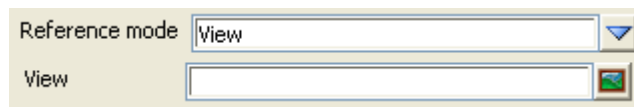

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Reference mode	choice box		Timeline, View
<i>whether to reference another timeline or a view</i>			

Timeline

the timeline to reference, if **Reference mode** is set to **Timeline**

View

the view to reference, if **Reference mode** is set to **View**

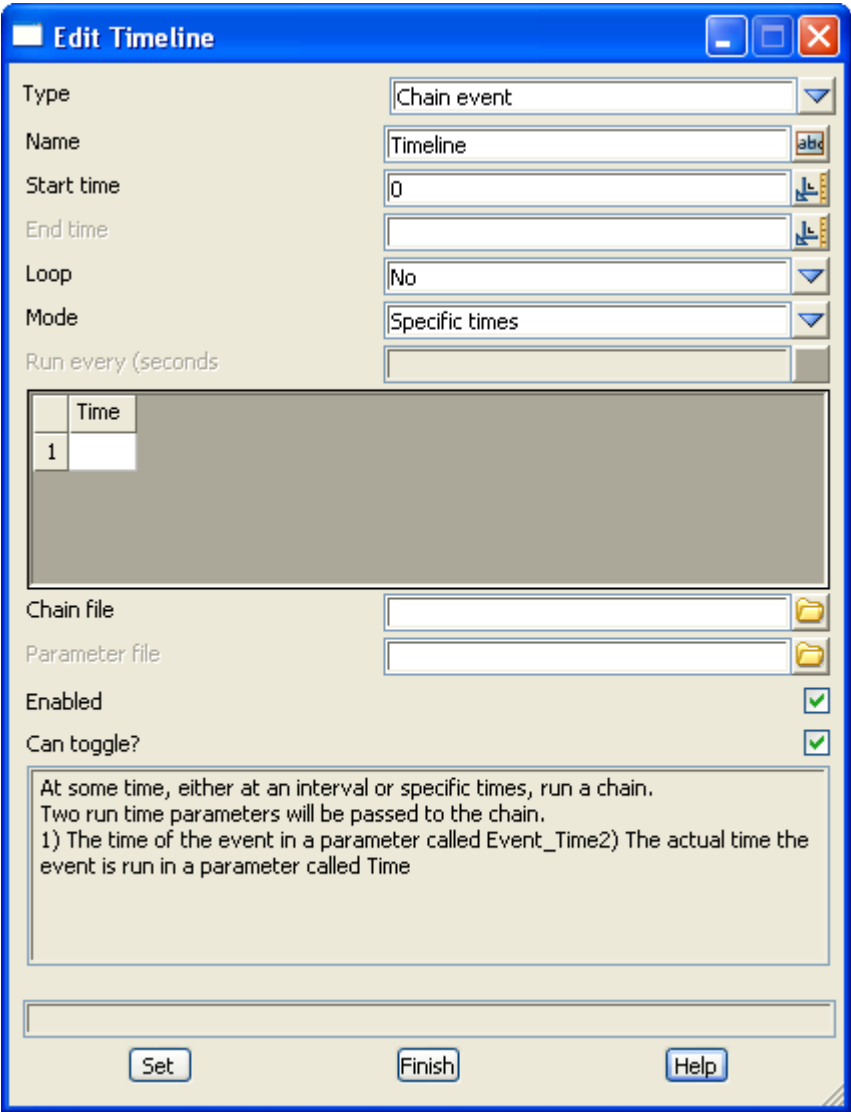

Use Parameters

defines which of the parameters to use from the transformation

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Chain Event Timeline

This allows you to define the settings for a **Chain Event Timeline**. A **Chain Event Timeline** runs a chain at discrete intervals or specific times.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Mode		choice box		Specific times, On interval
<i>the mode - either specific times, or on an interval</i>				
Run every (seconds)				
<i>if mode is set to On Interval, the interval, in seconds, between runs of the chain</i>				
Time Grid				
<i>if mode is set to Specific times, the list of times, in seconds, the chain should be run</i>				
Chain file		file		
<i>the chain file to run</i>				
Parameter file		file		
<i>the optional parameter file to pass to the chain</i>				

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Macro Event Timeline

This allows you to define the settings for a **Macro Event Timeline**. A **Macro Event Timeline** runs a macro at discrete intervals or specific times.

Edit Timeline

Type

Macro event

☒

Can toggle?

☒

At some time, either at an interval or specific times, run a macro.
Two command line arguments will be passed down to the macro.
1) The time of the event
2) The actual time the event is run

Set

Finish

Help

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box		Specific times, On interval
<i>the mode - either specific times, or on an interval</i>			
Run every (seconds)			
<i>if mode is set to On interval, the interval, in seconds, between runs of the macro</i>			
Time Grid			
<i>if mode is set to Specific times, the list of times, in seconds, the macro should be run</i>			

Macro file file

the macro file to run

Arguments

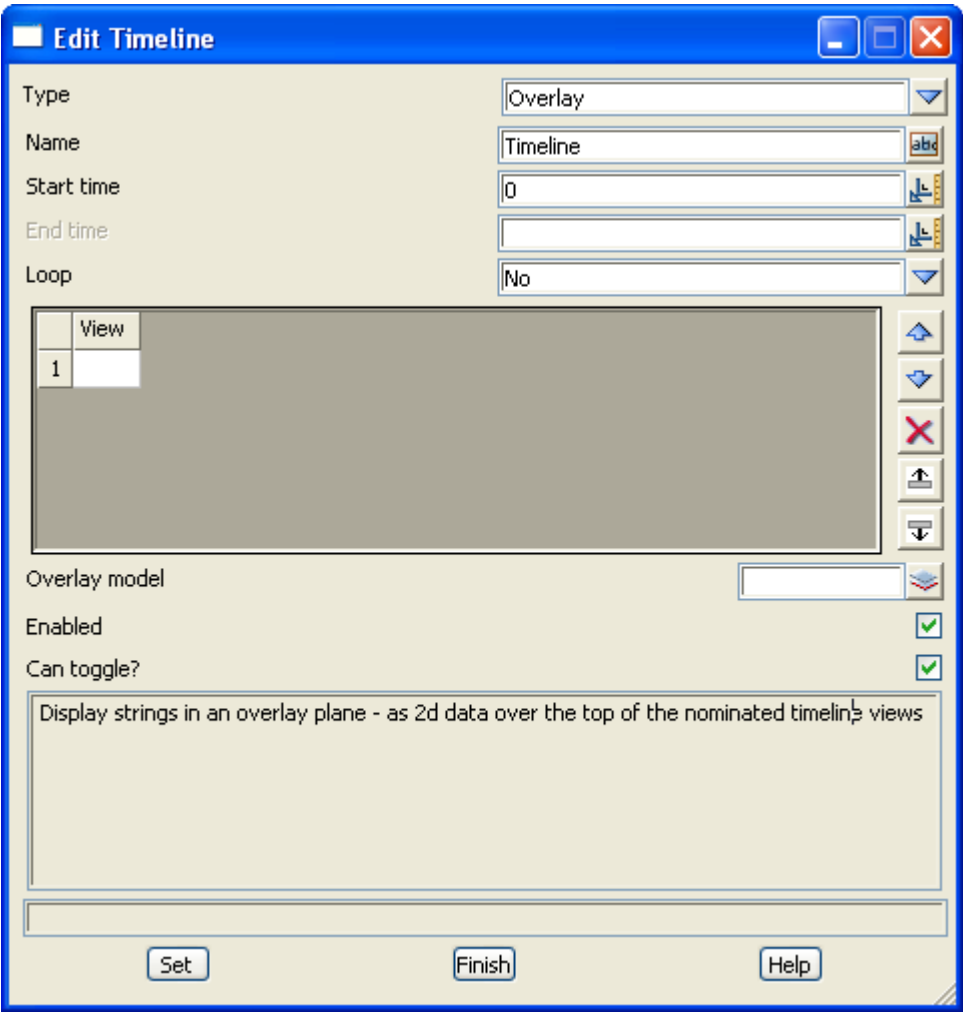

the optional arguments to pass to the macro

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Overlay Timeline

This editor defines the setting for an **Overlay Timeline**. An **Overlay Timeline** draws a model as an overlay, or on a 2 dimensional plane, on top of a number of perspective views. Any children timelines will also appear in the overlay plane.

An **Overlay Timeline** is quite useful for showing diagnostic or other information.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

View Grid

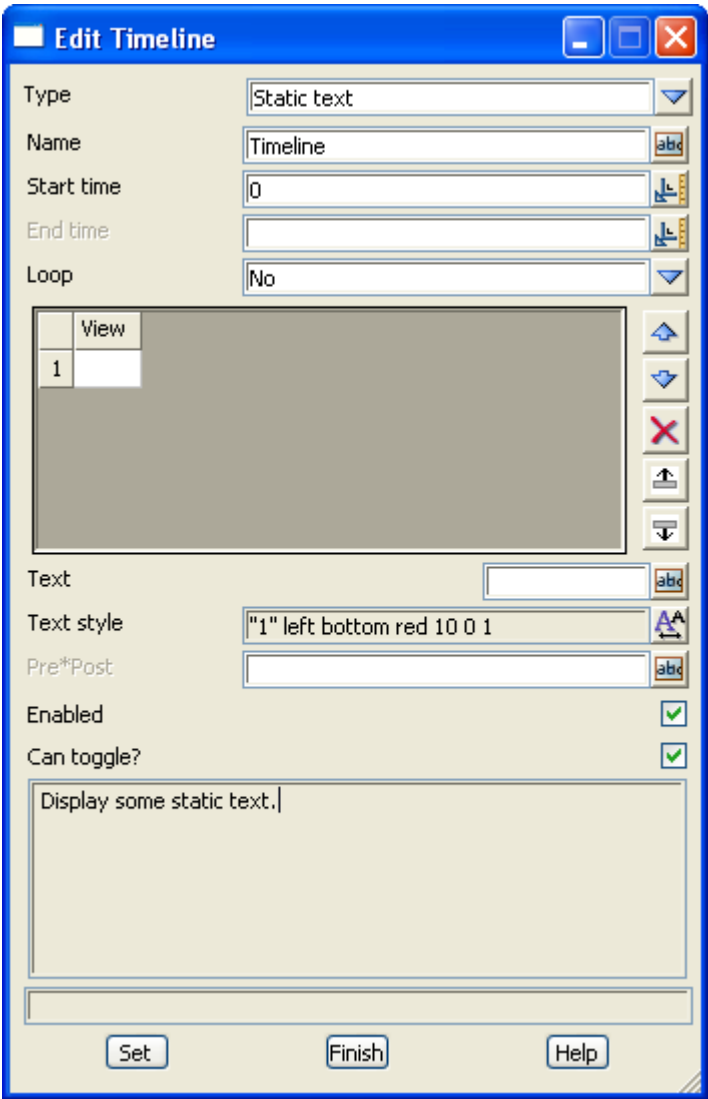

the set of views to draw the overlay plane on

Overlay model model box
the model to draw as an overlay plane

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Static Text Timeline

This editor edits the settings for a **Static Text Timeline**. A **Static Text Timeline Draws** user defined text on a perspective view.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View Grid <i>the list of perspective views to draw on</i>			
Text <i>the text to draw</i>			
Text style			

the style of the text

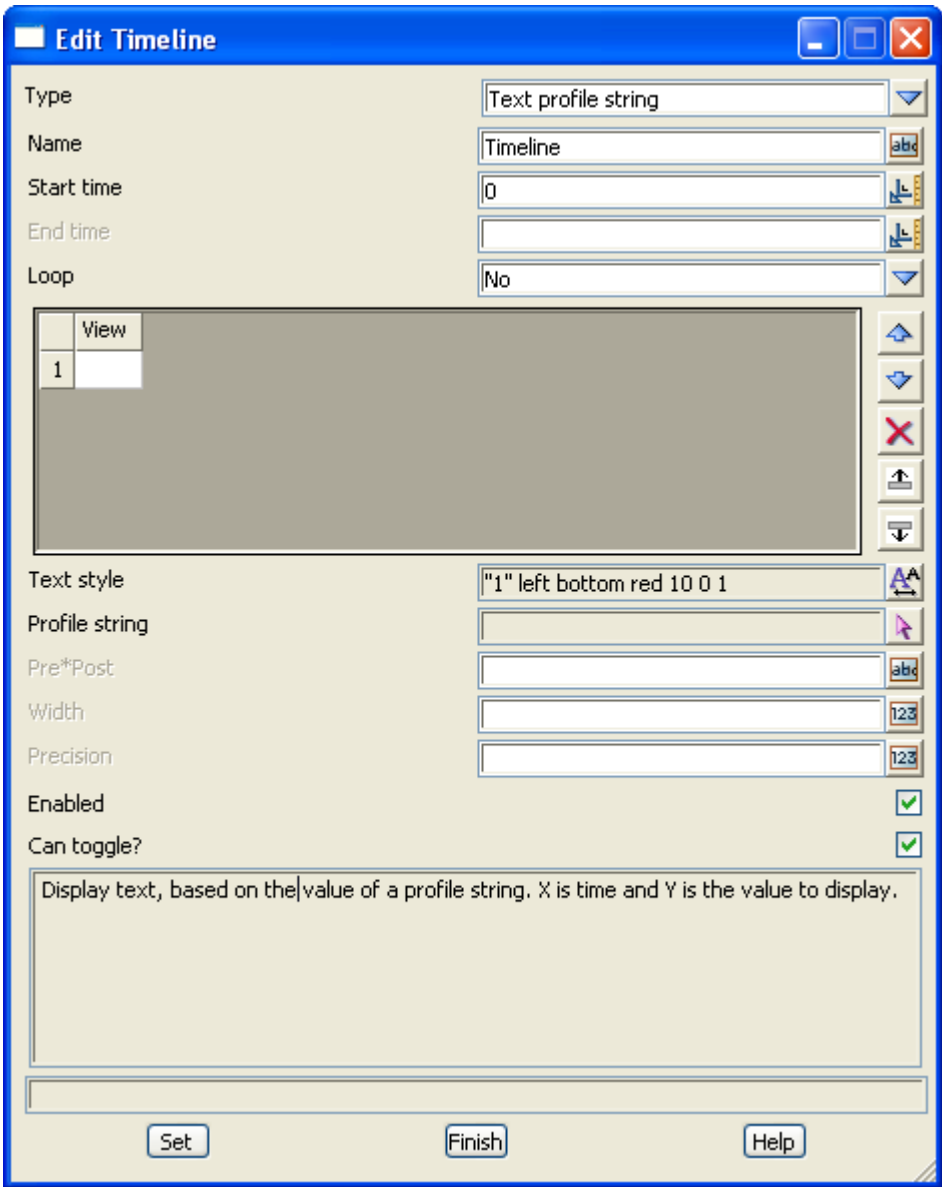

Pre*Post

*an optional pre*post to apply to the text*

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Text Profile String Timeline

This edits the settings for a **Text Profile String Timeline**. A **Text Profile String Timeline** displays text as defined by a profile string, at each time step in the timeline. The profile string should be created with X being time and Y being the value to display.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

View grid

the list of OpenGL views to draw text on

Text style

the style of the text

Profile string

string select

the profile string to use

Pre*Post

*an optional Pre*Post to be applied to the text*

Width

an optional width of the text

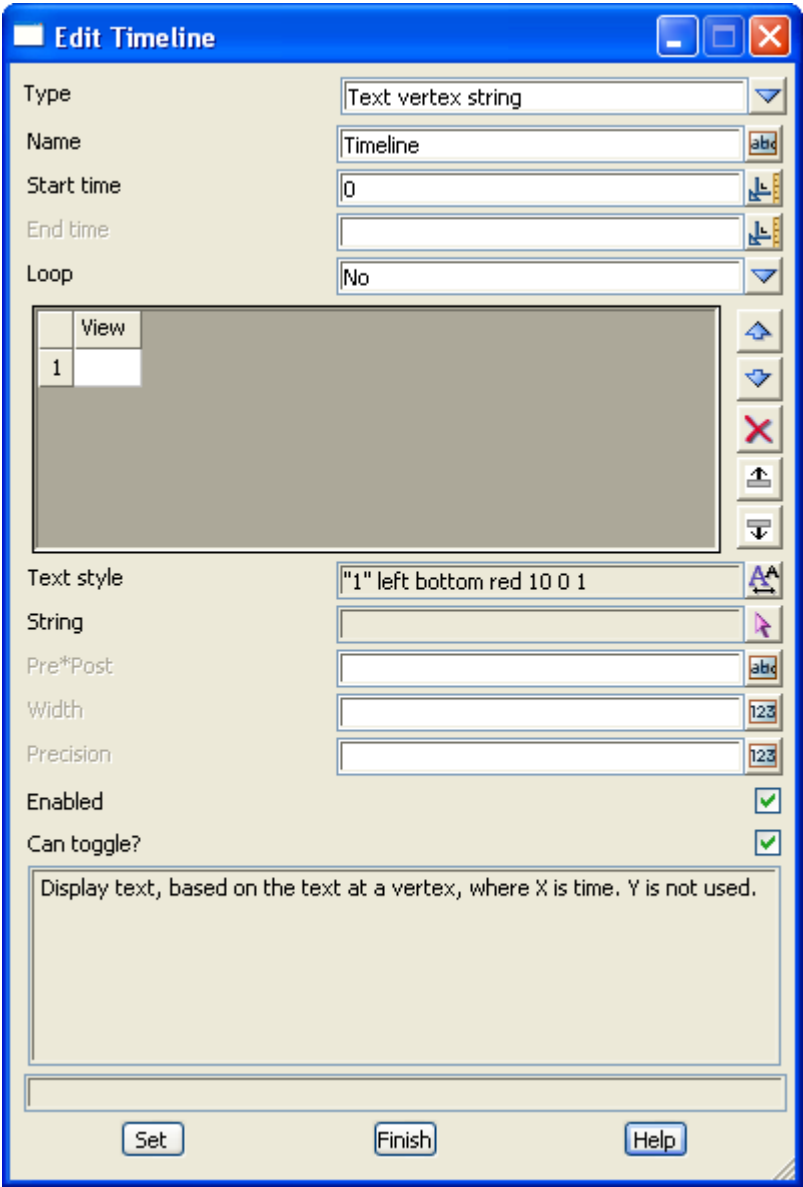

Precision

an optional precision for the text - used when displaying variables of type Real

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Text Vertex String Timeline

This editor allows you to define the settings for a **Text Vertex String Timeline**. A **Text Vertex String Timeline** draws the text on the vertex of a supplied profile string at the given time. The string should be created such that X is time.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

View Grid

the list of OpenGL views to draw the text on

String

string select

the string to draw

Text style

the style of the text

Pre*Post

*an optional Pre*Post to be applied to the text*

Width

an optional width of the text

Precision

an optional precision for the text - used when displaying variables of type Real

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Text Variable Timeline

This edits the settings for a **Text Variable Timeline**. A **Text Variable Timeline** displays text on a number of OpenGL perspective views, by specifying a variable or property of another timeline.

Each timeline publishes a number of variables or properties that can be used - such as start time, end time or other context specific items.

The 'Edit Timeline' dialog box is shown with the following fields and controls:

- Type:** Text variable
- Name:** Timeline
- Start time:** 0
- End time:** (empty)
- Loop:** No
- View:** A table with one row and one column, containing the number '1'.
- Source timeline:** (empty)
- Variable:** (empty)
- Text style:** "1" left bottom red 10 0 1
- Pre*Post:** (empty)
- Width:** 123
- Precision:** 123
- Enabled:** ☒
- Can toggle?:** ☒
- Description:** Display text, based on some variable of another timeline.
- Buttons:** Set, Finish, Help

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View grid			
<i>the list of OpenGL views to draw the text on</i>			
Source timeline			
<i>the timeline whose variable you wish to draw as text</i>			
Variable	choice box		
<i>the variable to be drawn</i>			
Text style			
<i>the style of the text</i>			
Pre*Post			
<i>an optional Pre*Post to be applied to the text</i>			
Width			
<i>an optional width of the text</i>			
Precision			
<i>an optional precision for the text - used when displaying variables of type Real</i>			

For all other fields and buttons please see [Timeline Common Fields and Buttons](#).

Edit a Timeline

Position of option on menu: View =>Visualisation =>Timelines => Edit
This panel creates a new timeline file or edits an existing one.
Selecting Edit brings up the Edit a timeline panel.

The fields and buttons used in the panel have the following functions.

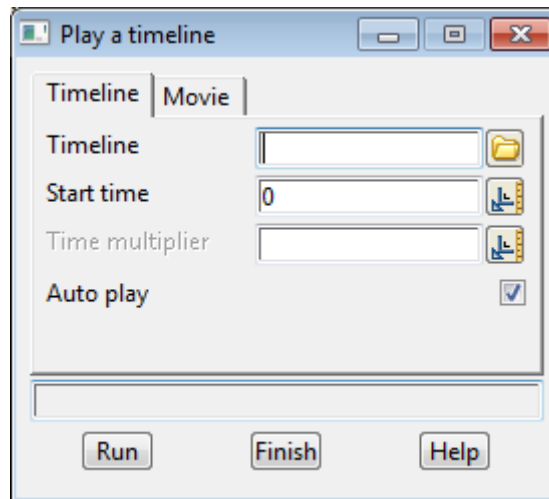

Field Description	Type	Defaults	Pop-Up
Timeline	file		
<i>the file to edit or create</i>			
Create	button		
<i>creates the new file</i>			
Edit	button		
<i>edits an existing timeline file</i>			

Play a Timeline

Position of option on menu: View => Visualisation => Timelines => Play

This panel plays a timeline file.

Selecting **Play** brings up the **Play a timeline** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Timeline tab

Timeline		file		
-----------------	--	------	--	--

the timeline file to run

Start time

the time at which to start playing the file

Time multiplier

an optional multiplier (for example, setting this to 2 would run the timeline at 2x, meaning each second would take half a second to play)

Auto play		tick box		
------------------	--	----------	--	--

whether or not to start playing the timeline when it is run

Movie tab

Create movie?		tick box		
----------------------	--	----------	--	--

if ticked, a movie is generated

Movie file		file box		
-------------------	--	----------	--	--

name of the movie file

available *.avi files

Record whole application		tick box		
---------------------------------	--	----------	--	--

if ticked, the whole application will be recorded, rather than just a selected view

View		view box		
-------------	--	----------	--	--

(only if Record whole application is not ticked) the view of which to record the movie

Frames per second		number box	10	
--------------------------	--	------------	----	--

the number of frames per second

Buttons at bottom

Run

button

runs the timeline

Timeline Playback Control Bar

The timeline playback control bar appears when a timeline is running. It offers playback controls while the timeline runs.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Restart				
<i>Restarts the timeline</i>				

Step back				
<i>Steps back by the nominated time step (the input box on the right)</i>				

Play / Pause	/			
<i>Plays or pauses the playback of the timeline</i>				

Stop				
<i>stops running the timeline</i>				

Step forward				
<i>Steps forward by the nominated time step (the input box on the right)</i>				

Time multiplier				
<i>Sets the time multiplier. For more information on the Change Timeline Multiplier panel, please see Change Timeline Multiplier</i>				

Interactive camera				
<i>Defines interactive cameras at runtime</i>				
<i>For more information on the Timeline Camera panel, please see Timeline Camera</i>				

Toggle				
<i>Toggles timelines enabled state on or off. For more information on the Enable/ Disable Timelines panel, please see Enable / Disable Timelines</i>				

Change Timeline Multiplier

This sets the current time multiplier for the timeline. For example, setting this to 2 would run the timeline at 2x, meaning each second would take half a second to play.

Clicking  on the **Timeline Playback Control Bar** brings up the **Change timeline multiplier** panel.

The fields and buttons used in the panel have the following functions.

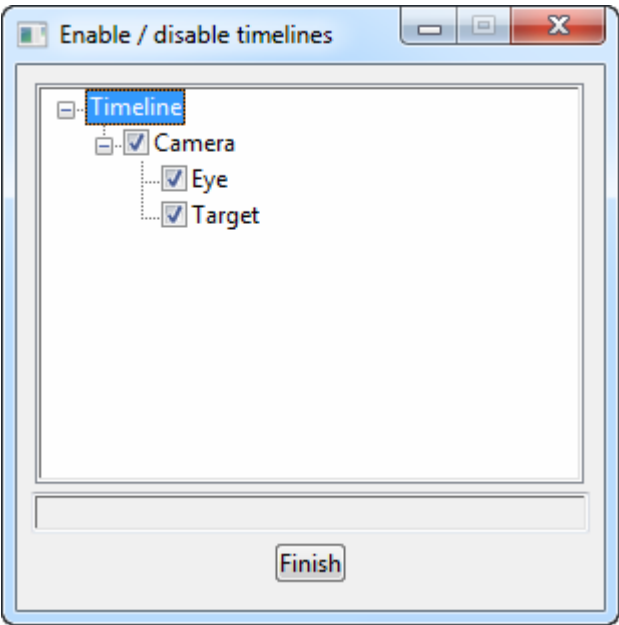

Field Description	Type	Defaults	Pop-Up
Multiplier <i>the multiplier to apply</i>	input		
Set <i>sets the multiplier</i>	button		

Enable / Disable Timelines

This panel provides a list of the timelines currently running and allows you to enable or disable them quickly. They can only be enabled or disabled if they are set to **Can toggle?**. Note that if you disable a parent, all child timelines will also be disabled. The **Can toggle?** tick box is found on the editor for each timeline.

To disable, simply tick off the required timeline and vice versa to enable them again.

Clicking  on the **Timeline Playback Control Bar** brings up the **Enable/ disable timelines** panel.

Timeline Camera

This panel allows you to define cameras for a supplied view during run time.
Clicking  on the **Timeline Playback Control Bar** brings up the **Timeline Camera** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View <i>the perspective view to control</i>	view box		
Target <i>a target timeline to reference</i>	choice box		

Eye Mode

choice box

Fixed, Offset, Floating

the mode for the eye of the camera, either fixed, offset or floating

Fixed

Position X coordinate
the x coordinate of the fixed eye

Position Y coordinate
the y coordinate of the fixed eye

Position Z coordinate
the z coordinate of the fixed eye

Use view eye *button*
loads the eye settings from the supplied view

Offset

Offset X
the x offset of the eye from the target

Offset Y
the y offset of the eye from the target

Offset Z
the z offset of the eye from the target

Floating

Floating mode sets the timeline camera into a floating mode. This means the camera will be set to a fixed target, but the user will retain control over the camera. When started, the camera will start at the current offset from the target.

Set

button

Creates and sets the details for the camera

Quick Timeline Create

Position of option on menu: View =>Visualisation =>Timelines => Quick timeline

This option creates a timeline along a selected Drive String, with the choice of a set of vehicles and/or a floating camera.

An optional Start and End chainage can be entered to limit the length of travel.

Enter a speed for the drive and an anchor tin for the four tyre anchor points of the vehicles.

The Calc Time button will calculate, in seconds, the travel time Duration at the selected speed.

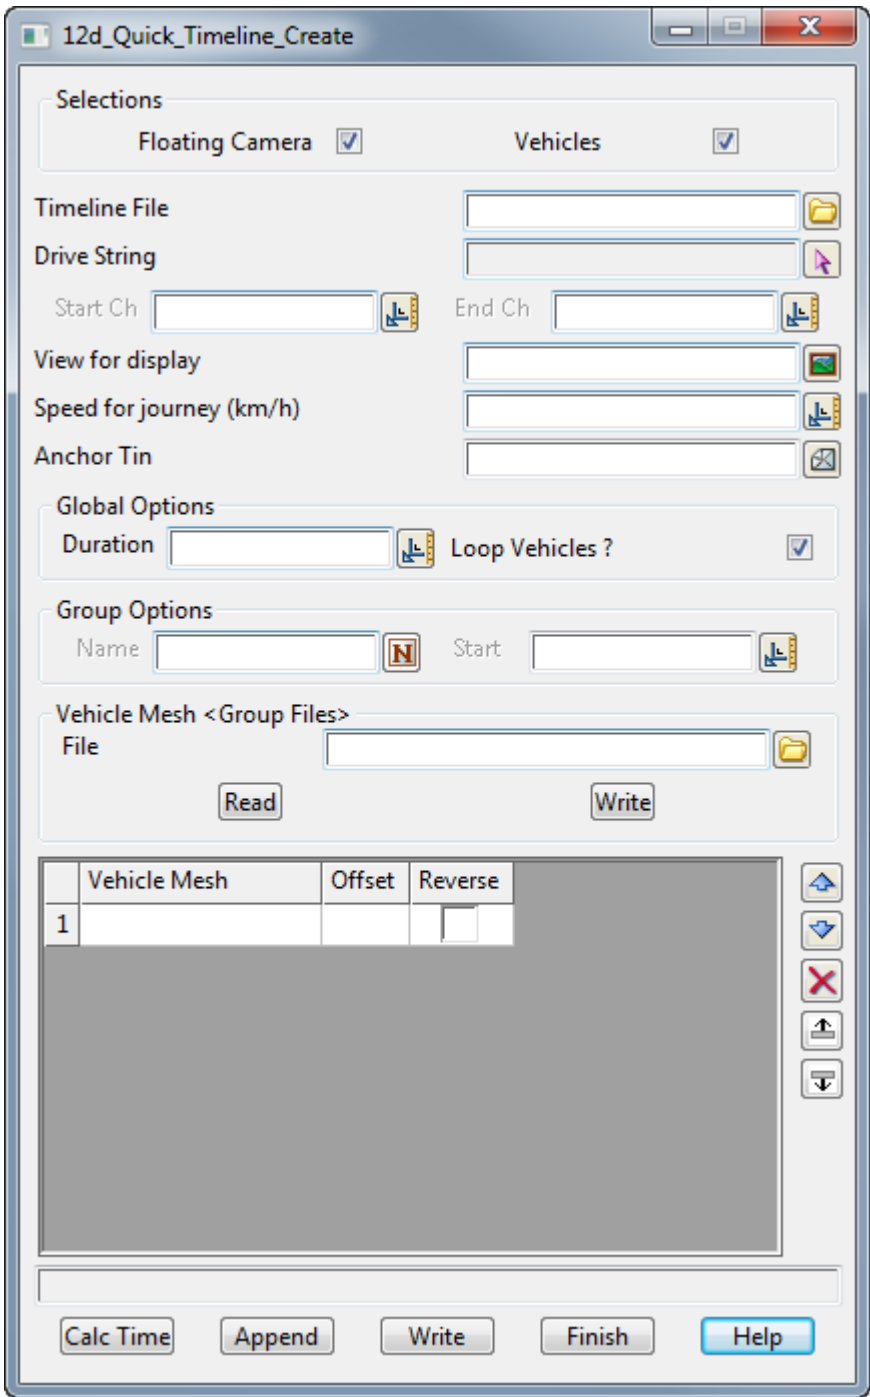

Vehicles are defined as meshes and can be Grouped together under a Name and a start time (in seconds)....optional.

Upon completing your selections (Drive String, Speed, Vehicles etc).... Save the selection using the Append button, and Write the file out.

Note: More than one Drive string and set of vehicles can be selected, appended and finally all written out in the same timeline file. Depending on the location of your drive string selection and its direction, you may have to enter an offset for the vehicles, and/or tick Reverse.

Once the timeline is written, it can be played under View=>Visualisation=>Timelines=>Play

Selecting **Quick timeline** brings up the 12d Quick timeline create panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Selections

Floating Camera	tick box	ticked
------------------------	----------	--------

A floating camera allows you to specify the floating eye component of a camera.

The target is defined as the Drive String, but during the playing of the timeline, the eye can be moved independently by the user (e.g. using the Orbit).

Vehicles	tick box	ticked
-----------------	----------	--------

Ticking this option on turns on appropriate fields for setting up timelines for vehicles.

Timeline File file box available files

If non-blank, entry used as timeline file name.

Drive String string select

If selected, string is used as timeline drive string and timeline duration can be calculated.

If non-blank, entry used as timeline file name.

Start Ch real

If non-blank, entry used as start of timeline...optional.

End Ch real

If non-blank, entry used as end of timeline...optional.

View for display view box available views

If non-blank, entry used to play back the timeline (an Open GL Perspective View is required).

Speed for journey (km/h) real

If non-blank, entry used to calculate the timeline duration in seconds.

Anchor Tin tin box

If non-blank, entry used as the location for the four vehicle tyre points.

Global Options

Duration real

If non-blank, entry used as timeline length (can be calculated initially via the Calc Time button).

Loop Vehicles? tick box ticked

If ticked, the set of vehicles will be replayed during the timeline.

Group Options

Name name box

If non-blank, entry used for the grouping of the vehicles under that name and can be toggled off during the playing of the timeline...optional.

Start real

If non-blank, entry used for start time of the group (in seconds)...optional.

Vehicle Mesh <Group Files>

File file box

If non-blank, entry used for populating the grid selection of vehicle meshes.

Refer library for standard examples.

Read button

Reads in the file above and populates the vehicle grid.

Write button

Writes out the data currently in the vehicle grid to the file.

Vehicle Mesh Grid:

Vehicle Mesh

Vehicle choices (can be viewed under View=>Visualisation=>Meshes=>Mesh library

Offset Real

If non-blank entry used for offset from drive string

Reverse tick box not ticked

If ticked, vehicles will run in the opposite direction to the drive string direction.

Calc Time button

Calculates the time of travel in seconds using the Drive String and Speed of journey.

Append button

One or more timelines (Drive String, speed, vehicle etc) can be appended, before finally being written out to the timeline file.

Write button

After appending, the Timeline File is written out.

Utilities

Position of menu: View =>Visualisation =>Utilities

The Utilities walk-right menu is

Visualise Utilities	
Clouds	create box of clouds as background
Sky dome	create sky dome of clouds as background
Billboards on strings	change billboards on super strings
Fences	inserting fences
Forest	create forest
Houses	insert houses
Line marking	create strings for line marking
Line marking (New)	
Roadside furniture	insert fences, guard rails, signs, walls etc.
Trees/shrubs	insert trees and shrubs as billboards
Trees/shrubs faces	insert trees and shrubs as faces
Traffic signals	
Colour within polygon	colour within a polygon
Explode (text)	explode text into vectors so it can be draped onto surface
Head to tail faces	
Create plan images from JPEG's	

For the option *Clouds* go to the section

[Explode Text](#) in the chapter [Utilities](#)

[Head to tail faces](#)

[Create Plan Images from JPEG Files](#)

Clouds

Position of option on menu: View =>Visualisation =>Utilities =>Clouds

This option is used to create a square box around the view with the cloud image on the inside of it. From within a scene, this will then appears as a sky with clouds as the background.

On selecting the Clouds option, the Visualisation Clouds panel is displayed:

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model <i>model to place the cloud square in.</i>	model box		available models
Centre of cloud square <i>give the x y z co-ordinates for the centre of the cloud square.</i>	xyz box		position select
Process <i>create the cloud square.</i>	button		

Sky dome

Position of option on menu: View =>Visualisation =>Utilities =>Sky dome

This option reads in a 12da of a triangulation and a raster image to form a dome, that represents the sky.

On selecting the Sky dome option, the **Visualisation Sky Dome** panel is displayed:

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Sky Dome Type	choice box		Drop down selection available, with a preview above.
<i>12d Sky Dome 1 (Cloud - Dark Blue)</i>			
<i>12d Sky Dome 2 (Cloud - Haze)</i>			
<i>12d Sky Dome 3 (Cloud - Light Blue)</i>			
<i>12d Sky Dome 4 (Cloud - Snow Mtns)</i>			
<i>12d Sky Dome 5 (Clear Sky)</i>			
Centre of Sky Dome	valid x,y,z		
Process	button		
<i>Read in data from Library and translate to centre coords</i>			
Model Format			

12d Sky Dome Data	(3 dimensional data for the triangulation)
12d Sky Dome Tin	(3 dimensional triangulation)
12d Sky Dome 1 Raster	(2 dimensional raster for the triangulation)

Note:

More than one sky type can be read in and used but the selected raster is then applied to the same tin.

To view the sky dome in the OpenGL perspective view, add the **12d Sky Dome Tin model** only to the view.

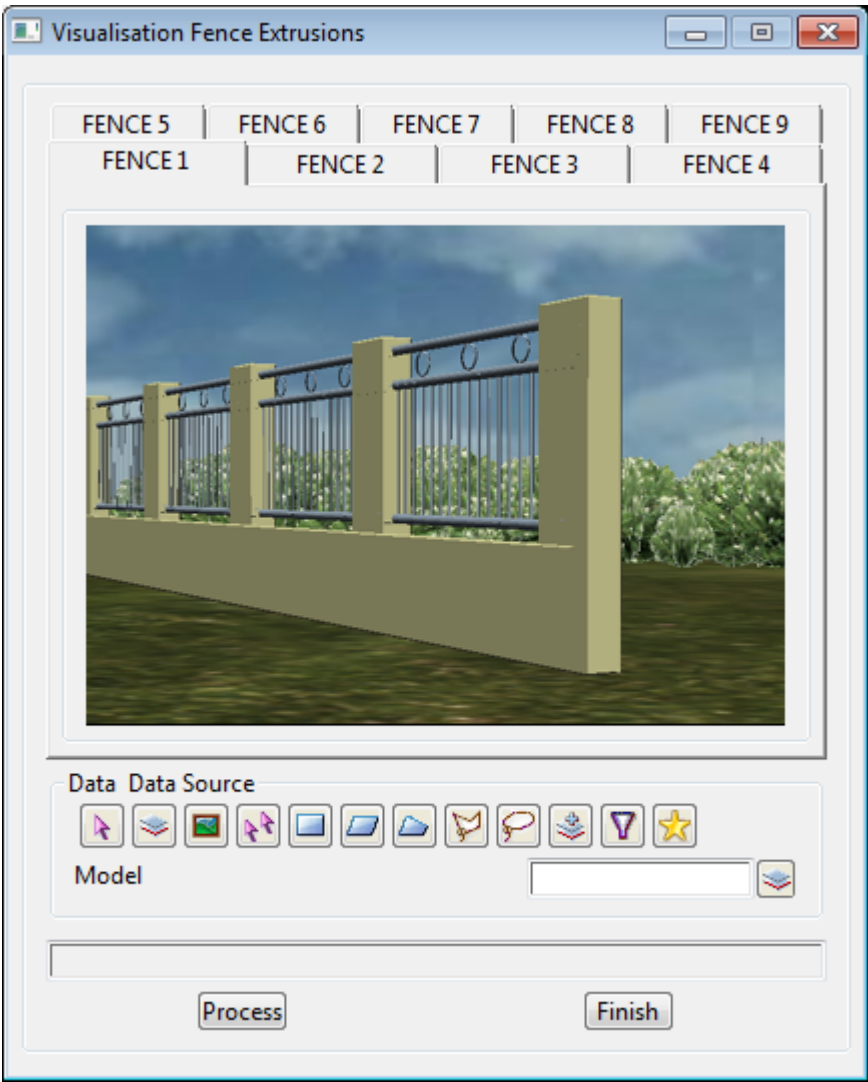

Fences

Position of option on menu: View =>Visualisation => Extrusions =>Fences

This option is for extruded 12d Solutions supplied fences along strings.

The list of fences is being continuously upgraded by 12d Solutions.

Selecting the Fences brings up the **Visualisation Fence Extrusions** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Clicking on the tabs brings up the type of fence to be extruded along selected super strings.			
Data source type	Model		
<i>data selection type - for a full description go to Data Source in the chapter Tools and Concepts</i>			
Data source	input		
<i>source of super string to extrude fences along</i>			
Process	button		
<i>apply the fence to the selected super strings</i>			

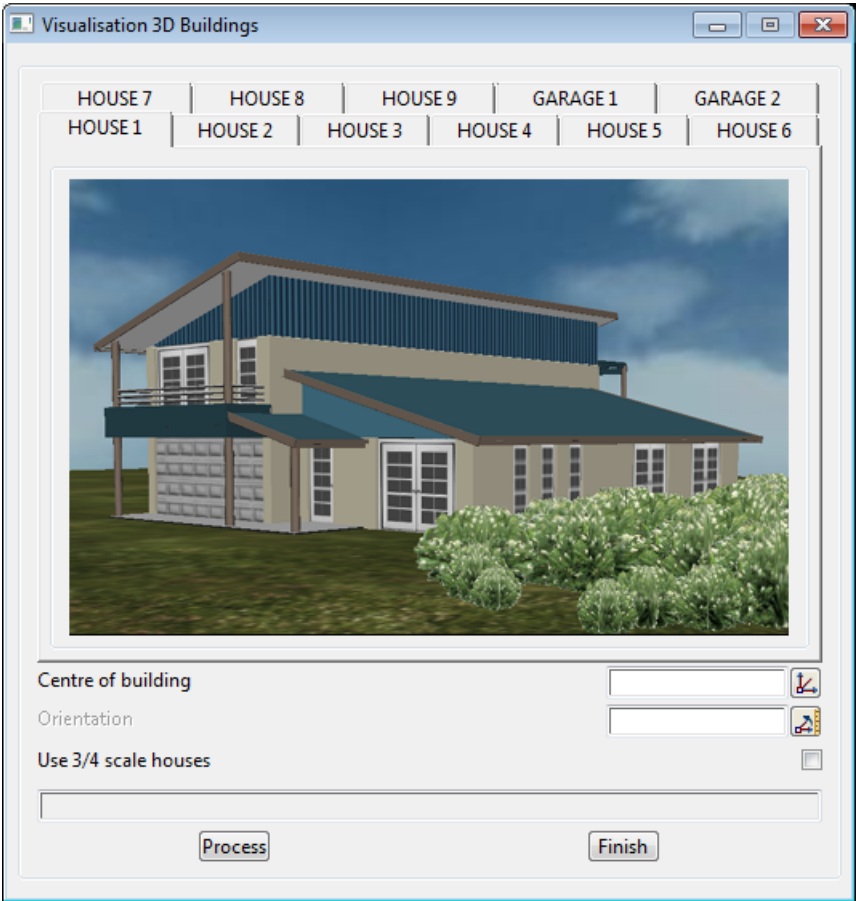

Houses

Position of option on menu: View =>Visualisation => Utilities =>Houses

This option is for inserting 12d Solutions supplied houses.

The list of houses is being continuously upgraded by 12d Solutions.

Selecting the Houses brings up the Visualisation 3D Buildings panel.

The fields and buttons used in the panel have the following functions.

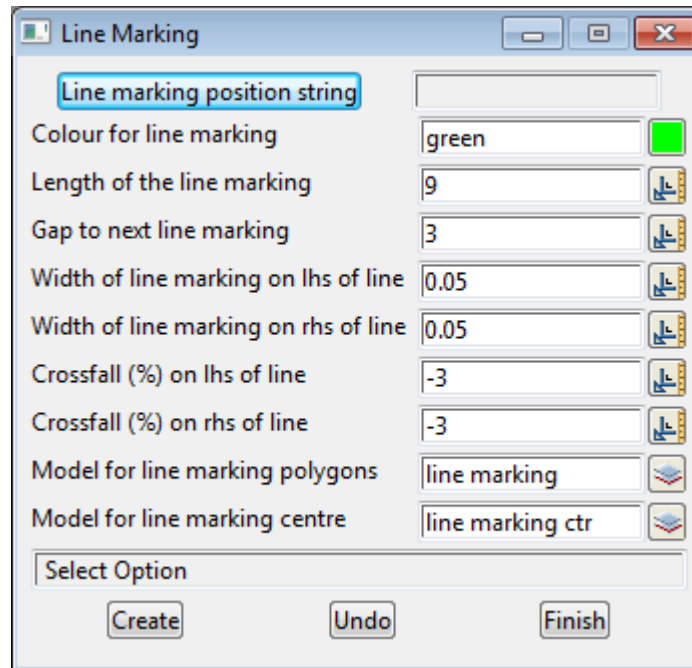

Field Description	Type	Defaults	Pop-Up
Clicking on the tabs brings up the type of house to be inserted.			
Centre of building	xyz box		position select
give the x y z co-ordinates for the centre of the base of the inserted building			
Orientation	angle box		angle select
give the angle to orient the building			
Process	button		
insert the selected building			

Line Marking

Position of option on menu: View =>Visualisation =>Utilities => Line marking

This option is used to create polygon data in 3d representing the line marking on a road. The polygons can then be included in the design tin for triangulating and the “Colour Triangles Within a Polygon” option used to colour the triangles for use in shades and renderings.

The line marking polygons created by the option represents a dashed line style centred around the selected line marking string marking the position of the dashed line. The length and separation of the dashed lines are user defined and the width of the dash is defined by a width to the left and a width to the right of the line marking string.

The fields and buttons used in this panel have the following functions:

Field	Description	Type	Defaults	Pop-Up
line marking position string	string select <i>select the string to define the position of the line marking on the road. The string will also provide z-values for use in creating the line marking.</i>			
Colour for line marking	input box <i>colour for the line marking polygons.</i>		green	available colours
Length of the line marking	input box <i>length of each line mark dash.</i>		9	
Gap to next line marking	input box <i>distance between the line marking dashes.</i>		3	
Width of line marking on lhs of line	input box <i>width of the line marking on the left hand side of the line marking position string.</i>		0.05	
Width of line marking on rhs of line	input box <i>width of the line marking on the right hand side of the line marking position string.</i>		0.05	
Crossfall (%) on lhs of line	input box <i>cross fall for the part of the line marking on the left hand side of the line marking position string (so z-</i>		-3	

values for the polygon can be calculated).

Crossfall (%) on rhs of lineinput box -3
cross fall for the part of the line marking on the right hand side of the line marking position string (so z-values for the polygon can be calculated).

Model for line marking polygons model box line marking available models
model for the polygons representing the line marking.

Model for line marking centre model box line marking ctr available models
model for a string with just the part of the line marking position string which is inside the line marking polygons.

Create button
run the option and create the line marking polygons.

Undo button
undo the last set of polygons created since the panel was up.

Line Marking (New)

Position of option on menu: View =>Visualisation =>Utilities => **Line marking (New)**

This option is made up of several parts.

1. Create line marking polygons:

The drop down menu has a list of linemarking definitions, that match the linestyle in 12d.

The length, gap and width values are used to create polygons along the strings selected.

Fill in the Linemarking model, colour and the optional tin (used to drape the polygons).

2. Apply Extrusions Only:

In this option extrusions are matched to linestyles, rather than producing individual polygons.

3. Pavement Arrows:

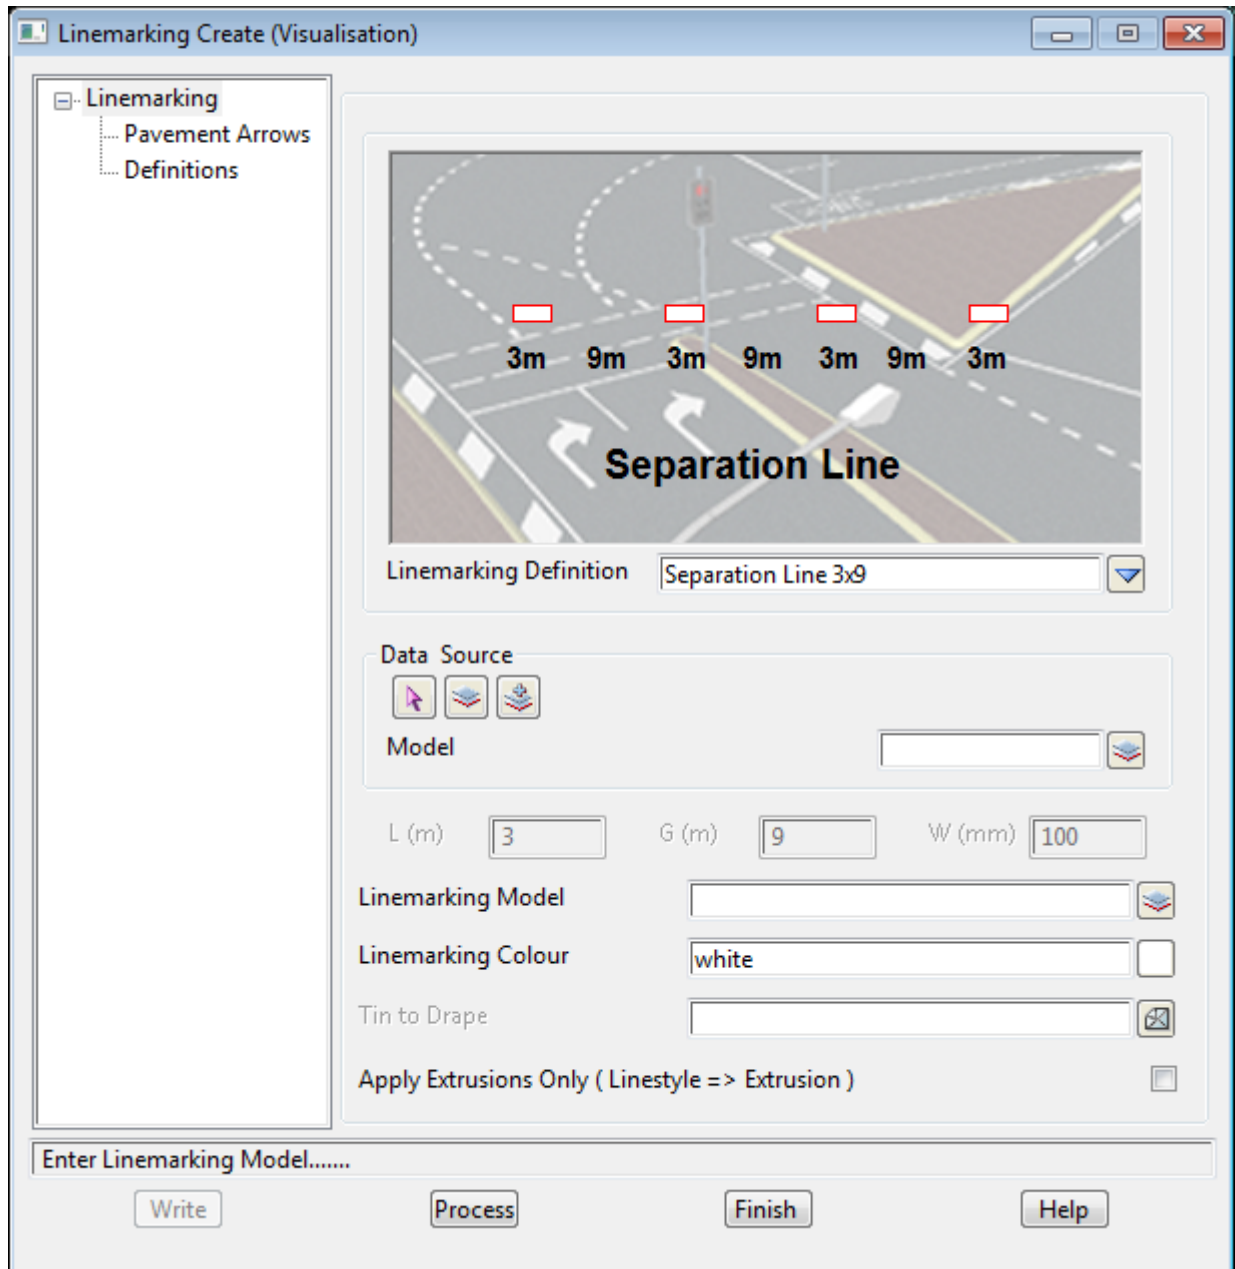

In this option polygons are created from the symbol definition.

Single Arrows can be placed, using the **Dynamic Orientation** button to select an x,y point on screen.

Multiple Arrows:

Arrow Edge Line Reference	"Pick with direction" along a string
Arrow Spacing	Distance apart
Arrow Offset	Relative to the directional pick
Arrow Start Point	If you select a right turn lane string, picking with direction towards an intersection, then the start point would be at the intersection and subsequent arrows placed at the Arrow Spacing away from the intersection.

Selecting **Line marking (New)** brings up the **Linemarking Create (Visualisation)** panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Linemarking Menu

Linemarking Definition	choice box	Separation Line 3x9	various

Definitions

A default file [12d_linemarking.def] is read in from the library and saved to the.project area.
Edits can be carried out to the following definitions.

Field Description	Type	Defaults		Pop-Up
Definition	Linestyle	Len	Gap	Width
Separation Line 3x9	Separation lines 3x9	3	9	100
Separation Line 6x6	Separation lines 6x6	6	6	100
Separation Edge Line	Separation lines full 100	3	0	100
Continuity Line	Continuity lines 1x3	1	3	200
Turn Line	Turn lines 600x600	0.6	0.6	100
Holding Line	Holding line 600x600	0.6	0.6	300
Give Way Line	Give way line 600x600	0.6	0.6	200
Cross Walk Line	Cross Walk Lines 1x0.3	1	0.3	150

Double Line	No overtaking	3	0	80
Stop Line	Stop line	3	0	300

Arrow Symbol

Right Turn Arrow	R_TURN
Left Turn Arrow	L_TURN
Str Ahead Arrow	ST_AHEAD
Str Left Turn Arrow	ST_L_TURN
Str Right Turn Arrow	ST_R_TURN
U Turn Arrow	U_TURN
Merge Arrow	MERGE

Write button

Write out any definition changes to 12d_linemarking.def

Process button

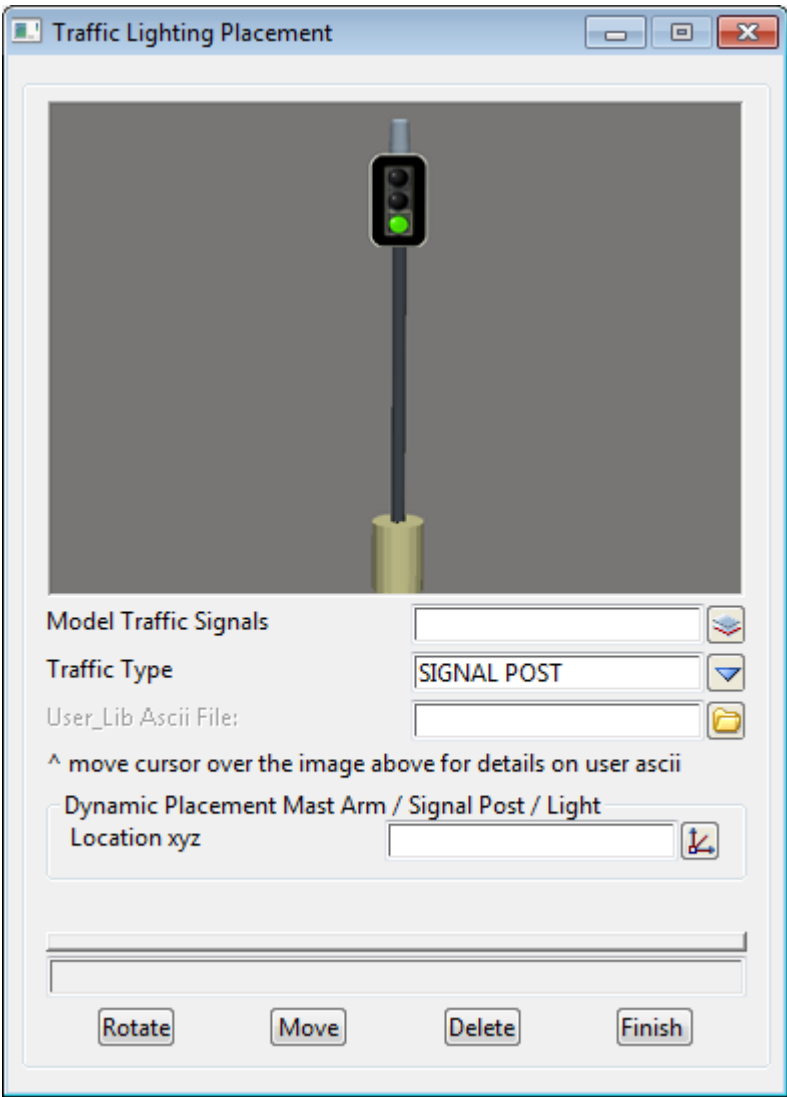

Runs and creates the linemarking

Traffic Lighting Placement

Position of option on menu: View =>Visualisation =>Utilities =>Traffic signals

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the Traffic signals option, the **Traffic Lighting Placement** panel is displayed:

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model Traffic Signals	model box		available models
Traffic Type	choice box	SIGNAL POST	available choices
User_Lib Ascii File:	file		
Location xyz			
Rotate	button		
Move	button		
Delete	button		

Colour Within Polygon

Position of option on menu: View =>Visualisation =>Utilities =>Colour within polygon

This option colours triangles in a tin. It has already been documented as

Tins =>Colour =>Colour within polygon

in the section [Colour Within Polygon](#) in the chapter [Triangles](#).

Explode Text

Position of option on menu: View =>Visualisation =>Utilities =>Explode text

This option explodes text into lines and arcs. It has already been documented as

Utilities =>A-G => Explode text

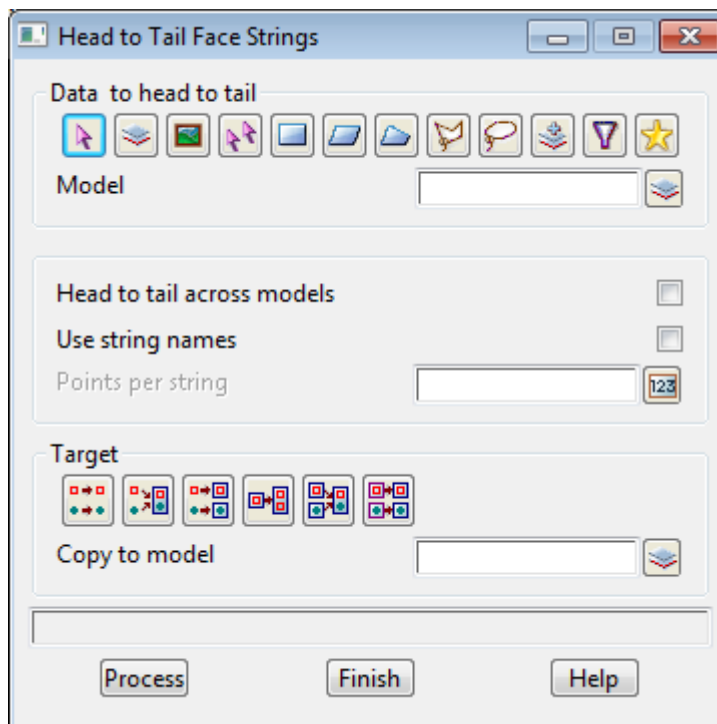

in the section [Explode Text](#) in the chapter [Utilities](#).

Head to tail faces

Position of option on menu: View =>Visualisation =>Utilities =>Head to tail faces

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting Head to tail faces brings up the **Head to Tail Face Strings** panel.

Create Plan Images from JPEG Files

Position of option on menu: View =>Visualisation =>Utilities =>Create plan images from JPEG's

Selecting Create plan images from JPEG's brings up the **Create Plan Images from JPEG Files** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Advanced		tick box	not ticked	
-----------------	--	----------	------------	--

*clicking **Advanced** brings up a grid to allow the user to enter many JPEG files.*

File to read		file box		available *.jpg files
---------------------	--	----------	--	-----------------------

the JPEG files to read in and create images from. The JPEG file must include EXIF and GPS information, which is used to position the image. If Projection is not blank, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If Projection is blank, then the co-ordinates are left as lat/long.

Projection		choice box		
-------------------	--	------------	--	--

if a Project Projection is set, then it is placed in the Projection field. This can be changed to any other projection. The projection is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no projection is set, then the co-ordinates are left as lat/long.

Rotate images		tick box	not ticked	
----------------------	--	----------	------------	--

*if **ticked**, the rotate value from the EXIF will be used to rotate the image.*

Pixel to mm		input box		
--------------------	--	-----------	--	--

*the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the **Pixel to mm** (mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.*

Model for images		input box		
-------------------------	--	-----------	--	--

the model for the image to be inserted into.

Create		button		
---------------	--	--------	--	--

*when all the fields have been entered, the **Create** button creates images from the selected files.*

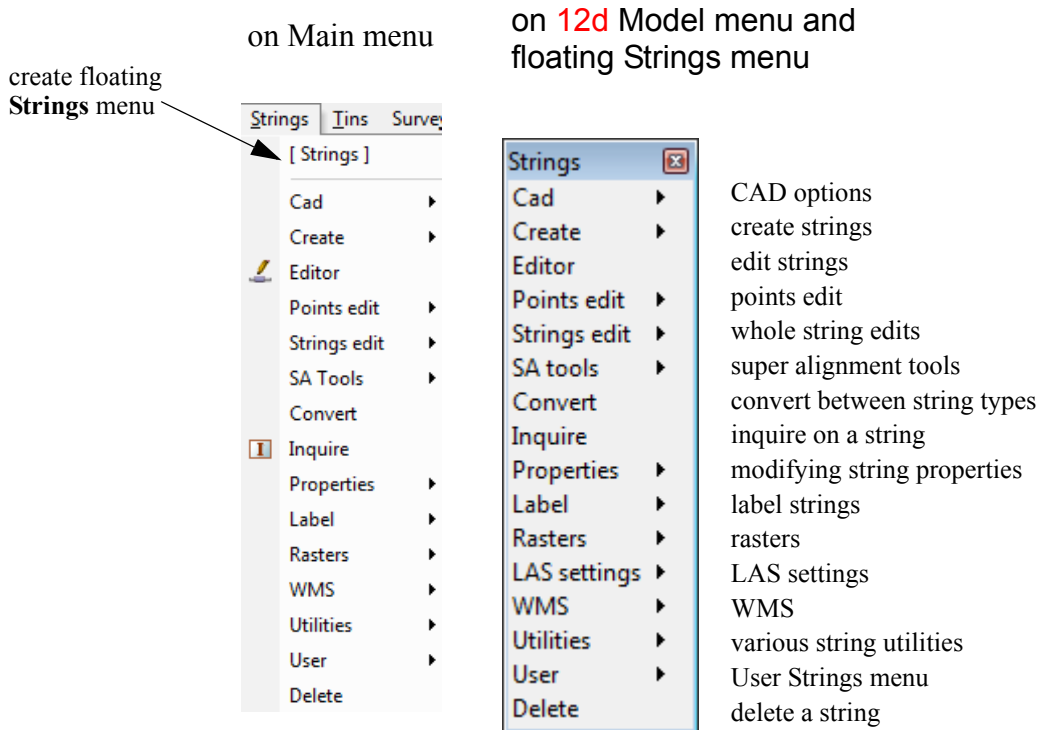

16 Strings

Position of menu: Strings

Strings are the basic modelling elements of 12d Model.

The Strings walk-right menu contains options to create, edit and manipulate strings in a variety of ways including copying, moving strings between models and deleting strings.

The Strings walk-right menu is

For the option CAD, go to [CAD](#)

Create [Create](#)

Editor [Editor](#)

Points edit [Points Edit](#)

Strings edit [Strings Edit](#)

SA Tools [SA Tools](#)

Convert [Convert](#)

Inquire [Inquire](#)

Properties [Properties](#)

Label [Label](#)

Rasters [Rasters](#)

LAS settings [Point Clouds](#)

WMS [WMS](#)

Utilities [Utilities](#)

User [User](#)

Delete [Delete](#)

Note

For the floating menu, the **Strings** option has another mode of operation. Rather than moving onto the walk-right arrow, if LB is clicked when the **strings** button is highlighted on the 12d Model menu, the **String inquire** panel is displayed on the screen. Unfortunately this does not work on the *Main* menu.

CAD

Position of option on menu: Strings =>CAD

In **12d Model** there are CAD options which are available under both the Strings =>CAD menu and flyouts on the *CAD Toolbar* which by default, is on the left hand side of the **12d Model** screen.

The CAD options create and edit strings using a variety of methods and are fully described in the section [CAD Options](#).

The *strings* created by the *CAD menu* or *CAD toolbars* use values in the three *controlbars* (**Cad Controlbar**, **Symbol Controlbar**, and **Text Controlbar**) to define string attributes such as name, model and colour.

So the controlbars will be described in full in the section [CAD, Symbol and Text Controlbars](#) before the CAD options.

For basic information on toolbars and controlbars, see the section [Toolbars and Controlbars](#) in the chapter [Tools and Concepts](#).

The CAD options create various elements using a number of methods. These options make use of **Tool bars** and **Control bars**. Tool bars just have icons on them but Control bars have icons and also controls such as a model box on them. The method groupings are shown on the toolbars (e.g. Points, Lines etc.).

For details on each of the walk rights menus on the CAD menu, go to the section [CAD Options](#)

For details on the Controlbars go to the section [CAD, Symbol and Text Controlbars](#)

CAD, Symbol and Text Controlbars

This default position of the *controlbars* is on the top left hand side of the screen under the main menu.

CAD Controlbar

The fields and buttons used in CAD controlbar have the following functions.

Field	Description	Type	Defaults	Pop-Up
	<i>name of string. If a valid name already exists in names.4d, the + button can be used to bring up a choice box of available names. On selection of a valid name, the rest of the values in the control bar will be filled out. e.g. colour, linetype etc.</i>	name box		names.4d names
		model box	cogo	existing models

this field can be recognised by the model icon button on the right hand side of the field. The user can select an existing model by selecting the model icon. If a new model is to be used, the user simply types the model name into the field.

colour box red standard 12d colours

this field can be recognised by the colour icon button on the right hand side of the field. The user can select a 12d standard colour model by selecting the colour icon

input height measures menu

this field allows a height or z value to be assigned to the created elements. If a valid value exists, this value will be applied to the created element. This is regardless if the z value was specified in an XYZ box. If blank, the null value is used.

If no value is specified, the level will be interpolated where possible. A value of null can be entered into the height field as well so that created vertices will be given a null height value.

linetype box 1 valid linestyles

this field can be recognised by the linestyle icon button on the right hand side of the field. The user can select a valid linestyle by selecting the linestyle icon.

weight box

this field can be recognised by the weight icon button on the right hand side of the field. The user can type in the required weight (millimetres on the plot). If blank, no weight is assigned.

tinability box no, yes, points

the choices in this field set the tinability for the string.
If **no**, no vertices or segments in the string are tinable.
If **yes**, all vertices and segments in the string are tinable.
If **point**, all vertices in the string are tinable but not the segments.

button

the eye dropper allows the user to select an existing element which will define the cad control bar values.

Symbol Controlbar

The fields and buttons used in Symbol controlbar have the following functions.

Field Description	Type	Defaults	Pop-Up
The  symbols data box allows a symbols favourite to be selected and fill the other boxes. The symbols data box will be described after the other controls.			
	symbols box		valid symbols
this field can be recognised by the symbol icon button on the right hand side of the field. The user can select a valid symbol by selecting the symbol icon.			
	input		size measures menu
this field gives the size of the created symbols. If a valid value exists, this value will be applied to the created symbol.			
	input		angle measures menu
this field gives the angle of the created symbols. If a valid value exists, this value will be applied to the created symbol.			

Symbols data box

on pressing the button a list of available symbols data predefined names read from the **symbols_names.4d** file are displayed. If a symbols data is selected, the values are used for the other Symbol Controlbar fields.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Symbols Information** panel. This allows for definition of symbol colour, sized, rotation, offset and raise.

Text Controlbar

Text can occur as a text string, or on vertices and segments of a super string.

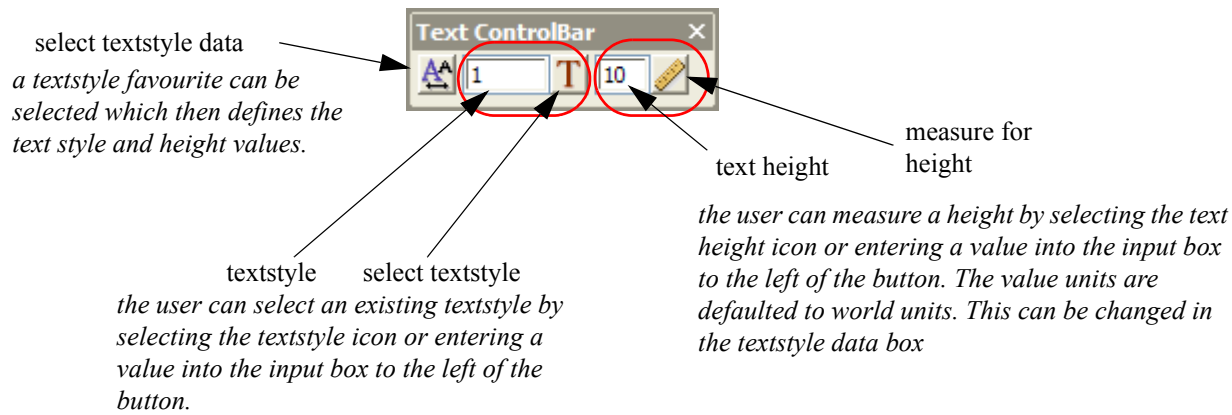

Each type of text has a vertex (these are displayed when Vertices are toggle on in a plan view), a justification point, a rotation, an offset and raise value.

The vertex and justification point only coincide if the offset and raise values are both zero. What parts of the text on a super string vertex or segment that can be independently modified depends on the settings for the super string.

For the CAD text options, the created elements will have attributes as defined by the **Text**

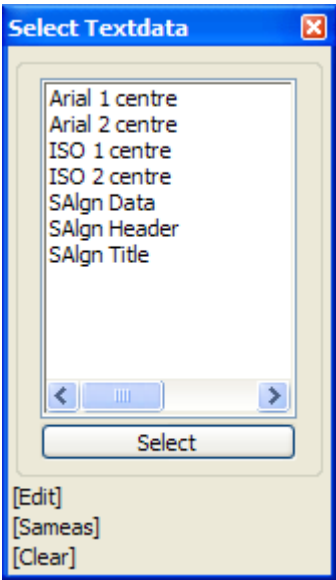

Controlbar. The default position of the Text Controlbar is in top middle of the screen under the main menu.

The **Text Controlbar** is

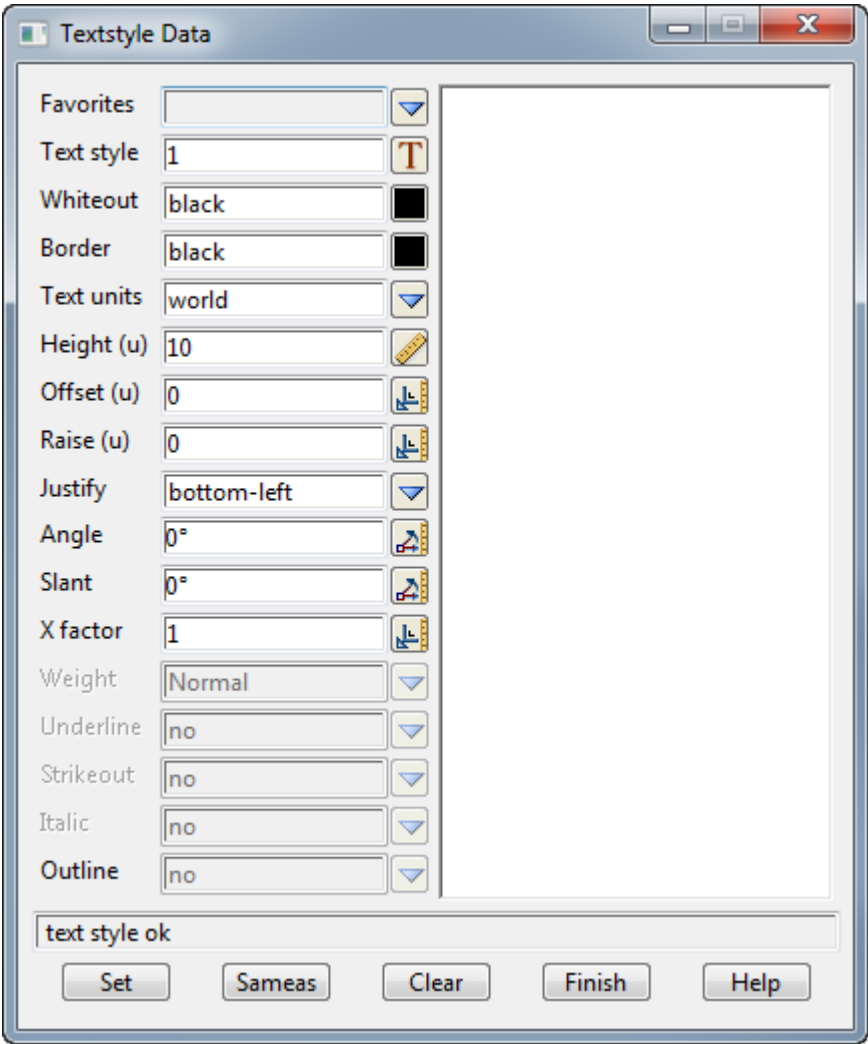

The operation of the Textstyle data box is as follows:

 **Textstyle data box**
on pressing the button a list of available textdata predefined names read from the **textstyle_names.4d** file are displayed.

If no names exist, the user can edit the current settings by selecting the edit button and bring up the **Textstyle Data** panel. This allows for definition of textstyle, units, height offset raise etc.

CAD Options

The CAD options are available from the CAD menu or from the CAD toolbar. The CAD toolbar is a flyout toolbar.

The CAD walk-right menu is

and the CAD Toolbar is

The string creation process is similar for each string type and for editing strings as well. On selecting the appropriate option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

For the option *Multipick*, go to

<i>Multipick</i>	CAD Multipick
<i>Point</i>	CAD Point

Scale

[CAD Multipick Scale](#)

Scale Dynamic

[CAD Multipick Scale Dynamic](#)

Selecting with Multipick

Upon selecting any of the Multipick options from the CAD Multipick menu

the *Screen Message Area* prompts are shown for selecting selection options.

The default option is <m> for multipick select.

For <m> go to	Multipick
<s>	Single
<a>	All
<c>	Clear
<i>	Inverse
<r>	Rectangle
</>	Lasso

Multipick

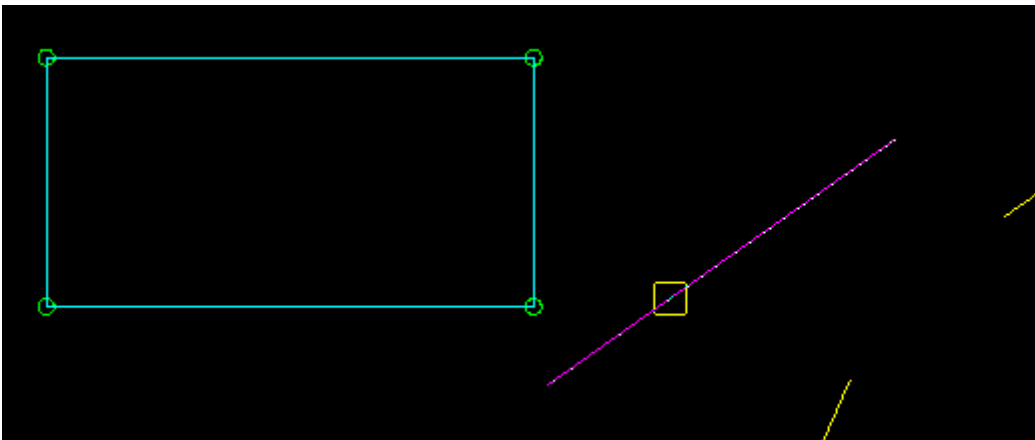

For <m>, strings are selected by clicking LB on the string, but unlike a normal select, **the string is not accepted**. After LB is clicked, the string is highlighted and circles placed at the string vertices to indicate that the string is part of the **Multipick set**.

Another string is added to the *Multipick set* by clicking LB on the new string and again **not accepting**. This string will also be drawn with circles at each of its vertices to indicate that it is part of the *Multipick set*.

A string is **removed** from a *Multipick set* by simply clicking LB on the string (and not accepting). The string is then deselected and the circles are removed from the vertices of the string to indicate that it is no longer part of the *Multipick set*.

When all the required strings of the *Multipick set* have been selected, the Multipick selection is terminated by clicking MB (accepting).

The selected strings in the *Multipick set* are then passed on to the CAD Multipick option for processing. For example, if the Multipick was part of **Multipick Copy**, then after Accepting, the **Copy** part of the **Multipick Copy** takes over.

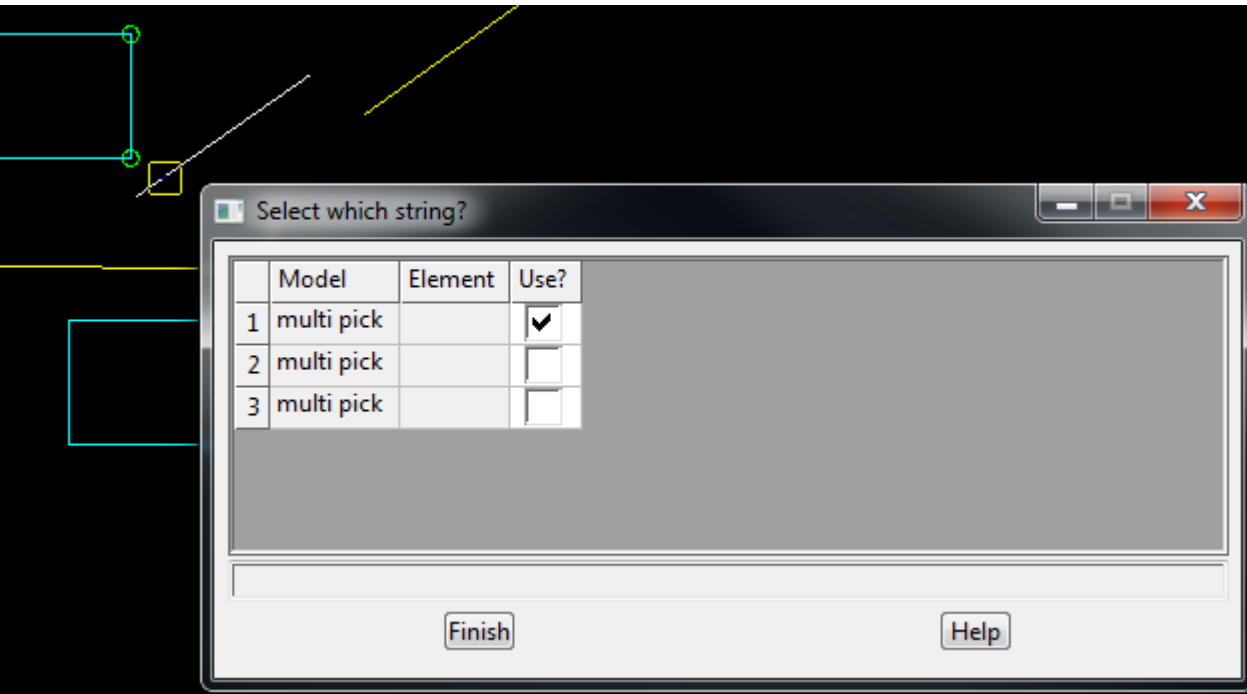

Once the Multipick option (e.g. **Multipick Copy**) is completed, the **Multipick set** is cleared and the Multipick CAD option begins again, and the process of building up a new **Multipick set** begins again for that same option.

To terminate the *Multipick option*, simply press <Esc>.

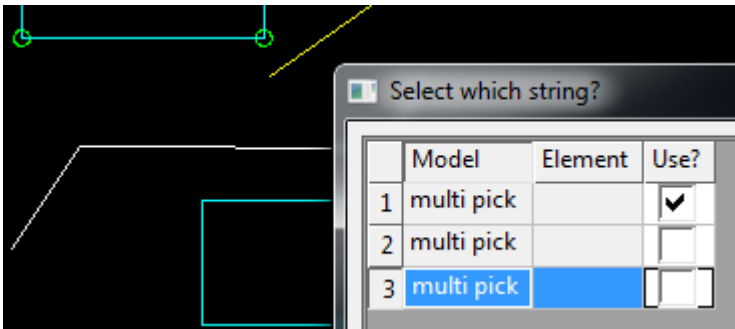

Note:

Because LB is used to keep adding new strings to the **Multipick set**, it can't be used for the normal cycling through a selection set when more than one string satisfies the picking tolerance. So when more than one string satisfies the picking criteria a **Select which string?** panel is placed on the screen with the list of strings satisfying the LB picking criteria.

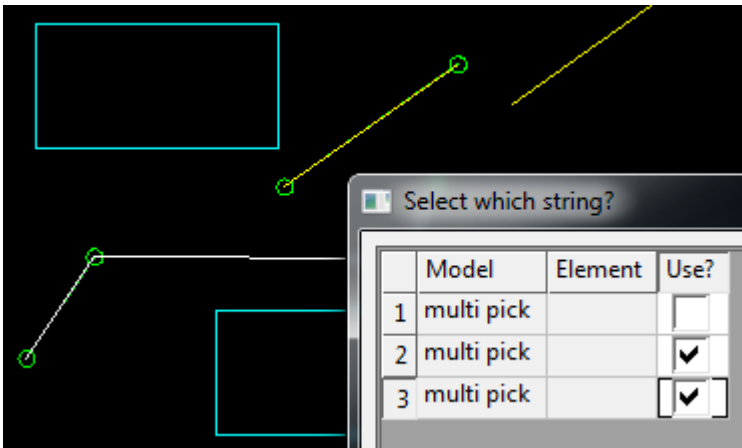

If the string is already in the *Multipick set*, there will be a *tick* in the **Use?** column.

Clicking on a line in the grid highlights the string.

And clicking in the **Use?** column to make a **tick** will add the string to the *Multipick* set and place circles on each of its vertices, or **turning off a tick** will deselect the string from the *Multipick* set and remove the circles from each of its vertices.

Clicking on the **Finish** button or **X** terminates that LB selection.

Single

<s> places the option back into the mode of selecting a single string. That is, Multipick is not used.

All

<a> will add all the strings in the models on the current view to the Multipick set. Note that the strings do not have to be visible on the view to be selected by **<a>**.

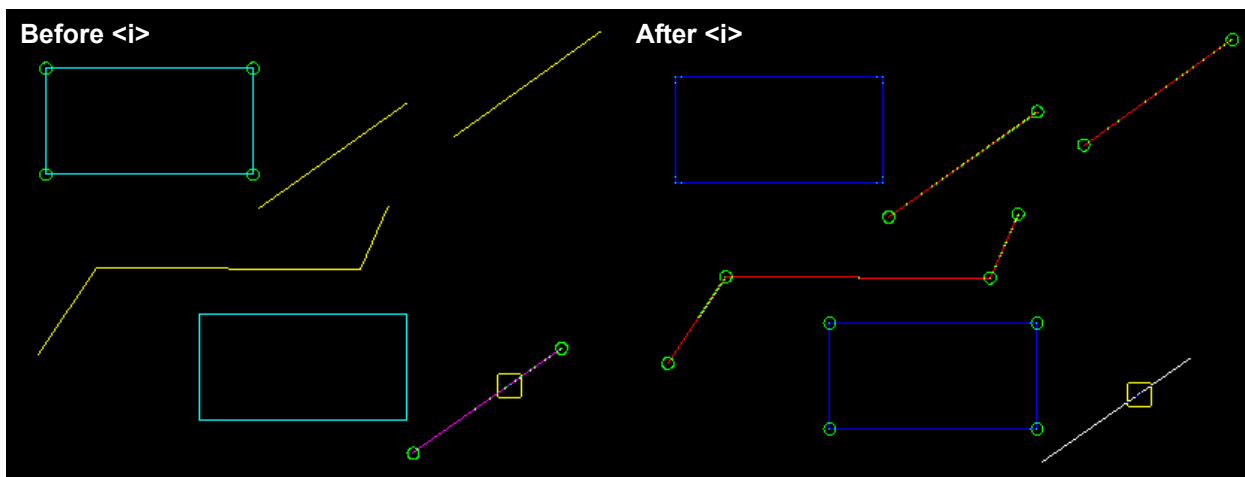

Clear

<c> will clear the current *Multipick set*. That is, all selected strings are deselected.

Inverse

<i> will take the inverse of the current *Multipick set*. That is, all strings in the models on the current view that are currently in the *Multipick set* are deselected, and all strings in the models on the current view that are not in the *Multipick set* are added to the *Multipick set*. Note that the strings do not have to be visible on the view to be selected/deselected by <i>.

Rectangle

<r> requires the user to create a rectangle and all strings totally enclosed by that rectangle will be added to the *Multipick set* if they are not already in the *Multipick set*, or **deselected** if they are already in the *Multipick set*.

After pressing <r>, the first corner of the rectangle is selected by pressing and holding down LB, and the cursor is then dragged to the second corner of the rectangle and LB released.

The strings totally enclosed by the rectangle are then added to/removed from the *Multipick* set.

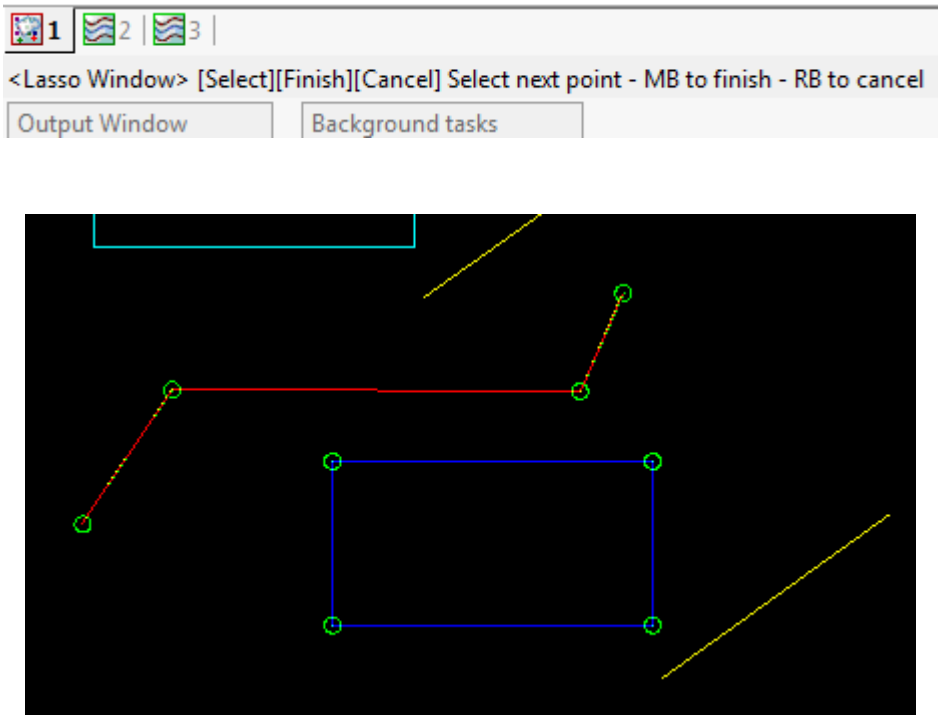

Lasso

<I> requires the user to create a lasso, and all strings enclosed by or crossing the lasso will be added to the Multipick set if they are not in the Multipick set, or deselected if they are already in the Multipick set.

After pressing <I>, the lasso start point is selected by pressing and holding down LB and the cursor is then dragged to trace out the lasso. LB is then released to stop adding to the lasso.

MB is pressed and released to accept the lasso. If LB is pressed down before accepting the lasso, further points are added to the lasso until LB is released.

The strings totally enclosed by, or crossing, the lasso are then added/removed from the *Multipick* set.

CAD Multipick Copy

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Copy part of the option is the same as the [CAD Copy](#) command.

CAD Multipick Move

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Move part of the option is the same as the [CAD Move](#) command.

CAD Multipick Rotate

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Rotate part of the option is the same as the [CAD Rotate](#) command.

CAD Multipick Array

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Array part of the option is the same as the [CAD Array](#) command.

CAD Multipick Mirror

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Mirror part of the option is the same as the [CAD Mirror](#) command.

CAD Multipick Mirror X

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Mirror X part of the option is the same as the [CAD Mirror X Axis](#) command.

CAD Multipick Mirror Y

For selecting the data, see [Selecting with Multipick](#)

After data has been selected, a base point is selected and the Mirror Y part of the option is the same as the [CAD Mirror Y Axis](#) command.

Scale About an Origin

A number of options use the concept of **Scaling** about an **Origin**.

To scale a point about an Origin by a given scale factor, the point is moved along the line joining the point to the origin so that

$$\text{distance between the scaled point and the origin} = \text{scale factor} * \text{distance from point to origin}$$

A **string** is scaled about an origin by a given scale factor by scaling each vertex in the string about the origin by the scale factor.

If the Scale Factor is greater than one, then the scaled string is enlarged and is on the same side of the origin as the original string but further from the origin than the original string.

If the Scale Factor is less than one but greater than zero, then the scaled string is reduced and is between the origin and the original string.

If the Scale Factor is negative then the scaled string is on the opposite side of the origin to the original string.

A Scale Factor of zero would put all the vertices of the string on top of the origin.

CAD Multipick Scale

For selecting the data, see [Selecting with Multipick](#)

For the definition of scaling about an origin, see [Scale About an Origin](#)

After data has been selected, an Origin point is selected and the Scale part of the option is the same as the [CAD Scale](#) command.

CAD Multipick Scale Dynamic

For selecting the data, see [Selecting with Multipick](#)

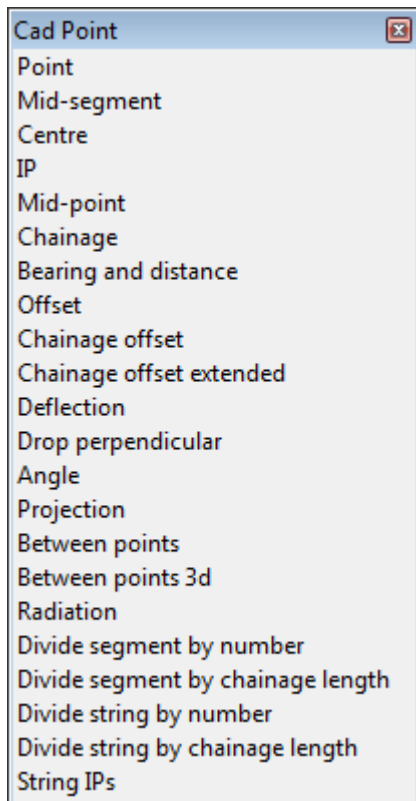

For the definition of scaling about an origin, see [Scale About an Origin](#)

After data has been selected, an Origin point and Start Scale position is selected and the Scale Dynamic part of the option is then similar to the [CAD Scale Dynamic](#) command.

CAD Point

Position of option on menu: Strings =>CAD =>Point

The Point walk-right menu is

Menu of Options to Create New One Point Strings

Point

Position of option on menu: Strings =>CAD =>Point =>Point

or by selection of appropriate icon from the toolbar. 

This option creates a single vertex (point) string.

On selecting **Point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar** then a value will be interpolated if possible, otherwise a null value will be assigned.

Mid Segment

Position of option on menu: Strings =>CAD =>Point =>Mid segment

or by selection of appropriate icon from the toolbar. 

This option creates a point in the middle of a selected line or arc segment.

On selecting **Mid segment**, the user is prompted to select a segment and a vertex is created at the mid point of the segment. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

Centre

Position of option on menu: Strings =>CAD =>Point =>Centre

or by selection of appropriate icon from the toolbar. 

This option creates a point at the centre of a selected arc or circle.

On selecting **Centre** the user is prompted to select an arc and a vertex is created at the centre of the arc. The model, colour, height, *etc.* are defined in the **Cad Control Bar**.

IP

Position of option on menu: Strings =>CAD =>Point =>IP

or by selection of appropriate icon from the toolbar. 

This option creates a point at the IP of a selected arc or transition segment. That is, it creates a point at the intersection of the tangent from the start of the segment and the tangent at the end of

the segment. Picking a straight segment will give an error.

On selecting **IP** the user is prompted to select an arc or transition segment and a new point is created at the IP of the selected segment. The model, colour, height, etc. are defined in the **Cad Control Bar**.

Mid point

Position of option on menu: Strings =>CAD =>Point =>Mid point

or by selection of appropriate icon from the toolbar. 

This option creates a point in the middle of two selected positions.

On selecting **Mid point**, the user is prompted to select the first position and then the second position. A vertex is created at the mid point of the two selected positions. The model, colour, height, etc. are defined in the **Cad Control Bar**.

Chainage

Position of option on menu: Strings =>CAD =>Point =>Chainage

or by selection of appropriate icon from the toolbar. 

This option creates a new point at the position of a user specified chainage of an existing string.

On selecting **Chainage**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a valid string (left mouse button) and accepts that string (Middle mouse button or <Enter>).

STEP 2:

The user enters a chainage value where a point should be placed followed by the <Enter> key. This chainage is with respect to the selected string.

**STEP 3:**

A new one point string is created at the position on the string at the given chainage.

To create another point, the user is prompted for the string as per **STEP 1**.

Bearing and distance

Position of option on menu: Strings =>CAD =>Point =>Bearing and distance
or by selection of appropriate icon from the toolbar. 

This option calculates a point string that is located a given bearing and distance from a start position.

On selecting **Bearing and distance**, the user is prompted for the relevant data in the screen

message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position is selected and accepted.

STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

A distance is selected and accepted with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the distance entry box. The value is entered into the input box followed by the Enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the

user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be used at the defined bearing to create the point.

STEP 4:

A point string is created using the information supplied. By entry into the input boxes:

Or by using the perpendicular/tangential tools:

Offset

Position of option on menu: Strings =>CAD =>Point =>Offset

or by selection of appropriate icon from the toolbar.

This option creates a one point string that is located by reference to a string, a control point, a chainage distance along the string from the control point and an offset to the selected string.

After selection and acceptance of a string, a control point is selected and accepted. This point is dropped perpendicular onto the string. The distance along the string is measured from this dropped point. Positive distances are in the direction that the string was picked. Finally a offset to the string can be specified for the placement of the new point string.

On selecting **Offset**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects and accepts a string with direction. This defines what side the offset applies to.

STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.

STEP 3:

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.

**STEP 4:**

An offset relative to the selected string (and direction) is specified in the input box followed by the enter key.

**STEP 5:**

A point string is created using the information supplied.

Chainage offset

This option creates a one point string that is located perpendicular to the reference string with a defined offset.

STEP 1:

The user selects the reference string with direction.

STEP 2:

The user specifies a chainage on the reference string.

STEP 3:

The user specifies an offset distance from the reference string.

A one point string is created using the information supplied.

Chainage offset extended

Is similar to chainage offset except the specified chainage can be extended beyond the start and end chainages of the selected string.

Deflection

Position of option on menu: Strings =>CAD =>Point =>Deflection

or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is located by reference to a string, a control point, a distance along the string from the control point, a deflection angle and deflection distance.

After selection of a string, a control point is selected. This point is dropped perpendicular onto the string. A distance along the string can be entered to move the measure point. Positive distances are in the direction that the string was picked. A deflection angle is specified which is a clockwise angle from the measure point. The deflection distance is the distance from the measure point to the point which is to be created.

On selecting **Deflection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects and accepts a string with direction.

**STEP 2:**

The user picks and accepts a control point to be dropped onto the selected string.

**STEP 3:**

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

STEP 4:

A deflection angle is specified. This angle is clockwise, relative to the direction of the string selection pick. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

STEP 5:

A deflection distance is supplied. Positive is in the direction of the string selection pick. The value is entered into the input box followed by the enter key.

**STEP 6:**

A point string is created using the information supplied.

**Drop Perpendicular**

Position of option on menu: Strings => CAD => Point => Drop perpendicular

or by selection of appropriate icon from the toolbar.

This option creates a one point string by dropping from a user selected position perpendicularly onto a user selected string.

On selecting **Drop perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a string and accepts (with direction) to have the point dropped onto.

**STEP 2:**

The user picks and accepts a position to drop onto the nominated string

**STEP 3:**

A point string is created at the perpendicular drop point.

Angle

This option creates a one point string that is located by projecting a selected position back to a string by a specified angle.

STEP 1:

User selects and accepts a string to have the point projected onto.

STEP 2:

User specifies an angle for the projection.

STEP 3:

User selects a position on the screen to be projected back to the string.

STEP 4:

A one point string is created, which form the nominated angle with the selected position on **STEP 3**.

Projection

Position of option on menu: Strings =>CAD =>Point =>Projection

or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is located by firstly dropping a point onto a string and then giving a distance along the string from the dropped point.

On selecting **Projection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects and accepts a string (with direction) to have the point dropped onto

**STEP 2:**

The user picks and accepts a position to drop onto the nominated string

**STEP 3:**

The user is prompted for the distance along the string. Positive distances are in the direction that the string was picked. A value is entered into the input box followed by the enter key.

**STEP 4:**

The point string is created the nominated distance along the string from the dropped point.

**Between Points**

Position of option on menu: Strings =>CAD =>Point =>Between points

or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is on the line between two selected positions and a given distance from the first point.

On selecting **Between points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

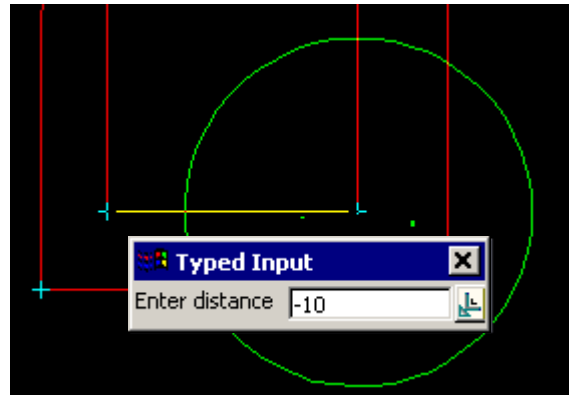

**STEP 2:**

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

**STEP 3:**

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

STEP 4:

A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.

Between points 3d

Position of option on menu: Strings =>CAD =>Point =>Between points 3d

or by selection of appropriate icon from the toolbar. 

This option creates a one point string that is on the line between two selected positions and a given distance from the first point. The z-value of the string is interpolated from the two selected positions.

On selecting **Between points 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).

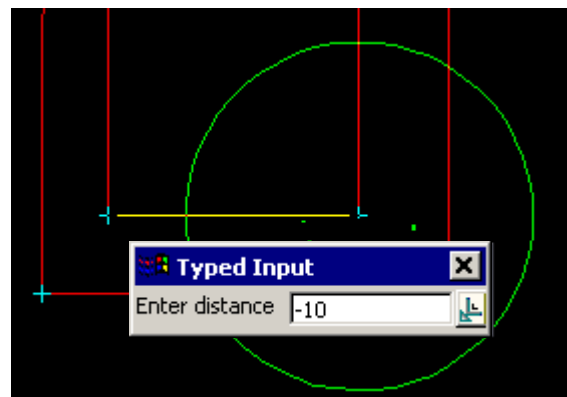

STEP 2:

The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

**STEP 3:**

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

**STEP 4:**

A point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.

Radiation

Position of option on menu: Strings =>CAD =>Point =>Radiation
or by selection of appropriate icon from the toolbar. 

This option creates a series of one point strings that are located by given bearings and distances from a chosen start position.

On selecting **Radiation**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position is selected and accepted.

STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the

mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

STEP 4:

A point string is created using the information supplied.

STEP 5

The next bearing and distance is prompted for as per step 3 and 4. Consequent points are created from the original start point selected.

Divide segment by number

Position of option on menu: Strings =>CAD =>Point =>Divide segment by number
or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string **segment** into equal pieces based on a user given number of intervals. The first and last points are not created since they are taken to be the end points of the selected segment. So for five intervals, four new one point strings are created. The option works for line or arc segments of a super string.

NOTES:

1. No vertices are inserted into the selected super string - the option **Strings =>Strings edits =>Segment strings** does that.
2. This option is for super strings only.

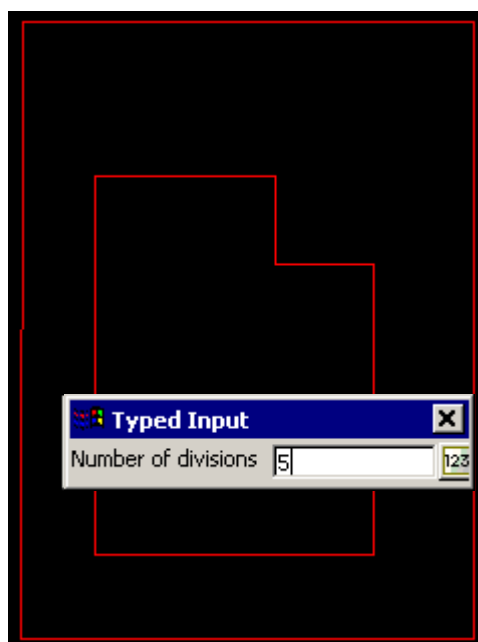

On selecting **Divide segment by number**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A super string segment is selected and accepted.

**STEP 2:**

The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.

**STEP 3:**

Given the above information, the new points are created.

Divide segment by chainage length

Position of option on menu: Strings =>CAD =>Point =>Divide segment by chainage length

or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string **segment** into pieces based on a user given chainage length. The process starts from the 1st point of the segment and continues until no more pieces can be created without going past the last point of the segment (the last piece may not be the correct length). This options works for line or arc segments of a super string.

NOTES:

1. No vertices are inserted into the selected super string - the option Strings =>Strings edits =>Segment strings does that.
2. This option is for super strings only.

On selecting **Divide segment by chainage length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A super string segment is selected and accepted.

**STEP 2:**

The user is prompted for the chainage distance. The value is entered into the input box followed by the enter key.

**STEP 3:**

Given the above information, the new points are created.

Divide string by number

Position of option on menu: Strings =>CAD =>Point =>Divide string by number

or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a super string into equal pieces based on a user given number of divisions. The first and last points are not created since they are taken to be the end points of the selected string. So for five intervals, four new one point strings are created.

NOTES:

1. No vertices are inserted into the selected super string - the option **Strings =>Strings edits =>Segment strings** does that.
2. This option is for super strings only.

On selecting **Divide string by number**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A super string is selected and accepted.

STEP 2:

The user is prompted for the number of divisions. The value is entered into the input box followed by the enter key.

**STEP 3:**

Given the above information, the new points are created.

Divide string by chainage length

Position of option on menu: Strings =>CAD =>Point =>Divide string by chainage length

or by selection of appropriate icon from the toolbar. 

This option creates one point strings which will break up a *super string* into pieces based on a user given chainage length. The process starts from the 1st vertex of the strings and continues until no more pieces can be created without going past the last vertex of the string (the last piece may not be the correct length).

NOTES:

1. No vertices are inserted into the selected super string - the option Strings =>Strings edits =>Segment strings does that.
2. This option is for super strings only.

On selecting **Divide string by chainage length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A super string is selected and accepted.

STEP 2:

The user is prompted for the chainage distance. The value is entered into the input box followed by the <Enter> key.

**STEP 3:**

Given the above information, the new points are created.

String IPs

Position of option on menu: Strings =>CAD =>Point =>String IPs

This option creates a separate point at each vertex of a selected string.

On selecting **String IPs** the user is prompted to select a string and a new point (a one vertex super string) is created for each vertex on the selected string. The model, colour, height, *etc.* for the new points are defined in the **Cad Control Bar**.

CAD Intersection

Position of option on menu: Strings =>CAD =>Intersection

The Intersection walk-right menu is

Menu of Options to Create One Point Strings by Intersections

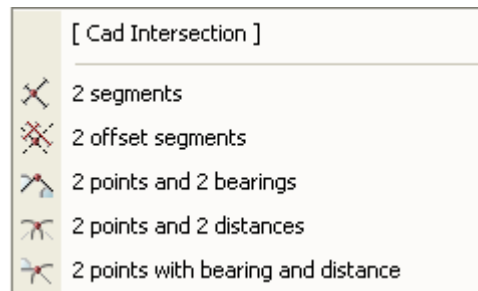

by intersecting two selected segments

by intersecting two offset selected segments

by given bearings from two selected positions

create a point with given distances from two selected positions

by selecting posn and bearing and another selected posn and dist

For the option *2 segments*, go to

2 offset segments

2 points and 2 bearings

2 points and 2 distances

2 points with bearing and distance

[2 segments](#)

[2 offset segments](#)

[2 points and 2 bearings](#)

[2 points and 2 distances](#)

[2 points with bearing and distance](#)

2 segments

Position of option on menu: Strings =>CAD =>Intersection=> 2 segments

or by selection of appropriate icon from the toolbar.

This option creates a point at the intersection of the projections of two line or arc segments.

On selecting *2 segments*, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st segment is selected and accepted.

**STEP 2:**

The 2nd segment is selected and accepted.

**STEP 3:**

A point is created at the intersection of the two segments (if a solution exists). Note that the 2nd segment in this case has been projected to enable a solution to be calculated.

2 offset segments

Position of option on menu: Strings =>CAD =>Intersection=> 2 offset segments

or by selection of appropriate icon from the toolbar. 

This option creates a point at the intersection of the offsets of two selected segments.

On selecting **2 offset segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st segment is selected and accepted with direction. This sets the positive direction of the offset to the right of the direction of pick.

STEP 2:

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.

**STEP 3:**

The 2nd segment is selected with direction and accepted. This sets the positive direction of the offset to the right of the direction of pick.

**STEP 4:**

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the enter key.

**STEP 5:**

A point is created at the intersection of the projected lines offset to the segments (if a solution exists).

2 points and 2 bearings

Position of option on menu: Strings =>CAD =>Intersection=>2 points and 2 bearings

or by selection of appropriate icon from the toolbar. 

This option creates a point by using two points and two bearings.

On selecting **2 points and 2 bearings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected and accepted.

**STEP 2:**

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

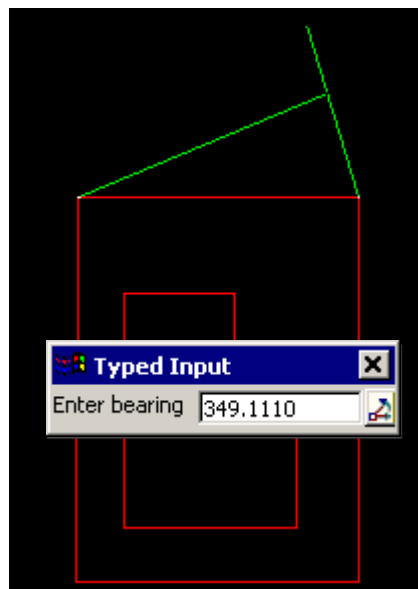

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The 2nd point to create the point from is selected and accepted.

**STEP 4:**

A bearing from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**

The point is created if there is a valid solution.

2 points and 2 distances

Position of option on menu: Strings =>CAD =>Intersection=>2 points and 2 distances

or by selection of appropriate icon from the toolbar. 

This option creates a point using two points and two distances.

On selecting **2 points and 2 distances**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

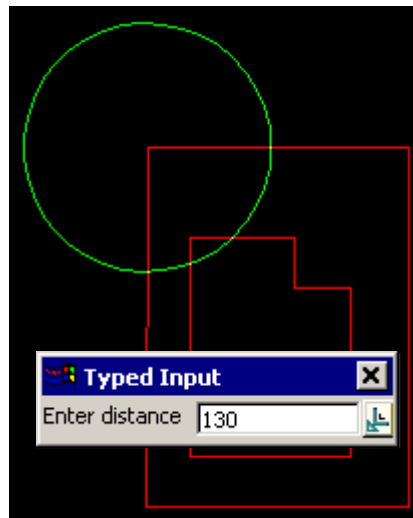

The 1st point is selected and accepted.

STEP 2:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

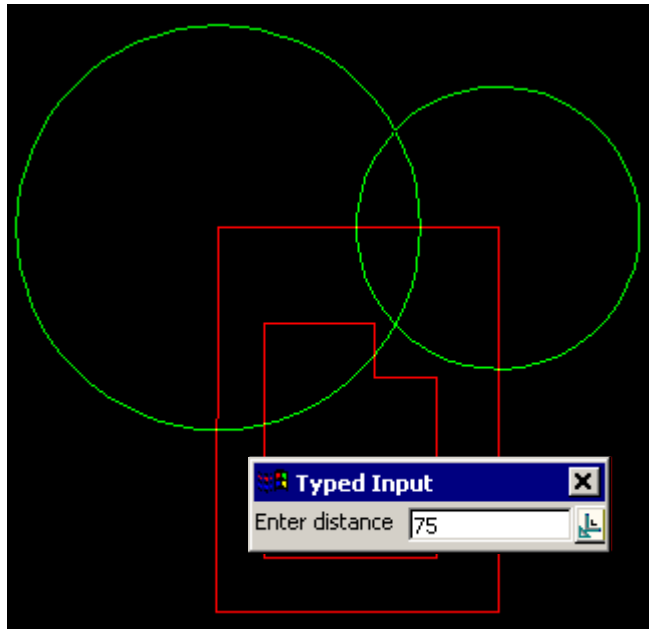

STEP 3:

The 2nd point to create the point from is selected.

STEP 4:

A distance from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

**STEP 5:**

As there is two solutions, the user can select the correct one depending on the method of construction. This can be done by the direct entry of distances or by use of the mouse.

1. Distance entry. After the entry of the 1st distance, the 2nd point is selected. Following the selection of the 2nd point, the 2nd radius is shown (rubber banding). The user can select one of the two solutions by choosing with a **LB** mouse click over the approximate position of the required solution. The solution chosen is the closest solution to the selected point. The final radius can then be entered via the keyboard by simply starting typing which brings up the radius entry panel automatically. This panel can also be activated by pressing the space bar.
2. Use of the mouse. The 1st point is selected and the radius entered by using the mouse or by direct entry from the keyboard. The 2nd point is then selected and the 2nd radius is displayed (rubber banding). A solution can be chosen by selecting with a **LB** mouse click over the required solution. The final solution will be the closest one to the selection. **MB** to accept the intersection and create the point.

**STEP 6:**

The point is created if there is a valid solution.

2 points with bearing and distance

Position of option on menu: Strings =>CAD =>Intersection=>2 points with bearing and distance

or by selection of appropriate icon from the toolbar. 

This option creates a point from a given point and a bearing, and a second point and a distance.

On selecting **2 points with bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected and accepted.

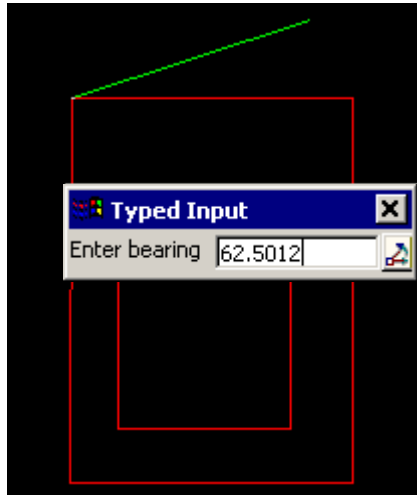

STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

Note: The Page up and page down keys can be used when the input angle box comes up

to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

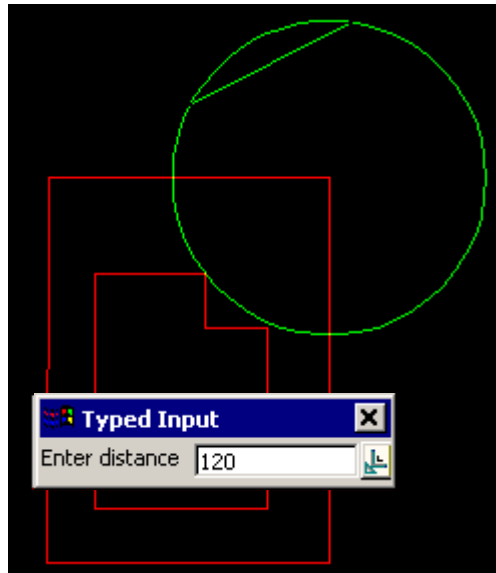

The 2nd point to create the point from is selected and accepted.

STEP 4:

A distance from the 2nd point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

A line is drawn between the two possible solutions.

STEP 5:

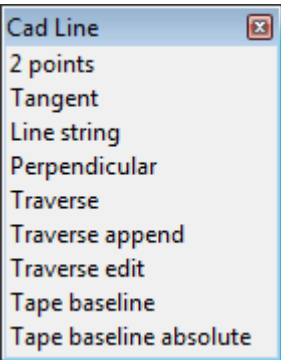

As there is two solutions, the user can select the correct one with the mouse.

CAD Line

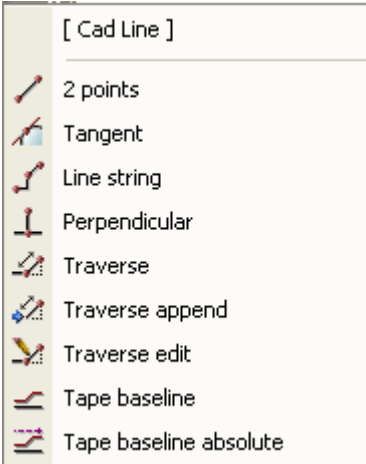

Position of option on menu: Strings =>CAD =>Line

The Line walk-right menu is

Menu of Options to Create Strings

- create a two vertex (point) super string
- create tangent to two selected items (vertices and/or arcs)
- create a many vertex super string
- create a two points string perpendicular to a reference string
- create many vertex super string by bearing distances from previous vertex
- append to a super string using bearing distance entry
- modify the bear/distance of a selected segment
- create string with vertices a dist along and dist offset to a line
- create string with vertices a dist along and dist offset absolute to a line

For the option *2 points*, go to

- | | |
|-------------------------------|----------------------------------------|
| <i>Tangent</i> | 2 Points |
| <i>Line string</i> | Tangent |
| <i>Perpendicular</i> | Line string |
| <i>Traverse</i> | Perpendicular |
| <i>Traverse append</i> | Traverse |
| <i>Traverse edit</i> | Traverse append |
| <i>Tape baseline</i> | Traverse edit |
| <i>Tape baseline absolute</i> | Tape baseline |
| | Tape baseline absolute |

2 Points

Position of option on menu: Strings =>CAD =>Line =>2 points

or by selection of appropriate icon from the toolbar. 

This option creates two vertex super strings with a line between the two vertices.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position. The model, colour, height etc. are defined in the **Cad Control Bar**.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can

choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar**

The 2nd point is selected in the same way as the 1st point. The line is created after successful selection and acceptance of the 2nd point. The option remains current so that a number of lines can be created.

Tangent

Position of option on menu: Strings =>CAD =>Line =>Tangent

or by selection of appropriate icon from the toolbar. 

This option creates the tangential line between two elements.

NOTE: This option is for super strings only. When Selecting an arc or circle, the selection must be a line snap with direction. If a point is selected on the arc/circle the line will be draw between the selected points and not the tangent.

On selecting **Tangent**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position of the reference line is selected and accepted.

STEP 2:

The user selects and accepts the arc/circle segment with direction. The direction is required because there are two possible solutions. In this case, the direction was anti clockwise.

**STEP 3:**

After accepting the segment, a line is drawn from the 1st selected point to the tangent point. Note that in this example, the arc is produced around so that a solution can be found.

**Line string**

Position of option on menu: Strings =>CAD =>Line =>Line string

or by selection of appropriate icon from the toolbar. 

This option creates a string of many points.

On selecting **Line string**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The position of each vertex of the string is selected and accepted in order from the first to the last vertex.

Perpendicular

This option creates a string by selecting a reference string and a reference point the create a line from the reference point perpendicular to the reference string.

On selecting **Perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A reference string is selected and accepted.

STEP 2:

A line is drawn from the current mouse position perpendicular to the reference string

STEP 3:

After the final position is accepted, a line string is created which start from the selected position and perpendicular to the reference string.

Traverse

Position of option on menu: Strings =>CAD =>Line=>Traverse

or by selection of appropriate icon from the toolbar. 

This option creates a string by giving the bearing and distance of each vertex from the previous vertex. The position of the first vertex is the start of the string and then the bearing and distance is given to define the position of the next vertex. The created vertex then become the position to take the next bearing and distance from.

On selecting **Traverse**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position is selected and accepted. This becomes the first vertex of the string.

STEP 2:

A line is drawn from the vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user

selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

**STEPS 4-5:**

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.

**Traverse append**

Position of option on menu: Strings =>CAD =>Line =>Traverse append

or by selection of appropriate icon from the toolbar. 

This option adds vertices to the **end** of a super string by giving the bearing and distance of each vertex from the previous vertex. When a string is selected, the end of the string becomes the position that the bearing distance is taken from. The created vertex then become the position to take the next bearing and distance from.

On selecting **Traverse append**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

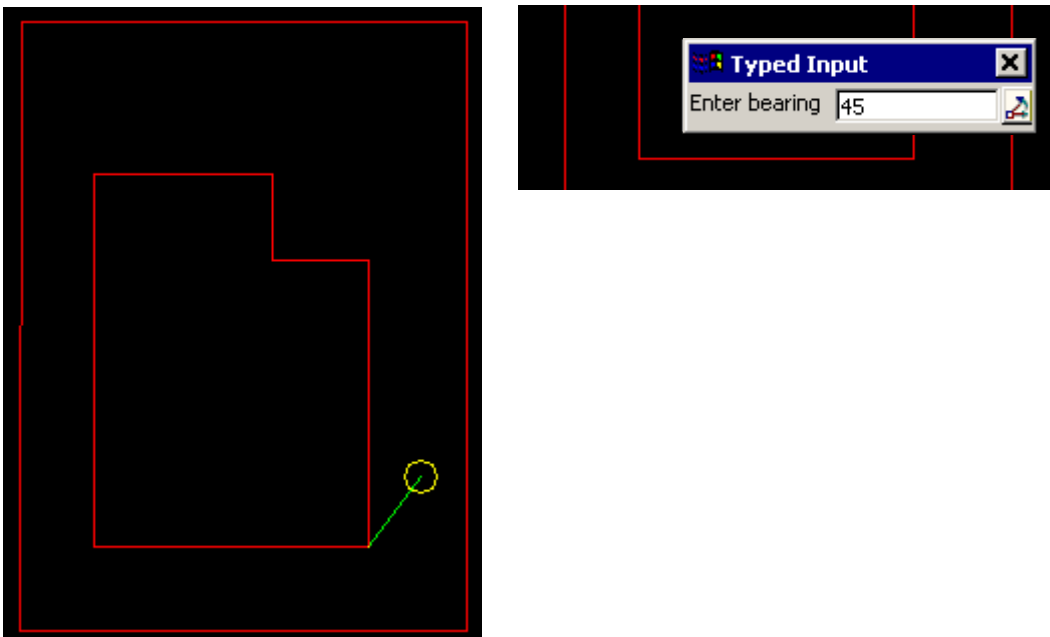

A string to append vertices to is selected and accepted. The end of this string becomes the position to define the first bearing distance from.

STEP 2:

A line is drawn from the last vertex to the current mouse position. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the enter key.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

**STEP 3:**

A distance from the start point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user

selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

**STEPS 4-5:**

The next bearing and distance is prompted for as per step 4 and 5. The start point is now the last created point. A number of segments can be entered in this way.

Traverse edit

Position of option on menu: Strings =>CAD =>Line =>Traverse edit

or by selection of appropriate icon from the toolbar. 

This option changes the bearing and length of a selected line segment of a super string.

On selecting **Traverse edit**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A line segment of a string is selected and accepted. This segment is the one to have its bearing distance redefined.

STEP 2:

A **Bearing** and then the **Distance** typed input boxes are presented with the current values for the line segment displayed. After new values are entered (or just <enter> if the original value is to be maintained) then the new bearing and distance values are applied to the start vertex of the segment to produce a new end vertex. The rest of the string keeps the same bearing/distances are in the original string.

Note: The **Page up** and **page down** keys can be used when the input bearing box comes up to add or subtract intervals of 90 degrees.

Tape baseline

Position of option on menu: Strings =>CAD =>Line =>Tape baseline

or by selection of appropriate icon from the toolbar. 

This option creates a line string by entering distances between points and the offset distance to a user defined reference line string.

On selecting **Tape baseline**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

STEP 2:

The interception point for the reference line is selected and accepted.

STEP 3:

After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the first point, the distance entered is relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

Note: The distance is always relative to the previously entered vertex (positive is from start point to intercept point along the reference line).

STEP 4:

After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

Note: The offset distance is always relative to the reference line (negative is to the left).

**STEP 5:**

Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.

**STEP 6:**

The option can be terminated by click on the close button  on the Input box, followed by the Esc key.

**Tape baseline absolute**

Position of option on menu: Strings => CAD => Line => Tape baseline absolute

or by selection of appropriate icon from the toolbar. 

This option creates a line string by entering distances from the start point and the offset distance to a user defined reference line string.

On selecting **Tape baseline absolute**, the user is prompted for the relevant data in the screen

message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start position of the reference line is selected and accepted.

Note: Originating at the start point, the reference line will extend to infinity after intercepting the 2nd point. The offset values are made relative to this reference line. The reference line will be removed once the option has been terminated.

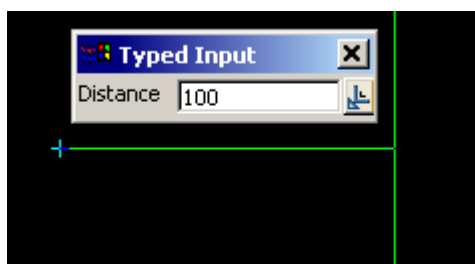

**STEP 2:**

The interception point for the reference line is selected and accepted.

**STEP 3:**

After the start and interception points are accepted, the reference line is constructed and the Distance Input box appears. A distance value is to be entered into the Input box, followed by the enter key. For the absolute option, all distances entered are relative to the start point of the reference line. A positive value means a distance towards the intercept point (from the start point).

Note: For the absolute option, distances are always relative to the start point of the reference line (positive is from start point to intercept point along the reference line).

**STEP 4:**

After the distance value has been entered, the Offset Input box will appear. Type the required offset value into the Input box and press the enter key.

Note: The offset distance is always relative to the reference line (negative is to the left).

STEP 5:

Steps 3 and 4 should be repeated until the required number of vertices have been created in the line string.

STEP 6:

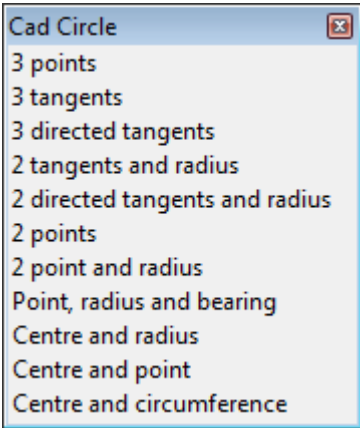

The option can be terminated by click on the close button  on the Input box, followed by the Esc key.

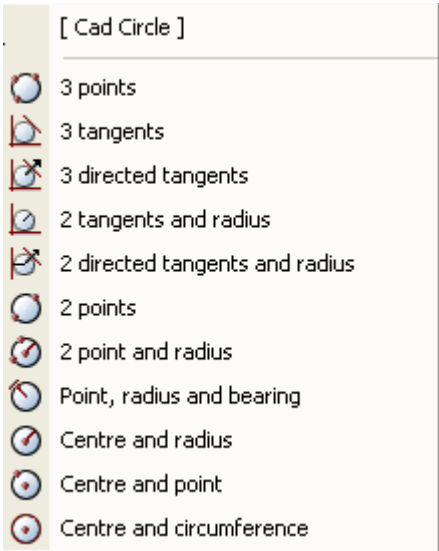

CAD Circle

Position of option on menu: Strings =>CAD =>Circle

The Circle walk-right menu is

from 3 selected points
tangential to 3 tangents (including points)
tangential to 3 directed tangents (including points)
known radius and tangential to 2 tangents
known radius and tangential to 2 directed tangents
from 2 points on diameter
through 2 points and known radius
through point with known radius and a bearing at point
centre position and specified radius
centre position and point on circle
centre position and the circumference of the circle

For the option *3 points*, go to
3 tangents
3 directed tangents
2 tangents and radius
2 directed tangents and radius.
2 points
2 points and radius
Point, radius and bearing
Centre and radius
Centre and point
Centre and circumference

[Centre and point](#)
[Centre and circumference](#)

3 Points

Position of option on menu: Strings =>CAD =>Circle =>3 points

or by selection of appropriate icon from the toolbar. 

This option creates the circle through three selected points.

On selecting 3 points, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

The 2nd point is selected and accepted.

After the 2nd point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

STEP 3:

The 3rd point is selected and accepted.

STEP 4:

A circle is constructed through the three selected points

**3 tangents**

Position of option on menu: Strings =>CAD =>Circle=>3 tangents

or by selection of appropriate icon from the toolbar. 

This option creates a circle that is tangential to three selected segments.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**

A circle is constructed that touches each of the three selected tangents.

**3 directed tangents**

Position of option on menu: Strings =>CAD =>Circle =>3 directed tangents

or by selection of appropriate icon from the toolbar. 

This option creates a circle that is tangential to three selected segments. The segments are selected in order and with direction and the circle is to the right of the direction of the selected segments.

On selecting **3 directed tangents** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**

If a solution exists, a circle is constructed using the given information.

2 tangents and radius

Position of option on menu: Strings =>CAD =>Circles=>2 tangents and radius

or by selection of appropriate icon from the toolbar. 

This option creates a circle with a given radius that is tangential to two selecting segments.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

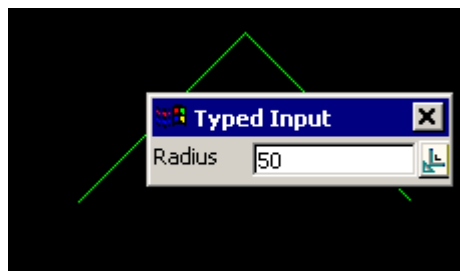

Select the 1st tangent with the mouse (Left Button) and accept it (Middle Button).

**STEP 2:**

Select the 2nd tangent and accept it.

**STEP 3:**

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.

**STEP 4:**

If a solution exists, a circle is fitted touching the two selected tangents using the given radius.

2 directed tangents and radius

Position of option on menu: Strings =>CAD =>Circle=>2 directed tangents and radius
or by selection of appropriate icon from the toolbar. 

This option creates a circle with a given radius that is tangential to two selected segments that are picked with direction.

On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the Enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

If a solution exists, a circle is constructed using the given information.

2 points

Position of option on menu: Strings =>CAD =>Circle =>2 points

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting two points that define the diameter of the circle.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor (cursor position taken as the other end of a diameter). This will continue until the 2nd point is selected and accepted.

STEP 2:

The 2nd point is selected and accepted.

STEP 3:

The circle is constructed through the two selected points. The two points define the diameter.

2 point and radius

Position of option on menu: Strings =>CAD =>Circle =>2 point and radius

or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius that goes through two selected points.

On selecting **2 point and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

STEP 2:

The 2nd point is selected and accepted.

STEP 3:

After the 2nd point is accepted, the Radius Input box will appear. The radius value is entered into

the input box followed by the enter key.

STEP 4:

If a solution exists, the circle is fitted through the two selected points using the given radius.

Point, radius and bearing

Position of option on menu: Strings =>CAD =>Circle=>Point, radius and bearing

or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius, a selected point on the circle and the bearing of the tangent to the circle at that point.

On selecting **Point, radius and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

After the 1st point is accepted, the **Enter radius** input box will appear. Type the radius value into

the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the radius has been entered, the **Enter bearing** input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.

STEP 4:

If a solution exists, a circle is fitted from the given bearing at the selected point using the selected radius.

Centre and radius

Position of option on menu: Strings =>CAD =>Circle =>Centre and radius

or by selection of appropriate icon from the toolbar. 

This option creates a circle of a given radius and a selected centre point

On selecting **Centre and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ

Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

The circle is constructed through the centre point using the specified radius.

Centre and point

Position of option on menu: Strings =>CAD =>Circle =>Centre and point

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting a centre point and then using the cursor to select a second point that in on the circle.

On selecting **Centre and point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the point into the Input box and press the enter key.

STEP 3:

A circle is constructed using the two points defined by the user.

Centre and circumference

Position of option on menu: Strings =>CAD =>Circle=>Centre and circumference

or by selection of appropriate icon from the toolbar. 

This option creates a circle by selecting the centre point and giving a circumference value.

On selecting **Centre and circumference**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted, the **Circumference** Input box will appear. Type the circumference length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

A circle is constructed using the centre point and the given circumference.

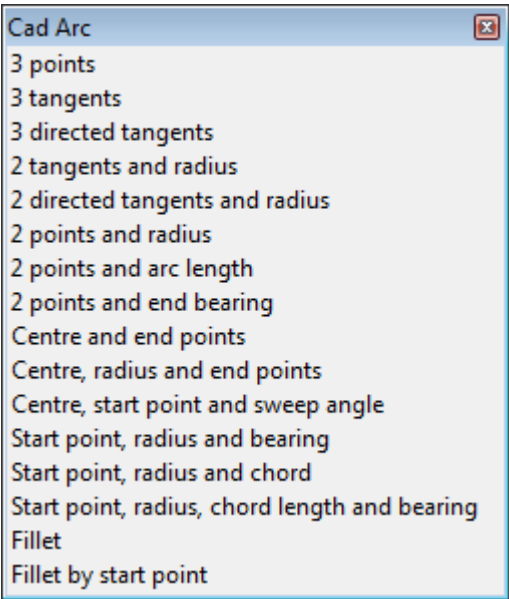

CAD Arc

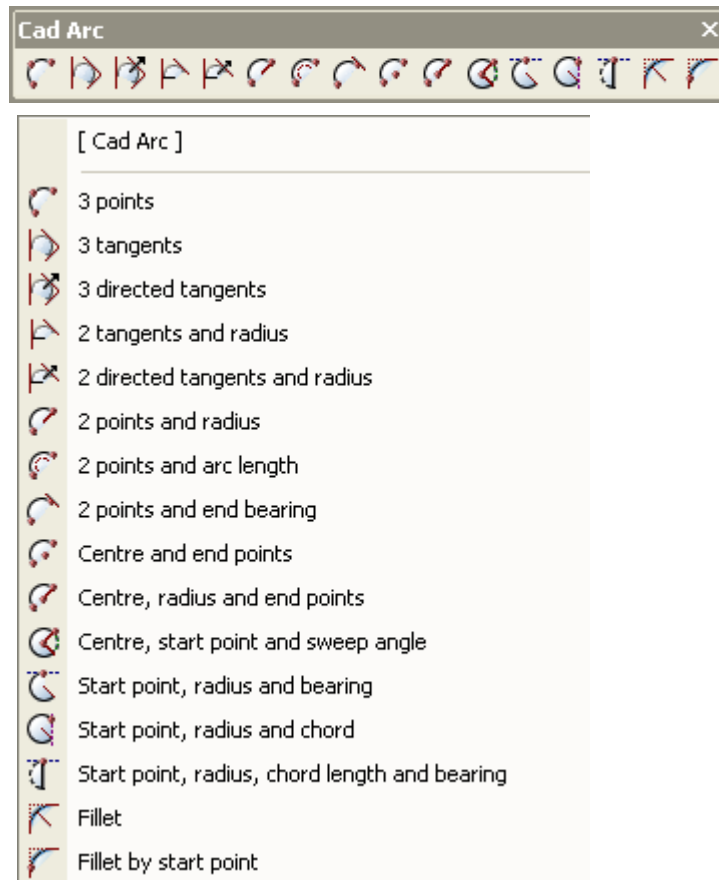

Position of option on menu: Strings =>CAD =>Arc

The arc options creates **super string arcs**, not arc strings. The options Strings =>Create =>Arc create arc strings.

The Arc walk-right menu is

- from 3 selected points
- tangential to 3 tangents (including points)
- tangential to 3 directed tangents (including points)
- known radius and tangential to 2 tangents
- known radius and tangential to 2 directed tangents
- through 2 points and known radius
- 2 points and known arc length
- 2 points and known bearing at first point
- centre and end points
- centre, radius and end points
- centre, start point and sweep angle
- through point with known radius and a bearing at point
- start point, radius and chord length
- start point, radius and chord length and bearing
- fillet between 2 segments and given radius
- fillet between 2 segments with selected start point

For the option *3 points*, go to

3 tangents

3 points

Position of option on menu: Strings =>CAD =>Arc =>3 points

or by selection of appropriate icon from the toolbar. 

This option creates the arc through three selected points and the first and third points are the start and end of the arc.

On selecting *3 points*, the user is prompted for the relevant data in the screen message box

located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

The 2nd point is selected and accepted.

After the 2nd point is accepted an arc will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.

STEP 3:

The 3rd point is selected and accepted.

STEP 4:

An arc is constructed through the three selected points.

3 tangents

Position of option on menu: Strings =>CAD =>Arc =>3 tangents

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is tangential to three selected segments. The first and third segments are the start and end of the arc.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

The 3rd tangent is selected and accepted.

**STEP 4:**

The arc is constructed touching the three selected tangents.

**3 directed tangents**

Position of option on menu: Strings =>CAD =>Arc =>3 directed tangents

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is tangential to three selected segments. The segments are selected in order and with direction and the arc is to the right of the direction of the selected segments. The first and third segments are the start and end of the arc.

On selecting **3 directed tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of the tangent. A user may reverse the direction of the tangent by selecting a tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

The 3rd tangent is selected and accepted.

**STEP 4:**

If a solution exists, an arc is constructed using the given information.

2 tangents and radius

Position of option on menu: Strings => CAD => Arc => 2 tangents and radius

or by selection of appropriate icon from the toolbar. 

This option creates an arc with a given radius that is tangential to two selecting segments. This is the same as a fillet.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

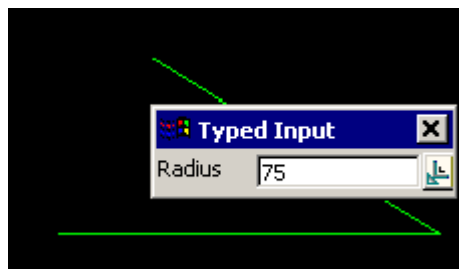

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).

**STEP 2:**

The 2nd tangent is selected and accepted.

**STEP 3:**

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 4:**

If a solution exists, the arc is fitted through the two selected tangents using the given radius.

2 directed tangents and radius

Position of option on menu: Strings =>CAD =>Arc =>2 directed tangents and radius

or by selection of appropriate icon from the toolbar. 

This option creates an arc with a given radius that is tangential to two selected segments that are

picked with direction.

On selecting 2 **directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:

The 2nd tangent is selected and accepted.

STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

If a solution exists, the arc is fitted through the two selected tangents using the given radius.

2 points and radius

Position of option on menu: Strings =>CAD =>Arc =>2 points and radius
or by selection of appropriate icon from the toolbar.

This option creates an arc of a given radius that starts and ends on two selected points.
On selecting **2 points and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.

2 points and arc length

Position of option on menu: Strings =>CAD =>Arc =>2 points and arc length

or by selection of appropriate icon from the toolbar 

This option creates an arc of a given arc length that starts and ends on two selected points.

On selecting **2 points and arc length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1: 12d

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the start point is accepted, the Arc length Input box will appear. Type the arc length value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc length by measuring existing elements.

STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.

2 points and end bearing

Position of option on menu: Strings =>CAD =>Arc =>2 points and end bearing
or by selection of appropriate icon from the toolbar. 

This option creates an arc that starts and end on two selected points and has a given bearing of the tangent at the end point (the end bearing).

On selecting **2 points and end bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

The 2nd point is selected and accepted.

STEP 3:

After the 2nd point is accepted, the Enter bearing input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.

**STEP 4:**

If a solution exists, the arc is fitted through the two selected points with the end point of the given bearing.

Centre and end points

Position of option on menu: Strings =>CAD =>Arc =>Centre and end points

or by selection of appropriate icon from the toolbar. 

This option creates an arc by selecting in order, the centre point and the start and end points. The radius of the arc is the distance between the centre and the start point.

On selecting **Centre and end points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

**STEP 2:**

Select and accept the start point. This point defines the radius and the start of the arc.

**STEP 3:**

The end point of the arc is specified.

**STEP 4:**

The arc is constructed using the given information.

Centre, radius and end points

Position of option on menu: Strings =>CAD =>Arc =>Centre, radius and end points

or by selection of appropriate icon from the toolbar. 

This option allows the creation of an arc given a centre point, radius, start and end points.

This option creates an arc of a given radius by selecting in the centre point and the start and end positions.

On selecting **Centre, radius and end points** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various

solutions according to the position of the cursor. This will continue until the start point is selected and accepted.

STEP 2:

A radius value is selected with the mouse or entered in via the keyboard. To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the Enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

STEP 3:

A start point defines the start of the sweep angle to define where to start the arc. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 4:

The end point of the arc is specified. The start and end points define the sweep angle to define the arc. The rubber banding of the arc will use the cursor position as the end position until a end point is selected and accepted. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The end point does not have to be on the arc itself. It is used to define the sweep angle.

**STEP 5:**

The arc is constructed using the given information.

Centre, start point and sweep angle

Position of option on menu: Strings =>CAD =>Arc =>Centre, start point and sweep angle
or by selection of appropriate icon from the toolbar. 

This option creates an arc by selecting a centre point and a start points and giving a sweep angle. The radius of the arc is the distance between the centre and start point.

On selecting **Centre, start point and sweep angle**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. This point defines the radius as well as the start point of the arc. To specify the 2nd point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 2nd point with the keyboard,

simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 3:

After the 2nd point is accepted, the **Sweep Angle** input box will appear. Type the sweep angle value into the input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

STEP 4:

The arc is created using the information supplied

Start point, radius and bearing

Position of option on menu: Strings =>CAD =>Arc =>Start point, radius and bearing

or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius, starting at a selected point and bearing of the tangent at the start point and going for a given arc length.

On selecting the **Start point, radius and bearing** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point

with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the radius has been entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 4:**

After the arc length is accepted, the Bearing Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

**STEP5:**

The arc is created with the given information.

Start point, radius and chord

Position of option on menu: Strings =>CAD =>Arc =>Start point, radius and chord
or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius, starting from a selected point and with a given chord bearing at the start point and a given arc length.

On selecting **Start point, radius and chord**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

**STEP 3:**

After the arc radius is entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc distance by measuring existing elements.

**STEP 4:**

After the arc length is entered, the **Chord Bearing** Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The **Page Up** and **Page Down** keys can be used when the **Chord Bearing** Input box comes up to add or subtract intervals of 90 degrees.

**STEP 5:**

An arc is created with the given information.

Start point, radius, chord length and bearing

Position of option on menu: Strings =>CAD =>Arc =>Start point, radius, chord length and bearing
or by selection of appropriate icon from the toolbar. 

This option creates an arc of a given radius, starting from a selected point, with a given bearing of the tangent at the start point and a given chord length from the start point.

On selecting **Start point, radius, chord length and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 3:

After the radius has been entered, the **Chord Length** Input box will appear. Type the chord length into the Input box and press the enter key. The browse button  on the Input box can be used to define the chord length by measuring existing elements.

STEP 4:

After the chord length has been entered, the **Bearing** Input box will appear. Type the bearing of the start tangent into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.

STEP 5:

The arc is created with the given information.

Fillet

Position of option on menu: Strings =>CAD =>Arc =>Fillet

or by selection of appropriate icon from the toolbar. 

This option creates an arc given a fillet radius

On selecting **Fillet**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown, the direction was in a north-east direction.

STEP 2:

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number

of solutions for intersecting segments. In the case shown the direction was in a south-east direction

STEP 3:

After the 2nd segment is accepted, the Arc Radius Input box will appear. Type the radius of the fillet in the Input box (positive radius for curves curving to the right) and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

STEP 4:

The fillet arc is placed between the selected segments.

Fillet by start point

Position of option on menu: Strings =>CAD =>Arc =>Fillet by start point

or by selection of appropriate icon from the toolbar. 

This option creates an arc that is a fillet between two selected sections and with a selected fillet start point (which will be a tangent point of the created arc).

On selecting **Fillet by start point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st segment where the fillet is to depart from is selected and accepted. This should be done by a pick with direction. The direction will influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a north-east direction.

**STEP 2:**

The 2nd segment where the fillet is to arrive from is selected and accepted. This should be done by a pick with direction. The direction will again influence the calculations as there are a number of solutions for intersecting segments. In the case shown the direction was in a south-east direction

**STEP 3:**

The tangent start point of the fillet is selected and accepted.

**STEP 4:**

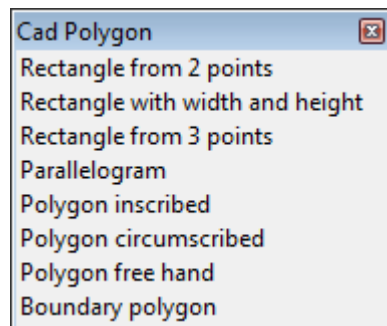

The fillet arc is placed between the selected segments.

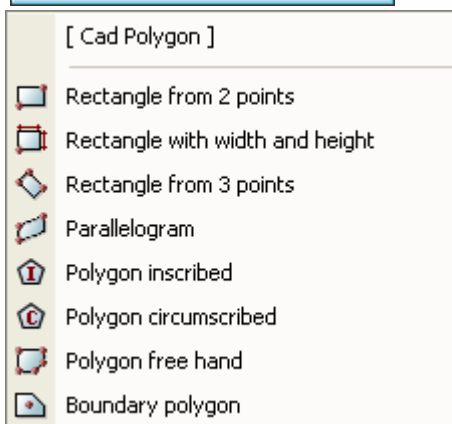

CAD Polygon

Position of option on menu: Strings =>CAD =>Polygon

The Cad polygon walk-right menu is

rectangle (fillet/chamfer) parallel to axes by picking 2 diagonal corners
 rectangle parallel to axes by picking BL point, width and height
 2 points defining base, 3rd point defining height
 2 points defining base, 3rd point defining corner
 centre point, number of sides and point on circumference
 centre point, number of sides and point on circumference
 pick in polygon vertices (in order)
 find polygon from lines and arcs, surrounding selected point

For the option *Rectangle from 2 points*, go to
Rectangle with width and height
Rectangle from 3 points
Parallelogram
Polygon inscribed
Polygon circumscribed
Polygon free hand
Boundary polygon

[Rectangle from 2 points](#)
[Rectangle with width and height](#)
[Rectangle from 3 points](#)
[Parallelogram](#)
[Polygon inscribed \(in a circle\)](#)
[Polygon Circumscribed About a Circle](#)
[Free Hand Polygon](#)
[Create Boundary Polygon](#)

Rectangle from 2 points

Position of option on menu: Strings =>CAD =>Polygon =>Rectangle from 2 Points

or by selection of appropriate icon from the toolbar. 

This option creates a rectangle parallel to the x and y axis by selecting two diagonal corners of the rectangle.

On selecting **Rectangle from 2 Points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a rectangle will be displayed 'rubber banding' to form a rectangle

with the first point and the cursor position being diagonal corners. This will continue until the 2nd point is selected and accepted.

STEP 2:

The following message is displayed in the screen message box:

<[N] Pick opposite corner or (r)adius, (c)hamfer, (l)ength> [picks][Fast][Menu]

Output Window

If filleted corners are required, type **r** and enter the *corner radius*.

If chamfered corners are required, type **c** and enter the *chamfer length*.

If a fillet or chamfer has been selected, type **n** to turn it off.

STEP 3:

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 4:

The rectangle is created with the given information.

Rectangle with width and height

Position of option on menu: Strings =>CAD =>Polygon =>Rectangle with width and height

or by selection of appropriate icon from the toolbar. 

This option creates a rectangle parallel to the x and y axis by selecting a start point and giving the width and height of the rectangle.

On selecting **Rectangle with width and height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

This point defines the bottom left point of the rectangle.

After the start point is accepted, the width will be displayed 'rubber banding' to right of the start point (positive distance). The width is equal to the distance from the start point to the position of the cursor. This will continue until the width is selected and accepted.

STEP 2:

The width is selected with the mouse or entered in via the keyboard. To specify the width with the mouse, a point must be selected and accepted. To enter the width with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

A negative distance (to the left of the 1st point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button  to select a distance, then place a minus "-" sign in front of the distance value.

After the width is accepted, the width of the rectangle is confirmed and the height will be displayed 'rubber banding' upwards on the screen. The height is equal to the distance from the found width point to the position of the cursor. The rectangle will be created once the height is selected and accepted.

**STEP 3:**

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the height with the keyboard, simply start typing or press the space bar to bring up the Distance Input box. Type the distance into the Distance Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

A negative distance (below of the 2nd point) can be entered via the Distance Input box in two ways. Either type a negative distance, or use the browse button  to select a distance, then place a minus "-" sign in front of the distance value.

**STEP 4:**

The rectangle is created with the given information.

Rectangle from 3 points

Position of option on menu: Strings =>CAD =>Polygon =>Rectangle from 3 points

or by selection of appropriate icon from the toolbar. 

This option creates a rectangle by selecting three points. The first and second point define the base of the rectangle, which can be at any angle, and the third point is on the opposite side of the rectangle. The rectangle can be filleted or chamfered.

On selecting **Rectangle from 3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point

with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted, the base of the rectangle will be displayed 'rubber banding' on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.

STEP 2:

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the rectangle is confirmed and the height will be displayed 'rubber banding' on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The rectangle will be created once the height is selected and accepted.

STEP 3:

The following message is displayed in the screen message box:

If filleted corners are required, type **r** and enter the *corner radius*.

If chamfered corners are required, type **c** and enter the *chamfer length*.

If a fillet or chamfer has been selected, type **n** to turn it off.

STEP 4:

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

**STEP 5:**

The rectangle is created with the given information.

**Parallelogram**

Position of option on menu: Strings =>CAD =>Polygon =>Parallelogram

or by selection of appropriate icon from the toolbar. 

This option creates a parallelogram by selecting three points. The first and second point define the base of the parallelogram, which can be at any angle, and the third point is the end point of the opposite side of the parallelogram.

On selecting **Parallelogram**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted, the base of the rectangle will be displayed 'rubber banding' on the screen. The baseline length is equal to the distance from the 1st point to the position of the cursor. This will continue until the 2nd point is selected and accepted.

**STEP 2:**

The 2nd point is selected with the mouse or entered in via the keyboard. To specify the 2nd point with the mouse, a point must be selected and accepted. To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

After the 2nd point is accepted, the baseline of the parallelogram is confirmed and the height will be displayed 'rubber banding' on the screen. The height is equal to the distance from the 2nd point to the position of the cursor. The parallelogram will be created once the height is selected and accepted.

**STEP 3:**

The height is selected with the mouse or entered in via the keyboard. To specify the height with the mouse, a point must be selected and accepted. To enter the 3rd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The browse button  on the Input box can be used to define the distance by measuring existing elements.

**STEP 4:**

The parallelogram is created with the given information.

Polygon inscribed (in a circle)

Position of option on menu: Strings =>CAD =>Polygon =>polygon inscribed

or by selection of appropriate icon from the toolbar. 

This option creates a polygon with a user defined number of sides on the inside of a circle.

The polygon is constructed inside a circle, thus each corner of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon circumscribed** option, the midpoint of each side of the polygon touches the circumference of the circle creating a polygon outside the circle.

On selecting **polygon inscribed**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

STEP 2:

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

After the number of sides have been selected, the polygon will be displayed 'rubber banding' on the screen. The polygon will be created once the radius is selected and accepted.

STEP 3:

Before a polygon can be created inside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

Note: One of the polygon's corners will be located on the point selected to defined the circle's radius

STEP 4:

A polygon is created inside a circle with a radius defined by the user.

Polygon Circumscribed About a Circle

Position of option on menu: Strings =>CAD =>Polygon =>Polygon circumscribed

or by selection of appropriate icon from the toolbar. 

This option creates a polygon with a user defined number of sides on the outside a circle.

The polygon is constructed outside a circle, thus the midpoint of each side of the polygon touches the circumference of the circle defined by the user. Conversely using the **Polygon inscribed** option, each corner of the polygon touches the circumference of the circle creating a polygon inside the circle.

On selecting **Polygon circumscribed**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The centre point is selected with the mouse or entered in via the keyboard. To specify the centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

**STEP 2:**

After the centre point is accepted, the Number of Sides Input box will appear. Type in the desired number of sides for the polygon into the Input box and press the enter key.

After the number of sides have been selected, the polygon will be displayed 'rubber banding' on the screen. The polygon will be created once the radius is selected and accepted.

**STEP 3:**

Before a polygon can be created outside the circle, its radius must be defined by the user. To specify the radius with the mouse, a point must be selected and accepted. To enter the point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

Note: One midpoint of the polygon's side will be located on the point selected to defined the circle's radius

**STEP 4:**

A polygon is created outside the circle with a radius defined by the user.

Free Hand Polygon

Position of option on menu: Strings =>CAD =>Polygon =>Polygon free hand

or by selection of appropriate icon from the toolbar. 

This option creates a closed polygon from selected vertices.

On selecting **Polygon free hand**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Pick and accept the position to form the vertices of the polygon. As each vertex is accepted, the polygon is automatically closed.

STEP 2:

The polygon is finished by pressing the <Esc> key.

Create Boundary Polygon

Position of option on menu: Strings =>CAD =>Polygon =>Boundary polygon

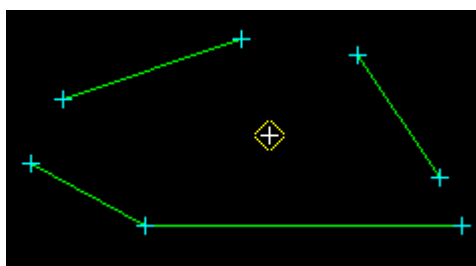

or by selection of appropriate icon from the toolbar. 

This option tries to form a boundary from a selected set of segments.

On selecting **Boundary polygon**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Pick a position inside the lines, arcs and strings to form a bounding polygon from.

STEP 2:

A circle is then drawn centred on the selected position with circumference going through the position of the cursor. Drag the cursor out until it encloses all the data to be used to create the closest bounding polygon around the centre.

**STEP 3:**

On accepting the circle position, an attempt is made to create the inner polygon using all the strings inside the circle.

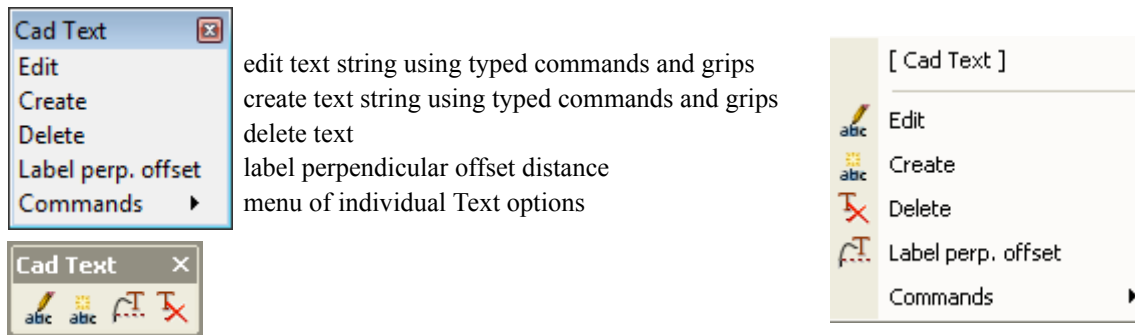

CAD Text

Position of option on menu: Strings =>CAD =>Text

Position of option on menu: Various toolbars

Text can occur as a text string, on vertices and segments of a super string or on vertices of a 4d string. But the display position of text is not as straight forward as simply placing a point. For more information about text, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

The Text walk-right menu is

For the option *Edit*, go to

Create

Delete

Label perp. offset

Commands

[Edit Text](#)

[Create Text](#)

[Text Delete](#)

[Label Perpendicular Offset](#)

[CAD Text Commands](#)

Create Text

Position of option on menu: Strings =>CAD =>Text =>Create

or by selection of appropriate icon from the toolbar. 

For information about text and its definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

12d Model has two CAD text options **Create** and **Edit**. However both of these run the same option which starts up in different modes - **Create** is in the mode to create text as straight text, or text on a super string vertex or on a super string segment and **Edit** which edits existing text.

Once either CAD text option is started it is possible to change between the **Create** and **Edit** modes at any time.

The **Create** option creates text strings, text at super string vertices and text on super string segments, and then displays a list key commands in the screen message area, and grips on screen, to quickly allow editing of the text, text size, colour, rotation, style, angle, raise, justification point etc.

After selecting the option, the **Pick position** message is displayed in the screen message area.

To go from **Create** to **Edit** mode, type **e** - go to [To Go from Create to Edit Mode - Typing e](#)

To create a text string, type **c** - go to [Creating a Text String - Typing c](#)

To create vertex text, type **V** - go to [Creating Text at a Super String Vertex- Typing v](#)
To create segment text, type **S** - go to [Creating Text at a Super String Segment- Typing s](#)

Creating a Text String - Typing c

After typing **C**, the **Pick position** message is again displayed in the screen message area and the position of the text is then selected with the cursor.

When the position is accepted an **Enter text** typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text vertex and text justification point is placed at that position and the direction of the text is parallel to the x-axis. The angle and raise are both zero and the text justification is (left x, bottom y).

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section [Text Grips](#) in the chapter [Tools and Concepts](#).

For the new text, the style and height are taken from the **Text controlbar** and the model and colour from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars, Symbol Controlbar](#) and [CAD Controlbar](#)).

After the text is created, a list of typed options is then displayed in the screen message area.

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)tyle, ( ) (t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

Output Window

and if **m** is typed, the rest of the options are shown

```
<[J] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

Output Window

These options are the same as when editing existing text, and will be described in detail in the section [Edit Text](#).

C is the default if nothing is typed.

Creating Text at a Super String Vertex- Typing v

After typing **v**, the **Pick vertex** message is displayed in the screen message area and the vertex of the super string to place the text at is then selected with the cursor.

```
<[Pick vertex] (e)dit, (c)reate, (v)ertex, (s)egment> [picks][fast][Menu]
```

Output Window

When the vertex is accepted an **Enter text** typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text justification point is placed at the selected string vertex and the direction of the text is parallel to the x-axis. The angle and raise are both zero and the text justification is (left x, bottom y).

When the text is displayed, grips for quick editing of size, rotation, moving of the justification point and string vertex are also shown. The appropriate grip can then be selected for quick editing. For details on using the grips, go to the section [Text Grips](#) in the chapter [Tools and Concepts](#).

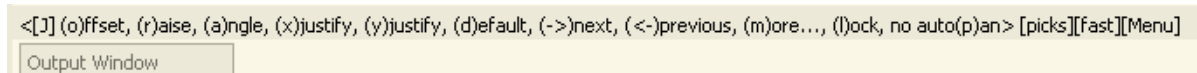

For the new text, the style and height are taken from the **Text controlbar** and colour from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars](#), [Symbol Controlbar](#) and [CAD Controlbar](#)). The created text will be part of the super string so no model is required.

After the vertex text is created, a list of typed options is then displayed in the screen message area.

and if **m** is typed, the rest of the options are shown

These option are the same as when editing existing text, and will be described in detail in the section [Edit Text](#).

Creating Text at a Super String Segment- Typing s

After typing **s**, the **Pick segment** message is displayed in the screen message area and the segment of the super string to place the text on is then selected with the cursor.

When the segment is accepted an **Enter text** typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text justification point is placed at the centre of the segment and the direction of the text is parallel to the segment. The angle and raise are both zero and the text justification is (left x, bottom y).

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section [Text Grips](#) in the chapter [Tools and Concepts](#).

For the new text, the style and height are taken from the **Text controlbar** and colour from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars](#), [Symbol Controlbar](#) and [CAD Controlbar](#)). The created text will be part of the super string so no model is required.

After the segment text is created, a list of typed options is then displayed in the screen message area.

```
<[S] Pick grip point or (c)olour, (s)tyle, ( )t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

Output Window

and if **m** is typed, the rest of the options are shown

```
<[S] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., no auto(p)an, <-previous, ->next> [picks][fast][Menu]
```

Output Window

These option are the same as when editing existing text, and will be described in detail in the section [Edit Text](#).

To Go from Create to Edit Mode - Typing e

After typing **e**, the **Pick text** message is displayed in the screen message area.

```
<[Pick text] (e)dit, (c)reate, (v)ertex, (s)egment> [picks][fast][Menu]
```

Output Window

This is the same as when selecting the Edit option from the CAD Text toolbar and will be described in detail in the section [Edit Text](#).

Edit Text

Position of option on menu: Strings =>CAD =>Text =>Edit
or by selection of appropriate icon from the toolbar. 

For information about text and its definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

12d Model has two CAD text options **Create** and **Edit**. However both of these run the same option which starts up in different modes - **Create** is in the mode to create text as straight text, or text on a super string vertex or on a super string segment and **Edit** which edits existing text.

Once either CAD text option is started it is possible to change between the Create and Edit modes at any time.

The **Edit** option edits text as either text strings, text at super string vertices or text on super string segments.

After typing **e**, the **Pick text** message is displayed in the screen message area

```
<[Pick text] (e)dit, (c)reate, (v)ertex, (s)egment> [picks][Fast][Menu]  
Output Window
```

and text either as a text string, or text on a super string vertex or segment, is then selected by the mouse for editing.

The selected text with the text edit grips is shown on screen, and a list of available typed commands in the screen message area to quickly allow editing of the text, text size, colour, rotation, style, angle, raise, justification point, vertex, etc.

Options displayed after selecting text

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)tyle, ( )t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][Fast][Menu]  
Output Window
```

and by typing **m**

```
<[J] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., (l)ock, no auto(p)an> [picks][Fast][Menu]  
Output Window
```

Text at Super String Vertex

Options displayed after selecting text

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)tyle, ( ) (t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

Output Window

and by typing **m**

```
<[J] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

Output Window

Text on Super String Segment

Options displayed after selecting text

```
<[S] Pick grip point or (c)olour, (s)tyle, ( ) (t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

Output Window

and by typing **m**

```
<[S] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., no auto(p)an, <-previous, ->next> [picks][fast]
```

Output Window

To change the text colour, type **C** - go to [Change Text Colour - Typing c](#)

To change the text style, type **S** - go to [Change Text Style - Typing s](#)

To change the actual text, type **t** or press **space bar** - go to [Change Text - Pressing space bar or Typing t](#)

To change the text height, type **h** - go to [Change Text Height - Typing h](#)

To change the text width factor, type **w** - go to [Change Text Width Factor - Typing w](#)

To create/edit a new text, type **n** - go to [Create/Edit New Text - Typing n](#)

To end the create/edit option, type **f** - go to [Finish the Create/Edit - Typing f](#)

To show the other line of options, type **m** - go to [Show Other Line of Options - Typing m](#)

To change the text offset, type **o** - go to [Change Text Offset - Typing o](#)

To change the text raise, type **r** - go to [Change Text Raise - Typing r](#)

To change the text angle, type **a** - go to [Change Text Angle - Typing a](#)

To change the text x justification, type **x** - go to [Change Text X Justification - Typing x](#)

To change the text y justification, type **y** - go to [Change Text Y Justification - Typing y](#)

To reset some text values to their defaults, type **d** - go to [Reset Text Parameters to Defaults - Typing d](#)

To change focus to the next text, press **->** - go to [Change Focus to the Next Text in String - Pressing right arrow key \(->\)](#)

To change focus to the previous text, press **<-** - go to [Change Focus to the Previous Text in String - Pressing left arrow key \(<-\)](#)

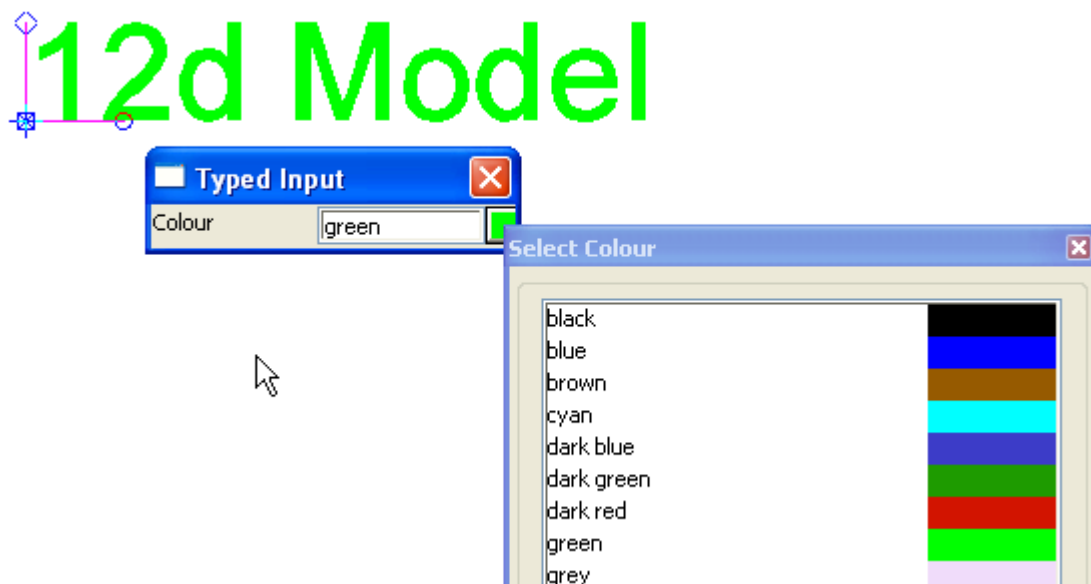

To show the other line of options, type **m** - go to [Show Other Line of Options - Typing m](#)

To toggle vertex lock on and off, type **l** - go to [Toggle Lock - Typing l](#)

To toggle autopan on and off, type **p** - go to [Toggle Autopan - Typing p](#)

Change Text Colour - Typing c

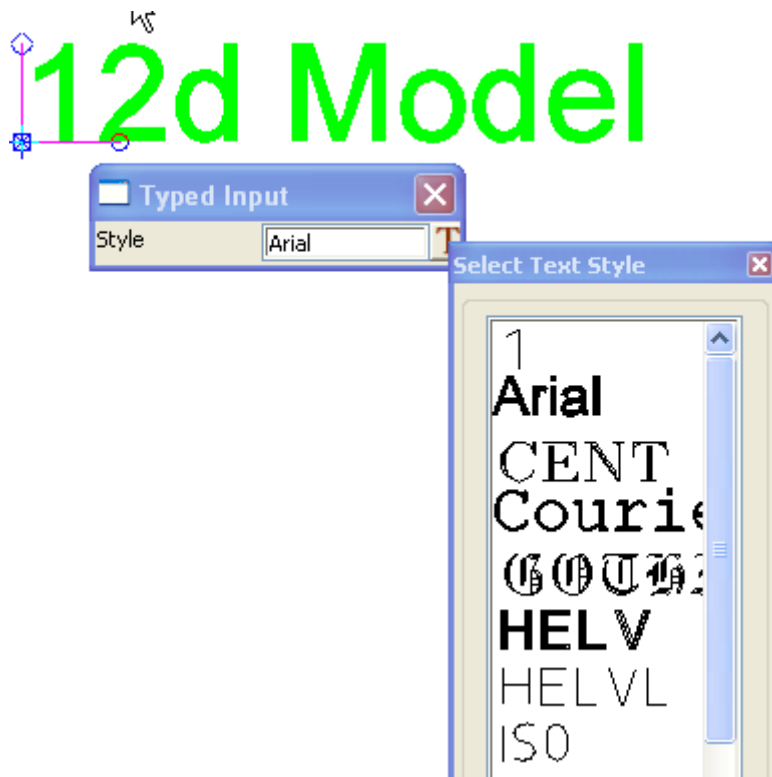

After typing **c**, a Colour **Typed input** box appears with the current text colour displayed.

The new colour for the text is typed into the Colour input box followed by the <enter> key, or by selecting a colour from the **Select Colour** box which is brought up by clicking B1 on the colour button.

Change Text Style - Typing s

After typing **s**, a Style **Typed input** box appears with the current text style displayed.

The new style for the text is typed into the Style input box followed by the <enter> key, or by selecting a style from the **Select Text Style** box which is brought up by clicking B1 on the style button.

Change Text - Pressing space bar or Typing t

After typing **t** or pressing the space bar, an Enter Text **Typed input** box appears with the current text in it.

The new text is typed into the Enter Text input box followed by the <enter> key.

Change Text Height - Typing h

After typing **h**, a Size **Typed input** box appears with the current text height in it.

The new height is typed into the Size input box followed by the <enter> key.

Note - Many arithmetic expressions are supported in the **Size** typed input box (e.g. 10+27). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

Change Text Width Factor - Typing w

After typing **W**, a X-Factor **Typed input** box appears with the current width (x-factor) in it.

The new width (x-factor) is typed into the X-factor input box followed by the <enter> key.

width (x-factor) = 0.5

Note - Many arithmetic expressions are supported in the **X-factor** typed input box (e.g. 0.5*2.2). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

Create/Edit New Text - Typing n

If the option was in **Edit** mode and **n** is typed, a new **Edit** is started (**e** mode). The **Pick text** message is displayed in the screen message area and another text is selected to edit.

Or a **new** text can be created by typing **C**, **V** or **S**. See the section [Create Text](#) for more information on **C**, **V** and **S**.

If the option was in **Create** mode and **n** is typed, a new **Create** is started in the **C** mode. The

Pick position message is displayed in the screen message area and a new text is created.

<[Pick position] (e)dit, (c)reate, (v)ertex, (s)egment> [picks][Fast][Menu] x=-83.686 y=-100.4
Output Window

Or a **new** segment or vertex text can be created by typing **V** or **S** or the Edit mode can be entered by typing **E**. See the section [Create Text](#) for more information on **C**, **V** and **S**.

Change Text Offset - Typing o

After typing **O**, an Offset **Typed input** box appears with the current text offset in it.

The new offset is typed into the Offset input box followed by the <enter> key.

The text justification point will be offset by the new amount

For information about text and the definition of **offset**, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Note - Many arithmetic expressions are supported in the **Offset** typed input box (e.g. 10+27). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

Change Text Raise - Typing r

After typing **r**, a Raise **Typed input** box appears with the current text raise in it.

12d Model

Vertex text - raise = 0

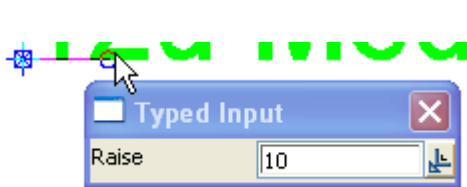

12d Model

Segment text - raise = 0

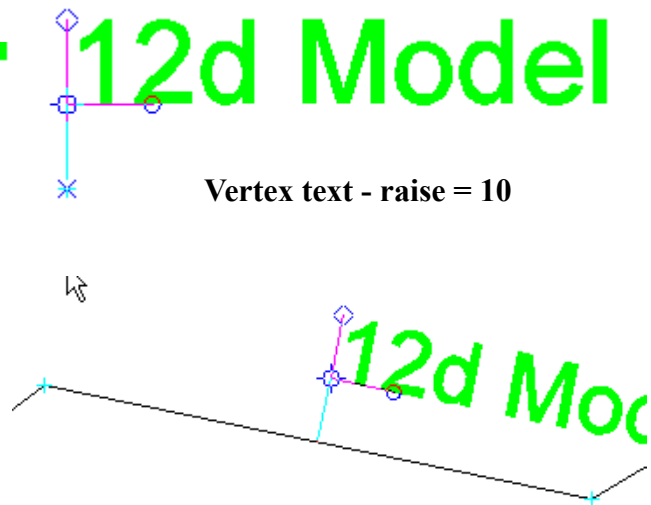

The new raise is typed into the Raise input box followed by the <enter> key.

The text justification point will be raised by the new amount

12d Model

Vertex text - raise = 10

12d Model

Segment text - raise = 10

For information about text and the definition of **raise**, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Note - Many arithmetic expressions are supported in the **Raise** typed input box (e.g. 10+27). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

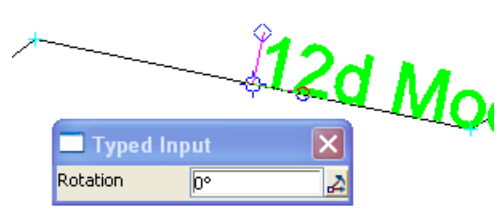

Change Text Angle - Typing a

After typing **a**, a Rotation **Typed input** box appears with the current text angle in it.

12d Model

Vertex text - angle = 0

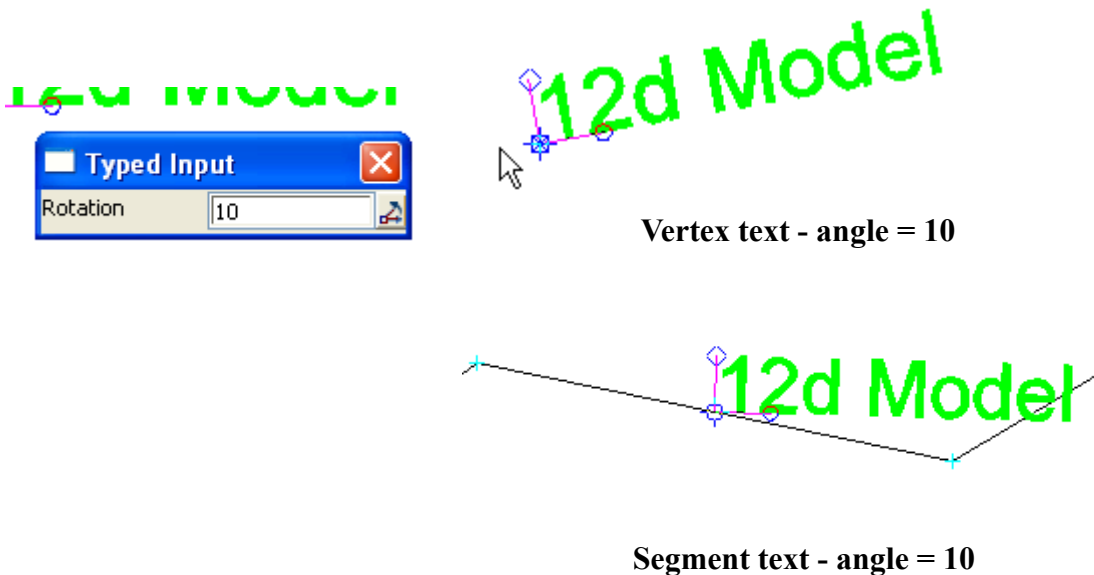

12d Model

Segment text - angle = 0

The new angle is typed into the Rotation input box followed by the <enter> key.

The direction of the text point will be rotated by the new amount.

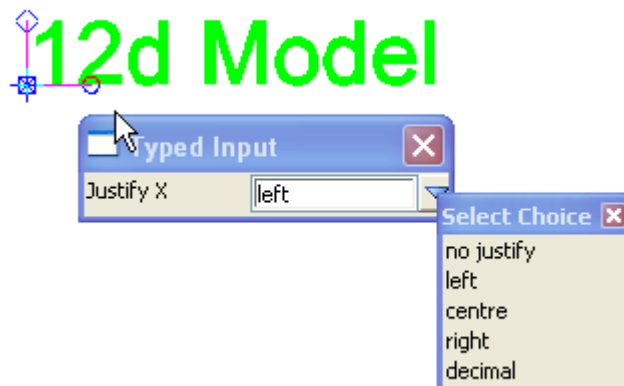

For information about text and the definition of **angle**, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Note - Some arithmetic expressions are supported in the **Rotation** typed input box (e.g. 10+90). See the section [Expressions in Bearing, Angle Panel Fields](#) for what is allowed in angle/bearing panel fields in the chapter [Tools and Concepts](#).

Change Text X Justification - Typing x

After typing **X**, a Justify X **Typed input** box appears with the current text x justification in it.

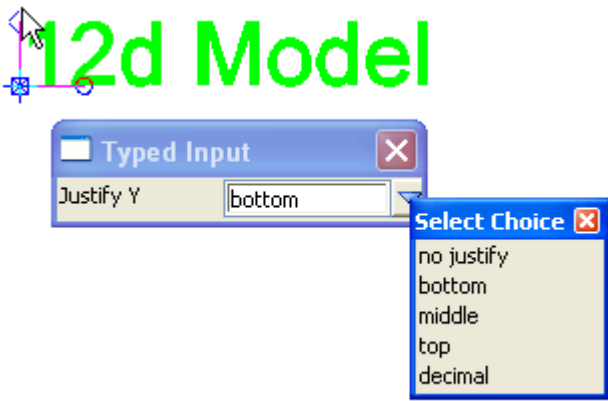

The new x justification for the text is typed into the Justify X input box followed by the <enter> key, or by selecting a justification from the **Select Choice** box which is brought up by clicking B1 on the choice button.

For information about text and the definition of **justification**, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Change Text Y Justification - Typing y

After typing **y**, a Justify Y **Typed input** box appears with the current text y justification in it.

The new y justification for the text is typed into the Justify Y input box followed by the <enter> key, or by selecting a justification from the **Select Choice** box which is brought up by clicking B1 on the choice button.

For information about text and the definition of **justification**, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Reset Text Parameters to Defaults - Typing d

After typing **d**, some of the text parameters are set back to their default values.

That is for a:

Text String, Vertex Text and Segment Text:

- Text style is set to the Text style in the Cad Text Controlbar
- Colour is reset to the colour in the Cad Controlbar
- Size is set to the size in the Cad Text Controlbar
- Angle is set to 0r
- Offset is set to 0
- Raise is set to 0
- X Factor is set to 1
- X Justification is set to left
- Y Justification is set to bottom
- Model stays the same

For information about text definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Change Focus to the Next Text in String - Pressing right arrow key (->)

For vertex text on a super string, pressing **->**, moves the focus of the edit commands to the vertex text on the next vertex of the super string. If the text is on the last vertex, pressing **->** does nothing.

For segment text on a super string, pressing **->**, moves the focus of the edit commands to the segment text on the next segment of the super string. If the text is on the last segment, pressing **->** does nothing.

For information about text definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Change Focus to the Previous Text in String - Pressing left arrow key (<-)

When editing vertex text on a super string, pressing **<-**, moves the focus of the edit commands to the vertex text on the **previous** vertex of the super string. If the text is on the first vertex, pressing **<-** does nothing. If Autopan is on, the selected vertex text is made the centre of the active plan view.

When editing segment text on a super string, pressing **<-**, moves the focus of the edit commands to the segment text on the **previous** segment of the super string. If the text is on the first segment, pressing **<-** does nothing. If Autopan is on, the selected segment text is made the centre of the active plan view.

For information about text definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Toggle Lock - Typing l

Typing **l** toggles locking the vertex on and off.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads (l) lock **(l)lock**, this means that vertex lock is off (unlocked) and typing **l** locks it.

When the screen message area reads un(l) lock **un(l)lock**, this means that the vertex is locked and typing **l** unlocks it.

For information about the vertex text grip, go to the section [Text Grips](#) in the chapter [Tools and Concepts](#).

For information about text definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Toggle Autopan - Typing p

Typing **p** toggles autopan on and off.

When editing vertex text on a super string and **Autopan** is **on**, pressing **->** or **<-**, moves the focus of the edit commands to the vertex text on the next/previous vertex of the super string, and the selected vertex text is made the centre of the active plan view.

When editing segment text on a super string and **Autopan** is **on**, pressing **->** or **<-**, moves the focus of the edit commands to the vertex text on the next/previous segment of the super string, and the selected segment text is made the centre of the active plan view.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads `auto(p)an` `auto(p)an`, this means that autopan is off and typing **p** turns autopan on.

When the screen message area reads `no auto(p)an` `no auto(p)an`, this means that autopan is on and typing **p** turns it off.

For information about text definitions, go to the section [Text Definitions](#) in the chapter [Tools and Concepts](#).

Show Other Line of Options - Typing m

There are too many *Edit* options to fit onto one line of the screen message and two lines of options are required. Typing **m** toggles between the two lines of options.

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)tyle, ( ) (t)ext, (h)eight, (w)factor, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

Output Window

```
<[J] (o)ffset, (r)aise, (a)ngle, (x)justify, (y)justify, (d)efault, (->)next, (<-)previous, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

Output Window

Finish the Create/Edit - Typing f

Typing **f** exits the create/edit text option.

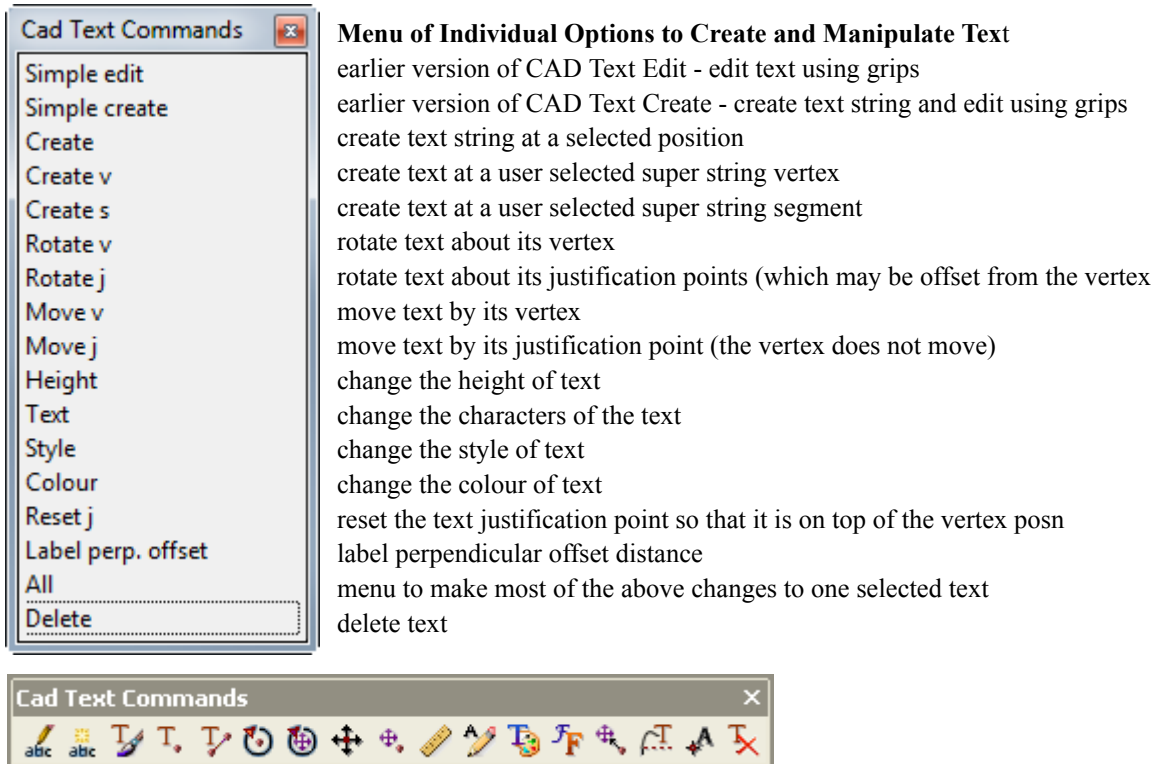

CAD Text Commands

The *Cad Text Commands* do just one text modification at a time but once one selected text has been modified, another text can then be selected to have the same type of modification.

So the CAD Text Commands perform the same modification on progressively selected texts whereas the CAD Text Create and CAD Text Edit options perform any of the modifications on the one selected text.

The Cad text commands walk-right menu is

For the option *Simple edit*, go to

Simple Text Edit

Position of option on menu: Strings =>CAD =>Text =>Commands =>Simple edit
or by selection of appropriate icon from the toolbar. 

This option edits text strings, and text on super string vertices or segments, using grips to quickly define the mode of editing (sizing, rotating or moving the justification point).

On selecting Simple edit, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:

When the text to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.

Size Grip (diamond):

If the Size grip is selected, the text size is dynamically adjusted by moving the cursor. The size of the text is displayed as part of the Enter height prompt in the message area.

The text size is set when a position is accepted.

An exact text size can be entered by hitting the <space bar> or by starting to type a size. This brings up the Enter distance typed input box. The size is typed in and the <enter> key pressed

To return to dynamic sizing without entering a distance, simply select the X on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically sized, the current size of the text can be displayed by pressing the d key which brings up the Enter distance typed input box with the current text size in it.

The size can be modified and the value used by pressing the <enter> key.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box.

Rotate Grip (circle):

If the **Rotate grip** is selected, the text bearing is dynamically adjusted by moving the cursor. The bearing of the text is displayed as part of the *Enter bearing* prompt in the message area.

The text bearing is set when a position is accepted.

An **exact** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the **Enter bearing** typed input box. The *bearing* is typed in and the <enter> key pressed

To return to dynamic rotating without entering a bearing, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the text is being dynamically rotated, the **current** bearing of the text can be displayed by pressing the **d** key which brings up the **Enter bearing** typed input box with the *current* text bearing in it.

The *bearing* can be modified and the value used by pressing the <enter> key.

To return to dynamic rotation without entering a bearing, simply select the **X** on the top of the input box.

Justification Grip (square):

If the **Justification grip** is selected, the text justification point is dynamically adjusted by moving the cursor. The (x,y) position of the text is displayed in the message area.

The text justification point is set when a position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Simple Text Create

Position of option on menu: Strings =>CAD =>Text =>Simple create

or by selection of appropriate icon from the toolbar. 

This option creates text strings and then displays grips to quickly allow editing of text size, rotation and justification point.

The text style and height are taken from the **Text controlbar** and the model and colour from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars](#), [Symbol Controlbar](#) and [CAD Controlbar](#)).

The text will be placed with the vertex and justification point at the selected position.

After defining one piece of text, the option restarts so that another of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting **Simple create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

An insertion point for the text is selected and accepted and an **Enter text** typed input box is then displayed on the screen.

The text is typed into the box and the <enter> key pressed.

The text will be placed with the vertex and justification point at the selected position and using values such as colour, model, text height and text style given in the **CAD controlbar** and **Text controlbar** (See [CAD, Symbol and Text Controlbars](#))

When the text is displayed, grips for quick editing of size, rotation and moving of the justification point are also shown. The appropriate grip can then be selected for quick editing. For details on using the grips, go to the section [Simple Text Create](#).

Text Create

Position of option on menu: Strings =>CAD =>Text =>Create

or by selection of appropriate icon from the toolbar. 

This option creates text strings at a selected insertion point (a cursor snap is valid).

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

An insertion point is selected and accepted. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel

STEP 2:

The actual text is entered into the text input box followed by the enter key.

STEP 3:
The text is created using the specified settings.

Create Text on Vertex of Super String

Position of option on menu: Strings =>CAD =>Text =>Create v
or by selection of appropriate icon from the toolbar.

This option creates text at a vertex of a super string. One piece of text is allowed per super string vertex, so if this option is used on existing vertex text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting Create v, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the 12d Model application window.

STEP 1:
An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The text will be placed relative to the insertion point given other parameters such as justification, as defined in the textstyle data panel

STEP 2:
The actual text is entered into the text input box followed by the Enter key.

**STEP 3:**

The text is created using the specified settings.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Text Create on Segment of Super Strings

Position of option on menu: Strings =>CAD =>Text =>Create s

or by selection of appropriate icon from the toolbar. 

This option creates text at the mid point of a selected super string segment. One piece of text is allowed per super string segment, so if this option is used on existing segment text, the existing value is displayed in the text input box.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

On selecting **Create s**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A super string segment is selected and accepted. The line snap is forced on so that a segment can be selected. The text will be placed relative to the insertion point which is the midpoint of the segment given other parameters such as justification, as defined in the textstyle data panel

**STEP 2:**

The actual text is entered into the text input box followed by the Enter key.

**STEP 3:**

The text is created using the specified settings.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

**Rotate Text around Vertex**

Position of option on menu: Strings =>CAD =>Text =>Rotate v

or by selection of appropriate icon from the toolbar. 

This option rotates text about its vertex. This applies to text strings, super string segment or vertex text and 4d string vertex text. For super string segment text, the vertex is taken to be the mid point of the segment.

After defining one piece of text, the option restarts so that another piece of text can be defined. Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.

On selecting **Rotate v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A text string to be rotated is selected and accepted.

**STEP 2:**

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an input box followed by the enter key. To bring up the input box start typing or press the space bar. The value is entered into the input box followed by the enter key.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the angle continued.

Note: The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Rotate Text about the Justification Point

Position of option on menu: Strings =>CAD =>Text =>Rotate j

or by selection of appropriate icon from the toolbar. 

This option rotates text about its justification point. Note that the vertex point and the justification point do not coincide when either the raise or offset for the text is not zero.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing text by that amount, rather it will reposition the text at that bearing.

On selecting **Rotate j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The text to be rotated is selected and accepted.

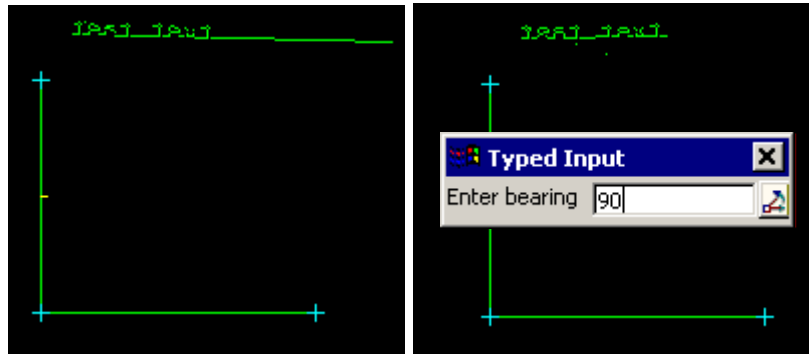

STEP 2:

The rotation bearing (the final bearing of the text) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The Page up and page down keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The text is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Move the Text Justification Point

Position of option on menu: Strings =>CAD =>Text =>Move j

or by selection of appropriate icon from the toolbar. 

This option moves the text justification point, and hence the text with it.

On selecting **Move j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The text to be moved is selected and accepted.

**STEP 2:**

The new position for the text is selected and accepted.

**STEP 3:**

The text is moved to the new position.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

**Move the Text Vertex Point**

Position of option on menu: Strings =>CAD =>Text =>Move v

or by selection of appropriate icon from the toolbar. 

This option moves the vertex that vertex text is attached to, and hence moves the text with it. The option works for text strings, vertex text for super strings and 4d string but will **not** work for segment text where there is no actual vertex at the mid segment position where the segment text

is initially placed.

On selecting **Move v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The vertex text to be moved is selected and accepted.

STEP 2:

The new position for the vertex and the text is selected and accepted.

STEP 3:

The vertex and the vertex text is moved to the new position.

Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.

Height of Text

Position of option on menu: Strings =>CAD =>Text =>Height

or by selection of appropriate icon from the toolbar. 

This option changes the height of text.

On selecting **Height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

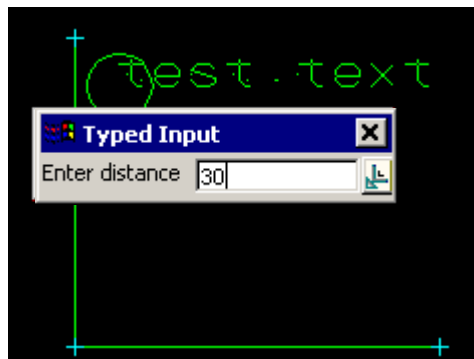

The text of which the height is to be changed is selected and accepted.

STEP 2:

A height for the text is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The text height is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Change Text

Position of option on menu: Strings =>CAD =>Text =>Text

or by selection of appropriate icon from the toolbar. 

This option edits the characters of selected text.

On selecting Text, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The text to be changed is selected and accepted.

STEP 2:

The new text is entered into the text input box followed by the Enter key.

STEP 3:

The text is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Style of Text

Position of option on menu: Strings =>CAD =>Text =>Style

or by selection of appropriate icon from the toolbar. 

This option changes the textstyle of selected text.

On selecting *Style*, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

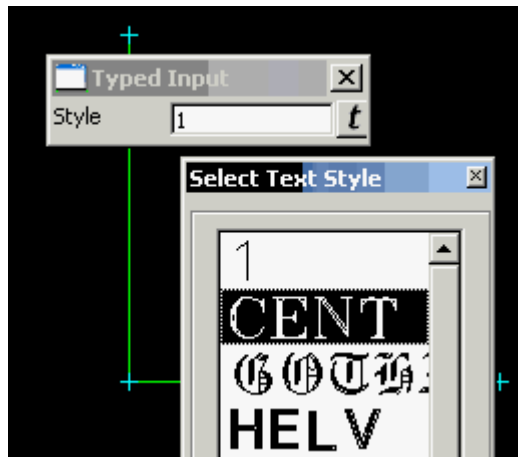

STEP 1:

The text to be changed is selected and accepted.

STEP 2:

The new textstyle is selected from the style pop-up list.

**STEP 3:**

The textstyle is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

**Text Colour**

Position of option on menu: Strings =>CAD =>Text =>Colour

or by selection of appropriate icon from the toolbar. 

This option changes the colour of selected text.

On selecting **Colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

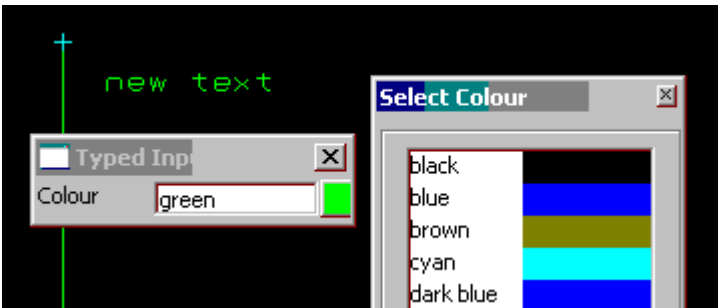

STEP 1:

The text to be changed is selected and accepted.

STEP 2:

The new colour for the text is entered into the text input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.

STEP 3:

The text colour is changed.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Reset Text Justification Point

Position of option on menu: Strings =>CAD =>Text =>Reset j

or by selection of appropriate icon from the toolbar.

This option resets the text justification point back to being the same as the vertex for vertex text, and to the segment mid point for segment text. That is, the offset and raise for the selected text are both set to zero.

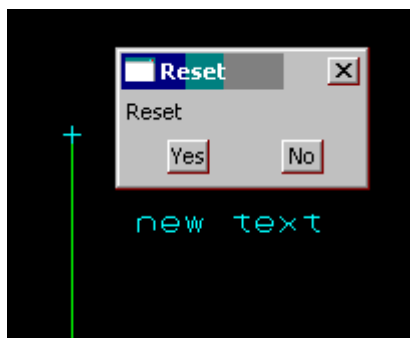

On selecting **Reset j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The text to be changed is selected and accepted.

**STEP 2:**

A warning message is shown giving the user the option of resetting the justification point or not.

**STEP 3:**

The text is reset if accepted.

Label Perpendicular Offset

Position of option on menu: Strings =>CAD =>Text =>Label perp. Offset

or by selection of appropriate icon from the toolbar. 

This option creates a perpendicular line from a selected segment to a selected position, and creates text with the value of the perpendicular distance between the segment and the selected position, on the line.

On selecting **Label perp. Offset**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A string is selected and accepted.

After the string is accepted a perpendicular line will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a 2nd point is selected and accepted.

STEP 2:

Select a 2nd point and accept it.

STEP 3:

A perpendicular line is constructed between the accepted string and point. The length value of this line will be displayed in text. This text can be modified or changed using the other CAD Text options.

STEP 4:

After the labelled perpendicular line is constructed, another perpendicular *rubber banding* line will be displayed. This will continue until the option is terminated (via the Esc key).

To create another labelled perpendicular line, select another point and accept it.

STEP 5:

Another labelled perpendicular line is constructed. Another perpendicular *rubber banding* line will be displayed. This will continue until the option is terminated (via the Esc key).

**All Text Edits**

Position of option on menu: Strings =>CAD =>Text =>All

or by selection of appropriate icon from the toolbar. 

This option positions text using a menu made up of most of text edits already described.

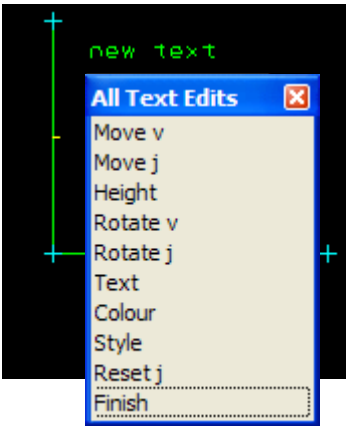

On selecting **All**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The text to be changed is selected and accepted.

**STEP 2:**

After the selection and acceptance of a piece of text, the positioning menu is shown. This also allows various other text editing functions such as colour, height and text.

STEP 3:

The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made in succession.

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Text Delete

Position of option on menu: Strings =>CAD =>Text =>Delete
or by selection of appropriate icon from the toolbar. 

This option deletes selected text.

On selecting **Delete**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The text to be deleted is selected and accepted.

**STEP 2:**

The selected text is deleted.

Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.

CAD Symbol

Position of option on menu: Strings =>CAD =>Symbol

Position of option on menu: Various toolbars

12d Model symbols are world styles at a vertex of a super string. The symbol is attached to a vertex (these are displayed when *Vertices* are toggle on in a plan view) and has a justification point, a rotation, a delta x and a delta y. The vertex and justification point only coincide if the delta x and delta y values are both zero.

In some symbol options, the symbol *type*, *size* and *angle* are defined by the **Symbol Controlbar** and *model* and *colour* from the **CAD Controlbar** (for more information, go to the section [Symbol Controlbar](#)).

The *symbols* are defined in the **symbols.4d** file.

For more information on the control bars, go to the sections [Symbol Controlbar](#) and [CAD Controlbar](#).

The Cad Symbol walk-right menu is

Menu of Options to Create and Manipulate Symbols

- edit symbols using grips
- create symbols and edit using grips
- delete a symbol
- menu of individual Symbol options

For the option *Edit*, go to
Create
Delete
Commands

[Edit Symbol](#)
[Create Symbol](#)
[Symbol Delete](#)
[Cad Symbol Commands](#)

Create Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Create

or by selection of appropriate icon from the toolbar.

For information about Symbol and its definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

12d Model has two CAD symbol options **Create** and **Edit**. However both of these run the same option which starts up in different modes - **Create** is in the mode to create symbols on a super string vertex and **Edit** which edits existing symbols.

Once either CAD symbol option is started it is possible to change between the Create and Edit modes at any time.

The **Create** option creates a new super string with a symbol on the vertex, or create a symbol on an existing super string vertex which does not already have a symbol, and then displays a list

key commands in the screen message area, and grips on screen, to quickly allow editing of the symbol type, size, colour, rotation, angle, x and y offset etc.

After selecting the option, the **Pick position** message is displayed in the screen message area.

```
<[Pick position] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

To go from Create to Edit mode, type **E** - go to [To Go from Create to Edit Mode - Typing e](#)

To create a symbol and a new super string, type **C** - go to [Creating a Symbol - Typing c](#)

To create vertex symbol, type **V** - go to [Creating Text at a Super String Vertex- Typing v](#)

Creating a Symbol - Typing c

After typing **C**, the **Pick position** message is again displayed in the screen message area and the position of the symbol is then selected with the cursor.

```
<[Pick position] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

When the position is accepted a new one vertex super string is created with the symbol on it.

The super string vertex and symbol justification point is placed at that position. The x and y offset both zero.

When the symbol is displayed, grips for quick editing of height, rotation and moving of the justification point are also shown. The appropriate grip can then be selected for quick editing. For details on using the grips, go to the section [Symbol Grips](#) in the chapter [Tools and Concepts](#).

For the new symbol, the symbol name, height and angle are taken from the **Symbol controlbar** and the model and colour from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars, Symbol Controlbar](#) and [CAD Controlbar](#)).

After the symbol is created, a list of typed options is then displayed in the screen message area.

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

and if **m** is typed, the rest of the options are shown

```
<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

These option are the same as when editing existing symbols, and will be described in detail in the section [Edit Symbol](#).

C is the default if nothing is typed.

Creating a Symbol at a Super String Vertex- Typing v

After typing **V**, the **Pick grip point** message is displayed in the screen message area and the vertex of the super string to place the symbol on is then selected with the cursor.

```
<[V] Pick grip point or (j)ustification, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

The symbol and symbol justification point are placed at that vertex. The x and y offset both zero.

When the symbol is displayed, grips for quick editing of size, rotation, moving of the justification point and string vertex are also shown. The appropriate grip can then selected for quick editing. For details on using the grips, go to the section [Symbol Grips](#) in the chapter [Tools and Concepts](#).

For the new symbol, the symbol name, height and angle are taken from the **Symbol controlbar** and colour from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars](#), [Symbol Controlbar](#) and [CAD Controlbar](#)). The created symbol will be part of the super string so no model is required.

After the vertex symbol is created, a list of typed options is then displayed in the screen message area.

```
<[V] Pick grip point or (j)ustification, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

and if **m** is typed, the rest of the options are shown

```
<[V] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an, <-previous, ->next> [picks][fast][Menu]
```

These options are the same as when editing existing symbols, and will be described in detail in the section [Edit Symbol](#).

To Go from Create to Edit Mode - Typing e

After typing **e**, the **Pick Symbol** message is displayed in the screen message area.

```
<[Pick symbol] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

This is the same as when selecting the Edit option from the CAD Symbol toolbar and will be described in detail in the section [Edit Symbol](#).

Edit Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Edit

or by selection of appropriate icon from the toolbar.

For information about Symbol and its definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

12d Model has two CAD symbol options **Create** and **Edit**. However both of these run the same option which starts up in different modes - **Create** is in the mode to create a new symbol, or a symbol on a super string vertex and **Edit** which edits existing symbols.

Once either CAD symbol option is started it is possible to change between the Create and Edit modes at any time.

After typing **e**, the **Pick symbol** message is displayed in the screen message area

```
<[Pick symbol] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

and a symbol **s** then selected by the mouse for editing.

The selected symbol with the symbol edit grips is shown on screen, and a list of available typed commands in the screen message area to quickly allow editing of the symbol name, symbol size, colour, rotation, angle, x and y offset, justification point, vertex, etc.

Options displayed after selecting symbol

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

and by typing **m**

```
<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

To change the symbol colour, type **C** - go to [Change Symbol Colour - Typing c](#)

To change the symbol name, type **S** - go to [Change Symbol Name - Typing s](#)

To change the symbol height, type **h** - go to [Change Symbol Height - Typing h](#)

To create/edit a new symbol, type **n** - go to [Create/Edit a New Symbol - Typing n](#)

To end the create/edit option, type **f** - go to [Finish the Create/Edit - Typing f](#)

To show the other line of options, type **m** - go to [Show Other Line of Options - Typing m](#)

To change the x offset, type **X** - go to [Change Offset x - Typing x](#)

To change the y offset, type **y** - go to [Change Offset y - Typing y](#)

To change the symbol angle, type **a** - go to [Change Symbol rotation - Typing a](#)

To reset some symbol values to their defaults, type **d** - go to [Reset Symbol Parameters to Defaults - Typing d](#)

To show the other line of options, type **m** - go to [Show Other Line of Options - Typing m](#)

To toggle vertex lock on and off, type **l** - go to [Toggle Lock - Typing l](#)

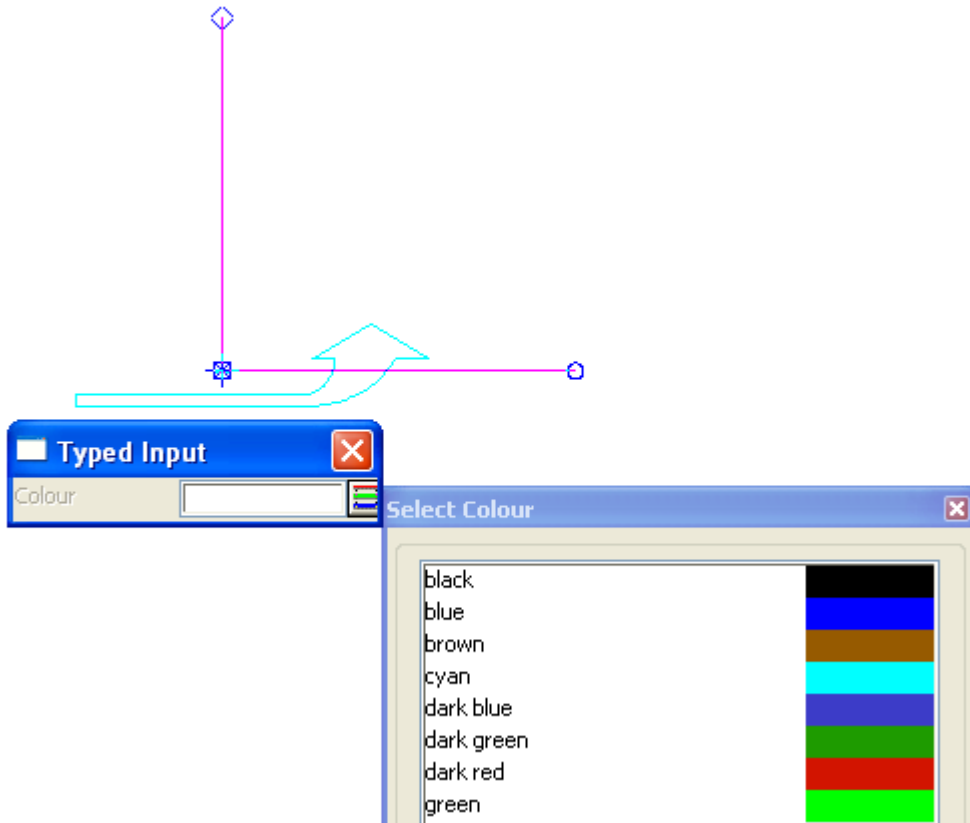

To toggle autopan on and off, type **p** - go to [Toggle Autopan - Typing p](#)

To change focus to the next symbol press **->** - go to [Change Focus to the Next Vertex in String - Pressing right arrow key \(->\)](#)

To change focus to the previous symbol, press **<-** - go to [Change Focus to the Previous Vertex in String - Pressing left arrow key \(<-\)](#)

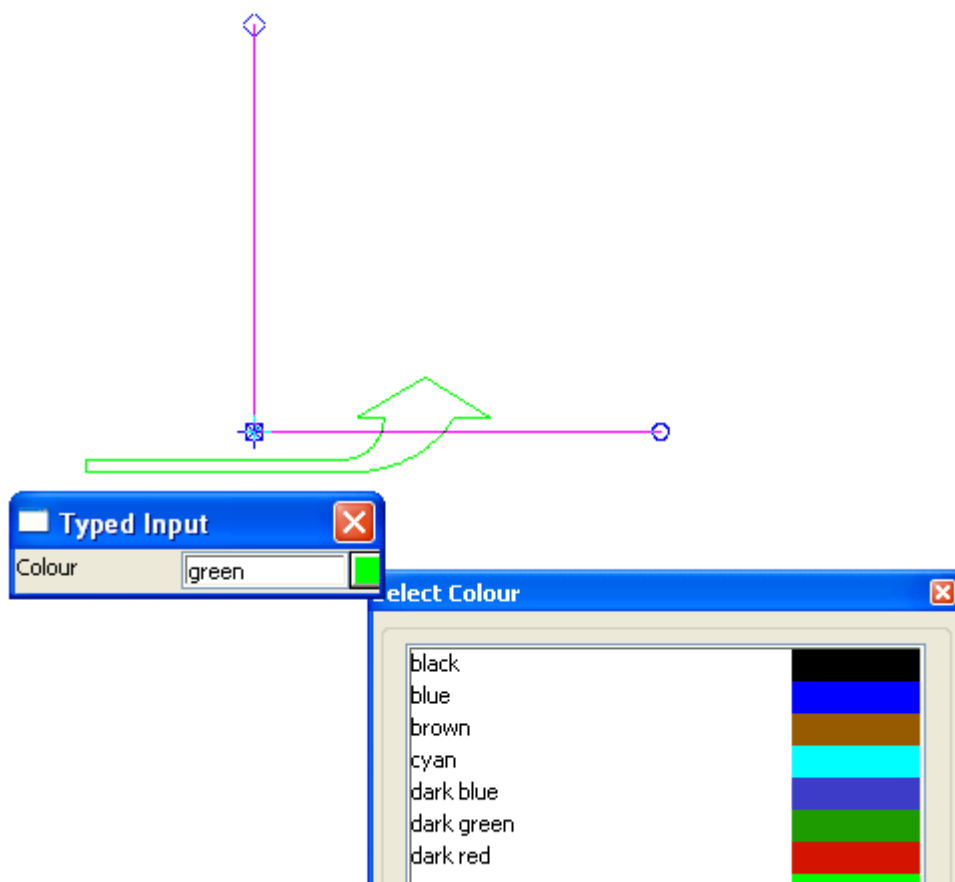

Change Symbol Colour - Typing c

After typing **C**, a Colour **Typed input** box appears on the screen.

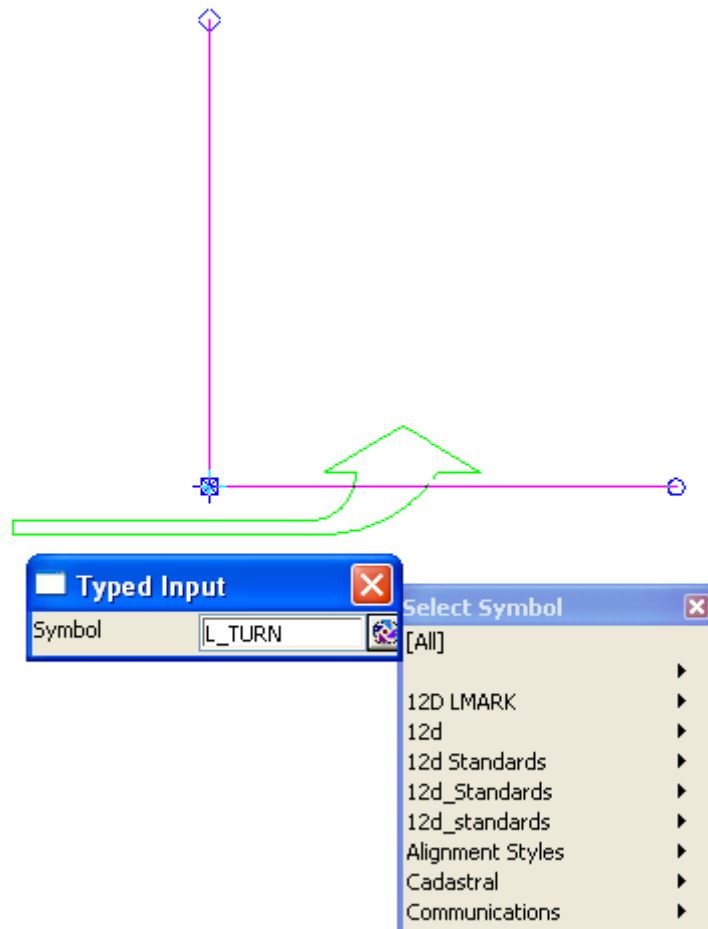

The new colour for the symbol is typed into the Typed input box followed by the <enter> key, or by selecting a colour from the **Select Colour** box which is brought up by clicking on the  colour button.

If the symbol has an existing colour, other then the default colour, typing **C** will display the Typed Input box with the current colour displayed.

Change Symbol Name - Typing s

After typing **S**, a Symbol **Typed input** box appears with the current symbol style displayed.

The new style for the symbol is typed into the Style input box followed by the <Enter> key, or by selecting a style from the **Select Symbol** box which is brought up by clicking on the  style button.

Change Symbol Height - Typing h

After typing **h**, a Size **Typed input** box appears with the current symbol height in it.

The new height is typed into the Size **Typed input** box followed by the <Enter> key.

Note - Many arithmetic expressions are supported in the **Size** typed input box (eg 10+27). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

Create/Edit a New Symbol - Typing n

If the option was in **Edit** mode and **n** is typed, a new **Edit** is started (**e** mode). The **Pick symbol** message is displayed in the screen message area and another symbol is selected to edit.

```
<[Pick symbol] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

Or a **new** symbol can be created by typing **C** or **V**. See the section [Create Symbol](#) for more information on **C** and **V**.

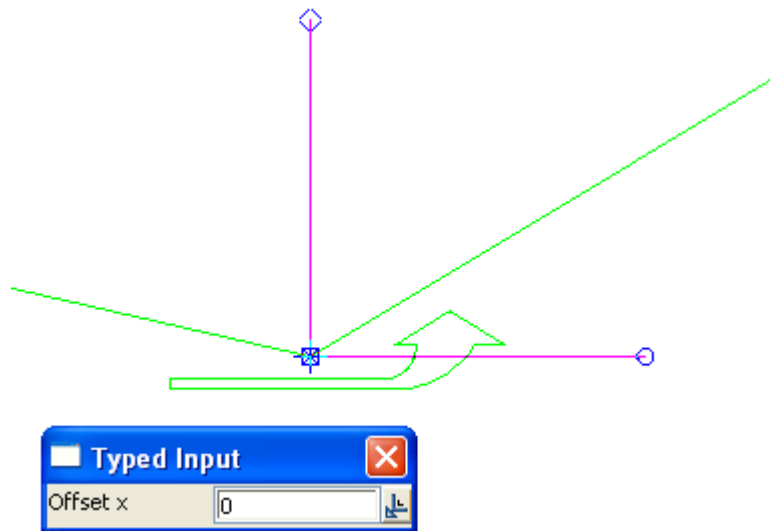

If the option was in **Create** mode and **n** is typed, a new **Create** is started in the **C** mode. The **Pick position** message is displayed in the screen message area and a new symbol is created.

```
<[Pick position] (e)dit, (c)reate, (v)ertex> [picks][fast][Menu]
```

Or a **new** vertex symbol can be created by typing **V**, or the **Edit** mode can be entered by typing **e**. See the section [Create Symbol](#) for more information on **C** and **V**.

Change Offset x - Typing x

After typing **x**, an Offset x **Typed input** box appears with the current symbol x offset in it.

Symbol - offset x = 0

The new offset x is typed into the Offset x input box followed by the <Enter> key.

The symbol justification point will be offset x by the new amount

For information about Symbol and the definition of **offset**, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Note - Many arithmetic expressions are supported in the **Offset** typed input box (eg 10+27). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

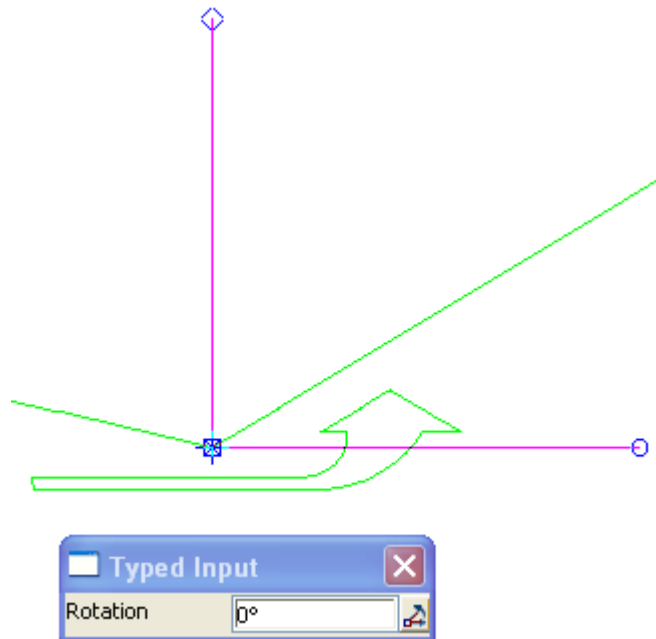

Change Offset y - Typing y

After typing **O**, an Offset y **Typed input** box appears with the current symbol offset in it.

Note - Many arithmetic expressions are supported in the **Offset** typed input box (eg 10+27). See the section [Expressions in Panel Fields](#) in the chapter [Tools and Concepts](#).

Change Symbol rotation - Typing a

After typing **a**, a Rotation **Typed input** box appears with the current symbol angle in it.

Symbol - angle rotation = 0

The new angle is typed into the Rotation **Typed input** box followed by the <Enter> key.
The direction of the symbol point will be rotated by the new amount.

Symbol - angle rotation= 60

For information about symbol and the definition of **angle rotation**, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Note - Some arithmetic expressions are supported in the **Rotation** typed input box (eg 10+90). See the section [Expressions in Bearing, Angle Panel Fields](#) for what is allowed in angle/bearing panel fields in the chapter [Tools and Concepts](#).

Reset Symbol Parameters to Defaults - Typing d

After typing **d**, some of the symbol parameters are set back to their default values.

That is:

- Symbol type is set to the symbol in the Cad Symbol Controlbar
- Height is set to the height in the Cad Symbol Controlbar
- Angle is set to the angle in the Cad Symbol Controlbar
- Model is left as it is
- Colour is rest to the string colour.

symbol name, height and angle

The default symbol *type*, *height* and *angle* are defined by the **Symbol Controlbar** and *model* and *colour* from the **CAD Controlbar** (for more information, go to the section [Symbol Controlbar](#)).

For information about Symbol definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Change Focus to the Next Vertex in String - Pressing right arrow key (->)

For vertex symbol on a super string, pressing ->, moves the focus of the edit commands to the vertex symbol on the next vertex of the super string. If the symbol is on the last vertex, pressing -> does nothing.

For information about symbol definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Change Focus to the Previous Vertex in String - Pressing left arrow key (<-)

When editing vertex symbol on a super string, pressing <-, moves the focus of the edit commands to the vertex symbol on the **previous** vertex of the super string. If the symbol is on the first vertex, pressing <- does nothing. If Autopan is on, the selected vertex symbol is made the centre of the active plan view.

For information about symbol definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Toggle Lock - Typing l

Typing **l** toggles locking the vertex on and off.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads (l) lock , this means that vertex lock is off (unlocked) and typing **l** locks it.

When the screen message area reads un(l) lock , this means that the vertex is locked and typing **l** unlocks it.

For information about the vertex symbol grip, go to the section [Symbol Grips](#) in the chapter [Tools and Concepts](#).

For information about symbol definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Toggle Autopan - Typing p

Typing **p** toggles autopan on and off.

When editing vertex symbol on a super string and **Autopan** is **on**, pressing -> or <-, moves the focus of the edit commands to the vertex symbol on the next/previous vertex of the super string, and the selected vertex symbol is made the centre of the active plan view.

When vertex lock is on, the vertex grip can not be selected and used to move the position of the string vertex.

When the screen message area reads auto(p)an , this means that autopan is off and typing **p** turns autopan on.

When the screen message area reads no auto(p)an , this means that autopan is on and typing **p** turns it off.

For information about symbol definitions, go to the section [Symbol Definitions](#) in the chapter [Tools and Concepts](#).

Show Other Line of Options - Typing m

There are too many *Edit* options to fit onto one line of the screen message and two lines of options are required. Typing **m** toggles between the two lines of options.

```
<[J] Pick grip point or (v)ertex, (c)olour, (s)ymbol, (h)eight, (n)ew, (f)inish, (m)ore...> [picks][fast][Menu]
```

```
<[J] offset (x), offset (y), rot(a)tion, (d)efault, (m)ore..., (l)ock, no auto(p)an> [picks][fast][Menu]
```

Finish the Create/Edit - Typing f

Typing **f** exits the create/edit symbol option.

Symbol Delete

Position of option on menu: Strings =>CAD =>Symbol =>Delete

or by selection of appropriate icon from the toolbar. 

This option deletes symbols.

On selecting **Delete**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol to be deleted is selected and accepted.

STEP 2:

The selected Symbol is deleted.

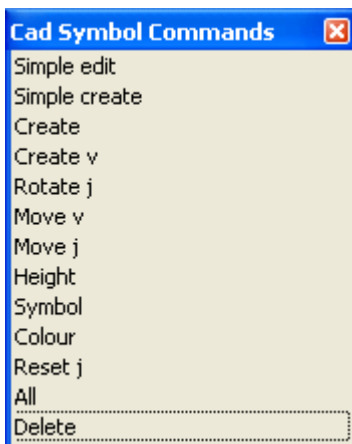

Picking Cancel from the Pick Ops menu, hitting <Esc> or selecting another option terminates the option.

Cad Symbol Commands

Position of option on menu: Strings =>CAD =>Symbol =>Commands

The Cad Symbol Commands walk-right menu is

Menu of Options to Create and Manipulate Symbols

edit symbols using grips
 create symbols and edit using grips
 create a symbol at a selected position - a one point string is created
 create a symbol at a user selected super string vertex
 rotate symbol about its justification pt (which may be offset from the vertex)
 move symbol by its vertex
 move symbol by its justification point (the vertex does not move)
 change the height of a symbol
 change the symbol
 change the colour of a symbol
 reset the symbol justification point so that it is on top of the vertex posn

Simple Symbol Edit

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Simple edit

or by selection of appropriate icon from the toolbar. 

This option edits symbols using grips to quickly define the mode of editing (sizing, rotating or

moving the justification point).

On selecting **Simple edit**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

When the symbol to be edited is selected, grips for size, rotating and moving the justification point are displayed. The appropriate grip is then selected for quick editing.

Size Grip (diamond):

If the **Size grip** is selected, the symbol size is dynamically adjusted by moving the cursor. The size of the symbol is displayed as part of the *Enter height* prompt in the message area.

The symbol size is set when a position is accepted.

An **exact** symbol size can be entered by hitting the <space bar> or by starting to type a size. This brings up the **Enter distance** typed input box. The size is typed in and the <enter> key pressed.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically sized, the **current** size of the symbol can be displayed by pressing the **d** key which brings up the **Enter distance** typed input box with the current dynamic symbol size in it.

The size can be modified and the value used by pressing the <Enter> key.

To return to dynamic sizing without entering a distance, simply select the **X** on the top of the input box.

Rotate Grip (circle):

If the **Rotate grip** is selected, the symbol bearing is dynamically adjusted by moving the cursor. The bearing of the symbol is displayed as part of the *Enter bearing* prompt in the message area.

The symbol bearing is set when a position is accepted.

An **exact** bearing can be entered by hitting the <space bar> or by starting to type a bearing. This brings up the **Enter bearing** typed input box. The *bearing* is typed in and the <Enter> key pressed.

To return to dynamic rotating without entering a bearing, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

If the symbol is being dynamically rotated, the **current** bearing of the symbol can be displayed by pressing the **d** key which brings up the **Enter bearing** typed input box with the *current* symbol bearing in it.

The *bearing* can be modified and the value used by pressing the <Enter> key.

To return to dynamic rotation without entering a bearing, simply select the **X** on the top of the input box.

Justification Grip (square):

If the **Justification grip** is selected, the symbol justification point is dynamically adjusted by moving the cursor. The (x,y) position of the symbol is displayed in the message area.

The symbol justification point is set when a position is accepted.

An **exact** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <Enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Simple Symbol Create

Position of option on menu: **Strings =>CAD =>Symbol =>Commands=>Simple create**

or by selection of appropriate icon from the toolbar.

This option creates symbols and then displays grips to allow quick editing of symbol size, rotation and justification point.

The symbol and symbol height and symbol angle are taken from the **Symbol controlbar** (See [CAD, Symbol and Text Controlbars](#)) and the model and colour (if the symbol does not have an inbuilt colour) from the **CAD controlbar** (see [CAD, Symbol and Text Controlbars, Symbol Controlbar](#) and [CAD Controlbar](#)).

The symbol will be placed with the vertex and justification point at the selected position.

After defining one symbol, the option restarts so that another symbol can be defined. Picking **Cancel** from the **Pick Ops** menu, hitting <Esc> or selecting another option terminates the option.

On selecting **Simple create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

An insertion point for the symbol is selected and accepted, the symbol is displayed on the screen.

Warning - if no symbol appears, then there is probably no symbol selected in the **Symbol** controlbar.

When the symbol is displayed, grips for quick editing of size, rotation and moving of the

justification point are also shown. The appropriate grip can then be selected for quick editing. For details on using the grips, go to the section [Simple Symbol Edit](#).

Create Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Create

or by selection of appropriate icon from the toolbar. 

This option creates a symbol (as a one vertex super string) at a selected point (a cursor snap is valid).

After defining a symbol, the option restarts so that another symbol can be defined. Picking **Cancel** from the **Pick Ops** menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

An insertion point is selected and accepted. A one vertex super string is created and the symbol placed at that vertex. The symbol is placed relative to the insertion point given in the symbol definition (See symbols.4d file).

STEP 2:

The symbol style (name) is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu

STEP 3:

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 4:

The symbol is created together with a point super string at the selected point.

Create Symbol at the Vertex of a Super String

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Create v

or by selection of appropriate icon from the toolbar.

This option creates a symbol at a vertex of a super string. One symbol is allowed per super string vertex, so if this option is used on existing vertex symbol, the existing value is displayed in the symbol input box.

After defining a symbol, the option restarts so that another symbol can be defined. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

On selecting **Create v**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

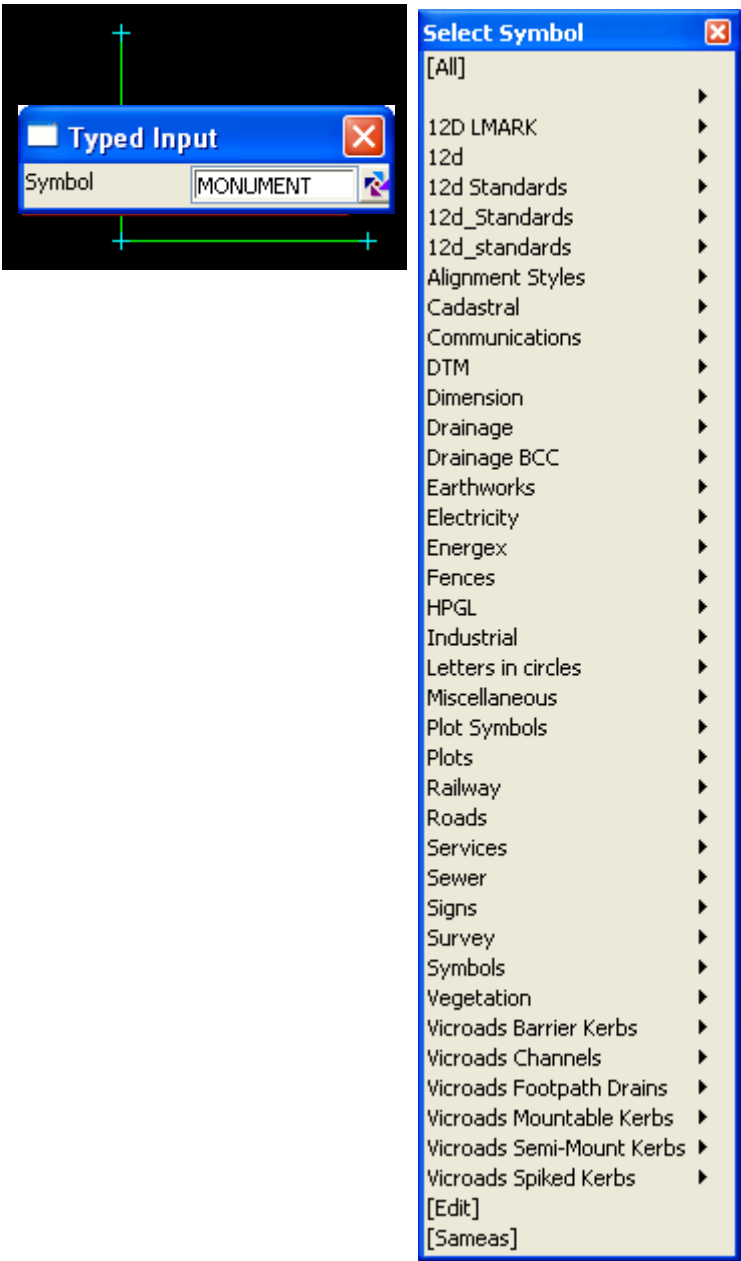

STEP 1:

An insertion point is selected and accepted. The point snap is forced on so that a vertex can be selected. The Symbol will be placed relative to the insertion point given other parameters such as justification, as defined in the symbol definition.

STEP 2:

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu

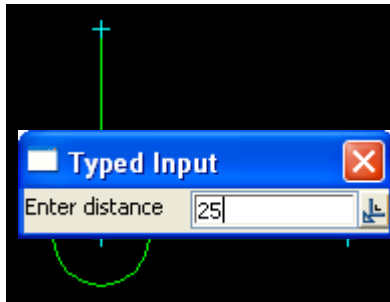

STEP 3:

A symbol size is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the size will appear. The user can also press the space

bar to bring up the input box. The value is entered into the input box followed by the enter key.

The circle drawn represents the size value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the symbol or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the size by the selection of a point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 4:

The symbol is created at the vertex of the super string.

Rotate Symbol about the Justification Point

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Rotate j

or by selection of appropriate icon from the toolbar. 

This option rotates a symbol about its justification point. The vertex point and the justification point often do not coincide. This occurs when non zero value is specified for either the x or y offset.

Note: The typed bearing is not relative but absolute. i.e. the value given will not rotate the existing symbol by that amount, rather it will reposition the symbol at that bearing.

On selecting **Rotate j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol to be rotated is selected and accepted.

**STEP 2:**

The rotation bearing (the final bearing of the symbol) is specified by selection and acceptance of a point with the mouse or by entry into an angle box followed by the enter key. To bring up the angle box start typing or press the space bar. The value is entered into the input box followed by the enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to specify the bearing or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

Note: The **Page up** and **page down** keys can be used when the bearing input box comes up to add or subtract intervals of 90 degrees.

This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

STEP 3:

The Symbol is rotated to the specified bearing.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Move the Symbol Justification Point

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Move j

or by selection of appropriate icon from the toolbar. 

This option moves a symbol by moving its justification point.

On selecting **Move j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol to be moved is selected and accepted.

STEP 2:

The new position for the Symbol is selected and accepted.

STEP 3:

The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Move the Symbol Vertex Point

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Move v

or by selection of appropriate icon from the toolbar. 

This option moves a symbol by moving the vertex that the symbol is attached to. Hence the symbol and the justification point for the symbol will move.

On selecting **Move V**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol to be moved is selected and accepted.

**STEP 2:**

The new position for the vertex of the Symbol is selected and accepted.

**STEP 3:**

The Symbol moves to the new position.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Height of Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Height

or by selection of appropriate icon from the toolbar. 

This option changes the height of a symbol.

On selecting **Height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol of which the height is to be changed is selected and accepted.

**STEP 2:**

A height for the Symbol is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the height will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by

the enter key.

The circle drawn represents the height value and changes with movement of the mouse. If the user wants to see what the current value of the height is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

The Symbol height is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Change Symbol

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Symbol

or by selection of appropriate icon from the toolbar. 

This option changes the actual symbol defined at a super string vertex.

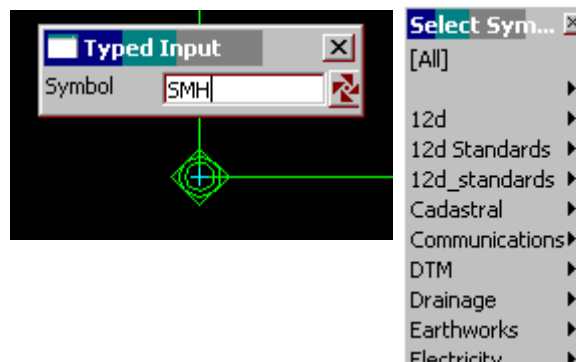

On selecting **Symbol**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol to be changed is selected and accepted.

**STEP 2:**

The symbol style is entered into the input box or selected from the select symbol choice box. The choice box is opened by pressing the symbol icon on the right of the input box. A valid symbol type can be found by walking right on the symbol menu

**STEP 3:**

The Symbol is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Symbol Colour

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Colour

or by selection of appropriate icon from the toolbar. 

This option changes the default colour of a symbol.

Important Note: if the symbol has inbuilt colours, changing the default colour will not change the symbols displayed colours. For this case, the definition of the symbol itself will need to be changed.

On selecting **Colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The symbol to have the default colour changed is selected and accepted.

**STEP 2:**

The new colour for the Symbol is entered into the Symbol input box or by selecting the colour square on the input box to bring up the select colour choice box followed by the enter key.

**STEP 3:**

The Symbol colour is changed.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Reset the Symbol Justification Point

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>Reset j

or by selection of appropriate icon from the toolbar. 

This option resets justification point of a selected symbol. That is, the x and y offsets for the justification point are set to zero.

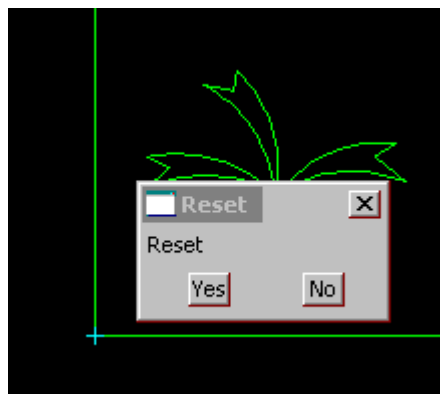

On selecting **Reset j**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The Symbol to be changed is selected and accepted.

**STEP 2:**

A warning message is shown giving the user the option of resetting the justification point or not.

**STEP 3:**

The symbol is reset if accepted.

All Symbol Edits

Position of option on menu: Strings =>CAD =>Symbol =>Commands=>All

or by selection of appropriate icon from the toolbar. 

This option allows a number of symbol editing options to be done in succession using a menu

made up of many of the options defined above.

On selecting **All**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

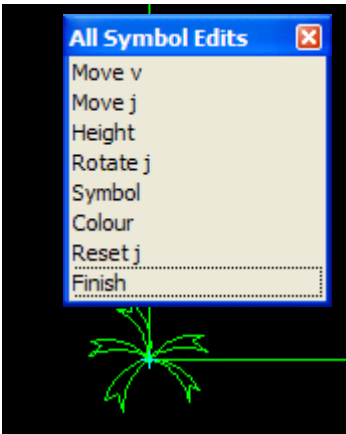

STEP 1:

The Symbol to be changed is selected and accepted.

STEP 2:

After the selection and acceptance of a symbol, the positioning menu is shown. This also allows various other symbol editing functions such as colour, height and rotate.

STEP 3:

The user can select the appropriate option from the menu and make the changes. The menu remains active allowing a number of operations to be made in succession.

Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

CAD Hole

Position of option on menu: Strings =>CAD =>Hole

The Cad Hole walk-right menu is

For the option *Add*, go to
Remove

[Add Holes](#)
[Remove Holes](#)

Add Holes

Position of option on menu: Strings =>CAD =>Hole =>Add

or by selection of appropriate icon from the toolbar. 

This option adds holes to a polygon.

On selecting **Add holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

First select the parent string. That is the polygon that is to have holes added to it.

STEP 2:

Then select the polygons that are to be the holes in the parent polygon (the child strings).

The selection of holes is terminated by pressing the <esc> key.

It is easier to see the result by colour filling the parent polygon.

Remove Holes

Position of option on menu: Strings =>CAD =>Hole =>Remove

or by selection of appropriate icon from the toolbar. 

This option removes all holes from a polygon with holes.

On selecting **Remove holes**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the parent string. That is the polygon that contains holes.

STEP 2:

On selecting and accepting the string, all holes are removed from the string. Super strings are created for each of the hole boundaries.

CAD Fill

Position of option on menu: Strings =>CAD =>Fill

The Fill walk-right menu is

For the option *Solid*, go to
Solid many

[Solid Fill](#)
[Solid Fill Many Strings](#)

Solid Fill

Position of option on menu: Strings =>CAD =>Fill =>Solid

or by selection of appropriate icon from the toolbar. 

This option fills a super string with a user defined colour and blend.

On selecting **Solid Fill**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept a string.

If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

Note: If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.

STEP 2:

After the string is accepted, the **Fill Colour** Input box will appear. Type the name of the required colour into the Input box and press the enter key. The browse button  on the Input box can be used to define the blend by measuring existing elements.

**STEP 3:**

After the colour is accepted, the Blend Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1 (totally transparent) must be selected.

**STEP 4:**

The selected super string is then filled.

Blend 0

Blend 1

Solid Fill Many Strings

Position of option on menu: Strings => CAD => Fill => Solid many

or by selection of appropriate icon from the toolbar. 

This option fills many selected super strings with the same user defined colour and blend.

On selecting **Solid fill many**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

After selecting the option, the **Fill Colour** Input box is displayed.

Type the name of the required colour into the Input box and press the enter key. The browse button  on the Input box can be used to define the blend by measuring existing elements.

STEP 2:

After the colour is accepted, the **Blend** Input box will appear. This selection determines the transparency of the filled colour. A value between 0 (totally opaque) and 1(totally transparent) must be selected.

STEP 3:

Select and accept a string and the string is coloured filled.

The selected super string is then filled.

Blend 0

Blend 1

Then select and accept the next string to fill and the same colour and blend is used to colour fill the next string

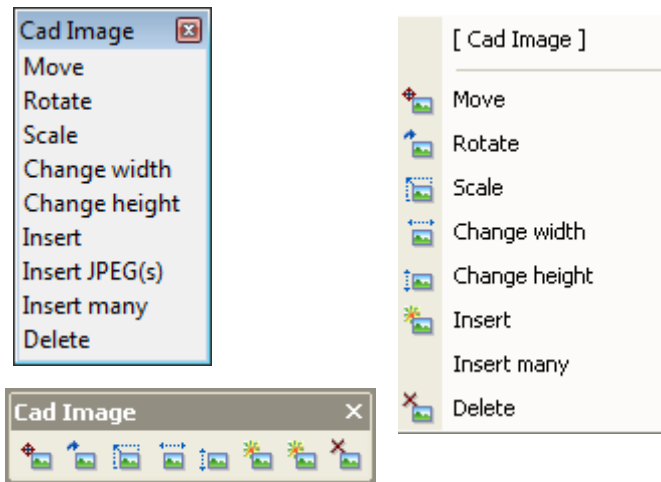

If the string selected is an enclosed shape, then the filled area is simply the closed shape. If the string isn't closed (such as two perpendicular lines), for the purposes of this option, the string will be temporarily closed and closed area coloured.

Note: If the string selected is a straight line, then its area is zero. When the colour fill of a line is completed, the line will simply disappear. This is because there is no area to colour.

CAD Image

Position of option on menu: Strings =>CAD =>Image

[Delete Image](#)

Move Image

Position of option on menu: Strings =>CAD =>Image =>Move

or by selection of appropriate icon from the toolbar. 

This option moves an inserted image by modifying the x and y offset for the image. The vertex that the image is attached to does not move.

On selecting **Move Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the vertex that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

**STEP 2:**

After a vertex of an image is accepted, an outline of the image is displayed and moves with the position of the cursor. This will continue until the new position is selected and accepted.

Select the new position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image is then displayed at its new position.

Note: The **CAD Move Image** option only moves **the image offset relative to the vertex**. Use the option **CAD Move** to **move the vertex** (and the corresponding image moves with it).

Rotate Image

Position of option on menu: Strings =>CAD =>Image =>Rotate

or by selection of appropriate icon from the toolbar. 

This option rotates an image around its justification point.

On selecting **Rotate Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the vertex that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex**

that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, an outline of the image is displayed. The outline is rotated dynamically as the position of the cursor changes. This will continue until a final position is selected and accepted.

Select the new rotated position and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The rotated image is then displayed.

Scale Image

Position of option on menu: Strings =>CAD =>Image =>Scale

or by selection of appropriate icon from the toolbar. 

This option changes the size of an image.

On selecting **Scale Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, an outline of the image is displayed. The size of the outline is determined by the position of the cursor. Both the height and the width of the image increase/decrease in the same ratio so that the image is not distorted.

Select the new size as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The scaled image is then displayed.

Change Width

Position of option on menu: Strings => CAD => Image => Change width

or by selection of appropriate icon from the toolbar. 

This option is user to increase or decrease the width of an image. The height of the image is not changed so the images will be stretched.

On selecting **Width Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

After the vertex of an image is accepted, the outline of the image is displayed. The width of the outline is determined by the position of the cursor. Whilst the height remains constant, the width of the outline increases and decreases dynamically as the position of the cursor changes.

Select the new width as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image with the new width is then displayed.

Change Height

Position of option on menu: Strings => CAD => Image => Change height

or by selection of appropriate icon from the toolbar. 

This option allows the user to increase or decrease the height of an image. The width of the image is not changed so the images will be stretched.

On selecting **Height Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

**STEP 2:**

After the vertex of an image is accepted, the outline of the image is displayed. The height of the outline is determined by the position of the cursor. Whilst the width remains constant, the height of the outline increases and decreases dynamically as the position of the cursor changes.

Select the new height as given by the cursor position, and accept it.

The cursor position can be selected with the mouse or entered in via the keyboard. To enter a position with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the <enter> key.

STEP 3:

The image with the new height is then displayed.

**Insert Image**

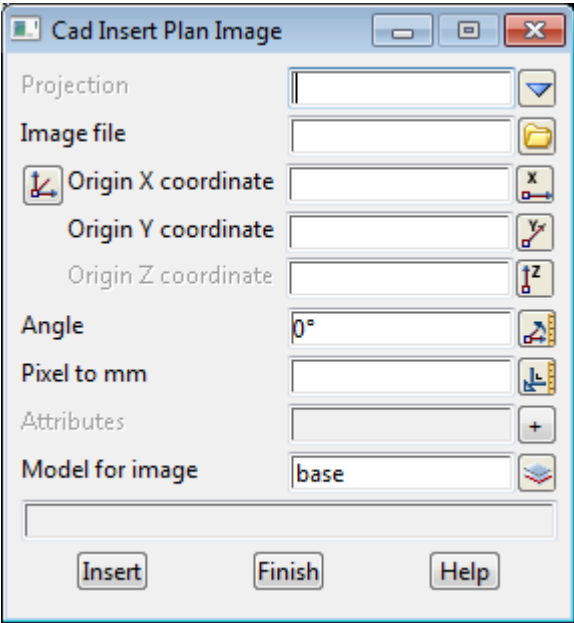

Position of option on menu: Strings =>CAD =>Image =>Insert

or by selection of appropriate icon from the toolbar. 

This option takes a user selected image file and creates a super string vertex with the image inserted at that vertex.

If the file type is JPEG and it includes the EXIF and GPS information, the information is loaded into attributes for the image.

On selecting **Insert**, the **Cad Insert Plan Image** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	input box		BMP, DIB, ECW, GIF, JPEG JPEG 2000, PNG, TGA TIFF, 12D
<i>select the type of image file to insert. If the file type is JPEG and it includes the EXIF and GPS information, the information is loaded into attributes for the image and they can be examined by clicking '+' next to the Attributes field.</i>			
Image file	input box		
<i>Select the image filename to be inserted into the project.</i>			
X/Y co-ordinate	XY Pick button		
<i>select the x/y co-ordinate for origin (bottom left corner) of the image.</i>			
Origin X coordinate	input box		
<i>enter the x coordinate for the bottom left of the image.</i>			
Origin Y coordinate	input box		
<i>enter the y coordinate for the bottom left of the image.</i>			
Pixel to mm	input box		
<i>the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the Pixel to mm (mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.</i>			
Attributes			
<i>when JPEG is selected for the Format and the JPEG file includes the EXIF and GPS information, the information is loaded into attributes for the image. The attributes can be looked at by clicking on the '+',</i>			

Model for image input box

select the model for the image to be inserted into.

Insert button

*when all the fields have been entered, the **Insert** button creates an image from the selected file.*

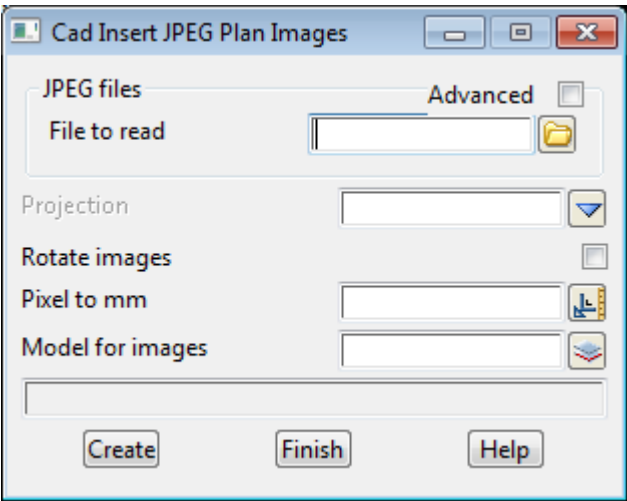

Insert JPEG(s)

Cad_Insert_JPEG_Plan_ImagesPosition of option on menu: Strings =>CAD =>Image =>Insert JPEG(s)

This option is for reading in JPEG files which must include EXIF and GPS information. This information is then used to position the image.

If a Projection is selected by the user, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no Projection is given, then the co-ordinates are left as lat/long.

On selecting **Insert JPEG(s)**, the **Cad Insert JPEG Plan Images** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Advanced	tick box	not ticked	
<i>clicking Advanced brings up a grid to allow the user to enter many JPEG files.</i>			
File to read	file box		available *.jpg files
<i>the JPEG files to read in and create images from. The JPEG file must include EXIF and GPS information, which is used to position the image. If Projection is not blank, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If Projection is blank, then the co-ordinates are left as lat/long.</i>			
Projection	choice box		
<i>if a Project Projection is set, then it is placed in the Projection field. This can be changed to any other projection. The projection is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no projection is set, then the co-ordinates are left as lat/long.</i>			
Rotate images	tick box	not ticked	
<i>if ticked, the rotate value from the EXIF will be used to rotate the image.</i>			
Pixel to mm	input box		
<i>the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the Pixel to mm (mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.</i>			
Model for images	input box		
<i>the model for the image to be inserted into.</i>			
Create	button		
<i>when all the fields have been entered, the Create button creates images from the selected files.</i>			

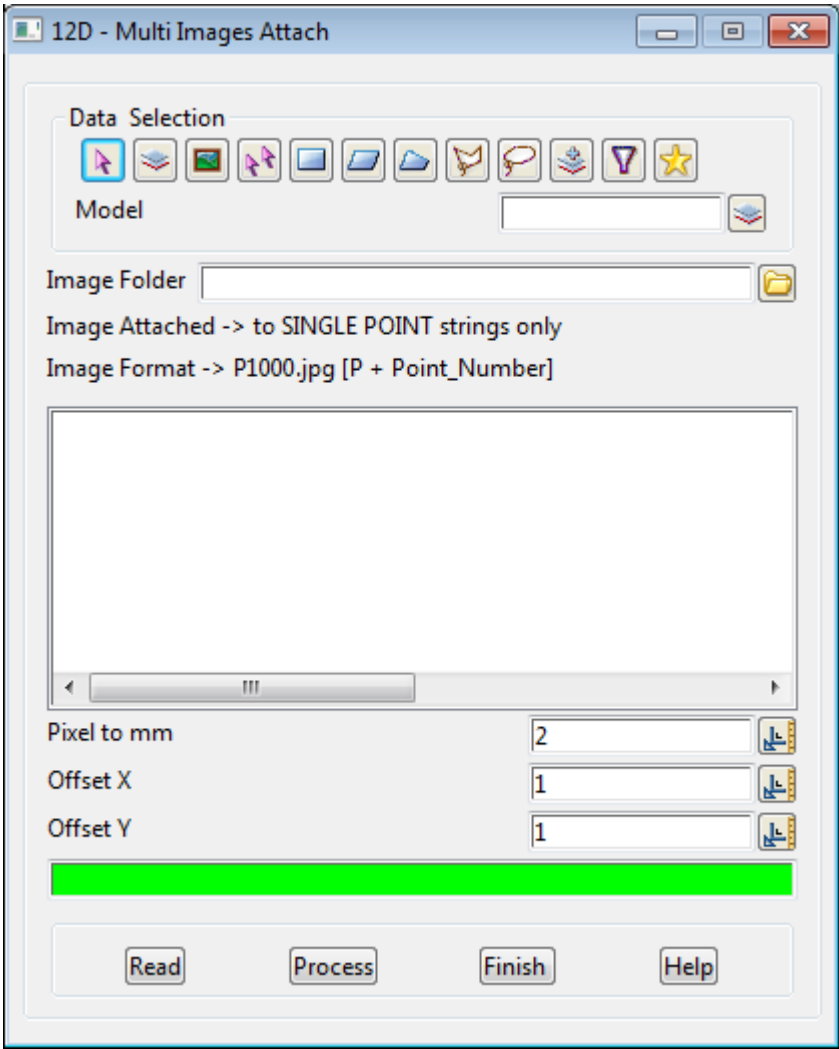

Insert Many

Position of option on menu: Strings =>CAD =>Image =>Insert Many
or by selecting the icon from the Cad Images toolbar. 

This option allows the attachment of an image to a selection of super point strings.
As shown on the panel, the images are to be stored in a directory folder and must be in the following format.

Image Format: P1000.jpg [P + point number]

Note: Attachment to Single Point super strings only

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
-------------------	------	----------	--------

Data source type		Model	
-------------------------	--	-------	--

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Data source	input	
--------------------	-------	--

source of data to be processed.

Image Folder	directory	select folder
<i>browse for a folder containing the images (folder only)</i>		
Pixel to mm	measure box	At Point, Point to Point, String from Point, String to Point
<i>scale factor for image (check pixel size first)</i>		
Offset X	measure box	At Point, Point to Point, String from Point, String to Point
<i>image offset in the x direction from point</i>		
Offset Y	measure box	At Point, Point to Point, String from Point, String to Point
<i>image offset in the y direction from point</i>

<i>searches the image folder for the jpg images and displays them in the list box above</i>		
Process	button	
<i>attaches the image to appropriate point</i>		

Delete Image

Position of option on menu: Strings =>CAD =>Image =>Delete
or by selection of appropriate icon from the toolbar. 

This option deletes an image.

On selecting **Delete Image**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the **vertex** that the image is attached to.

Note: The position of the image is defined **relative to the vertex**. To select the image, the **vertex** that the image is attached to **must be selected**. The image itself can not be picked.

STEP 2:

When the selected image is accepted, it is then deleted.

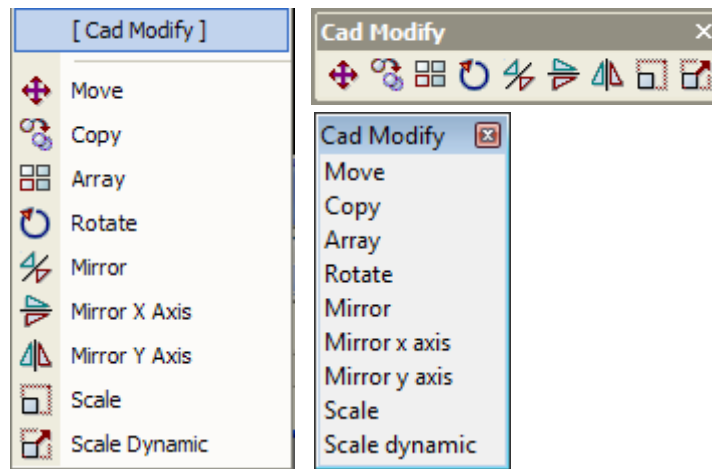

Note that the **vertex** that the image was attached to is not deleted.

CAD Modify

Position of option on menu: Strings =>CAD =>Modify

CAD Move

Position of option on menu: Strings =>CAD =>Modify =>Move

or by selection of appropriate icon from the toolbar. 

This option moves a selected string.

On selecting **Move**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the *12d Model* application window.

For **CAD Multipick Move**, go straight to Step 2.

STEP 1:

A super string or circle is picked.

STEP 2:

A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

NOTE: If the <Spacebar> or any other key is pressed, an **Enter X Y Z** typed input box is displayed on the screen.

X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the **Enter X Y Z** box from the screen. If values are not going to be typed in, clicking **X** on the top right-hand corner of the **Enter X Y Z** box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

Note: The base position is not required to lie on the string itself.

STEP 3:

A final cursor position is selected which defines a distance and direction from the base position to the final position.

STEP 4:

On accepting the final position, the selected super string is moved by the determined distance and direction.

CAD Copy

Position of option on menu: Strings =>CAD =>Modify =>Copy

or by selection of appropriate icon from the toolbar. 

This option copies a super string.

On selecting **Copy**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Copy**, go straight to Step 2.

STEP 1:

Select a super string.

STEP 2:

A base position is picked and then an outline of the selected string will be drawn and moved with the cursor, plus a line will be drawn from the base position to the current cursor position.

NOTE: If the <Spacebar> or any other key is pressed, an **Enter X Y Z** typed input box is displayed on the screen.

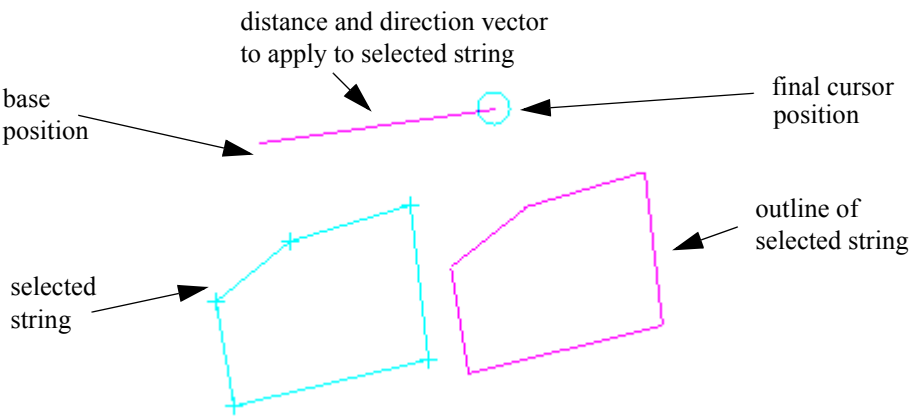

X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the **Enter X Y Z** box from the screen. If values are not going to be typed in, clicking on **X** on the top right-hand corner of the **Enter X Y Z** box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

Note: The base position is not required to lie on the string itself.

STEP 3:

A final cursor position is selected which defines a distance and direction from the base position to the final position.

STEP 4:

On accepting the final position, a copy of the selected super string is moved by the determined distance and direction.

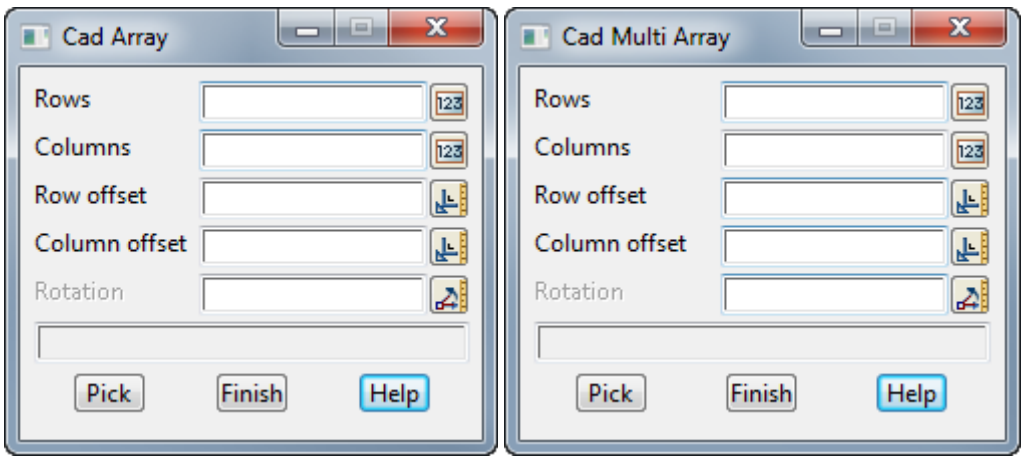

CAD Array

Position of option on menu: Strings =>CAD =>Modify =>Array
or by selection of appropriate icon from the toolbar. 

This option copies a super string a number of times. The Multipick Array option works in the same way once the *Multipick* set is selected.

On selecting **Array**, either the **Cad Array** panel (for CAD Array) or the **CAD Multi Array** panel (for CAD Multipick Array) is displayed.

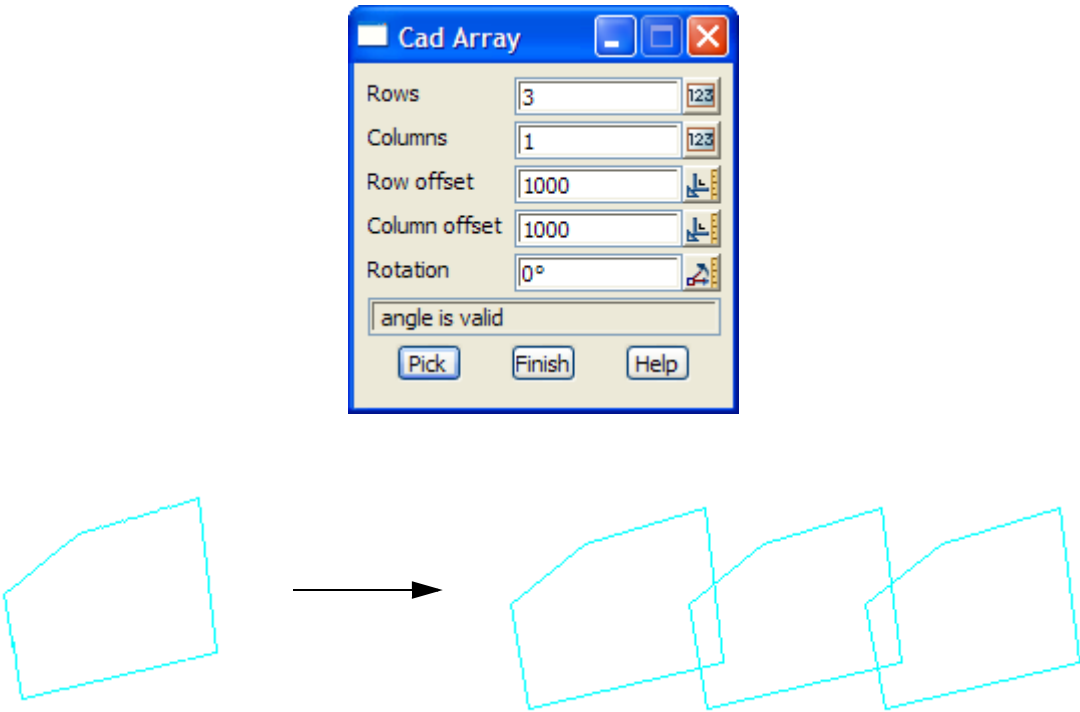

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Rows <i>number of rows</i>	Input box		
Columns <i>number of columns</i>	Input box		
Row offset <i>distance between the rows</i>	Input box		
Column offset <i>distance between the columns</i>	Input box		
Rotation <i>the angle to use for the rows and columns of copies</i>	angle box		
Pick <i>pick the super string to copy and when it is accepted the super string is copied</i>	button		

STEPS:

Fill in the fields in the **Cad Array** panel, click **Pick** and select the super string to copy.

CAD Rotate

Position of option on menu: Strings =>CAD =>Modify =>Rotate
or by selection of appropriate icon from the toolbar. 

This option rotates a super string.

On selecting **Rotate**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Rotate**, go straight to Step 2.

STEP 1:

Select the super string to rotate.

STEP 2:

A base position is picked and then an outline of the selected string is drawn and rotated around the base position with the cursor, plus a line will be drawn from the base position to the current cursor position.

NOTE: If the <Spacebar> or any other key is pressed, an **Enter X Y Z** typed input box is displayed on the screen.

X, Y and Z are entered, separated by a space, and <Enter> accepts the values and removes the **Enter X Y Z** box from the screen. If values are not going to be typed in, clicking on **X** on the top right-hand corner of the **Enter X Y Z** box removes the box from the screen and the option returns to selecting the base position by moving the cursor.

Note: The base position is not required to lie on the string itself.

When the line has an angle of 0 degrees (bearing of 90 degrees), the outline will be on top of the selected string (*i.e.* there is no rotation). As the line rotates around the base position, the outline rotates around the base position. This rotation will continue until the final point is selected and accepted.

NOTE: If the <Spacebar> or any other key is pressed, an **Enter Angle Typed Input** box is displayed on the screen.

An angle (measured counter-clockwise from the positive X-axis and in [HP Notation](#)) can be typed in and <Enter> will accept the value and remove the **Typed Input** box from the screen. If a value is not going to be typed in, clicking on **X** on the top right-hand corner of the **Typed Input** box removes the box from the screen and the option returns to selecting the rotation by moving the cursor.

STEP 3:

A final cursor position is selected which defines the rotation about the base position.

On accepting the final position, or after an angle has been entered, the selected string is rotated around the base position through the defined angle.

CAD Mirror

Position of option on menu: Strings =>CAD =>Modify =>Mirror

or by selection of appropriate icon from the toolbar.

This option creates a mirrored image of a selected string.

On selecting **Mirror**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Mirror**, go straight to Step 2.

STEP 1:

Select a super string to mirror.

STEP 2:

Select the 1st point of the mirror axis.

The 1st point is selected with the mouse or entered via the keyboard. To enter a point with the keyboard, simply start typing or press the space bar to bring up the **X Y Z Input** box. Type the coordinates into the **XYZ Input** box and press the <Enter> key.

After the 1st point is accepted a line will be drawn from the 1st point to the position of the cursor. This line forms the mirroring axis. The outline of the reflected image will be dynamically displayed according to the changing cursor position.

STEP 3:

Select and accept the 2nd point of the mirror axis.

STEP 4:

For **CAD Mirror**, after the base point is accepted, the **Delete Source String** box will appear.

Select **Yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **No** if you want the original super string to remain when the new mirrored string is constructed.

**STEP 5:**

The selected super string will be mirrored using the information given.

Delete the source string

Don't delete the source string

For **CAD Multipick Mirror**, the original strings are always deleted.

CAD Mirror X Axis

Position of option on menu: Strings =>CAD =>Modify =>Mirror X axis

or by selection of appropriate icon from the toolbar. 

This option mirrors a string through the X axis.

On selecting **Mirror X Axis**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Mirror X axis**, go straight to Step 2.

STEP 1: Picking a string

Select a super string to mirror through the X axis.

STEP 2:

After the string is accepted the position of the cursor on the Y axis determines the position of the mirror (which runs parallel to the X axis). As the cursor moves along the Y axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.

Select the final Y-position of the mirror X-axis.

The final position is selected with the mouse or entered via the keyboard. To enter a base point with the keyboard, simply start typing or press the <Spacebar> to bring up the **Enter X Y Z** box. Type the coordinates into the **Enter X Y Z** box and press the <Enter> key.

STEP 3:

For **CAD Mirror X axis**, after the final position is accepted, a **Delete Source String** box will appear.

Select **Yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **No** if you want the original super string to remain when the new mirrored string is constructed.

**STEP 4:**

The selected super string will be mirrored using the information given.

Delete the source string

Don't delete the source string

For **CAD Multipick Mirror X axis**, the original strings are always deleted.

CAD Mirror Y Axis

Position of option on menu: Strings =>CAD =>Modify =>Mirror Y Axis

or by selection of appropriate icon from the toolbar. 

This option mirrors a string through the Y axis.

On selecting **Mirror Y Axis**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Mirror Y Axis**, go straight to Step 2.

STEP 1:

Select a super string to mirror through the Y axis.

STEP 2:

After the string is accepted the position of the cursor on the X axis determines the position of the mirror (which runs parallel to the Y axis). As the cursor moves along the X axis, a reflection of the selected string will be dynamically displayed. This will continue until a final position is selected, thus determining the mirror axis.

Select the final X-position of the mirror Y-axis.

The final position is selected with the mouse or entered via the keyboard. To enter a base point with the keyboard, simply start typing or press the <Spacebar> to bring up the **Enter X Y Z** box. Type the coordinates into the **Enter X Y Z** box and press the <Enter> key.

STEP 3:

After the final position is accepted, a **Delete Source String** box will appear.

Select **Yes** if you want the original super string to be deleted when the new mirrored string is constructed.

Select **No** if you want the original super string to remain when the new mirrored string is constructed.

**STEP 4:**

The selected super string will be mirrored using the information given.

Delete the source string

Don't delete the source string

CAD Scale

Position of option on menu: Strings =>CAD =>Modify =>Scale

or by selection of appropriate icon from the toolbar. 

This option increases or decreases the size of a string by a given scale about a user selected origin. Go to [Scale About an Origin](#) for the definition of scaling.

On selecting **Scale**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Scale**, go straight to Step 2.

STEP 1:

Select a super string to scale.

STEP 2:

After a string is accepted, the **Scale** Typed Input box will appear. Type the desired scale factor into the input box and press the <Enter> key. The browse button  on the Input box can be used to define the scale by measuring existing elements.

Note: the Scale/Scale Factor can be positive or negative.

STEP 3:

After a scale value has been entered the user is required to select the position of the origin.

An origin position can be selected with the mouse or entered via the keyboard.

To enter an origin position with the keyboard, simply start typing or press the space bar to bring up the **Enter X Y Z** box. Type the coordinates into the **Enter X Y Z** box and press the <Enter> key.

If the position of the origin is given by the cursor, the position of the scaled highlighted string moves dynamically as the position of the origin changes as the cursor moves. The final selected origin position establishes the location of the scaled string relative to the original selected string.

The dimensions of the highlighted string are defined by the Scale value.

For example, if you selected a scale of **2**, the distance between the cursor and a point on the highlighted string would be double the distance between the cursor and the corresponding point on the original super string.

**STEP 4:**

After the final position has been accepted, the original string will be removed and the newly scaled highlighted string constructed.

CAD Scale Dynamic

Position of option on menu: Strings =>CAD =>Modify =>Scale Dynamic

or by selection of appropriate icon from the toolbar. 

This option dynamically increases or decreases the size of a string.

This option dynamically increases or decreases the size of a string about a user selected origin by selecting a point to define the scale factor. Go to [Scale About an Origin](#) for the definition of scaling.

On selecting **Scale Dynamic**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

For **CAD Multipick Scale Dynamic**, go straight to Step 2.

STEP 1:

Select a super string to scale.

STEP 2:

An Origin point is required to be defined. An Origin point can be selected with the mouse or entered in via the keyboard.

To enter an Origin point with the keyboard, simply start typing or press the space bar to bring up the **Enter X Y Z** box. Type the coordinates into the **Enter X Y Z** box and press the <Enter> key.

To enter the origin by the cursor, simply select and accept the required origin position.

STEP 3:

For **CAD Scale Dynamic**:

After an Origin point has been accepted, the cursor then defines the Projection point.

Note: the Projection Point is the cursor position dropped perpendicularly onto the line from the origin through the original point selected on the string.

The scale factor is taken to be the ratio of the distance from the projection point to the origin and the distance from the original point selected on the string to the origin.

That is,

Scale factor = (the distance from the projection point to the origin) divided by (the distance from the original point selected on the string to the origin)

The highlighted string is projected from the Origin point to the Projection point (which is being defined by the cursor).

For CAD Multipick Scale Dynamic:

After an Origin point has been accepted, a Start Scale Position is selected.

`<Pick start scale position> [picks][fast][Menu]`

After that the cursor then dynamically defines the End Scale position.

`<Pick end scale position> [picks][fast][Menu]`

For Multipick, the Projection Point is the End Scale position dropped perpendicularly onto the line from the origin through the Start Scale position.

The scale factor is taken to be the ratio of the distance from the Projection Point to the origin and the distance from the Start Scale position to the origin.

That is,

Scale factor = (the distance from the Projection Point to the origin) divided by (the distance from the Start Scale position to the origin)

The highlighted strings are projected from the Origin point using the scale factor dynamically defined by the cursor (and hence the Projection point).

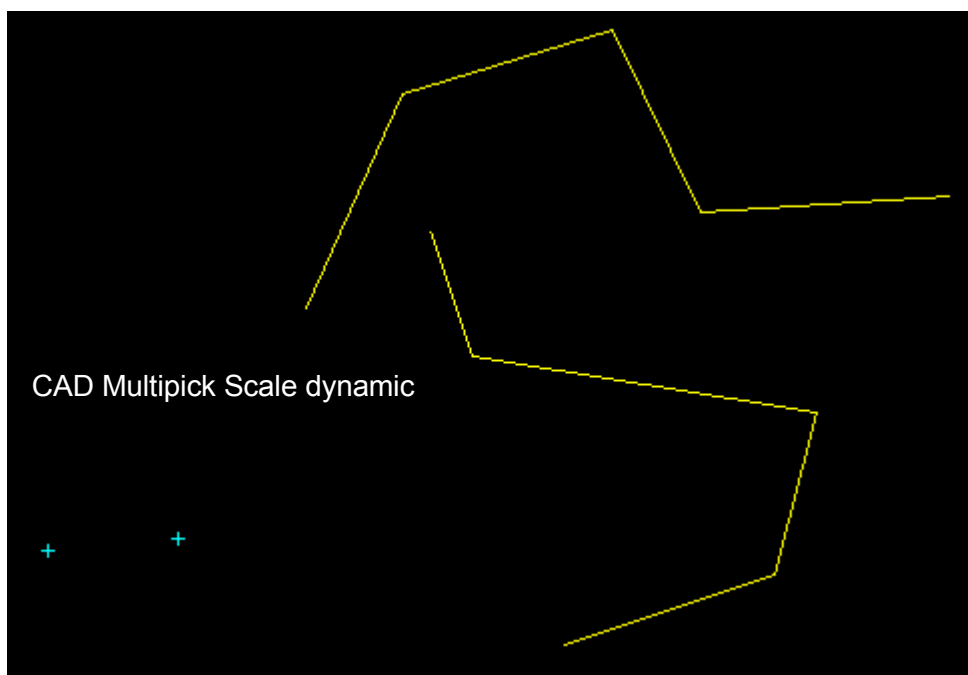

Hence for both the CAD Scale Dynamic and the CAD Multipick Scale Dynamic, the size and position of the highlighted string will move dynamically as the position of the Projection point moves with the cursor.

The highlighted string will increase in size if the cursor moves the Projection point further from the Origin than the original string point/Start Scale position, or decrease in size if the cursor moves the Projection point closer to the Origin than the original string point/Start Scale position.

This will continue until a Projection point is accepted.

STEP 4:

After the Projection point has been accepted, the new scaled strings are created and the original strings deleted.

CAD Vertex

Position of option on menu: Strings =>CAD =>Vertex

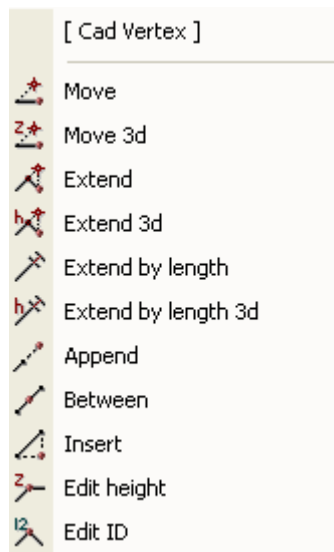

This section of documentation is a work in progress and will be updated in subsequent releases.

The Cad Vertex walk-right menu is

Menu of Options to Move Vertices

move a vertex
 move a vertex and modify its height
 move a vertex along its segment - keep the same height
 move a vertex along its segment - interpolate/extrapolate the height
 move a vertex by a given chainage distance along a segment - keep height
 move a vertex a given chainage dist along a segment - extrapolate height
 append a vertex to an existing string
 create a vertex on the segment joining two adjacent vertices of a string
 insert a vertex between two adjacent vertices of a string
 edit the height of a vertex
 edit the point (vertex) ID

These options allow the editing of vertices on super strings.

For the option *Move*, go to

Move 3d
Extend
Extend 3d
Extend by length
Extend by length 3d
Append
Between
Insert
Edit height
Edit ID

[Move a Vertex while Keeping its Height](#)
[Move a Vertex and Modify its Height](#)
[Extend a Vertex while Keeping its Height](#)
[Extend Segment and Extrapolating Heights](#)
[Extend Segment by Length and Keeping Height](#)
[Extend Segment by Length and Extrapolating Heights](#)
[Append a Vertex](#)
[New Vertex on a Segment \(Between Two Vertices\)](#)
[Insert a Vertex](#)
[Change Height of a Vertex](#)
[Edit ID](#)

Move a Vertex while Keeping its Height

Position of option on menu: Strings =>CAD =>Vertex =>Move
or by selection of appropriate icon from the toolbar.

This option moves the vertex of a super string. The height of the vertex is not modified.

On selecting **Move**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A vertex on a super string is selected and accepted.

STEP 2:

The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

STEP 3:

The selected vertex is moved to the new position.

Move a Vertex and Modify its Height

Position of option on menu: Strings =>CAD =>Vertex =>Move 3d
or by selection of appropriate icon from the toolbar.

This option moves the vertex of a super string and the height of the vertex is taken from the height of the final selected position.

On selecting **Move 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A vertex on a super string is selected and accepted.

STEP 2:

The position of the selected vertex moves with the cursor until the final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the vertex by the using the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

STEP 3:

The selected vertex is moved to the new position and takes on the height of the string it is snapped to, or the Z value entered into the **Enter XYZ** box.

Extend a Vertex while Keeping its Height

Position of option on menu: Strings =>CAD =>Vertex =>Extend

or by selection of appropriate icon from the toolbar. 

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is not modified.

On selecting **Extend**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

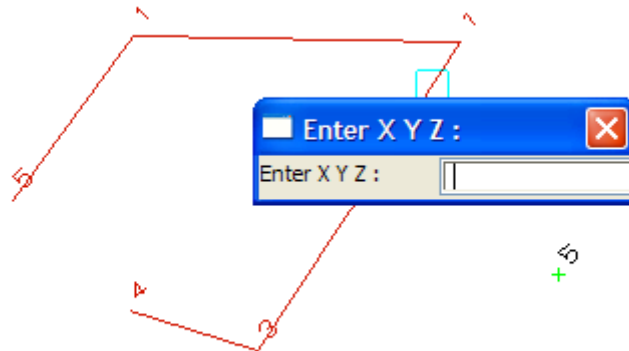

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

STEP 2:

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

STEP 3:

The selected vertex is moved to the new position. The height of the vertex is not changed.

Extend Segment and Extrapolating Heights

Position of option on menu: Strings =>CAD =>Vertex =>Extend 3d

or by selection of appropriate icon from the toolbar. 

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex. The height of the vertex is extrapolated.

On selecting **Extend 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

STEP 2:

As the cursor is moved, the string is redrawn reflecting the changing position of the moved vertex. The final position of the vertex is selected and accepted. Alternatively, the user can type in the final coordinate of the moved vertex into the **Enter XYZ** box. This box is brought up by simply typing a value or by pressing the space bar.

The point selected is moved to the cursor position in a rubber banding fashion. The final position of the point is selected and accepted. Alternatively, the user can enter the final coordinate value of the moved point by the Enter XYZ box. This box can be brought into view by simply typing a value or by pressing the space bar.

**STEP 3:**

The selected vertex is moved to the new position. The height of the vertex has been extrapolated from the heights at either end of the original segment.

Extend Segment by Length and Keeping Height

Position of option on menu: Strings =>CAD =>Vertex =>Extend by length
or by selection of appropriate icon from the toolbar.

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is not modified.

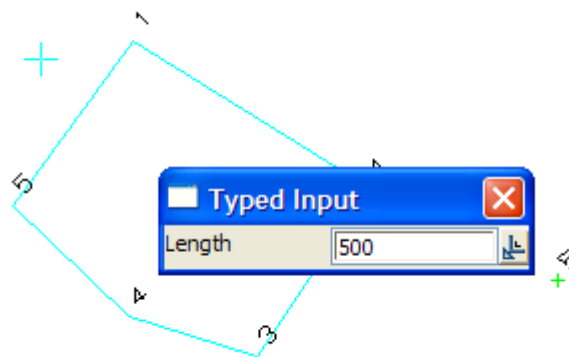

On selecting **Extend by length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

**STEP 2:**

The user enters the distance to extend the segment. This value is positive in the direction that the string was created.

**STEP 3:**

The point selected is moved to the new position and the string topology maintained.

Extend Segment by Length and Extrapolating Heights

Position of option on menu: Strings =>CAD =>Vertex =>Extend by length 3d

or by selection of appropriate icon from the toolbar. 

This option extends (or shortens) a segment by moving a vertex along the segment joining the vertex to its neighbouring vertex by a user defined distance. The height of the vertex is extrapolated modified.

On selecting **Extend by length 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

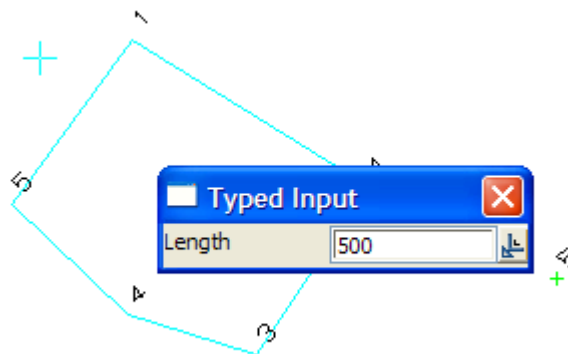

STEP 1:

Most vertices are on two segments so it is necessary to indicate which segment is to be extended, This is done by selecting **not the vertex**, but by selecting **on the segment** that is to be extended, close to the vertex to be moved.

STEP 2:

The user enters the length value for which the point is to be extended by. This value is positive in the direction that the string was created.

STEP 3:

The point selected is moved to the new position and the height adjusted according to the grade of the extended segment.

Append a Vertex

Position of option on menu: Strings =>CAD =>Vertex =>Append

or by selection of appropriate icon from the toolbar. 

This option adds vertices to an existing super string.

On selecting **Append**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select a string by picking near the end of the string that vertices are to be added to (added to the beginning of the string - prepend, or added to the end of the string - append).

STEP 2:

After the string is accepted, a line is drawn from the end of the string to the current cursor position.

Select the position for the new vertex.

STEP 3:

After the new vertex is accepted, a line is drawn from that vertex to the current cursor position.

That is, the process of adding points is repeated.

STEP 4:

This step should be repeated until the required number of vertices has been added.

STEP 5:

STEP 6:

After the required number of vertices have been added, the option is terminated for this string by pressing the <Esc> key.

New Vertex on a Segment (Between Two Vertices)

Position of option on menu: Strings =>CAD =>Vertex =>Between

or by selection of appropriate icon from the toolbar. 

This option adds a vertex to a string but it is constrained to be on an existing segment of the string. The height of the vertex is interpolated from the heights at the end of the segment.

On selecting **Between**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the string on the segment of the string that is to have a vertex added to it. The new vertex will be constrained to be on the segment.

**STEP 2:**

After the segment is accepted, a perpendicular line is drawn from the selected segment of the string to the position of the cursor.

**STEP 3:**

A position is selected with the mouse or typed in via the keyboard and the new vertex is created by **dropping** the position **perpendicularly** onto the segment.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the XYZ Input box and press the enter key.

**Insert a Vertex**

Position of option on menu: Strings =>CAD =>Vertex =>Insert

or by selection of appropriate icon from the toolbar. 

This option inserts a vertex into a string between two adjacent vertices but it is constrained to be on the existing segment joining the vertices. The height of the vertex is taken from the final selected position.

On selecting **Insert**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the string on the segment of the string that is to have a vertex added to it. The new vertex is **not** constrained to be on the segment.

**STEP 2:**

After a string is accepted, two lines will be drawn from the cursor position to either end of the selected segment.

**STEP 3:**

A final position is selected with the mouse or typed in via the keyboard and the new vertex is created at the final position.

Once the new vertex is created the original segment is no longer drawn.

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the XYZ Input box and press the enter key.

Change Height of a Vertex

Position of option on menu: Strings =>CAD =>Vertex =>Edit height

or by selection of appropriate icon from the toolbar. 

This option changes the height (z value) of a vertex.

On selecting **Edit height**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

To see the effects of this option, use the **Toggle** menu to toggle on **Z values**. The height of each vertex (z value) is then displayed on the plan view so any modification to the height will be visible.

STEP 2:

Select a vertex with either the mouse or via the keyboard.

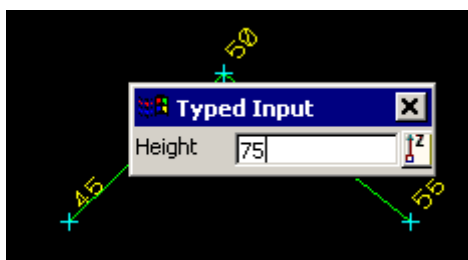

Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the **Enter XYZ** Input box and press the <Enter> key.

STEP 3:

After a point is accepted, the **Height** input box will appear with the current height displayed in it.

Type the new height (z value) of the vertex into the **Height** input box and press the <Enter> key. The browse button  on the Input box can also be used to define the point's height.

STEP 4:

The height (z value) of selected point will have changed to the new value.

If z values have been turned on, the new value will be displayed in the view.

Edit ID

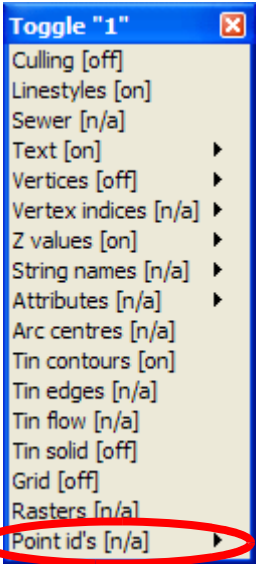

Position of option on menu: Strings =>CAD =>Vertex =>Edit ID
or by selection of appropriate icon from the toolbar. 

This option changes the point id of the vertex of a super string.
On selecting **Edit ID**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

To see the effects of this option, use the **Toggle** menu to toggle on **Point id's**. The Point id of each vertex is then displayed on the plan view so any modification to the point id will be visible.

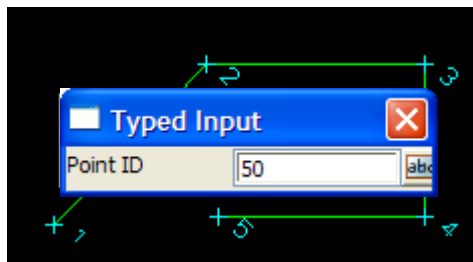

STEP 2:

Select a vertex with either the mouse or via the keyboard.
Note - to enter via the keyboard, simply start typing or press the space bar to bring up the **Enter XYZ** Input box. Type the coordinates into the **Enter XYZ** Input box and press the Enter key.

**STEP 3:**

After the vertex is accepted, the **Point ID** input box will appear. Type the point id into the input box and press the Enter key.

**STEP 4:**

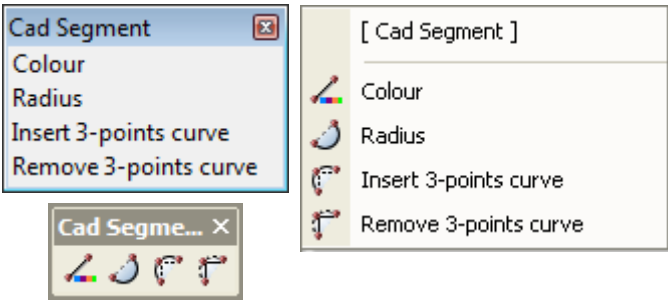

The point id of selected vertex is changed to the new value. If Point id's have been turned on, the new value will be displayed in the view.

CAD Segment

Position of option on menu: Strings =>CAD =>Segment

The Cad Segment walk-right menu is

For the option *Colour*, go to
Radius
Insert 3-points curve
Remove 3-points curve

[Colour](#)
[Radius](#)
[Insert 3-points curve](#)
[Remove 3-points curve](#)

Colour

Position of option on menu: Strings =>CAD =>Cad Segment =>Colour

or by selection of appropriate icon from the toolbar. 

This option changes the colour of a selected segment.

On selecting **Segment colour**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

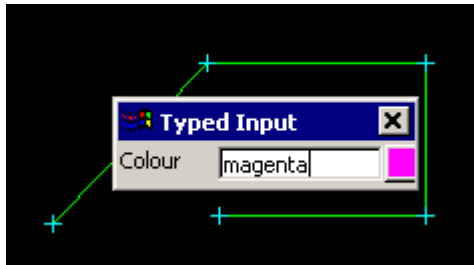

STEP 1:

Select the segment of the super string that is to have a colour change.

STEP 2:

After the segment is accepted, the **Colour** Input box will appear. Type the desired colour into the Input box and press the enter key. Alternatively you can select a colour from a list by clicking the browse button  on the Input box.

**STEP 3:**

The colour of the selected segment is drawn in the new colour.

**Radius**

Position of option on menu: Strings =>CAD =>Cad Segment =>Radius

or by selection of appropriate icon from the toolbar. 

This option changes the radius of a segment.

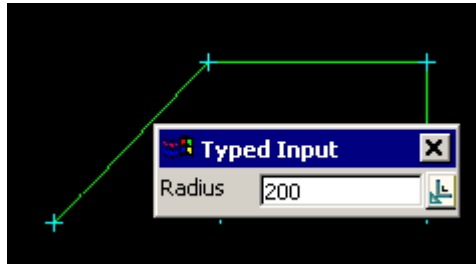

On selecting **Segment radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select the segment of the super string that is to have a change of radius.

**STEP 2:**

After the segment is accepted, the **Radius** box will appear. Type the desired radius into the Input box and press the enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.

**STEP 3:**

The selected segment is then drawn with the new radius.

**Insert 3-points curve**

Position of option on menu: Strings =>CAD =>Cad Segment =>Insert 3-points curve

or by selection of appropriate icon from the toolbar. 

This option allows the creation of a 3 point curve using 2 existing segments.

On selecting **Insert 3pt curve**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select a vertex of a super string a vertex with a segment on either side, or segment of a super string.

If a **vertex** is selected, that vertex will be the middle vertex of the constructed 3 point curve. If a **segment** is selected, the closest vertex will become the **middle** vertex of the 3 point curve.

**STEP 2:**

After the vertex or segment is selected and accepted, an arc is through the three vertices is calculated and its radius used for the tow segments on either side of the vertex.

Remove 3-points curve

Position of option on menu: Strings =>CAD =>Cad Segment =>Remove 3-points curve

or by selection of appropriate icon from the toolbar. 

This option removes the arcs from either side of a selected vertex. If a segment is selected, the closest vertex is used and the arcs removed from either side of the vertex,

On selecting **Remove 3pt curve**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select a vertex of a super string with arcs on one or two sides of the vertex.

STEP 2:

After the vertex is selected and accepted, arc on either side will removed (the radius is set to zero). Two line segments are then drawn.

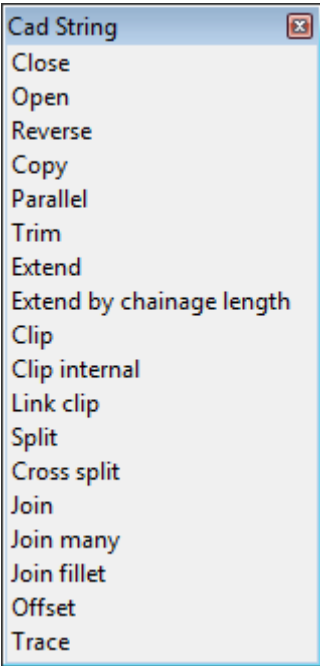

CAD Edit Strings

Position of option on menu: Strings =>CAD =>String

These options are currently under development.

The Cad String walk-right menu is

Menu of Options to Edit Strings

- close a string
- open a string
- reverse the direction of a string
- copy a string
- parallel a string
- trim a string back to a selected string
- extend a string until it cuts a selected string
- extend a string by a typed chainage length
- clip a string and keep the outer strings
- clip a string and keep the internal string
- deletes the selected link from the string (making two strings)
- split a string
- splits two strings where they first intersect each other
- join two strings
- join many strings
- fillet and join
- string parallel and more
- trace over parts of strings to form a new string

For the option *Close*, go to

- | | |
|----------------------------------|--------------------------------------------------------|
| <i>Open</i> | Close String |
| <i>Reverse</i> | Open String |
| <i>Copy</i> | Reverse a String |

| <i>Trace</i> | Offset |
| | Trace |

Close String

Position of option on menu: Strings =>CAD =>String=>Close

or by selection of appropriate icon from the toolbar. 

This option closes an open string.

On selecting **Close**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

An open string is selected and accepted.

STEP 2:

The string is closed

After closing of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

Open String

Position of option on menu: Strings =>CAD =>String=>Open

or by selection of appropriate icon from the toolbar. 

This option opens a closed string.

On selecting **Open**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A closed string is selected and accepted.

**STEP 2:**

The string is opened by deleting the last segment of the closed string.

Note - this may not be where the string was selected.

After opening of a string, the option restarts so that another string can be selected. Picking Cancel from the Pick Ops menu, hitting <esc> or selecting another option terminates the option.

**Reverse a String**

Position of option on menu: Strings =>CAD =>String=>Reverse

or by selection of appropriate icon from the toolbar. 

This option reverses the direction of a string

On selecting **Reverse**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A string is selected and accepted.

**STEP 2:**

The string is reversed.

After reversing of a string, the option restarts so that another string can be selected. Picking **Cancel** from the **Pick Ops** menu, hitting <esc> or selecting another option terminates the option.

Copy a String

Position of option on menu: Strings =>CAD =>String=>Copy

or by selection of appropriate icon from the toolbar. 

This option copies a string. The copied strings takes its attributes from the **Cad Control Bar**.

Copy is particularly helpful in backing up strings.

On selecting **Copy**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

A string is selected and accepted. The copied string will take on the values in the control bar at the time of accepting.

STEP 2:

A copy of the original string will be saved into the model **bu hse string**.

Parallel a String

Position of option on menu: Strings =>CAD =>String=>Parallel

or by selection of appropriate icon from the toolbar. 

This option parallel a string by a given to a selected string.

Note that if there are arcs in the string, the string can not be paralleled by a distance that would collapse the arcs.

On selecting **Parallel**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to parallel is picked with direction. The direction determines what it means to parallel to the right or left of the string.

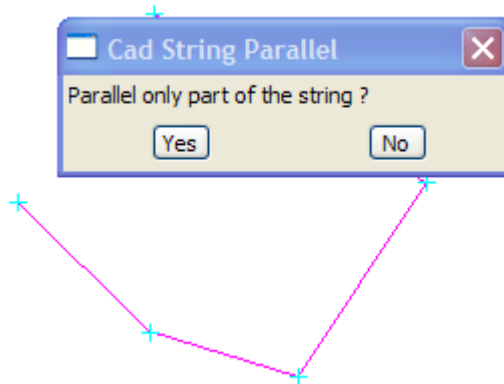

STEP 2:

The parallel option can be applied to **all** of the selected string or only **part** of the string.

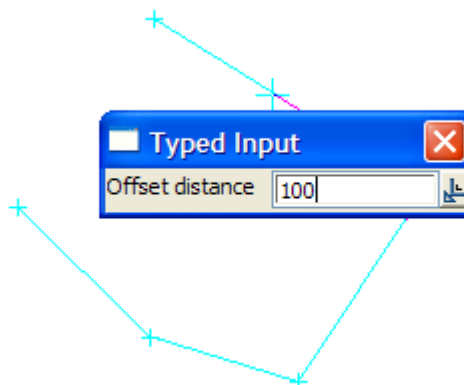

After the string is selected, a panel is displayed asking if only part of the string is to be paralleled.

If only part of the string is to be paralleled (i.e. **yes** selected) the user picks the start and end positions of where the string is to be paralleled. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values. If the whole string is to be paralleled the user should select **no**.

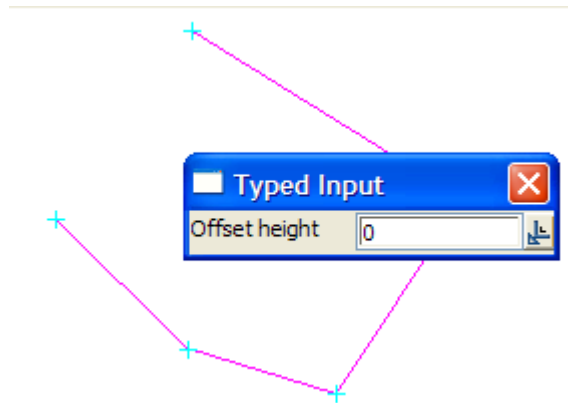

STEP 3:

The user is prompted for the parallel distance. Positive distance is to the right of the selected string. Negative to the left.

STEP 4:

The user is prompted for the offset height. This height value will be added to the selected string values to produce the heights for the paralleled string.

**STEP 5:**

The paralleled string is then generated using the supplied information.

**Trim a String**

Position of option on menu: Strings =>CAD =>String=>Trim

or by selection of appropriate icon from the toolbar. 

This option trims a string to another nominated cutting string.

On selecting **Trim**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The cutting string which will be used to define the trim extent is selected and accepted.

**STEP 2:**

The string to trim is selected. The position of the pick relative to the cutting string will dictate which part of the string will be trimmed. In this case, the selection is above the cutting string and so the trim will be of the top part of the string.

**STEP 3:**

The string is trimmed.

Extend a String

Position of option on menu: Strings =>CAD =>String=>Extend

or by selection of appropriate icon from the toolbar. 

This option extends a string to a another nominated string.

On selecting **Extend**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to extend to is selected and accepted.

STEP 2:

The string to extend **to** selected and accepted

STEP 3:

The string is extended.

Extend String by Chainage Length

Position of option on menu: Strings =>CAD =>String=>Extend by chainage length

or by selection of appropriate icon from the toolbar. 

This option extends a string by a given chainage value.

On selecting **Extend by chainage length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to extend is selected and accepted.

STEP 2:

The chainage length to extend the string is entered into the **Length** input Box. Positive is in the direction of the string. Negative in the opposite direction of the string.

STEP 3:

The string is extended by the given chainage amount.

Clip String

Position of option on menu: Strings =>CAD =>String=>Clip
or by selection of appropriate icon from the toolbar.

This option deletes part of a string.

On selecting **Clip**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to be clipped is selected and accepted.

STEP 2:

The first and second positions defining what part of the string is to **remain** are selected and accepted.

The positions do not have to be at vertices but can be anywhere on segments

STEP 3:

The string is clipped.

Delete an Internal Section of a String

Position of option on menu: Strings =>CAD =>String=>Clip internal

or by selection of appropriate icon from the toolbar. 

This option deletes an internal part of a string and leaves the two end sections.

On selecting **Clip internal**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to be clipped is selected and accepted.

**STEP 2:**

The first and second position defining what part of the string is to **remain** is selected and accepted. This does not necessarily have to be at the end of the segments as the user can select a position anywhere on the segment to define these values.

The first and second positions defining what part of the string is to be **deleted** are selected and accepted.

The positions do not have to be at vertices but can be anywhere on the segments

STEP 3:

The part of the string between the two selected clip points is deleted leaving two strings.

Delete a Segment

Position of option on menu: Strings =>CAD =>String=>Link clip
or by selection of appropriate icon from the toolbar. 

This option deletes a segment from a string.

On selecting **Link clip**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The **segment** to be deleted is selected and accepted.

**STEP 2:**

The selected segment is deleted.

Note - unless the selected string was a closed string, two strings are produced.

**Split String**

Position of option on menu: Strings =>CAD =>String=>Split

or by selection of appropriate icon from the toolbar. 

This option splits one string into two strings at a given split position.

On selecting **Split**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to be split is selected and accepted.

**STEP 2:**

The split position is selected and accepted.

**STEP 3:**

The split is made at the position selected. If no vertex exists at that position, a vertex is created.

**Split Crossing Strings**

Position of option on menu: Strings =>CAD =>String=> Cross split
or by selection of appropriate icon from the toolbar. 

This option splits two crossing strings at the position of their crossing.

If there are multiple intersections between the two strings, then it splits the strings at the intersection that is the shortest distance to a pick position.

On selecting **Cross split**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Pick the first string.

STEP 2:

Pick the second string.

STEP 3:

The two strings are then split where the strings crossed (at the intersection that is the shortest distance to a pick position). This will create four strings.

Join String

Position of option on menu: Strings =>CAD =>String=>Join
or by selection of appropriate icon from the toolbar. 

This option joins two super strings together at their end points.

There are four possible ways of joining the strings and the required case is determined by picking the strings with direction.

On selecting the **Join** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Select and accept a super string *with direction*.

For notes on picking strings with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: *Vertex indices* can be displayed by toggling the option on the Toggle Menu.

STEP 2:

Select and accept another super string *with direction*.

STEP 3:

The head of the first string (as determined by the picking direction) is then joined to the tail of the second string (as determined by the picking direction).

After the strings are joined, the vertex indices will change since the order of the vertices in the string is now different.

The colour of the constructed line is adopted from first selected super string. The colour of the second string will remain unchanged.

Note: The constructed line and selected strings are stored in the model of the first selected string.

Join String Many

Position of option on menu: Strings =>CAD =>String=>Join many

or by selection of appropriate icon from the toolbar.

This option joins many strings together. Picking with direction is used to specify which ends of the strings are joined.

On selecting the **Join many** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Pick a super string *with direction*.

For notes on picking strings with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: The **Vertex indices** can be displayed by toggling the option on the Toggle Menu.

pick with
direction

STEP 2:

Select and accept another super string, again picking *with direction*.

pick with
direction

STEP 3:

The **head** of the first string is then joined to the **tail** of the second string. What is the head or tail

of the strings is determined by the *picking direction*.

After the strings are joined, the vertex indices to reflect the new order of the vertices in the string. The colour of the constructed segment will be the same as that of the first selected super string. The colour of the second string will remain unchanged.

Note: The constructed segment and selected strings are stored in the model which contains the 1st selected string.

STEP 4:

The *Join Many* option joins extra strings to the already selected (and joined) strings. The user may continue selecting additional strings to join together by select and accept additional super strings by picking with direction.

This option can be terminated by the user with the **Esc** key.

Note: Each further construction line adopts the same colour as the 1st selected string. Both the constructed line and selected strings are stored in the model which contains the first selected string.

Join Fillet

Position of option on menu: Strings =>CAD =>String=>Join fillet

or by selection of appropriate icon from the toolbar. 

This option fillets, trims and joins strings.

There are eight possible ways of filleting the strings and the required case is determined by picking the strings with direction and by the sign of the radius.

On selecting the **Join strings** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

Pick a super string *with direction*.

For notes on picking strings with direction, see [Picking with Direction](#) in the chapter [Tools and Concepts](#).

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

pick with
direction

STEP 2:

Select and accept another super string, again picking *with direction*.

pick with
direction

STEP 3:

After the second super string is accepted, the **Radius** input box will appear. Type the *fillet radius* into the input box and press the Enter key. The browse button  on the input box can be used to define the fillet radius by measurement of existing elements.

Note: A **positive** fillet radius value will curve to the right, where as a **negative** fillet radius will curve to the left.

A fillet arc with the radius is constructed and joined to the two strings and the ends of the two strings are automatically trimmed back to the arc.

The vertex indices will change to accommodate the new vertices in the string. The colour of the constructed line and 2nd selected string adopts the colour of the 1st selected super string.

Note: The constructed arc and selected strings are stored in the model of the first selected string.

Offset

Position of option on menu: Strings =>CAD =>String =>Offset

or by selection of appropriate icon from the toolbar.

This option allows the user to create "parallel" strings, *i.e.* creating a string that is offset by a given distance from a selected string.

There are five possible ways of offsetting the strings as well as options for offsetting full strings or partial strings.

The string to offset is selected by picking with direction, and the offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

On selecting the **Offset** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

e.g.

```
<[N][J] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]
```

The letters in the square brackets indicate which offset modes are currently selected.

For example, [N][J] at the front indicates that (n)ormal and (j)oin are the selected options.

For the option *N* for (n)ormal, go to

P for (p)artial

J for (j)oin

I for (i)ntersect

F for (f)illet

D for (d)ual

C for (c)lip

[Typing N for \(n\)ormal](#)

[Typing P for \(p\)artial](#)

[Typing J for \(j\)oin](#)

[Typing I for \(i\)ntersect](#)

[Typing F for \(f\)illet](#)

[Typing D for \(d\)ual](#)

[Typing C for \(c\)lip](#)

Typing N for (n)ormal

Typing **N** or **n** for (n)ormal causes the **whole string to be offset**.

Note - the other choice is Partial when only part of a string is offset.

When **N** is typed, the first character in the square brackets changes to [N].

Continue to the next mode [Typing P for \(p\)artial](#) or to the beginning of the Offset documentation [Offset](#).

Typing J for (j)oin

For **Join**, each segment of the selected string is offset by the given distance and the end points of adjacent offset segments are joined together.

Offset Join with Offset Distance of -10

So when **J** or **j** is typed, the second character in the square brackets changes to **[J]** and the string to offset is then selected by picking with direction.

<[N][J] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode [Typing I for \(i\)ntersect](#) or to the beginning of the Offset documentation [Offset](#).

Typing I for (i)ntersect

For **Intersect**, each segment of the selected string is offset by the given distance and the ends of adjacent offset segments are extended or contracted so that they intersect.

So when **I** or **i** is typed, the second character in the square brackets changes to **[I]** and the string to offset is then selected by picking with direction.

```
<[N][I] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]
```

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode [Typing F for \(f\)illet](#) or to the beginning of the Offset documentation [Offset](#).

Typing F for (f)illet

For **Fillet**, each segment of the selected string is offset by the given distance and the ends of adjacent offset segments are extended or contracted so they intersect. If the change of direction between adjacent segments is greater than 180 degrees, an arc is used instead of an intersect of the two segments.

So when **F** or **f** is typed, the second character in the square brackets changes to **[F]** and the string to offset is then selected by picking with direction.

<[N][F] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode [Typing D for \(d\)ual](#) or to the beginning of the Offset documentation [Offset](#).

Typing D for (d)ual

For **Dual**, *construction* strings are created by offset fillets to both the left and right with the given offset distance.

Construction Strings for Offset Dual with Offset Distance of 10

Then the **Offset Dual** is created for the given offset distance but the created string **does not cut** either of the two left and right offset construction strings.

Offset Dual with Offset Distance of 10

More than one string may be created by the **Dual** option.

So when **D** or **d** is typed, the second character in the square brackets changes to [D] and the string to offset is then selected by picking with direction.

<[N][D] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

NOTE: Running the Dual offset command twice, one with an offset and then again with the negative of the offset (-offset)

Two Dual offsets in cyan - one with offset_value and the other -offset_value

Two Offset Duals with Offset Distance of 10 and -10

Continue to the next mode [Typing C for \(c\)lip](#) or to the beginning of the Offset documentation [Offset](#).

Typing C for (c)lip

For **Clip**, *construction* strings are created as for the Dual option by offsetting the selected string to both the left and right by the given offset distance as an offset fillet and a buffer zone defined by the construction strings and end caps with radius equal to the offset distance at each end of the selected string.

Buffer Zone for Offset Clip with Offset Distance of -10

Then the **Offset Clip** is created for the given offset distance, but it **does not cut** the buffer zone for the selected string.

Offset Clip with Offset Distance of -10

More than one string may be created by the **Clip** option.

So a Clip is like the Dual option except everything is removed from the buffer zone.

So when **C** or **c** is typed, the second character in the square brackets changes to [C] and the string to offset is then selected by picking with direction.

```
<[N][C] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]
```

After the string is selected, the **Offset distance** typed input box is placed on the screen and the distance to offset is typed into the box followed by the <Enter> key.

NOTE: The offset distance is negative to offset to the left of the pick direction and positive to offset to the right of the pick direction.

The selected string is then offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

NOTE: Running the Clip offset command twice, one with an offset and then again with the negative of the offset (-offset)

Continue to the first mode [Typing N for \(n\)ormal](#) or to the beginning of the Offset documentation [Offset](#).

Typing P for (p)artial

Selecting **P** for (p)artial allows for a **part** of the string to be offset.

When **P** or **p** is typed, the first character in the square brackets changes to [P].

e.g.

<[P][I] Pick string to offset or type (n)ormal, (p)artial, (j)oin, (i)ntersect, (f)illet, (d)ual, (c)lip> [picks][fast][Menu]

After **P** is typed, the two positions on the string are selected to indicate the subsection of the string that is to be offset.

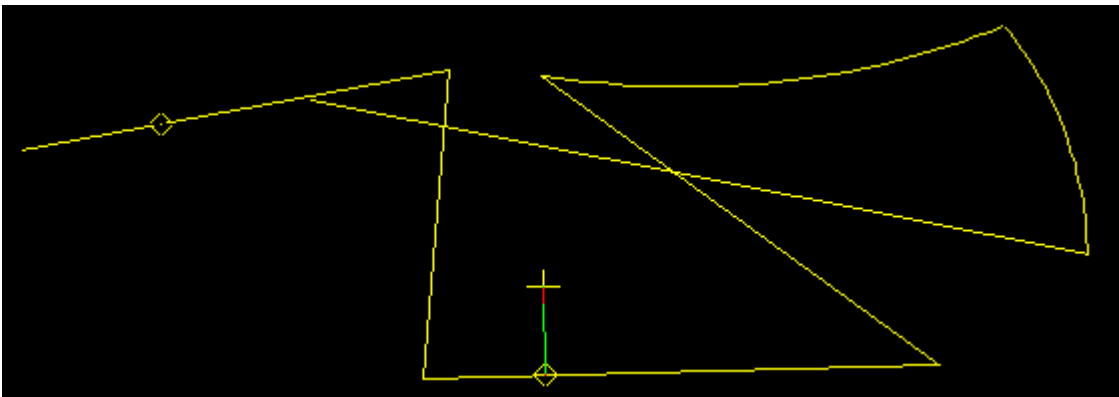

STEP 1:

Pick your first position. This does not have to be on the string to offset because it will be dropped perpendicular onto the string to give the first point of the partial offset.

STEP 2:

Pick your second position. This does not have to be on the string to offset because it will be dropped perpendicular onto the string to give the second point of the partial offset.

STEP 3:

After accepting the second position, the part of the string between the two dropped positions is offset.

After the string is offset, the mode can be changed or left the same and another string selected to offset using the new mode(s).

The option is terminated by pressing the <Esc> key or by clicking **X** on the top right corner of the **Offset distance** typed input box.

Continue to the next mode [Typing J for \(j\)oin](#) or to the beginning of the Offset documentation [Offset](#).

Trace

Position of option on menu: Strings =>CAD =>String =>Trace

or by selection of appropriate icon from the toolbar. 

This option allows the user to create a new string by

(a) creating points as in a normal string

and/or

(b) selecting parts of existing string to copy and make part of the new string (i.e. tracing over part of an existing string)

and/or

(c) closing the new string

On selecting the **Trace** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** screen message area at the bottom of the window.

e.g.

```
<[P] Pick point to append or (t)race, (c)lose> [picks][fast][Menu]
```

The letter in the square brackets indicate which trace mode is currently selected.

For example, [T] at the front indicates that (t)race mode is selected

For the option *P* for (p)ick go to

T for (t)race

C for (c)lose

[Typing N for \(n\)ormal](#)

[Typing P for \(p\)artial](#)

[Typing J for \(j\)oin](#)

Typing P for (p)ick

Typing P or p for pick means that new vertices of the string will be created in the normal way for a string editor, and the created vertices are appended to the end of the new string being created.

When **P** or **p** is typed, the first character in the square bracket changes to [P].

e.g.

```
<[P] Pick point to append or (t)race, (c)lose> [picks][fast][Menu]
```

Points are then created for the new string by the normal pick and accept.

The option is terminated by pressing the <Esc> key.

Continue to the next mode [Typing T for \(t\)race](#) or to the beginning of the Trace documentation [Trace](#).

Typing T for (t)race

For **Trace**, an part of an existing string is selected to copy and make part of the new string. That is, part of an existing string is traced over to form part of the new string.

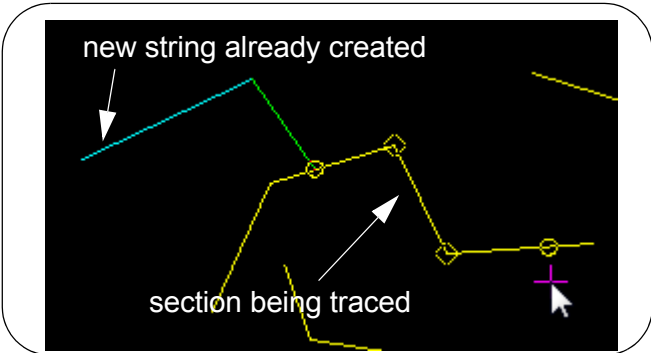

When **T** or **t** is typed, the second character in the square brackets changes to [T]

```
<[T] Select start point to trace or (p)ick, (c)lose> [picks][fast][Menu]
```

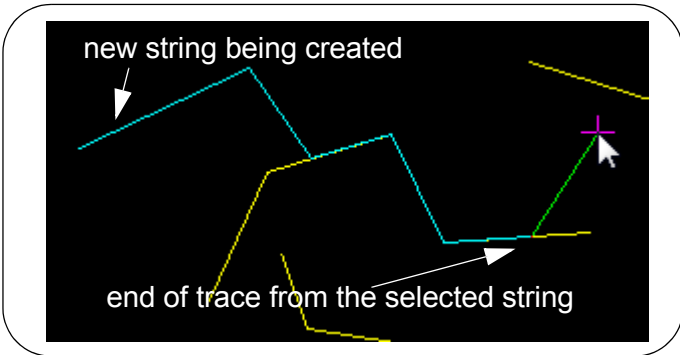

and the string to trace over is then selected by picking the string at the start position of the section of the string to trace over.

The cursor is then moved along the sting in the direction of the trace. Vertices on the traced section are displayed as diamonds and a non-vertex start on the string of the trace is shown as a circle.

The final position of the trace on the string is then selected and the traced portion is copied to the string being created.

Another string can then be selected to trace over, or P or C typed to change modes.

The option is terminated by pressing the <Esc> key.

Continue to the next mode [Typing C for \(c\)lose](#) or to the beginning of the Trace documentation [Trace](#).

Typing C for (c)lose

Typing **C** or **c** will **Close** the string and ends the creation of the new string.

A new Trace option then begins.

The option is terminated by pressing the <Esc> key.

Go to the beginning of the Trace documentation [Trace](#).

CAD Edit

For the option *Paste*, please go to
Copy rectangle
Copy many

[Paste](#)
[12d Copy Rectangle](#)
[12d Copy Many](#)

Paste

Pastes the 12d Ascii data from the clipboard into the current view in 12d.

12d Copy Rectangle

In the chosen view select the first point and then drag the cursor to visualise your desired rectangle. When the second point is accepted, the data inside the rectangle is copied to the clipboard in 12d Ascii format, ready for pasting into an open 12d project. The data is copied into models of the same model names as the original data.

12d Copy Many

Data is copied to the clipboard by selecting data from the **Data to Copy** field and then selecting **Copy**.

On selecting the **Copy many** option, a **Cad 12d Copy** panel is displayed.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data to Copy

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

Model

model box

select the data from the specified model.

Copy

button

Copies the selected data to the clipboard in 12d ascii format.

CAD Delete

Position of option on menu: Strings =>CAD =>Delete

The Cad Delete walk-right menu is

Menu of Options to Delete Vertices, Segments and Strings

delete a vertex
delete a segment
delete a string

For the option *Vertex*, go to
Segment
String

[Delete Vertices](#)
[Delete Segments](#)
[Delete Strings](#)

Delete Vertices

Position of option on menu: Strings =>CAD =>Delete =>Points

or by selection of appropriate icon from the toolbar. 

This option deletes vertices of super strings.

On selecting **Points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The vertex to be deleted is selected and accepted (This must be a super string).

STEP 2:

The vertex point is deleted and the string redrawn.

Delete Segments

Position of option on menu: Strings =>CAD =>Delete =>Segments

or by selection of appropriate icon from the toolbar. 

This option deletes segments of super strings.

On selecting **Segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The segment to be deleted is selected and accepted.

**STEP 2:**

The segment is deleted leaving two separate strings in this case.

Delete Strings

Position of option on menu: Strings =>CAD =>Delete =>Strings

or by selection of appropriate icon from the toolbar. 

This option deletes selected strings. The string type does not specifically have to be a super string.

On selecting **Strings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

STEP 1:

The string to be deleted is selected and accepted.

**STEP 2:**

The string is deleted.

Delete Selection of Strings

Position of option on menu: Strings =>CAD =>Delete =>Selection

or by selection of appropriate icon from the toolbar. 

This option allows the deleting of selected objects specified in a source box. For help on this

option see [Delete](#).

On selecting the **Delete** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the **12d Model** application window.

Cad Acad

Position of option on menu: Strings =>CAD =>Acad

The Cad Acad walk-right menu is

For the option *Paste*, go to
Copy rectangle
Copy many
Paste parameters
Copy parameters

[Paste](#)
[Copy rectangle](#)
[Copy many](#)
[Paste parameters](#)
[Copy parameters](#)

Paste

Pastes the Dwg/Dxf data from the clipboard into the current view in 12d.

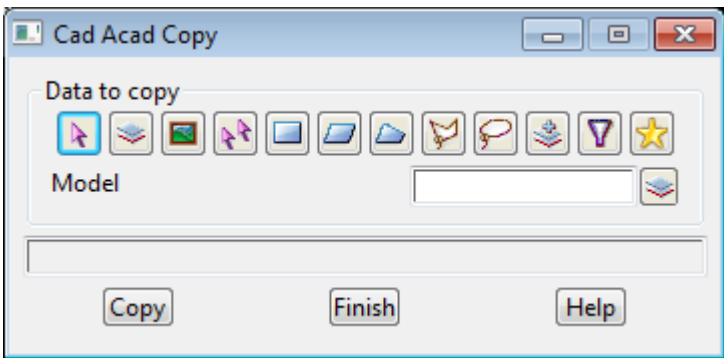

Copy rectangle

In the chosen view select the first point and then drag the cursor to visualise your desired rectangle. When the second point is accepted, the data inside the rectangle is copied to the clipboard for pasting.

Copy many

Data is copied to the clipboard by selecting data from the **Data to Copy** field and then selecting **Copy**.

Selecting the **Copy many** option, brings up the **Cad Acad Copy** panel.

The fields and buttons used in the panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
-------	-------------	------	----------	--------

Data to Copy

data selection type - for a full description go to [Data Source](#) in the chapter [Tools and Concepts](#)

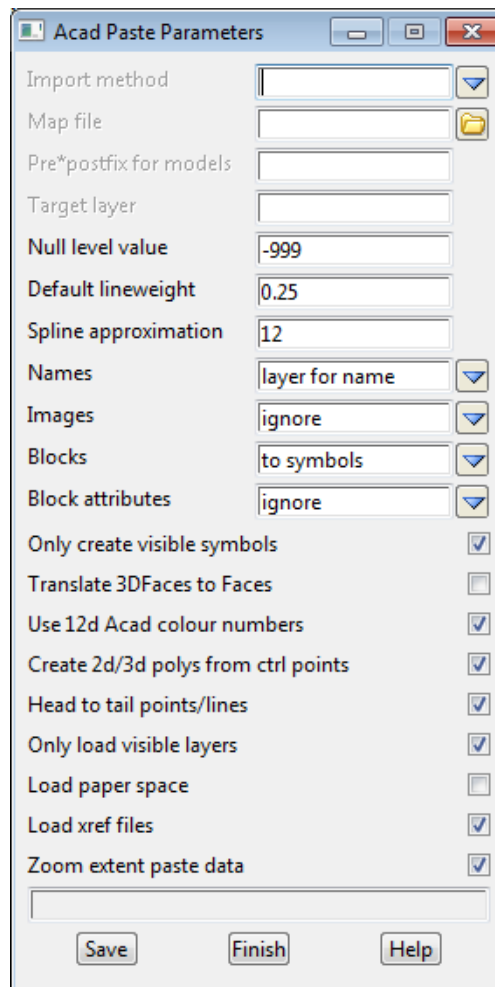

Model model box
select the data from the specified model.

Copy button
Copies the selected data to the clipboard.

Paste parameters

The parameters for this panel are the same as parameters in the **Read DWG/DXF Data** panel.

Selecting **Paste parameters** brings up the **Acad Paste Parameters** panel:

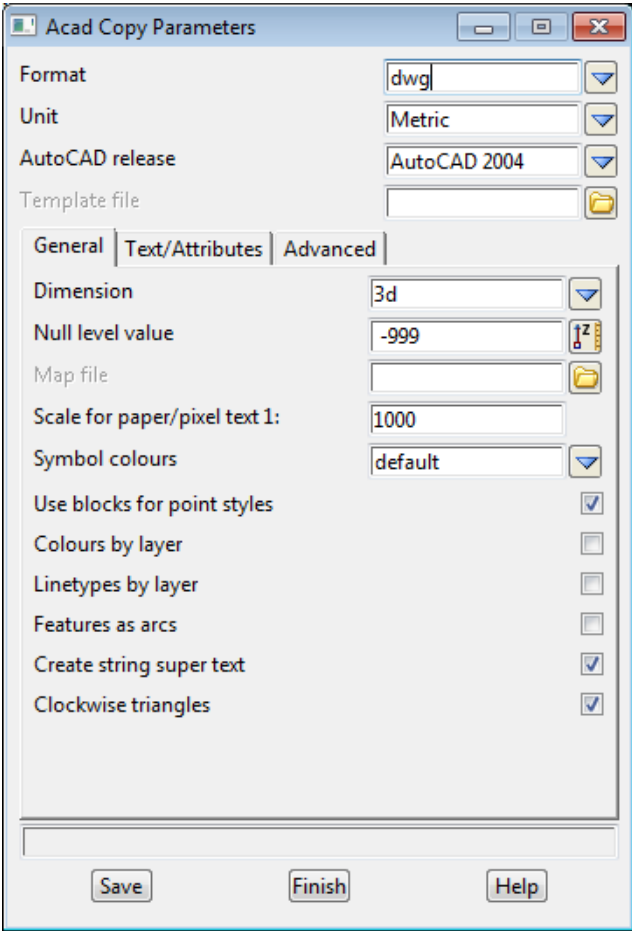

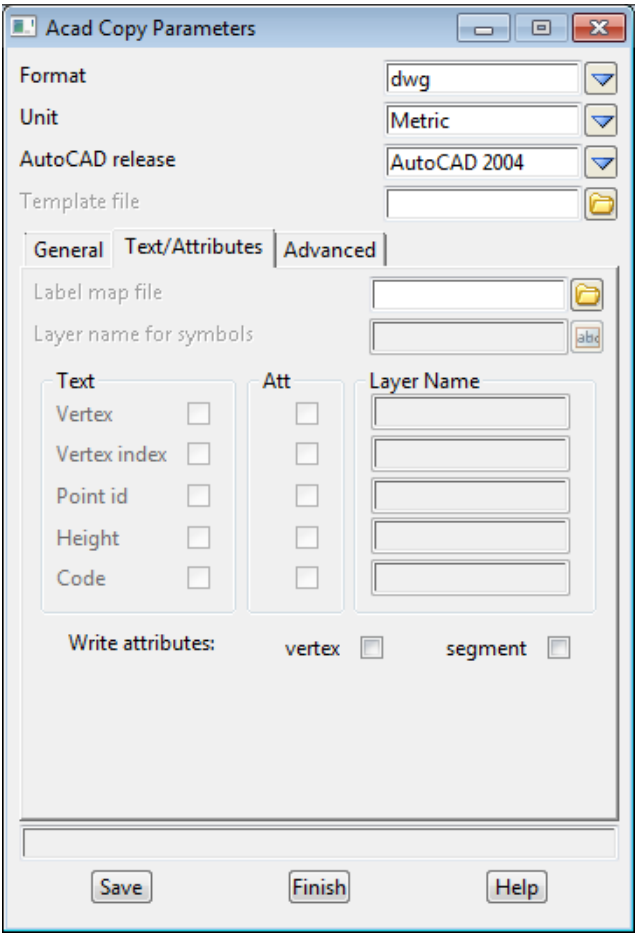

For more information please go to [DWG/DXF Input](#) in the section [Data Input](#)

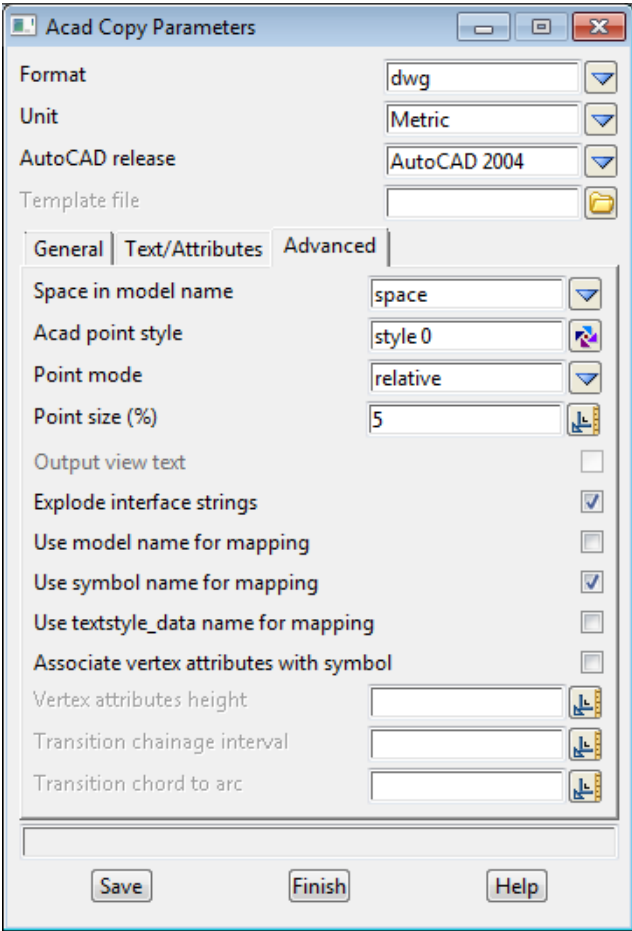

Copy parameters

The parameters for this panel are the same as parameters in the **Write DWG/DXF file for** panel.

Selecting **Copy parameters** brings up the **Acad Copy Parameters** panel:

For more information please go to [DWG/DXF/DXB Output](#) in the section [Data Output](#)

CAD Regression

Position of option on menu: Strings =>CAD =>Regression

This section of documentation is a work in progress and will be updated in subsequent releases.

The Cad Regression walk-right menu is

For the option *Line*, go to
Arc

Line

This section of documentation is a work in progress and will be updated in subsequent releases.

Arc

This section of documentation is a work in progress and will be updated in subsequent releases.

General

This section of documentation is a work in progress and will be updated in subsequent releases.

Create

Position of option on menu: Strings =>Create

The **Create** option is used to produce **new** strings. If a string already exists, the **Editor** option is used to modify it.

The **Create** walk-right menu contains options to create 2d, 3d, 4d, super alignment, circles, arcs, feature, pipe, polyline, super and text strings.

Each string type has its own special information so by choosing the appropriate type to be created, only information needed for that type of string is asked for.

Note that the 2d, 3d, 4d, pipe and polyline strings are actually super strings but automatically set some of the properties of the super string. For example a 2d string is a super string with just one constant z-value. Any of these strings can be made a full super string by clicking on the *Advanced Mode* icon in the string editor.

Once a string has been created, it can be converted to most of the other string types using the string **Convert** option.

To create a new string of the same type and with similar header information as an existing string, the **same as** option is selected from the **String Create** menu.

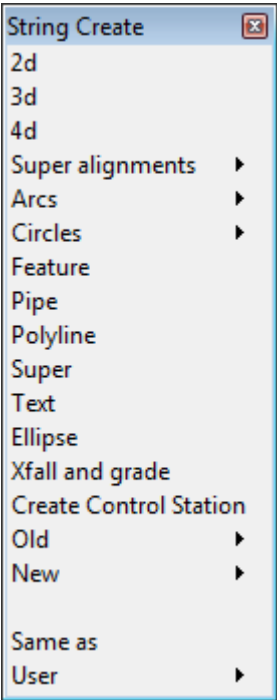

Notes

- 1. Depending on its breakline (point-line) type, a string with default style ("1") is displayed with crosses at each of its vertex (point type) or with straight lines joining the vertices (line type).

Linestyles can be defined that drawn lines between the points even though the breakline type is **point**.

- 2. The string vertices are also called intersection points (IP's).

The **String Create** walk-right menu is

The string creation process is similar for each string type and for editing strings as well.
For the option *2d*, go to [Create - 2d Super](#)

<i>3d</i>	Create - 3d Super
<i>4d</i>	Create - 4d Super
<i>Super alignment</i>	Super Alignments
<i>Arcs</i>	Create Arcs
<i>Circles</i>	Create - Circles
<i>Feature</i>	Create - Feature
<i>Pipe</i>	Create - Pipe Super
<i>Polyline</i>	Create - Polyline Super
<i>Super</i>	Create - Super
<i>Text</i>	Create - Text
<i>Ellipse</i>	Create - Ellipse
<i>Xfall and grade</i>	String by Xfall and Grade in the chapter Design
<i>Control stations</i>	Create - Control Stations
<i>Old</i>	Old
<i>New</i>	New
<i>Same as</i>	Create - Same As

Create - 2d Super

Position of option on menu: Strings =>Create =>2d

A **2d super string** is a *super string* with the restriction that it has:

- (a) vertices of (x,y) co-ordinates joined by straight segments only
- (b) One z-value for the entire string

That is, a 2d string consists of a series of (x,y) vertices joined only by straight segments, and all with the same z-value (height). 2d strings are often referred to as “contour strings” because contours are the most common example of a string with a constant height.

The **Many strings** tick-box is used when more than one string of the same type is to be created. If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super 2d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super 2d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, model, colour, type, linestyle, weight of the **Create Super 2d String** panel.

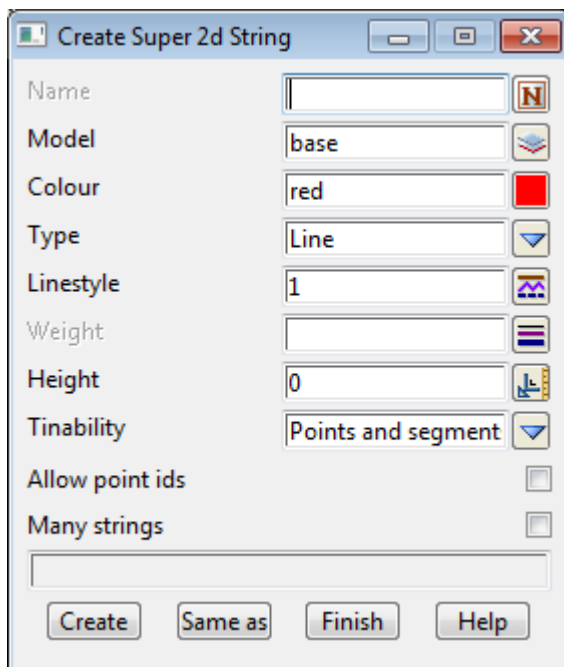

From **12d Model 8** onwards, the default is to create **2d super strings** rather than the **2d strings** used up to **12d Model 7**. A **2d super string** is a *super string* with **Constant height**. That is, there is only one z-value for the entire string. The advantage is using a **2d super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older *2d string* create options are still available under

Strings =>Create =>Old

(go to the section [Create - 2d \(pre V8\)](#))

On selecting 2d the **Create Super 2d String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see [CAD, Symbol and Text Controlbars](#))

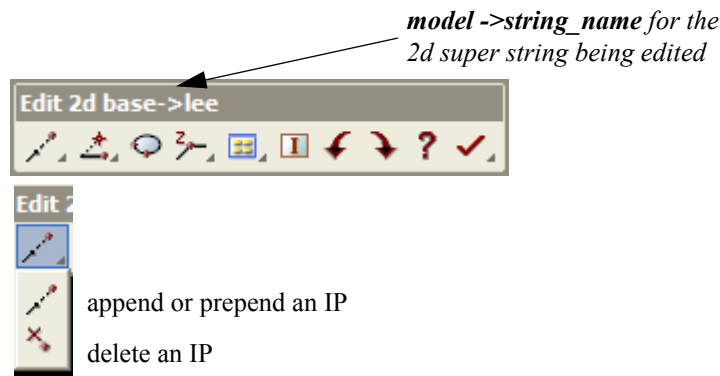

To **create a new 2d super string** (a **2d super string** is a *super string* with the **constant height** flag set on), the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super 2d String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	input	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Height <i>for a 2d super string, there is only one height (z-value) for the entire string.</i>	input	from CAD controlbar	
Tinability <i>if Vertices and segments, all the vertices and segments of the string are set to tinable. If Vertices only, all the vertices are set to tinable and the segments to not tinable. If Not tinable, all the vertices or segments are set to not tinable.</i>	choice box	Points and segments	Points and segments Points only Not tinable
Allow point ids <i>if ticked, the 2d super string can have point ids for each vertex. If not ticked, the 2d super string will not have point ids. This can be reversed if point ids are required in the future.</i>	tick box		
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box		
Create <i>After the Create button is chosen, the Edit 2d menu is displayed.</i>	button		
Same as <i>After the Same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button		
Finish <i>end the option, don't proceed to the edit stage.</i>	button		

Start Edit - 2d Super

On selecting the **Create** button in the **Create Super 2d String** panel the **Edit 2d** menu is placed on the screen. The **Edit 2d** menu for a *2d super string* is

To create a new *2d super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 2d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 2d** menu are usable.

The options in the **Edit 2d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 2d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 2d Editor, go to the section [Edit 2d](#)

Create - 3d Super

Position of option on menu: Strings =>Create =>3d

A 3d super string consists of a series of (x,y,z) vertices, joined only by straight segments.

The difference between a 2d and a 3d string is that for a 3d string, the z-value (height) can vary at each string vertex, whereas a 2d string has a constant height for the entire string. Hence a 2d string is simply a special case of a 3d string where the heights at all the vertices are the same.

Creating and editing a 3d string is very similar to a 2d string. The only major difference is that a height is required at each string vertex.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super 3d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super 3d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, model, colour, type, linestyle and weight of the **Create Super 3d String** panel.

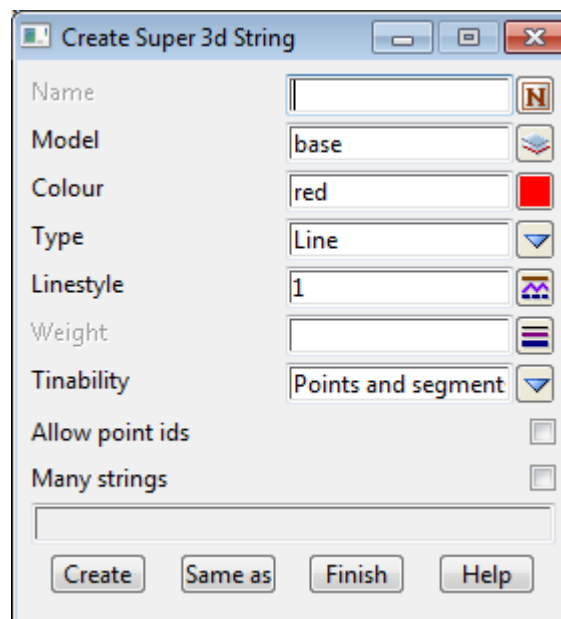

From **12d Model 8** onwards, the default is to create **3d super strings** rather than the **3d strings** used up to **12d Model 7**. The advantage is using a **3d super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older **3d string** create option is still available under

Strings =>Create =>Old

(go to the section [Create - 3d \(pre V8\)](#))

On selecting the 3d option, the **Create Super 3d String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see [CAD. Symbol and Text Controlbars](#))

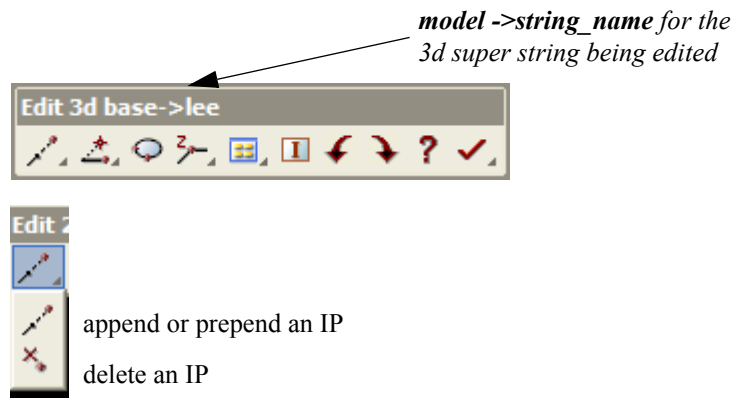

To **create a new 3d super string**, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super 3d String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar	
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string</i>	colour box	from CAD controlbar	available colours
Type <i>breakline type (point-line type) of the string</i>	choice box	line	line, point
Linestyle <i>line style of the string</i>	input	from CAD controlbar	available line styles
Weight <i>thickness of the string</i>	input	from CAD controlbar	
Tinability	choice box	Points and segments	Points and segments Points only Not tinable
<i>if Vertices and segments, all the vertices and segments of the string are set to tinable. If Vertices only, all the vertices are set to tinable and the segments to not tinable. If Not tinable, all the vertices or segments are set to not tinable.</i>			
Allow point ids <i>if ticked, the super string can have point ids for each vertex. If not ticked, the super string will not have point ids. This can be reversed if point ids are required in the future.</i>	tick box		
Many strings <i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>	tick box		
Create <i>after the Create button is chosen, the Edit 3d menu is displayed</i>	button		
Same as <i>after the Same as button is chosen, another string is selected and information about it is used for the fields in this panel</i>	button		
Finish <i>end the option, don't proceed to the edit stage</i>	button		

Start Edit - 3d Super

On selecting the **Create** button in the **Create Super 3d String** panel the **Edit 3d** menu is placed on the screen. The **Edit 3d** menu for a *3d super string* is

To create a new *3d super string*, select the **Append** icon.

The **Append** option is used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex.

For all 3d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 3d** menu are usable.

The options in the **Edit 3d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 3d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 3d Editor, go to the section [Edit 3d](#)

Create - 4d Super

Position of option on menu: Strings =>Create =>4d

A 4dsuper string consists of a series of (x,y,z) co-ordinates joined only by straight segments, and a text label at each vertex.

Creating and editing a 4d string is very similar to a 3d string.- the major difference is that a height **and** a text label is required at each string vertex.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Super 4d String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Super 4d String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, type, linestyle and weight of the **Create Super 4d String** panel.

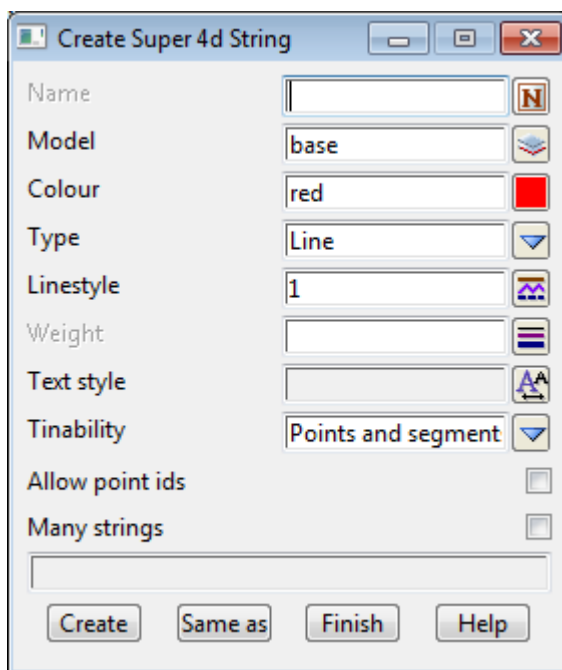

From **12d Model 8** onwards, the default is to create **4d super strings** rather than the **4d strings** used up to **12d Model 7**. The advantage of using a **4d super string** is that all the CAD options will work for it, vertices and segments can be assigned tinability and it can have point id's for setout.

The older **4d string** create option is still available under

Strings =>Create =>Old

(go to the section [Create - 4d \(Pre V8\)](#))

On selecting the **4d** option, the **Create Super 4d String** panel is displayed.

The default values for the panel fields are taken from the **CAD Controlbar** (see [CAD, Symbol and Text Controlbars](#))

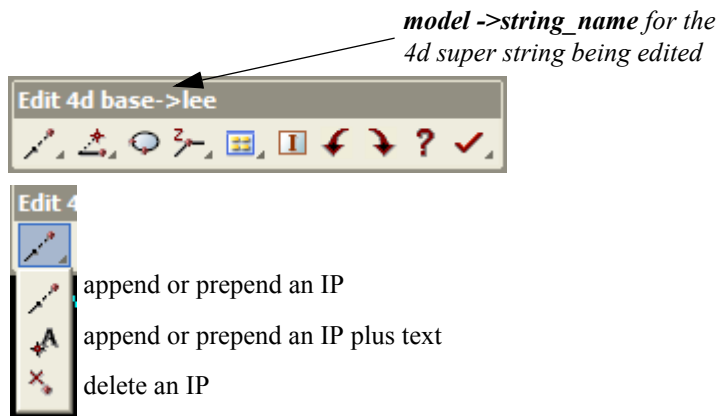

To **create a new 4d super string**, the panel fields are filled in and the **Create** button selected.

The fields and buttons used in the **Create Super 4d String** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	input	from CAD controlbar

Start Edit - 4d Super

On selecting the **Create** button in the **Create Super 4d String** panel the **Edit 4d** menu is placed on the screen. The **Edit 4d** menu for a *4d super string* is

To create a new *4d super string*, select the **Append** or **Append + Text** icon.

The **Append** and or **Append + Text** option are used to add vertices to either end of an existing string, or in the case of a new string, places the first vertex and then begins appending vertices to the first vertex. **Append + Text** also asks for text at each vertex.

For all 4d strings, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** vertex of the string (using the appropriate snaps).

If **Append + text** was selected, the user will then be prompted for the text to be placed at that vertex.

The string is then drawn from the first vertex to the cursor position, which represents the second vertex of the string. Clicking LB and accepting with MB selects the second string vertex and the process repeats for subsequent string vertices.

Now that the string is created, all the edit option on the string's **Edit 4d** menu are usable.

The options in the **Edit 4d** menu are not only used for placing the initial vertices of the string, but for editing the string once it is created. Since the **Append** and other options in the **Edit 4d** menu are identical to the options used when editing an existing string, they will be discussed in detail in the string **Editor** section.

For full information in the 4d Editor, go to the section [Edit 4d](#)

Super Alignments

Position of menu: Strings =>Create =>Super alignments

The **Super Alignment** walk-right menu contains options to create a super alignment string, plus options to created/edit labelling and information styles, and design standards and templates.

Super alignments	
Super alignment	create super alignment
Label styles	create/edit a super alignment label style
Info styles	create/edit a style for super alignment information panel
Design standards	define design standards
Design templates	create/edit a design template using selections from Design Standards
Import legacy design	read in V9 design tables

For the option <i>Super alignment</i> , go to	Create - Super Alignment
<i>Label styles</i>	Super Alignment Style
<i>Info styles</i>	Super Alignment Info Styles
<i>Design standards</i>	Design Standards
<i>Design templates</i>	Design Templates
<i>Import legacy design</i>	Import Legacy Design

Create - Super Alignment

Position of option on menu: Strings =>Create =>Super Alignments =>Super alignments

A super alignment string is defined by specifying both its horizontal and vertical geometry.

If the user does not have the **Alignment Module**, then the **super alignment** acts like the pre-V10 **alignment** string and consists of only horizontal and vertical intersection points consisting of leading transitions-arc-trailing transition for each horizontal intersection point, and parabolas or arcs on the intersection points for vertical geometry. The resultant elements are linked tangentially to form the horizontal and vertical geometry. The intersection points and the tangent points can be moved.

If the user has the **Alignment Module** then the **Super Alignment** includes IP constructions but also allows much more complicated parametric design.

The Horizontal Geometry of a Super Alignment is made up of **parts**, which may be as simple as a straight line between two points or an arc with a given centre and radius, or a horizontal intersection point with given leading and trailing transitions or the **parts** can be very complicated where for example the points of a line are defined by the offset intersection of the two arcs from other strings.

Often a horizontal part is **not** fully defined (parts are classified as fixed which are fully defined, floating which have one degree of freedom and free which have two degrees of freedom) and the extra restriction that the horizontal parts must be linked tangentially is necessary to fully defined the horizontal geometry. The horizontal geometry is then said to be **solved**.

Once solved, the horizontal geometry simply consists of linked known segments of types lines, arcs and transition, and so can be drawn in a plan view.

So the horizontal geometry is made up of the constructive definitions called **parts**, and if the horizontal geometry solves, it also contains the resultant **horizontal segments**.

Similarly the Vertical Geometry is made up of **parts**, which are made up of simple or complicated combinations of straight lines, arcs or a parabolas. Again the extra restriction that the vertical parts must be linked tangentially is often necessary to fully defined the vertical geometry. The vertical geometry is then said to be **solved** and the solved vertical geometry simply consists of linked known segments of types lines, arcs and parabolas, and so can be drawn in a section view.

So the vertical geometry is made up of the constructive definitions called **parts**, and if the vertical geometry solves, it also contains the resultant **vertical segments**.

Important Note

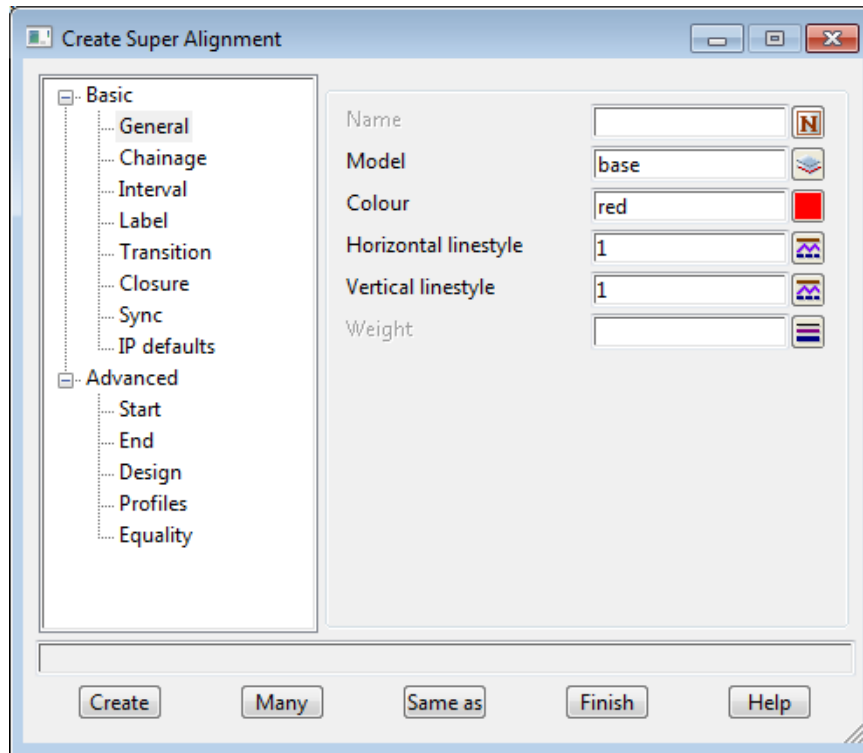

The horizontal and vertical parts of a super alignment are only displayed when the super alignment is being edited. When the super alignment is not being edited, the solved segments are displayed and any unsolved parts are displayed as red crosses.

For more information on Super Alignments and Parts, see [Placing Parts for Super Alignments](#).

Notes:

1. vertical geometry can only be added to an **existing** super alignment string. That is, to a string with some horizontal geometry.
2. for both the alignment and super alignment, the horizontal geometry is defined in a **plan** view and the vertical geometry in a **section** view.

On selecting the **Super Alignment** option, the **Create Super Alignment** panel is displayed.

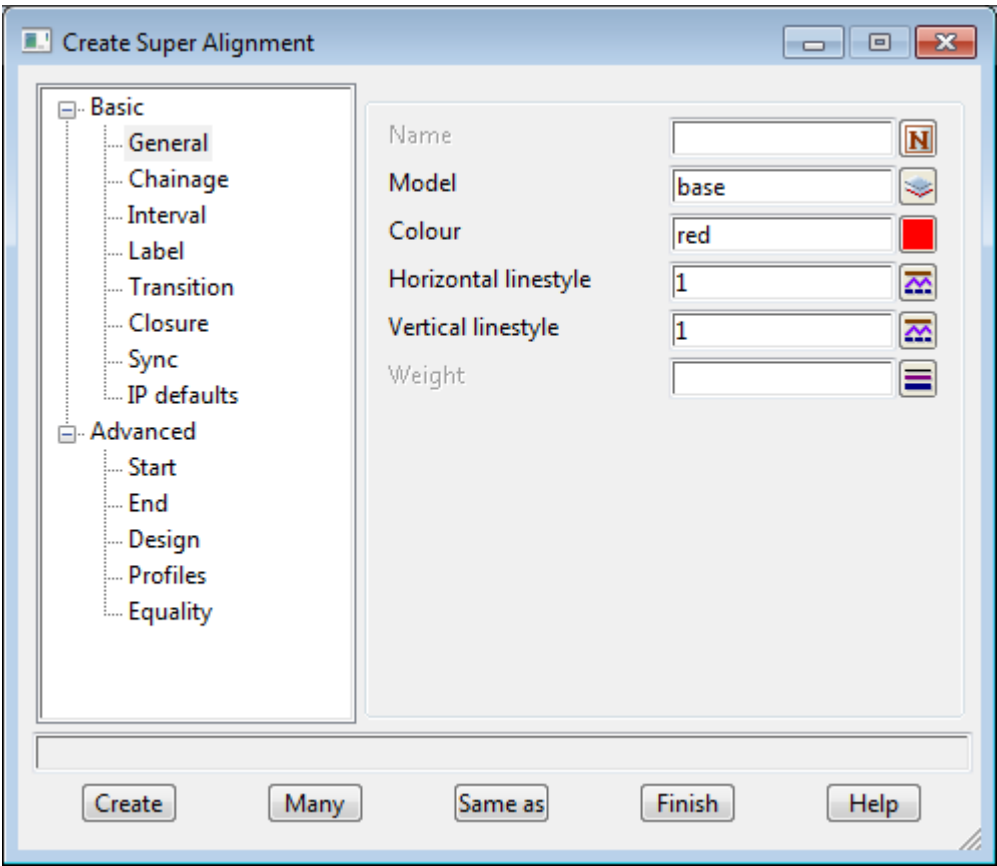

To create a new super alignment string, the name, model, colour, etc. of the new string are entered into the appropriate fields for each branch on the tree on the left-hand side of the panel, and the **Create** or **Many** button selected.

For information on each branch and the buttons (Create, Many, Same as), and starting to edit after selecting the **Create** or **Many** button, go to:

Basic > General branch

The fields and buttons used in the **Basic > General** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string</i>	name box	from CAD controlbar	available names
Model <i>name of the model that the new string is in</i>	model box	from CAD controlbar	available models
Colour <i>the colour of the new string. Note that the super alignment may not appear to have this colour if a Label style is set. The Label can define different colours to parts of the super alignment.</i>	colour box	from CAD controlbar	available colours
Horizontal Linestyle <i>linestyle of the string when displayed on a Plan view</i>	linestyle box	from CAD controlbar	available linestyles
Vertical Linestyle <i>linestyle of the string when profiled on a Section view</i>	linestyle box	from CAD controlbar	available linestyles
Weight <i>thickness of the string when plotted</i>	weight box	from CAD controlbar	

Basic > Chainage branch

The fields and buttons used in the **Basic > Chainage** branch of the **Create Super Alignment** panel have the following functions.

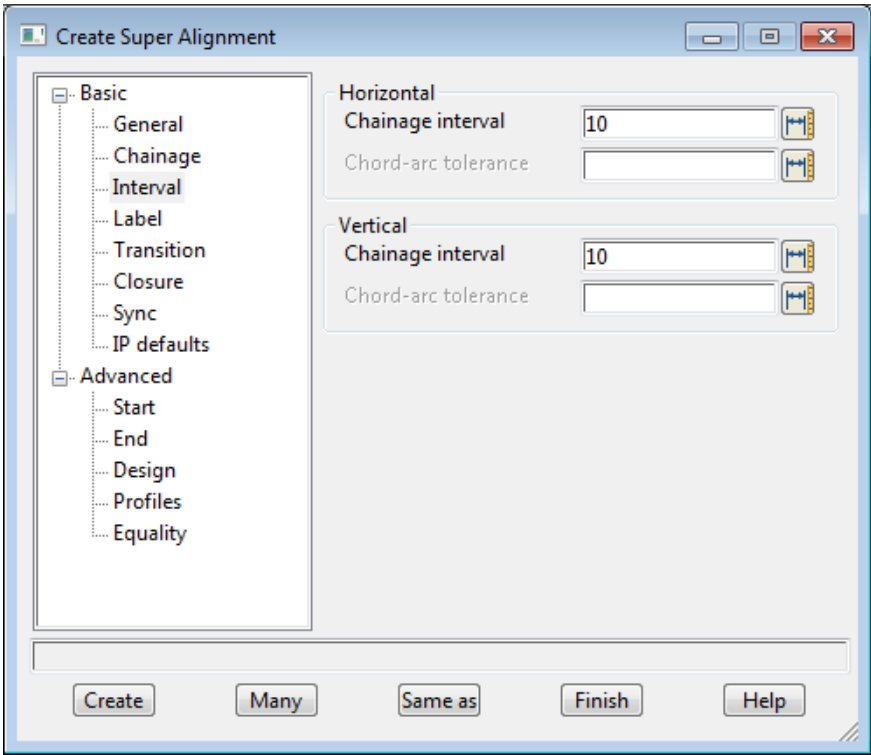

Field Description	Type	Defaults	Pop-Up
Control chainage	measure box	0	Measure Point/String from point
<i>defines the control chainage for the horizontal geometry. What this value refers to depends on the Mode.</i>			
Mode	choice box		start point end point control point start part end part

*if **start point**, the **Control chainage** value is applied to the start of the usable horizontal geometry.
If **end point**, the **Control chainage** value is applied to the end of the usable horizontal geometry.
If **control point**, a user given control point is dropped perpendicularly onto the horizontal geometry and that position is given the **Control chainage** value.*

Control point X/Y coordinate select x, y box
coordinates of the control point

*If **start part**, the **Control chainage** value is applied to the start of the first part of horizontal geometry, even if it is invisible.
If **end part**, the **Control chainage** value is applied to the end of the last part of horizontal geometry, even if it is invisible.*

Basic > Interval branch

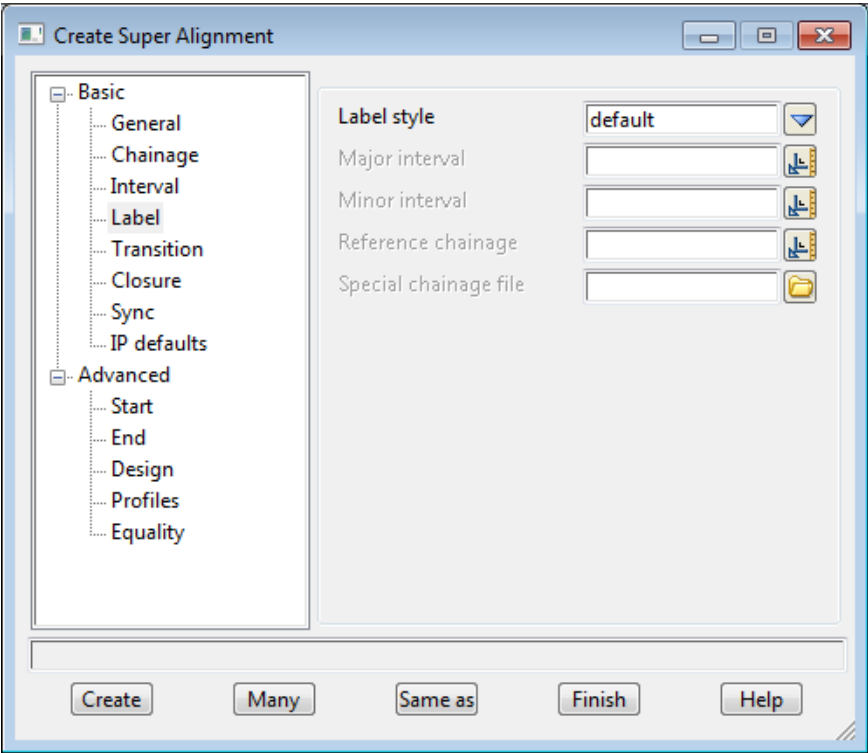

The fields and buttons used in the **Basic > Interval** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Horizontal Chainage interval <i>horizontal chainage interval for the string</i> <i>If blank, the default is 10.</i>	measure box		Point to point/String to point
Horizontal Chord to arc tol <i>horizontal chord to arc tolerance to use for any arcs and transitions</i> <i>If blank, the default is 0.1.</i>	measure box		Point to point/String to point
Vertical Chainage interval <i>vertical chainage interval for the string</i> <i>If blank, the default is 10.</i>	measure box		Point to point/String to point
Vertical Chord to arc tol <i>vertical chord to arc tolerance to use for any parabolas or circular curves.</i> <i>If blank, the default is 0.1.</i>	measure box		Point to point/String to point

***Note:** the horizontal and vertical intervals and chord to arc tolerances are used when the super alignment is approximated by straights in three dimensions.*

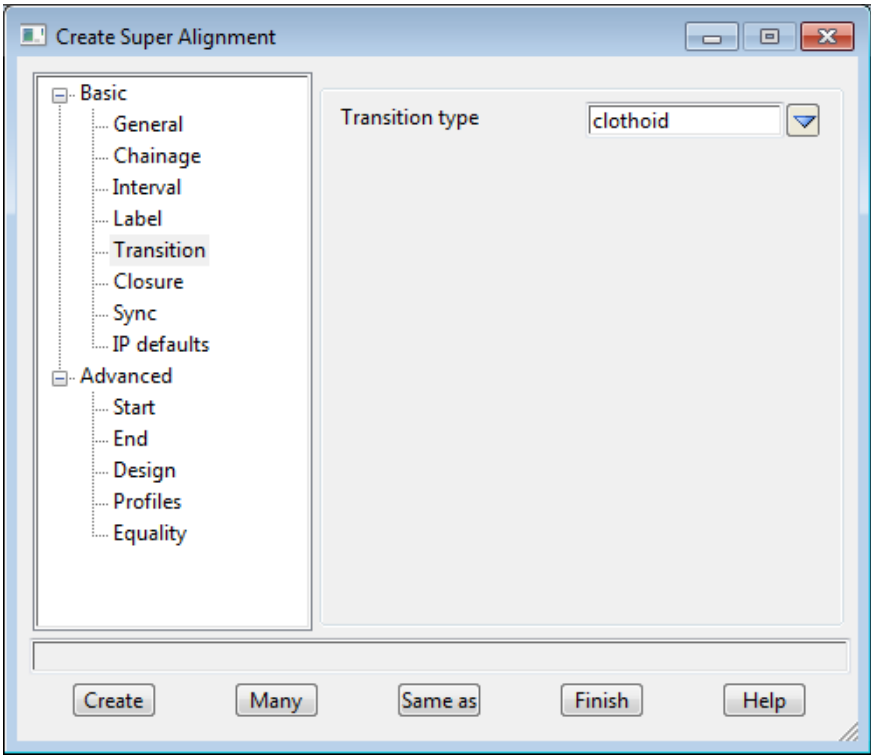

Basic > Label branch

The fields and buttons used in the **Basic > Label** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Label style	choice box	default	available label styles
<i>The super alignment style controls the way the super alignment draws and highlights on the screen.</i>			
<i>For more information please go to the section Super Alignment Style</i>			
Label Major Chainage interval	measure box		
<i>major chainage interval to use for labelling</i>			
<i>If blank, the default is 10.</i>			
Label Minor Chainage interval	measure box		
<i>minor chainage interval to use for labelling</i>			
Label Reference chainage interval	measure box		
<i>reference value for the chainage labelling intervals</i>			
Label Special chainage file	file box		available *.spc files
<i>file of special chainages for labelling</i>			
<i>Note: the labelling of the super alignment is given by the Label style on the General tab.</i>			
<i>For more information please go to the section Super Alignment Style</i>			

Basic > Transition branch

The fields and buttons used in the **Basic > Transition** branch of the **Create Super Alignment** panel have the following functions.

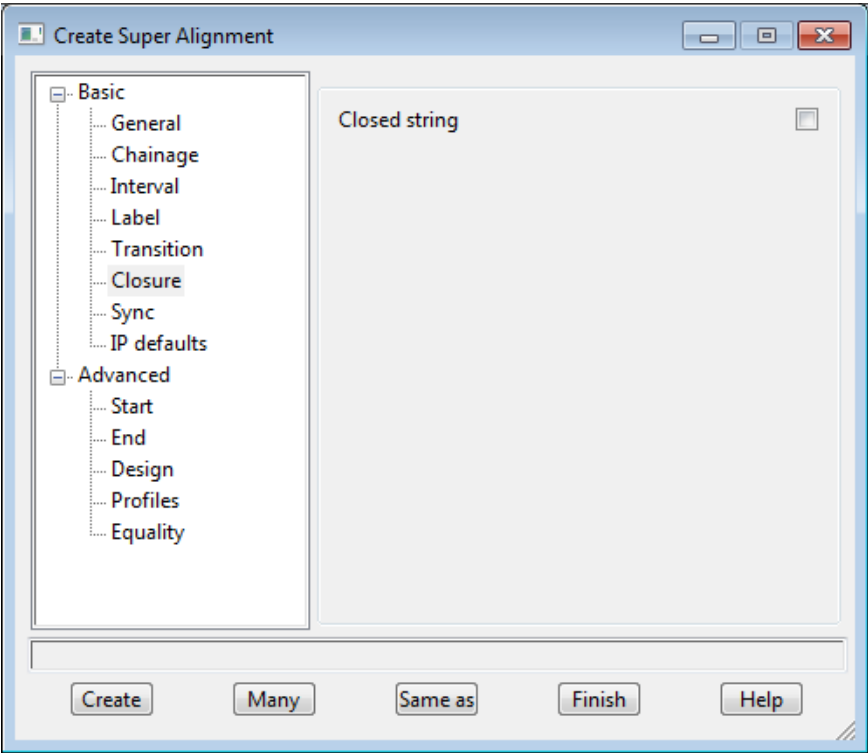

Field Description	Type	Defaults	Pop-Up
Transition type	choice box	clothoid	

transition (for example clothoid) to be used for this super alignment string.

For more information see [Transitions and Spirals File](#) in the chapter [Setting Up and Configuring 12d](#).

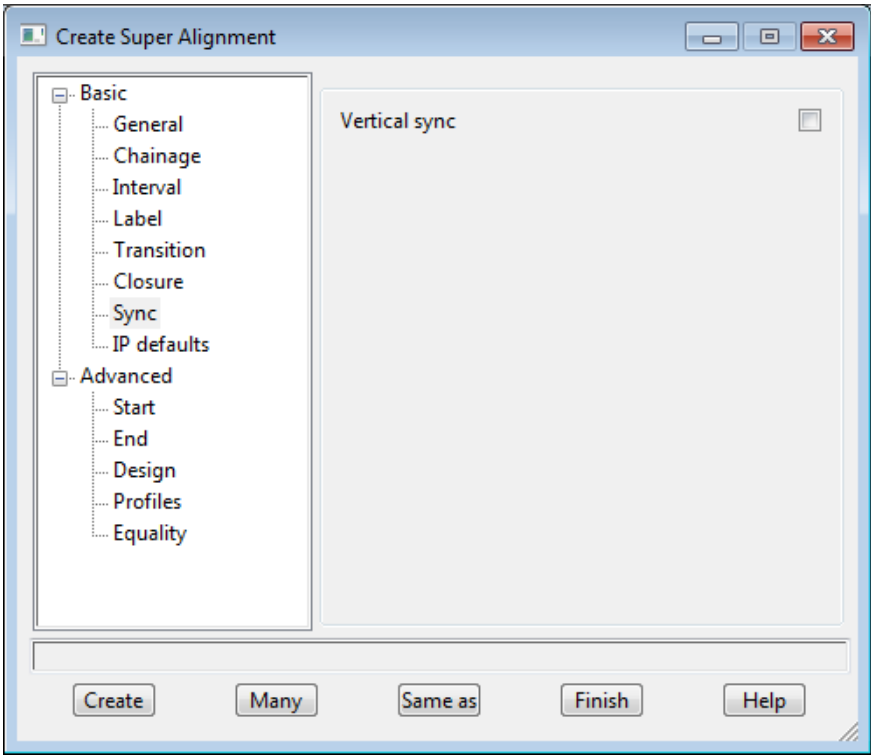

Basic > Closure branch

The fields and buttons used in the **Basic > Closure** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Closed string	tick box	not ticked	
<i>if ticked, the super alignment is automatically closed</i>			

Basic > Sync branch

The fields and buttons used in the **Basic > Sync** branch of the **Create Super Alignment** panel have the following functions.

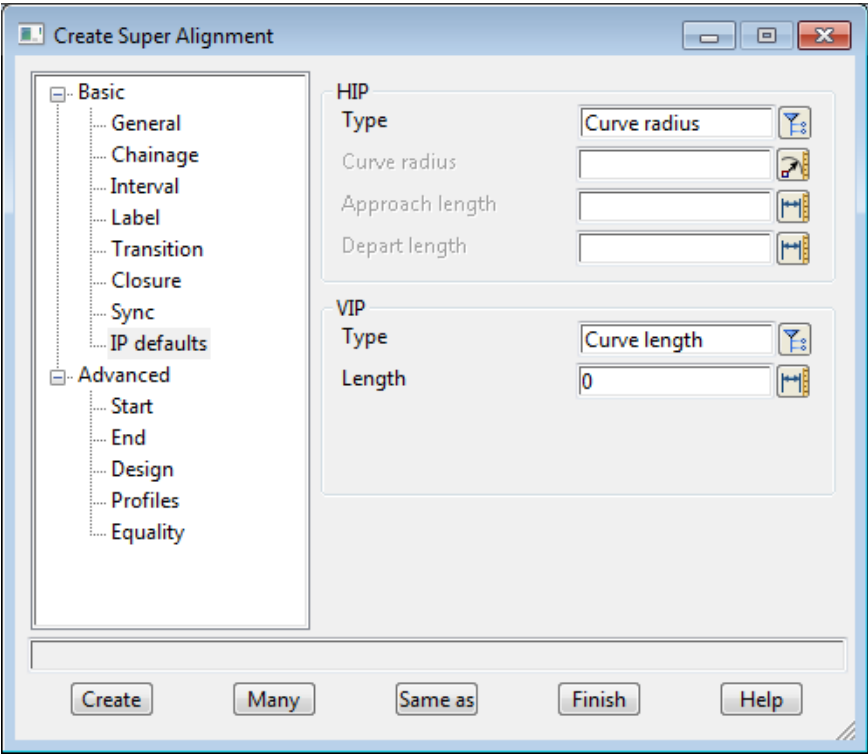

Field Description	Type	Defaults	Pop-Up
Vertical sync	tick box	not ticked	

*if **ticked**, when the horizontal geometry is modified, an attempt is made to modify the chainage position of the vertical geometry so that it remains locked to the same parts of the horizontal geometry as before the horizontal geometry was modified.*

*If **not ticked**, after horizontal geometry is modified, the vertical geometry will possibly be moved in relation to the horizontal geometry because the (x,y) position for a given chainage will change.*

Basic > IP defaults branch

the **IP Defaults** branch defines the types of **HIPs** and **VIPs** that are placed when laying down horizontal and vertical geometry.

The fields and buttons used in the **Basic > IP defaults** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
HIP type	choice box	Curve radius	Curve speed/radius/length
<p><i>The default HIP type given to any placed HIPs. The default for the panel is a Curve radius with blank Curve radius, Approach and Depart length. That is, just a HIP with no curve or transitions on it.</i></p> <p><i>If Curve speed, any new HIP being created will be a Speed IP with the speed specified in the Speed field.</i></p>			

If the **Speed** field is blank, the default alignment speed is used.

If **Curve radius**, any new HIP being created will be a Radius IP with the radius of the arc on the HIP specified in the **Curve Radius** field. Optional approaching and departing transitions can also be defined in the **Approach length** and **Depart length** fields.

HIP

Type

Curve radius

Curve radius

Approach length

Depart length

Curve radius

If the **Curve Radius** field is non-zero, an arc of the given value is placed on the HIP.

If the **Curve Radius** field is blank, the HIP won't have an arc associated with it.

If the **Approach length** field is non-zero, then a leading transition of the given value is placed on the HIP. If there is a non-zero value then there must also be a non-zero **Curve Radius** value.

If the **Depart length** field is non-zero, then a trailing transition of the given value is placed on the HIP. If there is a non-zero value then there must also be a non-zero **Curve Radius** value.

Note - if either the **Approach length** or **Depart length** fields are non zero then there must be a non zero **Curve radius**.

If the HIP is defined by **Curve radius**, then as the HIP is moved around, the values in the Curve radius definition are held for the HIP. That is, the radius of the arc and the transition lengths are kept constant and the length of the arc is modified.

If **Curve length**, any new HIP being created will be a Length IP with the length specified in the **Curve length** field.

HIP

Type

Curve length

Curve length

Curve length

If the **Curve length** field is blank, the HIP will have an arc of length zero.

If the HIP is defined by **Curve length**, then as the HIP is moved around, the arc length is held for the arc on the HIP and arc radius is modified.

VIP type

choice box

Curve length

Curve speed/radius/length
Asymmetric

The default VIP type given to any placed VIPs. The default for the panel is a **Curve length** with a **Length** of 0.

If **Curve speed**, any new VIP being created will be a Speed IP with the speed specified in the **Speed** field.

VIP

Type

Curve speed

Speed

Curve speed

If the **Speed** field is blank, the default alignment speed is used.

If **Curve radius**, any new VIP being created will be a Radius IP with the radius specified in the **Radius** field.

The screenshot shows a dialog box titled 'VIP'. It has a 'Type' dropdown menu set to 'Curve radius'. Below it is a 'Radius' text input field. There are two checkboxes: 'Circular curve' and 'Kvalue', both of which are currently unchecked. To the right of the input fields and checkboxes are two small icons: a funnel icon and a double-headed arrow icon.

If the **Radius** field is blank, the VIP won't have an parabola/arc associated with it. The value in the Radius field can be a k-value for a parabola, an effective radius (100 x k-value) for a parabola, or the radius of an arc.

If the **Kvalue** tick box is ticked, a parabola is placed on the VIP and the k-value of the parabola is the value in the **Radius** field.

If the **Circular curve** tick box is ticked, an arc is placed on the VIP and the radius of the arc is the value in the **Radius** field.

If **neither** Kvalue or Circular curve is ticked, a parabola is placed on the VIP and the effective radius of the parabola is the value in the **Radius** field.

If the VIP is defined by **Curve radius**, then as the VIP is moved up or down, the values in the Curve radius definition is held for the VIP. That is, the radius or k-value will be kept constant and the length of the parabola/arc is varied.

If **Curve length**, any new VIP being created will be a parabolic Length IP with the length specified in the **Length** field.

The screenshot shows a dialog box titled 'VIP'. It has a 'Type' dropdown menu set to 'Curve length'. Below it is a 'Length' text input field. There are two small icons to the right of the input field: a funnel icon and a double-headed arrow icon.

If the **Length** field is 0, then just the VIP will be drawn with no parabola on it.

If the **Length** field is blank, the VIP will be associated with an parabola of maximum length.

If the VIP is defined by **Curve length**, then as the VIP is moved up or down, the length of the parabola given in the Curve Length definition is held for the VIP. That is, the length is kept constant and the radius/k-value of the parabola is varied.

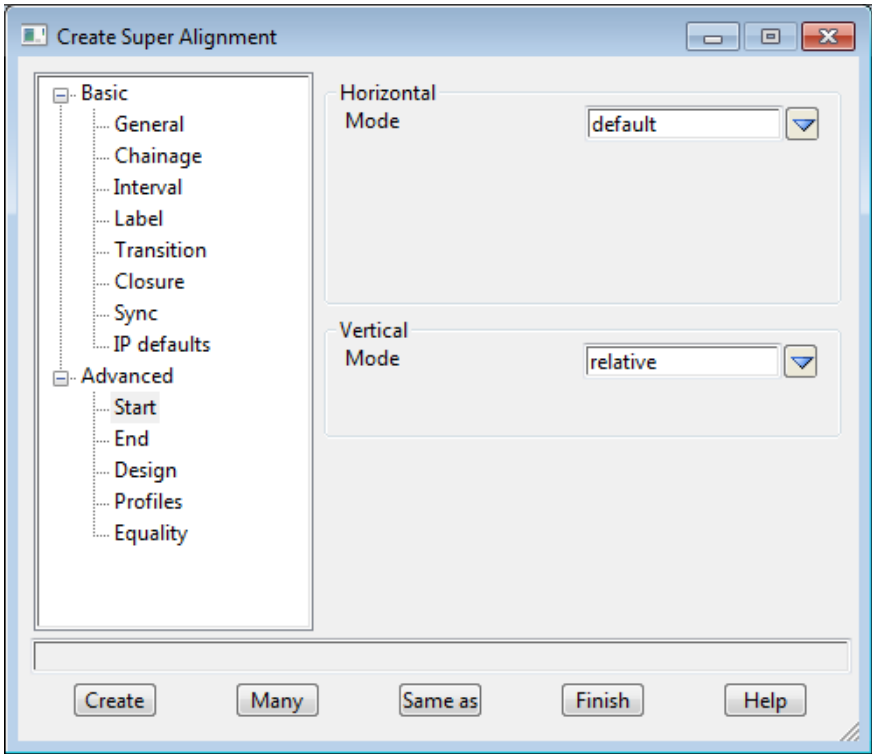

If **Asymmetric**, any new VIP being created will have parabolas of the combined lengths of **Approach length** and **Depart length**.

The screenshot shows a dialog box titled 'VIP'. It has a 'Type' dropdown menu set to 'Asymmetric'. Below it are two text input fields: 'Approach length' and 'Depart length'. Each input field has a small double-headed arrow icon to its right.

If the VIP is defined by **Asymmetric**, then as the VIP is moved up or down, the Approach and Depart Lengths of the parabolas given in the Asymmetric definition are held for the VIP. That is, the lengths are kept constant and the radius/k-value of the parabolas are varied.

Advanced > Start branch

the **Start** branch defines where the usable horizontal and vertical geometry starts for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.

The fields and buttons used in the **Advanced > Start** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Start Horizontal mode	choice box		default segment point
<i>specifies how the start of the usable horizontal geometry is defined.</i>			
<i>If default, the beginning of the first visible horizontal part is the start of the usable horizontal geometry.</i>			
<i>If segment, a user selected segment of the horizontal geometry is the start of the usable horizontal geometry.</i>			
<i>If point, a user selected position is dropped perpendicularly onto the super alignment to define the start of the usable horizontal geometry.</i>			
Start Control point X/Y coordinate	select x, y box		
<i>used in the segment and point cases of the Start Horizontal mode.</i>			
Start Vertical mode	choice box		absolute relative chainage
<i>specifies how the start of the usable vertical geometry is defined.</i>			
<i>If absolute, the beginning of the first visible vertical part is the start of the usable vertical geometry.</i>			
<i>If relative, the chainage of the start of the usable horizontal geometry is used as the start of the usable vertical geometry. If the beginning of the defined vertical geometry is after this chainage, then the first segment is extrapolated back to the required chainage.</i>			

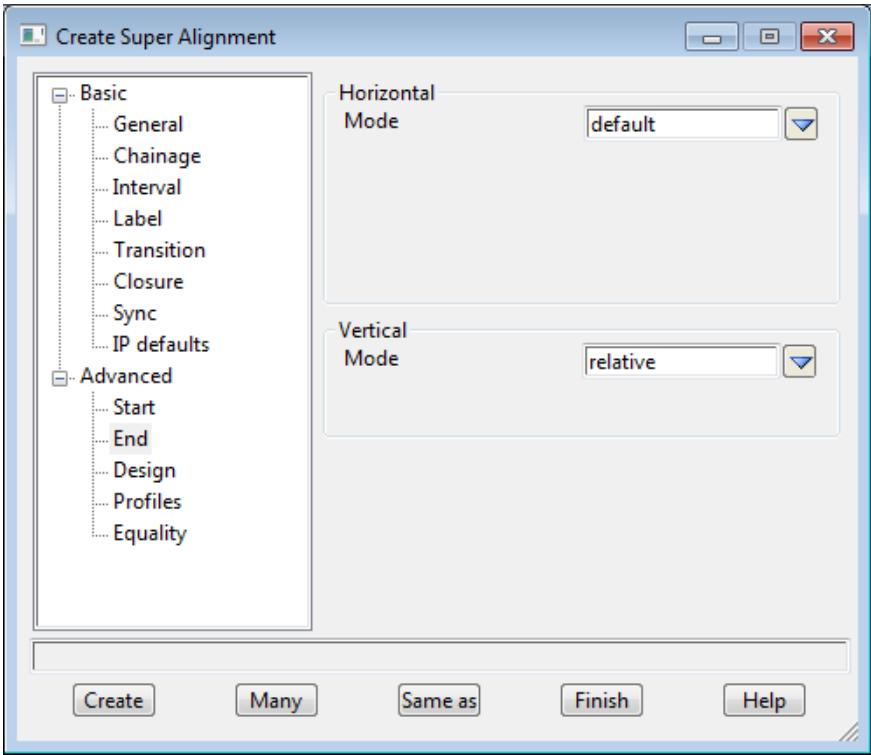

If *chainage*, a user given chainage defines the start of the usable vertical geometry.

Chainage	measure box	available measures
used in the <i>chainage</i> case of the <i>Start Vertical mode</i> .		

Advanced > End branch

the **End** branch defines where the usable horizontal and vertical geometry ends for the super alignment. Note that the super alignment can have more horizontal and vertical geometry than is actually used.

The fields and buttons used in the **Advanced > End** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
End Horizontal mode	choice box		default segment point

specifies how the end of the usable horizontal geometry is defined.
*If **default**, the end of the last visible horizontal part is the end of the usable horizontal geometry.*
*If **segment**, a user selected segment of the horizontal geometry is the end of the usable horizontal geometry.*
*If **point**, a user selected position is dropped perpendicularly onto the super alignment to define the end of the usable horizontal geometry.*

End Control X/Y coordinate select x, y box
*used in the **segment** and **point** cases of the **End Horizontal mode**.*

End Vertical mode	choice box	absolute relative chainage
--------------------------	------------	----------------------------------

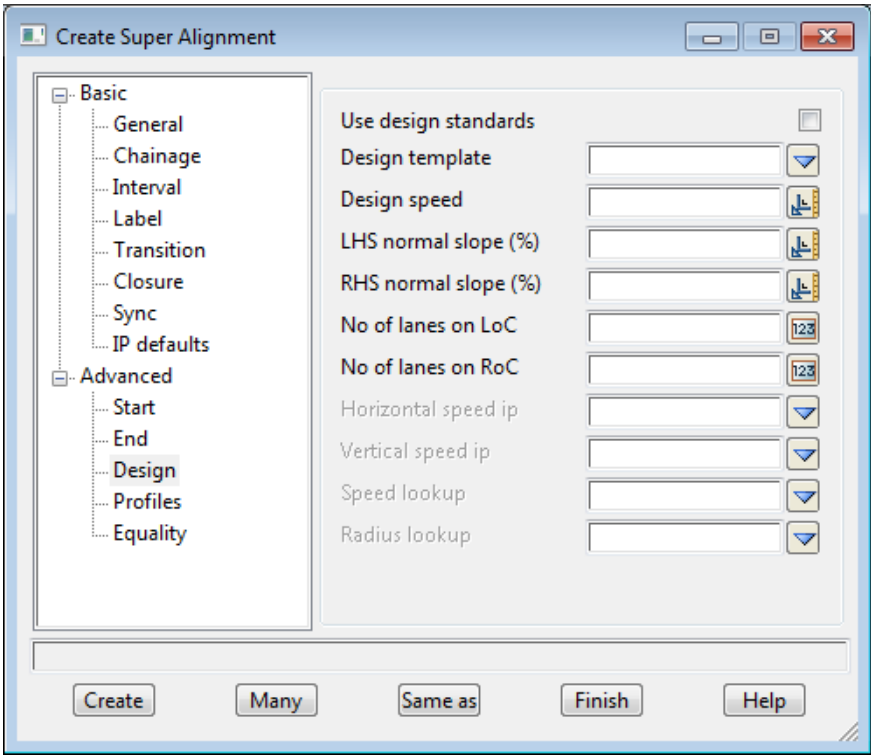

specifies how the end of the usable vertical geometry is defined.
*If **absolute**, the end of the last visible vertical part is the end of the usable vertical geometry.*
*If **relative**, the chainage of the end of the usable horizontal geometry is used as the end of the usable vertical geometry. If the end of the defined vertical geometry is **before** this chainage, then the last segment is extrapolated to the required chainage.*

If **chainage**, a user given chainage defines the end of the usable vertical geometry.

Chainage	measure box	available measures
used in the chainage case of the End Vertical mode .		

Advanced > Design branch

the **Design** branch is only used if a design template has been set up and is to be used for automatically inserting curves and transition curves in horizontal geometry, apply super elevation and widening, and automatically inserting vertical curves in the vertical geometry.

The fields and buttons used in the **Advanced > Design** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use design standards	tick box	not ticked	
<i>if ticked, the selected design template is used when creating horizontal and vertical geometry. If not ticked, no design template is used with Alignment speed elements.</i>			
Design template	choice box		available design templates
<i>Design template to use when creating horizontal and vertical geometry. For more information see Design Templates.</i>			
Design speed			*.design files
<i>the general design speed for the road. This is used with the design template when creating horizontal and vertical geometry. This can be over written by Speed IPs.</i>			
LHS normal slope (%)			
RHS normal slope (%)			
No of lanes on LoC			
<i>number of lanes on the left of the centreline. The number of lanes can be zero.</i>			
No of lanes on RoC			
<i>number of lanes on the right of the centreline. The number of lanes can be zero.</i>			
Horizontal speed IP	choice box		minimum

maximum

For *Alignment speed* and *Curve speed HIPs*.

If **minimum**, when an arc is automatically placed on an HIP using the design table, the arc with the smallest radius for the design speed is used.

If **maximum**, when an arc is automatically placed on an HIP using the design table, the arc with the largest radius for the design speed is used.

Vertical speed IP

choice box

minimum
maximum

For *Alignment speed* and *Speed VIPs*.

If **minimum**, when a parabola is automatically placed on an VIP using the design table, the parabola with the smallest kvalue for the design speed is used.

If **maximum**, when a parabola is automatically placed on an VIP using the design table, the parabola with the largest kvalue for the design speed is used.

Speed lookup

choice box

ceiling
floor
round up
round down

Different method to achieve the actual speed from the speed table.

If **ceiling**, then the design speed is the upper speed from the table.

If **floor**, then the design speed is the lower speed from the table.

If **round up**, the speed will be the upper speed from the table when the calculated speed is greater than or equal to the half way speed. Otherwise it will be the lower speed.

If **round down**, the speed will be the lower speed from the table when the calculated speed is less than or equal to the half way speed. Otherwise it will be the upper speed.

Radius lookup

choice box

ceiling
floor
round up
round down
interpolate

Different method to achieve the actual radius from the radius table.

If **ceiling**, then the design radius is the upper radius from the table.

If **floor**, then the design radius is the lower radius from the table.

If **round up**, the radius will be the upper radius from the table when the calculated radius is greater than or equal to the half way radius. Otherwise it will be the lower radius.

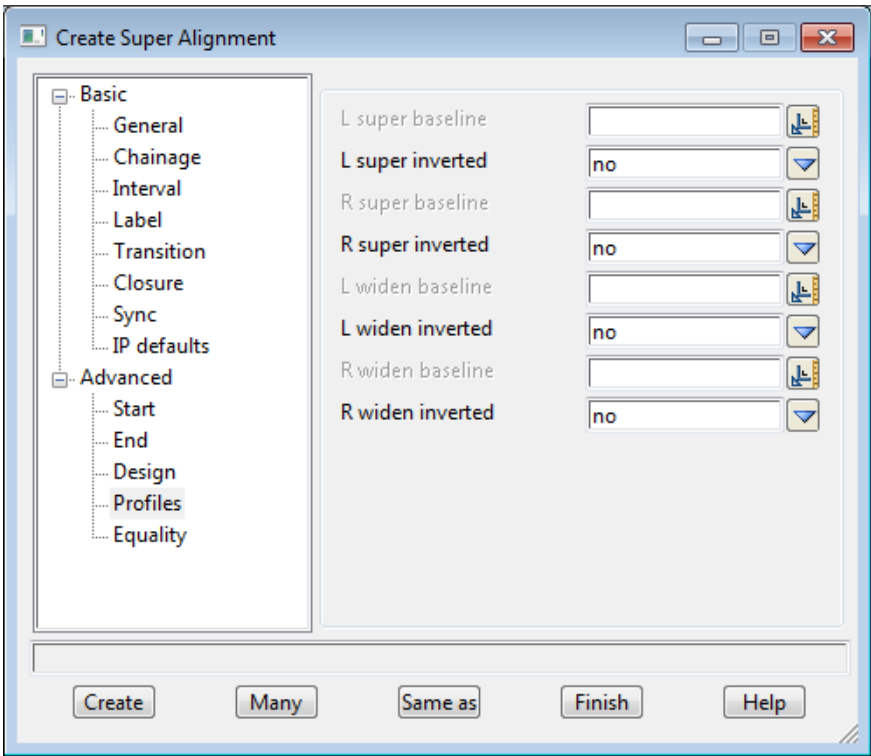

If **round down**, the radius will be the lower radius from the table when the calculated radius is less than or equal to the half way radius. Otherwise it will be the upper radius.

If **interpolate**, the radius is the calculated based on the specified speed.

For *non speed HIPs only* (that is, not *Alignment speed* or *Curve speed HIPs*).

The radius has been defined by the user and LJG?

Advanced > Profiles branch

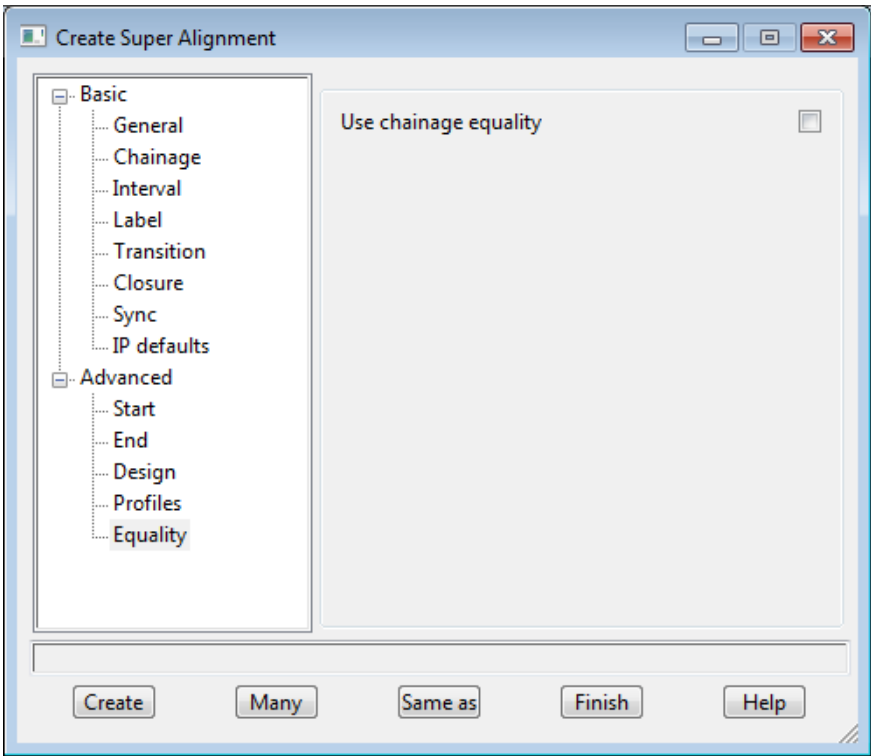

The fields and buttons used in the **Advanced > Profiles** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
L super baseline <i>the left super elevation diagram will be drawn at this Z value in the Section view</i>	measure box		available measures
L super inverted <i>if no, positive super elevation is drawn above the left super baseline and negative super elevation is drawn below the left super baseline. This is the default.</i> <i>if yes, positive super elevation is drawn below the left super baseline and negative super elevation is drawn above the left super baseline, i.e. the diagram is turned upside down</i>	choice box	no	yes, no
R super baseline <i>the right super elevation diagram will be drawn at this Z value in the Section view</i>	measure box		available measures
R super inverted <i>if no, positive super elevation is drawn above the right super baseline and negative super elevation is drawn below the right super baseline. This is the default.</i> <i>if yes, positive super elevation is drawn below the right super baseline and negative super elevation is drawn above the right super baseline, i.e. the diagram is turned upside down</i>	choice box	no	yes, no
L widen baseline <i>the left widening diagram will be drawn at this Z value in the Section view</i>	measure box		available measures
L widen inverted <i>if no, widening is drawn above the left widen baseline. Widening is always positive (or zero). This is the default.</i> <i>if yes, positive widening is drawn below the left widen baseline, i.e. the diagram is turned upside down</i>	choice box	no	yes, no

R widen baseline measure box available measures
the right widening diagram will be drawn at this Z value in the Section view

R widen inverted choice box no yes, no
*if **no**, widening is drawn above the right widen baseline. Widening is always positive (or zero). This is the default.*
*if **yes**, positive widening is drawn below the right widen baseline, i.e. the diagram is turned upside down*

Advanced > Equality branch

The fields and buttons used in the **Advanced > Equality** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use chainage equality	tick box	not ticked	
<i>if ticked, chainage equalities can be defined and the automatic labelling of the string will use the equalities.</i>			

Advanced > Chain branch (not yet implemented)

The fields and buttons used in the **Advanced > Chain** branch of the **Create Super Alignment** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Chain file <i>the chain parameter file to run every time the super alignment is resolved/recalced. For more information see the section Chains in the book Utilities.</i>	file box		available *.chain files
Run chain after set	tick box	not ticked	

Buttons at Bottom**Create** button

*when only one super alignment is to be created, click on the **Create** button. The **Edit Super Alignment** toolbar is displayed.*

Many button

*when more than one super alignment is to be created using the same set-up information, then click on the **Many** button. **Edit Super Alignment** toolbar is displayed.*

*After the editing for this string is finished, a new **Create Super Alignment** panel is placed on the screen with the same values for the panel fields as the string just created.*

*Hence new super alignments can be created (by clicking on the **Create** or **Many** button) without having to go back to the **String Create** menu.*

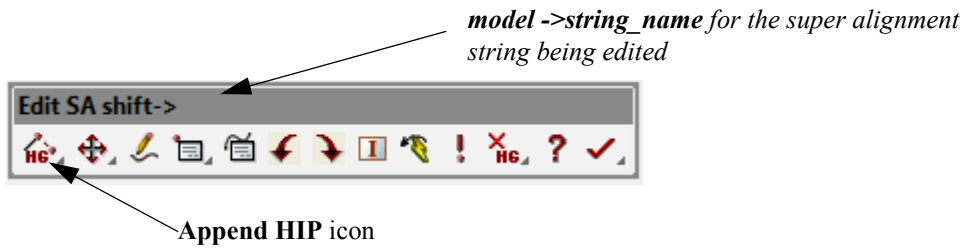

*If no more super alignments are to be created, click on the **Finish** button*

Same as button

*after the **Same as** button is chosen, another string is selected and information about it is used to fill in fields for this panel*

Start Edit - Super Alignment

After selecting the **Create** or **Many** button, the **Super Alignment** toolbar is created and placed on the screen.

To create a new Super Alignment, select the **Append HIP** icon.

The **Append HIP** simply creates horizontal intersection points (HIPs) that are joined by a straight segments.

For Appending HIPs, a cross is then drawn in each plan view that the string's model is on, and the cross follows the cursor around the screen. If the string's model is **not** added to any plan view, the model is automatically added to **all** plan views.

After the cross is on the screen (moving with the cursor), clicking LB and accepting with MB selects the **first** HIP of the string (using the appropriate snaps).

The string is then drawn from the first HIP to the cursor position, which represents the second HIP of the string. Clicking LB and accepting with MB selects the second string HIP and the process repeats for subsequent string HIPs.

Now that the string is created, all the edit option on the string's **Edit SA** toolbar are usable.

The options in the **Edit SA** toolbar are not only used for placing the initial HIPs of the string, but for editing the super alignment once it is created. Since the **Append HIP** and other options in the **Edit SA** toolbar are identical to the options used when editing an existing string, they will be discussed in detail in the **Editor** section.

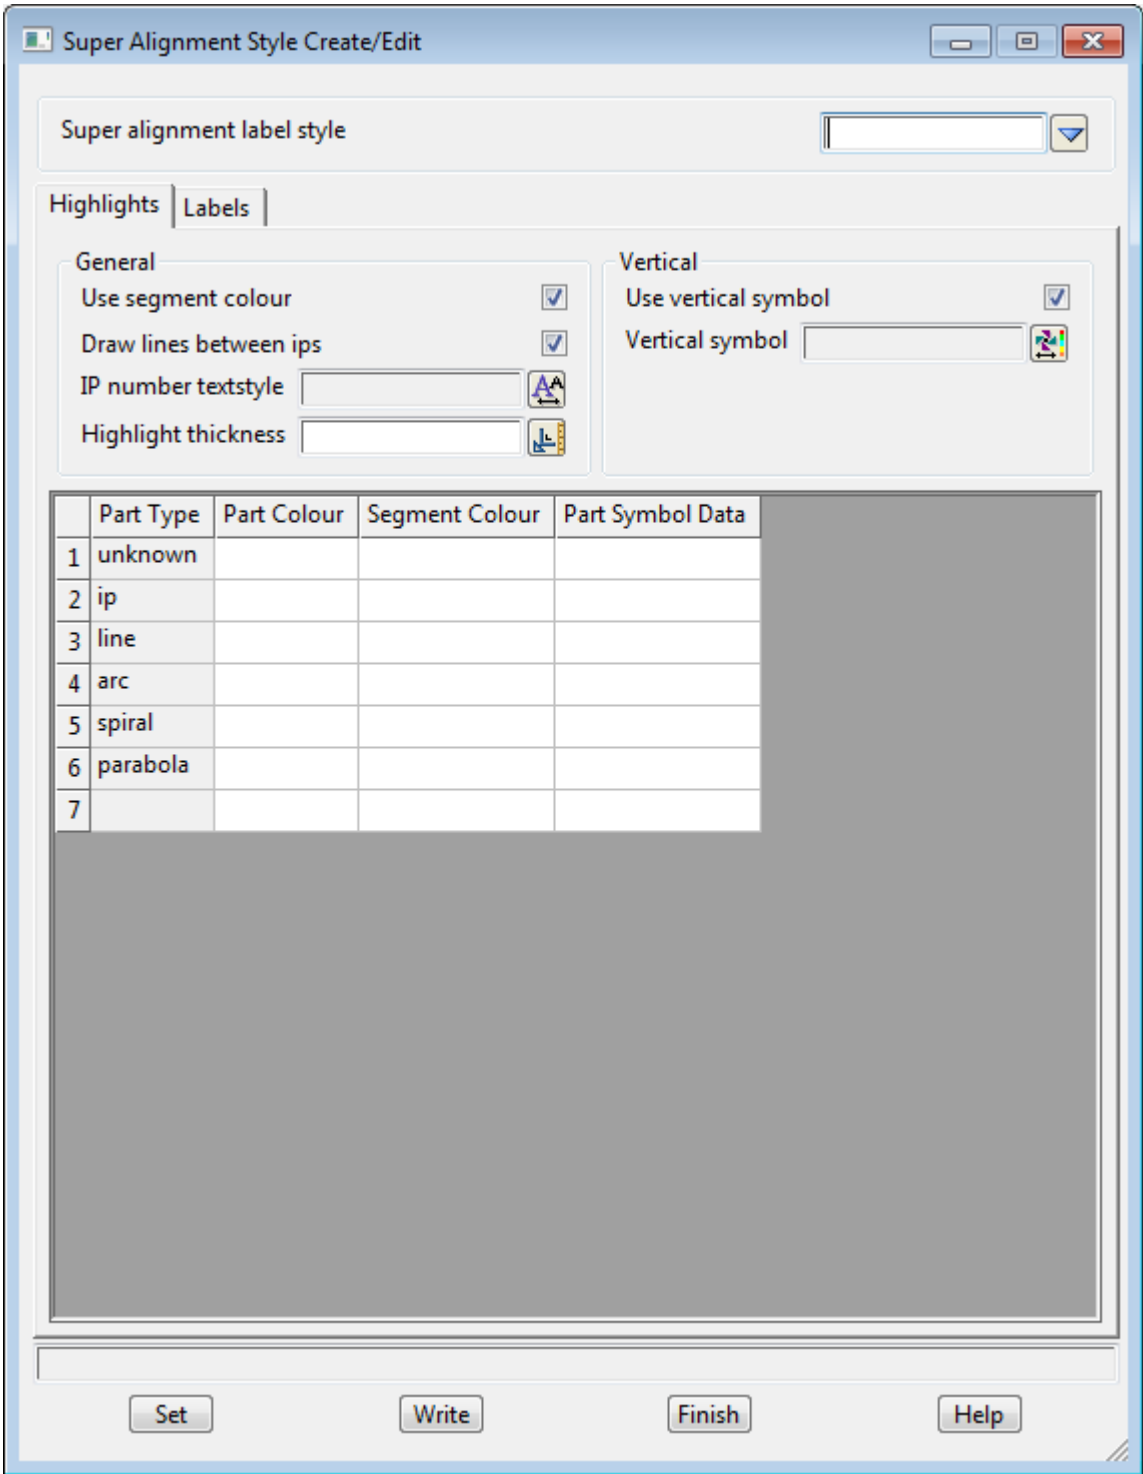

For full information on the Super Alignment Editor, go to the section [Edit Super Alignment](#)

Super Alignment Style

Position of option on menu: Strings =>Create =>Super alignments =>Super alignment style

The super alignment label styles control the way that the super alignment draws on the screen and when it is being edited.

Selecting Super alignment style displays the **Super Alignment Style Create/Edit** panel.

For the tab **Highlights** go to [Highlights tab](#)

For the tab **Labels** go to [Highlights Table](#)

For the **Buttons at the bottom** go to [Buttons at Bottom](#)

The fields and buttons used in the **Super Alignment Style Create/Edit** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Super alignment label style	choice box	design styles defined in astyles.4d	
<i>all the information in the panel refers to the selected labelling style. Note - the labelling styles are stored in the file astyles.4d.</i>			

Highlights tab

the definition of how to show the horizontal and vertical parts of the super alignment and also how to colour and label the segments when in and

Use segment colour tick box
*if **ticked**, each of the segment types are drawn in the colour given in the Highlights table given below (when the super alignment is on any view).*

Draw lines between IPs tick box
*if **ticked**, lines are drawn between intersection points (IPs).*

IP number textstyle textstyle box
the textstyle used to draw IP numbers in Plan and Section views.

Highlight thickness input
line thickness in pixels

Use vertical symbols tick box
*if **ticked**, vertical symbols are drawn when the super alignment is profiled on a Section view.*

Vertical symbol symbol box
the symbol to use for common points between segments in the Section views.

Highlights Table

*the definition of the segments that make up the definition of the part (part colour and part symbol for the fixed points) and the colour of the solved segments as a result of the part definition.
Defined for ip, line, arc, spiral (transition), parabola and unknowns.*

Part type
the part type - unknown, ip, line, arc, spiral (transition), parabola

Part colour colour box
*the definition of the part is only shown when in the edit mode.
When the string is being edited, the segments of the part are drawn in these colours.
For ip, this is the colour of the cross at the ip.
For line/arc/spiral/parabola, this is the colour of any line/arc/spiral/parabola segment.*

Segment colour colour box
*the resulting segments defined by the part are drawn in these colours.
for ip, this is the colour of the cross at the ip
line/arc/spiral/parabola, this is the colour of any line/arc/spiral/parabola segment*

Part symbol data symbol box
*when a string is being edited, the fixed points of the parts are displayed with these symbols.
for ip, the symbol at the ip of a part.
For line/arc/spiral/parabola, this is the symbols of the fixed points of any line/arc/spiral/parabola in*

the part. For example, if an arc is defined by going through three points, the three points will be drawn with the symbol for Part type arc.

Labels tab

on a plan view, the definition of what text, symbols and decimal places (precision) should be used in labelling tangent points, crest and sag points, major and minor intervals, segment radii and lengths, and special chainages.

Help

The fields and buttons used in the **Super Alignment Style Create/Edit** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use labels	tick box		
<i>if ticked, labels are automatically drawn when the super alignment is on a Plan view.</i>			
Use equality zone	tick box		
<i>if ticked and chainage equalities exist in the super alignment, the chainage intervals are relative to the beginning of the zone it is in.</i>			
Use reading angle	tick box		
<i>if ticked and the angle of the label relative to the Reading angle is over 180 degrees, the label will be flipped.</i>			
Reading angle	input		
<i>the angle to take as a base line for reading text. The angle is in HP Notation and is measured from the x axis in a counter clockwise direction.</i>			
Unsolved label	text box		
<i>the text label to use when a part is not solved. It is placed in the middle of the unsolved segment.</i>			
Unsolved textstyle	textstyle data box		
<i>the textstyle of the unsolved text label</i>			
Precision	input		
<i>the number of decimal places to use in the chainage labels</i>			
Direction type	choice box		none, at start, each segment
<i>how to draw the string direction symbol which is given in row 18 of the table below (horz. direction)</i>			
<i>If none, no direction symbol is drawn.</i>			
<i>If at start, a single direction symbol is drawn at the start of the string</i>			
<i>If each segment, a direction symbol is drawn at the middle of each segment of the string</i>			
String name textstyle	textstyle data box		
<i>the textstyle to use for drawing the name of the string</i>			
Name at start	tick box		
<i>if tick, draw the name of the string at the start of the string.</i>			
<i>If not ticked, no string name is drawn at the start of the string.</i>			
Name at end	tick box		
<i>if tick, draw the name of the string at the end of the string.</i>			
<i>If not ticked, no string name is drawn at the end of the string.</i>			
Name at interval	double box		
<i>if not blank, the name of the string is drawn at this chainage interval along the string, excluding the start and the end of the string.</i>			

Label Type Table

For each label type in the table, the Use flag is ticked if it is to be drawn, and if it is drawn, the symbol is given in the Symbol Data column, text is prefixed/postfixed as given in the Pre*Postfix column, the text used the textstyle data given in the Textstyle Data column with the number of decimal places given in the Precision column.
There are twenty four (24) types:

unknown - when it is not any of the other horizontal critical points
curve-spiral - the tangent point between an arc and a transition. Eg CS
spiral-curve - the tangent point between a transition and an arc. Eg SC
tangent-curve - the tangent point between a straight line and an arc. Eg TC
curve-tangent - the tangent point between an arc and a straight line. Eg CT

tangent-spiral - the tangent point between a straight line and a transition. Eg TS

spiral-tangent - the tangent point between a transition and a straight line. Eg ST

common tangent - the tangent point between two arcs. Eg CTP

spiral-spiral - the tangent point between two transitions Eg SS

interval - the chainage label at the major interval

vert. unknown - when it is not any of the other vertical critical points

vert. tangent-curve - the tangent point between a straight grade and a vertical curve (parabola or an arc). Eg VTC

vert. curve- tangent- - the tangent point between a vertical curve (parabola or an arc) and a straight grade. Eg VCT

vert. common tangent - the tangent point between two vertical curves. Eg VCTP

crest - a vertical crest (local maximum) point. Eg CREST

sag - a vertical sag (local minimum) point. Eg SAG

special chainages - chainages from a special chainage file given in the Special chainage file field in the Basic Label section of the Super Alignment Properties

horz. direction - the direction symbol of the string

minor interval - the chainage label at the minor interval

k post equality - label the k posts equations. Eg 15 Km 998 = 16 Km

internal equality - label the internal equality equation Eg 17 Km 500 = 17 Km 600

segment radius - label the radius of an arc segment Eg R 500.0

segment length - label the length of a segment Eg L 500.0

segment bearing - label the bearing of a segment in dms format Eg 125 30 20

Buttons at Bottom

Set button

*clicking the **Set** button means that for this session, all the definitions in the panel will be used for the style given in the **Super alignment label style** field. Unless the **Write** button is used to write the values out to the **astyles.4d** file, the values will be lost when the project is exited.*

Write button

*clicking the **Write** button writes out all the values in this panel to the **astyles.4d** file as the style given in the **Super alignment label style** field*

Note

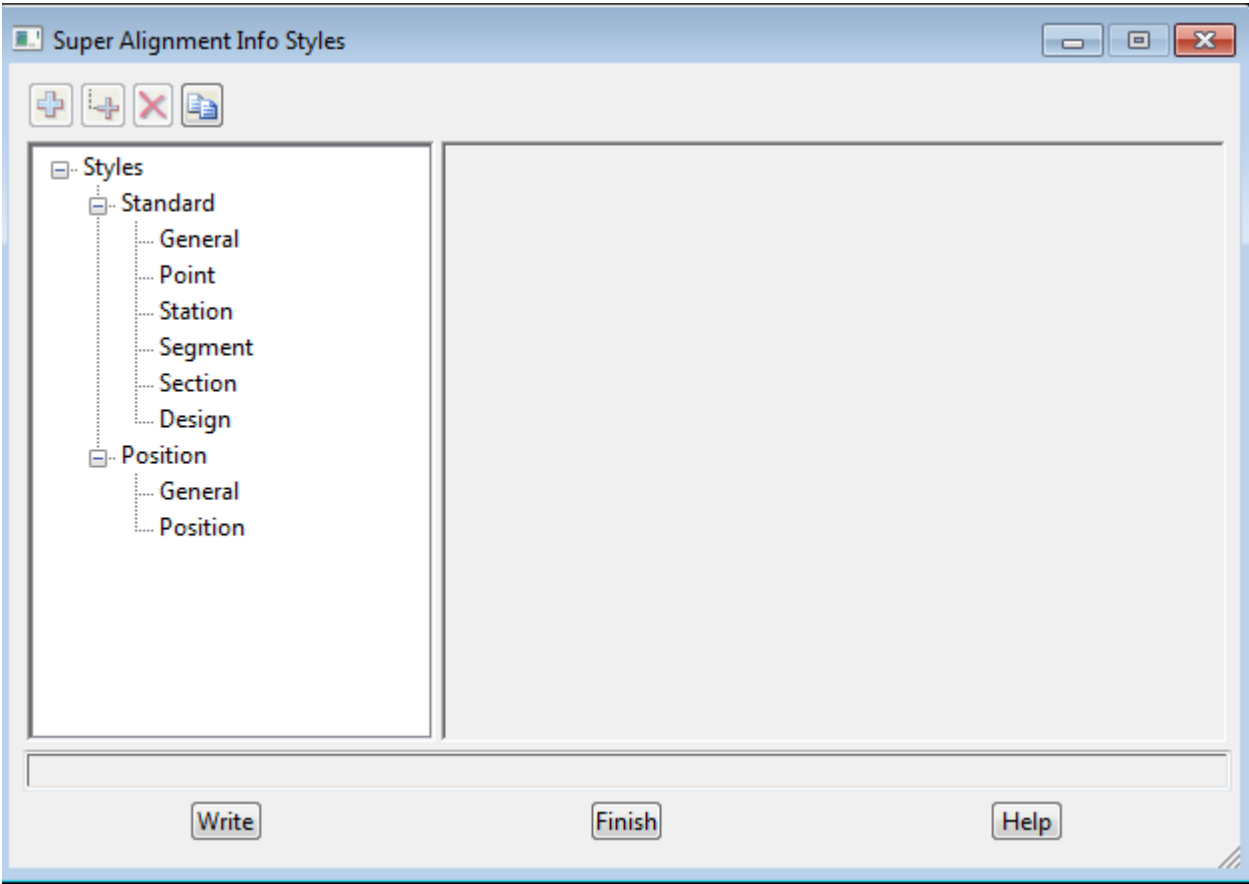

The new Super alignment label style is not used until a resolve is done on the super alignment string.

Super Alignment Info Styles

Position of option on menu: Strings =>Create =>Super alignments =>Info style

The *super alignment info styles* control what information is displayed in the **Super Alignment Info** panel brought up by the [Super Alignment Info](#) option on the SA Tools menu or toolbar.

Selecting Super alignment info displays the **Super Alignment Info Styles** panel.

Design Standards

Position of option on menu: Strings =>Create =>Super alignments =>Design standards

The **design standards** sets up numerous standard tables for

- (a) horizontal speed (speed_standards)

defines for various speeds, the use of horizontal arcs and transition curves, super elevation for various numbers of lanes.

- (b) horizontal widening (widening_standards)

defines the road widening for various lane widths, speeds and curve radii.

- (c) horizontal small deflection (small_deflection_standards)

- (d) vertical crest (crest_standards)

defines for crest curves the k-values of allowed parabolas for different speeds

- (e) vertical sag (sag_standards)

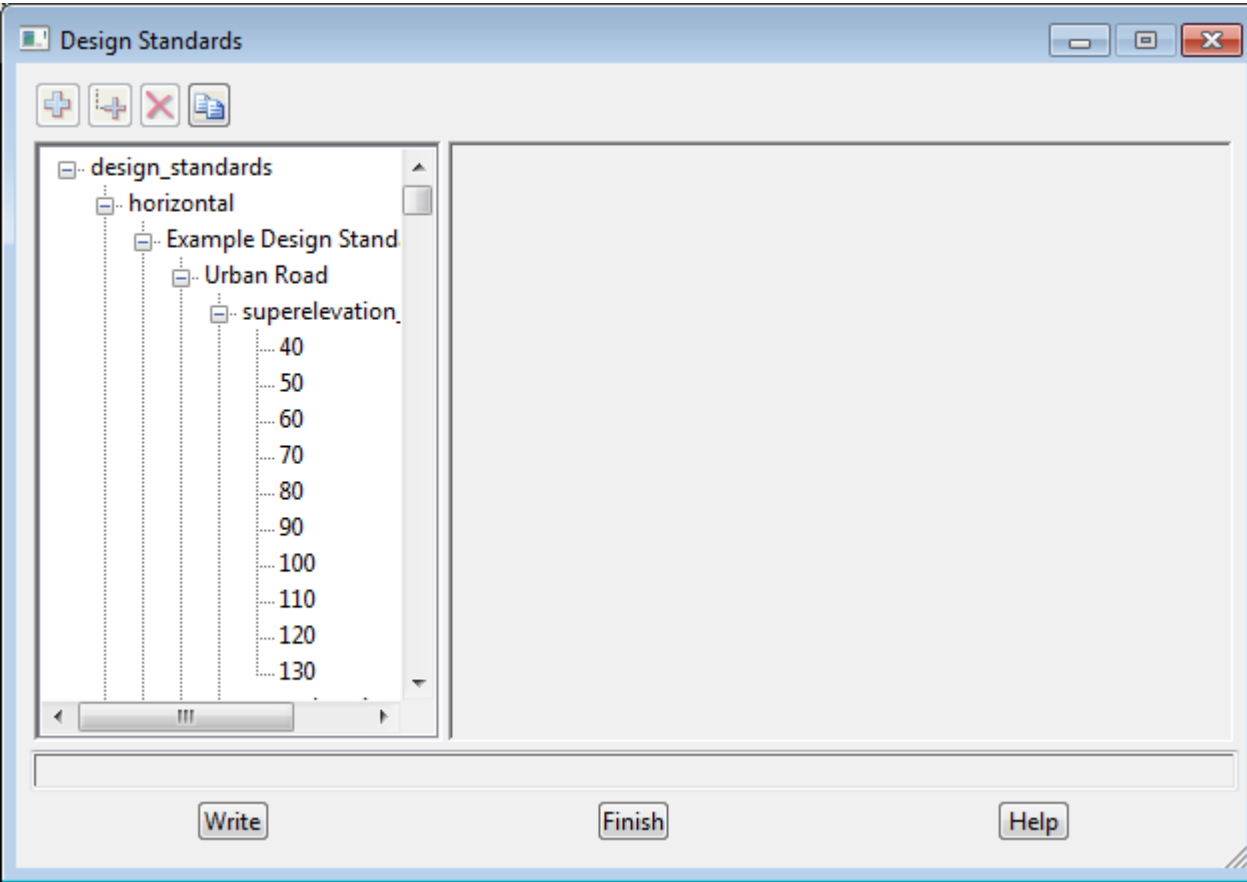

defines for sag curves the k-values of allowed parabolas for different speeds

For each of the five types of tables, specific tables of values are set up by the user for each of the different design scenarios that the user will undertake. Each specific table is given a name, and the names must be unique within each of the five types of tables.

The tables are written to a file (design_standards.xml) which is then read in whenever a project is opened.

The tables in the design standards file are used in the option Strings =>Create =>Super alignments =>Design templates to define **Design Templates** (see [Design Templates](#)), and when a super alignment is created, **one Design Template** is selected for use with that super alignment (see the section [Advanced > Design branch](#) from [Create - Super Alignment](#)).

Selecting Design standards displays the **Design Standards** panel.

DOCO TO GO INTO DEFINITIONS OF DESIGN PARAMETERS

Ease-off

choice box

none
maximum
by length

method of transitioning between minimum and maximum super elevation.

If **none**, no transition is done.

If **maximum**, maximum back to back curves are added to the super diagram between the minimum and maximum super elevation and are used to transition the super.

*If by length, the ease off distance is given by the **Ease off length** value.*

Ease-off length

input

*the length of the ease off for the transition of super elevation when the **by length** method is selected*

Min on reverse

input

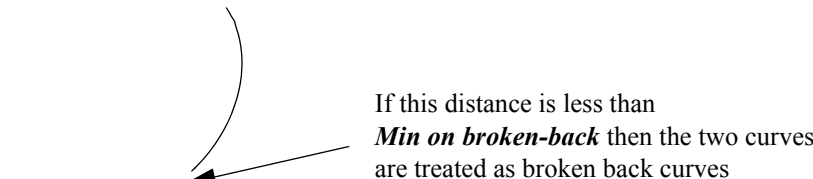

*if the chainage distance between two curves of opposite sign is less than the **Minimum on reverse** value then the two curves are treated as reverse curves when applying the design rules.*

Plan View

Min on broken back input

if the chainage distance between two curves of the same sign is less than the **Minimum on broken-back** value then the two curves are treated as broken-back curves when applying the design rules.

Plan View

FROM V9 DOCO

Slope type choice box planar
crowned
projected

If **planar**, then the design table is only applied for half of the road (from the hinge string to the end of the fixed template). The side used is given by **Highside**.

If **crowned**, then the design table is used for each side of the roads (from the left most fixed template to the hinge string, and from the hinge string to the right most fixed template).

If **projected**, then the design table is first applied to half of the road given by **Highside** (from the hinge string to the end of the fixed template). Then the grade from the **Highside** is projected through the hinge string and used on the other side of the road.

Highside choice box left edge left edge, right edge
*used if the **Slope type** is planar or projected to define the higher side of the road pavement.*

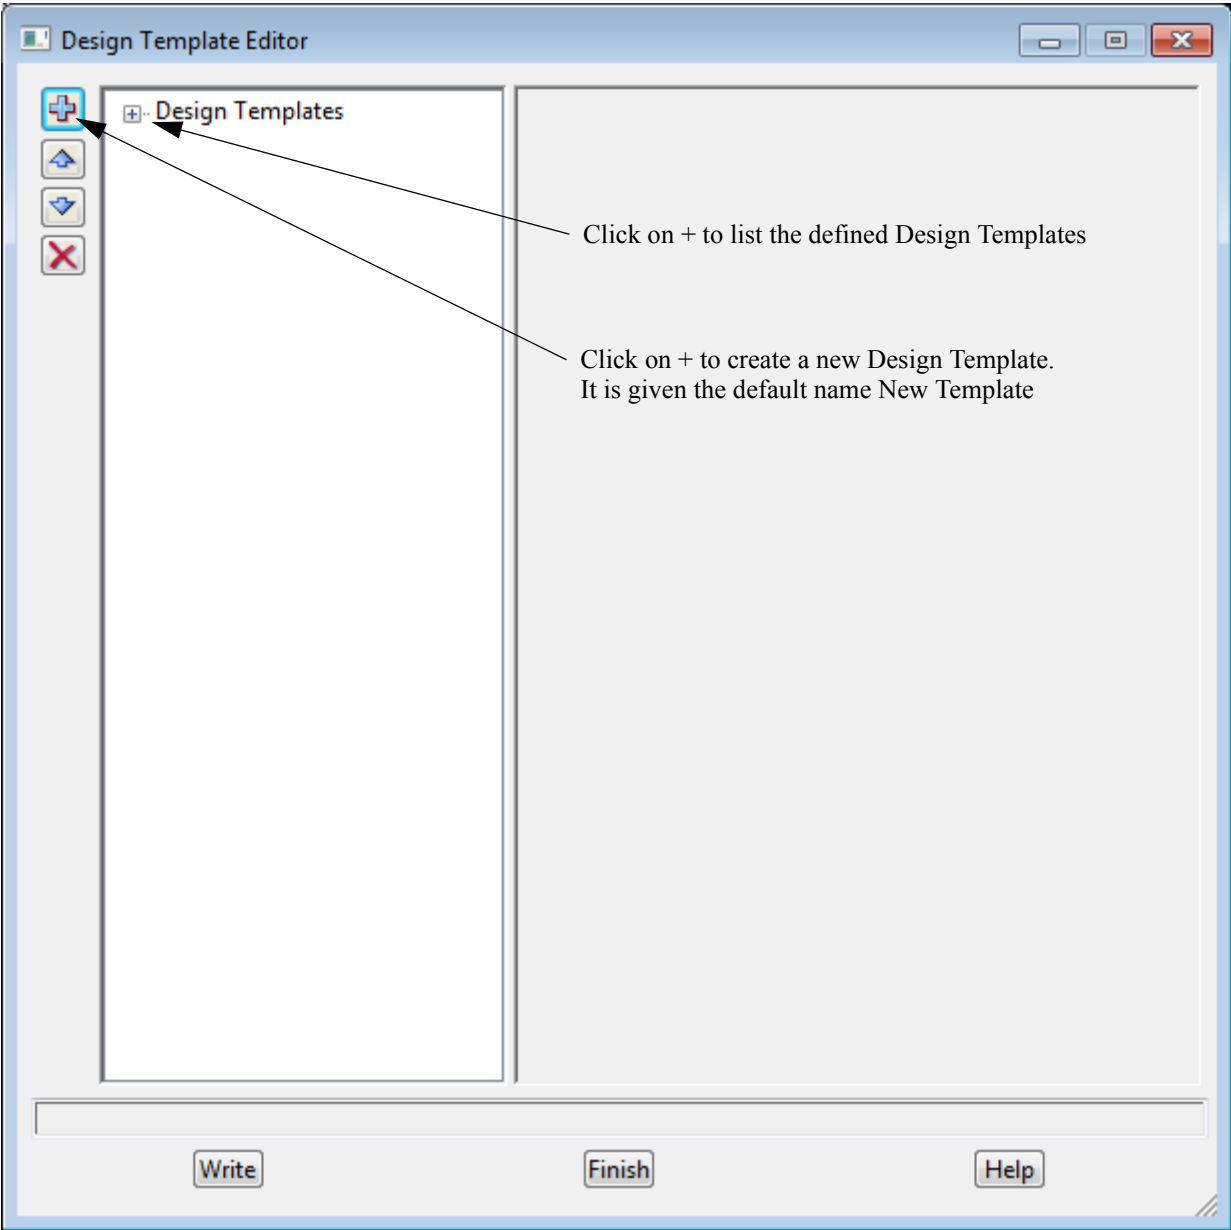

Design Templates

Position of option on menu: Strings =>Create =>Super alignments =>Design templates

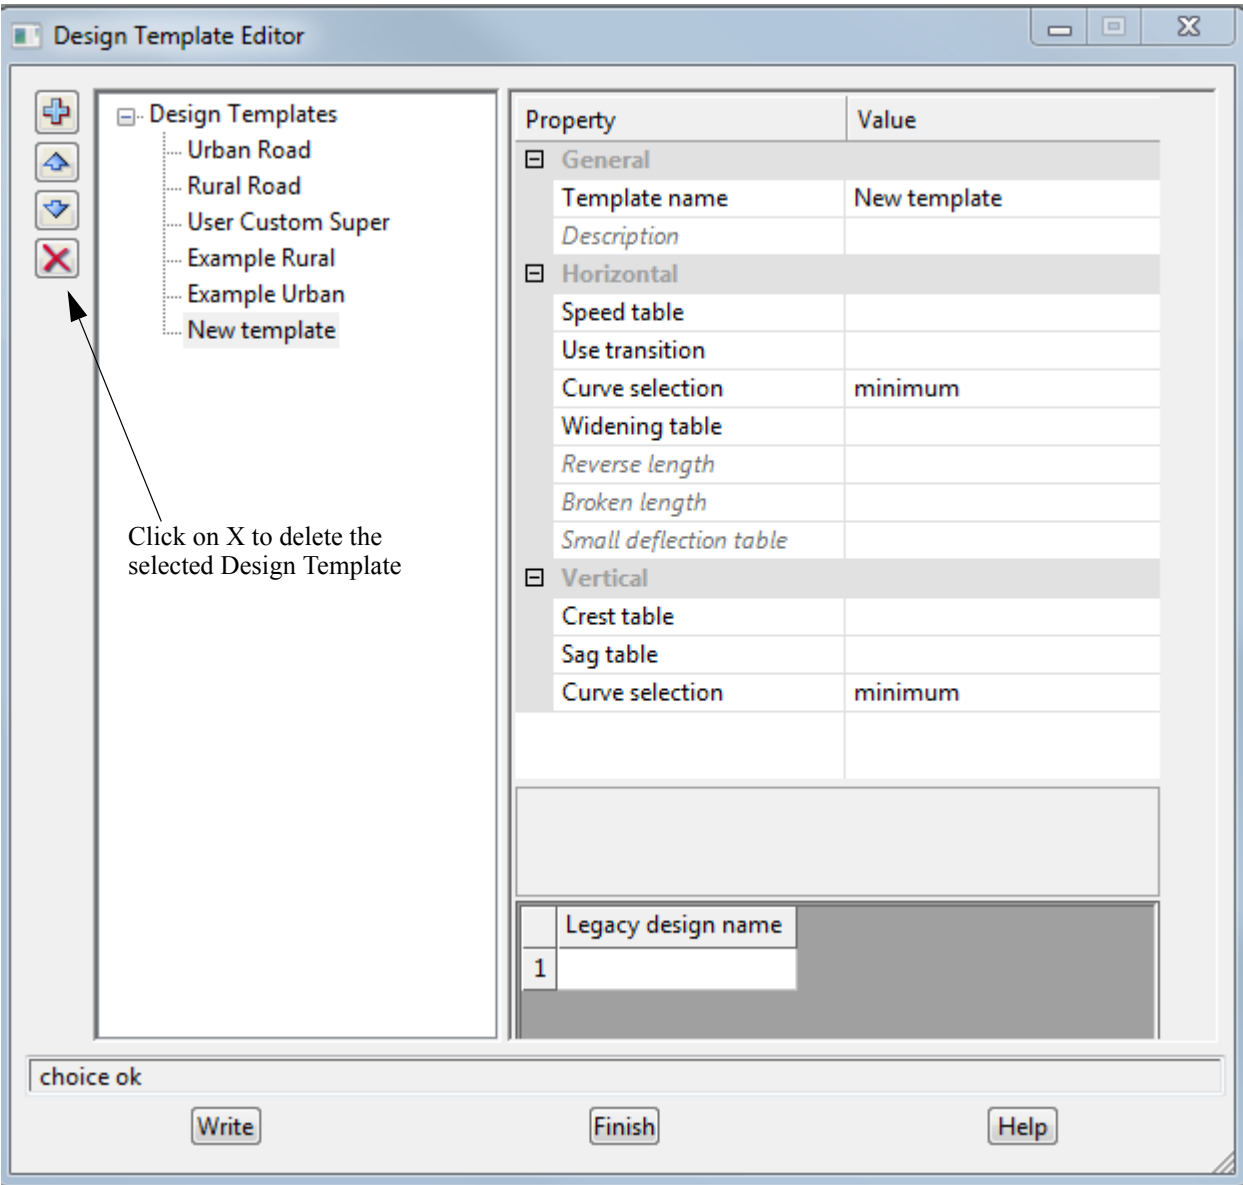

The **Design Templates** option is used to create Design Templates (each with a unique name) that have one of each of the five design table types (horizontal speed, horizontal widening, horizontal small deflection, vertical crest, vertical sag) that have been defined by the Strings =>Create =>Super alignments =>Design standards option (see [Design Standards](#)), plus whether curve transitions are allowed, whether minimum or maximum curve radii are used, and reverse and broken back curve lengths.

When a super alignment is created, **one Design Template** is selected for use with that super alignment (see the section [Advanced > Design branch](#) from [Create - Super Alignment](#)).

Selecting Design templates displays the **Design Template Editor** panel.

Clicking on the + in front of **Design Templates** will list all the design templates that are in the *design_templates.xml* file currently be used in the **12d Model** project.

The fields and buttons used in the **Design Template Editor** panel when creating a new *Design Template*, or when clicking on an existing *Design Template*, have the following functions.

Field Description	Type	Defaults	Pop-Up
Template name	text box		
<i>the name of the Design Template. This can not be blank and must be unique amongst the list of Design Templates. The default name is New Template and this can be changed by typing a new name into this field.</i>			
Description	text box		
<i>a description for this Design Template. This can be blank.</i>

is used.

Buttons at Bottom

Write button

*clicking the **Write** button writes out all the Design Templates defined in this panel to the **design_templates.xml** file.*

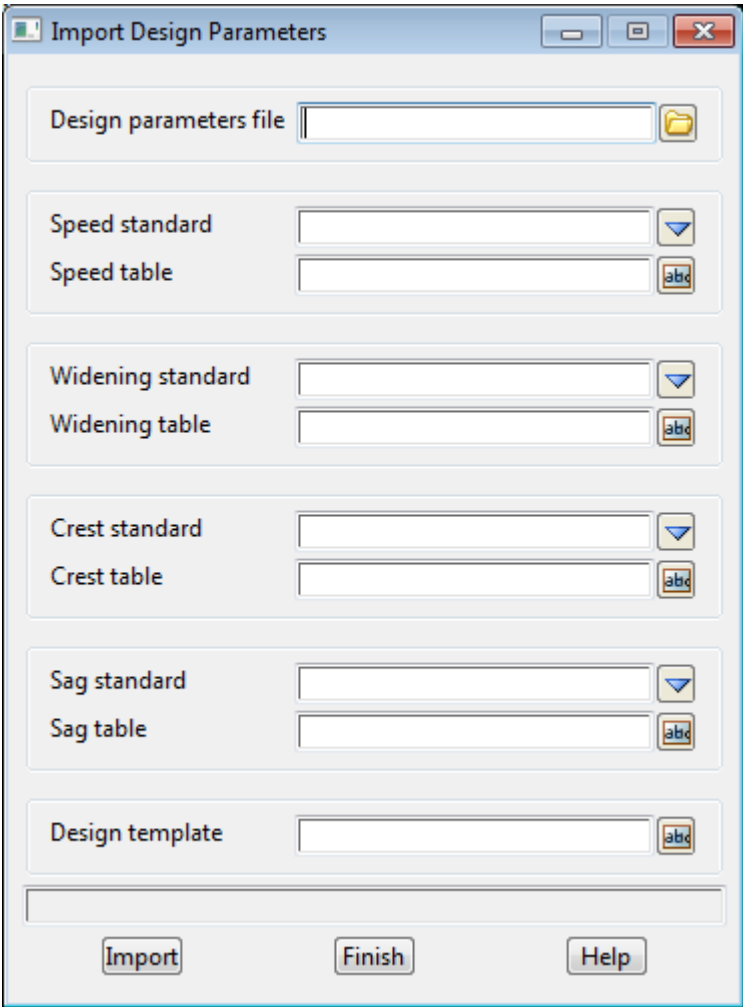

Import Legacy Design

Position of option on menu: Strings =>Create =>Super alignments =>Import legacy design

The **Import legacy design** option reads a **12d Model 9 Design Parameter File** and converts it to a **Design Template** for use in **12d Model 10**.

Note:

Selecting **Import legacy design** displays the **Import Design Parameters** panel.

Selecting a **Design parameters file** will read in the selected **.design** file and populate fields in the panel.

Define Design Parameters - from V9

Position of option on menu: Strings =>Create =>Super alignments =>Design parameters

This was superseded in 12d Model 10 by Design Tables and Design Templates.

The **design parameters table** defines the use arcs, transition curves, parabolas, super elevation and road widening for given design speeds. The table is used to use by a super alignment in conjunction with user supplied information given in the **Design** tab of the super alignment.

Selecting Design parameters displays the **Road Design Parameters** panel.

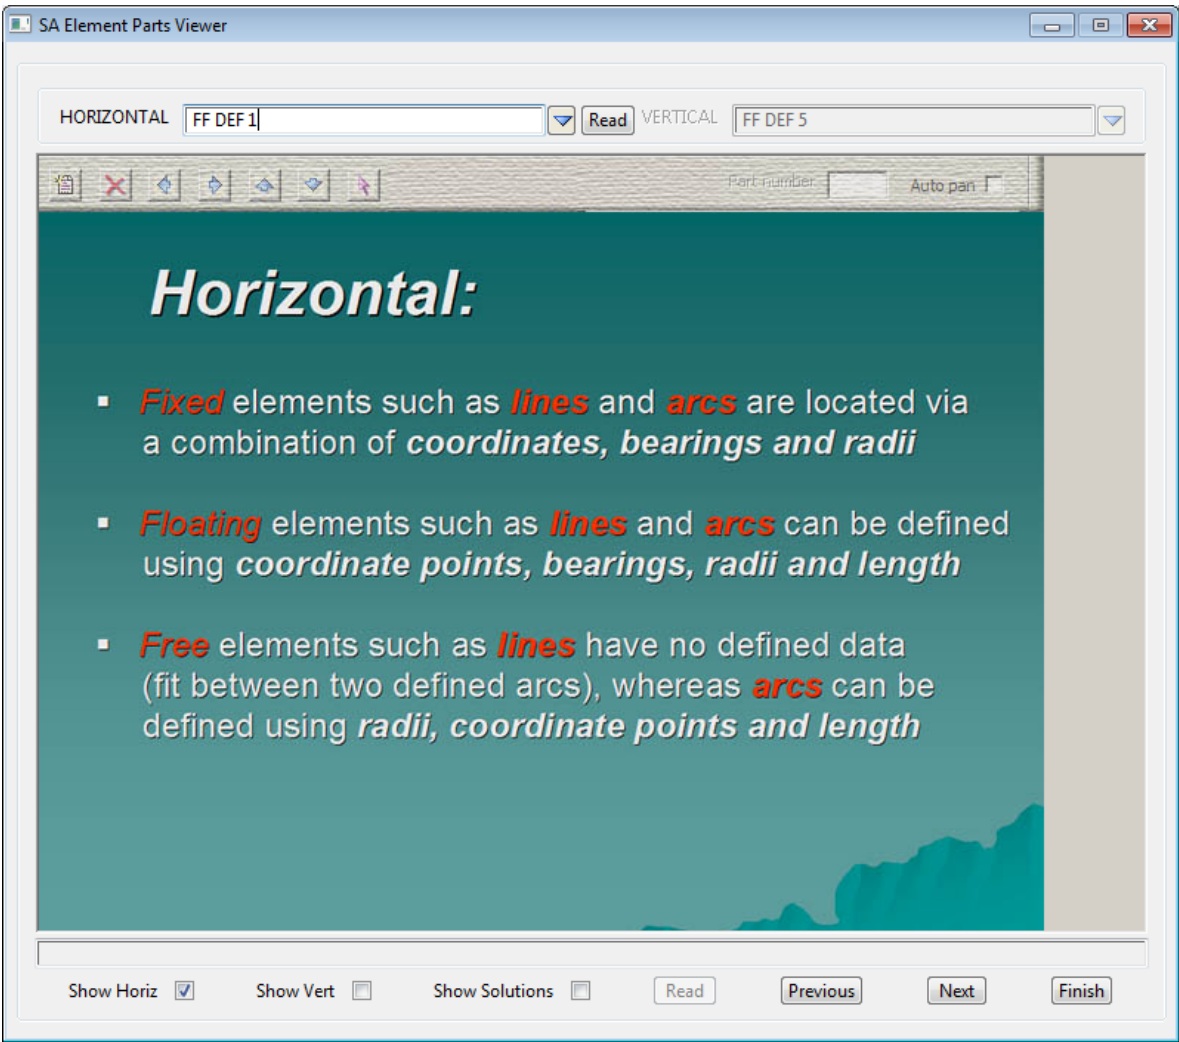

SA Element Parts Viewer

Position of option on menu: Super Alignment Toolbar=>Help

This option displays and explains all the parts in both horizontal and vertical, available in the Super Alignment.

Examples from the library can be read in for editing.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Horizontal	choice box		various
Quick selection of Horizontal parts			

Vertical choice box various

Quick selection of Vertical parts

Read Both button

*Will read in 12d ascii examples of all the parts. Most include vertical parts that are similar to their horizontal counter parts.
A plan view is created, called "SA Examples", and a model called "12D HOR ELEMENTS" is added to the plan view.*

Show Horiz tick box

If ticked, allows the explanation and viewing of all horizontal parts

Show Vert tick box

If ticked, allows the explanation and viewing of all vertical parts

Show Solutions tick box

If ticked, allows the viewing of examples that can be read in

Read button

*Will read in 12d ascii examples of Super Alignments. Most include vertical geometry.
A plan view is created, called "SA Examples", and a model in the format "12D SA EXAMPLE 1" is added to the plan view.*

Previous button

Step backward through examples

Next button

Step forward through examples

Super to SA Element Convert

Position of option on menu: Road Toolbar

This option is used to convert super strings that may have come in from other software.

The conversion will attempt to create a Super Alignment made up in the horizontal of element parts.

The parts will mainly include at least one fixed part followed by floating parts of varying types (lines and arcs).

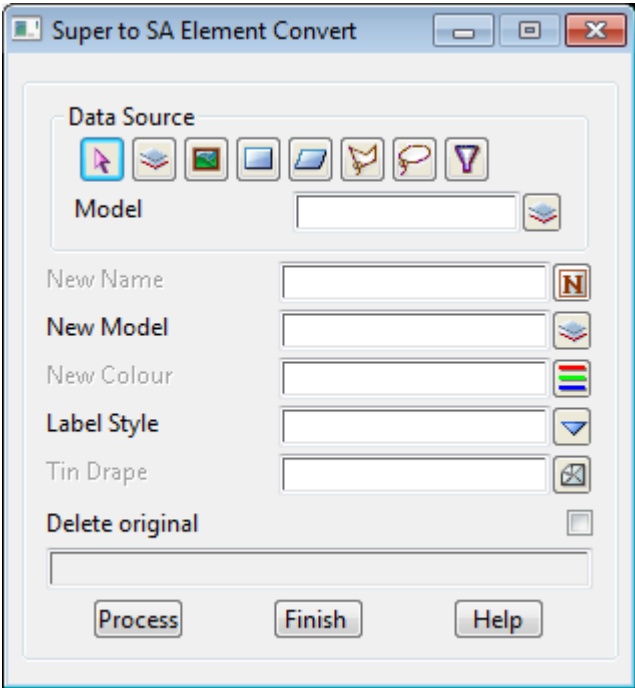

A label style can be set and a tin set in the vertical as a drape computerator.

Note: If the original string had a geometry error (non-tangential arcs e.g.), then the resulting Super Alignment will show an error.

The error however will be easy to find as any parts prior to the error, will still show as solved.

Selecting the convert alignment option brings up the Super to SA Element Convert panel.

The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Reference <i>Super Alignment selection only</i>	string select		
Process <i>Creates the function and runs</i>	button		
Move Table <i>Select IP Tabulation Box to move for clarity (esc or right mouse button to cancel)</i>	button		

Create Arcs

Position of menu: Strings =>Create =>Arcs

The Create arcs option is used to create 12d Model arcs.

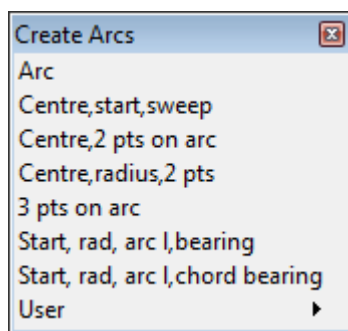

A 12d Model **arc** consists of a radius, a centre point, and a start and end point on the arc.

The radius can be positive or negative. If the radius is positive, the arc is drawn from the start-point to the end-point in a clockwise direction. If the radius is negative, the arc is drawn from the start-point to the end-point in counter-clockwise direction.

The height at the start point and at the end point can be different. In that case, the arc is still a plan arc but the z- value varies linearly from the start point to the end point as one moves around the arc. Hence the 12d Model arc string is actually a **helix** with its centre-line perpendicular to the xy-plane.

For convenient 12d Model includes a variety of methods for creating arcs.

On selecting the Arcs option, the Create arcs menu is displayed giving all the different methods for creating arcs.

Each option in the Create arcs menu fires up its own special panel to collect the necessary information for defining the arc.

The mouse is used to select the special points required for the arc and circle definitions. For example, in the arc - 3 points on arc option, the three points are selected using the mouse.

Unlike the other strings created under **strings=>create**, the arc can be created immediately without needing any options from the arc editors.

Consequently, after an arc is defined, the create panel is not removed and is left on the screen to create another arc. Any information that needs modifying is changed in the **arc** panel and is used for the new create.

New arcs are created until either the panel is removed by selecting the **finish** or **[X]** button, or the create terminated by selecting **cancel** from the **pick ops** menu in which case the panel will be left on the screen. In the last case, the **arc** button is then used to begin a new create sequence.

Each of the methods for creating arcs will now be described.

For the option Arc, go to

<i>Arc</i>	Create - Arc
<i>Centre,start,sweep</i>	Create Arc - Centre Point, Start Point and Sweep
<i>Centre,2 pts on arc</i>	Create Arc - Centre Point, Start and End Points
<i>Centre,radius,2 pts</i>	Create Arc - Centre, Radius, Start and End Points
<i>3 pts on arc</i>	Create Arc - Three Points on Arc

Start, rad, arc l, bearing [Create Arc - Start Point, Radius, Arc Length and Start Bearing](#)

Start, rad, arc l, chord bearing [Create Arc - Start Point, Radius, Arc Length and Chord Bearing](#)

Create - Arc

Position of option on menu: Strings =>Create =>Arcs =>Create Arcs

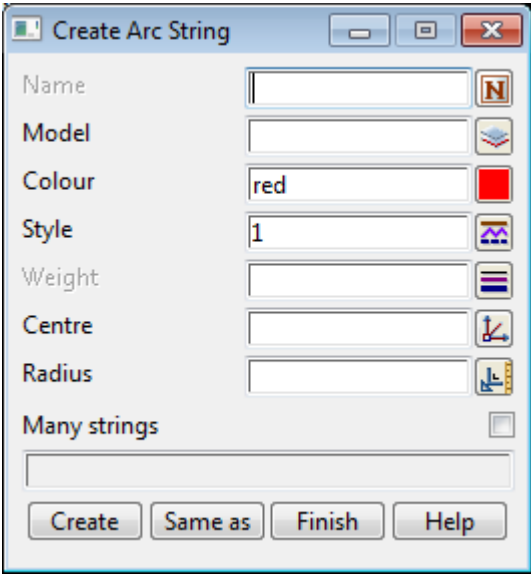

Arcs and circles are normally created using the strings=>create=> arcs OR strings=>create=> circles menu. Please see the documentation on that option for creating arcs and circles.

This option is a special arc creator so that a menu exists if the strings=>create=>same as option is used on an arc. It creates an arc with an initial sweep angle of 360 degrees.

The **Many strings** tick-box is used when more than one string of the same type is to be created, If **many strings** is set to *tick*, when the current string creation is **Finished** or **Quit**, a new **Create Arc String** panel is placed on the screen with the same information in it as the string just created. If any of the information needs to be modified for the new string, simply change it in the **Create Arc String** panel fields before selecting the **Create** button for the new string. Hence a new string of the same type can be created without going back to the **Create** menu.

The **Same as** button is used to obtain information from an existing string (not necessarily of the same type) and pipe it into the name, colour, model, style breakline type and height field of the **Create Arc String** panel.

After selecting the option, the **Create arc string** panel is displayed.

The new fields and buttons used in the **create arc string** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	

Centre	input	xyz ops menu
<i>co-ordinates of the centre of the arc.</i>		
Radius	input	
<i>the radius for the arc.</i>		
Many strings	tick	
<i>if ticked then after the current string is finished, a new create panel is placed on the screen with all the same values for the panel fields as the current string.</i>		
Create	button	
<i>After the create button is chosen, the arc edit menu and arc edit info panel are displayed.</i>		
Same as	button	
<i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>		

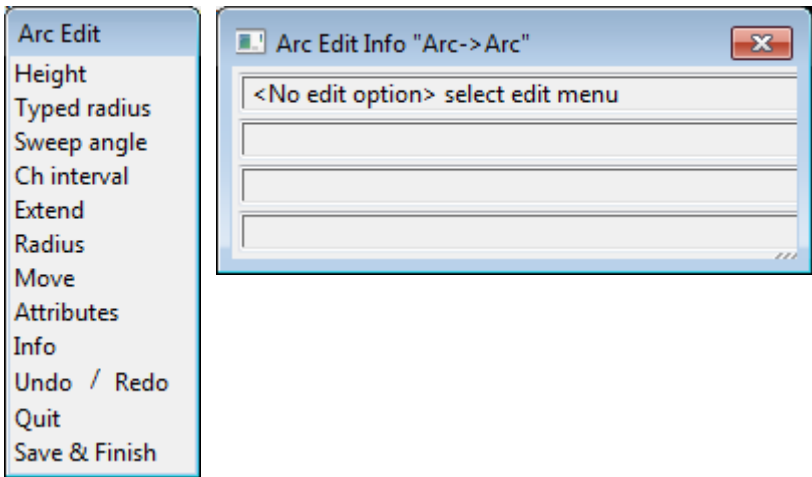

Note - the centre co-ordinates can either be typed into the **centre** panel field, or if LB is clicked on **[+]** for the **centre** panel field, the xyz ops menu comes up and the **pick xyz** option used to select a point as the arc centre.

Continue to the next section [Create Arc - Centre Point, Start Point and Sweep](#) or go back to [Create Arcs](#).

Start Edit - Arc

Unlike the other string creates, on selecting the **Create** button the arc string is immediately created with a sweep angle of 360 degrees. The **arc edit** menu and **arc edit info** panel are also placed on the screen at the same time

The **arc edit** menu and **arc edit info** panel for an arc string are

For full information in the Arc Editor, go to the section [Arc Edit](#)

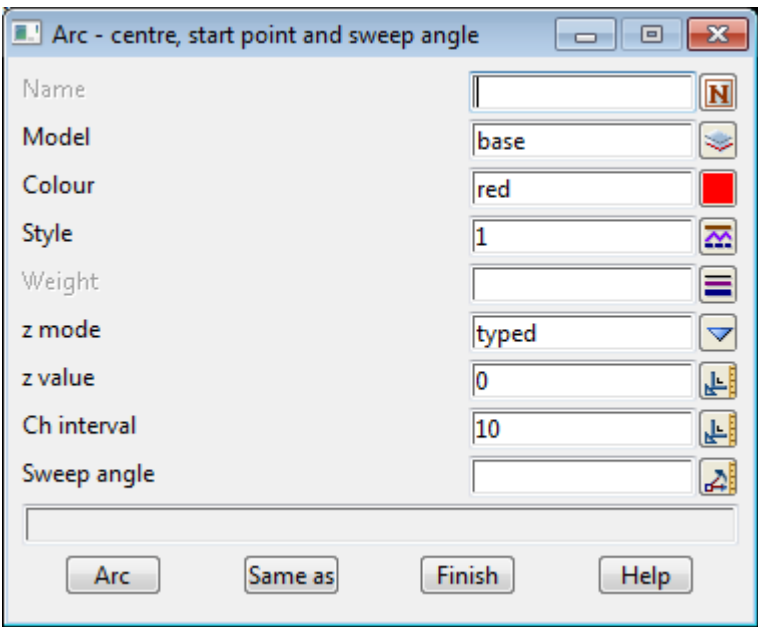

Create Arc - Centre Point, Start Point and Sweep

Position of option on menu: Strings =>Create =>Arcs =>Centre,Start,Sweep

This option defines an arc by selecting a centre point, the start point of the arc and the sweep angle of the arc. The sweep angle is measured in the **clockwise** direction.

The radius is calculated by the option and is simply the distance between the centre and start points. The arc end point is also automatically calculated using the known points, radius and sweep angle.

After selecting the option, the **arc - centre, start point and sweep angle** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval and sweep angle are entered into the appropriate fields and then the centre point and start point of the arc are selected with the cursor. The arc is then created using the information provided in the panel.

The new fields and buttons used in the **arc - centre, start point and sweep angle** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the end points is the value in the field.</i>	input	0	
Ch interval <i>the chainage interval used when a chord approximation is needed for the arc.</i>	input	10	
Sweep angle <i>sweep angle for the arc - Note: clockwise is positive for sweep angles</i>	input		
Arc <i>The arc button is used to begin a new create if the previous one was cancelled.</i>	button		
Same as <i>After the same as button is chosen, another string is selected and information about it is used for the fields in this panel.</i>	button

Create Arc - Centre Point, Start and End Points

Position of option on menu: Strings =>Create =>Arcs =>Centre, 2 pts on arc

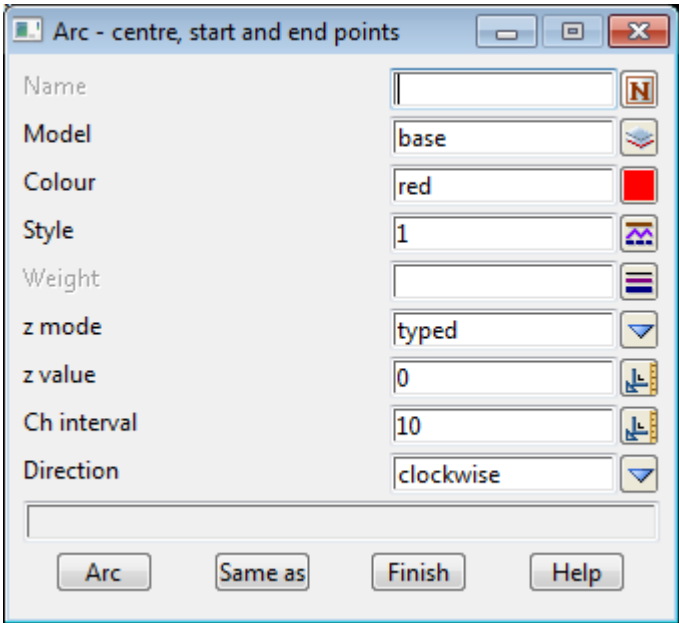

This option defines an arc by selecting a centre point, a start and end points for the arc and the direction (clockwise, anti-clockwise) that the arc travels in. The radius is calculated by the option

and is simply the distance between the centre and start points.

It is difficult to choose the end point correctly so that it lies exactly on the arc since it only occurs when the distance between the centre and selected end point is exactly the radius of the arc.

Hence, the selected end point and arc direction is used to determine the sweep angle from the start point to the “end point to centre point” line. This is enough information to define the arc. The real end point is then calculated so that it **lies** on the arc.

After selecting the option, the **arc - centre, start and end points** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - centre, start and end points** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name <i>the name of the new string.</i>	input		
Model <i>name of the model that the new string is in.</i>	input		available models
Colour <i>the colour of the new string.</i>	input	default colour	available colours
Style <i>line style of the string.</i>	input	1	available line styles
Weight <i>thickness of the string.</i>	input	0	
z mode <i>the method of specifying the z-value for the end points of the arc. It can be typed in or taken from the z-value of the selected end points.</i>	input	typed	snap, typed
z value <i>if the z mode method is typed, then the height (z-value) of the end points is the value in the field.</i>	input	0	

Ch interval	input	10

Create Arc - Centre, Radius, Start and End Points

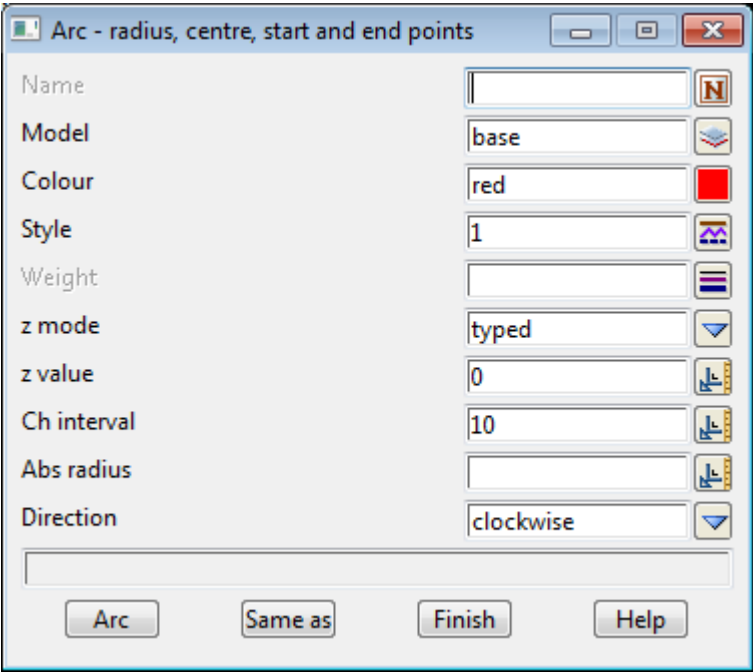

Position of option on menu: Strings =>Create =>Arcs =>Centre, radius, 2pts

This option defines an arc by the user setting a radius and direction of arc and then selecting the centre, start and end points for the arc.

Since the radius is given exactly, it is difficult to choose the start and end points so that they lie exactly on the arc. This only occurs when the distance between the centre and selected start and end points is exactly the radius of the arc.

Hence, the selected start point is dropped perpendicularly onto the arc to give the real start point. Similarly, for the real end point.

After selecting the option, the **arc - radius, centre, start and end points** panel is displayed.

To **create** an arc, the name, colour, model, chainage interval, radius and direction are entered into the appropriate fields and then the centre point, start and end points of the arc selected with the cursor. The arc is then created using the information provided in the panel.

The fields and buttons used in the **arc - radius, centre, start and end points** panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Create Arc - Three Points on Arc

Position of option on menu: Strings =>Create =>Arcs =>3 pts on arc

This option defines an arc by selecting three points that lie on the arc.

The selected arc points are the start point, a point between the start and end point, and the end point. The three points must be selected in that order.

After selecting the option, the **arc - 3 points on arc** panel is displayed.

To **create** an arc, the name, colour, model and chainage interval are entered into the appropriate fields and then three points - start point, point between the start and end point, and the end point- which lie on the arc are selected with the cursor.

After the three points are picked, the arc is created using the information provided in the panel.

After a arc is defined, the option does not terminate. Another arc can be created by simply modifying any of the information that needs changing in the **arc - 3 points on arc** panel and then selecting three points on a new arc.

The fields and buttons used in the **arc - 3 points on arc** panel have the following functions.

Field	Description	Type	Defaults	Pop-Up
Name	<i>the name of the new arc.</i>	input		
Model	<i>name of the model that the new arc is in.</i>	input		available models
